Frequency of return: The rate at which a particular type storm can be expected to occur (e.g., 1 year), such storms being classified by storm intensity and duration.

Infiltration: The process whereby water enters a sewer system from underground through such means as defective pipes, pipe joints, connections, or manhole walls. Infiltration does not include, and is distinguished from, inflow.

Inflow: The process whereby water enters a sewer system through such means as cellar and foundation drains, roof leaders, surface drainage, and cross connections from storm drains and catch basins. Inflow does not include, and is distinguished from, infiltration.

In-line storage: A type of storage that has no pumping requirements and can consist of either storage within the sewer (in-sewer/in-pipe) or channel, or storage in the in-line basins.

Interceptor: A sewer designed to receive dry weather flow from a number of transverse combined sewer trunks and additional quantities of intercepted surface runoff during low-flowing sanitary sewage periods and to convey such waters to a point for treatment.

Knee-of-the-curve: The point along a cost-benefit curve at which there is a noticeable change in the quantity of cost for an increment of benefit.

Lateral: A sewer that has no other common sewer discharging into it.

Longitudinal dispersion: One-dimensional dispersion (mixing) occurring along the length of the stream or estuary.

Mathematical modeling: Application of mathematical formulae to represent the processes and effects of natural and manmade systems for the purpose of forecasting responses to different conditions and inputs.

Model: Any representation of a system by something other than the system itself.

Model calibration: Refinement of mathematical model parameters and coefficients through comparison to data by making scientifically consistent and rational adjustments.

Model parameter: A quantity that cannot vary in a particular model run.

Model variable: A quantity that can vary in a particular model run.

Nonpoint: Diffuse; not attributable to a particular location.

Nonpoint source pollution: Any unconfined and nondiscrete conveyance from which pollutants are discharged.

Off-line storage: A type of storage that requires detention facilities (basins or tunnels) and facilities for pumping storm flow either into or out of the detention facilities.

Pathogen: A disease-causing microorganism.

Pathogenic bacteria and viruses: Bacteria and viruses capable of causing disease in humans.

Physical treatment processes: Means of treatment in which the application of physical forces predominate. Screening, sedimentation, flotation, and filtration are examples. Physical treatment operations may or may not include chemical additions.

Physical with/without chemical treatment processes: Means of treatment in which the removal of pollutants is brought about primarily by physical processes, with or without chemical addition to enhance removal efficiency.

Receiving waters: Natural or manmade water systems into which materials are discharged.

Recurrent frequency. The historical frequency at which a condition or situation occurs.

Regulator: A structure that controls the amount of sewage entering an interceptor by storing in the upstream trunk line or by diverting some portion of the flow to an outfall.

Sanitary sewer: A sewer that carries liquid and water-carried wastes from residences, commercial buildings, industrial plants, and institutions, together with relatively low quantities of ground-, storm-, and surface waters that are not admitted intentionally.

Sanitary sewer overflow (SSO): A sanitary sewer overflow is flow from an outfall (discharge conduit) of a sanitary sewer collection system in excess of the interceptor capacity that is discharged into a receiving water. Sanitary sewer overflows are the result of the unplanned relief of a sewer system intended only for sanitary sewage. An SSO typically occurs when the flow exceeds the carrying capacity of the system and although SSOs can, and do, occur during dry weather, they are most commonly associated with wet weather events.

Sanitary wastewaters: Wastewater of human origin.

Satellite facilities: Storage/treatment facilities at remote locations upstream of the dry weather flow sewage treatment plant and usually at the regulator/overflow site.

Sediment oxygen demand: Biochemical consumption of dissolved oxygen in overlying waters by decaying sediments across the water-sediment surface.

Sensitivity analysis: The variation of model parameters to determine the sensitivity of the model to each parameter.

Sewer: A pipe or conduit generally closed, and normally not flowing full, for carrying sewage or other waste liquids.

Sewer flushing: Flushing applied to combined sewer systems during dry weather flow periods to remove settled material periodically or as it accumulates, and to hydraulically convey it to the treatment facilities, thus preventing resuspension and overflow of a portion of the solids during storm-flow periods and lessening the need for CSO treatment.

Sewerage: System of piping, with appurtenances, for collecting and conveying wastewaters from source to treatment and/or discharge.

Simulation: The application of a model.

Source control: A method of abating wet weather flow or pollution at the upstream, upland source where the pollutants originate and/or accumulate.

Storage The slowing, dampening, or attenuating of storm-generated or combined sewer flows either entering the sewer/drainage system or within the sewer/drainage system by temporarily holding the flow on a surface area, in a storage basin, within the sewer itself, or within a receiving water.

Storm duration: The period over which rainfall occurs.

Storm flow: Overland flow, sewer flow, or receiving-stream flow caused totally or partially by surface storm runoff, storm-related subsurface infiltration, or snowmelt.

Storm frequency: See *frequency of return.*

Storm intensity: The rate of rainfall usually expressed as inches per hour.

Storm sewer: A sewer that carries intercepted surface runoff, street wash and other wash waters, or drainage, but excludes domestic sewage and industrial wastes except for unauthorized cross-connections.

Storm sewer discharge: Flow from a storm sewer that is discharged into a receiving water or to a sewer system.

Stormwater: Water resulting from precipitation that percolates into the soil; runs off freely from the surface; or is captured by storm sewer/drainage, combined sewer, and, to a limited degree, sanitary sewer facilities.

Subcatchment: A portion of a catchment producing the runoff that passes a channel or stream location upstream of the location defining the catchment.

Supernatant: The relatively clear liquid layer above the sediment layer in the vertical column.

Surcharging: The transition between open channel flow and pressure flow in sewers.

Surface runoff: Precipitation and water (e.g., street wash) that falls onto the surfaces of roofs, streets, ground, and so on, and is not absorbed or retained by that surface, thereby collecting and running off.

Swirl regulator/concentrator: A cylindrically-shaped CSO control device that provides the dual function of a regulator and a solids-liquid concentrator. As a concentrator, it achieves good removal of the heavier settleable solids fraction in CSO. (See also *regulator.)*

Toxicity: The degree to which a pollutant causes physiological harm to the health of an organism.

Trace metals: Metals present in small concentrations. From a regulatory standpoint, this usually refers to metal concentrations that can cause toxicity at trace concentrations.

Trunk: A sewer, also known as a main sewer, that receives the discharge of one or more submain sewers.

Urban runoff: Surface runoff from an urban drainage area that reaches a stream or other body of water or a sewer/channel.

Water quality criteria: A threshold value or concentration for a pollutant or pollutant effect as chosen by regulatory agencies to distinguish between acceptable and nonacceptable environmental conditions; usually chosen based on laboratory observations of organism response.

Water quality standard: A threshold value or concentration enforced by law as a requirement to maintain acceptable environmental water quality conditions; usually chosen based on laboratory observations of organism response.

Wet weather flow: Usually referred to as the flow in a combined sewer system with stormwater, but may also constitute the flow in a separate storm or sanitary drainage system with stormwater.

Wet weather pollution: The discharge from a conveyance system resulting from wet weather flows. This discharge may occur to a receiving water as well as streets and basements (street and basement flooding).

WERF Publications Order Form

Stock #	Publication Title/Project Number	WERF Subscriber	WEF Member	Other
D0013	Guidance Manual for Polymer Selection in Wastewater Treatment Plants (91-ISP-5)	$10	$55	$75
D0015	Document Long-Term Experience of Biosolids Land Application Programs (91-ISP-4)	$10	$55	$75
D41002	Optimization of Vortex Separator Removal Efficiencies for CSO Treatment (92-TCR-2)	$10	$55	$75

NRDC's Comments on EPA's Report to Congress on the Phase II Stormwater Regulations

Dated January 7, 2000

Addressed to:

Mr. George Utting
U. S. Environmental Protection Agency
Office of Wastewater Management
Mail Code 4203
401 M Street, S.W.
Washington, D.C. 20460

Re: COMMENTS ON Report to Congress on the Phase II Stormwater Regulations, EPA 833-R-99-001, October 1999

Dear Mr. Utting:

The Natural Resources Defense Council (NRDC) is a national, non-profit organization of scientists, lawyers and environmental specialists dedicated to protecting public health and the environment. Founded in 1970, NRDC has more than 400,000 members nationwide, served from offices in New York, Washington, Los Angeles and San Francisco. On behalf of our 400,000 members, NRDC is pleased to submit these comments on EPA's Report to Congress on the Phase II Storm Water Regulations.

NRDC believes that the Report to Congress adequately addresses Section 431(a) of the Department of Veterans Affairs and Housing and Urban Development and Independent Agencies Appropriations Act of 2000, Pub. L. No. 106-74 (1999). NRDC provides these comments to add to the discussion of the costs and benefits of storm water regulation. NRDC believes that EPA's report overestimates the compliance costs of storm water regulation. In several places, EPA states that it took a conservative approach (i.e., tending to overestimate costs) in estimating the compliance cost of the Phase II storm water regulations on local governments. Even while taking this conservatively high approach, EPA determined that the rule "is not expected to have a significant impact on a substantial number of local governments." However, while EPA recognizes substantial benefits associated with the rule, it neither quantified these benefits nor included them in the evaluation of costs. As such, the net cost to local governments is actually less than EPA indicates in the Report to Congress. Therefore, it is important to recognize that the benefits to regulated entities of implementing the Phase II rule are significant and are likely to offset some or all of the costs identified in this report.

Benefits of the Phase II Rule

The Phase II rule is an important step toward meeting the requirements of Section 402(p) of the Clean Water Act to protect the nation's waters from storm water discharges. It brings many currently unregulated, but harmful, sources of stream, lake, and estuary impairment under a familiar and flexible regulatory framework.

It is well documented that municipal storm water runoff and construction activity cause significant harm to the environmental and public health (see generally NRDC, Stormwater Strategies: Community Responses to Runoff Pollution, May, 1999; U.S. EPA, The National Urban Runoff Program (NURP) Study, 1983; U.S. EPA, The National Water Quality Inventory (305(b)), 1996 Report to Congress, 1998). Furthermore, we have found that uncontrolled storm water runoff often results in substantial adverse economic impacts.

In addition to the well-documented impacts of urban runoff, numerous studies, reports, and case studies show that storm water pollution prevention does not have to be an overwhelming issue for municipalities and developers. Effective storm water programs yield a broad spectrum of environmental and community benefits including, but not limited to, those benefits listed on pages I-4 through I-6 of the Report to Congress. In many cases, these programs have a significant economic advantage as presented in Stormwater Strategies: Community Responses to Runoff Pollution, NRDC, May 1999. These benefits could be used to more accurately reflect the benefits versus the costs of the Phase II rule. We expand upon EPA's discussion of these benefits below.

Enhanced Commercial Fishing: Fish consumption advisories are up 80% from 1993 to 1996 (NRDC, Contaminated Catch, April, 1998, p.1). NRDC's research shows that storm water runoff contributes to the contamination of fish and shellfish. For example, storm water runoff is a principal source of PCB contamination in fish (NRDC, Contaminated Catch, April, 1998, p.14). In addition, 38% percent of the nation's estuaries are impaired. Urban runoff is the second leading source of their impairment (U.S. EPA, The National Water Quality Inventory (305(b)), 1996 Report to Congress, 1998, pp. 62-63). Most of our nation's fish and shellfish industry relies on productive estuarine waters and their adjacent wetlands to provide healthy habitat for some stage of fish and shellfish development. Productive coastal waters contribute significantly to the economies of numerous communities. NRDC found that storm water pollution prevention programs can have a significant benefit to improving the quality of out nation's fisheries and shellfisheries. Efforts in Puget Sound, for example, where shellfishing contributes over $20 million to the economy annually, have resulting in upgrading nearly 5,000 acres of shellfish beds between 1997 and 1999. At the same time only 313 acres were downgraded. However, 20% of the shellfish beds still remain closed to commercial harvest due to sources of pollution including storm water. Puget Sound is currently the nation's leading oyster producer. Shellfishing is a significant proportion of the local economy, providing the second highest number of jobs and contributing to the tourism industry as well.

Enhanced Recreational and Subsistence Fishing and Opportunities for Boating, Swimming, and Noncontact Recreation: In addition to EPA's findings, research shows that recreational rivers have a positive economic effect on local regions. Protecting and managing rivers for recreation may provide a clean, economically viable means for enhancing local economic development (Cordell et al., "Economic Effects of River Recreation on Local Economies, Water Resources Bulletin, February, 1990). One study determined that water based recreation in the northern Connecticut River is valued at $26 to $31 million and creates a minimum of 650 to 750 jobs (National Wildlife Federation, Rivers, Recreation, and the Regional Economy: A Report on the Economic Importance of Water-based Recreation on the Upper Connecticut River, August 1996, p.8). Another study found that more than 52 million people spent more than 551 million days fishing in 1991(this does not include most salt water fishing) demonstrating that clean, productive waters are important economic and community resources (American Sports Fishing Association, 1991). The U.S. Fish and Wildlife Service estimates that over 35 million anglers spent over $38 billion dollars in pursuit of their pastime in 1996, money that would not be spent if there were no fish to catch (1996 National Survey of Fishing, Hunting and Wildlife-Associated Recreation: National Overview, 1997, pp. 4-5). Researchers have also found that water quality and aesthetic quality enhance the value of recreational fisheries. Storm water runoff is a significant contributor to beach closings in coastal and Great Lakes states. Investigators identified storm water as the source of 30% of the 1998 reported beach closings (NRDC, Testing the Waters 1999, July 1999, p. 1). EPA found that a typical swimming day is worth $30.84 to each individual, money that communities forego if they close a beach due to storm water runoff (U.S. EPA, Pathogens and Swimming: An Economic Assessment of Beach Monitoring and Closure, 1995).

Enhanced Nonconsumptive Wildlife Uses: NRDC agrees with EPA's assessment that storm water controls that result in greater numbers or diversity of viewable wildlife species will produce benefits. Storm water management strategies, including constructed storm water wetlands, wet detention ponds, vegetated buffers, and open space preservation, all provide or enhance habitat for wildlife. See Stormwater Strategies at pages 65, 72, 90, 92, 93, 148, 151, 167, 191, 224, and 243.

Reduced Flood Damage: Many storm water controls and management practices do prevent and mitigate flood damage, especially non-structural practices that minimize impervious cover, preserve wetlands, floodplains, and open space, or mimic these natural features. Increasingly, communities are realizing the link between increased urbanization and increased flooding ("Suburbia Learns It Has Paved Over the Natural Defense to Flooding," New York Times, September 29, 1999, p.B1). Responsible floodplain management and regulation of new development, encourage by the National Flood Insurance Program, saves over $800 million every year in flood losses. Communities can implement these same practices to control storm water runoff and realize both flood control and water quality benefits.

Drinking Water Benefits: EPA correctly makes the link between storm water runoff and drinking water quality. A study in Massachusetts on the Wachusett Reservoir Watershed Protection Plan rated storm water as a "high existing threat" to water quality. The study also rated construction activity and future development as a "high threat." The study rated pesticides, fertilizers and road salting, all documented sources of runoff pollution, as "moderate threats." In general, the study concluded that the most significant threats are associated with urbanization (Rizzo Associates, Inc., Watershed Protection Plan: Wachusett Reservoir Watershed, 1991, pp. 3-5 - 3-34). Microbes are almost always present in high concentrations in urban runoff, are notoriously variable, and derived from a variety of watershed sources (Schueler, T. R., "Microbes in Urban Watersheds," Watershed Protection Techniques, Vol. 3, No. 1, April 1999, pp. 551). Researchers often found standards of indicators exceeded by a factor of 50 to 75. Research cites bacteria as the third greatest pollution concern in a national survey of 272 surface water supply utilities (U.S. EPA, Office of Water, The Quality of Our Nations Waters: 1996, EPA841-S-97-001, 1998). In many cases, water supplies need expensive filtration to remove harmful microbes from drinking water supplies. Several major cities still rely on unfiltered water for much of their municipal water supply including New York, Boston, Portland, and Seattle. Pollution from storm water runoff and other sources may require filtration of these water supplies. The estimated cost of filtration for New York City's Catskill/Delaware system is $4.57 billion translating to $365 million in annual debt services and $140 million in yearling operating costs. A filtration plant is projected to increase NYC water and sewer rates by 45% (1994 testimony of NYC Comptroller Alan Hevesi).

Water Storage and Navigational Benefits: The nation loses approximately 820,000 acre-feet of water storage capacity each year due to pollution. EPA estimates that storm water runoff reduces annual dredging and construction costs by 7.9%, with an annual benefit of $170 million to $510 million, through storm water controls (U.S. EPA, Economic Analysis of Storm Water Phase II Proposed Rule: Final Draft, December, 1997, p. 7-11). The U.S. Army Corps of Engineers dredges 83 million cubic yards of sediment linked to pollutant sources each year. EPA estimates that 7.5% of this dredging is attributable to storm water at a cost of $13.4 million annually (U.S. EPA, Economic Analysis of Storm Water Phase II Proposed Rule: Final Draft, December, 1997, p. 7-12). In many cases, these dredged sediments are laden with nutrients, heavy metals, and toxic chemicals—making disposal expensive.

Public Health Benefits: NRDC agrees that storm water runoff is a serious threat to public health. The Phase II rule establishes a framework that helps protect public health by preventing runoff that pollutes swimming waters and contaminates seafood caught by recreational, commercial, and subsistence anglers. As previously stated, beach-water quality monitoring reports documented storm water runoff as the source for at least 30% of reported beach closings in 1998. Swimming in polluted waters can make you sick (NRDC, Testing the Waters 1999, July 1999, pp. 5-8). A study in Santa Monica Bay, comparing swimming near flowing storm-drain outlets to swimming at a distance of 400 yards form the outlet, found a 66% increase in a group of symptoms indicative of respiratory disease and a 111% increase in a group of symptoms indicative of gastrointestinal illness in those who swam close to a storm drain (Santa Monica Bay Restoration Project, An Epidemiological Study of Possible Advese Health Effects of Swimming in Santa Monica Bay,1996, pp. iv, v, 122). As previously states, microbes are ubiquitous in stormwater. Bacteria in shellfish poses a serious health threat. Nearly 40% of all shellfish beds in the nation have harvesting limitations due to high bacteria levels (NOAA, 1990 Shellfish Register of Classified Estuarine Waters: Data Supplement, 1992). National studies list urban runoff and failing septic systems as the leading causes of shellfish bed closures (U.S. EPA, Office of Water, The Quality of Our Nations Waters: 1996, EPA841-S-97-001, 1998).

Enhanced Aesthetic Value: There is often a premium associated with properties fronting well designed, aesthetically pleasing bodies of water including ponds, wetlands, and waterways used to treat or convey storm water runoff. The Department of Housing and Urban

Development found that, when all else is equal, the price of a home located near a body of water increases by up to 28%. In converse, there is likely a devaluation of properties located near degraded bodies of water (See Table 1 in Economic Benefits of Runoff Controls U.S. EPA, OWOW, Sept., 1995, EPA 841-S-95-002, p. 2). Furthermore, several studies have found that storm water runoff prevention and control strategies have significant aesthetic value or add value to property. For example, a study of the effects of greenbelts—an effective storm water control strategy—on property values found a $4.20 decrease in the price of a residential property for every foot one moves away from the greenbelt (Correll et. al., "The Effects of Greenbelts on Residential Property Value: Some Finding on the Polictical Economy of Open Space," Land Economics, Vol. 54, No. 2, May, 1978, p. 211). See also generally Lehner et al., Stormwater Strategies: Community Responses to Runoff Pollution, May 1999; U.S. EPA, Economic Benefits of Runoff Controls, OWOW, Sept., 1995, EPA 841-S-95-002; Schueler, T. R., "The Economics of Watershed Protection," Watershed Protection Techniques, Vol. 2, No. 4, June 1997; Fausold and Lilieholm, The Economic Value of Open Space: A Review and Synthesis, The Lincoln Institute of Land Policy, 1996; Metropolitan Washington Council of Governments, An Evaluation of the Cost of Stormwater Management Pond Construction and Maintenance,1983.

Additional Benefits and Economic Advantages of the 6 Minimum Measures

NRDC's report Stormwater Strategies: Community Responses to Runoff Pollution (May 1999) presents 77 detailed case studies and 88 additional examples highlighting environmentally beneficial and economically advantageous approaches to storm water management. The case studies come from a wide variety of communities throughout the United States and provide examples of effective strategies that meet the required six minimum measures. We summarize some examples of the benefits below.

Public Outreach and Education

Florida Yards and Neighbors Program: Program evaluation found that after participating in Florida Yards and Neighbors program, 13% more homeowners are using slow-release fertilizer and 23% more are reducing fertilizer use. The evaluation also found that more homeowners employed integrated pest management practices after participating in the program. Florida Yards and Neighbors program currently reaches out to 47 Florida counties.

Naturescaping for Clean Rivers, Portland, Oregon: Participants in the Naturescaping for Clean Rivers program have adopted better storm water management practices. For example, 49% have reduced the size of their lawn, 53% have increased composting, 27% now use less or no fertilizer, and 24% are using alternatives to pesticides.

Diazinon Toxicity Education, Fort Worth, TX: Public education and outreach efforts in Fort Worth have helped reduced home diazinon use, and appear to have a link to observed water quality improvements. The reduced toxicity of the water saves the city costly fines and treatment costs.

Multi-Agency Advertising Campaign, Alameda County, CA: An Alameda County add campaign cost-effectively raises awareness about storm water pollution. Evaluation of the campaign showed that 70% of those aware of the campaign changed their behavior, 36% became aware of pollution from illegal discharges, and 46% became aware of local educational opportunities.

Lake Harriet Watershed Awareness Project: This lawn care education program cost-effectively reduced storm water concentrations of pesticides by over 60% on average.

Public Involvement/Participation

Urban Watch Program, Monterey, CA: This partnership between the city of Monterey, the Coastal Watershed Council, and the Monterey Bay National Marine Sanctuary trains volunteers to monitor the city's storm water outfalls.

In-turn, the city uses the monitoring to identify storm water problems and target their outreach efforts. The program costs approximately $8,000 per year but saves the city almost $40,000 per year.

Water Quality Monitoring program, Chattanooga, TN: Chattanooga contracted with graduate students to monitor and map the city's storm water system. By using graduate students, the city saved over $65,000 while providing practical experience to students.

Outdoor Classroom, Oberon Middle School, Jefferson County, CO: Students at the Oberon Middle School constructed and continue to monitor a storm water wetland that treats runoff from their school. The benefits of this effort include cleaner water, an outdoor classroom, increased knowledge about storm water quality, recycled water used for irrigation, improved aesthetics, and a sense of community pride.

Illicit Discharge Detection and Elimination

Cohasset Harbor Board of Health, MA: The Cohasset Harbor Board of Health was able to reopen 400 acres of shellfish beds after issuing just two enforcement orders to private land owners.

Sanitary Surveys, Mason County, WA: Mason County's septic system inspection and maintenance requirements have improved water quality and allowed the state to reopen over 900 acres of shellfish beds. The program cost ($95 per inspection, $290 per dye test, and $285 per repair oversight) was minimal when compared to the value of the shellfish beds (projected to be $20 million in 2000)

Clean Charles 2005, Boston, MA: To date, this effort to eliminating illegal hookups and discharges to the Charles River has stopped roughly one million gallons of sewage discharge per day. Program administrators invest the fines, including one $400,000 fine, back into the program or into remediation efforts.

Clean Bay Business Program, Palo Alto, CA: This inspection and pollution prevention program awards "Clean Bay Business" status to compliant automotive businesses. The program increased compliance from 4% in 1992 to 94% in 1998 through ordinance requirements, increased inspections, and incentives. In addition, violations fell by 90% over 4 years. The total cost of the program, per facility, is only $300 for the first year and $150 per year thereafter.

Construction Site Storm Water Runoff Control

Study of Economic Advantages of Green Lots, Ohio and Indiana: This study comparing the preference for grass covered lots versus lots with bare soil among homebuyers, developers, and realtors. The study found that homebuyers perceived grass lots to be worth $750 more than comparable bare lots, with developers placing a $250, premium on the green lots and realtors $717 premium. The net benefit to the developer, based on the homebuyer valuation, is $450 per lot (seeding cost $300 per lot). In addition, vegetated lots have the environmental benefit of preventing erosion, sedimentation, and storm water runoff (Herzog et al., "Study of Economic Advantages of Green Lots, Ohio and Indiana," Journal of soil and Water Conservation, Accepted).

San Francisco Bay Regional Water Quality Control Board: Education and enforcement have brought compliance with erosion and sediment control requirements up from 30% in 1990 to 90% in 1998.

Certified Construction Reviewer program, DE: Approximately 100 tons per year of dirt and mud washes off each acre of the average Delaware construction site. Certifying private inspectors to ensure proper instillation and maintenance of BMPs improves compliance and saves municipalities money. For example, New Castle county requires a certified construction reviewer for about half their sites. This results in improved water quality and savings of approximately $111,000 per year in staffing costs.

Charlotte and Mecklenburg County, NC: These two municipalities teamed up to increase their attention to construction sites. The sharing of resources and responsibilities has increased compliance with erosion and sediment control requirements by 15%. It has also led to an increase in construction site inspections and enforcement actions, generating fines totaling $15,000 to $20,000 per year.

Post-Construction Storm Water Management in New Development and Redevelopment

The growth in urbanized areas has been dramatic over the past 50 years, increasing from 20,000 square miles in 1950 to over 60,000 square miles in 1990 (Bureau of the Census). Much of this growth has occurred near coastal areas, which are particularly vulnerable to and often severely degraded by storm water pollution. It is estimated that half the U.S. population will live in coastal areas by the year 2010. Furthermore, development is destroying wetlands, which are critical to minimizing the impacts of urban runoff. Wetlands are being destroyed at a rate of roughly 117,000 acres per year (Clean Water Network, Wetlands Fact Sheet, 1999).

Low-Impact Development, Prince George's County, MD: The principle behind low-impact development is to control runoff at the source using techniques such as bioretention, rain gardens, and alternative site design. Bioretention significantly reduces pollutants and has visual/aesthetic benefits as well. Property managers have found that bioretention maintenance costs are the same as grass only medians, approximately $200 per year per island. Developers of the Northbridge development in Bowie, Maryland found that using low-impact design principles, instead of a more conventional site design, reduced the impacts of storm water runoff, without increasing costs or decreasing the desired number of dwelling units. Furthermore, the homes sold better.

Prairie Crossing, Grayslake, IL: Prairie Crossing is a storm water sensitive development that minimizes impervious cover and uses a swale-prairie-wetland conveyance system to manage runoff. This approach removes 85% of pollutants and reduces runoff volume by 60%. This design saved the developer $2.7 million in capital costs and reduces maintenance costs. The homes sold at same rate or better than nearby conventional developments.

Village Homes, Davis, CA: Developers of Village Homes used natural features to convey runoff, clustering to reduce impervious cover, and better site design principles to reduce storm water pollution. This approach saved the developer $800 per lot in infrastructure costs. In addition, the homes sold in half the time and sold, on average, for $11 per square foot more than homes in nearby developments. The developers earned a 23% annual return on their investment. The design also reduced vehicle miles traveled per car, in the development, by 15% when compared to the average for the area, which has additional pollution prevention benefits.

U.S. Army, Fort Bragg, NC: A redesigned parking lot reduced impervious cover by 40% while increasing parking spaces by 20%. The design also incorporated a storm water treatment system into the parking lot. The new design cost 20% less to build than the original design saving the army $1.6 million.

Staten Island Blue Belt, New York, NY: The Blue Belt project makes use of natural drainage features to control runoff from 11 watersheds covering 6,000 acres of Staten Island. The city expects the project to save $50 million, including land acquisition costs, over conventional storm water management. Relying on natural features improves water quality and reduces flooding, while having the additional benefits of enhanced recreation, open space, education opportunities.

Prairie Waterway, Farmington, MN: To control runoff, eliminate drainage problems, and allow for some growth, Farmington constructed a natural, open storm water conveyance system. In addition to improving water quality, the Prairie Waterway saves residents $250,000 per year in wastewater treatment costs since it cost less to build and maintain than a conventional drainage system.

Pollution Prevention/Good Housekeeping for Municipal Operations

Vermont Agency of Transportation Smart Salting Program: Realizing that the temperature of the road surface can be considerably warmer than air temperature, the Vermont Agency of Transportation uses infrared temperature sensors on salt trucks to calculate more accurately the amount of salt needed to melt snow and ice. This approach reduces salt usage by 28%, on average, and saves the agency $2.2 million per year. For the pilot of this statewide program, the agency realized an 850% return on their investment in the sensors. Additional benefits include preventing drinking water contamination.

The Legacy Golf Course, Springfield, TN: The Legacy practices a number of runoff pollution prevention strategies including integrated pest management and the use of organic and slow release fertilizers. This approach improves water quality and saves this municipal golf course money.

Highway and Golf Course Partnership, Murray City, UT: A partnership between Murray City and Utah Department of Transportation (UDOT) saved the city about $1 million in golf course construction costs and UDOT $300,000 in land acquisition and storm water piping costs. The collected runoff is use as irrigation water, saving the city approximately $100,000 annually. The city uses revenues from this popular course to support the purchase land along the Jordan River to create a public greenway.

Innovative Funding Strategies

There are a number of ways that municipalities and developers can cost-effectively reduce or prevent storm water pollution, as discussed above. Municipalities can also improve their storm water programs by ensuring adequate funding for these programs. In the Report to Congress, EPA did not discuss options for local governments to generate funds for storm water programs such as a storm water utility, which would help offset compliance costs. Storm water utilities are a dedicated and equitable funding source for municipal storm water programs. There are almost 300 storm water utilities in operation in at least 20 states. They serve cities with populations ranging from 5,000 to 3.5 million. Preliminary legal research found that virtually all states and municipalities have the legal authority to set up such utilities (NRDC, Establishing a Stormwater Utility: A State-by-State Survey of the Law, June 1999). Rates for residential users appear to be in the range of $20 to $50 per year. Commercial and industrial users are often assess based on the amount of impervious cover at the site (i.e. their relative contribution of runoff). Revenues generated from utilities can be significant. Bellevue, WA (population 92,000) generated $7 million in 1990; Austin, TX (population 466,000) generated $15 million in 1998; Louisville, KY (population 671,000) generated $16.2 million in 1998. The revenues go to maintaining and improving storm water infrastructure. The dedicated and equitable nature is popular among administrators, elected officials, and citizens.

Impact of Phase II Rule on Local Governments

NRDC supports EPA's conclusion that the Phase II rule is not expected to have a significant impact on a substantial number of local governments. As discussed above, the overall societal benefits of controlling contaminated storm water discharges into our surface waters are vast. The benefits of implementing the storm water Phase II rule to local governments are also significant and offset much, if not all, of the estimated compliance costs. NRDC believes that the compliance cost to local governments is reasonable considering the environmental, public health, and community benefits of the storm water management measures required under the Phase II rule. NRDC also encourages EPA to consider the benefits and costs of storm water management relative to other municipal services. NRDC again points out that EPA did not, in this document, compare the benefits of the Phase II rule to the compliance costs, and that the methods used to calculate compliance cost relied on inflated cost assumptions.

In addition, NRDC agrees with EPA's conclusion that the Phase II rule provides considerable flexibility to municipalities. As shown above, there are a wide variety of approaches available to communities to control or prevent storm water runoff. There is also flexibility to develop cost-effective programs, implement innovative approaches, ease cost burden, and collaborate with other entities. The rule enables municipalities to choose, from a tool box of best management practices, the most appropriate strategies for their setting. In other words, local governments can tailor their programs around local issues, conditions, and concerns.

In conclusion, NRDC believes that the Report to Congress adequately addresses the requirements of the Appropriations Act. However, the report does not sufficiently consider the benefits to regulated entities of implementing the Phase II rule. Therefore, it fails to accurately reflect the impacts of the Phase II rule on local governments.

Sincerely,

Nancy Stoner, Clean Water Project Director
George Aponte Clarke, Stormwater Project Coordinator
Natural Resources Defense Council

RECONCILING FLOOD AND DIFFUSE POLLUTION CONTROL OBJECTIVES IN URBAN WATERSHED MANAGEMENT

Vladimir Novotny*, Douglas Booth*, David Clark*, Robert Griffin*, Jim Giese*, Alena Bartošová*, and Neal O'Reily**

* *Institute for Urban Environmental Risk Management, Marquette University, Milwaukee, WI 53201-1881, USA*
** *Hey and Associates, Brookfield, WI 53045-6590, USA*

ABSTRACT

Urban watersheds and receiving waters are adversely affected by urbanization that increases risk of flooding and, in the same time, reduces the chemical, physical (habitat) and biological integrity of the affected water bodies. Restoration of ecological integrity and flood control objectives in the past were conflicting, often to a degree that flood control alone lead to ecological degradation of the receiving water bodies by damaging the habitat. The two objectives in today's urban restoration/flood control projects must be reconciled.

This article describes a methodology and research that optimize both objectives. Numeric and flooding risks are will be correlated to the citizens "Willingness to pay" for reduction of either or both risks. Preliminary results of focus group surveys indicate that reduction of ecological risks and restoration of physical, chemical and biological integrity of urban streams is preferred by most citizens while the willingness to pay for flood control is related to the past history of flooding.

KEYWORDS
Flood risks, Stormwater pollution, Watershed management, Ecological risks, Integrity of urban streams, Public opinion surveys, Willingness to pay.

INTRODUCTION

Management of smaller and medium size urban streams today must today consider several objectives such as

I. Flood control
II. Preservation and restoration of ecological integrity of the receiving water body affected by point and nonpoint discharges and changes in hydrology and hydraulics.
III. Providing contact and noncontact recreation to urban population
IV. Other uses such as water supply, navigation, or hydropower production

Some of the objectives are conflicting some other are complementing each other. For example, preservation and restoration of ecological integrity and providing habitat for aquatic life complements recreational objective. As matter of fact, a healthy ecology of the stream is a prerequisite to the contact recreational use. On the other hand, flood control often is in conflict with ecological and recreational objectives. In the context of watershed and water body management these conflicts must be reconciled and uses must be optimal.

The increased magnitude and frequency of high flows caused by urbanization has several major adverse effects on floodplain, stream channel and on the ecology of the urban stream. The hydrologic effects include: (1) floodplain enlargement; (2) increase of the frequency of flooding inside the floodplain; (3) increase of peak flows during storm events; (4) increase of the magnitude and frequency of all runoff events of all sizes; (5) as a result of increased medium floods channels become unstable and more erosive (degrading); (6) imperviousness impedes recharge of shallow groundwater aquifers, which diminishes base flow contributions (after urbanization some streams may become ephemeral or effluent dominated); (7) more flow moves on the surface with a faster velocity which increases the volume of surface runoff contribution.

The most important adverse ecological impacts are: (1) loss of bank habitat by increased stream bank erosion and channel alteration to accommodate increased flows; (2) siltation of the channel by increased sediment loads; (3) water column and sediment contamination by pollutant discharges from point and nonpoint sources; (4) increased temperature due to more warmer surface flows and loss of stream shading by vegetation; (5) loss of pollution intolerant species.

The effects of urbanization are not only limited to the stream channels. The entire stream corridor consisting of the stream channel and floodplain must be considered in a comprehensive analysis of urban streams. Typically, urban developers try to reclaim floodplain and often development that was outside of the floodplain becomes a part of it as the floodplain enlarged as a result of urbanization.

Ecological and hydrological/hydraulic impacts of urbanization

The major impacts of urbanization on integrity of urban streams can be divided into three categories:

I. Hydrologic/hydraulic changes of flow regime and their effect on stream morphology.
II. Water and sediment quality degradation and their effects on composition and survival of aquatic species.
III. Ecological/habitat changes, including modifications of channels and floodplain.

Impervious surface in urban areas dramatically increases surface runoff during storm events. The changes affect both the rate and volume of flow. Schueler (1994) claimed that depending on the degree of imperviousness and soil type, annual volume of runoff of fully developed urban watersheds can increase 2 to 16 times the pre-development rate.

To accommodate the increased high stream flow caused by urbanization, streams themselves respond by increasing their cross sectional area. This is done by stream bed downcutting, stream widening, or a combination of both. Robinson (1976) in a study of eight watersheds in Baltimore, MD found that urban streams have channel cross-sections areas approximately twice those or rural streams and width-to-depth ratios about 1.7 times those of rural streams. Other studies have found that cross-sectional area increases by a factor of 2 to 5, depending on the degree of impervious cover in the watershed and the age of the development (Arnold et al., 1982; Gregory et al., 1992). Stream channels react to increased urban runoff not only by adjusting their widths and depths, but also by changing their gradients and meander pattern (Riley, 1998).

The final modification of urban stream, in the last phase, is again done by man. To constrict the widening stream, control stream bank erosion and contain the flood water in the channel, streams banks and channel are lined with artificial materials such as concrete, stone rip raps and gabions. Such engineering measures downgrade the stream to an open conveyance channel with minimum or no habitat conditions. Table 1 summarizes the hydrological/hydraulic effects of urbanization on urban streams.

RECONCILING THE CONFLICTS OF THE OBJECTIVES OF URBAN STREAM MANAGEMENT

Most of urban watershed management projects in the United States are driven by flood control objectives. On one side, public media pay extraordinary attention to the plight of people affected by flooding that then results in heavy pressure and lobbying of public officials by affected individuals and citizens groups. However, using traditional benefit/cost analysis most urban flood control projects are highly inefficient. In the Milwaukee (Wisconsin) metropolitan area the benefit/cost ratio of flood control drainage projects in which the benefit is the reduction of monetary damages to properties and land within the floodplain, are typically less than 0.2. Consequently, projects that would address flood control only are not feasible. Such projects would represent a massive transfer of benefits from the general taxpayer public to a small number of beneficiaries located in the floodplain. Further more, the *antidegradation rule* of the present regulations in the United States and elsewhere does not allow downgrading the integrity of the receiving water bodies even when the objective is drainage or flood control. Therefore, the sometimes conflicting concurrent objectives of drainage/flood control and restoration of ecological integrity of urban streams of urban stream projects must be reconciled.

Restoration of ecological al integrity of urban streams, on the other hand, benefits much larger segments of population. However, considering the benefits of ecological improvement in the classic economic benefit cost analysis is difficult because such benefits are mostly intangible. On the other hand, such benefits are very desired by the public, especially those living near the water body but in the floodplain. Consequently, another measure of benefits must be defined and substituted. The *Willingness to Pay* of the public for the ecological benefits is a common substitution for strictly monetary flood control benefits in a multi-objective watershed restoration and flood control projects.. In reality, projects that include both flood control benefits and ecological and water quality restoration and improvement may become acceptable to the general public as exemplified in two such projects in the Milwaukee Metropolitan area that are featured in this article.

Table 1 **Summary of impacts of urban stormwater runoff on stream ecosystems**

Potential Stream Ecosystem Change	Disturbance Activity							
	Increased Watershed Imperviousness	Increased Soil Erosion	Vegetative Clearing	Channelization	Streambed Armoring	Woody Debris Removal	Bridges, Culverts and Utility Crossings	Contaminants
Increased peak flood flows	•				•	•		
Increased frequency of bankfull flows	•			•				
Increased duration of flood flows	•							
Increased instream velocities	•		•	•	•			
Increased flood energy	•		•	•	•			
Increased channel bed and bank erosion	•		•	•				
Increased streambed turnover	•				•	•		
Decreased base flow	•							
Embedded streambed sediments	•	•	•					
Loss of fish refuge				•		•	•	
Loss of pool and riffle structure	•	•	•	•	•			
Increased streambed gradient	•		•	•	•			
Changes in meander patterns	•		•	•	•			
Increased stream migration	•		•	•	•			
Channel widening and down-cutting	•		•	•	•			
Loss of riparian vegetation			•	•	•	•	•	
Shift in organic material from external sources (leaves) to internal sources (algae)			•	•	•	•		
Reduction in macroinvertebrate numbers and diversity	•	•		•	•	•		•
Shift in macroinvertebrate community structure	•	•		•	•	•		•
Reduction in fish diversity	•	•	•	•	•	•	•	•
Shift in fishery to more pollutant tolerant species	•	•	•	•	•	•	•	•
Increase in fish disease	•	•						•
Blocked fish passage				•	•		•	
Increased water temperatures	•	•	•	•		•		
Reduced instream oxygen levels	•							•
Reduced gene pool of species for dispersal and colonization	•	•	•	•	•	•	•	•

INVESTIGATED URBAN WATERSHEDS

Oak Creek

The Oak Creek discharges to Lake Michigan in the City of South Milwaukee, WI. About 22 km of the stream is perennial.

TABLE 1. Basic watershed characteristics: Oak Creek watershed.

Area	69.8 km^2 (27.24 mi^2)
Percent urbanized	44.6%
Population (1980)	39,700

The Oak Creek watershed can be characterized as a rural area with a great potential for future development. Agricultural land (cropland and pasture) represents the prevailing type of the land use in the watershed (see Tab. 2). Most of the agricultural land is located in the western and southern portions of the watershed. The soils within the Oak Creek watershed are silty clay loams, loams, and sandy loams, and are developed on gently sloping or rolling morainel topography. Most of the soils are relatively fertile.

TABLE 2. Land use distribution: Oak Creek watershed [GIS].

Land Use	Percent Total
Cropland and Pasture	55.4
Residential	22.8
Other Urban or Built-Up	6.5
Transportation, Commerce, Utilities	6.0
Commercial and Services	5.8
Industrial	3.6

Pollution sources can be categorized as municipal, industrial, agricultural, landfill, and stormwater. A contribution of pollution from the point sources is negligible compared to that from the nonpoint sources. Rural sources dominate among the nonpoint sources (20-50%).

Menomonee River

The Menomonee River discharges into the Milwaukee River about 0.9 mile upstream from where the Milwaukee River enters Lake Michigan.

TABLE 3. Basic watershed characteristics: the Menomonee River watershed.

Area	350.7 km^2 (137 mi^2)
Percent urbanized	52.8%
Population	348,165 (1970)
	964,640 (1990)
	962,570 (1996)

Population density ranges from less than 135 to about 10,000 persons per square kilometer with an average of 980 po./km^2. Channel modifications are concentrated in the urban areas. The 120-km river system contains 42% of minor channelization, 22% of major channelization, and 3% of conduit, accounting for a total of 67% of river length.

Table 4 shows the land use distribution for the Menomonee River watershed. About 46% of the total area is still in rural uses, representing a great potential for nonpoint source pollution. Rural areas prevail in the northern portion of the watershed, while the southern portion of the watershed is mainly urban.

The soils within the Menomonee River watershed are rolling silt loams or gravelly loams. Most of the natural soils are relatively fertile. Where urbanization has occurred, artificial fill materials and paved surfaces have modified the natural character of the soils with regard to drainage and fertility.

TABLE 4. Land use distribution: the Menomonee River watershed [GIS].

Land Use	Percent Total
Commercial and Services	7.6
Confined Feeding Ops	0.1
Cropland and Pasture	42.6
Deciduous Forest Land	2.4
Forested Wetland	0.3
Industrial & Commercial	6.0
Mixed Forest Land	0.2

Ecological Risk Assessment

There are no point sources of pollution discharging in the two investigated water bodies.

The habitat quality and physical parameters were evaluated using Habitat Assessment and Physicochemical Parameters Protocol (Plafkin et al., 1989). The scores at Oak Creek ranged from 45 to 95% of reference score with majority of scores between 53 and 62% (non-supporting). Only one site has habitat conditions comparable to those of the reference site (>90%) and two sites are classified as supporting (75-90%). The scores at Menomonee River ranged from 40 to 97% of reference score. Three sites have conditions comparable to those of the reference site, one site is classified as partially supporting (60-75%) and four sites as non-supporting (<60%).

Biological monitoring was conducted during Summer 1999 in cooperation with Wisconsin Lutheran College. An index of biotic integrity (IBI) based on fish species composition was calculated based on procedures developed by Lyons (1992). A high percentage of tolerant species and low species diversity indicate very poor stream quality. The IBI scores indicate that all three locations do not support a typical fish community for this region.

Macroinvertebrates were collected at 5 sites on Oak Creek and 9 sites on Menomonee River, including 2 sites in headwaters without significant impairment by urbanization (reference sites). Sampling followed protocols for multihabitat using a D-frame dip net. Sampled habitat types included cobble, snags, vegetated banks, submerged macrophytes, sand and other fine sediment.

The chemical integrity monitoring program focused on key locations in the Oak Creek and Menomonee River watersheds. The following parameters were monitored: pH, suspended solids, volatile suspended solids, total solids, hardness, COD, total Kjeldahl nitrogen, nitrate and nitrite nitrogen, total phosphorus, total and dissolved heavy metals (Cd, Cu, Pb, Zn), cyanides (winter sampling only), and PAH (sampled twice). Total of 24 water column samples were analyzed. The sampling covered both low and high flow periods with wide range of flows. Sediment samples were also analyzed.

The data on water quality were used to estimate the ecological risk to aquatic biota by selected heavy metals (Cu, Pb, Zn). The calculation is based on modified methodology summarized in Novotny and Witte, 1997. The ecological risk is estimated as a joint probability of two probability functions: (i) the probability density function of ambient concentration (pdf), and (ii) the probability that an organism will be adversely affected by the exposure to the given concentration (toxic response curve). Ambient concentrations follow log-normal distribution.

Table 5 reports the calculated chemical risks by toxic metals. The risks (both chronic and acute) from copper calculated for the Menomonee River are two orders of magnitude higher than those for the Oak Creek. The risks from lead and zinc are at the same level for both watersheds.

Table 5. Chemical risk to aquatic biota. Oak Creek and Menomonee River.

Station Number	Cu	Pb <1987	Pb >1987	Zn
Oak Creek - acute	1 E-06	1 E-04	7 E-06	9 E-04
Oak Creek - chronic	7 E-05	2 E-02	3 E-03	1 E-03
Menomonee River - acute	1 E-04	2 E-04	2 E-06	6 E-04
Menomonee River - chronic	7 E-04	3 E-02	2 E-03	1 E-03

Flood Risk

The flood risk was defined as a probability at any point of the watershed that a flood will occur in any given year. Flood risks were estimated in the GIS ArcView environment. Two basic approaches were considered. The first is a vector-based approach that employed a custom developed ArcView Avenue scripts program. This approach permits estimation of risks only at specific points rather than for complete areas. The second more general approach works in a grid (raster) environment, and makes use of the Spatial Analyst Extension for ArcView. It permits flood risk to be calculated for the entire watershed, and specified points can be assigned the corresponding value from the underlying polygon. The second approach was selected because of its future applicability in watershed management applications.

RELATION OF THE WILLINGNESS TOP PAY TO THE RISKS OF FLOODING AND ECOLOGICAL DAMAGE TO THE STREAMS

Willingness to pay provides a measure of how much all beneficiaries, not just those living in the flood plain, are willing to spend for flood control and restoration of urban streams. In the research described herein, a hypothesis was advanced that the willingness to pay parameter could be related to the risks of flooding and damage to ecology.

To identify users's (citizen's) preferences for flood control and diffuse pollution control/stream restoration actions a two way survey is being conducted in two watersheds in the Milwaukee metropolitan area. The objectives of the surveys are as follows:

1. Find the extent and nature of physical and emotional connection to the water body;
2. Identify perceptions of the health of the water bodies;
3. Identify perceptions about flooding;
4. Assess understanding of the "Willingness to Pay" questions;
5. Identify salient beliefs about the water bodies and related issues;
6. Identify perceptions about the citizen's capacity to get information on this topic;
7. Identify beliefs about nature and quality of information about this topic from mass media;
8. Find the range of values placed on prevention of flooding and ecological improvement relative to other community issues.

Participants were drawn from a random sample of homeowners and residents of two investigated watersheds ion the Milwaukee metropolitan area.

Findings of the focus groups

Objective 1: There is great variance in people's connection to the river or creek. Some visit the river regularly to enjoy the scenery, walk or bike along the river while others avoid the river because they are too busy, or due to perceptions of pollution or lack of accessibility. Emotionally, some expressed anger at local agencies perceived as responsible for flooding/environmental quality problems.

Objective 2: Most participants felt that the health of the river and creek could be improved and that it had worsened over time. Specific concerns were about fertilizer, chemical runoff and trash and debris left behind by people. Several participants were concerned about the effect that communities upstream may have on the health of the river. A handful felt that some positive changes had taken place to improve the environmental quality. The following were seen as indicators of the health of the river or creek: 1) clarity and quality of water, 2) presence of fish, 3) presence of birds and other wildlife, 4) presence and condition of trees and plants, 5) ability for the water and areas surrounding the river and creek to sustain life, 6) the absence of fertilizers and chemical runoff from farms and homes, 7) the absence of industrial pollution.

Objective 3: Participants from Menomonee River groups perceived a much greater risk of flooding than respondents from Oak Creek. Menomonee River has a recent history of urban flooding. Participants were concerned about a wide range of damage, including flooding of yards and basements, roads and streets, sewer backup, well water contamination, the effects of future development and concern about others living in the flood plain. In general, it was difficult for participants to identify the cause of flooding in their community. Many were unsure whether the flooding they experienced was the result of poor drainage, sewers backing up, heavy rain, or rising water in the river and creek. It was suggested that future research include a set of items that tap into respondent's perceptions about the causes of flooding-- a consideration that is likely to influence WTP estimates.

Objective 4: Oak Creek residents had a hard time providing a WTP dollar amount because they did not believe the river was flooding and was not a problem in their community. Interestingly, flood plain residents gave WTP estimates that were lower than other groups. In fact, 4 out of 9 gave zero bids. Some of the reasons for the lower estimates include: 1) the beliefs that current taxes should be covering these projects; 2) the beliefs that past projects didn't work; 3) anger at and mistrust of public officials and local agencies. Given existing perceptions of minimal to nonexistent flood risks in the Oak Creek watershed, it was concluded that willingness to pay on flooding risk will only be evaluated in the Menomonee River watershed.

Objective 5: A number of salient behavioral beliefs were considered when subjects were formulating a WTP estimate. These appear to be the beliefs that are likely to be positively related to WTP. The most commonly held beliefs:

1. Perception that there is a current risk of flooding
2. Feeling strongly connected to the river/creek.
3. Concern for others in the flood plain.
4. Affordability and personal finances
5. Belief that paying would be making my contribution to solve a community problem
6. Belief that the project would benefit the community.
7. Belief that the project would improve the environmental quality

Some beliefs appear to be negatively related to WTP. These were:

1. Homeowners and developers are responsible for the increased risk and should be held responsible.
2. Belief that the project would be ineffective. General skepticism.
3. Taxes are too high already. Should be paid with current monies.
4. Belief that the project is not a priority for my community
5. Belief that the money would go to administrative costs and studying the problem, not solving the problem.

Objective 6: Participants generated a long list of potential information resources, but a majority of respondents said they would turn to governmental sources for information. (This may have been an artifact of the social context of the focus groups, however.) Some expressed distrust about the accuracy of information coming from government agencies. Many perceived a great difficulty in getting and understanding the information they would need to make a more educated WTP estimate (because of access and interpretability of information). Some felt it was not their responsibility to get information about potential projects.

Objective 7: A majority of participants said they would be unlikely to turn to the mass media for information. Participants varied greatly on the extent to which they held the following beliefs:

Stories with statistics are more believable than those without.
Someone's personal experience is more convincing than statistics.
In-depth features are more informative than single news articles or reports.
In-depth features are more trustworthy.

A number of additional possible items were suggested, designed to tap into people's beliefs about government agencies, experts, environmental groups and elected officials.

Objective 8: Most participants placed the prevention of floods and the environmental improvement of the river/creek as a medium to high priority for their community. Most participants disagreed with the notion that only those who live in the flood plain should be required to pay the cost of flood control. However, results were much more varied when a similar question implied taxation and the participant possibly having to make a contribution ("Taxpayers have a duty to share in the cost of flood control even thought only a minority is affected by floods"). Most participants agreed that we have an obligation to protect nature even if there are not human benefits.

The focus group surveys are being followed by two large surveys of approximately1000 citizems of the two investigated watersheds. Results of the surveys will be available at the end of the year 2000.

CONCLUSIONS

Urban streams are adversely affected by urbanization that increases risk of floods and decreases ecological integrity of urban receiving waters. Reducing both risks may lead to conflicting solutions. In the past emphasis was solely on flood control by using conveyance approaches. Today, efforts are on the way in many communities to restore the ecological integrity and in the same time provide flood control. BY correlating the numeric ecological and flood risks to the citizen's willingness to pay for reduction of the risks it will be possible to find an optimum of the solutions of the dual risks facing today many urban streams.

Focus group surveys by the research team of citizens living in two urban watersheds revealed that citizens value highly ecological integrity of the streams and are willing to support programs that would lead to its restoration. Willingness to pay for flood control may vary depending on the history of the flooding. Education of the public about future flooding potential is crucial because the citizens living in developing watersheds do not anticipate the future increases of the flood risks.

RISK BASED URBAN WATERSHED MANAGEMENT UNDER CONFLICTING OBJECTIVES

Vladimir Novotny, David Clark, Robert J. Griffin and Douglas Booth

Institute for Urban Environmental Risk Management, Marquette University, Milwaukee, WI 53201-1881, USA

ABSTRACT

Ecological impairment and flooding caused by urbanization can be expressed numerically by calculating the risks throughout the watershed (floodplain) and along the main stems of the streams. The risks can be evaluated in terms of the present and/or future. This article describes the methodologies for ascertaining the risks in the Geographical Information Systems (GIS) environment. The objectives of urban flood controls and ecological preservation/restoration of urban waters are often conflicting and, in the past, the sole emphasis on flood control led to destruction of habitat and deterioration of water quality.

An optimal solution to these two problems may be achieved by linking the risks to the concepts of risk communication, risk perception, and public *willingness to pay* for projects leading to ecological restoration and ecologically sustainable flood control. This method is appropriate because, in each case, public funds are used and the projects require approval and backing of policy makers and stakeholders. This article briefly describes a research project that attempts to resolve the conflict between the flood protection and stream ecological preservation and restoration and suggests alternative ways of expressing benefits of urban stream flood control and restoration projects.

INTRODUCTION

Urbanization has an irreversible impact on natural drainage patterns and flows in the receiving water bodies impacted by urban development. Uncontrolled development or past development in the flood plain that did not consider the impacts on hydrology, flood plain encroachment, morphology and ecology of the receiving water body system have had detrimental effects on the receiving water body, flood plain development and downstream uses of the water body. However, if development progresses in a planned, ecologically conscious way, the adverse impacts on population and properties can be minimal or minimized.

Management of smaller and medium size urban streams today must today consider several objectives, such as:

1. ***Controlling floods***;
2. ***Preserving and restoring the ecological integrity*** of the receiving water body affected by point and nonpoint discharges and changes in hydrology and hydraulics;
3. ***Providing contact and noncontact recreation*** to urban populations;
4. ***Optimizing other uses***, such as water supply, navigation, or hydropower production.

Some of the objectives conflict and some complement each other. For example, the preservation and restoration of ecological integrity and the provision of habitat for aquatic life complement recreational objectives. In fact, contact recreational uses require a healthy stream ecology. On the other hand, flood control often is in conflict with ecological and recreational objectives. In the context of watershed and water body management, these conflicts must be reconciled and uses must be optimized.

HYDROLOGIC CHANGES BY URBANIZATION

Figure 1 shows a probability-frequency chart of flows in a watershed located in central Wisconsin that underwent rapid urbanization. The flows were calculated by a well known TR-55 hydrologic runoff curve model (U.S. Soil Conservation Service) after entering the watershed characteristics as they are changed by urbanization. The watershed area is 36.7 km^2 (14.2 sq.mi.). The original use of land in the watershed before 1960 was as a rural mix of agri-cultural and forested lands. By the time of the 1985 Federal Emergency Management Administration (FEMA) flood delineation study, the watershed became about 20 to 25 percent urbanized. Soils of the watersheds were predominantly in the U.S. SCS hydrologic categories of B and C (loams and silt loams). As of 1998, the watershed was about 40 percent urbanized and the dominant land use had become residential. The other current, major land uses are transportation (including a freeway and state and local highways) and a large shopping mall. As Figure 1 illustrates, the flow that was a 100-year flood in the 1965 pre-development period is today a high flow occurring on average every three to four years and could become an annual high flow when the watershed is fully developed.

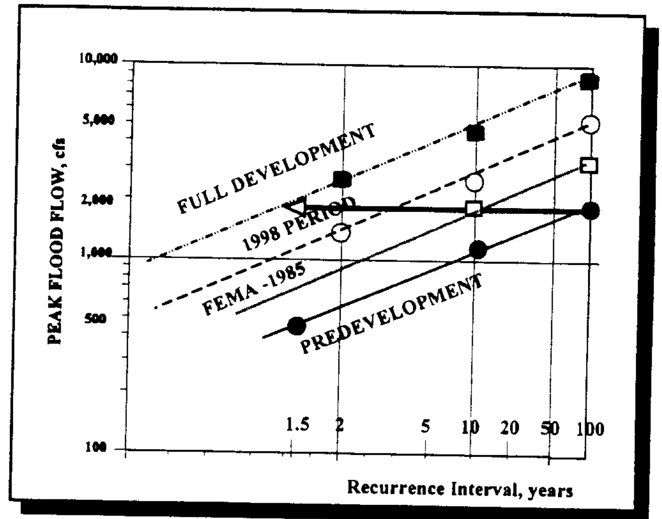

Figure 1 Effect of urbanization on flood flows in a small Midwestern (US) watershed

The increased magnitude and frequency of high flows have several major adverse effects on the community located near the water course, on the floodplain, and on the ecology of the urban stream. Hydrologic effects can be summarized as follows:

1. ***The floodplain enlarges***. In the United States, the *floodplain* is defined as an area that is flooded up to the extent of the 100 year flood. Figure 1 shows that as the magnitude of the 100 year flood increases, areas that were outside the 100 year flood plain would become a part of it.
2. ***The frequency of flooding inside the floodplain increases.*** Under natural conditions, a river channel overtops about once every 1½ to two years (Leopold, Wolman and Miller, 1992). Figure 1 documents that the channel, as a result of urbanization, is overtopped several times each year.
3. ***Peak flows during storm events are increased.*** Since surface flow moves faster, the time of concentration is decreased.
4. ***The magnitude and frequency of all runoff events of all sizes increases.*** This outcome is especially important for rainfalls of smaller and medium magnitudes. Before urbanization these smaller rainfalls mostly infiltrated into soil and the flows in the stream were smaller and could be easily contained in the natural channels of the stream. After urbanization the same medium rainfall could result in a flood.
5. ***Channels become unstable and more erosive*** (degrading) as a result of increased medium floods (Booth and Jackson, 1997). This outcome has an adverse impact on habitat.
6. ***Imperviousness of the watershed impedes recharge of shallow groundwater aquifers.*** This outcome diminishes the base flow contributions. Some streams may become ephemeral or effluent dominated.
7. ***More flow moves on the surface, and with a faster velocity.*** This outcome increases the volume of surface runoff contribution.

Urban engineers in the past had tried to resolve the problem of increased floods by enlarging the flow capacity of urban streams via the processes of lining, covering, and straightening the channels. Los Angeles River in California and the Kinnikinnic River in Milwaukee are examples of the ultimate transformation of urban streams into concrete high flood velocity channels with very little biological habitat. At the same time, flood-plains were being lost to urban development. In general, most urban stream modification projects are driven by the need to control floods. However, economics are not favorable to projects that consider only flood control needs and most urban flood control projects have negative net benefits, *i.e.*, the project costs far exceed the benefits in terms of flood damage reduction. This article briefly describes a research project that (1) makes an attempt to resolve the conflict between flood protection goals and stream ecological preservation and restoration needs, and (2) explores alternative ways of expressing the benefits of urban stream flood control and restoration projects.

RISKS OF FLOODS AND ECOLOGICAL INTEGRITY

In order to compare the risks of increased flooding and the deteriorated ecological integrity of urban streams, the first step is to define a measure for both. Ideally, these measures should be comparable. But that, at this point, seems impossible. The next best solution is to assign weights so they can be compared.

Measure of flood risk. There is a need to express a flood risk relation in the urban flood plain. First, let us define a flood as a flow that is greater than the capacity flow of the channel. A floodplain is a part of the river corridor (Figure 2).

It is also necessary to expand the probabilistic definition of flooding to areas away from the channel. As one moves away from the river's edge (the beginning of the flood plain) the probability of flooding decreases and at some point at a distance X from the river's edge the recurrence interval of flooding becomes 100 years, i.e., the risk of flooding is $\mathbf{r(X) = 0.01}$. This is the extent of the 100 year flood plain that defined and delineated for engineering and flood insurance purposes. The schematic of the risk is then shown on Figure 2. If before urbanization the smallest flow that leaves the channel is about a flow with a recurrence interval of two years (Figure 2) then the annual risk of flooding at the bank of the river is $\mathbf{r_n(0) = ½ = 0.5}$. If, as a result of urbanization, flooding becomes more frequent, for example, if the bankfull capacity flow is exceeded twice a year, the risk of flooding at the river's bank becomes $\mathbf{r_u(0) = 1/0.5 = 2}$ and so forth. The subscripts ***n*** and ***u*** denote natural (pre-development) and urbanized (post development) conditions, respectively.

The monthly probability (risk) can be calculated from a *series* of maximum monthly flows and not just from one, per-year maximum flow. This approach enables us to consider the fact that there may be more then one occasion in a year when the flow leaves the confines of the channel and becomes a flood. Thus, the monthly risk will be slightly different from 1/12 of the annual risk that is based on only one flood per year. To bring the magnitude of the risk on par with the water quality risks that are expressed in terms of the probability of daily grab or four day composite samples exceeding the acute or chronic toxic concentrations or water quality criteria, the risk of monthly flood would be further divided by 30.41.

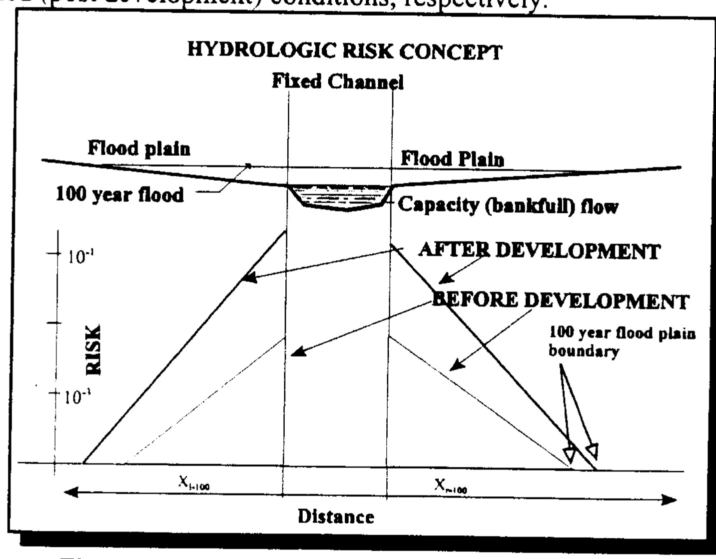

Figure 2 Concept of Urban Flood Risk

The logarithmic mathematical form of the risk function is selected for convenience and simply expresses the fact that floods on rare occasions may extend further than the 100 year flood plain limits. The risk function can be then expressed as

$$r = C\,10^{-K\,x} \qquad (1)$$

R0018583

The function parameters can be easily estimated from the knowledge of the risk of exceeding the bankfull capacity flow and from the extent of the 100 year flood plain. C in the above equation is the risk of exceeding the bankfull flow, or, **C = r(0)**. In the Geographical Information Systems (GIS) environment, the risk function can be ascertained from flood flow elevations and contours of the flood plain.

This risk function can be integrated, *i.e.*,

$$\boxed{R = \int_0^{\infty} r_l(x)\,dx + \int_0^{+\infty} r_r(x)\,dx = r(0)\int_0^{\infty}[\,10^{-K_l x_l} + 10^{-K_r x_r}]\,dx} \qquad (2)$$

where subscripts *l* and *r* correspond to left and right bank flood plains.

The flood plain risk parameter, **R**, or function, **r**, can be combined with the flood damage cost information to yield annualized flood damage indicator. If **d** is an uniform flood damage cost expressed in dollars ($) per m^2 of the flood plain ,then the total annualized flood damage function is simply **D = R x d.**
The unit of the annualized flood damage indicator is **$ (meter of length of the stream)$^{-1}$(year)$^{-1}$**. If **d** varies with the distance from the stream then this function is included into the integral (**Equation 2**) and solved. This parameter could be used in flood risk communication. The flood damage cost, **d**, includes a variety of the costs of remedies for flooding, such as pumping water from basements and streets, cleaning up flooded basements, repair of houses damaged by flooding, cleaning roads, loss of property, and loss of time. It represents the total cost of cleanup and repair divided by the flooded area.

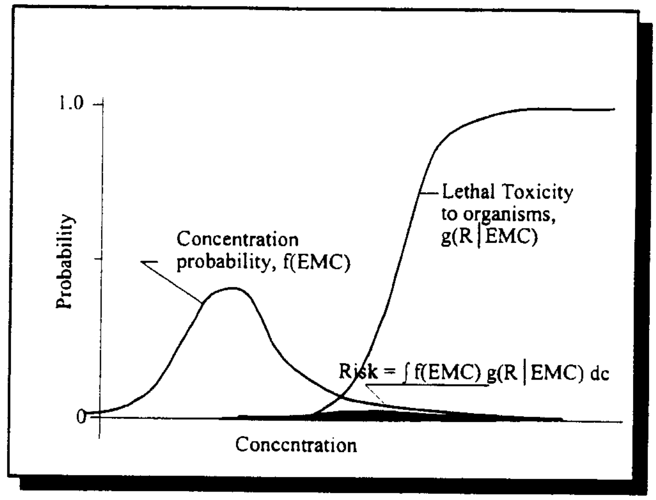

Figure 4 Concept of risk calculation for an individual stressor

The concept of flood risks can be incorporated into a GIS environment. The information and data necessary to develop the flood risk are obtainable from flood insurance maps, U.S. Geological Survey stage-flow rating curves, watershed elevation contours, and conventional hydrologic and hydraulic engineering calculations.

Ecological Risk. Following U.S. Environmental Protection Agency (EPA) (1992) and WERF (Parkhurst *et a.l,* 1996) risk assessment documents, ecological risk for aquatic systems is defined as *"a probability that a genus residing in or potentially indigenous to the receiving water body will be lost or acutely damaged by existing or potential discharges of pollutants."* The term *potentially indigenous* reflects the fact that the representative composition of organisms should be selected from a composition in similar unimpacted water bodies located in the same ecoregions.

The calculations of individual risks for each stressor is demonstrated in Figure 3 . EPA currently evaluates ecological risks in terms of the loss of species or genera that will result from the environmental impact (Parkhurst *et al.,* 1996, US EPA, 1992). This risk is basically a joint probability function of (1) probability density function of concentrations, **f(EMC)**, and (2) probability that species will be lethally or chronically impacted when exposed to a given concentration, **g(R | EMC)**. A simple model and method for calculating ecological risks of contaminants present in storm-water discharges was published by Novotny and Witte (1997). The method assumes that the event mean concentrations of pollutants are log-normally distri-buted. At this point the method estimates only the risk of acute damage to the indigenous population. Both storm-water and base flow discharges are considered. The method considers dilution of storm-water and CSO discharges and Water Effect Ratio. A simple soft-ware package has been developed by the Water

Environment Research Foundation (Parkhurst *et al.*, 1996). The single, dimensionless risk value has numerous advantages over the traditional separate comparison of measured water quality data with criteria because it puts all pollutants on the same basis, *i.e.*, the probability of ecological damage to the resident biota (or poten-tially resident as derived from reference unimpacted water bodies of the same character within the ecoregion). It may also be an additive and comparative number, *i.e.*, risks from several compounds and those from dry weather discharges could be added together to yield an overall risk and approximate synergy and individual risks can be quantitatively compared.

WILLINGNESS TO PAY - A WEIGHTING FACTOR FOR RISKS

As shown above, the ecological and urban flooding risk can be expressed in apparently similar units; however, these risks are not directly comparable and need not be valued the same by local residents. A solution is to assign weights to each risk and use a common denominator to develop the weigths. One technique that has been used by economists to assess the underlying value associated with nonmarket goods such as environmental and flooding risk reduction is the contingent valuation method (CVM). This approach employs a survey of residents to assess their maximum willingness to pay (WTP) to improve, or avoid degradation of a local resource. In the current context, the approach can be used to determine WTP for reduced ecological risk, and the maximum WTP to avoid increasing flooding risks above existing levels as a consequence of continued urbanization. The stated WTP payment should be that dollar value that would make the respondent indifferent between the original level of risk, and the hypothesized change in risk. Hence, the WTP response gives an indication of the true value to the respondent of the hypothetical change being described in the questionnaire. If carefully designed, these surveys can be used to not only gauge the level of public support for a project, but also determine the community benefits associated with public investments in flood control and ecological improvement to urban watersheds.

This technique is being employed in the present analysis of flooding and environmental risks in two watersheds within the Milwaukee metropolitan area. Development scenarios are described to the respondents based on ecological and hydrological simulation. Respondents are then asked to define maximum annual payments to (1) prevent increases in flood risks associated with development scenarios and, (2) improve ecological quality of the river and its environs. Although the economic theory that underlies the CVM has been thoroughly developed by Carson and Mitchell (1989), and others, there are a number of issues outlined below that are relevant to this particular application.

Descriptions of Public Goods. The respondents must understand clearly what is being valued and, equally important, the respondent must understand what is *not* being valued. For example, in the Milwaukee area, there have been consistent problems with sewer backups and basement flooding due to inadequate grading around houses. We are careful to point out that the flooding risks being valued are related to the rivers and streams overtopping their banks, rather than these alternative forms. To assist in the development of accurate and believable descriptions of the flood risk and ecological risk goods, focus groups drawn from residents within the watershed were conducted.

Referendum Format, Fiscal Reference Points and the Payment Vehicle. Since most flood control and environmental improvement projects are financed publicly, we used a referendum format to describe the project. That is, the project was described to the respondent in the form of a public referendum that would be financed with public tax dollars. Residents were then given as reference points average public expenditures on numerous public services provided by their state and local government (e.g., annual expenditures on police, fire, education, ambulance, etc.). We were careful to avoid identifying the property tax as the specific payment vehicle for the referendum. Rather, it was indicated that the payment would be made through a combination of state and local taxes. Given that most local flood control projects are financed over a period of 20-30 years, we indicated a 20 year period for the financing of the project. The respondent was presented with a randomly generated project cost between $0 and $500 (the range was determined from the focus groups) and asked if they would be willing to vote for the project if it were on the next ballot. This permits the determination of median responses to the WTP question. Furthermore, respondents were also asked to state the most they would be willing to pay in annual tax contributions over the next 20 years.

The Embedding Issue. A debate has developed as to whether WTP responses truly reflect the valuation of the good in question, or whether they simply reflect a desire to purchase moral satisfaction that one is actually doing something about an environmental problem (embedding). To test whether embedding is a problem among our respondents, we ask different WTP questions for three distinct groups of respondents. The first set of respondents were asked to place a value on maintaining the status quo on flood control in light of continued urbanization. A second group was asked to value ecological improvements to the watershed, and the third group was asked to value a project that included both ecological risk reduction and flood control. If embedding is not a problem, then the average WTP of the third group would be greater than that of either the first or the second groups. If completely separable, the WTP of the first two groups would sum to that of the third group.

Studying Watershed Residents. A two-wave, panel-design, probability sample survey of more than 1000 adult heads of households residing in two pilot watersheds (Oak Creek and the Menomonee River) located in the Milwaukee Metropolitan area is being conducted by telephone in 1999-2000 to ascertain WTP for flood control and/or ecological restoration of these two degraded watersheds. The interviews also ask most respondents questions that examine carefully various potential predictors of WTP, including a series of socio-demographic, attitudinal, risk perception, and risk communication variables based on a model of risk information seeking and processing developed by Griffin, Dunwoody and Neuwirth (1999) from powerful psychological theories such as the Theory of Planned Behavior (1988) and the Heuristic-Systematic Model of information processing (Eagly and Chaiken, 1993). The panel design of the study (i.e., reinterviewing the same individuals over time, with some new individuals added in the follow-up interview to control for sensitization effects) allows us to assess patterns of likely influence among the variables as well as the stability or volatility of WTP estimates over time.

Prior to the start of the survey, eight focus groups, consisting of citizens recruited in the watersheds, had been conducted in Spring 1999 to help develop survey questionnaire measures, including finding the best lay terminology for posing the WTP questions and describing flooding and ecological risks to survey interviewees. Because focus groups, even those drawn from samples, tend to be unrepresentative of the larger population, results were not used directly for policy or planning guidance

Theory of Planned Behavior. The Theory of Planned Behavior (Ajzen, 1988), which has been successfully tested in prediction of a wide range of human behaviors, is being applied in this study as a means of determining some key predictors of WTP. In this study, WTP is considered to be a form of *Behavioral Intention* (here, an intention to pay a particular amount for the described benefit in terms of flood risks or ecological improvements). Ajzen's theory indicates that behavioral intention (BI) is predicted by a limited set of psychological variables, notably one's sense of control over the behavior (*e.g.*, the amount one could pay), one's social normative beliefs (*e.g.*, one's sense that other people important to the individual would want him or her to pay for the benefit), a set of beliefs about the cost-benefit consequences of performing the behavior (*e.g.*, that paying a given amount would in fact help people who live in the flood plain), and a set of values that the individual holds about those consequences (*e.g.*, that helping people who live in the flood plain in this way is a desirable outcome). The latter two elements (outcome beliefs and outcome evaluations) are considered to be the building blocks of an *attitude* toward performing the behavior, which is the more direct predictor of BI. The theory should serve as a diagnostic tool (e.g., what separates those people who are willing to pay for flood control or environmental improvement from those who are not?) as well as a predictor.

Risk Communication and Perception. One dimension of WTP of key interest to researchers and policy makers is the stability (or volatility) of public WTP over time. Volatile WTP estimates mean that policy makers cannot truly plan on the level of public support voiced in WTP surveys. Thus this study seeks to determine factors that lead to stability in WTP estimates. In general, factors that contribute to stability in the variables that Ajzen (1988) uses as predictors of BI should contribute indirectly to stability in BI (WTP).

To examine these factors, we apply the model of risk information seeking and processing (Griffin et al., 1999).
The model proposes that seven factors -- (1) individual characteristics, (2) perceived risk characteristics, (3) affective responses to the risk, (4) felt social pressures to posses relevant information, (5) information sufficiency, (6) one's personal capacity to learn, and (7) beliefs about the usefulness of information in various channels -- will affect the extent to which a person will seek information about the risk in both routine and nonroutine channels and the extent to which he/she will spend time and effort analyzing the risk information critically (*i.e.*, "processing" it). A key aspect of this model is its reliance on Eagly and Chaiken's (1993) Heuristic-Systematic model, which proposes that information that is analyzed more systematically will produce attitudes more resistant to change over time. Thus, we would expect that factors that lead people to spend more effort gathering and analyzing information about flood risks and about risks to the urban watershed ecosystem will develop more stable beliefs and attitudes toward paying for flood control and ecosystem improvement and, therefore, will provide more stable WTP estimates.

Environmental values are a special form of beliefs about how things should be in the world and about what we should do to make the world a better place. For instance, a basic environmental value could be a belief that restoration of urban watersheds is the right thing to do. Environmental values can be anthropocentric (i.e. human centered) or they can be biocentric (Norton 1995). In the case of anthropocentric values, environmental improvement should be undertaken only for the benefit of people. For biocentric environmental values, ecological improvement should be undertaken both for the benefits humans and for the sake of nature itself. The surveys were designed to find these attitudes.

Synthesis.. Using the model of risk information seeking and processing (Griffin et al., 1999) and the Theory of Planned Behavior (Ajzen, 1988) enables us to predict variance in WTP and helps us explain cognitive, attitudinal, and social normative reasons for WTP. The WTP behavioral intention of respondents, as well as its cognitive and attitudinal precursors, are investigated by considering numerous factors such as upstream (source) vs. downstream (impact) location, living or owning real estate inside or outside the floodplain, other demographic parameters including the standard of living, and finally, the measured and calculated flooding and ecological risks. The estimated WTP functions can then be evaluated across various policy simulations to make derive the benefits associated with risk reductions. These benefit estimates can be compared with project costs to evaluate the economic efficiency of proposed projects.

CONCLUSION

This project represents an interdisciplinary analysis of two degraded urban watersheds. Hydrologic and biological models have been developed to quantify the impact of urbanization on flooding and ecological risks in two urban watersheds. The social scientists on the research team then derive individual and public values for such risk reductions. Although much of the engineering and biological work has been completed, the first wave of the survey was completed in April 2000, and the second wave will follow in the Fall and Winter of 2000/2001. Once the analyses of these surveys are completed, policymakers and stakeholders will be able to address a number of important issues. These include:

1. What are the relative weights placed on WTP for flood control vis a vis risk reductions for environmental quality in urban rivers, and how do these vary with individual and neighborhood circumstances?
2. What role does communication and public education play in determining WTP?
3. What factors lead to political support for flood control and ecological risk reductions?
4. Under what circumstances can officials count on continued public support in monetary terms (i.e., stability of WTP estimates over time)?
5. In light of future urbanization trends, how do the derived benefits associated with flood control and

watershed ecological improvement projects compare with the costs of these projects?

Because the location and other descriptors of respondents to the survey are known, the results will also enable the researchers to assign approximate spatial or neighborhood weights to these two types of risk, thereby reflecting community support for flood control and ecological risks. This outcome will help stakeholders to assign funding priorities. Preliminary results of the focus groups and of the first survey indicate that the WTP estimates in pilot watersheds are generally greater than the cost of the remediation, especially when ecological restoration and preservation are considered. Preliminary results of the survey indicate that 78.6 percent of respondents either strongly agree or agree with the statement that "the health of urban rivers should be improved for the sake of nature itself". This clearly suggests that the public in Milwaukee urban watersheds subscribe to biocentric urban values.

Acknowledgment. The research described in this presentation is sponsored by the Research Grant No. EPA Grant Number: R82-5759 from the US Environmental Protection Agency as a part of the EPA/NSF/USDA STAR Watershed Program. The views expressed in this presentation are those of the authors and not of the sponsoring agencies.

Edward Anton, Acting Executive Director
State Water Resources Control Board
901 P Street
Sacramento, California 95814

Dear Messrs. Douglas and Anton:

The National Oceanic and Atmospheric Administration (NOAA) and the U.S. Environmental Protection Agency (EPA) are pleased to inform you of our full approval of the *Plan for California's Nonpoint Source Pollution Control Program* (Program Plan), submitted in accordance with §6217 of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) and §319 of the Clean Water Act (CWA §319). We commend you for developing a nonpoint source pollution control program to address both the requirements of CZARA and the CWA §319. We congratulate you on your efforts to successfully complete development of this comprehensive program, while recognizing the most challenging work awaits us.

Nonpoint source pollution, caused by a wide range of activities including agriculture, mining, urban development and forestry, is the leading cause of water quality impairment in California. The restoration of California's waters will depend on a wide range of regulatory and non-regulatory actions. We fully support the Program Plan's stress on cooperation and local stewardship to resolve nonpoint source problems, but vitally important are your assurances of applicable State regulatory authorities available to protect and restore water quality degraded by nonpoint source discharges. We recognize success will ultimately rely on your ability to use these programs and authorities to foster the widespread implementation of practices that will restore and maintain the chemical, physical and biological integrity of California's waters.

NOAA and EPA find that California has satisfied all conditions of program approval pursuant to CZARA set forth in the *Findings on the California Coastal Nonpoint Program*, transmitted to the State on June 30, 1998. These conditions have been addressed in the Program Plan. Furthermore, EPA finds that the Program Plan successfully incorporates the nine key elements pursuant to CWA §319 that characterize an effective and dynamic state nonpoint source program (EPA, May 1996). Consequently, the California Nonpoint Source Pollution Control Program is now fully approved pursuant to CZARA and CWA §319. As a result, California will receive $10.6 million this year to implement the nonpoint source program. This includes $5.2 million of "new" funds that the Clean Water Action Plan (February 1998) has earmarked for those States that have upgraded their nonpoint source programs.

We greatly appreciate the effort and commitment your agencies and staff have shown in completing development of your nonpoint source program. We look forward to working closely with you to implement fully the management measures by 2013, and will be working with you to monitor your progress in achieving this goal. If you have any questions regarding the enclosed decision documents, please call Jeff Benoit (NOAA) (301-713-3155), Felicia Marcus (EPA Region 9) (415-744-1001), or Alexis Strauss (EPA Region 9) (415-744-1860), or refer staff to Keelin Kuipers (NOAA) (301-713-3121, ext. 175) or Sam Ziegler (EPA Region 9) (415-744-1990).

Yours,

Jeffrey R. Benoit, Director
Office of Ocean and Coastal Resource Management
National Oceanic and Atmospheric Administration

STATE WATER RESOURCES CONTROL BOARD
RESOLUTION NO. 99 - 114

APPROVAL OF A RESOLUTION ADOPTING THE PLAN FOR CALIFORNIA'S NONPOINT SOURCE POLLUTION CONTROL PROGRAM (PROGRAM PLAN) AND AUTHORIZING THE EXECUTIVE DIRECTOR TO SUBMIT THE PROGRAM PLAN TO THE U.S. ENVIRONMENTAL PROTECTION AGENCY AND NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION FOR APPROVAL AND TO IMPLEMENT THE PROGRAM PLAN

WHEREAS:

1. The State Water Resources Control Board (SWRCB) and Regional Water Quality Control Boards (RWQCBs) are committed to and are ultimately responsible for nonpoint source (NPS) pollution management to protect and restore water quality in California.

2. In February 1987, the federal Clean Water Act (CWA) was amended to include section 319 which required each state to address NPS pollution by: (a) assessing NPS pollution problems and causes within the state; (b) adopting management programs to control the NPS pollution; and (c) implementing the management programs.

3. In accordance with the requirements of CWA section 319, on November 15, 1988, the SWRCB adopted and, on January 4, 1990, the U. S. Environmental Protection Agency (USEPA) approved *California's Nonpoint Source Management Plan.*

4. On November 5, 1990, the Coastal Zone Act Reauthorization Amendments (CZARA) were enacted to address concerns with NPS pollution of coastal waters not adequately considered in the Coastal Zone Management Act of 1972.

5. Section 6217 of CZARA requires coastal states to develop Coastal Nonpoint Pollution Control Programs (CNPCP) that: (a) identify and adopt management measures to prevent and control NPS pollution; (b) ensure that enforceable mechanisms exist where self-determined efforts are insufficient to restore and protect water quality; (c) enhance cooperation among the states' land and water use agencies; (d) identify land uses which individually or cumulatively may cause or contribute significantly to a degradation of coastal waters; (e) identify "critical coastal areas" and identify and implement additional measures where necessary to achieve and maintain water quality in the such areas; (f) provide technical assistance to local governments and the public to implement the management measures;

(g) provide opportunities for public participation in CNPCP development and implementation; and (h) monitor management measure implementation. The CNPCP must be approved by USEPA and the National Oceanic and Atmospheric Administration (NOAA).

6. The lead agencies designated for upgrading the State's NPS Program to conform to the requirements of the CWA and CZARA are the SWRCB, the RWQCBs, and the California Coastal Commission (CCC).

7. In September 1995, the SWRCB and the CCC submitted to USEPA and NOAA the State's response to the CZARA requirements. In lieu of a separate program for the coastal zone, the SWRCB and the CCC applied the CZARA requirements on a statewide basis.

8. In July 1998, USEPA and NOAA issued their findings and conditional approval of the State's submittal. For final approval of the CNPCP, the State was required, consistent with the August 1997 Action Plan, to (a) adopt management measures; (b) identify back-up and enforceable policies and mechanisms for the management measures; and (c) demonstrate the ability for widespread implementation of the management measures.

9. The Program Plan is the State's final submittal to satisfy the requirements specified by USEPA and NOAA for CNPCP approval and NPS Program Upgrade. The Program Plan is composed of two volumes -- *Volume I: Nonpoint Source Program Strategy and Implementation Plan for 1998-2013* (PROSIP) and *Volume II: California Management Measures for Polluted Runoff (CAMMPR)* (Attachments 1 and 2, respectively).

10. SWRCB and CCC staffs held public workshops to receive comments on the Program Plan, and the Program Plan has been revised to incorporate pertinent comments.

THEREFORE BE IT RESOLVED THAT:

The SWRCB:

1. Adopts the Program Plan;

2. Authorizes the Executive Director to submit the Program Plan to the USEPA and NOAA for approval;

3. Authorizes the Executive Director to execute the Memorandum of Understanding between the SWRCB and CCC;

4. Directs the Executive Director in coordination with CCC to request the Secretaries of the California Environmental Protection Agency and Resources Agency to jointly transmit a memorandum directing all departments and boards within their agencies to use their respective authorities to implement the Program Plan; and

5. Directs the Executive Director in coordination with CCC to request the Secretaries of the California Environmental Protection Agency and Resources Agency to jointly transmit a memorandum asking the California Department of Transportation, Department of Food and Agriculture, and Department Health Services to use their respective authorities to implement the Program Plan;

6. Directs the Executive Director to work with the Executive Officers of each RWQCB and directors of the State agencies to implement the Program Plan; and

7. Directs staff to initiate activities described in the Program Plan.

CERTIFICATION

The undersigned, Administrative Assistant to the Board, does hereby certify that the foregoing is a full, true, and correct copy of a resolution duly and regularly adopted at a meeting of the State Water Resources Control Board held on December 14, 1999.

Subject: Adoption of the *Plan for California's Nonpoint Source Pollution Control Program*

Dear Mr. Benoit and Ms. Marcus:

On January 11, 2000, by a vote of 9 in favor, 0 opposed, and 1 abstention, the California Coastal Commission adopted the *Plan for California's Nonpoint Source Pollution Control Program* (Plan). The Plan provides a framework to focus, expand, and coordinate actions to prevent and control nonpoint source pollution Statewide.

By a vote of 8 in favor, 0 opposed, and 1 abstention, the Coastal Commission also directed me to enter into a Memorandum of Understanding with the State Water Resources Control Board to promote the continued close collaboration between the two State lead agencies that developed and are implementing the Plan.

Sincerely,

Peter Douglas

Peter M. Douglas
Executive Director

VOLUME I

NONPOINT SOURCE PROGRAM STRATEGY AND IMPLEMENTATION PLAN, 1998-2013 (PROSIP)

State Water Resources Control Board
California Coastal Commission

JANUARY 2000

EXECUTIVE SUMMARY

The *Plan for California's Nonpoint Source Pollution Control Program* (Program Plan) is the first significant upgrade of California's Nonpoint Source (NPS) Pollution Control Program (NPS Program) since its inception in 1988. California is required to have its Program conform to the Clean Water Act (CWA) and section 6217 of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA). The lead State agencies for upgrading the Program are the State Water Resources Control Board (SWRCB) (designated lead water quality agency), the nine Regional Water Quality Control Boards (RWQCBs), and the California Coastal Commission (CCC) (designated lead coastal zone management agency). The Program Plan will be submitted for approval to the U.S. Environmental Protection Agency (USEPA) and the National Oceanic and Atmospheric Administration (NOAA), the lead federal agencies that administer the CWA and the Coastal Zone Management Act (CZMA) respectively.

Finding solutions to NPS pollution poses unique challenges. Although the SWRCB and CCC have lead roles in developing and coordinating the implementation of the Program, they are not solely responsible for solving the problem. Over 20 other State agencies have authorities, programs, or responsibilities relating to the control of NPS pollution. Coordinating and focusing such a large number of entities to produce an effective NPS program in a state as large and geomorphologically diverse as California poses unique and difficult challenges. While increased use of regulatory authorities can help to address certain categories of NPS pollution (such as the relatively recent effort to issue permits for the most significant municipal storm water discharges), California will need to rely on a wide range of tools, activities, and authorities to address NPS pollution statewide. Initially, implementation will focus significant resources on management measures (MMs) identified as primary and secondary in Table 8, on retooling the Program's infrastructure, and on institutionalizing Program processes and mechanisms to make certain the State meets the commitments made in the Program Plan.

The State is committed to implementing the 61 NPS MMs by 2013 consistent with Federal Administrative Guidance (USEPA and NOAA, 1998), the Three-Tiered Approach adopted in the Nonpoint Source Management Plan, November 1988 (1988 Plan), and priorities identified in the Watershed Management Initiative (WMI) Chapters. The WMI, approved by the SWRCB in 1995, is used to help the SWRCB meet its goal to provide water resource protection, enhancement, and restoration. WMI uses an integrated planning approach to create and implement unique solutions for each watershed. Each RWQCB and the SWRCB revises its WMI Chapter annually to reflect changing priorities and conditions in the State's watersheds. Revisions currently underway will ensure that the WMI chapters and RWQCBs' actions are consistent with the Program Plan's goal of implementing all MMs by 2013.

Total Maximum Daily Loads (TMDLs) are another implementation planning tool that will enhance the State's ability to foster implementation of appropriate NPS MMs. By providing watershed-specific information, TMDLs will help target specific sources and corresponding corrective measures and will provide a framework for using more stringent approaches that may be necessary to achieve water quality goals and maintain beneficial uses.

Approximately 1,500 water body-pollutant combinations requiring TMDL development have been identified in the CWA section 303(d) list. During the Fifteen-Year Strategy, the RWQCBs are committed to the development of 500 to 800 individual TMDLs which will account for <u>all</u> 1,500 water body-pollutant combinations. The commitment of financial and staff resources to this effort will be influential in addressing the State's effectiveness in controlling NPS problems.

NPS pollution, also known as polluted runoff, is the leading cause of water quality impairments in California and in the Nation. NPSs, including natural sources, are the major contributors of pollution to impacted streams, lakes, wetlands, estuaries, marine waters, and ground water basins in California and are important contributors of pollution to harbors and bays (SWRCB, 1998). Unlike pollution from distinct, identifiable point sources (e.g., industrial or waste water treatment plant discharge pipes), NPS pollution comes from many diffuse sources. Rainfall, snowmelt, or irrigation water that moves over and through the ground results in NPS pollution. As the runoff moves, it picks up and carries away natural and human-made pollutants and deposits them into lakes, rivers, wetlands, ground water, and other inland and coastal waters.

The Program's roots were established in 1988 when the SWRCB adopted and the USEPA approved the original plan for the 1988 Plan (SWRCB, 1988) in response to CWA section 319. In 1990 Congress identified NPS pollution as a significant factor contributing to coastal water degradation, noting the link between coastal water quality and land use activities. In response, Congress amended the CZMA by passing CZARA. CZARA requires the lead water quality agency and coastal zone management agencies to jointly develop and submit a coastal nonpoint pollution control program (CNPCP).

In February 1994, the SWRCB initiated a comprehensive review of the Program using technical advisory committees (TACs) for ten categories of NPS pollution. Over 150 people participated in the TACs as public and private representatives for irrigated agriculture, nutrient application, pesticide application, confined animal facilities, grazing, urban runoff, on-site sewage disposal systems, boating and marinas, hydromodification and wetlands, and abandoned mines. The TACs presented their recommendations to the SWRCB in 1995 (SWRCB, 1994 a-i).

In lieu of a separate program for the coastal zone, the State decided to satisfy CZARA requirements on a statewide basis. As required by statute, in September 1995, the SWRCB and CCC submitted California's initial CZARA response to USEPA and NOAA. The response included two documents: *California's Coastal Nonpoint Pollution Control Submittal*, detailing the State's existing programs related to NPS pollution management, and the *Initiatives in Nonpoint Source Management*, based on the recommendations of the TACs.

USEPA and NOAA released draft findings and conditions for the State's September 1995 submittal in October 1996. In August 1997, the SWRCB, CCC, USEPA Region 9, and USEPA and NOAA headquarters staffs negotiated the *Action Plan* which outlined a framework and activities for the State to achieve both an approvable program consistent with CZARA and an *"enhanced status"* Program by addressing the nine key elements in the USEPA's *Nonpoint Source Program and Grants Guidance of 1997 and Future Years*. In July 1998, USEPA and NOAA issued their Final Findings and Conditional Approval for California's submittal. Consistent with the *Action Plan* and final administrative changes to CNPCP guidance issued in October 1998, for final approval the State must: (1) adopt MMs consistent with the *Guidance Specifying Management Measures for*

Sources of Nonpoint Pollution to Coastal Waters (USEPA, 1993); (2) identify back-up and enforceable policies and mechanisms for the MMs; (3) demonstrate the ability for widespread implementation of the MMs; and (4) address the nine key elements.

The Program Plan is the State's final submittal intended to satisfy the CWA section 319(h) requirements for "an upgraded program" and the CZARA requirements for a CNPCP. The Program Plan achieves this goal by providing a single unified, coordinated statewide approach to dealing with NPS pollution structured around 61 MMs. MMs serve as general goals for the control and prevention of polluted runoff. Site-specific management practices (MPs) are then used to achieve the goals of each management measure. Implementation of MMs will occur using a fifteen-year strategy with three nested five-year implementation plans. The fifteen-year strategy and each five-year implementation plan use an iterative program process. The program process includes: (1) assessing Program activities; (2) targeting efforts; (3) planning activities based on Program goals and objectives; (4) coordinating the efforts of federal, State, and local agencies and stakeholders; (5) implementing coordinated actions; (6) tracking and monitoring the results of implemented actions; and (7) reporting on Program results. The Program Plan is designed to be flexible and adaptable over time.

Specifically, the Program Plan:

1. Adopts 61 MMs as goals for six NPS categories (agriculture, forestry, urban areas, marinas and recreational boating, hydromodification, and wetlands/riparian areas/vegetated treatment systems);
2. Provides a fifteen-year strategy for fully implementing the MMs;
3. Continues use of the "Three-Tiered Approach" for addressing NPS pollution problems (Tier 1: Self-Determined Implementation of Management Practices [formerly referred to as "voluntary" implementation]; Tier 2: Regulatory Based Encouragement of Management Practices; and Tier 3: Effluent Limitations and Enforcement Actions). Senate Bill 227 (California Water Code [CWC] section 13369) requires the SWRCB to develop by February 1, 2001, guidance for describing the process by which the SWRCB and RWQCBs will enforce the Program Plan;
4. Provides the first of three five-year implementation plans targeting activities for specific MMs consistent with State and regional priorities in specific watersheds and also establishes mechanisms for: (a) coordination among agencies; (b) participation by the public; (c) assistance technically and financially; (d) adoption of additional MMs as goals, if needed; and; (e) monitoring and reporting of program effectiveness;
5. Promotes long-term interagency coordination among State agencies of the California Environmental Protection Agency and Resources Agency as well as other local, State, and federal agencies;
6. Identifies back-up authorities and enforceable policies and mechanisms for the 61 MMs adopted by the State; and
7. Relies on the use of existing authorities and regulatory processes to achieve implementation but allows for the adoption of the MMs as regulation after each five-year cycle if adequate progress in NPS pollution control has not been demonstrated.

Program accountability is critical to reassure the public of the State's commitment to deal with the NPS pollution problem. The Program Plan contains actions that will result in consistent and timely evaluation and reporting of the Program's progress in effectively dealing with NPS pollution. This includes annual, biennial, and five-year reporting cycles and the use of Internet-based interactive information tools. Also important is greater public participation through: (1) development of the five-year implementation plans; (2) tracking the implementation of and assessing effectiveness of MMs; (3) use of public reports; (4) expanded volunteer monitoring and education programs; (5) use of the Internet; and, (6) expansion of public outreach workshops.

The Program Plan also contains a Memorandum of Understanding (MOU) between the SWRCB and CCC. Although the two agencies have worked side-by-side to complete this document, the MOU commits the agencies to continue implementing the Program Plan after it is adopted by the SWRCB and CCC and approved by the federal agencies. Actions in the first five-year implementation plan require the SWRCB and CCC to review and update existing Management Agency Agreements and MOUs as appropriate and to develop others as needed. This aspect is important because the success of this Program Plan is dependent on the active participation of other government agencies with NPS responsibilities and private partners with significant influences over land use practices.

TABLE ES-1

SUMMARY OF MAJOR TASKS THAT THE NPS PROGRAM LEAD AGENCIES SEEK TO COMPLETE AS OF 2003

	Plan section
A. Assess Program Activities	
• The State will continue use of the State's Water Quality Assessment (WQA) as the primary tool for assessing NPS pollution statewide. **By August 1, 2001**, the SWRCB will provide WQA data prepared pursuant to CWA sections 305(b) and 303(d) on the Internet for public reference and to help monitor and track the effectiveness of the NPS Program. The data, included on the Geographically-based Water Body System (GeoWBS) database, will identify water body size, degree to which beneficial uses are supported, affected beneficial uses, pollutants, and pollution sources.	II-B
• **By August 1, 2001**, the State with the assistance of University of California, Davis's Information Center for the Environment (UCD ICE) will complete development of a database that will enable State agencies to geographically track implementation of MMs and MPs.	II-G
B. Target Efforts	
• **On even-numbered years** or as required by the USEPA, the SWRCB will prepare the CWA section 303(d) and TMDL priority lists that will assist the State in targeting priorities by water body, geographic region, pollutant, etc. • **By December 31, 2000**, the Critical Coastal Area (CCA) Committee will develop an initial list of CCAs where targeted implementation of MMs will occur.	II-C
C. Plan Activities Based on Program Goals and Objectives	
• **By July 1, 2000** and annually thereafter, the SWRCB, CCC, and RWQCBs will prepare joint annual workplans for NPS Program activities to include information on use of funding sources (including bond funds). • **By July 1, 2000**, the CCC will update its in-house Procedural Guidance Manual to reflect newest development of NPS MMs and to provide guidance for updates and amendments to local coastal programs (LCPs) and development of new LCPs. • Pursuant to the **schedules listed in Appendix C**, the RWQCBs will develop TMDLs.	II-D & Apx C
D. Coordinate Efforts of Federal, State, and Local Agencies and Stakeholders	
• **By January 31, 2000**, the SWRCB and CCC will sign an MOU designed to enhance coordination between these agencies. • **By July 1, 2000**, the SWRCB and CCC will convene the initial meeting of the Interagency Coordinating Committee (IACC). **By September 30, 2000** the CCC and SWRCB will convene the initial meeting of the CCA Committee. • **By July 1, 2000**, the SWRCB and CCC will initiate the development of five-year implementation plans for the California Environmental Protection Agency (Cal/EPA), California Resources Agency (Cal/RA), and other agencies with a goal of completing 50 to 100 percent of these plans by December 31, 2000. • **By July 1, 2000**, the SWRCB and CCC will begin the process to update existing Memorandums of Understanding/Management Agency Agreements (MOUs/MAAs) (e.g., agreements with the State Board of Forestry/Department of Forestry, Department of Pesticide Regulation, and Department of Food and Agriculture) and develop new MOUs/MAAs with other agencies as needed. **By December 31, 2001**, the SWRCB and CCC will prepare a schedule for completing any necessary remaining MOUs/MAAs.	II-E

	Plan section
E. Implement Coordinated Actions • **By July 1999 and each year thereafter**, the SWRCB and RWQCBs will support activities using CWA section 319(h) funds to implement the CAMMPR MMs. • **By February 2001**, the SWRCB will develop guidance to be used by the SWRCB and RWQCBs in establishing the process by which the SWRCB and RWQCBs will enforce their authorities as outlined in this Program Plan (CWC §13369). • **By July 1, 2002**, the State will prepare California MM implementation guidance. Links to existing guidance for implementation of MMs and MPs will be provided on the NPS Program website(s) in the interim (examples of existing guidance used in California include Natural Resources Conservation Service (NRCS) technical guides and Storm Water Quality Task Force Manuals). • Pursuant to the **schedules listed in Appendix C**, the RWQCBs will begin implementation of TMDL implementation plans.	II-F
F. Track and Monitor Results of Implemented Actions • By **November 30, 2000**, the SWRCB will assess and report to the Legislature on the SWRCB's and RWQCBs' current surface water quality monitoring programs for the purpose of designing a proposal for a comprehensive surface water quality monitoring program for the State (as provided for in CWC §13192). • By **January 1, 2001**, the SWRCB will prepare and submit to the Legislature a report that proposes the implementation of a comprehensive program to monitor the quality of State coastal watersheds, bays, estuaries, and coastal waters and their marine resources for pollutants (as provided for in CWC §13181[c]).	II-G
G. Report on Program Results • **By August 1, 2000 and annually thereafter**, the SWRCB will submit to the Legislature and make available to the public, copies of and a summary of information in all SWRCB and RWQCB reports that contain information related to NPS pollution and that the SWRCB or RWQCB are required to prepare in the previous fiscal year pursuant to CWA sections 303, 305(b), and 319 and CZARA section 6217. (CWC §13369[b]) • **By August 1, 2001 and August 1, 2003**, the SWRCB and CCC will complete biennial reports, for evaluation by USEPA and NOAA as well as other agencies and the public, regarding the State's progress in implementing the NPS Program.*	

* The reports to be produced in 2001 and 2003 will provide details to address questions such as:

1. Have the activities identified in the five-year plans been completed and have the associated performance measures been achieved?
2. Has an MM implementation tracking system been established? Based on that system, what is the extent of MM implementation for all source categories throughout the State?
3. Has the IACC become active and successful in fostering implementation?
4. Has the SWRCB/RWQCBs published NPS enforcement guidance in 2001 as per CWC section 13369(a)(2)(B)?
5. Has the technical assistance to land owners and managers been improved through the issuance of technical guides, information sharing, "field-level" assistance and/or other activities?
6. Have other State and federal agencies and non-governmental entities become involved in implementing the NPS Program? Where necessary, have formal agreements been established to enhance the effectiveness of these partnerships?
7. Has the planning process for the next five-year plan (2003-2008) been established to achieve more specific plans that include measurable objectives and that involve a wide range of key stakeholders?
8. Have adequate efforts been made to identify funding needs and mechanisms to ensure continuing MM implementation and Program Plan success?

NONPOINT SOURCE PROGRAM STRATEGY AND IMPLEMENTATION PLAN, 1998-2013 (PROSIP)

I. NONPOINT SOURCE PROGRAM OVERVIEW

A. Vision and Goals

Since 1991, staffs of the State Water Resources Control Board (SWRCB), California Coastal Commission (CCC), and nine Regional Water Quality Control Boards (RWQCBs), in coordination with other agency staffs and the public, have conducted a comprehensive inquiry into the future direction of California's Nonpoint Source Pollution Control Program (Program). This inquiry shows clearly that Californians have invested significant resources to address nonpoint source (NPS) pollution and improve water quality; however, NPSs continue to be a major contributor of pollution to State waters.

The *Plan for California's Nonpoint Source Pollution Control Program* (Program Plan) is intended to focus and expand the State's efforts over the next 15 years to prevent and control NPS pollution. The vision of the NPS Program is to reduce and prevent NPS pollution so that the waters of California support a diversity of biological, educational, recreational, and other beneficial uses. The NPS Program addresses both surface and ground water quality. The goals of California's NPS Program are the following:

Track, Monitor, Assess, and Report Program Activities

- Improve monitoring and assessment of State water quality and the effectiveness of management practices (MPs) that are implemented to prevent and control NPS pollution.
- Ensure consistent, accurate reporting and dissemination of information related to water quality and related environmental data, sources of NPS pollutants, and pollution control and prevention activities.

Target Program Activities

- Manage NPS pollution, where feasible, at the watershed level—including pristine areas and watersheds that contain water bodies on the Clean Water Act (CWA) section 303(d) list—where local stewardship and site-specific MPs can be implemented through comprehensive watershed protection or restoration plans.
- Apply previous experiences to future decisions (e.g., through the use of pilot projects and the incorporation of "lessons learned").

Coordinate with Public and Private Partners in All Aspects of the Program

- Build the NPS Program upon a foundation of public involvement and support and encourage public participation throughout all stages of the NPS Program.
- Encourage innovative approaches to NPS pollution control and prevention through interagency, interdisciplinary, and volunteer activities.

- Strive to make regulatory, planning, and monitoring processes and programs more effective, efficient, and user-friendly and to coordinate related programs to avoid duplication where possible.

Provide Financial and Technical Assistance and Education

- Enhance the leadership roles of the SWRCB, RWQCBs, CCC, and other agencies in providing local governments and the public with technical and financial assistance and educational programs related to NPS pollution control, land use management, and watershed management.
- Support applied research to expand NPS Program implementation (e.g., development of improved, cost-effective MPs, and environmentally friendly products).

Implement Management Measures

- Ensure the protection and restoration of State's water quality, existing and potential beneficial uses, critical coastal areas (CCAs), and pristine areas by implementing management measures (MMs) to prevent and control NPS pollution. All MMs will be implemented, where needed, by 2013.[1] MMs serve as general goals for the control and prevention of polluted runoff. Site-specific MPs are then used to achieve the goals of each MM.
- Target implementation of MMs using a combination of non-regulatory activities and enforceable policies and mechanisms with self-determined cooperation preferred over prescriptive measures.

To ensure that the NPS Program goals are met, the SWRCB, CCC, and RWQCBs have already taken the following steps: (1) developed MMs that are appropriate for implementation in California and (2) prepared an iterative Fifteen-Year Program Strategy (Strategy) and Five-Year Implementation Plan (1998-2003) (Implementation Plan).

Additional steps in California's long-term strategy and initial short-term plan that are needed are:

- Adoption of NPS MMs by the SWRCB and CCC as goals or through a rulemaking process, as necessary, to ensure that they are implemented statewide by the year 2013;
- Establish and enter into the first five-year plan all relevant information for each process element for primary and secondary MMs by July 1, 2000, with the exception of numeric program performance measures. Numeric program performance measures will be established for each primary and secondary MM in the first five-year plan by October 1, 2000. The revised five-year plan will be distributed to the public by November 1, 2000.

---

1 MMs are identified in Volume II of this Program Plan: *California's Management Measures for Polluted Runoff* (CAMMPR). CAMMPR identifies MMs for five land-use categories: (1) agriculture, (2) forestry (silviculture), (3) urban areas, (4) marinas and recreational boating, and (5) hydromodification. MMs specific to wetlands, riparian areas, and vegetated treatment systems are also identified. CAMMPR has been reviewed by other agencies with authorities and programs that are critical to addressing NPS pollution. Additional workshops were held in Southern and Northern California to solicit public input.

- Publication of an MMs Guidance document that includes examples of MPs that achieve the goals of each MM;
- Building a foundation for agencies with authorities related to the NPS Program to coordinate and collaborate in problem solving, implementing MMs, monitoring, and assessing program success (e.g., review and revise existing agency agreements or develop new agency agreements; convene an interagency committee or similar working forum);
- Increased funding and enhanced education to foster implementation of MMs statewide; and
- Conducting a workshop and reporting every two years (biennially) on the status of the NPS Program.

B. History

Nonpoint Source Water Quality Issues in California

California is a geomorphologically diverse state with 1,609 miles of shoreline and more than 200,000 miles of rivers and streams; 1.6 million acres of lakes and reservoirs; 645,000 acres of estuaries, harbors, and bays; and 275,000 acres of wetlands. California also contains more than 100 million acres of land, almost half of which (44.6 percent) is owned and/or overseen by the federal government (e.g., the U.S. Forest Service [USFS] and Bureau of Land Management [BLM]).

NPS pollution, also known as polluted runoff, is the leading cause of water quality impairments in California and nationally. NPSs, including natural sources, are the major contributors of pollution to impacted streams, lakes, wetlands, estuaries, marine waters, and ground water basins in California and are important contributors of pollution to harbors and bays (SWRCB, 1998). Unlike pollution from distinct, identifiable point sources (e.g., a discharge pipe), NPS pollution comes from many diffuse sources. It is caused by rainfall, snowmelt, or irrigation water that moves over and through the ground. As the runoff moves, it picks up and carries away natural and human-made pollutants and deposits them into lakes, rivers, wetlands, ground water, and other inland and coastal waters.

Adverse effects of point sources of pollution (e.g., those subject to National Pollutant Discharge Elimination System [NPDES] or Waste Discharge Permits [WDRs]) and NPSs of pollution on coastal areas include closures of beaches and shellfish harvest areas due to contamination (see Table 1). In 1998, causes of California beach closings or advisories included: (1) elevated bacteria levels—1,395 events; (2) sewage spills—1,607 events; and (3) rain related events—2,222 events (rain events include combined sewer overflows, storm water runoff, storm drains, and floods) (Natural Resources Defense Council [NRDC], 1999). Data from the *National Shellfish Register* reveal that in 1995, the most recent year that data are available, shellfish harvesting was prohibited at 9,000 out of 24,000 acres (38 percent) of harvesting areas in California due to water quality concerns (National Oceanic and Atmospheric Administration [NOAA], 1997). Table 2 contains 1995 pollution source data for harvesting waters in the State of California and in the Nation.

TABLE 1. CALIFORNIA BEACH CLOSING AND ADVISORY (C/A) COMPARISONS: 1991-1998 (NRDC, 1999)

Year	Beach days affected by C/A lasting less than 6 weeks	Number of Extended C/A (lasting 6-12 weeks)	Number of Permanent C/A (lasting more than 12 weeks)
1998	at least 3,273	30	12
1997	at least 1,141	1	37
1996	at least 1,061	7	9
1995	at least 1,305	3	11
1994	at least 910	2	6
1993	at least 1,397	2	2
1992	at least 609	2	1
1991	at least 745	1	5

TABLE 2. PRINCIPAL OR CONTRIBUTING FACTORS IN HARVEST-LIMITED SHELLFISH GROWING AREAS NATIONALLY, 1995 (NOAA, 1997)

Type	% (total is > 100% as areas can be affected by a combination of sources)
Urban runoff	40
Unidentified sources upstream of coastal watersheds	39
Wildlife	38
Individual waste water treatment systems (e.g., septic tanks)	32
Waste water treatment plants	24
Agricultural runoff	17
Marinas	17
Boating	13
Industrial facilities	9
Combined sewer overflows	7
Direct discharges	4
Feedlots	3

The major sources of NPS pollution in California are related to land use activities that occur throughout watersheds and include: (1) agriculture, (2) forestry (silviculture), (3) urban runoff, (e.g., from construction sites, roads and highways, septic systems), (4) marinas and boats, (5) hydromodification activities, and (6) resource extraction (e.g., mining) (see Table 3). Atmospheric deposition is also a source of NPS pollution. Examples of pollutants associated with specific land use activities include:

- Excess pesticides and fertilizers from agricultural lands, urban lawns, and parks;
- Oil, grease, heavy metals, and chemicals from urban streets, parking lots, and industrial sites;
- Sediment from improperly managed construction sites, crop and forest lands, abandoned roads, and eroding streambanks;
- Bacteria and nutrients from livestock, pet wastes, and faulty septic systems; and
- Other pollutants (e.g., salt from irrigation practices, acid from abandoned mines).

Agency Roles in Program Development and Implementation

The NPS Program's roots were established in 1988 when the SWRCB adopted and the U.S. Environmental Protection Agency (USEPA) approved the original plan, the NPS Management Plan, November 1988 (1988 Plan) (SWRCB, 1988), in response to CWA section 319. CWA section 319 required states to develop assessment reports that described the state's NPS problems and to establish an NPS management program to control or prevent the problems. The 1988 Plan identified projected and proposed activities to initiate the NPS Program and both to measurably improve water quality and the implementation of best MPs.

After passage of CWA section 319, Congress determined that additional efforts were needed to protect coastal waters from NPS pollution and subsequently enacted the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA). In passing CZARA, Congress noted the link between coastal water quality and land use activities and directed states to improve state and local efforts to manage land use activities that degrade coastal waters and coastal habitats (USEPA and NOAA, 1993). CZARA section 6217 requires coastal states to: (1) identify land uses which individually or cumulatively may cause or contribute significantly to a degradation of coastal waters; (2) identify "Critical Coastal Areas" and identify and implement additional measures where necessary to achieve and maintain water quality in such areas; (3) identify and adopt MMs to prevent and control NPS pollution; (4) provide technical assistance to local governments and the public to implement the MMs; (5) provide opportunities for public participation in Coastal Nonpoint Source Pollution Control Program (CNPCP) development and implementation; (6) enhance cooperation between the states' land and water use agencies; and (7) identify a program area sufficient to control NPS pollution affecting coastal waters. In addition, CZARA amended section 306 of the Coastal Zone Management Act (CZMA) requiring that " … the management program contains enforceable policies and mechanisms to implement the applicable requirements of the Coastal Nonpoint Pollution Control Program of the State required by section 6217 …." (CZMA section 306[d][16]).

TABLE 3. EXTENT OF CALIFORNIA WATER BODIES AFFECTED BY VARIOUS LAND PRACTICES

	Surface water (SW) bodies (acres)								
	bays/ harbors	estuaries	lakes/ reservoirs	saline lakes	wetlands fresh	wetlands tidal	Total SW bodies	rivers/ streams (miles)	ground water (square miles)*

Septage Disposal	(nd)	(nd)	(nd)	(nd)	(nd)	(nd)	(nd)	(nd)	15,436

Source: *1998 California CWA Section 305(b) Report on Water Quality. Extent of SW bodies that are partially or not supporting beneficial uses* (figures rounded to nearest thousand, where appropriate). (nd) = no data or unknown.

*The *1998 CWA Section 305(b) Report* states that 22,053 of 63,581 square miles of ground water (35 percent) are impaired (note: a ground water basin may be polluted by more than one source).

In February 1994, the SWRCB initiated a comprehensive review of the NPS Program using technical advisory committees (TACs) for ten NPS categories. Over 150 people participated in the TACs as public and private representatives for irrigated agriculture, nutrient application, pesticide application, confined animal facilities, grazing, urban runoff, on-site sewage disposal systems (OSDSs), boating and marinas, hydromodification and wetlands, and abandoned mines. The TACs presented their recommendations to the SWRCB in 1995. Common themes expressed in the TAC Reports include the following:

- Self-determined cooperation is preferred over prescriptive measures;
- Public education should be enhanced so that individuals can take responsibility for preventing and controlling NPS pollution;
- NPS pollution should be managed on a watershed scale where local stewardship and problem-responsive measures can be devised through comprehensive watershed protection plans;
- The State should provide for comprehensive and directed technical assistance to local groups and individuals; and
- Activities of resource management agencies should be better coordinated.

In September 1995, the SWRCB and CCC submitted California's initial response to CZARA to USEPA and NOAA—the lead federal agencies that administer the CWA and CZMA, respectively. California's submittal package included two documents: *California's Coastal Nonpoint Pollution Control Submittal* (SWRCB and CCC, 1995) and *Initiatives in Nonpoint Source Management* (Initiatives Document) (SWRCB, 1995).[2] In July 1998, USEPA and NOAA issued their Final Findings and Conditional Approval for California's submittal.

The SWRCB, RWQCBs, and CCC are committed to enhancing the NPS Program to further protect water quality and to address the federal findings and conditions. The revised NPS Program incorporates MMs into the Program Plan to help coordinate agency and individual actions. Volume II of the Program Plan—*California Management Measures for Polluted Runoff* (CAMMPR)—identifies 61 MMs with related State authorities for NPS pollution prevention and control in California (Table 4).[3] Staffs from the SWRCB, CCC, USEPA, and other agencies held initial meetings to review and refine CAMMPR and to identify actions to implement MMs over the next five to 15 years. Staff workshops to solicit public input were also held in Southern and Northern California in December 1998 and July 1999.

The SWRCB and CCC, in coordination with the nine RWQCBs, are the lead State agencies in California for the development and implementation of the Program Plan.

---

2 *California's Coastal Nonpoint Pollution Control Submittal* (SWRCB and CCC, 1995) details California's existing programs related to the management of NPS pollution. The *Initiatives in Nonpoint Source Management* (SWRCB, 1995), which is based on the TACs' recommendations, recognizes the need to continue and build upon the collaborative work initiated by the TACs.

3 These MMs are based on the *Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters* (g-Guidance) (USEPA, 1993).

B. Restoration of Wetlands and Riparian Areas
C. Vegetated Treatment Systems
D. Education/Outreach

The roles of the SWRCB and CCC are outlined in the Memorandum of Understanding (MOU) between those two agencies. The role of all of the State and federal partners is to:

- Implement the 61 MMs by 2013. Activities to support implementation will be included by the RWQCBs in the WMI chapters and by the State agencies in their five year implementation plans. Implementation of the MMs will also be incorporated into the NPS updates of the basin plans and other enforceable policy tools.
- Track implementation and effectiveness by MM and source category and provide this information to the SWRCB as part of the monitoring and assessment strategy.
- Actively participate in biennial and five-year program reviews, as well as new goal-setting activities, including the development of five-year implementation plans.
- Coordinate with the SWRCB in developing guidance as required by section 13369 of the California Water Code (CWC) to be used by the SWRCB and the RWQCBs to enforce the Program Plan.
- Coordinate NPS-related planning, assessment, and regulatory activities.
- Support statewide initiatives to implement the MMs.

California must enhance the NPS Program to remain eligible for funding for water quality and coastal protection by USEPA and NOAA. Implementation of the NPS Program is primarily supported by grants from USEPA under CWA section 319(h), approximately $10.6 million in Federal Fiscal Year (FFY) 1999. To continue to receive this level of funding--an increase of about $5.3 million from FFY 1998--the State must continue to protect and restore water quality and develop an effective NPS Program that complies with both the CWA and CZMA. Implementation of the Program Plan will occur through 2013 (within 15 years of the July 1998 federal conditional approval by USEPA and NOAA pursuant to CZARA).

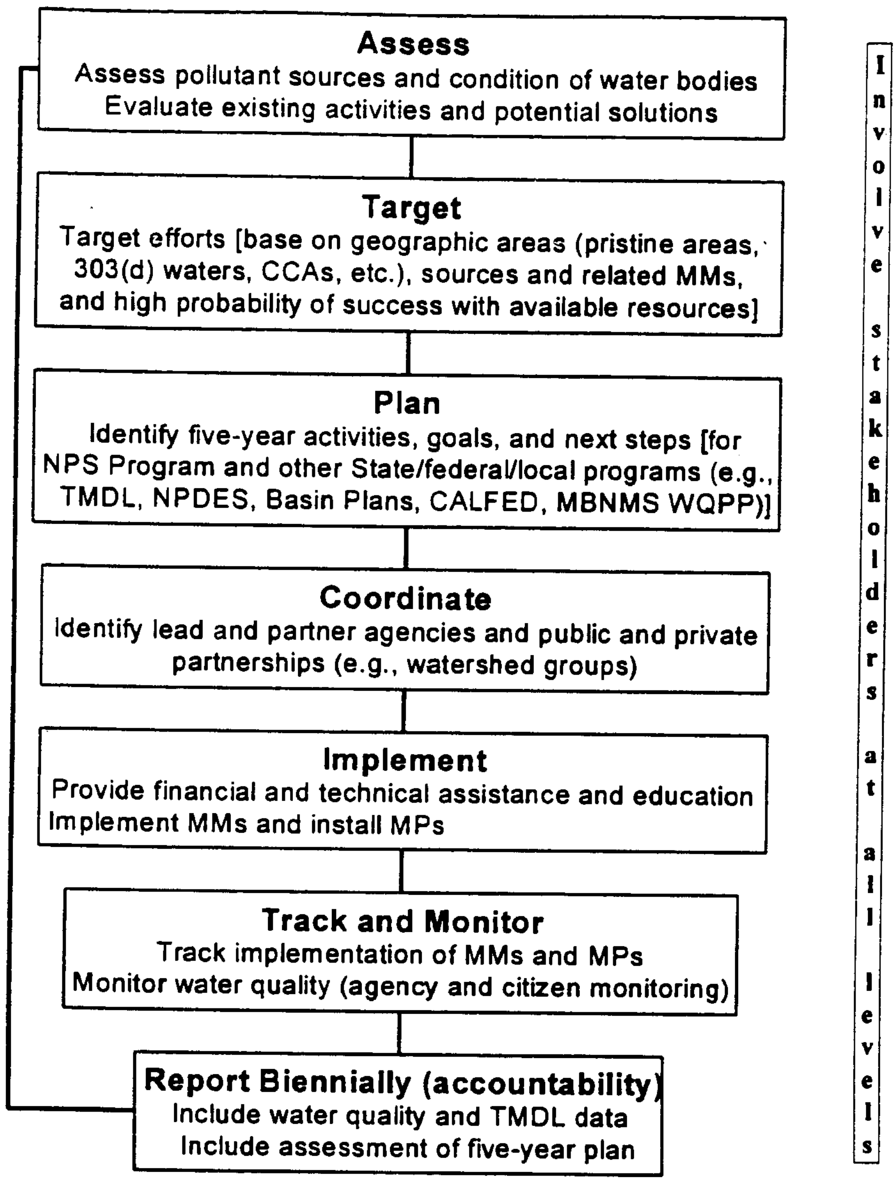
C. Program Infrastructure

Program infrastructure refers to the structure of the program, its components, and how they interact in a systematic process to achieve the program's goals. The Program Plan has three major components: (1) an overall long-term Fifteen-Year Program Strategy (Strategy); (2) three five-year implementation plans nested within the Strategy; and (3) 61 MMs. Running through and connecting these major components is a sequential iterative process that begins with assessing the program, identifying pollutant sources, and determining condition of water bodies and ends with reporting program results. It begins again with assessment activities (see Figure 1). The Program Plan infrastructure is designed to produce a dynamic program that is responsive to changing conditions during its fifteen-year life.

Program Process

For the Program Plan to produce a living, responsive program that is useful throughout its fifteen-year duration, previous experience (e.g., in implementing MMs) must be integrated into present and future planning and implementation efforts. Figure 1 depicts the Program Plan's iterative model. At any time during the fifteen-year life of the

FIGURE 1. NPS PROGRAM PROCESS



Acronyms used above: CCA - Critical Coastal Areas; MMs - Management Measures; MPs-Management Plans; TMDL-Total Maximum Daily Load; NPDES - National Pollution Discharge Elimination System; MBNMS WQPP- Monterey Bay National Marine Sanctuary Water Quality Protection Program

Program Plan, agencies and other stakeholders should be able to: (1) assess the present Program's activities; (2) target efforts; (3) plan future actions based on past and present goals and objectives; (4) coordinate federal, State, and local agencies' and stakeholders' efforts; (5) implement collaborated actions; (6) obtain data on water quality and implementation effectiveness from tracking and assessment documentation, Total Maximum Daily Loads (TMDLs), and other agency and citizen monitoring programs; and (7) return to Step 1 to reassess the NPS Program's progress and effectiveness.

Fifteen-Year Program Strategy

The Strategy, described later in this document, outlines how California will seek to achieve the vision and goals of the NPS Program. Specifically, the State will use the "Three-Tiered Approach" of broad-based local stewardship backed up by regulatory authority under the Porter-Cologne Water Quality Control Act (Porter-Cologne Act) with other local, State, and federal authorities serving as additional enforceable and/or back-up authorities. Recommendations from the TACs and from additional agency and stakeholder meetings convened by the SWRCB and CCC in 1998 and 1999 are a central part of the NPS Program.

The Strategy includes elements prescribed in federal guidance (NOAA and USEPA, 1993 and USEPA, 1996), including:

- A process to implement MMs to help coordinate agency and individual actions rather than focus on individual practices or separate programs;
- Actions related to administrative coordination, technical and financial assistance, public participation, critical coastal areas (CCAs), additional MMs as goals, and monitoring;
- A strategy for and evaluation of back-up authorities;
- A process to track implementing actions to assess Program progress and effectiveness; and
- The "nine key elements" of a dynamic and effective NPS management program. (See Appendix A.)

Five-Year Implementation Plans

Nested within the Strategy are three five-year implementation plans that describe the who, what, where, when and how of Program implementation. In each five-year implementation plan, California will target implementation actions where the NPS Program can make a difference in correcting current and potential problems.

Targeting involves a balance between the need to implement NPS controls broadly and the need to address priority water quality problems in specific watersheds. Targeting also allows the State to use limited resources efficiently and to ensure that actions are tailored to match the diversity of California's climate and land use activities. With climate ranging from rain forest in the north to desert in the south, different approaches are needed to manage NPS pollution in the State. In establishing targets, the State will address both pollution prevention and water quality improvement goals, including the protection of exceptional inland and coastal areas that are threatened by reasonably predictable increases in pollution loadings from new or expanding NPSs.

Each implementation plan will identify a set of MMs on which to target NPS Program efforts during the five-year time period. The implementation plans will also identify a series of actions related to (1) assessing water quality conditions and/or institutional efforts; (2) targeting implementation based on geographic regions or other criteria; (3) performing planning activities; (4) coordinating public and private efforts; (5) implementing the targeted MMs; and (6) obtaining data on water quality and implementation effectiveness. The Plans will also identify agencies responsible for MM implementation and will include actions, performance measures, and milestones.

Phased Approach to Managing Nonpoint Source Pollution

The State is committed to implementing the 61 NPS MMs by 2013, consistent with Federal Administrative Guidance (USEPA and NOAA, 1998) and the Three-Tiered Approach adopted in the 1988 Plan. The implementing agencies will increase the use of regulatory authorities as necessary to ensure implementation is achieved. In accordance with CWC section 13369, the SWRCB will develop on or before February 1, 2001 guidance to be used by the SWRCB and RWQCBs in establishing the process by which the SWRCB and RWQCBs will enforce their authorities as outlined in this Program Plan.

Initially the State is adopting the 61 MMs contained in CAMMPR as goals. MM implementation will be achieved through a set of activities outlined in each five-year implementation plan and will rely on existing local, State, and federal authorities and private efforts. At the end of each five-year implementation cycle, the State will evaluate and report on the effectiveness of the Program Plan to achieve the stated goals. Success will be determined by (1) the degree to which the performance measures have been met; (2) geographic extent of MM implementation; (3) selected evaluation of MPs used to implement MMs; and (4) analysis of available water quality information in those areas where implementation has occurred. Based on this evaluation, the SWRCB and CCC, in coordination with the RWQCBs and other appropriate agencies, will make public their findings and recommendations for the next five-year cycle. Depending on the degree of success, the State may choose to maintain the in-place efforts, modify, or add MMs and/or actions for each target MM. In cases where adequate progress is clearly not being made, the State will consider rulemaking to ensure successful implementation of specific MMs. Implementation of MMs in additional watersheds and water bodies will also take place as new geographic areas with NPS pollution are identified and targeted.

D. Legal Framework

Introduction

This section describes California's legal framework for implementing the NPS Program. The framework is based on two primary federal laws—the CWA and CZMA—and State and local law. In California, the Porter-Cologne Act is the principal State law governing water quality in California, and it provides the primary back-up authority to implement the NPS MMs. However, other State and local authorities are also critical components of the legal framework that address NPS pollution in California. In addition to the Porter-Cologne Act, this section describes the California Coastal Act (Coastal Act), the California Environmental Quality Act (CEQA), and the California Planning, Zoning and Development Law. Additional details on these and other authorities that are part of this framework are identified in Volume II: CAMMPR. Details on the SWRCB's and CCC's statutory authority for addressing NPSs are included in Appendix B—Legal Opinions.

Federal Laws

The Federal Water Pollution Control Act Amendments of 1972 and 1987, known as the CWA (33 United States Code [USC] §§1251 et seq.), are the principal federal statutes for water quality protection. In California, the SWRCB and nine RWQCBs administer many of the CWA's provisions. The CWA requires the State to adopt water quality standards and to submit those standards for approval by the USEPA. For point source discharges to surface water, the CWA authorizes USEPA or approved states to administer the NPDES Program. CWA section 303(d) requires states to list surface waters not attaining (or not expected to attain) water quality standards after the application of technology-based effluent limits, and states must perform a TMDL for all waters on the CWA section 303(d) list. The CWA also establishes a loan program—the State Revolving (SRF)—for the construction of water quality projects, including NPS projects.

In the 1987 CWA Amendments, Congress added CWA section 319 (33 USC §1329) which required states (1) to develop Assessment Reports that described the states' NPS problems, (2) to establish Management Programs to address these problems, and (3) to provide funding to support implementation of the Programs. California's *Nonpoint Source Management Plan* (SWRCB, 1988) outlined a general approach to address persistent NPS problems using education and outreach, financial and technical assistance, and regulatory authorities when necessary. To enhance activities to address NPS water pollution, states are currently encouraged to upgrade their NPS programs. In 1996, USEPA issued CWA section 319 program guidance that identified "nine key elements" that must be addressed to receive USEPA approval for upgraded NPS Plans (See Appendix A). Pursuant to the 1998 Clean Water Action Plan (CWAP), states with upgraded NPS Programs will receive increased funding based on a federal appropriation for State NPS Programs above $100 million. For California to receive additional funding in FFY 2000 and beyond, USEPA must certify that California's NPS Program has been upgraded consistent with the "nine key elements."

The CZMA of 1972 (16 USC §§1451 et seq.) established a national framework for effective management, protection, development, and beneficial use of the coastal zone. Pursuant to the CZMA, California prepared the California Coastal Management Program (CCMP) which was approved by NOAA. The bulk of California's coast is within the jurisdiction of the CCC pursuant to the Coastal Act of 1976 (Public Resources Code [PRC] §§30000 et seq.), while the San Francisco Bay Conservation and Development Commission (SFBCDC) has jurisdiction in San Francisco Bay (SFB) pursuant to the McAteer-Petris Act (MPA) (Government Code §§66600 et seq.). The State Coastal Conservancy (SCC) is a third partner agency in the CCMP.

Recognizing that the CZMA did not specifically mention water quality, in 1990 Congress amended CZMA section 306(d)(16)(16 USC §1455[d][16]) and added section 6217 (16 USC §1455b) to focus on NPS pollution problems and the protection of coastal waters. CZARA section 6217 requires state coastal zone management (CZM) agencies, in coordination with state water quality agencies, to develop and implement MMs to restore and protect coastal waters from adverse impacts of NPS pollution. Similarly, CZMA section 306(d)(16)(16 USC §1455[d][16]) requires that state CZM programs contain enforceable policies and mechanisms to implement applicable requirements of CZARA section 6217. To achieve these goals, states were directed to coordinate and integrate their existing CZM and water quality plans and programs, including the states' NPS management plans.

Porter-Cologne Water Quality Control Act (Porter-Cologne Act)

The Porter-Cologne Act is the principal law governing water quality regulation in California. It establishes a comprehensive program to protect water quality and the beneficial uses of water. The Porter-Cologne Act applies to surface waters, wetlands, and ground water and to both point and NPSs of pollution. Pursuant to the Porter-Cologne Act (CWC section 13000), it is the policy of the State:

- That the quality of all the waters of the State shall be protected,
- That all activities and factors affecting the quality of water shall be regulated to attain the highest water quality within reason, and
- That the State must be prepared to exercise its full power and jurisdiction to protect the quality of water in the State from degradation.

The Porter-Cologne Act established nine RWQCBs and the SWRCB which are charged with implementing its provisions and which have primary responsibility for protecting water quality in California. The SWRCB provides program guidance and oversight, allocates funds, and reviews RWQCB decisions. In addition, the SWRCB allocates rights to the use of surface water. The RWQCBs have responsibility for individual permitting, inspection, and enforcement actions within each of nine hydrologic regions. The SWRCB and RWQCBs have numerous NPS-related activities, including problem monitoring and assessment, planning, financial assistance, and regulatory and non-regulatory management.

The RWQCBs regulate discharges under the Porter-Cologne Act primarily through issuance of NPDES and WDR permits. Anyone discharging or proposing to discharge materials that could affect water quality (other than to a community sanitary sewer system regulated by an NPDES permit) must file a report of waste discharge. The SWRCB and the RWQCBs can make their own investigations or may require dischargers to carry out water quality investigations and report on water quality issues. The Porter-Cologne Act provides several options for enforcing WDRs and other orders, including cease and desist orders, cleanup and abatement orders, administrative civil liability orders, civil court actions, and criminal prosecutions.

The Porter-Cologne Act also implements many provisions of the federal CWA, such as the NPDES permitting program. Section 401 of the CWA gives the SWRCB the authority to review any proposed federally permitted or federally licensed activity which may impact water quality and to certify, condition, or deny the activity if it does not comply with State water quality standards. If the SWRCB imposes a condition on its certification, those conditions must be included in the federal permit or license.

Except for dredge and fill activities, injection wells, and solid waste disposal sites, WDRs may not "specify the design, location, type of construction or particular manner in which compliance may be had" (Porter-Cologne Act section 13360). Thus, WDRs ordinarily specify the allowable discharge concentration or load or the resulting condition of the receiving water, rather than the manner by which those results are to be achieved. However, RWQCBs may impose discharge prohibitions and other limitations on the volume, characteristics, area, or timing of discharges and can set discharge limitations such that the only practical way to comply is to use MPs. RWQCBs can also waive WDRs for a specific discharge or category of discharges on the condition that MMs identified in an SWRCB or RWQCB approved water quality management plan are followed.

The Porter-Cologne Act also requires adoption of water quality control plans (WQCPs) which contain the guiding policies of water pollution management in California. There are a number of statewide WQCPs adopted by the SWRCB. In addition, regional WQCPs, commonly referred to as basin plans, have been adopted by each of the RWQCBs. All basin plans identify the existing and potential beneficial uses of waters of the State and establish water quality objectives to protect these uses. The basin plans also contain implementation, surveillance, and monitoring plans. WQCPs include enforceable prohibitions against certain types of discharges, including those that may pertain to NPSs. Basin plans have been adopted for each of the nine RWQCBs as delineated in Table 5.

Table 5. RWQCB Numerical Designations

1	North Coast
2	San Francisco Bay
3	Central Coast
4	Los Angeles
5	Central Valley
6	Lahontan
7	Colorado River Basin
8	Santa Ana
9	San Diego

Portions of WQCPs are also subject to review by USEPA. When approved by USEPA, the water quality objectives and beneficial use designations become water quality standards under the CWA. In most cases, water quality objectives contained in a WQCP are not directly enforceable unless implemented through WDRs or water right permits.

California Coastal Act

The State Legislature enacted the California Coastal Act (PRC §30000 et seq.) (Coastal Act) to provide for the conservation and planned development of the State's coastline. The Coastal Act mandates the protection and restoration of coastal waters pursuant to several sections in the PRC. Mandated activities include:

- To carry out a public education program to promote coastal conservation.
- To maintain, enhance, and, where feasible, restore marine resources.
- To maintain and, where feasible, restore biological productivity and the quality of coastal waters, streams, wetlands, estuaries, and lakes through, among other means, minimizing adverse effects of wastewater discharges and entrainment, controlling runoff, preventing depletion of ground water supplies and substantial interference with surface water flow, encouraging wastewater reclamation, maintaining natural vegetation buffer areas that protect riparian habitats, and minimizing alteration of natural streams.
- To protect against spillage of crude oil, gas, petroleum products, or hazardous wastes.
- To limit the alteration of wetlands, coastal waters, and estuaries and provide for feasible mitigation measures to minimize adverse environmental effects.
- To phase out or upgrade, where feasible, existing marine structures causing water stagnation contributing to pollution problems and fish kills.
- To limit hydromodification of rivers and streams. Channelization, dams, and other substantial alterations of rivers and streams shall incorporate best mitigation measures feasible.
- To protect environmentally sensitive habitat areas (ESHAs). Site and design new development in areas adjacent to ESHAs to prevent significant adverse impacts.
- To protect long-term productivity of soils and timberlands.
- To site and design new development so as to not have significant adverse impacts either individually or cumulatively on coastal resources.
- To minimize alteration of natural landforms.
- To assure that new development is stable, has structural integrity, and does not contribute significantly to erosion.
- To control impacts of dredging in specified port areas.
- To minimize harmful effects to coastal waters, including water quality, from fill within ports.
- To locate, design, and construct port-related development to minimize substantial environmental impacts and protect beneficial uses.

In carrying out the mandates of the Coastal Act, the CCC certifies local coastal programs (LCPs) prepared by local governments (§30500). The CCC also certifies plans prepared by port districts (§30711 et seq.), colleges and universities (§30605), and proponents of public works projects (§30605). In addition, the CCC approves coastal development permits (CDPs), energy projects, and federal (federally approved, conducted, or funded) projects consistent with the Coastal Act policies. The Coastal Act also contains several means to deter and discipline violators of its provisions. In order to prevent imminent or further damage of coastal resources, the Executive Director of the SWRCB or the CCC can issue a cease and desist order to any party that is undertaking a development without a permit or in a manner inconsistent with the terms of a previously issued permit (§§ 30809 and 30810). The CCC can also order the restoration of a site (§ 30811). Civil liability fines for violations of the Coastal Act are specified in sections 30820, 30821.6, and 30822. In practice, the CCC protects water quality primarily through: (1) managing coastal development that generates runoff or creates spills; (2) assisting local coastal governments and other agencies to address land-use and development activities that may produce NPS pollution; and (3) implementing educational and technical assistance programs.

California Environmental Quality Act (CEQA)

California is one of 20 states with an environmental impact assessment law modeled after the National Environmental Policy Act (NEPA). The SWRCB, RWQCBs, and all State and local government agencies must comply with CEQA. CEQA applies to discretionary activities proposed to be carried out by government agencies, including approval of permits and other entitlements. CEQA has six objectives: (1) to disclose to decision-makers and the public the significant environmental effects of proposed activities; (2) to identify ways to avoid or reduce environmental damage; (3) to prevent environmental damage by requiring implementation of feasible alternatives or mitigation measures; (4) to disclose to the public reasons for agency approvals of projects with significant environmental effects; (5) to foster interagency coordination; and 6) to enhance public participation.

CEQA sets forth procedural requirements to ensure that the objectives are accomplished and also contains substantive provisions requiring agencies to avoid or mitigate, when feasible, impacts disclosed in an Environmental Impact Report (EIR). In addition, CEQA sets forth a series of sweeping policy statements encouraging environmental protection. These policies have led the courts to interpret CEQA "so as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language." (*Friends of Mammoth v. Board of Supervisors [1972] 8 Cal 3d 247, 259, 104 Cal. Rptr. 761.*)

Planning, Zoning, and Development Laws

The legal framework within which California cities and counties exercise local planning and land use functions that can play a critical role in addressing NPS pollution is provided in the California Planning and Zoning Law (Government Code §§65000 et seq.) and the Subdivision Map Act (SbMA) (Government Code §§66410 et seq.), as well as in the Coastal Act.

Under State planning law, each city or county must adopt a comprehensive, long-term general plan for the physical development of the city or county and any land outside its jurisdiction which bears relation to its planning. Pursuant to Government Code section 65302, general plans must contain seven elements: (1) land use, (2) circulation,

(3) housing, (4) conservation, (5) open space, (6) noise, and (7) safety. The following elements are the most relevant to NPS pollution prevention and control:

- Land Use. Designates categories such as housing, industry, and natural resources, including density and intensity of use.
- Conservation. Applies to conservation, development, and use of natural resources (e.g., soils, forests, rivers and other water bodies, and harbors). May also cover watershed protection, land or water reclamation, prevention or control of the pollution of streams and other coastal waters, regulation of land uses along stream channels and in other areas required to implement the conservation plan (e.g., buffer areas), to control or correct soil erosion, and for flood control.
- Open Space. Applies to preservation of natural resources, including fish and wildlife habitat, rivers, streams, bays and estuaries, and open space.
- Circulation. Plans infrastructure, including water, sewage, and storm drainage.

While the general plan is a long-range look at the future of a community, a zoning ordinance spells out the immediate allowable uses for each property in the community. Each property in the community is assigned a "zone" listing the kinds of uses that will be allowed on that land (e.g., single family residential, multi-family residential, neighborhood commercial, light industrial, agricultural, etc.) and setting development standards (e.g., minimum lot size, maximum building height, minimum front-yard depth). The distribution of residential, commercial, industrial, and other zones is based on the pattern of land uses established in the community's general plan. Zoning is adopted by ordinance and carries the weight of local law. All local governments use some form of a permitting process whereby a permit is issued for a specific project and can be conditioned based on conformance with the zoning ordinance.

Subdivision regulation, like zoning, is an exercise of police power and is a principal instrument for implementing a general plan. The SbMA (Government Code §§66410 et seq.) sets forth other mandates that must be followed for subdivision processing.

The local government's corporate and police powers and zoning and subdivision ordinances are tools commonly used to implement general plans. Preferential assessment of real property can also offer landowners an economic incentive for keeping their land in agricultural, timber, or open space uses. This can serve to implement the land use, open space, and conservation elements of a general plan by reserving areas designated for agriculture, timber, open space, scenic resources, and natural resource use.

The Coastal Act also requires cities and counties that are located wholly or partially in the coastal zone to have an "eighth element" (the LCP) for that portion of the local government's jurisdiction in the coastal zone. When an LCP is certified by the CCC as being consistent with the goals and policies of the Coastal Act, coastal permit authority for that area is delegated to the local government. However, development in State tidelands, submerged lands, and public trust lands continues to require a permit from the CCC, and certain types of local government decisions on coastal permits made under certified LCPs may be appealed to the CCC.

SWRCB Antidegradation Policy

A key policy of California's water quality program is the State's Antidegradation Policy. This policy, formally known as the *Statement of Policy with Respect to Maintaining High Quality Waters in California* (SWRCB Resolution No. 68-16), restricts degradation of surface and ground waters. In particular, this policy protects water bodies where existing quality is higher than necessary for the protection of beneficial uses.

Under the Antidegradation Policy, any actions that can adversely affect water quality in all surface and ground waters must: (1) be consistent with maximum benefit to the people of the State; (2) not unreasonably affect present and anticipated beneficial use of the water; and (3) not result in water quality less than that prescribed in water quality plans and policies. Furthermore, any actions that can adversely affect surface waters are also subject to the Federal Antidegradation Policy (40 Code of Federal Regulations [CFR], § 131.12) developed under the CWA.

E. Stakeholder Roles in Program Development and Implementation

NPS pollution control is the shared responsibility of both public and private interests. Ultimately all of us—agencies, landowners and land operators, and the general public—contribute to and must help to control NPS pollution.

The CWA and CZARA are the legal foundation for California's current strategy to prevent and control NPS pollution. Therefore, the SWRCB, RWQCBs, and the CCC are the lead agencies for developing the program and coordinating its implementation.

However, the management of land and water uses in California is conducted by numerous local, State, and federal agencies with independent or, in some cases, overlapping authorities and programs. These agencies may be broadly categorized as management agencies, regulatory agencies, land use agencies, or assistance agencies (Table 6). Some agencies' authorities and programs are limited to specific NPS categories (e.g., Department of Boating and Waterways [DBW], Board of Forestry [BOF]); other agencies have broad authority to protect resources (Table 7).

F. Scope and Schedule

California intends to implement a comprehensive statewide program under the CWA and CZMA rather than develop a separate new program for the coastal zone. This will allow the State (1) to protect water quality through a single upgraded NPS program, (2) to use resources more effectively, (3) to eliminate the potential for regulatory inequities that might occur if special zones are created, and (4) to enhance agency coordination. The Strategy is based on implementation of MMs through regulatory and non-regulatory activities including education and outreach, public participation, and technical and financial assistance and the use and coordination of enforceable authorities and programs where self-determined efforts are insufficient to restore and protect State waters.

TABLE 6. CATEGORIES OF IMPLEMENTING AGENCIES

Federal and State Land Management and Regulatory Agencies	This category comprises federal and State agencies that have the authority to implement MPs statewide. Such authority derives either from the agency's management responsibility for publicly owned or controlled land or its regulatory authority. For example, large portions of the State are managed by federal regulators or land and water managers (e.g., USEPA, NOAA, BLM, National Park Service, U.S. Army Corps of Engineers [USACOE], U.S. Fish and Wildlife Service [USFWS], U.S. Forest Service [USFS], and Federal Energy Regulatory Commission[FERC]). When such agencies have the capability to act effectively in their areas of jurisdiction as a lead NPS management agency, the SWRCB may seek formal agreements—e.g., Management Agency Agreements, Memoranda of Agreement (MAA), or MOU—that contain NPS controls.
Federal and State Assistance Agencies	This category comprises agencies that can provide technical or financial assistance to support implementation of MPs. These agencies include the Natural Resources Conservation Service (NRCS), SCC, and University of California Cooperative Extension (UCCE). They assist landowners and land managers to voluntarily implement MPs and help identify appropriate MPs for RWQCB or management agency enforcement. For example, SCC programs are directed at preserving coastal agriculture, resolving coastal land use issues, restoring and enhancing natural resources, developing urban water fronts, acquiring significant coastal sites, providing public access to and along the shoreline, and assisting local governments and nonprofit organizations. One action of the Program is for the SWRCB to seek agreement with these agencies so that they could target technical and financial resources to high priority NPS problems. Currently, the CCC works with the SCC to ensure that the watershed protection work reflects priorities of the Program Plan.
Local Land Use Agencies	This category comprises agencies (e.g., counties, cities, and some special districts) that have the authority to enforce implementation of MPs locally. Local government is the principal land use planning authority in the State. County and city government and special districts often institute the first tier of management requirements for a specific parcel of land. When such agencies have the capability of acting effectively in their jurisdictional areas as lead NPS management agencies, RWQCBs may seek formal agreements that provide for NPS control.
Local Assistance Agencies	This category comprises local agencies and special districts that provide technical or financial assistance to support implementation of MPs. These agencies assist landowners and land managers to voluntarily implement MPs and to help identify appropriate MPs for RWQCB or management agency enforcement. One action of the Program is for the RWQCBs to seek agreements with these agencies so that they can target technical and financial resources to high priority NPS problems.

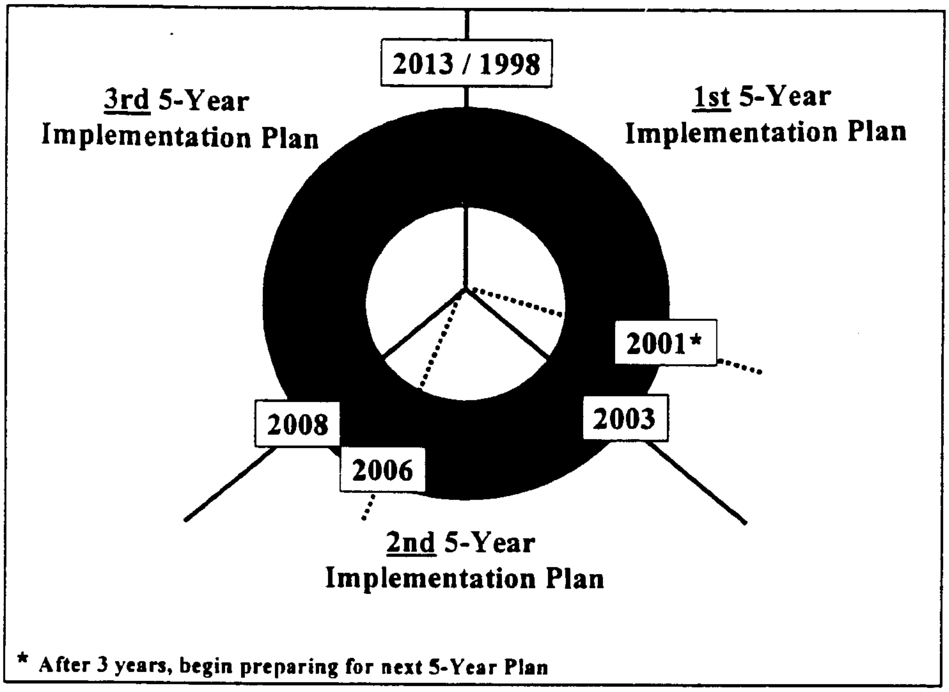
The assessment of implementation efforts conducted pursuant to each five-year implementation plan will occur on a regular basis in three distinct stages, with the SWRCB and CCC reporting on these efforts every two years (biennially). This process is detailed below and shown in Figure 2.

FIGURE 2. CALIFORNIA NPS POLLUTION CONTROL PROGRAM: A FIFTEEN-YEAR STRATEGY WITH THREE FIVE-YEAR IMPLEMENTATION PLANS



First Five-Year Implementation Plan (1998 - 2003) (Implementation Plan)

This document contains the first implementation plan which identifies an initial set of targeted MMs and describes NPS Program activities through June 2003 (five years after the July 1998 USEPA and NOAA Conditional Approval of the State's submittal pursuant to CZARA). In this Implementation Plan, the SWRCB and CCC have developed a plan to implement the MMs and achieve Program goals. In 2001, the SWRCB, RWQCBs, and CCC, in coordination with other agencies and the public, will begin reviewing implementation actions to assess the State's progress and effectiveness. At this time, the State will also start developing the next five-year implementation plan. Achieving designated milestones and meeting identified objectives will serve as a basis for evaluating progress. In 2003, California will report on the State's progress in meeting its milestones and objectives for the first five-year period.

Second Five-Year Implementation Plan (2003 – 2008)

Implementation of the second five-year implementation plan will occur from July 2003 through June 2008. The second five-year implementation plan will: (1) provide for the continued implementation of the initial set of actions and MMs, including increasing use

R0018627

of regulatory actions if necessary; (2) outline steps to improve and expedite program implementation determined to be appropriate in light of the review and evaluation; (3) target approximately half of the remaining NPS MMs, plus any additional MMs deemed necessary; and (4) include actions and milestones to ensure implementation of these MMs. In 2006, the State will again review and evaluate implementation to assess progress and effectiveness.

Third Five-Year Implementation Plan (2008 – 2013)

Implementation of the third five-year implementation plan is expected to begin in July 2008 and continue through June 2013. The third five-year implementation plan will: (1) provide for continued implementation of actions and NPS MMs as necessary; (2) target the remaining NPS MMs for implementation, plus any additional MMs deemed necessary; and (3) include actions and milestones to ensure implementation of these MMs.

II. FIFTEEN YEAR PROGRAM STRATEGY

A. Introduction

The Strategy describes how the vision and goals of NPS pollution prevention and control will be realized by utilizing the components of the Program process. The Program process begins with "assessing" the impact of NPS pollution on water quality. NPS issues are identified for waters across the State either individually or collectively. A thorough assessment allows the State to proceed to the second component, "targeting" appropriate human, financial, and technical resources into geographic areas and NPS MMs requiring immediate attention.

The State will fully address the NPS issues from multiple fronts. The "planning" component will take advantage of the numerous programs and tools already in place. Use of existing programs reduces duplicative efforts and benefits from the expertise already accumulated at different institutional levels. Based on previous success stories and lessons learned, the State can begin to identify and plan to use new approaches to address remaining NPS problems.

The complexity of the issues makes effective "coordination" of the various activities imperative. The State will therefore foster interagency cooperation and facilitate public participation through the establishment of formal agreements and formation of an Interagency Coordinating Committee (IACC).

Effective "implementation" of NPS MMs will rely on a "three-tiered approach," with an emphasis on self-determined cooperation of the stakeholders. Applicable regulatory programs and authorities will be invoked in the case of persistent NPS water quality problems and/or stakeholder resistance to self-determined implementation of MMs.

The final element of the Program process consists of "tracking" implementation of MMs, "monitoring" MP effectiveness, "assessing" program success, and "reporting" program progress. Again, participation of the stakeholders at this step will ensure the dissemination of lessons learned and will continue program success. These lessons learned will become the backbone of future decisions both within the Strategy and the subsequent five-year implementation plan.

These components make up an evolving and iterative process repeated in each of the three five-year implementation plan cycles. It is expected that by the end of the fifteen year duration of the Program Plan all the identified MMs for the prevention and control of NPS pollution will have been implemented in the appropriate watersheds and will have improved the quality of the State's waters.

B. Assessing the Problem

California will continue to use the State's Water Quality Assessment (WQA) as the primary tool for assessing NPS pollution statewide.[4] Pursuant to CWA section 305(b), this information is reported to USEPA every two years and is used to develop the CWA section 303(d) list of waters that do not meet water quality standards with technology-based pollution controls.[5] Assessment of waters used as drinking water will also be enhanced by the DHS's new Drinking Water Source Assessment and Protection (DWSAP) Program.[6]

These assessment systems support the NPS Program by identifying, individually and collectively, which waters are impacted by NPS pollution. This assists the NPS Program in targeting future actions and determining their effectiveness. To improve the usefulness of these assessment systems, the NPS Program will:

- Ensure that monitoring data from the Program is incorporated into the WQA,
- Support the development and improvement of a geographically-based assessment system, Geo Water Body System (GeoWBS) [7],
- Support efforts to provide consistency in listing impairments,
- Improve consistency in the definitions of specific sources of pollution,
- Promote public access to the WQA and its underlying data, and
- Seek funding to increase the quality and quantity of water quality monitoring.

These assessment systems also will be utilized to monitor and track the effectiveness of the NPS Program and are discussed in that context in subsequent sections of the Strategy (see Part II, Section G—*Track, Monitor, Assess, and Report*).

C. Targeting Efforts

Introduction

High quality water resources are of significant economic, social, and ecological value in California; however, the amount of available public funds is inadequate to address all the

[4] This compilation of water quality information, provided by the RWQCBs, synthesizes the results of monitoring programs conducted by dischargers, landowners, community members, and local, State, and federal agencies. The WQA reports on the degree to which these waters support their beneficial uses, such as municipal drinking water supply, recreational activities, or cold water fisheries.

[5] A total of 1,700 water bodies was assessed in the 1998 CWA section 305(b) Report. Of these, 509 surface waters did not meet water quality standards. The RWQCBs specified 392 water bodies (77 percent) as directly impacted by NPS pollution. The categorical sources (e.g., agriculture, urban, forestry, marinas) of the NPS pollution were identified for 173 surface water bodies. The categorical sources were not identified by the Los Angeles and San Diego RWQCBs. The identification of sources is not required by the CWA when listing waters as impaired.

[6] DHS, as required by the Safe Drinking Water Act Amendment of 1996, recently submitted to USEPA and received approval (April 1999) for the DWSAP Program. DHS will identify and assess all potential sources of contaminants, including NPS pollutants, for public drinking water systems in California. A report outlining the findings will be provided to customers of each system.

[7] The information in the WQA is stored in the SWRCB's GeoWBS database. The GeoWBS database identifies the water body size, the degree to which beneficial uses are supported, the affected beneficial uses, the pollutants, and the pollution sources.

existing water pollution sources all at once at every location in the State. The concept of targeting focuses State resources on specific actions or pollutants within limited geographic regions and improves the likelihood of achieving measurable water quality improvements. Actions that lead to water quality benefits can in turn increase public support of NPS pollution control programs and ensure that the public is more closely attuned to overall water quality goals. Such a change in attitude with a corresponding increase in pollution control knowledge and skill is a primary ingredient of lasting water resource protection.

In order to make the Strategy most effective, efforts must be targeted from both a water resources (e.g., water quality, geographic, or watershed area) and economic resources perspective. To achieve the overall objective to improve water quality, the Program Plan will target efforts towards accomplishing the following goals:

- Coordinate NPS pollution control implementation efforts to target both:
  1. MMs for agriculture, forestry, urban areas, marinas and recreational boating, and hydromodification in riparian corridors and wetlands, and
  2. Geographic regions, with a focus on the most impaired areas, areas most in need of protection, and areas where significant existing efforts or increased stakeholder participation are underway to prevent and control NPS pollution.
- Apply project resources to clearly specified, realistic goals and objectives (e.g., to efforts that will result in a high probability of success with available resources and funding).
- Protect and restore valuable resources from increased NPS pollution associated with changes in land use.

All targeting efforts will coordinate with existing State and federal programs that focus on water resources in general and NPS problems in particular. To increase stakeholder support of the prioritized efforts, public involvement needs to be directly incorporated into the targeting process. The following sources of information were used for targeting resources and priorities within the first five-year plan:

- Stakeholder interpretation of NPS priorities;
- Impaired waters as identified on the CWA section 303(d) list and TMDL priority lists; and
- Delineation of critical coastal areas and identification of additional MMs.

Stakeholder Involvement in Prioritization

In order to receive direct input from stakeholders concerning current and future efforts of the NPS Program, staffs of the SWRCB and the CCC held workshops in December 1998 and July 1999 (each series consisting of one workshop in the northern and southern parts of the State). In addition, a questionnaire was sent to over 200 stakeholders (including the RWQCBs and 17 other State agencies) requesting identification of "priority" MMs and program categories (e.g., administrative coordination, public participation, monitoring, and technical assistance) that need to be addressed during the first five-year implementation plan. The questionnaire results and comments from these opportunities for stakeholder involvement were used to target the initial activities outlined in the first five-year implementation plan.

The targeting efforts were also supplemented through the use of the reports developed by the NPS TACs (SWRCB, 1994a-i; SWRCB, 1995 a-b). The active involvement of the different representatives in the TACs ensured that priorities were given to the MMs and geographic areas with which those most intimately familiar with the NPS pollution issues, the stakeholders, expressed the most concern. For example, all the identified MMs for agriculture, the single most significant contributor of NPS pollution to the Nation's water bodies, have been targeted for implementation during the first five years. On the other hand, the recommendation for installation of pumpout facilities, during the first implementation cycle, at marinas on the Tomales Bay, an important shellfish production location, demonstrates the Program's focus on protecting areas with critical coastal-dependent industries.

Target Impaired Waters

CWA section 303(d)(1)(A) requires states to identify surface waters within their boundaries where numeric or narrative water quality objectives are not being maintained and/or beneficial uses are not fully protected after application of technology-based controls. Each state is also required to establish a priority ranking for such waters, taking into account the severity of the pollution and the beneficial uses to be made of the waters.

For those surface water bodies identified and prioritized above, section 303(d)(1)(C) requires that each state establish TMDLs for those pollutants identified under CWA section 304(a)(2) as suitable for TMDL development correlated with the achievement of water quality objectives. A TMDL is a numeric target which when achieved will result in attainment of water quality standards. The TMDL includes allocations (e.g., allowable pollutant loading) for both point and NPSs. The loadings are established with consideration given to seasonal variations of pollutant loadings and a margin of safety which takes into account any lack of knowledge concerning the relationship between effluent limitations and water quality.

The CWA section 303(d) and TMDL priority lists are developed biennially on even-numbered years. The RWQCBs first assess available data to develop the list. The assessment includes: (1) re-examining the water bodies previously listed under CWA section 303(d); (2) reviewing existing monitoring information; (3) soliciting additional information from other State and federal agencies; and (4) encouraging public participation. The CWA section 303(d) and TMDL priority lists are approved through a public noticing and hearing process at each RWQCB and the SWRCB. USEPA reviews the State's CWA section 303(d) and TMDL priority lists and either approves or disapproves them. If the lists are disapproved, USEPA proposes a modified list with a 30-day comment period. The USEPA's final list then becomes the State's list for the next two years.

The first five-year implementation plan made extensive use of the CWA section 303(d) list to prioritize its tasks. Several impaired water bodies have been targeted for TMDL development. Examples are abundant in the agriculture and forestry categories. Specifically, 33 water bodies have been targeted for nutrient (agriculture – nutrient management) TMDL development by 2003. The load allocations determined for NPSs at the end of the TMDL development process will help guide the selection of best management practices (BMPs) for implementation in the future to ensure NPS pollution prevention and control.

Critical Coastal Area Designation

Special coastal habitats (e.g., wetlands, tide pools, creeks, and lagoons) continue to be threatened from the impacts to water quality that accompany new and existing development. California recognizes that special coastal resources require special care and attention. The intent of CCA designation, therefore, is to direct needed attention to coastal areas of special biological, social, and environmental significance and to provide an impetus for these areas to receive special support and resources.

Pursuant to federal guidance (NOAA and USEPA, 1993), factors in identifying CCAs include:

- The nature and proximity of contaminant sources to the coastal area;
- Physical and biological characteristics of adjacent lands that will cause NPS problems;
- Important biological features;
- Characteristics of land use changes; and
- Extent to which the above effects can be prevented or reduced by implementation of additional MMs.

Federal guidance provides the states with flexibility in their approach to identifying CCAs.[8] California will use a combination of approaches in delineating CCAs. First, the State will designate special sections within the California coastal zone as CCAs. These include ESHAs currently designated in California's CZM program, as well as areas adjacent to Areas of Special Biological Significance (ASBS), California's National Estuarine Research Reserves (NERRs), NEPs, and National Marine Sanctuaries. Within these areas the CCC will use its existing authority under the CCMP to ensure that all appropriate MMs are implemented and, where appropriate, that additional MMs are

[8] A state can take one or both of the following approaches:

1. A state can establish the CCA as a strip of land along the portion(s) of the shoreline adjacent to threatened or impaired coastal waters. Within this area, special controls such as setbacks and low-density zoning can be employed to protect coastal waters.
2. A state can rely on site specific evaluations to determine the extent of a CCA. Under this approach, states may include broader geographic areas in the CCA designation, starting with shoreline segments adjacent to threatened or impaired coastal waters and extending inland to encompass significant coastal features or resources further inland. These broader areas may include entire watersheds or portions of watersheds adjacent to coastal waters and may encompass significant biological features such as wetlands.

developed to protect these coastal waters. Second, agency and public actions will be coordinated to protect the adjacent portions of the inland watersheds that impact the environmental processes within the coastal zone.

To coordinate the actions within the CCAs, the Program Plan will establish an interagency committee (CCA Committee)--led by the CCC in coordination with the SCC, SWRCB, six coastal RWQCBs, and the public--to identify CCAs and develop additional MMs necessary to protect these areas. The CCC and SWRCB have identified several initial goals for CCA designation and implementation.

First, the CCA Committee will evaluate the need for and the implementation of additional MMs to protect and restore coastal waters within CCAs. The Committee will work closely with appropriate agencies and researchers to develop additional MMs that address the issues that threaten or impact the designated CCAs. For the portions of CCAs within the coastal zone, the CCC will include additional MMs, when appropriate, in future coastal development permits and future Local Coastal Program (LCP) amendments associated with these areas. Further discussion of the development of additional MMs for CCAs is provided in Part II, Section H: *Overall Program Assessment—Refining the Program.*

Second, the CCA Committee will seek to channel appropriate NPS Program and agency resources to areas of special concern that may not fall within the initial stages of the Program Plan's other NPS activities. The Committee will act as an advocate for the prioritization, funding, and implementation of projects that can achieve measurable water quality improvements within and in watershed areas adjacent to CCAs. For example, the CCC will support and coordinate the implementation of additional MMs in the watersheds impacting CCAs by: (1) working directly with the appropriate agencies; (2) identifying and targeting resources for implementation in sensitive coastal habitats that can achieve prescribed water quality goals and in sensitive coastal habitats that are of regional concern but not a priority under other water quality designations (threatened or impaired); and (3) expanding participation in education and restoration programs.

This designation will help the State to protect pristine, threatened, and impaired waters that may be degraded by new or substantially expanding land use near the coastal zone by coordinating additional agencies and initiating special programs. Because CCA designation is a continuing process, sensitive coastal habitats that may become threatened by new or expanding development can be targeted as a priority in the future.

Finally, CCA designation will provide resources to special coastal areas which do not achieve priority ranking within other sections of this plan and will therefore provide solutions to program deficits rather than create an additional designation using the same review criteria.

Results of Targeting Efforts

One of the goals of the Program is to implement all of the MMs over the next fifteen years. Although the Strategy targets specific MMs during each five-year implementation plan, in any given year efforts will be ongoing for each MM throughout the State. Some of the MMs implemented during the first implementation cycle will undoubtedly require continued attention long past the initial five years. Similarly, sustained NPS pollution prevention and control efforts may be needed for certain geographic areas beyond the first five years. During the assessment processes in 2001 and 2006, these MMs and areas will be identified and incorporated into the subsequent implementation cycle.

In targeting MMs and geographic areas during the first five-year implementation cycle, special consideration was also given to dovetailing with existing programs. For example, in providing technical support to cities in the development of urban runoff plans, the State will build upon and expand upon the use of the Model Urban Runoff Program (MURP). MURP was originally developed for the Cities of Monterey and Santa Cruz. Taking advantage of existing NPS programs such as MURP will avoid duplicative efforts.

Depending on its relative priority, each MM for each five-year implementation cycle was targeted as either primary, secondary, or tertiary. In designating the targeting level for each MM, consideration was given also to the extent that specific actions are currently being implemented to address the NPS source. For example, urban runoff poses a considerable problem in California but was designated at the secondary and tertiary targeting level because of the existing NPDES Stormwater Program. At the conclusion of each five-year implementation cycle, the MMs targeted at the primary level will be evaluated using the following criteria: (1) the degree to which performance measures have been met; (2) geographic extent of MM implementation; (3) selected evaluation of MPs to implement the MMs; and (4) analysis of available water quality information in those areas where implementation has occurred. Depending on the degree of success, the State will determine whether to: (1) maintain the in-place efforts; (2) modify or add MMs and/or actions for each primary level MM; or (3) consider whether rulemaking is necessary to ensure successful implementation. The targeted MMs for the Strategy and each five-year implementation plan are presented in Table 8.

D. Planning

Introduction

To maintain the Program Plan as a working document, it will be continually updated, decisions will be re-evaluated, and priorities will be re-targeted based on updated information, pilot projects, and lessons learned. An important part of the updating process is integrating the Program Plan with existing federal and State plans and programs that impact NPS pollution control. The following sections provide a brief description of these plans and programs and how the Program Plan will integrate with them.

1988 NPS Plan

The CWA was amended in 1987 to include a new section 319 titled "Nonpoint Source Management Program." CWA section 319 required states to develop a management program describing the measures the State will take to address NPS pollution. Pursuant

TABLE 8 – SUMMARY OF TARGETED MANAGEMENT MEASURES FOR FIFTEEN-YEAR STRATEGY AND FIVE-YEAR IMPLEMENTATION PLANS

Management Measures	Targeting Level for Each Five Year Implementation Plan		
	1998-2003	2003-2008	2008-2013

* The Program Plan will implement the Urban MMs through the coordination and expansion of in-place activities including the Phase I and Phase II Storm Water Programs, the Cal/Trans Stormwater Permit, LCP amendments, CDPs and/or MURP.

R0018637

to these requirements, the SWRCB developed the 1988 Plan which outlined the steps to initiate systematic management of NPS pollution in California. The 1988 Plan emphasized the following characteristics of an effective management program: (1) developing an explicit long-term commitment by the SWRCB and RWQCBs; (2) coordinating existing SWRCB and RWQCB NPS related programs; (3) using more effectively RWQCB regulatory authorities coupled with non-regulatory programs; (4) improving the linkages among local, State, and federal agencies that have authorities to address NPS pollution; and (5) enhancing funding sources. Key elements of the 1988 Plan were the: (1) development of management options to address NPS pollution (the three-tiered approach); (2) establishment of the NPS Management Information System (NPSMIS); and (3) phased implementation of the 1988 Plan.

The Strategy builds on the lessons learned in the implementation of the 1988 Plan by maintaining and/or expanding those elements that were successful and deleting or altering those that did not achieve the goals of the 1988 Plan. The Strategy maintains the "three-tiered approach" and commits to expanding application of the "tiers" pursuant to the requirements of section 13369(a)(2)(B) of the CWC. The NPSMIS will be expanded through contracts with the University of California at Davis-Information Center for the Environment (UCD-ICE) to develop relational databases and geography-based information systems. The phased implementation program in the 1988 Plan was expanded to include a commitment from the SWRCB to consider adopting the MMs as regulation if clear progress is not being made in their implementation.

Water Quality Control Plans

In California, the RWQCBs and SWRCB are responsible for the development of statewide and regional WQCPs, respectively. Pursuant to section 13240 of the Porter-Cologne Act, each of the State's nine RWQCBs must formulate and adopt regional WQCPs (basin plans) for all surface and ground waters within their respective regions. Porter-Cologne Act section 13170 allows the SWRCB to adopt statewide WQCPs for waters for which water quality standards are required by the CWA. The statewide plans, when adopted, supersede any basin plan requirements for the same waters to the extent of any conflict.

Basin Plans

Section 13241 of the Porter-Cologne Act requires that each basin plan: (1) designate beneficial uses; (2) establish water quality objectives that protect the designated beneficial uses; and (3) provide an implementation plan for achieving the water quality objectives. The implementation plan for achieving water quality objectives must include, but is not limited to: (1) a description of the nature of the actions which are necessary to achieve the water quality objectives; (2) a time schedule for the actions to be taken; and (3) a description of the monitoring and surveillance to be undertaken to determine compliance with objectives.

As part of the "continuing planning process," components of the basin plan are reviewed as new information and data become available or as specific needs arise. Comprehensive updates of the basin plan occur in response to State and federal legislative requirements and as funding becomes available. All of the RWQCB basin plans were completely updated in 1995. In addition, the basin plan provides consistent long term standards and program guidance for the RWQCB.

Section 13240 of the Porter-Cologne Act directs the SWRCB and the RWQCBs to periodically review and update basin plans. Furthermore, CWA section 303(c) directs states to review water quality standards every three years (triennial review) and, as appropriate, modify and adopt new standards. In the triennial review process, basin planning issues are formally identified and ranked during the public hearing process. These and other modifications to the basin plan are implemented through basin plan amendments which must be reviewed by the RWQCB and the SWRCB in a public review process specified. Following adoption by the RWQCB, basin plan amendments and supporting documents are submitted to the SWRCB for review and approval. All basin plan amendments approved by the SWRCB after June 1, 1992 must also be reviewed by the State Office of Administrative Law (OAL). In addition, the USEPA must review and approve those basin plan amendments that involve changes in State standards for surface water quality to ensure such changes do not conflict with federal regulations.

The basin plans will be one of the most effective instruments for integrating the Program Plan. Many of the critical elements for implementing the NPS Program are required by statute to be incorporated into the basin plan. The SWRCB and RWQCBs can use their planning authority to prevent NPS pollution and implement MMs. Implementation programs within the basin plan can implement MMs through several approaches. The implementation plans can recommend that NPS dischargers carry out specific BMPs in order to achieve water quality standards. The implementation programs can also waive regulation of categories of NPS pollution discharges on condition that the dischargers implement specific MMs or BMPs. Alternatively, an implementation program can prohibit NPS discharges either entirely or partially, in certain areas or under certain conditions. The conditions can include compliance with appropriate MMs and applicable BMPs.

Inland Surface Waters Plan/Enclosed Bays and Estuaries Plan

The SWRCB is in the process of developing a new Inland Surface Waters Plan (ISWP) and Enclosed Bays and Estuaries Plan (EBEP) to reinstate the two plans it rescinded in response to an adverse court ruling in 1994. The SWRCB is generally authorized to adopt WQCPs under the Porter-Cologne Act (§13170) and is specifically mandated to adopt the EBEP (CWC §13391). Once adopted and in effect, the ISWP and EBEP will complement the California Ocean Plan (Ocean Plan) by establishing statewide water quality standards and implementation measures for controlling discharges of toxic pollutants to non-ocean surface waters of the State.

The SWRCB is developing the ISWP and EBEP in two phases. In Phase 1, the SWRCB will adopt the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (Policy). The Policy (adopted pursuant to CWC §13140) will establish statewide toxicity requirements and provisions to implement water quality standards for priority toxic pollutants in waste discharges. The adoption of water quality standards for priority toxic pollutants for all waters of the United States is mandated by federal CWA section 303(c)(2)(B) in accordance with implementing regulations (40 CFR 131). The vast majority of these standards will be promulgated for the State in the USEPA California Toxics Rule (CTR). Together, the CTR and the Policy will be the basis for establishing water quality-based effluent limitations and other permit requirements for priority pollutants and whole effluent toxicity in NPDES permits and other WDRs. Thus, the standards and implementation provisions established by the CTR and the Policy will function as replacements for the ISWP and EBEP until they are established in their entirety in Phase 2. In Phase 2, the SWRCB will combine the Policy provisions with State-adopted water quality standards for priority pollutants and other pollutants of concern to produce a new ISWP and EBEP. Other issues, such as toxicity testing and the evaluation of standards for effluent-dependent and agricultural drainage-dominated water bodies, will also be addressed in the future.

Currently, the USEPA expects to promulgate the CTR in December 1999. In November 1999, the SWRCB released a revised draft of the Policy and supporting documents for a second public review prior to an SWRCB workshop in December 1999. The Policy will be considered for adoption at a SWRCB meeting in early 2000. The Policy will become effective upon approval by the OAL in the spring of 2000. After the ISWP and EBEP are adopted, the plans will be periodically reviewed and, as appropriate, revised (generally every three years) in accordance with CWC section 13240 and CWA section 303(c)(1). These triennial reviews involve public hearings prior to adoption of amendments by the SWRCB.

California Ocean Plan

The 1997 Ocean Plan states that the SWRCB "finds and declares that protection of the quality of the ocean waters for use and enjoyment by the people of the State requires control of the discharge of waste to ocean waters in accordance with the provisions contained" in the Ocean Plan. State law (CWC §13170.2) requires that the Ocean Plan be reviewed at least every three years to guarantee that current standards are adequate and are not allowing degradation to marine species or posing a threat to public health. As defined by the Ocean Plan, "waste includes a discharger's total discharge, of whatever origin, i.e., gross, not net, discharge." Section 13170.2 of the CWC requires the SWRCB to adopt and review the Ocean Plan.

The Ocean Plan applies in its entirety to point source discharges to the ocean. NPS discharges are subject to the sections of the Ocean Plan covering beneficial uses, water quality objectives, general requirements, and discharge prohibitions. For NPSs of waste discharge to the ocean, "compliance with water quality objectives, in all cases, shall be determined by direct measurements in the receiving waters." The Ocean Plan is not applicable to discharges to enclosed bays and estuaries, inland waters, vessel wastes, or control of dredging materials. The SWRCB may make exceptions to the Ocean Plan in compliance with CEQA and a public hearing and in concurrence with the USEPA, provided that two conditions are met: (1) the exception will not compromise protection of ocean waters for beneficial uses and (2) the public interest will be served.

The Ocean Plan was established in 1972 and has been amended in 1978, 1983, 1988, 1990, and 1997. Draft amendments were made public in October 1998, public hearings on the draft were held in December 1998, and staff is currently responding to comments made during the hearings. It is anticipated that revised draft amendments will be submitted for SWRCB approval in May 2000. As part of the required review of current standards, a triennial review of the Ocean Plan, public hearings were held in September and October 1998. The public identified 35 specific issues that needed review. Staff subsequently prepared a Triennial Review Workplan, describing 22 high priority issues that the SWRCB approved on July 15, 1999 and submitted to the USEPA. The issue "Regulatory Control of Nonpoint Source Control" was reviewed by staff of the Division of Water Quality's NPS Section prior to SWRCB approval of the Workplan.

Bays and Estuaries Toxic Hot Spot Cleanup Plan

The purpose of this program was to implement the Bay Protection and Toxic Cleanup Program (BPTCP), which was established by the State Legislature in 1989. The BPTCP had four major goals: (1) to provide protection of present and future beneficial uses of the bays and estuarine waters of California; (2) to identify and characterize toxic hot spots; (3) to plan for toxic hot spot cleanup or other remedial or mitigation actions; and (4) to develop prevention and control strategies for toxic pollutants that will prevent creation of new toxic hot spots or the perpetuation of existing toxic hot spots in the bays and estuaries of the State.

The six coastal RWQCBs involved in the BPTCP conducted extensive water and sediment quality monitoring in the enclosed bays and estuaries of the State over a period of eight years. The monitoring data provided information on the chemistry (types and amounts of toxicants), toxicity, and benthic integrity of sediments. An assessment of monitoring data using a weight-of-evidence approach resulted in the designation of 48 toxic hot spots, 22 of which were ranked as high priority based on the guidance developed by the SWRCB. The RWQCBs developed regional toxic hot spot cleanup plans for the high priority hot spots.

The BPTCP concluded in June 1999 with the adoption of the statewide Toxic Hot Spot Cleanup Plan by the SWRCB. The Cleanup Plan includes: (1) a priority listing of all toxic hot spots; (2) description of each toxic hot spot including a characterization of the pollutants present at the site; (3) assessment of the most likely source or sources of pollutants; (4) estimate of the total costs to implement the cleanup plan; (5) estimate of the costs that can be recovered from parties responsible for the discharge of pollutants that have accumulated in sediments; (6) preliminary assessment of the actions required to remedy or restore a toxic hot spot; (7) a two-year expenditure schedule plan; and (8) findings on the need to establish a toxic hot spot cleanup program.

Depending on the source and areal extent of the known hot spot, the actions to remediate the sites include: (1) better characterization of the sites and problem, (2) institutional controls/education, (3) dredging, capping, a combination of dredging and capping, (4) source control watershed management, and (5) implementation of a no-action alternative. In order to prevent the further pollution or creation of known toxic hot spots, the cleanup plan requires RWQCBs to reevaluate WDRs in compliance with CWC section 13395. The re-evaluation consists of: (1) an assessment of whether the discharge may influence the creation or further pollution of the known toxic hot spot, (2) an assessment of which WDRs need to be modified to improve environmental conditions at the known toxic hot spot, and (3) a schedule for completion of any WDR modifications deemed appropriate.

Development of Total Maximum Daily Loads

Section 303(d)(1)(C) of the CWA requires the State to establish TMDLs for "303(d) listed water bodies" for those pollutants determined by USEPA to be suitable for TMDL measurement. The TMDL program provides an assessment and planning framework for identifying load reductions or other actions needed to attain water quality standards. The planning process for TMDL development is divided into two parts. Part 1 establishes and apportions the allowable level(s) of pollution in the water body (or watershed) necessary to achieve water quality standards. The recommended methods for achieving the necessary reductions in pollutant loadings are detailed in the second part of this process--the TMDL implementation plan.

Part 1 – Developing the TMDL

This process establishes the maximum allowable amount of pollution (for parameters of concern) and allocates this among the existing and potential sources. The allocation of pollutants is distributed among both point source and NPS discharges. This quantitative assessment includes determining the following components:

- Loading capacity--The greatest amount of loading that a water body can receive without violating water quality standards.
- Load allocation--The portion of a receiving water's loading capacity that is attributed either to one of its existing or future NPSs of pollution or to natural background sources.
- Wasteload allocation--The portion of a receiving water's loading capacity that is allocated to one of its existing or future point sources of pollution.
- Margin of safety--The portion of a receiving water's loading capacity that accounts for the uncertainty of the relationship between the pollutant loads and the quality of the receiving water.
- Seasonal variation--The influence of seasonally-dependent factors (e.g., flow volume) on the receiving water's loading capacity.
- TMDL--The sum of the individual wasteload allocations for point sources, load allocations for NPSs and natural background, and the margin of safety. The TMDL can be expressed in terms of either mass per time, toxicity, or other appropriate measures that relate to the State's water quality standard. In practice, allocations are not typically assigned on a daily basis but instead are

monthly, seasonal, or annual. In most cases mass load is utilized as the metric for the allocations. In some cases (e.g., pathogen problems), other measurable features are used to express the allowable amount of pollution.

Load allocations for NPS and/or natural background may range from reasonably accurate estimates to gross allotments, depending on the availability of data and the techniques used for predicting the loading. As such, a phased approach to TMDL development is often used where estimates are based on limited information. Using the phased approach provides a TMDL that includes monitoring requirements and a schedule for reassessing TMDL allocations to ensure attainment of water quality standards.

Part 2 – Developing the TMDL Implementation Plan

Once a TMDL or phased TMDL has been established, an implementation plan must be developed. The State (acting through the RWQCB) must implement the TMDL and must incorporate the TMDL into the appropriate basin plan. Section 13242 of the Porter-Cologne Act requires that a plan of implementation be incorporated into the basin plan. The implementation plan must include: (1) a description of the nature of the actions necessary to achieve the water quality objectives, including recommendations for appropriate action by any entity, public or private; (2) a time schedule for the actions to be taken; and (3) a description of the monitoring and surveillance to be undertaken to determine compliance with the objectives. Incorporating the TMDL into the basin plan requires approval by the SWRCB and approval of any regulatory provisions by OAL.

The RWQCBs make use of the NPDES permitting process to limit effluent from point source discharges consistent with the wasteload allocations. In the case of NPSs, the RWQCBs rely on the implementation of NPS controls, such as the MMs and associated MPs, and the application of a wide range of State programs and enforcement authorities.

During the Strategy, the RWQCBs have committed to the development of 500 to 800 TMDLs and their associated implementation plans. Appendix C provides a detailed summary of the TMDLs which the RWQCBs have identified for initial development or completion within the first five years of the Strategy. The commitment of financial and staff resources to this effort will be influential in addressing the State's effectiveness in controlling NPS problems.

In summary, TMDLs are planning tools that will enhance the State's ability to foster implementation of appropriate NPS MMs. By providing watershed-specific information, TMDLs will help target specific sources and corresponding corrective measures and will provide a framework for using more stringent approaches that may be necessary to achieve water quality goals and maintain beneficial uses.

Watershed Management Initiative

The watershed Management Initiative (WMI) was approved in 1995 by the SWRCB as part of its Strategic Plan. It was developed to help the SWRCB meet its goal to provide water resource protection, enhancement, and restoration while balancing economic and environmental impacts. The WMI uses an integrated planning approach to create and implement unique solutions for each watershed that consider all local conditions and pollution sources and rely on the input and involvement of local stakeholders. It is not a regulatory program and has no statutory mandate.

Watersheds are identified and prioritized primarily on the basis of water quality. Watershed management strategies have been developed for over 40 watersheds at the nine RWQCBs. These strategies are contained in the Integrated Plan for implementation of the WMI. This Integrated Plan is updated annually in November to reflect changing priorities and conditions in the State's watersheds. The 1998-99 State budget bill included funding for ten WMI coordinators to carry out the WMI. There is one coordinator at each of the nine RWQCBs and one at the SWRCB. The WMI relies on the existing authority of the SWRCB and RWQCBs, including the Porter-Cologne Act and the Federal CWA.

The WMI is consistent with the overall scheme of the Program Plan. Similar to the CWA section 303(d) list described above, prioritization of the watersheds helps the Program Plan in targeting areas with serious water quality issues. Moreover, the watershed management strategies were developed with considerations for local environmental and economic conditions. Consequently, in accordance with the NPS Plan's emphasis on self-determination and the voluntary approach, stakeholder involvement in the implementation of the management strategies is not only critical but feasible. Future annual updating of the management strategies will incorporate RWQCBs' activities identified in the five year implementation plans to support implementation of the Program Plan and make use of the MMs contained in the CAMMPR document of this Program Plan. Implementation of these strategies in targeted watershed will complement the NPS work being performed under other parts of the Program Plan and ensure the full implementation of all MMs in 15 years.

Community-Based Watershed Plans

Community-based watershed plans refer to a wide range of plans and activities that are being undertaken throughout California. These plans and activities are focused on specific geographic areas and involve strong local leadership and diverse stakeholders. Community-based watershed plans have as their premise that many water quality and ecosystem problems are best solved at the watershed level rather than at a statewide or individual discharger level.

Community-based watershed plans are a key component to implementing the MMs. Many of the community-based watershed plans and activities that are underway address NPS pollution. The SWRCB and RWQCBs have supported these plans through financial and technical assistance. Currently, several State agencies, in conjunction with the California Biodiversity Council (CBC) and the Cal/RA, are considering how to establish a statewide framework to more fully support community-based watershed plans and activities.

The SWRCB and the RWQCBs will continue to support watershed plans to foster implementation of the MMs. This is consistent with the federal CWAP that directs new CWA section 319(h) funding to supporting watershed restoration action strategies (WRASs). The intent of this requirement is to ensure that the activities supported by these funds are part of a comprehensive effort that has the community and technical support necessary to achieve significant environmental results. A wide range of community-based watershed plans will be considered to qualify as WRASs. For example, a local watershed stewardship plan, a Coordinated Resource Management and Planning Program (CRMP), or a Comprehensive Conservation and Management Plan prepared under section 320 of the CWA will all be considered to qualify as a WRAS.

Coastal CPR Plan

The CCC's *Plan for Controlling Polluted Runoff* (Coastal CPR Plan) outlines the CCC's authorities to address polluted runoff and identifies actions with timelines and milestones to achieve the CCC's objective to reduce polluted runoff. The Coastal CPR Plan specifies the CCC's role in addressing polluted runoff within the confines of existing budgets, staffing, and statutory authority. The four program enhancements that comprise the Coastal CPR Plan are developed from the CCC's existing and newly developed tools and programs related to the management of polluted runoff. They include: (1) implementation of MMs through planning, regulation, and technical assistance; (2) administrative coordination; (3) public participation and education; and (4) funding. Implementation of the Coastal CPR Plan helps to direct CCC staff efforts to prevent and control polluted runoff, thus leading to improved coastal water quality and enhanced coastal resources and uses.

Many of the actions identified in the Coastal CPR Plan are incorporated into the Program Plan. These actions are expected to help facilitate implementation of the NPS Program, as well as to improve the coastal program's overall treatment of water quality-related issues.

General Plans

The general plan is a local government's basic planning document. Under State planning law, each city or county must adopt a comprehensive, long-term general plan for the physical development of the city or county and any land outside its jurisdiction that bears relation to its planning. General plans must contain seven elements: (1) land use, (2) circulation, (3) housing, (4) conservation, (5) open space, (6) noise, and (7) safety. The following elements are the most relevant to NPS pollution prevention and control:

1. Land Use--Designates categories such as housing, industry, and natural resources, including density and intensity of use.
2. Conservation--Applies to conservation, development, and use of natural resources (e.g., soils, forests, rivers and other water bodies, and harbors). May also cover watershed protection, land or water reclamation, prevention or control of the

pollution of streams and other coastal waters, regulation of land uses along stream channels and in other areas required to implement the conservation plan (e.g., buffer areas), control or correction of soil erosion, and flood control.

3. Open Space--Applies to preservation of natural resources, including fish and wildlife habitat, rivers, streams, bays and estuaries, and open space.
4. Circulation--Plans infrastructure, including water, sewage, and storm drainage.

Local Coastal Programs

In carrying out its objectives and policies, the Coastal Act (PRC §§30000 et seq.) delegates to local governments specified authority to regulate coastal development.[9] The Coastal Act directs each of the 73 cities and counties lying wholly or partly within the coastal zone to prepare for review and certification by the CCC an LCP for the local government's portion of the coastal zone. Through LCP development, the Coastal Act provides a means to manage coastal resources of State, regional, and national significance in ways that respect special circumstances in each locality. The CCC works with local governments to tailor LCPs to reflect local issues and concerns while simultaneously meeting the statewide goals and policies of the Coastal Act.

An LCP consists of a local government's land use plans (LUPs), zoning ordinances, zoning district maps, and, within sensitive coastal resource areas, other implementing actions which, when taken together, meet the requirements of and implement the provisions and policies of the Coastal Act at the local level (PRC §30108.6). The LUP is the relevant portion of a local government's general plan or local coastal element which is sufficiently detailed to indicate the kinds, location, and intensity of land uses, the applicable resource protection and development policies, and, where necessary, a listing of implementing actions (PRC §30108.5). Most key land use and policy decisions are made in the LUP stage. The standard of review of the LCP Implementation Plan is that it conforms with and is adequate to carry out the certified LUP.

Upon LCP certification, a local government can issue permits for such development in the coastal zone as is consistent with LCP policies; alternatively, a local government conditionally approves or denies a coastal development permit application if the proposed development is inconsistent with the LCP. However, certain actions taken by a local government on a CDP application may be appealed to the CCC. The CCC hears appeals, and the standard of review is the certified LCP and the public access policies of the Coastal Act. And, because a CDP is either approved or denied depending on its conformity to a certified LCP, it is imperative that all appropriate NPS MMs are identified and included in the certification process.

The CCC water quality staff will update the in-house *Procedural Guidance Manual: Addressing Polluted Runoff in the California Coastal Zone* to reflect the newest development in NPS MMs. This manual is extensively utilized by the CCC staff in

9 The Coastal Act declares that "to achieve maximum responsiveness to local conditions, accountability, and public accessibility, it is necessary to rely heavily on local government and local land use planning procedures and enforcement" (PRC §30004).

reviewing LCPs and CDP applications. The CCC's water quality staff will also conduct training of its planners in use of the manual and in screening for NPS components in LCPs, Local Coastal Program Amendments (LCPAs), and CDPs. The initial training will be conducted by December 2000, with a refresher training every year thereafter. Currently, the CCC staff are routinely requesting applicants of development permits not already subject to NPDES permit requirements to submit Erosion & Sediment and Chemical Control Plans for the construction phase when appropriate. In addition, a polluted runoff control plan with regular BMP maintenance and inspection is required of most development proposals as well. These efforts will achieve tangible water quality benefits in the field.

Coastal Act section 30519.5 requires the CCC to conduct periodic reviews of certified LCPs to evaluate whether or not the LCPs are being implemented by the local governments in a manner that conforms to the Coastal Act. The periodic reviews also provide a means to ensure that the LCPs reflect new information (such as new MMs) and changing conditions regarding NPS pollution prevention and control and help local governments respond to post-certification NPS issues that develop over time in targeted areas.

Lastly, the CCC can also effect implementation of the NPS Program through either:
(1) the regular LCP amendment process initiated by the local governments or
(2) providing grant incentives to encourage appropriate NPS-related amendments to LCPs.

In short, the CCC will review all new LCPs, LCPAs, and CDP applications brought before it for appropriate NPS pollution prevention and control activities.

Annual Workplans

Each year since 1990, the SWRCB and RWQCBs have developed detailed annual workplans as part of the grant application to USEPA for CWA section 319(h) funding. In addition to satisfying federal funding requirements, the plans served as short-term planning and budgeting tools for the SWRCB and RWQCBs. Annual workplans are detailed, tasked-oriented documents. This Program Plan is not intended to replace annual workplans. In fact, good annual workplans are more important than ever if California is to achieve the goals and objectives set forth in the Program Plan. Annual workplans will continue to be used to plan, coordinate, budget, track, and report on each year's NPS-related work.

Beginning with Fiscal Year 2000 (July 1, 2000), the SWRCB, RWQCBs, and CCC will begin jointly developing a single annual workplan that focuses on implementing MMs. The workplan will detail all major tasks proposed for the coming year including those that support activities outlined in the State NPS Plan. Annual workplans will cover all federal and State (including bond funds) funding sources, fees, and any other sources including private commitments. Other State agencies and private entities will be encouraged to join in the process. This widespread participation is crucial if the State is to accurately evaluate and report the large number of efforts underway dealing with NPS pollution.

The State is faced with mounting annual, biennial, and five-year State and federal reporting requirements. To simplify reporting efforts, the SWRCB and CCC will develop a single, standardized report format (Figure 3) for use by all participants. The form will need to satisfy federal grant program requirements, be consistent with the five-year plans, and provide sufficient information so that information is usable in a program tracking database such as the one currently under development at UCD ICE. Another consideration is that it has an Internet-compatible file format to ensure electronic sharing over and posting on the Internet. One of the most important functions of the standardized report format is to simplify the task and thereby improve the State's ability to document and report its yearly progress in managing NPS pollution.

Regulatory Plans (National Pollution Discharge Elimination System)

While different legal authorities may apply to different situations, the goals of the NPS Program are complementary to the goals of the storm water regulatory programs that address urban runoff.[10] The two-phased program under CWA section 402(p) requires NPDES permits for storm water discharges. In California, the federal NPDES Program is administered by the SWRCB and the RWQCBs. Since 1990, Phase I regulations have required NPDES permits for storm water discharges from:

1. Municipal separate storm sewer systems serving populations greater than 100,000,
2. Specific industrial activities, and
3. Construction activities disturbing land of five or more acres.

Phase I requires that individual NPDES permits be issued for municipalities greater than 100,000ff In practice, the RWQCBs include many municipalities in urbanized areas with populations less than 100,000 in the Phase I programs. Individual municipal NPDES permits require implementation of structural and nonstructural control measures to reduce pollutant loads from industrial, commercial, and residential areas. The SWRCB elected to adopt a statewide NPDES General Permit requiring the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP) for all construction and certain industry-related discharges.

Implementation of the NPDES Phase II Program will expand the existing program to include all municipalities within urbanized areas and small municipalities outside of urbanized areas with a population of at least 10,000 and a population density of at least 1,000 persons per square mile. The program will also expand to include construction sites that disturb between one and five acres. All activities under Phase I and II of the NPDES permit regulations will be required to prepare a SWPPP to demonstrate how MMs will be used to protect water quality degradation.

---

[10] The 1987 CWA Amendments, which added section 319 related to NPS programs, also expanded the application of regulatory authority under CWA section 402 to prevent and control NPS pollution from certain urban areas and industrial activities. CZARA section 6217 also requires states to implement MMs to control NPS pollution, including urban runoff, to coastal waters.

DRAFT SAMPLE

California Nonpoint Source Pollution Control Program
Annual Workplan for FY 1999

Agency: *Cal/EPA* **Department/Board:** *SWRCB*

Division/Program: *DWQ/NPS*

Contact:

Management Measure Category: *3.5 Transportation Development*

Management Measure Title: *3.5A Planning, Siting, and Developing Roads and Highways*

Process Element: *Assess Problem*

Actions/Statements: *Conduct a consistency analysis of Cal/Trans' statewide storm water permit.*

Geographic Area: *Statewide*

Funding Sources and Amount: *CWA 319(h) and General Fund*

Performance Measures: *Upgrade NPDES permit.*

Annual Progress Report: *The SWRCB approved a statewide storm water permit for CalTrans in August 1999 that includes management measures consistent with the Program Plan.*

Involve Stakeholders in Planning Process (Public Participation)

The Program Plan identifies numerous mechanisms for stakeholder participation in the planning and implementation of Tier 1 activities. To ensure that stakeholders have both the representation and buy-in necessary for Tier 1 to truly be effective, the State recognizes the need for public participation in every step of the planning and implementation process. Public input will be included in plan development, targeting resources, planning five-year activities, coordinating partnerships, implementing MMs, and monitoring success. This coordination will be achieved from direct comments provided by the public during the decision making and planning process. The most effective first step will be to establish the IACC and include a public representative on the Assessment TAC to participate in problem solving activities. In addition, the Program Plan has to establish a role for public participation in, among others, the State WQA (statewide citizen monitoring network), CCAs designation and implementation, specific work groups (e.g., CRMP), tracking MM implementation and effectiveness, and in developing additional MMs.

The first five-year review period will be a critical point for stakeholder involvement and public comments. The public will be invited to participate in the review of the first five-year plan assessment and in the development of future priorities and objectives. This process will be obtained best through the establishment of review committees (identified by the TACs) to review the Program Plan's effectiveness as outlined in the five-year report. From these comments, the State hopes to increase MM implementation and streamline Tier 1 activities.

E. Coordinating with Agencies and Key Stakeholders

Building cooperative partnerships among agencies at every institutional level, as well as with stakeholders, is essential to the success of a sustainable effort to protect and restore the quality and environment of the State's waters. In order for the NPS Program to be successful, we need to ensure that the roles and responsibilities of stakeholders and agencies with authorities to implement the MMs are clarified and executed. Specific objectives include:

- Establishing coordination mechanisms to enhance implementation of the five-year implementation plans,
- Fostering effective partnerships and collaboration among State, regional, and local agencies and non-governmental organizations (NGOs)—including CRMPs, officials responsible for habitat protection, land use programs and permitting, water quality permitting and enforcement, and public health and safety—to implement all appropriate MMs, and
- Making available for public review and comment by January 1, 2001, a draft of the enforcement guidance required pursuant to Porter-Cologne Act section 13369.

We will use the example of marina and boating activities to illustrate the complex partnerships required in implementing the appropriate MMs. In addition to the CCC and SWRCB, numerous agencies have regulatory jurisdiction and non-regulatory oversight of California's water quality management efforts related to marina and boating activities (Table 9). Although agency jurisdiction overlaps in many cases, the goal of these agencies is to prevent NPS pollution before it happens. (For a more complete list of agency authorities related to the various NPS categories, the reader is referred to Volume II-CAMMPR of the Program Plan.)

For example, the RWQCBs, DFG, DHS, DTSC, and USCG all play an important role in regulating both the amount and type of wastes that enter California's waterways. The RWQCBs are the primary State agencies with water quality authority, which ranges from water quality planning to issuing permits for discharges of pollutants to State waters. Most RWQCBs use voluntary/cooperative management efforts for marina and boater NPS pollution control, although boat yards are regulated under a permit system. The DFG also has broad water quality authority and in addition to the USCG is the

TABLE 9 AGENCY PARTICIPATION IN MARINA AND BOATING ACTIVITIES

UCCE		X	X	X			X
MBNMS (NOAA)	X	X	X	X	X	X	X
NEPs (USEPA)	X	X	X	X	X	X	X
USCG	X		X	X	X		X

agency most likely to be on site at a marina. Its focus is on preventing pollution that harms fish and wildlife resources, especially discharges of oil and petroleum products. The DFG Office of Spill Prevention and Response (OSPR) is charged with oil spill prevention and response. The DHS also regulates the discharge of sewage, other waste, or effluent, while the DTSC regulates the storage, transport, and disposal of all hazardous wastes. The USCG implements federal laws related to garbage and sewage disposal.

In addition to the agencies listed above, DPR, SLC, SFBCDC, and CCC have leasing or permitting authority over many marinas. CCC, DBW, CIWMB, UCCE, MBNMS, and San Francisco Bay and Santa Monica Bay NEPs provide various levels of technical, financial, and/or educational assistance.

Many efforts related to marinas and recreational boating are coordinated through interagency and public committees, such as the California Clean Boating Network (CCBN) for Northern and Southern California (except San Diego County) and the Boating Safety and Environment Education Committee in San Diego. In 1995, a number of pollution educators, including agency, industry, and environmental representatives, came together to create the CCBN as a result of a recommendation by the Marina and Recreational Boating TAC (SWRCB, 1994e) and to assist boaters and marina managers. The purpose of the CCBN is to promote environmentally sound boating education efforts and to improve communication and coordination between marina and boating pollution educators in California. Examples of CCBN activities to support this purpose include, but are not limited to:

- Sharing information and developing expertise on current environmentally sound boating issues;
- Identifying funding sources for marina and boater pollution education projects;
- Providing a forum to allow cooperation on funding source proposals;
- Assisting in the dissemination of materials;
- Providing feedback on draft materials;
- Providing a forum for feedback on the impact that education is having on the identified audience;
- Sharing methodology for education, outreach, and the evaluation of materials;
- Reviewing existing programs and identifying where additional effort is needed; and
- Developing a strategy to implement the additional efforts.

While the CCBN supports the efforts of its member organizations by sharing information, networking, and providing expertise, the CCBN has lost its program funding to conduct education regarding environmentally sound boating practices. In fact, educational efforts in the State regarding environmentally sound boating are largely funded by short-term grants. No State agency has assumed programmatic responsibility for a permanent education and outreach effort akin to the boating safety education program of the DBW.

As the CCC is now completing a three-year statewide grant, funded by the CIWMB, to promote environmentally sound boating, the CCC acknowledges the need for a permanent boater education program to be implemented by an appropriate State agency. The CCC will work with the DBW, SWRCB, and RWQCBs to identify the appropriate agency for implementing a permanent education program as outlined in the Implementation Plan. Once an appropriate agency is identified, the State will work to develop a long-term funding structure and implementation strategies.

Formal Coordination through Memoranda of Understanding and Management Agency Agreements[11]

The State will formalize connections between the lead and enforcing agencies through the letter from Cal/EPA and Cal/RA, asking each agency, department, State boards, and RWQCBs to prepare a five-year implementation plan (see Appendix D). The State will

[11] Under the CWA and the State's Porter-Cologne Act, the SWRCB is given the authority and responsibility to develop and certify water quality management plans (including BMPs, implementation procedures, and management agency implementation responsibilities), to designate management agencies for plan implementation, and to execute MAAs setting forth management agency commitments to its implementation responsibilities. SWRCB encourages this management agency approach where it offers a viable alternative to direct SWRCB/RWQCB regulation in controlling NPS pollution and achieving compliance with the State's water quality standards. Where reasonably implemented by the management agency, the SWRCB will typically waive direct regulation under its own authority.

also enhance coordination by developing a formal agreement (MOU) between the lead agencies (SWRCB and CCC) responsible for the Program Plan's implementation. While the key elements of the NPS Program have been developed through a cooperative partnership without a formal agreement, an MOU would serve to clarify roles and responsibilities of each agency over the next 15 years. This MOU will be submitted with the Program Plan for approval by the SWRCB and CCC (see Appendix E).

The State will ensure that agencies with the ability to implement aspects of the Program Plan are effectively linked with the lead agencies by developing (or revising) MOUs or MAAs. MOUs and MAAs between the lead agencies and several implementing agencies already exist (Table 10). Additional MOUs/MAAs will be encouraged as a mechanism for officially designating other agencies with the responsibility and authority to implement aspects of the Program Plan. The State will revise existing or add additional MOUs/MAAs that support the implementation of MMs in accordance with the MMs' priorities. This approach is consistent with the Program Plan's phased approach and recognizes resource limitations.

TABLE 10. SUMMARY OF EXISTING MAAs AND MOUs

TYPE OF DOCUMENT	SIGNATORY AGENCY	GENERAL PURPOSE	DATE SIGNED
MOU	California Association of Resource Conservation Districts (CARCD)	Coordination of erosion control and water quality protection	1984
	Soil Conservation Service (SCS) (renamed NRCS)	Planning/technical assistance for water quality policies and activities	1990
	U.S. Bureau of Reclamation (USBR), USFWS, SCS (renamed NRCS), USGS, DWR, DFG, DFA	Implementation of San Joaquin Valley Drain Program	1991
	NOAA, USEPA, Association of Monterey Bay Area Governments (AMBAG), Cal/EPA, SWRCB, CCC, RWQCB 2 and 3	Develop and implement the MBNMS WQPP	1992
	BLM	Coordination of NPS policies and activities	1993
	DFA	Regulation of fertilizer and soil amendments	1998
Water Quality Management Plan (WQMP)/MAA	USFS	Control of NPS activities and pollution on National Forest System Lands	1981
	BOF, CDF	Control of NPS pollution from timber operations on nonfederal lands	1988
	CDPR	Control of pesticide pollution	1997
WQMP	None; cooperative program with technical assistance by UCCE and NRCS, support by CARCD, industry/professional associations	NPS control on private rangeland	1995
"Partnership Agreement" of CA Dairy Quality Assurance Program	14 dairy industry organizations, and state and federal agencies	Coordinated environmental stewardship for dairy waste management	1998

R0018653

The SWRCB and CCC are committed to formalizing interagency agreements. In 2000-2001, the SWRCB and CCC will initiate reviews of existing MOUs/MAAs and will work with other agencies to identify opportunities for new agreements. The review will address such issues as existing limitations related to Program implementation and will determine the appropriate mechanisms for correcting concerns. The SWRCB and CCC will subsequently develop those MOUs/MAAs that are identified as being feasible and necessary to ensure the implementation of the priority measures identified in the first five-year plan. Specifically, the SWRCB and CCC will update existing or develop new MOUs/MAAs with the BLM, CDPR, and NRCS by December 31, 2001. In addition, by December 31, 2001, the SWRCB and CCC will develop a schedule for updating or developing additional MOUs/MAAs that are necessary to fulfill the goals and objectives of the Program Plan.

For example, beginning in 2000, the SWRCB will work with the USFS to revise the USFS WQMP called for under the MAA between the SWRCB and the USFS[12]. The USFS has recently undertaken a significant review of its BMPs. These new BMPs adequately implement the MMs of the Program Plan. The USFS has initiated a collaborative effort to incorporate new information into national forest management of the Sierra Nevada National Forests. This effort, known as the Sierra Nevada Framework for Conservation and Collaboration, includes updates to forest plans to address problems in aquatic, riparian, and meadow systems, among other ecosystems. An Aquatic Conservation Strategy has been proposed to maintain and restore the ecological integrity of these systems. The WQMP for National Forest System Lands and the MAA between the USFS and the SWRCB should be modified to: (1) include the Aquatic Conservation Strategy; (2) improve the coordination and collaboration of restoration projects in these systems; and (3) include performance measures that can be used to track project/program effectiveness.

The SWRCB and the CDPR will revise their MAA so that the WQMP includes commitments to implement MMs for which CDPR has regulatory authority.

The SWRCB and the BLM are working to finalize a WQMP and MAA. In 1992, the SWRCB and BLM entered into an MOU (SWRCB Resolution No. 92-26) and agreed to pursue development of an MAA for NPS pollution control program on BLM lands. While that MAA is not yet in place, during the last year, BLM has shown renewed interest in completing the work. This effort should be completed prior to the year 2003. The WQMP with BLM should focus on (1) implementation and adaptive management of the rangeland standards and guidelines; (2) development and certification of BMPs and implementation measures for other NPSs of pollution on BLM lands; (3) evaluation and review of rangeland MPs; and (4) an annual assessment process with environmental and operational measures of success.

---

[12] Currently, the only federal agency with management agency status in California is the USFS. In 1981, the SWRCB certified a WQMP for National Forest System Lands, designated USFS as management agency for plan implementation, and executed an MAA with USFS. The WQMP and MAA currently provide for: (1) development and implementation of SWRCB-certified BMPs; (2) early State involvement in review of USFS projects; (3) monitoring and adaptive management of BMP effectiveness and implementation; and (4) annual meetings to maintain coordination and communication.

BLM and the SWRCB have worked together to avoid and reduce NPS pollution from BLM–owned land. BLM controls domestic livestock grazing on public lands through designated grazing allotments. In 1998 BLM developed standards for rangeland health and guidelines for livestock management. SWRCB worked with BLM to ensure that these rangeland standards and guidelines would (1) comprise BMPs; (2) conform with the (g) guidance MMs and the BMPs set forth in the SWRCB's 1995 Rangeland WQMP for private rangelands; and (3) achieve compliance with California's water quality standards. Implementation of the BLM standards and guidelines began earlier in 1999.

Strong stewardship by landowners is a critical mechanism for implementing MMs, and the NRCS is a key agency providing financial and technical assistance to those landowners. The SWRCB and NRCS staffs have agreed that an MOU between the agencies would greatly improve the technical assistance aspects of the NPS Program. NRCS (formerly the Soil Conservation Service) and the SWRCB have an existing MOU dated July 31, 1990, outlining planning and technical assistance related to water quality policies and activities. This MOU will be updated to address NRCS's role in the Program Plan (e.g., assisting landowners in voluntarily implementing Resource Management Systems [RMS] or MMs) and to affirm the SWRCB's commitment to work through a self-determined approach (Tier 1) as a valuable step in achieving clean water goals. The new MOU will also address the use of NRCS technical guidance materials (e.g., Field Office Technical Guide[FOTG]) in planning and installing resource MMs.

The SWRCB and the CCC are leading an effort to develop MOUs/MAAs among the agencies in Cal/EPA and Cal/RA. The purpose of these formal agreements is to develop commitments to implement MMs (e.g., develop five-year implementation plans for their agencies or establish NPS pollution control elements to existing workplans). The SWRCB has contracted with the CCC to facilitate the completion of these agency-specific five-year implementation plans. The SWRCB has authority to require agencies to provide technical reports (Porter-Cologne Act §13165), and this authority could be used if cooperative approaches are ineffectual. The five-year implementation plans would contain components such as:

1. Implementation of all identified NPS MMs for which they have authorities and are targeted in the Program Plan by 2013;
2. Tracking of implementation and effectiveness by MM and source category and providing this information to the SWRCB as part of the monitoring and assessment strategy; and
3. Participation in regular program reviews as well as new goal-setting activities, including development of the five-year implementation plans and coordination of planning, assessment, and regulation activities with the SWRCB, CCC, and RWQCBs.

Coordination Through Interagency Forums

In addition to using formal agreements to establish coordination, the SWRCB and CCC will establish an IACC to provide a regular working forum to collaborate in implementation and problem solving. We currently envision several roles for the IACC. First, where programmatic or policy conditions present problems for watershed management, the SWRCB and CCC, through the IACC, will act as a conduit for addressing and resolving those problems. The IACC will also be asked to evaluate agency functions and to recommend improvements that can benefit water quality on a statewide basis for various categories of activities. The IACC will be the primary forum for coordinating program activities of the lead and implementing agencies. Second, SWRCB and CCC staffs will work with the IACC to identify those agencies willing to become partners in interagency technical assistance teams. For these teams to function optimally, they must have broad-based support. Allowing agencies to assist with and utilize the functions of the teams will provide a powerful mechanism for improving coordination. Third, the SWRCB and CCC staffs will request the IACC to establish TACs in four major issue areas--assessment, technical assistance, education, and regulation. The role of these committees will be to identify opportunities for improved coordination and instances where impediments to effective management occur and to devise responses to move toward enhanced performance and management. Staff will work with the committees to ensure that the problems facing watershed groups are clearly understood and to provide a vehicle for implementing changes in State activities.

The lead agencies will work with the CBC to define the appropriate complementary roles of the CBC and the IACC. The CBC is comprised of 15 State agencies, the University of California (UC), CARCDs, and nine regional associations of county supervisors. The CBC was formed to improve coordination and cooperation among the various resource management and environmental protection agencies at federal, State, and local levels.

Interagency Initiatives and Public/Private Partnerships

Because stewardship is a fundamental principle upon which the NPS Program is based, we need to encourage collaborative relationships that include a broad range of groups. SWRCB, RWQCB, and CCC staffs will work with watershed groups and CRMPs to promote coordinated resource management and planning through the active participation of all stakeholders in a given watershed. The lead agencies encourage the participation of all relevant agencies and stakeholders in watershed management. There are a number of collaborative efforts in which the lead agencies are either currently active or will become active. As part of the effort to improve coordination, staff will work with the following efforts:

- Federal CWAP.
- CBC—Watersheds and Resource Assessment Initiatives.
- Implementation of Farm Bill Conservation Programs (including USDA, NRCS Locally-Led Conservation, Stream Corridor Restoration, Conservation Buffers, Salmon Restoration, and Air Quality Initiatives).
- The Environmental Stewardship component of the California Dairy Quality Assurance Program. This partnership among 14 entities including various State and federal agencies, UC, and representatives of the California dairy industry develops a voluntary, cooperative government and industry education and certification program. The program core components include: (1) education workshops for producers; (2) the creation of Environmental Stewardship Farm Management Plans specific to each dairy; and (3) on-site evaluation by a third party.
- The Range Management Advisory Committee of the BOF.

- Cal/RA's effort to inventory wetland and riparian areas statewide and to maintain data on projects subject to CWA section 401 certification.
- Cal/RA's efforts to establish a definition for riparian areas in consultation with other affected agencies.
- The California Aquatic Bioassessment Workgroup, chaired by staff from the DFG. SWRCB and RWQCB staffs have: (1) trained community members in bioassessment; (2) designed regional bioassessment monitoring programs; and (3) participated in the development and review of bioassessment methods and metrics.
- The California Watershed Project Inventory (Project Inventory) at UCD ICE. The SWRCB has provided significant financial support to this database of watershed projects. Currently, the SWRCB and UCD ICE are expanding the database to link MMs, agencies, and authorities to the Project Inventory.
- Certified Crop Advisor Program.
- CRMP groups throughout California.
- CALWATER watershed mapping initiative.
- CALFED Bay Delta Initiative/Program.
- Lake Tahoe Initiative.
- MBNMS WQPP.
- Southern California Beach Water Quality Workgroup.
- Southern California Coastal Water Research Project.

Review of Federal Projects and Programs

CWA section 319 authorizes and requires each state to review federal activities to ensure consistency with the state's NPS management program. The CWA also directs federal agencies to accommodate the concerns of each state.[13] While the 1988 Plan noted that federal consistency[14] would focus on the actions of three federal agencies (USACOE, USBR, and FERC), the SWRCB, and RWQCBs routinely review: (1) financial and technical assistance programs; (2) development activities; (3) environmental impact statements; and (4) monitoring programs from numerous federal agencies. The CCC has a similar federal consistency process under the CZMA (see Appendix B). The State Clearinghouse acts as the coordinating and notification agency for routing projects to appropriate State agencies. Many federal agencies directly notify State agencies of appropriate federal projects and programs through periodic NEPA reporting procedures or regional collaborative efforts.

The federal programs requiring review for NPS issues are listed in Table 11. The primary lead agency that reviews projects with statewide impact will be the SWRCB.

---

[13] This requirement is spelled out in Executive Order 12372 of July 14, 1982 (Federal Register Vol. 47, No. 137).

[14] The general process for review of federal projects, as outlined in this Executive Order, is: (1) State develops a list of federal assistance programs and development projects it will review; (2) State clearinghouse routes federal project information to appropriate State agency for review; (3) State agency reviews projects and provides timely comments to the federal agency; (4) federal agency reviews comments and accommodates concerns where possible; and (5) if concerns cannot be addressed, a timely explanation will be provided. Where the State cannot resolve federal consistency issues to its satisfaction, it requests USEPA assistance to help resolve the issues.

TABLE 11. LIST OF FEDERAL AGENCIES' PROGRAMS AND PROJECTS SUBJECT TO STATE REVIEW

U.S. BUREAU OF LAND MANAGEMENT
Watershed Projects
Mineral Exploration and Development
Oil and Gas Leasing
ORV Activities
Timber Activities
Grazing Allotment/Grazing Management/Permits Issuance
Chemicals/Pesticides
Area Analysis/Cumulative Impacts
Wetlands Protection
Riparian Management Plans
Hydrologic Modifications
Transportation Plans
U.S. DEPARTMENT OF DEFENSE
Natural Resource Management Plans and Projects
Military Construction Projects
Facilities Development Plans and Projects
Land and Water-Based Military Training Plans and Exercises
Environmental Restoration Projects
Spoil Disposal
Open Water Disposal Sites
FEDERAL ENERGY REGULATORY COMMISSION
Dam Relicensing
U.S. FOREST SERVICE
Forest Management Plans
Timber Sales
Grazing Allotments
NATIONAL MARINE FISHERIES SERVICE
Fisheries Management Plan
Habitat Conservation Plans
NATURAL RESOURCE CONSERVATION SERVICE
Environmental Quality Incentives Program (EQIP)
Wetland Reserves Program
Wetland Conservation
Forestry Incentives Program
NATIONAL PARK SERVICE
National Park Seashore Management and Proposed Acquisitions
Wildlife Management
Grazing Management
Abandoned Mines Management
NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION
Coastal Management Programs
U.S. BUREAU OF RECLAMATION
Irrigation Development
U.S. ARMY CORPS OF ENGINEERS
Permits for Dredged or Fill Material
U.S. FISH AND WILDLIFE SERVICE
Management of National Wildlife Refuges and Proposed Acquisitions
Habitat Conservation Plans

The appropriate RWQCBs will review local and regional projects. The CCC will also review programs in the coastal zone as defined in the Coastal Act. These State agencies will work with USEPA staffs who are liaisons with these federal agencies to ensure compliance with the CWA.

When project-by-project review and intervention by USEPA staff are insufficient to abate NPS pollution, the lead agencies will negotiate revisions to existing formal agreements or develop new agreements. If formal agreements are ineffectual, the SWRCB or RWQCBs can require federal agencies to provide NPS pollution prevention reports under their authority (Porter-Cologne Act §13267).

F. Implement Actions

The Three-Tiered Approach Overview

Originally adopted in the 1988 Plan , the "three-tiered approach" remains a cornerstone of the NPS Program. The "three-tiered approach" utilizes three different options of enforceable policies and mechanisms under the Porter-Cologne Act to ensure water quality objectives are achieved. The options are presented in order of increasing stringency. Through the "three-tiered approach," the NPS Program recognizes that many NPS problems are best addressed through the self-determined cooperation of stakeholders (Tier 1). However, persistent NPS water quality problems not effectively resolved through self-determined actions will be addressed through applicable regulatory programs and authorities (Tier 2 and Tier 3).

In general, which option is used depends on factors such as:

- Persistence of water quality impairments;
- Whether timely implementation of MMs and MPs is being achieved; or
- Whether the Tier 1 approach is being utilized effectively.

In practice, the RWQCBs will determine which or what combination of the three options will be used to address any given NPS problem. Sequential movement through the tiers (e.g., Tier 1 to Tier 2 to Tier 3) is not required of the RWQCBs. Depending on the water quality impacts and severity of the NPS problem, the RWQCBs may move directly to the enforcement actions specified in Tier 3. Pursuant to CWC section 13369(a)(2)(B), the SWRCB will develop, by February 1, 2001, guidance to be used by the SWRCB and RWQCBs for moving through the "three-tiered" process.

All three options implement BMPs. BMPs include, but are not limited to, structural and nonstructural controls and operation and maintenance procedures. BMPs can be applied before, during, and after pollution producing activities to reduce or eliminate the introduction of pollutants into receiving waters. BMPs are means of achieving certain MMs. For example, seeding and mulching of steep slopes at a construction site would be structural BMPs for achieving the MM of erosion control.

Tier One: Self-Determined Implementation of Management Practices

Since its inception in 1988, the "self-determined" or "voluntary approach" to the implementation of BMPs has been central to discussions of the NPS Program. The terms "voluntary" and the "voluntary approach" have been a popular concept grounded in the historic notions of autonomy and self-determination. The definition

of "autonomy" also refers to the concept of "moral independence," implying that autonomy also carries with it responsibility and accountability. This is especially critical in situations where individual actions may conflict with the public good.

As a concept the term "voluntary approach" is as important for what it does not mean as for what it does. Compliance with the CWA, CZARA, CWC, and the Porter-Cologne Act is not a voluntary choice. It is the responsibility of the SWRCB and the RWQCBs to see that these laws are enforced. The concept of "self-determined implementation" of NPS control measures was developed to acknowledge the potential capability of landowners and resource managers to develop and implement workable solutions to NPS pollution control and to afford them the opportunity to solve their own problems before more stringent regulatory actions are taken.

Property owners and/or managers may implement BMPs through their own initiative or self-determination. Implementation could occur for economic reasons and/or through awareness of environmental benefits. Self-determined implementation can be encouraged through education, training, financial assistance, technical assistance, and demonstration projects. A self-determined approach would take advantage of the expertise and incentives offered by a variety of existing local, State, and federal programs that are geared to promoting private actions which could have water quality benefits. Lead agencies for these programs include the DOC NRCS, Farm Services Agency (FSA), RCDs, and the UCCE.

Tier Two: Regulatory-Based Encouragement of Management Practices

In general, the Porter-Cologne Act constrains RWQCBs from specifying the manner of compliance with water quality standards. However, RWQCBs have two ways to use their regulatory authorities to encourage implementation of BMPs.

First, RWQCBs may encourage the use of BMPs by waiving adoption of WDRs on condition that dischargers comply with this requirement. Alternatively, the SWRCB and the RWQCBs may enforce BMPs indirectly by entering into MAAs with other agencies that have the authority to enforce BMPs. Such authority derives either from the agency's regulatory authority or its management responsibility for publicly owned or controlled land. MAAs will include (or reference) specific, acceptable BMPs and their means of implementation. Both the SWRCB and the RWQCBs may enter into MAAs. The SWRCB will develop MAAs, where appropriate, with State and federal agencies having statewide jurisdiction, such as the BLM or Cal/Trans. For example, the SWRCB has existing MAAs with the USFS and with the BOF and CDF. SWRCB MAAs will specify acceptable BMPs and how they will be implemented. Formal agreements between the SWRCB and other agencies pertaining to the prevention and abatement of NPS pollution will be referenced in RWQCB basin plans and will become the primary basis for RWQCB determination of compliance with State requirements. RWQCBs will seek agreements, where appropriate, with local agencies, such as cities and counties. For example, RWQCBs have existing MAAs with counties concerning regulation of on-site wastewater disposal systems. RWQCB MAAs may also reference BMPs that have been adopted into basin plans.

RWQCBs will generally refrain from imposing effluent requirements on dischargers who are implementing BMPs in accordance with a waiver of WDRs, an approved MAA, or other SWRCB or RWQCB formal action. Once the SWRCB or RWQCB has formally approved BMPs, they will become the primary mechanism for meeting water quality standards. While compliance with BMP requirements cannot excuse a violation of water quality standards, the RWQCBs may rely on their implementation of BMPs to demonstrate compliance with standards.

Implementation of BMPs will normally include: (1) specific site conditions; (2) monitoring to assure that practices are properly applied and are effective; (3) immediate mitigation of a problem where the practices are not effective (including regulatory action, if necessary); and (4) improvement of an approved BMP or implementation of additional BMPs when needed to resolve a deficiency.

RWQCBs have discretion in deciding what BMPs to encourage through conditional waiver of WDRs or inclusion in RWQCB MAAs. RWQCBs need not adopt BMPs into basin plans for these purposes but may do so to facilitate regionwide application. The SWRCB will encourage reasonable consistency among the RWQCBs in choosing BMPs by: (1) transferring information among RWQCBs on effective (or ineffective) practices; (2) reviewing amendments to basin plans; and (3) making determinations as the appeal agency for RWQCB decisions.

Tier Three: Effluent Limitations and Enforcement

RWQCBs can enforce requirements on any proposed or existing waste discharge, including NPS discharges. Although RWQCBs cannot specify the manner of compliance with waste discharge limitations (with certain exceptions), in appropriate cases the RWQCBs can set limitations at a level that, in practice, requires implementation of BMPs.

While many of the NPS Program activities support and promote self-determined implementation, the SWRCB and RWQCBs have a wide array of enforcement mechanisms at their disposal that also will be utilized. Enforcement actions may be considered to address many circumstances including, but not limited to, the following: (1) violation of an effluent limit, receiving water limit, or discharge prohibition contained in an order or basin plan adopted by the SWRCB or an RWQCB; (2) an

R0018661

unauthorized spill, leak, fill, or other discharge; and (3) failure to perform an action required by the SWRCB or an RWQCB, such as submittal of a self-monitoring or technical report or completion of a clean-up task by a specified deadline.

It is important to note that enforcement of State water quality statutes is not solely the purview of the SWRCB and RWQCBs and their staffs. State law allows members of the public to petition the SWRCB to review permitting and enforcement actions or inactions by the RWQCB. In addition, the CWC provides for public participation in the issuance of orders, policies, and WQCPs.

The SWRCB and RWQCBs have a variety of enforcement tools to use in response to noncompliance by dischargers. An enforcement action is any formal or informal action taken to address an incidence of actual or threatened noncompliance with existing regulations or provisions designed to protect water quality.

Formal Enforcement: Formal enforcement actions fall into two basic categories: those that direct future actions by dischargers and those that address past violations. Actions that generally direct future action include notices to comply, imposition of time schedules, and issuance of cease and desist orders (CDOs) and cleanup and abatement orders (CAOs). Actions taken to address past violations can also include CAOs, rescission of WDRs, administrative civil liability (ACL), and referral to the attorney general (AG) or district attorney (DA). In some instances, both types are used concurrently to deal with a specific violation (e.g., discharger has had past violations but has not yet corrected the problem).

Any person adversely affected by an action or failure to act by an RWQCB may petition the SWRCB to review the decision. The petition must be received by the SWRCB within 30 days of the RWQCB action or refusal to act or 60 days after a request has been made to the RWQCB to act. In addition, the SWRCB may review, at any time and on its own motion, any action or failure to act by an RWQCB, including planning actions.

Informal Enforcement: For minor violations, the first step is usually informal enforcement action. The discharger is informed of the specific violations and is provided information as to how and why the violations occurred and how and when the discharge must come back into compliance. This step can be deleted for significant violations, such as repeated or intentional illegal discharges and falsified reports.

The notice of violation (NOV) letter is also an informal enforcement action. The purpose of a NOV letter is to bring a violation to the discharger's attention and to give the discharger an opportunity to correct the violation before formal enforcement actions are taken. Continued noncompliance should trigger formal enforcement action. An NOV letter is signed by the RWQCB Executive Officer and covers the following points: (1) description of specific violations; (2) summary of applicable enforcement options (including maximum ACL); and (3) a request for a written response.

Time Schedule Order: Pursuant to CWC section 13300, actual or threatened discharges of waste in violation of requirements can result in imposition of a time schedule which sets forth the actions a discharger shall take to correct or prevent the violation.

Cease and Desist Orders: CDOs are adopted pursuant to CWC sections 13301-13303. They are normally issued to dischargers regulated by WDRs and often remain in force for years. CDOs are typically issued to regulate dischargers with chronic non-compliance problems. These problems are rarely amenable to a short-term solution. Often, compliance involves extensive capital improvements or operational changes. The CDO will usually set a compliance schedule, including interim deadlines (if appropriate), interim effluent limits (if appropriate), and a final compliance date. CDOs may also include restrictions on additional service connections (referred to as a "connection ban") to community sewer systems. These have been applied to sanitary sewer systems but can be applied to storm sewer systems as well. Violations of CDOs should trigger further enforcement in the form of an ACL or referral to the AG for injunctive relief or monetary remedies.

Cleanup and Abatement Orders (CAO): CAOs are adopted pursuant to CWC section 13304. They are generally issued to dischargers that are not being regulated by WDRs. With the exception of ground water cleanup, CAOs are typically short-lived enforcement orders. CAOs are issued through an RWQCB action or by the Executive Officer under delegation from the RWQCB Members pursuant to CWC section 13223. Executive Officer-issued CAOs should be used when speed is important, such as when a major spill or treatment plant upset has occurred and waiting until the RWQCB can meet to approve a CAO would be inappropriate. Violations of CAOs should trigger further enforcement in the form of an ACL or referral to the AG for injunctive relief or monetary remedies.

Prohibitions: Basin plans may set forth appropriate prohibitions for various categories of NPS pollution. In some cases, these prohibitions are written to allow application of the prohibition to be waived during planning and permitting of projects or activities covered by a water quality management plan. A prohibition allows an RWQCB to take direct and immediate enforcement action through issuance of CAOs, even in the absence of WDRs. Therefore, it allows RWQCBs to respond in a timely manner where NPS pollution generated by certain activities is creating an emergency or a problem which is not otherwise being remedied in an adequate or timely manner.

Modification or Rescission of Waste Discharge Requirements: In accordance with the provisions of the CWC, and in the case of NPDES permits, the RWQCB may modify or rescind WDRs in response to violations. Rescission of WDRs generally is not an appropriate enforcement response where the discharger is unable to prevent the discharge as in the case of a wastewater treatment plant.

Referrals to the Attorney General or District Attorney: The RWQCB can refer violations to the AG or ask the appropriate county DA to seek civil or criminal penalties. In either case, a Superior Court judge will be asked to impose civil or criminal penalties. In some cases, the RWQCB may find it appropriate to request the U.S. Attorney's Office to review potential violations of federal environmental statutes, including the CWA, Migratory Bird Treaty Act, or the Resource Conservation and Recovery Act (RCRA). Enforcement actions taken by the RWQCB are civil actions. In cases where there is reason to believe that specific individuals or entities have engaged in criminal conduct, the RWQCB or Executive Officer may request that the DA pursue criminal actions. Under criminal law, individual persons, as well as responsible parties in public agencies and business entities, may be subject to fines or imprisonment.

Administrative Civil Liability

ACL means monetary assessments imposed by an RWQCB. These actions are intended to address past violations. If the underlying problem has not been corrected, the ACL action should be accompanied by an RWQCB order to compel future work by the discharger (e.g., CAO or CDO). The CWC authorizes ACLs in several circumstances, summarized in Table 12:

TABLE 12. POTENTIAL MONETARY ASSESSMENTS IMPOSED BY AN RWQCB

CWC Section	Type of Violation
13261	Failure to furnish report of waste discharge or to pay required fees.
13265	Unauthorized discharge of waste.
13268	Failure to furnish technical report.
13308	Failure to comply with time schedule.
13350	Intentional or negligent violation of CDO or CAO; violation of WDRs; or RWQCB prohibition which results in pollution or unauthorized release of any petroleum product.
13385	Violation of NPDES Permit, Basin Plan Prohibition, etc.

A summary of the "three-tiered approach," including practical examples of its application in California, is presented in Table 13.

Implement TMDLs

The development and implementation of TMDLs for NPS impaired water bodies are expected to enhance our ability to address NPS problems, consistent with the three-tiered approach described above. Along with the TMDL, the State will develop implementation plans that describe specific measures needed to achieve the point and nonpoint allocations established by the TMDL. For point sources, the allocations will be implemented through NPDES permits while NPS allocations are implemented through a wider range of authorities and programs, including the use of applicable State enforcement authorities. Therefore, TMDLs are expected to promote the implementation of the appropriate MMs that will achieve timely water quality improvements that have not been achieved through the other approaches.

TMDLs will provide a more detailed approach to ensuring the implementation of the appropriate NPS MMs and will provide a better framework for "triggering" more stringent implementation. For example, TMDLs will (1) establish goals to judge the performance of management programs; (2) create the ability to better assess the effectiveness and appropriateness of MPs individually and collectively; (3) provide a basis for determining when to use more stringent management options (e.g., WDRs or other enforcement authorities); and (4) assist in prioritizing State's staff and financial resources when pursuing corrective actions.

Implement MMs in Regulation

NPDES – Storm Water

The two-phased program under CWA section 402(p) requires NPDES permits for storm water discharges. In California, the federal NPDES Program is administered by the SWRCB through the nine RWQCBs. Since 1990, Phase I regulations have required NPDES permits for storm water discharges for:

- Municipal separate storm sewer systems serving populations greater than 100,000,
- Specific industrial activities, and
- Construction activities disturbing land of five or more acres.

Phase I requires that individual NPDES permits be issued for municipalities greater than 100,000 (in practice, the RWQCBs include many municipalities in urbanized areas with populations less than 100,000 in the Phase I programs). Individual municipal NPDES permits require implementation of structural and nonstructural control measures to reduce pollutant loads from industrial, commercial, and residential areas. Implementation of the NPDES Phase II Program will expand the existing program to include all municipalities within urbanized areas and small municipalities outside of urbanized areas with a population of at least 10,000 and a population density of at least 1,000 persons per square mile. The program will also expand to include construction sites that disturb between one and five acres.

California's current and developing approaches to addressing urban runoff are and will be consistent with both the NPDES and NPS Programs. In the interest of consistency and comprehensiveness, the SWRCB and RWQCBs will ensure the implementation of urban MMs in areas and activities currently regulated by the NPDES Phase I Permit Program by incorporating the MMs into existing NPDES permits as the permits are renewed (at five-year intervals). Similarly, the SWRCB and RWQCBs will ensure that the NPDES Phase II permits will serve as the enforceable authorities to implement the urban MMs in areas and activities covered under Phase II. As lead agencies for the NPS Program, the SWRCB, RWQCBs, and CCC will ensure that all NPS MMs not covered by the NPDES Phase I or Phase II permits are implemented through other mechanisms identified within the NPS Program Plan.

TABLE 13. DESCRIPTION AND USE OF THE THREE-TIERED APPROACH

Tier	Description of Approach	Examples of the Three-Tiered Approach in Action
<u>Tier One</u>: Self-determined Implementation of Best Management Practices	Landowners and resource managers implement MMs/BMPs to achieve water quality standards. The RWQCBs may rely on implementation of MMs and BMPs to demonstrate compliance with, but cannot excuse violation of, water quality standards. Self-determined implementation is encouraged through incentives and technical assistance offered by State and federal programs that promote resource stewardship to achieve water quality benefits and to comply with statutory requirements. Agencies that provide such programs include the SWRCB, RWQCBs, DOC, NRCS, FSA, RCDs, and UCCE. Self-determined implementation is encouraged through the recognition by landowners and resource managers that this tier allows the discharger more "self-determination" in complying with statutory requirements than the more-stringent Tiers Two and Three.	• Financial support for local watershed stewardship projects (CWA §319) • EQIP cost-share for implementation • Sacramento Watershed Program fostering stewardship • Urban pesticide committee education efforts • Workshops promoting the Rangeland WQMP
<u>Tier Two</u>: Regulatory- Based Encouragement of Management Practices	There are two ways that RWQCBs can use their regulatory authorities provided by the Porter-Cologne Act to encourage implementation of MMs/MPs. First, RWQCBs may work with landowners and resource managers to waive the adoption of WDRs or a waste discharge prohibition on the condition that MMs and BMPs will be implemented to correct or prevent NPS pollutant(s) of concern. Second, the SWRCB and RWQCBs may enforce MMs and BMPs by entering into MAAs with other agencies that have authority to enforce the implementation of appropriate MMs and BMPs.	• MAAs with BOF/CDF, USFS, and CDPR • Marin County Stormwater Program (RWQCB-2) • Channel Islands National Park – improved grazing practices (RWQCB-3) • Required submittal of agricultural drainage operation plans (RWQCB-5) • Agricultural Nutrient Management Plans-Newport Bay (RWQCB-8)
<u>Tier Three</u> Effluent Limitations and Enforcement	RWQCBs can adopt and enforce requirements on any proposed or existing waste discharge, including discharges from NPSs. Although RWQCBs are generally precluded from specifying the manner of compliance with waste discharge limitations, in appropriate cases limitations may be set at a level which, in practice, requires implementation of MMs and BMPs. In addition, the SWRCB and RWQCBs have a variety of enforcement tools—such as CDOs and ACLs—that can be used in response to noncompliance.	• WDRs for commercial nurseries – Newport Bay (RWQCB-8) • WDR for selenium for San Joaquin River (RWQCB-5) • Permitted storm water programs • Erosion Control – Lake Tahoe (RWQCB-6) • WDRs for dairies

Provide Financial and Technical Assistance

Introduction

Strong stewardship by local stakeholders is critical to ensuring the successful implementation of the MMs identified in the five-year plans. Self-determined implementation can be encouraged through technical assistance provided by both State and local entities. A priority in the Implementation Plan is for the SWRCB and CCC to provide comprehensive technical assistance to local groups and landowners. The State will identify additional agencies and develop agreements (MOUs) to significantly increase the ease of acquiring and disseminating the most accurate and current information possible. A goal of the SWRCB and CCC is to provide each stakeholder with the information they require by coordinating efforts throughout the State.

Funding (Financial Assistance)

The Program will depend largely on funding received through the CWA section 319(h), State appropriations, and the contributions of other entities, including local governments, nongovernmental organizations, and private individuals. Unless additional funds are made available, it is possible that some of the activities contained within this Program Plan will not be completed as proposed. It is anticipated that implementation difficulties related to funding limitations will be identified and addressed as provided for through periodic program reviews.

Available Program funding will be directed at supporting activities that implement the MMs as identified in CAMMPR. Projects and staff positions at the SWRCB and RWQCBs funded under the CWA section 319(h) must support the implementation of MMs. This change will be included in the next CWA section 319(h) grant cycle (FFY 2000).

Federal Funding

USEPA provides annual funding to the SWRCB for implementation of the NPS program, pursuant to the CWA section 319. Since section 319 was established by the reauthorization of the CWA in 1987, California has received over $40 million to support the State's NPS program. In 1999, the federal allocation to support State NPS programs under CWA section 319(h) was significantly increased in recognition that many of the most serious remaining water quality problems are associated with NPS pollution. California's CWA section 319(h) funding level was increased from $5.7 million in 1998 to $10.3 million in 1999.

In California, the CWA section 319(h) funds have generally been divided between supporting State staff activities at the RWQCBs and the SWRCB and funding NPS implementation projects. As the lead water quality agency in California, the SWRCB receives the CWA section 319(h) funding from USEPA through a cooperative agreement. The SWRCB and the RWQCBs prepare annual workplans for USEPA approval to specify the activities that will be supported through these CWA section 319(h) funds. CWA section 319(h) funding is primarily for implementation activities; therefore, at least 80 percent of all CWA section 319(h) funds must be spent on implementation, while no more than 20 percent may be allocated to planning and program development activities.

NPS projects have been selected based on a competitive process administered by the SWRCB and RWQCBs. Generally, an annual Request for Proposals (RFP) is issued for projects that will reduce or prevent NPS pollution to ground and surface waters. Eligible projects include the implementation of MPs, TMDL implementation, technology transfer, demonstration projects, pollution prevention, technical assistance, volunteer monitoring, and public education. Nonprofit organizations, local government agencies, including special districts (e.g., RCDs or water districts), and educational institutions are the recipients of these funds.

Another important source of funding for NPS projects is the SRF. The SRF is a low interest loan program established by the CWA to fund a wide range of water quality projects, including the same types of projects that are eligible for section 319(h) funding. Traditionally, the SRF and its predecessor, the Clean Water Grant Program, have been used to fund publicly-owned treatment works (POTWs) for sanitary sewer systems. However, the amendments to the CWA that established the SRF allowed for expanded uses of the SRF beyond the traditional POTW project. Capitalization for the SRF comes from an annual federal appropriation, 20 percent of State matching funds and loan repayments that revolve back into the SRF. Current assets (loans and cash) in California exceed $1 billion. The utilization of these assets offers one of the best avenues for funding the implementation of NPS MMs and related watershed implementation efforts.

To date, California has been a national leader in using the SRF to fund a wide variety of expanded use projects. Examples of types of expanded use projects that have been funded include:

- Stream restoration,
- Irrigated agricultural BMPs (improved methods of irrigation to reduce salt and selenium loads to the receiving water),
- Animal feeding operation BMPs (on-site improvements at small dairies that do not meet the USEPA definition of a point source),
- A vineyard to demonstrate BMPs and sustainable viticulture,
- Forestry BMPs (removal of dead and dying trees in the Lake Tahoe Basin),
- On-site septic system rehabilitation,
- Storm water treatment (including wetlands treatment),
- Wetlands preservation,

- Marina education and improvements,
- Water quality enhancements to flood control, and
- Estuary enhancement.

Using the fund to address all types of water quality issues regardless of whether it is a POTW, NPS, etc., is beneficial. In so doing, the SRF will help to foster the watershed approach. The SWRCB (who administers the SRF) is currently developing a formal policy regarding the funding of expanded use projects, including NPS projects. Once this policy is adopted, the expanded use projects will be given appropriate consideration in comparison to the traditional POTW projects.

State Funding

State funds have been earmarked for NPS Program development and implementation. These funds support SWRCB staff to develop MMs, the Strategy, and the Implementation Plan; develop and oversee formal agreements and informal partnerships; provide technical assistance; and provide public participation, education, and outreach. Additional funds are earmarked to develop and implement a program to track the effectiveness of MMs.

Currently, State monies fund NPS pollution prevention and reduction efforts at the SWRCB and RWQCBs in four of the six management categories: agriculture, forestry, hydromodification, and wetlands/riparian areas. Through State General Funds, the SWRCB and the RWQCBs update and revise basin plans regarding the effects of subsurface agricultural drainage on the State's waters. Staff also review forestry activities to ensure control of NPS pollution. Primary activities include: (1) the review of timber harvest plans, (2) consultation with federal agencies on silviculture, mining and grazing on forest lands, (3) evaluation of corrective actions, (4) development of water quality criteria and guidelines for treatment and disposal, (5) regulatory actions, (6) laboratory quality assurance, and (7) coordination of data management. The SWRCB and the RWQCBs administer the water quality certification program authorized through the CWA section 401. CWA section 401 requires that any applicant for a federal license or permit to conduct any activity which may result in a discharge to navigable waters obtain a certification from the State that the discharge will comply with the applicable provisions of CWA sections 1311, 1312, 1313, 1316, and 1317 (essentially State water quality standards). Generally speaking, CWA section 401 applies to dredge and/or fill permits issued by the USACOE, pursuant to CWA section 404 or hydropower generation facility licenses issued by the FERC.

Starting in 1999, the baseline allocation of the SWRCB has been augmented by $3.9 million to develop TMDLs, a necessary first step in reducing NPS pollution in impaired watersheds. While these funds will not support implementation of TMDLs, SWRCB and RWQCB staffs will participate in stewardship groups and assist community-based watershed monitoring programs.

Funds are also provided to on-the-ground pollution prevention and reduction activities through two funding sources: the Delta Tributary Watershed Program and the Agricultural Drainage Management Program (ADMP) authorized under Proposition 204. The Delta Tributary Watershed Program was awarded, on a one-time basis, $14.5 million for rehabilitation projects in the watersheds tributary to the Sacramento-San Joaquin Rivers Delta or the Trinity River. Most of these projects will begin in 1999 or early 2000. Of the $30 million set aside for the ADMP, $27.5 million was for low interest loans and $2.5 million was for the nonfederal share of a project specific to the Salton Sea. The loan fund can be used for the treatment, storage, conveyance, reduction, or disposal of agricultural drainage water that if discharged untreated would pollute California's waters.

Request for Proposals

Each year the SWRCB and USEPA release RFPs for watershed planning and implementation projects to reduce, eliminate, or prevent water pollution and to enhance water quality. The RFP contains information concerning project requirements, anticipated funding levels, the review process, and selection criteria, and an application form is included that serves as the proposal. Funds made available are typically offered under the authority of Federal CWA section 205(j) Water Quality Planning and Assessment or CWA section 319(h) NPS Implementation Programs. However, in 1997 and 1998, the SWRCB offered $15 million made available through Proposition 204, the 1996 Bond Act.

The SWRCB and RWQCBs view the funding of projects consistent with priorities identified in the RFPs as an important tool in managing NPS pollution. Beginning with the calendar year 2000, RFP projects must implement actions that achieve NPS MMs goals and objectives to receive funding.

The funds contracted out under the RFPs represent half of the federal NPS funds California receives. The Program recognized several years ago the need to better track and evaluate the effectiveness of these projects. Working with UCD ICE, the State is working (1) to promote information exchange and coordination among watershed groups; (2) to geographically track the implementation of MMs; and (3) to determine the effectiveness of CWA section 205(j) and 319(h) projects in protecting beneficial uses and improving water quality. Effective with the 1999 RFP, all selected projects' contractors must complete a one page contract summary (format provided by SWRCB) within three months of the contract execution. The SWRCB will make the summaries available to the public, including posting them on the SWRCB's

NPS web site. At the completion of each funded project prior to final payment, all projects must complete a project survey form supplied by the SWRCB. At the same time, SWRCB and RWQCB staffs may survey project location and aerial extent using global position equipment. The information gathered will be entered into an internet-accessible geographic information system (GIS) and be provided as part of the required annual, biennial, and five-year cycle reports. In addition, information concerning each CWA section 319(h) funded project is being entered into a USEPA mandated tracking system known as the Grants Reporting and Tracking System (GRTS) to further aid in fiscal management, accountability, and the exchange of information.

Through these RFPs, the SWRCB, RWQCBs, and USEPA, Region 9, are encouraging watershed management as a means to ensure high quality waters, maximize the use of limited resources, and develop partnerships among all stakeholders of watersheds to address water quality issues. In this respect, grants offered through RFPs are being integrated under the SWRCB's and RWQCB's WMI to ensure the most efficient use of the funds. Local stewardship and partnerships among governmental agencies and private interests are vital parts of the type of watershed management envisioned. Involvement of stakeholders throughout a watershed is a critical feature of watershed management that will provide for sustained, long-term improvements in the beneficial uses of water and water quality. Implementation activities identified in a watershed management plan or similar comprehensive efforts to achieve sustained improvements in water quality and natural resources are a priority. CWA section 205(j) provides water quality planning funds, and CWA section 319(h) provides NPS implementation funds. The funds provided via RFPs are not intended to be used as the sole or principal source of support for local resource management.

Other Agencies Sources

Collaboration with the MBNMS

The CCC and MBNMS WQPP are working to develop coordinated grants among numerous nonprofit organizations improving water quality and restoration. This coordination of funding is intended to help nonprofit organizations obtain grant assistance, coordinate the expertise of the numerous groups working on NPS pollution, and identify a regional framework to guide future projects.

Technical Assistance

Introduction

The SWRCB, RWQCBs, and CCC recognize that individuals, watershed groups, and communities have varying levels of technical and financial capabilities related to water quality protection and restoration and the protection of beneficial uses. In particular, the level of expertise available at the local and/or watershed level during project planning, design, and implementation can have a significant effect on the time and effort needed to implement practices to address NPS pollution. Technical and financial assistance is needed for those who plan and manage resources (e.g., planners, forest managers, public works staff, harbor masters, watershed groups) and those whose activities alter the landscape or affect the water column (e.g., farmers, road builders, boat hull cleaners).

Types of technical assistance include MP manuals, training, assistance in developing ordinances and regulations, modeling to predict and assess the effectiveness of any additional NPS MMs, and the development and management of databases to track implementation of MMs, monitoring data, and land use changes. Technical assistance also includes demonstration projects and other innovations to protect water quality and designated uses. Financial assistance includes both grants and low-interest loans.

Goals

A priority goal of the NPS Program is to provide technical and financial assistance to local governments and the public in assessing watershed conditions and implementing applicable MMs to address identified problems. The NPS management agencies will also work with other federal, State, and local agencies, as well as other private experts where feasible, and will encourage them to use their expertise. Specific objectives include:

- Conducting an ongoing assessment of training and technical and financial assistance needs;
- Providing for the transfer of information on technical and financial assistance including available tools, training courses, grant and loan opportunities, and contact information;
- Improving technical tools;
- Providing technical training for resource managers, landowners and land operators, and the public; and
- Providing financial assistance for on-the-ground implementation of MMs and MPs for each land use sector (i.e., agriculture, forestry, urban, marinas, hydromodification, and wetlands).

The NPS Program will also support technical and financial assistance efforts within other agencies. Examples of existing technical assistance efforts include:

- UCCE and NRCS currently provide technical assistance to the livestock industry and rangeland owners and managers through the California Rangeland Water Quality Management Program (CRWQMP);
- The California Stormwater Quality Task Force (SWQTF) provides assistance to municipal agencies and other dischargers subject to existing storm water permits, while the MURP has been developed to help smaller

municipalities (less than 100,000 in population) develop runoff control programs to protect water quality and prepare for pending storm water permits;

- The MURP has been developed to help smaller municipalities (less than 100,000 in population) develop runoff control programs to protect water quality and prepare for pending storm water permits;
- The CCBN and San Diego Safe Boating and Environment Coalition are devoted to identifying education and technical assistance needs regarding environmentally sound boating and to providing networking opportunities;
- The SWRCB TMDL Program is focusing technical assistance efforts on assessing water conditions and, to the maximum extent practicable, on working with local interests on the collaborative identification of: (1) watershed problems, (2) desired future conditions, (3) numeric targets, (4) allocations of allowable pollution, and (5) implementation.
- The CCC is committed to make available and provide training for use of its Watershed Analysis Tool for Environmental Review (WATER). WATER is a GIS-based analysis tool that connects land use information to water quality in watersheds of the Monterey Bay area, and thus enabling selection of the appropriate MMs for implementation in those particular watersheds. The CCC's permit tracking system also provides a valuable tool for tracking land use activities.
- The NPS Program's future efforts in identifying and mapping CCAs will allow the implementing agencies to direct their resources to coastal areas faced with water quality threats that accompany new and existing development.

Actions

The SWRCB, RWQCBs, and CCC are committed to providing technical and financial assistance through 2013. New and changing needs and opportunities will be identified annually and outlined in each five-year implementation plan. Beginning in State FY 1999-2000, the SWRCB and RWQCBs will provide CWA section 319(h) grants for projects that implement NPS MMs and/or provide for watershed restoration. In State FY 1999-2000, the CCC approved $500,000 in local assistance grants to LCP work programs for eight coastal cities and counties, all of which include NPS requirements or guidelines.

In the short term, the SWRCB has identified the provision of technical assistance as a priority objective in the 1999 CWA section 319(h) RFP. The CCC identified technical and financial assistance as a priority for the State FY 1999-2000 CZMA grants workplan (the CCC is providing funding for projects that develop technical assistance tools, such as technical guidance and model ordinances). The SWRCB and USEPA are also investigating using the Clean Water SRF—a permanent source of low-interest funding for high-priority water quality projects—for addressing a variety of other NPS and estuary water quality issues. Other actions are identified in the Implementation Plan.

G. Track, Monitor, Assess, and Report

The NPS Program must establish mechanisms to determine success in achieving short- and long-term goals. We must:

- Track MM implementation,
- Monitor the program's effectiveness in controlling pollution,
- Assess success in achieving our objectives and milestones, and
- Report on program effectiveness.

Our efforts to demonstrate program effectiveness are guided by existing federal and State requirements. Section 319(b) of the CWA specifies the minimum contents of State NPS management programs including "*(viii) A description of the monitoring and other evaluation programs that the State will conduct to help determine short- and long-term program effectiveness.*" Federal guidance also requires the states to periodically review and evaluate NPS management programs using environmental and functional measures of success and to revise NPS assessment and management programs at least every five years[15]. Section 6217 of CZARA requires monitoring techniques to evaluate the success of the MMs in reducing pollution loads and improving water quality.[16] A monitoring program will also help fulfill the legislative mandate of the Comprehensive Coastal Monitoring Strategy required by Assembly Bill (AB) 1429. It stated, in part: "Sound water quality management decisions require a solid base of information collected from a variety of sources … improved monitoring, or in some cases improved coordination of existing programs, will be necessary for the State of California to achieve a systematic understanding of NPS pollution and to measure the effect of efforts to reduce this water pollution source."

A comprehensive monitoring strategy for the NPS program will soon be complete. This strategy will be designed to provide objective, quantified answers to broad management questions. These questions are then refined into more discrete monitoring objectives that will shape the design of specific monitoring programs. The monitoring strategy will focus primarily on answering the first two questions posed below while coordinating with other monitoring programs to effectively answer all questions.

---

[15] In 1996, USEPA released a CWA section 319(h) guidance document requiring states to upgrade their NPS programs consistent with nine key elements in order to achieve "*Enhanced Benefit Status.*" In a January 1999 memorandum, J. Charles Fox, USEPA Assistant Administrator, reiterated the requirement and outlined the process for approval of upgraded NPS Programs.

[16] NOAA and USEPA in accordance with these statutory mandates provide additional specifics for the monitoring and tracking of MMs in their January 1993 Coastal Nonpoint Pollution Control Program – Program Development and Approval Guidance.

1. *Are MPs to reduce polluted runoff being implemented (Tracking or Implementation Monitoring[17])?* Our efforts will focus on tracking MM implementation and determine whether practices are implemented in accordance with relevant standards and specifications.

2. *Are the MPs effective in avoiding or minimizing pollution generation (Effectiveness Monitoring[18], Compliance Monitoring[19])?* We will develop a monitoring strategy that measures the effectiveness of MPs for agriculture, forestry, urban sources, and marinas.

3. *Is water quality being protected and are narrative and numerical water quality criteria being achieved (Baseline Monitoring[20], Compliance Monitoring)?* We will coordinate with ongoing regional monitoring efforts and point-source compliance monitoring to identify impairments and determine the extent, causes, and sources of impairment.

4. *Is reasonable progress being made toward reducing NPS polluted runoff?* We will review tracking and monitoring information through external review committees and TACs and assess the state of the Program.

Implementation of the MMs through MPs can be considered a "technology-based" approach to NPS pollution control. Application of MPs will reduce NPS pollutant loadings and improve water quality. As such, tracking the extent of MM implementation (and the associated MPs) will provide the initial measure of NPS Program success. Due to the areal extent and scale of NPS problems, improvements in water quality will take time. Ultimately, however, the long-term success of the NPS Program must be measured by corresponding improvements in water quality. This water quality-based approach to assessing success will be accomplished through the SWRCB's development of a comprehensive surface water quality program, to the extent that funds are available, by January 1, 2001, pursuant to section 13181(c)(1) of the Porter-Cologne Act. The comprehensive water quality program will address, among other issues, the following:

- To the extent possible, a determination regarding the extent to which existing water quality objectives are being met;
- To the extent possible, a determination regarding the sources of pollution in areas where objectives, standards, and guidelines are not being met; and
- Methods for determining the degree of improvement or degradation in coastal water quality over time.

[17] Implementation monitoring assesses whether activities were carried out as planned. It does not necessarily include water quality measurements. Our efforts to track whether BMPs were performed follow under this type of monitoring.

[18] Effective monitoring evaluates whether the specified activities (e.g., individual management practices, timber sale, construction project) had the desired effect. Monitoring definitions are described further in USEPA (1991).

[19] Compliance monitoring evaluates whether a water quality standard is being met.

[20] Baseline monitoring characterizes existing water quality conditions and establishes a database for planning or future comparisons. Continued baseline monitoring may become trend monitoring.

Prior to development of the comprehensive monitoring program, the SWRCB will, pursuant to section 13192 of the Porter-Cologne Act, on or before November 30, 2000, assess and report on the SWRCB's and RWQCBs' current surface water quality monitoring programs. Important elements to be considered in this report include, but are not limited to, the following:

- The physical, chemical, biological, and other parameters that a comprehensive water quality monitoring program should collect and evaluate in order to determine ambient water quality; and
- A strategy for assessing and characterizing discharges from NPS pollution.

In addition, the SWRCB, pursuant to Porter-Cologne Act section 13181(b)(1), will prepare and complete an inventory of existing water quality and monitoring activities within State coastal watersheds, bays, estuaries, and coastal waters, by January 1, 2000, to the extent that funds are available for this purpose.

Tracking Management Measure Implementation

Tracking MM implementation is the simpler, more straightforward component of the monitoring strategy. The MMs are directly implemented on ground via MPs. MPs are implemented by the landowner or user because of their stewardship approach to land use; it makes business sense; or it is in response to regulatory pressures or requirements, such as to meet waste discharge or other permit requirements.

This tracking program will be broad-based and inclusive of all MM categories and water bodies in California. A tracking program is currently being designed to identify:

- What MMs are implemented,
- Where MMs are implemented,
- Who is implementing them,
- When they are implemented,
- Why they are being implemented (e.g., because of self-interest, regulatory-encouragement, or regulation), and
- Which agencies and programs are supporting implementation?

The tracking program will also include specific performance measures and goals that can be used at the end of the five-year period to determine the scope and extent of MM implementation. Combined with the effectiveness monitoring (described below), it will allow us to gauge the success of program implementation efforts. An example of a performance measure would be "the number of approved farm plans which implement relevant agricultural measures." Examples of performance goals would be (1) "to have in place approved farm plans for 80 percent of the farms in each watershed" or (2) "implement agricultural MMs or MPs on 80 percent of farm lands in each watershed." The five-year review will be comprehensive in scope, addressing all of the measures and broken out on a watershed basis, to the extent possible. The measures and goals will be developed through an interagency effort which will include public involvement, such as the IACC and the Assessment TAC.

The State recognized several years ago the need to better track and evaluate the effectiveness of these projects. Through contracts with UCD ICE, the State is working to: (1) promote information exchange and coordination among watershed groups; (2) geographically track the implementation of MMs; and (3) determine the effectiveness of CWA sections 205(j) and 319(h) projects in protecting beneficial uses and improving water quality. All selected projects must complete a one-page contract summary which the SWRCB will make available to the public. At the completion of each funded project, all projects must complete a project survey form and agency staff may survey the project location and determine the aerial extent of MM implementation. The information gathered will be entered into an internet-accessible GIS and be provided as part of the required annual, biennial, and five-year cycle reports.

This MM information will augment information already collected for watershed projects in California. Data on the over 1,000 conservation, mitigation, and restoration projects being developed and implemented throughout California resides on-line in the Natural Resource Project Inventory (NRPI). NRPI is a cooperative data-collection effort of environmental scientists at the UCD-ICE and over 30 private, State, federal, and international organizations interested in environmental protection[21]. The goal of NRPI is to make project and group information accessible to anyone who wants to review current activities in their region or statewide.

NRPI is an expansion of previous inventories such as the California Watershed Projects Inventory (CWPI) supported by the USEPA, the SWRCB, and Cal/RA and the California Ecological Restoration Projects Inventory (CERPI) supported by the USEPA, the Society for Ecological Restoration, and DOC. NRPI also integrates newer efforts, such as the Biological Resource Division's Mendocino Coast Metadata Inventory and the California Interagency Noxious Weeds Coordinating Committee's Noxious Weeds Projects Inventory. Environmental planning activities and agreements such as Habitat Conservation Plans, Natural Community Conservation Plans, and other resource-based plans will also be candidates for the NRPI database[22]. Beginning with the 1998 CWA sections 205 (j) and 319 (h) grant projects, all project contractors are now required, prior to final payment, to complete a post-project survey form that the SWRCB will provide to ICE for inclusion in NRPI.

[21] NRPI is supported by the CBC whose 37 members include nine regional associations of county supervisors, 15 State agencies, UC, and the CARCD. Each of these members has designated one expert to bring in data from his or her respective agency. This information is then entered into the NRPI database/web page designed and hosted by the ICE. Participation by the CBC signatories is augmented by a growing list of data contributors including UCCE, the CRMP Council, and the Klamath Watershed Coordination Group.

[22] The NRPI structure will allow core searches of all underlying inventories at the same time. Each NRPI record points to the separate underlying inventory for more detailed information. The inventories also exist separately and can be searched independently. Each dataset will also be referenced spatially in a GIS, allowing the creation of dynamic maps of projects, groups, and datasets.

Because of ICE's long history of developing and applying natural resource science to environmental issues, computer resource infrastructure, and the synergistic effect of so many participating agencies, the SWRCB has committed to use NRPI as the primary means to track implementation of MMs. In the spring of 1999, the SWRCB executed a contract with ICE to modify NRPI's data structure and to redesign the reporting form used to inventory projects to capture information specific to the implementation of the MMs and to further populate the database. Information collected from all participating entities will include such items as implementing programs, authorities, MMs, and graphic coordinates. Modifications will also include a link to the SWRCB's GeoWBS which contains the CWA section 303(d) Impaired Water Body List.

Besides the NRPI, the CCC also has a system for tracking permitted land use activities. Currently, there is a wetland-specific component contained in the more general Permit Tracking System. The CCC is prepared to develop similar runoff-specific tracking elements to allow for the tracking of MM implementation for preventing and controlling NPS pollution.

Monitoring the Effectiveness of Management Practices

With the tracking system underway, the next component of the monitoring strategy is documenting and evaluating the effectiveness of the NPS pollution control practices. Establishing the effectiveness of the State's efforts to control NPS pollution will be a long-term, complicated, and expensive commitment for the following reasons:

- Nature of the NPSs of pollution are typically diffuse and difficult to define.
- NPS pollutants are varied and include sediment, nutrients, pathogens, salts, toxic substances, petroleum products, and pesticides.
- NPS pollution is extensive and spread over the entire State (155,000 square miles) and is not limited to specific outfalls. There are over 4,000 water bodies listed in the SWRCB's GeoWBS, of which 480 are listed as impaired.
- Watersheds are complex, and multiple sources within a watershed may contribute to the same pollutant.
- There is usually a substantial lag time between implementation of MPs and response in the watershed.
- The need for water quality monitoring, both qualitative and quantitative, is extensive.
- There are limited resources for water quality assessment.
- Regulatory authority is complex. Over 31 State agencies have NPS regulatory authorities and programs.

However, determining MM effectiveness is critical to understanding how MPs avoid pollution generation and improve water quality. The lead agencies are currently designing this component of the monitoring strategy. In the spring of 1999, the SWRCB executed a contract with UCD to develop a comprehensive monitoring program to assess the functioning of MPs. The comprehensive monitoring program will:

- Establish criteria to assess the functioning of MPs;
- Monitor practices in each major pollution source category (i.e., agriculture, forestry, urban sources, marinas, and hydromodification);
- Monitor long-term at least one watershed within the jurisdiction of each of the nine RWQCBs;
- Integrate NPS monitoring with other monitoring programs, including citizen monitoring programs; and
- Report monitoring information to all interested parties.

The Program Plan's monitoring will focus primarily on the on-site evaluation of MP effectiveness and their ability to avoid pollution generation. Pollution control success criteria will be developed for each major pollution source category (i.e., agriculture, forestry, urban sources, marinas, and hydromodification). These criteria will be grounded in simple, empirical observations of the effectiveness of MMs performed by landowners or community members. UCD will review potential indicators and develop a preliminary list of criteria. These criteria will be reviewed by panels of agency, industry, and community members. A suite of candidate measures will be tested in the field during the pilot phase of the monitoring program (year 2000). This pilot phase, called the Functioning Assessment Criteria Test (FACT), will be implemented by UCD with the support of community volunteers, landowners, and qualified monitoring experts. From FACT's success we will develop a broader effectiveness-monitoring program that will evaluate all MM sectors by the year 2013.

The RWQCBs are currently targeting two impaired water bodies per year in each region for developing TMDLs. Following TMDL development and adoption into the basin plan, the RWQCBs will begin TMDL implementation. We will target our NPS monitoring in those watersheds where NPS pollution is a significant contributor to water quality impairment. Monitoring will need to continue in these watersheds over many years to accurately document changes in pollutant loads and the effectiveness of MPs. The lead agencies will work with other agencies, key stakeholders, and citizen monitoring programs to craft a long-term monitoring strategy. At a minimum, the strategy should be designed to implement base-line monitoring one watershed per region per year for ten years.

Various effectiveness-monitoring programs are ongoing and will be evaluated during the pilot phase (FACT) so that the most beneficial comprehensive strategy can be developed. Furthermore, these monitoring programs will be augmented rather than replaced. This is particularly true in the forestry arena where the proper implementation and effectiveness of forestry MPs is being evaluated by the Monitoring Study Group (MSG). This MSG was created by the California BOF to determine how effective the Forest Practice Rules (FPR) are in protecting water quality. The CDF implemented hillslope monitoring in 1996 on 50 randomly selected Timber Harvesting Plans (THPs) in Humboldt and Mendocino Counties to provide information on forest practices within the range of Coho salmon. The program expanded in 1997 and 1998 to evaluate THPs throughout the State. Evaluation of 150 THPs occurred in areas with the greatest risk to water quality—roads, skid trails, landings, watercourse crossings, and watercourse and lake protection zones (WLPZs). In total, approximately 150 FPR requirements were evaluated. From this monitoring study, forestry regulators will determine whether erosion problems on hillslopes were due to improperly implemented FPRs or the inadequacy of the FPRs.

In the agricultural arena, the Dairy Quality Assurance Project has developed a method for measuring the effectiveness of dairy nutrient MPs. The crux of the method is dairy inspections by certified third party inspectors. The method of inspections is under development and will be assessed for possible use in evaluating other MMs.

Since our effectiveness monitoring will focus primarily on the on-site evaluation of MPs, we must coordinate with other monitoring programs to ensure an accurate assessment of the effects of NPS pollution on aquatic resources. A blend of monitoring programs to achieve multiple objectives will be the most effective long-term monitoring strategy. This blending of objectives can only occur through active program coordination. First, a subcommittee of the IACC will focus on assessment to improve interagency coordination of monitoring programs. Second, the SWRCB and RWQCB staffs will continue intra-agency coordination through the Monitoring and Assessment Team. Third, SWRCB and RWQCB staffs will continue to work on existing monitoring programs such as: (1) the Comprehensive Coastal Monitoring Strategy; (2) CALFED's Comprehensive Monitoring, Assessment, and Research program on the San Francisco Bay-Delta; (3) the Regional Monitoring Program of the San Francisco Bay; (4) the Central Coast Regional Monitoring Program; (5) the Sacramento River Toxic Pollutant Control Program; (6) the Southern California Bight Program; (7) U.S. Geological Survey's (USGS) National Water Quality Assessment Program (NAWQA); and (8) USGS's National Irrigation Water Quality Program.

An example of specific questions being posed for State monitoring include measuring the effectiveness of MPs to reduce contamination of surface and ground waters by synthetic pesticides and fertilizers. The State will work with CDPR, U.S. Department of Agriculture (USDA) (NRCS, USFS, FSA, and RCD), the agricultural community, agricultural producers, researchers, and other public interests to design a set of trials to compare movement of nutrients and pesticides both before and after implementation.

Because of the emphasis in the NPS Program on self-determined pollution prevention, landowners, farmers, ranchers, boat owners, and community members will often monitor the effectiveness of their own practices, interpret the results, and, if necessary, modify their practices. In the next 15 years, SWRCB and RWQCB staffs will improve community-based watershed monitoring efforts by: (1) developing and reviewing new methods for monitoring MM implementation and effectiveness; (2) disseminating quality assurance requirements; and (3) increasing training opportunities. Technical resources will be developed and distributed statewide. These include standard monitoring protocols, quality assurance plans, guidance on how to start a community-based monitoring program, and data storage and retrieval mechanisms. Monitoring protocols will be designed to evaluate MP effectiveness and optimize data comparability between watersheds. However, efforts will be made to tailor protocols to stakeholder needs and geographical diversity. Guidance on quality assurance will identify the data quality needs of important programs such as TMDLs. Training in monitoring design, monitoring techniques, data interpretation, quality assurance, and database management will continue. The SWRCB and RWQCB staffs will continue to support regional steering committees that foster partnerships among local, State, and federal governments and business, industry, and volunteer groups. If funding permits, the SWRCB will develop a statewide small grants program to support volunteer monitoring efforts.

The SWRCB and RWQCBs will work to resolve concerns about confidentiality of data collected voluntarily by landowners on their own practices. Sharing data will be beneficial in transferring knowledge about the success of certain practices. However, landowners may fear that regulators may use data to require additional monitoring or permit MPs. These concerns should be aired and addressed through discussions with agency staff, landowners, and appropriate industry representatives. Hopefully, successful solutions, such as the third party inspections developed in the Dairy Quality Assurance Project, can be achieved.

Resource needs identified by this work will form the basis for future resource requests to the State. SWRCB and RWQCB resources are inadequate for statewide comprehensive water quality monitoring. SWRCB is working to procure funding for those currently unfunded monitoring and assessment activities that are of central importance to the SWRCB's programs. The funding strategy will seek to fund key activities that meet multiple program mandates. This selection of the activities to be funded is based on overlapping needs for data that can best be addressed by an integrated monitoring and assessment effort. One of the key activities identified by management is to develop a compliance-monitoring program for NPS pollutants. We will seek a broad base of funding support from federal, State, and local government sources.

Assessing Internal Program

Evaluating the success of the NPS Program will include the elements of tracking and monitoring noted above. However, it will also include a systematic evaluation of whether we have achieved the short- and long-term goals of the program. To do this, staffs from the SWRCB, CCC, and other agencies will participate in the Assessment TAC to conduct biennial reviews and report on issues such as:

1. Completion of the activities identified in the five-year implementation plans and the attainment of their associated performance measures;
2. Performance of the system(s) (e.g., NRPI and the CCC's permit tracking system) used to track the implementation of MMs;
3. Effectiveness of the implemented MMs;
4. Involvement of the appropriate federal and State agencies in implementing the Program Plan and the mechanisms of agency participation (e.g., MOUs/MAAs [see Table 10]);
5. Public participation;
6. Coordination of agency and public activities via the IACC;
7. Identification of additional needs for public education and technical assistance;

8. Evaluation of the overall program performance and the program's ability to stay on schedule for full implementation of all identified MMs by 2013; and
9. Recommendations for program improvement.

In addition, the biennial review/workshop will discuss funding for implementation of the Program Plan. Issues to be discussed will include, but are not limited to, the following: (1) significant funding needs integral to the success of the Program Plan; (2) an analysis of funding mechanisms that can be used to continue needed MM development and research; (3) monitoring activities; and (4) long-term funding such as CWA section 319(h) grants, the State budget process, and statewide initiatives.

Reporting Program Effectiveness

The monitoring data will need to be routinely interpreted, assessed, and reported to the community of resource managers, landowners, farmers, ranchers, industry, and environmentalists who are interested in NPS pollution prevention. In this way, the reviewing audience can use the information on effectiveness of MMs to redesign and retest those practices.

Three separate reporting efforts are integral to the NPS Program. First, SWRCB and the CCC will provide biennial reports of its progress in meeting its objectives and performance measures. These reports will assess program success and recommend modifications to MMs and their implementation. These reports will be available to the public, implementing agencies, the Legislature, USEPA, and NOAA. Second, the SWRCB and RWQCBs provide a performance report semi-annually to USEPA. This performance report covers NPS activities funded by CWA section 319(h) funds. The report lists major accomplishments, describes progress towards future accomplishments, and accounts for tasks that are behind schedule. The third report is the annual progress report on NPS programs and projects funded by CWA section 319(h). This report, authored by SWRCB and RWQCBs, focuses on the progress made in meeting milestones identified in the annual CWA section 319(h) workplan.

The State will improve the on-line inventories of watershed projects (e.g., NRPI, CWPI) and monitoring programs. Efforts will ensure that the NPS monitoring program data are integrated into the comprehensive, user-friendly water quality database system called "System for Water Information Management" (SWIM) that is being developed by the SWRCB. The ultimate goal of SWIM is an on-line accessible database of real monitoring results. These data will be accessible for public and agency use and will enable participants to have equal use of data in developing comments and revising strategies.

H. Overall Program Assessment - Refining the Program

Making the Program information available for external review not only bestows a certain degree of credibility to the Program, it also enables public participation in the periodic assessment and refinement processes. Public involvement is encouraged through the Assessment TAC created by the IACC. The Assessment TAC will then cooperate with the other TACs (Technical Assistance, Education, and Regulation) to propose modifications to the NPS Program which may include:

- Shifts in Program efforts (e.g., additional target watersheds and additional MMs),
- Strengthening individual NPS-related programs (e.g., expediting MM implementation and increasing enforcement, when appropriate),
- Improving agency coordination,
- Increasing public education and participation, and
- Increasing funding.

Modifying and Adding Additional Management Measures

One of the biggest challenges facing the NPS Program is providing for the implementation of "additional MMs" where water quality is impaired or threatened even after the implementation of California's MM goals. It is important for California to identify waters that are not attaining or maintaining applicable water quality standards and to identify and develop additional MMs to address persistent water quality problems.

Goals

Our overall goal is to develop a continuing process for identifying and implementing additional MMs that include milestones for implementation, evaluation, and, as necessary, revision. These additional MMs will be developed when needed to attain and maintain water quality standards.

New Management Measures

In developing the Program Plan, California identified the following additional MMs:

- Education MMs for Agriculture, Forestry, Hydromodification, and Wetlands. California added Education/Outreach MMs to reflect the State's intention to promote public awareness and involvement in controlling NPS pollution (the g-Guidance included education MMs for the urban and marinas sectors only). Nearly all of the TACs recommended that California enhance public education so that individuals can take responsibility and make the cooperative approach work.
- Post-Harvest Evaluation for Forestry. The post-harvest evaluation for forestry will help evaluate the successful implementation of the State's forest practice requirements. From this evaluation, appropriate changes to or oversight of the requirements can be developed. This evaluation of the forest practice requirements has been initiated and is described in the Monitoring Section.
- Marina Solid Waste Facilities. In addition to operating and maintaining these facilities, there is a need to support the installation of waste management facilities.

Process for Developing Additional Management Measures

California will conduct the following activities related to additional MMs:

- Ensure agency and public participation in developing and implementing the additional MMs.

- Coordinate review of CZARA section 6217(g) MMs and identify an initial set of additional MMs that are applicable for implementation in California.
- Involve the Assessment and/or Technical Assistance TACs, created by the IACC, to identify and recommend additional MMs.
- Develop a process for identifying and implementing additional MMs to address "additional" pollutant sources (e.g., resource extraction and abandoned mines, pitch canker [forestry], water conservation, and aerial deposition).
- Implement additional MMs in next five-year implementation plan.
- Track MM and MP implementation and review and assess effectiveness.
- Implement a long-term strategy for addressing pollution from active and inactive mines. (Active and abandoned mines are a significant source of NPS pollution as shown in Table 3 and discussed below.)

Abandoned Mines

Introduction

The SWRCB is the lead agency for control of water pollution by any source, including abandoned mines. However, there is no specific, comprehensive program at either a State or federal level for cleaning up abandoned and inactive non-coal mines. Rather, abandoned and inactive mine cleanup is carried out under a variety of State, federal, and local programs.

Over a century of mining since 1849 has left California with literally tens of thousands of small abandoned "hardrock" mines. Although not significant polluters individually, they often contribute cumulatively to chronic toxicity in affected watersheds via metals loading. Similarly, abandoned hydraulic placer gold mines and abandoned aggregate mines degrade aquatic habitat via excessive sediment loading. Again, the most serious sites are usually handled directly (e.g., Malakoff Diggings State Park, a historic hydraulic mining site, is under WDRs for sediment discharge), but the cumulative effects of smaller sites are not even addressed.

A few mine cleanups have been carried out under the Federal Superfund Program pursuant to California's Title 27 Program, which regulates waste discharges to land, and California's Surface Mining and Reclamation Program. For the most part, the worst abandoned mines are being cleaned up under the Federal Superfund Program. USEPA is also considering listing additional abandoned mines on the National Priority List in the future, but these would be sites that cause serious environmental problems or pose a substantial threat to human health. In a few instances, RWQCBs have tried to affect cleanup of abandoned mines by placing them under WDRs pursuant to Title 27.

The main barrier to a comprehensive program for abandoned mines is liability. Under the federal CWA, a third party can sue an agency or private party that performs abatement work at an abandoned mine if the discharge from the mine continues to violate the CWA (refer to the Penn Mine lawsuit). California recently passed legislation that provides protection for "Good Samaritan" cleanup under State law. Efforts over the last few years to amend federal law to provide similar protection have failed (although these efforts continue). Thus, liability is the main barrier to a comprehensive program for cleaning up abandoned mines.

Goals

- Continue to regulate the most prodigiously polluting abandoned mines under the appropriate programs.
- Support efforts to resolve the liability issue, the main impediment to a coordinated effort to clean up abandoned mines.
- Develop strategies and measures for abating chronic toxicity and habitat degradation from the cumulative effects of numerous small sites.

Actions – Characterization and Cleanup

The SWRCB and RWQCBs have identified approximately 40 mines that cause serious water quality problems resulting from acid mine drainage and acute mercury loading. Additionally, within the last year, State and federal agencies have realized that drainage structures and sluices associated with abandoned hydraulic gold mines are a potential source of mercury to waters of the State. Mercury from these abandoned mines poses a serious potential threat to coastal waters because mercury transported from these sites may bioaccumulate in fish. To that end, State and federal agencies are collaborating with local entities to investigate mercury loading from abandoned hydraulic mine sites in the Bear and South Fork Yuba watersheds. This effort is being supported by State funds (Proposition 204 Grant, bond money) as well as by federal and local matching funds. The investigation could serve as a model for additional investigations of watersheds affected by hydraulic mining.

The DOC is inventorying abandoned mines statewide and is anticipating that there will be at least 20,000 sites. To manage this inventory, DOC developed a relational database that records the salient features found at abandoned mines. Because the SWRCB participated in developing the database, features that contribute to water quality degradation are incorporated into the database. DOC is incorporating existing inventory information and is coordinating data gathering efforts with other State and federal agencies. DOC intends to distribute the database and supporting software to State and federal agencies that are responsible for regulating abandoned mines. When that distribution occurs, the SWRCB and RWQCBs will have a powerful new tool for tracking work performed at abandoned mines, evaluating regional clean-up efforts in affected watersheds, and evaluating the impact abandoned mines have on watersheds.

As a land-managing agency, the USFS also has a rigorous abandoned mine reclamation program. The program includes: (1) a regionwide inventory of abandoned mines; (2) documentation of location; (3) types of environmental and/or resource problems evident; (4) rehabilitation measures required; and (5) potential sources of funding. The USFS has worked with various RWQCBs on numerous occasions in the rehabilitation of old mine sites. Restoration funding has come from appropriated USFS funds, the Comprehensive Environmental Response and Compensation Liability Act (CERCLA), and RCRA sources. In addition, BLM has begun formulating an abandoned mine reclamation program.

Actions - Water Quality Standards for Abandoned Mine Cleanup

The SWRCB has undertaken various efforts to manage the quality of the State's waters. The goal of CWC section 13000 is " ... to attain the highest water quality that is reasonable, considering all demands being made and to be made ... and the total values involved ... ." Similarly, the Federal Water Pollution Control Act, United States Code (USC) Title A3, section 1251, aims, among other goals, to restore and maintain chemical, physical, and biological integrity of the Nation's waters by eliminating the discharge of pollutants. Such goals are fairly general and pragmatic.

Assuming that the liability issues are resolved soon, applying these general goals to both prodigiously polluting abandoned and inactive mines (which tend to be large sites) and watersheds affected by numerous small abandoned and inactive mines would be a major challenge for the following reasons. First, agreement must be reached on what is the highest water quality that is reasonable. This requires a statement on what natural conditions may have existed before mining to serve as a general guide in restoring the chemical, physical, and biological integrity of the affected waters. Second, the total values involved must be determined, recognizing that large abandoned mines are inherently costly to clean up and that the State's fiscal resources are limited.

Projects for restoring grossly polluting sites should have specific clean-up objectives and water quality goals. These site-specific goals for each site will differ depending on the magnitude of the pollution problem, clean-up technology, and cost of abatement.

Efforts for restoring watersheds affected by numerous small sites must take a different tack because it is unlikely that small sites would ever be evaluated individually by regulating agencies. Agreement on water quality and beneficial uses of an affected watershed would have to be reached first. Next, the contribution of similar pollutants from other sources would have to be considered in the context of how much benefit would be gained by cleaning up small abandoned mines. Last, it would be unrealistic to expect restoration efforts at small sites to meet specific water quality goals because most efforts would likely be limited to "low-tech" earth moving and revegetation projects.

The measure of success for such efforts would necessarily be an overall improvement of the targeted watershed. That would necessitate a carefully thought out watershed monitoring program.

It is important to keep in mind that reclamation goals for both individual abandoned mines and watersheds affected by numerous abandoned mines must be established pragmatically to ensure that the best possible improvement in overall basin water quality is achieved for a given expenditure. All interested parties must be willing to accept that this may not necessarily achieve background conditions.

Resource Extraction

Introduction

Resource extraction (i.e., aggregate and metal mining) operations are regulated locally by State administered programs and by State and federal programs when they occur on federal land (although State programs have primacy). Extraction operations become water quality concerns when they:

- Have discharges that could impair water quality (e.g., cyanide heap leach gold mines); or
- Could impair beneficial uses (e.g., water quality, habitat) resulting from extracting resources (usually aggregate) from within or nearby stream channels.

All active mining projects must comply with the Surface Mining and Reclamation Act (SMARA). The goal of SMARA is to have mined lands "reclaimed" to a beneficial end use. Local Enforcement Agencies (LEAs), usually counties, implement SMARA. The DOC's Office of Mine Reclamation provides technical support to LEAs and has limited enforcement authority.

Mining projects that could impair water quality and/or beneficial uses of waters of the State may also be subject to regulations administered by RWQCBs (Title 27 of the California Code of Regulations [CCR], NPDES and Stormwater) or subject to conditions under the CWA section 401 Water Quality Certification Program (WQCrP) administered by the RWQCBs and initiated when there is a federal permit or license required (such as the USACOE's section 404 Program).

On the federal level, both the BLM and USFS have reclamation programs. The objectives of the federal programs are to minimize the environmental impacts resulting from mining activities and to ensure that disturbed lands are returned to uses consistent with long-term forest land and resource management plans. Reclamation is an integral part of Plans of Operation submitted by proponents of mining on public domain lands that propose surface disturbances. The reclamation requirements included in the Plans of Operation include measurable performance standards. Reclamation bonds, sureties, or other financial guarantees are commonly required for all mineral activity requiring a Plan of Operation. All lands disturbed by mineral activities must be reclaimed to a condition consistent with resource management plans, including State air and water quality requirements.

Traditionally, each State regulatory program functions independently of one another even though some have overlapping regulatory authority. State agencies are beginning to recognize, however, that conflicts often arise when resource extraction operations are regulated by independently functioning programs with overlapping authority. Moreover, agencies are beginning to realize that the cumulative effects of multiple resource extraction operations within a given area cannot be anticipated when regulatory programs address each project individually. For example, the cumulative effects on beneficial uses of four or five instream aggregate operations in the same stream might be detrimental even though each individual operation is complying with conditions of their permit. Clearly, as society's demand for resources such as aggregate grows, the cumulative effects of these operations must be taken into account.

Goals

- Continue to regulate extraction operations for active resources under current programs.
- Work toward coordinating better among local, State, and federal entities that implement regulatory programs so that the regulatory goals of each applicable program are met.
- Begin evaluating extraction operations that occur within or near active stream courses in the context of their cumulative effect on their watershed.
- Develop MPs for alleviating cumulative detrimental effects of multiple resource extraction operations.

Actions

Agencies are making greater efforts to avoid conflicts stemming from overlapping regulatory programs. For example, DOC acted on a recommendation from the SWRCB that SWRCB and RWQCB staffs be invited to SMARA workshops. These workshops provide an opportunity for DOC, SWRCB, and RWQCB staffs to learn where areas of conflict are likely to arise. SWRCB and RWQCB staffs regularly meet with USFS staff to ensure that resource extraction operations comply with State programs.

Cumulative effects of resource extraction operations are also beginning to be addressed on a watershed basis. Although the reason for these efforts vary (e.g., a concern that threatened species listing will force onerous regulations on landowners, efforts to preserve fragile or unique habitats), the result is that extraction activities are beginning to be evaluated within the larger context of their watershed effects.

As the cumulative effects of multiple resource extraction operations are determined, SWRCB and RWQCB will work with local, private, and federal interests to formulate MPs for protecting the overall health of a watershed. Projecting into the future, we can anticipate that these MPs likely will be based on site-specific studies sponsored by State and federal agencies via grants.

Critical Coastal Areas Management Measures

The primary goal of CCA designation is to channel program resources to protect special coastal habitats from NPS pollution degradation through the implementation of additional MMs. CCAs will be designated in areas of the California coastal zone (1) in which new or substantially expanding land uses may cause or contribute to the impairment of coastal water quality and (2) that contain or are adjacent to threatened or impaired coastal waters.[23]

Where appropriate, additional MMs will be developed that address these site-specific concerns and which protect and restore the habitats for which the CCA designation was established.

The CCA Committee will first identify MMs within CAMMPR for immediate implementation in the CCAs. This will be accomplished through utilizing lessons learned, the existing monitoring programs, and the understanding of site-specific concerns and the threat of new development. For example, the CCA Committee could use the CCC's Permit Tracking System (PTS) for analyzing the cause-and-effect relationship between land use MPs and water quality. This would allow for the identification of the most effective MMs for immediate implementation in the CCAs. The anticipated development of runoff-specific tracking elements for the CCC's PTS would further accelerate and facilitate the MM identification process. Moreover, the statewide NPS Program's efforts in developing an effectiveness monitoring program will also assist in identifying and channeling appropriate resources to the implementation of appropriate MMs in the CCAs.

New and innovative MMs will be developed when needed to provide additional protection for the CCAs from NPS pollution degradation. The CCA Committee will work with appropriate agencies and researchers to develop these additional MMs with special considerations for the physical and biological characteristics of the CCAs and the nature of contamination in the adjacent threatened or impaired coastal waters.

[23] For federal approval of its NPS Program, California must identify and map CCAs to protect against current and anticipated NPS pollution problems (CZARA section 6217[b][2]).

Determining Need for Additional Regulations

During program assessment, it may be determined that current efforts to prevent and control NPS pollution are not sufficient to protect water quality and safeguard beneficial uses. Additional regulations may therefore be necessary to reinforce the implementing agencies' abilities in fully implementing NPS MMs and enforcing against NPS violations. In considering additional regulations, the Regulation TAC, in cooperation with the Assessment and Technical TACs, will perform the following activities:

- Invite the involvement of experts and all agencies with jurisdictions over NPS issues;
- Encourage public participation and input;
- Review all existing applicable regulations of the agencies to avoid duplicative regulations;
- Conduct research on lessons learned and other states' experiences;
- Create technologically-defensible and economically-feasible regulations that will accomplish the objective of preventing and controlling NPS pollution; and
- Ensure regulation adoption by the lead agencies and approval by OAL.

III. FIVE-YEAR IMPLEMENTATION PLAN

A. Introduction/Structure

The Implementation Plan describes in detail the actions to be taken for the period of 1998 to 2003. Specific MMs within the six identified NPS categories (Agriculture, Forestry, Urban Areas, Marinas and Recreational Boating Activities, Hydromodification, and Wetlands/Riparian Areas/Vegetated Treatment Systems), CCAs, and Program monitoring are identified.

Based on past agency experiences, the CWA section 303(d) and TMDL priority lists, a survey of the stakeholders, and recommendations from the previous NPS TACs, the lead agencies have targeted specific geographic areas and NPS MMs for implementation in this first five-year cycle. The areas selected either have the most impaired water bodies or face immediate water quality threats from new and/or expanding development. Depending on their relative priority, the MMs were targeted as either primary, secondary, or tertiary. The Implementation Plan only addresses those MMs targeted at the primary and secondary level for the first five-year cycle. The MMs chosen are those determined to be the most effective and appropriate for California. The CCAs will be addressed based on a year to year review of potential environmental degradation of sensitive coastal resources such as those previously identified as ESHAs and special areas including California's NERRs, NEPs, and National Marine Sanctuaries (NMSs).

Seven process elements are prescribed for each of the MM categories. They are to: (1) assess problems; (2) target resources; (3) plan activities; (4) coordinate with agencies and the public; (5) implement MMs; (6) track and monitor actions; and (7) report on the effectiveness of the Program Plan. These steps are essential to ensuring effective and efficient implementation of the MMs which will enable the Strategy to achieve the defined goals of preventing and controlling NPS pollution. The Implementation Plan also identifies parties/agencies responsible for performing the activities. Funding sources and milestones to be achieved by the end of the five-year period are identified as well. The implementation timelines are realistic estimates but may change due to changes in agency coordination, funding, new information, and public cooperation.

Certain process elements for some of the targeted MM categories have not been completed due to the lack of information at this time. All relevant information for each process element for each primary and secondary MM will be established and entered into the first five-year plan by July 1, 2000, with the exception of numeric program performance measures. Numeric program performance measures will be established for each primary and secondary MM in the first five-year plan by October 1, 2000. If more data, another agency commitment, or some other piece of information is needed in order to fill in a particular piece of the matrix, the steps that will be taken to fill in that missing information will be described. The revised five-year plan will be distributed to the public (as an addendum to the Program Plan) by November 1, 2000.

Beginning in 2001, biennial reports will be completed for evaluation by the USEPA and NOAA, as well as other agencies and the public regarding the State's progress in implementing the NPS Program. The reports to be produced in 2001 and 2003 will provide details to address questions such as:

1. Have the activities identified in the five-year plans been completed and have the associated performance measures been achieved?
2. Has an MM implementation tracking system been established? Based on that system, what is the extent of MM implementation for all source categories throughout the State?
3. Has the IACC become active and successful in fostering implementation?
4. Has the SWRCB/RWQCBs published NPS enforcement guidance in 2001 as per CWC section 13369(a)(2)(B)?
5. Has the technical assistance to landowners and managers been improved through the issuance of technical guides, information sharing, "field-level" assistance and/or other activities?
6. Have other State and federal agencies and non-governmental entities become involved in implementing the NPS Program? Where necessary, have formal agreements been established to enhance the effectiveness of these partnerships?
7. Has the planning process for the next five-year plan (2003-2008) been established to achieve more specific plans that include measurable objectives and that involve a wide range of key stakeholders?
8. Have adequate efforts been made to identify funding needs and mechanisms to ensure continuing MM implementation and Program Plan success?

In 2001, the SWRCB, RWQCBs, and CCC, in coordination with the new TACs to be established by the IACC, will begin developing the next five-year implementation plan. The five-year implementation plan for 2003 to 2008 will outline: (1) strategies to complete the unfinished tasks from the first five years; (2) rectify the NPS program's shortfalls identified in the assessment process; (3) implement an additional set of MMs; and (4) expand the geographic coverage of the NPS Program.

B. Agriculture

The SWRCB, CCC, and other State agencies have identified seven MMs to address agricultural NPSs of pollution that affect State waters. The agricultural MMs include practices and plans installed under various NPS programs in California, including systems of practices commonly used and recommended by the USDA as components of RMS, WQMPs, and Agricultural Waste Management Systems. These RMSs are planned by individual farmers and ranchers using an objective-driven planning process outlined in the NRCS National Planning Procedures Handbook. The RMSs are designed to achieve sustainable use of the different natural resource areas—soil, water, air, plants, animals, and human considerations.

California's MMs to address agricultural sources of NPS pollution in California:

- 1A. Erosion and Sediment Control
- 1B. Facility Wastewater and Runoff from Confined Animal Facilities
- 1C. Nutrient Management
- 1D. Pesticide Management
- 1E. Grazing Management
- 1F. Irrigation Water Management
- 1G. Education/Outreach

According to USEPA (1993), agriculture contributes more than half of the pollution entering the Nation's water bodies; recent studies have identified it as the greatest source of water pollution in the United States. The primary agricultural NPS pollutants are nutrients, sediment, animal wastes, pesticides, and salts. Agricultural activities may also affect habitat through physical disturbances caused by livestock or equipment or through the management of water.

Management Measures:

Erosion and Sediment Control. MM 1A addresses NPS problems associated with soil erosion and sedimentation. Where erosion and sedimentation from agricultural lands affect coastal waters and/or State's inland water bodies, landowners shall design and install or shall apply a combination of practices to reduce solids and associated pollutants in runoff during all but the larger storms. Alternatively, landowners may apply the erosion component of an RMS as defined in the NRCS FOTG. The NRCS FOTG contains standards and specifications for installing these practices.

Facility Wastewater and Runoff from Confined Animal Facilities. Pursuant to MM 1B, facility wastewater and contaminated runoff from confined animal facilities must be contained at all times. Storage facilities should be of adequate capacity to allow for proper wastewater use and should be constructed so they prevent seepage to ground water, and stored runoff and accumulated solids from the facility shall be managed through a waste use system that is consistent with MM 1C or shall be removed from the site.

Nutrient Management. MM 1C addresses the development and implementation of comprehensive nutrient management plans for areas where nutrient runoff is a problem affecting coastal waters and/or water bodies listed as impaired by nutrients. Such plans would include: (1) a plant tissue analysis to determine crop nutrient needs; (2) crop nutrient budget; (3) identification of the types, amounts, and timing of nutrients necessary to produce a crop based on realistic crop yield expectations; (4) identification of hazards to the site and adjacent environment; (5) soil sampling and tests to determine crop nutrient needs; and (6) proper calibration of nutrient equipment. When manure from confined animal facilities is to be used as a soil amendment and/or is disposed of on land, the plan shall discuss steps to assure that subsequent irrigation of that land does not leach excess nutrients to surface or ground water.

Pesticide Management. Implementation of MM 1D is intended to reduce contamination of surface water and ground water from pesticides. Implementation of this measure will primarily occur through cooperation with the CDPR as provided in a MAA with the SWRCB. Elements of this measure include: (1) development and adoption of reduced risk pest management strategies (including reductions in pesticide use); (2) evaluation of pest, crop, and field factors; (3) use of Integrated Pest Management (IPM); (4) consideration of environmental impacts in choice of pesticides; (5) calibration of equipment; and (6) use of anti-backflow devices. IPM is a key component of pest control. IPM strategies include evaluating pest problems in relation to cropping history and previous pest control measures and applying pesticides only when an economic benefit will be achieved. When used, pesticides should be selected based on their effectiveness to control target pests and environmental impacts such as their persistence, toxicity, and leaching potential.

Grazing Management. MM 1E is intended to protect sensitive areas (including streambanks, lakes, wetlands, estuaries, and riparian zones) by reducing direct loadings of animal wastes and sediment. This may include restricting or rotationally grazing livestock in sensitive areas by providing fencing, livestock stream crossings, and locating salt, shade, and alternative drinking sources away from sensitive areas. Upland erosion can be reduced by, among other methods: (1) maintaining the land consistent with the California Rangeland WQMP or BLM and Forest Service activity plans or (2) applying the range and pasture components of an RMS (NRCS FOTG). This may include prescribed grazing, seeding, gully erosion control, such as grade stabilization structures and ponds, and other critical area treatment.

Irrigation Water Management. MM 1F promotes effective irrigation while reducing pollutant delivery to surface and ground waters. Pursuant to this measure, irrigation water would be applied uniformly based on an accurate measurement of crop water needs and the volume of irrigation water applied, considering limitations raised by such issues as water rights, pollutant concentrations, water delivery restrictions, salt control, wetland, water supply, and frost/freeze temperature management. Additional precautions would apply when chemicals are applied through irrigation.

Education/Outreach. The goals of MM 1G are to implement pollution prevention and education programs to reduce NPS pollutants generated from the following activities where applicable:

1. Activities that cause erosion and loss of sediment on agricultural land and land that is converted from other land uses to agricultural land;
2. Activities that cause discharge from confined animal facilities to surface waters;
3. Activities that cause excess delivery of nutrients and/or leaching of nutrients;
4. Activities that cause contamination of surface water and ground water from pesticides;
5. Grazing activities that cause physical disturbance to sensitive areas and the discharge of sediment, animal waste, nutrients, and chemicals to surface waters;
6. Irrigation activities that cause NPS pollution of surface and ground waters.

Management Measure Category: Agriculture

Management Measure Title: 1A – Erosion and Sediment Control

Management Measures Targeting Level: Primary

Objectives:

1. By the year 2002, develop MAA and WQMP with BLM.
2. By the year 2003, sediment/erosion control guidelines for six watersheds. Begin implementation of those guidelines.
3. By the year 2003, implement interagency streamlined permit process in 50 watersheds.

Management Measure Category: Agriculture

Management Measure Title: 1B – Facility Wastewater and Runoff from Confined Animal Facilities (all units)

Management Measure Targeting Level: Primary

Objectives:

1. By the year 2000, develop statewide strategy for Animal Feeding Operations (AFO).
2. By the year 2002, complete dairy waste management training for 50 percent of dairy produces in RWQCBs 1 and 5.
3. By the year 2003, inspect all AFO facilities in the RWQCB 5-Central Valley and RWQCB 8-Chino Basin.

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years					Notes
						98	99	00	01	02	
Assess	Conduct surface and ground water quality monitoring to assess current and historic dairy waste impacts.	RWQCB 8	Chino Basin, Lake Elsinore/San Jacinto watershed		Database	x	x	x	x		
Target	To be completed as specified in Part III.A. – Introduction /Structure.										
Plan	Quantify nutrient load and propose reductions.	USEPA, SWRCB, RWQCB 4	RWQCB 4	Basin Planning , CWA §104 and §106 TMDL funds	Technical TMDLs			x	x	x	TMDLs for nutrients are scheduled for different watersheds each year
	Update nutrient reduction goals of RWQCB 4 Basin Plan.	RWQCB 4	RWQCB 4		Update plan by 7/2001		x	x	x		Triennial review and TMDL implementation, as required
	Foster grant program for NPS control on dairies.	RWQCB 1	Humboldt WMA	CWA §319	Number of projects		x	x	x	x	
	Develop manure removal strategies.	Local dairy agencies, RWQCB 8, Orange County Sanitation District (OCWD)	Chino Basin, San Jacinto Watershed		Reduction in manure remaining in Chino Basin	x	x	x			

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes
Plan	Work with USEPA and NRCS on development of the joint unified AFO National Strategy. Target EQIP funding to needed projects through participation on the State Technical Committee.	NRCS SWRCB USEPA RWQCBs	Statewide	Current staff, EQIP	Annual list of priority areas, number of plans produced	x	x	x	x	x	Ongoing activity
	Develop statewide strategy for AFO.	SWRCB	Statewide	Baseline	Statewide strategy		x	x			
Coordinate	Coordinate statewide and regional dairy waste management activities to develop more cohesive regulatory framework through monthly Interagency Confined Animal Coordination Group meetings and quarterly RWQCB roundtable meetings.	SWRCB	Statewide	CWA §319 Current staff	Monthly meeting summaries	x	x	x	x	x	Ongoing activity.-most significant impacts are in the San Joaquin Valley and Chino Basin
	Support and participate in Sonoma-Marin Animal Waste Committee, Dairy Waste Management Partnership Agreement (California Dairy Quality Assurance Program), and producer training through UC.	SWRCB	Statewide with emphasis on Regions 1 and 5	TSCA grant CWA §319 Current staff	Under the Partnership Agreement, complete dairy waste management training for 50 percent of producers in two years. Perform 1,000 independent evaluations in four years.	x	x	x	x	x	On going activity Also supports process element of implementation
Implement	Work with USEPA and NRCS on implementation of the joint unified AFOs National Strategy. Target EQIP funding to needed projects through participation on the State Technical Committee. Management Measure Category: Agriculture

Management Measure Title: 1C - Nutrient Management

Management Measure Targeting Level: Primary

Objectives:

1. By the year 2003, develop regional numeric nutrient criteria and incorporate into Basin Plans.
2. By the year 2003, develop and implement standards for heavy metals in organic and inorganic fertilizers.
3. By the year 2003, develop nutrient management guidelines in nine watersheds. Begin implementation of those guidelines.

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years					Notes
						98	99	00	01	02	
Assess	Thirty-five (35) water bodies listed for nutrients with agricultural sources of sediment on CWA §303(d) list.	RWQCBs	Statewide	Current staff	CWA §303(d) list	x					
	For watersheds with limited information, inspect irrigated agriculture and grazing areas for nutrient discharges.	RWQCB 3	Lands with irrigated agriculture or grazing uses	New	Number of watersheds inspected per year	x	x		x	x	
Target	Thirty-three (33) water bodies targeted for nutrient TMDLs by year 2003.	SWRCB	Statewide	Current staff	TMDL schedule						
	Identify additional high quality water bodies in need of protection.										
Plan	Develop regional numeric nutrient criteria in cooperation with USEPA, RWQCBs, and Nutrient Criteria Team.	USEPA, SWRCB, RWQCBs	Statewide	CWA §319(h) grant	Develop regional criteria by 2000. Incorporate into basin plans by 2003	x	x	x	x	x	
	Evaluate and modify as appropriate for incorporation into basin plans.										
	Develop standards for heavy metals in organic and inorganic fertilizers.	DFA and SWRCB	Statewide		Standards	x	x	x			
	Develop TMDLs and associated implementation plans for CWA §303(d) listed water bodies.	RWQCB 1	Laguna de Santa Rosa, Scott River, Shasta River, Stemple Creek		TMDLs, implementation plans	x	x	x	x	x

Management Measure Category: Agriculture

Management Measure Title: 1D – Pesticide Management

Management Measures Targeting Level: Primary

Objectives:

1. By the year 2000, complete and begin implementation of a WQPP for agricultural pesticides in the MBNMS.
2. By the year 2002, develop and begin implementation of effective pesticide control program in Newport Bay Watershed as part of TMDL.
3. By the year 2003, develop a total of six TMDLs for pesticides in RWQCB 5.

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes
Assess	To be completed as specified in Part III.A. – Introduction /Structure.										
Target	To be completed as specified in Part III.A. – Introduction /Structure.										
Plan	Develop strategies for protection of resources from agricultural pollution, including pesticides, in cooperation with the MBNMS WQPP.	RWQCB 3 MBNMS CCC SWRCB	Central Coast	CWA §319	Complete final WQPP agriculture plan by summer 1999 and begin implementation.	x	x	x	x	x	Ongoing activity. Includes all NPSs impacting sanctuary watersheds
	Identify pesticide impairment to beneficial uses/water quality; develop effective pesticide control program through TMDL development and implementation.	RWQCB 8, local agencies	Newport Bay watershed	To be determined	Toxics TMDL	x	x	x	x		Toxics TMDL to be approved by the State by January 2002
	Analyze irrigation return water.	RWQCB 4	Ventura County		Collect and analyze as necessary for pesticide TMDLs			x	x	x	
	Coordinate with WMI and TMDL units to document levels of pesticides in receiving waters.	RWQCB 4 CDPR	RWQCB 4		Number of watersheds reviewed. Summary of findings		x	x	x	x	

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes
Plan	Participate in the Sacramento River Watershed program to develop an organophosphate pesticide management strategy.	RWQCB 5S CDPR	Sacramento River Watershed	Sacramento River Watershed Project, CWA §319	Determine diazinon loading and toxicity evaluation	x	x	x			May extend to 2002. Will help TMDL development for diazinon.
	Develop TMDL for diazinon.	RWQCB 5S CDPR	Delta, Sacramento River, and San Joaquin River	Federal, CALFED	TMDL	x	x	x	x	x	
	Develop TMDL for chlorpyrifos.	RWQCB 5S CDPR	Delta and San Joaquin River	Federal, CALFED	TMDL	x	x	x	x	x	
	Develop water quality objectives for rice pesticides.	RWQCB 5S CDPR	Sacramento River	To be determined.	Water quality objectives						While work is a high priority, work cannot proceed without funding.
Coordinate	Prevent and mitigate threats to water quality from pesticides through coordination with the RWQCBs and implementation of the MAA and Pesticide WQMP with the CDPR.	SWRCB RWQCBs CDPR	Statewide	CWA §319	Conduct semi-annual technical briefings with CDPR and RWQCB staffs	x	x	x	x	x	Ongoing activity – RWQCB and CDPR staff work together as needed on indiv. pesticide TMDLs
	Review the control/eradication program for red imported fire ants (RIFA) in southern California in coordination with DFA, CDPR, and the RWQCBs.	CDPR, SWRCB, RWQCB 8, local agencies	Statewide Newport Bay Watershed	CWA §319	Comprehensive monitoring program for evaluation of impacts from RIFA eradication program	x	x	x	x		This may be an ongoing activity if eradication is not effective.
	Minimize/avoid NPS pollution in pest eradication programs. Consult with RWQCBs and SWRCB when developing programs.	DFA	Statewide		Consultation	x	x	x	x	x	
Implement	Implement strategies for protection of resources from agricultural pollution, including pesticides, in cooperation with the MBNMS WQPP.	RWQCB 3 MBNMS CCC SWRCB	Central Coast	CWA §319	Complete final WQPP agriculture plan by summer 1999 and begin implementation.	x	x	x	x	x	Ongoing activity. Includes all NPSs impacting sanctuary watersheds.

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes
Implement	Enforce water quality standards.	RWQCB 4	RWQCB 4		Number of Enforcement Actions	x	x	x	x	x	
	Prevent aquatic toxicity from organophosphate pesticide residues through voluntary efforts to monitor for compliance with water quality standards.	CDPR, RWQCB 5, RWQCB 8	Sacramento River and San Joaquin River Watersheds; Newport Bay watershed	CDPR Regulation Fund, General Fund	Monitoring data		x	x	x	x	If by the year 2001-2002 use-season aquatic toxicity persists, CDPR will impose regulatory controls to lower dormant spray residues to acceptable levels.
	Reduce pesticides in both agricultural and urban surface water through local outreach to promote MPs that reduce pesticide runoff and through CDPR's registration process. Fund and assist in pesticide control applicator and grower training promoting pesticide management. Mitigate impacts through self-regulation as well as regulatory authorities of CDPR, SWRCB, and RWQCB.	CDPR, RWQCB 5, RWQCB 8, SWRCB	Statewide, with initial emphasis beginning with the San Joaquin River, Orestimba Creek, Sacramento River, Sacramento Slough, Wadsworth Canal, Colusa Basin Drain, Butte Slough; Newport Bay watershed	CALFED, CDPR Regulation Fund, General Fund, and Environmental License Fund	Number of pesticides evaluated in the registration process Number of pesticide control applicators and growers trained Decreases in OP pesticides use as reported in CDPR's pesticide use report database and corresponding increases in the use of lower risk pesticide control products. Descreases in surface water toxicity due to OP pesticides.		x	x	x	x	

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years					Notes
						98	99	00	01	02	
Implement	Prevent pesticide contamination of ground water through education, modeling, and monitoring. Components include voluntary wellhead protection stewardship programs with the County Agricultural Commissioners; CDPR's registration process in which potential adverse effects to ground water quality are evaluated; and creation of Pesticide Management Zones (PMZs) which restrict or prohibit use when criteria are met.	CDPR, County Agriculture Commission	Statewide	CDPR Regulation Fund, General Fund	Number of pesticides evaluated in the registration process Number of PMZs created		x	x	x	x	Ongoing program
	Form alliances with the regulated community to jointly focus on reducing environmental risks while providing pest management solutions using IPM applied research, demonstration, implementation, and outreach.	CDPR	Statewide	CDPR Regulation Fund	Number of alliances		x	x	x	x	
	Provide grants for applied research focused on IPM practices and technologies.	CDPR	Statewide	Food Safety Fund	Number of grants Amount of grants		x	x	x	x	
	Reduce rice pesticide loading in the Sacramento and San Joaquin Rivers by managing water in treated fields so that discharges of pesticides into surface waters do not impair beneficial uses.	CDPR, SWRCB, RWQCB 5	Sacramento River and San Joaquin River Watersheds	CDPR Regulation Fund, General Fund	Documentation of loadings		x	x	x	x	
Track and Monitor	Coordinate water quality sampling program for RIFA program.	CDPR, SWRCB, RWQCB 8, local agencies	Statewide, Newport Bay Watershed	CWA §319	Comprehensive monitoring program for evaluation of impacts from RIFA eradication program	x	x	x	x		This may be an ongoing activity if eradication is not effective
	Work with CDPR and RWQCBs to target funds for monitoring for TMDL development.	CDPR, SWRCB, RWQCBs	Statewide	CDPR	Monitoring agreements		x	x	x	x	CDPR has received approximately $800,000 per year to do this monitoring.
Report Biennially	To be completed as specified in Part III.A. – Introduction /Structure.										

Management Measure Category: Agriculture

Management Measure Title: 1E – Grazing Management

Management Measure Targeting Level: Primary

Objectives:

1. By the year 2000, develop MAA or MOU between SWRCB and BLM to implement CWA section 319 consistency review.
2. By the year 2003, complete rangeland WQMPs for two million acres throughout California.
3. By the year 2003, develop TMDLs with rangeland load allocation and implementation plans in two watersheds in RWQCB 1 and three watersheds in RWQCB 3.

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes
Assess	To be completed as specified in Part III.A. – Introduction /Structure.										
Target	To be completed as specified in Part III.A. – Introduction /Structure.										
Plan	Provide financial support for rangeland water quality workshops held by UC.	UCD Range and Agronomy, SWRCB	Statewide	CWA §319	Complete rangeland WQMPs for 500,000 acres each year.	x	x	x	x	x	Ongoing activity
	Participate in the MBNMS WQPP to develop strategies for protection of MBNMS resources from agricultural pollution, including rangeland.	RWQCB 3, MBNMS, CCC, SWRCB	Central Coast	CWA §319	Complete final WQPP agriculture plan by summer of 1999 and begin implementation	x	x	x	x	x	Ongoing activity, includes all NPSs impacting MBNMS watersheds
	Develop TMDLs for CWA §303(d) listed waters.	RWQCB 3	Lower Salinas River, Lower Pajaro River, Morro Bay Watershed	CWA §319, CWA §104, CWA §106, General Fund (funding fairly secure for development through 2001)	Adopted TMDL according to established schedule Implementation of practices per the TMDL	x	x	x	x	x

C. Forestry

There are 12 MMs to address various phases of forestry operations relevant to controlling NPSs of pollution that affect State waters. The forestry MMs are for the most part a system of practices used and recommended by the BOF and CDF in rules or guidance.

California's MMs to address silvicultural sources of nonpoint pollution:
2A. Preharvest Planning
2B. Streamside Management Areas
2C. Road Construction/Reconstruction
2D. Road Management
2E. Timber Harvesting
2F. Site Preparation/Forest Regeneration
2G. Fire Management
2H. Revegetation of Disturbed Areas
2I. Forest Chemical Management
2J. Wetlands Forest
2K. Postharvest Evaluation
2L. Education/Outreach

Silviculture contributes pollution to 17 percent of the polluted rivers and 21 percent of the polluted lakes in California (SWRCB, 1996). Without adequate controls, forestry operations may degrade the characteristics of waters that receive drainage from forest lands. For example (1) sediment concentrations can increase due to accelerated erosion, (2) water temperatures can increase due to removal of over-story riparian shade, (3) dissolved oxygen can be depleted due to the accumulation of slash and other organic debris, and (4) concentrations of organic and inorganic chemicals can increase due to harvesting and fertilizers and pesticides.

Management Measures:

Preharvest Planning. Silvicultural activities shall be planned to reduce potential delivery of pollutants to surface waters. Components of MM 2A address aspects of forestry operations, including: the timing, location, and design of harvesting and road construction; site preparation; identification of sensitive or high-erosion risk areas; and the potential for cumulative water quality impacts.

Streamside Management Areas (SMAs). SMAs protect against soil disturbance and reduce sediment and nutrient delivery to waters from upland activities. MM 2B is intended to safeguard vegetated buffer areas along surface waters to protect the water quality of adjacent streams.

Road Construction/Reconstruction. MM 2C requires that road construction/reconstruction shall be conducted so as to reduce sediment generation and delivery. This can be accomplished by following, among other means, preharvest plan layouts and designs for road systems, incorporating adequate drainage structures, properly installing stream crossings, avoiding road construction in SMAs, removing debris from streams, and stabilizing areas of disturbed soil such as road fills.

Road Management. MM 2D describes how to manage roads to prevent sedimentation, minimize erosion, maintain stability, and reduce the risk that drainage structures and stream crossings will fail or become less effective. Components of this measure include inspections and maintenance actions to prevent erosion of road surfaces and to ensure the effectiveness of stream-crossing structures. The measure also addresses appropriate methods for closing roads that are no longer in use.

Timber Harvesting. MM 2E addresses skid trail location and drainage, management of debris and petroleum, and proper harvesting in SMAs. Timber harvesting practices that protect water quality and soil productivity also have economic benefits by reducing the length of roads and skid trails, reducing equipment and road maintenance costs, and providing better road protection.

Site Preparation and Forest Regeneration. Impacts of mechanical site preparation and regeneration operations—particularly in areas that have steep slopes or highly erodible soils or where the site is located in close proximity to a water body—can be reduced by confining runoff on site. MM 2F addresses keeping slash material out of drainageways, operating machinery on contours, timing of activities, and protecting ground cover in ephemeral drainage areas and SMAs. Careful regeneration of harvested forest lands is important in protecting water quality from disturbed soils.

Fire Management. MM 2G requires that prescribed fire practices for site preparation and methods to suppress wildfires should be conducted as feasible in a manner that limits loss of soil organic matter and litter and that reduces the potential for runoff and erosion. Prescribed fires on steep slopes or adjacent to streams and that remove forest litter down to mineral soil are most likely to impact water quality.

Revegetation of Disturbed Areas. MM 2H addresses the rapid revegetation of areas disturbed during timber harvesting and road construction—particularly areas within harvest units or road systems where mineral soil is exposed or agitated (e.g., road cuts, fill slopes, landing surfaces, cable corridors, or skid trails) with special priority for SMAs and steep slopes near drainageways.

Forest Chemical Management. Application of pesticides, fertilizers, and other chemicals used in forest management should not lead to surface water contamination. Pesticides must be properly mixed, transported, loaded, and applied; and their containers must be disposed of properly. Fertilizers must also be properly handled and applied since they also may be toxic depending on concentration and exposure. Components of MM 2I include applications by skilled workers according to label instructions, careful prescription of the type and amount of chemical to be applied, use of buffer areas for surface waters to prevent direct application or deposition, and spill contingency planning.

Wetland Forest Management. Forested wetlands provide many beneficial water quality functions and provide habitat for aquatic life. Under MM 2J, activities in wetland forests shall be conducted to protect the aquatic functions of forested wetlands.

Postharvest Evaluation. The goals of MM 2K are to incorporate postharvest monitoring, including: (a) implementation monitoring to determine if the operation was conducted according to specifications and (b) effectiveness monitoring after at least one winter period to determine if the specified operation prevented or minimized discharges.

Education/Outreach. The goals of MM 2L are to implement pollution prevention and education programs to reduce NPS pollutants generated from applicable silvicultural activities.

Management Measure Category: Forestry

Management Measure Title: Applicable to all MMs

Management Measure Targeting Level: All MMs are designated at the primary level, except for 2G-Fire Management and 2I-Forest Chemical Management which are at the secondary level and 2J-Wetlands Forest which is at the tertiary level.

Objectives:

1. By year 2001, adopt FPR to address watercourse and lake protection zones, roads and landings, exempt and emergency timber operations, mass wasting, and cumulative watershed effects.
2. By year 2003, increase agency staffing, broaden enforcement authority, increase review of THPs, and monitor effectiveness of MPs.

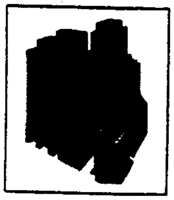
R0018720

D. Urban Areas



The SWRCB, CCC, and other State agencies have identified 15 MMs to address urban NPSs of pollution that affect State waters. With approximately 80 percent of the nation's population living in coastal areas, controlling polluted runoff in urban areas is a challenge. Negative impacts of urbanization on coastal and estuarine waters are well documented in a number of sources, including California's CWA section 305(b) and section 319 reports and the Nationwide Urban Runoff Program.

California's MMs to address urban sources of nonpoint pollution:

- 3.1 Runoff from Developing Areas
  - A. Watershed Protection
  - B. Site Development
  - C. New Development
- 3.2 Runoff from Construction Sites
  - A. Construction Site Erosion and Sediment Control
  - B. Construction Site Chemical Control
- 3.3 Runoff from Existing Development
  - A. Existing Development
- 3.4 On-site Disposal Systems (OSDSs)
  - A. New OSDSs
  - B. Operating OSDSs
- 3.5 Transportation Development (Roads, Highways, and Bridges)
  - A. Planning, Siting, and Developing Roads and Highways
  - B. Bridges
  - C. Construction Projects
  - D. Chemical Control
  - E. Operation and Maintenance
  - F. Road, Highway, and Bridge Runoff Systems
- 3.6 Education/Outreach
  - A. Pollution Prevention/Education: General Sources

Major pollutants found in runoff from urban areas include sediment, nutrients, oxygen-demanding substances, road salts, heavy metals, petroleum hydrocarbons, pathogenic bacteria, and viruses. Suspended sediments constitute the largest mass of pollutant loadings to receiving waters from urban areas. Construction is a major source of sediment erosion. Petroleum hydrocarbons result mostly from automobile sources. Nutrient and bacterial sources include garden fertilizers, leaves, grass clippings, pet wastes, and faulty septic tanks. As population densities increase, a corresponding increase occurs in pollutant loadings generated from human activities. Many of these pollutants enter surface waters via runoff without undergoing treatment.

Urban runoff management requires that several objectives be pursued simultaneously. These objectives include the following (American Public Works Association, 1981):

- Protection and restoration of surface waters by the minimization of pollutant loadings and negative impacts resulting from urbanization;
- Protection of environmental quality and social well-being;
- Protection of natural resources, e.g., wetlands and other important aquatic and terrestrial ecosystems;
- Minimization of soil erosion and sedimentation problems;
- Maintenance of the predevelopment hydrologic conditions;
- Protection of ground water resources;
- Control and management of runoff to reduce or prevent flooding; and
- Management of aquatic and riparian resources for active and passive.

Management Measures:

The control of urban NPS pollution requires the use of two primary strategies: (1) the prevention of pollutant loadings and (2) the treatment of unavoidable loadings. California's urban MMs are organized to parallel the land use development process in order to address the prevention and treatment of NPS pollution loadings during all phases of urbanization. This strategy relies primarily on the watershed approach, which focuses on pollution prevention and source reduction practices. Emphasizing pollution prevention and source reduction practices over treatment practices is favored because conducting education practices and incorporating pollution prevention practices into project planning and design activities are generally more effective, require less maintenance, and are more cost-effective in the long term than treatment strategies. Treatment strategies should only be used to address unavoidable loadings or where they are truly cost-effective.

The major opportunities to control NPS loadings occur during the following three stages of development: (1) the siting and design phase, (2) the construction phase, and (3) the post-development phase. Before development occurs, land in a watershed is available for a number of pollution prevention and treatment options, such as setbacks, buffers, or open space requirements, as well as wet ponds or constructed urban runoff wetlands that can provide treatment of the inevitable runoff and associated pollutants. In addition, siting requirements and restrictions and other land use ordinances, which can be highly effective, are more easily implemented during this period. After development occurs, these options may no longer be practicable or cost-effective. MMs 3.1A through 3.1C address the strategies and practices that can be used during the initial phase of the urbanization process.

The control of construction-related sediment loadings is critical to maintaining water quality. The implementation of proper erosion and sediment control practices during the construction stage can significantly reduce sediment loadings to surface waters. MMs 3.2A and 3.2B address construction-related practices.

After development has occurred, lack of available land severely limits the implementation of cost-effective treatment options. MM 3.6A focuses on improving controls for existing surface water runoff through pollution prevention to mitigate NPSs of pollution generated from on-going domestic and commercial activities.

Management Measure Category: 3.1 – Urban Areas

Management Measure Title: 3.1 – Runoff from Developing Areas; 3.1A - Watershed Protection; 3.1B - Site Development; and 3.1C - New Development

Management Measure Targeting Level: Secondary

Objectives:

1. Provide general goals for State and local agencies to use in developing comprehensive watershed protection programs for guiding future development and land use activities in a manner that will prevent and mitigate the effects of NPS pollution.
2. Reduce the generation of NPS pollutants and mitigate the impacts of urban runoff and associated pollutants that result from new development or redevelopment.

Management Measure Category: Urban Areas

Management Measure Title: 3.4 - On-site Disposal Systems; 3.4A - New On-site Disposal Systems; and 3.4B - Operating On-site Disposal Systems

Management Measure Targeting Level: Secondary

Objectives:

1. Improve coordination among State agencies and between State and local agencies in all matters dealing with OSDS.
2. Develop a consistent statewide and/or regional approach to policy interpretation, regulation, implementation, and development of standards for OSDS to support regional and/or local regulation.
3. Provide financial, technical, and educational assistance to help ensure that OSDSs are located, designed, installed, operated, inspected, and maintained to prevent the discharge of pollutants onto surface water and into ground water.
4. Provide financial and technical assistance for and educational information on "alternative" OSDS technologies (i.e., other than conventional gravity septic tank-leachfield systems).

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes
Assess	To be completed as specified in Part III.A. – Introduction /Structure										
Target	Provide loans or grants to counties for upgrades to individual systems.	SWRCB, local municipalities	Statewide	SRF loans	Loans provided and individual systems upgraded				x	x	OSDS TAC Recommendation
Plan	Establish uniform statewide standards for minimum criteria for OSDS siting and design (appropriate additional criteria will depend on local geographical and topographical conditions and level of protection required for regional beneficial uses). Management Measure Category: Urban Area

Management Measure Title: 3.6A - Education and Outreach

Management Measure Targeting Level: Primary

Objectives:

1. Implement educational programs to provide greater understanding of watersheds.
2. Raise awareness of and increase the use of applicable urban MMs and MPs where needed to control and prevent adverse impacts to surface and ground water.
3. Involve the general public in coastal and watershed protection programs.
4. Improve watershed education in public schools.
5. Improve NPS practitioners' ability to support community-based watershed management.

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes

E. Marinas and Recreational Boating Management Measures[24]

Recreational boating and marinas are increasingly popular uses of coastal areas and inland surface water bodies (e.g., lakes and delta). And, they are an important means of public access, and California must balance the need for protecting the environment and the need to provide adequate public access (USEPA, 1993). Because marinas and boats are located at the water's edge, pollutants generated from these sources are less likely to be buffered or filtered by natural processes. When boating and adjunct activities (e.g., marinas and boat maintenance areas) are poorly planned or managed, they may pose a threat to water quality and the health of aquatic systems and may pose other environmental hazards. Sources of pollution associated with marinas and boating include:

- Poorly flushed waterways;
- Pollutants discharged from boats (recreational boats, commercial boats, and "live-aboards");
- Pollutants carried in storm water runoff;
- Physical alteration of wetlands and of shellfish/ other benthic communities during construction of marinas, ramps, and related facilities;
- Pollutants generated from boat maintenance activities on land and in the water.

> California's marina and recreational boating MMs:
>
> 4.1 Assessment, Siting and Design
> - A. Water Quality Assessment
> - B. Marina Flushing
> - C. Habitat Assessment
> - D. Shoreline Stabilization
> - E. Storm Water Runoff
> - F. Fueling Station Design
> - G. Sewage Facilities
> - H. Waste Management Facilities
>
> 4.2 Operation and Maintenance
> - A. Solid Waste Control
> - B. Fish Waste Control
> - C. Liquid Material Control
> - D. Petroleum Control
> - E. Boat Cleaning and Maintenance
> - F. Maintenance of Sewage Facilities
> - G. Boat Operation
>
> 4.3 Education/Outreach
> - A. Public Education

There are 16 MMs to address marina and boating sources of nonpoint pollution. Effective implementation of these MMs can (1) avoid impacts associated with siting marinas and boat maintenance areas, (2) ensure the best available design and construction practices (for new and expanding facilities), (3) ensure appropriate operation and maintenance practices to prevent and/or reduce the delivery of NPS pollutants to State waters, and (4) encourage the development and use of effective pollution control and education efforts. The MMs cover the following operations and facilities:

- Any facility that contains ten or more slips, piers where ten or more boats may tie up, or any facility where a boat for hire is docked;
- Any residential or planned community marina with ten or more slips;
- Any mooring field where ten or more boats are moored;
- Public or commercial boat ramps;
- Boat maintenance or repair yards that are adjacent to the water and any federal, State, or local facility that involves recreational boat maintenance or repair on or adjacent to the water.

The Implementation Plan involves targeting implementation of six of the 16 marina and boating MMs, specifically those measures for water quality assessment, sewage facilities, boat cleaning and maintenance, hazardous waste

---

[24] Commercial and military ports are not targeted in this Program Plan because they are subject to the storm water NPDES permits regulating industrial and construction activities. Commercial ports are also required to submit a port master plan (PMP) for certification by the CCC. The PMP must include the conditions contained in Coastal Act section 30711. An NPS-related condition is "an estimate of the effect of development on habitat areas and the marine environment, a review of existing water quality, habitat areas, and quantitative and qualitative biological inventories, and proposals to minimize and mitigate any substantial adverse impact." Section 30711 further states that, "each city, county, or city and county which has a port within its jurisdiction shall incorporate the certified [PMP] in its [LCP]." In addition, activities in military ports are subject to federal consistency review by the CCC, affording the State an opportunity to ensure that appropriate NPS pollution prevention and control measures are in place. Ports located in the San Francisco Bay are under the jurisdiction of SFBCDC and subject to regulations of the MPA.

management, and public education. These MMs and related actions were identified by representatives of the marina and boating community at four meetings held between December 1998 and April 1999 and by the SWRCB, RWQCBs, and CCC. The 1994 Marina TAC Report provided additional recommendations. The 16 MMs are summarized below.

Assessment, Siting, And Design Management Measures:

41.A **Water Quality Assessment.** Consider impacts to water quality in siting and designing new and expanding marinas.

41.B **Marina Flushing.** Site and design marinas to provide for maximum flushing and circulation of surface waters, which can reduce the potential for water stagnation, maintain biological productivity, and reduce the potential for toxic accumulation in bottom sediment.

41.C **Habitat Assessment.** Site and design marinas to protect against adverse impacts on fish and shellfish, aquatic vegetation, and important locally, State, or federally designated habitat areas.

41.D **Shoreline Stabilization.** Stabilize shorelines where shoreline erosion is a pollution problem.

41.E **Storm Water Runoff.** Implement runoff control strategies to remove at least 80 percent of suspended solids from storm water runoff coming from boat maintenance areas (some boatyards may conform to this provision through NPDES permits).

41.F **Fueling Station Design.** Locate and design fueling stations to contain accidental fuel spills in a limited area; and provide fuel containment equipment and spill contingency plans to ensure quick spill response.

41.G **Sewage Facilities.** Install pump out, pump station, and restroom facilities at new and expanding marinas where needed to prevent sewage discharges directly to State waters.

41.H **Waste Management Facilities.** Install facilities at new and expanding marinas where needed for the proper recycling or disposal of solid wastes (e.g., oil filters, lead acid batteries, used absorbent pads, spent zinc anodes, and fish waste as applicable) and liquid materials (e.g., fuel, oil, solvents, antifreeze, and paints).

Operation And Maintenance Management Measures:

4.2A **Solid Waste Control.** Properly dispose of solid wastes produced by the operation, cleaning, maintenance, and repair of boats to limit entry of these wastes to surface waters.

4.2B **Fish Waste Control.** Promote sound fish waste management where fish waste is an NPS problem through a combination of fish cleaning restrictions, education, and proper disposal.

4.2C **Liquid Material Control.** Provide and maintain the appropriate storage, transfer, containment, and disposal facilities for liquid materials commonly used in boat maintenance; and encourage recycling of these materials.

4.2D **Petroleum Control.** Reduce the amount of fuel and oil that leaks from fuel tanks and tank air vents during the refueling and operation of boats.

4.2E **Boat Cleaning and Maintenance.** Minimize the use of potentially harmful hull cleaners and bottom paints and prohibit discharges of these substances to State waters.

4.2F **Maintenance of Sewage Facilities.** Maintain pumpout facilities in operational condition and encourage their use so as to prevent and control untreated sewage discharges to surface waters.

4.2G **Boat Operation.** Prevent turbidity and physical destruction of shallow-water habitat resulting from boat wakes and prop wash.

Education and Outreach Management Measures:

4.3A **Public Education.** Institute public education, outreach, and training programs to prevent and control improper disposal of pollutants into State waters.

Management Measure Category: Marinas and Recreational Boating

Management Measure Title: 4.1A--Water Quality Assessment

Management Measure Targeting Level: Primary

Objectives:

1. By the year 2003, determine baseline water quality conditions in at least 50 percent of California's marinas in targeted geographical regions.

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes
Assess	Inventory existing data on water quality conditions at marinas to identify levels and potential sources of priority pollutants/stressors such as metals (e.g., copper, lead, tributyltin [TBT]), pathogens/high coliform counts, and other pollutants associated with boat discharges/vessel wastes and other recreational boating-related operations).	CCC, RWQCBs	Statewide	CWA §319 or CZMA §6217	Compilation of data from 1998 CWA §303(d) list, §305(b) report, and other sources.		x				Marina TAC and attendees of 1998-1999 stakeholder meetings identified the need for State to provide baseline data to aid in assessing the effectiveness of implementing MPs.
Target	To be completed as specified in Part III.A. – Introduction /Structure										
Plan	To be completed as specified in Part III.A. – Introduction /Structure										

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes
Coordinate	Provide water quality data to marinas (port captains, harbor masters, lessors, marina owners, etc.) and the public to help identify baseline conditions.	RWQCBs, SWRCB	MBNMS and San Francisco, Tomales, Morro, Santa Monica, and San Diego Bays, Anaheim Bay and Hunting-ton Harbor Marin County (as pilot project in RWQCB 2).	To be determined. BCP	Water quality assessment reports developed and provided to marina operators and for the boating community						Sources of data may include NPDES permits, CWA §401 certifications, CEQA reports, State Mussel Watch Program, and regional surveys (e.g., Coordinated Monitoring Program of the Comprehensive Management Plan for San Diego Bay)
Implement	Establish baseline water quality data at marinas.	RWQCBs, SWRCB	MBNMS and San Francisco, Tomales, Morro, Santa Monica, and San Diego Bays	To be determined.	See above		x			x	
					Plans to establish baseline data at marinas				x	x	
		RWQCB 8 with SWRCB, SCCWRP, DFG (Mussel Watch data), and other entities	Lower Newport Bay and Anaheim/ Huntington Harbor	SWRCB BCP for additional funding SWRCB grant to SCC Wetlands Restoration Project (WRP) Current funds	On-line searchable water quality database	x	x	x	x	x	Limited data are available from BPTCP program; need to update and conduct additional monitoring
Track and Monitor	To be completed as specified in Part III.A. – Introduction /Structure										
Report Biennially	To be completed as specified in Part III.A. – Introduction /Structure										

R0018739

Management Measure Category: Marinas and Recreational Boating

Management Measure Title: 4.1G and 4.2F--Sewage Facilities Siting, Design, and Maintenance

Management Measure Targeting Level: Primary

Objectives:

1. By the year 2003, establish regional standards for the minimum number of sewage facilities (e.g., fixed, mobile, and/or floating pump outs, dump stations, and restrooms) per recreational vessel in the MBNMS, San Francisco, Tomales, Morro, Santa Monica, and San Diego Bays, and SFB Delta.
2. Provide for the installation and maintenance of an adequate number of sewage facilities in the above-listed regions, and increase accessibility to and use of all facilities.

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes
Assess	Identify water bodies on CWA §303(d) list that are listed for bacteria (or other indicators related to vessel sewage) and that are potentially affected by discharges at marinas.	SWRCB	Statewide assessment		Data provided to marina operators (port captains, harbormasters, lessors, marina owners, etc.) and public		x				See also actions for water quality assessment (MM 4.1A)
	Assess effectiveness of current vessel sewage waste programs in selected regions.	MBNMS WQPP	MBNMS		Assessment and recommendations for changes to current program						
		San Francisco Estuary Project (SFEP)	SFB								
		Morro Bay NEP	Morro Bay								
		SMB NEP	Santa Monica Bay								
		Orange County, City of Newport Beach, RWQCB 8	Lower Newport Bay				x	x			Requirement of Newport Bay fecal coliform TMDL
	Assess whether or not adequate enforcement powers exist for and are being implemented by federal, State, and/or local enforcement personnel.	SWRCB, RWQCBs, DBW	Statewide by region	CWA §319	Assessment and recommendations for new laws if needed			x			Recommendation from 2/99 CCBN meeting

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes
Target	Expand educational programs aimed at marina operators to (a) promote a better understanding of the need to construct and maintain vessel sewage pump out facilities, (b) get commitment to construct new pump outs; and (c) provide assistance in applying for Clean Vessel Act (CVA) grant funds.	DBW	Statewide by region	CVA	Workshops and education materials	x	x	x	x	x	Recommendation in SFEP letter (1/99)
	Identify future sources of funding for installation of sewage pump out facilities pending reauthorization of CVA.	DBW	Statewide	Current staff	Support for funding in CVA reauthorization		x				
Plan	Establish minimum standards defining what constitutes an "adequate" number of pump outs, dump stations, and/or restroom facilities.	RWQCBs (excluding RWQCB 8) and DBW (coordinate with permit and leasing agencies and regional entities [e.g., MBNMS and NEPs])	Statewide by region (e.g., MBNMS, Santa Monica Bay, Morro Bay, and SFB NEPs, San Diego Bay)	CVA, CWA §319	MOA among SWRCB, RWQCBs, and DBW establishing minimum standards for regions		x	x			Recommendation in 1/19/99 letter from SFEP DBW guidelines are one station per 300 boats—California currently has 125 stations for 85,000+ boats (or less than one station per 680 boats)
Coordinate	Establish agreements regarding the lead or shared responsibility for inspection of pump out facilities.	RWQCBs (excluding RWQCB 8) and local health departments	Statewide by region	Agency General Funds	MAAs or MOUs with appropriate agencies		x	x	x		Recommendation in Marina TAC and Initiatives in NPS Mgmt.
	Establish clear lines of authority for enforcement of violations	RWQCBs and local governments	Statewide by region	Agency General Funds	MAAs by region			x			Recommendation in SFEP letter (1/99)

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes
Coordinate	Develop and regularly maintain a vessel sewage information clearinghouse to include: • BMPs; • Guidance on how to comply with federal, State, and local laws and regulations; • Examples of effective pump out operations currently used around the State; • Referrals to sources of reliable information.	DBW	Statewide	CVA, CWA §319, and other grants as applicable	Internet web site with information and links to other sites (DBW, UC Sea Grant, USCG Auxiliary, etc.)	x	x	x	x	x	Marina TAC recommendation
Implement	Meet minimum standards through: (a) Financial incentives (e.g., grants to marinas; launch ramp grants to provide dump stations);	DBW	Statewide by region	CVA, CWA §319	Meet standards in target regions by 2003		x	x	x	x	Marina TAC recommendation
	(b) Permit and lease conditions through permit issuance and renewal as appropriate.	City and county government, and other permit and lessor agencies (e.g., CCC, BCDC, SLC, DPR)	Statewide by region	Agency General Funds			x	x	x	x	Marina TAC recommendation
	(c) Recommend or require as necessary that commercial entities install pump out facilities.	RWQCB 2, Marin County Parks and Recreation Department, DPR, and National Park Service	Tomales Bay, Marin County	BCP	Assist commercial entities in applying for CVA grants Install pump out facilities			x x	x x	x x	
	(d) Instigate enforcement program and effectively enforce violations	RWQCBs and local gov'ts	Statewide by region	Agency General Funds		x	x	x	x	x	

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years					Notes
						98	99	00	01	02	
Track and Monitor	Pursue a water quality indicator test specific for human pathogens (e.g., evaluate utility of switching from total and fecal coliform indicators to enterococcus as an indicator of public health risk related to vessel sewage).	SWRCB (Ocean Plan Unit staff)	Statewide	Current staff	Address issue in Ocean Plan Triennial Review			x			Marina TAC recommendation
Report Biennially	To be completed as specified in Part III.A. – Introduction /Structure										

Management Measure Category: Marinas and Recreational Boating

Management Measure Title: 4.2E--Boat Cleaning and Maintenance

Management Measure Targeting Level: Primary

Objectives:

1. By the year 2003, develop and establish programs to implement BMPs for underwater hull cleaning and maintenance in 50 percent of marinas in the MBNMS and San Francisco, Morro, Santa Monica, and San Diego Bays.
2. Increase the availability and promote the use of financially feasible hull paints and cleaning materials whose contents are less toxic or that break down to non-toxic levels quickly within the marine environment, and decrease the use and release to State waters of toxic recreational boating hull paints (e.g., TBT and copper-based paints).

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes
Assess	Identify water bodies on CWA §303(d) list that are listed for copper, tributyltin, detergents (or other indicators related to boat cleaning and maintenance) and that are potentially affected by discharges at marinas.	SWRCB	Statewide assessment		Data provided to marina operators (port captains, harbormasters, lessors, marina owners, etc.) and public		x				See also actions for water quality assessment (MM 4.1A)
Target	Develop education program where divers who clean boats inform boat owners that they work in the water so please do not pollute, and divers provide information about less toxic bottom paints.	Dive groups	Statewide	CWA §319	Educational materials		x	x	x	x	Recommendations from Marina TAC and 12/98 marina stakeholder meeting
Plan	To be completed as specified in Part III.A. – Introduction /Structure										
Coordinate	Develop model ordinances and provide training for local enforcement personnel.	CCC	Statewide by region	To be determined	Training component for local enforcement personnel			x	x	x	Recommendation from 2/99 CCBN meeting
	Develop and regularly maintain a "clearinghouse" of boat cleaning and maintenance information such as: • Boat cleaning and maintenance BMPs; • A shopping guide for non-toxic paints, cleaners, solvents, etc.; • Guidance on how to comply with local, State, and federal laws and regulations; • Referrals to other sources of reliable information.	CCC (coordinate with CCBN)	Statewide	CCC general funds; CWA §319 and other grants as applicable	Internet web site with information and links to other sites (DBW, UC Sea Grant, USCG Auxiliary, etc.)		x			x	Marina TAC recommendation (The CCBN web page provides information at http://ceres.ca.gov/coastalcomm/ccbn/ccbndx.html)

R0018744

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	98	99	00	01	02	Notes
Implement	Implement short-course hull-cleaning training and certification programs and policies using a 2-tier program based on: Tier 1: Self-certification program approved by SWRCB and CCC with specific targets (e.g., 75 percent of boat cleanings in region done by certified divers after four years); Tier 2: Regional certification (trigger to develop regional certification would be if self-certification program fails to meet identified targets).	RWQCBs (excluding RWQCB 8) or regional entity such as the MBNMS WQPP (coordinate with diver trade associations)	Regionally in State, beginning in San Diego, MBNMS, and SFB NEP	CWA §319 Federal dollars passed through NMSs or NEPs	Training and certification program initiated in 1+ regions 95 percent of marinas in above regions certify divers 75 percent of boat cleanings in region done by certified divers			x x	 x		Recommended by Marina TAC, 12/98 marina stakeholder meeting, and MBNMS WQPP. In addition, a strategy in WQPP Action Plan III (Marinas & Boating) is to initiate a regional certification program.
	Promote the use of non-toxic products and target toxic products: (a) Hold a conference addressing recreational boating hull paints;	UC San Diego Cooperative Extension Sea Grant	Statewide	CWA §319, Sea Grant	Conference, with recommendations added to five-year plan		x	x			Recommendation from 12/98 marina stakeholder meeting
	(b) Work with manufacturers, distributors and USEPA to increase research and development and speed up the review and release to market of financially-feasible, non-toxic marine products;	SWRCB and DTSC (coordinate with NMMA)	Statewide	To be determined.	50 percent increase in alternative products in stores		x	x	x		Recommendation from 12/98 marina stakeholder meeting
	(c) Compile a list of options for less toxic products and distribute them through marinas, boatyards, and marine products stores;	CCBN	Statewide	CWA §319, Sea Grant	List of options		x	x	x	x	Strategy in MBNMS WQPP Action Plan III (Marinas and Boating)
	(d) Phase out of the use of toxic hull paints on State and local agency- owned vessels regardless of size;	Cal/RA and Cal/EPA	Statewide	General funds	Certifications by agencies		x	x	x	x	Recommendation from 12/98 marina stakeholder meeting
	(e) Recommend measures to reduce the transport of toxics into State waters from boats that have TBT or other toxic hull paints applied out-of-State;	SWRCB USEPA	California-Mexico border issue	To be determined	Recommendations added to five-year plan		x	x	x	x	Marina TAC recommendation

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes
Implement	(f) Assess and promote stripping and refinishing technologies that reduce emissions and discharges, as well as regional guidelines for hull paint preparation to reduce premature detachment from hulls;	Port captains and harbor masters, boatyards	MBNMS pilot project and Statewide	To be determined	Clean technologies manual and guidelines		x	x	x	x	Strategy in MBNMS WQPP Action Plan III (Marinas & Boating)
	(g) Develop legislation that prohibits the sale and use of toxic hull paints, as necessary after a thorough analysis of situation.	SWRCB SCC	Statewide	To be determined	Passage of new legislation					x	Trigger, if toxic paints still widely applied and financially feasible alternatives are available
Track and Monitor	To be completed as specified in Part III.A. – Introduction /Structure										
Report Biennially	To be completed as specified in Part III.A. – Introduction /Structure										

Management Measure Category: Marinas and Recreational Boating

Management Measure Title: 4.1H, 4.2A, and 4.2C--Hazardous and Toxic Materials Management

Management Measure Targeting Level: Primary for 4.1H-Waste Management Facilities and 4.2A-Solid Waste Control

Secondary for 4.2C-Liquid Material Control

Objectives:

1. Resolve potential regulatory and liability issues that currently discourage many harbor districts and marinas from taking a more active role in hazardous waste management.
2. Develop convenient disposal options for boaters that allow for the drop off and collection of hazardous wastes in marinas and harbors.
3. By the year 2003, develop and implement one or more pilot Temporary Waste Collection Program(s) where 100 percent of marinas in the pilot region(s) are included as collection points during the regular recruitment of common household hazardous wastes by municipalities and counties.

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years 98	99	00	01	02	Notes
Assess	Assess existing hazardous waste disposal and used oil recycling services available to California boaters in order to identify gaps in service.	CCC, SFEP, and Santa Monica Bay Restoration Project	Statewide by region	CIWMB	Report to CIWMB and public	x	x	x			A survey of marinas in Northern and Southern California has been conducted by the CCC's BCGC.
Target	To be completed as specified in Part III.A. – Introduction /Structure										
Plan	To be completed as specified in Part III.A. – Introduction /Structure										
Coordinate	To be completed as specified in Part III.A. – Introduction /Structure										
Implement	Resolve issues discouraging harbors and marinas from temporarily storing hazardous and toxic materials generated by boaters (such as waste oil, batteries, paints, solvents, antifreeze, detergents, and contaminated fuels) until pickup and/or recycling by local waste management agencies. (For example, investigate the possibility of obtaining categorical exemptions for harbors for periodic collection and/or transport of small quantities of hazardous materials.)	DTSC, City and County Household Hazardous Waste (HHW) agencies	MBNMS pilot project and Statewide	CWA §319	MOA (e.g., between DTSC, HHW agencies, RWQCBs, SWRCB, and Port Captains and Harbor Masters Association) or new legislation			x			Recommendations from Marina TAC, 12/98 and 1/99 marina stakeholder meetings, and MBNMS WQPP Action Plan III (Marinas & Boating)

Process Element	Actions/ Statements	Lead Agency	Geographic Area	Potential Funding	Performance Measures	Years					Notes
						98	99	00	01	02	
Implement	Coordinate waste disposal and recycling programs to include marinas as a collection point during the regular recruitment of common household hazardous wastes. Key steps may include: • Plan development of temporary waste collection program that includes recycling programs for waste oil and batteries; • Obtain funding; • Develop sites; • Establish procedures to handle materials at collection points within designated harbors and marinas; • Implement pickup services program; and • Implement education programs.	City and County Environ-mental Health and HHW Departments (coordinate with waste management districts and port captains and harbor masters; in MBNMS coordinate with WQPP)	MBNMS pilot project and Statewide	SWRCB, DTSC, and/or CIWMB grants			x	x	x	x	Marina TAC recommendation (Marina TAC identified waste oil and batteries as the two most voluminous hazardous wastes) See also Strategy M.4 in MBNMS WQPP Action Plan III (Marinas & Boating)
Track and Monitor	To be completed as specified in Part III.A. – Introduction /Structure										
Report Biennially	To be completed as specified in Part III.A. – Introduction /Structure										

Management Measure Category: Marinas and Recreational Boating

Management Measure Title: 4.3--Education/Outreach

Management Measure Targeting Level: Primary

Objectives:

1. Communicate to boaters and owners/operators of marinas and boatyards the environmental and economic impacts of pollution; identify and increase the awareness and use of MMs and BMPs where needed to prevent and control adverse impacts associated with marinas and boats.
2. Enhance and coordinate State educational, technical and financial assistance, and enforcement programs to assist the boating community's efforts to implement MMs to prevent and control polluted runoff from marinas, boat yards, and boating activities.

F. Hydromodification Management Measures

The SWRCB, CCC, and other State agencies have identified seven MMs to address hydromodification sources of nonpoint pollution affecting State waters. Hydromodification includes modification of stream and river channels, dams and water impoundments, and streambank/shoreline erosion.

California's MMs to address sources of nonpoint pollution related to hydromodification activities:

5.1 Channelization/Channel Modification
- A. Physical and Chemical Characteristics of Surface Waters
- B. Instream and Riparian Habitat Restoration

5.2 Dams
- A. Erosion and Sediment Control
- B. Chemical and Pollutant Control
- C. Protection of Surface Water Quality & Instream and Riparian Habitat

5.3 Streambank and Shoreline Erosion
- A. Eroding Streambanks & Shorelines

5.4 Education/Outreach
- A. Educational Programs

Channel modification activities are undertaken in rivers or streams to straighten, enlarge, deepen, or relocate the channel. These activities can affect water temperature, change the natural supply of fresh water to a water body, and alter rates and paths of sediment erosion, transport, and deposition. Hardening the banks of waterways with shoreline protection or armor also accelerates the movement of surface water and pollutants from the upper reaches of watersheds into coastal waters. Channelization can also reduce the suitability of instream and streamside habitat for fish and wildlife by depriving wetlands and estuarine shorelines of enriching sediments, affecting the ability of natural systems to filter pollutants, and interrupting the life stages of aquatic organisms (USEPA, 1993).

Dams can adversely impact hydrology and the quality of surface waters and riparian habitat in the waterways where the dams are located. A variety of impacts can result from the siting, construction, and operation of these facilities. For example, improper siting of dams can inundate both upstream and downstream areas of a waterway. Dams reduce downstream flows, thus depriving wetlands and riparian areas of water. During dam construction, removal of vegetation and disturbance of underlying sediments can increase turbidity and cause excessive sedimentation in the waterway.

The erosion of shorelines and streambanks is a natural process that can have either beneficial or adverse impacts on riparian habitat. Excessively high sediment loads resulting from erosion can smother submerged aquatic vegetation, cover shellfish beds and tidal flats, fill in riffle pools, and contribute to increased levels of turbidity and nutrients.

Management Measures:

Channelization/Channel Modification. California's MMs for channelization and channel modification promote the evaluation of channelization and channel modification projects. Channels should be evaluated as a part of the watershed planning and design processes, including watershed changes from new development in urban areas, agricultural drainage, or forest clearing. The purpose of the evaluation is to determine whether resulting NPS changes to surface water quality or instream and riparian habitat can be expected and whether these changes will have a detrimental (or negative) impact. Existing channelization and channel modification projects can be evaluated to determine the NPS impacts and benefits associated with the projects. Modifications to existing projects, including operation and maintenance or management, can also be evaluated to determine the possibility of improving some or all of the impacts without changing the existing benefits or creating additional problems. In both new and existing channelization and channel modification projects, evaluation of benefits and/or problems will be site specific.

Dams. The second category of MMs addresses NPS pollution associated with dams. Dams are defined as constructed impoundments that are either: (1) 25 feet or more in height *and* greater than 15 acre-feet in capacity or (2) six feet or more in height *and* greater than 50 acre-feet in capacity. MMs 5.2A and 5.2B address two problems associated with dam construction: (1) increases in sediment delivery downstream resulting from construction and operation activities and (2) spillage of chemicals and other pollutants to the waterway during construction and operation. MM 5.2C addresses the impacts of reservoir releases on the quality of surface waters and instream and riparian habitat downstream.

Streambank and Shoreline Erosion. The third category of hydromodification measures addresses the stabilization of eroding streambanks and shorelines in areas where streambank and shoreline erosion creates a polluted runoff problem. Bioengineering methods such as marsh creation and vegetative bank stabilization are preferred. Streambank and shoreline features that have the potential to reduce polluted runoff shall be protected from impacts, including erosion and sedimentation resulting from uses of uplands or adjacent surface waters. This MM does not imply that all shoreline and streambank erosion must be controlled; the measure applies to eroding shorelines and streambanks that constitute an NPS problem in surface waters.

Education/Outreach. MMs 5.4A focuses on the development and implementation of pollution prevention and education programs for agency staffs and the public, as well as the promotion of assistance tools that emphasize restoration and low-impact development. Education, technical assistance, incentives, and other means can be used to promote projects that: (1) reduce NPS pollutants, (2) retain or reestablish natural hydrologic functions (e.g., channel restoration projects and low-impact development projects), and/or (3) prevent and restore adverse effects of hydromodification activities.

Management Measure Category: Hydromodification

Management Measure Titles: 5.1 – Channelization/Channel Modification; 5.3 – Streambank and Shoreline Erosion; and 5.4-Education/Outreach (Hydromodification)

Management Measure Targeting Level: Primary for MM 5.4-Education/Outreach and secondary for all others.

Objectives:

1. By the year 2001, implement CWA §401 certification program regulations to delegate program authority to the RWQCBs.
2. By the year 2002, develop a technical assistance manual that will assist local governments and small businesses with guidelines for designing projects to avoid wetlands and riparian areas.
3. By the year 2001, adopt general WDRs that prescribe channel maintenance activities with minimal threat to water quality.

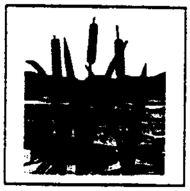
Report Biennially	To be completed as specified in Part III.A. – Introduction /Structure										

G. Wetlands, Riparian Areas, and Vegetated Treatment Systems



The SWRCB, CCC, and other State agencies have identified four MMs to promote the protection and restoration of wetlands and riparian areas and the use of vegetated treatment systems as means to control NPSs of pollution. Wetlands and riparian areas reduce polluted runoff by filtering out runoff-related contaminants, such as sediment, nitrogen, and phosphorus, thus maintaining the water quality benefits of these areas is important. These areas also help to attenuate flows from higher-than-average storm events. This protects downstream areas from adverse impacts, such as channel scour, erosion, and temperature and chemical fluctuations. Changes in hydrology, substrate, geochemistry, or species composition can impair the ability of wetland or riparian areas to filter out excess sediment and nutrients and therefore can result in deteriorated water quality. The following activities can cause such impairment: drainage of wetlands for cropland, overgrazing, hydromodification, highway construction, deposition of dredged material, and excavation for ports and marinas.

California's MMs to protect and restore wetlands and riparian areas and use vegetated treatment systems as means to control pollution from nonpoint sources:

- 6A. Protection of Wetlands & Riparian Areas
- 6B. Restoration of Wetlands & Riparian Areas
- 6C. Vegetated Treatment Systems
- 6D. Education/Outreach

Management Measures:

6A **Protection of Wetlands/Riparian Areas.** Implementation of MM 6A is intended to protect the existing water quality improvement functions of wetlands and riparian areas as a component of NPS Programs.

6B **Restoration of Wetlands/Riparian Areas.** Restoration of wetlands and riparian areas (MM 6B) refers to the recovery of a range of functions that existed previously by reestablishing hydrology, vegetation, and structure characteristics. Damaged or destroyed wetland and riparian areas should be restored where restoration of such systems will significantly abate polluted runoff.

6C **Vegetated Treatment Systems.** MM 6C promotes the installation of vegetated treatment systems (e.g., artificial or constructed wetlands) in areas where these systems will serve a polluted runoff-abatement function. Vegetated filter strips and engineered wetlands remove sediment and other pollutants from runoff and wastewater and prevent pollutants from entering adjacent water bodies. Removal typically occurs through filtration, deposition, infiltration, absorption, adsorption, decomposition, and volatilization.

6D **Education/Outreach.** MM 6D promotes the establishment of programs to develop and disseminate scientific information on wetlands and riparian areas and to develop greater public and agency staff understanding of natural hydrologic systems—including their functions and values, how they are lost, and the choices associated with their protection and restoration.

Wetlands, Riparian Areas, and Vegetated Treatment Systems

Management Measure Titles: 6A - Protection of Wetlands and Riparian Areas; 6B - Restoration of Wetlands and Riparian Areas; and 6D - Education/Outreach (Wetlands)

Management Measure Target Level: Primary for MM 6D and secondary for all others.

Objectives:

1. By the year 2001, implement CWA§401 certification program regulations to delegate program authority to the RWQCBs.
2. By the year 2002, develop a technical assistance manual that will assist local governments and small business with guidelines for designing projects to avoid wetlands and riparian areas.

H. Critical Coastal Area

Actions

An initial task in the Strategy and the Implementation Plan is to create the CCA Interagency Committee to complete a list of criteria and methods for CCA designation. The Committee will consider the factors listed in the Strategy, as well as other criteria used by other programs to identify sensitive coastal areas. While CCA delineation will be based on special water quality concerns and may deviate from other classifications, the final CCA recommendation to be used by the CCC and SWRCB will fully consider other existing programs. Other programs that will be used to help designate CCAs include the ASBS, NERRs, the MBNMS WQPP, university research programs, TMDLs, and regional monitoring efforts. CCA designation will provide resources to special coastal areas which do not achieve priority ranking within other sections of this plan and will therefore provide solutions to program deficits.

In addition to creating a committee to identify CCA criteria, the Implementation Plan will include these specific actions:

1. Identify and map CCAs using newly developed criteria.
2. Dedicate funding and other resources to areas in which new or substantially expanding land uses may cause or contribute to the impairment of water quality within CCAs.
3. Increase public interest in protecting special coastal habitats by implementing additional MMs, supporting public education and outreach, and continuing local watershed restoration and research efforts within the CCAs.

CCA Coordination

The renewed emphasis by local governments and stakeholders on watershed-scale resource management (including the offshore marine component of watersheds) has provided California with initial information to help identify CCAs and apply additional MMs to these areas. Related programs from which to gain information include:

- The SWRCB has designated CWA section 319(h) funds for restoration efforts in watersheds with impaired water quality or impaired aquatic communities.
- The SWRCB, through the WQCP for the Ocean Plan, designates ASBS in State tidelands and submerged lands and can limit or prohibit discharges in their general proximity.
- The SWRCB BPTCP (CWC §§13390-13396) has identified numerous toxic coastal sediment deposits from urban and agricultural runoff.
- The CCC, RWQCB 4, and other entities are developing a long-term MP for the dredging and disposal of contaminated sediments for coastal waters adjacent to Los Angeles County. This plan must include components for watershed management and source reduction.
- The Cal/RA is leading a statewide work group to identify and coordinate offshore Marine Management Areas, which may be linked to adjacent CCAs.
- The MBNMS WQPP is developing a water quality plan that, when completed, may provide a mechanism to apply additional MMs to CCAs within watersheds draining to Monterey Bay.
- If a TMDL is completed within a designated CCA, the TMDL and CCA activities will be coordinated to help determine if additional MMs are needed.

Critical Coastal Areas

Objectives:

1. Identify and map initial list of CCAs.
2. Develop an ongoing process to identify CCAs and additional NPS MMs to implement as necessary in CCAs.
3. Provide information on CCAs (areas adjacent to impaired, threatened, and/or pristine coastal waters, including ocean waters that fail to attain or maintain Ocean Plan water quality standards) to local, State, and regional decision makers and the public.
4. Review water quality and land use data every two years as part of the CWA §305(b) WQAP.
5. Review the effectiveness of existing MM implementation in CCAs and identify and implement additional MMs as needed to protect and restore CCAs.
6. Update CCA list, maps, and watershed information at least every two years and report on implementation efforts at public hearings every two years.

I. Monitoring

Objectives

A. Evaluate the effectiveness of specific MMs or BMPs in improving water quality or achieving water quality standards.
B. Maximize usefulness of monitoring by coordinating effectiveness monitoring with other monitoring programs.
C. Improve usefulness of community-based watershed monitoring efforts by developing and reviewing new methods for ambient and effectiveness monitoring, disseminating quality assurance requirements, and increasing training opportunities.
D. Improve data acquisition, evaluation, and access.

Objective		Actions	Lead Agency	Geographic Area	Potential Funding	Performance Measures	98	99	00	01	02	Notes
		MONITORING EFFECTIVENESS OF BEST MANAGEMENT PRACTICES										
A	1.	Design and implement a monitoring strategy to evaluate effectiveness of BMPs statewide that will:										
	a.	Create criteria to assess functioning of BMPs used to reduce pollution from agriculture, forestry, urban practices, and marinas.	SWRCB UCD	Statewide	State	Functioning assessment criteria		x	x			
	b.	Develop protocols and quality assurance methods for BMP functioning assessment criteria.	SWRCB UCD	Statewide	State	Written protocols, QA Plan		x				
	c.	Monitor functioning of one BMP per sector (agriculture, forestry, urban practices, and marinas) in at least two watersheds.	SWRCB UCD	Statewide	State	Monitoring data		x				
	d.	Develop database on BMP effectiveness.	SWRCB UCD	Statewide	State	Database		x				
	e.	Develop and implement a monitoring strategy to monitor effectiveness of BMPs in reducing NPS pollution. Design a strategy that links to regional/local ambient or project monitoring.	SWRCB, RWQCBs, UCD	Statewide	State	Monitoring strategy, Monitor 9 key watersheds statewide, Report on effectiveness of BMPs			x

APPENDICES

APPENDIX A. MEETING FEDERAL REQUIREMENTS

Federal Requirements Under Section 319 Of CWA
Check List on Nine Key Elements

Index for the Nine Key Elements of an Effective NPS Program as described in the USEPA NPS Program and Grants Guidance for Fiscal Years 1997 and Future Years (May 1996)

1. ***The State program contains explicit short- and long-term goals, objectives, and strategies to protect surface and ground water.***

a.	The California program includes a Vision Statement.	1
b.	California has specified MMs as long-term goals to be implemented by 2013 directed toward the expeditious achievement and maintenance of beneficial uses of water.	CAMMPR, 1
c.	Short-term (e.g., 1-5 year) objectives and activities have been specified for implementing the MMs that are linked to the vision statement.	86
d.	The California program addresses both surface and ground water.	1
e.	California has identified performance measures that will be used to assess the State's success in achieving its goals and objectives.	86
f.	Implementation strategies have been prepared that identify activities and the expected effects of those activities on water resources.	86, WMI Chapters

2. ***The State strengthens its working partnerships and linkages with appropriate State, Tribal, regional, and local entities (including conservation flood control districts), private sector groups, citizens groups, industry groups, and Federal agencies.***

a.	The State relies on several statewide partnerships to provide for input and recommendations from representatives of federal, State, Tribal, and local agencies, private sector groups, and citizens groups, regarding NPS program direction, project selection, and other similar aspects of program administration.	45
b.	These partnerships meet regularly and promote collaborative and inclusive decision making.	50
c.	The State program specifies procedures to provide for periodic public input into the program.	45
d.	California's program actively supports broad-based local watershed efforts that incorporate a variety of organizations and interests into the implementation of NPS activities.	39
e.	The State uses its partnerships effectively to promote comprehensive solutions that avoid the transfer of problems among environmental media.	51

3. ***The State uses a balanced approach that emphasizes both statewide NPS programs and on-the-ground management of individual watersheds where waters are impaired and threatened.***

a.	The SWRCB and RWQCBs' WMI document is a multi-year work plan that contains NPS implementation actions directed at both specific priority watersheds and activities of a statewide nature.	39
b.	The SWRCB/RWQCBs prepare annual work plans for CWA Section 319 funding, consistent with the WMI document that contains NPS implementation actions directed at both specific priority watersheds and activities of a statewide nature.	42
c.	The CCC has prepared a Polluted Run-off Strategy that is a multi-year work plan that contains NPS implementation actions directed at both specific priority watersheds and activities of a wider scope, consistent with its jurisdiction.	40
d.	State tracks both statewide activities and watershed projects.	71
e.	State has institutionalized its program beyond the annual implementation of CWA section 319 funded activities and projects.	Vol. I
f.	State uses an integrated watershed approach for assessment, protection, and remediation that is well integrated with other water or natural resource programs.	24
g.	Each of the nine RWQCBs adopt Basin Plans that identify existing and potential beneficial uses, establish basin specific water quality objectives, contain implementation, surveillance and monitoring plans, and include enforceable prohibitions against certain types of discharges.	33

4. ***The State program (a) abates known water quality impairments from NPS pollution and (b) prevents significant threats to water quality from present and future activities.***

a.	State has comprehensively characterized water quality impairments and threats throughout the State which are caused or significantly contributed to by NPSs.	25
b.	State program addresses all significant NPS categories and subcategories and promotes pollution prevention through the implementation of appropriate MMs.	CAMMPR
c.	State program has identified specific programs to abate pollution from categories of NPSs which cause or substantially contribute to the impairments identified in its assessments.	CAMMPR
d.	State has identified specific programs to prevent future water quality impairments and threats that are likely to be caused by NPS pollution.	19 CAMMPR

5. ***The State program identifies waters and their watersheds impaired by NPS pollution and identifies important unimpaired waters that are threatened or otherwise at risk. Further, the State establishes a process to progressively address these identified waters by conducting more detailed watershed assessments and developing watershed implementation plans, and then by implementing the plans.***

a.	State water quality assessments (including those performed under CWA sections 305[b], 319[a], 303[d], 314, and others), along with the California Unified Watershed Assessment, form the basis for the identification of the State's planned NPS activities and projects.	25
b.	State activities focus on remediating the identified impairments and threats and on protecting the identified at-risk waters.	25
c.	State has provided for public participation in the overall identification of problems to be addressed in the State program and in the establishment of a process to progressively address these problems.	19, 26
d.	State NPS priorities are communicated to, consistent with, and reflected in program planning and implementation activities by other water resource management agencies operating within the State.	45
e.	State revises its identification of waters and revisits its process for progressively addressing these problems periodically (e.g., once every five years).	9

6. ***The State reviews, upgrades, and implements all program components required by section 319(b) of the CWA, and establishes flexible, targeted, and iterative approaches to achieve and maintain beneficial uses of water as expeditiously as practicable. The State programs include:***
   - ***A mix of water quality-based and/or technology-based programs designed to achieve and maintain beneficial uses of water; and***
   - ***A mix of regulatory, nonregulatory, financial, and technical assistance as needed to achieve and maintain beneficial uses of water as expeditiously as practicable.***

a.	The State program identifies MMs to control NPSs of pollution focusing on measures which will be effective to address the most prevalent types of NPS pollution.	CAMMPR
b.	Identification of regulatory and nonregulatory programs to achieve implementation of the measures.	24
c.	Processes used to coordinate and, where appropriate, integrate various programs used to implement NPS controls in the State.	45
d.	Five-year implementation plans with goals, objectives, and milestones for program implementation and a process to revise these implementation plans twice by 2013.	86
e.	A legal opinion describing the State authorities available for implementing the MMs.	Appendix: Legal opinion
f.	Sources of funding from federal (other than CWA section 319), State, local, and private sources.	62
g.	Monitoring and other evaluation programs to help determine short- and long-term program effectiveness.	69
h.	The State program also incorporates/coordinates with existing baseline requirements established by other applicable federal or State laws to the extent that they are relevant.	30, 45 CAMMPR

7. ***The State identifies federal lands and activities which are not managed consistently with State NPS program objectives. Where appropriate, the State seeks USEPA assistance to help resolve issues.***

a.	The State works with federal agencies to resolve potential inconsistencies among federal programs and activities and the State programs.	52
b.	Where the State cannot resolve federal consistency issues to its satisfaction, it requests USEPA assistance to help resolve the issues.	52
c.	The State coordinates with federal agencies to promote consistent activities and programs and to develop and implement joint or complementary activities and programs.	47

8. ***The State manages and implements its NPS Program efficiently and effectively, including necessary financial management.***

a.	The State fosters plans for watershed projects and statewide activities that are well-designed with sufficient detail to assure effective implementation.	65
b.	The State's watershed projects focus on the critical areas and critical sources within those areas that are contributing to NPS problems.	65
c.	State implements its activities and projects, including all tasks and outputs, in a timely manner.	69
d.	State has established systems to assure that the State meets its reporting obligations.	77
e.	State utilizes the GRTS effectively.	65
f.	State has developed and uses a fiscal accounting system capable of tracking expenditures of both CWA section 319 funds and nonfederal matching funds.	42
g.	NPS projects include appropriate monitoring and/or environmental indicators to gauge effectiveness.	65

9. ***The State periodically reviews and evaluates its NPS management program using environmental and functional measures of success and revises its NPS assessment and its management program at least every five years.***

		Page #
a.	The State has and uses a process to periodically assess both improvements in water quality and new impairments or threats.	69
b.	The State uses a feedback loop based on monitoring and other evaluative information to assess the effectiveness of the program in meeting its goals and objectives, revises its activities, and tailors its annual workplans, as appropriate, in light of its review.	9
c.	The State's annual report successfully portrays the State's progress in meeting milestones, implementing BMPs, and achieving water quality goals.	77

Federal Requirements Under Section 6217 Of CZARA
Check List On Conditions

Index for the section 6217 CZARA Conditions for Program Approval for the California Coastal NPS Program as described in the Program Findings and Conditions issued by USEPA/NOAA, July 1998.

1. ***Include NPS MMs in conformity with the Guidance Specifying MMs for Sources of Nonpoint Pollution in Coastal Waters (EPA, January 1993), issued under the authority of Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990.***

	Page #
a. MMs have been adopted by the SWRCB and CCC for agriculture, forestry, urban areas, marinas and recreational boating, hydromodification, and wetlands and riparian areas.	CAMMPR
b. The State Porter-Cologne Act provides authorities that will be used, as necessary, to implement the MMs, in conformity with CZARA requirements for enforceable policies and mechanisms (see #2 below).	CAMMPR
c. The State and local authorities and programs being used to implement the MMs are clearly described.	CAMMPR, 24
d. Implementation strategies have been developed to implement the MMs statewide by 2013.	24

2. ***Identify authorities that can be used to prevent nonpoint pollution and require management measure implementation, as necessary.***

	Page #
a. The Chief Counsels of the SWRCB and the CCC have prepared legal opinions concerning their respective authorities to implement the MMs for each of the appropriate source categories.	Appendix: Legal Opinions
b. For each of the source categories, the NPS Plan provides a description of the voluntary or incentive-based programs, including the methods for tracking implementation of MMs and evaluating those programs that the State will use to encourage implementation of the MMs.	CAMMPR CZARA Submittal (1995)
c. A description of the mechanisms or processes that link the implementing agencies for each of the source categories with the enforcement agencies and a commitment to use the existing enforcement authorities, where necessary, is included in the State program.	Appendix

3. ***Prepare a fifteen-year program strategy that briefly describes the State's overall approach and schedule to ensure implementation of the MMs and improve water quality within 15 years of the date of conditional approval.***

	Page #
a. California's NPS Program Plan has been "upgraded" to include a Strategy.	24
b. The goal of the NPS Program is to implement the MMs by 2013 (within 15 years of the date of federal conditional approval pursuant to CZARA).	1
c. The program has a process whereby the State will determine the need to use a backup authority and/or to adopt additional enforceable policies and mechanisms to ensure implementation of the MMs within 15 years.	54, 85

4. ***Nested within the longer-term Strategy, prepare a five-year implementation plan that provides more specifics for achieving full implementation of the MMs.***

	Page #
a. The Implementation Plan is more specific than and nested within the longer term Strategy for achieving full implementation of the MMs.	86
b. The Implementation Plan describes when, where, and how program implementation will occur, including mechanisms for tracking and monitoring implementation.	159
c. The Implementation Plan contains interim milestones and benchmarks, including a time frame; and will be updated, as necessary, but at least every five years. Achieving the milestones and benchmarks of these plans will serve as a basis for evaluating progress in achieving program implementation goals.	86
d. The Implementation Plan is designed to ensure adequate progress in achieving the Strategy and is integrated and consolidated with other federal and State water quality programs.	86

5. ***Common program elements required by CZARA (technical assistance, critical coastal areas, additional MMs, administrative coordination, and monitoring) should be included in the 15-Year Program Strategy and Implementation Plan.***

	Page #
a. The program includes mechanisms for ensuring coordination among State agencies and between State and local officials with a role in the implementation of the MMs.	45
b. The program includes activities to provide technical assistance to local governments and the public for implementing MMs.	62
c. A process has been developed to provide for the identification of critical coastal areas.	28
d. The program includes an additional management measure process for developing and revising MMs to be applied in critical coastal areas and in areas where necessary to attain and maintain water quality standards. In addition, the State has described a process to identify additional MMs for forestry necessary to attain and maintain water quality standards.	78, 111
e. California includes in its program a monitoring element to enable the State to assess over time the extent to which implementation of MMs is reducing pollution loads and improving water quality.	69

APPENDIX B. LEGAL OPINIONS

STATE WATER RESOURCES CONTROL BOARD
CHIEF COUNSEL'S STATEMENT
FOR THE
CALIFORNIA'S NONPOINT SOURCE POLLUTION CONTROL PROGRAM

NOVEMBER 1999

CHIEF COUNSEL'S STATEMENT
FOR THE
CALIFORNIA'S NONPOINT SOURCE POLLUTION CONTROL PROGRAM

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD
OFFICE OF CHIEF COUNSEL
NOVEMBER 1999

CHIEF COUNSEL'S STATEMENT

I hereby certify that in my opinion the State of California can use the Porter-Cologne Water Quality Control Act[1] as a backup authority in the California's Nonpoint Source Pollution Control Program to prevent nonpoint source pollution and to ensure management measure implementation. This authority can be used to address nonpoint source pollution due to agricultural operations, urban sources, marinas, hydromodification activities and wetlands. This authority is described below.

I. INTRODUCTION

In 1990 Congress enacted legislation requiring states with approved coastal zone management programs to prepare and submit a coastal nonpoint pollution control program to the United States Environmental Protection Agency (EPA) and the National Oceanic and Atmospheric Administration (NOAA) for approval.[2] The program's purpose was to restore and protect coastal waters through the implementation of management measures for nonpoint pollution sources. To further this effort, EPA was directed to develop management measure guidance.[3] State programs had to provide for implementation of management measures in conformity with this guidance, referred to as the (g) guidance.[4]

In September 1995, California submitted its program, a joint effort of the California Coastal Commission and the State Water Resources Control Board (State Water Board), to EPA and NOAA. For five nonpoint pollution sources, agricultural operations, urban sources, marinas, hydromodification activities and wetlands, the state proposed voluntary or incentive-based programs to implement the (g) guidance management measures. The state identified the Porter-Cologne Water Quality Control Act (Porter-Cologne) as a backup enforcement authority to ensure management measure implementation.[5]

In 1998 EPA and NOAA conditionally approved California's program.[6] For final program approval, EPA and NOAA require a legal opinion from the State Water Board's

2 Section 6217 of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA), 16 U.S.C. § 1455b.

3 *Id.* § 6217(g), 16 U.S.C. § 1455b(g).

4 *Id.* § 6217(b), 16 U.S.C. § 1455b(b). See Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters, EPA, 840-B-92-002 (January 1993) (Management Measure Guidance).

5 The state also identified Porter-Cologne as a backup authority to implement the forestry management measures. EPA and NOAA found that California's program includes management measures for forestry activities in conformity with the (g) guidance and enforceable policies and mechanisms for implementation. However, the state program needs more management measures. See *infra*, fn. 6.

6 Letter, dated June 30, 1998, to Rusty Areias, Chairman, California Coastal Commission, and John Caffrey, former Chairman, State Water Board, from Jeffrey R. Benoit, Director, Office of Ocean and

Chief Counsel that Porter-Cologne can be used as a backup authority to prevent nonpoint pollution and to ensure management measure implementation[7] for these five sources.[8]

The following discussion addresses this issue. The discussion begins with an overview of Porter-Cologne. It then addresses three specific questions raised by EPA and NOAA regarding Porter-Cologne's use as a backup authority.

II. OVERVIEW OF PORTER-COLOGNE

Porter-Cologne is the primary water quality control law for California. In addition, the act authorizes the state to implement the federal Clean Water Act.[9] Porter-Cologne applies broadly to all state waters, including surface waters, wetlands, and groundwater.[10] Its provisions reflect the legislative intent that activities and factors that could affect the quality of state waters "be regulated to attain the highest water quality that is reasonable . . . ."[11] Porter-Cologne applies to both point and nonpoint sources.[12]

Porter-Cologne is administered regionally, within a framework of statewide coordination and policy.[13] The state is divided into nine regions, each governed by a regional water quality control board (Regional Water Board).[14] The State Water Board oversees and guides the Regional Water Boards through several activities. The State Water Board adopts state policy for water quality control, statewide water quality control plans, and regulations that are binding on the Regional Water Boards.[15] In

---

Coastal Resource Management, NOAA, and Felicia Marcus, Regional Administrator, EPA Region 9, transmitting Findings for the California Coastal Nonpoint Program.

[7] The state program has identified 61 management measures for six categories, including agriculture, forestry, urban areas, marinas, hydromodification, and wetlands. These measures are nearly identical to the (g) guidance management measures. The state measures are included in a draft document, dated June 3, 1999, entitled California's Nonpoint Source Pollution Control Program, Vol. II: California Management Measures for Polluted Runoff.

[8] See Final Administrative Changes to the Coastal Nonpoint Pollution Control Program Guidance for section 6217 of [CZARA] (Oct. 1998). This document states that NOAA and EPA will approve those program elements for which the states have proposed voluntary or incentive-based programs, backed by existing state enforcement authority, if the states provide a legal opinion that such authorities can be used to prevent nonpoint pollution and require management measure implementation. The states must also describe the voluntary or incentive-based programs, including the methods for tracking those programs, and the processes that link the implementing agency with the enforcement agency.

addition, the State Water Board must approve regional water quality control plans before they become effective.[16] The State Water Board also adopts statewide general permits.[17] They review Regional Water Board decisions on petitions for review.[18] Finally, the State Water Board exercises budgetary control over the Regional Water Boards and provides centralized legal services to the Regional Water Boards.[19]

A. Planning

Porter-Cologne addresses two primary functions - planning and waste discharge regulation. Porter-Cologne's planning authority extends to any activity or factor which may affect water quality.[20] These factors include, for example, not only waste discharges, but also saline intrusion, reduction of waste assimilative capacity caused by reduction in water quantity, hydrogeologic modifications, and watershed management projects.[21]

Both the State and the Regional Water Boards plan for water quality control. The State Water Board is charged with adopting state policy for water quality control.[22] These policies contain principles and guidelines for long range resource planning, including ground and surface water management.[23] They also contain water quality objectives at key locations for planning and operation of water resource development projects and for water quality control activities.[24] Since 1968 the State Water Board has adopted 13 policies.[25]

In addition to the State Water Board-adopted policies, Porter-Cologne establishes state policy for the coastal marine environment.[26] This policy states that wastewater discharges must be treated to protect present and future beneficial uses, and, where

[25] These policies cover enclosed bays and estuaries, the use and disposal of inland waters used for powerplant cooling, water quality control, maintaining high quality waters, water reclamation, shredder waste disposal, the underground storage tank pilot program, sources of drinking water, enforcement, investigation and cleanup and abatement of discharges under Water Code section 13304, municipal solid waste, guidance on development of regional toxic hot spot cleanup plans, and pollutant policy for the San Francisco Bay-Delta.

[26] Wat. Code § 13142.5.

feasible, to restore past beneficial uses of the receiving waters.[27] Highest priority must be given to improving or eliminating discharges that adversely affect wetlands, estuaries, and other biologically sensitive areas, important water contact areas, shellfish areas, and ocean areas subject to massive waste discharge.[28]

The State Water Board can also adopt water quality control plans for waters requiring water quality standards under the Clean Water Act (essentially surface waters)[29] and must adopt a water quality control plan for ocean waters and for enclosed bays and estuaries.[30] Water quality control plans designate beneficial uses of water, establish water quality objectives to protect those uses, and contain a program to implement the objectives.[31] The beneficial use designations and water quality objectives together constitute water quality standards for purposes of the Clean Water Act.[32] The program of implementation must describe the nature of actions that are necessary to meet the objectives, including recommendations for action by both private and public entities.[33] The program also includes a time schedule and describes proposed surveillance activities to assess compliance with objectives.[34]

Water quality control plans can prohibit the discharge of waste, or certain types of waste, in specified areas or under certain conditions.[35] The Ocean Plan,[36] for example, prohibits the discharge of waste to 34 coastal "areas of special biological significance".[37]

In addition to the Ocean Plan, current State Water Board-adopted plans include the Thermal Plan,[38] which addresses temperature control in coastal, interstate, estuarine and bay waters, and the Delta Plan,[39] covering San Francisco Bay and the

[39] Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary (May 22, 1995).

Sacramento-San Joaquin Delta. Plans adopted by the State Water Board supersede any Regional Water Board-adopted plans to the extent of any conflict.[40]

Each Regional Water Board must adopt a water quality control plan for waters within the region.[41] The regional plans must conform with state policy for water quality control,[42] and they must be approved by the State Water Board.[43]

Both state policy for water quality control and state and regional water quality control plans are binding on other state agencies, departments, and boards, unless they are otherwise directed or authorized by statute.[44] In the latter case, they must notify the State or Regional Water Board of their authority for not complying.[45]

B. Waste Discharge Control

1. Permitting

Porter-Cologne also establishes a program to regulate waste discharges that could affect water quality.[46] This program is the principal way that state water quality control policies and plans are implemented. The program covers waste discharges to land as well as to surface and groundwaters.[47] Any person discharging or proposing to discharge waste that could affect water quality must file a report of waste discharge with the Regional Water Board, unless the Regional Water Board waives the filing.[48] A report is also required if the discharger proposes a material change in the character, volume, or location of a discharge.[49] The Regional Water Board must then issue waste discharge requirements to the discharger, unless requirements are waived.[50] The requirements must implement applicable state policies and state and regional water quality control plans.[51] The requirements can also prohibit the discharge of waste or certain types of waste, either under certain conditions or in specified areas.[52]

[47] See *id.*, §§ 13050(e), 13260(a), 13263(a).

[48] See *id.* §§ 13260, 13269, 13376. Persons discharging into a community sewer system are excepted from this requirement.

[49] See *id.* § 13264.

[50] See *id.* §§ 13263, 13269, 13377.

[51] *Id.* §§ 13263, 13377; see id. §13240.

[52] *Id.* § 13243.

The activities subject to regulation under waste discharge requirements include both point and nonpoint source discharges. Under the Clean Water Act, the point source discharge of pollutants to surface waters must be regulated under a National Pollutant Discharge Elimination System (NPDES) permit.[53] A point source is a discernible, confined and discrete conveyance, such as a pipe, ditch, or channel, but excluding irrigated agricultural return flows and agricultural stormwater discharges.[54] Waste discharge requirements for point source pollutant discharges to surface waters serve as NPDES permits for purposes of the Clean Water Act.[55]

Nonpoint pollution sources generally are sources that don't meet the definition of a point source. Nonpoint source pollution typically results from land runoff, precipitation, atmospheric deposition, drainage, seepage, or hydrologic modification.[56] The term "discharge of waste" in Porter-Cologne covers nonpoint, as well as point, sources of pollution.[57]

"Waste" is broadly defined in Porter-Cologne to include sewage and "any and all other waste substances, liquid, solid, gaseous, or radioactive, associated with human habitation, or of human or animal origin, or from any producing, manufacturing, or processing operation . . . ." This definition includes all Attorney General interpretations of the terms "sewage", "industrial waste", and "other wastes" under Porter-Cologne's predecessor legislation.[58] The Attorney General had interpreted the latter terms to include wastes from a variety of activities typically considered nonpoint, such as:

° drainage, flow, or seepage containing debris or eroded earth from logging operations;[59]

° garbage disposal;[60]

° drainage, flow or seepage containing garbage, ashes, mixed refuse, or solid industrial waste from inactive or closed dumps;[61]

° return irrigation or drainage water from agricultural operations;[62]

° pesticides improperly applied to waters of the state, or which find their way into waters of the state after application;[63]

° changes in the physical or chemical characteristics of receiving waters caused by extraction of minerals from a streambed;[64] and

° dumping of earth moved from construction operations, or drainage of wastewater from construction sites.[65]

These examples indicate that discharges of waste are not limited to waste disposal but also include releases of pollutants as part of other activities.[66] Hydrological or hydrogeological modifications, for example, that cause the release of wastes into state waters may be regulated under waste discharge requirements.

On the other hand, the Attorney General has concluded that salt water intrusion and reductions in waste assimilative capacity caused by diversions which reduce water quantity are not discharges of waste.[67] These activities may, however, be addressed in state policy for water quality control and state or regional water quality control plans, which are binding on other state agencies.[68]

The Regional Water Boards are primarily responsible for issuing waste discharge requirements and NPDES permits. Waste discharge requirements may be either individual or general, for a category of discharges.[69] The Regional Water Boards may, likewise, adopt either individual or general NPDES permits.[70]

The State Water Board can issue or modify Regional Water Board-adopted waste discharge requirements in response to a petition for review of the requirements.[71] The State Water Board can also issue general waste discharge requirements.[72] The State Water Board has used this authority, for example, to adopt general requirements for small

domestic wastewater systems.[73] Like the Regional Water Boards, the State Water Board has independent authority to issue individual and general NPDES permits. The State Water Board has issued several general NPDES permits, including two covering stormwater discharges from industrial sources[74] and construction sites,[75] respectively.

2. Investigations

Both the State and Regional Water Boards have broad powers to investigate water quality.[76] They can investigate water quality in connection with any action authorized or required under Porter-Cologne, including the development or review of water quality control plans or waste discharge requirements.[77] Their investigative powers include the authority to conduct sampling; inspect facilities, records, and monitoring equipment; and issue subpoenas for the production of evidence.[78]

The State and Regional Water Boards can require state and local agencies to investigate and report on any technical factors involved in water quality control.[79] In addition, they can require any person who has discharged, discharges, proposes to discharge or is suspected of discharging waste, whether from a point or a nonpoint source, to monitor and report information.[80]

The Regional Water Boards are primarily responsible for inspecting regulated facilities.[81] The State Water Board can enter and inspect a non-NPDES facility in response to a petition for review.[82] The State Water Board also has independent authority to enter and inspect facilities covered under the NPDES permit program.[83]

Recent amendments to Porter-Cologne impose specific responsibilities on the State Water Board with respect to investigating coastal water quality.[84] Subject to the availability of funds, the State Water Board must prepare a report for the Legislature that

proposes implementing a comprehensive program to monitor the quality of coastal watersheds, bays, estuaries, and their marine resources. The pollutants targeted for monitoring include, at a minimum, bacteria and viruses, petroleum hydrocarbons, heavy metals, and pesticides.[85] The program must include an identification of pollution sources and estimates of total pollutant discharges, to the extent possible, recommended actions that should be undertaken to maintain and improve coastal water quality, and other information.[86]

3. Enforcement

The Regional Water Boards also have primary authority for enforcement. They may choose from a variety of enforcement options.[87] These include notices to comply for minor violations,[88] time schedule orders,[89] cleanup and abatement orders,[90] cease and desist orders,[91] administrative civil liability orders,[92] and referrals to the Attorney General for injunctive relief and civil and criminal penalties.[93] The Regional Water Boards can use their enforcement authority to respond to unauthorized discharges, discharges in violation of waste discharge requirements or prohibitions, discharges that cause or threaten to cause pollution or nuisance, and violations of monitoring or reporting requirements.[94]

The State Water Board is authorized to take enforcement action in certain instances, although the State Water Board normally defers to the appropriate Regional Water Board. The State Water Board can take enforcement action in the first instance for NPDES-related violations.[95] For non-NPDES violations, the State Water Board can use the same enforcement tools as the Regional Water Boards in response to a petition for review of a Regional Water Board action.[96] The State Water Board can also issue notices to comply for minor violations.[97]

C. Other Programs

In addition to the specific planning and waste discharge control provisions discussed above, Porter-Cologne contains other water quality control programs. Chapter 5.6 establishes a program to identify and cleanup toxic hot spots in the state's bays, estuaries, and coastal waters.[98] Toxic hot spots include sites impaired by nonpoint, as well as point, sources of toxic pollution.[99] Plans to remediate these sites can include, in addition to remedial actions, measures to prevent toxic pollution, such as best management practices to address nonpoint pollution sources.

Porter-Cologne addresses a variety of other subjects, including: onsite, subsurface disposal systems;[100] drainage from abandoned mines;[101] storm water enforcement;[102] discharges of methyl tertiary-butyl ether (MTBE) to drinking water sources;[103] regulation of the use of recycled water;[104] waste discharges from houseboats;[105] and the construction and abandonment of water wells, cathodic protection wells and groundwater monitoring wells.[106] Porter-Cologne also contains several programs to provide grants or loans for water quality facilities and programs.[107]

D. Clean Water Act Authority

The State Water Board is "the state water pollution control agency" for all purposes stated in the Clean Water Act.[108] Thus, the State Water Board is authorized to fulfill the state's responsibilities to adopt water quality standards for surface waters, to develop a nonpoint source management program, and to establish total maximum daily loads (TMDLs) for impaired waterbodies.[109]

While the Regional Water Boards typically adopt water quality control plans for waters within their regions, Porter-Cologne specifically authorizes the State Water Board to adopt plans for surface waters that supersede any conflicting regional plans. In

addition, the State Water Board can issue water quality certifications under section 401[110] of the act.[111] The State Water Board can accept federal capitalization grants for a state/federal revolving fund loan program to finance construction of publicly owned sewage treatment works,[112] implement the state's nonpoint source management program under section 319,[113] and develop and implement the national estuary program under section 320[114] of the Clean Water Act.[115]

Chapter 5.5 of Porter-Cologne authorizes the State and Regional Water Boards to carry out the NPDES permit program.[116] Chapter 5.5 applies to point source discharges to surface waters, introduction of pollutants into publicly owned treatment works, use and disposal of sewage sludge, and disposal of pollutants into wells.[117]

III. QUESTIONS

A. Question: Can Porter-Cologne be used to (1) prevent nonpoint source pollution and (2) require the implementation of management measures?

Response: Yes, Porter-Cologne can be used to generally prevent nonpoint source pollution and to specifically implement, either directly or indirectly, the (g) guidance management measures. The following discussion describes the State and Regional Water Boards' authority to prevent pollution, methods that they can use to both prevent pollution and require management measure implementation, and the potential impacts of Water Code section 13360.

1. Authority to Prevent Pollution

Porter-Cologne can unquestionably be used to prevent nonpoint source pollution. Under the Dickey Act,[118] the predecessor to Porter-Cologne, the Regional Water Boards' jurisdiction to regulate waste discharges, depended, in part, on whether the discharge created or threatened to create a "condition of pollution".[119] "Pollution" meant a water quality impairment that "does not create an actual hazard to the public health" but that does "adversely and unreasonably affect such waters" for beneficial use, or that

[116] See *id.* §§ 13370-13388.

[117] See *id.* §§ 13370, 13370.5, 13373, 13376, 13377, 13382, 13383.

[118] Stats. 1949, ch. 1549, as amended. The Dickey Act, originally called the "Water Pollution Control Act", became the "Water Quality Control Act" in 1965. Stats. 1965, ch. 1657.

[119] See 48 Ops.Cal.Atty.Gen. 30, 33-34 (1966), construing former Water Code § 13053.

"adversely and unreasonably affect[s] the ocean waters and bays of the state devoted to public recreation."[120]

The Regional Water Boards'[121] jurisdiction to regulate waste discharges under Porter-Cologne is much broader. The Regional Water Boards do not have to find that a discharge, if unregulated, would create or threaten to create pollution. They can regulate any actual or proposed waste discharge that "could affect" the quality of state waters.[122] Further, they do not have to authorize use of the full waste assimilation capacities of the receiving waters.[123] Rather, they can maintain a margin of safety in waste discharge requirements to assure protection of all beneficial uses.[124]

2. Methods

The State and Regional Water Boards can use Porter-Cologne to generally prevent nonpoint source pollution and to specifically require management measure implementation. There are several ways that this can be done.

(a) Nonpoint Source Management Plan

Under its Porter-Cologne authority, the State Water Board has adopted a Nonpoint Source Management Plan (1988) (NPS Plan). The plan describes a three-tiered management approach to address nonpoint source pollution. The plan focuses on implementation of best management practices as the primary way to meet water quality standards.

The first management tier relies on the dischargers' voluntary implementation of best management practices. The second tier is regulatory encouragement of best management practices. "Encouragement" is through two mechanisms. The State and Regional Water Boards can waive waste discharge requirements on condition that dischargers comply with best management practices. Alternatively, where other agencies can require implementation of best management practices, the boards can enter into agreements with those agencies in which the agencies agree to exercise their authority. In the third tier, the State and Regional Water Boards adopt waste discharge requirements.

The NPS Plan's intent is to prevent nonpoint source pollution through the three-tiered approach. The plan can be used to directly implement the (g) guidance

---

121 References to the Regional Water Boards in Part III of this statement include the State Water Board, where appropriate. See Part II of this statement for a discussion of the respective authorities of the State and Regional Water Boards.

122 See Wat. Code §§ 13260, 13263.

123 See *id.* § 13263(b).

124 Final Report, *supra*, fn. 58, App. A, p. 59.

management measures in the first and second tiers. The third tier, likewise, can be used to directly or indirectly implement the measures.

To the extent authorized by Water Code section 13360, as discussed below, waste discharge requirements can directly require implementation of the management measures if the management measures implement applicable water quality standards. Waste discharge requirements can also indirectly implement the measures by prohibiting or regulating a nonpoint source activity in such a manner that the discharger must implement the management measures in order to comply. Additionally, waste discharge requirements can, in lieu of establishing effluent limitations, require a discharger to develop and implement a plan, such as a stormwater pollution prevention plan, containing best management practices or other measures, to ensure compliance with applicable water quality standards. The requirements can mandate that the discharger consider the (g) guidance management measures, along with other relevant material, in developing the plan.

(b) Waste Discharge Requirements

Waste discharge requirements issued under Porter-Cologne prevent pollution by implementing applicable water quality control plans and policies. Under Porter-Cologne, "pollution" is an alteration of water quality by waste that unreasonably affects the waters for beneficial uses.[125] Waste discharge requirements must implement the applicable water quality control plan, including the designated beneficial uses and the water quality objectives required to protect those uses.[126] Thus, a discharge that complies with waste discharge requirements should not alter water quality in a manner that causes pollution.

Nonpoint source discharges can be regulated under waste discharge requirements, either individually or as a group. The requirements can directly or indirectly implement the (g) guidance management measures, as described in the above discussion on the NPS Plan.

(c) Waivers

The Regional Water Boards can also use their waiver authority to prevent pollution and implement the management measures. The Regional Water Boards can waive regulation of nonpoint source discharges, either on an individual basis or for a category of discharges.[127] A waiver must be in the public interest, and it is conditional and may be terminated at any time.[128] The Regional Water Boards can waive waste discharge requirements for nonpoint source discharges, either individually or as a group,

---

[125] See Wat. Code § 13050(l)(1). "Pollution" also includes water quality alterations that unreasonably affect facilities that serve beneficial uses.

[126] *Id* § 13263(a).

[127] *Id.* § 13269(a).

[128] *Ibid.*

on condition that the dischargers comply with specified best management practices designed to achieve water quality standards. In particular, a waiver for a nonpoint source category could be conditioned on compliance with the applicable (g) guidance management measures, provided that the management measures implemented applicable water quality standards.

(d) Water Quality Certification

The State Water Board certifies activities requiring a water quality certification under section 401 of the Clean Water Act. This section requires applicants for federal licenses or permits to obtain state certification that any discharge of pollutants to surface waters from a proposed activity will comply with the Clean Water Act, including applicable water quality standards. As long as an activity will result in a discharge to surface waters, the State Water Board can use its certification authority to prevent nonpoint source pollution associated with the activity. The State Water Board can include conditions on the entire activity to protect water quality standards, including beneficial uses.[129] In particular, in appropriate cases the State Water Board can condition a section 401 certification on compliance with management measures implementing water quality standards.

(e) Plans and Policies

In addition, the State Water Board and Regional Water Boards can use their planning authority to prevent nonpoint source pollution and to implement the management measures. The State Water Board can adopt state policy for water quality control, and both the State and Regional Water Boards can adopt water quality control plans that address this type of pollution. Both policies and plans are binding on other state agencies.

Water quality control plans must include an implementation program to achieve water quality objectives. Implementation programs can prevent nonpoint source pollution and implement the management measures through several approaches. The programs can recommend that nonpoint source dischargers carry out specific best management practices, including the management measures, in order to achieve water quality standards. The programs can also waive regulation of categories of nonpoint source discharges on condition that the dischargers implement specific best management practices, such as the measures. Alternatively, an implementation program can prohibit nonpoint source discharges, either entirely or partially, in certain areas or under certain conditions. The conditions can include compliance with appropriate best management practices, including the applicable management measures.

---

[129] See *PUD No. 1 of Jefferson County v. Washington Dept. of Ecology* (1994) 511 U.S. 700, 114 S. Ct. 1900.

(f) Investigatory Powers

The State and Regional Water Boards can use their broad investigatory authority to foster nonpoint source pollution prevention. Both the State and Regional Water Boards can investigate the scope, causes, and sources of nonpoint source pollution, and potential practices or control measures to prevent it. They can also require that state or local agencies or dischargers conduct this type of investigation. The State and Regional Water Boards can use information obtained from these investigations to, for example, encourage voluntary implementation of best management practices by dischargers, to encourage state or local agencies that regulate nonpoint source activities to require best management practices, or to develop appropriate planning or regulatory programs addressing nonpoint source pollution.

In addition, the State and Regional Water Boards can use their investigatory powers to directly require implementation of several of the management measures. As discussed below, some management measures requires plans, such as erosion control plans.

(g) Enforcement Authority

The Regional Water Boards can use their enforcement authority to require cleanup, abatement, and remediation of sites adversely impacted by nonpoint source pollution, including wetlands and riparian areas.[130] They can also impose administrative civil liability on this basis.[131] The Regional Water Boards can encourage dischargers to consider, as environmental credit projects reducing an administrative civil liability assessment, projects that protect and restore sensitive areas, such as wetlands and riparian areas.[132]

(h) Regulations

As an additional tool, the State Water Board can adopt regulations covering categories of nonpoint source discharges. The State Water Board, for example, has adopted regulations covering waste discharges from confined animal facilities[133] and mining activities.[134] To the extent authorized by Water Code section 13360, as discussed below, the State Water Board can adopt regulations for categories of nonpoint source dischargers, requiring implementation of measures that are appropriate to implement applicable water quality standards.

[133] See Cal. Code Regs., tit. 27, §§ 22560 - 22565.

[134] See *id.*, §§ 22470-22510.

(i) Other programs

Finally, Porter-Cologne is currently being used to prevent or to remediate nonpoint source pollution in two specific programs. The Regional Water Boards are developing TMDLs for impaired waterbodies within their regions. Many of the TMDLs address ongoing nonpoint source pollution, and these TMDLs include implementation programs to bring the nonpoint source dischargers into compliance with water quality standards. The North Coast Regional Water Board, for example, adopted a sediment TMDL that prohibits the discharge of controllable sources of sediment unless the discharger agrees to implement certain best management practices, to monitor, and to comply with other requirements. In appropriate cases, a TMDL could require that affected nonpoint source dischargers implement applicable management measures in order to achieve water quality standards.

The Bay Protection and Toxic Cleanup Program also addresses nonpoint, as well as point, source pollution. Some of the Regional Water Boards have proposed best management practices as the recommended action to remediate ongoing nonpoint source pollution. The Regional Water Boards could implement the (g) guidance management measures in appropriate cases under this program.

3. Water Code section 13360

(1) Section 13360

Under certain circumstances, Porter-Cologne restricts the State and Regional Water Boards' ability to require dischargers to implement specific practices. Under Water Code section 13360, the boards may not "specify the design, location, type of construction, or particular manner" of compliance with waste discharge requirements or other orders, and dischargers can comply "in any lawful manner."[135] This restriction "is a shield against unwarranted interference with the ingenuity of the party subject to waste discharge requirements", who can "elect between available strategies to comply with the standard."[136]

On the other hand, section 13360 is not violated if, under present technology and the laws of nature, there is only one way to comply with the standard.[137] Thus, for example, a water quality control plan could legally prohibit surface runoff from new development in amounts exceeding the runoff that would occur if certain impervious

[135] Wat. Code § 13360.

[136] *Tahoe-Sierra*, *supra*, fn. 11, 210 Cal.App.3d at 1438-1439, 259 Cal.Rptr. 132.

[137] *Ibid.*; see *Pacific Water Conditioning assn., Inc. v. City Council* (1977) 73 Cal.App.3d 546, 554, 140 Cal.Rptr. 812, 816-17.

coverage limitations were met.[138] It did not matter that the only practical way to comply with the prohibition was to comply with the coverage limitations.[139]

Water Code section 13360 also contains several exceptions. It does not apply to discharges of waste to injection wells.[140] Likewise, the restrictions do not apply to the discharge of solid waste to disposal sites. Waste discharge requirements for these sites can require the construction of dikes, installation of drainage facilities, and other similar measures.[141]

(2) Application to Management Measures

Water Code section 13360 does not restrict management measure implementation. The extent of its applicability depends on the type of measure in question. The management measures fall into several categories. They range from measures requiring plans on how to control nonpoint source pollution to measures that are more prescriptive.

Some management measures require plans. For example, nutrient management plans are required for agricultural activities and erosion and sediment control plans and chemical control plans for construction sites less than 5 acres.[142] Water Code section 13360's restrictions do not apply to this type of management measure. The measures do not dictate the manner of compliance with waste discharge requirements or other board orders, but rather require dischargers to submit plans addressing specific pollution problems. The Regional Water Boards can directly implement this type of management measure under their investigative authority. As discussed previously,[143] they can require anyone who has discharged, discharges, proposes to discharge, or is suspected of discharging waste to file technical or monitoring program reports. They can also require state and local agencies to submit technical reports on water quality control, even though those entities are not waste dischargers. The only restriction is that the burden of preparing the reports bear a reasonable relationship to the need for and the benefits to be obtained from the reports.[144]

Some management measures specify an end result to be achieved. To illustrate, an urban management measure for new development requires that, after construction is completed and a site is permanently stabilized, average annual total suspended solids (TSS) loadings be reduced by 80 percent or to a level no greater than predevelopment

[142] Management Measure Guidance, *supra*, fn. 4, pp. 2-52, 4-63, 4-83.

[143] See Part II, B.2 of this Statement.

[144] Wat. Code §§ 13165, 13225(c), 13267(b).

loadings.[145] This can be accomplished by either design or performance. The Regional Water Boards can ensure that this type of management measure is implemented without violating Water Code section 13360 because the measure dictates the end result but leaves the method of compliance up to the site developer.

Other management measures prescribe both the end result and the means of achieving it. This is typified by the agricultural management measure for grazing.[146] Part of this measure seeks to protect sensitive areas, such as streambanks and wetlands, from physical disturbance and direct loading of animal wastes and sediment, by one or more of five options. These include excluding livestock, providing stream crossings or hardened watering access for drinking, and others. The Regional Water Boards can require implementation of this measure, by adding a sixth option allowing a discharger to demonstrate that some other alternative would achieve the same end result, i.e. protection of sensitive areas from adverse, water quality-related, grazing impacts. Alternatively, the Regional Water Boards could indirectly ensure implementation of the management measure by adopting a prohibition against waste discharge in sensitive areas.

Still other management measures require development of watershed protection programs. For example, an urban management measure requires development of a watershed protection program for new development.[147] The program aims at avoiding the conversion, to the extent practicable, of areas particularly susceptible to erosion and sediment loss, preserving areas that provide important water quality benefits, and siting development to protect, to the extent practicable, the natural integrity of waterbodies and natural drainage systems. This type of management measure does not violate Water Code section 13360. It dictates only the end result, e.g., a watershed protection program that achieves several goals. Also, the State and Regional Water Boards would likely implement this management measure by promoting local or regional watershed efforts. Alternatively, the State Water Board could adopt state policy or the State and Regional Water Board could adopt water quality control plan provisions implementing this management measure. Water Code section 13360, on the other hand, only applies to waste discharge requirements or orders issued to waste dischargers.[148]

B. Question: Please describe any other aspect of state law, either contained in Porter-Cologne or in other authorities, that would limit or preclude the use of Porter-Cologne to regulate nonpoint source pollution. Is Porter-Cologne limited in its application to particular sources or geographic areas? Is it otherwise limited?

Response: The nonpoint sources for which California seeks to use Porter-Cologne as a backup authority are subject to Porter-Cologne. Porter-Cologne is not

[148] See *People v. Barry* (1987) , 194 Cal.App.3d 158, 180-181, 239 Cal.Rptr. 349, 363-364.

limited in its application, geographically or otherwise, to these sources. Under Porter-Cologne, the State and Regional Water Boards can regulate any activity that results in a waste discharge that can affect water quality. Activities that affect water quality, but that do not involve a waste discharge, can be addressed under the State and Regional Water Board's broad planning authority. The five nonpoint sources for which the state intends to use Porter-Cologne as a backup authority are discussed below.

(1) Agricultural Activities

The (g) guidance lists pollutants that cause agricultural nonpoint source pollution. These include: nutrients, sediments, animal wastes, salts, pesticides, and habitat impacts due to grazing.[149] The Regional Water Boards can clearly regulate the discharge of pollutants from agricultural activities, including those listed, that can affect water quality. Likewise, the Regional Water Boards can regulate grazing or other agricultural activities that directly or indirectly cause the release of pollutants, such as sediments or animal wastes, that can affect water quality.

Porter-Cologne's legislative history indicates that the act was not meant to limit the Regional Water Boards' preexisting authority under the Dickey Act to regulate the discharge of agricultural wastes.[150] Further, "waste" for purposes of regulation under Porter-Cologne was meant to include all materials that the Attorney General had concluded were "waste" under the Dickey Act.[151] These materials included irrigation return flows and drainage water from agricultural activities, pesticides, herbicides, and other agricultural chemicals. The legislative history also indicates that, while these wastes are clearly subject to regulation, the Regional Water Boards can choose to waive waste discharge requirements, either with or without conditions, for agricultural operations where a waiver is not against the public interest.[152]

In addition to regulating waste discharges, the State and Regional Water Boards can address any activity or factor affecting water quality in their planning capacities.[153] They are not restricted to addressing only the impacts of waste discharge. State agencies, departments, and boards must comply with state policy for water quality control and statewide and regional water quality control plans, unless otherwise directed by statute. In addition, water quality control plans can contain recommendations for action by any entity, public or private. Before implementing any agricultural water quality control plan, however, the Regional Water Boards have to indicate an estimate of the total cost of the program and identify potential sources of financing.[154]

R0018794

(2) Urban Sources

The (g) guidance addresses six major categories of urban nonpoint pollution.[155] These include runoff from developing areas, construction sites, and existing development. Onsite disposal systems; general sources, such as households, commercial sites and landscaping; and roads, highways and bridges are also included. The principal pollutants found in urban runoff are sediments, nutrients, oxygen-demanding substances, pathogens, salts, hydrocarbons, heavy metals, and toxic substances.[156]

Urban runoff containing wastes, such as those listed, is clearly subject to regulation under Porter-Cologne. "Waste" is broadly defined in Porter-Cologne, and the term has specifically been construed to include these types of waste.[157] The State and Regional Water Boards have already adopted NPDES permits for some types of urban runoff; and the State Water Board has adopted general waste discharge requirements for small domestic wastewater systems.

In addition, the State and Regional Water Boards can use their planning authority to address urban runoff on a watershed basis. This authority has been used, for example, to regulate activities causing erosion that add silt to Lake Tahoe and its tributaries.[158]

(3) Marinas

The (g) guidance also contains management measures for nonpoint source pollution from marinas and recreational boating.[159] Nonpoint source pollution identified with this category includes water column toxicity, low dissolved oxygen, metals and petroleum hydrocarbons, as well as disruption of sediment and habitat, and shoaling and shoreline erosion.[160]

As stated previously, the Porter-Cologne definition of "waste" is broad. It would include any pollutants from marinas that enter surface waters through boat discharges, spills, or storm water runoff.[161] Shoreline erosion caused by the construction or

[159] Porter-Cologne is not listed as a backup authority for the boat operation management measure.

[160] Management Measure Guidance, *supra*, fn. 4, pp. 5-3 through 5-7.

[161] See discussion in Section II.B.1 of this Statement.

expansion of a marina is also subject to regulation as a waste discharge because the activity causes the release of sediments. Additionally, if marina construction requires a federal permit, such as a dredge and fill permit under section 404 of the Clean Water Act,[162] the applicant will have to obtain a section 401 certificate from the state. The State Water Board can condition a certification, if appropriate, to address both the point and nonpoint source impacts of the project.

In addition, state law specifically authorizes the Regional Water Boards to require marinas to install vessel pumpout facilities.[163] State law also requires that vessel pumpout facilities be operated and maintained to prevent sewage discharges to state waters.[164] They must be maintained in good working order and regularly cleaned.[165]

In addition to regulating waste discharges, the State and Regional Water Boards can address any marina or boating activities that affect water quality but that do not involve a waste discharge under their planning authority.[166] For example, they could address the marina flushing management measure in a water quality control plan and include recommendations for appropriate action by affected agencies.

(4) Hydromodification

The hydromodification management measure addresses nonpoint source pollution from channelization and channel modifications, dams, and streambank and shoreline erosion.[167] The state has identified Porter-Cologne as a backup authority for channelization and channel modification and streambank and shoreline erosion.

In general, channelization and channel modifications can change sediment supply, reduce freshwater availability, accelerate the delivery of pollutants, cause a loss of contact with overbank areas, and adversely impact instream and riparian habitat.[168] Streambank and shoreline erosion can likewise adversely impact instream and riparian habitat and contribute to increased levels of turbidity and nutrients.[169]

Under Porter-Cologne, the Regional Water Boards can regulate any channelization or channel modification projects that cause a waste discharge, either as a result of construction or operation.[170] Similarly, they can regulate any activities that

170 See discussion in Section II.B.1 of this Statement.

cause streambank or shoreline erosion, resulting in the release of sediments or other wastes to state waters. The State Water Board can condition a section 401 water quality certificate for a federally-permitted activity involving a surface water discharge to address both the activity's point and nonpoint source impacts. The State and Regional Water Boards can address any other activities that affect water quality, but that do not entail a waste discharge, under their broad planning authority.[171]

(5) Wetlands

The (g) guidance contains management measures for categories of nonpoint sources. The management measures for wetlands promote protecting and restoring wetlands and riparian areas and using vegetated treatment systems to control nonpoint source pollution from these sources. The Regional Water Boards can use their Porter-Cologne authority to regulate any activities that result in a waste discharge to wetlands or riparian areas.[172] Where past waste discharges have adversely impacted wetland areas, they can issue enforcement orders requiring restoration.[173] The Regional Water Boards can also promote the protection and restoration of wetlands and the use of engineered vegetated treatment systems as supplemental environmental credit projects mitigating administrative civil liability assessments.[174] Finally, the State and Regional Water Boards can use their broad planning authority to address the protection and restoration of wetlands and to promote the use of vegetated treatment systems.[175]

C. Question: Will it be necessary for the state to issue regulations prior to using its Porter-Cologne authority to ensure implementation of the management measures?

Response: No, regulations are not necessary. The (g) guidance management measures vary from requirements for reports and watershed management plans to more prescriptive requirements. The appropriate Porter-Cologne response will also vary. If the State or Regional Water Boards choose to implement one or more of the management measures through their planning authority or regulations, they will have to comply with the state Administrative Procedure Act (APA).[176] Unlike the adoption of formal regulations, however, the APA contains special, abbreviated procedures for the adoption or amendment of plans, policies and guidelines.[177] If the State or Regional Water Boards choose other implementation alternatives, they will not have to comply with the APA.

---

[171] See discussion in Section II.A. of this Statement.

[172] See discussion in Section II.B.1 of this Statement.

[173] See, e.g., Wat. Code § 13304. See also State Water Board Order WQ 90-5, upholding a San Francisco Bay Regional Water Board order requiring a discharger to mitigate for losses of wetland habitat.

[174] See discussion in Guidance to Implement the Water Quality Enforcement Policy, State Water Board (April 1996), pp. 22-23.

[175] See discussion in Section II.A. of this Statement.

[176] See Gov. Code § 111340 et seq.

[177] Compare Gov. Code § 11353 with § 11346 et seq.

As explained previously, the State Water Board's Nonpoint Source Management Plan lays out a three-tiered management approach to nonpoint pollution regulation.[178] In the first tier, the State and Regional Water Boards will encourage affected discharger groups to voluntarily implement applicable management measures. This can be done through, for example, funding and education. These activities are voluntary and can be accomplished without formal rulemaking.

The second tier is regulatory encouragement - through adoption of conditional waivers or management agency agreements with other enforcement agencies. Waivers may be either individual or general. The Regional Water Boards can waive waste discharge requirements for an individual discharger, on condition that the discharger comply with appropriate management measures; and this does not require a water quality control plan amendment.[179] Typically, the Regional Water Boards adopt waivers for classes of dischargers, and these waivers are included in the applicable water quality control plans. As stated previously, the adoption or amendment of water quality control plans, policies, or guidelines is subject to abbreviated, APA rulemaking procedures.[180] Alternatively, the State and Regional Water Boards can enter into management agency agreements with agencies with enforcement authority over the nonpoint sources. These agreements can ensure management measure implementation, and they do not require a water quality control plan amendment.

In the third tier, the State and Regional Water Boards adopt waste discharge requirements. The adoption of waste discharge requirements, either individual or general, is not subject to the APA's rulemaking requirements.[181] Waste discharge requirements can directly or indirectly require compliance with applicable management measures in appropriate cases.[182] If appropriate, general waste discharge requirements can be adopted to ensure management measure implementation on a regionwide or statewide basis.

Some management measures require submission of plans, such as erosion and sediment control plans. The Regional Water Boards can implement these measures under their existing Porter-Cologne investigative powers, without undertaking a rulemaking.[183] Likewise, if the Regional Water Boards choose to adopt enforcement orders to address, for example, wetland or riparian areas degraded by waste discharges, the Regional Water Boards will not have to undertake formal rulemaking.

---

[178] See discussion in Section III.A.2.(a) of this Statement.

[179] See Gov. Code § 11352.

[180] See *id.* § 11353, which contain special procedures for State and Regional Water Board plans, policies, and guidelines.

[181] See *id.* § 11352(b).

[182] See discussion in Section III.A.2.(a) & (b).

[183] See Wat. Code §§ 13165, 13225(c), 13267, 13383. See also Gov. Code § 11342(g), defining "regulation" as a rule, regulation, order, or standard of general application.

On the other hand, the Regional Water Boards are currently engaged in developing TMDLs for impaired waterbodies, many of which are impaired by nonpoint sources. These TMDLs can be used as a vehicle to implement appropriate management measures. The TMDLs have to be included in the state's water quality management plan under the Clean Water Act; they will, therefore, necessarily result in water quality control plan amendments.[184]

IV. Conclusion

In sum, the State and Regional Water Boards have broad-reaching power under Porter-Cologne to prevent nonpoint source pollution. In their planning capacity, they can address all activities and factors that may affect water quality, including nonpoint source activities. They can also directly regulate all waste discharges, both point and nonpoint source, that may affect the quality of state waters. In addition to preventing nonpoint source pollution, the State and Regional Water Boards can ensure implementation of the management measures through several mechanisms. Finally, the State and Regional Water Boards are not required to undertake rulemaking before implementing the measures.

CALIFORNIA COASTAL COMMISSION
CHIEF COUNSEL'S STATEMENT
FOR THE
CALIFORNIA'S NONPOINT SOURCE POLLUTION CONTROL PROGRAM

NOVEMBER 1999

R0018800

STATE OF CALIFORNIA – THE RESOURCES AGENCY

GRAY DAVIS, Governor

CALIFORNIA COASTAL COMMISSION
45 FREMONT STREET, SUITE 2000
SAN FRANCISCO, CA 94105-2219
VOICE AND TDD (415) 904-5200

MEMORANDUM

October 21, 1999

TO: Peter Douglas, Executive Director
Jaime Kooser, Deputy Director

FROM: Ralph Faust, Chief Counsel
Dorothy Dickey, Deputy Chief Counsel D. Dickey

SUBJECT: **Enforceability of Nonpoint Source Pollution Control Program**

We are writing to address the scope of the Coastal Commission's authority to enforce the nonpoint source pollution control provisions of the Coastal Zone Management Act. (16 U.S.C. § 1451 *et seq.*) Section 6217 of that Act provides that each state "for which a management program has been approved pursuant to section 306 of the Coastal Zone Management Act … shall prepare and submit to the Secretary and the Administrator a Coastal Nonpoint Pollution Control Program for approval pursuant to this section." (16 U.S.C. § 1455b.) The Coastal Zone Management Act explains that the "purpose of the program shall be to develop and implement management measures for nonpoint source pollution to restore and protect coastal waters, working in conjunction with other State and local authorities." (16 U.S.C. § 1455b(a)(1).) You have asked whether the Commission can enforce those nonpoint pollution control provisions.

The Coastal Commission implements the policies of California's Coastal Act. (Public Resources Code § 30000 *et seq.*) A central focus of the Coastal Act is the protection and, where feasible, restoration, of coastal water quality. The Act includes numerous enforceable policies that are directed toward that objective. For example, section 30230 provides that:

> *Marine resources shall be maintained, enhanced, and where feasible, restored. Special protection shall be given to areas and species of special biological or economic significance. Uses of the marine environment shall be carried out in a manner that will sustain the biological productivity of coastal waters and that will maintain healthy populations of all species of marine organisms adequate for long-term commercial, recreational, scientific, and educational purposes.*

The Commission is required specifically to control runoff in section 30231:

> *The biological productivity and the quality of coastal waters, streams, wetlands, estuaries, and lakes appropriate to maintain optimum*

R0018801

> *populations of marine organisms and for the protection of human health shall be maintained and, where feasible, restored through, among other means, minimizing adverse effects of waste water discharges and entrainment, controlling runoff, preventing depletion of ground water supplies and substantial interference with surface water flow, encouraging waste water reclamation, maintaining natural vegetation buffer areas that protect riparian habitats, and minimizing alteration of natural streams.*

In addition, Coastal Act policies limit development in numerous other ways to protect water quality. (See Attachment 1.)

The Commission implements these protective policies as it undertakes its three major regulatory tasks. Its first regulatory responsibility is to review and certify plans that address how development will occur along the California coast. Most of those plans are developed by local governments and are called "local coastal programs". (Public Resources Code § 30500 *et seq.*) Plans are also prepared by port districts (Public Resources Code § 30711 *et seq.*), colleges and universities (Public Resources Code § 30605) and proponents of public works projects (*id.*).

The Commission reviews those plans to determine whether they are consistent with applicable policies of the Coastal Act, including those related to water quality. If the Commission determines that a plan is not consistent with the policies of the Coastal Act, it is required to deny certification of the plan. In that event the Commission generally suggests modifications to the plan that the local government or other plan proponent could adopt.[1] Once the plan has been modified to incorporate the changes identified by the Commission, it can be resubmitted to the Commission for certification. Following certification by the Commission of a plan, any amendments to the plan must be submitted to the Commission. Until the Commission certifies an amendment, the measure has no legal effect for purposes of the Coastal Act.

The Commission has the authority to enforce Coastal Act provisions relating to water quality, including nonpoint source pollution. As described above, the Commission is required to refuse to certify plans and amendments which it determines do not meet the Coastal Act's water quality requirements. The Commission is additionally authorized to identify appropriate changes to those plans and amendments to bring them into conformity with the Coastal Act's water quality provisions. Such changes may include nonpoint source pollution management measures necessary to bring a plan or amendment into conformity with Coastal Act provisions relating to water quality.

The Commission's second regulatory task is to review applications for coastal development permits. The Coastal Act provides that any person who wishes to pursue

[1] The procedures for processing those modifications differ depending on the type of plan reviewed by the Commission. A discussion of the specific procedural mechanisms involved is beyond the scope of this memo.

"development" in the coastal zone must obtain a coastal development permit. (Public Resources Code § 30600.) "Development" is broadly defined in Public Resources Code § 30106 to mean:

> *"... on land, in or under water, the placement or erection of any solid material or structure; discharge or disposal of any dredged material or of any gaseous, liquid, solid, or thermal waste; grading, removing, dredging, mining, or extraction of any materials; change in the density or intensity of use of land, including, but not limited to, subdivision pursuant to the Subdivision Map Act (commencing with Section 66410 of the Government Code), and any other division of land, including lot splits, except where the land division is brought about in connection with the purchase of such land by a public agency for public recreational use; change in the intensity of use of water, or of access thereto; construction, reconstruction, demolition, or alteration of the size of any structure, including any facility of any private, public, or municipal utility; and the removal or harvesting of major vegetation other than for agricultural purposes, kelp harvesting, and timber operations which are in accordance with a timber harvesting plan submitted pursuant to the provisions of the Z'berg-Nejedly Forest Practice Act of 1973 (commencing with Section 4511).*
>
> *As used in this section, "structure" includes, but is not limited to, any building, road, pipe, flume, conduit, siphon, aqueduct, telephone line, and electrical power transmission and distribution line."*

The Commission performs its permit review function with respect to development within the coastal zone until the Commission has certified a local coastal program for each coastal city and county or a port master plan for that jurisdiction. (Public Resources Code §§ 30600(c), 30715(a).) In determining whether or not to approve a particular coastal development permit application, the Commission applies the Coastal Act's policies concerning coastal protection, which include the policies to protect coastal water quality that are cited above. (Public Resources Code §§ 30604, 30715(a).) As a condition of approving coastal development permit applications, the Commission may impose conditions to prevent and mitigate nonpoint source pollution in order to implement those water quality requirements.[2]

After the Commission has certified a local coastal program, it delegates coastal development permitting authority to the local government. (Public Resources Code § 30519(a).) The Commission retains permitting jurisdiction over development proposed on tidelands,

---

[2] The Coastal Act does not authorize the Commission to require a coastal development permit for the "removal or harvesting of major vegetation ... for agricultural purposes, kelp harvesting and timber operations which are in accordance with a timber harvesting plan submitted pursuant to the provisions of the Z'berg-Nejedly Forest Practice Act of 1973...." (Public Resources Code § 30106.) Nevertheless, the Commission is authorized to regulate other development activities related to agriculture and forestry. As a condition of approval of such development, the Commission may require that nonpoint source pollution control measures be undertaken in order to find that the development meets Coastal Act water quality standards.

submerged lands and public trust lands. (Public Resources Code § 30519(b).) Similarly, the Commission delegates coastal development authority to a port once the Commission has certified the port's master plan. (Public Resources Code § 30519(b).)

Local governments' and ports' decisions concerning applications for coastal development permits may be appealed to the Coastal Commission in certain instances. (Public Resources Code §§ 30603, 30715.) The standard of review for permit decisions after the Commission has certified a local coastal program or a port master plan is the certified program or plan. (Public Resources Code §§ 30604(b), 30715.5.) The Commission's actions on appeals are also governed by the certified program or plan. (*Id.*) As noted above, those planning documents must meet the Coastal Act's standards concerning water quality, including nonpoint source pollution. Thus, when the Commission, a local government or a port makes a decision on whether to issue a coastal development permit after the Commission has certified such a plan or program, the permitting agency must determine whether the proposed development will comply with the policies and standards set forth in its plan or program, including those related to water quality. If the Commission or other permitting agency determines that the proposed development will not comply with those standards, it may impose conditions on the project to bring it into compliance with the standards in the plan or program, including any management measures to prevent or mitigate nonpoint source pollution. Alternatively, the Commission or other permitting agency may deny the development.

The applicable requirements concerning water quality are found in the Coastal Act. Thus, a coastal development permit application may not be approved unless it complies with the water quality requirements contained in the Coastal Act or in certified plans and programs.

The Coastal Commission's third major regulatory responsibility is federal consistency review under the Coastal Zone Management Act. (16 U.S.C. § 1451 *et seq.*) The Commission reviews activities conducted by the federal government, federally issued licenses and permits, plans for exploration and production of the outer continental shelf, and federally funded activities. (16 U.S.C. § 1456.) The Commission reviews each proposed activity to determine whether it is consistent with the California Coastal Management Program. The Program includes the Coastal Act and those local coastal programs that have been formally approved by the Office of Ocean and Coastal Resource Management for incorporation into the State's program. The Commission must determine that the proposed activity is consistent with those policies and standards, including any required nonpoint source pollution control measures.

As noted above, the Coastal Act includes policies to protect coastal water quality. Therefore, in performing federal consistency review, the Commission is authorized to apply those water quality standards and to "disagree" or "object" as appropriate to those activities and projects that do not comply with those standards. (*Id.*, 15 C.F.R. §§ 930.32(a), 930.39, 930.42, 930.79.)

For the reasons set forth above, we conclude that the Coastal Commission has adequate legal authority under the Coastal Act to enforce water quality requirements related to nonpoint source pollution.

APPENDIX D: LETTERS FROM THE CALIFORNIA ENVIRONMENTAL PROTECTION AGENCY AND THE CALIFORNIA RESOURCES AGENCY TO LEAD AND ENFORCING STATE AGENCIES WITH RESPECT TO DEVELOPMENT OF THE FIVE-YEAR NONPOINT SOURCE IMPLEMENTATION PLANS

California Environmental Protection Agency
Winston H. Hickox
Agency Secretary

GRAY DAVIS
GOVERNOR

Resources Agency
Mary D. Nichols
Agency Secretary

MEMORANDUM

TO: William Lyons, Jr., Secretary
Department of Food and Agriculture

Diana Bontá, Director,
Department of Health Services

José Medina, Director
Department of Transportation

FROM: Winston H. Hickox — Winston H. Hickox
Agency Secretary
California Environmental Protection Agency

Mary D. Nichols — Mary D. Nichols
Agency Secretary
Resources Agency

DATE: February 2, 2000

SUBJECT: CALIFORNIA'S NONPOINT SOURCE POLLUTION CONTROL PROGRAM

By this memorandum, we are requesting your assistance in addressing nonpoint source (NPS) pollution by implementing the attached Plan for California's Nonpoint Source Pollution Control Program (Program Plan). NPS pollution, also known as polluted runoff, is the leading cause of water quality impairments in California and nationally. Nonpoint sources are the major contributor of pollution to impacted water bodies including surface, ground, and coastal waters in California. Your participation is needed if we are going to protect and restore the myriad of beneficial uses our water resources support and the economic benefit derived from these uses.

This memorandum underscores the commitment of both the California Environmental Protection Agency (Cal/EPA) and Resources Agency to protect the beneficial uses and restore the quality of California's waters. In order to achieve measurable improvements, we are requesting your agencies to use your respective authorities to implement the Program Plan to prevent and control NPS pollution affecting State surface, ground, and coastal waters.

We commend those agencies that have worked with the State Water Resources Control Board (SWRCB) and California Coastal Commission (CCC) in the development of the Program Plan's Fifteen-Year Program Strategy and Five-Year Implementation Plan (Volume I) and the California Management Measures for Polluted Runoff (Volume II). Effective implementation of the Program Plan requires continued collaboration among all responsible State agencies as well as coordination among federal and local agencies and public groups.

The SWRCB and CCC, in conjunction with the nine Regional Water Quality Control Boards, are the lead agencies in coordinating implementation of the Program Plan. To ensure success of the Program Plan, we are requesting your agencies to undertake several important program actions.

- Each agency is requested to designate a lead staff person to be responsible for coordinating with the SWRCB and CCC on NPS issues.
- Each agency is requested to identify through a five-year plan appropriate actions to implement management measures for which they have authorities and are targeted in the first Five-Year Implementation Plan.
- Each agency is requested to ensure that actions to implement its respective portions of the Program Plan are tracked, monitored, assessed, and reported to the SWRCB and CCC consistent with State law (Water Code sections 13165 and 13369 [AB 227]) and in accordance to the Program Plan.
- Each agency in consultation with the SWRCB and CCC shall consider the need to establish or revise existing formal agreements with the SWRCB and CCC to ensure successful implementation of the Program Plan.

In addition, we encourage each agency to adopt policies that support the Program Plan.

Please reply to William Vance, Ph.D., Assistant Secretary for Policy and Regulations, Cal/EPA or Maria Rea, Assistant Secretary for Watershed and Salmon Restoration, Resources Agency, by February 25, 2000 with the name, telephone number, and e-mail address of your designated lead staff person. If you have any questions, please call Dr. Vance, at (916) 324-7584 or Ms. Rea, at (916) 653-5656.

MEMORANDUM

TO: Distribution List

FROM: Winston H. Hickox Winston H. Hickox
Agency Secretary
California Environmental Protection Agency

Mary D. Nichols
Agency Secretary
Resources Agency

DATE: February 2, 2000

SUBJECT: CALIFORNIA'S NONPOINT SOURCE POLLUTION CONTROL PROGRAM

By this memorandum, we are requesting your assistance in addressing nonpoint source (NPS) pollution by implementing the Plan for California's Nonpoint Source Pollution Control Program (Program Plan) (see attachment). NPS pollution, also known as polluted runoff, is the leading cause of water quality impairments in California and nationally. Nonpoint sources are the major contributor of pollution to impacted water bodies including surface, ground, and coastal waters in California. Your participation is needed if we are going to protect and restore the myriad of beneficial uses our water resources support and the economic benefit derived from these uses.

This memorandum underscores the commitment of both the California Environmental Protection Agency (Cal/EPA) and Resources Agency to protect the beneficial uses and restore the quality of California's waters. In order to achieve measurable improvements, we are directing all Boards, Departments, and Regional Water Quality Control Boards (RWQCBs) within our Agencies to use their respective authorities to implement the Program Plan to prevent and control NPS pollution affecting State surface, ground, and coastal waters.

We commend those Departments and Boards that have worked with the State Water Resources Control Board (SWRCB) and California Coastal Commission (CCC) in the development of the Program Plan's Fifteen-Year Program Strategy and Five-Year Implementation Plan (Volume I) and the California Management Measures for Polluted Runoff (Volume II). Effective implementation of the Program Plan requires continued collaboration among all responsible State agencies as well as coordination among federal and local agencies and public groups.

The SWRCB and CCC, in conjunction with the nine RWQCBs, are the lead agencies in coordinating implementation of the Program Plan. To ensure success of the Program Plan, we are directing our Boards, Departments, and RWQCBs to undertake several important program actions.

- Each Board or Department shall designate a lead staff person to be responsible for coordinating with the SWRCB and CCC on NPS issues.
- Each Board or Department shall identify through a five-year plan appropriate actions to implement management measures for which they have authorities and are targeted in the first Five-Year Implementation Plan.
- Each Board or Department shall ensure that actions to implement its respective portions of the Program Plan are tracked, monitored, assessed, and reported to the SWRCB and CCC consistent with State law (Water Code sections 13165 and 13369 [AB 227]) and the requirements of the Program Plan.
- Each Board or Department in consultation with the SWRCB and CCC shall consider the need to establish or revise existing formal agreements with the SWRCB and CCC to ensure successful implementation of the Program Plan.

In addition, we encourage each Board or Department to adopt policies that support the Program Plan.

Please reply to William Vance, Ph.D., Assistant Secretary for Policy and Regulations, Cal/EPA, or Maria Rea, Assistant Secretary for Watershed and Salmon Restoration, Resources Agency, by February 25, 2000 with the name, telephone number, and e-mail address of your designated lead staff person. If you have any questions, please call Dr. Vance, at (916) 324-7584 or Ms. Rea, at (916) 653-5656.

APPENDIX E. MEMORANDUM OF UNDERSTANDING BETWEEN THE STATE WATER RESOURCES CONTROL BOARD AND THE CALIFORNIA COASTAL COMMISSION

This Memorandum of Understanding (MOU) is between the State Water Resources Control Board (SWRCB) and the California Coastal Commission (CCC). The SWRCB is part of the California Environmental Protection Agency (Cal/EPA), and the CCC is part of the California Resources Agency.

AGENCIES AGREE AS FOLLOWS:

A. PURPOSE

The purpose of this MOU is to promote protection of (1) water quality and (2) the uses and resources dependent on clean water from the potential adverse effects of nonpoint source (NPS) pollution. The SWRCB and CCC concur that the State will benefit from a unified and cooperative program to protect and restore water quality.

B. AUTHORITY

The authority of the SWRCB and CCC are defined by federal and State law described as follows:

1. The SWRCB and CCC, in coordination with the nine Regional Water Quality Control Boards (RWQCBs), are the lead State agencies in California for the development and implementation of the *Plan for California's Nonpoint Source Pollution Control Program: 1998-2013* (Program Plan) which has been prepared pursuant to the Federal Clean Water Act section 319 (33 U.S.C. §1329) and Coastal Zone Management Act section 6217 (16 U.S.C. §1455b).

2. The SWRCB and the RWQCBs are the State agencies with primary responsibility for coordination and control of water quality throughout California. The SWRCB and RWQCBs are the State agencies authorized under the Clean Water Act and State law to designate beneficial uses of the State's waters and establish water quality objectives for protecting those uses. The SWRCB and RWQCBs have a variety of regulatory powers under which they investigate water quality issues; adopt water quality control plans, regulations, and policies; prohibit waste discharges in certain areas; and issue permits regulating waste discharges affecting water quality. The SWRCB is required to provide information to the public regarding water quality issues. The SWRCB also administers several loan and grant programs for the protection of water quality, including the NPS grant program under the Federal Clean Water Act section 319 (33 U.S.C. §1329). RWQCBs also have the authority to order cleanup of waste discharges and to take enforcement actions against waste dischargers, including imposing administrative civil liability.

3. The CCC has the primary responsibility for implementation of the California Coastal Act and has been designated the State coastal zone planning and management agency for any and all purposes and may exercise any and all powers set forth in the Federal Coastal Zone Management Act of 1972 (16 U.S.C. §1451, et seq.) and any amendments thereto or other federal laws that relate to the planning or management of the coastal zone. The California Coastal Act mandates the protection and restoration of coastal waters. The CCC certifies local coastal programs and approves coastal development permits, energy projects, and federal projects within the Coastal Zone in accordance with water quality policies in the California Coastal Act. The CCC protects water quality through the management of development that generates runoff, creates spills, or otherwise affects water quality. The CCC also implements educational and technical assistance programs and coordinates with other agencies to address land-use and development activities that may generate polluted runoff.

4. According to Public Resources Code section 30400, in the absence of specific authorization by law or by agreement with the CCC, no State agency shall exercise any powers or carry out any duties or responsibilities established by the California Coastal Act or by the Federal Coastal Zone Management Act of 1972 or any amendment thereto.

5. According to Public Resources Code section 30412, the CCC, subject to limited exceptions regarding wastewater treatment plants, shall not modify, adopt conditions, or take any action in conflict with any determination by the SWRCB or any RWQCB in matters relating to water quality or the administration of water rights.

C. IMPLEMENTATION

Effective implementation of the Program Plan requires continued collaboration between the SWRCB and CCC. The SWRCB and the CCC therefore agree to:

1. To continue to work cooperatively to implement the Program Plan;
2. To be partners in the administrative coordination of California's Nonpoint Source Pollution Control Program (NPS Program);
    a. The SWRCB and CCC will be joint partners in developing, implementing, and participating in interagency coordinating committees;
    b. The SWRCB will act as the lead coordinating agency with Cal/EPA members; the CCC will act as the lead coordinating agency with Resources Agency members;
    c. The SWRCB will serve as the liaison with the U.S. Environmental Protection Agency (USEPA); the CCC will serve as the liaison with the National Oceanic and Atmospheric Administration (NOAA);

3. To implement and to track the implementation of applicable management measures and management practices related to NPS pollution prevention and control;

4. To modify or add to the Program Plan, including the actions identified in the Five-Year Implementation Plans (Volume 1) and the management measures in *California Management Measures for Polluted Runoff* (CAMMPR) (Volume 2), in a joint effort;

5. To meet on a regular basis (quarterly) to assess Program implementation, to discuss existing and proposed projects of mutual interest, and to consider changes to the Program Plan or MOU;

6. To have staff and management actively participate in regular updates on implementation of the Plan and identify concerns regarding the coordination and control of water quality due to changes in laws, regulations, policies, water quality control plans, or local coastal programs;

7. To work cooperatively through the legislative process to the extent permitted by law and Governor's Office procedures to further the NPS Program;

8. To work cooperatively in the budgetary process to support NPS Program activities;

9. To jointly convene public workshops to develop the next Five-Year Implementation Plan, no later than three years after the effective date of each Five-Year Implementation Plan;

10. To report biennially on program effectiveness;

11. To improve communication with the members of the CCC, SWRCB, and RWQCBs by:

    a. SWRCB staff and CCC staff jointly presenting an annual status report to the CCC and the SWRCB Members regarding the NPS program;

    b. SWRCB and RWQCB staffs consulting with CCC staff regarding NPS projects implemented or ordered by the SWRCB or a RWQCB requiring a coastal development permit issued or reviewed by the CCC. CCC staff will brief Commission Members in advance and take other actions needed to expedite a decision on the project. CCC staff will consult with SWRCB and RWQCB staffs regarding any of their projects that require SWRCB approval; and SWRCB and RWQCB staffs will brief SWRCB Members in advance and take other actions needed to expedite a SWRCB decision on the project.

D. RESERVATION OF AUTHORITY

Nothing herein shall be construed in any way as limiting the authority of the SWRCB or CCC in carrying out their respective legal responsibilities for management, regulation, coordination, and control of water quality or land uses affecting water quality.

Nothing herein shall be construed to prohibit the establishment of MOUs/Management Agency Agreements/Memoranda of Agreements with State or other agencies by either the SWRCB or CCC.

E. MODIFICATION OR RECISION

This MOU shall become effective upon the date of final signature and shall continue in effect until modified by the mutual written consent of both parties or until terminated by either party upon a 30-day advance written notice to the other party.

VOLUME II

CALIFORNIA'S MANAGEMENT MEASURES FOR POLLUTED RUNOFF (CAMMPR)

I. INTRODUCTION

A. Background

California's Management Measures for Polluted Runoff (CAMMPR) is designed to assist California in improving implementation of the California's Nonpoint Source (NPS) Pollution Control Program (Program). Management measures (MMs) form the core of the State's Plan for California's Nonpoint Source Pollution Control Program 1998-2013 (Program Plan) and provide goals for the management of NPS pollution to which various management practices are applied.[1] The measures are organized into six categories or sectors, all of which are present in California:

1. Agriculture;
2. Forestry (Silviculture);
3. Urban Areas;
4. Marinas and Recreational Boating;
5. Hydromodification Activities; and
6. Wetlands, Riparian Areas, and Vegetated Treatment Systems.

To help states develop sound and effective NPS programs, the U.S. Environmental Protection Agency (USEPA) developed a guidance document pursuant to the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) section 6217(g) titled the *Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters (g-Guidance)* (USEPA[1993]). USEPA and the National Oceanic and Atmospheric Administration (NOAA) expect state programs to implement MMs "in conformity" with the *g-Guidance*.[2] This MM approach is technology-based rather than water-quality based. Because NPSs of pollution are so diverse and since each individual source may contribute only a small quantity of contaminants, identifying the exact sources of NPS pollution can be very expensive and time-consuming. Implementation of technology-based MMs allows states to concentrate their resources initially on implementing measures that are proven to be effective in preventing and controlling NPS pollution.

---

[1] MMs are defined in CZARA section 6217(g)(5) as "economically achievable measures for the control of the addition of pollutants from existing and new categories and classes of nonpoint sources of pollution, which reflect the greatest degree of pollutant reduction achievable through the application of the best available nonpoint pollution control practices, technologies, processes, siting criteria, operating methods, or other alternatives."

[2] USEPA's g-Guidance identifies 56 MMs to control or prevent NPS pollution. The management measures and related practices can be viewed on the Internet at http://www.epa.gov/OWOW/NPS/MMGI.

Pursuant to the Clean Water Act (CWA) and CZARA, the Program Plan addresses two types of MMs:

1. **Minimum Management Measures**

   These measures are based on the federal guidance and will apply to the land use activities known to be major causes of NPS pollution. For example, keeping grazing animals out of streams is a minimum MM for agricultural sources of NPS pollution. State programs will ensure that people and organizations conducting these specified land use activities implement the appropriate MMs. The goal of implementing these measures is to protect water quality and habitat.

2. **Additional Management Measures**

   Where NPS pollution continues to prevent critical areas from meeting CWA requirements, even when minimal MMs are used, additional MMs may be necessary. These measures will be targeted directly at reducing the NPS pollution activities that prevent State waters from meeting appropriate water quality standards, such as ensuring the water is safe for drinking, fishing, or swimming.

Implementation of MMs can be achieved through the implementation of management practices (MPs). MPs are structural and nonstructural solutions, used singularly or in combination, that are aimed at reducing the input of particular NPS contaminants into surface waters. An example of a structural MP is an infiltration basin (a structure that is built to hold runoff and filter contaminants from that runoff before the water is absorbed into the ground). Nonstructural MPs include buffer strips (areas of natural vegetation) that are left as protection between streams or other surface water bodies and farmlands or construction sites.

B. Development and Use of CAMMPR

CAMMPR is divided into sections for each of the major categories of NPS pollution: (1) agriculture; (2) forestry; (3) urban areas; (4) marinas and recreational boating; (5) hydromodification; and (6) wetlands, riparian areas, and vegetated treatment systems. Each section identifies:

- Individual MMs appropriate for implementation in California;
- The various State and local agencies with authorities and programs to implement and/or enforce each MM;
- State and local backup authorities that can be used to assure implementation when self-determined programs are not followed;
- Program implementation locations; and
- Notes to clarify how the programs operate.

In developing CAMMPR, the Program has emphasized consensus building and flexibility to the extent feasible while also ensuring that California's MMs remain in conformity with federal guidance.

In January 1998, staffs of the State Water Resources Control Board (SWRCB), Regional Water Quality Control Boards (RWQCB), and California Coastal Commission (CCC) began preparing CAMMPR by evaluating the *g-Guidance* MMs for their appropriateness for implementation in California. To assist in this evaluation, the agencies reviewed recommendations made in 1995 by the ten Technical Advisory Committees (TACs) established by the SWRCB to assist in the upgrade of the Program. In March 1998, the staffs completed their initial review and submitted a preliminary draft to USEPA and NOAA for comment. Revisions were subsequently made based on the federal review, and in July 1998, the revised draft of CAMMPR was circulated for review by each State agency that was designated in the document.

CAMMPR retains the original *g-Guidance* MM language for nearly all of California's NPS MMs. Language in the MM has been modified only slightly, and in most cases the modifications have made the MMs more protective of the environment. Other specific changes to the federal guidance were made to reach a total of 61 NPS MMs that will be implemented in California.

- Two agriculture MMs for small and large confined animal facilities were combined into a single MM because California law does not differentiate between small and large animal facilities.
- Additional MMs were added for Forestry (Post-Harvest Evaluation) and Marinas and Recreational Boating (Waste Facilities Management) to address perceived needs.
- Education/Outreach MMs were added to the agriculture, forestry, hydromodification, and wetlands NPS categories to reflect the State's intention to promote public awareness and involvement in controlling NPS pollution. The *g-Guidance* included education MMs for the urban and marinas sectors only. Nearly all of the TACs recommended that public education be enhanced so that individuals can take responsibility and make the cooperative approach to problem solving work.

Not all of the identified MMs may be needed to address the NPSs at a specific site. For example, forestry and construction operations that do not use chemicals would not need to implement chemical-control MMs. Similarly, farms or other agriculture enterprises that do not have animals as part of the enterprise would not need to implement the MMs that address confined animal facilities or grazing. Other operations that have more than one source to address may need to employ two or more measures to address the multiple sources. Application of the measures should be coordinated to produce an overall system that adequately addresses all sources for the site in a cost-effective manner.

In addition, many operations may already be in compliance with the MMs needed to address the associated NPSs. Existing NPS pollution control activities will be recognized and appropriate credit given for practices that are in existence and operational. Existing practices, plans, and systems should be viewed as building blocks for the MMs and may need no additional improvement. For cases where existing source control is inadequate to achieve conformity with the needed MMs, only one or two more practices may need to be added to achieve conformity.

Finding solutions to NPS pollution poses unique challenges. While increased use of regulatory authorities can help to address certain categories of NPS pollution (such as the relatively recent effort to issue permits for the most significant municipal storm water discharges), California will need to rely on a wide range of tools, activities, and authorities to address NPS pollution statewide. In particular, these efforts need to focus on better integration and coordination at the State level and collaborative approaches to establish ongoing community-based stewardship.

The SWRCB, CCC, and other State agencies have identified seven management measures (MMs) to address agricultural nonpoint sources of pollution that affect State waters. The agricultural MMs include practices and plans installed under various NPS programs in California, including systems of practices commonly used and recommended by the U.S. Department of Agriculture (USDA) as components of Resource Management Systems (RMS), Water Quality Management Plans and Agricultural Waste Management Systems. These RMSs are planned by individual farmers and ranchers using an objective-driven planning process outlined in the NRCS National Planning Procedures Handbook. The RMSs are designed to achieve sustainable use of the different natural resource areas—Soil, Water, Air, Plants, Animals, and Human considerations.

California's MMs to address agricultural sources of NPS pollution in California:

1A. Erosion and Sediment Control
1B. Facility Wastewater and Runoff from Confined Animal Facilities
1C. Nutrient Management
1D. Pesticide Management
1E. Grazing Management
1F. Irrigation Water Management
1G. Education/Outreach

According to the USEPA (1993), agriculture contributes more than half of the pollution entering the Nation's water bodies; recent studies have identified it as the greatest source of water pollution in the United States. The primary agricultural NPS pollutants are nutrients, sediment, animal wastes, pesticides, and salts. Agricultural activities may also affect habitat through physical disturbances caused by livestock or equipment, or through the management of water.

Management Measures:

Erosion and Sediment Control. MM 1A addresses NPS problems associated with soil erosion and sedimentation. Where erosion and sedimentation from agricultural lands affects coastal waters and/or waterbodies listed as impaired by sediment, landowners shall design and install or apply a combination of practices to reduce solids and associated pollutants in runoff during all but the larger storms. Alternatively, landowners may apply the erosion component of an RMS as defined in the NRCS Field Office Technical Guide (FOTG). The NRCS FOTG contains standards and specifications for installing these practices.

Facility Wastewater and Runoff from Confined Animal Facilities. Pursuant to MM 1B, facility wastewater and contaminated runoff from confined animal facilities must be contained at all times. Storage facilities should be of adequate capacity to allow for proper waste water use and should be constructed so they prevent seepage to ground water, and stored runoff and accumulated solids from the facility shall be managed through a waste use system that is consistent with MM 1C or removed from the site.

Nutrient Management. MM 1C addresses the development and implementation of comprehensive nutrient management plans for areas where nutrient runoff is a problem affecting coastal waters and/or water bodies listed as impaired by nutrients. Such plans would include a plant tissue analysis to

R0018850

determine crop nutrient needs; crop nutrient budget; identification of the types, amounts, and timing of nutrients necessary to produce a crop based on realistic crop yield expectations; identification of hazards to the site and adjacent environment; soil sampling and tests to determine crop nutrient needs; and proper calibration of nutrient equipment. When manure from confined animal facilities is to be used as a soil amendment and/or is disposed of on land, the plan shall discuss steps to assure that subsequent irrigation of that land does not leach excess nutrients to surface or ground water.

Pesticide Management. Implementation of MM 1D is intended to reduce contamination of surface water and ground water from pesticides. Implementation of this measure will primarily occur through cooperation with the Department of Pesticide Regulation as provided in a Management Agency Agreement with the SWRCB. Elements of this measure include development and adoption of reduced risk pest management strategies (including reductions in pesticide use); evaluation of pest, crop, and field factors; use of Integrated Pest Management (IPM); consideration of environmental impacts in choice of pesticides; calibration of equipment; and use of anti-backflow devices. IPM is a key component of pest control. IPM strategies include evaluating pest problems in relation to cropping history and previous pest control measures, and applying pesticides only when an economic benefit will be achieved. When used, pesticides should be selected based on their effectiveness to control target pests and environmental impacts such as their persistence, toxicity, and leaching potential.

Grazing Management. MM 1E is intended to protect sensitive areas (including streambanks, lakes, wetlands, estuaries, and riparian zones) by reducing direct loadings of animal wastes and sediment. This may include restricting or rotationally grazing livestock in sensitive areas by providing fencing, livestock stream crossings, and by locating salt, shade, and alternative drinking sources away from sensitive areas. Upland erosion can be reduced by, among other methods: (1) maintaining the land consistent with the California Rangeland Water Quality Management Plan or Bureau of Land Management and Forest Service activity plans or (2) applying the range and pasture components of a Resource Management System (NRCS FOTG). This may include prescribed grazing, seeding, gully erosion control, such as grade stabilization structures and ponds, and other critical area treatment.

Irrigation Water Management. MM 1F promotes effective irrigation while reducing pollutant delivery to surface and ground waters. Pursuant to this measure, irrigation water would be applied uniformly based on an accurate measurement of cropwater needs and the volume of irrigation water applied, considering limitations raised by such issues as water rights, pollutant concentrations, water delivery restrictions, salt control, wetland, water supply and frost/freeze temperature management. Additional precautions would apply when chemicals are applied through irrigation.

Education/Outreach. The goals of MM 1G are to implement pollution prevention and education programs to reduce NPS pollutants generated from the following activities where applicable:

a. Activities that cause erosion and loss of sediment on agricultural land and land that is converted from other land uses to agricultural land;
b. Activities that cause discharge from confined animal facilities to surface waters;
c. Activities that cause excess delivery of nutrients and/or leaching of nutrients;
d. Activities that cause contamination of surface water and ground water from pesticides;
e. Grazing activities that cause physical disturbance to sensitive areas and the discharge of sediment, animal waste, nutrients, and chemicals to surface and ground waters;
f. Irrigation activities that cause NPS pollution of surface waters.

Management Measure 1A Erosion and Sediment Control Management Measure

Apply the erosion component of a CMS as defined in the Field Office Technical Guide of the U.S. Department of Agriculture – Natural Resources Conservation Service (NRCS) to minimize the delivery of sediment from agricultural lands to surface waters, *or*
Design and install a combination of management and physical practices to settle the settleable solids and associated pollutants in runoff delivered from the contributing area for storms of up to a 25-year, 24-hour frequency.

Agency	Authority	Programs	Implementation Location	Notes
Local governments	PZL (Gov. Code §§ 65000 et seq.) and California Coastal Act (CCA) §30500	• General Plans/GP updates • Local Coastal Programs(LCP)/LCP amendments • Permits pursuant to above • Enforcement	Statewide (LCP policies/ordinances apply in coastal zone)	Local gov'ts adopt ordinances and rules and make land-use decisions consistent with State law. R0018857

Management Measure (MM) 1C Nutrient Management Measure

Develop, implement, and periodically update a nutrient management plan to: (1) apply nutrients at rates necessary to achieve realistic crop yields, (2) improve the timing of nutrient application, and (3) use agronomic crop production technology to increase nutrient use efficiency. When the source of the nutrients is other than commercial fertilizer, determine the nutrient value and the rate of availability of the nutrients. Determine and credit the nitrogen contribution of any legume crop. Soil and plant tissue testing should be used routinely. Nutrient management plans contain the following core components:

Management Measure Component (1): Farm and field maps showing acreage, crops, soils, and water bodies.

Management Measure Component (2): Realistic yield expectations for the crop(s) to be grown, based primarily on the producer's actual yield history, State Land Grant University yield expectations for the soil series, or NRCS Soils-5 information for the soil series.

Management Measure Component (3): A summary of the nutrient resources available to the producer, which at a minimum include: (a) soil test results for pH, phosphorus, nitrogen and potassium; (bnutirnet analysis of manure, sludge, mortality compost (birds, pigs, etc.), or effluent (if applicable); (c) nitrogen contribution to the soil from legumes grown in the rotation (if applicable); and (d) other significant nutrient sources (e.g., irrigation water).

Management Measure Component (4): An evaluation of field limitations based on environmental hazards or concerns such as: (a) sinkholes, shallow soils over fractured bedrock, and soils with high leaching potential, (b) lands near surface water, (c) highly erodible soils, and (d) shallow aquifers.

Management Measure Component (5): Use of the limiting nutrient concept to establish the mix of nutrient sources and requirements for the crop based on a realistic yield expectation.

Agency	Authority	Programs	Implementation Location	Notes

* The following limitations and special conditions apply:

(1) In some locations, irrigation return flows are subject to other water rights or are required to maintain stream flows. In these special cases, on-site reuse could be precluded and would not be considered part of the management measure for such locations.

(2) By increasing the water use efficiency, the discharge volume from the system will usually be reduced. While the total pollutant discharge load may be reduced somewhat, there is the potential for an increase in the concentration of pollutants in the discharge. In these special cases, where other management measures (nutrients and pesticides) do not reduce concentrations in the discharge, increasing water use efficiency would not be considered part of the management measure.

(3) In some irrigation districts, the time interval between the order for the delivery of irrigation water to the farm may limit the irrigator's ability to achieve the maximum on-farm application efficiencies that are otherwise possible.

(4) In some locations, leaching is necessary to control salt in the soil profile. Leaching for salt control should be limited to the leaching requirement for the root zone.

(5) Where leakage from delivery systems or return flows supports wetlands or wildlife refuges, it may be preferable to modify the system to achieve a high level of efficiency and then divert the "saved water" to the wetland or wildlife refuge. This will improve the quality of water delivered to wetlands or wildlife refuges by preventing the introduction of pollutants from irrigated lands to such diverted water.

(6) In some locations, sprinkler irrigation is used for frost or freeze protection, or for crop cooling. In these special cases, applications should be limited to the amount necessary for crop protection and applied water should remain on-site.

Management Measure 1G Education/Outreach

Implement educational programs to provide greater understanding of watersheds, and to raise awareness and increase the use of applicable agricultural management measures and practices where needed to control and prevent adverse impacts to surface and ground water. Public education, outreach, and training programs should involve applicable user groups and the community.

R0018875

Forestry (Silviculture) Management Measures

The SWRCB, CCC, and other State agencies have identified 12 MMs to address various phases of forestry operations relevant to controlling nonpoint sources of pollution that affect State waters. The forestry MMs are for the most part a system of practices used and recommended by the Board of Forestry and Department of Forestry and Fire Protection in rules or guidance.

California's MMs to address silvicultural sources of nonpoint pollution:

- 2A. Preharvest Planning
- 2B. Streamside Management Areas
- 2C. Road Construction/Reconstruction
- 2D. Road Management
- 2E. Timber Harvesting
- 2F. Site Preparation/Forest Regeneration
- 2G. Fire Management
- 2H. Revegetation of Disturbed Areas
- 2I. Forest Chemical Management
- 2J. Wetlands Forest
- 2K. Postharvest Evaluation
- 2L. Education/Outreach

On a national level, silviculture contributes approximately 3 to 9% of NPS pollution to the Nation's waters (USEPA, 1992a). Without adequate controls, forestry operations may degrade the characteristics of waters that receive drainage from forest lands. For example (1) sediment concentrations can increase due to accelerated erosion, (2) water temperatures can increase due to removal of overstory riparian shade, (3) dissolved oxygen can be depleted due to the accumulation of slash and other organic debris, and (4) concentrations of organic and inorganic chemicals can increase due to harvesting and fertilizers and pesticides.

<u>Management Measures</u>:

Preharvest Planning. Pursuant to MM 2A, silvicultural activities shall be planned to reduce potential delivery of pollutants to surface waters. Components of MM 2A address aspects of forestry operations, including: the timing, location and design of harvesting and road construction; site preparation; identification of sensitive or high-erosion risk areas; and the potential for cumulative water quality impacts.

Streamside Management Areas (SMAs). SMAs protect against soil disturbance and reduce sediment and nutrient delivery to waters from upland activities. MM 2B is intended to safeguard vegetated buffer areas along surface waters to protect the water quality of adjacent streams.

Road Construction/Reconstruction. Pursuant to MM 2C, road construction/reconstruction shall be conducted so as to reduce sediment generation and delivery. This can be accomplished by, among other means, following preharvest plan layouts and designs for road systems, incorporating adequate drainage structures, properly installing stream crossings, avoiding road construction in SMAs, removing debris from streams, and stabilizing areas of disturbed soil such as road fills.

Road Management. MM 2D describes how to manage roads to prevent sedimentation, minimize erosion, maintain stability, and reduce the risk that drainage structures and stream crossings will fail or become less effective. Components of this measure include inspections and maintenance actions to prevent erosion of road surfaces and to ensure the effectiveness of stream-crossing structures. The also addresses appropriate methods for closing roads that are no longer in use.

Timber Harvesting. MM 2E addresses skidtrail location and drainage, management of debris and petroleum, and proper harvesting in SMAs. Timber harvesting practices that protect water quality and soil productivity also have economic benefits by reducing the length of roads and skidtrails, reducing equipment and road maintenance costs, and providing better road protection.

Site Preparation & Forest Regeneration. Impacts of mechanical site preparation and regeneration operations—particularly in areas that have steep slopes or highly erodible soils, or where the site is located in close proximity to a waterbody—can be reduced by confining runoff onsite. MM 2F addresses keeping slash material out of drainageways, operating machinery on contours, timing of activities, and protecting ground cover in ephemeral drainage areas and SMAs. Careful regeneration of harvested forest lands is important in protecting water quality from disturbed soils.

Fire Management. Prescribed fire practices for site preparation and methods to suppress wildfires should as feasible be conducted in a manner that limits loss of soil organic matter and litter and that reduces the potential for runoff and erosion. Prescribed fires on steep slopes or adjacent to streams and that remove forest litter down to mineral soil are most likely to impact water quality.

Revegetation of Disturbed Areas. MM 2H addresses the rapid revegetation of areas disturbed during timber harvesting and road construction—particularly areas within harvest units or road systems where mineral soil is exposed or agitated (e.g., road cuts, fill slopes, landing surfaces, cable corridors, or skidtrails) with special priority for SMAs and steep slopes near drainageways.

Forest Chemical Management. Application of pesticides, fertilizers, and other chemicals used in forest management should not lead to surface water contamination. Pesticides must be properly mixed, transported, loaded, and applied, and their containers disposed of properly. Fertilizers must also be properly handled and applied since they also may be toxic depending on concentration and exposure. Components of MM 2I include applications by skilled workers according to label instructions, careful prescription of the type and amount of chemical to be applied, use of buffer areas for surface waters to prevent direct application or deposition, and spill contingency planning.

Wetland Forest Management. Forested wetlands provide many beneficial water quality functions and provide habitat for aquatic life. Activities in wetland forests shall be conducted to protect the aquatic functions of forested wetlands.

Postharvest Evaluation. The goals of MM 2K are to incorporate postharvest monitoring, including: a) implementation monitoring to determine if the operation was conducted according to specifications, and b) effectiveness monitoring after at least one winter period to determine if the specified operation prevented or minimized discharges.

Education/Outreach. The goals of MM 2L are to implement pollution prevention and education programs to reduce NPS pollutants generated from applicable silvicultural activities.

2. FORESTRY

IMPLEMENTATION AUTHORITIES

2A. Preharvest Planning

2B. Streamside Management Areas (SMAs)

2C. Road Construction and/or Reconstruction

2D. Road Management

2E. Timber Harvesting

2F. Site Preparation and Forest Regeneration

2G. Fire Management

2H. Revegetation of Disturbed Areas

2I. Forest Chemical Management

2J. Wetlands Forest

2K. Postharvest Evaluation

2L. Education/Outreach

Management Measure 2A Preharvest Planning
Component I. Perform advance planning for forest harvesting that includes the following elements where appropriate:

Agency	Authority	Programs	Implementation Location	Notes
Board of Forestry (BOF)/ California Department of Forestry and Fire Protection (CDF)	Forest Practice Act (Z'Berg Nejedly) (FPA)[1]; Forest Practice Rules (FPRs)[2]	CDF Resource Management Program, Forest Practice Regulation	Statewide--Non-federal lands	[1] FPA is in PRC, Division 4, Chapter 8, § 4511 *et seq.* [2] FPRs are in Title 14, CCR, § 895 *et seq.* The authorities set forth on this page are the general informational requirements for each program document. On subsequent pages, more specific informational requirement authorities are given. These general requirements are not repeated, even where they specify relevant information.
	FPA 4551.3; FPR 1091.4-1091.7	Sustained Yield Plan	Same as above	Tiered landscape-scale option available to industrial timberland owners; may reduce issues to be addressed in subordinate Timber Harvesting Plans (THPs).
	FPA 4581, 4582; FPR 898, 1034	THP	Same as above	Required for all commercial timber harvesting not otherwise exempt.
	FPA 4581, 4582; FPR 1051.1	Modified THP (MTHP)	Same as above	Option for small low-impact operations meeting specified criteria
	FPA 4581, 4582; FPR 1092.9	Program THP (PTHP)	Same as above	THP tiered to a Program Timberland Environmental Impact Report (EIR). FPR 1092 requires that PTHPs comply with most operational and some informational requirements for THPs.
	FPA 4593.3, 4594; FPR 1090.5, 1090.7	Nonindustrial Timber Management Plan (NTMP) and Notice	Same as above	Option for uneven-age silviculture on nonindustrial parcels smaller than 2,500 acres. FPR 1090 requires that NTMPs comply with most operational and some informational requirements for THPs.
	FPR 921.1 (b)	THP	Coastal Zone Special Treatment Areas (CZSTA)	THP requirements are somewhat different and more stringent in Special Treatment Areas designated by CCC
	FPA 4516.5; 4516.8; FPR 927.2 4584	THP Exemption	Marin Co.	These counties have slightly different planning requirements.

Agency	Authority	Programs	Implementation Location	Notes
Element (1): Identify (a) the area to be harvested including location of waterbodies and sensitive areas such as wetlands, threatened or endangered aquatic species habitat areas, or high-erosion-hazard areas (landslide-prone areas) within the harvest unit, and (b) the hydrologic unit where the project is located and name the waterbodies the project is tributary to.				
BOF/CDF	Same as Component; plus FPR 895.1; 912.5, Tech. Rule Addendum #1; 912.9, Tech. Rule Addendum # 2; FPR 914; 914.2(d), (f); 916.4(a), (b); 939.15	THP, MTHP, PTHP, NTMP	Statewide

	Same as above, plus FPR 927.12(a)	Same as above	Marin Co	

Agency	Authority	Programs	Implementation Location	Notes
Element (4): Reduce the risk of occurrence of landslides and severe erosion by identifying high-erosion-hazard areas and avoiding timber operations where they may exacerbate risk.				
BOF/CDF	Same as component I, plus FPR 912.5, Tech Rule Addendum #1; 912.9, Tech Rule Addendum #2; 913.1(a), 914.2(d), (f), 914.6(c), 914.7, 916.4(a)	THP, MTHP, PTHP, NTMP	Statewide	
	Same as above, plus FPR 921.1(a), 921.5(a), (b), 961.5(d)	Same as above	CZSTA	
	Same as above, plus FPR 913.8(b)	Same as above	Southern Subdistrict of Coast District	
Element (5): Consider cumulative effects from timber operations or roads to any known existing water quality impairments or problems in watersheds.				
BOF/CDF	Same as component; FPR 898; 912.9, Tech. Rule Addendum #2	THP	Statewide	

Management Measure 2A Preharvest Planning Component 2. Perform advance planning for forest road systems that includes the following elements where appropriate:				
Element (1): Locate and design road systems to minimize, potential sediment generation and delivery to surface waters. Key components are: (a) locate roads, andings, and skid trails to avoid steep grades and steep or unstable hillslope areas, and to decrease the number of stream crossings; (b) avoid to the extent racticable locating new roads and landings in SMAs; and (c) determine road usage and select the appropriate road standard.				
BOF/CDF	FPA 4562.7; **4582**; **4593**.3(b) FPR 895.1; **914**, **914**.**2**, **914**.8; 916.3(c); 916.4(a), (d); 923; 923.1; 923.2(v); 923.3; 923.5(a), **(b)**, **(d)**	THP, MTHP, PTHP, NTMP	Statewide	
	Same as above, plus **FPR** 921.1(b); 921.5(a), (b), (c), (d); 961.5	Same as above	CZSTA	
	Same as above, plus **FPR** 926.16	Same as above	Santa Cruz Co	
	Same as above, plus 927.2(e); 965.1	Same as above	Marin, Monterey Co.	
	FPR 1091.6(c)	SYP	Statewide	
Element (2): Locate and design temporary and permanent stream crossings to prevent failure and control impacts from the road system. Key components are: (a) size, design and site crossing structures to prevent failure and minimize diversion potential; (b) for fish-bearing streams, design crossings to facilitate fish passage.				
BOF/CDF	FPA 4562.7(b), (f) FPR 895.1; 914.8; 916.3(c); 916.4(c), (d); 923.2(e); 923.3(a), (c), (e)	THP, MTHP, PTHP, NTMP	Statewide	
	FPR 926.16	Same as above	Santa Cruz Co.	
Element (3): Ensure that the design of road prism and the road surface drainage is appropriate to the terrain and that road surface design is consistent with the road drainage structures.				
BOF/CDF	FPR 914.6(c); 923(c), (f); 923.1(d), (f), (g); 923.2	THP, MTHP, PTHP, NTMP	Statewide	
	FPR 921.5(b)	Same as above	CZSTA	
	FPR 927.11(a)	Same as above	Marin Co	
Element (4): Use suitable materials for surface roads planned for all-weather use to support truck traffic.				
BOF/CDF	FPR 895.1; 923.1(a), 923.2(t); 923.4(h)	THP, MTHP, PTHP, NTMP	Statewide	

Element (5): Design road systems to avoid high erosion or landslide hazard areas. Identify these areas and consult a qualified specialist for design of any roads that must be constructed through these areas.				
BOF/CDF	FPR 898.1(b); 912.5, Tech. Rule Addendum #1; 914.2(d); 923(c), (d), (f), (g); 923.1(c), (d)	THP, MTHP, PTHP, NTMP	Statewide

Management Measure 2C: Road Construction/Reconstruction				
Agency	Authority	Programs	Implementation Location	Notes
Component (1): Follow preharvest planning (as described under Management Measure A) when constructing or reconstructing the roadway.				
BOF/CDF	Same as MM 2A, Component 2, plus FPR 923.2	THP, MTHP, PTHP, NTMP	Same as MM 2A, Component 2	
Component (2): Follow designs planned under Management Measure A for road surfacing and shaping..				
BOF/CDF	Same as above	Same as above	Same as above	
Component (3): Install road drainage structures according to designs planned under Management Measure A and regional storm return period and installation specifications. Match these drainage structures with terrain features and with road surface and prism designs.				
BOF/CDF	Same as above, plus FPR 895.1; 923.1(f), (g); 923.2(h), (o)	Same as above	Same as above	
Component (4): Guard against the production of sediment when installing stream crossings.				
BOF/CDF	FPR 916.3; 923; 923.3			
Component (5): Protect surface waters from slash and debris material from roadway clearing.				
BOF/CDF	FPR 914.1(a), (c); 916.3(a), (b), (c), (e); 916.4(b), (c); 923.19(d); 923.2(g), (u)			
Component (6): Use straw bal[illegible]ences, mulching, or other favorable practices on disturbed soils on cuts, fill, etc.				
BOF/CDF	FPR 916.7, 923.4(i), (k)			
Component (7): Avoid constructing new roads in SMAs to the extent practicable.				
BOF/CDF	FPR 916.3(c); 923.1(h); 923.3(v)			

The following are BACKUP AUTHORITIES that pertain to the Road Construction/Reconstruction Management Measure

Management Measure 2D Road Management				
Agency	**Authority**	**Programs**	**Implementation Location**	**Notes**
Component (1): Avoid using roads for timber hauling or heavy traffic during wet or thaw periods on roads not designed and constructed for these conditions.				
BOF/CDF	FPR 923.2(t); 923.4(o); 923.6	THP, MTHP, PTHP, NTMP	Statewide	
Component (2): Evaluate the future needs for a road and close roads that will not be needed. Leave closed roads and drainage channels in a stable condition to withstand storms.				
BOF/CDF	FPR 923; 923.4(a), (b), (g); 923.8	Same as above	Statewide	
	FPR 926.17	THP, MTHP, PTHP, NTMP	Santa Cruz Co	
Component (3): Remove drainage crossings and culverts if there is a reasonable risk of plugging or failure from lack of maintenance.				
BOF/CDF	FPR 923.2(i); 923.4(d), (f), (l), (m); 923.8(e)	Same as above	Same as above	
Component (4): Following completion of harvesting, close and stabilize temporary spur roads and seasonal roads to control and direct water away from the roadway. Remove all temporary stream crossings.				
BOF/CDF	FPR 923.3(d); 923.4(b), (f), (g); 923.8	THP, MTHP, PTHP, NTMP	Statewide	
	FPR 926.19; 965.9	Same as above	Santa Cruz/Monterey Co	
Component (5): Inspect roads to determine the need for structural maintenance. Conduct maintenance practices, when conditions warrant, including cleaning and replacement of deteriorated structures and erosion controls, grading or seeding of road surfaces, and, in extreme cases, slope stabilization or removal of road fills where necessary to maintain structural integrity.				
BOF/CDF	FPR 923; 923.4(all); 923.8 PRC 4562.9	Same as above	Same as above	
Component (6): Conduct maintenance activities, such as dust abatement, so that contaminants or pollutants are not introduced into surface waters.				
BOF/CDF	FPR 916.3; 923, 923.4(h)	Same as above	Same as above	
Component (7): Properly maintain permanent stream crossings and associated fills and approaches to reduce the likelihood (a) that stream overflow will divert onto roads, and (b) that fill erosion will occur if the drainage structures become obstructed.				
BOF/CDF	FPR 923.2(h); 923.3(e); 923.4(n)	Same as above	Same as above	
The following are BACKUP AUTHORITIES that pertain to the Road Management Measure.				
Agency	**Authority**	**Programs**	**Implementation Location**	**Notes**

Management Measure 2E Timber Harvesting The timber harvesting management measure consists of implementing the following:				
Agency	Authority	Programs	Implementation Location	Notes
Component 1. General Element (1): Timber harvesting operations with skid trails or cable yarding follow layouts determined under Management Measure 2A.				
BOF/CDF	FPA 4562.7; FPR 914.2(f); 914.3(e);916.3(c); 916.4(d), (e)	THP, MTHP, PTHP, NTMP	Statewide	
	Same as above, plus FPR 921.1(a)	Same as above	CZSTA	
	FPA 4516.5(a); FPR 925.5; 926.16; 927.3; 928.3	Same as above	Santa Clara, Santa Cruz , Marin , San Mateo Co	
Element (2): Install landing drainage structures to minimize erosion and prevent sedimentation.				
BOF/CDF	FPR 923.1(d), (f); 923.5(f)	THP, MTHP, PTHP, NTMP	Statewide	
Element (3): Construct landings away from steep slopes and reduce the likelihood of fill slope failures. Protect landing surfaces used during wet periods. Locate landings outside SMAs.				
BOF/CDF	FPR 914.2(d), (f); 914.7; 916.3(c); 916.4(c), (d), (e); 923; 923.1(c), (d); 923.4(h), (i), 923.5(a), (b), (c), (f), (g); 923.6	THP, MTHP, PTHP, NTMP	Statewide	
Element (4): Protect stream channels and significant ephemeral drainages from logging debris and slash material.				
BOF/CDF	FPR 914.1(a), (c); 914.2(e); 916.3(a), (b) 916.4(c)	THP, MTHP, PTHP, NTMP	Statewide	
Element (5): Use appropriate areas for petroleum storage, equipment maintenance and service. Establish procedures to contain and treat spills. Recycle or properly dispose of all waste materials.				
BOF/CDF	FPR 914.5	THP, MTHP, PTHP, NTMP	Same as above	
Component 2. For cable yarding: Element (1): Limit yarding corridor gouge or soil plowing by properly locating cable yarding landings.				
BOF/CDF	FPR 914.3,(a), (d); 923(c)	THP, MTHP, PTHP, NTMP	Statewide	
Element (2): Locate corridors for SMAs following Management Measure 2B.				
BOF/CDF	Same as above	THP, MTHP, PTHP, NTMP	Statewide	

R0018889

Component 3. For groundskidding: Element (1): Within SMAs, operate groundskidding equipment only at stream crossings. In SMAs, fell and endline trees to avoid sedimentation and damage to residual vegetation.				
Agency	Authority	Program	Implementation Location	Notes
BOF/CDF	FPR 914; 914.1(a), (c); 914.2(a); 916.3(c), (e); 916.4(c), (d), (e), (f)	THP, MTHP, PTHP, NTMP	Statewide	
Element (2): Use improved stream crossings for skid trails which cross flowing drainages. Construct skid trails to disperse runoff and with adequate drainage structures.				
BOF/CDF	FPR 914; 914.2(a), (i); 914.6 (c), (e), (f); 914.8(b); 916.3(c); 916.4(d), (f)	THP, MTHP, PTHP, NTMP	Statewide	
Element (3): On steep slopes, use cable systems rather than groundskidding where groundskidding may cause excessive erosion.				
BOF/CDF	FPR 914.2(b), (f); 914.3(e)	THP, MTHP, PTHP, NTMP	Statewide	
	FPR 921.5(a)	Same as above	CZSTA

Management Measure 2F Site Preparation and Forest Regeneration Confine on-site potential NPS pollution and erosion resulting from site preparation and the regeneration of forest stands. The components of the management measure for site preparation and regeneration are:				
Agency	**Authority**	**Programs**	**Implementation Location**	**Notes**
Component (1): Select a method of site preparation and regeneration suitable for the site conditions.				
BOF/CDF	FPA 4551.5, 4551.7, 4562.5; FPR 895.1; 914, 914.2(d), (e), (f), (j), 915, 915.1(a); 915.2; 915.3	THP, PTHP, NTMP	Statewide	Site preparation using fire is addressed in MM 2.0 G. CA has extensive restocking requirements not included in MMs.
BOF/CDF	Same as above, plus FPR 914.2(k), 954.4	Same as above	Southern District	
BOF/CDF	Same as above, plus FPRA 921.3(b), (c)	Same as above	CZSTA	
BOF/CDF	Same as above, plus FPR 913.8(b)	Same as above	Southern subdistrict of Coast District	
BOF/CDF	Same as above, plus FPR 927.9	Same as above	Marin Co.	
Component (2): Conduct mechanical tree planting and ground-disturbing site preparation activities on the contour of sloping terrain.				
BOF/CDF				CA has no equivalent requirement
Component (3): Do not conduct mechanical site preparation and mechanical tree planting on streamside management areas.				
OF/CDF	FPR 915.3(a), 916.4(c), (d)	THP, PTHP, NTMP	Statewide	
Component (4): Protect surface waters from logging debris and slash material.				
BOF/CDF	FPR 914; 914.2(e), (f), (j); 915; 915.3(a); 916.3(a), (b)	THP, MTHP, PTHP, NTMP	Statewide	
Component (5): Suspend operations during wet periods.				
BOF/CDF	FPR 914.7; 915.1(b)	THP, PTHP, NTMP	Statewide	
Component (6): Locate windrows at a safe distance from drainages and SMAs to control movement of the material during high runoff conditions.				
BOF/CDF	FPR 914.2 (e); 915.3(a)	THP, MTHP, PTHP, NTMP	Statewide	
Component (7): Conduct bedding operations in high-water-table areas during dry periods of the year. Conduct bedding in sloping areas on the contour.				
BOF/CDF	FPR 915; 915.3(a), 916.3(d); 916.4(c), (d)	THP, PTHP, NTMP	Statewide	
Component (8): Protect small ephemeral drainages when conducting mechanical tree planting.				
BOF/CDF	FPR 915; 915.3(a); 916.4(c), (d)	THP, PTHP, NTMP	Statewide

Management Measure 2G Fire Management				
Prescribe fire for site preparation and control or suppress wildfire in a manner which reduces potential nonpoint source pollution of surface waters.				
Component (1): Intense prescribed fire should not cause excessive erosion due to the combined effect of removal of canopy species and the loss of soil-binding ability of subcanopy and herbaceous vegetation roots, especially in SMAs, in streamside vegetation for small ephemeral drainages, or on very steep slopes.				
Agency	**Authority**	**Programs**	**Implementation Location**	**Notes**
BOF/CDF	FPA 4551.5, 4551.7; FPR 895.1; 915.2(a), (b); 915.3(a); 916.4(b); 916.5(e); 917.3(d); 937.3(c); 957.3(c)	THP, PTHP, NTMP	Statewide	CA has extensive logging-related fire hazard reduction requirements not in MMs.

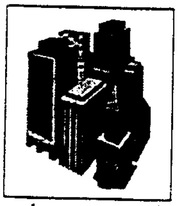
Management Measure 2L Education/Outreach

Implement educational programs to provide greater understanding of watersheds, and to raise awareness and increase the use of applicable forestry management measures and practices where needed to control and prevent adverse impacts to surface and ground water. Public education, outreach, and training programs should involve applicable user groups and the community.

[Refer to the Forestry Management Measures 2A – 2K listed in this document.]

Agency	Authority	Programs	Implementation Location	Notes



The SWRCB, CCC, and other State agencies have identified 15 MMs to address urban nonpoint sources of pollution that affect State waters. With approximately 80% of the nation's population living in coastal areas, controlling polluted runoff in urban areas is a challenge. Negative impacts of urbanization on coastal and estuarine waters are well documented in a number of sources, including California's CWA §305(b) and §319 reports and the Nationwide Urban Runoff Program.

Major pollutants found in runoff from urban areas include sediment, nutrients, oxygen-demanding substances, road salts, heavy metals, petroleum hydrocarbons, pathogenic bacteria, and viruses. Suspended sediments constitute the largest mass of pollutant loadings to receiving waters from urban areas. Construction is a major source of sediment erosion. Petroleum hydrocarbons result mostly from automobile sources. Nutrient and bacterial sources include garden fertilizers, leaves, grass clippings, pet wastes, and faulty septic tanks. As population densities increase, a corresponding increase occurs in pollutant loadings generated from human activities. Many of these pollutants enter surface waters via runoff without undergoing treatment.

California's MMs to address urban sources of nonpoint pollution:

3.1 **Runoff from Developing Areas**
- A. Watershed Protection
- B. Site Development
- C. New Development

3.2 **Runoff from Construction Sites**
- A. Construction Site Erosion and Sediment Control
- B. Construction Site Chemical Control

3.3 **Runoff from Existing Development**
- A. Existing Development

3.4 **Onsite Disposal Systems (OSDSs)**
- A. New OSDSs
- B. Operating OSDSs

3.5 **Transportation Development (Roads, Highways, and Bridges)**
- A. Planning, Siting, and Developing Roads and Highways
- B. Bridges
- C. Construction Projects
- D. Chemical Control
- E. Operation and Maintenance
- F. Road, Highway, and Bridge Runoff Systems

3.6 **Education/Outreach**
- A. Pollution Prevention/Education: General Sources

Urban runoff management requires that several objectives be pursued simultaneously. These objectives include the following (American Public Works Association, 1981):

- Protection and restoration of surface waters by the minimization of pollutant loadings and negative impacts resulting from urbanization;
- Protection of environmental quality and social well-being;
- Protection of natural resources, e.g., wetlands and other important aquatic and terrestrial ecosystems;
- Minimization of soil erosion and sedimentation problems;
- Maintenance of the predevelopment hydrologic conditions;

- Protection of ground-water resources;
- Control and management of runoff to reduce or prevent flooding; and
- Management of aquatic and riparian resources for active and passive pollution control.

Management Measures:

The control of urban NPS pollution requires the use of two primary strategies: the prevention of pollutant loadings and the treatment of unavoidable loadings. California's urban management measures are organized to parallel the land use development process in order to address the prevention and treatment of NPS pollution loadings during all phases of urbanization; this strategy relies primarily on the watershed approach, which focuses on pollution prevention or source reduction practices. Emphasizing pollution prevention and source reduction practices over treatment practices is favored because conducting education practices and incorporating pollution prevention practices into project planning and design activities are generally more effective, require less maintenance, and are more cost-effective in the long term than treatment strategies. Treatment strategies should only be used to address unavoidable loadings or where they are truly cost-effective.

The major opportunities to control NPS loadings occur during the following three stages of development: (1) the siting and design phase, (2) the construction phase, and (3) the post-development phase. Before development occurs, land in a watershed is available for a number of pollution prevention and treatment options, such as setbacks, buffers, or open space requirements, as well as wet ponds or constructed urban runoff wetlands that can provide treatment of the inevitable runoff and associated pollutants. In addition, siting requirements and restrictions and other land use ordinances, which can be highly effective, are more easily implemented during this period. After development occurs, these options may no longer be practicable or cost-effective. MMs 3.1A through 3.1C address the strategies and practices that can be used during the initial phase of the urbanization process.

The control of construction-related sediment loadings is critical to maintaining water quality. The implementation of proper erosion and sediment control practices during the construction stage can significantly reduce sediment loadings to surface waters. MMs 3.2A and 3.2B address construction-related practices.

After development has occurred, lack of available land severely limits the implementation of cost-effective treatment options. MM 3.6A focuses on improving controls for existing surface water runoff through pollution prevention to mitigate nonpoint sources of pollution generated from ongoing domestic and commercial activities.

- F. Road, Highway, and Bridge Runoff Systems

3.6 **Education/Outreach**
- A. Pollution Prevention/Education: General Sources

Urban Management Measure 3.1A — Watershed Protection [1]
Develop a watershed protection program to: 1. Avoid conversion, to the extent practicable, of areas that are particularly susceptible to erosion and sediment loss; 2. Preserve areas that provide important water quality benefits and/or are necessary to maintain riparian and aquatic biota; 3. —Protect to the extent practicable the natural integrity of water bodies and natural drainage systems associated with site development—including roads, highways, and bridges; 4. Limit increases of percent impervious surfaces; and 5. Provide education and outreach to address sources or nonpoint pollution.

Agency	Authority	Programs	Implementing Area	Notes
SWRCB/ RWQCBs	• CWA (33 USC § 1251 et seq.) • PCWQCA (WC §§ 13000 et seq.) • CWA §401 • CEQA (PRC §§21000 to 21177)	SWDP (CWA § 402) • General Industrial and Construction Activities Storm Water Permits • MSWP TMDL Program [pursuant to CWA § 303(d)] Water Quality Certification [pursuant to CWA §401 for discharges of dredge and fill materials] CEQA--Environmental Review	SWDP applies to: • cities >100,000 pop. (Phase I) • cities of 50,000 - 100,000 pop. (Phase II) TMDL programs apply in CWA § 303(d)-listed watersheds. Water Quality Certification applies to waters of the U.S. statewide and individual projects. CEQA--Statewide	NPDES Permits (Phase I): • major industrial facilities; • large/medium municipalities separate storm sewer systems • construction sites that disturb 5 or more acres. NPDES Permits (Phase II): • smaller municipalities • construction sites that disturb 1 to 5 acres. TMDL goals include: identify pollution sources in watersheds; allocate pollution control responsibilities where water quality goals are not met. CWA §401--Water quality certification is required for most watershed level developments (e.g., HCPs, planned community developments) CEQA--Comments on general plans, watershed level developments, and project specific impacts.

[1] Sound watershed management requires that both structural and nonstructural measures be employed to mitigate the adverse impacts of storm water. Nonstructural Management Measures 3.1A (Watershed Protection) and 3.1B (Site Development) can be effectively used in conjunction with Management Measure 3.1C (New Development) to reduce both the short-and long-term costs of meeting the treatment goals of this management measure.

Regional Authorities (e.g., ABAG, AMBAG, SCAG, SANDAG)	CWA § 208	Areawide water quality control plans	Regionally	Regional authorities conduct areawide water quality control efforts. Though dated, § 208 plans can provide a starting point for identifying problems in specific watersheds.
SCC	PRC Chapter 6, Div 21	CREP	Coastal zone and coastal watersheds, statewide	SCC (1) implements watershed plans to protect and enhance natural resources and preserve open space and(2) helps to acquire sensitive lands to protect water quality and preserve natural resources.

DFG	FGC §§ 1 et seq. ♦ § 5650 ♦ §§ 12000-12002	• Enforcement • Reporting	Statewide	• Enforcement: citations by DFG wardens • Reporting: DFG staff report chronic (sublethal, long-term) water pollution conditions to RWQCBs, and cooperate in obtaining corrections or abatements to the condition.
DPR	Div. I, Chapter 1.25, Div. V, PRC §5000 et seq.		SPS	DPR operates and maintains units of the SPS in urban areas.
DHS	HSC §116275 et seq.	Drinking water source assessment and protection; drinking water sampling and analysis; regulation of public drinking water systems	Watersheds associated with drinking water sources	Assessment of potential contaminating activities in watershed; self-determined protection programs by drinking water systems and communities; collection of data on contaminants in drinking water supplies for the evaluation of water quality.

Urban Management Measure 3.2B — Construction Site Chemical Control	
Part (1):	Limit application, generation, and migration of toxic substances;
Part (2):	Ensure the proper storage and disposal of toxic materials;
Part (3):	Apply nutrients at rates necessary to establish and maintain vegetation without causing nutrient runoff to surface waters; and
Part (4):	Prepare and implement, prior to the use or storage of toxic materials on site, an effective, approved chemical control plan or similar administrative document that contains chemical control provisions (e.g., minimize use of toxic materials; ensure proper containment if toxic materials are to be used/stored on site).

The agencies and authorities for the four components of this MM are the same as the agencies/authorities identified for MMs 3.1B, 3.1C, and 3.2A, with the additional agency/authorities listed below.				
Agency	Authority	Programs	Implementing Area	Notes
DTSC	• HSC §§ 58000 et seq. • HSC §§ 25100 et seq.	• Permits to Operate • Hazardous Waste Facilities Permits • Site Mitigation Program and other hazardous waste cleanup programs	• Statewide	DTSC is lead State agency for hazardous waste management. • DTSC issues permits to operate to any person who stores, treats or disposes of or otherwise manages "hazardous waste." • DTSC manages the cleanup of hazardous waste sites, and regulates the transport, treatment, storage, and disposal of hazardous waste.

The following BACKUP AUTHORITIES pertain to Urban Management Measure 3.2B (Construction Site Chemical Control)
The backup authorities for this MM are the same as the backup authorities identified for MMs 3.1B, 3.1C, and 3.2A.

R0018913

Urban Management Measure 3.3A — Existing Development

Develop and implement watershed management programs to reduce runoff pollutant concentrations and volumes from existing development:

1. Identify priority local and/or regional watershed pollutant reduction opportunities (e.g., improve existing urban runoff control structures);
2. Specify a schedule for implementing appropriate controls;
3. Limit destruction of natural conveyance systems; and
4. Where appropriate, preserve, enhance, or establish buffers along surface water bodies and their tributaries.

Agency	Authority	Programs	Implementing Area	Notes
Cities/Counties (CA contains 58 counties and approximately 468 incorporated cities.)	• PZL (Gov. Code §§ 65000 et seq.) • SMA (Gov. Code §§ 66410 et seq.) • CCA § 30500	• General Plans/GP updates • LCPs/LCP amendments • Zoning ordinances • Subdivision ordinances • Permits pursuant to above • Enforcement	• Statewide • LCP policies/ ordinances apply in coastal zone	Cities/counties can adopt ordinances/rules and make land-use decisions consistent with State law. Enforcement tools include: inspections; fines; infractions; misdemeanors; stop work orders; and general police powers to protect public health, safety and welfare and declare, prohibit, and abate nuisances.
SWRCB/ RWQCBs	• CWA (33 USC § 1251 et seq.) • PCWQCA (WC §§ 13000 et seq.)	SWDP (CWA § 402) • General Industrial and Construction Activities Storm Water Permits • MSWP TMDL Program [pursuant to CWA § 303(d)]	SWDP applies to: • cities >100,000 pop. (Phase I) • cities of 50,000 - 100,000 pop. (Phase II) TMDL programs apply in CWA § 303(d)-listed watersheds.	NPDES Permits (Phase I): • major industrial facilities; • large/medium municipalities separate storm sewer systems • construction sites that disturb 5 or more acres. NPDES Permits (Phase II): • smaller municipalities • construction sites that disturb 1 to 5 acres. TMDL goals include: identify pollution sources in watersheds; allocate pollution control responsibilities where water quality goals are not met.
CARB		Congestion Management Plan	Statewide: cities with pop.> 100,000	Reduction in vehicle congestion can reduce pollution
CIWMB	• CIWMA (PRC §§ 40400-49620) • CCR Title 14, Div. 7 and Title 27, Div. 2	Waste Reduction Program	Statewide at local level	UnderCIWMA, 50% of waste generated Statewide must be diverted from landfills by 2000 (using source reduction, hazard-ous waste control, education.)

R0018915

Urban Management Measure 3.4A — New Onsite Disposal Systems (OSDSs)	
Part (1):	Ensure that new OSDS are located, designed, installed, operated, inspected, and maintained to prevent the discharge of pollutants to the surface of the ground and to the extent practicable reduce the discharge of pollutants into ground water. Where necessary to meet these objectives: (a) discourage the installation of garbage disposals to reduce hydraulic and nutrient loadings; (b) install low-volume plumbing fixtures in new developments or redevelopments as required by State law; and (c) encourage installation of low-volume plumbing fixtures in existing developments. Implement OSDS inspection schedules for pre-construction, construction, and post-construction.
Part (2):	Direct placement of OSDS away from unsuitable areas. Where OSDS placement away from unsuitable areas is not practicable, ensure that the OSDS is designed or sited at a density so as not to adversely affect surface waters or ground water. Unsuitable sites include, but are not limited to, areas (a) with poorly or excessively drained soils; (b) with shallow water tables or high seasonal water tables; (c) within floodplains; or (d) where nutrient and/or pathogen concentrations in the effluent cannot be sufficiently treated or reduced before the effluent reaches sensitive water bodies.
Part (3):	Establish protective setbacks from surface waters, wetlands, and floodplains for conventional as well as alternative OSDS. The lateral setbacks should be based on soil type, slope, hydrologic factors, and type of OSDS. Where uniform protective setbacks can not be achieved, site development with OSDS so as not to adversely affect water bodies and/or contribute to a public health nuisance.
Part (4):	Establish protective separation distances between OSDS system components and groundwater. The separation distances should be based on soil type, distance to ground water, hydrologic factors, and type of OSDS.
Part (5):	Where conditions indicate that nitrogen-limited surface waters may be adversely affected by excess nitrogen loadings from ground water, prohibit the installation of OSDSs or require the installation of OSDS that reduce total nitrogen loadings to meet water quality objectives.

R0018918

Urban Management Measure 3.4B — Operating Onsite Disposal Systems (OSDSs)	
Part (1):	Establish and implement policies and systems to ensure that existing OSDSs are operated and maintained to prevent the discharge of pollutants to the surface of the ground and, to the extent practicable, reduce the discharge of pollutants into ground water. Where necessary to meet these objectives, encourage the reduced use of garbage disposals, encourage the use of low-volume plumbing fixtures, and reduce total phosphorus loadings to the OSDS by 15 % (if the use of low-level phosphate detergents has not been required or widely adopted by OSDS users). Establish and implement policies that require an OSDS to be repaired, replaced, or modified where the OSDS fails or threatens or impairs surface waters.
Part (2):	Inspect OSDSs at a frequency adequate to ascertain whether the OSDSs are failing.
Part (3):	Consider replacing or upgrading OSDS to treat influent so that total nitrogen loadings in the effluent are reduced to meet water quality objectives. This provision applies only where: (a) conditions indicate that nitrogen-limited surface waters may be adversely affected by significant ground water nitrogen loadings from an OSDS, and (b) nitrogen loadings from OSDS are delivered to ground water.

The backup authorities for this MM are the same as the backup authorities identified for MMs 3.4A (New OSDSs).

Urban Management Measure 3.5A — Planning, Siting, and Developing Roads and Highways
Plan, site, and develop roads and highways to: 1. Protect areas that provide important water quality benefits or are particularly susceptible to erosion or sediment loss; 2. Limit land disturbance such as clearing and grading and cut and fill to reduce erosion and sediment loss; and 3. Limit disturbance of natural drainage features and vegetation.

Urban Management Measure 3.5B — Bridges
Site, design, and maintain bridge structures so that sensitive and valuable aquatic ecosystems and areas providing important benefits are protected from adverse effects.

Urban Management Measure 3.5C — Construction Projects [Roads, Highways and Bridges]
Part (1): Reduce erosion and, to the extent practicable, retain sediment on site during and after construction and Part (2): Prior to land disturbance, prepare and implement an approved erosion control plan or similar administrative document that contains erosion and sediment control provisions.

Urban Management Measure 3.6A — Pollution Prevention/Education: General Sources
Implement educational programs to provide greater understanding of watersheds, and to raise awareness and increase the use of applicable urban management measures and practices where needed to control and prevent adverse impacts to surface and ground water. Public education, outreach, and training programs should involve applicable user groups and the community. Implementation of urban pollution prevention and education programs includes the following activities, where applicable: 1. Households • Improper storage, use, and disposal of household hazardous chemicals, including automobile fluids, pesticides, paints, solvents, etc.; • Lawn and garden activities, including the application and disposal of lawn and garden care products, and improper disposal of leaves and yard trimmings; • Improper operation and maintenance of onsite disposal systems; • Improper disposal of pet excrement. 2. Landscaping • Turf management on golf courses, parks and recreational areas. 3. Commercial • Commercial activities, including parking lots, restaurants, vehicle service facilities, and other entities. 4. Other General Sources • Discharge of pollutants into storm drains, including floatables, waste oil, and litter; • Roads, highways, and bridges. • [Refer to the Urban Management Measures 3.1 – 3.5 listed in this document.]

Agency	Authorities (•) and Programs (♦)	Implementing Area	Notes
Local Governments (Cities and Counties)	Many programs, including the following: ♦ SFB/Southern CA NPDES stormwater programs (education/outreach efforts to reduce urban pollution from litter and improper disposal into storm drains). ♦ MBNMS WQPP watershed module for the Adopt-a-Beach coastal clean-up activities in central CA. ♦ Santa Clara Valley NPS Control Program/San Jose Office of Env. Management automobile service station management practice handbook. ♦ Sunnyvale's curbside used oil collection/outreach program. ♦ San Francisco's permanent HHW collection facility (includes education, waste disposal, facility inspection).	• Varies Statewide	Many local governments maintain planning, community liaison, or public education/information staff to organize special projects (e.g.., management practice handbooks, curbside collection, storm drain stenciling).

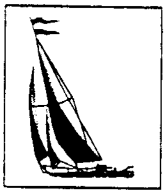
CDPR	• FAC §11501F • H_2O Home to Ocean Workbook	Statewide in urban areas	This workbook is a comprehensive guide for wastewater treatment plants on how to launch a public education campaign or enhance an existing outreach program for water quality.

R0018927

Marinas & Recreational Boating Management Measures



The SWRCB, CCC, and other State agencies have identified 17 MMs to address marina and recreational boating sources of nonpoint pollution. Because marinas are located at the water's edge, pollutants generated from marinas and boats are less likely to be buffered or filtered by natural processes. When boating and related activities (e.g., marinas and boat maintenance areas) are poorly planned or managed, they may threaten the health of aquatic systems and pose other environmental hazards. The USEPA (1993) identifies several sources of pollution associated with marinas and boating activities:

- Poorly flushed waterways;
- Pollutants discharged from boats (recreational boats, commercial boats, and "live-aboards");
- Pollutants carried in stormwater runoff;
- Physical alteration of wetlands and of shellfish/ other benthic communities during construction of marinas, ramps, and related facilities;
- Pollutants generated from boat maintenance activities on land and in the water.

California's marina and recreational boating MMs:

4.1 Assessment, Siting and Design
- A. Water Quality Assessment
- B. Marina Flushing
- C. Habitat Assessment
- D. Shoreline Stabilization
- E. Storm Water Runoff
- F. Fueling Station Design
- G. Sewage Facilities
- H. Waste Management Facilities

4.2 Operation and Maintenance
- A. Solid Waste Control
- B. Fish Waste Control
- C. Liquid Material Control
- D. Petroleum Control
- E. Boat Cleaning and Maintenance
- F. Maintenance of Sewage Facilities
- G. Boat Operation

4.3 Education/Outreach
- A. Public Education

California's management measures are intended to be applied to control impacts to water quality and habitat from marina siting and construction (new <u>and</u> expanding marinas), and marina and boat operation and maintenance. The measures are designed to reduce NPS pollution by requiring the best possible siting for marinas and maintenance areas, providing for the best available design and construction practices and appropriate operation and maintenance practices, and encouraging the development and use of effective pollution control and education efforts. The management measures cover the following operations and facilities (USEPA, 1993):

- Any facility that contains 10 or more slips, piers where 10 or more boats may tie up, or any facility where a boat for hire is docked;
- Any residential or planned community marina with 10 or more slips;
- Any mooring field where 10 or more boats are moored;
- Public or commercial boat ramps;
- Boat maintenance or repair yards that are adjacent to the water, and any Federal, State, or local facility that involves recreational boat maintenance or repair on or adjacent to the water.

The assessment, siting, and design MMs for marinas and recreational boating is summarized as follows:

4.1.A. **Water Quality Assessment** — Consider impacts to water quality in siting and designing new and expanding marinas.
4.1.B. **Marina Flushing** — Site and design marinas to provide for maximum flushing and circulation of surface waters, which can reduce the potential for water stagnation, maintain biological productivity, and reduce the potential for toxic accumulation in bottom sediment.
4.1.C. **Habitat Assessment** — Site and design marinas to protect against adverse impacts on fish and shellfish, aquatic vegetation, and important local-, State-, or federal-designated habitat areas.
4.1.D. **Shoreline Stabilization** — Stabilize shorelines where shoreline erosion is a pollution problem.
4.1.E. **Storm Water Runoff** — Implement runoff control strategies to remove at least 80% of suspended solids from storm water runoff coming from boat maintenance areas (some boat yards may conform to this provision through NPDES permits).
4.1.F. **Fueling Station Design** — Locate and design fueling stations to contain accidental fuel spills in a limited area; provide fuel containment equipment and spill contingency plans to ensure quick spill response.
4.1.G. **Sewage Facilities** — Install pumpout, pump station, and restroom facilities at new and expanding marinas where needed to prevent sewage discharges directly to State waters.
4.1.H. **Waste Management Facilities** — Install facilities at new and expanding marinas where needed for the proper recycling or disposal of solid wastes (e.g., oil filters, lead acid batteries, used absorbent pads, spent zinc anodes, and fish waste as applicable) and liquid materials (e.g., fuel, oil, solvents, antifreeze, and paints).

The operation and maintenance MMs for marinas and recreational boating are summarized as follows:

4.2.A. **Solid Waste Control** — Properly dispose of solid wastes produced by the operation, cleaning, maintenance, and repair of boats to limit entry of these wastes to surface waters.
4.2.B. **Fish Waste Control** — Promote sound fish waste management, where fish waste is a NPS problem, through a combination of fish cleaning restrictions, education, and proper disposal.
4.2.C. **Liquid Material Control** — Provide and maintain the appropriate storage, transfer, containment, and disposal facilities for liquid materials commonly used in boat maintenance, and encourage recycling of these materials.
4.2.D. **Petroleum Control** — Reduce the amount of fuel and oil that leaks from fuel tanks and tank air vents during the refueling and operation of boats.
4.2.E. **Boat Cleaning and Maintenance** — Minimize the use of potentially harmful hull cleaners and bottom paints, and prohibit discharges of these substances to State waters.
4.2.F. **Maintenance of Sewage Facilities** — Maintain pumpout facilities in operational condition, and encourage their use so as to prevent and control untreated sewage discharges to surface waters.

4.2.G. **Boat Operation** — Prevent turbidity and physical destruction of shallow-water habitat resulting from boat wakes and propwash.

The education/outreach MM for marinas and recreational boating is summarized as follows:

4.3A **Public Education** — Institute public education, outreach, and training programs to prevent and control improper disposal of pollutants into State waters.

4.0 MARINAS AND RECREATIONAL BOATING

IMPLEMENTATION AUTHORITIES

Marina and Recreational Boating Management Measures

4.1. **Assessment, Siting and Design**
- A. Water Quality Assessment
- B. Marina Flushing
- C. Habitat Assessment
- D. Shoreline Stabilization
- E. Storm Water Runoff
- F. Fueling Station Design
- G. Sewage Facilities
- H. Waste Management Facilities

4.2. **Operation and Maintenance**
- A. Solid Waste Control
- B. Fish Waste Control
- C. Liquid Material Control
- D. Petroleum Control
- E. Boat Cleaning and Maintenance
- F. Maintenance of Sewage Facilities
- G. Boat Operation

4.3. **Education/Outreach**
- A. Public Education/Outreach

Marinas and Recreational Boating Management Measure 4.1A — Water Quality Assessment

Part (1): Assess water quality as a part of the siting and design of new and expanding marinas to establish baseline water quality conditions or trends.
Part (2): Assess water quality at existing marinas to establish baseline water quality conditions.

Marinas and Recreational Boating Management Measure 4.1B — Marina Flushing

Site and design new and expanding marinas such that tides and/or currents will aid in flushing of the site or renew its water regularly.

Marinas and Recreational Boating Management Measure 4.1C — Habitat Assessment

Site and design new and expanding marinas to protect against adverse effects on shellfish resources, wetlands, submerged aquatic vegetation, or other important riparian and aquatic habitat areas as designated by local, State, or federal governments.

Marinas and Recreational Boating Management Measure 4.1D — Shoreline Stabilization

Where streambank or shoreline erosion is a nonpoint source pollution problem, streambanks/shorelines should be stabilized (when determining whether streambank/shoreline erosion is a NPS problem, assess natural erosion rates and the dynamic equilibrium of the streambank/shoreline). The use of vegetative stabilization methods is preferred over the use of structural stabilization methods, if appropriate considering the climate, severity of erosion, offshore bathymetry, and/or the potential adverse impact on other streambanks or shorelines and offshore areas.

Agency	Authority	Programs	Implementing Area	Notes
Various State and Local	• California Environmental Quality Act (CEQA) (PRC §§ 21000 et seq.) • CEQA Guidelines (Title 14 CCR §§ 15000 et seq.)	Environmental review of "projects" using Initial Study (Environmental Checklists), EIR, or Negative Declaration	Statewide	• Environmental Checklists help to identify potential NPS impacts. • EIR or Negative Declaration may identify mitigation measures to address potential adverse impacts.
Cities/Counties (CA contains 58 counties and approximately 468 incorporated cities.)	• PZL (Gov. Code §§ 65000 et seq.) • Subdivision Map Act (SbMA) (Gov. Code §§ 66410 et seq.) • CCA § 30500	• General Plans/GP updates • LCPs/LCP amendments • Zoning ordinances • Subdivision ordinances • Permits pursuant to above • Leases on granted tide and submerged lands • Enforcement	• Statewide • LCP policies/ ordinances apply in coastal zone • Tide- /submerged lands granted in trust to cities and counties	• Cities/counties adopt policies/ ordinances; make land-use decisions consistent with State law. • Local governments may lease granted lands for marinas and may condition leases (e.g., to address assessment, siting, and design). • Enforcement tools include: inspections; fines; infractions; misdemeanors; stop work orders; general police powers to protect public health, safety and welfare and declare, prohibit, and abate nuisances.

R0018931

CCC	• CCA (PRC §§ 30000 et seq.) • CCC Administrative Regulations (Title 14 CCR §§ 13000 et seq.) • CCMP pursuant to CZMA (16 USC §§ 1451 et seq.)	• Coastal development permits • LCP certification/ amendments • Federal consistency: review of federal actions affecting land or water uses or natural resources of the coastal zone • Enforcement	Coastal zone (includes tidelands, submerged lands, public trust lands).	• CCC certifies LCPs prepared by coastal cities/counties. • Federal projects, permits and licenses must be found consistent with the CCMP before they are implemented. • Enforcement tools include: issue cease and desist/ restoration orders; file complaint for civil penalties.
SFBCDC	• MacAteer-Petris Act (MPA) (Gov. Code §§ 66600 et seq.), including San Francisco Bay (SFB) Plan • SMPA (PRC §§ 29000 et seq.) • CCMP pursuant to CZMA (16 USC §§ 1451 et seq.)	• Designation of priority uses adjacent to SFB • Permitting: development permits and marsh development permits • Federal consistency • Enforcement	SFB (shoreline areas within 100 ft. of SFB; tidal areas and specified tributaries; Suisun Marsh)	• Enforcement and federal consistency authorities are similar to those of CCC.
DFG	FGC §§ 1 et seq. ♦ § 1600-1607	• Streambed alteration permits for grading, filling, dredging activities in State waters or stream beds	Statewide: State waters or stream beds	• FGC focuses on problems including control of erosion and sedimentation (e.g., from grading, construction sites, golf courses, road cuts, etc.).
SLC	• PRC §§ 6000 et seq. (includes lease authority)	• SLC leases (PRC §6501.1 • Marina Leasing Program •	• Ungranted State sovereign lands •	• May condition leases for lands owned by the State which are under the jurisdiction of the SLC for such purposes as the SLC deems advisable, including, but not limited to, commercial, industrial, and recreational purposes. •

DBW	• HNC §§ 1 et seq. • FCVA	• (HWRF • CVAP • Other Financial, Technical Assistance, and Educational Programs	• SPS, SWP reservoirs and on other State lands. • Assists local governments Statewide.	• Authorized uses of HWRF loans related to implementing this MM are installation of receptacles for separating, reusing, or recycling solid waste materials.
CIWMB (relates to Solid Waste MM, not Fish Waste MM)	• PRC §§ 40400-49620, including CIWMA • CCR Title 14, Div. 7 and Title 27, Div. 2	• Diversion, Planning, and Local Assistance • HHW Grants	• Statewide	• Assists local governments in complying with CIWMA (to divert 50% of waste from landfills by the year 2000). • Provides model planning documents, workbooks, etc. on waste prevention, reduction, reuse, recycling, and safe disposal of HHWs. • Awards grants to implement programs that emphasize HHW waste source reduction or HHW reuse/recycling.
State/local/federal agency participation in MBNMS	• MPRSA (16 USC § 1431 et seq.)	MBNMS WQPP Action Plan for Marinas	MBNMS	The MBNMS WQPP is a collaborative effort of federal, State and local agencies and public and private groups to address NPS pollution in the region's watersheds. An MOA has been signed by: NOAA; USEPA, Region 9; Cal/EPA; SWRCB; RWQCB 2 (SFB); RWQCB 3 (Central Coast); CCC; and AMBAG.

R0018945

Marinas and Recreational Boating Management Measure 4.2C — Liquid Material Control
Provide and maintain appropriate storage, transfer, containment, and disposal facilities for liquid material—such as fuel, oil, solvents, antifreeze, and paints—and encourage recycling of these materials to the fullest extent possible.

Marinas and Recreational Boating Management Measure 4.2D — Petroleum Control
Reduce the amount of fuel and oil from boat bilges and fuel tank air vents entering marina and surface waters.

Agency	Authority	Programs	Implementing Area	Notes
Various State and Local	• CEQA (PRC §§ 21000 et seq.) • CEQA Guidelines (Title 14 CCR §§ 15000 et seq.)	Environmental review of "projects" using Initial Study (Environmental Checklists), EIR, or Negative Declaration	Statewide	• Environmental Checklists help to identify potential NPS impacts. • EIR or Negative Declaration may identify mitigation measures to address potential adverse impacts.
Cities/Counties (CA contains 58 counties and approximately 468 incorporated cities.)	• PZL (Gov. Code §§ 65000 et seq.) • SbMA (Gov. Code §§ 66410 et seq.) • CCA § 30500	• General Plans/GP updates • LCPs/LCP amendments • Zoning ordinances • Subdivision ordinances • Permits pursuant to above • Leases on granted tide and submerged lands • Enforcement	• Statewide • LCP policies/ ordinances apply in coastal zone • Tide- /submerged lands granted in trust to cities and counties	• Cities/counties adopt policies/ ordinances; make land-use decisions consistent with State law. • Local governments may lease granted lands for marinas and may condition leases (e.g., to address assessment, siting, and design). • Enforcement tools include: inspections; fines; infractions; misdemeanors; stop work orders; general police powers to protect public health, safety and welfare and declare, prohibit, and abate nuisances.
SWRCB/ RWQCBs	• CWA (33 USC § 1251 et seq.) • PCWQCA (WC §§ 13000 et seq.)	• SWDP (CWA § 402) GMSWPs • TMDL Program [pursuant to CWA § 303(d)]	SWDP applies to: • cities >100,000 pop. (Phase I) • cities of 50,000 - 100,000 pop. (Phase II) TMDL programs apply in CWA § 303(d)-listed watersheds.	NPDES Permits (Phase I): • large/medium municipalities separate storm sewer systems NPDES Permits (Phase II): • smaller municipalities TMDL goals include: identify pollution sources in watersheds; allocate pollution control responsibilities where water quality goals are not met.

CCC	• CCA (PRC §§ 30000 et seq.) • CCC Administrative Regulations (Title 14 CCR §§ 13000 et seq.) • CCMP pursuant to CZMA (16 USC §§ 1451 et seq.) • OSPRA (Gov. Code §§ 8670.28 et seq.)	• Coastal development permits • LCP certification/ amendments • Federal consistency: review of federal actions affecting land or water uses or natural resources of the coastal zone • CCC/SFBCDC JOSP • Enforcement	Coastal zone (includes tidelands, submerged lands, public trust lands).	• CCC certifies LCPs prepared by coastal cities/counties. • Federal projects, permits and licenses must be found consistent with the CCMP before they are implemented. • Enforcement tools include: issue cease and desist/ restoration orders; file complaint for civil penalties.
SFBCDC	• MPA (Gov. Code §§ 66600 et seq.), including SFB Plan • SMPA (PRC §§ 29000 et seq.) • CCMP pursuant to CZMA (16 USC §§ 1451 et seq.) • OSPRA (Gov. Code §§ 8670.28 et seq.)	• Designation of priority uses adjacent to SFB • Permitting: development permits and marsh development permits • Federal consistency • CCC/SFBCDC JOSP • Enforcement	SFB (shoreline areas within 100 ft. of SFB; tidal areas and specified tributaries; Suisun Marsh)	• Enforcement and federal consistency authorities are similar to those of CCC.
DBW	• HNC §§ 1 et seq.	•		• It is a misdemeanor for any person to discharge oil (including fuel oil, oil sludge, and oil refuse) by any methods, means, or manner, into or upon the navigable waters of the State from any vessel (HNC § 133). • Any person that intentionally or negligently causes or permits any oil to be deposited in State waters is liable for civil penalties and cleanup costs (HNC § 151). • It is unlawful to transfer petroleum, chemicals, other hazardous substances between shore and a vessel unless the flow is continuously monitored as specified [HNC § 135(a)]. This section does not apply to: (a) fuel transfers to any self-propelled vessel < 65 feet in length, if the fueling facility is equipped with dispensing nozzles of the automatic shut-off type that do not have catch-locks and meet all federal standards;

R0018947

				(b) onshore tanks if appropriate containment or diversionary structures, or both, or other equipment that is adequate to prevent the overflowed substance from reaching State waters.
OSPR	• OSPRA (Gov. Code §§ 8670.28 et seq.); • PRC Div. 7.8; • Title 14 CCR §§ 815.01 et seq.; • OPA.	• Contingency Planning • Enforcement and Inspection	Statewide	• OSPR is lead State agency for oil spill prevention and response (responsibility shared with 22 agencies represented on SIOSC) • OSPR requires spill contingency plans for all marine facilities with potential discharge into the marine waters of the State. • OSPR enforces laws designed to prevent spills, responds to spills, and investigates spills. • OSPR/DFG wardens conduct spill investigations, gather and prepare evidence, and enforce the criminal statutes contained in the OSPRA (e.g., civil/criminal penalties for OSPRA violations).
DPR	•	•	SPS	DPR operates and maintains units of the SPS that have boating-related activities.
DTSC	• HSC, Div. 20 §§ 25100 et seq. • HSC, Div. 38 §§ 58000 et seq.	• Hazardous Waste Facilities Permits	• Statewide	Regulates hazardous material transport, treatment, storage, and disposal; issues permits to operate to any person who stores, treats, or disposes of hazardous waste. Programs also encourage recycling of certain hazardous materials (e.g., used oil, spent batteries, etc.).
SLC	• PRC §§ 6000 et seq. (includes lease authority)	• SLC leases (PRC §6501.1) • Marina Leasing Program	• Ungranted State sovereing lands	General lease provisions require lessees to be fully responsible for any hazardous wastes generated in the lease area and to comply with all applicable provisions of federal, State, and local law, regulation or ordinance dealing with such wastes or materials.

R0018958

Marinas and Recreational Boating Management Measure 4.2G — Boat Operation
Restrict boating activities where necessary to decrease turbidity and physical destruction of shallow-water habitat.

Agency	Authority	Programs	Implementing Area	Notes
Cities/Counties (CA contains 58 counties and approximately 468 incorporated cities.)	• PZL (Gov. Code §§ 65000 et seq.) • SbMA (Gov. Code §§ 66410 et seq.) • CCA § 30500	• General Plans/GP updates • LCPs/LCP amendments • Zoning ordinances • Subdivision ordinances • Permits pursuant to above • Leases on granted tide and submerged lands • Enforcement	• Statewide • LCP policies/ ordinances apply in coastal zone • Tide-submerged lands granted in trust to cities and counties	• Cities/counties can adopt policies/ ordinances, and can condition leases for marinas on granted lands, to address boat operations at marinas. • Enforcement tools include: inspections; fines; infractions; misdemeanors; general police powers to protect public health, safety and welfare and declare, prohibit, and abate nuisances.
DPR	•	•	SPS	DPR operates and maintains units of the SPS that have boating-related activities.
The following BACKUP AUTHORITIES pertain to Marina Management Measures 4.2G				
DBW	• HNC §§ 1 et seq.		Statewide	DBW promotes boating safety and education as part of its mission to ensure that boating is as safe as possible. The agency sponsors boating law enforcement to ensure that California boating laws are enforced uniformly throughout the State, and provides supplemental State funding to local governments for marine patrols.

Marinas and Recreational Boating Management Measure 4.3A — Public Education/Outreach
Implement educational programs to provide greater understanding of watersheds, and to raise awareness and increase the use of applicable marina and boating management measures and practices where needed to control and prevent adverse impacts to ground and surface water. Public education, outreach, and training programs should involve applicable user groups and the community (e.g., boaters, boating groups, marina owners and operators, boat maintenance facility operators, waterfront agencies, service providers, live-aboards, environmental community and other related groups). [Refer to the Marinas and Recreational Boating Management Measures 4.1 – 4.2 listed in this document.]

Efforts that pertain to Management Measure 4.3A — Education/Outreach: Public Education

Agency	Authorities (•) and Programs (♦)	Implementing Area	Notes
Local Governments (Cities and Counties)	Many programs, including the following: ♦ SFB/Southern CA NPDES stormwater programs (education/outreach efforts to reduce pollution from litter and improper disposal into storm drains). ♦ HHW collection facilities (includes education, waste disposal, facility inspection).	Varies Statewide	• Many local governments maintain planning, community liaison or public education/information staff to organize special projects (e.g., management practice handbooks). • Many local harbor departments/harbor patrols maintain harbor facilities, coordinate federal dredging activities, administer tidelands lease sites, and provide boater assistance and emergency response, including water safety, education, and school and community outreach programs.
CCC	• CCA (PRC §§ 30000 et seq.) ♦ Conservation Education Program (PRC§ 30012) ♦ Boater Education Program ♦ *Boating and Clean Green Campaign (BCGC)* ♦ Coastal Cleanup Day ♦ Adopt-A-Beach program ♦ Save Our Seas curriculum	• Coastal zone/ Statewide (e.g., throughout the San Francisco Bay/Delta, Los Angeles County, Orange County, San Diego County, and other areas).	• CCC programs promote conservation awareness, recycling, and litter abatement efforts through community involvement and environmental education efforts/materials. • *BCGC* is a Statewide campaign intended to: (1) facilitate installation of new services at marinas to help boaters prevent emissions of oil and other pollutants into State waters; and (2) educate boaters to use these services and other practices that reduce the pollution associated with boating. *BCGC* staff have: (1) researched practices and awareness of boaters related to managing used oil and preventing oil/fuel discharges; (2) presented boater used oil management and spill prevention strategies to local government and marina operators; (3) developed "boater kits" containing bilge pads, environmental/safety information for boaters, etc.; and (4) helped hand out boater kits from the SF Baykeeper's "green" boat (a natural gas-powered boat maintained/retrofitted using environmentally sound products/equipment).

CIWMB	• CIWMA (PRC §§ 40400-49620), including CIWMA • CCR Title 14, Div. 7 and Title 27, Div. 2 ♦ Diversion, Planning, and Local Assistance ♦ HHW Grants and Used Oil Grants ♦ Used Oil Certification ♦ Waste Reduction Program	Statewide at local level	• Helps local governments in CIWMA compliance (to divert 50% of waste from landfills by year 2000). • Provides model planning documents, workbooks, etc. on waste prevention, reduction, reuse, recycling, and safe disposal of used oil and HHWs. • Awards used oil grants and grants to implement programs that emphasize HHW waste/source reduction and HHW reuse/recycling. • Provides incentives to centers that provide a convenient location for "do-it-yourselfers" to bring used oil for proper disposal or re-refining.
DBW	• HNC §§ 1 et seq. • FCVA ♦ HWRF ♦ Clean Vessel Act Pumpout Grant Program ♦ Aquatic Safety Educational Program (AquaSMART) for K-12 students in CA public schools. ♦ Other Financial, Technical Assistance, and Educational Programs	• SPS, SWP reservoirs and on other State lands. • Assists local governments Statewide.	• DBW plans, designs, finances, and constructs State boating facilities and coordinates with local governments to develop local boating facilities. Financing includes boating facility construction loans, boat launching facility grants, marina construction loans, and capital outlay projects. • DBW provides educational materials regarding vessel pumpout locations and use and pamphlets that review State/federal marine pollution laws [e.g., the pamphlet *Shipshape Sanitation, MSDs and Pumpouts* explains laws and regulations for Marine Sanitation Devices and vessel sewage discharge, and the importance of proper disposal].
DFG-OSPR	• OSPRA (Cal. Gov. Code §§ 8670.28 et seq.); ♦ Education-Outreach Program	Statewide	Education-Outreach Program is intended to assist operators of SCRDs (waterside operations serving primarily small craft of less than 20 meters in length and less than 5 tons net weight) in spill prevention/response efforts. Certified docks must make efforts to prevent spills, and must report spills that occur to the USCG and Cal/OES. Information is provided through: (1) brochures/flyers/other materials/slide shows/ telephone contact; (2) self-determined inspections by OSPS (who can identify strengths and weaknesses in a refueling dock's system, and when appropriate show a dock operator ways to improve his/her ability to prevent and respond to spills); and (3) training.

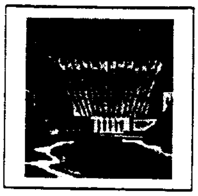
State/local/federal agency participation in CA's • **NMSs** • **NERRs** • **NEPs**	• MPRSA (16 USC § 1431 et seq.) • CZMA § 315 • CWA § 320 (33 USC § 1330) ♦ MBNMS WQPP ♦ Santa Monica Bay Restoration Project (SMBRP) ♦ San Francisco Estuary Project (SFEP)	NMSs: • Monterey Bay • Channel Islands • Cordell Bank/ Gulf of the Farallones NERRs: • Elkhorn Slough • Tijuana River NEPs: • Santa Monica Bay (SMB), SFBand Morro Bay	• See MBNMS WQPP Action Plan for Marinas • The MBNMS WQPP is a collaborative effort of federal, state, and local agencies and public and private groups to address NPS pollution in the region's watersheds. An MOA has been signed by: NOAA; USEPA, Region 9; Cal/EPA; SWRCB; RWQCB 2 (SFB); RWQCB 3 (Central Coast); CCC; and AMBAG. • The National Estuary Program (NEP) provides impetus, funding, and technical assistance for the management of nationally significant estuaries.
California Clean Boating Network (CCBN)			The CCBN (comprised of public members and CCC, SLC, DFG, DBW, NOAA, USCG, and other agency staffs) conducts public outreach, including the development and distribution to marinas and other users of the marine environment of a binder that includes exemplary education products that address pollutants associated with marina and boater activity.
DPR	Div. 1, Chapter 1.25, Div. V, PRC §5000 et seq.	SPS	DPR has an extensive educational program that includes talks, displays, curriculum development and special programs.

Hydromodification Management Measures



The SWRCB, CCC, and other State agencies have identified eight management measures (MMs) to address hydromodification sources of nonpoint pollution affecting State waters. Hydromodification includes modification of stream and river channels, dams and water impoundments, and streambank/shoreline erosion.

Channel modification activities are undertaken in rivers or streams to straighten, enlarge, deepen or relocate the channel. These activities can affect water temperature, change the natural supply of fresh water to a water body, and alter rates and paths of sediment erosion, transport, and deposition. Hardening the banks of waterways with shoreline protection or armor also accelerates the movement of surface water and pollutants from the upper reaches of watersheds into coastal waters. Channelization can also reduce the suitability of instream and streamside habitat for fish and wildlife by depriving wetlands and estuarine shorelines of enriching sediments, affecting the ability of natural systems to filter pollutants, and interrupting the life stages of aquatic organisms (USEPA, 1993).

California's MMs to address sources of nonpoint pollution related to hydromodification activities:

5.1 Channelization/Channel Modification
- A. Physical & Chemical Characteristics of Surface Waters
- B. Instream & Riparian Habitat Restoration

5.2 Dams
- A. Erosion & Sediment Control
- B. Chemical & Pollutant Control
- C. Protection of Surface Water Quality & Instream and Riparian Habitat

5.3 Streambank & Shoreline Erosion
- A. Eroding Streambanks & Shorelines

5.4 Education/Outreach
- A. Educational Programs

Dams can adversely impact hydrology and the quality of surface waters and riparian habitat in the waterways where the dams are located. A variety of impacts can result from the siting, construction, and operation of these facilities. For example, improper siting of dams can inundate both upstream and downstream areas of a waterway. Dams reduce downstream flows, thus depriving wetlands and riparian areas of water. During dam construction, removal of vegetation and disturbance of underlying sediments can increase turbidity and cause excessive sedimentation in the waterway.
The erosion of shorelines and streambanks is a natural process that can have either beneficial or adverse impacts on riparian habitat. Excessively high sediment loads resulting from erosion can smother submerged aquatic vegetation, cover shellfish beds and tidal flats, fill in riffle pools, and contribute to increased levels of turbidity and nutrients.

Management Measures:

Channelization/Channel Modification. California's management measures for channelization and channel modification promote the evaluation of channelization and channel modification projects. Channels should be evaluated as a part of the watershed planning and design processes, including watershed changes from new development in urban areas, agricultural drainage, or forest clearing. The purpose of the evaluation is to determine whether resulting NPS changes to surface water quality or instream and riparian habitat can be expected and whether these changes will be good or bad. Existing channelization and channel modification projects can be evaluated

R0018963

to determine the NPS impacts and benefits associated with the projects. Modifications to existing projects, including operation and maintenance or management, can also be evaluated to determine the possibility of improving some or all of the impacts without changing the existing benefits or creating additional problems. In both new and existing channelization and channel modification projects, evaluation of benefits and/or problems will be site-specific.

Dams. The second category of management measures address NPS pollution associated with dams. Dams are defined as constructed impoundments that are either (1) 25 feet or more in height *and* greater than 15 acre-feet in capacity, or (2) 6 feet or more in height *and* greater than 50 acre-feet in capacity. MMs 5.2A and 5.2B address two problems associated with dam construction: (1) increases in sediment delivery downstream resulting from construction and operation activities and (2) spillage of chemicals and other pollutants to the waterway during construction and operation. MM 5.2C addresses the impacts of reservoir releases on the quality of surface waters and instream and riparian habitat in downstream.

Streambank and Shoreline Erosion. The third category of hydromodification measures addresses the stabilization of eroding streambanks and shorelines in areas where streambank and shoreline erosion creates a polluted runoff problem. Bioengineering methods such as marsh creation and vegetative bank stabilization are preferred. Streambank and shoreline features that have the potential to reduce polluted runoff shall be protected from impacts, including erosion and sedimentation resulting from uses of uplands or adjacent surface waters. This MM does not imply that all shoreline and streambank erosion must be controlled; the measure applies to eroding shorelines and streambanks that constitute an NPS problem in surface waters.

Education/Outreach. MM 5.4A focuses on the development and implementation of pollution prevention and education programs for agency staffs and the public, as well as the promotion of assistance tools that emphasize restoration and low-impact development. Education, technical assistance, incentives, and other means can be used to promote projects that reduce NPS pollutants, which retain or re-establish natural hydrologic functions (e.g., channel restoration projects and low-impact development projects), and/or which prevent and restore adverse effects of hydromodification activities.

5. HYDROMODIFICATION

IMPLEMENTATION AUTHORITIES

5.1 **Channelization and Channel Modification**

A. Physical and Chemical Characteristics of Surface Waters

B. Instream and Riparian Habitat Restoration

5.2 **Dams**

A. Erosion and Sediment Control

B. Chemical and Pollutant Control

C. Protection of Surface Water Quality and Instream and Riparian Habitat

5.3 **Streambank and Shoreline Erosion**

A. Eroding Streambanks and Shorelines

5.4 **Education/Outreach**

A. Educational Programs

Hydromodification Management Measure 5.1A — Physical and Chemical Characteristics of Surface Waters

1. Evaluate the potential effects of proposed channelization and channel modification on the physical and chemical characteristics of surface waters;
2. Plan and design channelization and channel modification to reduce undesirable impacts;
3. Develop an operation and maintenance program for existing modified channels that includes identification and implementation of opportunities to improve physical and chemical characteristics of surface waters in those channels.

Hydromodification Management Measure 5.1B — Instream and Riparian Habitat Restoration

1. Evaluate the potential effects of proposed channelization and channel modification on instream and riparian habitat;
2. Plan and design channelization and channel modification to reduce undesirable impacts;
3. Develop an operation and maintenance program with specific timetables for existing modified channels that includes identification of opportunities to restore instream and riparian habitat in those channels.

Hydromodification Management Measure 5.3A — Eroding Streambanks and Shorelines

1. Where streambank or shoreline erosion is a NPS problem, streambanks and shorelines should be stabilized. The use of vegetative stabilization methods is strongly preferred over the use of structural stabilization methods, if appropriate considering the climate, severity of wave and wind erosion, offshore bathymetry, and the potential adverse impact on other streambanks, shorelines and offshore areas.
2. Protect streambank and shoreline features with the potential to reduce NPS pollution.
3. Protect streambanks and shorelines from erosion due to uses of either the shorelands or adjacent surface waters.

R0018970

Hydromodification Management Measure 5.2A — Dams: Erosion and Sediment Control

1. Reduce erosion and, to the extent practicable, retain sediment onsite during and after construction, and
2. Prior to land disturbance, prepare and implement an approved erosion and sediment control plan or similar administrative document that contains erosion and sediment control provisions.

Hydromodification Management Measure 5.2B — Dams: Chemical and Pollutant Control

1. Limit application, generation, and migration of toxic substances;
2. Ensure the proper storage and disposal of toxic materials; and
3. Apply nutrients at rates necessary to establish and maintain vegetation without causing significant nutrient runoff to surface waters.

Hydromodification Management Measure 5.2C — Dams: Protection of Surface Water Quality and Instream and Riparian Habitat

Develop and implement a program to manage the operation of dams in coastal areas that includes an assessment of:

1. Surface water quality and instream and riparian habitat and potential for improvement and
2. Significant nonpoint source pollution problems that result from excessive surface water withdrawals.

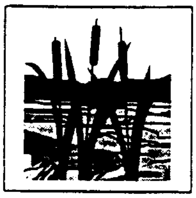
R0018973

Wetlands, Riparian Areas, & Vegetated Treatment Systems Management Measures



The SWRCB, CCC, and other State agencies have identified four management measures (MMs) to promote the protection and restoration of wetlands and riparian areas and the use of vegetated treatment systems as means to control nonpoint sources of pollution. Wetlands and riparian areas reduce polluted runoff by filtering out runoff-related contaminants such as sediment, nitrogen and phosphorus; thus maintaining the water quality benefits of these areas is important. These areas also help to attenuate flows from higher-than-average storm events. This protects downstream areas from adverse impacts such as channel scour, erosion and temperature and chemical fluctuations. Changes in hydrology, substrate, geochemistry, or species composition can impair the ability of wetland or riparian areas to filter out excess sediment and nutrients, and so can result in deteriorated water quality. The following activities can cause such impairment: drainage of wetlands for cropland, overgrazing, hydromodification, highway construction, deposition of dredged material, and excavation for ports and marinas.

California's MMs to protect and restore wetlands and riparian areas and use vegetated treatment systems as means to control pollution from nonpoint sources:

6A. Protection of Wetlands & Riparian Areas

6B. Restoration of Wetlands & Riparian Areas

6C. Vegetated Treatment Systems

6D. Education/Outreach

Management Measures:

Wetlands/Riparian Areas Protection. Implementation of MM 6A is intended to protect the existing water quality improvement functions of wetlands and riparian areas as a component of NPS programs.

Wetlands/Riparian Areas Restoration. Restoration of wetlands and riparian areas (MM 6B) refers to the recovery of a range of functions that existed previously by reestablishing hydrology, vegetation, and structure characteristics. Damaged or destroyed wetland and riparian areas should be restored where restoration of such systems will significantly abate polluted runoff.

Vegetated Treatment Systems. MM 6C promotes the installation of vegetated treatment systems (e.g., artificial or constructed wetlands) in areas where these systems will serve a polluted runoff-abatement function. Vegetated filter strips and engineered wetlands remove sediment and other pollutants from runoff and wastewater, and prevent pollutants from entering adjacent waterbodies. Removal typically occurs through filtration, deposition, infiltration, absorption, adsorption, decomposition and volatilization.

Education/Outreach. MM 6D promotes the establishment of programs to develop and disseminate scientific information on wetlands and riparian areas and to develop greater public and agency staff understanding of natural hydrologic systems—including their functions and values, how they are lost, and the choices associated with their protection and restoration.

6.0 WETLANDS, RIPARIAN AREAS, AND VEGETATED TREATMENT SYSTEMS

IMPLEMENTATION AUTHORITIES

Management Measures

6A. Protection of Wetlands and Riparian Areas

6B. Restoration of Wetlands and Riparian Areas

6C. Vegetated Treatment Systems

6D. Education/Outreach

R0018975

Management Measure 6A — Protection of Wetlands and Riparian Areas
Protect from adverse effects wetlands and riparian areas that serve to reduce NPS pollution; maintain this function while protecting the other existing functions of these wetlands and riparian areas as measured by characteristics such as vegetative species composition, diversity, and cover, hydrology and quality of surface water and ground water, geochemistry of the substrate, and fauna species composition, diversity, and abundance.

Management Measure 6B — Restoration of Wetlands and Riparian Areas
Promote the restoration of the pre-existing functions in damaged and destroyed wetlands and riparian systems in areas where the systems will serve to reduce NPS pollution.

Management Measure 6C — Vegetated Treatment Systems
Promote the use of engineered vegetated treatment systems such as constructed wetlands or vegetated filter strips where these systems will serve to reduce NPS pollution.

Agency	Authority	Programs	Implementing Area	Notes
Various State and Local	• CEQA (PRC §§ 21000 et seq.) • CEQA Guidelines (Title 14 CCR §§ 15000 et seq.)	Environmental review of "projects" using Initial Study (Environmental Checklists), EIR, or Negative Declaration	Statewide	• Environmental Checklists help to identify potential NPS impacts. • EIR or Negative Declaration may identify mitigation measures to protect/ restore wetlands or use vegetated treatment systems.
Cities/Counties (CA contains 58 counties and approximately 468 incorporated cities.)	• PZL (Gov. Code §§ 65000 et seq.) • SbMA (Gov. Code §§ 66410 et seq.) • CCA § 30500	• General Plans/GP updates • LCPs/LCP amendments • Zoning ordinances • Subdivision ordinances • Permits pursuant to above • Enforcement	• Statewide • LCP policies/ ordinances apply in coastal zone	• Cities/counties adopt policies/ ordinances; make land-use decisions consistent with State law. • Enforcement tools include: inspections; fines; infractions; misdemeanors; stop work orders; and general police powers to protect public health, safety and welfare and declare, prohibit, and abate nuisances.
SWRCB/RWQCB	• CWA (33 USC § 1251 et seq.) • PCWQCA (WC §§ 13000 et seq.)	• CWA § 401 Certification Program	Statewide at local level	• Regulate impacts to wetland/riparian areas • Develop CEQA guidance • Establish interagency agreements • Develop technical assistance/guidance • Alternatives to flood management approaches
RWQCB	CEQA (PRC §§21000 to 21177)	Environmental Review	Statewide	Comments on watershed scale and project-specific impacts to riparian/wetland areas

R0018976

CCC	• CCA (PRC §§ 30000 et seq.) • CCC's Administrative Regulations (Title 14 CCR §§ 13000 et seq.) • CCMP pursuant to CZMA (16 USC §§ 1451 et seq.)	• Coastal development permits • LCP certification/ amendments • Federal consistency: review of federal actions affecting land or water uses or natural resources of the coastal zone • Enforcement	Coastal zone (includes tidelands, submerged lands, public trust lands).	• CCC certifies LCPs prepared by coastal cities/counties. • Federal projects, permits and licenses must be found consistent with the CCMP before they are implemented. • Enforcement tools include: file complaint for civil penalties; issue cease and desist orders; and issue restoration orders.
SFBCDC	• MPA (Gov. Code §§ 66600 et seq.), including SFB Plan • SMPA (PRC §§ 29000 et seq.) • CCMP pursuant to CZMA (16 USC §§ 1451 et seq.)	• Designation of priority uses adjacent to Bay • Permitting: development permits and marsh development permits • Federal consistency • Enforcement	SFB (shoreline areas within 100 ft. of SFB; tidal areas and specified tributaries; Suisun Marsh)	• Federal projects, permits and licenses must be found consistent with the CCMP, before they are implemented. • Enforcement/federal consistency authorities similar to CCC.
DFG	• FGC § 1 et seq. ♦ FGC §§ 1600-1603 ♦ California Endangered Species Act (CESA) • California Wetlands Conservation Policy, 1993 (CWCP)	• Streambed alteration permits for grading, filling, dredging activities in State waters or stream beds • MOU between DFG, DWR, Cal/RA, and SRB to implement habitat protection provisions	Statewide: State waters or stream beds (including wetlands)	• In streambed alteration agreements, DFG suggests fish and wildlife protection measures; measures accepted by project proponent become part of an enforceable agreement. • FGC focus includes control of erosion and sedimentation. • CWCP calls for no net wetlands loss and a long-term net gain in the quantity/quality/permanence of wetland acreage and values.
WCB	•	• Wetland purchase and riparian purchase/restoration programs (e.g., Riparian Habitat Conservation Program [RHCP], CVJV)	• Statewide • Central Valley	Acquires, restores, and enhances wetlands and riparian areas

R0018977

SLC	• PRC §§ 6000 et seq. (includes lease authority) • Kapiloff Land Bank Act (PRC §§8600 et seq.)	• SLC leases (PRC §6501.1) • Kapiloff Land Bank Fund	• Ungranted State sovereign lands • Statewide	• SLC may lease sovereign lands for wetlands habitat preservation and/or restoration. • As trustee of the Kapiloff Land Bank Fund, SLC acquires lands for wetlands restoration and preservation. These lands then take on the characteristics of sovereign tide and submerged lands. • Granted lands are monitored to ensure compliance with the Public Trust. • Enforcement tools include: insurance, indemnity, bonding, remediation, inspections, fines, stop work orders, termination of lease, etc
SCC	CPRC Chapter 6, Div 21	CREP	Coastal zone and coastal watersheds, statewide	• The SCC implements many projects to protect wetlands and riparian areas through acquisition of fee or less-than-fee interests in land. • SCC implements many projects that restore wetlands and riparian areas through the development of enhancement plans and undertaking efforts to alter hydrology, replant vegetation, and restore fisheries habitat. • SCC has helped on a few occasions to actually construct wetlands that serve as vegetated treatment systems to reduce NPS pollution.

The following BACKUP AUTHORITIES pertain to Urban Management Measures 6A, 6B, and 6C				
Agency	Authority	Programs	Implementing Area	Notes
SWRCB/RWQCBs	PCWQCA (WC §§ 13000 et seq.)	• WQCP (Basin Plans) • WDRs • NPSMP • WMI	Statewide	• Enforcement tools: Cleanup and Abatement Orders; Cease and Desist Orders; Administrative Civil Liability • RWQCBs have primary responsibility for individual permitting, inspection and enforcement.
DFG	FGC § 1 et seq.	• Enforcement • Reporting	Statewide	• Enforcement: DFG wardens enforce water pollution control sections of FGC (e.g., §§ 5650) • Reporting: DFG staff report chronic (sublethal, long-term) water pollution conditions to RWQCBs and cooperate in obtaining corrections or abatements to the condition.
DPR	Div. 1, Chapter 1.25, Div. V, PRC §5000 et seq.		SPS	DPR operates and maintains units of the SPS in and around wetlands.
DHS	HSC § 116275 et seq.	Drinking water source assessment and protection, drinking water sampling and analysis regulation of public drinking water systems	Watersheds associated with drinking water sources	Assessment of potential contaminating activities in watershed; self-determined protection programs by drinking water systems and communities; collection of data on contaminants in drinking water supplies for the evaluation of water quality.

Management Measure 6D — Education/Outreach
Implement educational programs to provide greater understanding of watersheds, to raise awareness and increase the use of applicable management measures and practices for wetlands and riparian areas, and to promote projects which retain or re-establish natural hydrologic functions. Public education, outreach, and training programs should involve applicable user groups and the community. [Refer to the Wetlands, Riparian Areas, and Vegetated Treatment Systems Management Measures 6A – 6C listed in this document.]

Appendix K Sample List of Best Management Practices Manuals

Appendix L References

Preface

The American Public Works Association (APWA) received funding from the United States Environmental Protection Agency (EPA) to develop a training program for local governments who will be affected by the Phase II rules developed as part of the National Pollutant Discharge Elimination System (NPDES) storm water program. The training program consisted of:

- This workbook; and
- A series of workshops conducted in the fall of 1998 and the spring of 1999.
- A live workshop, combined with satellite videoconfcrencing, presented in 21 cities on February 15, 2000.

Project Participants

APWA Environmental Programs and Government Relations staff from Washington, D.C. took the lead on this project, supported by Education Program staff from APWA's Kansas City offices.

To assist with the project, an advisory group was formed with local governmental representatives from each of the ten EPA regions around the country. These individuals, who are experts in implementing storm water management programs in their communities, committed to help design and implement an effective training program.

R. W. Beck, Inc., a national utility and engineering consulting firm, was hired to work with APWA and its advisors to create the workbook and the workshop curriculum.

Training Program Audience

The primary audience for the workbook and workshops is:

- Public Works officials from communities under 100,000 in population;
- Elected officials from those communities; and
- Agencies/Counties who may be involved in storm water program development.

Learning Objectives

The workbook and workshops are designed to help answer the following questions:

- Why is storm water management important?
- What are the requirements of the proposed regulations?
- What can you do to manage storm water more effectively? (What strategies are working? How can you determine which strategies are most applicable in your community?)
- How can you convince people that storm water management is important? (How can you educate the public, encourage community involvement, and build consensus with decision-makers and other affected parties?)
- Who should administer and oversee your storm water management program? (What institutional and organizational options are working in Phase I and Phase II communities?)
- How can you get needed funding for your storm water management program?
- Does it make sense to cooperate with your neighbors to develop a watershed approach to storm water management?

Each of the seven chapters of this workbook correspond with one of these learning objectives.

Project Approach

To develop this workbook and the workshop curriculum, R. W. Beck, Inc. conducted extensive research into storm water management practices for smaller communities. The research included the following activities:

- Literature search to find articles, manuals, workbooks, and electronic resources related to storm water management;
- Telephone interviews with communities/entities responsible for effective or innovative storm water management programs;
- Four site visits to develop more detailed documentation about storm water management programs in the selected communities/regions; and
- Discussions with industry experts, APWA staff, and the storm

Appendix A, included on the enclosed CD-ROM, includes brief fact sheets summarizing each of the telephone interviews.

Appendices C through E provide summaries of the site visits conducted as part of this project.

Appendix J contains a list of selected electronic resources that address storm water management and water quality issues. Selected Best Management Practices manuals are listed in Appendix K. Appendix L includes selected references and documents used to develop this workbook.

Feedback Exchange

To learn more about upcoming APWA workshops, find out how you can get involved in APWA's storm water advisory group, or provide feedback to APWA about this workbook, please contact:

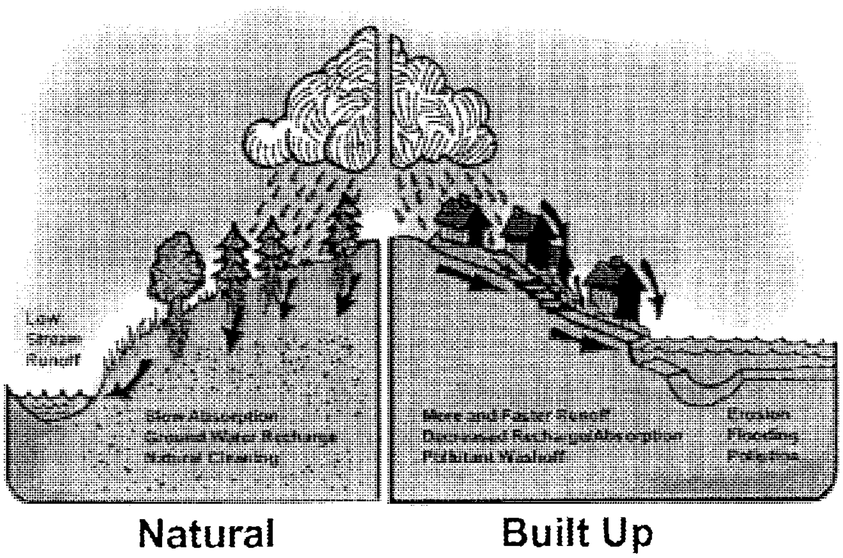
Chapter 1
Why Worry About Storm Water?



"Into every life a little rain must fall," so goes the old saying.

What the adage forgets to mention is what happens when the rainfall becomes storm water runoff.

Storm water runoff is a natural process. In the natural course of events, precipitation that falls over undeveloped land:

- Transpires or evaporates,
- Soaks into the ground to nourish plants, trees and other vegetation and to recharge aquifers, or
- Flows through natural conveyances (such as grassy channels, gullies, and ravines) to wetlands, streams, lakes, and other waterways.

As development occurs, impervious surfaces - such as streets, parking lots, and buildings - replace natural ground cover, preventing infiltration of rainfall. The result is an increase in surface runoff. The runoff carries whatever pollutants are in its path to our water bodies. In addition, when a storm event occurs, and rainfall is unusually heavy, surface water and runoff are carried quickly through conveyances, with no chance for infiltration. Heavy concentrations of pollutants may result, along with flooding of streets and waterways.

To address concerns associated with this runoff, communities and regulators have been examining storm water management strategies for decades, with particular strides toward best management practices in recent years.

This chapter describes the need for storm water management planning and policy and addresses:

- A definition of storm water;
- Reasons to be concerned about storm water management;
- Impacts of storm water quantity and quality;
- Benefits of storm water management; and
- The relationship between storm water management and other environmental programs.

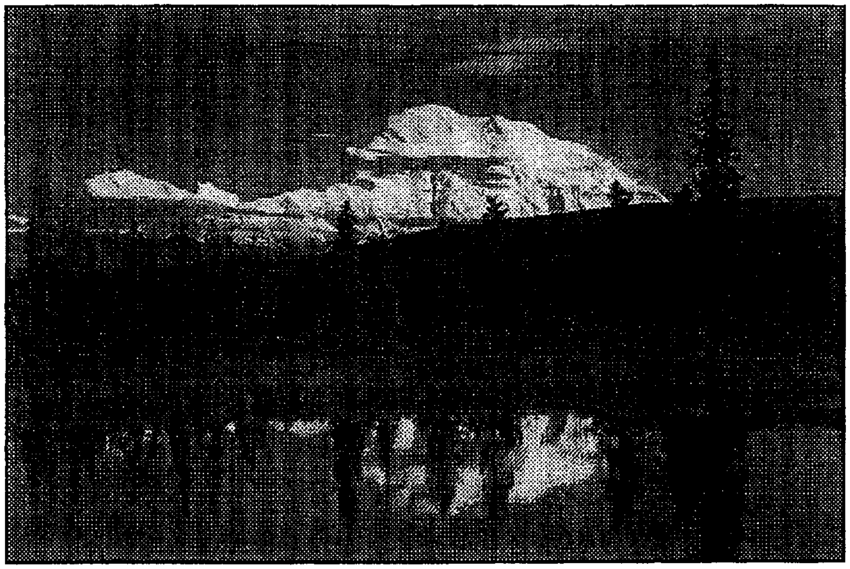
What is Storm Water?

Storm water is surface flow water from precipitation that accumulates in and flows through natural and/or man-made storage and conveyance systems during and immediately following a storm event. As storm water travels through a conveyance system, it carries pollutants to lakes, rivers, wetlands, coastal waters, and ground waters, impairing water quality. The sources of these pollutants are typically diffuse, therefore sources of pollutants carried by runoff have not historically been regulated.

Why Worry About Storm Water?

Although pollution conveyed by storm water has historically been overlooked due to the complications associated with identifying the sources of pollution, it is one of the most significant sources of pollution to our nation's waters today. Poor management of storm water can lead to impaired water bodies, degraded animal habitats, polluted drinking water, increased flooding, and hydrologic changes to streams, lakes, wetlands and rivers (such as erosion of streambeds or deposits of soil and silt in waterways, which can further alter their natural state).

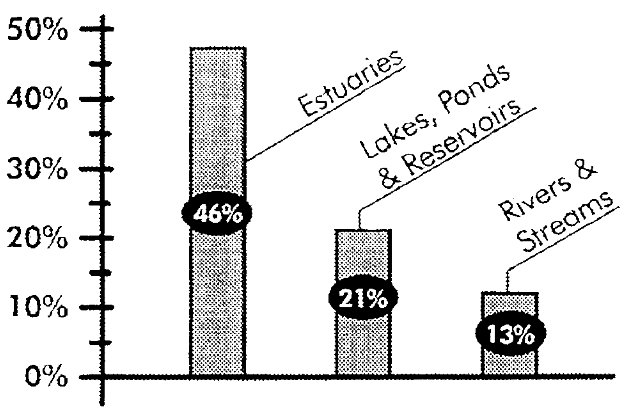
Conversely, communities that have developed aggressive storm water management programs, especially in conjunction with other environmental activities, have revitalized their surface waters, improved local quality of life, and created places where businesses and residents want to locate.



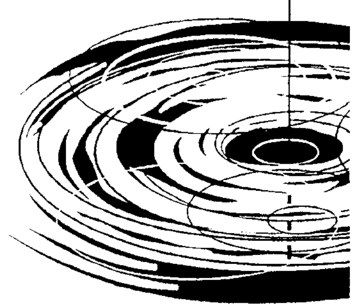
The National Picture

Several comprehensive studies have indicated that diffuse sources of pollution conveyed by storm water runoff are major contributors of water pollution in the United States. The Association of State and Interstate Water Pollution Control Administrators and the United States Environmental Protection Agency (EPA) conducted a study and published a report in 1985 entitled *America's Clean Water - The States' Nonpoint Source Assessment.* This report indicated that 38 states reported urban runoff as a major cause of impairment to their waters. Twenty-one states reported construction site runoff as a major cause of impairment. In addition, *The National Water*

Percent of Assessed U.S. Water Bodies Impaired by Urban Runoff/Storm Sewers



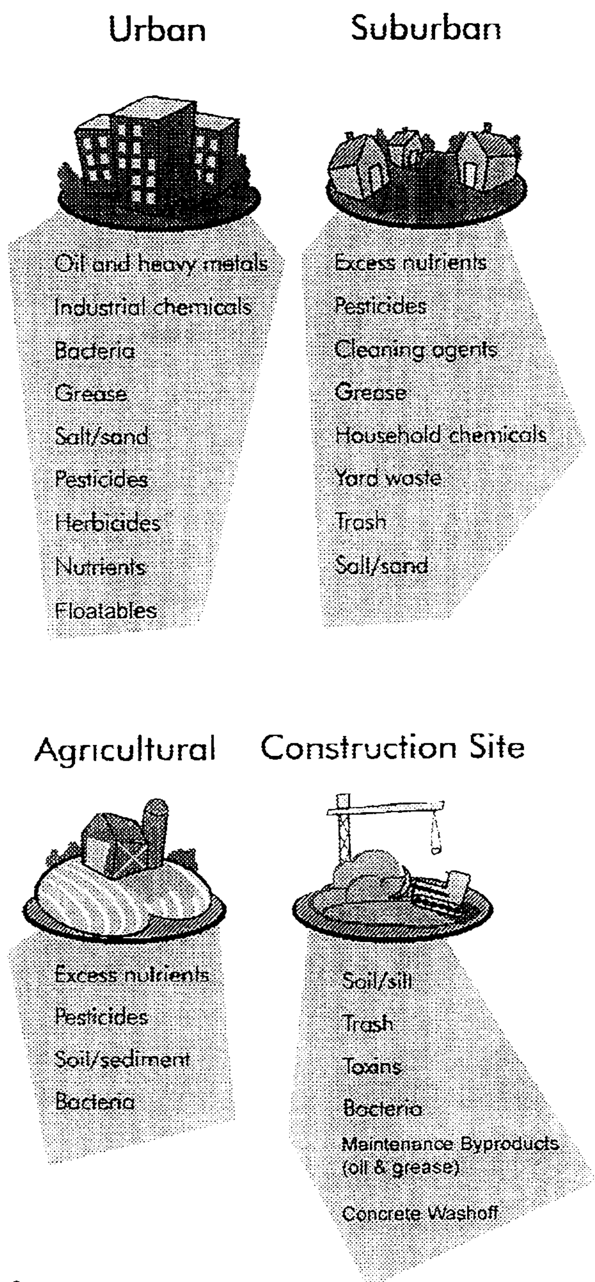
Source: EPA, 1998. *The National Water Quality Inventory, 1996 Report to Congress*, EPA 841-R-97-008



R0018994

Quality Inventory, 1996 Report to Congress reported that the leading cause of water quality impairment, on a nationwide basis, was diffuse (nonpoint) sources, carried by stormwater runoff.

Typical Pollutants Associated with Different Types of Runoff



R0018995

Storm Water Quality

The quality of storm water is important to your community because storm water conveys to rivers, streams, estuaries, bays and reservoirs. Storm water can also seep into aquifers, which are often used to supply drinking water. Pollutants in storm water, therefore, can impair drinking water, recreational waters, and animal habitats (such as waterfowl habitats, fish spawning areas, and shellfish beds). These resources are inherently valuable, but they also provide many communities with sources of economic viability.

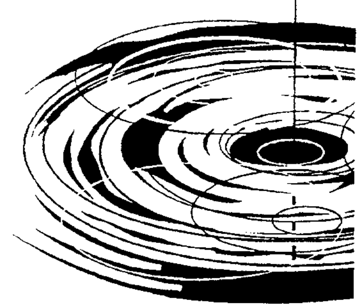
Different types of non point source runoff present distinct challenges to surface and ground water. Pollutants carried by storm water in all types of environments, however, have the potential to impair aquifers, rivers, streams, lakes, and wetlands.

Storm Water Quantity

As land is developed, the amount of impervious area increases. Storm water does not have as much soft, porous ground to sink into, therefore more runoff is introduced to your storm water conveyance system. This increase in storm water can result in the following negative impacts to your community:

- An increase in pollutants introduced to waterways;
- An increase in flooding due to overloaded storm water conveyance systems and higher surface body (lakes, ponds, rivers and resevoirs) water levels;
- A decrease in the amount of water recharged to aquifers; and
- An increase in salinity of ground water (in coastal areas) due to the lack of groundwater recharge and an imbalance in hydrostatic pressure.

Increased storm water quantity, therefore, can result not only in flooding, but also in additional pollution to water bodies due to erosion and lack of pollutant settling time, as well as a reduction in the amount and/or quality of water recharged to the aquifer.



Common Factors that Affect Storm Water Quantity or Quality

Illicit discharges to storm sewer system	• Illicit sanitary discharges result in high bacteria counts in waters • Illicit industrial/commercial discharges result in high pollutant loadings
Heavy rainfall	• Flooding due to overloaded storm sewer system • Increased pollutant loadings due to overloaded storm sewer system • Increased pollutant loadings due to increased storm water runoff
Old/poorly maintained storm sewer system	• Increased pollutants flushed into receiving water because of poor maintenance practices • Flooding due to inadequate system • Turbidity from excessive erosion
Heavy use of fertilizer in watershed	• Increased algae bloom leads to reduction in oxygen in water (eutrophication), which kills fish, leads to beach closings
Heavy use of pesticides in watershed	• Increased chemical loadings • Increased toxicity
High level of development/ urbanization	• Increased frequency and /or severity of flooding due to overloaded storm sewer system • Increased pollutant loadings due to urban activities (e.g. automobile fluids, industrial chemicals) • Increased pollutant loadings due to runoff reaching streams more quickly (lack of setting time and natural filtration) • Increased pollutant loadings due to increased erosion • Increased presence of fertilizers, herbicides, floatables, etc. • Increased presence of floatable trash (cigarette butts, styrafoam containers, etc.)
Cross connection from sanitary sewer system	• Increased pollutants loadings to receiving water

Flood Control in Griffin, Georgia

The City of Griffin, Georgia implemented a storm water management program in 1996. The impetus for their program was 150-year old, deteriorating infrastructure that was worn out, frequently clogged, and no longer serving the needs of the City's 23,000 residents. Storm events in Griffin often resulted in pipes overflowing into streets and ditches being carved through yards by the runoff. In some areas, yards, garages, and homes were flooded on a regular basis.

The City formed a storm water utility to fund the storm water management program. Griffin worked hard to make citizens and businesses aware of the need for the storm water utility through radio, television, and public forums addressing storm water issues. They also met with the local Chamber of Commerce and sent letters to the top 150 industries and the top 25 chief financial officers.

Some of the activities Griffin undertook include:

- Implemented an Adopt-A-Stream program
- Implemented an Adopt-A-Storm Drain program
- Improved drainage and conveyance systems
- Required use of extended detention ponds
- Improved storm drain maintenance
- Improved street cleaning operations
- Sought grants for public education, bioengineering research, and flood mitigation

The City of Griffin has alleviated its flood problem, improving the quality of life, health and safety of residents, and increasing local housing values by implementating a pro-active storm water management program.

What Benefits Can You Expect from Improved Storm Water Management?

Storm water management is a vital component of preserving our nation's waters and wetlands. Your community's drinking water, recreational facilities, economic resources, animal habitats, shellfish beds, fish spawning areas, river and stream beds, and roadways are being placed at risk if you do not design and implement an adequate storm water management plan.

Benefits of Storm Water Management

- Decreased flooding ➡ increased safety and reduced property damage
- Improved surface water quality ➡ potential increase in recreation/tourism

Source Control Measures — Reduce or eliminate the possibility of storm water coming into contact with a pollutant. Examples include:

- Storing chemicals properly
- Using conservation tillage
- Keeping clean rainfall away from wastes
- Timing chemical applications or logging activities based on weather forecasts or seasonal weather patterns
- Protecting natural hydrology by maintaining pervious surfaces in developing areas
- Improving street sweeping and catch basin cleaning measures
- Minimizing salt/sand application for de-icing, or using alternative materials such as clay and gravel
- Active erosion control practices for all construction sites
- Intelligent land use and management of developments

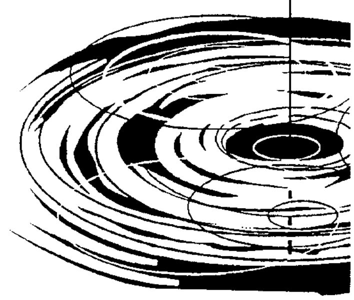
Delivery Reduction Measures — Intercept pollutants leaving the source before they are introduced to a waterway. Examples include:

- Using infiltration basins
- Using grassy swales
- Restoring wetlands
- Planting trees to absorb excess storm water
- Using grit and oil separators
- Water quality detention ponds

Storm Water Management - It's Part of Smart Environmental Programming

While "storm water management" may not immediately leap to mind as a top priority for most citizens or elected officials, clean water is an issue that almost everyone can agree on. Lack of or a poor storm water management program is a disservice to the community. You need to understand and promote the link between storm water management and other important community issues such as:

- Abundant clean drinking water
- Availability of healthy lakes, bays, and streams for fishing, swimming, recreation, and tourism
- Flood control
- Clean roadways
- Adequate animal habitats
- Existence of trees and other vegetation
- Pollution control
- Erosion control



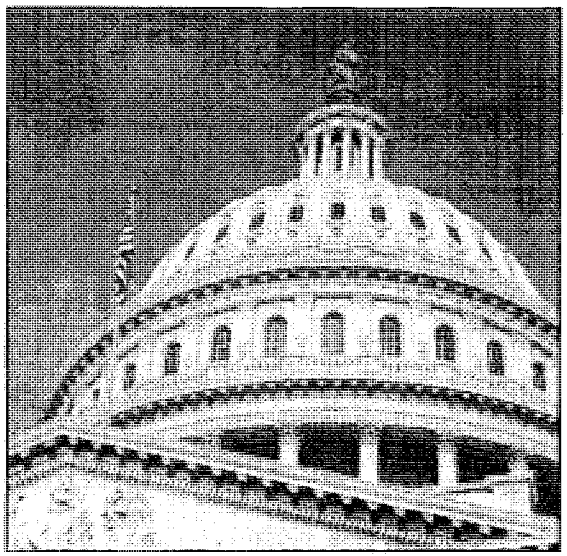
R0019000

- Smart growth, sustainability, and livability concerns
- Comprehensive master planning

Your community may already have programs underway that address these issues or may be faced with other requirements such as TMDLs that will require you to address some of these issues.

When we try to pick out anything by itself, we find it hitched to everything else in the universe. - John Muir

Chapter 2
What Are We Required To Do About Storm Water?



Developing an effective storm water management program makes sense. In addition to the practical benefits derived from storm water management programs, federal regulations govern how you manage storm water in your community.

This chapter addresses:

- An overview of federal policy and regulations for storm water management;
- The objectives of Phase II regulations;
- A discussion of EPA's role in administering the Phase II Rule, as well as the roles of state, local, and tribal governments and permitting authorities;
- A description of NPDES storm water Phase II requirements;
- A discussion of who is covered by the Phase II regulations; and
- A description of what's involved in the Phase II permitting process.

Federal Storm Water Management Policy

The federal government has finalized regulations for storm water management in smaller communities - known as the National Pollutant Discharge Elimination System (NPDES) Phase II Rule. This rule is designed to comply with the requirements of the Clean Water Act and to further protect our nation's streams, rivers and beaches from polluted storm water runoff. Phase II regulations follow the 1990 NPDES Phase I Rule, which addressed priority sources of pollutant runoff, including storm water pollution from medium and large municipal separate storm sewer systems, industrial sources, and construction sites disturbing at least five acres.

Phase II requirements grew out of a long-standing concern on the part of federal legislators for protecting surface water. To better understand these regulations, you must look at the evolution of the NPDES program.

The Clean Water Act

The Clean Water Act (CWA) is the primary federal legislation that protects surface waters, such as lakes, rivers, and coastal areas. The CWA stems from the federal Water Pollution Control Act (WPCA), which was originally enacted in 1948. This legislation employed ambient water quality standards in specifying the acceptable levels of pollution in a state's waters. This approach - stressing tolerable pollution rather than preventable causes of water pollution - proved to be an ineffective means of preventing pollution. Other problems with the WPCA included awkwardly shared federal and state responsibility for promulgating the standards and cumbersome enforcement procedures.

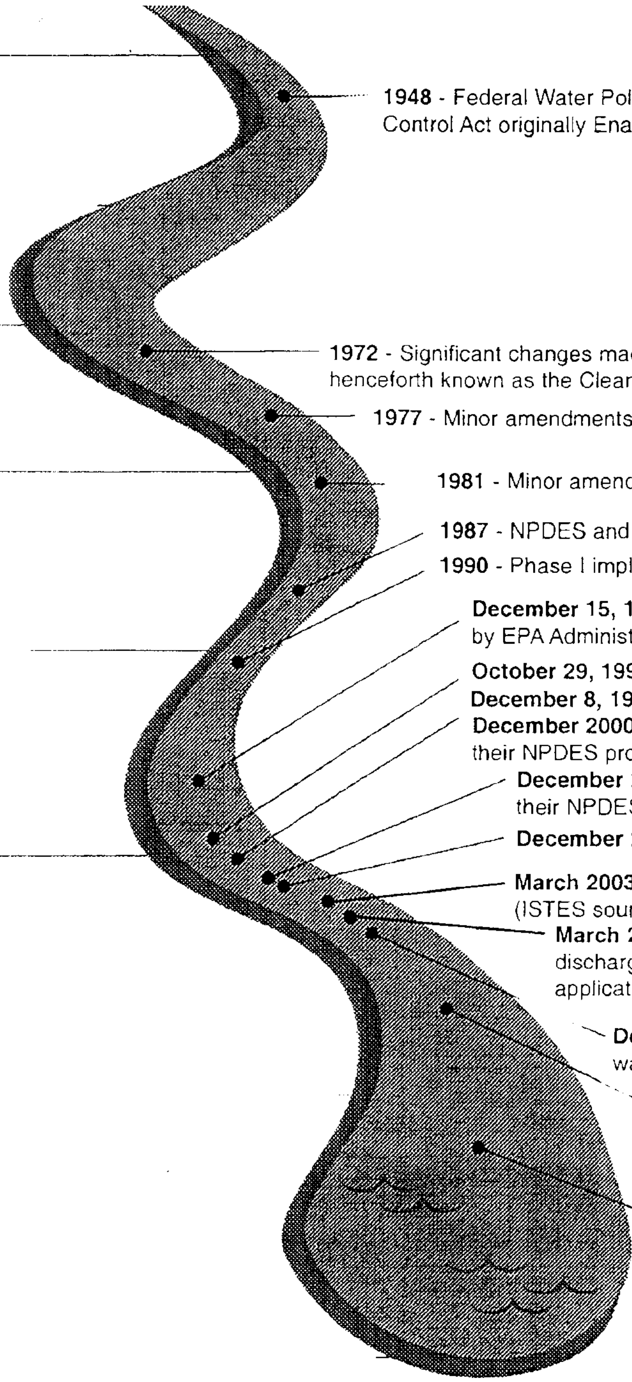
The CWA was developed in 1972 to strengthen and expand the WPCA. The CWA took a different approach to addressing water pollution. The amendments focused on establishing effluent limitations on point sources, or "any discernible, confined and discrete conveyance... from which pollutants are or may be discharged" (P.L. 92-500). Increased accountability for protecting water quality was placed on dischargers of pollutants. The amendments also required states and tribes to survey their waters and determine an appropriate use for each, then set specific water quality criteria for various pollutants to protect those uses. Another addition to the 1972 CWA was the provision of certain funding mechanisms to help communities meet their clean water goals.

The 1972 CWA also introduced the National Pollutant Discharge Elimination System (NPDES).

NPDES (Section 402)

The NPDES program was established as the fundamental regulatory mechanism of the CWA. The NPDES program requires anyone discharging a pollutant from a point source into the waters

Federal Storm Water Management Policy Timeline



1940

1950

1948 - Federal Water Pollution Control Act originally Enacted

1960

1970

1972 - Significant changes made to FWPCA henceforth known as the Clean Water Act

1977 - Minor amendments made to the CWA

1980

1981 - Minor amendments made to the CWA

1987 - NPDES and nonpoint source programs established

1990 - Phase I implementation

1990

December 15, 1997 - Proposed Phase II rule signed by EPA Administrator

October 29, 1999 - Final Phase II rule signed by EPA

December 8, 1999 - Final Phase II rule published in Federal Register

December 2000 - NPDES-authorized states must modify their NPDES program if no statutory change is required

December 2001 - NPDES-authorized states must modify their NPDES program if no statutory change is required

2000

December 2002 - Permitting authority designates small MS4s

March 2003 - Municipal industrial NPDES application due (ISTES sources)

March 2003 - regulated small MS4s and storm water discharges associated with other activity submit permit application (or 3 yrs and 90 days after final regulations issued)

December 2004 - Permitting authority with storm water watershed plans designates small MS4s

2010

2008 - Regulated small MS4s programs developed and implemented (or five years after permit issuance)

December 2012 - Reevaluation of the Phase II rule by EPA

2020

Every 5 Years - Submission of No Exposure Certification of the United States to obtain an NPDES permit. The initial focus was on industrial and municipal wastewater. Controlling these targeted point sources has substantially improved water quality.

However, several studies have shown that pollution from diffuse (nonpoint) sources - such as storm water runoff from urban and agricultural areas, construction sites, land disposal, and resource extraction (mining) - are now the leading cause of water quality impairment. Although storm water runoff originates from diffuse sources, it is often discharged through separate storm sewers or other conveyances, which are regulated under the CWA.

The 1987 amendments to the CWA, therefore, added Section 402(p), which required the EPA to develop a comprehensive phased program to regulate storm water discharges under the NPDES program. This task promised to be challenging because storm water originates from so many separate, undiscernable sources, and there were not yet proven control techniques to mitigate storm water pollution.

The Phase I rule was issued in November 1990. The rule addressed storm water discharges from medium and large municipal separate storm sewer systems(MS4s)(those serving communities with a population of at least 100,000), as well as storm water discharges associated with industrial activity.

The Phase II proposed rule was signed by the EPA Administrator on December 15, 1997. Final Phase II regulations, which effect smaller communities, were signed October 29, 1999.

NPDES permitting authorities must modify their existing NPDES permits by December 2000, if statutory changes are not required, or by December 2001 if statutory changes are required. Regulated small MS4s and storm water discharges associated with other activities need to submit their permit applications by March 2003 (or 3 years and 90 days after final regulations are issued). Regulated small MS4 programs should be developed and implemented by 2008, or five years after permit issuance.

Appendix G includes a copy of the Phase II Rule. Appendix H presents a brief summary of other federal regulations that affect storm water management.

What are the Objectives of Phase II Regulations?

The United States Environmental Protection Agency's (EPA's) objectives in developing the Phase II regulations include:

- Provide a comprehensive storm water program that designates and controls additional sources of storm water discharges to protect water quality, pursuant to CWA Section 402 (p)(6).

Major Differences Between Phase I and Phase II

	Phase I	Phase II
Who Is Covered	• Large MS4s (serving a population of 250,000 or more) • Medium MS4s (serving a population of 100,000 to 250,000) • Construction activities disturbing five or more acres • Industries (specified by SIC code)	• Small MS4s (serving a population of less than 100,000 and located in an urbanized area or designated by the permitting authority) • Construction activities disturbing between one and five acres • Industrial sources designated by the permitting authority • ISTEA sources (including municipally owned/operated industrial facilities)
Monitoring	• Mandatory ongoing monitoring required of medium and large MS4s	• NPDES permitting authorities establish small MS4 monitoring requirements
Application Requirements	• Very specific, detailed application requirements. • Application requirements don't lend themselves to general permits	• Streamlined application requirements • General permits encouraged; application requirements lend themselves to this approach
Program Requirements	• Specific activities required • Municipalities must address commercial and industrial dischargers in the community	• More broad – municipalities can develop own BMPs to address minimum control measures • Municipalities do not necessarily have to address industrial dischargers

- Address discharges of storm water activities not addressed by Phase I, including:
    - Construction activities disturbing less than five acres;
    - "Light" industrial activities not exposed to storm water;
    - "MS4s located in urbanized areas not covered under Phase I; and
    - Municipally owned industrial facilities that were addressed under Phase I but granted an extension under ISTEA (Intermodal Surface Transportation Efficiency Act).
- Facilitate and promote watershed planning as a framework for implementing water quality programs wherever possible.

EPA aims to achieve these objectives by balancing nationwide automatic designation and locally based designation. EPA will designate on a nationwide basis:

- Storm water discharges from small MS4s located in urbanized areas; and
- Construction activities that result in land disturbance equal to or greater than one acre.

EPA believes that this designation criteria addresses the main sources of storm water pollution causing significant degradation of surface waters. Permitting authorities may designate additional small MS4s, categories, or individual sources of storm water discharges that are problematic in specific communities.

What is EPA's Role in Implementing Phase II?

EPA's role in Phase II implementation includes provision of a flexible regulatory framework; development of tools to help the regulated community; provision of permits; and oversight of state programs.

Provide Flexible Regulatory Framework

EPA's approach is to provide a regulatory framework that ensures that permits issued to municipalities include the minimum control measures, while providing the NPDES permitting authorities with a significant amount of flexibility so that they can be sensitive to regional issues. Some of the ways in which Phase II allows for flexibility include:

- Permitting authorities establish designation criteria for small MS4s located outside of urbanized areas.

- Permitting authorities can designate other MS4s or construction, industrial, or commercial facilities that are not covered nationally, on a case-by-case or regional basis.

- Permitting authorities may provide waivers to MS4s and construction activities in certain situations, such as where:

    - Construction activities of between one and five acres:

        (1) The value of the rainfasll erosivity factor is less than five (5);

        (2) TMDL assessment or equivelant assessment addresses the pollutants of concern.

    - Regulated small MS4s serving jurisdictions with a population of less than 1,000:

        (1) Its discharges are not contributing substantially to pollutant loadings; and

        (2) If there is a discharge of any pollutant(s) a TMDL is already established to address the pollutant(s) of concern.

    - Regulated small MS4s with a population under 10,000 if:

        (1) All water receiving discharges from the system have been evaluated; and

        (2) A TMDL or equivalent analysis has been conducted and allocated for pollutants; and

        (3) It has been determined that current and future discharges do not have the potential to result in exceedences of water quality standards.

- General permits are encouraged and may be issued on a watershed basis.

- Qualifying local programs can be incorporated in NPDES permit requirements.

- Minimum control measures may be implemented by another governmental entity, such as a larger, neighboring community.

- A cooperative and/or a watershed-based approach is encouraged.

- TMDLs for single pollutant(s) os concern.

EPA expects encouraging the use of general permits for the majority of sources to be designated under Phase II to lessen the regulatory burden placed on the permitting authority. EPA is also working to streamline the application/Notice of Intent (NOI) process to reduce the burden on the regulated community.

Roles of the Federal Government, States, Permitting Authorities, and Municipalities/Tribes in Implementing Phase II NPDES Regulations

Federal Government	All States	NPDES Permitting Authorities	Municipalities/ Tribes
Develop overall framework of program: • Rule • Toolbox • Permit Encourage use of watershed approach Provide financial assistance: • No appropriated funds • Federal grant programs Implement program for non-NPDES authorized states, tribes, and territories Oversee state programs Comply with requirements as a discharger: • Federally-owned MS4s (i.e., hospitals/prisons) • Federal construction projects	Comply with requirements as a discharger: • State-operated MS4s • State construction sites Communicate with EPA	Comply with other regulatory requirements Designate sources: • Develop criteria • Apply criteria • Designate interconnected sources • Address public petition Provide waivers Issue permits Issue menu of appropriate BMPs in cases of general permits Support local programs: • Provide financial support (to extent possible) • Oversee programs • Ensure municipalities have adequate legal authority	All regulated MS4s must establish a storm water management program that meets the requirements of six minimum control measures: • Public education • Public involvement/ participation • Illicit discharge detection and elimination • Construction site controls • Post-construction controls • Pollution prevention/good housekeeping for municipal operations Comply with requirements as a discharger, including municipally owned/operated industrial sources

Develop Tool Box

EPA has made a commitment to work with the Storm Water Phase II Urban Wet Weather Flows Advisory Committee to develop a "tool box" to assist states, tribes, municipalities and other parties involved in the Phase II program. This tool box will facilitate efficient and cost-effective implementation of the regulation. EPA developed a preliminary working tool box in 1999. The tool box should be finalized by the time the general permit is issued and will be updated as new information becomes available. The tool box will include:

- Fact sheets;
- Guidance documents;
- Information clearinghouse;
- Training and outreach efforts;
- Technical research;
- Support for demonstration projects; and
- Regional workshops.

EPA worked with the Urban Water Resources Research Council of the American Society of Civil Engineers to develop a database on BMP effectiveness, which is available on CD-ROM and through the Internet. For more information on this database, refer to Appendix I.

Provide Permits

The EPA is the permitting authority for non-authorized states, tribes and territories. EPA, therefore, has the same responsibility as any other NPDES permitting authority - issuing permits, designating additional sources, and taking appropriate enforcement actions. EPA will tailor the program to the needs of the state, tribe, or territory.

Oversee State Programs

EPA also must oversee the programs for NPDES-approved states and tribes. EPA and the states and tribes will work together to implement, enforce, and improve the program. EPA also will work with states and tribes to help them modify their existing programs where inadequacies exist. In addition, EPA reviews the continuing planning process (CPP) periodically, to assess the accomplishments of the program. If EPA's evaluation of a state's program deems that the program is inadequate, EPA will work extensively with the state to help improve the program. If the state program is not brought into compliance, the NPDES authorization can be revoked.

What Does the Federal Government Require for Storm Water Management under Phase II?

For MS4s:

The EPA requires, under the Phase II regulation, that all owners/operators of small MS4s reduce the discharge of pollutants from a regulated system to the "maximum extent practicable" to protect water quality. At a minimum, jurisdictions regulated under Phase II must:

- Specify BMPs for six minimum control measures and implement them to the "maximum extent practicable;"
- Identify measurable goals for control measures;
- Show an implementation schedule of activities or frequency of activities; and
- Define the entity responsible for implementation.

For Construction and Other Activities:

Construction activities that disturb one to five acres must also be regulated under an NPDES Phase II permit. The NPDES permitting authority may also require that other facilities and industrial and construction activities, as well as small MS4s outside urbanized areas, be designated on a case-by-case or categorical basis.

Each of these requirements is discussed in more detail in the subsections that follow.

What is a BMP?

Best management practices (BMPs) for storm water management are schedules of activities, prohibitions of practices, maintenance procedures, the use of pollution control devices and other management practices used to prevent or reduce the amount of pollution introduced to receiving bodies of storm water runoff.

Non-structural BMPs include: ordinances and zoning requirements (such as erosion and sediment control ordinances); maintenance activities (such as storm drain cleaning and street sweeping); and education/outreach activities.

Structural BMPs include structures like: detention ponds; grassed swales; sand filters and filter strips; infiltration basins; and porous pavement, etc.

Generally non-structural BMPs are more cost-effective than structural BMPs. If structural BMPs are needed, they can be implemented in a more cost-effective manner if they are included in initial plans.

BMPs for Six Minimum Control Measures

Municipal storm water management programs must specify best management practices (BMPs) for the following six minimum control measures:

1) Public Education and Outreach on Storm Water Impacts

- A public education program must be implemented to distribute educational materials to the community.
- The community should be made aware about the impacts of storm water discharges to waterbodies and the steps needed to decrease storm water pollution.
- Municipalities are **encouraged** to work with their state and Phase I communities to develop an education/outreach program more efficiently.

2) Public Involvement/Participation

- The public **must** be involved in developing the municipality's storm water program by following state, tribal, and local public notice requirements.
- All economic and ethnic groups **should** be included.
- Examples of public involvement/ participation that **should** be considered include public hearings, citizen advisory boards, and working with citizen volunteers.

3) Illicit Discharge Detection and Elimination

- The owner or operator of a regulated small MS4 **must** demonstrate awareness of their system, using maps or other existing documents.
- They also **must** develop a storm sewer system map that shows all outfalls, and the location/name of all waters of the US that receive discharges.
- A Phase II community **must** effectively prohibit illicit discharges into the separate storm sewer system.
- Appropriate enforcement procedures **must** be implemented.
- A Phase II community **must** develop and implement a plan to detect and address illicit discharges (including illegal dumping) to the system.
- Public employees, businesses, and the general public **must** be informed of the hazards associated with illegal discharges and improper disposal of waste.
- Need to specifically address categories of non-storm water discharges in 40 CFR 122.34 (b)(3)(iii).

4) Construction Site Storm Water Runoff Control

- The owner or operator of a regulated small MS4 **must** develop, implement, and enforce a program to reduce pollutants in any storm water from construction sites of more than one acre.

- An ordinance or other regulatory mechanism **must** be used to control erosion and sediment to the maximum extent practicable and allowable under state, tribal or local law, as well as sanctions to ensure compliance.

- Must include procedures for site inspection and enforcement of control measures.

- Must have procedures for input from public.

- Must address water quality impacts through site plan review process.

- Must require construction site operators to control wastes generated at site.

- Existing erosion and sediment control ordinances **may** suffice, if approved by the NPDES permitting authority.

5) Post-Construction Storm Water Management in New Development and Redevelopment

- Owners or operators of regulated small MS4s **must** develop, implement, and enforce a program that addresses storm water runoff from new development and redevelopment projects that result in land disturbances of at least an acre and that discharge to their MS4.

- Appropriate structural and non-structural BMPs **must** be used.

- Controls **must** ensure that water quality impacts are minimized.

- Adequate long-term operation and maintenance of BMPs connected to a regulated MS4 **must** be addressed.

- The goal, at a minimum, **should** be to maintain pre-development runoff conditions.

- EPA **encourages** the use of preventive measures, including non-structural BMPs, which are usually thought to be more cost-effective.

6) Pollution Prevention/Good Housekeeping for Municipal Operations

- Owners or operators of small MS4s **must** develop and implement a cost-effective operation and maintenance as well as employee training programs with the goal of preventing or reducing pollutant runoff from municipal operations.

EPA Encourages:

- The use of maintenance activities and schedules and long-term inspection procedures
- The use of controls for reducing or eliminating the discharge of pollutants from roads, highways, parking lots, maintenance and storage yards, and waste transfer stations
- Implementation of procedures for the proper disposal of waste, such as dredge spoil, floatables, and other debris removed via operations and maintenance activities
- New flood management projects should incorporate water quality protection to the greatest extent possible
- Pollution prevention measures in municipal operations, such as golf course maintenance, fleet maintenance, open space maintenance, planning, building and oversight, and storm water maintenance

Measurable Goals for Control Measures

The requirement of identifying measurable goals for each control measure is unique to Phase II. Communities regulated under Phase I were not required to devise measurable goals. Examples of measurable goals include:

- Inspecting or repairing a certain number of drain inlets each year;
- Conducting street-sweeping operations a certain number of times each year;
- Surveying all municipal right-of-ways to identify illicit discharges;
- Conducting a certain number of training classes for municipal operations each year;
- Soliciting the help of a certain number of volunteers each year to perform water quality monitoring or education/outreach activities; or
- Reducing sediment loading.

Implementation Schedule of Activities or Frequency of Activities

Regulated communities must show an implementation schedule of activities or frequency of activities that will be done as part of the storm water management program. An example might include the following entries:

Sweep entire x miles of road in county	2 times per year
Vacuum storm drain inlets	2 times per year

Conduct classroom storm water education	4 times per year
Implement Household Hazardous Waste Program	by July 31, 1999

Common Storm Water Management Implementation Entities

Storm Water Utility

Storm Water or Surface Water Department or Division

Storm Water Management Commission

Special Storm Water District

Engineering Department

Public Works Department

Department of Public Health (water quality monitoring)

Fire Department (illicit discharge detection)

Planning Department (construction/post-construction)

State transportation agency

State environmental regulatory agency

Watershed Management Group

Joint Powers Authority (Adjacent municipalities)

A more in-depth discussion of institutional frameworks that could implement a storm water management program is provided in Chapter 5.

What is a Watershed Approach?

A watershed is a land area that drains into a particular stream, river, or bay. Watersheds can vary in size from a few acres (i.e., for a minor stream) to thousands of square miles.

A watershed approach to storm water management planning considers an entire ecosystem. Because ecosystems, and the pollutants that can impact them, do not know legal boundaries, such as town or county lines, it makes sense to address storm water pollution on a watershed basis.

Taking a watershed approach allows for communities in the watershed to share resources, beginning with watershed mapping efforts, to most effectively combat nonpoint source pollution. The EPA encourages a watershed approach, and several communities, such as Chesapeake Bay and Casco Bay, have found the watershed approach to be successful.

Who is Regulated Under Phase II?

Automatically Included	***Exceptions***
Owners/operators of small municipal separate storm sewer systems located in urbanized areas including military facilities, large hospitals, prisons or other such MS4s operators that exist in an urbanized area.	• Systems that serve less than 1,000 people where no significant impacts are known, and where TMDL assessment addresses the pollutants of concern if any are identified. • Any other system waived from the requirements by the NPDES permitting authority.
All construction site activities involving clearing, grading and excavating land equal to or greater than 1 acre (including projects that are comprised of several sites of less than one acre each).	Requirements could be waived by NPDES permitting authority based on: • Low predicted soil loss (erosivity factor of less than 5); or • TMDL addresses pollutant of concern.
Municipally owned/operated industrial sources required to be regulated under the existing NPDES storm water program but exempted from immediate compliance by ISTEA.	Industrial and other sources that provide a written certification of "no exposure of materials and activities to storm water."

Conditionally Included
Owners/operators of small municipal separate storm sewer systems meeting the criteria for designation (to be established by permitting authority)
Owners/operators of any municipal separate storm sewer system contributing substantially to the storm water pollutant loadings of a regulated, physically interconnected municipal separate storm sewer system
Construction site activities that disturb less than 1 acre of land that are designated by the permitting authority

Entity Responsible for Implementation

Regulated communities must also indicate who is responsible for the storm water management program. There may be one individual in one department who is responsible for the entire program, or the responsibility may be shared among several departments.

Many Phase II communities have a more limited resource base than communities regulated under Phase I. Phase II communities will also have a broad array of governing structures. Defining an implementation entity will therefore require much thought and perhaps some creativity.

The Phase II regulations are amenable to creative implementation strategies, as they encourage communities to take a watershed or cooperative approach. Communities may also be covered under a neighboring Phase I community, or allow another entity, such as a county, to implement certain minimum control measures or portions of minimum control measures. The regulated entity, however, is still responsible for complying with the requirements of the permit.

In defining an implementation entity, you should consider the following:

- What financial resources are already available to your community?
- What will the cost of implementing and operating the storm water management plan be?
- What other communities are located in the watershed?
- Who in the community has expertise in storm water management components of a storm water management program?
- What actions have already been taken that would qualify as BMPs under the Phase II regulations?
- Are there neighboring communities or other communities in the watershed that already have a storm water management program in place?
- Are there neighboring communities that will also be subject to proposed Phase II regulations with whom a community can share resources?

Who Is Covered by Proposed Phase II Regulations?

Those covered by the NPDES Phase II regulations include the federal government, tribes, states, local governments, individuals undertaking construction activities, and industry.

On a national basis, the following entities will be covered:

- Owners/operators of small MS4s located in urbanized areas; and

- Construction activities resulting in land disturbances equal to or greater than one acre.

The NPDES permitting authority could, however, provide waivers for construction activities serving less than 5 acres if certain conditions apply, such as:

- Determination of low soil loss associated with construction activity based on an erosivity factor less than five; and

- A TMDL assessment or equivelant analysis addresses the pollutants of concern on the construction site.

Waivers could also be provided for small MS4s if they:

- Regulated small MS4s serving jurisdictions with a population of less than 1,000:

  (1) Its discharges are not contributing substantially to pollutant loadings; and

  (2) If there is a discharge of any pollutant(s) of concern.

- Regulated small MS4s with a population under 10,000 if:

  (1) all water receiving discharges from the system have been evaluated; and

  (2) a TMDL or equivalent analysis has been conducted and allocated for pollutants; and

  (3) it has been determined that current and future discharges do not have the potential to result in exceedences of water quality standards.

In addition, the NPDES permitting authority could extend designation to municipalities, construction sites, or industrial/commercial sources outside of the nationwide designated classes on a case-by-case or categorical basis. Small MS4s located outside of an urbanized area, for example, could be included based on watershed and water quality considerations. At a minimum, the rule requires that the NPDES permitting authority consider for regulation a particular subset of small MS4s located outside of urbanized areas.

Other storm water discharges from unregulated industrial, commercial, and residential sources could also be designated if an NPDES permitting authority deems it necessary to protect water quality.

It is important to note that the Phase II regulations also apply to communities that will be included under the 2000 Census. These communities are expected to have the same deadline as those included under the 1990 Census - in other words, 3 years and 90 days from publication of the final rule.

What is an Urbanized Area?

An "urbanized area" comprises one or more places - the central place(s) (which include both incorporated and Census-designated places) and the adjacent densely settled surrounding area (or urban fringe) consisting of:

- Incorporated places,
- Census-designated places, and
- Unincorporated areas of the county or Census-designated places

that together have a population of at least 50,000.

The urban fringe is a contiguous area with an average population density of at least 1,000 persons per square mile at its perimeter.

There are 405 urbanized areas in the United States that cover 2 percent of total U.S. land area and approximately 63 percent of the nation's population.

For a graphic depicting the definition of urbanized area, see Appendix G.

What's Involved in the PHASE II Permitting Process?

There are two types of NPDES permits — general and individual. An individual permit is a permit specifically tailored for an individual facility based on the information contained in the application(s). The permitting authority develops a permit for that facility based on the information contained in the permit application, such as type of activity, nature of discharge, receiving water quality, etc. The permit is then issued to the facility for a specific time period (not to exceed five years).

A general permit is developed and issued by a permitting authority to cover multiple facilities within a specific category. General permits may offer a cost-effective option for agencies because of the large number of facilities that can be covered under a single permit. Permittees usually submit a Notice of Intent (NOI) to the permitting authority to be covered under a general permit.

Generally both types of NPDES permits (individual and general) are obtained by application to the EPA or to the appropriate state agency. The owner or operator of a regulated small MS4 would be

Which States, Tribes and Territories Are Not Authorized to Issue NPDES Permits?*

State/Territory	Who State/Territory Needs to Contact	
Alaska	EPA Region X	(206) 553-8399
Arizona	EPA Region IX	(415) 744-1906
Idaho	EPA Region X	(206) 553-8399
Maine	EPA Region I	(617) 565-3580
Massachusetts	EPA Region I	(617) 565-3580
New Hampshire	EPA Region I	(617) 565-3580
New Mexico	EPA Region VI	(214) 665-7175
Texas*	EPA Region VI	(214) 665-7175
District of Columbia	EPA Region III	(215) 597-0547
Puerto Rico	EPA Region II	(212) 637-3724
Pacific Territories	EPA Region IX	(415) 744-1906
Indian Territories	EPA Region Where Tribe is Located	

The remaining 42 states and the Virgin Islands have NPDES permitting authority. *Florida and Texas do not yet have NPDES authorization for storm water permits, but expect to receive such authorization in 2000.

required to identify and submit to the NPDES permitting authority the following information:

- The BMPs that will be implemented;
- The measurable goals for the minimum control measures;
- The month and year in which each BMP will be started and completed, or the frequency of action if it is ongoing; and
- The person(s) responsible for implementing or coordinating the storm water management program.

This information could be submitted in a Notice of Intent (NOI), if the community wishes to apply under a general permit, or on an individual application if the community or facility seeks an individual permit. If a community wants to propose other controls within its permit rather than the Six Minimum Control Measures, the rule provides an alternative application process.

EPA is not specifying NOI requirements for operators of construction sites of less than five acres applying for coverage under a general permit. While EPA recognizes tbe benefit of NOIs — which allow for better outreach and dissemination of information — federal regulators are sensitive to the burden being placed on the regulated community and on the NPDES regulators. Therefore, it is up to the NPDES permitting authority to determine whether it will require NOI submission for construction sites disturbing less than five acres.

The application form is reviewed by the permit writer who then prepares a draft permit. Once the draft is ready, it is sent to the applicant and published in order to notify the general public of the proposed permitting activity. The permit writer then accepts comments on the draft permit from all interested persons. Revisions are then made based on comments received, and the permis is issued final.

What Do Regulated Communities Have to Do On an Ongoing Basis?

Under the Phase II rule, regulated communities must conduct periodic evaluations and assessments of their storm water management practices, maintain records, and prepare required reports.

Evaluation and Assessment Requirements	***Record Keeping Requirements***	***Reporting Requirements***

• Evaluate program compliance
• Evaluate the appropriateness of identified BMPs
• Evaluate progress toward achieving measurable goals.
The NPDES permitting authority may determine monitoring requirements appropriate to your watershed. EPA encourages participation in a group monitoring project.
	• Keep records required by the NPDES permitting authority for at least three years.
	• Submit the records when requested by the permitting authority.
	• Make your records and stormwater management plan accessible to the public during regular working hours.
	    • A reasonable copying fee may be charged.
	    • Advance notice of up to two days for copying may be requested.
		• Submit annual reports to the permitting authority for the 1st permit term.
		• In subsequent terms, submit reports in years two and four, or more frequently as required
		• Reports should include:
		    • Status of permit condition compliance
		    • Appropriateness of identified BMPs
		    • Progress toward achieving measurable goals for each measure
		    • Results of data collected and analyzed during the reporting period
		    • A summary of the activities that will take place during the next reporting period
		    • Any changes in measurable goals

A Closer Look at the General Permit Process

Under Phase II, the NPDES permitting authority may issue a general permit for all nationally delegated entities. The process of issuing a general permit could include the following components:

- The NPDES permitting authority might announce its intent to develop a general permit for a particular category of discharger (i.e., based on population of community, etc).

- The NPDES permitting authority might solicit ideas from those who will be covered under the general permit as to what should be included in the permit.

- The NPDES permitting authority issues a draft general permit and requests comments on the draft permit to be made within 90 days. Generally notice of the permit is published in the newspaper that serves the localities that would be covered by the permit. Some states may require that the notice run for a certain length of time.

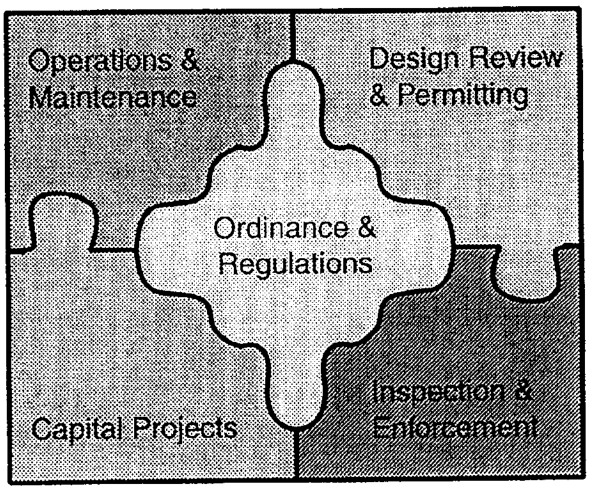
- The NPDES permitting authority analyzes the comments and writes a final permit. If the permit is issued by a non-EPA entity, it must be approved by EPA.

- Municipalities or others seeking coverage under the general permit submit a Notice of Intent (NOI) to the NPDES permitting authority. Current dischargers must apply for coverage within 3 years and 90 days of the date the final regulation goes into effect (if it goes into effect on March 1, 1999, the deadline would be June 1, 2002).

- The permitting authority reviews the NOI and follows up with permitee as required.

- The permitee is covered under the general permit in 48 hours. They will be notified by mail of their permit number. If, for some reason, the NOI is not adequate, they will hear from the NPDES permitting authority.

Chapter 3
What Does an Effective Storm Water Management Program Look Like?



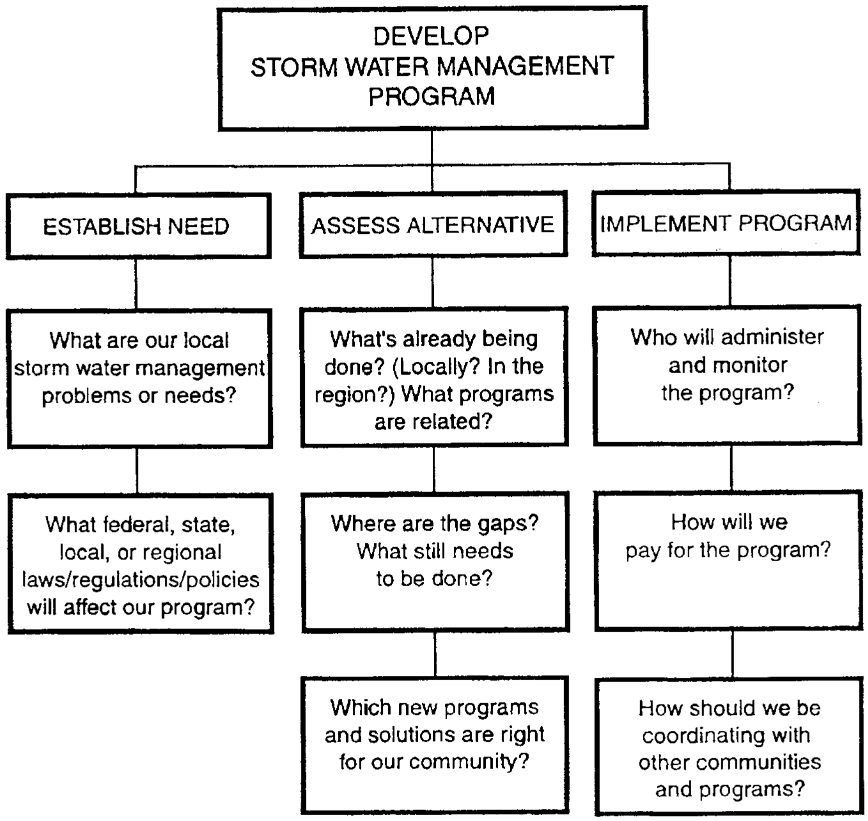
Effective storm water program planning requires several key steps: (1) identifying your local needs and requirements for compliance with the Phase II rule; (2) assessing alternatives; and (3) developing a plan to implement the selected alternatives. Chapters 1 and 2 of this workbook addressed the need for storm water management programs for smaller communities, from both a practical and regulatory context.

This chapter describes the alternative approaches to storm water management required by the Phase II rule and the process of evaluating the best solutions for your community. The chapter addresses typical components of a storm water management program, including:

- New or revised regulations/ordinances;
- Design review and permitting;
- Inspection and enforcement activities;
- System inventory/mapping;
- Operations and maintenance;

- Capital projects;
- Program planning;
- Public education;
- Project administration; and
- Linkages with other environmental programs.

First Things First



Before you begin planning a Phase II-compliant storm water management program, you should examine what's already being done in your community. At a minimum, ask yourself the following questions:

- What is the nature and status of your storm water system, including its capacity, how it operates, where the components of the system are located, what the maintenance routine is, and where the storm water discharges?

- What existing ordinances or regulations currently address storm water management directly or indirectly? Even if you do not have a storm water management ordinance, you may have other ordinances or regulations with features that affect storm water management, such as: land use and development, zoning, landscaping, wellhead protection, open space and conservation, economic development, growth management, etc.

- What related environmental programs may affect storm water management in the region?

- What storm water management programs are currently in place? How many of the six minimum control measures specified in the Phase II rule or identified by your local NPDES permitting authority are in place?

- Where are the gaps between current programs and policies and those that will be needed to effectively manage storm water and fulfill regulatory and permitting requirements?

Once you have answered these questions, you are ready to begin evaluating alternatives to fill those gaps. Each BMP should be evaluated using locally appropriate criteria, including:

- How much will it cost? Who will bear those costs? How acceptable are costs likely to be to affected stakeholders?

- What minimum control measures will this program element address?

- What is the likelihood of success (both technically and socio-politically) given local conditions?

- How easy or difficult will implementation be?

- Do we have the needed expertise, authority, and control?

- Is this alternative compatible with community values?

- Is there potential for cooperation with other agencies?

- What are the potential "unintended consequences" (environmental and otherwise)?

By answering these questions, you can better design a program that meets federal standards as well as the needs of your community. The sections that follow address additional questions that will help you understand the requirements of a Phase II storm water management program.

Will We Need New Ordinances or Regulations?

You will need to ensure that you have regulations or ordinances in place that satisfy the Phase II minimum control measures for:

- Construction site storm water runoff control;
- Post-construction storm water management in new development and redevelopment;
- Illicit discharge detection and elimination; and
- Illegal dumping
- Pollution prevention/ good housekeeping for municipal operations.

In addition to meeting new federal requirements for storm water management, developing and enforcing appropriate regulations can minimize your future cost of implementing and maintaining storm water facilities from newly developed areas.

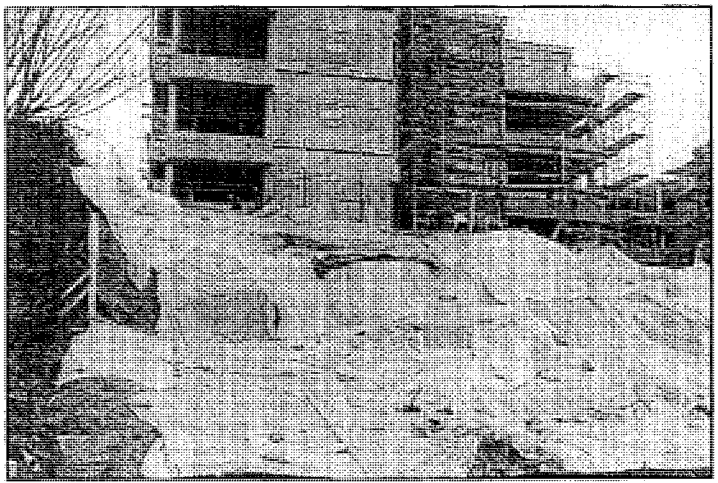
Regulations to satisfy minimum control measures usually consist of design standards for new development and redevelopment; operations and maintenance requirements for private facilities; and ordinances/regulations prohibiting illicit discharges.

Design Standard Regulations for New Development and Redevelopment

Design standards to control storm water runoff should:

- Define what types of construction activities must comply with the standards;
- Define thresholds and standards for different types of construction activities, such as:
  - Small sites for single family residential construction,
  - Larger residential, commercial, or industrial sites,
  - Very large or unique residential, commercial, or industrial sites,
  - Sites in close proximity to environmentally sensitive areas, and
  - Redevelopment projects;
- Mitigate for downstream impacts;
- Define exemptions; and
- Take into consideration the resources available for design review, inspection and enforcement.

If you don't already have them in place, you will need design standards for storm water runoff pollution controls to satisfy Phase II minimum control measures for pre- and post-construction. While treatment control BMPs may be applicable, most agencies with successful storm water management programs emphasize source controls. There is increasing recognition that treating storm water runoff with today's BMPs may be only partially effective.



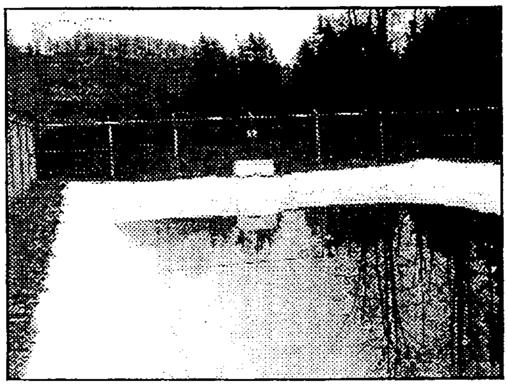
During construction, regulations will be needed for temporary BMPs to control erosion and sedimentation and reduce pollutants in runoff from sites with one or more acres of land disturbance. State, regional, or local requirements may set more stringent thresholds for temporary erosion and sediment controls. Regulations for temporary BMPs must also control other waste on the construction site that can adversely affect water quality.

From sites with one or more acres of land disturbance, regulations will also be needed to ensure that BMPs are used to control the quantity and quality of storm water runoff after construction. State, regional, or local requirements may set more stringent thresholds for these permanent BMPs.

Sample Temporary Erosion and Sediment Control BMPs

Source Controls	Treatment Controls
• Construction sequencing	• Stabilized construction entrances
• Limiting the amount of area disturbed at one time	• Silt fences and hay bales
• Time limits on activities during both wet and dry weather	• Diversions
• Timely stabilization of denuded areas	• Sediment traps and basins
• Proper storage of construction materials	• Temporary vegetation/mulching
• Proper disposal of construction waste	

Vegetated Water



Oil/Water Separator

Operation and Maintenance Regulations for Private Facilities Connected to Regulated MS4s.

To satisfy the Phase II minimum control measure for storm water management for new development and redevelopment, an operations and maintenance program is required for all storm water facilities discharging to a regulated MS4. To prevent and reduce pollutant runoff from your municipal system, operations and maintenance will be required for your publicly owned system, as well as any privately owned storm water facilities connected to the public system.

Typically local governments maintain the public system, but you must make a policy decision about who is responsible for maintaining the privately owned facilities connected to the public system. The issue of who maintains privately owned storm water facilities is further complicated where storm water from the publicly owned system enters a private system on private property. Some common policy options for maintaining private facilities are listed below.

- **Option 1** - The municipality is responsible only for maintaining the public system where it owns or has maintenance easements to the facilities. Private property owners are responsible for maintaining all private systems on private property.

R0019028

• **Option 2** - The municipality is responsible for maintaining both the public system (where it owns or has maintenance easements to the facilities) and the private facilities where storm water from the public system enters a private system on private property. Private property owners are responsible for maintaining those private systems that do not accept water from public systems.

• **Option 3** - The municipality is responsible for maintaining both the public and private systems. This arrangement can be implemented with formal or informal agreements with property owners for right-of-entry.

Whose Water Is It, Anyway?

With regard to storm water system maintenance, the overriding philosophy in King County, Washington is simple — storm water facilities located on private property that do not impact public conveyances or stem from public conveyances are the responsibility of the property owner.

In 1992, however, King County was asked to address some of these issues as a provision of a rate increase. Thus the Neighborhood Drainage Program was established. This program dedicates approximately $650,000 each year to repair storm drain problems on private property.

Projects are NOT considered for the Neighborhood Drainage Program if:

- The property is in an incorporated municipality;
- The project could fall under the responsibility of another program;
- The problem is simply a neighbor versus neighbor dispute; or
- The problem is due to violation of an enforceable code.

Potential projects are ranked by a point system. Consistent problems, and those that impact living quarters, receive higher points. The projected cost of fixing the problem is also considered, with the lowest cost projects typically receiving a higher priority.

On average, the County undertakes 6 to 8 capital improvement projects, 12 to 15 somewhat complex maintenance projects, and 30 more simple "quick fix" projects per year. One third to one half of the projects that are not accepted in the program receive some other sort of technical assistance.

The program is very popular among property owners, as well as elected officials, because it is highly visible and has resulted in the repair of many nuisances in the County.

More information on King County's storm water management program can be found on the World Wide Web at http://splash.metrokc.gov/wlr.

You will need regulations to support any policy decision made to require private property owners to maintain all or a portion of their systems for pollution prevention. These regulations usually include:

- A definition of what the private property owner is required to maintain;
- A requirement that prevents the obstruction or disposal of debris in the storm water system on private property;
- Requirements for proper disposal of waste from maintenance activities; and
- Inspection and enforcement provisions.

Regulations to Prevent Illicit Connections

The Phase II regulations require minimum control measures to prevent illicit discharges of non-storm water into your municipal storm sewer system (MS4). If you have not already done so, you will need to establish the authority to prevent illicit connections by implementing regulations that address:

- Definition of discharges prohibited to the MS4;
- Definition of discharges permissible to the MS4;
- Exemptions; and
- Authority to enforce.

What Type of Design Review and Permitting Requirements are Appropriate for Our Community?

Effective enforcement of minimum control measures number 4 (construction site storm water runoff control) and 5 (post-construction storm water management in new development and redevelopment) will require you to implement new or revise current design standards and a permitting process. You will need to review project design plans and calculations to verify that both pre-construction and post-construction storm water BMPs meet your requirements. Permits can then be either granted or denied depending upon whether all the community standards for the project were met.

One important tenet of successful storm water management programs is linkage to other land development programs at the local level. For example, approximately 88 percent of the urban communities surveyed by the Watershed Management Institute in 1997 require storm water management and erosion and sediment control plans to be approved before building permits can be issued.

In fact, Winter Park, Florida (a Phase II community located near the City of Orlando) coordinates zoning approval with the approval of runoff control plans.

Educating the development community as to what your standards are will also be a crucial element in the process.

The process that you use to perform reviews and issue permits for construction will depend on the following factors:

- The size of your community;
- Your institutional framework;
- Your staffing level; and
- The level of storm water runoff controls required.

In some communities it may be appropriate to perform design reviews and issue permits for all projects using the same procedure. In other communities, the review process may be different depending upon the size or type of project and the potential for adverse impacts.

Rules of Thumb for Establishing Design Review Procedures

- Meet with project engineer and/or architect early in the process
- Provide plan review checklists or other tools to ensure that the requirements are clear
- Make sure there are clear linkages with other approvals
- Allow for a pre-construction conferencing phase to help prevent problems from occurring later in the design review and permitting process.
- Create a relationship between the complexity of the permitting process and the potential for adverse impacts.
- Clearly convey design requirements to the development community.

Saving Time and Money through Pre-Application Meetings

When Stafford Township, New Jersey passed their aggressive storm water management ordinance in 1987 — which requires developers to give preference to underground infiltration systems to control storm water runoff - the Township had no experience in actually constructing or maintaining the underground infiltration type system. It was a learning experience for the Township's Engineer, the Environmental Commission, and the development community.

The Township has been willing to listen to developers and make adjustments to the original requirements where it is reasonable and practical to do so. "This does not mean," emphasizes the Township's Mayor, Carl Block, "that we just roll over when we get opposition from a developer. We are very clear. You either meet our standards, or you build elsewhere. But we are willing to make sensible compromises as long as our overall standards aren't affected."

According to Martha Kremer, the Director of Community Development and the Township's Zoning Officer, some of the biggest challenges that staff faced in trying to implement the storm water management ordinance were:

- Lack of understanding about the technology;
- Difficulties in communicating the plan's goals and requirements to small residential builders ; and
- Working through objections from larger retailers who have wanted to move into the Township.

"Most of the time, once we sat down with the engineer or project developer and explained what we wanted them to do, it was no problem," noted Kremer.

To ensure that such discussions took place early in the site development process, the Township implemented requirements for pre-application meetings in 1988. These meetings are intended to expedite the application process, reduce development costs, suggest and recommend appropriate and ordinance-compliant site design; and provide applicants with direction toward the other agency approvals that may have jurisdiction over their site.

The pre-application meetings require flexibility on the part of the Township's professional staff, as well as the applicant. The advantages include providing input from several local sources early in the design process, saving applicants the costs involved with repetitive engineered revisions, and allowing the Township to be well-informed as it considers the development application. In addition, Kremer notes that projects where pre-application meetings have been conducted experienced a shorter review process and a less costly project. "We spend more time in up-front planning, but we spend less time trying to fix the problems and monitoring bad situations."

R0019032

What Types of Inspection and Enforcement Tasks Are Required?

Phase II NPDES regulations will require you to enforce the requirements of minimum control measure number 3 (illicit discharge detection and elimination), number 4 (construction site storm water runoff control), and number 5 (post-construction storm water management in new development and redevelopment). To comply with these requirements, you will need adequate inspection and enforcement activities.

Inspections

Inspections are required to ensure that storm water BMPs are constructed and maintained in accordance with approved designs. Inspections are also required to detect and address illicit discharges to the system. At a minimum, you must conduct:

- Inspections during construction for erosion and sediment control;

- Inspections during and immediately after construction for proper installation of permanent storm water control BMPs;

- Ongoing maintenance inspections of completed storm water BMPs to ensure continued water quality protection; and

- A plan to detect and address illicit discharges (including illegal dumping) to the system.

Inspections of temporary erosion and sediment controls used during construction should be performed at regular frequencies and after significant storm events.

When inspection staff resources are insufficient to visit all construction sites on a regular basis, priorities should be established based on potential impacts to water quality at the site. Cooperative partnerships between you and the development community can increase the effectiveness of limited staff resources for inspection.

Keys to Building a Cooperative Inspection Policy

- Perform high profile inspections and provide reports that emphasize the importance of proper erosion and sediment controls to key project stakeholders
- Provide training to "certify" private inspectors. Require contractors or private facility owners to hire "certified" inspectors to inspect on a regular frequency, and to supply your agency with inspection reports
- Provide training and education to the development community on how to install erosion and sediment control BMPs
- Provide training to private facility owners about proper facility maintenance
- Implement inspection procedures that outline what the inspector should do and what should be done if requirements are not met

Inspections for proper installation of permanent storm water control BMPs must be performed at critical stages during construction. These inspections should occur prior to when structures are buried, when details can be observed and necessary corrections can be made. Implementing requirements for the developer to produce "as-constructed" record drawings will also encourage construction that conforms to approved plans.

Where maintenance is required by private property owners, ongoing maintenance inspections of completed storm water BMPs is a key, but often under funded element in many storm water management programs. Proper maintenance is necessary to ensure continued water quality protection and to extend the effective life of permanent storm water BMPs. Again, cooperative partnerships between you and private facility owners can increase the effectiveness of limited staff resources for these inspections.

Going for the Green

Maryland Department of the Environment's Nonpoint Source Program conducts a "Responsible Person Training and Certification Program" for Erosion and Sediment Control. This program, which was implemented in 1980, teaches best management practices associated with erosion and sediment control. Since its inception, approximately 15,000 people have taken the training course. Training is typically provided during the winter months when construction and earth-moving workload is light. Once a person completes the one-day seminar and passes an exam, he or she is certified and receives a "Green Card." Certification is valid for three years and is automatically renewed unless the Department of the Environment notifies the certification holder that additional training is required. A Green Card holder must be on a construction site at all times.

The program helps to ensure that construction activities within the State meet minimum sediment and erosion control standards without overburdening developers or inspection staff within the regulating agency.

Enforcement

Formal inspection procedures are performed to identify violations of regulations. In these instances enforcement mechanisms should be in place that give you:

- The legal authority to act;
- The procedures to follow; and
- The flexibility to use enforcement methods appropriate for the situation.

The vast majority of municipalities surveyed as part of this project use civil rather than criminal penalties as an enforcement tool. Even with civil penalties available, most communities note challenges with implementing the enforcement mechanisms. Unless the local government has established an "Environmental Court" (dedicated to enforcement of a wide range of environmental code violations), enforcing environmental laws is likely to be a low priority in the local justice system.

Data from a 1997 research effort conducted by the Watershed Management Institute suggests that over half of the municipalities with legal authority to enforce storm water management facility maintenance requirements have failed to take legal steps to facilitate the needed maintenance. In fact, the State of Florida estimates that over 70 percent of storm water management systems constructed since 1982 are not being maintained and operated properly.

Common Enforcement Tools

- Positive recognition of those complying with regulations
- Written notification to project manager
- Stop work orders
- Withholding permits
- Performance bonding
- Action by the locality upon failure of the developer to act, with costs levied against the developer
- Civil penalties
- Criminal penalties

Do We Need an Inventory of our Municipal Storm Sewer System?

The phase II regulations require minimum control measures to detect and address illicit discharges of non-storm water into your MS4. To accomplish this task, the regulations require that you have a storm sewer map showing the location of outfalls, and the name and location of the waters of the US that receive discharges from these outfalls. Inspection, enforcement, and spill response programs also need system maps in order to detect illicit discharges. These system inventory maps are also necessary to operate and maintain the system in accordance with the minimum control measures for pollution prevention and good housekeeping.

Getting the Most out of GIS

A Geographic Information System (GIS) was once considered a high-tech tool used essentially for planning and mapping. Now GIS is becoming a handy instrument for nearly every aspect of local government service. Communities use GIS for:

- Code enforcement
- Emergency response and management
- Recreation and parks management
- Roads and streets management
- Utilities management
- Infrastructure and facility management
- Police protection
- Land use management
- Ecosystem study and management
- Pollutant effect tracking

Using GIS allows municipal departments to more easily share data. Resulting policy decisions can be made, and projects that require inter-departmental coordination can run more efficiently. An added bonus is that a GIS allows officials to show citizens planned or completed improvements to the community.

The applications of GIS programs for water quality management are exciting. The Commonwealth of Massachusetts, for example, is using a GIS to monitor the water quality of the entire Merrimack River basin. The location of each sampling station, landfill, incinerator, pond, and tributary is stored in the GIS database. The GIS can plot the relationships between test sampling station water quality and potential sources of pollutants.

Although GIS systems are more affordable than they once were, the costs of developing and maintaining a sophisticated GIS may be unwarranted for smaller communities. As a result, many communities are developing GIS systems jointly, thus sharing in costs and responsibilities. Cities and towns often find counties, regional planning districts, or councils of governments to be good teaming partners for GIS projects.

If you are considering jointly developing a GIS program, you should resolve issues such as:

- How the cost of developing and maintaining the system will be shared;
- Who will have access to the system;
- What types of data will be included in the system;
- How priorities will be established for collecting and entering data and using the system;
- How users will pay for access to the system; and
- Whether data will be sold to outside entities.

Communities that share in developing a GIS system not only create a valuable policy tool that they might not otherwise be able to afford, but they also help each other through the kinks of developing the system and open opportunities for other cooperative efforts.

What Types of Operations and Maintenance Are Required?

The Phase II minimum control measure for pollution prevention/good housekeeping for municipal operations requires an operations and maintenance program for your MS4. You must develop this operations and maintenance program with the goal of preventing and reducing pollutants in storm water runoff from municipal operations.

At a minimum your maintenance program must include:

- Training local government employees to prevent or reduce pollutants in storm water from municipal operations; and
- Implementing regulations requiring private property owners to maintain their systems if a policy decision is made to require that.

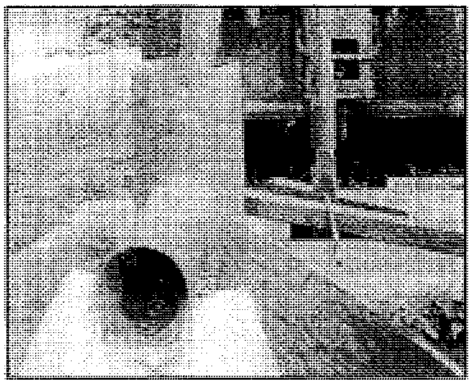
EPA also encourages communities to:

- Schedule maintenance activities and inspection procedures; and
- Dispose of wastes from maintenance activities in a proper manner.

Maintenance activities performed by a typical storm water management program include:

- Cleaning catch basins, manholes and outfalls;
- Cleaning pipes and culverts;
- Removing sediment from roadside ditches (only as necessary — avoid disturbing vegetated ditches that help remove pollutants in storm water);
- Controlling vegetation in roadside ditches;
- Sweeping streets;
- Cleaning detention structures;
- Controlling vegetation in above ground detention ponds;
- Repairing and replacing infrastructure;
- Performing inspections; and
- Properly disposing of waste from maintenance activities, such as catch basin cleaning.

In addition to its use to help locate illicit discharges, a map of the MS4 is necessary to carry out an effective maintenance program. From this map an inventory of system components can be created and used to schedule maintenance.



Cable toll rig used to clean storm drains

Catch basin cleaning

Elements of a Maintenance Program

- The number or length of each system component that needs maintenance
- The frequency with which each maintenance activity needs to be completed
- The crew sizes and equipment needed to perform each maintenance activity
- The production rate for each maintenance activity

What Types of Capital Projects Will Be Required?

The Phase II minimum control measure for pollution prevention/good housekeeping for municipal operations encourages communities to consider storm water controls from public facilities. This minimum measure also encourages communities to consider water quality BMPs in flood management projects.

Compliance with these requirements may require capital facilities construction. It is important to remember that, in addition to the NPDES program, there are other regulatory requirements and citizen concerns that establish the need for your capital improvements program.

Capital improvement programs are not specifically required by the NPDES Phase II regulations, however most storm water management capital improvement programs are driven by local interest in solving flooding, water quality, and sensitive aquatic resource problems. Community interest in solving these problems may be the source for much of the support for your program. Many of these problems you already know about because of citizen feedback. You may also be confronted with agency concerns and possible enforcement actions when there is a problem that impacts water quality.

Capital projects may include:

- Detention facilities;
- Water quality treatment facilities;
- Conveyance systems;
- Pumping stations;
- Dikes or berms;
- Culverts;
- Fish passage structures;
- Stream channel habitat restoration projects;
- Neighborhood drainage projects; and
- Retrofits of existing facilities.

The mandate from the public and elected officials for both new and existing storm water management programs may be to assume responsibility for both typical drainage problems, as well as water quality problems, associated with storm water runoff. Managing the drainage, or water quantity, part of your storm water program can require significant investment in capital projects that must be balanced with other program needs.

Capital projects can be a highly visible and popular part of your program, but you need to manage the public's expectations that there are quick fixes to longstanding problems. Oftentimes these expectations are inconsistent with the rate at which funding is available to implement new capital projects. You can educate your community on how quickly you can afford to resolve the problem, explaining that speeding up the process will require additional financial resources. In planning your capital program, it will also be important to show the community that everyone benefits by distributing projects in neighborhoods throughout your service area.

What Should We Do About Planning?

Although it is not specifically required as part of the Phase II regulations, you may want to plan your surface water program to make it more effective. This planning activity could consist of a comprehensive planning process that includes all the storm water policy, programmatic, funding, and technical issues. You may also decide that you want to perform the technical analysis for each of your watersheds or sub-basins separately and have the comprehensive plan include the results of those efforts.

What is Included in a Comprehensive Plan?

Storm water program comprehensive planning is a process of developing a unified vision for your community that, at a minimum, identifies and addresses:

- Goals;
- Policies for managing your storm water;
- Programs needed to accomplish your goals;
- Program costs; and an
- Implementation strategy.

Your goals will most likely include complying with regulations and meeting other local needs such, as flood protection. Policies will be needed, such as determining who is responsible for maintaining private storm water facilities. You will need to establish the specific duties associated with most of the program elements presented in this chapter. In order to develop an implementation strategy you will need to determine what it will cost to put these programs in place. Your implementation strategy will need to consider a number of possible funding mechanisms and how to obtain the necessary support from your community.

Your storm water management program will affect and be affected by other plans and policies in your community and region. The comprehensive planning process can help to ensure that your storm water management program interacts appropriately with other local and regional philosophies and programs. In addition, if the storm water management program can be demonstrated to mesh appropriately with existing comprehensive plans, both public and political support is more likely.

What is Included in a Watershed or Drainage Basin Plan?

Drainage basin or watershed planning is a process that uses data gathering and technical analysis methods to:

- Characterize the environmental, hydrologic, and hydraulic features of a surface water drainage area and its water bodies;
- Define problems with those features;
- Analyze solutions to those problems;
- Recommend a preferred set of solutions; and
- Determine the costs to implement the recommended solutions.

Drainage basin or watershed planning should determine needed capital projects, special regulations, maintenance, monitoring, and costs.

It is preferable to have the drainage basin or watershed technical analysis completed prior to finalizing your comprehensive plan. In this manner, your comprehensive plan contains a more accurate projection of your program costs. But oftentimes it is necessary to prepare a comprehensive plan prior to completing the drainage basin planning because the comprehensive plan is needed as a basis to obtain funding for the overall program (which includes the drainage basin planning).

Comprehensive plans can be used as a powerful tool to obtain community support for your program, especially if your planning effort shows a strong link between the goals established by the community at the outset and the various program elements. Your comprehensive plan can then include a level of service analysis that defines costs associated with each program element. In this manner the community can clearly see what can and cannot be provided with the resources available to implement the plan.

Why Is Public Education and Involvement Important?

An effective public education and involvement program will enable you to meet the following objectives:

- Satisfy the Phase II minimum requirements for public education and involvement;
- Improve water quality by modifying community awareness and behavior; and

• Obtain the necessary community support to fund your program.

Because public education and involvement is so crucial to the success of your program, Chapter 4 is devoted to this topic. Chapter 4 describes specific techniques that can be used to involve the community in your storm water program and educate them about the importance of adequate storm water management.

What are the Administrative Requirements of a Storm Water Management Program?

The Phase II regulations specify requirements for:

- Designating an entity responsible for implementation;
- Seeking public input into the storm water management planning process and communicating with the public about storm water management issues;
- Defining measurable goals for each of the six required minimum control measures;
- Establishing an implementation schedule that includes frequency of actions; and
- Establishing appropriate evaluation, record keeping, and reporting procedures.

In addition, you will need funding for your storm water management program. And all of these steps need to be evaluated within the framework of planning processes and programs that may already be underway in your community.

Chapter 5 of this workbook addresses selecting the implementation entity that makes sense in your community. Chapter 6 describes some common approaches to funding and financing storm water management programs. The sections that follow discuss the other key elements of storm water management program administration.

Establishing Measurable Goals

As part of your Phase II permit, you will identify and implement specific BMPs to meet the six minimum control measures. The effectiveness of each BMP must be assessed using measurable goals. Examples of measurable goals for the six minimum control measures are listed below:

Minimum Control Measure	*Sample Measurable Goals*
Public Education and Outreach	• Distributing a specified number of brochures or utility bill inserts addressing storm water management • Participating in a specified number of community meetings • Issuing a specified number of press releases on storm water management topics • Providing contractors with technical assistance
Public Involvement/ Participation	• Conducting a specified number of meetings with a citizen advisory committee • Soliciting a specified number of volunteers to participate in storm water management related activities • Stenciling a specified number of storm drains • Receiving a certain number of calls to an illicit discharge hotline
Illicit Discharge Detection and Elimination	• Surveying municipal rights of way a specified number of times over a specified time period • Inspecting or repairing a specified number of drain inlets per year • Performing dry weather testing a specified number of times
Construction Site Runoff Control	• Conducting a specified number of training programs for non-governmental inspectors • Conducting a specified number of inspections per year (% of construction permits)
Post-Construction Storm Water Management Control	• Conducting a specified number of inspections per year (% of occupancy permits)
Pollution Prevention/Good Housekeeping for Municipal Operations	• Conduct a specified number of training programs for municipal operations staff per year • Sweep a specified number of miles of road per year • Vacuum each storm drain outlet a specified number of times per year • Inspect and clean a specified number of gulches, regional ponds, and municipal facilities

Developing an Implementation Schedule

Your implementation schedule will be closely linked to your measurable goals for each minimum control measure. Availability of staff and other resources should be carefully weighed as you set frequencies for key activities and determine your overall timeline.

Evaluating Your Program

You are required to evaluate the effectiveness of your BMPs and achievement of measurable goals. Your storm water program should be monitored to determine the effectiveness of program elements and to provide a feedback loop to guide program changes. Monitoring must evaluate your program delivery systems, as well as their effectiveness.

Monitoring your program delivery systems can involve:

- Strategic planning;
- Comprehensive planning;
- Tracking the number of capital projects implemented;
- Determining actual maintenance frequencies and production rates;
- Linking goals to outcomes in program evaluation methods;
- Measuring regulatory compliance; and
- Achieving public participation goals.

Monitoring your program effectiveness includes physical measurements that determine how well your program is meeting its goals. Common steps involve:

- Stream gauging;
- Water quality sampling and testing;
- Channel bank erosion monitoring;
- Fish habitat/population monitoring; and
- Sediment deposition monitoring.

Keeping Up with Record Keeping

Your NPDES permit will require you to keep records for at least three years. These records should include information on what your storm water management program has accomplished, such as:

- Monitoring information;
- Inspection and enforcement records;
- Your public involvement program;

- Operations and maintenance records;
- Records of capital expenditures for storm water quality control facilities; and
- Monitoring data.

Reporting to Appropriate Agencies

You will be required under Phase II to submit annual reports to your NPDES permitting authority in the first permit term. The rules provide for more limited reporting in subsequent permit periods. This reporting must contain information on:

- Status of compliance with your permit;
- Monitoring data; and
- Summary of activities to be accomplished the next year.

Are There Other Programs Linked to Your Storm Water Management Program?

Although it is not included in the Phase II requirements, many jurisdictions manage storm water related environmental programs as a part of their overall surface water management program. Many of these programs involve fish, wildlife, and wetlands preservation. In some instances these programs are prompted by endangered species listings. In other instances, these programs are prompted by public input where preservation of environmental resources is an important quality of life issue for the community. It is important to take advantage of the public support that can be achieved for the program by implementing these types of environmental programs.

Local Land Use Policy Links with Watershed Protection

Mount Joy Borough, Pennsylvania, is a small municipality in the Chesapeake Bay watershed. In 1989, the Borough amended its zoning ordinance to provide for and encourage cluster development. Provisions in the ordinance permit cluster development (for residential use only) as follows:

- The cluster development may occur as a unified development of a lot that is 15 acres or more;
- The development must be served by public water and sewer;
- The overall density of the cluster development cannot exceed six units per acre;
- Special consideration will be given to the use of slant curbing to facilitate storm water management controls;
- At least 30 percent of the parcel to be developed must be preserved as common open space, wherever possible making open space interconnected with open space on adjacent parcels;
- The common open space must be improved for active residential use, unless the areas contains natural features, such as wetlands or wildlife habitat;
- The common space must be owned and maintained to ensure its preservation; and
- Depending on the maintenance method, the Borough may request that owners bordering the open space be assessed to provide reserve funds for maintenance or capital improvements of the open space.

This approach helps to ensure that land use in the Borough is compatible with environmental and quality of life priorities of the community and the watershed.

There may also be other mandatory water quality management programs that your community may be required to implement, such as a TMDL (total maximum daily load) on an impaired body of water. The requirements of the TMDL program may be in excess of what you are required to do under your Phase II NPDES permit.

Acquiring Land to Protect Water

As one example of how storm water management programs can link to other conservation and preservation activities, consider the Southwest Florida Water Management District's land acquisition program. In order to enhance water management, improve or protect water supply, or protect water resources, Florida's Water Management Districts are given the statutory authority to acquire land under two programs:

- "Save Our Rivers" Program ; and
- "Preservation 2000" Program.

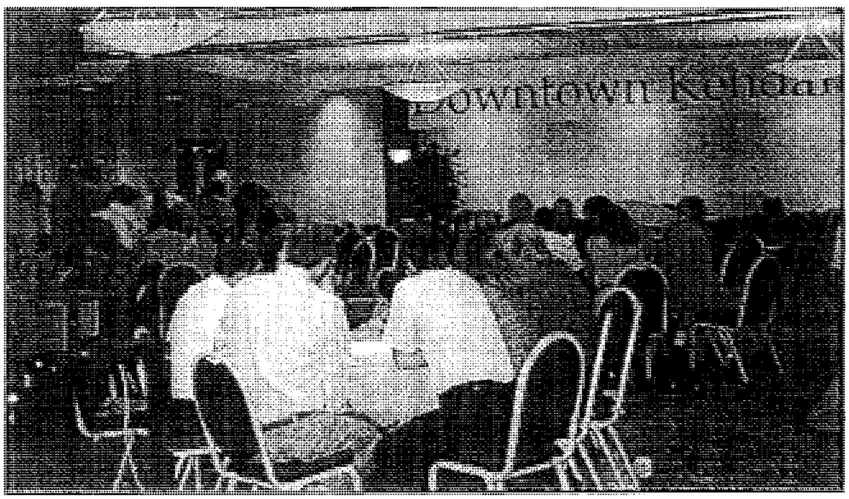
Anyone can nominate land for acquisition, and a site identification model is used to determine which properties would yield the best environmental impact. To date, the Southwest Florida Water Management District has acquired over 268,000 acres of land. A small portion of this acreage - approximately 13 percent - is acquired through conservation easements. Under this approach, owners agree to leave the designated land undeveloped or to develop only minimally on the selected property. The remainder of the acquired land is purchased outright by the District.

Of the land that has been acquired by the District to date, over 95 percent is open for public use. Thus, the acquired land provides recreational opportunities, such as hiking, camping, equestrian paths, biking, boating, and picnics. The District is also using some of the acquired land for cattle, hay management, and timber production.

Is There a Need for Interlocal Cooperation?

Storm water runoff does not start and stop at jurisdictional boundaries. Developing regional solutions for elements of your storm water program will be critical for success. Regional cooperation is discussed in more detail in Chapter 7.

Chapter 4
How Can We Build Support For Our Storm Water Management Program?



As anyone who has ever tried to site a landfill or get political support for major capital improvements knows, finding the right technology is only part of the problem. The same is true with storm water management programs.

Building public support and getting political consensus for Phase II storm water management programs will require planning, communication, and perseverance. This chapter addresses effective strategies to help you involve citizens in decision making, develop public outreach programs that work, and grow support for the storm water management program within your organization, including:

- Defining your target audiences;
- Understanding the importance of stakeholder involvement;
- Selecting a stakeholder involvement approach;
- Developing effective outreach and education programs; and
- Evaluating your public outreach efforts.

Who Needs To Be Involved?

The Phase II rules place certain requirements on your community to develop a storm water management program. Who needs to know about those requirements and have a say in what your program looks like?

At a minimum, Phase II communities must make efforts to involve citizens from diverse economic and ethnic backgrounds in the storm water management planning process. But citizens are just one of the target audiences who need to be involved and educated in order for storm water programs to be successful. Consider the following internal and external audiences who could be affected by your storm water program.

Internal Audiences	*External Audiences*
Elected officials	Builders/developers
Other decision-makers	Private facility owners
Department heads	Environmental activists
Economic development agencies	Taxpayer groups
Public works and planning department staff	Industries that may depend on surface water quality (e.g., tourism, fishing, etc.)
Inspectors Operations and maintenance personnel	Entities who will be most impacted by your selected funding approach
Public information staff	School-aged children/educators
Customer service personnel	General public
Utility billing staff	Neighborhood leaders

Including representatives from major stakeholder groups in the planning process, from visioning to planning, results in "ownership" of a plan and willingness to participate in its implementation. Involving diverse stakeholders can, however, pose some challenges. People will not always agree, and involving many people in the process can add a sense of disorder. Therefore, the process must be managed carefully.

What Is Stakeholder Involvement and What Can It Do for Me?

Stakeholder involvement is allowing those groups and individuals that care about, or will be affected by, your storm water management program's outcome to participate in planning and implementing the program.

"Participation" is a largely subjective word. It means different things to different people. For some people, participation may mean being informed every step of the way, others may only want a project update from time to time, still others will want their voices heard and will want to contribute expertise.

Typically, stakeholder involvement programs fall into two main categories:

- **Procedural:** Procedural programs fulfill federal, state, or local requirements for public involvement through such procedural steps as mandatory legal notices, public meetings, or hearings. Typically, these steps follow substantial effort on the part of the local government in developing a proposed plan or system. The public notices and meetings are designed to explain what will happen unless anyone can show cause why it should not.

- **Substantive:** Substantive stakeholder involvement efforts provide for open dialogue and exchanges of information, expertise, and concerns during planning and implementation processes. This approach allows stakeholders to more thoroughly shape the outcome of the plan or system from the beginning.

Local governments often approach stakeholder participation projects with a degree of trepidation. While almost everyone can acknowledge the potential benefits associated with getting up-front buy-in from residents and other constituents, there are often misconceptions about what stakeholder involvement can and should do. Responses to the concept of public involvement may include:

- We want our stakeholder involvement program to guarantee public support for our preferred plan of action and limit our political liability for controversial programs.

- We already know what needs to be done. Why do we need to involve a bunch of stakeholders who will try to influence us into making decisions that may not be sound in the long term?

- Go ahead and start some kind of citizen involvement committee, but make sure that you don't get any "whackos" on the thing. We just need some reasonable folks who will let us do what we know we need to do.

Phrased another way, some communities mistakenly believe that stakeholder involvement will eliminate controversy. Other communities believe that local governments have the responsibility to take action to protect the environment and public health, with or without public buy-in for those actions. These communities mistakenly believe that stakeholder involvement will automatically "water down" local government resolve to "do the right thing." Still others want to go through the motions of stakeholder involvement, mistakenly believing that a "rubber stamp" committee is a substitute for the give-and-take of real stakeholder involvement.

The solution to this dilemma is relatively simple. Stakeholder involvement is no substitute for leadership and vision. Nor can stakeholder involvement eliminate political risk or guarantee widespread acceptance. Real stakeholder involvement, where participants can affect the course of their community's plan or system, takes time and flexibility. However, the lack of a well-designed and implemented stakeholder involvement program can almost certainly derail projects that are otherwise sound from a technical, economic, and environmental perspective.

> ***"The public will not support you unless you are trusted."***
>
> ***– George Noble, P.E., land use expert***

What is Consensus?

Don't be fooled. Consensus is rarely the same as complete agreement.

A consensus process includes parties who have a stake in the outcome working together and maximizing their ability to resolve differences. When parties reach consensus, it means that they have agreed to accept the total package even though individual stakeholders may not agree with all components of the total package.

Why Is Stakeholder Involvement So Important?

Stakeholder involvement is vital to the success of a storm water management program. Involving members of various groups, as well as citizens at large, helps to ensure that key stakeholder groups feel involved in the decision-making process. As a result, your storm water management program will be more likely to receive widespread support and be implemented successfully. Additional benefits of stakeholder involvement include:

- People with different areas of expertise and philosophies contribute ideas, resulting in well thought-out storm water management programs and better solutions.
- Elected officials are more likely to support programs that have widespread public support or stakeholder buy-in.
- Project planners and decision-makers have the opportunity to think "outside the box."
- Using "citizen experts" helps communities implement change, even in the face of ever-constricting budgets.
- The process of working together helps different groups understand each other's cultures, philosophies, and attitudes, resulting in a more cohesive community.
- Acceptable funding approaches require equity, which can only be accomplished if stakeholders are represented in the planning process.
- Citizens are increasingly demanding to be involved and informed. They have greater knowledge, and expect to be informed of the decisions being made.
- Interested stakeholders can often help sustain the momentum of a project. A "closed" project, on the other hand, typically relies on the enthusiasm of one or more project champions, who are likely to be overburdened government officials or municipal employees.
- Storm water management program approval and implementation is facilitated when stakeholder comments are heard and responded to early in the process.

"Never doubt that a small group of thoughtful, committed citizens can change the world; indeed, it's the only thing that ever has."

– Margaret Mead

How Can I Involve Stakeholders?

Approaches to stakeholder involvement vary widely depending on your storm water management problems, how you want to implement your program, and the resources of your community. Typical stakeholder involvement strategies fall into two categories: (1) those that promote information exchange; and (2) those designed to collect information.

Stakeholder Involvement Strategies that Promote Information Exchange

Promote Information Exchange	***Collect Information***
Community visioning	Surveys Focus groups
Commissions and standing advisory committees	Commissions and standing advisory committees
Task forces, blue ribbon panels, and other special committees	Task forces, blue ribbon panels, and other special committees
Community meetings	Public hearings
Charrettes Public hearings	

Stakeholder involvement strategies can accomplish two important goals at once by allowing you and your staff to provide information to stakeholders and local leaders at the same time that you are collecting information about local needs and values. Examples of these interactive approaches are described below.

Community visioning processes: Most common when a community is undergoing a comprehensive planning process, community visioning allows diverse stakeholder groups and representatives from the general public to participate in policy making that could affect multiple areas of community life. While public works staff is less likely to initiate a community visioning process, the need to develop a storm water management plan can facilitate a broader planning process. Alternatively, a community visioning process may already be underway within your community on a parallel track - being spurred by concerns such as transportation, or growth management, for example. One important element of developing a community vision is getting stakeholders to help define local environmental values. Storm water management programs and related environmental programs will be affected by this local vision.

Commissions and Standing Advisory Committees: Many communities already have environmental commissions or similar standing committees, such as environmental or public works advisory committees. These groups typically comprise volunteers and receive support from governmental staff or other paid advisors.

If you don't already have this type of permanent community outreach mechanism in place, you may need an ordinance or proclamation from your elected body to establish the commission or committee. Typically, members will be appointed for specific terms and provide non-binding input to your elected officials. You may select members based on their personal interest in participating, one or more areas of relevant expertise, and/or their ability to represent one or more constituent groups. You can use these groups to help address specific issues, such as storm water management planning and implementation.

Creating a Community Vision

'Would you tell me, please, which way I ought to go from here?'

'That depends a good deal on where you want to get to,' said the Cat.

'I don't much care where' said Alice.

'Then it doesn't matter which way you go,' said the Cat.

- Lewis Carroll, Alice in Wonderland.

A community vision is a "wish list" of what citizens want for their community. In most instances, results from discussions of representative groups of stakeholders are synthesized into a community vision statement or vision points, which ideally lead to actions toward achieving the goals of the vision. Key characteristics of an effective vision statement include the following:

- Focuses on a time period 15 - 25 years into the future;
- Uses strong visual descriptions;
- Uses positive, present tense language;
- Gives a sense of what is unique about the community;
- Encompasses the desires of diverse community members;
- Is easily understood; and
- Focuses on people and quality of life.

Task Forces, Blue Ribbon Panels, and Other Special Committees: You may want to establish a special committee, panel, or task force to help solve a particular planning challenge. These types of committees are usually invited to form at the request of the local elected body, with a specific intent, timeframe, and outcome in mind. For example, a storm water management planning committee could be formed as a subset of an existing standing committee or as a new temporary entity. Again, you would seek volunteers who would represent the diverse interests of your community and/or contribute specific expertise to the process.

Some Key Steps to More Effective Committees

Establish a mission statement, including: What is the role of the committee? What are the specific tasks to be accomplished? Under what timeframe? To whom does the committee report? What is the structure of the committee?

Determine what guidelines or requirements will affect the committee, including open meeting laws, open record laws, public notice requirements, ADA accessibility regulations, and financial disclosure requirements

Define resource needs, including facilitation services, meeting rooms, audio-visual equipment, staff time, and consultant or advisor input

Develop a stakeholder assessment, including: Who will be affected by the decisions made by the committee? How will those stakeholders be included in the process? How will decisions and outcomes be communicated to stakeholders?

Develop a recruitment plan, including establishing demographic goals for the committee, a timeline for recruiting all members, and a clear appointment or application process Develop a "job description" for committee members, including: a statement of responsibilities, a clear definition of the role members will play, a statement of how much time is involved, and information on how the process and outcomes will be evaluated

Develop committee guidelines, including clarifying conflicts of interest, defining representation and reporting, and defining how the open process will work (for example, will input from non-committee members be accepted throughout committee meetings or at specified times?)

Develop communications guidelines, including distribution of minutes, notice of meetings, press releases and other communication with the print and broadcast media, and updates to other committees or elected officials

Establish evaluation/reporting procedures, including self-evaluation by the committee, constituent evaluation, evaluation by the originating bureau or official, and follow-up reports stating the impact of he work of the group

Source: Adapted from "Committees, Some Important Considerations" in An Outreach and Involvement Handbook for City of Portland Bureaus. Office of Neighborhood Associations, City of Portland, OR.

Community Meetings: Neighborhood associations meetings, civic groups, religious organizations, and business-related coalitions (such as Chambers of Commerce or trade groups) typically conduct regular meetings that can provide an opportunity to share information about storm water management planning and hear local stakeholder concerns. In addition, you may want to call a series of special community meetings to publicize your planning process and get needed feedback. You will probably want to develop a presentation that includes slides, overheads or other visual aids that can help meeting attendees grasp the importance of storm water management planning to clean water and other environmental issues. You can use techniques, such as consensus voting, to encourage meeting participants to rank their ideas and comments related to the storm water management program. You may also want to train a cadre of select volunteers who can make presentations as well. This approach can extend limited staff resources.

Simple Rules for Meeting Success

- Pick a meeting location that is accessible, has breathing room, and is stocked with needed equipment (electrical outlets, AV equipment, easel and pads, markers, masking tape, etc.).
- Confirm meeting times, sending reminders to key participants.
- End every meeting with an action check (What did we accomplish or agree on? What will we do at our next meeting? What follow up is required? Who will do what?)
- Bring extra copies of agendas and any other materials that have been sent to invitees in advance.
- Develop and use meeting agendas; start every meeting with a recap of the intended purpose and agenda items.
- Develop meeting summaries to document decision, agreements and consensus and define action items.
- Notice if someone is not participating — ask for his or her opinion directly.
- Notice members who come late, leave early or miss meetings. Confirm the importance of their participation in the process.
- Start and end on time.

Charrettes: A charrette is an intensive planning process that includes interaction of technical experts, affected governmental agencies, and citizens or other stakeholders. A planning charrette could include a full-day meeting with representatives from the community and a full-day meeting of representatives from various governmental departments, with a follow-up feedback meeting scheduled with community members. As a result of these focused meetings, recommendations for plans, projects, and codes can evolve. Charrettes can provide a forum for non-technical stakeholders to interact in small groups with planners, engineers, architects, and other related professionals who understand the technical issues of storm water management systems and actively work on a plan for your community.

Ground Rules for an Effective Charrette (Public Involvement Component)

- Go fast—produce lots of ideas
- Don't get hung up on intricate details
- Don't just say it – put it on paper (sketch or write)
- Everyone can write or draw at once, but everyone can't talk at once
- No one cares how well you spell or draw
- Build up ideas – don't say "no" to ideas yet
- Stay positive, don't complain – make a suggestion instead
- Be respectful – everyone's ideas count
- No speeches
- For at least the day, everything is on the table – pretend the sky is the limit

Public Hearings: Often a procedural requirement, public hearings are a more formal way to get stakeholder feedback. You may ask interested parties to submit questions or comments in advance.

Stakeholder Involvement Strategies for Collecting Information

Some stakeholder involvement approaches are designed specifically to collect information and opinions from stakeholders without providing a lot of information or direction. Examples of these approaches are discussed below.

Surveys: A good way to find out how much a broad audience knows about storm water management issues or how they might feel about specific storm water management strategies is a survey. You can develop a specialized survey that focuses specifically on storm water management issues, or you may want to include related questions on a broader survey that addresses a wide range of municipal plans, policies, and services.

Focus Groups: Used to collect more subjective information from stakeholders, focus groups can provide more in-depth information about how and why customers respond to a storm water management policy or outreach strategy. Typically not represented as "statistically valid," focus groups instead provide a richer context of information in which to evaluate stakeholder reactions.

Which Stakeholder Involvement Strategy is Right for Our Community?

The answer to this question depends on many locally specific factors, including:

- Time and resource availability
- Local experience with various stakeholder involvement techniques
- Flexibility and willingness on the part of decision-makers for stakeholders to significantly affect the outcome of the planning process

A combination of approaches may be most appropriate, as different involvement strategies may seem best at different stages in your storm water management program development. Remember the importance of internal stakeholders as you evaluate involvement strategies.

Survey Savvy

- How do you select a survey approach?
- What makes a good survey?
- How many people should you survey?
- How many responses should you expect?

The answers, of course, vary with your program goals, the amount of time and money you have available, and local demographics. Typically, however, some of the following guidelines can be helpful.

- **Survey approach** – Direct mail surveys typically involve less direct staff time than phone surveys, but often have a lower response rate. However, local governments that send out direct mail surveys under the signature of a high-ranking official have found that their response rates have been impressive. While standard industry wisdom would suggest that response rates to most mail surveys fall in the 3 to 10% range, many local governments receive responses from 30 to 50% of the survey audience. In addition, many local governments are increasingly sensitive to the potentially intrusive nature of phone surveys – especially given the increase in direct phone solicitations and computer-generated phone sales techniques that are prevalent today.

- **Designing the survey** – Almost anyone can design a survey. But designing a GOOD survey is a specialized skill. To make sure that you have minimized survey bias and that you are asking the right questions in the right way, you may need to rely on the help of survey professionals. Local universities, public relations firms, or market research firms can all be excellent sources of expertise in survey development.

- **Open-ended questions** – Open-ended questions, such as "What can we do to improve storm water management in your neighborhood?" provides residents with the chance to document specific problems and provide more qualitative feedback. If residents believe that these questions will result in positive actions, it may increase your response rate and provide valuable information about specific storm water concerns in your community. On the flip side, open-ended questions are more difficult to tabulate and use to draw conclusions.

- **Selecting the sample** – For most fairly homogenous populations, a survey sample of 300 to 400 responses is considered sufficiently large to be statistically representative. To determine the best sample size for your community, consult with market research firms or universities in your area. Statisticians can work with you to develop criteria for sample selection that meet the needs of your survey effort and population.

Communication is Key in Stafford Township, New Jersey

High levels of citizen involvement are not dependent on Madison Avenue-style advertising or big city budgets. Small communities often have the advantage of accessibility in their favor.

In Stafford Township, a community on New Jersey's coastal plain with fewer than 20,000 residents, a comprehensive storm water management program was implemented over a decade ago. To get buy-in for their ordinance and plan, the Township used several stakeholder involvement approaches:

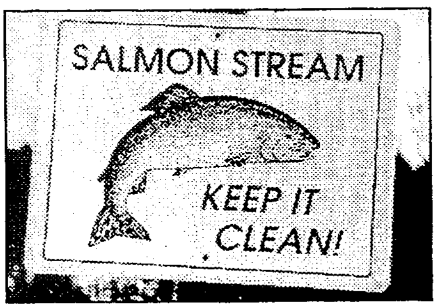
- **Special task force:** An Auxiliary Environmental Commission was formed to assist the standing Environmental Commission in evaluating storm water management practices and developing the recommended plan.
- **Community meetings:** The Mayor and members of the Environmental Commission made presentations about the program to civic, community, and religious groups throughout the Township.
- **Surveys:** Citizens were surveyed to assess their understanding of storm water management issues and gauge approval for the storm water management initiatives under consideration.

"Communication is the key to our success," notes Mayor Carl Block. "We get a lot of media coverage and spend a lot of time talking with people about our environmental programs." In an era where many local governments fear getting tough on environmental issues, Block notes that the Council member who consistently gets the most votes in each election is the man behind their strict environmental codes.

Getting the Word Out

Stakeholder involvement is only half of the story. The Phase II regulations require that you use public outreach as a component of your storm water management program. You will probably want to develop public education strategies to accomplish these key goals (at a minimum):

- Increase general awareness of storm water and the importance of storm water management;
- Inform the public about the specifics of your storm water management plans, policies, and systems; and
- Increase awareness of things that residents and businesses can do to improve water quality and volunteer their resources.
- Common outreach strategies could apply to either element of your public information plan.



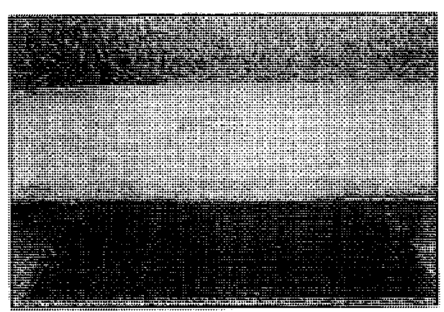


Illustration Source: Hampton Roads Planning District Commission, *Nonpoint Source Pollution... Be Part of the Solution: A Guide for Hampton Roads Citizens.*

Sample Public Information Strategies

Media Relations
- Press releases
- Media kits
- News conferences and related media events
- Articles and editorials
- Editorial Board meetings
- Appearances on local television, city cable channel, or radio programs

Advertising/promotion
- Logos/mascots/themes
- Print and broadcast public service announcements
- Paid advertisements
- Legal notices
- Illegal dumping hotline

Special events and public forums
- Environmental fairs
- Clean-up days
- Conferences or symposia
- Other speaking engagements

Direct mail
- Brochures
- S Flyers
- Utility bill inserts
- Newsletters Signage
- Drain stencils/signs
- Manhole labels
- Point of purchase displays

Educational Programs (Schools)
- Field trips
- Educational curricula. Use of volunteers
- Water quality monitoring
- Labeling storm sewer inlets
- Adopt a Tree, Adopt a Drain, Adopt a Highway, Adopt a Stream programs
- Clean up programs

Volunteers to the Rescue

Many communities have implemented volunteer programs that address storm water management issues. Some of these programs may already be operating in your state or locality, for example:

- Lakewatch -- a statewide program in Florida that recruits volunteers to monitor the water quality of lakes.
- "Adopt-A-Tree" Program – Stafford Township, New Jersey has implemented this program, and as a result 1,000 trees have been planted in the community in the past 8 years.
- "Adopt-A-Highway" Program – Many communities, including Griffin, Georgia, implement this program in which community groups take responsibility for cleaning certain stretches of highway, resulting in less debris in waterways.
- "Adopt-A-Stream" Program – Like Adopt-A-Highway, volunteer groups take responsibility for properly maintaining a stretch of stream.
- Waterwise Program – In Virginia, the Extension Service offers this program, which teaches residents how to treat lawns and gardens with water quality in mind. Similar programs exist through county extension offices in other states.

Picking the Right Channel

Deciding which combination of public outreach strategies is most appropriate in your community will depend on your target audience and the resources that you have available to design, distribute, and pay for public information materials. Many of the items listed above are available for little or no money, but staff time will be required (for example, to develop relationships with your local media contacts and respond to media inquiries).

It is important to match your distribution medium with your target audience. For general information about your program, your will want to ask yourself: "How do people in this community get information about government services and programs now?" You may have a sense of the answer to this question from previous surveys or your general understanding of the community. Local opinion leaders may also be able to provide insight.

In addition, you may want to launch special educational programs designed to address specific storm water problems in your area. For example, if you want to remind do-it-yourselfers that automotive fluids should not be dumped down storm drains, you may consider several specific media:

- Point of purchase displays at local retailers where motor oil and antifreeze are sold;
- Signs or stencils on storm drains (perhaps in multiple languages, depending on your local demographics); and
- Public service announcements that air during prime commute times or during popular sports or automotive programming.

You don't need to be a media expert to take advantage of Madison Avenue know-how. Your local newspapers, magazines, and radio stations already track detailed information about who views or listens to their programs or reads their materials. This information includes not only demographics (such as age, education, and income level), but also spending habits, reading/listening/viewing patterns, and related behavioral information. This type of data is called "psychographics," and the psychographic profiles in your media market are available to you for the asking. Armed with this information, you can design a public education program that best meets the needs of your target audiences.

> ***"The best approach to take in our overcommunicated society is the oversimplified message."***
>
> ***– Al Ries and Jack Trout, Positioning: The Battle for Your Mind***

Choosing the Right Message

"A picture paints a thousand words" may seem trite, but it couldn't be more apt.

If you serve communities with language or literacy barriers, drawings, photographs, and symbols will be critical to your public information materials. Clear, easy-to-follow guidelines with concise pictures or illustrations will help to minimize confusion and promote more widespread understanding of your message.

> ***"The mind rejects new information that doesn't 'compute.' It accepts only that new information which matches its current state of mind. It filters out everything else."***
>
> ***– Al Ries and Jack Trout, Positioning: The Battle for Your Mind***

Even if language or literacy challenges are not an issue in your community, most people have little time for reading complicated sets of instructions or densely written documents. Your information will be competing with thousands of other messages.

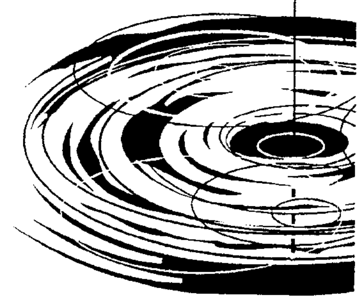
Consider the fact that the average American consumes over 94 pounds of newsprint per year — that's more than 10 million words per year from the newspaper alone. When you couple that estimate with 750,000 television images viewed by the average American EACH DAY, you begin to understand the importance of clear and simple messages that can help blast through our clogged communication highways.

What's the Appeal?

There are three main types of messages - those that use rational, emotional, or moral appeal.

- **Rational:** These messages are directed to the rational self-interest of the audience and are used to demonstrate the functional benefits of storm water management. For example, "Proper storm water management helps prevent water pollution and environmental degradation."

- **Emotional:** These messages encourage support for storm water management by stirring up emotions. For example, "Would you drink water contaminated with dangerous chemicals? Without a storm water management plan, every rain shower carries motor oil, bacteria, pesticides, and other chemicals from our neighborhoods into our water supply."



- **Moral:** These messages appeal to a person's sense of what is right or wrong. For example, "It makes sense to invest in effective storm water management systems now, rather than leaving a legacy of pollution and expensive remediation for our children."

The WII-FM Test

According to Susan Peterson, a media consultant in Washington, D.C., WII-FM is a "communication channel" that everyone in North America tunes in to every day. Sound impressive?

In order to get your messages on the WII-FM channel, they have to pass a simple test. It's been nicknamed the WII-FM (pronounced whiff 'em) test by Peterson and her associates. What's involved?

WII-FM stands for What's In It For Me.

To be effective, your informational materials must communicate the need for a storm water management program to stakeholders in ways that are meaningful to them.

Too often, we tell our customers what the changes mean to us. For example, we might say "In order to meet federal mandates, we must assess a fee to households and businesses for developing and maintaining a storm water management system." This message emphasizes the burden placed on the local government by the federal mandate. But it does little to address the concern/needs of the ratepayer. In other words, it fails the WII-FM test.

A better message might be: "Clean water is important to all of us. Every building and paved surface in our community contributes to increased storm water run off. This run off carries pollutants and contaminants that can foul our water supplies and negatively affect the entire watershed. A small fee is being assessed, based on the amount of impervious surface on each property, to help pay for needed storm water controls. This small fee will help protect one of your most precious resources – clean and abundant drinking water. Isn't it worth the price?"

Be Prepared

Public meetings may provide an excellent opportunity to explain your storm water management program and get stakeholder feedback. However, if elements of your proposed storm water management plan are controversial - for example, storm water assessments or related development impact fees - it is important to be prepared for the possibility of public hostility and negative media coverage.

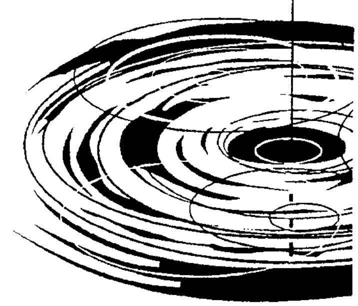
Media consultants suggest a preparation technique known as "rolodexing." The steps are simple:

- Identify likely areas of concern.
- Get your technical facts straight. Have facts and figures at your fingertips.
- Brainstorm your possible responses to those concerns (using the WII-FM technique described above).
- Pick up to three of the best responses and hone them to sound bites.
- Write the sound bites on a rolodex or business card (the small size will make it easy to carry and will limit the number of words that you use).
- Practice. Remember — tone of voice and body language account for over 90% of an audience's response to your message.
- Remember that groups who oppose your storm water management program may be well-funded, with spokespersons that are comfortable in front of the camera. You need to take advantage of similar levels of media savvy.
- Consider the use of consultants to add technical credibility and help "take the heat."

Can You Believe It?

Source credibility is a factor that affects how audiences will perceive your message. Three factors will typically determine a speaker's perceived credibility. You should carefully weigh these factors as you select one or more spokespersons for your storm water management program.

- **Expertise:** Does your spokesperson have the authority to back up what he or she claims?
- **Trustworthiness:** Is your spokesperson likely to be perceived as honest and objective? Will audiences believe that he or she has a hidden agenda or ulterior motives?
- **Likability:** Does your spokesperson have personal charisma? Do people generally like him or her?



Evaluating Your Public Outreach Program

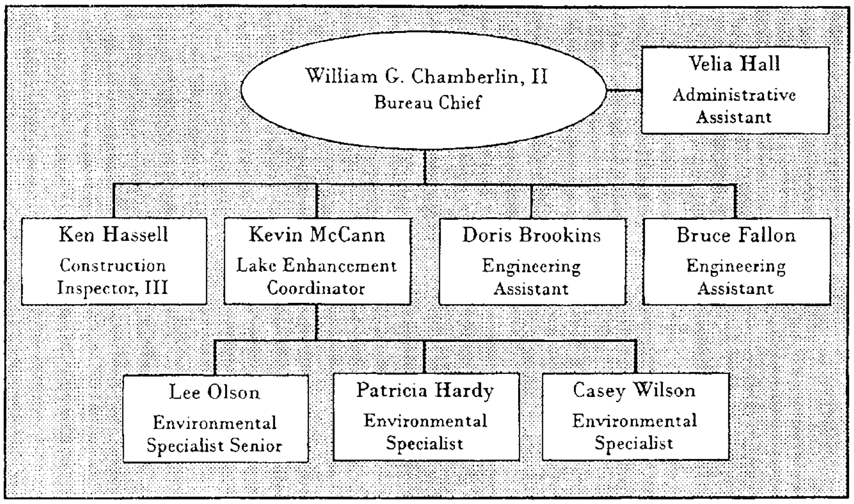
How will you know if your public outreach program is effective?

Annual surveys can help assess how levels of awareness of storm water management issues have changed. Other strategies that can help you monitor effectiveness include:

- Tracking media coverage;
- Tracking requests for publications, speakers, and information about storm water management that come into your agency;
- Tracking responses to "how did you hear about our program?" inquiries;
- Tracking the number of volunteers or groups/citizens involved in your clean up programs or drain labeling programs;
- Tracking changes in enforcement patterns (e.g., increases or decreases in violations of your ordinances);
- Surveying residents and businesses to document changes in levels of awareness and/or behavior; and
- Collecting anecdotal and informal information from staff, stakeholder groups, and your own interaction with representatives from the community.

> ***"You have to do more than just get your message in the media; you have to design a message that will have an impact on the audience."***
>
> ***– Dr. Pete Sandman, Communication Theory and Persuasion***

Chapter 5
What Type of Institutional Framework Will Work for Our Community?



- Who will develop your storm water management program and select locally appropriate BMPs for the minimum control measures required under Phase II?
- How will program responsibilities be shared?
- Who will be responsible for monitoring the program and fulfilling reporting requirements?
- Who will develop and manage the budget for the storm water program?

As you consider the answers to these questions, there are a variety of institutional frameworks available to you, and no one approach is inherently better than another.

In order to select the approach that is right for your community, you must examine the characteristics of your community, determine which structure will best suit local needs, and assess which structure will work most successfully within your resource base.

R0019069

This chapter addresses organizational and institutional issues related to implementing a Phase II-compliant storm water management program, including:

- Strategies for developing and implementing a storm water program independently, assuming the responsibility for addressing all six minimum control measures internally; and
- Strategies for seeking cooperation of an umbrella entity, such as a county, commission, or regional district.

Chapter 6 addresses funding strategies, which are closely related to organizational structure.

Internal or External?

An internal program is a program housed in within your jurisdiction. External programs are administered outside of the boundaries of your jurisdiction. Your storm water management program may rely solely on internal resources, or you may find it beneficial to use a combination of internal and external resources to achieve your storm water management objectives.

Internal Programs

If you will be developing and managing your storm water management program with local governmental resources, you may select one internal entity to design and implement your program. Alternatively, several departments or entities within your municipality may work jointly. Common approaches to storm water management program organization at the local level include:

- Developing a storm water department;
- Giving responsibility to a multi-functional department, such as the public works department;
- Sharing responsibility for implementing the program among several departments within your community; and
- Creating a storm water district.

Each of these alternatives is discussed briefly in the sections that follow.

Storm Water Department

Some communities form a storm water department to perform most or all of the functions required in a storm water management program. Forming a storm water department generally requires that a group of staff be dedicated solely to storm water management activities. This group of staff is usually responsible for program administration but may share the responsibility of implementing some elements of the storm water program with other departments.

The obvious advantage of forming a storm water department is the availability of dedicated staff resources to focus exclusively on storm water management issues. However, most smaller communities may have difficulty justifying establishing a separate department. In many areas of local government, consolidation among departments is the trend, designed to reduce administrative requirements and achieve economies of scale between departments with common functional responsibilities.

Department of Public Works

In many Phase II communities, the department of public works will take the lead role in developing and implementing a storm water management program.

Because critical departments –such as engineering, code enforcement, and streets and maintenance - often fall under the authority of the public works department, this arrangement makes sense. In addition, the department of public works generally has the proper equipment to construct and maintain storm drains and storm water conveyance systems. Another advantage to coordinating your storm water management program through the public works department is the natural synergy between streets and drainage systems. Conveyance systems and storm drains are located along streets, so coordinating repair and maintenance is crucial to program cost-effectiveness.

Alternatively, because public works is a multi-functional department, your storm water program may not have dedicated resources - people and equipment will be shared for different types of projects. In most small communities, however, the need to share staff and equipment among programs is nearly universal.

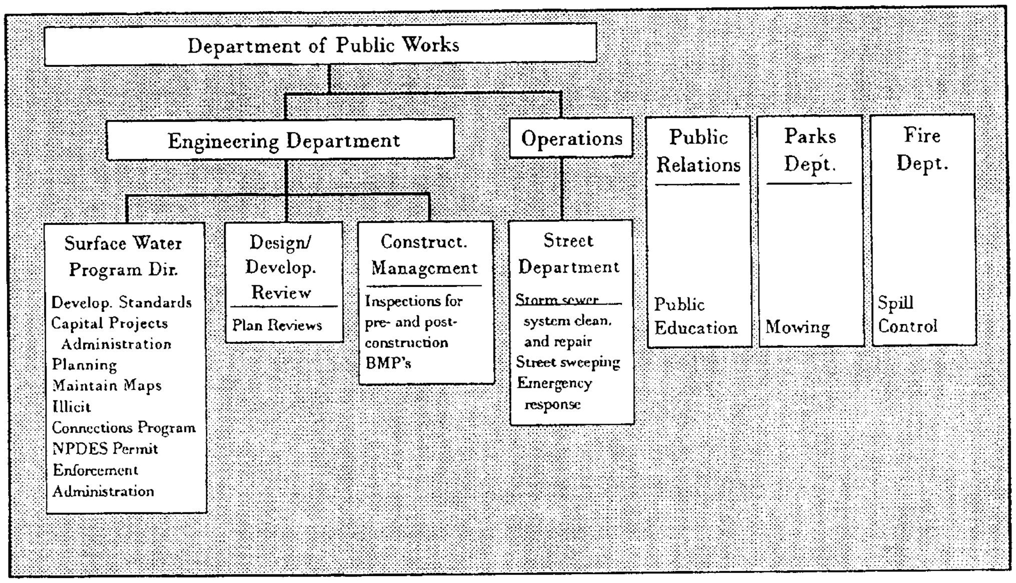
Housing your storm water program under the department of public works makes particularly good sense if your community:

- Does not have the resources to establish a new department, such as a storm water department;
- Already has a public works department that handles streets and drainage, engineering, and code enforcement activities;
- Can perform storm water management functions in the most efficient manner by using existing and possibly additional resources within the department; and
- Does not have access to a regional entity that would implement a comprehensive storm water management program on your behalf.

When storm water management falls under the department of public works, a staff person within the department may be designated as the lead person to ensure that all aspects of the program are being accomplished. For example, many communities designate the City Engineer or a deputy engineer to coordinate all aspects of the storm water management program.

It is important that all sub-departments within the department of public works maintain good communications with each other regarding storm water projects. An inter-departmental newsletter, regularly scheduled meetings, a storm water bulletin board, and other informational resources dedicated solely to storm water management could prove helpful.

Sample Organizational Chart



Intra-Departmental Cooperation

Because storm water has an impact on (and is impacted by) so many other resources and aspects of your community, your storm water management program may require the coordination of several different departments.

Coordinating between different departments can be challenging, but often it is the most logical approach - particularly in communities with limited resources. Naturally, combining resources from a variety of departments to manage one program requires excellent communication and clear understanding of who is responsible for implementing which elements of the program.

R0019072

Barriers to Cooperation

In 1987, the Watershed Management Institute surveyed 30 jurisdictions (combination of state, regional, county, and municipal governments) to assess the impacts of various institutional arrangements on storm water and sediment and erosion control programs. Over 70 percent of the respondents noted that there were conflicts with other programs than hindered effective implementation of storm water management programs.

Common challenges included:

- Ideological differences between advocates of development and advocates of increased environmental protection;
- Conflicts between wetlands management and storm water management (typically found when wetlands are filled or converted to open ponds);
- Conflicts with roads departments related to transportation corridor planning. Because storm water BMPs are often land-intensive, roads departments may be required to obtain more right-of-way, which increase costs. In addition, if roads departments are assessed storm water utility fees (see Chapter 6), additional tensions could arise; and
- Conflicts with other environmental programs that may be competing staff resources, funding, volunteer assistance, and public support. Overlapping areas of responsibility are sometimes a key cause of tensions between environmental programs, as well.

Although it is not necessary to interact with all of the following entities to meet the requirements of the Phase II storm water management regulations, a mature, comprehensive storm water management program might include interacting with the following departments within your community:

- Department of Public Works
    - Streets and roads maintenance
    - Municipal good housekeeping measures
    - Storm sewer system maintenance
    - Street flooding issues
    - Household hazardous waste program
- Sanitary Sewer Department
    - Detect illicit discharges and connections

- Engineering
  - Inspection/design permitting
  - Erosion and sediment controls
  - Construction contract administration
  - Code enforcement
- Department of Education
  - Public education activities for school-age children
- Department of Parks and Recreation
  - Mowing detention ponds
- Fire Department/Police Department
  - Illicit discharge detection
  - Spill containment
- Other municipal departments
  - Planning
  - Building Inspection
  - Accounting
  - Legal
  - Administrative
- Neighborhood organizations
  - Public outreach/education activities
  - Citizen involvement

When in Rome...

The City of Rome, GA, is an example of a community that implements their storm water management program with the cooperation of two departments.

The Public Works Department is responsible for most of the plan, including public education and developing pre-construction and post-construction storm water requirements. The Code Enforcement Division, under the Department of Building Inspections, undertakes inspection and enforcement activities. In addition, the Code Enforcement Division conducts illicit discharge monitoring. Citizens are supposed to direct complaints to the Code Enforcement Division, however, if the Department of Public Works is contacted, they forward the information to Code Enforcement.

When a developer applies for the proper permits, the storm water management plans are submitted along with the permit application to the Division of Code Enforcement. Code Enforcement ensures that all information is complete, then sends a copy of the storm water management plan to the Engineering Department, which is part of the Public Works Department. The Engineering Department ensures that the plan is adequate, then sends a copy back to the Code Enforcement Division, along with a letter stating that the plan is acceptable. The Code Enforcement Division is then responsible for permit issuance and enforcement. Code Enforcement staff conduct weekly on-site inspections of ongoing projects and have the authority to issue notices of complaint, notices of violation, and citations if proper BMPs are not followed.

City staff report that the arrangement works out fairly well, and both the Public Works Department and the Code Enforcement Division realize that cooperation is needed in this small city of 31,000 residents. Neither entity has the resources to implement the entire program single-handedly.

External Programs

In many cases, communities have found it advantageous to pool resources to more effectively design and implement storm water management programs. You may decide to be responsible for some or most of your storm water management program elements, but that other elements - such as some aspects of public education, or construction of regional storm water management facilities - may be appropriate for regional entities that are external to your program. Examples of such regional entities include quasi-governmental entities and other forms of inter-governmental cooperation. Additional discussion of regional cooperation is presented in Chapter 7.

Quasi-Governmental Entities

Many communities throughout the country have formulated special districts, commissions, and authorities to establish and implement storm water projects. State enabling legislation may be necessary to form such entities. Special districts, commissions and authorities may be formed along watershed boundaries, or may consist of a group of municipalities. The functions that these quasi-governmental entities undertake vary widely. In some cases the entity addresses a broad array of water issues - such as flooding, drainage, and water quality. In other cases, the entities focus on a much more specific concern, such as the quality of water in shellfish beds or diking practices.

Examples of quasi-governmental entities that address storm water issues include:

- The Urban Drainage and Flow Control District (Denver, CO)
- Water Management Districts (five such districts have been created by the Florida State Legislature)
- The Hampton Roads Planning District Commission (VA)
- The Green River Flood Control District (WA)
- Kent County Conservation District (DE)
- Kitsap County Shellfish Protection District (WA)
- Lake County Storm Water Management Commission (IL)

Regional Planning for Hampton Roads

The Hampton Roads Planning District Commission (HRPDC) in Virginia serves as a regional cooperative effort for its fifteen member cities and counties. The HRPDC Stormwater Management Committee meets monthly to cooperate on a variety of storm water management programs. The committee is made up of: (1) representatives from each of the fifteen member communities; (2) a representative from the Hampton Roads Sanitation District, which provides monitoring and laboratory analytical support for the permitted communities' programs; and (3) a representative from the Virginia Department of Environmental Quality.

The meetings provide a forum in which members can share information and education regarding storm water management projects. The six Phase I permitted communities are providing significant education to the non-permitted localities, which are expected to be affected by the Phase II regulations.

The following activities take place at HRPDC Storm water Management Committee Meetings:

- Representatives of state and federal agencies brief the committee on developing issues, regulatory guidance and technical programs.
- Localities exchange information regarding their experiences with various funding mechanisms.
- Educational materials, such as pamphlets and promotional items, are exchanged. Communities may adapt the materials, giving appropriate credit to the community that developed the material, and use it in their own program.
- The six permitted communities participate in a joint water-sampling program through the Hampton Roads Sanitation District.
- The communities participate in the Hampton Roads Tributary Strategies Project, which aims to work with the state and others to reduce nutrient loadings to the Chesapeake Bay.

In addition, other examples of HRPDC's activities include:

- The six permitted member communities are implementing programs in response to Virginia's Chesapeake Bay Preservation Act.
- The member communities are pursuing a comprehensive Regional Watershed Management Program, which will focus on protection of surface water components of municipal water supplies.
- The HRPDC Newsletter includes brief status reports on the storm water programs. The newsletter is distributed quarterly to local government officials, citizen groups, business groups, and state federal legislators.
- The HRPDC developed an educational booklet, Nonpoint Source Pollution...Be Part of the Solution: A Guide for Hampton Roads Citizens.
- The Regional Storm Water Management Committee actively participates in the state and federal regulatory process.

Some advantages of quasi-governmental entities are:

- They provide an opportunity for several communities to share ideas, expertise, and oftentimes funds for special projects.

- Often the quasi-governmental entity takes a leadership role and provides member communities with technical assistance and expertise that otherwise would not be available to them.
- A dedicated, unified funding source is created, protecting funds for storm water management projects and removing competition for money.
- A watershed approach is facilitated - important because storm water from one community can have an impact on many other communities.

Some of the disadvantages of a quasi-governmental agency implementing the storm water management program include:

- It may be difficult to prioritize projects.
- The district or commission may not be located close to certain communities, making them feel "out of touch."
- It may be difficult to decide on funding methods and proportions.

Inter-Governmental Cooperation

In some cases, jurisdictions will cooperate directly with each other to implement storm water management projects. One community may take a leadership role, or two neighboring communities may simply develop a partnership.

The cities of Orlando and Maitland, Florida, for example, maintain a good rapport and share test results of water quality experiments. In this manner, they avoid duplicating efforts and can learn from each others' experiences. Orange County and the Cities of Orlando, Maitland, and Winter Park (FL) also have round table discussions from time to time. These discussions allow the communities to share information regarding the issues that they all face and to learn from each other without having to duplicate efforts. The participants find these discussions very helpful.

In some communities, the state takes on a role. Many state environmental regulatory departments, for example, will provide technical assistance, training and grants for certain aspects of your storm water management program. Many states, too, have already implemented other regulations related to storm water, such as strict erosion and sediment control programs (such as Maryland and Delaware) and may offer training to developers.

Some counties also take the lead in helping local governments to cooperate. This leadership may take the form of serving as a lead agency for watershed planning or providing other regional needs.

Regional Cooperation - Who Should Get What?

Deciding how resources should be allocated to projects can be challenging for quasi-governmental agencies implementing storm water programs. The Lake County (IL) Storm Water Management Commission has devised the following prioritization criteria grid to help decide which projects to help fund.

		Project 1			Project 2		
Rank	**Prioritization Criteria**	**Weight**	**Score**	**Total**	**Weight**	**Score**	**Total**
1	Benefits multiple jurisdictions/has multi-jurisdictional impacts/drainage area > 100 acres	25%					
2	Beneficial results/ impacts for up to 100 year flood event	20%					
3	Remove, elevate or floodproof buildings	15%					
4	Improve surface water quality using BMPs	15%					
5	Natural resource protection/emphasis on non-structural strategies	10%					
6	Alleviates major nuisance flooding and/or blocked transportation access	5%					
7	Provides multiple use benefits	5%					
8	Utilized federal/state funding	5%					

Score: 0=no effect, 1=minimal effect, 2=below avg. effect, 3=avg. effect, 4=above avg. effect, 5=maximum effect practicableTotal=Score x Weight

Some advantages of taking an "external approach" to storm water management include:

- Expertise and resources can be combined to effectively plan and implement projects;
- A regional or watershed approach can be utilized, so that communities who have an impact on each others' watersheds are working together, not isolated from each other; and
- Programs can be carried out more cost-effectively.

Some challenges posed by taking an external approach include:

- Deciding how to fund joint projects can be challenging.
- You may feel disconnected with some external players, such as state agencies.
- Proper communication and establishment of roles and responsibilities is essential.

While there is no one right or wrong way to implement a storm water management program, there are certain activities that will promote a productive relationship between the entities involved. These activities include:

- Have one person responsible for overall coordination of the storm management program. Ensure that all departments involved know who the "program manager" is.
- Have one person responsible for the NPDES permitting portion of the program. This person may be the program manager or someone else.
- Ensure that needed ordinances or agreements that clearly define responsibilities and authorities of the cooperating entities are in place.
- Solicit the input of all involved departments while developing the storm water management program.
- Clearly define who is responsible for implementing what portion of the storm water management program.
- Discuss monitoring and reporting requirements in advance. Establish who will be responsible for keeping records, how records will be kept, and how often they will be submitted to the NPDES permit coordinator.
- Establish how activities will be funded.

- Establish an accounting system in advance. If storm water activities have a separate account, ensure all participating departments are able to charge storm water activities to the storm water account. Employees should also be informed of changes in procedures.

There are a number of advantages and disadvantages to various approaches to storm water management. In all likelihood, your program will incorporate a combination of those approaches that best meet your community's needs.

Choosing the Right Approach for Your Community

It is important that when you choose your storm water management institutional framework, that you consider the following:

- What resources (expertise) currently exist in your community?
- Where are the functions that relate to storm water management currently housed?
- Are there neighboring communities with similar storm water issues?
- Is there a regional group that could implement or help with such a program?
- Are there particular storm water issues that pertain to your community?
- Are there state or federal programs that could interface with your community's program?

Advantages and Disadvantages of Various Organizational Approaches to Storm Water Management

	Advantages	Disadvantages
Department of Public Works	• Communication may be easier • No need to form a new department • Many functions typically performed in this department relate closely to storm water management • Equipment may be used for multi-purposes, which could enhance its productivity	• Could be missing out on valuable research/expertise from external entities • Department has several interests, not dedicated solely to storm water needs • Communication among different branches of department may be an issue
Storm Water Department	• Communication may be easier if program housed in one department • People and equipment dedicated to storm water projects • Smaller department may facilitate communication· • You can focus on issues that apply to your community	• Could be missing out on valuable research/expertise from external entities • May be costly to form a new department • An ordinance may be required to form a new department
Intra-Govern. Cooperation	• Expertise of various staff in different departments can be called upon • May be most efficient use of resources – not necessary to form a new department • You can focus on issues that apply to your community	• Communication between departments may be an issue • Roles and responsibilities for implementing program need to be clearly define • Accounting issues may arise
Quasi-Governmental Entity	• Expertise from other jurisdictions can be used – learn from others' experiences • Partnerships can be formed, resulting in implementation of projects that might otherwise not occur • A watershed approach is feasible • A quasi-governmental entity may take a leadership/coordination role • Dedicated funding – competition for money is removed	• Deciding on a funding mechanism and proportions may be a challenge • Prioritizing projects can be problematic • Some issues the entity addresses may not pertain to your community • Roles and responsibilities need to be clearly defined • Enabling legislation may be required
Inter-Govern. Cooperation	• A watershed approach is feasible • Combined resources may create opportunities that wouldn't otherwise exist • Expertise from other jurisdictions can be used – learn from others' experienees	• Communication may be a challenge • Roles and responsibilities need to be clearly defined • You may feel "disconnected" with some outside entities

Chapter 6
How Can We Pay for Our Storm Water Management System?

Talking about storm water management strategies is one thing. But the bottom line for many program coordinators, elected officials, and concerned stakeholders is:

"Who is going to pay for these storm water management programs?"

This chapter addresses:

- Determining your storm water management system costs;
- Options for funding and financing storm water management programs; and
- Selecting the approach that is right for your community.

Determining Program Costs

Before you can select the best funding and financing strategies, you need to understand how much money your storm water management program is expected to cost, including start-up costs and ongoing costs.

Your program will need to include, at minimum, the elements described in Chapter 3 that are required to comply with regulations. Local pressures may require that your storm water management program is even more stringent than Phase II requirements.

The U.S. EPA developed detailed cost estimates for the incremental requirements proposed under the proposed Phase II rule which was published in January 1998. A discussion from this publication follows.

Measure	Percentage of Municipalities Expected to Incur Costs (%)	Low End of Per Capita Costs ($ per capita)	High End of Per Capita Costs ($ per capita)
First Permit Cycle:			
Public Education	39	$0.02	$0.34
Public Involvement	100	$0.19	$0.20
Illicit Discharge Detection and Elimination	90	$0.04	$2.61
Construction Site Storm Water Runoff Control	83	$0.04	$1.59
Post Construction Storm Water Management	4	$1.09	$1.09
Pollution Prevention/Good Housekeeping for Municipal Management	71	$0.01	$2.00
Second & Third Permit Cycle:			
Public Education	39	$0.01	$0.34
Public Involvement	100	$0.12	$0.20
Illicit Discharge Detection and Elimination	73	$0.04	$2.17
Construction Site Storm Water Runoff Control	80	$0.01	$0.83
Post Construction Storm Water Management	4	$1.09	$1.09
Pollution Prevention/Good Housekeeping for Municipal Management	67	$0.01	$1.08

R0019084

Proposed Rule: Cost Estimates for MS4s

Implementation of the six minimum measures was projected to represent the primary cost component. Using data from Phase I communities, EPA projected:

- The percentage of Phase II municipalities that would be affected (i.e., would bear increased costs associated with implementing BMPs to address the minimum measures); and

- The range of per capita costs that would be expected during the first permit cycle, as well as the second and third permit cycle.

Note that these cost projections were developed based on the following assumptions (and EPA has requested public comment on the validity of these assumptions):

- Data from a sample of 21 permit applications for Phase I communities was used to calculate cost projections for the six minimum control measures;

- Municipalities that did not show costs on their permit applications for a specific measure were assumed to already have programs in place to address that measure;

- Per capita costs that were more than two standard deviations above or one standard deviation below the mean were dropped from the analysis;

- In estimating costs for the second and third permit cycle, costs were dropped that would be expected to occur only once, such as development of municipal ordinances.

Several concerns were raised about EPA's methodolog during the public comment period including:

- Using Phase I permit application costs may lead to:
  - **Overestimating costs:** For example, Phase II communities may have fewer structures to maintain, systems to map, and connections to map. In addition, in some cases, Phase II communities may be able to reduce costs by coordinating with nearby Phase I communities.
  - **Underestimating costs:** Because of fixed costs and the economies of scale associated with implementation of the measures, the per capita costs for Phase II municipalities may be higher than those for Phase I communities. In addition, Phase I communities may not have reported all costs associated with compliance on their permit applications.

- Though some costs associated with the first permit cycle may not be repeated in subsequent permit cycles, there may be counteracting tendencies for subsequent permit cycles to be higher (such as population growth and more areas being classified as urbanized areas).

- It may not be appropriate to apply the percentages of Phase I communities who apparently incurred costs for the implementation of each measure to the estimation of Phase II costs. Because Phase II communities are smaller, they may be less likely than Phase I municipalities to already have adequate storm water management programs in place. Therefore, Phase II communities may be more likely to incur costs as a result of the proposed new rule.

Final Rule: Cost Estimates for MS4s

To address the concerns raised in the development of the original cost estimates for incremental impacts for MS4s (discussed above), EPA utilized data collected by the National Association of Flood and Storm Water Management Agencies (NAFSMA). NAFSMA conducted a survey of more than 1,600 potential Phase II municipalities that were identified in the draft rules. Their purpose was to solicit information about the rules and the impact. One hundred twenty-one surveys were returned to NAFSMA.

Using this information, EPA estimated average annual per household program costs for automatically designated Phase II communities. In addition, they estimated and annual average administrative cost to cover the application, reporting, and record keeping costs. The total per household cost of the final rule is expected to be $9.16 annually.

EPA utilized this number to estimate the national cost to municipalities, multiplying the per household average cost ($9.16) times the number of households (32.5 million) to generate the national annual cost of $258 million.

In addition, EPA reviewed actual costs from 35 Phase I communities, using municipalities that were close to the end of their five year permit period and were smaller in size. Of the 35 reviewed, only 26 had appropriate cost data. The cost range and annual per household program costs of $9.08 is very close to the NASFMA survey data

The cost projections developed by U.S. EPA provide a guideline for estimating local budget impacts on a macro level. Because local NPDES permitting authorities and regulated sources have significant flexibility in program implementation, actual costs may vary widely. You will need to undertake detailed budget planning to ensure that you have sufficient funds to develop a storm water management program that is right for your community.

Typical Funding/Financing Strategies

As with most local government programs, a wide array of funding sources and financing approaches is typically used to support storm water management programs. Some of the most common approaches are described below.

- **Debt Financing** - Typically used for capital-intensive projects, local governments can issue debt to finance storm water management programs and facilities. Revenue bonds - or bonds that rely on an ongoing source of revenue (such as assessments or utility fees) - may be used. Alternatively, you could choose to issue general obligation bonds, which are backed by the full faith and credit of your municipality (based on your ability to generate revenues through taxes and other fees).

- **Federal, State or Regional Grants and Loans -** Grant or loan funds may be available for some elements of your storm water program, depending on the BMPs that you select and your location. Grants and loans are usually applicable to specific projects and not on-going activities, such as operations and maintenance.

Grants and More

Griffin, Georgia, has been successful in creatively acquiring supplemental funds for their storm water management program. The community of 23,500 residents has a storm water utility, which is the mainstay of their program, providing $1.2 million per year in revenue from utility fees. In addition voters approved a special purpose local option sales tax for storm water capital improvements. The special tax will contribute $1 million to the City's program between 1997 and 2001. Griffin has also acquired a Section 319 grant to do extensive detention pond research and was awarded a grant from the Ford Foundation to enhance public outreach regarding storm water.

- **Utility Service Charges** - These charges are rates billed to customers for providing storm water management services. The service charges may be flat rates, or variable rates based on classes of customers. Utility service charges may represent a dedicated source of funding (i.e., collected fees are dedicated to the storm water management program via an Enterprise Fund or similar accounting structure) and an ongoing method of funding some or all storm water management program elements.

- **Special Assessments** - Properties can be assessed annually to fund a storm water management program. Often, special assessments are used to fund a special district or authority that can implement all or portions of a region's storm water management program.

Fort Worth's Approach

The City of Fort Worth, Texas, originally paid for their storm water management program entirely with general fund dollars. In 1991 the City established an environmental protection fee through the state legislature. This legislation enabled the City to charge households, commercial businesses, and industries $.50 per month on their water bill to go toward environmental issues. The environmental protection fee brought in about $750,000 to $800,000 per year. In 1997 Fort Worth restructured their rates to charge businesses and industries on a sliding scale. Rates are based on their water account category, such as commercial, commercial-multi-use, commercial-industrial, and multi-family. The rates range from $.50 per unit for multi-family housing to $35 per month. Now the fee contributes approximately $2.5 million to Fort Worth's budget. Approximately half of that funding is used to support the storm water management program. An additional $520,000 or so from the General Fund is also used to fund the program.

- **Local Improvement Districts** - Under this type of funding system, individual properties benefited by storm water projects are assessed to fund the project. Some states require special enabling legislation to establish this type of special benefits district.

- **General Fund** - General Fund monies are used for many storm water programs. If storm water programs are funded from your General Fund, the programs are at risk in each budget cycle. In addition, in order to increase funding levels for your program, other local government services may be affected or a general tax increase may be required.

- **Plan Review and Inspection Fees** - Communities may recover some or all of the direct costs associated with performing design reviews for pre and post construction BMPs by implementing plan review and inspection fees.

- **Fee-in-Lieu of On-Site Construction** - Instead of constructing on-site facilities to meet development requirements, developers may be given the option of paying a comparable fee to be used by the local government to build regional facilities that are designed to meet the same objectives as the developer-constructed on-site mitigation.

- **Developer Participation** - Developers construct needed facilities as a condition of development, and bear associated costs.

Developers Pay in Stafford Township

In Stafford Township, New Jersey, storm water management facilities associated with new development are implemented through developer participation. The Township passed an ordinance in the late 1980's requiring developers to install curbs in new developments, implement storm water BMPs (including giving preference to an underground infiltration system that successfully removes pollutants and recharges the aquifer), and meet landscaping requirements designed to provide further surface and groundwater protections. Initially developers fought the ordinance, claiming the infiltration system was too costly to install. The Township agreed to be flexible where their overall environmental requirements were still met. Township officials also commissioned a cost/benefit study to demonstrate to developers that the Township's preferred storm water management program is more cost-effective than more traditional treatment and control approaches when the cost of land is considered.

- **System Development Fees/Connection Charges** - One time charges assessed at the time of development to recover a proportionate share of the cost of existing facilities and planned future facilities. Applicability depends upon legislation in your state.

Developers Mind Storm Water in Rockville, Maryland

The City of Rockville, Maryland, has always been progressive in storm water management. The Phase II City, with a population of approximately 50,000 residents, implemented their storm water management program in the late 1970's. Their program is entirely funded by developers' fees. When a developer wishes to build in Rockville, they may either:

- Provide onsite storm water management (which the City prefers and encourages); or
- Contribute to the City's storm water management fund, so that a regional BMP can be built to effectively control runoff from the development.

Under the first scenario, the developer's storm water management plan must be approved by the City of Rockville's Engineering Department. The developer is charged 8% of the cost of construction, or what they'll bond. This option is utilized in most cases.

Under the second option, the developer must apply for a regional participation waiver. If the development project will contain more than 0.2 acres of impervious surface, then it must go to the Mayor and City Council for approval. The developer is then charged a storm water management fee of $40,000 per impervious acre for storm water quantity and $6,000 per acre for storm water quality.

The City strongly encourages the use of Option 1, as it is difficult to build BMPs in an already established area. In most cases, if there is room for the developer to put a BMP — such as a detention or retention pond on the site — the Council will not approve the regional participation waiver. A portion of the developer's fee is used to fund ongoing maintenance of the City's system.

- **Combination Approaches:** In many jurisdictions, a combination of funding sources is used for storm water management programs. The City of Rome, Georgia, is an example of a community that pays for the storm water management program from several different sources. The public works department, which is responsible for implementing acceptable construction and post-construction BMPs, good-housekeeping requirements, and public education efforts, is funded entirely by the General Fund. The Division of Code Enforcement, which is under the Department of Building Inspections, receives their funding from developers' fees.

Storm Water Utilities

Many communities develop storm water utilities to create a dedicated and reliable funding mechanism for their storm water management program. State enabling legislation is often required, and local implementation ordinances will be needed as well.

The basic philosophy behind the utility fee is that "users" should pay for storm water programs to the extent that they contribute to the problem. The term "users," in this case, includes property owners, particularly, property owners that have impervious surfaces on their property.

Most storm water utilities charge either a monthly or annual fee based upon the amount of impervious area on the property. A base rate is set for each household based on the average amount of impervious surface (known as equivalent residential units (ERUs)). A fee is then developed in association with this ERU. For example, the average amount of impervious surface per household may be 2,500 square feet, for which a resident pays $5.00 per month.

In most communities that use this method, each household is charged for one ERU. However, some communities charge households based on actual measurements of impervious surface.

Typically, the impervious surfaces of businesses and institutions are measured, and these customers are charged according to the number of ERUs calculated from their property measurements.

Some storm water utilities only charge if there is impervious surface on the property. Others charge all landowners, however if there is no development on the property the rate is typically lower than that charged for a single ERU.

Some communities are evaluating adding a water quality component to their utility fee rate formula. This quality factor would allow communities to have user pay for not only the quantity of storm water that they contribute, but also the quality.

Because a utility charges a user fee, not a tax, schools and churches typically are not exempted from paying the fee. Some storm water utilities receive additional funding from developers' fees and permit application fees.

Storm Water Credits

Many communities offer a storm water utility credit, typically available only to businesses and institutions, for implementing certain BMPs. In some communities, for example, if a business or institution wishes to construct a retention or detention pond on their property, they can earn up to a 50% storm water credit. It is important that communities establish strict guidelines for storm water credits, if they choose to have a credit program. They should have a clear application process, and BMPs that earn credits should not represent what is required under the program, but should go above and beyond what is required. A cost-benefit analysis should be performed to ensure that it is in the best interest of the municipality to grant the credit.

In Griffin, Georgia, for example, a school can earn up to a 50% storm water credit, as well as a reduced "educational water/wastewater rate" for teaching the Waterwise Curriculum.

Some advantages of forming a storm water utility include:

- A steady funding mechanism is dedicated to storm water management;
- Fees can be based on the amount of impervious surface on the property, which is a more equitable means of charging property owners than a flat fee;
- Financial incentives can be used to encourage businesses and institutions to implement storm water BMPs;
- Utilities tend to run more efficiently (more like a business); and
- Implementing a storm water fee is often more appealing politically than imposing a new tax or raising property taxes.

Some challenges associated with storm water utilities include:

- Some residents, businesses or institutions may resist paying the fees;
- The idea may face political opposition;
- Once rates are in place, it may be difficult to secure additional funding;
- Enabling legislation is often required;
- It may be difficult and/or time-consuming to devise an equitable rate structure, and to develop a database with required information, such as amount of impervious surface; and
- A billing system will be needed.

How Does a Storm Water Utility Create and Maintain its Customer Database?

To properly assess businesses and residents, most storm water utilities choose to calculate the amount of impervious surface on each residential, business and institutional property. How do storm water utilities obtain this information?

- 49% use property tax assessor records
- 41% use on-site property measurements
- 38% use aerial photography
- 23% use planimetric map take-offs
- 20% use geographic information systems
- 13% use other methods

Picking the Approach that Is Right for Your Community

Evaluating funding options and deciding which combination of revenue sources is most appropriate for your community is dependent on a number of criteria, including:

- **Political acceptance** - Elected officials or other persons responsible for adopting a storm water program must compare any proposed funding package to other local needs and resources.
- **Fairness and equity** - The degree to which the funding package is linked to a payee's specific contribution to storm water problems
- **Administrative simplicity** - The ease of administering the funding package
- **Feasibility of Implementation** - The relative ease or difficulty of making a funding package operational
- **Legal defensibility** - The probability of the funding package being defended in the courts
- **Revenue Generating Capacity** - The ability of the funding package to produce sufficient revenue for the program
- **Dedicated Funding Source** - The ability of the funding package to be available in future years to maintain an ongoing program.

Developing a funding and financing strategy will likely involve a number of funding sources. Your public involvement process may provide input about local attitudes about storm water spending levels and funding sources. Your ability to inform stakeholders about the need for your program and obtain the necessary community support may determine whether your elected officials approve a funding package. A good way to inform stakeholders about what they will receive for their fee is to do a level of service analysis. Costs associated with different elements of service can then be communicated clearly. If there are objections to the rate, it would then be easier to negotiate specific program changes and cost reductions with stakeholders.

Take it from Me...

Advice from those who have been involved in implementing a storm water utility...

"Encourage community involvement early on to get buy-in."

- Kansas City, MO

"You need to establish a fee structure so that it's acceptable... but know that it is hard to get more later for special projects."

- Littleton, CO

"Look at finances ahead of time and prepare a realistic plan..."

- St. Petersburg, FL

"It's important that you sell the concept and the reasoning for the program to the elected officials - get them on your side. It's also important to let citizens know in advance, educate them and make them aware of the reason for the utility. Also, plan in advance how you will handle undeveloped land."

- Orlando, FL

"Understand the complex amount of work it takes to establish... a fair fee for every property. Recognize, too, that once that work is done you have a reliable income stream...to fund maintenance and improvement of storm water facilities."

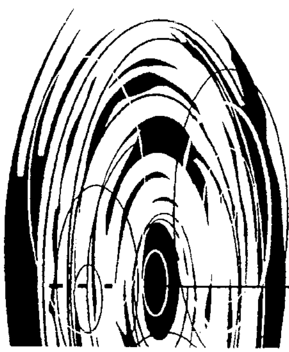
- Winter Park, FL

Funding Source Evaluation Matrix

Funding Source	Political Acceptance	Equity	Feasibility of Implementation	Ease of Administration	Legally Defensible	Revenue Capacity	Dedicated Funding Source
Debt Financing	Must have political will to implement dedicated funding source.	System paid for as it depreciates	Must have rates in place to support revenue bonds	Paid through rates &/or connection charges	Debt ceiling for G.O. debt, covenants for revenue bonds	Can be used for capital only	Assumes dedicated funding source is in place for revenue bonds
State/Federal Grants & Loans	Politically less risky to accept grants.		Highly competitive process for acquisition	Careful tracking required	Must meet terms of grant/loan scope	Can only be used for qualifying projects	Not a dedicated source
Utility Rates	Requires political will to implement a new service change.	Fees for service	Requires administrative support for billing	Depends on sophistication of rate structure	Must verify that it is allowed per State Statute	Can be used for operating &/or capital	This is a dedicated funding source
Assessments	Requires political will to implement a new assessment; may conflict with property tax lids.	May be unrelated to cost of service	Requires administrative support for billing	Not difficult	Allowed	Can be used for operating and capital	This is a dedicated funding source
Local Improvement Districts	Must be approved by the area to be served by the LID	Assigns costs of facilities to benefiting areas	May be cumbersome to initiate	May be cumbersome to track	Allowed	Can be used for specific capital projects only	Dedicated to specific projects only
General Fund/Street Fund	Difficult to allocate revenue to all the conflicting needs in the general fund.	May be unrelated to cost of service	Not difficult; political will	Not difficult	Allowed	Available for operating & capital	Not a dedicated source; subject to changing priorities
Plan Review & Inspection Fees	Politically less risky to charge fees for plan review.	Recovery of cost of direct services	Not difficult; requires isolation and calculation of fees	Not difficult	Allowed	Can be used for specific operating activities only	Dedicated to specific operating activities

Funding Source Evaluation Matrix (continued)

Funding Source	Political Acceptance	Equity	Feasibility of Implementation	Ease of Administration	Legally Defensible	Revenue Capacity	Dedicated Funding Source
Fees-in-lieu of Construction	Politically less risky if storm water ordinance is already in place that requires on-site facilities.	Option to meet development requirements	Need good SW ordinance in place, requiring on-site facilities	Fee paid at time of development	Allowed	Can be used for specific capital projects only; growth dependent	Dedicated to specific projects only
Developer Participation	May be difficult to get private development to pay for building your infrastructure.	May mitigate direct impacts of new development	Requires negotiation	Not difficult	Allowed	Available for specific capital projects only	Not a fund source, but a capital project contribution
System Development Fees/Connection Charges	Requires political will to assess a new fee on new development.	Add equity between existing and future customers	May be opposed by developers	Fee paid at time of development	Must verify that it is allowed per State Statute	Can be used for capital only; usually partial funding only; growth dependent	This is dedicated to storm water capital projects only
Local Gas Tax	Requires political will, particularly where taxes are already high	Justified because autos and roads contribute to water quality problems	Not difficult	Not difficult	May require State legislation	Depends on amount of tax and how much is dedicated to storm water programs	Dedicated to environmental programs, a portion of which could be earmarked for storm water programs.



Chapter 7
What About My Neighbor's Storm Water?

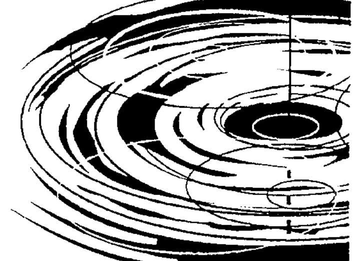
It's usually pretty easy to see why regional cooperation for storm water management programs makes sense. You can extend limited resources, extend your sphere of emphasis, and - particularly in the case of watersheds - improve the overall environmental benefits of your storm water management program. A watershed approach will help you to jointly address storm water flow, impacts and costs, producing benefits that cross jurisdictional boundaries as well.

In spite of these practical benefits, regional cooperation is often difficult to get off the ground. This chapter addresses reasons to cooperate, as well as issues associated with regional cooperation that may help you:

- Develop a framework for interlocal cooperation;
- Agree on activities that need to be accomplished;
- Agree on funding approaches;
- Agree on implementation schedules; and
- Overcome common barriers to cooperation.

Why Cooperate?

The Phase II regulations only specify what your storm water management program must accomplish within your jurisdictional boundary or service area. But in many instances, meeting these requirements will be very difficult or impossible without regional cooperation. Drainage basins, or watersheds, do not coincide with political boundaries. As a result, it is likely that the storm water



R0019098

you must manage either comes from or goes to your neighbors.

Interlocal cooperation, then, is a vital component of a successful storm water management program. Issues that arise that require interlocal cooperation may include:

- Agreeing on interlocal funding methods for capital facilities that provide a regional benefit for controlling storm water quantity and quality;
- Developing regionally consistent design standards that protect water quality as well as promote economic development;
- Determining if certain activities carried out by your storm water program can be performed more efficiently on a regional basis;
- Cooperating on regional initiatives or requirements to improve water quality;
- Cooperating on other water quality regulatory requirements, such as TMDLs; and
- Participating in regional planning for a wide range of water resource issues that could also include water supply or fish habitat restoration.

Developing a Framework for Cooperation

Depending on the issue, some type of forum is usually required to plan and implement projects or programs that require interlocal cooperation. These forums include:

- Interlocal agreements;
- Special districts;
- County or City governments acting as lead agency;
- Joint Powers Authorities
- Commissions; and
- Regional Councils of Governments.

In addition, some interlocal cooperation takes the form of sharing technical information or educational resources or developing a common ordinance throughout the watershed planning area.

You may already participate in a regional forum dealing with storm water issues. If not, choosing an appropriate forum will depend on the regional storm water issues that need to be addressed. For example, to resolve interlocal funding issues for a specific regional capital facility, a simple interlocal agreement between the affected jurisdictions may suffice. More complex storm water issues that encompass multiple jurisdictions may require a broader forum, such as a special district or commission created for this purpose.

It may be easier to implement certain projects or programs that are recommended by a regional forum that has the support of the community and key stakeholders. For example, an interlocal agreement among several jurisdictions could have been the forum for preparing a watershed plan that recommends storm water policies, operating procedures, projects, and funding. The plan recommendations may be much easier for each jurisdiction to implement if they have the force of all the participants in an interlocal process behind them.

Barnegat Bay Estuary Program

In May 1998, New Jersey's Barnegat Bay Estuary Program hosted two roundtables for mayors and other municipal officials to discuss widespread implementation of environmental programs and ordinances in the region. According to a newspaper article appearing in The SandPaper following the meetings, "the [participating] municipalities are aware they have a new address; it's not only Ocean County, but the Barnegat Bay Watershed."

The Barnegat Bay Estuary Program would seem to have several factors weighing in its favor – for example, it is located completely within one state (unique among the 29 other national estuaries) and completely within Ocean County. However, the development and implementation of a comprehensive conservation management plan to protect and preserve the Barnegat Bay hinges on local government involvement.

Even with the two roundtables planned to accommodate communities at the northern and southern ends of the region, only 19 of Ocean County's 33 municipalities sent representatives to the meetings.

"It's a race for [tax revenues]," claimed the Administrator from one participating community. "There's a lot of pressure. We all want to protect our environment, but when these multimillion [dollar] developers come around making these big offers, it's hard to resist."

According to the Barnegat Bay Estuary Program Director, Terry Fowler, "Developers want to cooperate. They just want to know what the rules are, how many trees per acre, and what kind of runoff system. ..." Fowler also added that developers would like some coordination among the various governing bodies in the region.

To spur this kind of cooperation, a clearinghouse of ordinances, technical information, and environmental program data is being developed. This central source of information, to be managed by the Barnegat Bay Estuary Program, will help to promote improved communication and understanding among the municipalities that make up the watershed.

Agreeing on a Program

A forum established to address regional needs should be limited to those activities that are best accomplished on a scale broader than local programs. The process of agreeing on an appropriate forum and activities for regional cooperation could involve a series of meetings/workshops among the affected jurisdictions to:

- Define regional needs;
- Determine the best forum for addressing regional needs; and
- Define the activities the forum might assume.

Activities such as watershed planning, construction of regional storm water control facilities, preparing public education materials, and technical assistance are potential activities that a regional forum might address.

Agreeing on a Funding Approach

Once the activities are defined for a forum designed to address regional storm water issues, the costs of conducting these activities can be determined as well. Funding a regional forum can consist of:

- Contributions from sponsoring local jurisdictions according to an agreed upon formula;
- Assessments on property within the regional forum service area;
- Service charges; and
- State or federal funding.

Reaching agreement on how to fund a regional forum may include an agreement on how the regional forum will expend funds, and how these funds will be distributed geographically. In some cases, regional forums are required to allocate funds throughout the service area according to the amount collected from each jurisdiction.

Developing an Appropriate Implementation Schedule

If a regional forum is implemented and recommendations are made for regional projects or programs, jurisdictions within the service area must also agree on an implementation schedule. The implementation schedule could be based on a process for evaluating and prioritizing projects. All the regional forum participants should be represented in this evaluation process, and agreed upon evaluation criteria should be used to establish priorities. Regional projects or programs may not have the same priority among all the participating jurisdictions. However, once the group decides on a schedule for implementation, all the participants should cooperate if the regional forum is to be successful.

The Urban Drainage and Flood Control District (Denver, CO)

The District is an independent agency, governed by a 17-member board of directors. The board of directors consists of 15 locally elected officials that represent the member jurisdictions and two registered professional engineers selected by the other board members. The District operates with an annual budget of approximately $12 to $18 million, employing 18 full-time employees and six part-time college student interns. Funding is derived from four mill levies.

The District operates five programs:

- Master Planning;
- Design and Construction;
- Maintenance;
- Floodplain Management; and
- South Platte River

Major activities targeted in each of the five programs are outlined below:

Major Activities Undertaken by the Urban Drainage and Flood Control District's Programs

Master Planning	Design/ Construction	Maintenance	Floodplain Management	South Platte River
Develop master drainage plans	Design and construction of master planned projects	Assist member communities with the maintenance of floodplains and floodways	Work with FEMA and local communities to make sure all communities have affordable flood insurance	Share in the cost of capital improvement projects on the basis of a minimum contribution of 25% from local government
Conduct outfall systems planning	Cost-share (50/50) with member communities	Maintenance projects are chosen on a priority basis	Help local governments develop their floodplain regulations	Will undertake maintenance projects, paying for up to 100% of the cost.
Support members' storm water discharge permitting efforts	District tax revenue from a community is spent on projects that will benefit that community	Private contractors are hired to do much of the work – the District does not have a public works department	Help communities develop flood warning plans	Involved in cooperative projects with property owners to stabilize river banks, & conduct inventories of properties along the river, as well as hydrologic data
Special projects such as wetlands issues and benefit-cost analyses	Once projects are completed, they are the property of the community, not the District		Publish detailed 100-year floodplain maps that incorporate expected growth and development	

The District is successful for several reasons. One contributing factor is that, although they have the authority to regulate in certain areas, they choose not to. Instead they choose to be a resource to the community. By avoiding taking on the role of enforcer and regulator, they encourage interagency cooperation.

In addition, the members of the board represent the member communities. Although deciding how to prioritize projects can still become an issue, all communities are represented fairly. The District also is committed to "paying out" to each community based upon what they pay in. Capital projects are planned to attain this goal.

The District does not operate and maintain capital projects. Once a project is completed, it is the property of the community. For this reason, and because the District does not have a public works department, there are no questions as to who is responsible for maintenance.

The District has its own source of funding. It also has a staff of talented professionals, which serves as a great resource to the member communities.

Overall, the District is able to provide communities with valuable resources that help them implement their storm water and flood control programs. Without such a resource, many of the projects would not ever have been undertaken. The District also provides member communities with a "big picture" scenario of the drainage issues for the entire area and can help communities implement their programs so that they complement each others' plans, rather than conflict with them.

Overcoming Barriers

One of the most important elements when structuring a forum to plan and implement regional storm water projects or programs is assigning appropriate roles to the forum that do not interfere with local responsibilities. Careful planning will assign responsibilities so there are no duplicate efforts between regional and local programs.

The key to success is to design a framework for regional cooperation that builds trust among all the stakeholders with a process that enhances and assists the local programs. A locally driven initiative to plan and implement regional storm water projects and programs may be the best way to support and maintain control of your local programs.
