R0063444

Data package includes:

Section 1. General Descriptive Statistics

Section 2. Descriptive Statistics for Reference Stations

Section 3. Results of Cluster Analyses

Section 4. Comparison of West Basin Station Data to Project Reference Data

- **Section 4-1.** Comparison of West Basin Data by Station to Project Reference Values
- **Section 4-2.** Comparison of Clam Tissue Data to Project Reference Values
- **Section 4-3.** Comparison of Surfece Sediment Toxicity Data to Project Reference Values
- **Section 4-4.** Comparison of Fish Tissue Data to Project Reference Values
- **Section 4-5.** Comparison of Surface Sediment Data to Project Reference Values

Section 5. Correlation Analysis

- **Section 5-1.** Summary of Correlation Analysis for Biological Parameters
- **Section 5-2.** Detail Results of Correlation Analysis for All Parameters
- **Section 5-3.** Principal Component Analysis
- **Section 5-4.** Multiple Regression Analysis

Section 1. General Descriptive Statistics

Listing is for all physical, chemical, and toxicity parameters that were analyzed in samples of clam tissue (bioaccumulation test), fish bile (California halibut), fish tissue (California halibut fillet, white croaker fillet, California halibut whole body, white croaker whole body), and surface sediment. Data are grouped by location: basin stations, pier stations, and reference stations. Data were included for this analysis as the detectable concentration for detectable compounds, and as one half the practical quantitation limit (PQL) when the compound was not found at detectable levels. The following descriptive statistics are presented.

Analyte name	Name of analyte.
Units	Units associated with analyte concentration.
# Values	Number of data values available. A value is the concentration at which a compound was detected, or when the compound was not found at detectable levels one half of the PQL is the value. Number of data values may change from one analyte to the next due to the results of data validation (i.e. some data values were rejected).
# Detectable Values	Number of data values reported at a detectable concentration.
% Frequency of Detection	Frequency of detection for this analyte in the specific group. (# Detectable Values / # available data Values)
Minimum Value	Minimum concentration in the data set. Frequently, this is one half of the PQL.
Minimum Detectable Value	Minimum concentration in the data set where the compound was found at a detectable level.
Maximum Value	Maximum concentration in the data set. When the frequency of detection for this compound is 0, then this value is one half of the PQL.
Mean Value	Arithmetic average of available data values for this compound.
Median Value	Median concentration of available data values for this compound.
Standard Deviation	Standard deviation of the mean of available data values for this compound.
Upper 95% Confidence Limit	Upper 95 percent confidence limit of available data values for this compound, using a 2-tail *t* statistic ($t_{(0.05,n-1)}$).

Section 2. Descriptive Statistics for Reference Stations

Listing is for all physical and chemical parameters that were analyzed in samples of fish bile (California halibut), fish tissue (California halibut fillet, white croaker fillet, California halibut whole body, white croaker whole body), and surface sediment. Data were included for this analysis as the detectable concentration for detectable compounds, and as one half the practical quantitation limit (PQL) when the compound was not found at detectable levels. The following descriptive statistics are presented.

Analyte name	Name of analyte.
Units	Units associated with analyte concentration.
# Values	Number of data values available. A value is the concentration at which a compound was detected, or when the compound was not found at detectable levels one half of the PQL is the value.
Shapiro-Wilks Statistic (untrans. data)	Shapiro-Wilks test for normality. Value shown is the Shapiro-Wilks *W* statistic for the data values for this compound. No data transformation was used in this test. Value is not calculated when the standard deviation of the mean is not greater than 0.
Prob. < W (untrans. data)	Probability associated with *W* statistic shown in previous column. When the probability is less than 0.05, then null hypothesis of a normal distribution is rejected. Value is not calculated when the standard deviation of the mean is not greater than 0.
Shapiro-Wilks Statistic (log10 (value+1))	Shapiro-Wilks test for normality. Value shown is the Shapiro-Wilks *W* statistic for the data values for this compound. A $\log_{10}$ data transformation was used in this test. Value is not calculated when the standard deviation of the mean is not greater than 0.
Prob. < W (log10 (value+1))	Probability associated with *W* statistic shown in previous column. When the probability is less than 0.05, then null hypothesis of a log-normal distribution is rejected. Value is not calculated when the standard deviation of the mean is not greater than 0.
Mean Value	Arithmetic average of available data values for this compound.
Standard Deviation	Standard deviation of the mean of available data values for this compound.
Minimum Value	Minimum concentration in the data set where the compound was found at a detectable level.
Maximum Value	Maximum concentration in the data set. When the frequency of detection for this compound is 0, then this value is one half of the PQL.
Upper 95% Confidence Limit	Upper 95 percent predictive interval limit of available data values for this compound, using a 1-tail *t* statistic ($t_{0.05,n-1}$). Not calculated when number of values is less than 2. The following formula was used (Statistical Intervals, Hahn & Meeker, Wiley, Inc.):

$$95\%\ \text{Predictive Limit} = \text{mean} + t * \sigma(1+1/n)^{1/2}$$

VOL 18 1098

where: t = critical t value for appropriate n and 95% 1-tail distribution
σ = standard deviation of the mean
n = number of data values

VOL 18 1099

Section 3. Results of Cluster Analyses

Cluster Analysis was used to evaluate patterns among different groups of stations and variables. Stations were evaluated as all 52 together (basin, pier, and reference) and as the 45 West Basin stations (basin and pier). Both of these station groups were evaluated with three variable groups: 1) chemical and physical data, 2) physical data, and 3) chemical data. The results of six cluster analyses are presented in this section.

For the purposes of this evaluation, chemicals included all compounds that were analyzed (except total organic carbon) that were found in at least 50 percent of the samples. Variations in detection limits (due to complex sample matrices) for compounds that were detected at a frequency less than 50 percent caused interference in pattern recognition. Therefore, compounds not detected at a frequency greater than 50 percent were not included in this process.

The physical data group for this analysis included grain size as percent fines (sum of clay and silt) and total organic carbon.

The results of each cluster analysis are presented in three figures: 1) dendrogram showing groups of variables, 2) dendrogram showing groups of stations, and 3) two-way table showing relative analyte concentration by station. The dendrograms (tree diagrams) show groupings of analytes and stations according to a dissimilarity index (Bray-Curtis) shown on the vertical axis as "distance between clusters."

VOL 18

Section 4. Comparison of West Basin Station Data to Project Reference Data

This section presents the results of comparisons of West Basin station data to the project reference data for sediment chemistry, clam tissue chemistry, fish tissue chemistry, and toxicity bioassay data. Benthic infauna data were evaluated separately in a benthic infauna report (MEC, 1995).

Comparisons of West Basin data to project reference data were evaluated by comparing each individual value per station to the reference data, and by comparing the mean value of sediment evaluation zones (determined by cluster analysis) to the mean of the project reference values.

VOL 18

1128

Section 4-1. Comparison of West Basin Station Surface Sediment Data to Project Reference Values

Concentrations of chemical analytes that were detected in surface sediment at West Basin stations were compared to project reference values (see Section 2 for description of project reference values calculated as 95 percent upper predictive limit). The following listing shows compounds that were detected at West Basin stations at levels exceeding the project reference value. The results are presented by compound and by station.

Analyte name	Name of analyte.
Units	Units associated with analyte concentration.
Station	Station at which analyte was detected.
Station Value	Concentration of analyte at the station.
Upper 95% Confidence Limit	Upper 95 percent predictive limit of reference station values as calculated in Section 2.
Station Value / Upper 95% CL	Ratio of analyte value at the station to the upper 95 percent predictive limit of reference station values.

Section 4-2. Comparison of Clam Tissue Data to Project Reference Values

Mean concentrations of chemical analytes detected in clam tissue at basin stations and pier stations were compared to project reference values using analysis of variance (ANOVA). The ANOVA results include: 1) a listing of analytes tested, 2) results of Levene's test for homoscedasticity, 3) list of data transformation used for each analyte, 4) list of mean and count (n) for untransformed data for each analyte, 5) ANOVA table and Tukey's multiple range test by analyte, and 6) summary of significant ANOVA results. For the clam data the summary of significant ANOVA results is absent because none of the ANOVA tests showed a significant difference.

Levene's test for homoscedasticity was used as a key for data transformation. When the results of Levene's test of raw data showed homoscedasticity the untransformed data were used in the ANOVA. When the results of Levene's test of the raw data showed no homoscedasticity, but the results of the Levene's test of log transformed data did show homoscedasticity the log transformed data were used in the ANOVA. When the results of the Levene's test of both the raw and log transformed data showed no homoscedasticity the data were rank transformed prior to the ANOVA (also known as a Kruskal-Wallis non-parametric test).

ANOVA results are considered significant when the probability associated with the calculated *F* statistic is less than an alpha of 0.05. Tukey's HSD multiple range test was performed to evaluate differences between the ANOVA cases.

VOL 178

Section 4-3. Comparisons of Surface Sediment Toxicity Data to Project Reference Values

Mean values of toxicity bioassays for surface sediment, grouped by sediment evaluation zones (determined from cluster analysis), were compared to project reference values using analysis of variance (ANOVA). The ANOVA results include: 1) a listing of analytes tested, 2) results of Levene's test for homoscedasticity, 3) list of data transformation used for each analyte if any, 4) list of mean and count (n) for untransformed data for each analyte, 5) ANOVA table and Tukey's multiple range test by analyte, and 6) summary of significant ANOVA results.

Levene's test for homoscedasticity was used as a key for data transformation. When the results of Levene's test of raw data showed homoscedasticity the untransformed data were used in the ANOVA. When the results of Levene's test of the raw data showed no homoscedasticity, but the results of the Levene's test of log transformed data did show homoscedasticity the log transformed data were used in the ANOVA. When the results of the Levene's test of both the raw and log transformed data showed no homoscedasticity the data were rank transformed prior to the ANOVA (also known as a Kruskal-Wallis non-parametric test).

ANOVA results are considered significant when the probability associated with the calculated *F* statistic is less than an alpha of 0.05. Tukey's HSD multiple range test was performed to evaluate differences between the ANOVA cases.

Section 4-4. Comparison of Fish Tissue Data to Project Reference Values

Mean concentrations of chemical analytes detected in fish tissue (California halibut bile, California halibut fillet, white croaker fillet, California halibut whole body, white croaker whole body), at basin stations were compared to project reference values using analysis of variance (ANOVA). The ANOVA results include: 1) a listing of analytes tested, 2) results of Levene's test for homoscedasticity, 3) list of data transformation used for each analyte if any, 4) list of mean and count (n) for untransformed data for each analyte, 5) ANOVA table and Tukey's multiple range test by analyte, and 6) summary of significant ANOVA results.

Levene's test for homoscedasticity was used as a key for data transformation. When the results of Levene's test of raw data showed homoscedasticity the untransformed data were used in the ANOVA. When the results of Levene's test of the raw data showed no homoscedasticity, but the results of the Levene's test of log transformed data did show homoscedasticity the log transformed data were used in the ANOVA. When the results of the Levene's test of both the raw and log transformed data showed no homoscedasticity the data were rank transformed prior to the ANOVA (also known as a Kruskal-Wallis non-parametric test).

ANOVA results are considered significant when the probability associated with the calculated *F* statistic is less than an alpha of 0.05. Tukey's HSD multiple range test was performed to evaluate differences between the ANOVA cases.

Section 4-5. Comparison of Surface Sediment Data to Project Reference Values

Mean concentrations of chemical analytes analyzed in surface sediment at basin stations were compared to project reference values using analysis of variance (ANOVA) by sediment evaluation zones (determined from cluster analysis). Chemical analytes were not screened for frequency of detection before the ANOVA test was performed, therefore, use of the following tables should include a step to exclude results of testing for analytes that were not found at detectable levels at any of the basin stations.

The ANOVA results include: 1) a listing of analytes tested, 2) results of Levene's test for homoscedasticity, 3) list of data transformation used for each analyte if any, 4) list of mean and count (n) for untransformed data for each analyte, 5) ANOVA table and Tukey's multiple range test by analyte, and 6) summary of significant ANOVA results.

Levene's test for homoscedasticity was used as a key for data transformation. When the results of Levene's test of raw data showed homoscedasticity the untransformed data were used in the ANOVA. When the results of Levene's test of the raw data showed no homoscedasticity, but the results of the Levene's test of log transformed data did show homoscedasticity the log transformed data were used in the ANOVA. When the results of the Levene's test of both the raw and log transformed data showed no homoscedasticity the data were rank transformed prior to the ANOVA (also known as a Kruskal-Wallis non-parametric test).

ANOVA results are considered significant when the probability associated with the calculated *F* statistic is less than an alpha of 0.05. Tukey's HSD multiple range test was performed to evaluate differences between the ANOVA cases.

VOL 18

Section 5. Correlation Analysis

Patterns of association between physical, chemical, toxicity, and benthic infauna parameters were analyzed by correlation analysis. The following sections present the results of the correlation analysis in summary and detail format.

VOL 18

1518

Section 5-1. Summary of Correlation Analysis for Biological Parameters

Patterns of association between physical, chemical, toxicity, and benthic infauna parameters were analyzed by correlation analysis. This section presents a summary of the results of the correlation analysis of toxicity and benthic infauna parameters verse the chemical parameters, where the r^2 value exceeds 0.4. Chemical data were evaluated as raw data and as carbon normalized data (analyte concentration divided by total organic carbon concentration).

Section 5-2. Detail Results of Correlation Analysis for All Parameters

Patterns of association between physical, chemical, toxicity, and benthic infauna parameters were analyzed by correlation analysis. This section presents detailed results of the correlation analysis of all physical, chemical, toxicity, and benthic infauna parameters. Chemical data were evaluated as raw data and as carbon normalized data (analyte concentration divided by total organic carbon concentration). A list of parameter name abbreviations used in the correlation table is presented at the front of this section.

Section 5-3. Principal Component Analysis of Sediment Physical and Chemistry Data

Data distribution patterns among the physical and chemical data were analyzed by principal component analysis (PCA). This section presents detailed results of the PCA for all the physical and chemical parameters for West Basin and reference stations. The data were evaluated as the statistical value: the result or one half of the PQL if the analyte was not detected. The results of PCA are shown as factors, representing similar analyte patterns, which were assigned scores for each station. The factor scores were further analyzed by multiple regression (see next section).

General Linear Models Procedure

Tukey's Studentized Range (HSD) Test for variable: VALUE

NOTE: This test controls the type I experimentwise error rate, but generally has a higher type II error rate than REGWQ.

Alpha= 0.05 df= 11 MSE= 2.25
Critical Value of Studentized Range= 3.820
Minimum Significant Difference= 2.6668
WARNING: Cell sizes are not equal.
Harmonic Mean of cell sizes= 4.615385

Means with the same letter are not significantly different.

Section 5-4. Stepwise Multiple Regression

Relationships between the physical and chemical data and the toxicity and benthic infauna data were evaluated with stepwise multiple regression. This section presents detailed results of the multiple regression analysis of all physical and chemical data represented by PCA factors with the biological response data represented by the toxicity and benthic infauna parameters.

COPEC FATE AND TRANSPORT

1733

VOL 18

Appendix U
COPEC FATE AND TRANSPORT

Environmental fate and transport processes affect most chemicals, leading to their accumulation and ultimate depletion in environmental media. This section first presents general processes that may control chemical fate and transport in surface water and sediments, focusing on those processes relevant to West Basin chemicals of potential ecological concern (COPECs). Following release into the aquatic environment, chemicals may be transported to the atmosphere or throughout the water column either in a dissolved phase or sorbed to suspended sediment particles. Chemicals sorbed to suspended particulates may eventually be deposited in bed sediments. As they are dispersed in the aquatic environment, chemicals may also be transformed or degraded through physical, chemical, or biological processes. Secondly, this section contains qualitative, COPEC-specific analyses of the movement and ultimate fate of chemicals discharged into the West Basin, utilizing physical and chemical properties of the COPECs as a basis for describing their behavior within West Basin.

1.0 ENVIRONMENTAL FATE AND TRANSPORT PROCESSES

This section presents general and West Basin-specific fate and transport information for chemicals in sediments and in aquatic environments.

1.1 Environmental Fate Processes

Chemicals released to surface waters or sediments undergo a number of physical, chemical, and biological processes that may alter their chemical makeup or their chemical properties. These processes include chemical reaction, biotransformation, and bioaccumulation.

1.1.1 PHOTOLYSIS

Chemicals exposed to direct sunlight may be degraded by photolysis. Photolysis of chemicals in aquatic systems occurs when sunlight of irradiating wavelengths above 290 nm is absorbed by the chemical (U.S. EPA 1982) resulting in bond cleavage, dimerization, oxidation, hydrolysis, or rearrangement. The susceptibility of a compound to photolysis is directly proportional to its absorption maxima in ambient sunlight. The most susceptible compounds possess a high degree of unsaturation as is typically associated with structures containing conjugated double bonds or fused aromatic rings (e.g., polynuclear aromatic hydrocarbons [PAHs] and polychlorinated biphenyls [PCBs] containing five or more chlorine atoms). Certain of the high molecular weight organic chemicals found in West Basin may therefore be expected to degrade via photolysis if exposed to direct sunlight.

1.1.2 HYDROLYSIS

Hydrolysis refers to reaction of a chemical with water, usually resulting in the introduction of a hydroxyl functional group into a molecule and loss of a leaving group (-X).

1134

R0064110

Organic chemicals: $R\text{-}X + H_2O \Leftrightarrow ROH + HX$

Metal salts: $M\text{-}X + H_2O \Leftrightarrow MOH + H^+ + X^-$

The hydrolysis of some classes of compounds are catalyzed by acids or bases, and therefore the hydrolysis rates of these chemicals in the environment can be pH dependent. Hydrolysis is not expected to be environmentally significant for organic COPECs in West Basin. The PAHs contain no hydrolyzable functional groups and chemical hydrolysis of the organochlorine pesticides only occur at extreme pHs or temperatures, or with catalysts not available in aquatic environments. Studies on the aqueous stability of organotins have shown very little, if any, chemical degradation in the absence of light energy (SWRCB 1988). On the other hand, hydrolysis may be an important fate process for many of the highly charged and divalent metal ions found in West Basin (e.g., Be^{2+}, Cr^{3+}, Cu^{2+}, Pb^{2+}, and Zn^{2+}).

1.1.3 OXIDATION

Chemical oxidation of organic chemicals in aquatic environments may occur due to several different oxidants, among which are singlet oxygen (O_2^*), alkyl peroxyl radical (RO_2^*), alkoxy radical (RO^*), or hydroxyl radical (OH^*). Oxidation reactions are considered discrete processes apart from photochemistry even though the source of these oxidants is primarily photochemical. The oxidants react with chemicals in their ground state and therefore oxidation does not involve the photochemistry of the chemical itself. Availability of oxidants within the environment depends on concentrations and origins of humic-fulvic materials and sunlight intensity (U.S. EPA 1982). Although not expected to be a major fate process, oxidation of PAHs and organochlorine pesticides may occur within West Basin. On the other hand, metal-catalyzed oxidation is an important degradation process for phenol.

1.1.4 COMPLEXATION

Complexation refers to the reaction of a metal ion with an anionic ligand to form a soluble compound called a complex. Transition metals form the most stable complexes, while alkaline earth metals form less stable complexes, and the alkali metals form virtually no complexes. Common inorganic ligands are OH^-, CO_3^{2-}, CN^-, SO_4^{2-}, S^{2-}, Cl^-, F^-, NH_3, PO_4^{3-}, and polyphosphates. Common organic ligands include amines, pyridines, and phenols, as well as humic substances. Organic ligands often form stronger complexes with a given metal than inorganic ligands (Connell and Miller 1984). All of the metal ions identified as COPECs within West Basin are subject to complexation.

1.1.5 BIOTRANSFORMATION

Another important chemical fate process in water and sediments is biotransformation (biodegradation) by microorganisms (e.g., protozoa, bacteria, fungi, and algae). Reactions include hydrolysis, oxidation, reduction, and rearrangement of chemical structures to ultimately produce carbon dioxide and water (U.S. EPA 1982). The factors that influence

VOL 18
1135
R0064111

the biotransformation of a chemical include pH, temperature, dissolved oxygen (DO), available nutrients, the presence of other organic chemicals that may serve as co-metabolites or alternative energy sources, and the populations and types of organisms capable of transforming the chemical (Connell and Miller 1984). Biodegradation in sediments is the dominant fate process for PAHs and organotins. Organochlorine pesticides, lower chlorinated PCBs (i.e., the mono- through tetrachlorinated compounds), phenol, and certain metals (e.g., As, Pb, Hg), are also expected to be degraded or transformed by microorganisms.

1.1.6 BIOACCUMULATION

Bioaccumulation is considered an important environmental fate mechanism for those compounds identified as COPECs within West Basin. All of the organic COPECs (with the exception of phenol) and most of the metals will potentially be bioaccumulated by aquatic organisms. Chemical uptake by such organisms can occur either directly from the physical environment or from gastrointestinal absorption.

1.2 Environmental Transport Processes

Chemicals may enter surface waters via precipitation from air, groundwater inflow, or surface water runoff. Once within the aquatic environment, the key physical processes that primarily govern the distribution of chemicals are volatilization, adsorption, sedimentation of suspended particulates, and resuspension and subsequent transport of bed sediments.

1.2.1 VOLATILIZATION

Chemicals may be released to the atmosphere from surface waters by volatilization. A number of parameters are used to represent the tendency of a chemical to evaporate, including vapor pressure and the Henry's Law Constant. Larger values of vapor pressure and Henry's Law Constant indicate a greater tendency to vaporize. Both vapor pressure and Henry's Law Constant are temperature-dependent, and, in most cases, the volatilization of a chemical increases with temperature. Many chemicals, such as pesticides, PCBs, and petroleum hydrocarbons, volatilize at relatively high rates despite low vapor pressures because of high activity coefficients in solution. Volatilization is an important loss process for pollutants with low solubilities and low polarity (Connell and Miller 1984). Although PAHs, PCBs, organochlorine pesticides, phenol, arsenic, and mercury may volatilize from surface waters, volatilization is not considered a major transport process for West Basin COPECs.

1.2.2 ADSORPTION

Adsorption is the term used to describe the affinity of a solute for the surface of a solid. Chemicals in aquatic environments, especially those organic compounds (except phenol) and metals identified as West Basin COPECs, may be sorbed to bed sediments, biota, or suspended particulates. If not degraded, the sorbed chemical may be transported on the

VOL 18
1736
R0064112

particulates or enter the food chain and may later be desorbed from the particulates back into solution in the water column. Many organic compounds form a hydrophobic bond with (i.e., adsorb to) the organic matter naturally present in sediments (Connell and Miller 1984). Many inorganic compounds will likewise bond to mineral groups (e.g., hydrous iron and manganese oxides) present at the surface of sediment particles.

1.2.3 SEDIMENTATION

Sedimentation plays a major role in the transport and ultimate fate of chemicals in an aquatic environment. No sediment transport or accumulation studies were performed for this RI. Chemical-sorbed particles suspended in the water column are deposited in bed sediments, which, in turn, act as a sink or even a continuing source of contamination via sediment resuspension. Suspended particles, including large organic compounds like humic substances, clays, and iron oxides, generally have diameters less than 50 to 100 μm. They are unable to sink rapidly through the water column because of their small size, and thus are easily maintained in suspension by the action of currents. These finer particles with slow settling velocities (less than 1 m/d) may, in time, coalesce to form particles large enough to overcome the buoyancy and drag forces preventing them from readily settling to the bed sediments.

1.2.4 SEDIMENT RESUSPENSION AND TRANSPORT

The redistribution of bottom sediments requires the initial mobilization of sediments and subsequent transport by currents. The intensity of currents required to initiate sediment motion is far less than that required for subsequent transport. Currents persisting in West Basin are not strong enough to mobilize sediments (JEG 1993). However, other mechanisms, such as ship operations and, to a lesser extent, dredging activities, can mobilize the bottom sediments and make them available for transport. Once suspended, these sediments can be transported throughout West Basin by tidal and wind-driven currents.

Ship-induced sediment disturbance occurs throughout the general harbor area of West Basin. Areas in West Basin that are not disturbed by vessel activities are the marina, where small crafts are not likely to disturb the bottom, the northwest harbor, and areas underneath the piers. Based on the absence of potential physical disturbance, current speeds, and circulation patterns, these locations probably act as net sediment depositional areas.

2.0 FATE AND TRANSPORT OF WEST BASIN COPECS

Table U-1 contains the list of West Basin COPECs along with the corresponding physical and chemical parameters used to provide the site-specific evaluation of transport and fate processes within this section. These parameters include volatilization coefficients (Henry's Law Constant, vapor pressure), octanol-water partition coefficients, sediment-water partition coefficients, water solubility, and half-lives in surface water.

VOL 18 1137

R0064113

2.1 Organic Compounds

Both PAHs and organochlorine pesticides are subject to photolytic and microbial degradation. The rate at which such degradations occur, however, varies with molecular weight (PAHs) and degree of chlorine substitution (pesticides) and is reflected by the half-life in the aqueous phase. Low-molecular weight polynuclear aromatic hydrocarbon (LPAH) compounds have short half-lives. Short half-lives indicate that a compound is not environmentally persistent, is more water soluble, and is far less likely to bioaccumulate. LPAH compounds are less likely to accumulate in biological tissue and sediments as a result of these properties.

In contrast, high-molecular weight polynuclear aromatic hydrocarbon (HPAH) compounds and chlorinated pesticides have longer half-lives (up to 250 days) and are more recalcitrant to microbial breakdown in surface water and sediments. HPAH homologues and chlorinated pesticides are also more prone to bioaccumulate and even to biomagnify in aquatic systems. This is reflected by higher partition coefficients as shown in Table U-1 (K_{ow} and BCF as indicators of partitioning into biological tissue, and K_{oc} values as indicators of partitioning into sediments).

2.1.1 PAHS

PAHs are made up of two or more aromatic (e.g., benzene) rings. Differences observed in the behavior of HPAHs as compared to LPAHs may be attributed to the number and arrangement of the aromatic rings that make up their overall structure. HPAH compounds with five or more rings are relatively insoluble, as indicated by the high values of log K_{ow} and log K_{oc} associated with these compounds.

Rapid direct photolysis of PAHs is an important fate process in surface water. Singlet oxygen is the oxidant and quinones are the products in photolysis reactions involving PAHs. With the exception of benzo(a)anthracene, free-radical oxidation of most PAHs is likely to be slow and is therefore not likely to be a significant environmental process. Volatilization, while not generally important for anthracene and phenanthrene, may play a role in acenaphthylene transport depending on mixing rates in both the water and air column. Adsorption is the dominant aquatic transport process for PAHs. Consideration of the log K_{ow} coefficients indicate that PAHs can be strongly adsorbed onto suspended and sedimentary particulate matter, especially particulates high in organic content. It is likely that these compounds can be readily transported as adsorbed matter or suspended particulates in waters. Data for PAHs in general indicate that they will accumulate in the sediments and biota of the aquatic environment (U.S. EPA 1985). Removal rates from the water column associated with adsorption and subsequent sedimentation are probably slower than photolysis and microbial degradation, but may be competitive with volatilization (U.S. EPA 1985).

Data for PAHs suggest that bioaccumulation is a short-term process (U.S. EPA 1985). Although PAHs are rapidly accumulated, they also are rapidly metabolized and excreted, and consequently long-term partitioning into biota is not a significant fate process. PAHs

VOL 18
1738
R0064114

can be metabolized by multicellular organisms and degraded by microbes. Degradation by mammals is likely to be incomplete, with parent compound and metabolites being excreted by the urinary system. Biodegradation by microorganisms is probably the ultimate fate process for PAHs.

2.1.2 PESTICIDES

Chlorinated hydrocarbon insecticides are similar in that they have low water solubility, high lipophilicity, and are comparatively persistent in the natural environment. They also tend to bioaccumulate in individual organisms and biomagnify in food chains. In natural waters, the major proportion of the lipophilic pesticides are either adsorbed onto suspended and settled particles or partitioned into organic substrates.

Removal of pesticides from the water column may occur by sedimentary sorption, degradation by microorganisms, uptake by aquatic organisms, or dilution via translocation to the open oceans (Connell and Miller 1984). Pesticides may also decompose via photolytic reactions which are influenced by factors such as natural photosensitizers, pH, and availability of DO. Organochlorine pesticides associated with suspended particulate matter will ultimately be transferred to bed sediments. Once in the sediments, pesticides may be re-released to the waters, absorbed by benthic organisms, transformed or degraded by microbiological organisms, or permanently buried. Microbial degradation of dichloro-diphenyl-trichloroethane (DDT) and lindane proceeds more favorably under anaerobic conditions.

2.1.3 PCBs

PCBs are a family of compounds composed of two connected benzene rings (biphenyl) with 1 to 10 chlorine atoms attached; 209 congeners are possible. The physical, chemical, and biological properties of PCBs depend to a large degree on the amount and location of the chlorine atoms on the biphenyl structure. PCBs were commercially produced as mixtures of chlorinated species, the most common trade name being "Aroclor". Aroclors are characterized by a four digit number which indicates the composition of the PCB mixture. The first two digits indicate the type of parent compound (e.g., a "12" represents chlorinated biphenyl compounds) The last two digits represent the percentage weight of chlorine in the individual Aroclor. For example, Aroclor 1260 is composed of biphenyl compounds with 60 percent chlorine by weight.

Although individual congeners vary in the rates at which processes occur, some generalizations of fate and transport properties can be made about PCBs as a class of compounds. The primary processes that determine the fate of PCBs in the environment include adsorption, biodegradation, and bioaccumulation. PCBs are relatively inert, and therefore persistent, compounds, with low vapor pressures, low water solubility, and high log octanol-water partition coefficients. Adsorption to sediments is the primary non-destructive fate mechanism. The affinity of PCBs for sediments increases as the organic carbon of the sediment increases. PCBs are relatively immobile in sediments, however,

VOL 18
1139
R0064115

sediments may serve as a PCB reservoir, promoting movement into other media through diffusion, desorption, or dissolution.

PCBs are primarily degraded by two routes. Congeners with less than four chlorine atoms per molecule can be biodegraded by some microorganisms, resulting in significant destruction and transformation of the molecule (U.S. EPA 1979). However, PCBs with five or more chlorines per molecule are not biodegradable. Of the Aroclors of concern at West Basin, Aroclor 1260 contains mostly penta-, hexa-, and heptachlorobiphenyls (Connell and Miller 1984), and therefore is not readily biodegradable. Highly chlorinated PCBs can, however, be photolyzed by ultraviolet (UV) light, but it is not known whether photodegradation occurs to a significant degree in the environment (U.S. EPA 1979).

Bioaccumulation of PCBs also occurs, with most of the compound stored in the adipose tissue of the body (U.S. EPA 1985). The tendency of PCBs to bioaccumulate depends on their degree of chlorination. The highly chlorinated PCB compounds, such as Aroclor 1260, have higher octanol-water partition coefficients, and are therefore more likely to bioaccumulate.

2.1.4 PHENOL

Phenol consists of a single aromatic ring with a hydroxyl group attached. Phenol is readily degraded in surface water, with reported half lives of 0.22 to 10 days (Howard et al. 1991). Photooxidation may be an important degradation process, especially in aerated, clear, surface waters. Phenol may also be nonphotolytically oxidized in highly aerated waters that contain iron and copper in solution or as part of the suspended particulates (U.S. EPA 1985). The relatively low log octanol-water partition coefficient and high water solubility of phenol suggests that sorption to particulate matter and bioaccumulation are not important environmental fate processes. Biodegradation can be a significant fate pathway in aquatic systems when significant concentrations of microorganisms are present. In addition, it is possible that phenol present in surface waters can volatilize into the atmosphere (U.S. EPA 1985).

2.2 Organotins

Organotin compounds, once released into waters, will dissociate to form organotin cations. The cation has both ionic properties, due to the positive charge, and lipophilic properties from the butyl moieties. Organotin cations normally react with anions in seawater to form a mixture of hydroxide, chloride, and carbonate molecules. The concentration of chloride ion, dissolved carbon dioxide, and pH will influence the proportion of each organotin species (SWRCB 1988).

Three major processes determine organotin fate in the environment: biological uptake and metabolism; adsorption onto particulates and sediments; and chemical or microbial degradation. Partition coefficients and measurements of organotin in sediment samples indicate that organotin adsorbs to particulate matter in the water column and in sediments. The fraction of organotin adsorbed on particulates will depend greatly on the

VOL 18 1740
R0064116

concentration of suspended solids in the water column. Laboratory studies have shown that agitated sediments can, in turn, release sorbed organotin to the surrounding water. Organisms exposed to contaminated sediments in laboratory studies have also been shown to accumulate organotin.

While studies indicate that the rate of chemical degradation of organotin in water is minimal, microbial degradation of organotin has been shown to be the most significant route of degradation in salt water. The half-life of organotin in salt water from microbial degradation has been reported as being as short as 4 days. Degradation of organotin in sediments is a slower process than in water, with an aerobic half-life of 162 days reported in marine sediments. Although laboratory UV irradiation of water containing organotin produces rapid degradation, degradation by natural sunlight has been shown to be insignificant.

2.3 Metals

Metals are fundamentally different from organic compounds in that they are naturally occurring elements that do not disappear or degrade from the environment. Metals vary widely in solubility, ability to complex with various ligands in the aquatic environment, bioaccumulation potential, toxicity, and sorption potential. The following paragraphs will discuss the fate and transport properties specific to those metals identified as West Basin COPECs.

One group of metals potentially a cause of concern in West Basin sediments are the divalent cationic metals, which include beryllium, copper, lead, zinc, and mercury. While these metals vary in toxicity, they behave similarly in aquatic environments and thus are frequently addressed collectively. For example, these metals readily complex with sulfides and other ligands under anaerobic conditions. This complexation is predictable and has been shown to correlate with chemical bioavailability in aqueous sediments.

Similar factors control environmental fate and transport for most metals. For example, most metals in aqueous systems will tend to interact with hydroxyl ions to form hydrolyzed species, or with inorganic anions such as HCO_3^-, CO_3^{2-}, NO_3^-, SO_4^{2-}, Cl^-, and F^- to form complexed species (Connell and Miller 1984). These interactions may well yield compounds of lesser or greater solubility than the unassociated metal. Many hydrolyzed metals are sparingly soluble. Hydrolysis may induce precipitation, thereby affecting the fate of the metal. On the other hand, complexation may increase solubility, thereby affecting the transport of the metal. The fate of metallic species in the environment is primarily dependent upon such factors as sorption, chemical speciation and complexation, biological transformation, and bioaccumulation.

2.3.1 ARSENIC

The oxidation state of arsenic is used in determining both its behavior in the environment and its toxicity. Under aquatic conditions, arsenic may be found in any of four oxidation states depending on factors such as pH and Eh: +5, +3, 0, and -3. Metallic arsenic occurs

VOL 18
1741
R0064117

only rarely, and the -3 oxidation state is stable only under conditions of extremely low ionization potential. Interconversions of the +3 and +5 valence states as well as organic complexation are the most important forms of arsenic.

Arsenic is generally quite mobile in the environment; the degree of mobility is dependent on its chemical form and the properties of the surrounding medium. Volatilization is important in the aquatic environment when biological activity or highly reducing conditions produce arsine or methylarsenics. Cycling of arsenic by sediments is governed by adsorption and desorption, and is one of the factors controlling its environmental fate. Arsenic may be sorbed onto clays, iron oxides, and organic material (U.S. EPA 1979). Pentavalent arsenic species tend to sorb to a greater extent than trivalent species. The ultimate fate of arsenic in the aquatic environment is probably the deep ocean, although it may pass through numerous stages before finally reaching the sea.

A number of studies show that arsenic is bioaccumulated primarily in fatty tissue. Bioaccumulation has been shown to occur more readily in marine conditions than in fresh water conditions. Arsenic in sediments may be mobilized by biomethylation.

2.3.2 BERYLLIUM

Most beryllium compounds are readily soluble in water. However, in water, soluble beryllium salts are hydrolyzed to form beryllium hydroxide; the solubility of beryllium hydroxide is quite low in the pH range of most natural waters (U.S. EPA 1985). Beryllium is also expected to be adsorbed onto clay mineral surfaces at low pH and to be complexed into some insoluble compounds at high pH. Thus, in most natural environments, beryllium is likely to be present in sorbed or precipitated, rather than dissolved, form.

Beryllium may be accumulated to a slight extent by aquatic organisms. Although it has a low solubility in water, it is possible that benthic organisms could accumulate beryllium from sediment and thereby transfer the metal to higher organisms via the food chain. There is no evidence for food chain magnification, however (U.S. EPA 1985).

2.3.3 CHROMIUM

Chromium is a heavy metal that generally exists in either a trivalent or hexavalent oxidation state. The chemical analyses for this RI did not identify specific chromium types. Hexavalent chromium (Cr^{6+}) is rather soluble and is quite mobile in surface water, existing in solution as a component of a complex anion. It is not sorbed to any significant degree by clays or hydrous metal oxides. The anionic form varies according to pH and may be a chromate (CrO_4^{2-}), hydrochromate ($HCrO_4^-$), or dichromate ($Cr_2O_7^{2-}$). The speciation is dependent on pH, with the dichromate predominating at very low pH and the chromate predominating at basic to neutral pH. The chromate and hydrochromate forms of Cr^{6+} are favored in the pH ranges typical of natural waters. Hexavalent chromium is efficiently removed by activated carbon and thus may have some affinity for organic

VOL 18 1742

R0064118

materials in natural waters. Hexavalent chromium is a moderately strong oxidizing agent and reacts with reducing materials to form trivalent chromium.

The trivalent (Cr^{3+}) oxidation state is the most stable and important in aqueous media. Trivalent chromium is relatively insoluble and evidences little toxicity (U.S. EPA 1985). Most trivalent chromium is hydrolyzed and precipitates as chromium hydroxide. Sorption to sediments and bioaccumulation will remove much of the remaining trivalent chromium from solution. It forms a number of complexes with organic and inorganic ligands, including water, sulfate, and ammonia. Studies have shown that chromium-containing sediments do not release significant amounts of deposited chromium under either oxidizing or reducing conditions (U.S. EPA 1985). Chromium may be present in sediments in the form of precipitated, mineral, and adsorbed species.

2.3.4 COPPER

The primary fate processes of copper include formation of complexes (especially with humic substances), sorption (especially to hydrous metal oxides, clays, and organic materials), and bioaccumulation. Copper is present as Cu^{2+} in aqueous solutions and has a strong affinity for hydrous iron and manganese oxides, clays, carbonate minerals, and organic matter. Sorption to these materials, both suspended in the water column and in sediments, results in relative enrichment of the solid phase and reduction in dissolved levels. The levels of copper able to remain in solution are directly dependent on water chemistry. Generally, ionic copper is more soluble in low pH waters and less soluble in high pH waters (U.S. EPA 1985).

Copper is strongly bioaccumulated and biological activity is a primary fate mechanism for copper. Seasonal fluctuations have been observed in aqueous copper concentrations with higher levels of copper occurring in the fall and winter and lower levels occurring in the spring and summer. This pattern probably reflects the following:

- Copper is taken up by biota in spring and summer.
- Adsorption of copper may be enhanced by greater availability of biogenic ligands.
- Copper is released by decomposing biota in fall and winter.

2.3.5 LEAD

The transport of lead in the aquatic environment is influenced by the speciation of the ion. Lead exists mainly as the divalent cation in most unpolluted waters and becomes adsorbed into particulate phases. However, in polluted waters, organic complexation is most important. Volatilization of lead compounds is not an important transport process in most aquatic environments (U.S. EPA 1985).

Sorption processes exert a dominant effect on the distribution of lead in the environment. Adsorption to inorganic solids, organic materials, and hydrous iron and manganese oxides usually controls the mobility of lead and results in a strong partitioning of lead to the bed sediments in aquatic systems. The sorption mechanism most important in a particular

VOL 18
1743
R0064119

system varies with geological setting, pH, Eh, availability of ligands, dissolved and particulate ion concentrations, salinity, and chemical composition (U.S. EPA 1985). Lead is strongly complexed to organic materials present in aquatic systems.

Aquatic organisms evidence a tendency towards bioaccumulation of lead. Biological activity may transform lead through biomethylation. Certain anaerobic bacteria metabolize lead, producing methylated forms such as tetraethyl lead. Methylated lead compounds are more mobile and volatile than the dissolved or sorbed forms of the metal. The ultimate sink of lead is probably the deep oceans.

2.3.6 MERCURY

Mercury exists in the environment in any one of three different oxidation states: 0, +1, and +2. In general, the mercurous (+1) salts are much less soluble than the more commonly found mercuric (+2) salts. The nature and solubility of the chemical species that occur in an environmental system depend on the redox potential and the pH of the environment (U.S. EPA 1985).

Mercury and certain of its compounds, including several inorganic species and dimethyl mercury, can volatilize to the atmosphere from aquatic sources. Adsorption onto suspended and bed sediments is probably the most important process determining the fate of mercury in the aquatic environment. Sorption is strongest onto organic materials. Under mildly reducing conditions and in the presence of sulfite, mercury will form a sulfite complex which readily precipitates. Mercury also forms complexes with organic amino and sulfhydryl groups. Complexation is dependent upon such factors as pH, temperature, and redox potential.

Biomethylation is a significant transformation process for mercury. Conditions which favor biomethylation of mercury include both concentrated mercury and bacterial populations, the absence of complexing agents, neutral pH, and a moderately aerobic environment.

Mercury is strongly bioaccumulated by most organisms and acquired through direct contact in water, sediment, and the food chain. Bacteria commonly found in natural waters are capable of converting many mercury compounds to methyl mercury. Methyl mercury is more readily accumulated and retained than inorganic mercury, and may become a hazard if environmental conditions favor biomethylation.

2.3.7 ZINC

In aqueous media, zinc exists primarily as a salt in the +2 valence state (U.S. EPA 1985) and can occur in both suspended and dissolved forms. Dissolved zinc may occur as the free (hydrated) zinc ion or as dissolved complexes and compounds with various degrees of stability. Suspended (undissolved) zinc may be dissolved following minor changes in water chemistry or may be sorbed to suspended matter. The predominant fate of zinc in aerobic aquatic systems is sorption of the divalent cation by hydrous iron and manganese oxides, clay minerals, and organic material. The efficiency of these materials in removing

VOL 18
1744
R0064120

zinc from solution varies according to their composition and concentrations, the pH and salinity of the water, the concentrations of complexing ligands, and the concentration of zinc. Concentrations of zinc in suspended and bed sediments always exceed concentrations in ambient waters. Precipitation of zinc sulfide limits the mobility of zinc in reducing environments. However, under aerobic conditions, precipitation of zinc compounds is probably important only where zinc is present in high concentrations. Zinc tends to be more readily sorbed at higher pH than lower pH and tends to be desorbed from sediments as salinity increases. Compounds of zinc with the common ligands of surface waters are soluble in most neutral and acidic solutions, so that zinc is readily transported in most unpolluted, relatively organic-free waters.

Zinc is bioaccumulated by all organisms as an essential nutrient. Bioaccumulation of zinc can occur even when the aqueous concentration of zinc is low. Zinc does not appear to be biomagnified. However, organisms constitute a minor reservoir for zinc compared to aquatic sediments (U.S. EPA 1985). Since it is actively bioaccumulated, the environmental concentrations of zinc probably exhibit seasonal fluctuations.

APPENDIX V

LIFE HISTORY AND BIOLOGY OF CALIFORNIA HALIBUT AND WHITE CROAKER – A SYNOPSIS

11747

VOL 1 8

Appendix V

LIFE HISTORY AND BIOLOGY OF CALIFORNIA HALIBUT AND WHITE CROAKER – A SYNOPSIS

This appendix provides a synopsis of the life history and biology of California halibut and white croaker.

1.0 CALIFORNIA HALIBUT

1.1 Spawning

The major spawning areas for the California halibut are unknown. In spring, halibut emigrate from relatively deep offshore waters to shallow coastal waters to spawn at depths of 5 to 18 m. California halibut spawn from February through July, peaking in May. The eggs are demersal. After spawning the adults return to water about 40 to 100 m deep.

1.2 Larval Stage

The larval and postlarval stages of the California halibut are pelagic for several months before the postlarvae settle to the bottom. In southern California, the planktonic larval stages, about 10 mm standard length, are pelagic and live in water 12 to 45 m deep and 1.9 to 5.4 km out from shore. Larger and older larvae live closer to shore, and most are suspected to live in embayments.

1.3 Juveniles

Juveniles begin to settle and assume bottom dwelling habits in June. They remain in shallow water and do not move extensively. Juvenile halibut begin to emigrate to deeper water when they are about 200 mm total length (TL).

1.4 Maturity and Life Span

Most halibut females are sexually mature at 430 mm TL or at the end of their third year of life. Most males mature when about 230 mm TL or at the end of their second year of life. Halibut are generally long-lived. Both males and females may live as long as 30 years, though generally the males do not grow as large or live as long as the females. Halibut are about 1,080 mm TL when they are 12 years old.

1.5 Feeding Habits

The larvae and young juveniles of the California halibut are planktivorous, but as they grow to adulthood they become piscivorous. Halibut has been described as a tertiary carnivore. Halibut 230 mm TL or longer feed heavily on fish (primarily during daylight) and, to a less extent, on shrimp. Juvenile and adult California halibut are especially adapted for catching and digesting fish because they are equipped with long heavily toothed gill rakers that aid in holding and swallowing, an intestine with a simple loop, and

1 7 4 8

R0064124

a brain with large optic lobes. This raptorial predator has sharp canine-like teeth and a large mouth. In one study the stomachs of halibut 12 to 510 mm TL contained 65% fish, 34% crustaceans, and 1% mollusks, though the diet of these fish changed as the fish grew. For example, halibut less than 55 mm TL ate mostly small fish (gobies) and small crustaceans such as amphipods, copepods and mysids. Fish from 55 to 230 mm TL ate larger prey. The northern anchovy is probably the most important prey of the California halibut.

1.6 Habitat Associations

Adults occur over sandy bottoms from the surf zone to 100 m. Most commercially caught fish are on the bottom at water depths of 6 to 40 m. Age I+ fish and II+ fish segregate by depth, with older juveniles and young adults occurring deeper than younger juveniles. Shallow bays and estuaries may be critical habitat for the survival and growth of larvae and young juveniles, and the shallow waters of the open coast almost surely serve as nursery grounds for California halibut.

1.7 Status

The California halibut supports a small but valuable sport and commercial fishery. A sharp reduction in California halibut landings from California in the late 1920's and declining landings in recent years have prompted scientists to determine the cause. To date little is known about its biology and life history.

2.0 WHITE CROAKER

2.1 Spawning

Spawning takes place close to shore though ripe males of Atlantic croaker have been taken in water as deep as 108 feet (18 fathoms). They spawn for the first time when 2-3 years old laying thousands of eggs at a time.

2.2 Larval and Juvenile Stage

Little is known about the larvae and juveniles of white croaker.

2.3 Maturity and Life Span

White croaker may live as long as 15 years. A typical large fish would be 14 inches long and weigh 1.5 pounds.

2.4 Feeding Habits

White croakers have mouths on their underside and feed on bottom dwelling organisms. They usually swim in loose schools and can be abundant in the surf zone and in shallow bays and lagoons. A study by Ware (1979) found that as the fish grew their diet changed

VOL 18
1749
R0064125

from zooplanktonic to benthic species dominated by polycheates, pericardean crustaceans, pelecypods, and nematodes. His study took place in the outer Los Angeles harbor where he found 191 total taxa of benthic fauna of which white croaker were found to consume 132 taxa.

2.5 Habitat Associations

White croaker spend most of their time in offshore areas at depths of 10 to 100 feet and have even been found fairly abundantly at depths of 300 feet. They have been collected from Vancouver Island, British Columbia, to Magdalena Bay, Baja California, but are not very abundant north of San Francisco. They can be found in sandy bottom areas and in murky waters.

2.6 Status

The white croaker is one of the most abundant near-shore fishes in southern California.

6.2	Union Oil Company of California - Los Angeles Refinery, Wilmington	85-8

Non-NPDES Requirements - Rescission

7.1	Lockheed Environmental Systems, Burbank	88-043
7.2	Limoneira Association, Ventura	59-134

9. Consideration of a Resolution of Appreciation for David Gildersleeve.

MOTION: By Mr Zarian, seconded by Mr. Coe and approved on a voice vote, with Mr. Slezak abstaining on Item 7.2.

6.1 The Los Angeles County Department of Public Works (Sepulveda Storm Drain Project), Carson 92-22

(Mr Drane joined the meeting during this discussion.)

Roy Thun of ARCO addressed the Board and recommended the proposed project not include soil treatment but endorsed vapor extraction. His concern is the cost effectiveness of cleaning up soil and then putting it back again to get recontaminated. He stated other areas are in the process of being cleaned up. Staff member Keith Elliott addressed the Board stating that ARCO is the potentially responsible party for the problem in Sepulveda Blvd. He also said that staff and ARCO have worked very closely together to resolve this matter. The normal process of the Regional Board is to have the responsible party clean up the soil using the options available to them. Staff member James Ross stated that the soil will be treated and there should be no threat to the groundwater with the cost being at a minimum.

VOL 19

0010

R0064135

Following discussion among staff and the Board members, staff suggested that the matter be discussed further with interested parties and brought back to the Board at a subsequent meeting.

MOTION By Mr Zarian, seconded by Mr Vernon, and carried on a unanimous voice vote to continue this item until further information was received.

ENFORCEMENT

8. Consideration of an Order Rescinding Cease and Desist Order Nos 86-2 and 87-94 issued to the City of Los Angeles.

Staff member Gary Schultz presented this Item to the Board Sam Furuta of the City of Los Angeles Bureau of Sanitation stated that one half of the North Outfall Sewer has been cleaned and that the North Outfall Relief Sewer has at the moment and for the near future the capacity to prevent any wet weather overflows while the remainder is being seen to The City has future plans to construct the East Valley Interceptor Sewer . He also said that out of the seven tasks originally required, the other six have already been completed.

MOTION By Mr. Drane, seconded by Mr. Dipple, with Mr Zarian abstaining and adopted on a voice vote.

OTHER BUSINESS

10. Discussion of the Basin Plan Amendment Regarding Landfills in Sand and Gravel Pits.

Dr. Ghirelli presented this matter to the Board He said that the External Program Review Committee recommended Chapter 15 be followed and to let the issue run its course Staff will continue to work with State Board staff and wait until they have completed their work Mr Vernon stated that when the Board approved the ALR expansion it was in full compliance with Chapter 15 Later, the Tanner Bill was enacted and did not cover all basins in the State.

Chairman Keston asked if there would be a risk involved on waiting approximately four months until the State Board has made their determination. Dr. Ghirelli said that, at present, there are no issues being raised that would constitute a risk.

Burton Gindler of the Main San Gabriel Basin Watermaster representing Azusa Landfill Task Force addressed the Board with his concerns. He stated that this issue has "dragged on" for too long and suggested that the Board make a strong stand to eliminate a variance procedure.

The Board directed staff to keep close contact with this matter, monitor the progress of Chapter 15 regulations and report back to the Board periodically on any revisions that may occur. They also directed staff to wait for a decision from the State Board if one was to be forthcoming in a reasonable time.

11. Status Report on Compliance by the City of Los Angeles (Terminal Island Treatment Plant) with the time schedule to obtain an exception from the Bays and Estuaries Policy prohibition or to contract with the County Sanitation Districts of Los Angeles County (CA0053856).

Staff member Mazhar Ali gave a presentation to the Board Sam Furuta of the City of Los Angeles Bureau of Sanitation addressed the Board and stated that after extensive studies, it is concluded that the best alternative for the City is the water reclamation alternative. Action would most likely occur from the City Council at their

VOL 19 0011

R0064136

meeting on July 19, 1994. Even if they could accelerate their schedule, it will take 4-6 months. At present, the project has a June 1995 deadline. Bids will be taken August 26, 1994, and a decision on those bids will be October 21, 1994.

In the last 14 months, they have only had one violation and that was because the pH balance was too low, and they are in the process of upgrading equipment to prevent recurrences. The City is requesting that the deadline of the NPDES permit be extended to allow the water reclamation progress to concur.

Mark Gold of Heal the Bay addressed the Board with his concerns once again on the City of Los Angeles and their lack of commitment to this project. He stated that we need to "pull together" to get Terminal Island Treatment Plant to get tertiary treatment, including reverse osmosis, as soon as possible and resolve the dilution factor.

State Board member Mary Jane Forster suggested that the Board write a letter to the State Board asking them to proceed immediately for the Bays and Estuaries Policy prohibition to be put on the Agenda. A letter would insure that this matter remain narrow and focused. Dr. Ghirelli assured that a staff member will be assigned this task and the matter will be a priority issue.

There was agreement among presenters that such a letter is essential. Mr. Slezak recommended that a formal resolution endorsing an amendment be presented for the Board's consideration at a future board meeting.

INFORMATION ITEM

12 Staff Report on the Los Angeles County Metropolitan Transportation Authority Ground Water Reuse Study for Segment 2 of Metro Red Line.

Mr. Coe asked staff what would be considered a "large" discharge of water. Staff member Winnie Jessen answered that any discharge over 50,000 or 100,000 gpd would fall in that category.

13. Executive Officer's Report.

Dr. Ghirelli reminded the Board of the San Gabriel Valley Superfund briefing scheduled on July 27, 1994. He informed the Board that the External Program Review report was submitted to the State Board. He was informed at the ECC meeting in Sacramento that our Budget did not suffer any "major" cuts.

PUBLIC FORUM

14. Public Forum.

Royall Brown, representing the West Carmina Coalition of Homeowners, addressed the Board on his concerns about the BKK Landfill. He suggested that the Board should hold a workshop about the site and see what steps BKK, staff, and EPA will take to clean up the groundwater. He stated that BKK has a problem with vinyl chloride escaping to the air and the water. He believes the public have a right to obtain annual data reports on the studies done at the site.

Mark Gold of Heal the Bay addressed the Board on the National Resource Defense Council's Notice of Intent Letter to Los Angeles County Department of Public Works regarding the stormwater permit. He suggested that the Board set up a Municipal Stormwater Permit work group including the City of Los Angeles, NRDC, Heal the Bay, and others involved.

VOL 19 0012

R0064137

Darlene Ruiz, representing the Small Business Environmental Coalition, introduced herself and the 9-month old coalition. She stated that she only represents small businesses and will look forward to future input and policy direction from the Board. She also looks forward to working with the Board in future matters.

15. Board Member Communications

Chairman Keston reported on the Chairs' meeting and the Cal/EPA meeting in Sacramento on July 12, 1994.

CLOSED SESSION

14. There was no closed session.

ADJOURNMENT

15. Adjournment to Regular Meeting of August 22, 1994, at 9:30 a.m., 501 Poli Street, Council Chambers, San Buenaventura, California.

The meeting was adjourned at 12:35 p.m.

6.4 County Sanitation Districts of Los Angeles County (Puente Hills Landfill-Eastern Canyons Expansion) Unincorporated, Los Angeles County

Chairman Keston opened the hearing with a general statement regarding the staff report. Staff member Blythe Ponek-Bocharowski made a presentation to the board recommending the board adopt the revisions as set forth in the tentative order.

R0064142

DRAFT

VOL 19 0018

Barbara Fish, representing HHIA, addressed the board about her concerns of the review of well data collected and the unlined area of the landfill. She is concerned with documented findings in the Stetson report and recommended the board not reissue the permit.

Marlene Fox, representing RR&C Development Company, addressed the board with her concerns on reissuing the permit and stated she did not believe the Environmental Impact Report to be satisfactory.

Dr. Dennis Williams of RR&C Development Company made a presentation to the board using several graphs and charts. He stated that 75% of the landfill barrier is not monitored and should be. He also stated that the contaminated portions of the landfill have not been taken care of and are in continuity with the groundwater. He expressed his concerns with the insufficient bedrock and monitoring data collected. He suggested additional monitoring be done.

Dave Johns of the Hacienda Heights Improvement Association addressed the board about his concerns regarding the solid waste landfill and the reactivated spring in the fault. He believes the landfill barriers are leaking and suggests full monitoring be done and that data collected should meet federal requirements. The date also needs to be tabulated and available to the public.

Reinaldo Rodriguez of the Upper San Gabriel Valley Municipal Water District expressed his concerns about the landfill and presented a written statement. He suggested a committee be formed to deal with this and other future landfill issues.

Staff member Blythe Ponek-Bacharowski requested the opportunity to clarify and separate the "old" waste discharge requirement from the "present" waste discharge requirement. She informed the board that, at present, several different tests are being performed at the site such as packer tests, tow inspections, and drilling. She also stated additional monitoring can be done if necessary. She ensured that staffs' records are, and have always been of public record.

After discussion from the board, Chairman Keston closed the public hearing. He asked Dr. Ghirelli to voice his opinion on forming a new committee to address the concerns set forth. Dr. Ghirelli stated that new information will always be welcome to staff, but believes staff should continue to make decisions, and that a new committee is not necessary at this time.

MOTION By Mr. Zarian, seconded by Mr. Drane, and approved on a unanimous voice vote.

Item 6.3 Dr. Ghirelli stated that item 6.3 was inadvertently continued and requested it be "put back on" the consent calendar and voted on at this time.

MOTION By Ms. Craven, seconded by Mr. Dipple, and approved on a unanimous voice vote that the tentative requirements be adopted.

8. Consideration of a Cease and Desist Order Requiring Los Angeles County Department of Public Works (Los Angeles County) to Implement a Storm Water/Urban Runoff Monitoring Program and Cease and Desist Discharges in Violation of Board Order No. 90-079.

Mark Gold of Heal the Bay addressed the board with his concerns whether the County will do all required by them. He suggested that pathogen-nutrient matters be taken into consideration and toxicant monitoring also be done. He wants to see that all regulation requirements are enforced and met, and an investigative plan be put into place regarding stormdrains.

R0064143

DRAFT

Dr. Ghirelli informed the board that a meeting was held with County of Los Angeles Department of Public Works and staff on September 19, 1994, to discuss permit compliance. A mutual agreement on the actions necessary to comply with the permit and applicable timeframes was reached. The County committed to completing the actions within the time frame stated and monthly progress reports will be submitted.

A motion was made to withdraw the Cease and Desist Order.

MOTION: By Mr. Drane, seconded by Mr. Slezak, and approved on a unanimous voice vote.

2. Election of Officers.

Mr. Zarian arrived during the Election of Officers.

The Nominating Committee recommended Mr. Michael Keston for Chair and Mr. John Slezak for Vice-Chair for 1995.

MOTION: By Mr. Zarian, seconded by Mr. Drane, and approved on a unanimous vote.

Mr. Slezak presented Chairman Keston with an outstanding service award for his dedication as Chair for 1994, and Chairman Keston presented Mr. Vernon with an outstanding service award for his dedication as Vice-Chair for 1994.

3. Approval of Minutes of the Regular Meeting held on December 5, 1994.

There was a motion to adopt the minutes with the following addition to Item 9 (Board Member Communications):

Chairman Keston requested staff prepare a letter from him to Felicia Marcus, USEPA Regional Administrator, urging that a Joint "No Further Action" letter be drafted from the Regional Board and USEPA to Potentially Responsible Parties.

MOTION: By Mr. Zarian, seconded by Ms. Craven, and approved on a unaninous voice vote.

UNCONTESTED ITEMS

Mark Gold of Heal the Bay addressed the Board on item 5.13 (City of Los Angeles, Department of Water and Power, Scattergood Generating Station) and his concerns regarding the residual chlorine objective variances. He suggested staff change the language of the permit to supply more information.

Susan Damron of Los Angeles Department of Water and Power answered questions asked from the Board. She confirmed that LADWP would not suffer any hardships if their permits were continued for 30 days to 60 days.

Grant Adamson of Serra Canyon Company Limited addressed the Board requesting a language change in the permit regarding the sewer hookup requirement. The Board directed staff to change the language in the permit.

Member Rogers arrived during Mark Gold's presentation.

4. A motion was made to continue items 5.11 - 5.13 and modify language of item 7.7.

MOTION: By Mr. Vernon, seconded by Mr. Coe, and approved on a unanimous voice vote.

The Board approved the following items on the Uncontested Items Calendar.

MOTION: By Mr. Zarian, seconded by Mr. Vernon, and approved on a unanimous voice vote.

PUBLIC FORUM

8. Public Forum

Rosemary Dealey Woodlock representing North Valley Coalition of Concerned Citizens addressed the board with her concerns regarding Sunshine Canyon Landfill. She asked the board to consider her request to involve a 3rd party in reviewing the final report from Geosyntec. She thanked the board for "halting" the process, and informed the board that she will bring this matter to the State Board counsel.

Chairman Keston thanked her for her presentation.

9. Consideration of Resolution of Appreciation for Rand Corporation.

The board adopted a Resolution of Appreciation thanking the Rand Corporation for their contribution to the Los Angeles County Storm Water Program.

MOTION: By Mr. Vernon, seconded by Ms. Siezak and approved on a unanimous voice vote.

10. Board Member Communications.

Member Dipple discussed his concerns with the City of Claremont's sewer hookups and septic tanks. He suggested the board consider proposing a policy statement to address the concerns of the city.

Member Craven agreed with member Dipple and said that the board needs to look at these requirements. Chairman Keston asked Assistant Executive Officer Dick Harris to draw up a policy statement.

Member Coe, in his December 15 memorandum to the board, asked for a list of suggested topics for the upcoming Water Quality Coordinating Committee meeting. The Board discussed the upcoming meeting priorities list. Dr. Ghirelli informed them that the State Board asked for a response by February 1. Chairman Keston suggested that before determining the list, we ask the State Board for a list of their priorities.

11. Interim Site Assessment and Cleanup Guidebook and Interim Guidance for Remediation of Petroleum and Volatile Organic Compound (VOC) Impacted Sites.

Dr. Ghirelli made the presentation and answered questions from the Board. He informed the board that he was not asking for formal board approval of the guidebook at this time, but rather their concurrence to allow the guidebook to be distributed to the public. Within 6 - 12 months, however, staff intends to bring it in front of the board for final approval.

000018

0024

DRAFT

Staff member Roy Sakaida made a brief presentation to the board on this item.

The board gave their verbal approval to distribute the guidebook to the public.

12. Report of Significant Accomplishments in 1994.

Dr Ghirelli gave a presentation summarizing the major accomplishments of the board in 1994. The report will be sent to legislators who reside in our region along with Cal EPA and the State Board.

13. Executive Officer's Report.

14. Consideration of Regional Board Management Priorities for 1995.

Dr. Ghirelli presented the list of management priorities and asked the board for policy direction. After discussion of the board, the following priorities were suggested:

Jack Coe:

1. Staff prepare guidelines for evaluating the need for feasibility and reuse of a waste discharge. Priority should be given to pumped groundwater discharges. The guidelines should also define the board's role in implementing such reuse.

2. Extend prohibition against new landfills in sand and gravel pits, which now applies to the Main San Gabriel Basin through the Mountjoy and Tanner legislation, to remainder of the Los Angeles Region (i e , remove the authority of the Regional Board to approve by granting waiver). This could be accomplished by Basin Plan Amendment, revision to Chapter 15, legislation, or other means.

Larry Zarlan

1. Regional Board Chair bring the Water Quality Task Force together one time a year.
2. Underground Storage Tank Issues.
3. Septic Tank Issues -- (Where does the jurisdiction stop?)
4. Superfund Program -- (What exactly is our role?) -- (Can we intervene?)

Terry Dinak

1. Sand/Gravel Pit issues
2. Septic Tank issues

Charles Vernon

1. In agreement with member Coe to separate into two categories 1) Policy; and 2) Management.

John Slezak

1. In agreement with other members, especially the reuse of waste discharged water.
2. Make 401 Certification fit well with watershed management approach --broader management approach.
3. Facilitate the removal of dams to enhance riparian habitat.

000014

VOL 19 00025

R0064150

DRAFT

VOL 19

Clark Drane

1. Lockheed should be monitored more closely.
2. Let State Board handle landfills.
3. Create a simple, easier way for cleanups.

Beth Rogers

1. Create a handbook of policy procedures for the board members.
2. Cost effectiveness issues.

Charlotte Craven

In agreement with all the above members' priorities.

Dr. Ghirelli informed the board that he will firm up the list of goals and priorities and prepare another version for the board's review.

CLOSED SESSION

15. None.

ADJOURNMENT

16. Adjournment to Regular Meeting of February 27, 1995, at 9:30 a.m., 623 East Broadway, Council Chambers, Glendale, California.

The meeting was adjourned at 12:24 p.m.

STATE OF CALIFORNIA
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

392nd Regular Meeting
Monday, April 1, 1996 - 9:00 A.M.

CITY COUNCIL CHAMBERS
613 EAST BROADWAY
GLENDALE, CALIFORNIA

STORM WATER PERMIT STUDY SESSION

After the regular meeting adjourns, there will be an informal discussion among Board Members and staff regarding the Municipal Storm Water Permit for Los Angeles County. There will be no voting or formal action taken by the board during the study session.

INTRODUCTION

1. Roll Call.

2. Approval of Minutes of the Regular Meeting held on February 26, 1996.

UNCONTESTED ITEMS

3. Uncontested Items Calendar. *(Items marked with an asterisk are expected to be routine and noncontroversial. The Board will be asked to approve these items at one time without discussion. If any interested party, Board Member, or staff person requests that an item be removed from the calendar, it will be taken up in the regular agenda order.)*

WASTE DISCHARGE REQUIREMENTS

4. Consideration of NPDES Requirements - New and Renewal. *(The Board will be asked, during a public hearing, to adopt the proposed permits for the following facilities:)*

VOL 19 0027

R0064152

NEW

*4.1	Anacapa Marina Services, Oxnard (A. Zaszkodina)	CA0063886
*4.2	McWhorter Technologies, Inc., Lynwood (J. Tang)	CA0063908

RENEWAL

*4.3	Chevron U.S.A., Inc. (Van Nuys Terminal), Van Nuys (J. Tang)	CA0058629

5. Consideration of NPDES Requirements - Rescission (J. Lewis) *(The Board will be asked to rescind the requirements for the following facilities).*

*5.1	W & M Partners Development Corporation, Los Angeles	CA0061531
*5.2	Abraham Moradzadeh & Sam Shaou, West Hollywood	CA0061221
*5.3	Douglas, Emmet Joint Venture Village on Canon, Beverly Hills	CA0060097
*5.4	American Home Mortgage Corporation (Former Gasoline Service Station), Los Angeles	CA0060771
*5.5	Hallwood, Inc dba Chase Brothers Dairy	CA0062545
*5.6	Elmer George Friend Estate, Ojai	CA0060379

6. Consideration of Non-NPDES Requirements - New and Revision. *(The Board will be asked, during a public meeting, to adopt the proposed requirements for the following facilities).*

NEW

*6.1	Hugo Neu-Proler Company, Terminal Island (R. Chou)	90-047

REVISION

*6.2	Social Model Recovery Systems, Inc. (River Community Sewage Treatment Plant), Azusa (A. Lamas)	71-047
*6.3	TCL Consent Order Study Area, Wilmington (D. Peterson)	65-121
*6.4	S.L.S & N., Inc. (Peck Road Gravel Pit Landfill), Monrovia (D. Peterson)	82-017

7. Consideration of Non-NPDES Requirements- Rescission (J.L. Lewis) *(The Board will be asked to adopt the proposed order rescinding requirements for the following facilities.)*

*7.1	Mobil Oil Corporation, Torrance	85-007
*7.2	Freight Terminals, Inc. (Heritage Park), Commerce	87-011
*7.3	Unocal Torrance Tank Farm, Torrance	100.315
*7.4	Cusenza Partnership, Woodland Hills	91-001
*7.5	Michael D. Joseph, et al., Northern Trust of California (Former Texaco Service Station), Reseda	92-049
*7.6	Los Angeles County Fire Department Camp No. 9, Angeles National Forest	55-166
*7.7	Department of Water Resources (Pyramid Lake Powerplant), Castaic	79-021

VOL 19 0028

OTHER BUSINESS

*8 Consideration of Proposed 1997 State Revolving Fund (SRF) Loan Program Priority List for Fiscal Years 1996-1997 Through 2000-2001. (J. Lewis) *(The Board will be asked to adopt the tentative Resolution approving the priority list.)*

PUBLIC FORUM

9. Public Forum *(Any member of the public may address the Board regarding any matter within the Board's jurisdiction. This need not be related to any item on the agenda.) Remarks will be limited to 3 minutes.*

INFORMATION ITEMS *(Please note that these items are for information only. There will be no voting or formal action taken by the Board on these items.)*

10. Staff Report on Closure Criteria for Low Risk Fuel Contamination Sites. (A. Saffell) *(Staff will report on proposed closure criteria for low risk fuel contamination cases in the Underground Tanks Program.)*

11. Staff Report on the Revised Interim Site Assessment and Cleanup Guidebook. (A. Heath) *(Staff will report on the status of the Guidebook.)*

12. Board Member Communications. *(The Board Members may discuss communications, correspondence, or other items of general interest relating to matters within the Board's jurisdiction.)*

13. Executive Officer's Report.

CLOSED SESSION

14. Closed Session. *(Please note that this item is not open to the public).*

At any time during the regular session, the Board may adjourn to a closed session to consider litigation, personnel matters, or to deliberate on a decision to be reached based upon evidence introduced in a hearing. Discussion of litigation is within the attorney-client privilege and may be held in closed session. Authority: Government Code Section 11126(a)(d)(q).

ADJOURNMENT

15. Adjournment to Regular Meeting of May 6, 1996 at 9:00 a.m., City Council Chambers, City of Glendale, 613 East Broadway, Glendale.

•••

A copy of the Agenda is available for examination by the public at the office of the Board during regular working hours. Please call the Executive Office at (213) 266-7514 for general information about the Agenda. Questions about specific items on the Agenda should be directed to the staff person whose name is listed with the item.

VOL 19 00299

R0064154

••••

Material presented to the Board as part of testimony that is to be made part of the record must be left with the Board. This includes photographs, slides, charts, diagrams, etc. All Board files pertaining to the items on this Agenda are hereby made a part of the record submitted to the Regional Board by staff for its consideration prior to action on the related items.

•••••

A Bulletin Board Service is available to the public that provides ready access to information about various Regional Board programs. The bulletin board telephone number is 213-266-7663 and is accessible with a computer and modem 24 hours a day, seven days a week. Currently, the bulletin board contains agenda notices, agenda minutes, executive officer's reports, a stormwater data base, a list of Regional Board staff phone numbers, and the text of the Porter-Cologne Water Quality Control Act. It also functions as a message service.

••••••

The Regional Board's Business Assistance Office offers help to business owners and others seeking information about discharge permits, cleanup requirements, and other water-related issues. Callers can reach the Office by dialing 1-800-300-8008, or in the Los Angeles area at 213-266-7671. The Office is open Mondays through Fridays from 8:00 a.m. to 4:00 p.m. Staff are available to answer general questions, help callers prepare permit applications, and address other concerns relating to the permitting process.

•••••••

A listing of pending applications for water quality certification pursuant to Section 401 of the Federal Clean Water Act may be obtained by calling Lauma Jurkevics at (213)266-7609. Alternatively, if you have a computer with a modem, you may obtain this information by calling in to our Bulletin Board at (213)266-7663. This information will be updated every week and also as new applications are received.

GENERAL STATEMENT

The primary duty of the Regional Water Quality Control Board (Regional Board) is to protect the quality of the waters within the region for all beneficial uses. This is accomplished by formulating and adopting water quality control plans for specific ground or surface water basins and discharges. Specific responsibilities and procedures of the Regional Board and the State Water Resources Control Board (State Board) are outlined in the Porter-Cologne Water Quality Control Act.

The purpose of the meeting is for the Board to obtain testimony and information from concerned and affected parties and make decisions after considering the recommendations made by the Executive Officer.

The Board and the Staff welcome information on pertinent problems, but comments at the meeting should be brief and directed to specifics of the case to enable the Board to take appropriate action. Whenever possible, lengthy testimony should be presented to the Board in writing and only a summary of pertinent points presented verbally. If you wish to make a statement, please fill out one of the cards on the table at the back of the room, indicate the agenda number or name of the item you wish to comment on, and turn the card in to a member of the Board's staff. The Board would appreciate written testimony (14 copies) being provided to the Board's Executive Assistant for distribution at or before the beginning of the meeting.

Any person affected adversely by a decision of the Regional Board, Los Angeles Region, may petition the State Board to review the decision. The petition must be received by the State Board within 30 days of the Regional Board's meeting at which the adverse action was taken. Copies of the law and regulations applicable to filing petitions will be provided upon request.

DISCLOSURE STATEMENT

All persons who actively support or oppose the adoption of waste discharge requirements or an NPDES permit pending before Regional Board must submit a statement to the Board disclosing any contribution of $250 or more to be used in a federal, state, or local election, made by the action supporter or opponent, or his or her agent within the last 12 months to any Regional Board Member.

Also, all permit applicants and all persons who actively support or oppose adoption of a set of waste discharge requirements or an NPDES permit pending before the Regional Board are prohibited from making a contribution of $250 or more to any Board Member for 3 months following a Regional Board decision on the permit application.

VOL 19

00333

4/1/96 RWQCB Overhead Presentation. Catherine Tyrell

NOTES: LA STORMWATER (ENVIRONMENTAL IMPACTS OF URBAN RUNOFF)

1. Rivers are not meeting State Standards (beneficial uses)

Figure 1 is a map of selected waterbodies within the LA River and San Gabriel River Watersheds that are not meeting State standards due to urban runoff.

In the LA River watershed we have identified problems with lead, copper, ammonia, coliform.

In the San Gabriel River watershed we have identified problems with lead, copper, ammonia, coliform.

2. Stormwater loadings appear to be comparable to loadings from POTW's

Figure 2 is a comparison of estimated annual loadings of metals from the three largest rivers (LA River, San Gabriel River, and Ballona Creek) in these two watersheds compared to an estimate of metals loadings from the two largest sewage treatment plants discharging into the ocean (Hyperion and LA County).

Figure 2a shows how metals loadings from POTWs have decreased dramatically over time. Estimates of loadings from rivers are comparable to POTWs.

Figure 2b indicates loadings of cadmium, chromium, copper and lead from the rivers are comparable to POTWs.

Figure 2c provides a comparison of POTW loadings (Hyperion and LA County) to LA Counties estimate for the Santa Monica Watershed. These data suggest the loadings are comparable.

Data Sources and Caveats:

Estimates of metal loadings from POTWs are from SCCWRP Reports (1990, 1991, 1992, 1993). We have a high degree of confidence in these numbers.

Estimates of stormwater loadings for Ballona, Los Angeles River and San Gabriel River are from SCCWRP,1990. These should be considered as ballpark estimates (i.e. within an order of magnitude estimates). These estimates are based on a limited number of samples collected in 1986 and 1987. The data was collected during years that were not particularly wet years. For instance 1986 was a drought year and in 1987 flows were about average. Loadings could be higher during wet years with above average flows.

Estimates of stormwater loadings from the Santa Monica Bay Watersheds are from the LA County Stormwater Monitoring Report.

VOL 19 0034

R0064159

3. Concentrations of metals and bacteria in stormwater channels often exceed criteria.

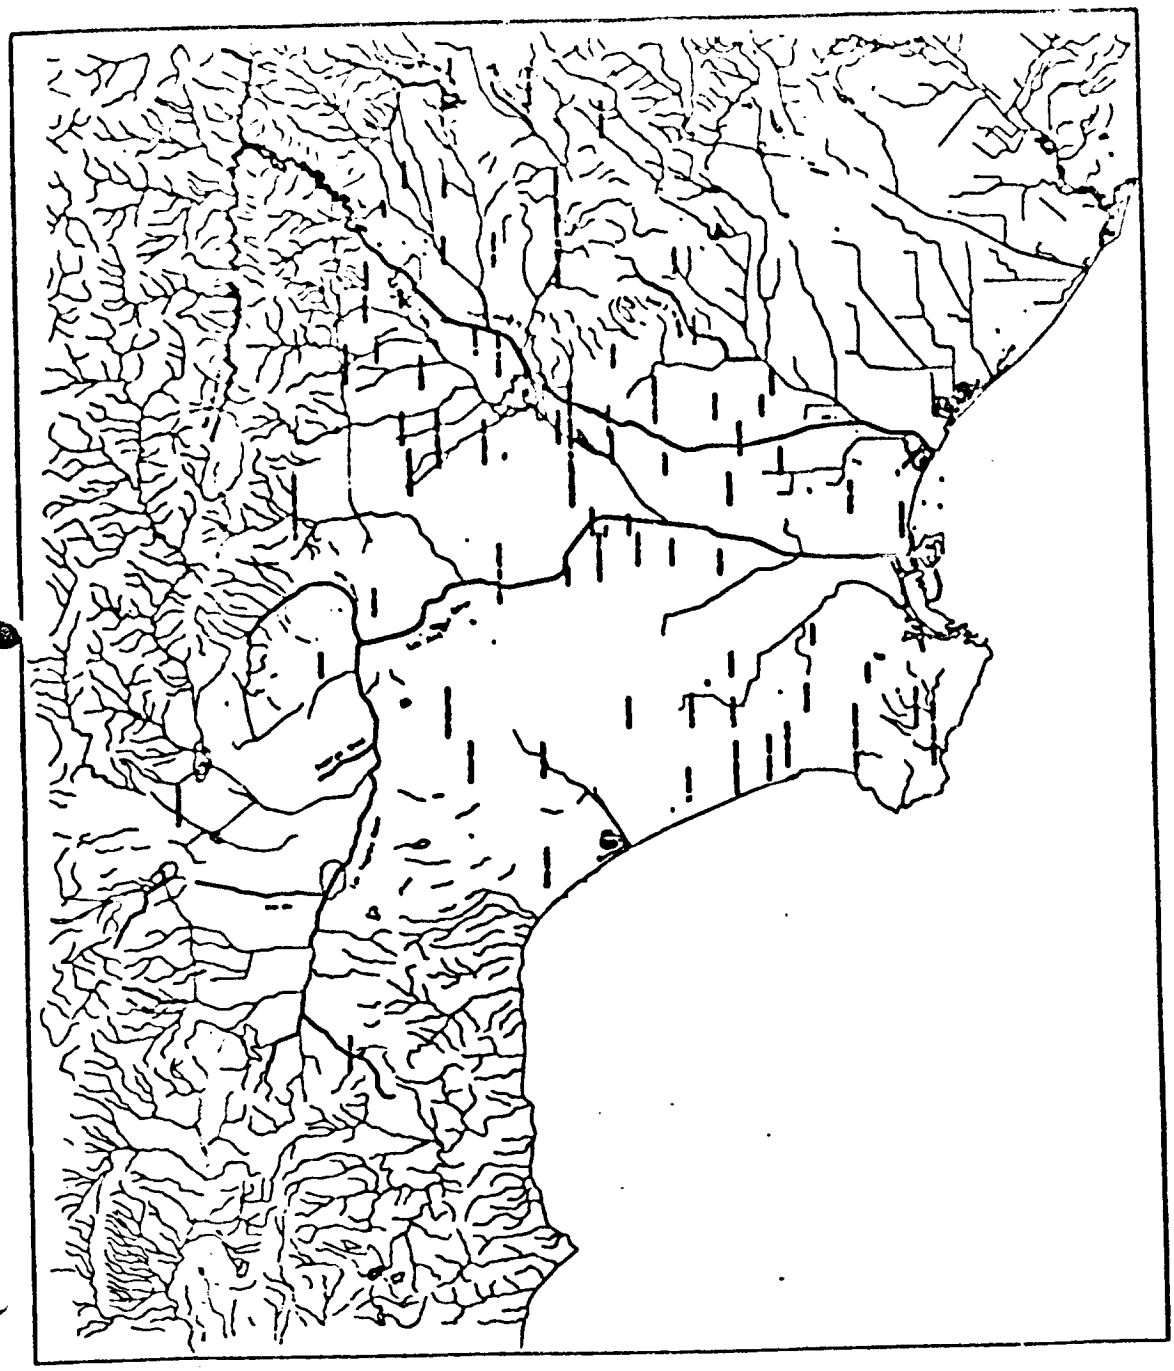
Data from the LA County stormwater monitoring program (1990 - 1994)was graphed and compared to EPA water quality criteria.

Cadmium (Fig. 3a) was rarely detected in dry-weather flows from LA River and San Gabriel River and not detected in any of the wet-weather samples from either. However, the County's detection limits (10 ppb) are well above both chronic and acute criteria.

Copper (Fig. 3b)was detected at concentrations exceeding criteria in both the LA River and San Gabriel River in dry-weather. Copper occasionally exceeded criteria during wet-weather flows. Note that the County's detection limit for copper (10 ppb) is near the chronic criteria of 11 ppb.

Lead (Fig. 3c) concentrations from dry-weather samples exceeded chronic and acute criteria in both LA River and San Gabriel River. Wet-weather flows also indicate occasional exceedances in both rivers. Note that the detection limit of 10 ppb is above the chronic criteria of 2.5 ppb.

Fecal coliform (Fig. 4c) concentrations were very high in wet-weather samples from both rivers. Dry-weather concentrations were lower but still very high when compared to standards.



Conclusions.

Urban runoff has been implicated in reducing water quality in several rivers and lakes within the LA River and San Gabriel River Watershed Management Area.

The concentrations of metals and bacteria in stormwater often exceed EPA criteria.

Loadings to the ocean are comparable to those discharged from large POTWs.

COMPARISON OF LOS ANGELES COUNTY DRAFT STORM WATER PERMIT WITH SIMILAR PERMITS IN ORANGE AND SANTA CLARA COUNTIES
EPA, Region 9

The California Regional Water Quality Control Boards (RWQCBs) are in the process of reissuing the "early" municipal storm water permits which were originally issued in 1990. The permits are considered "early" because they were issued prior to the final EPA storm water regulations of November, 1990. "Early" permit were issued in San Diego, Orange, Riverside, San Bernardino, Los Angeles, Santa Clara and Sacramento Counties. Final permits have now been reissued for Santa Clara, Orange, Riverside and San Bernardino Counties. Draft permits have been prepared for Los Angeles, San Diego and Sacramento Counties.

Los Angeles County and many of its 86 co-permittees have argued that the draft permit which has been prepared by the Los Angeles RWQCB is too detailed and contains excessive requirements. To evaluate this claim, EPA, Region 9 has prepared this comparison of the more controversial requirements of the Los Angeles County permit with the corresponding requirements of the Santa Clara County and Orange County permits. The Santa Clara County program is an outstanding program and was the winner of EPA's 1993 national award for excellence in storm water quality management. The Orange County program would be considered at least a representative, if not above average program.

Table 1 summarizes the principal requirements of concern in the Los Angeles County permit in comparison with the permits for Santa Clara County and Orange County. Appendix 1 discusses these requirements in more detail. Appendix 2 highlights principal areas where the Los Angeles County permit appears to be more stringent or more detailed than one or the other of the Santa Clara County or Orange County permits. The differences do not seem to be especially significant in most cases, however.

It should also be noted that the Los Angeles County permit does not reference the storm water program proposals in the permit applications as is done for the permits for Santa Clara County and Orange County. The Los Angeles RWQCB found the Los Angeles County permit application deficient in many respects and elected to write all the requirements into the permit. This factor contributes substantially to the length and detail of the Los Angeles County permit as compared to the other two permits.

VOL 19 0044

TABLE 1 - SUMMARY PERMIT COMPARISON

Permit Requirements	Los Angeles	Santa Clara	Orange County
Receiving Water Limitations	Compliance Via BMPs	Compliance Via BMPs	Compliance Via BMPs[1]
Program Management	Implement Permittee Proposal[2]	Implement Permittee Proposal	Implement Permittee Proposal
Illicit Discharges	Inspection Schedule Developed By Permittees	Inspection Schedule Developed By Permittees	Inspection Schedule Developed By Permittees
	BMPs Required For Street and Sidewalk Washing	BMPs Required For Street and Sidewalk Washing Plus Review of 12 Other Discharges	
Industrial/ Commercial			
a) Inspections[3]	Specifies Inspection Schedule Plus Types Of Facilities To Be Inspected	Inspection Schedule Proposed By Permittees	Inspection Schedule Based On Other Insp. Programs
b) Specific BMPs	Includes Specific BMPs	Developed By Permittees	Developed By Permittees
New Developments[4]	Storm Water BMPs Required	Storm Water BMPs Required	Storm Water BMPs Required
Monitoring Requirements	Basic Program Plus Critical Source Monitoring	Basic Program Plus Pilot Projects	Basic Program Plus Upgrades To Meet Permit Goals
Street Sweeping	Once/Month Or More	Once/Month Or More	Once/Month Or More

[1] Includes provision that permittees would not be violation of receiving water limitations if they implement required BMPs.

[2] More complicated due to 6 watersheds; an overall Executive Advisory Committee and individual Watershed Management Committees are required. Los Angeles RWQCB would delete proposed membership requirement.

[3] Inspections slightly more frequent in the Los Angeles County permit than in a proposal from the Santa Clara County permittees. For Orange County, the inspection frequency of the other programs (e.g. hazardous wastes) is slightly greater than the requirements of the Los Angeles permit. However, Orange County is still in the process of incorporating storm water into the other inspection programs and no specific schedule is included in the permit for this task.

[4] Slightly differing requirements on applicability and BMPs.

VOL 19 0045

APPENDIX 1 - COMPARISON OF PERMIT CONDITIONS OF PRINCIPAL CONCERN

1) Receiving Water Limitations:

The RWQCBs are attempting to standardize the language in all the State's municipal storm water permits concerning receiving water limitations. A workgroup was formed and model permit language was developed which appears to be close to being acceptable to all municipalities.

The model permit language essentially requires compliance with receiving water limitations via implementation of storm water BMPs. Storm water monitoring is required with additional BMPs as necessary to ensure compliance with the receiving water limitations. The model language also states that permittees will not be in violation of the permit provision requiring compliance with the receiving water limitations as long as they implement the required BMPs.

The model language was incorporated into the final permit for Orange County which was issued on March 8, 1996 by the Santa Ana RWQCB. The Santa Clara County permit and the draft Los Angeles County permit include similar language without, however, the provision that the permittees would be in compliance with the receiving water limitations if they implement the required BMPs. The Orange County permittees appear to be generally comfortable with the language in their permit.

EPA's National Urban Wet Weather Flows Advisory Committee met in March, 1996 to discuss a draft policy developed by EPA that addresses storm water permits and receiving water limitations. Under the draft policy, permittees would be presumed to comply with receiving water limitations as long as they implement required BMPs (provided this appears reasonable to the permitting authority). EPA is redrafting this policy in response to comments received in March from the State of California and others. EPA's Office of Water expects to provide its revised dr ft to interested persons by April 3, 1996. The redraft will likely include revised statements related to BMPs and presumptions regarding compliance with receiving water limitations. The Advisory Committee will consider the redrafted policy in April and May, after which EPA's Office of Water expects to issue its final policy.

2) Program Management

Several Los Angeles County co-permittees have objected to the permit requirements for program management and coordination. In particular, the draft permit requires the establishment of an

VOL 19 0046

Executive Advisory Committee (EAC) and also specifies the membership. In addition, Watershed Management Committees (WMCs) are mandated by the permit. A couple of co-permittees have argued that the EAC should not be required and that they should be allowed to choose their own organizational structure. A more common complaint pertains to the specification of the membership on the EAC.

The permit application submitted by Los Angeles County on behalf of the co-permittees proposed the same basic program management requirements as in the draft permit, including the establishment of the EAC and the WMCs. As such, it is not clear why any co-permittees would object to this structure, and it would seem likely that this issue would be easily resolvable. The draft permit does require, however, that each WMC's representative on the EAC come from the co-permittee with the largest population. This was not in the County's proposal and co-permittees feel that they should be allowed to select their own representatives. The Los Angeles RWQCB has agreed to this minor change.

Both the Santa Clara County and Orange County co-permittees voluntarily developed suitable implementation agreements to coordinate the individual storm water programs of the various permittees. The permits for these Counties simply require that the permittees follow through with their own proposals. With the above change, the Los Angeles County permit would in effect be comparable to the Santa Clara County and Orange County permits since all co-permittees would basically be implementing their own proposals.

In response to those co-permittees who have argued that the requirement for the EAC is illegal and not mandated by the CWA, we would point to NPDES regulations at 40 CFR 122.26(d)(2)(iv) which require "where necessary intergovernmental coordination" in developing and implementing a storm water management program. The EAC could be considered an appropriate means of ensuring the necessary coordination.

3) Illicit Discharges

The Los Angeles, Santa Clara and Orange County permits all require programs to prevent illicit discharges which are based on the requirements of the EPA regulations. The Santa Clara County permit requires that the co-permittees develop performance standards to set forth the level of activity (e.g., number of inspections) of the program. The Orange County permit requires submittal of a schedule for periodic inspections to be approved

VOL 19 0047

by the Santa Ana RWQCB. The Los Angeles County permit requires the development of a program which presumably would be similar to those developed in Santa Clara County and Orange County.

The Los Angeles County permit does go beyond the Orange County permit in the area of non-storm water discharges. The Los Angeles County permit specifically requires that BMPs must be developed for street and sidewalk washing. The Orange County permit provides that the permittees need not prohibit these discharges unless they are determined to be a source of pollutants.

The Santa Clara County permit also requires that BMPs be developed and implemented to reduce pollutants from street and sidewalk washing operations. In addition, the Santa Clara County permit requires that permittees evaluate a list of 12 other non-storm water discharges and consider the need for additional BMPs. Overall, in the area of illicit discharges, the Los Angeles County permit would seem to be midway in stringency between the Orange County and Santa Clara County permits.

4) Controls for Industrial/Commercial Sources

a) Inspections

The Los Angeles County permit sets forth the specific types of facilities which must be inspected and the inspection frequencies. In this regard the permit goes beyond the requirements of both the Orange County and Santa Clara County permits. The Santa Clara County permit requires that the co-permittees develop a performance standard for the industrial/commercial runoff control program including an appropriate inspection program. The Orange County permit requires that co-permittees incorporate storm water inspections into previously existing inspection programs (e.g., hazardous waste, pretreatment), and thus the inspection frequency and types of facilities which are inspected depend on the nature of these other inspection programs.

The Santa Clara County permittees have submitted their proposal for a performance standard for inspections to the San Francisco Bay RWQCB. The types of facilities which would be inspected are similar to the requirements of the Los Angeles County permit; however, the proposed inspections are slightly less frequent. For example:

VOL 19 0048

Facility Type	Santa Clara	Los Angeles
Vehicle Repair Facility	once/2 years	three/5 years
Restaurants	once/3 years	twice/5 years
Facility with Pretreatment Permit	once/2 years	once/year

As noted above, the types of facilities to be inspected in the Orange County program depend on the types already being inspected under the existing inspection programs. However, these types of facilities are similar to the facilities which would be inspected in the other Counties. The number of inspections conducted annually by the Orange County Health Care Agency is 5,500; another 7,000 inspections are conducted annually by Orange County fire departments. The City of Los Angeles has estimated that 12,000 inspections would be required per year under the proposed permit for the City alone. Given that the population of the City of Los Angeles is about 3.5 million (vs. 2.6 million for Orange County), the inspection frequency in the proposed Los Angeles County permit is slightly less than the Orange County permit. It should also be noted, however, that Orange County is still in process of incorporating storm water into the other inspection programs. No specific schedule is included in the Orange County permit to complete this task.

b) Specific BMPs

Many Los Angeles County co-permittees have objected to the highly specific BMPs which the draft permit requires for industrial and commercial facilities. Examples cited by the City of Long Beach include the requirement for regular sweeping of parking lots with more than 25 spaces, and the prohibition on the repair of machinery or vehicles in areas exposed to storm water, if they are visibly leaking oil or other fluids.

The Santa Clara County program is currently conducting a study of parking lot runoff, and the co-permittees have committed to consider appropriate parking lot BMPs after the study has been completed. The nature of the BMPs and the size of the affected facilities remain to be determined. The Orange County permit requires inspections of commercial and industrial facilities and general pollution prevention would be required (which could include regular sweeping). In addition, for new developments with a property owners association, sweeping of parking lots is required prior to the wet season.

VOL 19 0049

With regards to the other issue involving the repair of machinery or vehicles, the Santa Clara County and Orange County permits are less precise than the Los Angeles County permit. The Santa Clara County permit requires a performance standard for industrial/commercial runoff control. The draft performance standard which has been submitted by the co-permittees would not necessarily prohibit outdoor repairs, but would require appropriate BMPs for such activities. The Orange County permit would essentially require BMPs based on the judgment of the co-permittees. Overall, the Orange County and Santa Clara County permits are less specific than the Los Angeles permit.

5) Controls for New Developments

The Los Angeles County co-permittees have expressed various concerns regarding the proposed requirements for storm water controls for new developments. In particular, co-permittees object to the classification scheme for prioritizing projects. Projects are classified as high priority, priority or limited priority depending on detailed criteria in the permit. In addition, objections have been raised regarding the requirement for a storm water mitigation plan for priority and high priority projects.

The requirement for a storm water mitigation plan does not seem to be excessive considering the requirements of the Santa Clara County and Orange County permits. The Santa Clara County permit requires the development of a performance standard by co-permittees by September 1, 1996. Co-permittees would develop and then require specific BMPs to be included in development projects which are proposed. The equivalent of a storm water mitigation plan would be required to be submitted by a developer for review by the appropriate municipality. The specific BMPs remain to be developed, but would be based on a 1994 guidance memorandum from the San Francisco Bay RWQCB. In as in the proposed Los Angeles County permit, the guidance includes a 3-tier scheme for project prioritization.

The Orange County permit also requires the equivalent of a storm water mitigation plan to be submitted by developers for review. Orange County has also developed detailed guidance for developers regarding appropriate storm water BMPs. BMPs are required "in keeping the size and type of development."

Overall, the Los Angeles County permit requirements do not seem excessive in comparison to the Santa Clara County and Orange County permits.

VOL 19 0050

6) Monitoring Requirements

In most respects, the monitoring requirements of the Los Angeles County permit are similar to the requirements of the Orange County and Santa Clara County permits. Few adverse comments were received. One particular requirement in the Los Angeles County permit which did generated concerns is the requirement for critical source/BMP monitoring. Los Angeles County would be required to monitor runoff from 5 (and possibly 3 more) particular types of sources (industrial, commercial, or construction sites), and subsequently test appropriate BMPs at the sites. Other co-permittees would monitor and evaluate BMPs for 5 more critical sources. Los Angeles County noted that in its recent settlement agreement with NRDC, the County has agreed to implement this type of project; however, the County suggested certain changes to the program set forth in the draft permit. Other co-permittees argued that this type of research is excessive as a permit condition.

The Santa Clara County permit requires the submittal of an annual monitoring program proposal, and also sets forth the general objectives of the monitoring program. Special studies or pilot projects are expected to be part of the proposal in order for the proposal to be approvable, and several such studies are underway or planned by the co-permittees. Examples include a brake pad study and several other metals reductions studies, a parking lot study, a street sweeping study and others.

The Orange County permit establishes various goals for the monitoring program (which include research concerning pollutant sources and BMPs) and requires the submittal of a upgraded monitoring program in 1997. However, the permit also recognizes that the goals may not be achievable in this permit term. It is unclear but probably doubtful that research at the level required by the Los Angeles County permit would be required. Nevertheless, it should also be pointed out that the Orange County program did conduct some pilot projects in the first permit term including monitoring of golf course runoff and runoff from new developments.

Overall, the permit requirements of the Los Angeles County permit related to critical source monitoring would exceed the requirements of the Orange County permit. The source identification and control program required by the Santa Clara County permit, however, would seem comparable to the requirements of the Los Angeles County permit.

VOL 19 0051

7) Street Sweeping

In a cost analysis prepared by the Los Angeles County co-permittees, street sweeping was cited as a particularly high cost item. The cost specifically attributable to the storm water permit was not estimated, however. In comparison with the Santa Clara County and Orange County permits, the requirements of the Los Angeles County permit regarding street sweeping are not excessive.

The Los Angeles County permit requires sweeping of curbed streets at least monthly, and more frequently where feasible for areas which generate high levels of refuse. In Santa Clara County, the sweeping frequency varies among cities, but generally exceeds once/month. Examples are: Palo Alto, once/week or more; Mountain View, once or twice/month; San Jose, weekly to monthly. In addition, a study is required to investigate improved street sweeping methods with revisions in sweeping programs to be implemented based on the results of the study. In Orange County, sweeping frequencies are also on the order of monthly or more frequent.

The street sweeping requirements of the Los Angeles County permit were not among the more controversial aspects of the permit (the City of Los Angeles did recommend that the monthly frequency be considered a target rather than a requirement). However, the costs associated with the Los Angeles County street sweeping should be comparable to the programs of the other Counties.

VOL 19
0052

APPENDIX 2 - KEY LOS ANGELES COUNTY PERMIT REQUIREMENTS WHICH ARE MORE DETAILED OR EXCEED THE REQUIREMENTS OF THE SANTA CLARA COUNTY AND/OR ORANGE COUNTY PERMITS

- *Receiving water limitations* - the Los Angeles County permit omits the provision in the Orange County permit that the permittees would not be in violation of receiving water limitations if they implement the required BMPs.

- *BMPs for street and sidewalk washing* - specifically included in the Santa Clara County permit, but not Orange County. The Santa Clara County permit also requires review of 12 other types of non-storm water discharges for possible BMP requirements.

- *Specific inspection program for industrial/commercial businesses* - inspection program is developed by the Santa Clara and Orange County permittees, rather than specified by the permit. The proposed Los Angeles County inspection frequency is slightly greater than a proposal from Santa Clara County, but slightly less than Orange County's frequency. Orange County plans to incorporate storm water inspections into other inspection programs (e.g., hazardous waste). However, Orange County is still in the process of incorporating storm water into the other inspection programs and no specific schedule is included in the permit to complete this task.

- *Specific BMPs for industrial/commercial businesses* - these requirements are developed by the Santa Clara County and and Orange County permittees rather than specified by the permit. Similar BMPs are likely to be required by Santa Clara and Orange County, but more flexibility is provided.

- *Critical source monitoring* - comparable requirements are found in the Santa Clara County permit, but the Los Angeles County permit generally exceeds Orange County requirements in this area.

- Choices of Action
  - Education (Voluntary)
  - Compliance schedule to develop BMPs
  - Specific BMPs
- Negotiation

R0064194

"EXEMPTED" NON-STORM WATER DISCHARGES CURRENTLY REGULATED

TYPE OF DISCHARGE	CONCERNS	REGULATORY APPROACH/ COMMENTS
Water line flushing - Hydrotest water	Residual chlorine Sediments	Board Order No. 91-111 (NPDES No. CAG994002)
Potable water sources	Residual chlorine Sediments, cleaning chemicals, downstream erosion	Proposed general permit pending at the State Board Regional Board encourages BMPs to minimize and/or beneficially reuse reservoir drainage. Cleaning wastes should be treated, hauled away, or sewered.
Uncontaminated ground water - pumped, infiltration, - foundation/ footing drains	Depending on land use & contamination history, may draw in contamination plumes: HCs, solvents, metals	Commercial/Industrial/Construction Dewatering - Board Order No. 91-092 (NPDES No. CAG994001); Board encourages reuse of pumped ground water.
Swimming pool discharges	Residual chlorine, TSS	Commercial & public swimming pools - individual NPDES permits. Filter backwash are mostly sewered.
Irrigation - reclaimed water reuse	Res. chlorine, salts, ground water contamination	Water reclamation requirements. Title 22 prohibits excessive runoff.
Water from crawl space pumps	Contaminated ground water seepage, oil & grease	DWP is currently characterizing discharges from their utility vaults, and if necessary, determine appropriate BMPs.

Kathy Letcher, Metropolitan Transportation Authority
Dorothy Sperry, Metropolitan Transportation Authority
Katherine Winsor, Pacific Environmental Group
Jovita Pajunlio, U.S. Environmental Protection Agency
Cat Kuhlman, U.S. Environmental Protection Agency
Eugene Browley, U.S. Environmental Protection Agency
Zafar Kanmi, City of Los Angeles
Gary Hildebrand, Los Angeles County Public Works
Charles Gale, BIA/SC
Jeff Wilson, WSPA

2. Approval of Minutes of the Regular Meeting held on February 26, 1998.

There was a motion to adopt the minutes.

MOTION: By Mr. Zarian, seconded by Ms. Craven, and approved on a voice vote.

UNCONTESTED ITEMS

3. Uncontested Items Calendar.

Item 4.1 (Anacapa Marine Services) and Item 8 (Consideration of Proposed 1997 State Revolving Fund (SRF Loan Program Priority List for Fiscal Years 1996-1997 Through 2000-2001) were pulled from the consent calendar for discussion. A change sheet was issued for Item 8.1. After discussion of both items, there was a motion to adop the consent calendar.

MOTION: Mr. Drane, seconded by Mr. Zarian and approved on a voice vote with Mr. Slezak abstaining on Item 8.

OTHER BUSINESS

8. Consideration of Proposed 1997 State Revolving Fund (SRF) Loan Program Priority List for Fiscal Years 1996-1997 Through 2000-2001.

Chairman Keston asked that a memo be sent to the board which prioritizes the projects within the categories.

PUBLIC FORUM

VOL 19 3 4 00076

000005

R0064201

9. Public Forum.

There were no speakers.

INFORMATION ITEMS

11. Staff Report on the Revised Interim Site Assessment and Cleanup Guidebook.

Staff member Arthur Heath gave a staff report on the interim guidebook. The board directed staff to send them a list of sites awaiting joint EPA/RWQCB NFA letters and the "final" guidebook when available.

10. Staff Report on Closure Criteria for Low Risk Fuel Contamination Sites.

Staff member Anne Saffell gave a staff report on proposed closure criteria for low risk cases. The board directed staff to consider options available to accelerate the closure rate of low risk UST cases, modify the management plan if necessary, and report back to the board.

12. Board member Communications.

The following issues were discussed:

Brownfields Task Force [B. Rogers] - recommended staff develop proposal on cost/risk/benefit case study using "brownfields".

Monitoring cost factsheets [C. Craven] - recommended staff use factsheets to identify "big ticket" cost items

Groundwater pollution in the Oxnard Plain [J. Slezak] - recommended staff review nitrate problems in the Oxnard plain.

Calleguas Creek Watershed [C. Craven, B. Rogers] - recommended staff update landowners list: add property owners in "flood plain", check "Mary Smith Trust" and send outline of permit issues to board.

13. Executive Officer's Report.

Dr. Ghirelli updated the board on the list of priority action items.

14. Closed Session.

There was not a closed session.

ADJOURNMENT

15. Adjournment.

The meeting adjourned at 11:25 a.m. to the Storm Water Permit Study Session.

VOL 19 000717

000006

R0064202

MOTION: Ms. Craven, seconded by Mr. Vernon, and approved on a unanimous voice vote.

Adjournment to the Regular Meeting of May 6, 1996, at 9:00 a.m., 613 East Broadway, Glendale, California.

STORM WATER PERMIT STUDY SESSION

Vice Chairman Slezak opened the informal study session to discuss the ongoing storm water permit processes. Members Keston and Zanan were not present for the session. Staff members Catherine Tyrrell and Xavier Swamikannu presented background information as well as framework for the permit. Catherine Kuhlman of USEPA presented a comparison of the Los Angeles Permit with similar permits in Orange and Santa Clara Counties.

The study session was adjourned at 12:40 pm.

OTHER BUSINESS

8. Consideration of a Resolution Adopting a Proposed Negative Declaration for the Conditional Waiver of Waste Discharge Requirements for Specified Composting Operations. *[Adopted on the Consent Calender].*

9. Consideration of a Conditional Waiver of Waste Discharge Requirements for Specified Composting Operations in the Los Angeles Region. *[Adopted on the Consent Calender].*

10. Consideration of a Resolution Authorizing the Executive Officer to Sign an Investigation and Cleanup Agreement with the Small Business Environmental Coalition.

Staff member Ana Veloz presented the item and recommended the Board adopt the resolution. The board directed staff to work with U S. EPA to issue a joint sign-off letter as sites are cleared. The Boare also directed staff to move quickly on Coalition sites and report back in 60 days, the progress of the investigation activities at these dry cleaner facilities.

PUBLIC FORUM

11. Public Forum.

The following speakers addressed the Board expressing concerns over the proposed Sunshine Canyon Landfill extensions, and requested a public hearing:

1. Rosemary Woodlock, legal counsel for North Valley Coalition
2. Chuck White, Waste Management, Inc.
3. William Lettis, William Lettis & Associates, Inc.
4. Phyllis Hines, Lake View Terrace Improvement Assoc.
5. Damian Durrant, Bill Hussey & Associates
6. Katie Koning, Field Representative for Congressman McKeon
7. Mary Edwards, Granada Hills Womens Club
8. Kevin Jeung, Student Body President -Robert Frost Middle School
9. Krista Lundgren, Student Body Vice-President-Robert Frost Middle School

After discussion of the board, there was a motion to hold a public hearing at the June 10, 1996 regular board meeting in City of Camarillo with the following conditions:

1) The Board receive a staff report, including staff assessment of each issue raised, a minimum of two weeks prior to the hearing.
2) Staff meet with BFI to explain that, in the interim, that they are proceeding at their own risk.

MOTION: By Mr. Zarian, seconded by Mr. Drane and approved on a voice vote.

0000006

VOL 19 0082

R0064207

12. Board Member Communications.

The following issues were discussed:

Mr. Slezak referred to a recent article he authored regarding the State Board's containment zone policy and a Department of Fish & Game steelhead management plan.

Mr. Vernon informed the Board about an upcoming epi-study press conference on Tuesday, May 7, 1996 in Santa Monica.

13. Executive Officer's Report.

Dr. Ghirelli reminded the Board of the upcoming WQCC meeting, May 16-17, 1996 in Ontario and presented an update on the Priority Action Items. The Board directed staff to give them regular status reports of the number of low risk underground storage cases being closed. Dr. Ghirelli also updated the board on the municipal stormwater permit. The board directed staff to proceed with releasing the next draft of the permit and staff response to comments.

14. Closed Session.

There was not a closed session.

ADJOURNMENT

15. Adjournment.

The meeting adjourned at 11.50 a.m. to the Calleguas Creek Watershed Study Session.

MOTION: Ms. Craven, seconded by Mr. Vernon, and approved on a unanimous voice vote.

Adjournment to the Regular Meeting of June 10, 1996, at 9:00 a.m., City of Camarillo, Council Chambersm 601 Carmen Drive, Camarillo, California.

CALLEGUAS CREEK STUDY SESSION

Chairman Keston opened the informal study session. Staff member Veronica Cueves-Alpuche gave status update on the watershed approach for NPDES permits in the Calleguas Creek Watershed.

The study session ended at 12:50 pm.

R0064213

MOTION: By Mr. Keston, seconded by Mr. Zarian and approved on a voice vote. Dr. Coe and Mr. Siezak abstained from item 6.1, Ms. Craven abstained from items 6.2 and 6.6.

Item 6.2 - (Ventura Regional Sanitation District, Toland Road Landfill, Ventura County, File No. 69-091).

The following individuals addressed the Board to request this item be continued until they have sufficient time to review the tentative permit:

Ed McCombs, General Manager, Ventura Regional Sanitation District
John A.F. Melton, Mayor, City of Santa Paula
Roger Campbell, Mayor, City of Fillmore

A motion was made to continue this item until a future board meeting.

MOTION: By Mr. Keston, seconded by Ms. Rogers and approved on a voice vote, with Ms. Craven and Mr. Siezak abstaining.

PUBLIC HEARING

10. Public Hearing to Obtain Testimony Concerning Action to be Taken Concerning Staff Approval of the Liner Design for the Sunshine Canyon Landfill Los Angeles County Expansion.

Staff member Rodney Nelson presented the item to the Board, and recommended the Board approve the landfill liner design.

Les Harder, a Consultant to staff from the California Department of Water Resources, answered questions of the Board.

Dan Templis, Browning-Ferris Industries (BFI), and Dr. Edward Kanbazanjian, Geosyntec in Huntington Beach, spoke in support of the staff recommendation.

The following speakers addressed the Board to oppose the liner design of the Sunshine Canyon Landfill:

1. Norah Schumacher, North Valley Coalition
2. Esther Simmons, North Valley Coalition
3. Rosemary Woodlock, Legal Counsel, North Valley Coalition
4. Robert Pike, Geotec Engineer
5. Dr. Benham Hershman, Hershman Associates
6. Dr. Norman Abrahamson, Independant Consultant
7. Dr. Ted Hromadka, Failure Analysis Associates
8. Dr. Douglas Hamilton, Stanford University
9. Wade Hunter, President, North Valley Coalition

The Board Members adjourned for a 10 minute break.

24. William Lettis, William Lettis & Associates, Inc.

The following speakers spoke in support of the staff recommendations:

25. Kathy Davis, Councilmember, City of Apple Valley
26. Tony Strickland, Chief Aide for Former Assemblyman Tom McClintock

The following speakers spoke but took no position:

27. Larry Sweetzer, Director, Regulatory Affairs of North Cal Waste Systems was not in support or opposition. His concern was the decision-making processes regarding state and federal standards.
28. Charles Dowdell, Los Angeles County Sanitation Districts was not in support or opposition. His concern was the policy issues relating to the seismic-design process.

Mr. Zarian departed at 2:00 for the remainder of the meeting.

The public hearing was closed. The Board discussed the testimony presented. A motion was made to affirm the Executive Officer's decision to approve the liner design of the Sunshine Canyon Landfill.

MOTION: By Mr. Drane, seconded by Ms. Rogers and approved on a voice vote. [6 Ayes - 0 Noes]

The hearing adjourned at 2:35 p.m.

13. Executive Officer's Report.

Mr. Keston discussed an on-going issue regarding Southern California Association of Governments (SCAG). SCAG requested that a meeting be scheduled with board members to discuss the Los Angeles County Municipal Stormwater Permit. The Board directed Dr. Ghirelli contact SCAG to discuss this issue.

Dr. Ghirelli updated the Board on the Dry Cleaner's Agreement. He informed the Board that the agreement will be ready for signature on June 18, 1996, and the field work will begin in July, 1996.

Dr. Ghirelli updated the Board on the San Fernando Valley Joint No Further Action letters.

PUBLIC FORUM

11. Public Forum.

Lewis Berti of Val Verde Civic Association addressed the Board requesting they investigate violations of Waste Discharge Requirements (Order No. 89-052 Laidlaw Waste Systems, Inc. - Chiquita Landfill - File No. 67-020). He stated that Laidlaw has exceeded the height, area and acreage limit restrictions of the WDR.

0000016

VOL 19 0090

R0064215

Paul Stiglich, a Private Consultant, representing Majestic Realty Co., addressed the Board regarding a underground storage tank in City of Industry. He expressed his concerns regarding a workplan implementing further investigation at the site. He requested the Board direct staff to move forward on this case and review for closure.

Dr. Ghirelli indicated staff would follow up in both matters.

12. Board Member Communications.

There was no discussion by the Board members.

14. Closed Session.

There was not a closed session.

ADJOURNMENT

15. Adjournment.

The meeting adjourned at 3:15 p.m.

MOTION: Mr. Slezak, seconded by Ms. Rogers, and approved on a unanimous voice vote.

Adjournment to the Regular Meeting of July 15, 1996, at 8:00 a.m., Junipero Serra Building, State Office Building, 107 S. Broadway, Room 1138 - Auditorium, Los Angeles.

11. Executive Officer's Report.

ADJOURNMENT

12. Adjournment to Regular Meeting of August 19 at 9:00 a.m., City Council Chambers, City of Glendale, 613 East Broadway, Glendale.

•••

A copy of the Agenda is available for examination by the public at the office of the Board during regular working hours. Please call the Executive Office at (213) 266-7514 for general information about the Agenda. Questions about specific items on the Agenda should be directed to the staff person whose name is listed with the item.

••••

Material presented to the Board as part of testimony that is to be made part of the record must be left with the Board. This includes photographs, slides, charts, diagrams, etc. All Board files pertaining to the items on this Agenda are hereby made a part of the record submitted to the Regional Board by staff for its consideration prior to action on the related items.

•••••

A Bulletin Board Service is available to the public that provides ready access to information about various Regional Board programs. The bulletin board telephone number is 213-266-7663 and is accessible with a computer and modem 24 hours a day, seven days a week. Currently, the bulletin board contains agenda notices, agenda minutes, executive officer's reports, a stormwater data base, a list of Regional Board staff phone numbers, and the text of the Porter-Cologne Water Quality Control Act. It also functions as a message service.

••••••

The Regional Board's Business Assistance Office offers help to business owners and others seeking information about discharge permits, cleanup requirements, and other water-related issues. Callers can reach the Office by dialing 1-800-500-8008, or in the Los Angeles area at 213-266-7671. The Office is open Mondays through Fridays from 8:00 a.m. to 4:00 p.m. Staff are available to answer general questions, help callers prepare permit applications, and address other concerns relating to the permitting process.

VOL 19

0094

****

A listing of pending applications for water quality certification pursuant to Section 401 of the Federal Clean Water Act may be obtained by calling Lauma Jurkevics at (213)266-7609. Alternatively, if you have a computer with a modem, you may obtain this information by calling in to our Bulletin Board at (213)266-7663. This information will be updated every week and also as new applications are received.

GENERAL STATEMENT

The primary duty of the Regional Water Quality Control Board (Regional Board) is to protect the quality of the waters within the region for all beneficial uses. This is accomplished by formulating and adopting water quality control plans for specific ground or surface water basins and discharges. Specific responsibilities and procedures of the Regional Board and the State Water Resources Control Board (State Board) are outlined in the Porter-Cologne Water Quality Control Act.

The purpose of the meeting is for the Board to obtain testimony and information from concerned and affected parties and make decisions after considering the recommendations made by the Executive Officer.

The Board and the Staff welcome information on pertinent problems, but comments at the meeting should be brief and directed to specifics of the case to enable the Board to take appropriate action. Whenever possible, lengthy testimony should be presented to the Board in writing and only a summary of pertinent points presented verbally. If you wish to make a statement, please fill out one of the cards on the table at the back of the room, indicate the agenda number or name of the item you wish to comment on, and turn the card in to a member of the Board's staff. The Board would appreciate written testimony (14 copies) being provided to the Board's Executive Assistant for distribution at or before the beginning of the meeting.

Any person affected adversely by a decision of the Regional Board, Los Angeles Region, may petition the State Board to review the decision. The petition must be received by the State Board within 30 days of the Regional Board's meeting at which the adverse action was taken. Copies of the law and regulations applicable to filing petitions will be provided upon request.

DISCLOSURE STATEMENT

All persons who actively support or oppose the adoption of waste discharge requirements or an NPDES permit pending before a Regional Board must submit a statement to the Board disclosing any contribution of $250 or more to be used in a federal, state, or local election, made by the action supporter or opponent, or his or her agent within the last 12 months to any Regional Board Member.

Also, all permit applicants and all persons who actively support or oppose adoption of a set of waste discharge requirements or an NPDES permit pending before the Regional Board are prohibited from making a contribution of $250 or more to any Board Member for 3 months following a Regional Board decision on the permit application.

Closed Session.

The Board adjourned at 8:10 a.m. to a closed session to discuss personnel issues. The regular meeting reconvened at 9:20 a.m.

Mr. Drane arrived at 8:15 a.m.

PUBLIC FORUM

Public Forum.

Mark VonBurger of Sav-Mor Oil Co. addressed the Board regarding an underground storage tank issue. The Board directed staff to meet with him and resolve the issue.

Item 7.2 - (Ventura Regional Sanitation District, Toland Road Landfill, Ventura County, File No. 69-091)

Members Craven and Slezak abstained from this item and left the room while the testimony was being given. A change sheet was submitted with this item.

Staff member Rod Nelson gave a presentation to the Board on the proposed vertical and lateral expansion of the landfill and recommended adoption of the Waste Discharge Requirements.

The following individuals addressed the Board supporting the waste discharge requirements:

Ed McCombs, General Manager, Ventura Regional Sanitation District
Mark Zerbel, General Counsel, Ventura Regional Sanitation District
Jim Acosta, Ventura Regional Sanitation District
Judy Lazar, Mayor Pro Tem, City of Thousand Oaks
Ken Gose, Mayor, City of Camarillo

The following individuals addressed the Board opposing the waste discharge requirements:

John A.F. Melton, Mayor, City of Santa Paula
Roy Payne, Councilmember, City of Fillmore
Katherine Stone, City of Ventura and City of Santa Paula
Gary Huftile, Oregon State University, Dept. of Geosciences
Robert Palmer, Gibson, Dunn & Crutcher
John Tommy Rosas, Jr. aka, Ki Nuah, Indian, Chumash Nation
Roger Myers, City of Fillmore

A motion was made to support staff's recommendation to adopt the tentative waste discharge requirements.

MOTION: By Ms. Rogers, seconded by Mr. Vernon and approved on a voice vote, with Ms. Craven and Mr. Slezak abstaining.

The

The Outlook

WEDNESDAY, March 27, 1996

Cleanup plan for bay is criticized by cities

From staff and news service reports

A proposed set of regulations aimed at cleaning up Santa Monica Bay by tidying up the streets and storm drains of Los Angeles County is running into opposition from some cities that claim the rules are too stringent and too costly to enforce.

"Santa Monica fully supports the efforts to control runoff into the storm drains. We have implemented already all of the significant proposals and we don't find them overly burdensome or onerous," said Santa Monica Mayor Paul Rosenstein.

"It is every city's responsibility to do its share to clear up the bay and we are distressed at the thought the process may be reversed. We realize most cities are strapped and we can understand the financial pressures they are under."

The environmental organization Heal the Bay said the cleanup of urban runoff is vital to the health of the bay.

BAY/B2

Bay

FROM PAGE B1

If the cities cannot live with the proposed regulations, said Heal the Bay staff scientist Jacque Forrest, they should offer alternatives.

"When everyone first came to the table in February '95, the environmentalists wanted cities to do everything under the sun. And that was not possible, and we know that," Forrest said. "But we need to find alternative solutions."

Representatives from 85 cities and the county have been meeting for the past year to hammer out an unprecedented guide for keeping pollution out of storm drains, which are one of the biggest sources of coastal contamination, especially during the rainy season.

With controls placed in recent years on industrial and sewage treatment plant discharges, the largest sources of pollution are roadways, parking lots, construction zones and certain businesses that funnel debris into the urban runoff system.

Some cities are unwilling to sign off on a cleanup plan that includes regulations that would prohibit local businesses from hosing down soiled sidewalks or rinsing out floor mats.

While the county and other local governments have launched public education campaigns asking residents to avoid rinsing soaps, pesticides and fertilizers into the gutter, the new set of regulations would make such practices illegal for businesses.

The cleanup plan, known as a National Pollutant Discharge Elimination System permit, is required by the Clean Water Act.

Xavier Swamikannu, associate engineer for the Los Angeles Regional Water Quality Control Board, said a response to the cities' concerns is due next month.

LOS ANGELES TIMES EDITORIALS

Clean It Up, Now

The problem is ugly and obvious: floating cups, newspapers, plastic bags and other trash in the waters of Playa del Rey. Much of the rubbish finds its way to Santa Monica Bay via storm drains from streets and commercial facilities. It jeopardizes marine life and the health of swimmers and compromises our tourism-dependent economy. And its continued presence in the bay means this region will be unable to comply with the federal Clean Water Act.

Outright dumping of sewage and toxic waste has largely been eliminated through enforcement of federal law. On a national scale, what remains is a formidable environmental challenge: controlling the debris and contaminants that drain into rivers, lakes and bays from farms, highways, yards, businesses and alleys.

The local problem is far bigger than the Santa Monica Bay. Orange County beaches were closed for 125 days in 1994, double the previous year's figure, according to a report by the Natural Resources Defense Council.

Solutions are controversial; they usually involve plans for close monitoring by regulators and programs to change the behavior of individuals. Proposals under discussion for Santa Monica Bay, for example, include limiting the hosing of streets and sidewalks and requiring businesses to regularly sweep their parking lots.

Cities seem headed in the wrong direction. Many of the 85 Los Angeles-area municipalities that had been working toward a common plan to control bay runoff are now balking. Moreover, the consensus and cooperation that once guided their efforts have disintegrated; by summer, the plan, which must be accepted by state regulators, will be a year overdue.

The bickering should end. Cities that have walked away from countywide negotiations should return to the table. State and county officials should encourage them. Meanwhile, neighborhood associations, business groups and local chambers of commerce need not wait. They should set up programs to voluntarily clear storm drains, monitor businesses and educate the public. Clean it up.

Warnings Near Storm Drains to Be Replaced

■ Pollution: Los Angeles finds tile signs glued to curbs urging people not to dump trash where it will be carried into the ocean are getting knocked off.

By BOB POOL
TIMES STAFF WRITER 1-22-96

Close encounters of the terrestrial kind are sending part of an antipollution campaign down the drain in Los Angeles.

Officials are prying up 1,150 customized signs glued to curbs around the city that urge people not to dump trash into storm drains that empty into the ocean.

The reason: Buses pulling close to the curb for passengers are crushing the tile-like signs, knocking ceramic chunks into the very drains they're designed to protect.

It's the second setback for a $720,000 effort to prevent foam cups, cigarette butts, used motor oil and other discards from washing through 100,000 urban street drains into Santa Monica Bay and Long Beach Harbor.

Earlier "no dumping" reminders stenciled onto sidewalks above drain openings were worn away by pedestrians or obliterated by weather, dirt and discarded chewing gum.

City officials say they'll try tougher plastic curb tiles next. And if that doesn't work, they will try to attach signs to sidewalks with a special adhesive.

"It's life in the big city," shrugged Mark Gold, executive director of Heal the Bay—an environmental group whose lawsuit against the city eight years ago triggered the sign campaign. "Thank God they stopped it before wasting a lot of taxpayer money. You can imagine them doing all of their drains before realizing it didn't work."

Not that plenty of taxpayer money hasn't already been spent.

The city has so far paid $320,000 for the storm drain markers—including the cost of focus groups that helped pick the signs' fish-skeleton logo. There was even debate over the wording. "No Dumping—This Drains to Ocean." A proposal to include the words "No Tire Basura" (don't throw trash) was scrapped after Latino groups complained that Spanish-speaking people were unfairly being singled out.

> **'Thank God they stopped it before wasting a lot of taxpayer money. You can imagine them doing all of their drains before realizing it didn't work.'**
>
> MARK GOLD
> Heal the Bay executive director

The logos made their first appearance in the fall of 1993 on spray-painted signs stenciled on sidewalks above street drain openings. But many were blurry and difficult to read. And most started fading after about six months.

Looking for something more lasting, officials turned last year to ceramic tiles, which cost about $5 each. Fearful that pedestrians might trip over them and sue the city, officials decided to glue them to the sides of curbs rather than place them on sidewalks.

The first tiles were installed Downtown, near UCLA and in the San Fernando Valley's Porter Ranch and Northridge-Winnetka areas. Officials soon noticed that bus tires were bumping against them and breaking them, said Chuck Ellis, spokesman for the city Department of Public Works.

Los Angeles is responsible for about 55,000 of the region's 100,000 or so storm drains. Unlike sewer lines that run from homes and businesses to waste-water treatment plants, storm drains funnel street runoff directly to the ocean through open channels.

Ellis said the city is determined to find a durable sign for its drains. In a new test, 850 plastic tiles are being glued to curb sides and 175 stenciled signs are being cemented to sidewalks with "hot tape"—a process most commonly used to put crosswalk lines on streets, he said.

"We may have to change the design, or the color," he added. "We're trying to figure out how to label so it lasts the longest."

The city has paid workers from the Los Angeles Conservation Corps to install the test signs. Marun Ludlow, that group's Downtown director, predicted Thursday that the hot tape method—with more legible white-and-blue lettering—will be the eventual winner.

But will any sign actually stop people from tossing trash into storm drains? Officials acknowledged that they don't know—although the campaign has had at least one positive result.

Workers stenciling signs next to drains have taken it upon themselves to pluck debris from adjacent gutters, Heal the Bay storm water manager Lisa Crossley said.

"We can document keeping 180 grocery-size bags of trash out of the bay," she said.

Stop This Monstrous Runoff

UCLA study points finger at storm drains as a major bay polluter

It's yucky, possibly even deadly: runoff from city streets. Trash, motor oil, chemicals, pet droppings and who knows what else find their ways into gutters. All this collects in catch basins and flows though storm drains into the great Pacific Ocean, where people and fish play.

How powerful can such toxins be? Just look at what happened to the Teenage Mutant Ninja Turtles, contaminated when they were dropped into storm drains as babies. Well, OK—that's just fiction. But the fact is that preventing ocean contamination should be a major, year-round concern. Even in hard times, a little public awareness can help keep storm drains from being receptacles of contaminants.

A new study by UCLA found that an estimated 160 toxic chemicals—many of them known or suspected carcinogens—flow daily through storm drains into Santa Monica Bay, the home of Southern California's most popular beaches. The study, commissioned by American Oceans Campaign, the City of Santa Monica and Environment Now, identified a wider range of chemical pollutants than had been previously analyzed in the bay, long known as a site of toxic contamination.

Most of the attention and pollution remedies have been directed at sewage plants; storm drains have been studied little. Now it turns out that Santa Monica Bay levels of some carcinogens from storm drains are above those allowed in other situations under the California Ocean Plan, which sets standards for California coastal areas. Storm drains are not covered in the plan. Perhaps they should be—a matter for the State Water Resources Board to consider.

Meanwhile, cities in Los Angeles County that feed into the Santa Monica Bay watershed should be complying with the 1990 requirement that they file a storm water management plan. Even if implementation must be delayed because of tight budgets, cities could at least embark on educational efforts to drive home the point that people can help keep the ocean clean even when they are many miles away from the shoreline.

Study finds 160 toxins reach bay

Environmentalists release results

By Nick Madigan
STAFF WRITER

At least 160 toxic chemicals, many of them known or suspected carcinogens, are flowing into Santa Monica Bay on a regular basis, according to a UCLA study released Tuesday by the environmental group American Oceans Campaign.

In the most extensive study undertaken of the effluents of storm drains, researchers found significant traces of polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs) and chlorinated pesticides, the most toxic and dangerous of the many substances analyzed.

"There are very real storm water risks to users of the bay," said Robert H. Sulnick, executive director of the Santa Monica-based American Oceans Campaign, "and this is just the tip of the iceberg. If we'd had more money, we'd have found more."

The $100,000 study was funded by AOC, the Santa Monica Bay Restoration Project, Environment Now and the city of Santa Monica, and was conducted by Dr. John Froines and Dr. Mel Suffet of the UCLA School of Public Health and Dr. Michael Stenstrom of the UCLA Department of Civil and Environmental Engineering.

5 drains chosen

Although 64 storm drains empty into the bay, the researchers concentrated on five — Pico-Kenter, Ashland, Sepulveda Channel, Ballona Creek and Centinela — from which samples were collected over a six-month period. The five were chosen because they were good examples of high-flow areas.

"Many of the compounds identified are widely recognized as being probable or possible carcinogens, reproductive toxicants, or having other chronic or acute toxicities," Froines said at a press conference Tuesday morning at Ballona Creek. "The finding of alpha-chlordane, dieldrin and PCBs, the latter es-

Toxins

FROM PAGE A1

pecially in the Ashland drain, represents an important finding in this study. These substances are of particular significance because of their potential toxicity, persistence and potential for bioaccumulation in the environment."

Chemical contamination was found in all five of the drains surveyed. By far the worst storm drain was Ashland, which runs into Santa Monica State Beach, where 120 trace organic compounds were found.

At least 50 such compounds were identified at each of the other storm drains tested. The most toxic compounds found were polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), phthalates, chlorinated pesticides and hydrocarbons, phenols and other carcinogenic organic compounds and organophosphate pesticides. In addition, 33 volatile organic compounds were found in the effluent of all five storm drains.

Chemicals identified in the study can enter the body in one of two ways — through bioaccumulation, the build-up of toxins in living organisms, usually through eating fish or shellfish, or through the skin. The study summary did not mention swallowing water while swimming.

PAHs, which were found in all five drains, were deemed carcinogenic in studies that focused on contact with skin. Petroleum-based, they are often the product of incomplete combustion and are found throughout the environment. They may come from exhausts, tires and used motor oil as well as from barbecues and industrial sources.

PCBs at 5 sites

PCBs, likewise sampled at all five sites, are found in aerosols and are also used for insulation in transformers. They are virtually indestructible in the environment and accumulate in the body through the food chain. PCBs are considered probable carcinogens by the Environmental Protection Agency and the International Agency for Research on Cancer.

"The existence of PCBs in the studied storm drains is one of the most important discoveries of the study and is a serious concern to both humans and the ecology of Santa Monica Bay," according to a summary of the study issued by American Oceans Campaign.

"To date, the state Department of Health Services has taken the position that there was no need to warn the public of any health impact from storm water contamination free of human waste," said Lisa Weil, policy director for AOC. "The results of this study demonstrate that it is time for DHS to step up to the plate, post those warnings and do the job they are charged with — protecting the health and safety of the citizens of California."

Carol J. Henry, director the office of Environmen Health Hazard Assessment the state Environmental P tection Agency, said the st "points to the strong need improved control of storm d discharges into Californ bays and estuaries."

In a letter Monday to Molly Joel Coye, director of state Department of He Services, Assemblyman T B. Friedman, D-Brentw urged that DHS "adopt an gressive statewide policy conjunction with county he departments, of perma warning signs on beaches w swimmers come into con with storm drain effluent."

160 Toxics Per Day Flow Into Santa Monica Bay, Study Finds

■ Pollution: Urban runoff into the ocean deserves more research, says a report commissioned by an environmental group. Statewide posting of warning signs about the danger of swimming near storm drains is being sought.

By MARIA L. La GANGA
TIMES STAFF WRITER

An estimated 160 toxic chemicals—many of them known or suspected carcinogens—flow daily into Santa Monica Bay through the storm drains that capture urban runoff, causing potential danger to humans and marine life, according to an environmental study released Tuesday.

Although the bay, the most popular Southern California beach destination, has long been known as a site of some toxic contamination, the study identified a wider range of chemical pollutants than had been analyzed before.

"As this study shows, there are very real storm water risks to users of the bay and the ecology itself, which must be evaluated and quantified if we are to properly inform our citizens and protect Santa Monica Bay," said Robert H. Sulnick, executive director of the American Oceans Campaign, an environmental group that commissioned UCLA to conduct the study.

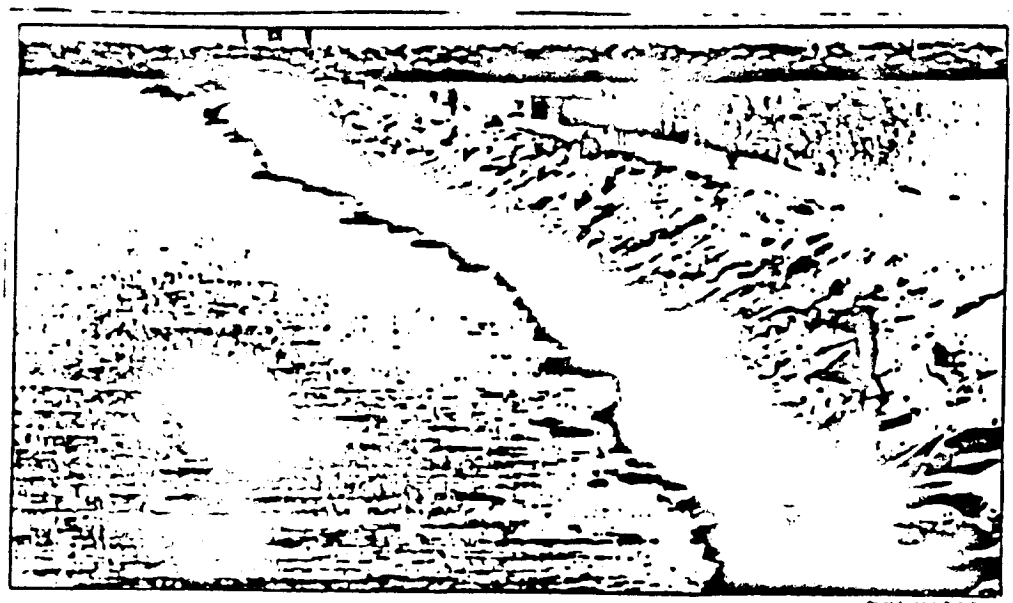
The findings are the latest salvo against the widespread problem of ocean pollution from urban runoff. Although the most single sources of pollution to the bay—such as sewage plants—have largely been remedied, storm water pollution is an area that has had little study and even less prevention, scientists and environmentalists say.

One of the most findings of the report is a high level of polycyclic aromatic hydrocarbons, also known as PAHs, carcinogens that are byproducts of incomplete combustion and may emanate from auto exhaust, used motor oil and tires. A wide range of PAHs were found in levels above those allowed in the California Ocean Plan, which sets standards for California's coastal areas.

"If PAHs are well above Ocean Plan standards, shouldn't we care about them, if humans and marine life are directly exposed to urban runoff, which we are?" asked Mark Gold, staff scientist for Heal the Bay, another environmental organization. "This brings out the need for the Ocean Plan to apply to urban runoff as well. It's not clear that it does."

To John Froines, a professor of toxicology at the UCLA School of Public Health and the lead scientist on the study, the presence of PCBs, or polychlorinated biphenyls, in levels greater than allowed under the Ocean Plan is also of great concern. PCBs are known carcinogens and cause reproductive problems. They can enter the body through contact with the skin and also concentrate in fish that are later eaten by people.

"We don't know their origin," Froines said, "or why they've come into the storm drains."



The study sampled water from five of the bay's 64 storm drains over a six-month period and found what Froines characterized as probably 10% of the chemicals that flow from drains into the bay.

"What this study shows is that there's a lot more there that needs to be characterized, but also that we're only seeing part of the problem," Froines said.

Although Los Angeles County beaches have signs at most storm drains warning of the dangers of swimming closer than 100 feet, the American Oceans Campaign is asking for statewide warnings—large and bilingual—about swimming near drains. The group also is urging the state to come up with a management strategy for pollution from urban runoff.

Assemblyman Terry B. Friedman (D-Brentwood) this week wrote to Molly J. Coye, director of the state Department of Health Services, informing her of the study and requesting that signs be posted at beaches throughout the state.

DAILY NEWS, August 18, 1993

Researchers took samples from five storm drains, including the one at Ballona Creek, and found traces of organic compounds

Toxics found in 5 drains feeding bay

UCLA study says compounds came from pesticides, other chemicals

By Tony Knight
Daily News Staff Writer

Storm drains carry into the Santa Monica Bay traces of about 160 chemical compounds, including some that are known to cause cancer and birth defects, according to a study released Tuesday by researchers from the UCLA School of Public Health.

The traces, which were found in five of 64 storm drains that empty into the bay, come from the widespread use of pesticides and other chemicals throughout Los Angeles, said the study by the University of California, Los Angeles.

Researchers, who described the testing as the most exhaustive look at storm drain pollutants to date, called for additional studies to assess the possible health threat and for programs to find and eliminate the sources of pollution.

"The PCBs and the pesticides that we found deserve much more investigation because where they're coming from is not clear, and they do stick around in the environment, so they are accumulating," said John Froines, one of the principal researchers.

Froines and fellow researchers took samples for six months from five storm drains, including the Pico-Kenter storm drain near Santa Monica Pier, the Ashland storm drain in Venice, the Ballona Creek channel south of Marina del Rey, and the Sepulveda and Centinela channels that empty into Ballona Creek.

Fifty traces of organic compounds were found in all the storm drains. More than 120 compounds were found in the Ashland storm drain alone.

The $100,000 study was funded with grants from the city of Santa Monica, a federally funded public/private consortium known as the Santa Monica Bay Restoration Project and two environmental groups — the American Oceans Campaign and Environment Now!

The environmentalists urged people to stay out of storm drain water where it crosses the beach, never to swim within 100 yards of a discharge point and to avoid swimming in the ocean for three days after a storm.

"The actual levels of the contaminants were not in and of themselves so great," said Lisa Weil, policy director for American Oceans Campaign. "The cause for concern is that they found so many. They found over 150 in only five storm drains monitored."

Officials with the California Environmental Protection Agency said the study points out the need to control storm drain discharges.

"Little has been done to address the quantities of hazardous consumer products, illegally dumped motor oil and other toxic compounds that find their way into storm drains, and ultimately, the bay," said Carol J. Henry, director of CAL-EPA's health hazard assessment office.

Assemblyman Terry Friedman, D-Encino, in a letter called on Molly J. Coye, director of the state Department of Health Services, to immediately post warning signs at all 64 storm drain outlets to the bay.

"People living in coastal communities who spend time at the beach should be made aware of precautions that can be taken to minimize contact with these dangerous chemicals," Friedman said.

Ken August, spokesman for the state health department said Coye could not respond directly to Friedman's letter or the study results on Tuesday.

"The department is looking into his (Friedman's) request," August said.

Los Angeles County officials already post permanent warnings at three storm drains and temporarily post a half dozen others when they have water in them, said Jack Petralia, director of Environmental Protection for the county Department of Health Services.

Petralia said the levels of the toxics that were found was extremely low compared to safe drinking water standards. The study measured toxic traces in nanograms (millionths of a gram) per liter. One nanogram per liter is equal to one part toxic compound for every trillion parts of water.

"Nanograms are below drinking water standards," Petralia said. "When you start talking about parts per trillion that doesn't make any sense. The drinking water standards are based on you drinking a liter a day, every day, for 70 years."

L.A. CITY COUNCIL APPROVES GALANTER MOTION TO SUPPORT SWEEPING COASTAL ANTI-POLLUTION PROGRAM

The Los Angeles City Council today approved Councilmember Ruth Galanter's motion supporting the proposed Los Angeles County Municipal Storm Water NPDES (National Pollution Discharge Elimination System) Permit regulating urban runoff.

Under the federal Clean Water Act of 1987, local governments must adopt an NPDES permit regulating runoff and storm water pollution. The Los Angeles Regional Water Quality Control Board (RWQCB) will vote on the draft NPDES permit on July 15. The proposed storm drain pollution permit will reduce storm water pollution to the maximum extent practicable and ensure compliance with the objectives contained in the permit. Those conditions include identification of illicit discharges into the storm drain system, increasing public and business education, and increasing site inspections.

Everyday, an estimated 100 million gallons of urban runoff flow off city streets into storm drains into San Pedro and Santa Monica Bays. Urban runoff typically consists of a toxic mixture of oil, gasoline and lawn fertilizers and chemicals washed from parking lots, driveways and from watering lawns. An epidemiological study report released in May by the Santa Monica Bay Restoration Project revealed that swimmers who swim near storm drains are at a significantly higher risk of getting sick than those who swim further away, demonstrating the need for tough storm water and runoff regulations.

"The most significant action the RWQCB can take to clean-up Santa Monica Bay is to adopt this permit," said Galanter. "Local government and businesses may have to take some extra steps, but at stake is the health of the millions of swimmers at our beaches and our region's multi-billion

dollar tourist industry. Since some local governments have balked at some of the permit requirements, the Los Angeles City Council's adoption of this resolution sends a strong message to the Water Board that the City of Los Angeles and its residents are willing to do what it takes to control pollution and clean-up the Bay."

PASADENA STAR-NEWS

Clean oceans start at home

EDITORIAL

LOCAL cities should welcome the new consensus plan for cleaning up our coastal waters. Storm drain runoff has been identified as the No. 1 pollutant fouling our beaches and threatening marine life.

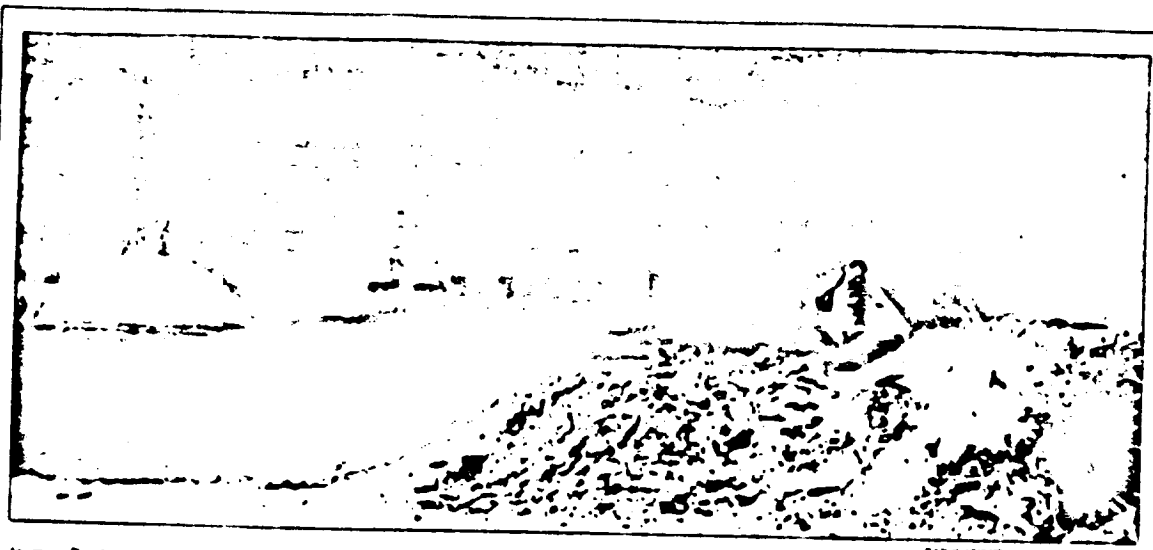
During the rainy season, rubbish, silt, pesticides and toxics from streets, parking lots, yards and farmland flow into street drains, forming a lethal soup. Much of the unsightly and disease-laden mess is dumped directly into the ocean and washed back up along the Southland's biggest tourist attraction — miles of beach.

THE ISSUE: Cities and counties will soon have pollution abatement guidelines for helping clean up coastal waters.

WE SAY: Individuals can help by proper disposal of toxics and better management of water resources.

The largely voluntary plan relies heavily on education, leaving enforcement up to existing local agencies. Mitigation is based on simple and often inexpensive measures that cities must take now.

For instance, barriers around storm drains catch much of the urban debris, offering easy and ongoing cleanup. They are an efficient solution to clogged catch basins, which often back up, resulting in flooding. Cheaper, too.



Regular street sweeping must be a priority for cities and counties. This midnight maintenance not only clears streets, alleyways and parking lots of paper and dirt, but also vacuums up oil, gasoline and other automotive fluids from leaking vehicles.

The state could go a long way toward reducing these contaminants by making checks and repairs part of the biannual smog certification required for vehicle registration. Most folks would be grateful if such leaks were caught early enough to avoid costly repairs.

The Regional Water Quality Control Board will oversee the program and is expected to adopt an abatement permit by July 15. Based on the consensus concept, the permit is expected to require cities to reduce runoff from public facilities such as vehicle maintenance yards, fire stations and parks as well as include storm water runoff considerations in General Plan revisions. Cities must move immediately to make mitigation part of environmental impact requirements for developments.

Individuals must become part of the solution as well, putting trash in containers instead of tossing it on the street. Proper disposal of used motor oil at a service station; timing lawn sprinklers to prevent pesticides, fertilizer and soil from going over the curb; and sweeping, instead of hosing driveways are precautions people can implement easily and quickly. Only by working together can we turn the tide on the wave of pollution that is killing our oceans. Let's clean it up, now.

Flotsam AND Jetsam

Rains Wash Ashore Everything From Old Refrigerators to Rattlesnakes Along the Coast

By PAUL FELLMAN
TIMES STAFF WRITER

When Earl and Sandee Simons arrived at the beach in Ventura the other day, they were hard pressed to find a clean spot to plunk down their towels.

The problem was the 20-foot-wide layer of driftwood and other debris that washed out of the Santa Clara and Ventura rivers and up onto the shore.

"It's as if the tributaries of all the rivers have puked into the ocean," mused Earl Simons, a disabled oil field foreman.

From Santa Barbara south to San Diego, the unusual season of heavy storms has left an impressive residue on Southern California's glistening sands—tons and tons of flotsam and jetsam, the likes of which have not been seen for more than a decade.

On many Ventura County beaches, piles of bamboo-like sticks are so thick that it looks as if a Pier 1 Imports warehouse exploded at seaside.

More than a month after the harshest rains, the coastline in Long Beach resembles a hay farm just after harvest, as city maintenance workers stack piles of driftwood and man-made debris that continue to spew out of the mouth of the Los Angeles River near the Queen Mary.

With Easter but a week away and summer looming as something more than an abstract concept, the debris is proving a daunting physical, fiscal and aesthetic challenge.

FLOTSAM: Heavy Rains Bring Rattlesnakes, Reeds and Refuse Ashore

Continued from A3

Some beach-goers, though, see the deluge of driftwood as a healthy sign that a whole lot of nature still remains in metropolitan Southern California.

"It makes you feel like you're so far away from the city—it makes it so much more natural here," said surfer Michael Creel, 24, as he shaded himself in an impromptu tepee made of tree branches and logs at Trestle, a venerated surfing beach near the border of Orange and San Diego counties.

Although the bulk of debris can be found on beaches in the vicinity of river and creek mouths, some has floated in the sea 10 to 20 miles before washing ashore.

Particularly mobile is arundo, a prolific bamboo-like giant reed that grows in large groves along stream beds in the Ventura and Malibu areas and has been found on the sand as far south as Hermosa Beach.

"It's an exotic, invasive weed that has gone wild," said marine biologist Susan Williams, who works as a Channel Islands National Park ranger. "With lots of rain, lots of the stuff grew last year. And with the rain this year, there has been a tremendous flow down the watersheds."

Surfers seemed to be taking the invasion of floating obstacles in stride.

"Occasionally, you see a log cruising by and laugh and say: 'Whoa, log, look out,'" said Troy Peters, 23, after a morning in the waves at Surfer's Knoll in Ventura. "I hit a half a tree, a big old huge branch. It broke a fin on my board. But I like the beach this way. I'm opposed to making the beach all perfect. You see the craziest wood formations. It's real intense."

The same day, Ventura Harbor beach-goers sifted through weathered driftwood for natural art or made use of cane-like branches for surfside baseball games. On the beach next to the Ventura County Fairgrounds, near a homeless encampment in the live arundo groves known as "Hobo Jungle," two homeless Vietnam veterans improvised a game of their own—seaside ringtoss, employing a washed-up bicycle inner tube and a two-foot reed.

"We know this game from 'Nam," said one of the drifters, who said he goes by the name "The Preacher." "We're bored and so this keeps our morale high."

Also boosting their spirits, The Preacher added, were the fresh oranges and lemons that were carried to sea from citrus groves along the Santa Clara River. "We pick 'em off the beach to eat," he said.

While the fallen fruit lent a festive color to the shore, several surfers at Ventura said it also stood as testimony to a silent representation of the storm season.

"God knows what kind of pesticides are washing out to sea," said Craig Lane, 27, a restaurant manager from San Luis Obispo. "The pollution concerns me."

In less developed areas of Orange County, the issue of agricultural runoff has been complemented by fears of rattlesnakes.

At San Clemente State Beach near the one-time Western White House of Richard Nixon, lifeguard Mike Broussard said he recently spotted a three-foot rattler.

"I wasn't going to be a hero," Broussard said. "I called the animal control people."

At nearby San Onofre State Beach, a recent surfing contest was canceled when a participant noticed a live rattlesnake floating in the surf on a branch. And at Doheny State Beach off Dana Point, free driftwood is available for use as firewood—but consumers are warned to watch out for snakes when parking through the timber.

> **"I hit a half a tree, a big old huge branch. It broke a fin on my board. But I like the beach this way. I'm opposed to making the beach all perfect."**
>
> TROY PETERS
> Surfer

Clearly, though, the heaviest impact of this year's storms has been on beaches that were forced to shut for several days because of pollutants streaming out of storm drains and overflow from sanitary sewage systems.

Moreover, the most lingering impact has been in the coastal communities of Long Beach, Seal Beach and Playa del Rey, which suffer the misfortune of abutting the mouths of the Los Angeles River, the San Gabriel River and Ballona Creek.

When the sun beats down on Dockweiler State Beach at Playa del Rey these days, the little bits of foam in the sand glisten as if they were mica.

"During each storm, it looks like white lilies are floating down the creek—it's like a Styrofoam garden," said artist Kelly Fenn, as she sifted through the sand and refuse for seashells.

On a nearby jetty, fisherman Aaron Crawford, 48, said conditions remain dreadful in the water—at least if fish are the object of one's desires. "I've caught plenty of plastic bags, T-shirts and all kinds of stuff," said the Southern Pacific freight car worker.

The heavy storms have also helped create a large underwater buildup of sediment at the south entrance to the Marina del Rey channel. Last October, the Army Corp of Engineers spent $400,000 on a dredging project—but now the channel has shoaled up again.

At Seal Beach last week, the shoreline was more the consistency of mulch than sand because of the high content of pulpy debris washing ashore from the adjacent San Gabriel River.

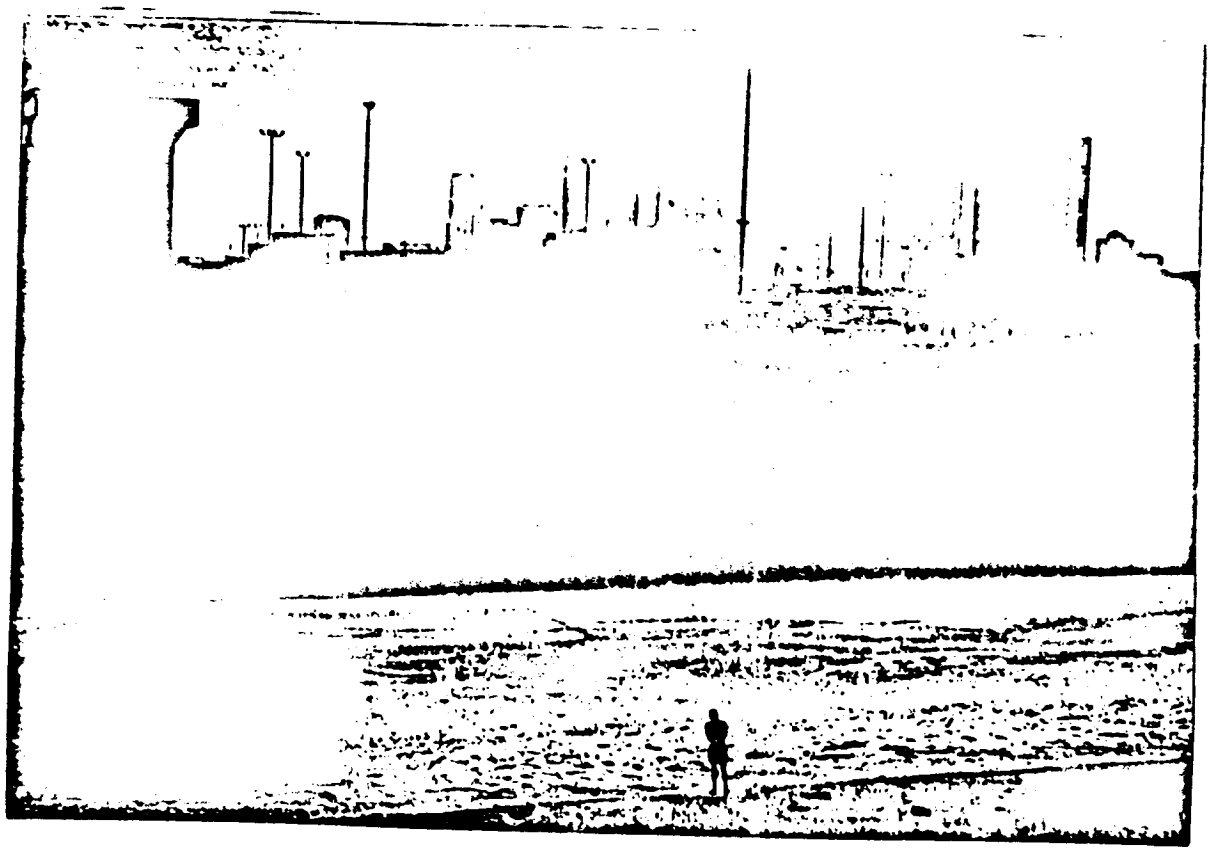
"It's not what they show on TV about Southern California," said vacationing Portland, Ore., resident Sandy Barkstadt. "It's pretty nasty here."

Tractor operator John Ayala, 37, said the cleanup has been nonstop work. "Every time it seems like you can breathe a sigh of relief, it starts up again the next day."

Nowhere has it been worse than in next-door Long Beach, where city officials say a staggering 8,000 tons of debris have washed to shore.

That is twice as much refuse as the Los Angeles County Department of Beaches and Harbors picks up in an entire year along 31 miles of beaches from San Pedro's Cabrillo Beach north to Zuma Beach. It is also twice as much debris as Long Beach has ever had to deal with before, said Long Beach parks and recreation manager Phil Hester.

"It's probably going to cost a minimum of $700,000 to clean," Hester said. "We anticipate it will be another month before we get all the debris off the beach."



Hester said his crews have picked up refrigerators, 30 foot logs, cigarette butts, tires, plastic oil containers and dead dogs.

After sifting out the sand with a $75,000 machine, he said, trash haulers transport the refuse where it should have gone in the first place before tumbling down the Los Angeles River—the county dump.

BLANK

PR firms to do dirty work in cleanup plan

By Marni McEntee
Daily News Staff Writer

Storm drains might be a dirty subject, but certainly not a sexy one. Just ask the public relations experts at Rogers and Associates and Harris and Co.

With $5.2 million in Los Angeles County money, the two companies have the unenviable task of teaching people what happens when what they dump down storm drains ends up in the ocean.

They were chosen for the job in May, partly because they have launched other successful public education efforts, including AIDS and smoking prevention campaigns, Rogers and Associates partner Lynne Doll said.

Making the transition to, say, explaining how a discarded fast-food wrapper makes its way from a restaurant parking lot to the beach should be a snap.

"If we can get people to stop smoking or put on a condom before they have sex, then getting them not to litter, for example, is easy," Doll said.

The public education campaign is the main feature of a plan to help bring Los Angeles County in line with federal Clean Water Act regulations designed to clean up coastal waters.

On July 15, the Regional Water Quality Control Board is scheduled to consider issuing Los Angeles County a five-year permit for its cleanup plan, called the National Pollutant Discharge Elimination System permit.

The meeting is scheduled for 9 a.m. in the county Hall of Administration, 500 W. Temple St.

The plan is designed to reduce a toxic soup of pathogens, oil wastes, heavy metals, pesticides and animal wastes that run down storm drains and account for an estimated 60 percent of the pollution in the Santa Monica Bay — toxins that sicken ocean swimmers and surfers, a recent scientific study found.

"Watershed management is a concept whose time has come," declared Dennis Washburn, a Calabasas City Council member, who has helped shepherd the county's permit process.

The efforts have not been without controversy.

Glendale City Engineer Desi Alvarez predicts that the plan will be expensive — for consumers, businesses and public agencies.

The cleanup plan requires 85 cities in Los Angeles County to adopt and enforce regulations on runoff pollution. That means cities must develop a public education system for businesses and consumers, identify and eliminate illicit storm drain hookups, limit street and sidewalk washing, and mandate regular sweeping of larger parking lots and proper waste disposal at restaurants, car repair shops and gas stations.

Alvarez said some requirements, such as rules that require swimming pool water to be chlorine-free before it is flushed down untreated drains, will be a burden to consumers and the city.

"That means you'll have to pay someone to come out and test the water. It could cost $300 to do the test," Alvarez said. "Somebody's going to bear the burden of that and it's going to be the homeowners."

Still, plan supporters say the final product actually has been stripped of many of its teeth.

Although it requires the county and cities to visit businesses and industries to explain storm water regulations, it does not require regular city inspections to ensure commercial and industrial businesses are complying with wastewater permit requirements, said Roger Gorke, science and policy analyst for the environmental group Heal The Bay.

Yet, some business associations say there's no good science behind the permit requirements.

Restaurant operators, for example, would be required to make sure any runoff from food-covered mats doesn't make it into storm drains untreated.

"We have been concerned about the fact that we have been included in here without any empirical evidence that we should be," said Gerald Breitbart, a consultant for the California Restaurant Association.

Long Beach officials have requested that the board postpone permit requirements for that city, until studies can determine whether storm drain runoff has tainted beaches there, said Deputy City Attorney Lisa Peskay Malmsten.

That city already spends $12.4 million on storm water projects, such as street sweeping and public education, she said

The new requirements could cost an additional $3.5 million per year, which may be funded through an assessment district similar to the one in Los Angeles, she said.

"If you're a taxpayer you're paying for it out of one pocket or the other," Peskay Malmsten said.

Redondo councilmember key player in water debate

by Corrinne Frost Jr.

When the countywide permit that regulates storm drain pollution expired a year ago, a group of city engineers, Los Angeles County officials and representatives of environmental organizations met to craft a new permit that would directly address the growing problem of the waste that flows into our oceans.

Giving extra impetus to their mission was the recent publication of a study that for the first time linked pollution from storm drains to illness in swimmers.

As negotiations continued, though, it became clear to all parties that an agreement would be difficult. Officials from local governments balked at the high cost of broad enforcement measures. Environmental organizations argued that tough policing was the only way to get real gains.

At that point, the negotiations fell into an impasse over the enforcement heavy proposal that was on the table. That is where negotiations would probably still be if not for a group of city representatives from the Santa Monica Bay Restoration Project who brought forth an alternative.

It was these representatives who, in fighting what they described as unfunded mandates in the original permit proposal, put forth a plan that would keep strong enforcement provisions intact, but would allow cities to first attack the problem with education. This newer, less-divisive and less-costly permit proposal will go to a vote before the California Regional Water Quality Control Board July 15.

Representing small cities on the Restoration Project's executive advisory committee was Redondo Beach

Bob Pinzler

Councilmember Bob Pinzler who, as the negotiations continued, found himself in the midst of one of the most heated environmental debates that the county has seen in years.

Further, this representative from a small- to medium-sized beach city found himself dealing with political heavyweights from county, state and federal government, as well as some savvy players in the environmental community.

But Pinzler said this work that he was not intimidated by the company.

"In everything that happens that affects the (City) council, you can take the position of being a superficialist or get involved," Pinzler said. "I tend to get involved."

While not describing himself as a textbook environmentalist, Pinzler said that

(Please turn to page 15)

VOL 20

0018

R0064251

Pinzler

(Continued from page 10)

because controlling storm drain pollution was very important to him, he felt the need to get involved.

"I felt this was extremely important to the economy, and I felt it was extremely important to our quality of life," he said. "I sort of took it to heart."

According to Pinzler, he and his associates were originally concerned with the costs that small cities were facing under the proposed permit. He estimates that if the original proposal had been approved, it would have cost his city $250,000 a year to implement. In a cash-strapped city like Redondo, that would have been a tough pill to swallow.

Although specific estimates aren't available for the new proposal, Pinzler says the costs will be "substantially less" because they give cities the option of devising their own strategies, using resources that, in many cases, are already in place.

Another problem that Pinzler and his associates on the Restoration Project found with the old proposal was that there was no real plan to change the behavior of the violators who were doing the most damage with regard to storm drain pollution. These were the common citizens who dump motor oil in the gutter or let their dogs defecate in the street.

Most agreed that getting compliance from these people was the most important step in cleaning up storm drain runoff. Save an elaborate and expensive method of policing, the only way to achieve the necessary change in behavior would be through education, contended the Restoration Project and a number of city representatives.

"We can't afford storm drain police," Pinzler said. "What this (the new proposed permit) does is permit cities to try stuff. If it doesn't work, there is still tough enforcement.

"The key is that it allows for a period of time to see if it (each city's educational programs) will work. I think it will."

Pinzler drew the analogy to recycling. Once ignored by most adults, recycling became the norm when kids learned about the importance of such programs at school and brought that information home.

"Kids shame their parents," he said. "That's what we're going to deal with here."

Most citizens were never privy to the work that Pinzler and his colleagues performed behind the scenes. However, if they've watched a Redondo or Manhattan Beach council meeting recently they may have seen the video that Pinzler helped produce with the county, the Restoration Project and Heal the Bay.

"In our travels around, Dennis Washburn (the inland cities representative with the Restoration Project) found a lack of awareness on this issue," Pinzler said. "We wanted not only to let them know what was going on, but to get their responses to it."

Because both Pinzler and Washburn have backgrounds in advertising, they were perfect choices to put together the informational video which presents the problems of storm drain pollution and discusses the proposed permit. Pinzler is credited with writing and directing the video.

The video has been distributed to just about every city in the county. Other government officials and environmental groups have also received a copy of the video.

The Outlook

June 19, 1996

OUR VIEWS

A new chapter for bay cleanup

Cities must address urban runoff

Years of efforts to clean up Santa Monica Bay have yielded many successes. Pollution from so-called "point sources," such as industrial giants, has been markedly reduced. Water monitoring has increased. Government agencies have invested millions of dollars in sewage treatment.

But in July the clean-the-bay drive will reach a new plateau. As Joan Hartmann of the American Oceans Campaign in Santa Monica explains, urban runoff now accounts for as much as 60 percent of water pollution.

A new regionwide campaign will attempt to neutralize this "toxic cocktail" of pesticides, animal droppings, trash, food wastes and automobile by-products that are commonly dumped down storm drains in the Los Angeles basin. On July 15, the Regional Water Quality Control Board, a state agency, will vote on requiring the county and 65 cities in the region to follow stricter stormwater pollution practices.

AT ISSUE:

Will a regional stormwater program reduce pollution in Santa Monica Bay?

The new program, the product of more than a year of negotiations, has evolved from one focused on enforcement to a more business-friendly campaign based on education. And though it will mean some additional responsibilities for local governments, it's a reasonable way to achieve a goal everyone agrees with: a cleaner bay.

A cleaner storm-drain system bolsters the region's $2 billion tourism economy. It reduces health risks to swimmers, surfers and other beachgoers. And it lessens the risk of storm-drain backups that create flood conditions during the rainy season.

The new program would create a coordinated effort to identify illicit disposals of pollutants; require educational visits to affected businesses such as gasoline stations, auto repair firms and restaurants; reduce stormwater runoff at construction sites; and develop an outreach program to educate the public.

VOL 20

00020

R0064253

The Outlook

June 19, 1996

Smaller cities should be able to reduce their compliance costs by "piggy-backing" with other cities and public agencies. Making businesses more aware of stormwater issues can be done in conjunction with ongoing fire, health and industrial-waste inspections.

Moreover, businesses would not be required to install expensive new technology. They would be given basic instructions on keeping oil, grease and other chemicals out of the storm drains and how to go about emptying industrial wash basins.

Most of these things are simply good housekeeping practices that should appeal to everyone living in the Los Angeles area, especially those who enjoy the beach.

It is also worth mentioning that while some cities — Redondo Beach and El Segundo among them — have had concerns about previous drafts of the new stormwater policy, the current proposal has the backing of the county and the city of Los Angeles in addition to such businesses as Maguire Thomas Partners, Jon Douglas Co. and Body Glove. The Santa Monica Chamber of Commerce is also on board.

Redondo Beach City Councilman Robert Pinzler says the current proposal is geared toward what's "doable and affordable." We agree. By approving the countywide stormwater permit, the Regional Water Quality Control Board would take Santa Monica Bay cleanup efforts to a new level, one that is ambitious, yet necessary to preserve one of the region's most valuable resources.

101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Mr. Keston:

As a business operator in the Los Angeles Area, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times about pollution from storm drains in the Santa Monica Bay (3/26/96, page B1), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures. I am pleased that the business community was included in the negotiations–as were representatives of all the effected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

c: Governor Pete Wilson
Mayor Richard Riordan

Monterey Park, California 91754-2156

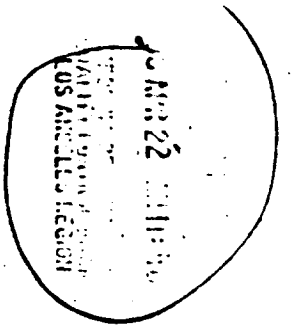
Dear Chairman Keston:

I am very concerned about the pollution of Santa Monica Bay, and the effect of that pollution on the health, not only of the Bay, but on the health of our economy. I encourage you to adopt the pending stormwater permit. It offers the only way to restore the Bay to health and to ensure the prosperity of coastal and tourism businesses.

The Bay has developed a reputation as being polluted and, as a result, visitation has declined. The soon-to-be released epidemiological study showing the health effects of swimming near storm drains could exacerbate this trend. I understand that the epidemiological study deals only with the impact of pathogens on one-time swimmers during dry weather; it does not address the impact of regular swimmers, those who swim in wet weather when flows are greatest, or the impact of toxic pollutants (scores of which have been identified and are known or suspected carcinogens or mutagens). The release of the epidemiological study is likely to raise many questions. If the regulatory authority has no compelling response about how to reduce pollutants from urban runoff flowing to the Bay, people will stay away. This will have enormous short and long-term economic consequences.

As the regulatory authority charged with protecting our waters, I urge you not to delay in adopting the pending stormwater permit.

Sincerely,



Gerald Breslauer

Dear Chairman Keston,

Urban runoff is the largest source of coastal pollution to Santa Monica and San Pedro Bays. As you know, the Santa Monica Bay Restoration Plan targets reducing storm water pollution as the plan's most important goal. Los Angeles County has suffered through a drastic reduction in the number of beach visitors (from over 80 million per year to less than 50 million) to L.A. County beaches largely because many people are afraid to swim in the runoff polluted waters off our coast. Also, clogged catch basins cause hundreds of thousands of dollars in property damage every year. Urban runoff dumps tons of contaminated sediments at the mouths of the L.A. and San Gabriel Rivers and Ballona Creek next to Marina Del Rey. The end

Dear Chairman Keston:

I am writing to express my agreement with the Los Angeles Times editorial titled "Clean It Up, Now"—referring to the runoff polluting Santa Monica Bay.

As the editorial states, this pollution jeopardizes marine life, the health of swimmers, and our tourism-dependent economy. We cannot afford *not* to take action.

The Regional Water Quality Board must use its authority to ensure that cities assume responsibility for educating their residents and businesses about good housekeeping practices related to runoff.

Respectfully,

Annett Wolf

April 25, 1995

Mr. Michael Keston, President
California Regional Water Quality Control Board
101 Center Plaza Drive
Monterey Park, CA 91754

Dear Mr. Keston:

I live in Santa Monica, and love the area primarily because of its proximity to the ocean. The ocean breezes, the moderate temperatures during the summer, and the beaches are all great reasons to live in Santa Monica and all of the communities that line Santa Monica Bay.

I am also an avid swimmer, and when the water is warm enough thrre is nothing better than swimming in the ocean. Thankfully, significant steps have been made to treat the water that flows into Santa Monica Bay so I and millions of others can enjoy the coastal waters. But urban runoff continues to be a major source of pollution in Santa Monica Bay, and one that desperately needs to be addressed.

Urban runoff dumps tons of contaminants into the rivers and creeks that flow into Santa Monica Bay, threatening the health of marine life and swimmers like me. The threat of water contamination also scares off millions of other possible beach visitors costing communities such as Santa Monica millions in tourist dollars.

The Santa Monica Bay Restoration Plan targets the reduction of storm water runoff as its highest priority. This is a problem that can and should be addressed, but we need your support. The public health, millions of dollars to the local economy, and the health of Santa Monica Bay are all at stake.

I urge you to support the Municipal Storm Water NPDES permit for Los Angeles County. Do the right thing Mr. Keston!

Sincerely,

Matt Middlebrook

State Capitol, First Floor
Sacramento, California 95814

Dear Governor Wilson:

As a proud Republican and supporter of your administration, I felt I would be remiss not to write this letter.

Urban runoff is the largest source of coastal pollution to Santa Monica and San Pedro Bays. As you know, the Santa Monica Bay Restoration Plan targets reducing storm water pollution as the plan's paramount goal.

Los Angeles County has suffered through a drastic reduction of 30 million beach visitors per year largely because many people are afraid (and wisely so) to swim in the murky, polluted waters off our coast. Additionally, clogged catch basins generate hundreds of thousands of dollars in property damage every year. These situations pose severe health risks to local marine life as well as human swimmers and surfers.

Though not typically high on the Republican agenda, environmental concerns must be addressed when they become this severe. Tens of millions of tourism dollars could disappear each year as travelers seek safer waters in states other than California. Please protect the public health, marine life, real estate and the County's $12 billion a year tourism economy BY SUPPORTING THE MUNICIPAL STORM WATER NPDES PERMIT FOR LOS ANGELES COUNTY.

Dear Mr. Keston:

The Beach Club has enjoyed Santa Monica Bay since its founding in 1923. Our 645 member families are committed to the improvement and preservation of this world class asset for the enjoyment of our members, our neighbors in Santa Monica and the entire Los Angeles community.

Storm drain runoff is a threat to the health and safety of the Bay and is understandably a concern to our members. Knowing this, we urge you to adopt the proposed storm water permit that is currently under consideration by your Board. The continued improvement of this public asset requires that measures like this be adopted so that our and future generations can enjoy this Southern California treasure.

Thank you for your commitment!

With best wishes always, I remain...

Sincerely,

THE BEACH CLUB

Gregg Patterson
General Manager

Michael Keston, Chair
California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, Ca 91754-2156

Dear Mr. Keston:

As a citizen of the Los Angeles Area, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times about pollution from storm drains in the Santa Monica Bay (3/26/96, page B1), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures. I am pleased that the citizens of the community were included in the negotiations- as were representatives of all the effected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

Trip Reeb
General Manager

Dear Chairman Keston:

We are very concerned about the pollution of Santa Monica Bay and the effect of that pollution on the health not only of the Bay but on the health of our economy. We encourage you to adopt the pending stormwater permit. It offers the only way to restore the Bay to health and to ensure the prosperity of coastal and tourism businesses.

The Bay has developed a reputation as being polluted and, as a result, visitation has declined. The soon-to-be released epidemiological study showing the health effects of swimming near storm drains could exacerbate this trend. We understand that the epidemiological study deals only with the impact of pathogens on one-time swimmers during dry weather; it does not address the impact of regular swimmers, those who swim in wet weather when flows are greatest, or the impact of toxic pollutants (scores of which have been identified and are known or suspected carcinogens or mutagens). The release of the epidemiological study is likely to raise many questions. If the regulatory authority has no compelling response about how to reduce pollutants from urban runoff flowing to the Bay, people will stay away. This will have enormous short and long-term economic consequences.

As the regulatory authority charged with protecting our waters, we urge you not to delay in adopting the pending stormwater permit.

Sincerely,

Lauren Shuler Donner

Dear Chairman Keston:

I am writing to urge the Water Board to issue the proposed stormwater permit. Stormwater is the single greatest contributor to pollution of Southern California coastal waters. It contains toxics, pathogens, and debris that harms marine life and afflicts swimmers with an array of ailments.

Some cities are concerned about the costs, but opportunities for cooperation among cities reduce costs considerably. The permit simply calls for education and ordinary, good housekeeping practices.

Without leadership from the Board in addressing stormwater, growth and development will lead to increased degradation of coastal waters. More illness, beach closures, and heart-rending ailments among marine mammals will result. Such degradation threatens our economic prosperity and our very identity as Southern Californians.

Sincerely,

John A. Buropp

QUALITY CONTROL BOARD
LOS ANGELES REGION

May 13, 1996

Dear Sirs:

As a businessperson in Los Angeles County, I am concerned that the pollution along the Los Angeles County coastline is costing millions of dollars out of our economy. We cannot afford to have more businesses leave our region, and have fewer tourists visit our beaches because of the well-known pollution problems.

While there has been a 75% reduction of sewage dumped into the bay stretching from the Palos Verdes Peninsula to Malibu - thanks to the hard work of a coalition of businesses and citizens led by Heal the Bay - there is still one more major source of pollution that must be tackled head on to prevent further economic damage to our regional economy: storm drain runoff pollution.

Storm drain runoff pollution is the largest source of coastal pollution in Los Angeles County. Residues from vehicles, lawn irrigation, various industrial processes, animal wastes, food wastes, human wastes, and a variety of other sources drain into the storm water system and into the ocean - without being treated at all. Public health, marine life, local real estate values, and the County's $2 billion a year tourism economy are at stake. L.A. County has already suffered a drastic reduction in the number of beach visitors (from 80 million per year to less than 50 million) largely because many people are afraid to swim in the runoff polluted waters off our coast. They will not come back to the beach unless they know that serious measures are taken to heal the bay. We need to clean up our coastline to preserve the lifestyle that keeps and attracts new businesses here.

Sincerely,

Jon A. Douglas

Dear Chairman Keston:

I am writing to ask that you share with your colleagues on the Los Angeles Regional Water Quality Control Board the correspondence directed to you that deals with the municipal stormwater permit.

Individuals and organizations interested in the municipal stormwater permit have identified you, as the appropriate individual representing the Board, to be the recipient of their mail. Many have made the assumption that you would make this correspondence available to your colleagues on the Board. I realize that you will not be voting on this issue and that a new Chair will be presiding at the July 15 meeting when the municipal stormwater permit decision is scheduled. In addition, I now understand that you have no formal obligation to either copy other Board members or compile a file that would be available to all Board members to peruse.

As a matter of good government, I believe that this correspondence should be shared. This mail was not directed to you personally, but as a representative of the decision making body on this issue. Many of us assumed, if erroneously, that the letters would as a matter of course be made available to the Board as a whole.

I strongly urge you to allow the voices of those who have taken the initiative to write to be heard by the other Board members.

Respectfully,

Robert H. Sulnick

Dear Chairman Keston and Members of the Board:

As a business operator in the Los Angeles Area, I take a great interest in improving the quality of our local coastline. Moreover I am greatly concerned with the latest news (L.A. Times 5/7/96, page A1) that some areas of our coastline are not safe to swim. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

Subsequent to the release of the swimming study, Mayor Riordan pledged that the City of Los Angeles would take major steps in reducing the risk to swimmers in the Bay by diverting the runoff during summer months to a sewage treatment plan. This is an important step for the city to take. We need more cities in Los Angeles County to take similar steps whether they are located on the coast or not. I urge you to adopt the municipal storm water permit so that all of the cities in Los Angeles County are working together on this very important issue.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

Richard Foos

Dear Chairman Keston:

The recent Los Angeles Times article regarding the pollution of coastal waters by storm drain runoff addressed an issue which has become very important on a personal level to my family. I have a 5 ½ year old son who for several years now I have been taking to the beach to play in the sand and surf. My husband is a member of the Jonathan Club and so we frequent the beach facility which is very close to the Santa Monica pier.

In May of 1995, after being at the beach and playing in the sand at the surf's edge, my son became ill. No one at his school was ill. In the sixteen days following his visit to the beach he had eleven days of fever in excess of 103°. He lost weight but had no other symptoms which could be pinpointed; his doctors could only suspect he was suffering a virus. No one else we knew had these symptoms.

On April 7th of this year, we again took my son to the beach to play in the sand and surf. If you check the weather history for that period of time, you will see that earlier in the week it had rained. Beginning with the night of April 9th, my son again began suffering very high temperatures with no other symptoms. Again no one else in the family or in his school or among his playmates suffered this illness.

Dear Chairman Keston and Members of the Board:

As a business operator in the Los Angeles area, I take great interest in improving the quality of our local coastline. Our beaches are an important economic drive for the region, and we must take smart, reasonable and cost effective action to protect our resources.

After reading in the LA Times about pollution from the storm drains in the Santa Monica Bay (3/26/96), I am moved to write to request that the Board adopt effective means to address the problem, and there are obviously strong scientific data to support such measures.

In an era when government is often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic and environmental sense.

Thank you for your consideration.

Sincerely,

Chris Allaire

Mr. Michael Keston, Chair
California Regional Water Quality Control Board, Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston:

I am writing to urge the Water Board to issue the proposed stormwater permit. Stormwater is the single greatest contributor to pollution of Southern California coastal waters. It contains toxics, pathogens, and debris that harms marine life and afflicts swimmers with an array of ailments.

Some cities are concerned about the costs, but opportunities for cooperation among cities reduce costs considerably. The permit simply calls for education and ordinary, good housekeeping practices.

Without leadership from the Board in addressing stormwater, growth and development will lead to increased degradation of coastal waters. More illness, beach closures, and heart-rending ailments among marine mammals will result. Such degradation threatens our economic prosperity and our very identity as Southern Californians.

Sincerely,

William Kohnen
President & CEO

Dear Chairman Keston:

I am writing or urge the Water Board to issue the proposed stormwater permit. Stormwater is the single greatest contributor to the pollution of Southern California coastal waters. It contains toxics, pathogens and debris that harms marine life and afflicts swimmers with an array of ailments.

Personally, I have not been swimming in the Bay in over 15 years because of this continuing situation, and urge all of my friends and out-of-town visitors to avoid contact with the Bay at all costs.

Some cities are concerned about the costs, but opportunities for cooperation among cities reduce costs considerably. The permit simply calls for education and ordinary good housekeeping practices.

Without leadership from the Board in addressing stormwater, growth and development will lead to increased degradation of coastal waters. More illness, beach closures and heart-rending ailments among marine mammals will result. Such degradation threatens our economic prosperity and our very identity as Southern Californians.

Dear Mr. Vernon: Chuck

I am enclosing some of the letters that have been sent to the Regional Water Quality Control Board with copies to American Oceans Campaign.

I hope that by now you have been given access to all letters that were addressed to the Chair of the Regional Board, Mr. Keston.

Needless to say, it is distressing to learn that the Board may not have an official, single point of contact for the public. It is difficult to ask members of the public to write to each Board member individually.

Thank you very much for taking the substance of these letters into serious consideration as you make your decision on the municipal stormwater permit.

Sincerely,

Joan Hartmann

Monterey Park, CA. 91754-2156

Dear Chairman Keston:

The recent Los Angeles Times article regarding the pollution of coastal waters by storm drain runoff addressed an issue which has become very important on a personal level to my family. I have a 5 ½ year old son who for several years now I have been taking to the beach to play in the sand and surf. My husband is a member of the Jonathan Club and so we frequent the beach facility which is very close to the Santa Monica pier.

In May of 1995, after being at the beach and playing in the sand at the surf's edge, my son became ill. No one at his school was ill. In the sixteen days following his visit to the beach he had eleven days of fever in excess of 103°. He lost weight but had no other symptoms which could be pinpointed; his doctors could only suspect he was suffering a virus. No one else we knew had these symptoms.

On April 7th of this year, we again took my son to the beach to play in the sand and surf. If you check the weather history for that period of time, you will see that earlier in the week it had rained. Beginning with the night of April 9th, my son again began suffering very high temperatures with no other symptoms. Again no one else in the family or in his school or among his playmates suffered this illness.

In 1995 when my son became ill, I suspected he may have contracted a virus during play at the ocean. His illness in April confirmed in my mind that it is simply not safe for young children to be digging huge holes at the water's edge on the Santa Monica beach. The recent article in the Los Angeles Times on this issue was only further confirmation of my suspicions.

VOL 21

May 2, 1996

Mr. Michael Keston, Chair
California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston:

We are very concerned about the pollution of Santa Monica Bay and the effect of that pollution on the health not only of the Bay but on the health of our economy. We encourage you to adopt the pending stormwater permit. It offers the only way to restore the Bay to health and to ensure the prosperity of coastal and tourism businesses.

The Bay has developed a reputation as being polluted and, as a result, visitation has declined. The soon-to-be released epidemiological study showing the health effects of swimming near storm drains could exacerbate this trend. We understand that the epidemiological study deals only with the impact of pathogens on one-time swimmers during dry weather; it does not address the impact of regular swimmers, those who swim in wet weather when flows are greatest, or the impact of toxic pollutants (scores of which have been identified and are known or suspected carcinogens or mutagens). The release of the epidemiological study is likely to raise many questions. If the regulatory authority has no compelling response about how to reduce pollutants from urban runoff flowing to the Bay, people will stay away. This will have enormous short and long-term economic consequences.

As the regulatory authority charged with protecting our waters, we urge you not to delay in adopting the pending stormwater permit.

Sincerely,

Lauren Shuler Donner

April 24, 1996

Dear Chairman Keston:

I am concerned about an article (3/26/96) appearing recently in the Los Angeles Times that describes the debate about cleaning up the region's urban runoff. I therefore want to urge you to deal with this problem by adopting the stormwater permit now undegoing review and comment.

As the article notes, urban runoff is the primary source of pollution in Santa Monica Bay. Urban runoff results from a vast array of activities and we must begin to address these systematically or lose the tremendous ecological and economic benefits deriving from Southern California's coast. The stormwater permit offers the only reasonable method to ensure the continued enjoyment of these benefits.

Despite the reluctance of cities to take on new responsibities, it is imperative for our economic well-being, our health, and our very identity to take action to safeguard our waterbodies from the contaminated runoff to which we all contribute.

We are looking to the Regional Board to exercise leadership in this area. Our future depends on it.

Sincerely,

Sharon Robinson

Dear Chairman Keston:

I am writing to express my agreement with the Los Angeles Times editorial titled "Clean It Up, Now"—referring to the runoff polluting Santa Monica Bay.

As the editorial states, this pollution jeopardizes marine life, the health of swimmers, and our tourism-dependent economy. We cannot afford not to take action.

The Regional Water Quality Board must use its authority to ensure that cities assume responsibility for educating their residents and businesses about good housekeeping practices related to runoff.

Respectfully,

Annett Wolf

Dear Mr. Keston and Members
Los Angeles Region CRWQCB:

This communication is to inform you that the Santa Monica Chamber of Commerce Board of Directors unanimously approved a motion requesting your support for the adoption of the proposed storm water permit at the earliest possible date.

Santa Monica has long been a leader in such issues, and the Santa Monica Chamber of Commerce has proactively been supportive of similar issues facing our community's sustainability and efforts to maintain a strong and viable economic base. There is no question that quality of life factors such as those being addressed by this proposal directly impact the economic, as well as the physical, health and well being of a community and the region in which it is located. It is because of these concerns, the question of applied equity for all of our regional communities, exceptional scientific bases which support such measures and the reasonable, cost-effective and intelligent approach this proposal takes, the Santa Monica Chamber Board of Directors unanimously approved its recommendation to you to support the adoption of the proposed storm water permit as soon as possible.

Your invaluable time and consideration of our request to support the adoption are greatly appreciated. We also want to express our sincere appreciation for the outreach to the business community and its inclusion in this process and the negotiations. It is also in this spirit of cooperation and partnership that we hope your action will be positive and proactive.

Very sincerely yours,

Daniel L. Ehrler, Executive Director

Dear Chairman Keston:

I am very concerned about the pollution of Santa Monica Bay and Southern California waters by urban runoff. This runoff degrades water quality, harming not only marine life, but the health of those who swim, surf, and dive in coastal waters and diminishing the vitality of our southern California recreation and tourist economy. The pending stormwater permit offers the only way to restore public confidence that the water is clean and safe.

The Santa Monica Bay has developed a reputation as being polluted and, as a result, visitation has declined. The epidemiological study showing conclusively that those swimming near storm drains are at risk of becoming ill could exacerbate this downward visitor trend. (see enclosed article). The epidemiological study deals only with the impact of pathogens on one-time swimmers during dry weather; it does not address the impact of regular swimmers, those who swim in wet weather when flows are greatest, or the impact of toxic pollutants (scores of which have been identified and are known or suspected carcinogens or mutagens).

The release of the epidemiological study raises many questions. If the regulatory authority has no compelling response about how to reduce pollutants from urban runoff flowing to the Bay, people will stay away. This will have enormous short and long-term economic consequences.

As the regulatory authority charged with protecting our waters, I urge you not to delay in adopting the pending stormwater permit. We are looking to the Regional Board to exercise leadership in this area. Our very Southern California identity is at stake.

Sincerely,

Sam Jackson, Executive Director

Dear Mr. Keston and Boardmembers:

Maguire Thomas Partners (MTP) is the developer of Playa Vista, a large multi-use community planned for the west side of Los Angeles In 1989, MTP assumed the lead role in guiding the planning and development of this complex project, and as a critical first step we met with many environmental and neighborhood groups in order to better understand and address community concerns regarding the project. These discussions reinforced and expanded our awareness of the importance of water quality generally, and of a healthy Santa Monica Bay specifically, and, as a result, Playa Vista includes a number of features that will enhance the water quality of the Ballona Wetlands and the Santa Monica Bay.

We believe that responsible development and environmental protection can not only coexist but are mutually dependent. We support efforts to strengthen the municipal storm water permit as an effective means of improving the water quality of the Santa Monica Bay. We urge the members of the board to further the restoration of an important economic and environmental resource by adopting the proposed permit.

Very truly yours,

Douglas J. Gardner
Senior Vice President
