CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SANTA ANA REGION

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT
NPDES NO. CAS 618033
AND
WASTE DISCHARGE REQUIREMENTS
ORDER NO. 96-30
FOR
THE RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT, THE COUNTY OF RIVERSIDE, AND THE INCORPORATED CITIES OF RIVERSIDE COUNTY WITHIN THE SANTA ANA REGION
AREAWIDE URBAN STORM WATER RUN-OFF

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Board), finds that:

1. On January 3, 1995, the Riverside County Flood Control and Water Conservation District (RCFC&WCD), in cooperation with the County of Riverside, and the incorporated cities of Beaumont, Corona, Calimesa, Canyon Lake, Hemet, Lake Elsinore, Moreno Valley, Norco, Perris, Riverside, and San Jacinto (hereinafter collectively referred to as "permittees"), have jointly submitted a National Pollutant Discharge Elimination System (NPDES) Application No. CAS 618033 to renew their areawide NPDES permit for urban storm water run-off.

2. The 1987 amendments to the Clean Water Act required the United States Environmental Protection Agency (EPA) to develop permitting regulations for storm water discharges from municipal separate storm sewer systems serving a population of 100,000 or more and for storm water discharges associated with industrial activities, including construction sites. The EPA published proposed storm water regulations on December 7, 1988 and promulgated the final regulations on November 16, 1990. Prior to the EPA's promulgation of the final storm water regulations, the three counties (Orange, Riverside, and San Bernardino) and the incorporated cities within the jurisdiction of the Santa Ana Regional Board requested areawide NPDES permits for urban storm water run-off.

3. On July 13, 1990, the Regional Board adopted Order No. 90-104 for urban storm water run-off from urban areas in Riverside County within the Santa Ana Region. Order No. 90-104 expired on July 1, 1995. The Riverside County Flood Control and Water Conservation District was named as the principal permittee and Riverside County and the incorporated cities were named as the co-permittees. In order to more effectively carry out the requirements of this order, the permittees have agreed that the RCFC&WCD will continue as principal permittee and Riverside County and the incorporated cities will continue as co-permittees. However, the Regional Board, in exercising its enforcement discretion, will take action only against the individual permittee responsible for specific violations of this order, whenever possible.

VOL 16
0001
F
R0061401

4. Order No. 90-104 required the permittees to develop and implement a drainage area management plan (DAMP); develop and implement storm water and receiving water monitoring plans; to eliminate illegal and illicit discharges to the storm drain systems; and, to enact the necessary legal authority to effectively prohibit illegal and illicit discharges. The overall goal of these requirements was to reduce pollutant loadings to surface waters from urban run-off to the maximum extent practicable (MEP)[1]. This Order regulates urban storm water run-off[2] from areas under the jurisdiction of the permittees.

5. The Report of Waste Discharge (the permit renewal application) included the following major components:

   a. A map of the drainage area and maps of existing storm drain facilities
   b. A summary of the storm water management program
   c. A Consolidated Program for Water Quality Monitoring
   d. A copy of a Proposed Storm Water/Urban Run-off Management and Discharge Control Ordinance
   e. A copy of the current Implementation Agreement
   f. A copy of the Interagency Agreement
   g. The Drainage Area Management Plan (DAMP)
   h. A copy of Proposed Riverside County Grading and Erosion Control Ordinance

6. Within the Santa Ana Region, the permittees serve a population of approximately 930,000, occupying an area of approximately 1,360 square miles. The permitted area is shown on Appendix 1. This order regulates storm water run-off from areas under the jurisdiction of the permittees. The term storm water as used in this order includes storm water run-off, snow melt run-off, and surface run-off and drainage. The average annual rainfall in the urbanized area of Riverside County ranges from 10 to 12 inches. The permittees have jurisdiction over and/or maintenance responsibility for storm water conveyance systems within Riverside County. The storm drain system includes an estimated 200 miles of open and closed storm drains owned and operated by RCFC&WCD and an estimated 57 miles of open and closed storm drains owned and operated by the remaining permittees. The permittees have identified major outfalls(with a pipe diameter of 36 inches or greater or drainage areas draining 50 acres or more) and have submitted maps of existing storm drain facilities.

7. Approximately one quarter (1/4) of the entire Riverside County area drains into water bodies within the Santa Ana Region. Most of the urbanized areas of Riverside County lie within this Regional Board's jurisdiction. Storm water run-off from other portions of

---

[1] Maximum Extent Practicable (MEP) means to the maximum extent possible, taking into account equitable considerations of synergistic, additive and competing factors, including but not limited to the gravity of the problem, fiscal feasibility, public health risks, societal concerns and social benefits.

[2] Urban storm water run-off discharges include those discharges from residential, commercial, industrial and construction areas within the permitted area and excludes discharges from feedlots, dairies and farms

VOL 16 0002

Riverside County is regulated by the San Diego and Colorado River Basin Regional Boards. The discharges consist of run-off from rainfall, snow melt, and surfacing ground water from various land use areas which either discharge directly to the Santa Ana River or to watercourses tributary to the Santa Ana River. Other major rivers in the area include the San Jacinto River and Temescal Creek. The San Jacinto Mountain areas drain into the San Jacinto River, which discharges into Lake Elsinore. Any overflow from Lake Elsinore is tributary to Temescal Creek, which flows into Reach 3 of the Santa Ana River in the Prado Flood Control Basin.

8. The Santa Ana River Basin is the major watershed within this Region. This watershed is divided into the upper and lower Santa Ana watersheds. The lower Santa Ana River Basin (downstream from Prado Dam) includes the Orange County drainage areas and the Upper Santa Ana River Basin includes the San Bernardino County and the Riverside County drainage areas. The San Bernardino County drainage areas are generally upstream of the Riverside County drainage areas.

9. The three county areas within this Region are regulated under three areawide permits for urban storm water run-off. These areawide NPDES permits are:

   a. Orange County, NPDES No. CA 8000180, Order No. 90-71 (upon renewal NPDES No. CAS 618030, Order No. 96-31)

   b. Riverside County, NPDES No. CA 8000192, Order No. 90-104 (upon renewal NPDES No. CAS 618033, Order No. 96-30)

   c. San Bernardino County, NPDES No. CA 8000200, Order No. 90-136 (upon renewal NPDES No. CAS 618036, Order No. 96-32)

10. Run-off from the San Bernardino County drainage areas is generally conveyed to the Riverside County drainage areas through the Santa Ana River or other drainage channels tributary to the Santa Ana River. These flows are then discharged to Reach 2 of the Santa Ana River through Prado Dam (Reach 3 of the Santa Ana River). Most of the flow in Reach 2 is recharged in Orange County. During wet weather, some of the flow is discharged to the Pacific Ocean through Reach 1 of the Santa Ana River.

11. In addition to the Regional Board, a number of other stakeholders are involved in the management of the water resources of the Region. These include, but are not limited to, the incorporated cities in the Region, publicly owned treatment works, the three counties, and the Santa Ana Watershed Project Authority and its member agencies. The entities listed in Appendix 2 are considered as potential dischargers of storm water to the Riverside County drainage areas. It is expected that these entities will also work cooperatively with the permittees to manage urban run-off. The Regional Board has the discretion and authority to require non-cooperating entities to participate in this areawide permit or to issue individual storm water permits, pursuant to 40 CFR 122.26(a).

VOL 16
0003

Cooperation and coordination among all the stakeholders are critical to optimize the use of limited resources and insure economical management of the watershed. Recognizing this fact, this order focusses on watershed management and seeks to integrate the programs of all the stakeholders, especially the three municipal storm water permit holders, within this watershed.

12. The 1989, 1991, and 1994 Water Quality Assessments by the Regional Board identified impairment of a number of water bodies within the permitted area. The beneficial uses of these water bodies are threatened or impaired in part due to urban storm water run-off and non-storm water flows from urbanized areas. Preliminary results from urban storm water monitoring programs within the Region indicate that major pollutants of concern in urban run-off are certain heavy metals, sediment, coliform bacteria, pesticides, and nutrients. Municipal storm water run-off is a source of pollutants to waters of the Region that may be causing or contributing to water quality impairment. It is recognized that instream or end-of-channel treatment of storm water is difficult and expensive. Therefore, it is critical to identify the pollutant sources and to develop management practices necessary to reduce pollutant loading to storm water. The quality of these discharges varies considerably and is affected by land use activities, basin hydrology and geology, season, the frequency and duration of storm events and point source discharges permitted by the Regional Board under individual permits.

13. Studies conducted by the EPA, the states, flood control districts and other entities indicate the following major sources of urban storm water pollution nationwide:

    a. Industrial sites where appropriate pollution control and best management practices (BMPs) are not implemented,

    b. Construction sites where erosion and siltation controls and BMPs are not implemented, and

    c. Urban run-off where the drainage area is not properly managed.

14. To address the industrial and construction sites, the State Water Resources Control Board (State Board) issued two statewide general NPDES permits: one for storm water run-off from industrial sites (NPDES No. CAS000001, General Industrial Activities Storm Water Permit) and the second one for storm water run-off from construction sites (NPDES No. CAS000002, General Construction Activity Storm Water Permit). Most industrial activities (some light industrial activities are exempt) and construction activities on five acres or more are required to get individual NPDES permits for storm water discharges, or get coverage under these statewide general permits by completing and filing a Notice of Intent (NOI) with the State Board.

VOL 16 0004

15. In addition, the Regional Board adopted Order No. 94-005, NPDES NO. CA 8000279, for storm water run-off from facilities owned and/or operated by Caltrans, which includes freeways and highways, and Order No. 94-7, NPDES NO. CA 8000336, for concentrated animal feeding operations, including dairies (General Dairy Permit). The Regional Board has issued and continues to issue individual storm water permits for certain industrial facilities within the Region.

16. One of the major components of these statewide permits, the Caltrans permit, and the General Dairy Permit is the requirement for the development and implementation of a storm water pollution prevention plan (SWPPP).

17. The Regional Board is the enforcing authority for the two statewide general permits. However, in most cases, the industrial and construction sites discharge directly into storm drains and/or flood control facilities owned and operated by the permittees. These industrial and construction sites are also regulated under local laws and regulations. Therefore, a coordinated effort between the permittees and the Regional Board is critical to avoid duplicative storm water regulatory activities. A memorandum of understanding between the permittees and the Regional Board may be appropriate to efficiently implement the storm water regulations for industries and construction sites at the local level.

18. The permittees generally conduct inspections of industrial and commercial facilities and construction sites within their jurisdiction to determine compliance with local storm water ordinances and regulations as well as for other regulatory purposes. The permittees have established a subcommittee to develop an enforcement/compliance strategy for industrial and commercial facilities and construction sites. The permittees have agreed to notify Regional Board staff when conditions are observed during such inspections which result in a threat or potential threat to water quality. This also includes failure to obtain coverage under the general storm water permits.

19. The permittees have agreed not to issue grading and/or building permits without proof of compliance for projects subject to the State's General Construction Activity Storm Water Permit.

20. The permittees own/operate facilities where industrial or related activities take place that may have an impact on storm water quality. Some of the permittees also enter into contracts with outside parties to carry out activities that may also have an impact on storm water quality. These facilities and related activities include, but are not limited to, street sweeping, catch basin cleaning, maintenance yards, vehicle and equipment maintenance areas, waste transfer stations, corporation and storage yards, parks and recreational facilities, landscape and swimming pool maintenance activities, storm drain system

VOL 16
0005
R0061405

maintenance activities and the application of herbicides, algaecides and pesticides. As part of this order, the permittees will assess public agency activities and facilities for potential impact to storm water quality and develop and implement best management practices to reduce pollutant discharges from those activities/facilities found to be significant sources of pollutants. Non-storm water discharges from these facilities and/or activities also affect water quality. This order prohibits non-storm water discharges from public facilities unless the discharges are exempt under Section III., Discharge Limitations, 3 of this order or are permitted by the Regional Board under an individual NPDES permit.

21. The major focus of storm water pollution prevention is the development and implementation of an appropriate drainage area management plan (DAMP) including best management practices (BMPs). The ultimate goal of the urban storm water management program is to attain water quality consistent with the water quality objectives for the receiving waters in order to protect beneficial uses. The permittees developed and submitted a DAMP, which was approved on January 18, 1994.

22. The DAMP is a dynamic document and the permittees have implemented, or are in the process of implementing its various elements. The Regional Board also recognizes other drainage area management plans such as the Drainage Water Quality Plan for Lake Mathews (DWQPLM), which includes structural BMPs for pollution control. The RCFC & WCD and Riverside County are involved in the DWQPLM.

23. There is some contribution of pollutants in urban run-off from privately owned and operated facilities such as residences, businesses and commercial establishments and public and private institutions. Therefore, a successful storm water management plan should include the participation and cooperation of the public, businesses, and institutions. Therefore, the DAMP has a strong emphasis on public education.

24. The DAMP included 34 BMPs and a time schedule for implementation. These BMPs are organized into two components: BMPs for existing facilities and BMPs for new development. Both components include regulatory activities, public education programs and operations and maintenance activities.

25. In order to characterize storm water discharges, to identify problem areas, and to determine the effectiveness of the various BMPs, an effective monitoring program is critical. From 1990 through 1995, the principal permittee administered the monitoring program for the permittees which included storm water monitoring, receiving water monitoring, dry weather monitoring and sediment monitoring. The Report of Waste Discharge included a Consolidated Program for Water Quality Monitoring.

VOL 16 0006

26. In order to make the best use of limited resources of all the permittees (including other municipal permittees in San Bernardino and Orange Counties), and to derive maximum benefit from the storm water management programs, future programs should consider and explore approaches and program elements common to all three counties. An integrated management program may be developed with the cooperation of all the stakeholders, including the permittees in the three counties, and the Regional Board. The Regional Board will coordinate the activities within the watershed and seek participation of the permittees

27. The permittees have agreed to revise the implementation agreement that was developed in 1990 as required under Order No. 90-104 to coordinate the activities of the principal and co-permittees.

28. Illegal dumping and illicit/illegal connections and discharges to the storm drains are contributors to storm water and other surface water contamination. All the permittees have completed a reconnaissance survey of the municipal storm drain systems (open channels and underground storm drains). The permittees are required to detect, identify and eliminate illicit/illegal discharges. Additionally, the permittees are required to develop a program to prohibit illegal/illicit connections to their storm drains and flood control facilities.

29. This order requires the permittees to continue to implement the BMPs listed in the DAMP and to effectively prohibit illegal and illicit discharges to the storm drain system. One of the major elements of the DAMP, the Storm Water/Urban Run-off Management and Discharge Controls Ordinance, was adopted by Riverside County on May 9, 1995. The purpose of this ordinance is to reduce pollutant discharges in storm water, and to regulate illicit connections and non-storm water discharges to the storm drain system.

30. Early identification of potential storm water impacts and mitigation measures can significantly reduce storm water pollution problems. The permittees should consider these impacts and appropriate mitigation measures in planning procedures, in the California Environmental Quality Act (CEQA) review process for specific projects, Master Plans, etc.

31. Successful implementation of the provisions and limitations in this order will require the cooperation of all the public agency organizations within Riverside County having programs/activities that have an impact on storm water quality (e.g., Fire Department, Department of Environmental Health, Planning Department, Building and Safety, Code Enforcement, etc.). As such, these organizations are expected to actively participate in implementing this areawide storm water program.

VOL 16
0007
R0061407

32. The permittees may lack legal jurisdiction over storm water discharges into their systems from some of the State and federal facilities, agricultural land, utilities and special districts, and Native American tribal lands. The Regional Board recognizes that the permittees should not be held responsible for such facilities and/or discharges.

33. The permittees may petition the Regional Board to issue a NPDES permit to any discharger of non-storm water into storm drain systems that the permittees own or operate.

34. A revised Water Quality Control Plan (Basin Plan) was adopted by the Regional Board and became effective on January 24, 1995. The Basin Plan contains water quality objectives and beneficial uses for water bodies in the Santa Ana Region.

35. The requirements contained in this order are necessary to implement the Basin Plan.

36. In accordance with the Clean Water Act and its implementing regulations, this order requires the permittees to develop and implement programs and policies necessary to control the discharge of pollutants to waters of the United States to the maximum extent practicable.

37. The legislative history and the preamble to the federal storm water regulations indicate that Congress and the U.S. EPA were aware of the difficulties in regulating urban storm water run-off solely through traditional end-of-pipe treatment. However, the U.S. EPA and the State Water Resources Control Board have determined that the NPDES permits for urban storm water run-off must contain effluent limitations based on water quality standards (beneficial uses and water quality objectives). The development and implementation of best management practices (BMPs), which will achieve compliance with applicable standards, are generally considered to be acceptable as effluent limitations. In accordance with Section 402 (p) of the Clean Water Act, this order requires the permittees to develop controls to reduce the discharge of pollutants to the maximum extent practicable. If urban storm water discharges cause an exceedance of the water quality standards in the receiving waters, the BMPs must be reevaluated, revised and implemented as appropriate to address any exceedances of receiving water quality standards. Numeric and narrative water quality objectives are contained in the Basin Plan for the water bodies in this Region. This order does not contain numeric effluent limitations for any constituents because the impact of the storm water discharges on the water quality of the receiving waters has not yet been fully determined. Extensive water quality monitoring and analysis of the data are essential to make that determination. Due to the high cost associated with monitoring, and due to the variability that exists in the current storm water monitoring efforts being conducted by the permittees and other municipal permittees in Orange and San Bernardino Counties under their municipal storm

VOL 16
00008
R0061408

water permits, a tri-county monitoring program to develop and implement effective monitoring procedures and strategies will be considered.

38. It is the Regional Board's intent that this order shall achieve attainment and protection of the beneficial uses of receiving waters. This order therefore, includes Receiving Water Limitations required to implement water quality objectives and to prevent nuisance and water quality impairment in receiving waters. The Permit requires implementation of control measures in accordance with the approved DAMP that will reduce pollutants in storm water discharges to the maximum extent practicable. The Receiving Water Limitations require the implementation of control measures that are technically and economically feasible as necessary to protect beneficial uses and attain water quality objectives in the receiving waters.

The Regional Board finds that the unique aspects of the regulation of storm water discharges through municipal storm sewer systems, including intermittent discharges, difficulties in monitoring and limited physical control over the discharge, will require adequate time to implement and evaluate the effectiveness of best management practices and to determine whether they will adequately protect receiving waters. Therefore, the permit includes a procedure for determining whether storm water discharges are causing continuing or recurring exceedances of receiving water limitations and for evaluating whether the approved DAMP must be revised. The permittees will be in compliance with the Receiving Water Limitations so long as the permittees comply with that procedure.

39. The storm water regulations require public participation in the storm water management program development and implementation. As such the permittees are required to solicit and consider all comments received from the public and submit copies of the comments to the Executive Officer of the Regional Board. In considering the public comments, the permittees may modify reports, plans, or schedules prior to submittal to the Regional Board.

40. In accordance with California Water Code Section 13389, the issuance of waste discharge requirements for this discharge is exempt from those provisions of the California Environmental Quality Act contained in Chapter 3 (commencing with Section 21100), Division 13 of the Public Resources Code.

41. The Regional Board has considered anti-degradation requirements, pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16, for this discharge. The Regional Board finds that the storm water discharges are consistent with the federal and state anti-degradation requirements and a complete anti-degradation analysis is not necessary.

VOL 16
0009
R0061409

42. The Regional Board has notified the permittees and interested parties of its intent to issue waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

43. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

IT IS HEREBY ORDERED that the permittees, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and the regulations and guidelines adopted thereunder, shall comply with the following:

I. RESPONSIBILITIES OF THE PRINCIPAL PERMITTEE:

The principal permittee shall be responsible for managing the overall storm water program and shall:

1. Conduct water quality and hydrographic monitoring of the municipal separate drain system outfalls as agreed upon by the Executive Officer of the Regional Board.

2. Develop criteria for inspections of the municipal storm drain systems.

3. Conduct inspections of the storm drain systems owned and operated by the RCFC&WCD.

4. Implement management programs, monitoring programs, and related plans as required by this order.

5. Enact and revise policies and ordinances necessary to establish and maintain adequate legal authority within the scope of the Riverside County Flood Control and Water Conservation District Act, as required by the Federal Storm Water Regulations, 40CFR, Part 122.26(d)(2)(i)(A-F).

6. Respond and/or arrange for responding to emergency situations such as accidental spills, leaks, illicit discharges/illegal connections, etc., to prevent or reduce the discharge of pollutants to the municipal separate storm drain systems and to waters of the United States.

7. Prepare and submit to the Executive Officer of the Regional Board, unified reports, plans, and programs necessary to comply with this order.

VOL 16
0010

The activities of the principal permittee should include, but not be limited to, the following:

8. Coordinate permit activities and participate in any committees/subcommittees formed to coordinate permit compliance activities.

9. Provide technical and administrative support and inform the co-permittees of the progress of other pertinent municipal programs, pilot projects, research studies, etc.

10. Coordinate the implementation of areawide storm water quality management activities such as monitoring programs, public education, other pollution prevention measures, household hazardous waste collection, etc.

11. Gather and disseminate information on the progress of statewide municipal storm water programs and evaluate the information for potential use in the execution of this order.

12. Monitor the implementation of the plans and programs required by this order and determine their effectiveness in reducing pollutant loadings to surface waters to the maximum extent practicable.

13. Coordinate activities pertaining to implementation of this order with the Regional Board.

14. Solicit and coordinate public input for any major proposed storm water management programs and implementation plans.

15. Develop and implement mechanisms, performance standards, etc., to promote consistent implementation of BMPs among the permittees.

16. In conjunction with the co-permittees, implement the BMPs listed in the approved DAMP.

II. RESPONSIBILITIES OF THE CO-PERMITTEES

Each co-permittee shall be responsible for managing the storm water program within its jurisdiction and shall:

1. Adopt the Grading and Erosion Control Ordinance or its equivalent, within 120 days of adoption of this order.

VOL 16
0011

2. Conduct storm drain system inspections in accordance with the criteria developed by the principal permittee.

3. Enact and revise policies and ordinances necessary to establish and maintain adequate legal authority as required by the Federal Storm Water Regulations, 40CFR, Part 122.26(d)(2)(i)(A-F).

4. Implement management programs, monitoring programs, and related plans as required by this order.

The co-permittees' activities should include, but not be limited to, the following:

5. Administer the storm water and erosion control ordinances adopted pursuant to Item 1., above.

6. Conduct and coordinate with the principal permittee any surveys, monitoring and/or characterizations needed to identify the pollutant sources and drainage areas.

7. Review and comment on all plans, strategies, management programs, monitoring programs, as developed by the principal permittee or any subcommittee to comply with this order.

8. Cooperate in committees and/or subcommittees formed by the principal permittee to address compliance with this order.

9. In conjunction with the principal permittee, implement the BMPs listed in the approved DAMP.

10. Submit to the principal permittee any information necessary to develop unified report submittals to the Executive Officer of the Regional Board.

11. Prepare and submit any specific reports/information related to the permittees' storm water program as deemed necessary by the Executive Officer of the Regional Board.

VOL 16 0012

III. DISCHARGE LIMITATIONS

1. The permittees shall prohibit illicit discharges from entering into the municipal separate storm sewer systems (municipal storm drain systems) and require controls to reduce the discharge of pollutants to the maximum extent practicable.

2. This order authorizes storm water discharges to waters of the State from the permittees' existing municipal separate storm drain systems provided that the permittees implement the BMPs (structural and/or non-structural control measures) necessary to reduce the pollutants in the discharge to the maximum extent practicable. All other discharges are prohibited except those listed under Item 3., below, those for which the Regional Board has issued individual permits, and those discharges which are in accordance with Item 5., below.

3. The following discharges need not be prohibited by the permittees unless identified by the permittees as sources of pollutants to the waters of the United States.

   a. Discharges covered by an NPDES permit, or for which an approval has been issued by the Regional or State Board office;

   b. Discharges from potable water line flushing and other potable water sources;

   c. Discharges from fire fighting and fire hydrant testing and flushing;

   d. Discharges from landscape irrigation, lawn watering and other irrigation activities;

   e. Diverted stream flows;

   f. Rising ground waters and natural springs;

   g. Uncontaminated groundwater infiltration (as defined in 40 CFR 35.2005(20)) and uncontaminated pumped groundwater;

   h. Passive foundation drains;

   i. Air conditioning condensate;

   j. Water from crawl space pumps;

VOL 16
0013

k. Passive footing drains;

l. Discharges from individual residential vehicle washing (not including discharges from mobile sources such as automobile/equipment detailing or washing);

m. Flows from riparian habitats and wetlands;

n. Dechlorinated swimming pool discharges;

o. Street wash water and run-off from fire fighting (program descriptions shall address discharges or flows from fire fighting only where such discharges are identified as significant sources of pollutants to waters of the United States),

p. Waters not otherwise containing wastes as defined in California Water Code Section 13050 (d); and

q. Other types of discharges identified and recommended by the permittees and approved by the Regional Board.

For purposes of this order, a discharge may include storm water and other types of discharges as indicated above.

4. The permittees shall take necessary steps as required under Item 1., above, to ensure that non-storm water discharges to the municipal storm drain system do not cause or contribute to violations of water quality objectives or discharge pollutants to waters of the United States.

5. Non-storm water discharges from permittees' activities into waters of the state are prohibited unless the non-storm water discharges are permitted by an NPDES permit or are included in Item 3., above. If permitting or immediate elimination of the non-storm water discharges is impractical, the permittees shall include in the storm water pollution prevention strategy, required under Section V., Provision 13., of this order, a proposed plan to address the non-storm water discharges.

6. The discharge shall not cause or contribute to degradation of groundwaters.

7. Pollutants in storm water discharges from the municipal separate storm sewer system shall be reduced to the maximum extent practicable.

VOL 16 0014

IV. RECEIVING WATER LIMITATIONS

1. Receiving water limitations are based upon beneficial uses, water quality objectives and water quality standards contained in the Basin Plan, and amendments thereto, and on ambient water quality. They are intended to protect the beneficial uses and attain the water quality objectives contained in the Basin Plan. The discharge of urban storm water, or non-storm water from a municipal storm sewer system for which the permittees are responsible under the terms of this permit shall not cause continuing or recurring impairment of beneficial uses or exceedances of water quality objectives. The permittees will not be in violation of this provision so long as they are in compliance with the requirements set forth in 2.

2. If the Executive Officer determines that a continuing or recurring impairment of beneficial uses or exceedance of water quality objectives has been caused by urban storm water discharges from the municipal storm sewer system, the following steps shall be taken:

   a. The Executive Officer will evaluate the adequacy of the permittees implementation of the approved DAMP based on the permittees submitted reports. The Executive Officer will determine if implementation of the approved DAMP has a reasonable likelihood of preventing future continuing or recurring impairment of beneficial uses or exceedances of water quality objectives resulting from urban storm water discharges. If the Executive Officer makes this determination, the permittees are required to continue implementing the approved DAMP.

   b. If the Executive Officer determines that the implementation of the approved DAMP will not have a reasonable likelihood of preventing future impairment of beneficial uses or exceedances of water quality objectives, the permittees shall, upon notice from the Executive Officer, do the following:

      i. Submit a report that includes an evaluation of the relative contribution of the urban storm water discharges to the impairment of beneficial uses or the exceedance of water quality objectives. The report shall address the persistence, the significance, and to the extent feasible, the causes of the impairment or exceedance, and the technical and economic feasibility of control actions available to the permittees to reduce or eliminate the impairment or exceedance.

VOL 16 0015

ii. Submit a report reviewing the approved DAMP to determine whether it should be revised so that there will be a reasonable likelihood of preventing future continuing or recurring beneficial use impairment or exceedances of water quality objectives, or whether revisions to achieve protection of beneficial uses or attainment of water quality objectives are technically or economically infeasible. If the report recommends revision of the approved DAMP, the report shall include a work plan to revise the DAMP so that it will have a reasonable likelihood of preventing future continuing or recurring beneficial use impairment or exceedances of water quality objectives. If the report concludes that no revisions are necessary to achieve protection of beneficial uses or attainment of water quality objectives, the report shall explain how implementation of the approved DAMP will achieve compliance. If the report determines that revisions to achieve protection of beneficial uses or attainment of water quality objectives are technically or economically infeasible, the permittees shall continue to comply with the approved DAMP, shall fully document this determination and shall make recommendations for actions to achieve compliance, including for example, commencement of a total maximum daily load report or revisions of the Basin Plan or mitigation projects to protect beneficial uses, and identification of possible funding sources for such actions.

iii. The permittees shall implement the work plan and the revised DAMP as approved by the Executive Officer.

3. The Executive Officer shall review and approve or disapprove the reports required under Receiving Water Limitation 2. The reports may be submitted as part of the next Annual Report, or at some other time designated by the Executive Officer. So long as the permittees have complied with the procedures set forth in Receiving Water Limitation 2, they do not have to repeat the procedure for continuing or recurring exceedances of the same receiving water limitations. As appropriate, any determinations under this part or revisions to the approved DAMP may be considered by the Regional Board in a public meeting.

VOL 16

0016

V. PROVISIONS

GENERAL

1. Permittees shall demonstrate compliance with all the requirements in this order and specifically with Section III., Discharge Limitations, and Section IV., Receiving Water Limitations, through timely implementation of their approved Drainage Area Management Plan and any approved modifications, revisions, or amendments thereto, which are developed pursuant to this order. The Drainage Area Management Plan and any amendments thereto are hereby made an enforceable part of this order.

2. Permittees shall implement all elements of the approved DAMP. Any proposed revisions to the DAMP shall be submitted to the Executive Officer of the Regional Board for review and approval. All revisions to the DAMP approved by the Executive Officer shall be implemented in a timely manner.

3. The permittees shall comply with Monitoring and Reporting Program No. 96-30, which is hereby made a part of this order, and any revisions thereto. The Executive Officer is authorized to revise the Monitoring and Reporting Program and also to allow the permittees to participate in regional, statewide, national, or other monitoring programs in lieu of Monitoring and Reporting Program No. 96-30.

4. Upon approval by the Executive Officer of the Regional Board, all plans and reports required by this order, including any subsequent amendments, shall be implemented and shall become an enforceable part of this order.

5. The permittees shall report to the Executive Officer of the Regional Board:

   a. Any enforcement actions and known discharges of storm or wastewaters to facilities owned or operated by the permittees which may impair domestic water supply sources (e.g., discharges due to a levee break, illegal discharges to the street, etc.) or which may have an impact on human health or the environment; if the discharge is to Canyon Lake or any tributary to Canyon Lake, Elsinore Valley Municipal Water District shall also be notified immediately;

   b. Any industrial and/or construction facilities found not to be in compliance with the State's General Storm Water Permits or where the activities may be contributing pollutants to the waters of the U.S.; and

VOL 16
00117

c. Any suspected or reported activities on federal, state, or other entity's land or facilities, where the permittees do not have any jurisdiction, and where the suspected or reported activities may be contributing pollutants to waters of the United States.

6. The permittees shall not issue occupancy permits unless the applicant is informed of his obligation under the State's NPDES industrial general permit. The permittees shall not issue grading or building permits to developments that may result in land disturbance of five acres or more (or less than five acres, if it is part of a larger common plan of development or sale which is five acres or more) unless the applicant shows proof of coverage under the State's General Construction Activity Storm Water Permit. The proof of coverage may include a letter from the Regional Board office, a copy of the Notice of Intent, etc. The permittees shall coordinate the activities of the various departments/sections within each permittee's jurisdiction to insure consistent implementation of storm water regulations.

7. Permit application and special NPDES program requirements contained in 40 CFR 122.21 (a), (b), (d) (2), (f), and (p), 122.41 (a), (b), (c), (d), (e), (f), (g), (h), (i), (j), (k), and (l); and 122.42 (c) are incorporated into this order by reference.

IMPLEMENTATION AGREEMENT

8. No later than June 4, 1996, the permittees shall submit to the Executive Officer of the Regional Board an updated copy of an implementation agreement with authorized signatures of each of the permittees. Any subsequent revisions to the implementation agreement shall be forwarded to the Executive Officer of the Regional Board within 30 days of approval by the permittees. At a minimum, the implementation agreement should include all the essential elements of the existing agreement, developed in accordance with Order No. 90-104.

LEGAL AUTHORITY

9. The permittees shall adopt the proposed Storm Water/Urban Run-off Management and Discharge Control Ordinance, or its equivalent. No later than June, 26, 1996, each permittee shall certify to the Regional Board that it has adequate legal authority to control the discharges of pollutants into the municipal storm drain system and that it has, at a minimum, satisfied each of the key regulatory requirements contained in 40 CFR Section 122.26(d)(2)(i)(A-F).

VOL 16 0018

ENFORCEMENT/COMPLIANCE STRATEGY

10. Permittees shall develop and implement an enforcement/compliance strategy to enforce storm water and erosion control ordinances. This enforcement/compliance strategy should include a mechanism to determine compliance of industrial facilities and construction sites, and notification to the Executive Officer of any finding of non-compliance and any proposed local enforcement action. The enforcement/compliance strategy shall be submitted to the Executive Officer of the Regional Board by August 27, 1996.

PUBLIC EDUCATION AND OUTREACH

11. The permittees shall continue to implement the public education efforts already underway and shall implement all of the proposed efforts identified in the Report of Waste Discharge.

12. When feasible, the permittees shall participate in joint outreach with other programs including, but not limited to, other municipal storm water programs to ensure that a consistent message on storm water pollution prevention is brought to the public.

13. The permittees shall develop public education materials to encourage the public to report illegal dumping from residential, industrial, construction and commercial sites into public streets, storm drains and other water bodies.

MUNICIPAL FACILITIES

14. The permittees shall develop a pollution prevention strategy to address their public agency facilities and activities which are determined by the permittees (with the approval of the Executive Officer of the Regional Board) to be activities of concern regarding storm water pollution. The pollution prevention strategy shall be developed to ensure that the public agency facilities and/or activities that are currently not required to obtain coverage under the State's general storm water permits are not sources of pollutants into the waters of the United States. The pollution prevention strategy shall be submitted to the Executive Officer of the Regional Board by October 9, 1996. In developing the pollution prevention strategy, the permittees shall consider the following:

    a. Identification of public agency facilities and activities that are potential contributors of pollutants to waters of the United States.

VOL 16
0019

b. Potential pollutants of concern that are associated with the facilities and/or activities;

c. Proposed BMPs and a schedule for their implementation to ensure that these facilities are not sources of pollutants into the waters of the United States;

d. A monitoring program to measure the effectiveness of the BMPs;

e. A schedule for training of public agency staff to ensure proper implementation of the BMPs; and

f. Identification of any non-storm water discharges from the public agency facilities/activities, frequency of the discharge, characterization of the discharge, volume, flow and duration of the discharge, short term source control BMPs to mitigate the impacts from the discharge, and a schedule for elimination or permitting of the discharge.

MUNICIPAL CONSTRUCTION PROJECTS/ACTIVITIES

15. This Order authorizes the discharge of storm water run-off from construction projects that may result in land disturbance of 5 acres or more (or less than five acres, if it is part of a larger common plan of development or sale which is five acres or more) that are under ownership and/or direct responsibility of any of the permittees.

16. Prior to commencement of construction activities, the permittees shall notify the Executive Officer of the Regional Board of the proposed construction project. Upon completion of the project, the Executive Officer shall be notified of the completion of the project.

17. The permittees shall develop and implement a storm water pollution prevention plan and a monitoring program that is specific for the construction project prior to the commencement of any of the construction activities. The SWPPP and monitoring program shall be implemented throughout the duration of the construction project. The SWPPP shall be kept at the construction site and released to the public and/ or Regional Board staff upon request.

VOL 16
0020
R0061420

18. The SWPPP and the monitoring program for the construction projects shall be consistent with the requirements of the most recent version of the State's General Permit for Storm Water Discharges Associated with Construction Activities.

19. The permittees shall give advance notice to the Executive Officer of the Regional Board of any planned changes in the construction activity which may result in non-compliance with the current version of the State's General Permit for Storm Water Discharges Associated with Construction Activities.

20. All other terms and conditions of the latest version of the State's General Construction Activity Storm Water Permit shall be applicable.

NEW DEVELOPMENT (INCLUDING RE-DEVELOPMENT)

21. Within 90 days of the issuance of this order, the permittees shall begin implementation of the new development BMPs (DAMP Supplement A) that were developed pursuant to Order No. 90-104.

22. Within 120 days of the issuance of this order, the permittees shall review their General Plan update and CEQA document preparation processes to insure that storm water-related issues are properly considered. If necessary, these processes shall be revised to include requirements for evaluation of storm water-related impacts and identification of appropriate mitigation measures.

23. The permittees shall establish a mechanism to insure proper maintenance and operation of all permanent flood control structures. For new developments, the parties responsible for the maintenance of the flood control structures and funding sources for maintenance and operation of the facilities shall be identified prior to issuance of grading permits.

FISCAL RESOURCES

24. The permittees shall prepare and submit a unified fiscal analysis report appropriate for implementation of the requirements of this order to the Executive Officer of the Regional Board. The fiscal analysis report shall be submitted no later than November 15, of each year and shall at a minimum include the following:

    a. Each permittee's expenditures for the previous fiscal year;
    b. Each permittee's budget for the current fiscal year;
    c. A description of the source of funds;

VOL 16
0021

VOL 16

PERMIT EXPIRATION AND RENEWAL

25. This order expires on March 1, 2001 and the permittees must file a Report of Waste Discharge (permit application) no later than 180 days in advance of such expiration date as application for issuance of new waste discharge requirements. The Report of Waste Discharge shall, at a minimum, include the following:

    a. Any revisions to the Drainage Area Management Plan including, but not limited to, all the activities the permittees propose to undertake during the next permit term, goals and objectives of such activities, an evaluation of the need for additional source control and/or structural BMPs, any proposed pilot studies, etc.;

    b. Changes in land use and/or population including map updates; and

    c. Any significant changes to the storm drain systems, outfalls, detention or retention basins or dams, and other controls, including map updates of the storm drain systems.

26. This order may be modified, revoked or reissued prior to its expiration date for the following reasons:

    a. To address significant changes in conditions identified in the technical reports required by the Regional Board which were unknown at the time of the issuance of this order;

    b. To incorporate applicable requirements of statewide water quality control plans and policies adopted by the State Water Resources Control Board or any amendments to the Basin Plan approved by the Regional Board, the State Board, and, if necessary, by the Office of Administrative Law; or

    c. To comply with any applicable requirements, guidelines, or regulations issued or approved under the Clean Water Act, if the requirements, guidelines, or regulations contain different conditions or additional requirements than those included in this order.

    d. To incorporate new or revised program elements and compliance schedule(s) necessary to comply with Section IV of this order.

27. This order shall serve as a National Pollutant Discharge Elimination System (NPDES) permit pursuant to Section 402 (p) of the Clean Water Act, or amendments thereto, and shall become effective ten days after the date of its adoption provided the Regional Administrator of the U. S. EPA has no objections.

0022

If the Regional Administrator objects to its issuance, the permit shall not become effective until such objection is withdrawn.

28. Order No. 90-104 is hereby rescinded.

I, Gerard Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on March 8, 1996.

Santa Ana Region

Monitoring and Reporting Program No. 96-30

NPDES NO. CAS 618033
for
RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT, THE COUNTY OF RIVERSIDE, AND THE INCORPORATED CITIES OF RIVERSIDE COUNTY WITHIN THE SANTA ANA REGION
AREAWIDE URBAN STORM WATER RUN-OFF

I. GENERAL

1. Revisions of the monitoring and reporting program may be necessary to ensure that the discharger is in compliance with requirements and provisions contained in this order. Revisions may be made by the Executive Officer at any time during the term of this order, and may include a reduction or increase in the number of parameters to be monitored, the frequency of monitoring, or the number and size of samples collected.

2. All sample collection, handling, storage, and analyses shall be in accordance with 40 CFR Part 136 or other methods approved by the Executive Officer.

3. The permittees are authorized to complement their monitoring data with data from other sources provided those sources are similar to sources in the Santa Ana Watershed.

4. The permittees shall implement the Consolidated Program for Water Quality Monitoring (submitted as part of the Report of Waste Discharge) until development and implementation of other acceptable monitoring programs.

II. OBJECTIVES

The overall goal of this monitoring program is to provide feedback in direction for and in support of an effective watershed management program. The following are the major objectives:

1. To define storm water quality status, trends, and pollutants of concern.

2. To characterize pollutants in storm water and to assess the influence of land use on storm water quality.

3. To identify significant water quality problems related to storm water discharges within the watershed.

VOL 16
0026
R0061426

4. To identify other sources of pollutants in storm water run-off to the extent possible (e.g., atmospheric deposition, contaminated sediments, other non-point sources, etc.).

5. To verify and to control illicit discharges.

6. To identify those waters which without additional action to control pollution from storm water discharges cannot reasonably be expected to attain or maintain applicable water quality objectives or the goals and requirements of the Basin Plan.

7. To evaluate the effectiveness of existing management programs, including an estimate of pollutant reductions achieved by the structural and nonstructural BMPs.

The Regional Board recognizes that these objectives may not be attainable during this permit period and authorizes the Executive Officer to evaluate and to determine adequate progress toward meeting each objective.

III. MONITORING PROGRAM REQUIREMENTS

The lead permittee shall develop and submit for the approval of the Executive Officer an integrated monitoring program to achieve the above stated objectives. In developing this program, the lead permittee is encouraged to seek cooperation with the permittees from San Bernardino and Orange counties. The Executive Officer or his/her designated representative(s) shall facilitate the coordination meetings or subcommittees formed to achieve this goal. The development and implementation of the monitoring program shall be in accordance with the time schedule prescribed by the Executive Officer. At a minimum, the program shall consider the following:

1. Uniform guidelines for quality control, quality assurance, data collection and data analyses.

2. A mechanism for the collection, analysis and interpretation of existing data from Orange, Riverside, and San Bernardino County monitoring programs. These and other data from local, regional or national sources should be utilized to characterize different storm water sources; to determine pollutant generation, transport and fate; to develop a relationship between land use, development size, storm size and the event mean concentration of pollutants; to determine spatial and temporal variances in storm water quality and seasonal and other bias in the collected data; and to identify any unique features of the Santa Ana Watershed. The permittees are encouraged to use data from similar studies, if available.

VOL 16
00027
R0061427

3. A description of the monitoring program including:

   a. The number and location of monitoring stations;
   b. Environmental indicators (e. g., ecosystem, biological, habitat, chemical, sediment, stream health, etc.) chosen for monitoring;
   c. Parameters selected for field screening and for laboratory work; and
   d. Total number of samples to be collected from each station, receiving water and major outfall monitoring, frequency of sampling during dry weather and short or long duration storm events, type of samples (grab, 24-hour composite, etc.), and the type of sampling equipment.

4. A mechanism for analyzing the collected data and interpreting the results including an evaluation of the effectiveness of the management practices, and need for any refinement of the management practices.

5. A description of the responsibilities of all the participants in this program including estimated cost.

IV. REPORTING

1. All progress reports and proposed strategies and plans required by this order shall be signed by the principal permittee and copies shall be submitted to the Executive Officer of the Regional Board under penalty of perjury.

2. The permittees shall submit an **ANNUAL PROGRESS REPORT** to the Executive Officer of the Regional Board and to the Regional Administrator of U. S. EPA, Region 9, no later than November 15, of each year. This progress report may be submitted in a mutually agreed upon electronic format. At a minimum, the annual progress report shall include the following:

   a. A review of the status of program implementation and compliance (or non-compliance) with the schedules contained in this order.

   b. An assessment of the effectiveness of control measures established under the illicit discharge elimination program and the Drainage Area Management Plan. The effectiveness may be measured in terms of how successful the program has been in eliminating illicit/illegal discharges and in reducing pollutant loads in storm water discharges.

   c. An analysis of the feasibility and usefulness of using structural BMPs based on data collected from the Drainage Water Quality Plan for Lake Mathews and/or other similar programs..

VOL 16 00028

d. An assessment of any storm water management program modifications made to comply with Clean Water Act requirements to reduce the discharge of pollutants to the maximum extent practicable.

3. Co-permittees shall be responsible for the submittal of all required information/materials needed to comply with this Monitoring and Reporting Program in a timely manner to the principal permittee. All such submittals shall be signed by a duly authorized representative of the co-permittee under penalty of perjury.

V. REPORTING SCHEDULE

All reports required by this order shall be submitted to the Executive Officer of the Regional Board in accordance with the following schedule:

ITEM	*DUE DATE*
Legal Authority Certification	June 26, 1996
Revised Implementation Agreement	June 4, 1996
Enforcement Strategy	August 27, 1996
Municipal Activities Pollution Prevention Strategy	October 9, 1996
Annual Report including the Fiscal Analyses Report	November 15 of each year (next report due in 1996)

Ordered by _____
Gerard J. Thibeault
Executive Officer

March 8, 1996

VOL 16 0029

California Regional Water Quality Control Board
Santa Ana Region

ORDER NO. 96-31
NPDES No. CAS618030

Waste Discharge Requirements
for
the County of Orange, Orange County Flood Control District
and
The Incorporated Cities of Orange County Within the Santa Ana Region
Areawide Urban Storm Water Run-off
Orange County

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Board), finds that:

1. On December 30, 1994, the County of Orange and the Orange County Flood Control District (OCFCD), in cooperation with the cities of Anaheim, Brea, Buena Park, Costa Mesa, Cypress, Fountain Valley, Fullerton, Garden Grove, Huntington Beach, Irvine, La Habra, La Palma, Lake Forest, Los Alamitos, Newport Beach, Orange, Placentia, Santa Ana, Seal Beach, Stanton, Tustin, Villa Park, Westminster, and Yorba Linda (hereinafter collectively referred to as permittees), submitted National Pollutant Discharge Elimination System (NPDES) Application No. CA 8000180 and a Report of Waste Discharge for reissuance of their areawide storm water NPDES permit.

2. Section 402(p) of the federal Clean Water Act (CWA), as amended by the Water Quality Act of 1987, requires NPDES permits for storm water discharges from separate municipal storm drain systems, storm water discharges associated with industrial activity (including construction activities), and designated storm water discharges which are considered significant contributors of pollutants to waters of the United States (U.S.). On November 16, 1990, the United States Environmental Protection Agency (hereinafter US EPA) published regulations (40 CFR Parts 122, 123 and 124) which describe permit application requirements for storm water discharges pursuant to Section 402(p) of the CWA. Prior to EPA's promulgation of the final storm water regulations, the three counties (Orange, Riverside, and San Bernardino) and the incorporated cities within the jurisdiction of the Santa Ana Region requested areawide NPDES permits for urban storm water run-off.

3. On July 13, 1990, the Regional Board adopted Order No. 90-71 for urban storm water run-off from urban areas in Orange County within the Santa Ana Region. The County of Orange was named as the principal permittee and the Orange County Flood Control District (OCFCD) and the incorporated cities were named as the co-permittees. In order to more effectively carry out the requirements of this order, the permittees have agreed that the County of Orange will continue as principal permittee and the OCFCD and the incorporated cities will continue as co-permittees. Order 90-71 expired on July 1, 1995.

VOL 16
0030
R0061430

4. Order No. 90-71 required the permittees to develop and implement a drainage area management plan (DAMP) and a storm water and receiving water monitoring plan, to eliminate illegal and illicit discharges to the storm drain systems and to enact the necessary legal authority to effectively prohibit such discharges. The overall goal of these requirements was to reduce pollutant loadings to surface waters from urban run-off to the maximum extent practicable (MEP)[1].

5. This order outlines the next step toward an effective program and specifies requirements to protect the beneficial uses of the waters of the U. S. The intent of this permit is to regulate pollutant discharges, identify and focus on those areas which threaten the beneficial uses and improve water quality in the Region in a timely manner. This order regulates urban storm water run-off[2] from areas under the jurisdiction of the permittees.

6. The Report of Waste Discharge (the permit renewal application) included the following major components:

   a. Summary of status of current Storm Water Management Program
   b. Proposed Plan of Storm Water Quality Management Activities for 1995-2000
   c. The Drainage Area Management Plan
   d. A Model Water Quality Ordinance
   e. An Enforcement Consistency Guide
   f. A Reconnaissance Survey Field Inspection and Documentation Manual

7. The permittees serve a population of approximately 2.6 million, occupying an area of approximately 511 square miles (including both unincorporated areas and the limits of 31 cities). The permittees have jurisdiction over and /or maintenance responsibility for storm water conveyance systems within Orange County. The County's systems include an estimated 400 miles of storm drain systems. A major portion of the urbanized areas of Orange County drains into water bodies within this Regional Board's jurisdiction. The project area is shown on Attachment A. The major storm drain systems and drainage areas in Orange County which are within this Region are shown on Attachment B. A portion of the Orange County drainage area is within the jurisdiction of the San Diego Regional Board and is currently regulated under an order issued by that Board.

---

[1] Maximum Extent Practicable (MEP) means to the maximum extent possible, taking into account equitable considerations of synergistic, additive, and competing factors, including but not limited to, gravity of the problem, fiscal feasibility, public health risks, societal concerns, and social benefits.

[2] Urban storm water run-off includes those discharges from residential, commercial, industrial and construction areas within the permitted area and excludes discharges from feedlots, dairies and farms.

VOL 16 0031

8. The permittees may lack legal jurisdiction over storm water discharges into their systems from some of the State and federal facilities, utilities and special districts, Native American tribal lands, waste water management agencies and other point and non-point source discharges otherwise permitted by the Regional Board. The Regional Board recognizes that the permittees should not be held responsible for such facilities and/or discharges.

9. Storm water discharges consist of surface run-off generated from various land uses in all the hydrologic drainage areas which discharge into the water bodies of the U. S. The quality of these discharges varies considerably and is affected by land use activities, basin hydrology and geology, season, the frequency and duration of storm events, and the presence of illegal disposal practices/illicit connections. Nationwide studies in urban areas have shown that urban run-off typically contains significant quantities of pollutants. Preliminary results from urban storm water monitoring programs within the permitted area indicate that the major pollutants of concern are certain heavy metals, sediment, chemical oxygen demand (COD), pesticides, herbicides, and nutrients.

   The 1989, 1991, and 1994 Water Quality Assessments by the Regional Board identified impairment of a number of water bodies within the permitted area. The beneficial uses of these water bodies have been found to be threatened or impaired due to point and non-point source discharges.

10. Certain activities that generate pollutants present in storm water runoff are beyond the ability of the permittees to eliminate. Examples of these include operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear and leaching of naturally-occurring minerals from local geography.

11. Storm water discharges to the storm drain systems in Orange County are tributary to various water bodies of the Region. The permitted area can be subdivided into five tributary watersheds: the San Gabriel River drainage area, the Huntington Harbor and Bolsa Bay drainage area, the Greenville-Banning Channel drainage area, the Santa Ana River drainage area, and the Newport Bay drainage area (see Attachment B). These watersheds are tributary to the Pacific Ocean. The surface water bodies in Orange County include:

   Inland Surface Streams

   a. Santa Ana River, Reaches 1 and 2,

   b. Silverado Creek (tributary to Santiago Creek),

   c. Santiago Creek, Reaches 1, 2, 3, and 4 (tributary to the Santa Ana River),

   d. San Diego Creek, Reaches 1 and 2 (tributary to Newport Bay),

VOL 16

0032

e. San Joaquin Freshwater Marsh (tributary to San Diego Creek),

f. All other tributaries to these Creeks: Bonita Creek, Serrano Creek, Peters Canyon Wash, Hicks Canyon Wash, Bee Canyon Wash, Borrego Canyon Wash, Agua Chinon Wash, Laguna Canyon Wash, Rattlesnake Canyon Wash, Sand Canyon Wash, Black Star Creek, Carbon Canyon Creek, Coyote Creek and other tributaries to these washes,

Bays, Estuaries, and Tidal Prisms

g. Anaheim Bay,

h. Sunset Bay,

i. Bolsa Bay and Bolsa Chica Ecological Reserve,

j. Lower and Upper Newport Bay,

k. Tidal Prism of Santa Ana River (to within 1000 feet of Victoria Street) and Newport Slough, Santa Ana Salt Marsh,

l. Tidal Prism of San Gabriel River (River Mouth to Marina Drive),

m. Tidal Prisms of Flood Control Channels Discharging to Coastal or Bay Waters (e.g. Huntington Harbor),

Ocean Waters

Nearshore Zone

n. San Gabriel River to Poppy Street in Corona Del Mar,

o. Poppy Street to Southeast Regional Boundary,

Offshore Zone

p. Waters between Nearshore Zone and Limit of State Waters,

Lakes and Reservoirs

q. Irvine Lake (Santiago Reservoir), and

r. Laguna, Peters Canyon, and Rattlesnake Reservoirs.

VOL 16 0033

11. (cont'd)
The beneficial uses of these water bodies include: municipal and domestic supply, agricultural supply, industrial service supply, groundwater recharge, navigation, hydropower generation, water contact recreation, non-contact water recreation, commercial and sportfishing, warm freshwater habitat, cold freshwater habitat, preservation of biological habitats of special significance, wildlife habitat, preservation of rare, threatened or endangered species, marine habitat, shellfish harvesting, spawning, reproduction and development of aquatic habitats, and estuarine habitat . The ultimate goal of this storm water management program is to protect the beneficial uses of the receiving waters.

12. The Santa Ana River Basin is the major watershed within the jurisdiction of the Regional Board. The lower Santa Ana River Basin (downstream from Prado Basin) includes the Orange County drainage areas and the Upper Santa Ana River Basin includes the San Bernardino and the Riverside drainage areas. Within the Region, generally the San Bernardino County drainage areas drain to the Riverside County drainage areas, and Riverside County drainage areas discharge to Orange County.

13. Within the Region, run-off from the San Bernardino County areas is generally conveyed to the Riverside County areas through the Santa Ana River or other drainage channels tributary to the Santa Ana River. These flows are then discharged to Reach 2 of the Santa Ana River through Prado Basin (Reach 3 of the Santa Ana River). Most of the flow in Reach 2 is recharged in Orange County. During wet weather, some of the flow is discharged to the Pacific Ocean through Reach 1 of the Santa Ana River.

14. The three county areas within this Region are regulated under three areawide permits for urban storm water run-off. These areawide NPDES permits are:

a. Orange County, NPDES No. CAS618030;
b. Riverside County, NPDES No. CAS618033; and
c. San Bernardino County, NPDES No. CAS618036.

15. Studies conducted by the EPA, the states, flood control districts and other entities indicate the following major sources for urban storm water pollution nationwide:

a. Industrial sites where appropriate pollution control and best management practices (BMPs)[3] are not implemented;

b. Construction sites where erosion and siltation controls and BMPs are not implemented; and

c. Urban run-off where the drainage area is not properly managed.

---

[3] Best Management Practices (BMPs) are water quality management practices that are maximized in efficiency for the control of storm water run-off pollution.

VOL 16 0034

16. To address the industrial and construction sites, the State Board issued two statewide general NPDES permits: one for storm water run-off from industrial sites (NPDES No. CAS000001, General Industrial Activities Storm Water Permit) and the second one for storm water run-off from construction sites (NPDES No. CAS000002, General Construction Activity Storm Water Permit). In addition, the Regional Board adopted Order No. 94-005, NPDES NO. CA 8000279, for storm water run-off from facilities owned and/or operated by Caltrans, which includes freeways and highways, and Order 94-7, NPDES No. CA 8000336 for concentrated animal feeding operations, including dairies. The Regional Board issued and continues to issue individual storm water permits for certain industrial facilities within the Region.

17. One of the major components of these statewide permits and the Caltrans permit is the development and implementation of a storm water pollution prevention plan (SWPPP).

18. Most industrial activities (some light industrial activities are exempt) and construction sites on five acres or more are required to get coverage under these statewide general permits.

19. The Regional Board administers compliance with the State's General Industrial Activities Storm Water Permit and the General Construction Activity Storm Water Permit. However, in most cases, the industries and construction sites discharge into storm drains and/or flood control facilities owned and operated by the permittees. These industries and developers are also regulated under local laws and regulations. Therefore, a coordinated effort of the permittees and the Regional Board staff is critical to avoid duplicative and overlapping storm water regulatory activities. A memorandum of understanding between the permittees and the Regional Board may be appropriate to efficiently implement the storm water regulations for industries and construction sites at the local level.

20. The permittees have agreed to continue to notify Regional Board staff when conditions are observed during their routine activities which result in a threat or potential threat to water quality. This also includes failure to obtain coverage under the general storm water permits.

21. The permittees have developed project conditions of approval for new developments to be implemented at the time of grading or building permit issuance for individual sites on five acres or more, with the intent to comply with the General Construction Activity Storm Water Permit.

22. The permittees own/operate facilities where industrial or related activities take place that may have an impact on storm water quality. Some of the permittees also enter into contracts with outside parties to carry out municipal related activities that may also have an impact on storm water quality. These facilities and related activities include, but are not limited to, street sweeping, catch basin cleaning, maintenance yards, vehicle and equipment maintenance areas, waste transfer stations, corporation and storage yards, parks and recreational facilities, landscape and swimming pool maintenance activities, storm

VOL 16
0035

drain system maintenance activities and the application of herbicides, algaecides and pesticides. As part of this order, the permittees will prepare an environmental performance report for appropriate public facilities under their jurisdiction, and develop and implement best management practices for those activities found to require pollution prevention measures. Non-storm water discharges from these facilities and/or activities could also affect water quality. This order prohibits non-storm water discharges from public facilities unless the discharges are exempt under Section III, Discharge Limitations, 3 & 5 of this order or are permitted by the Regional Board under an individual NPDES permit.

23. Successful implementation of the provisions and limitations in this order will require the cooperation of all the public agency organizations within Orange County having programs/activities that have an impact on storm water quality. A list of these organizations is included in Attachment C. As such, these organizations are expected to actively participate in implementing the Orange County NPDES Storm Water Program. The Regional Board has the discretion and authority to require non-cooperating entities to participate in this areawide permit or obtain individual storm water discharge permits, pursuant to 40 CFR 122.26(a).

24. The major focus of storm water pollution prevention is the development and implementation of appropriate drainage area management plan (DAMP) including best management practices (BMPs). The ultimate goal of the urban storm water management program is to support attainment of water quality consistent with the water quality objectives for the receiving waters in order to protect beneficial uses through the implementation of the DAMP. The permittees developed and submitted a DAMP for approval, which was approved on May 3, 1994.

25. The DAMP is a dynamic document and the permittees have implemented, or are in the process of implementing, the various elements of the DAMP. This order requires the permittees to continue to implement the BMPs listed in the DAMP and to effectively prohibit illegal and illicit discharges to the storm drain system.

26. Urban run-off contains pollutants from privately owned and operated facilities such as residences, businesses, private and/or public institutions, and commercial establishments. Therefore, a successful storm water management plan should include the participation and cooperation of the public, businesses, the permittees and the regulators. The DAMP has a strong emphasis on public education.

27. The Orange County DAMP defined a management structure for the permittees' compliance effort, a formal agreement to underpin cooperation, and detailed municipal efforts to develop, implement, and evaluate various BMPs or control programs in the areas of public agency activities, public information, new development and construction, public works construction, industrial discharger identification, and illicit discharger/connection identification and elimination. The DAMP also defined an extensive surface water quality and sediment monitoring program.

VOL 16
0036
R0061436

28. In order to characterize storm water discharges, to identify problem areas, to determine the impact of urban run-off on receiving waters, and to determine the effectiveness of the various BMPs, an effective monitoring program is critical. From 1990 through 1995, the principal permittee administered the monitoring program for the permittees which included storm water monitoring, receiving water monitoring, dry weather monitoring and sediment monitoring. The permit application included a summary of monitoring data collected during 1991-1994. The monitoring program did not identify any specific pollutant sources which could be targeted for special pollutant control programs. The monitoring data indicated spatial differences in water quality between Orange County's major watersheds. Some of the monitoring data collected to date may be used to develop baseline water quality data for future evaluation of program effectiveness.

29. The Strategic Plan and Initiatives (June 22, 1995) for the State Water Resources Control Board and the Regional Water Quality Control Boards recognizes the importance of an integrated watershed management approach. The Regional Board also recognizes that a watershed management program should integrate all related programs, including the storm water programs. Consistent with this approach, an integrated monitoring program could be developed with the cooperation of all the stakeholders, including the permittees in the three counties, and the Regional Board. The Regional Board will coordinate the activities within the watershed and seek participation of the permittees.

30. Any illegal dumping and illicit/illegal connections and discharges[4] to the storm drains could contribute to storm water and other surface water contamination. A reconnaissance survey of the municipal storm drain systems (open channels and underground storm drains) is being conducted by the permittees. The permittees are required to detect, identify and eliminate illicit/illegal discharges. Additionally, the permittees are also required to develop a program to prohibit illegal/illicit connections to their storm drains and flood control facilities.

31. The County of Orange obtains its authority to control pollutants in storm water discharges, to prohibit illegal discharges/illicit connections, to control spills, and to require compliance and carry out inspections of the storm drain systems in the County of Orange from the Orange County Flood Control Act, Orange County Water Pollution Ordinance, and various county ordinances which address industrial wastes and waste discharges within the unincorporated areas of Orange County and contract cities. The permittees have various forms of legal authority in place, such as charters, State Code provisions for General Law cities, city ordinances, and applicable portions of municipal codes and the State Water Code, to regulate storm water/urban run-off discharges.

---

[4] Illegal discharge means any discharge (or seepage) to the municipal separate storm sewer that is not composed entirely of storm water except for the authorized discharges listed in Section III of this permit. Illegal discharges include the improper disposal of wastes into the storm sewer system.

VOL 16
0037
R0061437

In order to insure countywide consistency and to provide a legal underpinning to the entire Orange County Storm Water Program, a model water quality ordinance was completed on August 15, 1994 and is available to the permittees for adoption.

32. Early identification of potential storm water impacts and mitigation measures can significantly reduce storm water pollution problems. The permittees should consider these impacts and appropriate mitigation measures in the planning procedures and in the California Environmental Quality Act (CEQA) review process for specific projects, Master Plans, etc. The County of Orange already requires a Water Quality Management Plan which addresses permanent post-construction BMPs, in addition to the SWPPP required by the statewide general permit for construction activity.

33. Successful implementation of the provisions and limitations in this order will require the cooperation of all the public agency organizations within Orange County having programs/activities that have an impact on storm water quality (e.g. Fire Department, Building and Safety, Code enforcement, etc.). As such, these organizations are expected to actively participate in implementing this areawide storm water program.

34. In accordance with the Clean Water Act and its implementing regulations, this order requires the permittees to develop and implement programs and policies necessary to control the discharge of pollutants in urban run-off to waters of the U. S. to the maximum extent practicable.

35. The legislative history and the preamble to the federal storm water regulations indicate that the Congress and the U.S. EPA were aware of the difficulties in regulating urban storm water run-off solely through traditional end-of-pipe treatment. However, it is the Regional Board's intent that this order shall achieve attainment and protection of the beneficial uses of receiving waters. This order, therefore, includes Receiving Water Limitations required to implement water quality objectives and to prevent nuisance and water quality impairment in receiving waters. In accordance with Section 402 (p) of the Clean Water Act, this order requires the permittees to implement control measures in accordance with the approved DAMP that will reduce pollutants in storm water discharges to the maximum extent practicable. The Receiving Water Limitations require the implementation of control measures that are technically and economically feasible as necessary to protect beneficial uses and attain water quality objectives of the receiving waters.

36. The Regional Board finds that the unique aspects of the regulation of storm water discharges through municipal storm sewer systems, including intermittent discharges, difficulties in monitoring and limited physical control over the discharge, will require adequate time to implement and evaluate the effectiveness of best management practices and to determine whether they will adequately protect receiving waters. Therefore, the permit includes a procedure for determining whether storm water discharges are causing

VOL 16
0038
R0061438

continuing and recurring exceedances of receiving water limitations and for evaluating whether the DAMP must be revised. The permittees will be in compliance with the Receiving Water Limitations so long as it complies with that procedure.

37. A revised Water Quality Control Plan (Basin Plan) was adopted by the Regional Board and became effective on January 24, 1995. The Basin Plan contains water quality objectives and beneficial uses for water bodies in the Santa Ana Region. The Basin Plan also incorporates by reference all State Board water quality control plans and policies including the 1990 Water Quality Control Plan for Ocean Waters of California (Ocean Plan) and the 1974 Water Quality Control Policy for Enclosed Bays and Estuaries of California (Enclosed Bays and Estuaries Plan).

38. The requirements contained in this order are necessary to implement the plans and policies described in Finding 36, above. These plans and policies contain numeric and narrative water quality standards for the water bodies in this Region. This order does not contain numeric effluent limitations for any constituents because the impact of the storm water discharges on the water quality of the receiving waters has not yet been fully determined. Continuation of water quality/biota monitoring and analysis of the data are essential to make that determination.

39. The permittees may petition the Regional Board to issue a separate NPDES permit to any discharger of non-storm water into storm drain systems that they own or operate.

40. The permittees have developed a Storm Water Implementation Agreement between the County, its cities and the Orange County Flood Control District as required under Order No. 90-71.

41. The storm water regulations require public participation in the storm water management program development and implementation. As such the permittees are required to solicit and consider all comments received from the public and submit copies of the comments to the Executive Officer of the Regional Board. In considering the public comments, the permittees may modify reports, plans, or schedules prior to submittal to the Executive Officer.

42. In accordance with California Water Code Section 13389, the issuance of waste discharge requirements for this discharge is exempt from those provisions of the California Environmental Quality Act contained in Chapter 3 (commencing with Section 21100), Division 13 of the Public Resources Code.

43. The Regional Board has considered anti-degradation requirements, pursuant to 40 CFR 131.12 and State Board Resolution 68-16, for this discharge. The Regional Board finds that the storm water discharges are consistent with the federal and state anti-degradation requirements and a complete anti-degradation analysis is not necessary.

VOL 16 0039

44. The Regional Board has notified the permittees and interested parties of its intent to issue waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

45. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

IT IS HEREBY ORDERED that the permittees, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and regulations and guidelines adopted thereunder, shall comply with the following:

I. RESPONSIBILITIES OF PRINCIPAL PERMITTEE

The principal permittee shall be responsible for the overall program management and shall:

1. Conduct chemical and biological water quality monitoring of the storm drain system outfalls as agreed upon by the Executive Officer of the Regional Board.

2. Develop criteria for inspections of the municipal separate storm drain systems.

3. Conduct inspections of the storm drain systems within its jurisdiction.

4. Implement management programs (within its jurisdiction), monitoring programs, and related plans as required by this order.

5. Enact and revise policies/ordinances necessary to establish legal authority as required by the Federal Storm Water Regulations.

6. Respond and/arrange for responding to emergency situations such as accidental spills, leaks, illegal discharges/illicit connections, etc. to prevent or reduce the discharge of pollutants to storm drain systems and waters of the U.S.

7. Prepare and submit to the Executive Officer of the Regional Board unified reports, plans, and programs as required by this order.

The activities of the principal permittee should include, but not be limited to, the following:

8. Coordinate permit activities and participate in any subcommittees formed as necessary, to coordinate compliance activities with this order.

VOL 16
0040

9. Provide technical and administrative support and inform the co-permittees of the progress of other pertinent municipal programs, pilot projects, research studies, etc.

10. Coordinate the implementation of areawide storm water quality management activities such as public education, pollution prevention, household hazardous waste collection, etc.

11. Develop and implement mechanisms, performance standards, etc., to promote uniform and consistent implementation of BMPs among the permittees.

12. Pursue enforcement actions as necessary within its jurisdiction to ensure compliance with storm water management programs, ordinances and implementation plans including physical elimination of undocumented connections and illicit discharges.

13. In conjunction with the other permittees, implement the BMPs listed in the approved DAMP.

14. Monitor the implementation of the plans and programs required by this order and determine their effectiveness in protecting beneficial uses.

15. Coordinate all the activities with the Regional Board including the submittal of all reports, plans, and programs as required under this order.

16. Obtain public input for any proposed management and implementation plans where applicable.

17. Cooperate in watershed management programs and regional and/or statewide monitoring programs.

II. RESPONSIBILITIES OF THE CO-PERMITTEES

The co-permittees shall be responsible for the management of storm drain systems within their jurisdictions and shall:

1. Implement management programs, monitoring programs, implementation plans and all BMPs outlined in the DAMP within each respective jurisdiction as required by Order No. 96-31.

2. Adopt the Orange County Water Quality Ordinance or the equivalent legislation necessary to establish and maintain adequate legal authority as required by the Federal Storm Water Regulations.

VOL 16 0041

3. Conduct storm drain system inspections in accordance with the criteria developed by the principal permittee.

The co-permittees' activities should include , but not be limited to, the following:

4. Participate in committees or subcommittees formed by the principal permittee to address storm water related issues to comply with this order.

5. Review, approve, implement, and comment on all plans, strategies, management programs, monitoring programs, as developed by the principal permittee or any subcommittee to comply with this order.

6. Pursue enforcement actions as necessary to ensure compliance with the storm water management programs, ordinances and the implementation plans including physical elimination of undocumented connections and illicit discharges.

7. Conduct and coordinate with the principal permittee any surveys and characterizations needed to identify the pollutant sources and drainage areas.

8. Submit storm drain system maps with periodic revisions as necessary.

9. Respond to emergency situations such as accidental spills, leaks, illegal discharges/illicit connections, etc. to prevent or reduce the discharge of pollutants to storm drain systems and waters of the U.S.

10. Prepare and submit all reports to the principal permittee in a timely manner.

III. DISCHARGE LIMITATIONS

1. The permittees shall prohibit illicit/illegal discharges from entering into the municipal separate storm sewer systems (municipal storm drain systems) and require controls to reduce the discharge of pollutants to the maximum extent practicable.

2. The discharge of storm water from permittees' municipal storm drain systems to waters of the United States containing pollutants which have not been reduced to the maximum extent practicable is prohibited.

3. The following discharges need not be prohibited by the permittees unless identified by the permittees as a source of pollutants to the receiving waters.

   a. discharges composed entirely of storm water,

VOL 16 0042

b. covered by NPDES permits or written clearances issued by the Regional or State Board
c. from potable water line flushing and other potable water sources,
d. fire hydrant testing and flushing,
e. air conditioning condensation,
f. landscape irrigation, lawn garden watering and other irrigation waters,
g. passive foundation drains,
h. passive footing drains,
i. water from crawl space pumps,
j. dechlorinated swimming pool discharges,
k. non-commercial vehicle washing,
l. diverted stream flows,
m. rising ground waters and natural springs,
n. ground water infiltration as defined in 40 CFR 35.2005 (20) and uncontaminated pumped groundwater,
o. flows from riparian habitats and wetlands,
p. street wash water and run-off from fire fighting (program descriptions shall address discharges or flows from fire fighting only where such discharges are identified as significant sources of pollutants to waters of the United States),
q. waters not otherwise containing wastes as defined in California Water Code Section 13050 (d), and
r. other types of discharges identified and recommended by the permittees and approved by the Regional Board.

For purposes of this order, a discharge may include storm water and other types of discharges as indicated above.

4. If it is determined by the permittees that any of the preceding discharges cause or contribute to violations of water quality standards or are significant contributors of pollutants to waters of the U.S., the permittees shall prohibit these discharges from entering the storm drain system.

5. Non-storm water discharges from public agency activities into waters of the U.S. are prohibited unless the non-storm water discharges are permitted by an NPDES permit or are included in Item 3., above. If permitting or immediate elimination of the non-storm water discharges is impractical, the permittees shall include in the Environmental Performance Report, required under Section V., Provision 18., of this order, a proposed plan to eliminate the non-storm water discharges in a timely manner.

6. The permittees shall reduce the discharge of pollutants to the storm water conveyance systems to the maximum extent practicable.

VOL 16 0043

IV. RECEIVING WATER LIMITATIONS

1. Receiving water limitations have been established based on beneficial uses, water quality objectives, and water quality standards contained in the Basin Plan, and amendments thereto, and on ambient water quality. They are intended to protect the beneficial uses and attain the water quality objectives contained in the Basin Plan. The discharge of urban storm water, or non-storm water, from a municipal storm sewer system for which the permittees are responsible under the terms of this permit shall not cause continuing or recurring impairment of beneficial uses or exceedances of water quality objectives. The permittees will not be in violation of this provision so long as they are in compliance with the requirements set forth in 1.a.

   a. If the Executive Officer determines that a continuing or recurring impairment of beneficial uses or exceedances of water quality objectives has been caused by urban storm water discharges from the municipal storm sewer system, the following steps shall be taken:

      i. The Executive Officer will evaluate the adequacy of the permittees' implementation of the approved DAMP based on the permittees' submitted reports and other relevant information. The Executive Officer will determine if implementation of the approved DAMP has a reasonable likelihood of preventing future continuing or recurring impairment of beneficial uses or exceedances of water quality objectives resulting from urban storm water discharges. If the Executive Officer makes this determination, the permittees are required to continue implementing the approved DAMP.

      ii. If the Executive Officer determines that implementation of the approved DAMP will not have a reasonable likelihood of preventing future impairment of beneficial uses or exceedances of water quality objectives, the permittees shall, upon notice from the Executive Officer, do the following:

         A. Submit a report that includes an evaluation of the relative contribution of the urban storm water discharges to the impairment of beneficial uses or the exceedances of water quality objectives. The report shall address the persistence, the significance, and to the extent feasible, the causes of the impairment or exceedance, and the technical and economic feasibility of control actions available to the permittees to reduce or eliminate the impairment or exceedance.

VOL 16
0044
R0061444

B. Submit a report reviewing the approved DAMP to determine whether it should be revised so that there will be a reasonable likelihood of preventing future continuing or recurring beneficial use impairment or exceedances of water quality objectives, or whether revisions to achieve protection of beneficial uses or attainment of water quality objectives are technically or economically infeasible. If the report recommends revision of the approved DAMP, the report shall include a work plan to revise the plan so that it will have a reasonable likelihood of preventing future continuing or recurring beneficial use impairment or exceedance or water quality objectives. If the report concludes that no revisions are necessary to achieve protection of beneficial uses or attainment of water quality objectives, the report shall explain how implementation of the approved DAMP will achieve compliance. If the report determines that revisions to achieve protection of beneficial uses or attainment of water quality objectives are technically or economically infeasible, the permittees shall continue to comply with the DAMP, shall fully document this determination and shall make recommendations for actions to achieve compliance.

C. The permittees shall implement the work plan and the revised DAMP as approved by the Executive Officer.

2. The Executive Officer shall review and approve or disapprove the reports required under Receiving Water Limitation 1. The reports may be submitted as part of the next Annual Report, or at some other time designated by the Executive Officer. So long as the permittees have complied with the procedures set forth in Receiving Water Limitation 1, they do not have to repeat the procedure for continuing or recurring exceedances of the same receiving water limitations. As appropriate, any determinations under this part or revisions to the approved DAMP may be considered by the Regional Board in a public meeting.

V. PROVISIONS

GENERAL

1. Permittees shall demonstrate compliance with all the requirements in this order and specifically with Section III. Discharge Limitations and Section IV. Receiving Water Limitations, through timely implementation of their approved Drainage Area Management Plan (DAMP) and any approved modifications, revisions, or amendments developed pursuant to this order. The approved DAMP, as included in the Report of Waste Discharge, including any approved amendments thereto, is hereby made an enforceable component of this order.

VOL 16 0045

2. The permittees shall implement all elements of the approved DAMP. Where the dates are different than those of the order, the dates in the order shall prevail. Any proposed revisions to the DAMP shall be submitted with the Annual Report to the Executive Officer of the Regional Board for review and approval. All approved revisions to the DAMP shall be implemented in a timely manner.

3. The permittees shall comply with Monitoring and Reporting Program No. 96-31 which is hereby made a part of this order and any revisions thereto. The Executive Officer is authorized to revise the Monitoring and Reporting Program and also to allow the permittees to participate in regional, statewide, national or other monitoring programs in lieu of Monitoring and Reporting Program No. 96-31.

4. Upon approval by the Executive Officer of the Regional Board, all plans, reports and subsequent amendments as required by this order shall be implemented and shall become an enforceable part of this order. Prior to approval by the Executive Officer, these plans, reports and amendments shall not be considered as an enforceable part of this order.

5. The permittees shall report to the Executive Officer of the Regional Board:

   a. Any enforcement actions and discharges of storm or wastewaters, known to the permittees, which may have an impact on human health or the environment,

   b. Any suspected or reported activities on federal, state, or other entity's land or facilities, where the permittees do not have any jurisdiction, and where the suspected or reported activities may be contributing pollutants to waters of the U.S.

6. The permittees shall not issue any grading permit for construction activities which will disturb five acres or more (or less than five acres, if it is part of a larger common plan of development or sale which is five acres or more) until proof of coverage with the State's General Construction Activity Storm Water Permit is verified. The proof of coverage may include a letter from the Regional Board office, a copy of the Notice of Intent, Waste Discharger Identification number, etc.

7. The permittees shall identify all illegal and or illicit connections by February 1, 1997 and submit a report of the findings by February 28, 1997 including a schedule for elimination of any identified illicit connection and for periodic inspections of the storm drain facilities.

8. Permit application and special NPDES program requirements contained in 40 CFR 122.21 (a), (b), (d)(2), (f), (p); 122.41 (a), (b), (c), (d), (e), (f), (g), (h), (i), (j), (k), (l); and 122.42 (c) are incorporated into this order by reference.

VOL 16 0046

VOL 16 0047

IMPLEMENTATION AGREEMENT

9. No later than May 31, 1996, the permittees shall submit to the Executive Officer of the Regional Board a copy of the existing Storm Water Program Implementation Agreement with authorized signatures of each of the permittees. Any further revisions to the implementation agreement shall be forwarded to the Executive Officer of the Regional Board within 30 days of approval by the permittees.

LEGAL AUTHORITY

10. The permittees shall adopt the proposed Water Quality Ordinance, or its equivalent. The permittees shall review their existing grading and erosion control ordinances and determine the need for any revision. Upon adoption of the ordinances, but no later than July 31, 1997 each permittee shall certify to the Regional Board that it has adequate legal authority to control the discharges of pollutants into the municipal storm drain system and that it has satisfied the requirements of 40 CFR Section 122.26(d)(2)(i)(A-F). The certification may be submitted jointly by all permittees.

ENFORCEMENT/COMPLIANCE STRATEGY

11. The Permittees shall implement the Enforcement Consistency Guide, dated 8/15/94, or an equivalent enforcement strategy, in order to enforce the Water Quality Ordinance. Upon implementation, but no later than July 31, 1997, each permittee shall certify to the Regional Board that the guide or similar policies are in place for their enforcement staff. Before implementation, this guide and its equivalent must include the following:

    a. A mechanism to determine compliance of industrial facilities, commercial facilities, and construction sites with storm water ordinances and concerns;

    b. A program to monitor and control the pollutants in storm water discharges to the municipal system from industrial facilities that the permittees determines are contributing to a substantial pollutant loading to the municipal storm drain system. The program shall identify priorities and procedures for inspections and establishing and implementing control measures.

12. The permittees shall develop a training program and offer it to the staff of existing industrial and construction inspection programs, to raise concerns with regard to storm water requirements.

13. The permittees will continue to provide notification to the Regional Board regarding storm water related information gathered during site inspections of industrial and construction sites regulated by the Statewide General Storm Water Permits.

R0061447

PUBLIC EDUCATION AND OUTREACH

14. The permittees will continue to implement the public education efforts already underway and shall implement all of the proposed efforts contained in the permit application. Any proposed changes shall be reported in the Annual Report.

15. When feasible, the permittees shall participate in joint outreach with other programs including, but not limited to, other municipal storm water programs to ensure that a consistent message on storm water pollution prevention is brought to the public.

16. The permittees shall develop public education materials to encourage the public to report illegal dumping from residential, industrial, construction and commercial sites into public streets, storm drains and other water bodies.

17. The permittees shall develop BMP guidance for the control of those potentially polluting activities not otherwise regulated by any agency.

MUNICIPAL FACILITIES

18. The permittees shall prepare an Environmental Performance Report, as stated in the amended DAMP, to address public agency facilities and activities not currently required to obtain coverage under the State's general storm water permits. This report may include a pollution prevention strategy to ensure that the public agency facilities and/or activities that are currently not required to obtain coverage under the State's general storm water permits are not sources of pollutants into the waters of the U.S. A report shall be submitted to the Executive Officer of the Regional Board by July 31, 1997, identifying the extent of the investigation and all findings of the Environmental Performance Report as it pertains to storm water quality. Thereafter, the permittees shall include in the annual report for each year the actions taken by the permittees to eliminate discharges of pollutants to waters of the U.S., identified by the permittees, at public agency facilities.

MUNICIPAL CONSTRUCTION PROJECTS/ACTIVITIES

19. This order authorizes the discharge of storm water run-off from construction projects that may result in land disturbance of five (5) acres or more (or less than five acres, if it is part of a larger common plan of development or sale which is five acres or more) that are under ownership and/or direct responsibility of any of the permittees.

20. Prior to commencement of construction activities, the permittees shall notify the Executive Officer of the Regional Board of the proposed construction project. Upon completion of the construction project, the Executive Officer shall be notified of the completion of the project.

VOL 16
0048

21. The permittees shall develop and implement a storm water pollution prevention plan (SWPPP) and a monitoring program that is specific for the construction project prior to the commencement of any of the construction activities. The SWPPP shall be kept at the construction site and released to the public and/or Regional Board staff upon request.

22. The SWPPP and the monitoring program for the construction projects shall be consistent with the requirements of the latest version of the State's General Construction Activity Storm Water Permit.

23. The permittees shall give advance notice to the Executive Officer of the Regional Board of any planned changes in the construction activity which may result in non-compliance with the latest version of the State's General Construction Activity Storm Water Permit.

24. All other terms and conditions of the latest version of the State's General Construction Activity Storm Water Permit shall be applicable.

NEW DEVELOPMENT (INCLUDING RE-DEVELOPMENT)

25. Within 90 days of the issuance of this order, the permittees shall begin implementation of the new development BMPs (DAMP, Appendix G, dated September 1993) and BMPs for public works construction (DAMP, Appendix H) that were developed under Order 90-71. Each permittee shall certify to the Regional Board by November 15, 1996, that these guidelines or the equivalent are being implemented and enforced.

26. Within 120 days of the issuance of this order, the permittees shall review their planning procedures and CEQA document preparation processes to insure that storm water-related issues are properly considered. If necessary, these processes shall be revised to include storm water requirements for evaluation of appropriate mitigation measures.

27. The permittees shall, through conditions of approval, insure proper maintenance and operation of any permanent flood control structures installed in new developments. The parties responsible for the maintenance and operation of the facilities shall be identified.

FISCAL RESOURCES

28. The permittees shall prepare and submit a unified fiscal analyses to the Executive Officer of the Regional Board. The fiscal analysis shall be submitted with the Annual Report document no later than November 15th of each year and shall, at a minimum, include the following:

    a. Each permittee's expenditures for the previous fiscal year,
    b. Each permittee's budget for the current fiscal year,
    c. A description of the source of funds, and
    d. Each permittee's estimated budget for the next fiscal year.

VOL 16
0049

PERMIT EXPIRATION AND RENEWAL

29. This order expires on March 1, 2001 and the permittees must file a Report of Waste Discharge (permit application) no later than 180 days in advance of such expiration date as application for issuance of new waste discharge requirements. The Report of Waste Discharge shall, at a minimum, include the following:

    a. Any revisions to the Drainage Area Management Plan including, but not limited to, all the activities the permittees propose to undertake during the next permit term, goals and objectives of such activities, an evaluation of the need for additional source control and/or structural BMPs, any proposed pilot studies, etc.;

    b. Changes in land use and/or population including map updates; and

    c. Any significant changes to the storm drain systems, outfalls, detention or retention basins or dams, and other controls including map updates of the storm drain systems.

    d. To incorporate new or revised program elements and compliance schedule(s) necessary to comply with Section IV of this order.

30. This Order may be modified, revoked or reissued prior to its expiration date for the following reasons:

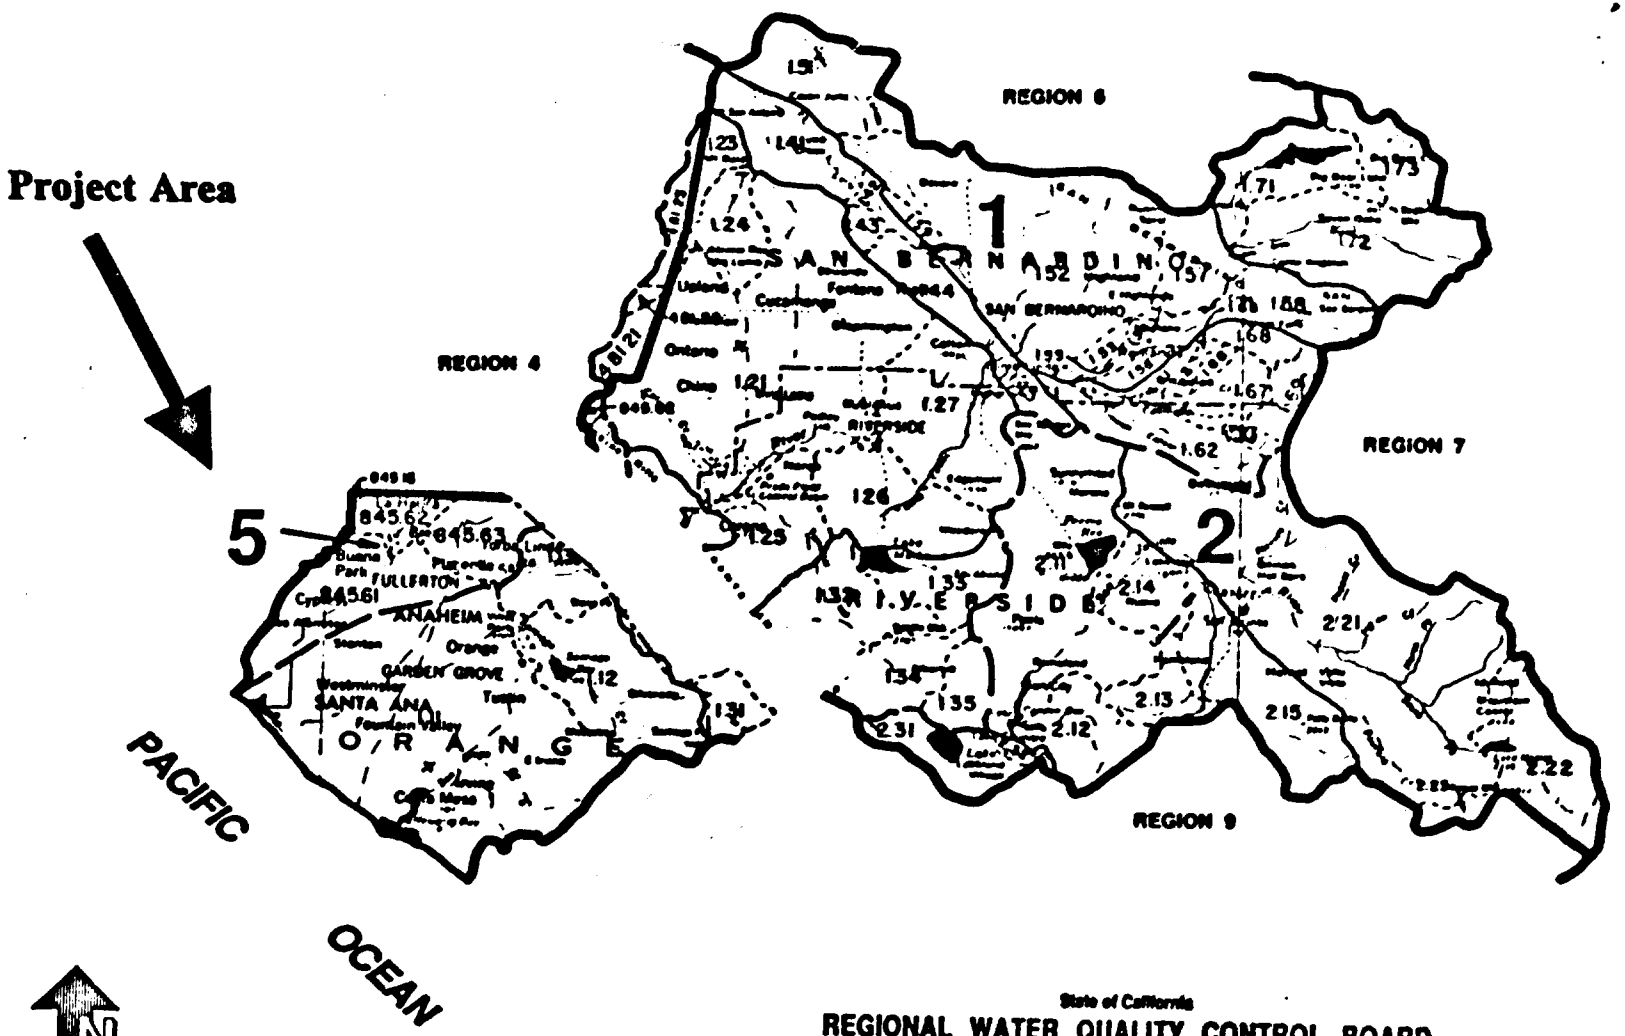
    a. To address significant changes in conditions identified in the technical reports required by the Regional Board which were unknown at the time of the issuance of this order;

    b. To incorporate applicable requirements of statewide water quality control plans adopted by the State Water Resources Control Board or any amendments to the Basin Plan approved by the Regional Board, the State Board, and, if necessary, by the Office of Administrative Law; or

    c. To comply with any applicable requirements, guidelines, or regulations issued or approved under the Clean Water Act, if the requirements, guidelines, or regulations contain different conditions or additional requirements than those included in this order.

31. This order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit pursuant to Section 402 (p) of the Clean Water Act, or amendments thereto, and shall become effective ten days after the date of its adoption provided the Regional Administrator of the U. S. EPA has no objections. If the Regional Administrator objects to its issuance, the permit shall not become effective until such objection is withdrawn.

VOL 16 0050



32. Order No. 90-71 is hereby rescinded.

I, Gerard Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on March 8, 1996.

Monitoring and Reporting Program No. 96-31
NPDES No. CAS618030

for
the County of Orange, Orange County Flood Control District,
and
Incorporated Cities of Orange County Within the Santa Ana Region
Areawide Urban Storm Water Run-off

I. GENERAL

1. Revisions of the monitoring and reporting program are appropriate to ensure that the permittees are in compliance with requirements and provisions contained in this order. Revisions may be made under the direction of the Executive Officer at any time during the term, and my include a reduction or increase in the number of parameters to be monitored, the frequency of monitoring, or the number and size of samples collected.

2. The Executive Officer is authorized to allow the permittees to participate in statewide, national, or other monitoring programs in lieu of this monitoring program.

3. All sample collection, handling, storage, and analysis shall be in accordance with 40 CFR Part 136 or other methods approved by the Executive Officer.

4. The permittees are authorized to complement their monitoring data with other monitoring sources provided the monitoring conditions and sources are similar to those in the Santa Ana Watershed.

5. The permittees shall implement the Orange County Water Quality Monitoring Program (submitted as part of the permit application) until development and implementation of other acceptable monitoring programs.

II. OBJECTIVES

The overall goal of this monitoring program is to develop and support an effective watershed management program. The following are the major objectives:

1. To develop and support an effective municipal non-point source control program.

2. To define water quality status, trends, and pollutants of concern associated with municipal storm water discharges.

3. To characterize pollutants associated with municipal storm water discharges and to assess the influence of urban land uses on water quality and the beneficial uses of receiving waters.

4. To identify significant water quality problems related to urban storm water discharges.

VOL 16
0056
R0061456

5. To identify other sources of pollutants in storm water run-off to the maximum extent possible (e.g., atmospheric deposition, contaminated sediments, other non-point sources, etc.).

6. To identify and prohibit illicit discharges.

7. To identify those waters, which without additional action to control pollution from urban storm water discharges cannot reasonably be expected to attain or maintain applicable water quality standards required to sustain the beneficial uses in the Basin Plan.

8. To evaluate the effectiveness of existing municipal storm water quality management programs, including an estimate of pollutant reductions achieved by the structural and nonstructural BMPs implemented by the permittees.

9. To evaluate costs and benefits of proposed municipal storm water quality control programs to the stakeholders including the public.

The Regional Board recognizes that these objectives may not be attainable during this permit period and authorizes the Executive Officer to evaluate and to determine adequate progress toward meeting each objective.

III. MONITORING PROGRAM REQUIREMENTS

The permittees shall develop and submit for approval of the Executive Officer an integrated watershed monitoring program geared towards achieving the above stated goals. This program may be developed in cooperation with the permittees from the San Bernardino and Riverside counties. The Executive Officer or his/her designated representative(s) shall facilitate the coordination meetings or subcommittees formed to achieve this goal. The development and implementation of the monitoring program shall be in accordance with the time schedules prescribed by the Executive Officer. At a minimum, the program shall include the following:

1. Uniform guidelines for quality control, quality assurance, data collection and data analysis.

2. A mechanism for the collection, analysis and interpretation of existing data from local, regional or national monitoring programs. These data sources may be utilized to characterize different storm water sources; to determine pollutant generation, transport and fate; to develop a relationship between land use, development size, storm size and the event mean concentration of pollutants; to determine spatial and temporal variances in storm water quality and seasonal and other bias in the collected data; and to identify any unique features of the Santa Ana Watershed. The permittees are encouraged to use data from similar studies, if available.

3. A description of the monitoring program including:

   a. The number of monitoring stations;

VOL 16 0057

b. Monitoring locations within flood control channels, bays and estuaries, coastal areas, major outfalls, and other receiving waters;

c. Environmental indicators (e.g., ecosystem, biological, habitat, chemical, sediment, stream health, etc.) chosen for monitoring;

d. Parameters selected for field screening and for laboratory work; and

e. Total number of samples to be collected from each station, frequency of sampling during wet and dry weather, short duration or long duration storm events, type of samples (grab, 24-hour composite, etc.), and the type of sampling equipment.

4. A mechanism for analyzing the collected data and interpreting the results including an evaluation of the effectiveness of the management practices, and need for any refinement of the management practices.

5. A description of the responsibilities of all the participants in this program including cost sharing.

IV. REPORTING

1. All progress reports and proposed strategies and plans required by this order shall be signed by the principal permittee and copies shall be submitted to the Executive Officer of the Regional Board under penalty of perjury.

2. The permittees shall submit an **ANNUAL PROGRESS REPORT** to the Executive Officer of the Regional Board and to the Regional Administrator of the U.S. EPA, Region 9, no later than November 15th, of each year. This progress report may be submitted in a mutually agreeable electronic format. At a minimum, annual progress report shall include the following:

a. A review of the status of program implementation and compliance (or non-compliance) with the schedules contained in this order;

b. An assessment of the effectiveness of control measures established under the illicit discharge elimination program and the Drainage Area Management Plan. The effectiveness may be measured in terms of how successful the program has been in eliminating illicit/illegal discharges and reducing pollutant loads in storm water discharges;

c. An assessment of any storm water management program modifications made to comply with Clean Water Act requirements to reduce the discharge of pollutants to the maximum extent practicable;

d. A summary and analysis of monitoring results from the previous year and any changes to the monitoring program for the following year;

VOL 16
0058

e. A fiscal analysis progress report as described in Section V., Provision, 25., of this order;

f. A draft workplan which describes the proposed implementation of the DAMP for next fiscal year. The workplan shall include clearly defined tasks, responsibilities, and schedules for implementation of the storm water program and each permittee's actions for the next fiscal year; and

g. Major changes in any previously submitted plan/policies.

3. The permittees shall be responsible for the submittal of all required information/materials needed to comply with this order in a timely manner to the principal permittee. All such submittals shall be signed by a duly authorized representative of the permittee under penalty of perjury.

V. REPORTING SCHEDULE

All reports required by this order shall be submitted to the Executive Officer of the Regional Board in accordance with the following schedule:

ITEM	DUE DATE
Report on Illicit/Illegal Discharges & Storm Water Program Implementation Agreement	February 28, 1997
Legal Authority & Enforcement Strategy Certification	July 31, 1997
Environmental Performance Report	July 31, 1997
New Development BMP Certification	November 15, 1996
Proposed Monitoring Program	July 31, 1997
Annual Report/Fiscal Analysis	November 15th of each year

VOL 16 0059

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SANTA ANA REGION

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT
AND
WASTE DISCHARGE REQUIREMENTS
NPDES NO. CAS618036
ORDER NO. 96-32
FOR
THE SAN BERNARDINO COUNTY TRANSPORTATION/FLOOD CONTROL DEPARTMENT, THE COUNTY OF SAN BERNARDINO, AND THE INCORPORATED CITIES OF SAN BERNARDINO COUNTY WITHIN THE SANTA ANA REGION
AREAWIDE URBAN STORM WATER RUN-OFF

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Board), finds that:

1. On April 4, 1995, the San Bernardino County Transportation/Flood Control Department (SBCFCD), in cooperation with the County of San Bernardino, and the incorporated cities of Big Bear Lake, Chino, Chino Hills, Colton, Fontana, Grand Terrace, Highland, Loma Linda, Montclair, Ontario, Rancho Cucamonga, Redlands, Rialto, San Bernardino, Upland, and Yucaipa (hereinafter collectively referred to as "permittees") jointly submitted National Pollutant Discharge Elimination System (NPDES) Application No. CAS618036 to renew their areawide NPDES permit for urban storm water run-off.

2. The 1987 amendments to the Clean Water Act required the United States Environmental Protection Agency (EPA) to develop permitting regulations for storm water discharges from municipal separate storm sewer systems serving a population of 100,000 or more and for storm water discharges associated with industrial activities including construction sites. The EPA published proposed storm water regulations on December 7, 1988 and promulgated the final regulations on November 16, 1990. Prior to the EPA's promulgation of the final storm water regulations, the three counties (Orange, Riverside, and San Bernardino) and the incorporated cities within the jurisdiction of the Santa Ana Regional Board requested early areawide NPDES permits for urban storm water run-off.

3. On October 19, 1990, the Regional Board adopted Order No. 90-136 for urban storm water run-off from urban areas in San Bernardino County within the Santa Ana Region. Order No. 90-136 expires on October 1, 1995. The San Bernardino County Transportation/Flood Control Department was named as the principal permittee and San Bernardino County and the incorporated cities were named as

VOL 16
0060
R0061460

the co-permittees. In order to more effectively carry out the requirements of this order, the permittees have agreed that the SBCFCD will continue as principal permittee and San Bernardino County and the incorporated cities will continue as co-permittees. However, the Regional Board, in exercising its enforcement discretion, will take action only against the individual permittee responsible for specific violations of this order, whenever possible.

4. San Bernardino County Municipal Permit required the permittees to develop and implement a Drainage Area Management Plan (DAMP), a receiving and storm water monitoring program, reconnaissance survey program, a plan for prosecution of illegal dischargers, and to establish legal authority to effectively prohibit illegal/illicit discharges. The overall goal of these requirements was to effectively reduce the pollutant loadings to surface waters from urban run-off to the maximum extent practicable (MEP).

5. The Report of Waste Discharge (the permit renewal application) included the following components:

   a. A Municipal Storm Water Management Program which is an extension of the October, 1993 Drainage Area Management Plan.
   b. Letters of intent for compliance with San Bernardino County Municipal Storm Water Permit by all the co-permittees.

6. Within the Santa Ana Region, the permittees serve a population of approximately 1.11 million, occupying an area of approximately 985 square miles. The latest figures obtained from the Reconnaissance Progress Report estimated 384 miles of above-ground and 334 miles of below-ground storm drain channels in the project area. Approximately seven percent (7%) of the San Bernardino County area drains into water bodies within this Regional Board's jurisdiction. The project area is shown on Attachment 1. This order regulates storm water run-off from areas under the jurisdiction of the permittees. The term storm water as used in this order includes storm water run-off, snow melt run-off, and surface run-off and drainage. The permittees have jurisdiction over and/or maintenance responsibility for storm water conveyance systems within San Bernardino County. Approximately 50% of the remaining San Bernardino County drainage areas is within the jurisdiction of the Lahonton Regional Board and the other 43% is within the jurisdiction of the Colorado River Basin Regional Board. However, urbanization in these areas is minimal compared to areas within the Santa Ana Regional Board's jurisdiction.

7. The Santa Ana River Basin is the major watershed within this Region. This watershed is divided into the upper and lower Santa Ana watersheds. The lower Santa Ana River Basin (downstream from Prado Dam) includes the Orange County

VOL 16 0061

drainage areas and the Upper Santa Ana River Basin includes the San Bernardino County and the Riverside County drainage areas. The San Bernardino County drainage areas are generally upstream of the Riverside County drainage areas.

8. The three county areas within this Region are regulated under three areawide permits for urban storm water run-off. These areawide NPDES permits are:

   a. Orange County, NPDES No. CA 8000180, Order No. 90-71 (upon renewal Order No. 96-31, NPDES No. CAS618030)

   b. Riverside County, NPDES No. CA 8000192, Order No. 90-104 (upon renewal Order No. 96-30, NPDES No. CAS618033)

   c. San Bernardino County, NPDES No. CA 8000200, Order No. 90-136 (upon renewal Order No. 96-32, NPDES No. CAS618036)

9. Surface Water bodies in San Bernardino County within the jurisdiction of Santa Ana Region are listed in Attachment 2.

10. Run-off from the San Bernardino County drainage areas is generally conveyed to the Riverside County drainage areas through the Santa Ana River or other drainage channels tributary to the Santa Ana River. These flows are then discharged to Reach 2 of the Santa Ana River through Prado Basin (Reach 3 of the Santa Ana River). Most of the flow in Reach 2 is recharged in Orange County. During wet weather, some of the flow is discharged to the Pacific Ocean through Reach 1 of the Santa Ana River.

11. The entities listed in Attachment 3 are considered as potential dischargers of storm water to the San Bernardino County drainage areas. It is expected that these entities will also work cooperatively with the permittees to manage urban run-off. The Regional Board has the discretion and authority to require non-cooperating entities to participate in this areawide permit or obtain individual storm water permits, pursuant to 40 CFR 122.26(a).

12. The 1989, 1991, and 1994 Water Quality Assessments by the Regional Board identified apparent impairment of a number of water bodies within the permitted area. The beneficial uses of these water bodies are thought to be threatened or impaired in part due to urban storm water run-off and non-storm water flows from urbanized areas. Preliminary results from urban storm water monitoring programs within the Region indicate that major pollutants of concern in urban run-off are certain heavy metals, sediment, coliform bacteria, pesticides, and nutrients. Municipal storm water run-off is a source of pollutants to waters of the U.S. that

VOL 16
0062
R0061462

VOL 16

may be causing or contributing to water quality impairment. It is recognized that instream or end-of-channel treatment of storm water is difficult and expensive. Therefore, it is critical to identify the sources and to develop management practices necessary to reduce pollutant loading to storm water. The quality of these discharges varies considerably and is affected by land use activities, basin hydrology and geology, season, the frequency and duration of storm events and point source discharges permitted by the Regional Board under individual permits.

13. Studies conducted by the EPA, the states, flood control districts and other entities indicate the following major sources for urban storm water pollution:

    a. Industrial sites where appropriate pollution control and best management practices (BMPs) are not implemented,

    b. Construction sites where erosion and siltation controls and BMPs are not implemented, and

    c. Urban run-off where the drainage area is not properly managed.

14. To address the industrial and construction sites, the State Board issued two statewide general NPDES permits: one for storm water run-off from industrial sites (NPDES No. CAS000001, General Industrial Activities Storm Water Permit) and the second one for storm water run-off from construction sites (NPDES No. CAS000002, General Construction Activity Storm Water Permit). In addition, the Regional Board adopted Order No. 94-005, NPDES NO. CA 8000279, for storm water run-off from facilities owned and/or operated by Caltrans, which includes freeways and highways, and Order No. 94-7, NPDES No. CA 8000336, for concentrated animal feeding operations, including dairies (General Dairy permit). The Regional Board has and continues to issue individual storm water permits for industrial facilities within the Region.

15. One of the major components of these statewide permits, the Caltrans permit, and the General Dairy Permit is the development and implementation of a storm water pollution prevention plan (SWPPP).

16. Most industrial activities (some light industrial activities are exempt) and construction activities on five acres or more are required to get individual NPDES permits for storm water discharges or get coverage under these statewide general permits.

17. The Regional Board is the enforcing authority for the two statewide general permits. However, in most cases, the industrial and construction sites discharge

0063

directly into storm drains and/or flood control facilities owned and operated by the permittees. These industrial and construction sites are also regulated under local laws and regulations. Therefore, a coordinated effort between the permittees and the Regional Board staff is critical to avoid duplicative storm water regulatory activities. A memorandum of understanding between the permittees and the Regional Board may be appropriate to efficiently implement the storm water regulations for industries and construction sites at the local level.

18. The permittees or other agencies generally conduct inspections of most industrial and commercial facilities and construction sites within their jurisdiction to determine compliance with local storm water ordinances and regulations, as well as for other regulatory purposes. The permittees have agreed to notify Regional Board staff when conditions are observed during such inspections which result in threat or potential threat to water quality. This also includes failure to obtain coverage under the general storm water permits.

19. The permittees have agreed not to issue grading and/or building permits without proof of filing for a Notice of Intent (NOI) for sites subject to State's General Construction Activity Storm Water Permit.

20. The permittees own/operate facilities where industrial or related activities take place that may have an impact on storm water quality. Some of the permittees also enter into contracts with outside parties to carry out municipal related activities that may also have an impact on storm water quality. These facilities and related activities include, but are not limited to, street sweeping, catch basin cleaning, maintenance yards, vehicle and equipment maintenance areas, waste transfer stations, corporation and storage yards, parks and recreational facilities, landscape and swimming pool maintenance activities, storm drain system maintenance activities and the application of herbicides, algaecides and pesticides. As part of this order, the permittees will assess public agency activities and facilities for potential impact to storm water quality and develop and implement best management practices to reduce pollutant discharges from those activities that are found to be pollutant sources. Non-storm water discharges from these facilities and/or activities also affect water quality. This order prohibits non-storm water discharges from public facilities unless the discharges are exempt under Section III., Discharge Limitations, 5., of this order or are permitted by the Regional Board under an individual NPDES permit.

21. The major focus of storm water pollution prevention is the development and implementation of an appropriate drainage area management plan (DAMP) including best management practices (BMPs). The ultimate goal of the urban storm water management program is to attain water quality consistent with the

VOL 16
0064
R0061464

water quality objectives for the receiving waters in order to protect beneficial uses. The permittees developed and submitted a DAMP, which was approved on May 2, 1994. The Municipal Storm Water Management Program (MSWMP) is an extension of the DAMP.

22. The MSWMP provides a framework for continuing the implementation of DAMP elements for the term of the renewed permit.

23. There is some contribution of pollutants in urban run-off from privately owned and operated facilities such as residences, businesses and commercial establishments and public and private institutions. Therefore, a successful storm water management plan should include the participation and cooperation of the public, businesses, the permittees and the regulators. Therefore, the DAMP has a strong emphasis on public education.

24. The MSWMP included numerous BMPs under nine major program elements and a time schedule for implementation. These BMPs are organized into various components such as BMPs for existing residential, commercial and industrial areas; BMPs for construction sites; BMPs for new developments, etc. These components include regulatory activities, public education programs and operations and maintenance activities.

25. In order to characterize storm water discharges, to identify problem areas, and to determine the effectiveness of the various BMPs, an effective monitoring program is critical. San Bernardino County monitoring program commenced in January of 1994 which included storm water monitoring, receiving water monitoring, dry weather monitoring and sediment monitoring. The Report of Waste Discharge included a Consolidated Program for Water Quality Monitoring.

26. In addition to the Regional Board, a number of other stakeholders are involved in the management of these water resources which includes, but is not limited to, the incorporated cities in the Region, publicly owned treatment works, the three counties, Santa Ana Watershed Project Authority and its member agencies. The cooperation and coordination between all the stakeholder are critical for an efficient and most economical management of the watershed. The Regional Board will coordinate the activities within the watershed and seek participation of the permittees.

27. The permittees have agreed to revise the implementation agreement that was developed in 1990 as required under Order No. 90-136.

28. Illegal dumping and illicit/illegal connections and discharges to the storm drains are

VOL 16 0065

contributors to storm water and other surface water contamination. Most of the cities have completed their reconnaissance survey of the municipal storm drain systems (open channels and underground storm drains) and the remaining cities have scheduled the completion prior to expiration of their municipal permit (October 1, 1995). The permittees were required to detect, identify and eliminate illicit/illegal discharges. Additionally, the permittees are also required to develop a program to prohibit any future illegal/illicit connections to their storm drains and flood control facilities.

29. As part of Order No. 90-136, the permittees were required to develop and implement a plan to eliminate the illicit connections and to prosecute the illegal dischargers. This order requires the permittees to continue the implementation and enforcement required under this plan.

30. This order requires the permittees to continue to implement the BMPs listed in the ROWD and to effectively prohibit illegal and illicit discharges to the storm drain system. One of the major elements of the DAMP was the establishment of legal authority. The permittees within San Bernardino County have already adopted ordinances to establish their legal authority. This task was completed as of April 1995.

31. Successful implementation of the provisions and limitations in this order will require the cooperation of all the involved agencies and organizations within San Bernardino County (e.g. Fire Department, Department of Environmental Health, Planning Department, Building and Safety, Code Enforcement, etc.). As such, these agencies and organizations are expected to actively participate in implementing this areawide storm water program. Early identification of potential storm water impacts and mitigation measures can significantly reduce storm water pollution problems. The permittees should consider these impacts and appropriate mitigation measures in the planning procedures, in the California Environmental Quality Act (CEQA) review process for specific projects, Master Plans, etc.

32. The permittees may lack legal jurisdiction over storm water discharges into their systems from some of the State and federal facilities, agricultural land, utilities and special districts, and Native American tribal lands. The Regional Board recognizes that the permittees should not be held responsible for such facilities and/or discharges.

33. The permittees may petition the Regional Board to issue a separate NPDES permit to any discharger of non-storm water into storm drain systems that they own or operate.

VOL 16
0066

34. A revised Water Quality Control Plan (Basin Plan) was adopted by the Regional Board and became effective on January 24, 1995. The Basin Plan contains water quality objectives and beneficial uses for water bodies in the Santa Ana Region.

35. The requirements contained in this order are necessary to implement the Basin Plan.

36. In accordance with the Clean Water Act and it's implementing regulations, this order requires the permittees to develop and implement programs and policies necessary to control the discharge of pollutants to waters of the U.S. to the maximum extent practicable.

37. The legislative history and the preamble to the federal storm water regulations indicate that the Congress and the U.S. EPA were aware of the difficulties in regulating urban storm water run-off solely through traditional end-of-pipe treatment. However, the U.S. EPA and State Water Resources Control Board have determined that the NPDES permits for urban storm water run-off must contain effluent limitations based on water quality standards (beneficial uses and water quality objectives). The development and implementation of best management practices (BMPs), which will achieve compliance with applicable standards, are generally considered to be acceptable as effluent limitations. In accordance with Section 402 (p) of the Clean Water Act, this order requires the permittees to develop controls to reduce the discharge of pollutants to the maximum extent practicable. If urban storm water discharges cause an exceedance of the water quality standards in the receiving waters, the BMPs will be reevaluated, revised, and implemented, as appropriate, to address any exceedance of receiving water quality standards. Numeric and narrative water quality objectives are contained in the Basin Plan for the water bodies in this Region. This order does not contain numeric effluent limitations for any constituents because the impact of the storm water discharges on the water quality of the receiving waters has not yet been fully determined. Extensive water quality monitoring and analysis of the data are essential to make that determination. Due to the high cost associated with monitoring, and due to the variability that exists in the current storm water monitoring efforts being conducted by the permittees and other municipal permittees in Orange and Riverside Counties under their municipal storm water permits, a tri-county monitoring program will be considered to develop and implement effective monitoring procedures and strategies.

38. It is the Regional Board's intent that this order shall achieve attainment and protection of the beneficial uses of receiving waters. This order therefore, includes Receiving Water Limitations required to implement water quality objectives and to prevent nuisance and water quality impairment in receiving waters. This order

VOL 16 0067

requires implementation of control measures in accordance with the approved MSWMP that will reduce pollutants in storm water discharges to the maximum extent practicable. The Receiving Water Limitations require the implementation of control measures that are technically and economically feasible as necessary to protect beneficial uses and attain water quality objectives of the receiving waters.

The Regional Board finds that the unique aspects of the regulation of storm water discharges through municipal storm sewer systems, including intermittent discharges, difficulties in monitoring and limited physical control over the discharge, will require adequate time to implement and evaluate the effectiveness of best management practices and to determine whether they will adequately protect receiving waters. Therefore, the permit includes a procedure for determining whether storm water discharges are causing continuing or recurring exceedances of receiving water limitations and for evaluating whether the approved MSWMP must be revised. The permittees will be in compliance with the Receiving Water Limitations so long as the permittees comply with that procedure.

39. The storm water regulations require public participation in the storm water management program development and implementation. As such the permittees are required to solicit and consider all comments received from the public and submit copies of the comments to the Executive Officer of the Regional Board. In considering the public comments, the permittees may modify reports, plans, or schedules prior to submittal to the Regional Board.

40. In accordance with California Water Code Section 13389, the issuance of waste discharge requirements for this discharge is exempt from those provisions of the California Environmental Quality Act contained in Chapter 3 (commencing with Section 21100), Division 13 of the Public Resources Code.

41. The Regional Board has considered anti-degradation requirements, pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16, for this discharge. The Regional Board finds that the storm water discharges are consistent with the federal and state anti-degradation requirements and a complete anti-degradation analysis is not necessary.

42. The Regional Board has notified the permittees and interested parties of its intent to issue waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

43. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

VOL 16
0068

IT IS HEREBY ORDERED that the permittees, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and the regulations and guidelines adopted thereunder, shall comply with the following:

I. RESPONSIBILITIES OF THE PRINCIPAL PERMITTEE

The principal permittee shall be responsible for managing the overall storm water program and shall:

1. Conduct water quality and hydrographic monitoring of the municipal separate storm sewer system outfalls as agreed upon by the Executive Officer of the Regional Board.

2. Develop uniform criteria to inspect the municipal storm drain systems.

3. Develop minimum criteria for inspections at industrial facilities and construction sites, and reporting to the Regional Board of observed non-compliance discharges, as well as non-compliance with local ordinances at sites which fall under the general construction or industrial storm water permits.

4. Conduct inspections of the storm drain systems owned and operated by the SBCFCD.

5. Implement management programs, monitoring programs, and related plans as required by this order.

6. Prepare and submit to the Executive Officer of the Regional Board, unified reports, plans, and programs necessary to comply with this order.

7. Enact and revise policies and ordinances necessary to establish and maintain adequate legal authority within the scope of the San Bernardino County Transportation/Flood Control Department Act, as required by the Federal Storm Water Regulations.

8. Respond and/or arrange for responding to emergency situations such as accidental spills, leaks, illicit discharges/illegal connections, etc., to prevent or to reduce the discharge of pollutants to the municipal separate storm sewer systems and to waters of the U.S.

In addition, the activities of the principal permittee should, at a minimum, include the following:

VOL 16
0069

9. Coordinate permit activities and participate in any subcommittees formed as necessary, to coordinate compliance activities with this order.

10. Provide technical and administrative support and inform the co-permittees of the progress of other pertinent municipal programs, pilot projects, research studies, etc.

11. Coordinate the implementation of areawide storm water quality management activities such as monitoring program, public education, pollution prevention, household hazardous waste collection, etc.

12. Gather and disseminate information on the progress of statewide municipal storm water programs and evaluate the information for potential use in the execution of this order.

13. Monitor the implementation of the plans and programs required by this order and determine their effectiveness in attaining water quality standards.

14. Coordinate activities pertaining to implementation of this order with the Regional Board.

15. Solicit and coordinate public input for any major proposed storm water management programs and implementation plans.

16. Develop and implement mechanisms, performance standards, etc., to promote consistent implementation of BMPs among the permittees.

17. In conjunction with the other permittees, implement the BMPs listed in the approved DAMP, as amended by the Report of Waste Discharge (ROWD).

18. Participate with other counties (Orange and Riverside counties) in the development and implementation of a tri-county monitoring program coordinated by the Regional Board.

II. RESPONSIBILITIES OF THE CO-PERMITTEES

The co-permittees shall be responsible for managing the storm water program within their jurisdiction and shall:

VOL 16
00070

1. Enact and revise policies and ordinances necessary to establish and maintain adequate legal authority as stated in Section V(10) of this order and required by the Federal Storm Water Regulations.

2. Conduct storm drain system inspections in accordance with the uniform criteria developed by the principal permittee.

3. Submit to the principal permittee any information necessary to develop unified report submittal to the Executive Officer of the Regional Board.

4. In conjunction with the principal permittee, implement the BMPs listed in the approved DAMP, as amended by the ROWD.

Co-permittees activities should, at a minimum, include the following:

5. Administer the storm water and erosion control ordinances.

6. Conduct and coordinate with the principal permittee any surveys and characterizations needed to identify the pollutant sources and drainage areas.

7. Review and comment on all plans, strategies, management programs, monitoring programs, as developed by the principal permittee or any subcommittee to comply with this order.

8. Participate in committees or subcommittees formed to address storm water related issues to comply with this order.

III. DISCHARGE LIMITATIONS

1. The permittees shall prohibit illicit discharges from entering into the municipal separate storm sewer systems (municipal storm drain systems) and require controls to reduce the discharge of pollutants to the maximum extent practicable.
2. This order authorizes storm water discharges to waters of the U.S. from the permittees' existing municipal separate storm drain systems provided that the permittees implement the BMPs (structural and/or non-structural control measures) necessary to reduce the pollutants in the discharge to the maximum extent practicable. Discharges other than those listed under Item 5., below, and those for which the Regional Board has issued individual permits are prohibited.

VOL 16
0071

3. The following discharges need not be prohibited by the permittees unless identified by the permittees as a source of pollutants to the receiving waters.

   a. Discharges for which an approval has been issued by the Regional Board office or State Board, including discharges authorized under NPDES permits issued by the State or Regional Boards,

   b. Discharges from potable water line flushing and other potable water sources,

   c. Discharges from fire fighting and fire hydrant testing and flushing,

   d. Discharges from landscape irrigation, lawn watering and other irrigation activities,

   e. Diverted stream flows,

   f. Rising ground waters and natural springs,

   g. Uncontaminated groundwater infiltration (as defined in 40 CFR 35.2005(20)) and uncontaminated pumped groundwater,

   h. Passive foundation drains,

   i. Air conditioning condensate,

   j. Water from crawl space pumps,

   k. Passive footing drains,

   l. Discharges from individual residential vehicle washing (not including discharges from mobile sources such as automobile/equipment detailing or washing),

   m. Flows from riparian habitats and wetlands,

   n. Dechlorinated swimming pool discharges,

   o. Waters not otherwise containing wastes as defined in California Water Code Section 13050 (d) and,

   p. Other types of discharges identified and recommended by the permittees and approved by the Regional Board.

VOL 16 0072

For purposes of this order, a discharge may include storm water and other types of discharges as indicated above.

4. The permittees shall take necessary steps to ensure that non-storm water discharges to the municipal storm drain system do not cause or contribute to violations of water quality standards or degrade the waters of the U.S.

5. Non-storm water discharges from permittee's activities into waters of the U.S. are prohibited unless the non-storm water discharges are permitted by an NPDES permit or are included in Item 3., above. If permitting or immediate elimination of the non-storm water discharges is impractical, the permittees shall include in the storm water pollution prevention strategy, required under Section V. Provision 19., of this order, a proposed plan to address the non-storm water discharges.

6. The MSWMP, as outlined in the ROWD, is hereby made an enforceable component of this order.

IV. RECEIVING WATER LIMITATIONS

1. Receiving Water Limitations are based upon beneficial uses, water quality objectives and water quality standards contained in the Basin Plan, and amendments thereto, and on ambient water quality. They are intended to protect the beneficial uses and attain the water quality objectives contained in the Basin Plan. The discharge of urban storm water, or non-storm water, from a municipal storm sewer system for which the permittees are responsible under the terms of this permit shall not cause continuing or recurring impairment of beneficial uses or exceedances of water quality objectives. The permittees will not be in violation of this provision so long as they are in compliance with the requirements set forth in 1.a.

   a. If the Executive Officer determines that a continuing or recurring impairment of beneficial uses or exceedance of water quality objectives has been caused by urban storm water discharges from the municipal storm sewer system, the following steps shall be taken:

      i. The Executive Officer will evaluate the adequacy of permittees' implementation of the approved MSWMP based on the permittees' submitted reports and other relevant information. The Executive Officer will determine if implementation of the approved MSWMP has a reasonable

VOL 16 0073

likelihood of preventing future continuing or recurring impairment of beneficial uses or exceedances of water quality objectives resulting from urban storm water discharges. If the Executive Officer makes this determination, the permittees are required to continue implementing the approved MSWMP.

ii. If the Executive Officer determines that implementation of the approved MSWMP will not have a reasonable likelihood of preventing future impairment of beneficial uses or exceedances of water quality objectives, the permittees shall, upon notice from the Executive Officer, do the following:

A. Submit a report that includes an evaluation of the relative contribution of the urban storm water discharges to the impairment of beneficial uses or the exceedance of water quality objectives. The report shall address the persistence, the significance, and to the extent feasible, the causes of the impairment or exceedance, and the technical and economic feasibility of control actions available to the permittees to reduce or eliminate the impairment or exceedance.

B. Submit a report reviewing the approved MSWMP to determine whether it should be revised so that there will be a reasonable likelihood of preventing future continuing or recurring beneficial use impairment or exceedances of water quality objectives, or whether revisions to achieve protection of beneficial uses or attainment of water quality objectives are technically or economically infeasible. If the report recommends revision of the approved MSWMP, the report shall include a work plan to revise the MSWMP so that it will have a reasonable likelihood of preventing future continuing or recurring beneficial use impairment or exceedances of water quality objectives. If the report concludes that no revisions are necessary to achieve protection of beneficial uses or attainment of water quality objectives, the report shall explain how implementation of the approved MSWMP will achieve compliance. If the report determines that revisions to achieve protection of beneficial uses or attainment of water quality objectives are technically or economically

VOL 16 0074

infeasible, the permittees shall continue to comply with the approved MSWMP, shall fully document this determination, and shall make recommendations for actions to achieve compliance, including, for example, commencement of a total maximum daily load report or revision of the Basin Plan or mitigation projects to protect beneficial uses, and identification of possible funding sources for such actions.

C. The permittees shall implement the work plan and the revised MSWMP as approved by the Executive Officer.

2. The Executive Officer shall review and approve or disapprove the reports required under Receiving Water Limitation 1. The reports may be submitted as part of the next Annual Report, or at some other time designated by the Executive Officer. So long as the permittees have complied with the procedures set forth in the Receiving Water Limitation 1, they do not have to repeat the procedure for continuing or recurring exceedances of the same receiving water limitations. As appropriate, any determinations under this part or revisions to the approved MSWMP may be considered by the Regional Board in a public meeting."

V. PROVISIONS

GENERAL

1. Permittees shall demonstrate compliance with all the requirements in this order.

2. The Report of Waste Discharge, including the MSWMP, submitted as application for renewal of the NPDES permit is hereby made a part of this order.

3. Permittees shall implement all elements of the approved DAMP, as amended by the ROWD (MSWMP). Any proposed revisions to the MSWMP shall be submitted to the Executive Officer of the Regional Board or included in the Annual Report for review and approval. All revisions to the MSWMP, approved by the Executive Officer, shall be implemented in a timely manner.

4. The permittees shall comply with Monitoring and Reporting Program No. 96-32, which is hereby made a part of this order and any revisions thereto.

VOL 16
0075

The Executive Officer is authorized to revise the Monitoring and Reporting Program and also to allow the permittees to participate in regional, statewide, national, or other monitoring programs in lieu of Monitoring and Reporting program for Order No. 96-32.

5. Upon approval by the Executive Officer of the Regional Board, all plans and reports required by this order, including any subsequent amendments, shall be implemented and shall become an enforceable part of this order.

6. The permittees shall report to the Executive Officer of the Regional Board:

   a. Any enforcement actions and discharges of storm or wastewaters, known to the permittees, which may have an impact on human health or the environment;

   b. Any industrial or construction facilities observed to potentially be not in compliance with the storm water regulations or where the activities may be contributing pollutants to the waters of the U.S.; and

   c. Any observed activities on federal, state, or other lands or facilities, where the permittees do not have any jurisdiction, and where the observed activities may be contributing pollutants to waters of the U.S.

7. The permittees shall not issue occupancy permits unless the applicant is informed of his obligation under the State's NPDES industrial general permits. The permittees shall not issue grading or building permits to developments on 5 acres or more unless the applicant shows proof of filing a Notice of Intent in accordance with the State's General Construction Activities Storm Water Permit. The proof of filing may include a letter from the Regional Board office, a copy of the Notice of Intent or other acceptable proof of coverage under the general permit. The permittees shall coordinate the activities of the various departments/sections within each permittee's jurisdiction to ensure consistent implementation of storm water program.

8. Permit application and special NPDES program requirements contained in 40 CFR 122.21(a), (b), (d)(2), (f), and (p); 122.41(a), (b), (c), (d), (e), (f), (g), (h), (i), (j), (k), and (l); and 112.42(c) are incorporated into this order by reference.

VOL 16 0076

VOL 16

IMPLEMENTATION AGREEMENT

9. No later than March 1, 1996, the permittees shall submit to the Executive Officer of the Regional Board an updated copy of an implementation agreement with authorized signatures of each of the permittees. Any subsequent revisions to the implementation agreement shall be forwarded to the Executive Officer of the Regional Board within 30 days of approval by the permittees. At a minimum, the implementation agreement should include all the essential elements of the existing agreement and a mechanism for active participation of all permittees in the committees and subcommittees to ensure uniform co-operation and involvement of the permittees in the decision making process.

LEGAL AUTHORITY

10. The permittees adopted the Storm Water Run-off Management Ordinance. This task was completed as of April, 1995. The permittees shall establish a mechanism for periodic review and update of their ordinances to ensure compliance with the requirements of 40 CFR Section 122.26(d)(2)(i)(A-F).

ENFORCEMENT STRATEGY

11. Permittees have developed an enforcement strategy as outlined in the ROWD (submitted on April 4, 1995) to enforce storm water and erosion control ordinances. The permittees shall implement the enforcement strategy which includes a mechanism for the inspection of industrial facilities and construction sites, notification to the Executive Officer of any observations of non-compliance with the storm water regulations and any proposed local enforcement action.

12. The enforcement strategy shall include enforcement and control of discharges from facilities not covered under the State's existing General Storm Water Permits.

13. Permittees have completed the reconnaissance survey of their storm drain conveyance systems as of October 1, 1995 and will eliminate all illegal and/or illicit connections by December 1, 1996. Permittees shall submit a report of the findings by April 30, 1997 and each year thereafter (including the detection, elimination and prosecution of illegal dischargers).

00077

PUBLIC EDUCATION AND OUTREACH

14. The permittees shall continue to implement the public education efforts already underway and shall implement all of the proposed efforts contained in the Report of Waste Discharge. Any proposed changes shall be submitted to the Executive Officer of the Regional Board for approval.

15. When feasible, the permittees shall participate in joint outreach with other programs including, but not limited to, other municipal storm water programs to ensure that a consistent message on storm water pollution prevention is brought to the public.

16. The permittees shall develop public education materials to encourage the public to report illegal dumping from residential, industrial, construction and commercial sites into public streets, storm drains and other water bodies.

17. The permittees shall develop a public education program geared toward the industrial facilities and construction sites through active participation of the county and city departments.

18. Permittees shall develop an educational program targeted toward educating the staff at the county and city departments/agencies under their jurisdiction about storm water program and utilize their assistance in enforcing the requirements of this order. Example of these departments/agencies include Fire Department, Department of Health and Safety, Pre-treatment Programs, Hazardous Waste Collection, Building and Safety, etc.

MUNICIPAL FACILITIES

19. The permittees have developed a pollution prevention strategy to address their public agency facilities and activities not currently required to obtain coverage under the State's general storm water permits. The pollution prevention strategy is to ensure that the public agency facilities and/or activities that are currently not required to obtain coverage under the State's general storm water permits are not sources of pollutants into the waters of the U.S. The pollution prevention strategy shall be implemented in accordance with the time schedule proposed in the ROWD.

VOL 16 0078

VOL 16 0079

MUNICIPAL CONSTRUCTION PROJECTS/ACTIVITIES

20. This order authorizes the discharge of storm water run-off from construction projects that may result in land disturbance of five (5) acres or more (or less than five acres, if it is part of a larger common plan of development or sale which is five acres or more) that are under ownership and/or direct responsibility of any of the permittees.

21. Prior to commencement of construction activities, the permittees shall notify the Executive Officer of the Regional Board of the proposed construction project. Upon completion of the construction activities, the Executive Officer shall be notified of the completion of the construction project.

22. The permittees shall develop and implement a storm water pollution prevention plan and a monitoring program that is specific for the construction project prior to the commencement of any of the construction activities. The SWPPP and the monitoring program shall be implemented throughout the duration of the construction activities on site. The SWPPP shall be kept at the construction site and released to the public and/or Regional Board Staff upon request.

23. The SWPPP and the monitoring program for the construction projects shall be consistent with the requirements of the most recent version of the State's General Permit for Storm Water Discharges Associated with Construction Activities.

24. The permittees shall give advance notice to the Executive Officer of the Regional Board of any planned changes in the construction activities which may result in non-compliance with the current version of the State's General Permit for Storm Water Discharges Associated with Construction Activities.

NEW DEVELOPMENTS (INCLUDING RE-DEVELOPMENT)

25. The permittees shall begin implementation of the new development BMPs as described in Section 4 of the ROWD in accordance with the schedule provided in the ROWD.

26. By April 30, 1997, the permittees shall update their General Plan and CEQA document preparation processes to ensure that storm water-related issues are properly considered. If necessary, these processes shall be revised to include requirements for evaluation of storm water-related impacts and identification of appropriate mitigation measures.

27. The permittees shall establish a mechanism to ensure proper maintenance and operation of all permanent flood control structures. For new developments, the parties responsible for the maintenance of the flood control structures and funding sources for maintenance and operation of the facilities shall be identified prior to issuance of grading permits.

FISCAL RESOURCES

28. The permittees shall prepare and submit a unified fiscal analyses report to the Executive Officer of the Regional Board. The fiscal analysis report shall be submitted no later than August 31 of each year and shall, at a minimum, include the following:

    a. Each permittee's expenditures for the previous fiscal year;
    b. Each permittee's budget for the current fiscal year;
    c. A description of the source of funds.

PERMIT EXPIRATION AND RENEWAL

29. This order expires on March 1, 2001 and the permittees must file a Report of Waste Discharge (permit application) no later than 180 days in advance of such expiration date as application for issuance of new waste discharge requirements. The Report of Waste Discharge shall, at a minimum, include the following:

    a. Any revisions to the Municipal Storm Water Management Program including, but not limited to, all the activities the permittees propose to undertake during the next permit term, goals and objectives of such activities, an evaluation of the need for additional source control and/or structural BMPs, any proposed pilot studies, etc.;

    b. Changes in land use and/or population including map updates; and

    c. Any significant changes to the storm drain systems, outfalls, detention or retention basins or dams, and other controls including map updates of the storm drain systems.

30. This order may be modified, revoked or reissued prior to its expiration date for the following reasons:

VOL 16

00800

a. To address significant changes in conditions identified in the technical reports required by the Regional Board which were unknown at the time of the issuance of this order,

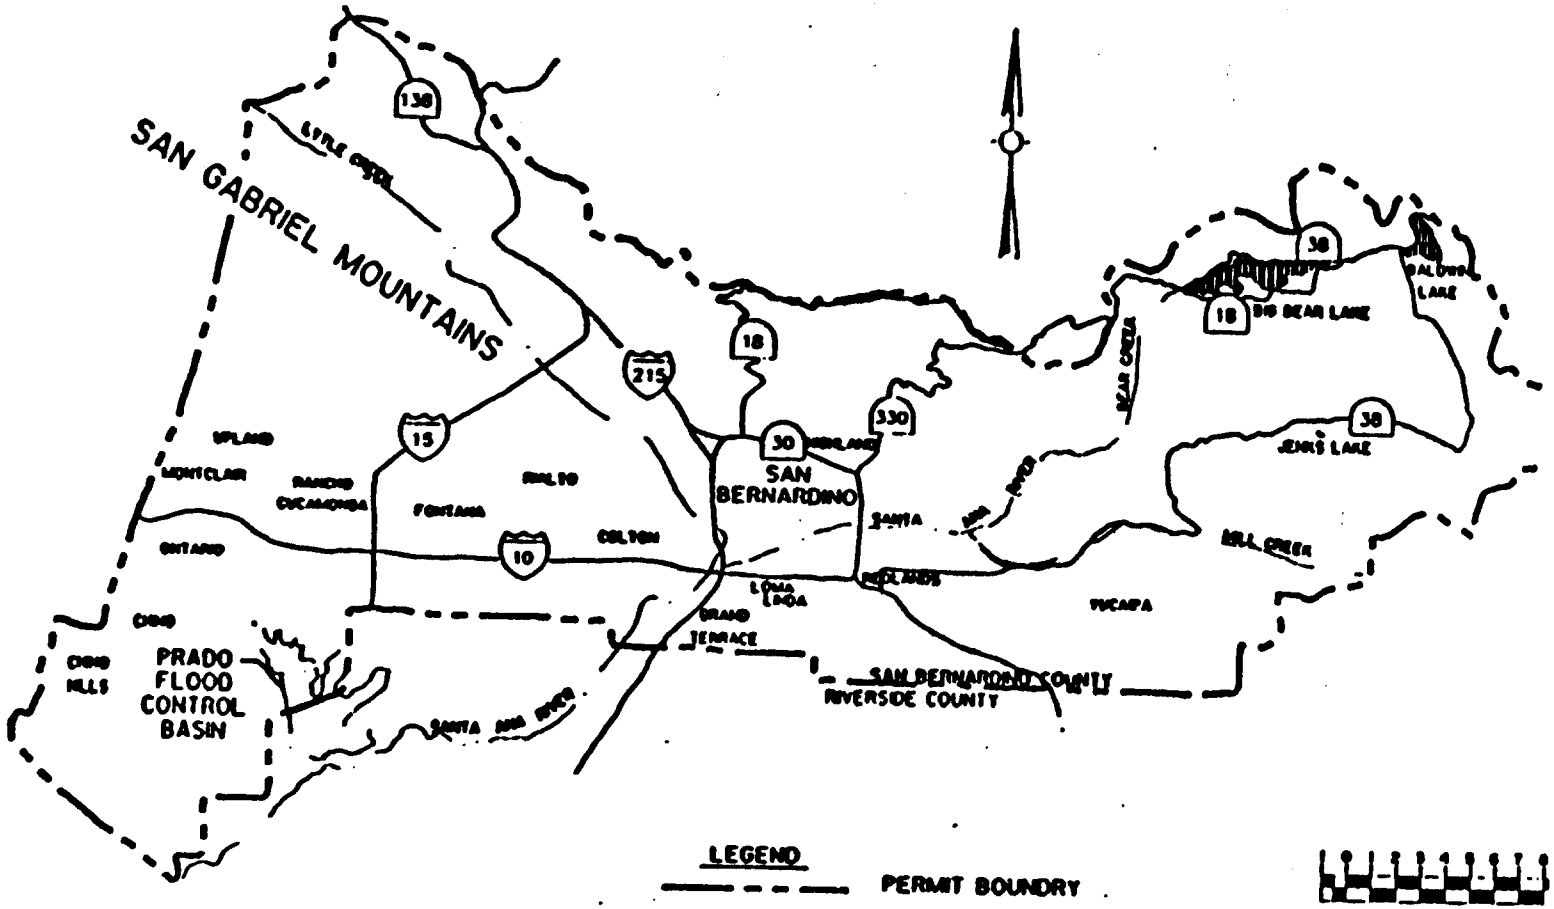
b. To incorporate applicable requirements of statewide water quality control plans and policies adopted by the State Water Resources Control Board or any amendments to the Basin Plan approved by the Regional Board, the State Board, and, if necessary, by the Office of Administrative Law; or

c. To comply with any applicable requirements, guidelines, or regulations issued or approved under the Clean Water Act, if the requirements, guidelines, or regulations contain different conditions or additional requirements than those included in this order.

31. This order shall serve as a National Pollutant Discharge Elimination System (NPDES) permit pursuant to Section 402 (p) of the Clean Water Act, or amendments thereto, and shall become effective ten days after the date of its adoption provided the Regional Administrator of the U. S. EPA has no objections. If the Regional Administrator objects to its issuance, the permit shall not become effective until such objection is withdrawn.

32. Order No. 90-136 is hereby rescinded.

I, Gerard Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on March 8, 1996.



Gerard J. Thibeault
Executive Officer

MONITORING AND REPORTING PROGRAM NO. 96-32
NPDES NO. CAS618036
FOR
THE SAN BERNARDINO COUNTY TRANSPORTATION/FLOOD CONTROL DEPARTMENT, THE COUNTY OF SAN BERNARDINO, AND THE INCORPORATED CITIES OF SAN BERNARDINO COUNTY WITHIN THE SANTA ANA REGION
AREAWIDE URBAN STORM WATER RUN-OFF

I. GENERAL

1. Revisions of the monitoring and reporting program may be necessary to ensure that the discharger is in compliance with requirements and provisions contained in this order. Revisions may be made by the Executive Officer at any time during the term of this order, and may include a reduction or increase in the number of parameters to be monitored, the frequency of monitoring, or the number and size of samples collected.

2. All sample collection, handling, storage, and analyses shall be in accordance with 40 CFR Part 136.

3. The permittees are authorized to complement monitoring data from other sources provided those sources are identical to sources in the Santa Ana Watershed.

4. The permittees shall implement the Consolidated Program for Water Quality Monitoring (submitted as part of the Report of Waste Discharge) until development and implementation of an acceptable watershed monitoring program.

II. OBJECTIVES

The overall goal of this monitoring program is to develop and support an effective watershed management program. The following are the major objectives:

1. To define water quality status, trends, and pollutants of concern.

2. To characterize pollutants and to assess the influence of land use on water quality.

3. To identify significant water quality problems related to storm water discharges within the watershed.

4. To identify other sources of pollutants in storm water run-off to the extent possible (e.g., atmospheric deposition, contaminated sediments, other nonpoint sources, etc.).

5. To verify and to control illicit discharges.

VOL 16 0089

6. To identify those waters which without additional action to control pollution from storm water discharges cannot reasonably be expected to attain or maintain applicable water quality standards or the goals and requirements of the Basin Plan.

7. To evaluate the effectiveness of existing management programs, including an estimate of pollutant reductions achieved by the structural and nonstructural BMPs.

8. To evaluate costs and benefits to the stakeholder including the public.

The Regional Board recognizes that these objectives may not be attainable during this permit period and authorizes the Executive Officer to evaluate and determine adequate progress toward meeting each objective.

III. MONITORING PROGRAM REQUIREMENTS

The permittees shall develop and submit for approval of the Executive Officer an integrated monitoring program geared towards achieving the above stated objectives. In developing this program, the principal permittee is encouraged to seek cooperation with the permittees from the Riverside and Orange counties. The Executive Officer or his/her designated representative(s) shall facilitate the coordination meetings or subcommittees formed to achieve this goal. The development and implementation of the monitoring program shall be in accordance with the time schedules prescribed by the Executive Officer. At a minimum, the program shall include the following:

1. Uniform guidelines for quality control, quality assurance, data collection and data analyses.

2. A mechanism for the collection, analyses and interpretation of existing data from Orange, Riverside, and San Bernardino County monitoring programs. These and other data from local, regional or national sources should be utilized to characterize different storm water sources; to determine pollutant generation, transport and fate; to develop a relationship between land use, development size, storm size and the event mean concentration of pollutants; to determine spatial and temporal variances in storm water quality and seasonal and other bias in the collected data; and to identify any unique features of the Santa Ana Watershed. The permittees are encouraged to use data from similar studies, if available.

3. A description of the monitoring program including:

   a. The number of monitoring stations;
   b. Environmental indicators (e. g., ecosystem, biological, habitat, chemical, sediment, stream health, etc.) chosen for monitoring;
   c. Parameters selected for field screening and for laboratory work; and

VOL 16
0090

d. Total number of samples to be collected from each station, receiving water and major outfall monitoring, frequency of sampling during wet and dry weather, short duration or long duration storm events, type of samples (grab, 24-hour composite, etc.), and the type of sampling equipment.

4. A mechanism for analyzing the collected data and interpreting the results including an evaluation of the effectiveness of the management practices, and need for any refinement of the management practices.

5. A description of the responsibilities of all the participants in this program including estimated cost.

IV. REPORTING

1. All progress reports and proposed strategies and plans required by this order shall be signed by the principal permittee and copies shall be submitted to the Executive Officer of the Regional Board under penalty of perjury.

2. The permittees shall submit an **ANNUAL PROGRESS REPORT** to the Executive Officer of the Regional Board and to the Regional Administrator of U.S. EPA, Region 9, no later than November 30, of each year. This progress report may be submitted in a mutually agreed upon electronic format. At a minimum, the annual progress report shall include the following:

   a. A review of the status of program implementation and compliance (or non-compliance) with the schedules contained in this order.

   b. An assessment of the effectiveness of control measures established under the illicit discharge elimination program and the MSWMP. The effectiveness may be measured in terms of how successful the program has been in eliminating illicit/illegal discharges and in reducing pollutant loads in storm water discharges.

   c. An assessment of any storm water management program modifications made to comply with Clean Water Act requirements to reduce the discharge of pollutants to the maximum extent practicable.

   d. An analysis and discussion on the monitoring results and any impacts on the receiving waters. Also, recommendations for corrective actions during the upcoming year of MSWMP implementation and monitoring.

VOL 16 0091

e. An analysis and the effectiveness of the overall storm water management program. The permittees identification of proposed programs which will result in the attainment of the water quality standards, and a time schedule to implement the new programs.

f. An assessment of the public education program (including industrial facilities and construction sites) and educational activities proposed for the upcoming year.

g. A progress report on the prosecution of illegal dischargers and reduction or elimination of illegal discharges.

3. Permittees shall be responsible for the submittal of all required information/materials needed to comply with this order in a timely manner to the principal permittee. All such submittal shall be signed by a duly authorized representative of the permittee under penalty of perjury.

V. REPORTING SCHEDULE

All reports required by this order shall be submitted to the Executive Officer of the Regional Board in accordance with the following schedule:

ITEM	DUE DATE
Revised Implementation Agreement	June 1, 1996
Municipal Activities Pollution Prevention Strategy	December 1, 1996
Report on illegal/illicit connections	April 30, 1997
Fiscal Analyses Report	August 31 of each year
Report on Illicit/Illegal Discharges	April 30 of each year
Annual Report	November 30 of each year

Ordered by _____

Gerard J. Thibeault
Executive Officer

March 8, 1996

VOL 16
0092

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

ORDER NO. 94-082
NPDES PERMIT NO. CAS063339
WASTE DISCHARGE REQUIREMENTS
FOR
STORM WATER MANAGEMENT/URBAN RUNOFF DISCHARGES
FOR
VENTURA COUNTY FLOOD CONTROL DISTRICT,
COUNTY OF VENTURA, AND THE CITIES OF VENTURA COUNTY

The California Regional Water Quality Control Board, Los Angeles Region (hereinafter called the Regional Board), finds that:

1. The Ventura County Flood Control District (VCFCD), the County of Ventura, and the Cities of Camarillo, Fillmore, Moorpark, Ojai, Oxnard, Port Hueneme, San Buenaventura, Santa Paula, Simi Valley, and Thousand Oaks (hereinafter referred to separately as Co-Permittees and jointly as the Discharger) have joined together to form the Ventura Countywide Storm Water Management Program, and petition to be covered by a single National Pollutant Discharge Elimination System (NPDES) permit for publicly owned municipal storm drains in Ventura County under their jurisdiction.

2. The Discharger submitted a two-part permit application (hereinafter called the Application) to the Regional Board for issuance of waste discharge requirements under the NPDES. Part 1 of the Application was submitted on January 19, 1994, and Part 2 was submitted on April 1, 1994. This Application included all the Co-Permittees except the City of Oxnard, which had submitted its own Part 1 permit application on May 18, 1992, and Part 2 on May 17, 1993.

3. Approximately thirty four square miles of unincorporated Ventura County are tributary to Malibu Creek, and ultimately to Santa Monica Bay in Los Angeles County. The County of Ventura was not included as a Co-Permittee of NPDES Permit No. CA0061654 issued for the Los Angeles County municipal storm water systems, but subsequently agreed to become a Co-Permittee of that permit. Currently the County of Ventura is in compliance with conditions of that permit. Upon the expiration of NPDES Permit No. CA0061654, this area may request to become a Co-Permittee to the Ventura County NPDES permit.

4. Approximately nine square miles of the City of Thousand Oaks are tributary to Malibu Creek in Los Angeles County, and ultimately to Santa Monica Bay. This portion of the City is not covered by the Los Angeles County Municipal Storm Water Permit.

VOL 16
0093
R0061493

The City of Thousand Oaks initially applied for a separate NPDES permit for this portion of the city and submitted their NPDES application Part 1 in March 1992, and Part 2 on March 25, 1993. To avoid duplication of reporting requirements, the City of Thousand Oaks, including the portion tributary to Malibu Creek, became a single Co-Permittee under the Ventura County NPDES permit.

5. The applications submitted by the Discharger, the City of Oxnard, and the City of Thousand Oaks are collectively referred to as the Application Package. The information contained in the Application Package is generally found by the Regional Board to satisfy the NPDES permit application requirements of the United States Environmental Protection Agency (EPA) for municipal storm water discharges.

6. The area subject to permit requirements includes all areas within the boundaries of the cities as well as unincorporated areas of Ventura County defined as urban by the U.S. Census Bureau (Figure 1). Municipal storm drain systems in this area discharge either directly into the Pacific Ocean or one of five major water bodies:

Water Body	Receives Municipal Storm Drain Discharges from:
Ventura River	City of Ojai, City of San Buenaventura (part), unincorporated Ventura County (part)
Santa Clara River	City of Fillmore, City of Oxnard (part), City of San Buenaventura (part), City of Santa Paula, unincorporated Ventura County (part)
Calleguas Creek	City of Camarillo, City of Moorpark, City of Simi Valley, City of Thousand Oaks (part), unincorporated Ventura County (part)
Malibu Creek	City of Thousand Oaks (part), unincorporated Ventura County (part)
Bays/ Estuaries	City of Oxnard (part), City of Port Hueneme, City of San Buenaventura (part)

7. In the Application, the Discharger proposed the Ventura Countywide Storm Water Management Plan (hereinafter called the Plan) which describes in detail all group activities and entity-specific activities. The Plan also describes management measures that are included and how they are organized; it lists tasks required to accomplish the measures, the schedule for implementation, and specific goals. The schedule and tasks are projected for the 5-year permit period. An outline of the Plan is presented in Table 1. The Plan will be applied to all areas within Ventura County that are subject to permit requirements, and supersedes storm water management plans presented in the

VOL 16 0094
R0061494

VOL 16 0095

separate Part 2 permit applications submitted by the City of Oxnard and the City of Thousand Oaks.

8. The Co-Permittees are separate legal entities and have the authority to develop, administer, implement, and enforce storm water management programs within their own jurisdiction. The Plan defines certain storm water discharge requirements that apply to the Discharger, and others that apply to specific Co-Permittees. Each Co-Permittee shall be responsible for compliance with relevant portions of this permit within their jurisdiction.

9. The Water Quality Act of 1987 added Section 402(p) to the Federal Clean Water Act (CWA). This section requires the EPA to establish regulations setting forth NPDES requirements for storm water discharges. The first phase of these requirements is directed at municipal separate storm drainage systems serving a population of 100,000 or more and storm water discharges associated with industrial activities, including construction activities. Other dischargers, including municipalities with a population of less than 100,000, for which the EPA Administrator or the State determines that the storm water discharge contributes to a violation of a water quality standard, or is a significant contributor of pollutants to waters of the United States, may also be subject to NPDES requirements. On November 16, 1990, EPA published these final regulations in the Federal Register under Part 122. For municipalities serving a population greater than 100,000, the regulations detail a two-part application process. Part 1 of the application requires a summary of existing programs and resources. Part 2 of the application requires the proposed management program to address pollutant discharges from the municipal storm drain system.

10. The Federal Clean Water Act allows EPA to delegate its NPDES permitting authority to states with an approved environmental regulatory program. The State of California is a delegated State. The Porter-Cologne Water Quality Control Act (California Water Code) authorizes the State Water Resources Control Board, through the Regional Boards, to regulate and control the discharge of pollutants into waters of the state and tributaries thereto.

11. California Water Code Section 13263(a) specifies that waste discharge requirements issued by Regional Boards include provisions to implement water quality based objectives. Numerical water quality objectives are not provided in this Order because information is not available to establish appropriate numerical limits and determine locations where Co-Permittees shall be made accountable. The requirements in this Order will provide the data necessary to make these determinations while concurrently achieving reductions in pollutant loads to water bodies from storm water runoff. Numerical criteria may be developed in the future.

R0061495

12. Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point pollution impacting or threatening coastal water quality. CZARA address five sources of non-point pollution: agriculture, silviculture, urban, marinas, and hydromodification. This NPDES permit addresses the management measures required for the urban category.

13. Storm water discharges consist of surface runoff generated from various land uses in all the hydrologic drainage basins which discharge into waters of the State. The quality of these discharges varies and is affected by hydrology, geology, land use, season, and sequence and duration of hydrologic events. The pollutants of concern in these discharges include, but are not limited to, total suspended solids (TSS), total dissolved solids (TDS), chemical oxygen demand (COD), biochemical oxygen demand (BOD), oil and grease, total and fecal coliform and enterococci bacteria, heavy metals, nutrients, sediments, petroleum hydrocarbons, polynuclear aromatic hydrocarbons (PAHs), pesticides, and herbicides.

14. This permit is intended to develop, achieve, and implement a timely, comprehensive, and cost-effective storm water pollution control program to minimize pollutants in storm water discharges to waters of the United States from Ventura County.

15. The Application designates the VCFCD as the Principal Co-Permittee for permit implementation while the remaining entities, including the County of Ventura and the ten cities, are designated as Co-Permittees. The Application contains the following Implementation Agreement between the Principal Co-Permittee and the Co-Permittees:

As the Principal Co-Permittee, VCFCD shall:

a. Coordinate permit activities;
b. Establish uniform data submittal format;
c. Set time schedules;
d. Prepare regulatory reports;
e. Forward information to the Co-Permittees;
f. Arrange for public review;
g. Secure services of consultants as necessary;
h. Implement activities of common interest;
i. Develop/prepare/generate all materials and data common to all Co-Permittees;
j. Update Co-Permittees on Regional Board and EPA regulations; and
k. Arrange for collection and payment of annual permit renewal fee.

VOL 16 0096
R0061496

VOL 16 0097

All Co-Permittees shall:

a. Comply with the requirements of the permit within their own jurisdictional boundaries;
b. Prepare and provide to the Principal Co-Permittee permit-required submittals; and
c. Develop programs to address:
   - Implementation of controls to reduce pollution from commercial, industrial, and residential areas;
   - Implementation of structural/non-structural controls on land development and construction sites;
   - Implementation of controls to reduce pollution from maintenance activities;
   - Elimination of illegal connections, including discouragement of improper disposal, encouragement of spill prevention and containment, and implementation of appropriate spill response;
   - Inspection monitoring and control programs for industrial facilities; and
   - Implementation of public awareness and training programs.

16. Within its own jurisdiction, each Co-Permittee is responsible for adoption and enforcement of storm water pollution prevention ordinances, implementation of self-monitoring programs and Best Management Practices (BMPs), and conducting applicable inspections. The Principal Co-Permittee shall be responsible for the preparation and submittal of progress and annual reports to the Regional Board.

17. The Regional Board may require a separate NPDES permit for, or to modify this Order to include, as a Co-Permittee, any entity which discharges storm water in the portion of Ventura County. Such entity can be any State or Federal agency, State or Federal facility, real estate development, waste disposal facility, special district, private interest, etc. Pursuant to 40 CFR 122.26(a), the Regional Board will give these entities the option to become a Co-Permittee or obtain an individual storm water discharge permit.

18. The State Water Resources Control Board adopted a revised Water Quality Control Plan for Ocean Waters of California (Ocean Plan) on March 22, 1990. The Ocean Plan contains water quality objectives for the coastal waters of California.

19. This Regional Board adopted a revised Water Quality Control Plan for the Santa Clara River Basin (Basin Plan) on June 3, 1991. The Basin Plan incorporates the Ocean Plan and lists the following existing beneficial uses that apply (depending on the specific receiving waters) to the Ventura County water bodies and their tributary streams:

R0061497

VOL 16
0098

a. Municipal and Domestic Supply
b. Agricultural Supply
c. Industrial Service Supply
d. Industrial Process Supply
e. Ground Water Recharge
f. Freshwater Replenishment
g. Navigation
h. Hydropower Generation
i. Water Contact Recreation
j. Non-contact Water Recreation
k. Ocean Commercial and Sport Fishing
l. Warm Freshwater Habitat
m. Cold Freshwater Habitat
n. Preservation of Areas of Special Biological Significance
o. Saline Water Habitat
p. Wildlife Habitat
q. Preservation of Rare and Endangered Species
r. Marine Habitat
s. Fish Migration
t. Fish Spawning
u. Shellfish Harvesting

20. The requirements contained in this Order, as they are met, will be in conformance with the goals of the Water Quality Control Plans.

21. The issuance of waste discharge requirements for this discharge is exempt from the provisions of the California Environmental Quality Act (CEQA), Chapter 3 (commencing with Section 21100) of Division 13 of the Public Resources Code in accordance with Section 13389 of the California Water Code.

The Board has notified the Discharger and interested agencies and persons of its intent to issue waste discharge requirements for this discharge, and has provided them with an opportunity to submit their written views and recommendations.

The Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

This Order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit, pursuant to Section 402 of the Federal Clean Water Act, or amendments thereto, and shall take effect at the end of ten days from the date of its adoption provided the Regional Administrator of the EPA has no objections.

R0061498

IT IS HEREBY ORDERED that the Ventura County Flood Control District, the County of Ventura, and the Cities of Camarillo, Fillmore, Moorpark, Ojai, Oxnard, Port Hueneme, San Buenaventura, Santa Paula, Simi Valley, and Thousand Oaks, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and regulations and guidelines adopted thereunder, shall comply with the following:

A. DISCHARGE PROHIBITIONS

1. Non-storm water discharges entering storm drainage systems without a NPDES permit are prohibited. This prohibition does not apply to the following types of non-storm water discharges unless the Regional Board determines that these discharges cause specific receiving water limit violations:

   a. Water line flushing;
   b. Landscape irrigation;
   c. Diverted stream flows;
   d. Rising ground waters;
   e. Uncontaminated ground water infiltration [as defined at 40 CFR 35.2005(20)] to separate storm sewers;
   f. Uncontaminated pumped ground water;
   g. Discharges from potable water sources;
   h. Foundation drains;
   i. Air conditioning condensate;
   j. Irrigation water;
   k. Natural springs;
   l. Water from crawl space pumps;
   m. Footing drains;
   n. Lawn watering;
   o. Individual residential car washing;
   p. Flows from riparian habitats and wetlands;
   q. Dechlorinated swimming pool discharges;
   r. Discharges or flows from emergency fire fighting activities;
   s. Other types of discharges identified and recommended in annual reports by the Discharger, as approved by the Executive Officer of the Regional Board.

2. The discharges of storm water containing pollutants which have not been reduced through measures identified in the Plan, to the maximum extent practicable, are prohibited.

VOL 16
0099
R0061499

B. RECEIVING WATER LIMITATIONS

1. The Discharger shall not allow the following conditions to create a condition of nuisance or to adversely affect beneficial uses of waters of the State:

   a. Floating, suspended, or deposited macroscopic particulate matter, or foam;

   b. Bottom deposits or aquatic growths;

   c. Alteration of temperature, turbidity, or apparent color beyond present natural background levels;

   d. Visible, floating, suspended or deposited oil or other products of petroleum origin; or

   e. Toxic or deleterious substances to be present in concentrations or quantities which will cause deleterious effects on aquatic biota, wildlife, or waterfowl, or which render any of these unfit for human consumption either at levels created in the receiving waters or as a result of biological concentration.

2. The discharge shall not cause a violation of any applicable water quality objective for receiving waters contained in the Ocean Plan or the Basin Plan. If different applicable water quality objectives are adopted after the date of adoption of this Order, the Regional Board may revise and modify this Order, as appropriate.

C. PROVISIONS

1. The Discharger shall demonstrate compliance with Discharge Prohibitions A.1 and A.2 and Receiving Water Limitations B.1 and B.2 through the timely implementation of control measures and other actions to reduce pollutants in the discharge as proposed in the Plan. As such, the Plan submitted by the Discharger is an integral and enforceable component of this Order. Any subsequent modifications, revisions, or amendments must be approved by the Executive Officer of the Regional Board. Each of the Co-Permittees need only to comply with the permit conditions (including Discharge Prohibitions A.1 and A.2 and Receiving Water Limitations B.1 and B.2) applicable to discharges from the municipal separate storm drains for which they are operators.

2. The Discharger shall implement the following storm water management program areas during the 5-year permit period. The Plan includes appropriate

VOL 16
0-100
R0061500

source control best management practices (BMPs) and treatment control BMPs that are implemented through education, regulation and public agency activities.

a. **Programs for residents.** Programs that implement appropriate storm water pollution control measures for residents, provide municipal oversight and regulation of these programs, and educate residents about control measures for storm water pollutants generated by residents.

b. **Programs for industrial/commercial businesses.** Programs to incorporate storm water pollution control duties into current municipal programs regulating businesses in Ventura County. These programs will define priority businesses, identify storm water pollution controls that priority businesses will conduct, provide municipal oversight/regulation of these programs, and educate businesses and residents about these programs.

c. **Programs for public infrastructure.** Programs to implement storm water pollution controls into the planning, administration, operation, and maintenance of public facilities.

d. **Programs for illicit discharge control.** Programs that seek to prevent, detect, locate, and properly control illicit discharges to the storm drain system. Each Co-Permittee shall adopt requirements as described in the Plan that effectively prohibit non-storm water discharges into the storm drains.

e. **Programs for land development.** Programs that implement storm water pollution control consideration into land development planning activities, and educate those involved in land development about these programs.

f. **Programs for construction sites.** Programs that implement storm water pollution controls into the Co-Permittee public works construction projects, refine the Co-Permittee regulatory programs for construction projects by private entities and other public agencies, and educate construction workers and site inspectors about these programs.

3. The Discharger shall implement the Plan in two phases (as described in Section 4.4 of the Plan). An initial implementation phase shall begin when this permit is adopted and the full implementation phase shall begin 18 month thereafter. During the initial implementation phase, the Co-Permittees will begin to

R0061501

VOL 16 0101

implement select storm water management programs as detailed in the Plan. A summary of the schedule for the initial implementation phase is presented as following:

Storm Water Management Program	Co-Permittee Specific Program Begins by
Programs for Residents - General Public Information/Participation Program - Refuse Disposal Practices	 September, 1994 August, 1995
Programs for Industrial/Commercial Businesses - Specific Business Outreach Programs Automobile Services Restaurants	 February, 1996 August, 1996
Programs for Public Infrastructure - Education for Public Agencies and Employees	 August, 1995
Programs for Illicit Discharge Control - Illicit Discharge Investigation	 September, 1994
Programs for Land Development - Education/Outreach to Land Developers - Land Use Planning and Zoning - Development Standards and Reviews - Permits and Inspection	 September, 1994 August, 1995 August, 1995 August, 1995
Programs for Construction Sites - Education/Outreach to Construction Site Personnel	 September, 1994

The remaining programs in the Plan shall be implemented during the full implementation phase. Program work plans for the full implementation phase shall be prepared as necessary and presented as part of regular annual and semi-annual progress reports to the Regional Board.

4. The City of Thousand Oaks, when implementing control measures and other actions for specific pollutant sources and activities observed to occur within the area tributary to Malibu Creek, will, to the maximum extent practicable, achieve consistency with the waste discharge requirements issued to Los Angeles County municipal storm water systems (NPDES Permit No.

VOL 16 0102
R0061502

CA0061654) and amendments thereto. To achieve this, the City of Thousand Oaks shall submit all the required up-to-date program elements that apply to the Phase I cities, as defined in the Los Angeles County Permit, by September 18, 1994.

5. It is anticipated that the initial storm water management program, as delineated in the Plan and/or implementation agreement, may need to be modified, revised, or amended from time-to-time to respond to changed conditions and to incorporate more effective approaches to pollutant control. Minor changes may be made at the direction of the Executive Officer. Minor changes requested by the Discharger shall become effective upon written approval of the Executive Officer. If proposed changes imply a major revision in the overall scope of effort of the program, such changes must be approved by the Regional Board as permit amendments.

6. This Order may be modified, revoked, or reissued, prior to the expiration date as follows:

   a. To address changed conditions identified in the required technical reports or other sources deemed significant by the Regional Board;

   b. To incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;

   c. To comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain any other requirements of the CWA then applicable; or

   d. Any CWA reauthorization.

VOL 16
0103
R0061503

7. This Order expires on August 10, 1999. The Discharger must submit a Storm Water Management Plan in accordance with Title 23, California Code of Regulation, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

I, Robert P. Ghirelli, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on August 22, 1994.

FOR
VENTURA COUNTY FLOOD CONTROL DISTRICT,
COUNTY OF VENTURA, AND THE CITIES OF VENTURA COUNTY

NPDES PERMIT NO. CAS063339

I. Reporting Requirements

A. The Discharger shall develop, and submit to the Regional Board by March 1, 1995, an internal audit program to verify the timely and comprehensive implementation of the Plan by each Co-Permittee. The Principal Co-Permittee shall be responsible for carrying out such a program and reporting to the Regional Board the result of the audit in the annual report.

B. The Discharger shall submit, by March 1 of each year, a semi-annual progress report documenting the progress of the implementation of the Plan.

C. The Discharger shall submit, by September 1 of each year, an annual report documenting the status of all the general program and individual tasks contained in the Plan. The annual report shall be a detailed compilation of all the deliverables and milestones completed as described in the Plan. On an annual basis, each Co-Permittee shall conduct an evaluation of the effectiveness of its scheduled activities as described in the Plan. Measures of effectiveness include, but are not limited to, quantitative monitoring to assess the effectiveness of control measures, detailed accounting of program accomplishments, funds expended, and staff hours utilized. This annual report shall provide an overall evaluation of the program and set forth plans and a schedule of implementation for the upcoming year.

D. All applications, reports, or information submitted to the Regional Board shall be signed and certified pursuant to EPA regulations 40 CFR 122.41 (k).

II. Monitoring Requirements

A. The Discharger shall develop and submit to the Regional Board all available water quality data and flow data from 1980 to the present to facilitate identification of sources of pollutants present in discharges from the areas subject to the requirements of this permit. These data must be submitted to the Regional Board by November 22, 1994.

VOL 16
0108
R0061508

B. The Discharger shall implement the Countywide Monitoring Plan, as described in Chapter 6 of the Application, which will address discharge characterization (outfall monitoring), pollutant source identification, receiving water quality impacts, and management program effectiveness. To achieve this, the Discharger shall:

1. Conduct outfall monitoring at six sites, during a minimum of three storm events per year, to characterize storm water runoff from various land uses: one commercial, two industrial, two residential, and one agricultural. This program shall be in place and operational prior to October 1, 1994.

2. Conduct receiving water monitoring during a minimum of three storm events at two sites in a major tributary to the Arroyo Simi, upstream and downstream of its passage through the urban area. This program shall be conducted in conjunction with the outfall monitoring.

3. Analyze the monitoring samples, at a minimum, for the following constituents:

Composite samples:
- Dissolved and total recoverable metals including arsenic, cadmium, chromium (total), copper, lead, nickel, selenium, silver, and zinc;
- Biochemical oxygen demand (BOD_5), chemical oxygen demand (COD), total organic carbon (TOC), total dissolved solids (TDS), total suspended solids (TSS), and total hardness;
- Total phosphorous, ortho-phosphorous, nitrate nitrogen, organic nitrogen, and ammonia nitrogen;
- Acute toxicity using fathead minnow (*Pimephales promelas*)[1].

Grab samples:
- Field pH and field specific conductance;
- Oil and Grease and total recoverable petroleum hydrocarbons;
- Total and fecal coliform, and fecal streptococcus;
- Total mercury;
- Volatile organics and semi-volatile organics.

[1]This analysis shall be done for two storm events per year for all stations except for the agriculture land use area.

VOL 16
0109
R0061509

VOL 16

Samples from agricultural land uses shall also be analyzed for organochlorine and organophosphate pesticides and chlorinated herbicides.

4. Use the results of the annual outfall monitoring and illicit discharge program along with a review of potential pollutant sources, to select suspected pollutant sources. Verify this selection using grab sampling during storm events to identify the presence and concentration of specific pollutants in storm water runoff from the identified areas or facilities. Identify toxicity and schedule for Toxicity Identification Evaluations (TIE), as necessary, in the annual reports.

5. Employ appropriate techniques to evaluate the monitoring data and produce pollutant load estimates, identify long term storm water pollutant loading trends, and assess receiving water quality impacts.

The above monitoring program, or subsequent modification thereto, shall become effective when Order No. 94-082 is adopted. All reports shall be signed by a responsible officer or duly authorized representative (as specified in 40 CFR Section 122.2) of the Discharge and submitted under penalty of perjury.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

ORDER NO. 94-244

NPDES NO. CA0083500

WASTE DISCHARGE REQUIREMENTS FOR FRESNO METROPOLITAN FLOOD CONTROL DISTRICT CITY OF FRESNO, CITY OF CLOVIS COUNTY OF FRESNO CALIFORNIA STATE UNIVERSITY FRESNO AND CALTRANS URBAN STORM WATER DISCHARGES FRESNO COUNTY

The California Regional Water Quality Control Board, Central Valley Region, (hereafter Board) finds that:

1. The Fresno Metropolitan Flood Control District (District), City of Fresno, City of Clovis, County of Fresno (County), California State University Fresno (CSUF), and Caltrans (hereafter referred to separately as Permittees and jointly as the Discharger) submitted Part 1 of a National Pollutant Discharge Elimination System (NPDES) area-wide municipal storm water permit application on 18 May 1992, and Part 2 of the application on 17 May 1993. They request an NPDES permit for continued discharge of urban storm water runoff. They propose to implement their "Storm Water Quality Management Plan" dated 17 May 1993 (hereafter SWMP) within District boundaries.

2. The City of Fresno is defined as a medium municipality (population greater than 100,000 but less than 250,000) in Appendix G to Part 122 of Title 40 of the Code of Federal Regulations (40CFR). The District owns and operates the municipal separate storm sewer system for the Cities of Fresno and Clovis, and portions of the County.

3. The permit application designates the District as the lead agency for permit implementation and the other Permittees as co-permittees. As lead agency, the District will compile and submit annual reports to the Board, and serve as primary contact and liaison with the Board regarding permit matters.

4. The Permittees are legal entities with authority to develop, administer, implement, and enforce storm water management programs within their own jurisdictions (See Attachment A, Vicinity Map). Each Permittee is responsible for compliance of this Order for portions under their jurisdiction. If a Permittee is in noncompliance with the terms of the permit for its jurisdiction, the Board may consider taking enforcement action against only that specific Permittee. To provide the additional legal authority required by 40 CFR 122.26(d)(2)(i), the Discharger is preparing a master storm water

0112

quality ordinance and accompanying memoranda of understanding between the participating Permittees, and proposes to make them effective by 1 July 1996.

5. All applicants must obtain a permit because:

   a. The District is the primary owner/operator of the municipal separate storm sewer system which serves the urbanized portion of the permit area;

   b. The cities of Fresno and Clovis, and the County, control development and land use in the permit area and are responsible for construction and maintenance of streets and roads;

   c. The County owns and operates limited roadway drains along the outskirts of the urban area.

   d. The CSUF owns and operates a storm sewer system for its campus which discharges to the District system; and,

   e. Caltrans owns and operates major transportation corridors in the Fresno-Clovis metropolitan area, which discharge into the District's system or directly to waters of the United States.

6. Parts I and II of the permit application include pertinent information required by 40CFR 122.26(d)(1&2). Part II of the application includes the SWMP, which describes in detail all group and entity-specific activities that will be conducted over the 5-year term of this Order. The SWMP describes the Best Management Practices (BMPs) currently being implemented, and proposed BMPs to be implemented. It defines the goals and objectives of the BMPs, and provides a detailed list of tasks required to implement and evaluate the BMPs with an implementation schedule.

7. The permit area is defined in the Fresno-Clovis Storm Water Quality Management Program Part 2 NPDES Storm Water Permit Application. The permit area is defined by the District's Storm Drainage and Flood Control Master Plan drainage area boundaries and the County's Copper-Friant Study Area which lies adjacent to the District's northern boundary between the San Joaquin River and the Friant-Kern Canal. The permit area encompasses approximately 127,000 acres. The permit area includes future urban drainage service areas that will be established by the Permittees during the term of the permit.

8. Predominant land use types within County jurisdiction include agriculture, open space, and rural land development. It is not the intent of the federal storm water regulations

VOL 16 0113

to regulate storm water discharges from land used in this manner (40CFR 122.26 (a)(v)).

9. The term "storm water", as used in this permit, includes storm water runoff, snowmelt runoff, and surface runoff and drainage from areas other than those land use types identified in Finding No. 8.

10. This permit regulates the discharge of all wet weather urban storm runoff and dry weather runoff generated from drainage areas within the jurisdiction of the Discharger, as it depicted in Figure 5-2 of Part 1 of the application, that discharge to waters of the United States. Waters of the U.S. receiving runoff include the San Joaquin River, other eastside streams, and valley floor waters, including Fresno Irrigation District canals. The Discharger identified major outfalls defined in 40 CFR 122.26(b)(5) as outfalls with a pipe diameter of 36 inches or greater from various land use watersheds (or drainage areas 50 acres or greater), and outfalls with a pipe diameter of 12 inches or greater (or drainage areas 2 acres or greater) from industrial land use drainage areas in the SWMP. There are seven major outfalls that discharge to the San Joaquin River, four of which discharge directly to the river without prior detention. Thirty major outfalls discharge to the Fresno Irrigation District's irrigation canals or channels, including nine outfalls which have no prior detention.

11. Precipitation in the Fresno-Clovis metropolitan area, as measured at the Fresno Air Terminal weather station, averages 10.7 inches per year.

12. Industrial facilities within the permit area discharge urban storm water runoff to storm sewers, maintained channels, and natural watercourses within the jurisdiction of the Discharger. These discharges contain typical urban storm water runoff pollutants and may also contain pollutants from industrial activities.

13. National and local studies have documented that urban storm water runoff can contribute significant levels of pollutants to receiving waters and may impact beneficial uses. The Nationwide Urban Runoff Program (NURP) Study concluded that discharges of urban storm water runoff were one of the main unregulated sources of pollutants to waters of the United States. The Fresno NURP Study, conducted in 1984, and studies done by the Board in the Sacramento area have documented a seasonal flush of metals, oils, and grease during the first few storms of the wet season.

14. Section 402(p) of the Clean Water Act (CWA) as amended by the Water Quality Act of 1987 (WQA), requires that persons who discharge storm water from separate municipal storm sewer systems obtain NPDES permits and it prohibits non-storm water discharges into these systems. On 16 November 1990, the US Environmental Protection Agency (USEPA) published regulations for storm water discharges, pursuant

VOL 16 0114

VOL 16

to Section 402(p). The SWMP submitted by the Discharger is Part 2 of its permit application, and dated 17 May 1993, was prepared to comply with EPA regulations codified in 40 CFR 122. The SWMP and other information contained in the Discharger's application package are generally found by Board staff to satisfy EPA's NPDES permit application requirements for medium municipal storm water discharges, except for not providing adequate legal authority and, annual and seasonal pollutant load estimates.

15. The SWMP establishes a phased and tiered approach over the next five years to reduce the discharge of pollutants to storm drains within the area defined in Attachment A to the maximum extent practicable (MEP). The SWMP emphasizes pollution prevention activities through the following BMPs:

a. **Public Involvement and Education**

Educate the public to better understand and participate in the control of urban runoff pollution and to solicit support for the program.

b. **Illicit Discharges**

Identify and eliminate illicit connections and illegal dumping to the storm drain system.

c. **Operation and Maintenance**

Review and revise current maintenance practices to increase removal of storm water pollutants and reduce pollutants in storm water runoff.

d. **Structural Controls**

Continue to plan, design, and build storm water retention basins to provide storm drainage services, pollutant removal, flood control, and ground water recharge.

e. **Construction and Development**

Control storm water pollution related to construction and development.

f. **Commercial and Industrial**

Monitor and control pollutants in storm water discharges to the municipal storm water system from landfills; hazardous waste treatment, storage, disposal, and recovery facilities; and industrial facilities.

0115

16. The SWMP emphasizes incorporating storm water BMPs into established programs as much as possible in order to maximize the use of existing resources, minimize the risk of creating redundant and overlapping regulatory programs, and expedite the implementation of the SWMP.

17. The State Water Resources Control Board (State Board) has issued NPDES General Permits for the regulation of storm water discharges associated with industrial and construction activities. To implement the industrial, new development, and construction elements of the SWMP effectively, the Discharger will, as necessary, conduct inspection activities at industries or construction sites covered by the State NPDES General Permit. Under the CWA, the Discharger cannot directly enforce the State NPDES General Permit. However, the Discharger will have adequate legal authority (master storm water quality ordinance and accompanying memoranda of understanding between the participating permittees) to enforce its own ordinances, orders, and permits. Board staff shall coordinate activities with the Discharger to insure that industries, businesses, and developers within the permit area comply with the CWA without being subjected unnecessarily to duplicate or overlapping storm water regulatory activities.

18. The Board adopted Water Quality Control Plans for the Tulare Lake Basin and San Joaquin River Basin, Second Edition, (hereafter Basin Plans) which contain water quality objectives for all waters of the Basins. These requirements implement the Basin Plans.

19. The Basin Plans designate the beneficial uses of the San Joaquin River downstream of the discharge as municipal, domestic, industrial, and agricultural supply; water contact and non-contact water recreation; esthetic enjoyment; navigation; ground water recharge, fresh water replenishment; and preservation and enhancement of fish, wildlife and other aquatic resources.

20. As it is not feasible at this time to establish reasonable numeric effluent limits for storm water, the Discharger must reduce the discharge of pollutants to the maximum extent practicable. The Discharger proposes to accomplish this reduction through implementation of its SWMP, which is an approach acceptable to the Board. Accordingly, the SWMP shall be incorporated herein by reference and made an integral and enforceable part of this Order.

21. The permitted discharge is consistent with the antidegradation provisions of 40 CFR 131.12 and State Water Resources Control Board Resolution 68-16. Given the continuing development within the area, it is possible that future degradation in water quality could occur. The programs required pursuant to this order and implemented to the MEP constitute treatment or control of discharges intended to assure that pollution

VOL 16 0115

VOL 16 0117

or nuisance will not occur and the highest receiving water quality consistent with maximum benefit to people of the State will be maintained. Hence, the discharge will not result in receiving water quality less than that prescribed in policies of the State Board.

22. Section 402(p)(4)(B) of the CWA requires that the Discharger achieve full compliance as expeditiously as practicable, but in no event later than three (3) years after issuance of this permit. Implementation of the SWMP, in accordance with its schedule, is recognized as achieving the MEP standard and will result in substantial compliance being achieved within three (3) years.

23. The action to adopt an NPDES permit is exempt from the provisions of the California Environmental Quality Act (CEQA) (Public Resources Code Section 21000, et seq.), in accordance with Section 13389 of the California Water Code.

24. The Board has notified the Discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for this discharge and has provided them with an opportunity for a public hearing and an opportunity to submit their written views and recommendations.

25. The Board, in a public meeting, heard and considered all comments pertaining to the discharge.

26. This Order shall serve as an NPDES permit pursuant to Section 402 of the CWA, and amendments thereto, and shall take effect upon the date of hearing, provided EPA has no objections.

IT IS HEREBY ORDERED that Fresno Metropolitan Flood Control District, City of Fresno, City of Clovis, County of Fresno, California State University Fresno, and Caltrans, their agents, successors and assigns, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act and regulations and guidelines adopted thereunder, shall comply with the following:

A. Discharge Prohibitions

1. Discharge of non-storm water, except as allowed by Provision D.4. or an individual NPDES permit, is prohibited.

2. Discharge of material other than storm water is prohibited (see Provision D.2).

VOL 16

B. Discharge Specifications:

1. The Discharger shall reduce the discharge of pollutants into the storm drainage system to the maximum extent practicable by implementing the SWMP.

C. Receiving Water Limitations:

Receiving Water Limitations are based upon water quality objectives contained in the Basin Plan. As such, they are a required part of this permit.

Discharges to structural controls, such as detention and terminal basins, shall not cause underlying ground water to be degraded.

Discharges from the municipal separate storm sewer system shall not cause the following in the San Joaquin River and other receiving waters:

1. Oils, greases, waxes, or other materials to form a visible film or coating on the water surface or on the stream bottom.
2. Oils, greases, waxes, floating material (liquids, solids, foams, and scums) or suspended material to create a nuisance or adversely affect beneficial uses.
3. Aesthetically undesirable discoloration.
4. Fungi, slimes, or other objectionable growths.
5. Taste or odor-producing substances to impart undesirable tastes or odors to fish flesh or other edible products of aquatic origin or to cause nuisance or adversely affect beneficial uses.
6. Deposition of material that causes a nuisance or adversely affects beneficial uses.
7. Aquatic communities and populations, including vertebrate, invertebrate, and plant species, to be degraded.
8. Toxic pollutants to be present in the water column, sediments, or biota in concentrations that adversely affect beneficial uses; that produce detrimental response in human, plant, animal, or aquatic life; or that bioaccumulate in aquatic resources at levels which are harmful to human health.

0118

VOL 16

9. Violations of any applicable water quality standard for receiving waters adopted by the Board or the State Water Resources Control Board pursuant to the CWA and regulations adopted thereunder.

D. Provisions:

1. The Discharger shall comply with Prohibition A.1. by implementing and enforcing institutional controls that effectively prohibit discharge of non-storm water (except as noted in Provision D.4) through its system into waters of the United States.

2. The Discharger shall comply with Prohibition A.2. by implementing and enforcing controls on spills, dumping, and disposal of materials other than storm water into the municipal storm sewer system, and by establishing and maintaining an effective spill emergency response program to respond to and contain spills that inadvertently occur.

3. The Discharger shall comply with Discharge Specification B.1 by implementing the SWMP, pursuant to time schedules contained therein, by 17 October 1994.

4. Unless determined by the Discharger to be significant sources of pollutants, the following non-storm waters may be discharged through the storm water drainage system:

   a. water line flushing;
   b. landscape irrigation;
   c. diverted stream flows;
   d. rising ground waters;
   e. uncontaminated ground water infiltration (as defined in 40CFR 35.2005(20)) to separate storm sewers;
   f. uncontaminated pumped ground water;
   g. discharges from potable water sources;
   h. foundation drainage;
   i. air conditioning condensate;
   j. irrigation water;
   k. springs;
   l. water from crawl space pumps;
   m. footing drainage;
   n. lawn waters;
   o. individual residential car wash water;
   p. flows from riparian habitats and wetlands;

0119

VOL 16

q. dechlorinated swimming pool discharges;
r. street wash waters
s. waters from fire fighting activities

5. Major outfalls not identified in the SWMP, but constructed during the term of this Order to receiving waters identified herein, shall not be considered a material change in character, location, or volume of the permitted discharge, and shall be allowed under the terms of this Order without permit application or permit modification, provided at least 90 days prior to construction of the outfall the Discharger submits a report that includes:

a. Receiving water name;
b. Storm water outfall location map;
c. Drainage area (in acres);
d. Land use designation; and
e. Certification that the SWMP shall be amended to include the drainage area.

6. Storm water drainage areas predominantly agricultural, open space, or rural residential not subject to planned development, are not subject to this Order.

7. The Discharger shall perform the actions set forth in the SWMP and Part 2 of the application to achieve compliance with the terms of this Order, including, but not limited to:

a. Implementing the necessary legal authorities as required in 40CFR 122.26(d)(2)(i);

b. Performing inspection, surveillance, and monitoring procedures necessary to determine compliance with ordinances, permits, and other components of the SWMP;

c. Implementing programmatic functions as described in the SWMP;

d. Providing the requisite funding and personnel to implement the storm water program as described in the SWMP; and,

e. Enforcing codes, ordinances, and permits.

8. The Discharger may require that any industrial discharger with a general industrial NPDES storm water permit discharging to the municipal storm sewer system comply with more stringent local conditions specified in the SWMP, including a local prohibition. In no case shall a municipality be less stringent than

0120

the NPDES requirements. The Discharger shall develop appropriate legal authority to allow the Discharger to conduct adequate enforcement and compliance activities to insure an industry's compliance with the Discharger's ordinance or statute. An element of the Discharger's enforcement plan may include requesting assistance from Regional Board to pursue a noncomplying industrial facility, once the Discharger has exhausted all enforcement actions provided in its legal authority.

9. If the Discharger determines through implementation of the SWMP that a general storm water permittee (industrial and construction) may be violating the terms of the State's general storm water permit, it shall notify Board staff within 72 hours. The Discharger shall submit all documents and other pertinent information regarding the possible noncompliance, and any information regarding follow-up enforcement activities conducted by the Discharger, when requested to do so by Regional Board staff.

10. If the Discharger chooses to implement any portion of the SWMP through the use of an agency or department not under the jurisdictional control of the Discharger, it shall first enter into an intra/interagency agreement, and submit a signed copy of said agreement to the Board.

11. By 6 January 1995, the Discharger shall submit a technical report that estimates the annual average percentage of storm water that originates within the District's boundaries and flows into waters of the United States. The report shall include a rationale for the estimate and shall indicate the probable percentages of the total discharge to surface waters that will occur at each discharge location. By 7 April 1995, the Discharger shall estimate annual pollutant load and seasonal pollutant load of discharges to waters of the United States to comply with 40CFR 122.26(d)(2)(iii)(B-D).

12. By 1 July 1995, the Discharger shall submit the draft master storm water quality ordinance and accompanying draft memoranda of understanding between the participating Permittees. By 1 July 1996, the Discharger shall submit the adopted master storm water quality ordinance and accompanying memoranda of understanding to comply with 40CFR 122.26(d)(2)(i) for adequate legal authority.

13. The Discharger shall update the data regarding regulated industrial dischargers at least annually.

VOL 16 0121

14. The SWMP, and any modifications or revisions to the SWMP that are approved in accordance with Provision D.16 of this Order, are an enforceable component of this Order. The timely implementation of BMPs and other actions to reduce pollutants in storm water discharges in accordance with the SWMP and any of its modifications, revisions, or amendments thereto shall serve to demonstrate compliance with federal requirements to implement BMPs to the MEP and this Order.

15. The SWMP may need to be revised or amended to respond to changed conditions and to incorporate more effective approaches to pollutant control. Requests for changes may be initiated by the Board's Executive Officer or by the Discharger. Administrative changes may be made by the Discharger with the Executive Officer's approval or at his request and will be reported to the Board as information items. Major changes shall be submitted to the Board as technical reports as needed and brought before the Board as permit modifications.

16. This Order may be modified, or alternatively, revoked or reissued, prior to the expiration date in order to comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order.

17. The Discharger shall comply with all applicable Standard Provisions of the "Standard Provisions and Reporting Requirements for Waste Discharge Requirements (NPDES)", dated 1 March 1991, which are part of this Order. This attachment and its individual paragraphs are referred to as "Standard Provision(s)".

18. A copy of this Order and the SWMP shall be kept at the appropriate offices of the Permittees. Personnel responsible for supervising compliance with this Order and implementing the SWMP shall be provided copies and be familiar with the contents of each.

19. The Discharger shall comply with the attached Monitoring and Reporting Program No. 94-244, which is part of this Order, and any revisions thereto, as ordered by the Executive Officer.

20. The Discharger may request changes to the Monitoring and Reporting Program. Revisions to the Monitoring and Reporting Program shall be subject to approval of the Executive Officer.

VOL 16

0122

21. This Order expires on 1 September 1999. The Discharger must file a Report of Waste Discharge in accordance with Title 23, CCR, not later than 180 days in advance of such date in application for renewal of this NPDES Storm Water Permit.

I, WILLIAM H. CROOKS, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Central Valley Region, on 16 September 1994.

WILLIAM H. CROOKS, Executive Officer

FOR
FRESNO METROPOLITAN FLOOD CONTROL DISTRICT
CITY OF FRESNO, CITY OF CLOVIS
COUNTY OF FRESNO
CALIFORNIA STATE UNIVERSITY FRESNO
AND CALTRANS
URBAN STORM WATER DISCHARGES
FRESNO COUNTY

Specific sample station locations shall be established with concurrence of the Board's staff, and a description of the stations shall be attached to this Order. Sampling and analytical procedures shall be in accordance with the Environmental Protection Agency's recommended procedures. A complete list of all substances which are tested for and reported on by the testing laboratory shall be provided to the Board. Chain of custody forms shall be completed for each sample collected and copies provided to the Regional Board.

IN-SYSTEM STORM WATER MONITORING

By 7 April 1995, the Discharger shall submit a monitoring plan with the goal of evaluating the effectiveness of best management practices implemented in compliance with this Order. Upon approval of the Executive Officer, the Discharger shall implement the plan.

RECEIVING WATER MONITORING

By 6 January 1995, the Discharger shall submit a monitoring plan for evaluating the effects of urban storm water runoff on receiving waters using information from its technical report that will be submitted to comply with Provision No. D.10. Upon approval by the Executive Officer, the Discharger shall implement the plan.

REPORTING

The Discharger shall submit, by 1 September each year, an annual report which includes:

1. The implementation status of program tasks contained in the SWMP;
2. The status or completion of all deliverables and milestones described in the SWMP;
3. Program accomplishments;

4. Monitoring information collected pursuant to the Storm Water Monitoring program, including

   a. results of sampling;

   b. estimation of pollutant loads generated within the drainage area;

   c. percent change in pollutant load

5. Results of the Illicit Discharge Elimination Program, including

   a. number, quantity, and quality of identified dry weather flows, and

   b. number, quantity, quality, and source of identified illicit discharges existing and eliminated;

6. A summary of industrial and construction activity storm water inspections conducted, including

   a. number of inspections conducted,

   b. follow-up activities,

   c. results of follow-up activities, and

   d. problem areas to be considered for further attention;

7. Known spill incidents that resulted in a discharge to the storm sewer or water of the United States, including the type, quantity, quality, and source of spill;

8. Public education activities;

9. The names, titles, and phone numbers of personnel responsible for supervising implementation of the SWMP;

10. A report assessing the effectiveness of pollution control activities described in the SWMP including information gathered to qualitatively and quantitatively evaluate the ability of the SWMP to reduce pollutants;

11. A discussion of the adequacy of legal authority and/or legal controls for implementing and carrying out the SWMP; and

VOL 16 0125

MONITORING AND REPORTING PROGRAM
FRESNO-CLOVIS METROPOLITAN AREA
URBAN STORM WATER DISCHARGES
FRESNO COUNTY

12. An overall evaluation of the SWMP.

13. Recommended changes and/or modifications to the SWMP.

In addition, the Discharger shall submit by 6 January 1995 a proposed format for the annual report, subject to Executive Officer approval. Format changes proposed for subsequent annual reports are subject to prior approval of the Executive Officer.

In its annual report, the Discharger shall demonstrate whether the discharge of pollutants to the storm sewer system has been reduced to the maximum extent practicable, and whether it is in substantial compliance with the SWMP.

All reports submitted in response to this Order shall comply with the signatory requirements stipulated in Standard Provision D.6.

The Discharger shall implement this program on the first day of the month following the effective date of this Order.

PART 1 PERMIT APPLICATION
NPDES STORM WATER PERMIT

VOL 16

INFORMATION SHEET

STORM WATER PERMIT
FRESNO-CLOVIS METROPOLITAN AREA
FRESNO COUNTY

The 1972 Amendments to the federal Clean Water Act (CWA) prohibited the discharge of any pollutants from a point source into waters of the United States unless permitted under the National Pollutant Discharge Elimination System (NPDES). Storm water and urban runoff discharges that occur through discreet conveyance systems are considered point sources subject to NPDES requirements. The 1987 amendments to the CWA mandated the USEPA to publish regulations establishing permit requirements for storm water discharges associated with industrial activities, and large and medium municipal separate storm sewer systems that service an urbanized area with a population greater than 100,000. On 16 November 1990, USEPA published these Regulations which were codified in Title 22, Code of Federal Regulations (40CFR), Part 122.

The Regulations allow for the issuance of area-wide municipal NPDES storm water permits. This approach allows the Board to designate as a medium or large municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a municipality that are required by the Regulations to obtain storm water permits. This has resulted in many cities throughout California with populations less than 100,000, or government entities such as flood control districts or transportation districts, being required to obtain storm water permits.

Under the area-wide approach, the Regulations allow multiple entities to be named as permittees under one NPDES permit. The Regulations recognize differences between permittees with regard to responsibilities for discharges from municipal storm sewer systems, and allows permittees to develop site-specific storm water programs.

The Fresno Metropolitan Flood Control District, the City of Fresno, the City of Clovis, the County of Fresno, the California State University of Fresno and Caltrans (referred to jointly as the Discharger) have applied jointly for an NPDES permit to reduce pollutants in storm water and urban runoff discharges throughout the Fresno-Clovis metropolitan area.

Appendices to Part 122 of the Regulations provide a listing of the cities and counties throughout the United States that meet threshold urbanized population criteria that requires a municipality to obtain a NPDES storm water permit. Appendix G of the Regulations has listed the City of Fresno as a city with an incorporated urbanized area population greater than 100,000 but less than 250,000. In listing the City, the Regulations have identified it as a medium municipality that is required to obtain a municipal NPDES storm water permit.

The proposed permit requires that the permittees control the discharge of pollutants in storm water to the Maximum Extent Practicable (MEP). In accordance with the Regulations, implementation of Best Management Practices (BMPs) is an acceptable control to meet MEP. Timely and effective implementation of the BMPs and other program elements outlined in the SWMP will constitute compliance with MEP.

0128

VOL 16

INFORMATION SHEET - Continued

STORM WATER PERMIT
FRESNO-CLOVIS METROPOLITAN AREA
FRESNO COUNTY

The SWMP proposes a number of BMPs and controls to be implemented over the 5-year period of the permit. To facilitate planning and implementation, these practices and controls were organized in six program elements. The program elements for the SWMP are as follows:

- Public Involvement and Education
- Illicit Discharges
- Operation and Maintenance
- Structural Controls
- Construction and Development
- Commercial and Industrial

This Order requires implementation of the above programs within 30 days to reduce the level of storm water pollutants at industrial and construction sites, new developments, and existing urbanized areas that discharge to receiving waters.

A key element in the controlling of pollutants in storm water lies with source identification and characterization of the discharge. Each year the monitoring data will be analyzed and evaluated to assess its effectiveness in assisting the permittees determine compliance with its permit. Based on the results of the assessment, the permittees or Board staff may request that the monitoring program be modified.

Annually, the permittees are required to evaluate the overall effectiveness of their SWMP. Assessment activities will include quantitative analysis based on sampling results from the monitoring data, and qualitative analysis based on sampling results from the monitoring data, and qualitative analysis based on indirect measures, such as level of effort. Qualitative analysis will be used throughout the early stages of the permit to evaluate the nonstructural, nonconventional BMPs. Upon completion of the evaluation assessment, the permittees or Board staff may request modifications to the SWMP.

The permittees are required to oversee implementation of the SWMP and compile annual report information within their respective areas of legal jurisdiction throughout the fiscal year to be submitted to the District.

Implementation and ongoing evaluation of the SWMP will reduce discharge of pollutants into storm water runoff to the maximum extent practicable, improve water quality, and protect beneficial uses.

The action to adopt an NPDES permit is exempt from the provisions of the California Environmental Quality Act (Public Resource Code Section 21000, et. seq.), in accordance with Section 13389 of the California Water Code.

0129

STATE OF CALIFORNIA
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

ORDER No. 90-079

NPDES NO. CA0061654 (CI 6948)

WASTE DISCHARGE REQUIREMENTS STORMWATER/URBAN RUNOFF DISCHARGE for LOS ANGELES COUNTY and CO-PERMITTEES

The California Regional Water Quality Control Board, Los Angeles, (Regional Board) finds :

1. The County of Los Angeles, in cooperation with the following cities : Agoura Hills, Beverly Hills, Culver City, El Segundo, Hermosa Beach, Inglewood, Los Angeles, Manhattan Beach, Rancho Palos Verdes, Redondo Beach, Rolling Hills Estates, Rolling Hills, Santa Monica, Torrance, West Hollywood, and Westlake Village, has submitted a report of waste discharge (NPDES permit application) dated March 15, 1990 for issuance of waste discharge requirements for the County of Los Angeles and other cities tributary to Los Angeles County (excluding Antelope Valley) under the National Pollutant Discharge Elimination System. (NPDES Permit No. CA0061654).

2. The discharges consist of surface runoff generated from various land uses in all the hydrologic drainage basins which discharge into water courses flowing into water bodies in Los Angeles County. The quality of these discharges varies considerably and is affected by land use, basin hydrology and geology, season, and the frequency and duration of storm events. The constituents of concern and significance in these discharges are: total and fecal coliform and enterococci bacteria, total suspended solids, biochemical oxygen demand, oil and grease, heavy metals, nutrients, polychlorinated biphenyls, polycyclic aromatic hydrocarbons, pesticides and herbicides, and petroleum hydrocarbons.

VOL 16

0130

VOL 16

3. The objective of this permit is to develop a timely, comprehensive, and cost-effective stormwater pollution control program to minimize pollutants in urban runoff/stormwater discharges to water bodies in Los Angeles County.

4. Due to the complexity and networking of drainage facilities within and tributary to Los Angeles County, the county and adjacent areas discharging storm water into Los Angeles County are divided and prioritized into five drainage basins for the implementation of the permit. The owners/operators of all facilities impacting stormwater quality will be ultimately a party to these waste discharge requirements. The County of Los Angeles together with the cities identified above, the initial parties filing for the system-wide permit, are 'Permittees', with the County of Los Angeles as the 'Principal Permittee' and the rest as 'Co-Permittees'. All other cities and recognized entities such as Caltrans, college/university campuses, hospitals, parks, agricultural areas, real estate developments and waste disposal facilities identified in this Order, are designated 'Co-Participants'. A 'Co-Participant' will be a 'Co-Permittee' upon becoming an active party to the permit.

   Attachments 1 and 2 show, respectively, the list of cities and a partial list of entities designated as Co-Participants for this permit. The list of entities will be revised as necessary. .

5. The County of Los Angeles, as the 'Principal Permittee', will obtain the cooperation of 'Co-Participants' to become 'Co-Permittees'. The Regional Board has the discretion and authority to require non-cooperating cities and/or entities to become 'Co-Permittees' or obtain individual stormwater discharge permits, pursuant to 40 CFR 122.26 (a).

0131

6. Los Angeles County as the 'Principal Permittee' is the permit coordinator responsible for general administration of this Order, and coordinating cooperation by 'Co-Permittees', including but not limited to the implementation of local self-monitoring programs and Best Management Practices, and the preparation and submittal of reports required by this Order.

7. Los Angeles County obtains its authority to :

   - control pollutants in stormwater discharge
   - prohibit illegal discharges and control spills
   - require compliance and carry out inspections

R0061531

VOL 16

of drainage facilities in the County of Los Angeles from the Los Angeles County Flood Control Act and various county ordinances which address industrial wastes and waste discharges within the unincorporated areas of Los Angeles County and contract cities. 'Co-Permittees' with the status of incorporated cities have various forms of legal authority in place, such as charters, State Code provisions for General Law cities, city ordinances and applicable portions of Municipal Codes and the State Water Code, to regulate stormwater/urban runoff discharges.

8. The division and prioritization of Los Angeles County and adjacent areas into five drainage basins for program implementation are based on hydrological characteristics of the watersheds, perceived importance and beneficial uses of water bodies, and the existence of an adequate infrastructure for program implementation. The five drainage basins are :

I : Santa Monica Bay Drainage Basin

II : Upstream Los Angeles River Drainage Basin, to and including Sycamore Canyon Channel (San Fernando Valley);

III : Upper San Gabriel River (San Gabriel Valley) Drainage Basin.

IV : Lower Los Angeles River Drainage Basin

V : Lower San Gabriel River Drainage Basin; and Santa Clarita Valley Basin.

Attachment 3 shows a map of Los Angeles County with the boundary delineations of the five drainage basins.

Attachment 4 shows Co-Participant cities in Los Angeles County (and their respective populations).

[Note: Detailed maps of the Los Angeles County storm drain system with boundary delineations of drainage basins are available for review at the Regional Board Office.]

0132

9. A number of studies on stormwater/urban runoff pollution in the permit areas has been conducted by agencies such as the City of Los Angeles, the Southern California Coastal Water Research Project and the Southern California Association of Governments. These studies indicate stormwater/urban runoff contributes significantly to the deterioration of the quality of water bodies in Los Angeles County.

   The University of California at Los Angeles, under the sponsorship of the Santa Monica Bay Restoration Project, is currently compiling and summarizing data and information on stormwater/urban runoff discharges for the Santa Monica Bay watershed.

10. The Los Angeles County Department of Public Works has an active surface water quality monitoring program in the permit area, comprising twenty-eight monitoring stations located at principal storm drains and water conservation facilities. The Surface Water Quality Monitoring Program comprises the collection and analysis of dry weather water samples for general minerals, pesticides, total petroleum hydrocarbons, heavy metals and bacteria (total and fecal coliform, KF streptococci and enterococci). Volatile organic constituents are tested semi-annually at selected stations. Stormwater runoff is monitored three to four times annually at twenty-one stations for minerals, pesticides, heavy metals (total and dissolved), bacteria, total and organic suspended solids, oil and grease, biochemical oxygen demand, total organic carbon and volatile organics.

11. The Los Angeles County Department of Public Works and some cities have on-going activities that reduce stormwater/urban runoff pollutant loads. These activities include periodic catch-basin cleaning and street sweeping, public information on proper disposal of household hazardous waste, and emergency responses to reports of illegal dumping, illicit disposal, illegal connections, and industrial waste spills. The Los Angeles County Department of Public Works also participates and coordinates action with local, State, and Federal agencies responding to spills and illegal dumping reports that threaten surface waters.

12. The Regional Board currently regulates industrial process and point source non-process wastewater and stormwater discharges to storm drain systems through NPDES permits. Point source discharges including stormwater will continue to be regulated by the Regional Board. An information system will be developed and maintained to update pollutant loadings to designated

VOL 16
0133

drainage facilities and water bodies from permitted point source discharges.

13. The State Water Resources Control Board (State Board) adopted a Water Quality Control Policy for the Enclosed Bays and Estuaries of California on May 16, 1974. The policy provides that the discharge of industrial process waters to enclosed bays and estuaries shall be prohibited. Storm water and urban runoff are not considered industrial process waters for the purpose of that policy.

14. The State Board adopted a revised Water Quality Control Plan for Ocean waters of California (Ocean Plan) on March 22, 1990, which amended the Plan adopted on September 22, 1988. The Plan contains water quality objectives for the coastal waters of California.

15. The Regional Board adopted a revised Water Quality Control Plan for the Los Angeles River Basin (Basin Plan) on November 27, 1978. The Basin Plan incorporates the Ocean Plan, and contains water quality objectives for the basin, including the beneficial uses of water bodies.

16. The beneficial uses of water bodies in Los Angeles County and their tributary streams include contact water recreation, non-contact water recreation, wildlife habitat, preservation of rare and endangered species, marine habitat, estuarine habitat, fish migration, fish spawning, industrial service and process supply, agricultural water supply, shellfish harvesting, navigation, commercial and sport fishing, and groundwater recharge.

17. Section 405 of the Water Quality Act of 1987 added Section 402(p) to the Clean Water Act of 1972 to require the Environmental Protection Agency (EPA) to establish regulations for stormwater/urban runoff discharge under the National Pollutant Discharge Elimination System (NPDES).

18. The Federal Clean Water Act allows EPA to delegate its NPDES permitting authority to States with an approved environmental regulatory program. The State of California is one of the delegated States. The Porter-Cologne Act (State Water Code) authorizes the State Board, through its Regional Boards, to regulate and control the discharge of pollutants into waters of the state and tributaries thereto.

19. Although Water Code Section 13263 (a) requires that waste discharge requirements issued by Regional Boards shall include provisions to implement water quality based objectives, numerical water quality standards

VOL 16 0134

VOL 16

are not provided in this Order. Information is not available to establish appropriate numerical limits, and determine locations where permittees shall be made accountable. The requirements in this Order will provide the necessary information while concurrently achieving reductions in pollutant loads to water bodies from stormwater/urban runoff discharges. Numerical water quality objectives will be developed by Board staff for consideration in the permit renewal process and utilized for the evaluation of Best Management Practices.

20. Due to the significance of the Los Angeles County Stormwater/Urban Runoff Program, the Regional Board, in recognition of the need for public involvement and participation in the development and implementation of an effective program will conduct at a minimum an annual workshop, prior to approving plans submitted by Permittees, to solicit comments and to inform the public of the progress of the program. Comments presented will be referred to Los Angeles County for response.

21. Stormwater/urban runoff discharges to drainage facilities that cross County boundaries and Regional Board jurisdictions, and which are regulated under NPDES permits, are the regulatory responsibility of those agencies issuing the permits.

22. The issuance of waste discharge requirements for this discharge is exempt from the provisions of the California Environmental Quality Act (CEQA); Chapter 3 (commencing with Section 21100) of Division 13 of the Public Resources Code in accordance with Water Code Section 13389.

The Board has notified the Permittees and interested agencies and persons of its intent to issue waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

The Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

This Order shall serve as a National Pollutant Discharge Elimination System permit pursuant to Section 402 of the Federal Clean Water Act, or amendments thereto, and shall take effect at the end of ten days from the date of its adoption provided the Regional Administrator, EPA, has no objections.

IT IS HEREBY ORDERED that the Permittees, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder,

0135

and the provisions of the Clean Water Act as amended and regulations and guidelines adopted thereunder, shall comply with the following:

1.0 COMPLIANCE

1.1 The Permittees and Co-Permittees shall comply with the requirements contained in this Order according to the following schedule:

	DRAINAGE BASIN	STARTING DATE FOR COMPLIANCE WITH REQUIREMENTS
I.	Santa Monica Bay	July 1, 1990
II.	Upper Los Angeles River (San Fernando Valley)	July 1, 1992
III.	Upper San Gabriel River (San Gabriel Valley)	July 1, 1992
IV.	Lower Los Angeles River	July 1, 1993
V.	Lower San Gabriel River and Santa Clarita Valley	July 1, 1993

2.0 REQUIREMENTS - YEAR 1

2.1 For each Drainage Basin, prepare and submit to the Regional Board within 12 months of the starting date for compliance, according to the schedule under 1.1:

2.1.1 Water quality data and flow data from 1980 to the present to facilitate identification of sources of pollutants present in discharges from the prioritized drainage basin. "Drainage areas" in the drainage basin are to be reported and the "drainage areas" associated with each drainage basin clearly identified.

VOL 16 0136

For purposes of stormwater/urban runoff, a "drainage area" is defined as a subdivision of a drainage basin which is unique in land use patterns, and pollutant characteristics and loadings.

2.1.2 The 90th percentile value for the water quality parameters, (i) Total Suspended Solids (TSS), and (ii) Oil and Grease, from the data set of all wet weather samples collected from 1980 to the present. These data will be used to establish guidance for early action control of stormwater pollution.

The 90th percentile for a given water quality parameter is defined as the concentration value exceeded in ten percent of the samples of the reference data set.

2.1.3 Additional information of a qualitative nature that would contribute to isolating and identifying sources of problems. Such information should include but not be limited to visual observations of factors exacerbating stormwater contamination, principal land use classifications and Standard Industrial Code (SIC) categories of facilities in "drainage areas", and a description of soils, dumps, landfills, waste disposal sites and Resource Conservation and Recovery Act (RCRA) facilities associated with each area.

2.1.4 Monthly precipitation data from rain gauge stations, relevant to the drainage basin, for the years 1980 to the present, and an estimate of the area of impervious surfaces (including paved areas and building roofs) within each "drainage area".

2.1.5 Documentation of existing procedures to detect and address illegal discharges and illicit disposal practices.

2.1.6 Documentation of existing practices and improvement plans to control pollutants in stormwater/urban runoff from construction sites.

2.1.7 Documentation of existing stormwater/urban runoff management practices and existing Best Management Practices (BMPs) for the control of pollutants in discharges from residential, commercial and industrial areas.

For purposes of this permit, a Best Management Practice is defined as a stormwater quality management practice that has been demonstrated to reduce stormwater/urban runoff constituents of concern in studies in the United States and elsewhere, or a stormwater/urban runoff quality management practice that can significantly control stormwater/urban runoff pollution.

VOL 16 0137

VOL 16

2.1.8 Plan with schedule of implementation, for approval by the Executive Officer, of early action BMPs.

For purposes of this permit, an early action BMP is defined as an existing stormwater/urban runoff quality management practice that is optimized to the maximum extent practicable (MEP) in efficiency for the control of stormwater runoff pollution, such as improving the frequency of storm drain catchment basin cleaning or the stricter enforcement of existing regulations, or a BMP that is not specific to stormwater/urban runoff constituents or "drainage area" in its constituent removal capacity and can be applied on a system-wide basis, such as public outreach and educational programs.

For purposes of this permit, maximum extent practicable means to the maximum extent possible, taking into account equitable considerations of synergistic, additive and competing factors, including but not limited to gravity of the problem, fiscal feasibility, public health risks, societal concern, and social benefits.

The Principal-Permittees, in the submittal of plans and schedules to the Executive Officer, shall demonstrate that public input has been obtained.

For purposes of this permit, public input is demonstrated by, (i) disseminating the notice of availability of plans for review and comment, to the public at large, environmental groups, Federal, State and local officials and other interested parties, and (ii) addressing concerns expressed by the public.

The Board may modify the plans in response to public input received at the Board during its comment/review period. Permittees are required to implement the original or modified plan on approval by the Executive Officer.

2.1.9 A workplan for the development of a stormwater/urban runoff monitoring program, for approval by the Executive Officer, to include but not be limited to the following information :

- o listing of constituents and parameters to be monitored and the rationale for their choice.
- o listing of monitoring locations and the rationale for their choice.
- o listing of sampling methodology of choice and frequency of sampling for both wet weather and dry weather flow.
- o supplementary information that influences the design of the monitoring plan.

0138

R0061538

The Principal-Permittee, in the submittal of the workplan to the Executive Officer, shall demonstrate that public input has been obtained.

2.1.10 Documentation that each Permittee, individually and/or jointly, through the establishment of a joint powers authority or a stormwater utility, possesses adequate legal authority to operate and manage stormwater/urban runoff quality management programs, and/or plans to obtain the necessary legal authority to regulate illegal discharges and illicit disposal practices into storm drains, and to prosecute violators.

3.0 REQUIREMENTS - YEAR 2

3.1 For each Drainage Basin, prepare and submit to the Regional Board, for approval by the Executive Officer, within 24 months of the starting date of compliance, according to the schedule under 1.1:

3.1.1 A monitoring program based on the approved workplan. This program shall be designed to:

- detect accurately the constituents and parameters of concern, in discharges indicated in the workplan, and to identify their possible sources.
- identify illegal dischargers and/or locations of illicit disposal practices.

Monitoring reports for this program shall be submitted according to the format and frequency to be approved by the Executive Officer.

3.1.2 Plan with schedule of implementation for additional BMPs, judged appropriate for each city or drainage basin, to control pollutants from residential, commercial and industrial sites to the maximum extent practicable.

Both structural and non-structural BMP measures are to be evaluated at the MEP standard. Examples of non-structural measures include catch basin cleaning, street sweeping and public education, while controls such as detention/retention basins, first flush diversions, grassy swales and porous pavements are examples of structural measures.

VOL 16 0139

3.1.3 Plan with schedule of implementation of procedures to detect and eliminate illegal discharges and illicit disposal practices.

3.1.4 Plan with schedule of implementation of measures to control pollutants in surface runoff from construction sites.

The Principal Permittee, in the submittal of plans and schedules (items 3.1.2, 3.1.3, and 3.1.4) to the Executive Officer shall demonstrate that public input has been obtained. The Board may modify the plans in response to public input received at the Board during its comment/review period. Permittees are required to implement the original or modified plans on approval by the Executive Officer.

3.2 Evidence of satisfactory progress of implementation of plan and schedule for early action BMPs.

3.3 Evidence of all requisite legal authority to regulate illegal discharges and illicit disposal practices to drainage facilities, and to prosecute violators.

4.0 REQUIREMENTS - YEAR 3

4.1 For each Drainage Basin, submit to the Regional Board, within 36 months of the starting date of compliance, according to the schedule under 1.1, the following:

4.1.1 Evidence of satisfactory progress of implementation of plan and schedule for early action BMPs and additional BMPs.

4.1.2 Evidence of implementation and progress of procedures to detect and eliminate illegal discharges and eliminate illicit disposal practices.

4.1.3 Evidence of implementation and progress of measures to control pollutants in surface runoff from construction sites.

5.0 EXPIRATION AND RENEWAL

5.1 This Order expires on June 18, 1995.

5.2 The Permittees shall file a report of waste discharge (ROWD), not later than 180 days before the expiration date, as application for reissuance of waste discharge requirements. This report of waste discharge shall include but not be limited to the following:

VOL 16
0140
R0061540

5.2.1 Summary of the results of the monitoring program.

5.2.2 Summary of BMPs implemented and evaluations of their effectiveness.

5.2.3 Summary of procedures implemented to detect illegal discharges and illicit disposal practices and an evaluation of their effectiveness.

5.2.4 Summary of measures implemented to control pollutants in surface runoff from construction sites and an evaluation of their effectiveness.

5.2.5 Evaluation of the need for additional BMPs, source control, and/or structural control measures.

5.2.6 Proposed plan of stormwater/urban runoff quality management activities that will be undertaken during the term of the next permit.

I, Robert P. Ghirelli, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on June 18, 1990.

Robert P. Ghirelli

California Regional Water
Santa Ana

July 13,

ITEM: 11

SUBJECT: Waste Discharge Requirements for the Riverside County Flood Control & Water Conservation District, the County of Riverside, and the Incorporated Cities of Riverside County Within the Santa Ana Region, Stormwater Runoff Management Program, Riverside County, Order No. 90-104 (NPDES No. CA 8000192)

DISCUSSION:

See attached Fact Sheet.

RECOMMENDATION:

Adopt Order No. 90-104, NPDES No. CA 8000192, as presented.

In addition to the dischargers, comments were solicited from the following agencies and/or persons:

U. S. Environmental Protection Agency - Robert Wills, Pretreatment, Sludge, and Stormwater Section
U.S. Army District, Los Angeles, Corps of Engineers - Permits Section
NOAA, National Marine Fisheries Service
U.S. Fish and Wildlife Service
State Water Resources Control Board - Ted Cobb, Office of the Chief Counsel
State Water Resources Control Board - Archie Matthews, Division of Water Quality
State Department of Water Resources - Los Angeles
California Regional Water Quality Control Board, San Francisco Bay Region (2) - Tom Mumley
California Regional Water Quality Control Board, Los Angeles Region (4) - David Gildersleeve
California Regional Water Quality Control Board, Central Valley Region (5) - Wayne Pierson
California Regional Water Quality Control Board, Colorado River Basin Region (7)
California Regional Water Quality Control Board, San Diego Region (9) - Bruce Posthumus
State Department of Fish and Game - Marine Resources Region
State Department of Health Services - Santa Ana
State Department of Health Services - San Diego
State Department of Health Services - San Bernardino
State Department of Parks and Recreation - Henry R. Agonia
Orange County Health Care Agency - Robert Marryman

Riverside, CA 92506-4298

FACT SHEET

PROJECT

The attached pages contain information concerning an application for waste discharge requirements and a National Pollutant Discharge Elimination System (NPDES) permit. Order No. 90-104, NPDES No. CA 8000192, prescribes waste discharge requirements for urban stormwater runoff from the cities and the unincorporated areas in Riverside County within the jurisdiction of the Santa Ana Regional Board. On May 8, 1990, the Riverside County Flood Control & Water Conservation District (RCFC&WCD) and the County of Riverside, in cooperation with the cities of Beaumont, Corona, Hemet, Lake Elsinore, Moreno Valley, Norco, Perris, Riverside, and San Jacinto (hereinafter collectively referred to as the dischargers), submitted NPDES Application No. CA 8000180 for an areawide stormwater discharge permit under the National Pollutant Discharge Elimination System (NPDES). As part of the permit application, a topographic map, storm drain system maps, listings of cities and entities participating in this program, and copies of ordinances relevant to the urban stormwater runoff from the Cities of Riverside and Moreno Valley were submitted. Copies of ordinances from the remaining seven cities participating in this program will be submitted at a later date.

PROJECT AREA

The permitted area is delineated by the San Bernardino-Riverside County boundary line on the north and northwest, the Orange Riverside County boundary line on the west, the Santa Ana-San Diego Regional Board boundary line on the south, and the Santa Ana Colorado River Basin Regional Board boundary line on the east (see Attachment "A").

CLEAN WATER ACT REQUIREMENTS

The Federal Clean Water Act (CWA) allows the U. S. Environmental Protection Agency (EPA) to delegate its NPDES permitting authority to states with an approved environmental regulatory program. The State of California is one of the delegated states. The Porter Cologne Act (California Water Code) authorizes the State Board, through its Regional Boards, to regulate and control the discharge of pollutants into waters of the state and tributaries thereto.

0150

R0061550

CLEAN WATER ACT REQUIREMENTS - CONT'D

Section 405 of the Water Quality Act (WQA) of 1987 added Section 402(p) to the CWA. Pursuant to Section 402(p)(4) of the CWA, the EPA is required to promulgate regulations for stormwater permit applications for stormwater discharges associated with industrial activities and municipal separate storm drain systems serving a population of 100,000 or more. Section 402 (p)(4) of the CWA also requires dischargers of stormwater associated with industrial activities and municipal separate storm drain systems serving a population of 250,000 or more to file stormwater permit applications by February 4, 1990.

On December 7, 1988, EPA published its proposed regulations in the Federal Register to solicit public comments. Final regulations are tentatively scheduled to be promulgated on July 20, 1990 and to be published in the Federal Register on August 4, 1990. In the absence of final stormwater regulations, a permit governing municipal stormwater discharges should meet both the statutory requirements of Section 402 (p)(3)(B) and all requirements applicable to a NPDES permit issued under the issuing authority's discretionary authority in accordance with Section 402 (a)(1)(B) of the CWA.

AREAWIDE STORMWATER PERMIT

To regulate and control stormwater discharges from the Riverside County area to the Riverside County storm drain systems, an areawide approach is essential. The entire storm drain system is not controlled by a single entity; the RCFC&WCD, several cities, and the State Department of Transportation (Caltrans) manage the system. In addition to the cities and the RCFC&WCD, there are a number of other significant contributors of urban stormwater runoff to these storm drain systems. These include: large institutions such as the State University system, schools, hospitals etc.; federal facilities such as military sites etc.; state agencies such as Caltrans; water and wastewater management agencies such as Eastern & Western Municipal Water Districts; the National Forest Service; and state parks. The management and control of the entire flood control system cannot be effectively carried out without the cooperation and efforts of all these entities. Also, it would not be meaningful to issue a separate stormwater permit to each of the entities within the permitted area whose land/facilities drain into the county storm drain systems. The Regional Board and a majority of the cities and the county have concluded that the best management option for the Riverside County area is to issue an areawide stormwater permit.

VOL 16 0151

AREAWIDE STORMWATER PERMIT - CONT'D

Some of the RCFC&WCD storm drain systems discharge into storm drain systems controlled by other entities, such as the Orange County Flood Control District, which is regulated under the Regional Board's Order No. 90-71, NPDES No. CA 8000180. Some of the storm drain systems discharge into drainage areas of Riverside County within the Colorado River Basin and San Diego Regional Boards' jurisdiction. Permit requirements for stormwater runoff from the drainage areas of Riverside County within the jurisdiction of the San Diego and Colorado River Basin Regional Boards will be addressed by these Regional Boards.

COORDINATION WITH OTHER REGIONAL AGENCIES

In developing best management practices and monitoring programs, consultation/coordination with other flood control districts and other regional boards is essential. Regional Board staff will coordinate the program with other regional boards and other flood control districts/cities on an "as needed" basis.

EXISTING FACILITIES AND PROGRAMS

Within the Santa Ana Region, the RCFC&WCD serves a population of approximately 0.8 million, occupying an area of approximately 1,300 square miles. The District's system includes an estimated 200 miles of opened and closed storm channels. The cities' systems include an estimated 57 miles of opened and closed storm channels. Approximately one-quarter (1/4) of Riverside County drains into water bodies within this Regional Board's jurisdiction. Stormwater discharges from urbanized areas consist mainly of surface runoff from residential, commercial, and industrial developments. In addition, there are stormwater discharges from agricultural land uses, including dairy operations. The constituents of concern and significance in these discharges are: total and fecal coliform, enterococcus, total suspended solids, biochemical oxygen demand (BOD), chemical oxygen demand (COD), total organic carbon (TOC), oil and grease (O&G), heavy metals, nutrients, base/neutral and acid extractibles, pesticides, herbicides, and petroleum hydrocarbon components.

The RCFC&WCD has an active surface water quality monitoring program in the permit area. This monitoring program includes 12 water quality monitoring stations, 11 continuous stream gaging stations and 6 crest stage gaging stations, and 51 automatic precipitation gaging stations. Water quality sampling is performed quarterly in January, April, July, and October under dry weather conditions. Samples collected are analyzed for nutrients, metals, minerals, specific conductance, total filtrable residue, and pH. Most of the water quality monitoring stations are located at stormwater drain systems in the Santa Ana River area.

VOL 16 0152

EXISTING FACILITIES AND PROGRAMS - CONT'D

To protect the beneficial uses of waters of the state, the pollutants from all sources need to be controlled. Recognizing this, and the fact that stormwater discharges contain significant amounts of pollutants, the RCFC&WCD, the County of Riverside, the incorporated cities of Riverside County, and the Regional Board have all agreed that an areawide stormwater permit is the most effective way to develop and implement a comprehensive stormwater management program in a timely manner. This areawide stormwater permit contains requirements with time schedules that will allow the County of Riverside and the cities to address water quality problems caused by urban stormwater runoff by developing and implementing management programs to reduce pollutants in stormwater discharges to the maximum extent practicable.

PERMIT REQUIREMENTS

In accordance with Section 402(p)(3), as part of a program to reduce the pollutants in stormwater discharges to the maximum extent practicable, the dischargers are required to submit existing management plans and programs being implemented in the localities, and information that could lead to successful identification of illegal discharges and sources of pollutants in stormwater discharges. In addition, the dischargers will be required to adopt and implement effective management programs and control measures in accordance with a time schedule approved by the Executive Officer of the Regional Board. Due to the large number of water bodies covered in this order, it is necessary to prioritize water bodies for the development and implementation of the stormwater management program. The stormwater management program will be developed and implemented in two phases, Phase I and Phase II. In Phase I, the dischargers will be required to submit existing stormwater qualitative data and to develop stormwater management and monitoring programs for those water bodies where beneficial uses are threatened or impaired due to runoff of stormwater and urban nuisance water. These water bodies include Reaches 3 and 4 of the Santa Ana River, Prado area streams, San Gabriel Mountain Streams (Valley Reaches), Lake Evans, Lee Lake, Lake Mathews, Lake Elsinore, and Canyon Lake. In Phase II, the dischargers will be required to submit existing stormwater qualitative data and to develop stormwater management and monitoring programs for the remaining water bodies which include the San Jacinto River and its tributaries, San Timoteo Creek and its tributaries, Lake Perris, Lake Fulmor, Lake Hemet, Lake Norconian, and Mockingbird Reservoir.

If existing management programs are not effective in controlling pollutant loading and in achieving the water quality objectives of the receiving waters, additional programs shall be developed and implemented.

VOL 16 0153

PERMIT REQUIREMENTS - CONT'D

The permit also requires the development and implementation of management programs (best management practices) during the life of the permit such that the quality of stormwater discharged can be improved and the water quality objectives of the receiving waters can be met ultimately. It is also expected that the beneficial uses of the receiving waters will be protected through implementation of best management practices.

Currently, the RCFC&WCD has 12 monitoring stations throughout its system. The proposed order requires the dischargers to submit a stormwater system monitoring program that will meet the objectives, as outlined in Item VII.1., of the program.

BENEFICIAL USES

Stormwater flows which are discharged to storm drain systems in Riverside County are tributary to various water bodies (inland surface streams and lake and reservoirs) of the state. The beneficial uses of these water bodies include municipal and domestic supply, agricultural supply, industrial service supply, industrial process supply, groundwater recharge, water contact recreation, non-contact water recreation, warm freshwater habitat, cold freshwater habitat, wildlife habitat, and preservation of rare and endangered species. The ultimate goal of this stormwater management program is to protect the beneficial uses of the receiving waters.

ANTIDEGRADATION ANALYSIS

The Regional Board has considered whether a complete antidegradation analysis, pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16, is required for the stormwater discharges. The Regional Board finds that the pollutant loading rates to the receiving waters will be reduced with the implementation of the requirements in this order. As a result, the quality of stormwater discharges and receiving waters will be improved, thereby protecting the beneficial uses of waters of the United States. This discharge is consistent with the federal and state antidegradation requirements and a complete antidegradation analysis is not necessary.

VOL 16 0154

PUBLIC WORKSHOP

The Regional Board recognizes the significance of Riverside County's Stormwater/Urban Runoff Management Program and will conduct at least one workshop every year during the term of this permit to discuss the progress of the stormwater management program. The details of the annual workshop will be published in local newspapers and mailed to interested parties. Persons wishing to be included in the mailing list for any of the items related to this permit may register their name, mailing address and phone number with the Regional Board office at the address given below.

PUBLIC HEARING

The Regional Board will hold a public hearing regarding the proposed waste discharge requirements. The public hearing is scheduled to be held on Friday, July 13, 1990, at 9:00 a.m. at the City Council Chambers in Riverside. Further information regarding the conduct and nature of the public hearing concerning these waste discharge requirements may be obtained by writing or visiting the Santa Ana Regional Board office, 6809 Indiana Avenue, Suite 200, Riverside.

WRITTEN COMMENTS

Interested persons are invited to submit written comments on the proposed waste discharge requirements and the Executive Officer's proposed determinations. Comments should be submitted by June 22, 1990, either in person or by mail to:

Joanne Lee
California Regional Water Quality Control Board
Santa Ana Region
6809 Indiana Avenue, Suite 200
Riverside, CA 92506-4298

INFORMATION AND COPYING

Persons wishing further information may write to the above address or call Joanne Lee at (714)782-4130. Copies of the application, proposed waste discharge requirements, and other documents (other than those which the Executive Officer maintains as confidential) are available at the Regional Board office for inspection and copying by appointment scheduled between the hours of 10:00 a.m. and 4:00 p.m., Monday through Thursday (excluding holidays).

REGISTER OF INTERESTED PERSONS

Any person interested in a particular application or group of applications may leave his name, address, and phone number as part of the file for an application. Copies of tentative waste discharge requirements will be mailed to all interested parties.

VOL 16 0155

VOL 16 0156

California Regional Water Quality Control Board
Santa Ana Region

ORDER NO. 90-104

NPDES No. CA 8000192

Waste Discharge Requirements
for
the Riverside County Flood Control & Water Conservation District
and
the County of Riverside, and
the Incorporated Cities of Riverside County Within the Santa Ana Region
Areawide Urban Stormwater Runoff
Riverside County

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Board), finds that:

1. On May 8, 1990, the County of Riverside and the Riverside County Flood Control & Water Conservation District (RCFC&WCD), in cooperation with the cities of Beaumont, Corona, Hemet, Lake Elsinore, Moreno Valley, Norco, Perris, Riverside, and San Jacinto (hereinafter collectively referred to as the dischargers), submitted NPDES Application No. CA 8000192 for an areawide stormwater discharge permit under the National Pollutant Discharge Elimination System (NPDES).

2. The 1972 Clean Water Act (CWA) recognised the need to prohibit the discharge of pollutants to surface water bodies from point sources such as industrial facilities and municipal sewage treatment plants. The discharges of pollutants from point sources are regulated by the NPDES permit system, which required technology-based controls for treatment of wastewater. Stormwater point source discharges were exempt from the NPDES permitting requirements unless these discharges were contaminated by industrial/commercial activity. The Regional Board recognised the water quality problems associated with stormwater discharges from industrial facilities and has issued a number of stormwater permits for such facilities in accordance with the EPA regulations.

3. In 1976, the United States Environmental Protection Agency (EPA) issued new regulations establishing a comprehensive permitting program for all stormwater discharges except for rural runoff uncontaminated by industrial/commercial activity. Channelised stormwater runoff from rural areas continued to be defined as nonpoint source unless designated otherwise by the permitting authority.

R0061556

4. Since 1976, EPA has issued several revisions to the stormwater regulations. Section 405 of the Water Quality Act (WQA) of 1987 added Section 402(p) to the CWA. Pursuant to Section 402(p)(4) of the CWA, EPA is required to promulgate regulations for stormwater permit applications for stormwater discharges associated with industrial activities and municipal separate storm drain systems serving a population of 100,000 or more. Section 402 (p)(4) of the CWA also requires dischargers of stormwater associated with industrial activities and municipal separate storm drain systems serving a population of 250,000 or more to file stormwater permit applications by February 4, 1990.

5. On December 7, 1988, EPA published its proposed regulations in the Federal Register to solicit public comments. Final regulations are tentatively scheduled to be promulgated on July 20, 1990 and to be published in the Federal Register on August 4, 1990. In the absence of final stormwater regulations, a permit governing municipal stormwater discharges should meet both the statutory requirements of Section 402 (p)(3)(B) and all requirements applicable to a NPDES permit issued under the issuing authority's discretionary authority in accordance with Section 402 (a)(1)(B) of the CWA.

6. The beneficial uses of a number of water bodies within Riverside County are threatened or impaired wholly or in part due to urban stormwater runoff and nuisance water. These water bodies include the Santa Ana River (SAR), Reaches 3 and 4, Canyon Lake, Lake Elsinore, Lake Evans, and Lake Mathews. A comprehensive stormwater and urban runoff management and regulatory program is essential for the protection of the water resources of the Region. The RCFC&WCD, the County of Riverside, the cities in Riverside County, and the Regional Board have recognized this fact, and as a first step towards protecting water quality in the area, a comprehensive management program is being developed. This order outlines the existing programs and specifies additional requirements to achieve water quality objectives for the Riverside County drainage areas. The intent of this permit is to regulate pollutant discharges and improve water quality in the Region in a timely manner.

VOL 16 0157

7. Within the Santa Ana Region, the RCFC&WCD, serves a population of approximately 0.8 million, occupying an area of approximately 1,300 square miles. The District's system includes an estimated 200 miles of opened and closed storm channels and the cities' systems include an estimated 57 miles of opened and closed storm channels. Approximately one-quarter (1/4) of the entire Riverside County area drains into water bodies within this Regional Board's jurisdiction. The project area is shown on Attachment "A" and the drainage areas are characterised as shown on Attachment "B". Approximately 5/8 of the Riverside County drainage areas is within the jurisdiction of the Colorado River Basin Regional Board and the remaining one-eighth (1/8) of the Riverside County drainage areas is within the jurisdiction of the San Diego Regional Board. Urbanization of the drainage areas within the Colorado River Basin and San Diego Regional Boards is minimal in comparison to that in the drainage areas under the Santa Ana Regional Board's jurisdiction. Permit requirements for stormwater runoff from the drainage areas of Riverside County within the jurisdiction of the San Diego and Colorado River Basin Regional Boards will be addressed by these Regional Boards.

8. The discharges consist of surface runoff generated from various land uses in all the hydrologic drainage areas which discharge into water bodies in Riverside County. The quality of these discharges varies considerably and is affected by land use activities, basin hydrology and geology, season, the frequency and duration of storm events, and the presence of illicit connections to the storm drain systems. The constituents of concern and significance in these discharges are: total and fecal coliform, enterococcus, total suspended solids, biochemical oxygen demand (BOD), chemical oxygen demand (COD), total organic carbon (TOC), oil and grease, heavy metals, nutrients, base/neutral and acid extractibles, pesticides, herbicides, and petroleum hydrocarbon components.

9. There are several entities whose land/facilities drain into the Riverside County storm drain systems. The RCFC&WCD has control over approximately 85% percent of the storm drain systems within the Region and has agreed to be the major responsible party in implementing the provisions of this order. The remaining storm sewer systems are owned and operated by the cities within the county and by the State Department of Transportation (Caltrans). The County of Riverside, and the incorporated cities within the county have agreed to

VOL 16 0158

9. (cont'd)

cooperate with the RCFC&WCD in controlling and improving the quality of urban runoff from their respective areas. The RCFC&WCD has been named as the "principal permittee" and the County of Riverside and the incorporated cities have been named as the "co-permittees". Attachment "C" lists the incorporated cities with their 1990 estimated populations. Of the nine cities listed, there are two cities with an estimated 1990 population over 100,000.

10. Due to the enormous variability in stormwater quality and the complexity of the urban runoff management program, this areawide stormwater permit is categorized as a major NPDES permit. This areawide stormwater permit requires all entities discharging stormwater/urban runoff into the storm drain systems or any surface water bodies to have appropriate controls for proper management of this runoff. The Regional Board has the discretion and authority to require non-cooperating entities to participate in this areawide permit or obtain individual stormwater discharge permits, pursuant to 40 CFR 122.26(a). The entities listed in Attachment "D" are considered as potential dischargers of stormwater to the Riverside County drainage areas. It is expected that these entities will also work cooperatively with the County of Riverside to manage urban runoff.

11. The RCFC&WCD, as the "principal permittee", will obtain the cooperation of all entities in implementing the provisions of this order. The dischargers have agreed upon the responsibilities as outlined in the draft June 6, 1990 Implementation Agreement. In general, the RCFC&WCD, as the "principal permittee", will be responsible for preparing operating budgets, preparing and monitoring the implementation programs, coordinating and submitting reports to the Regional Board, and conducting inspections on District's storm drain systems. The County of Riverside and the incorporated cities, as the "co-permittees", will develop site-specific compliance requirements, perform compliance monitoring and inspections, submit storm drain maps and compliance reports to the RCFC&WCD, exercise enforcement authority for achieving compliance, and review and implement stormwater management programs.

VOL 16 0159

12. The RCFC&WCD obtains its authority to control pollutants in stormwater discharges, to prohibit illegal discharges and control spills, and to require compliance and carry out inspections of the storm drain systems in the County of Riverside from the Riverside County Flood Control and Water Conservation District Act and various county ordinances which address industrial wastes and waste discharges, and land use within the unincorporated areas of Riverside County and contract cities. The "co-permittees" have various forms of legal authority in place, such as charters, State Code provisions for General Law cities, city ordinances, and applicable portions of municipal codes and the State Water Code, to regulate stormwater/urban runoff discharges.

13. The RCFC&WCD has an active surface water quality monitoring program in the permit area. This monitoring program includes 12 water quality monitoring stations, 11 continuous stream gaging stations and 6 crest stage gaging stations, and 51 automatic precipitation gaging stations. Water quality sampling is performed quarterly in January, April, July, and October under dry weather conditions. Samples collected are analyzed for nutrients, metals, minerals, specific conductance, total filtrable residue, and pH. Most of the water quality monitoring stations are located at stormwater drain systems in the Santa Ana River area.

14. A Water Quality Control Plan was adopted by the Regional Board on May 13, 1983. The Plan contains water quality objectives and beneficial uses of waters in the Santa Ana Region. On July 14, 1989, the Regional Board adopted a Basin Plan amendment, incorporating revised beneficial use designations for the ground and surface waters of the Region.

15. The requirements contained in this order are necessary to implement the Water Quality Control Plan.

16. An attempt has been made to incorporate all of the essential elements of the proposed federal stormwater regulations in this permit.

17. Stormwater discharges to the storm drain systems in Riverside County within the Santa Ana Region are tributary to various water bodies of the state. The identified water bodies are as follows (Only a portion of some of the water bodies listed below is within the Santa Ana Regional Board's jurisdiction):

VOL 16 0160

17. (cont'd)

Inland Surface Streams

A. Santa Ana River
Santa Ana River, Reaches 3 and 4

B. Prado Area Streams
Tequesquite Arroyo (Sycamore Creek)
Chino Creek
Temescal Creek, Reaches 1, 2, 3, 4, 5, and 6
Coldwater Canyon Creek
Bedford Canyon Creek
Other tributaries to these Creeks.

C. San Gabriel Mountain Streams (Valley Reaches)
Day and East Etiwanda Creek
Cucamonga Creek

D. San Jacinto River Basin
San Jacinto River, Reaches 1, 2, 3, 4, 5, 6, and 7
Bautista Creek - Headwaters to Debris Dam
Strawberry Creek and San Jacinto River, North Fork
Fuller Mill Creek
Stone Creek
Salt Creek
Other tributaries: Indian, Murkey, Poppet and Potrero Creeks, and other tributaries to these Creeks

E. San Timoteo Creek Area Streams
San Timoteo Creek, Reaches 3 and 4
Little San Gorgonio Creek
Yucaipa Creek
Other Tributaries to these Creeks - Valley Reaches
Other Tributaries to these Creeks - Mountain Reaches

Lake and Reservoirs

F. Lake Evans
G. Lee Lake
H. Lake Mathews
I. Mockingbird Reservoir
J. Lake Norconian
K. Canyon Lake
L. Lake Elsinore
M. Lake Fulmor
N. Lake Hemet
O. Lake Perris

VOL 16 0161

17. (cont'd)

The beneficial uses of these water bodies include municipal and domestic supply (MUN), agricultural supply (AGR), industrial service supply (IND), industrial process supply (PROC), groundwater recharge (GWR), water contact recreation (REC-1), non-contact water recreation (REC-2), warm freshwater habitat (WARM), cold freshwater habitat (COLD), wildlife habitat (WILD), and preservation of rare and endangered species (RARE). The beneficial uses of individual water bodies are shown on Attachment "E".

18. Stormwater discharged from the storm drain systems operated by the County of San Bernardino drain into various water bodies in the project area. These water bodies include the Santa Ana River and San Timoteo Creek. The County of San Bernardino will also be required to obtain an areawide stormwater permit for effective control of the pollutants in the stormwater runoff discharged from its storm drain systems.

19. Due to the large number of water bodies covered in this order, it is necessary to prioritise these water bodies for the development and implementation of the stormwater management program to effectively control the pollutants in the stormwater discharges. The stormwater management program will be developed and implemented in two phases, Phase I and Phase II. In Phase I, the dischargers will be required to submit existing stormwater qualitative data and develop management and monitoring programs for those water bodies where beneficial uses are threatened or impaired due to runoff of stormwater and urban nuisance water. These water bodies include Reaches 3 and 4 of the Santa Ana River, Prado area streams, Temescal Creek and its tributaries, Lake Evans, Lee Lake, Lake Mathews, Lake Elsinore, and Canyon Lake. In Phase II, the dischargers will be required to submit existing stormwater qualitative data and to develop stormwater management and monitoring programs for the remaining water bodies which include the San Jacinto River and its tributaries, San Timoteo Creek and its tributaries, Lake Perris, Lake Fulmor, Lake Hemet, Lake Norconian, and Mockingbird Reservoir.

VOL 16 0162

20. Numeric and narrative water quality standards exist for the water bodies listed in Item No. 17, above. Currently, this permit does not contain numeric limitations for any constituents because the impact of stormwater discharges on the water quality of the above named receiving waters has not been fully determined. Extensive water quality monitoring and analysis of the data are essential to make that determination. This order requires the dischargers continue to monitor the stormwater discharges or begin monitoring as necessary, and to analyze the data. Additionally, the order also requires development and implementation of best management practices[1] (BMPs) in accordance with the WQA of 1987. It is anticipated that with the implementation of BMPs by the dischargers, the pollutants in the stormwater runoff will be reduced and the quality of the receiving waters will be improved. The ultimate goal of the urban stormwater runoff management program is to attain water quality consistent with the water quality objectives for the receiving waters to protect the beneficial uses.

21. With respect to industrial activities, the Regional Board currently regulates discharges of point source process wastewater and non-process wastewater and stormwater discharges to storm drain systems through NPDES permits. Point source discharges other than stormwater will continue to be regulated by the Regional Board. Industrial stormwater dischargers are required to cooperate with the RCFC&WCD to control the discharge of pollutants in the stormwater runoff from individual facilities or to obtain individual industrial stormwater discharge permits from the Regional Board.

22. Recognizing the need for public involvement and participation in the development and implementation of an effective stormwater/urban runoff management program, the Regional Board will conduct at least one workshop each year during the term of this permit. The purposes of the workshops will be to solicit comments and to inform the public of the progress of the program. Written comments submitted will be forwarded to the State Board, EPA, and the RCFC&WCD for their review and comments.

---

[1] Best Management Practices (BMPs) are water quality management practices that are maximized in efficiency for the control of stormwater runoff pollution.

VOL 16 0163

23. In accordance with California Water Code Section 13389, the issuance of waste discharge requirements for this discharge is exempt from those provisions of the California Environmental Quality Act contained in Chapter 3 (commencing with Section 21100), Division 13 of the Public Resources Code.

24. The Regional Board has considered an antidegradation analysis, pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16, for this discharge. The Regional Board finds that the stormwater discharges are consistent with the federal and state antidegradation requirements and a complete antidegradation analysis is not necessary.

25. The Regional Board has notified the dischargers and interested agencies and persons of its intent to issue waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

26. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

IT IS HEREBY ORDERED that the dischargers, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and regulations and guidelines adopted thereunder, shall comply with the following:

I. RESPONSIBILITIES OF PRINCIPAL PERMITTEE

The principal permittee shall be responsible to manage the program overall, including:

1. Administer the Riverside County Flood Control and Water Conservation District Act.

2. Conduct water quality and hydrographic monitoring of the storm drain system outfalls as agreed upon by the Executive Officer.

3. Develop uniform criteria for storm drain system inspections.

4. Conduct inspections of the storm drain systems within its jurisdiction.

5. Implement management programs, monitoring programs, and implementation plans within its jurisdiction as required by this order.

VOL 16 0164

I. RESPONSIBILITIES OF PRINCIPAL PERMITTEE - CONT'D

6. Prepare and submit to the Regional Board all the reports, plans, and programs as required in this order.

7. Monitor the implementation of the plans and programs and determine their effectiveness in attaining water quality objectives.

8. Coordinate all the activities with the Regional Board.

9. Enact legislation and ordinances as necessary to establish legal authority.

10. Obtain public input[2] for any proposed management and implementation plans.

11. Pursue enforcement actions as necessary to ensure compliance with stormwater management programs and implementation plans.

12. Respond to emergency situations such as accidental spills, leaks, illegal discharges/illicit connections etc. to prevent or reduce the discharge of pollutants to storm drain systems and waters of the United States.

II. RESPONSIBILITIES OF THE CO-PERMITTEES

The co-permittees shall be responsible to manage the program within its jurisdiction, including:

1. Administer the county and city ordinances.

2. Conduct storm drain system inspections in accordance with the uniform criteria developed by the principal permittee.

3. Conduct and coordinate with the principal permittee any surveys and characterizations needed to identify the pollutant sources and drainage areas.

4. Review and approve management programs, monitoring programs, and implementation plans.

---

[2] Public input is demonstrated by: (1) disseminating the notice of availability of plans for review and comment to the public at large, environmental groups, federal, state and local agencies and other interested parties; and, (2) addressing concerns expressed by the public.

VOL 16 0165

II. RESPONSIBILITIES OF THE CO-PERMITTEES - CONT'D

5. Implement management programs, monitoring programs, and implementation plans within each respective jurisdiction as required by this order.

6. Submit storm drain system maps with periodic revisions as necessary.

7. Prepare and submit all reports to the principal permittee in a timely manner.

8. Enact legislation and ordinances as necessary to establish legal authority.

9. Pursue enforcement actions as necessary to ensure compliance with the stormwater management programs and the implementation plans.

10. Respond to emergency situations such as accidental spills, leaks, illegal discharges/illicit connections, etc. to prevent or reduce the discharge of pollutants to storm drain systems and waters of the United States.

III. GENERAL REQUIREMENTS

1. The dischargers shall prohibit illegal discharges from entering into the municipal storm drain systems. Discharges conditionally allowed to enter storm drain systems are specified in Item V.6.

2. The dischargers shall develop and implement best management practices (BMPs) to control discharge of pollutants to the maximum extent practicable[3] to waters of the United States. The BMPs so developed, along with a time schedule for implementation, shall be submitted for the approval of and/or modification by the Executive Officer of the Regional Board. In developing the best management practices, the dischargers shall consider the water quality objectives of all the receiving water bodies.

---

[3] Maximum Extent Practicable (MEP) means to the maximum extent possible, taking into account equitable considerations of synergistic, additive, and competing factors, including but not limited to, gravity of the problem, fiscal feasibility, public health risks, societal concern, and social benefits.

VOL 16 0166

IV. COMPILATION AND SUBMITTAL OF EXISTING DATA - CONT'D

b. An identification of the drainage areas, more than 50 acres in size, that discharge stormwater to the storm drain systems and of those drainage areas that discharge to storm drain systems with pipe diameters greater than 36 inches.

c. The sizes of these drainage areas (acreage) and the sizes (pipe diameters or approximate dimensions of the storm drain systems) and physical characteristics of the storm drain systems. These physical characteristics shall include, but not be limited to, whether the storm drain system is lined or unlined and whether it has intermittent or continuous flow;

d. The names, locations, and Standard Industrial Codes (SIC) of specific industrial sources and principal land use activities in each drainage area, identified in IV.2.a., above, discharging to the storm drain systems. An estimate of the runoff coefficients for these drainage areas shall also be provided;

e. The locations of present storm drain outfalls discharging to waters of the United States. The name of each receiving water body shall be reported and the location of each outfall shall be indicated on a map;

f. The locations of major structural controls for stormwater discharge (e.g. retention basins, detention basins, etc).

3. Illegal Discharges/Illicit Connections

a. The dischargers shall provide a list of dischargers (permitted and unpermitted) known to exist currently who discharge process or non-process wastewater to the storm drain systems. The dischargers shall also provide any existing procedures used for detecting illegal discharges/illicit connections to the storm drain systems, the rationale for the procedures, and the drainage areas (or cities) in which these programs are practiced; and

b. A description of the present and historic use of ordinances or other controls to prohibit the illegal discharges/illicit connections to storm drain systems;

VOL 16 0167

IV. COMPILATION AND SUBMITTAL OF EXISTING DATA - CONT'D

4. Stormwater Management Program

A description of the existing stormwater/urban runoff management programs and structural and non-structural BMPs implemented by the dischargers.

5. Stormwater/Urban Runoff Monitoring Program

A description of the existing monitoring programs and the rationale for their selection.

6. Pollutant Information

The dischargers shall provide information regarding the discharge of any pollutant required under 40 CFR 122.21(g)(7)(iii) and (iv).

7. Other Pertinent Existing Information

The dischargers shall provide to the Regional Board any other existing information that is pertinent to this permit. For example, a description of drainage areas hydrologic parameters.

8. The dischargers shall submit the above information, IV.1. - IV.7., for various water bodies within the project area in accordance with the following schedule:

Phase	Description of Water Body	Compliance Report Due
I	Santa Ana River, Reaches 3 & 4, Prado area streams, San Gabriel Mountain Streams (Valley Reaches), Lake Evans, Lee Lake, Lake Mathews, Lake Elsinore, and Canyon Lake.	03/31/91
II	San Jacinto River and its tributaries, San Timoteo Creek and its tributaries, Lake Fulmor, and Lake Hemet, Lake Perris, Lake Moroconian, and Mockingbird Reservoir.	03/31/92

VOL 16 0168

V. RECONNAISSANCE SURVEY

1. The dischargers shall submit information from a reconnaissance survey to be conducted at the storm drain systems. The purpose of the survey is to identify illegal discharges/illicit connections to the storm drain systems. The reconnaissance survey field manual and implementation plan for prosecuting violators and eliminating illegal discharges so developed, along with time schedules for implementation, shall be submitted for the approval of and/or modification by the Executive Officer of the Regional Board.

2. By September 30, 1991, a proposed reconnaissance survey field manual, including a time schedule, for Phase I shall be submitted for approval and/or modification by the Executive Officer of the Regional Board. By September 30, 1992, a proposed reconnaissance survey field manual, including a time schedule, for Phase II shall be submitted.

3. The discharger shall implement the reconnaissance survey field manual after consideration of public comments and approval/modification of the manual by the Executive Officer of the Regional Board. By September 30, 1992 and every year thereafter until the completion of the survey, a progress report containing the following information shall be submitted:

   a. Results of the reconnaissance survey, including an analysis of the results.

   b. Additional information that would lead to isolating and identifying sources of illegal discharges/illicit connections to the storm drain systems. Such information should include, but is not limited to, visual observations (e.g. color, turbidity, odor, etc), major land use activities in the surrounding drainage areas, seasonal change of flow, the surrounding hydrogeologic formation, etc.

   c. A listing of any identified or suspected illegal dischargers including the names, locations, and types of the facilities and the names of the storm drain systems and receiving waters the illegal discharges are discharged to.

VOL 16 0169

V. RECONNAISSANCE SURVEY - CONT'D

d. A listing of large industrial facilities (with more than 100 employees) where hazardous/toxic substances are stored and/or used, landfills, hazardous waste disposal, treatment, and/or recovery facilities, and any known spills, leaks or other problems in the area.

e. A discussion on all activities, related to the survey, conducted for the past 12 months.

4. By September 30, 1992, the dischargers shall submit a proposed implementation plan, including a tentative time schedule, for Phase I to prosecute violators and eliminate such discharges to the storm drain systems. By September 30, 1993, a proposed implementation plan to prosecute violators and eliminate illegal discharges/illicit connections shall also be submitted for Phase II. The proposed plan shall also include a description of the legal authorities for prosecuting violators and eliminate or control illicit disposal practices and illegal discharges to the storm drain systems, and a proposed time schedule for obtaining such legal authorities, if necessary.

5. The dischargers shall implement the program for prosecuting violators and eliminate illegal discharges to the storm drain systems after consideration of public comments and approval/modification of the program by the Executive Officer of the Regional Board. By September 30, 1993 and every year thereafter, the discharger shall submit a progress report evaluating the effectiveness of the plan in detecting and eliminating illegal discharges to the storm drain systems.

6. The permittees shall effectively eliminate all identified illegal discharges/illicit connections in the shortest time practicable, and in no case later than July 1, 1995. Those illegal discharges/illicit connections identified after July 1, 1995 shall be eliminated in the shortest time practicable. The following discharges shall not be considered illegal discharges provided the discharges do not cause or contribute to violations of water quality standards and are not significant contributors of pollutants to waters of the United States: discharges composed entirely of stormwater, discharges covered under NPDES permits or waivers/clearances, discharges to storm drain systems form potable water line flushing, fire fighting, landscape irrigation, diverted stream flows, rising groundwaters (not including active dewatering systems), groundwater infiltration as defined at 40 CFR

VOL 16 0170

V. RECONNAISSANCE SURVEY - CONT'D

6. (cont'd)

35.2005(20), discharges from potable water sources, passive foundation drains (not including active groundwater dewatering), air conditioning condensation, irrigation water, water from crawl space pumps, passive footing drains (not including active groundwater dewatering systems), lawn watering, individual residential vehicle washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, street wash waters related to cleaning and maintenance by permittees, or waters not otherwise containing wastes as defined in California Water Code Section 13050 (d). If it is determined that any of the preceding discharges cause or contribute to violations of water quality standards or are significant contributors of pollutants to waters of the United States, the permittees shall prohibit these discharges from entering storm drain systems.

VI. DRAINAGE AREA MANAGEMENT PROGRAM

1. The dischargers shall develop and implement best management practices (BMPs) to control the discharge of pollutants to waters of the United States. The discharger shall submit information pertaining to the proposed stormwater system management programs for approval of and/or modification by the Executive Officer of the Regional Board. The information shall include, but need not be limited to, the following:

a. A brief description of the existing BMPs and stormwater management programs.

b. Proposed modifications to the existing BMPs and stormwater/urban runoff management programs to reduce pollutants in the stormwater discharges from industrial, commercial, and residential areas to the maximum extent practicable. At a minimum, the following shall be considered in developing the BMPs:

Structural Controls

i. For the permitted area, wherever appropriate, structural controls such as first flush diversion, detention/retention basins, infiltration trenches/basins, porous pavement, oil/grease separators, grass swales, wire concentrators, etc.

VOL 16 0171

VI. DRAINAGE AREA MANAGEMENT PROGRAM - CONT'D

Non-Structural Controls

ii. Programs to educate the public on proper disposal of hazardous/toxic wastes. These may include public workshops, meetings, notifications by mail, collection programs for household hazardous wastes, etc.

iii. Management practices such as street sweeping, proper maintenance of streambanks, erosion control structures, etc.

iv. Regulatory approaches such as county and local ordinances, permitting of construction sites, etc.

v. Enforcement programs, established by the county and cities, including response to emergency incidents, field inspections, and identification and elimination of illegal discharges/illicit connections to the storm drain systems.

c. An implementation plan for site-specific BMPs which are required to reduce pollutants in the stormwater discharges from residential, commercial and industrial areas, and construction sites. Requirements for the implementation of BMPs at these sites are described below:

i. New Construction Sites

Runoff from construction sites has the potential to adversely impact the quality of waters of the United States. A full range of structural and non-structural BMPs shall be required at new construction sites. All industrial/commercial construction operations that result in a disturbance of one acre or more of total land area (or a smaller parcel of land which is a part of a larger common development) and residential construction sites that result in a disturbance of five acres or more of total land area (or a smaller parcel of land which is a part of a larger common development) shall be required to develop and implement BMPs, including a long term funding mechanism and commitment to support required maintenance of the BMPs, to control erosion/siltation and contaminated runoff from the construction sites.

VOL 16 0172

VI. DRAINAGE AREA MANAGEMENT PROGRAM - CONT'D

ii. Residential and Commercial/Industrial Sites

Numerous studies have shown that runoff from residential and commercial/industrial areas has contributed a number of pollutants to waters of the United States. As development progresses, the percentage of paved surface increases, the rate of runoff increases, and the amount of pollutants in the runoff also increases. To prevent the increase of pollutants in the stormwater discharges, all new developments and existing facilities with significant redevelopment, irrespective of their size, must develop individual comprehensive, long-term, post construction stormwater management plans, incorporating structural and non-structural BMPs. These management plans shall include a long term funding mechanism and commitment to support required maintenance of the BMPs.

d. A description of the legal authorities for implementing the programs, and a proposed time schedule for obtaining such legal authorities, if necessary.

e. A description of staff, equipment, and funds available to implement the programs.

2. The dischargers shall submit the BMPs so developed, along with a time schedule for implementation, for the approval of and modification by the Executive Officer of the Regional Board in accordance with the following schedule:

Phase	Description of Water Body	Compliance Report Due
I	Santa Ana River, Reaches 3 & 4, Prado area streams, San Gabriel Mountain Streams (Valley Reaches), Lake Evans, Lee Lake, Lake Mathews, Lake Elsinore, and Canyon Lake.	03/31/92
II	San Jacinto River and its tributaries, San Timoteo Creek and its tributaries, Lake Fulmor, and Lake Hemet, Lake Perris, Lake Norconian, and Mockingbird Reservoir.	03/31/93

VOL 16 0173

VI. DRAINAGE AREA MANAGEMENT PROGRAM - CONT'D

3. The dischargers shall implement the BMPs and other stormwater management programs after consideration of public comments and approval/modification of the programs by the Executive Officer of the Regional Board. By October 31, 1992 and every year thereafter, the dischargers shall submit a progress report assessing the reduction of pollutants discharged to waters of the United States and evaluating the effectiveness of the BMPs developed for the stormwater discharges. The dischargers shall also include recommended BMP modifications, with a time schedule for implementation, needed to achieve compliance with any water quality objectives not attained.

VII. STORMWATER SYSTEM MONITORING PROGRAM

1. The discharger shall submit a stormwater system monitoring program for approval of and/or modification by the Executive Officer. The objectives of the stormwater system monitoring program are:

   a. To define the type, magnitude (concentration and mass load), and sources of pollutants in the stormwater system discharges within each permittee's respective jurisdiction so that appropriate pollution prevention and correction measures can be identified;

   b. To evaluate the effectiveness of pollution prevention and correction measures; and

   c. To evaluate the compliance with water quality objectives established for the stormwater system or its components.

2. At a minimum, the stormwater system monitoring program shall include the following:

   a. A brief description of the existing monitoring programs.

   b. For both storm and non-storm conditions, sampling of the stormwater system discharges at major and representative outfalls discharging to waters of the United States to determine the pollutant loading rates to each receiving water body listed in Attachment "E".

VOL 16 0174

VII. STORMWATER SYSTEM MONITORING PROGRAM - CONT'D

c. For both storm and non-storm conditions, a description of the number of monitoring stations, the locations of these monitoring stations, and the rationale for their selection.

d. For both storm and non-storm conditions, a description of the physical, chemical, and biological parameters selected for analysis, the method of analysis, the type of sampling, and the sampling frequency proposed. The rationale for each of these selections shall be provided.

e. Monitoring of the stormwater system discharges to identify illicit connections shall be conducted.

f. Quality assurance and quality control plans for the stormwater system monitoring program shall be submitted.

g. A data base that consolidates all monitoring information shall be maintained.

h. A description of the staff, equipment, and funds available to implement the monitoring program shall be provided.

i. A description of the legal authorities for implementing the program, and a proposed time schedule for obtaining such legal authorities (if necessary) shall be provided.

3. The dischargers shall submit the stormwater monitoring program so developed, along with a time schedule, for various water bodies in the project area in accordance with the following schedule:

Phase	Description of Water Body	Compliance Report Due
I	Santa Ana River, Reaches 3 & 4, Prado area streams, San Gabriel Mountain Streams (Valley Reaches), Lake Evans, Lee Lake, Lake Mathews, Lake Elsinore, and Canyon Lake.	03/31/92
II	San Jacinto River and its tributaries, San Timoteo Creek and its tributaries, Lake Fulmor, and Lake Hemet, Lake Perris, Lake Norconian, and Mockingbird Reservoir.	03/31/93

VOL 16 0175

VII. STORMWATER SYSTEM MONITORING PROGRAM - CONT'D

3. The dischargers shall implement the stormwater system monitoring program after consideration of public comments and approval/modification of the program by the Executive Officer of the Regional Board. By March 31, 1992 and every year thereafter, the dischargers shall submit a report on progress towards implementation of the approved monitoring program.

VIII. RECEIVING WATER MONITORING PROGRAM

1. The discharger shall develop a receiving water monitoring program to assess the effects of pollutants from the stormwater system discharges on receiving water bodies, and to evaluate compliance with water quality objectives of the receiving water bodies. All the water bodies listed in Attachment "E" shall be addressed. The receiving water monitoring program shall be coordinated with the stormwater system monitoring program required under Section VII such that the aforestated objectives of the receiving water monitoring program will be achieved.

2. At a minimum, the receiving water monitoring program shall include the following:

   a. A brief description of the existing monitoring programs.

   b. A description of the number of monitoring stations, the location of these monitoring stations, and the rationale for their selection.

   c. A description of the physical, chemical and biological selected for analysis, the type of sampling, and the sampling frequency proposed. The rationale for each of these selections shall be provided.

   d. Quality assurance and quality control plans for the receiving water monitoring program.

   e. Maintenance of a data base that consolidates all monitoring information. This data base shall be coordinated with the data base required for the stormwater system monitoring program (VII.2.g.).

VOL 16 0176

VIII. RECEIVING WATER MONITORING PROGRAM - CONT'D

3. The dischargers shall submit the receiving water monitoring programs for various water bodies within the project area in accordance with the following schedule:

Phase	Description of Water Bodies	Compliance Report Due
I	Santa Ana River, Reaches 3 & 4, Prado area streams, San Gabriel Mountain Streams (Valley Reaches), Lake Evans, Lee Lake, Lake Mathews, Lake Elsinore, and Canyon Lake.	03/31/92
II	San Jacinto River and its tributaries, San Timoteo Creek and its tributaries, Lake Fulmor, and Lake Hemet, Lake Perris, Lake Moroconian, and Mockingbird Reservoir.	03/31/93

4. The dischargers shall implement the receiving water monitoring program after consideration of public comments and approval/modification of the program by the Executive Officer of the Regional Board. By March 31, 1992 and every year thereafter, the discharger shall submit a report on progress towards implementation of the approved receiving water monitoring program.

IX. FISCAL ANALYSIS

1. By July 31 of each year, a fiscal analysis of the capital and operation and maintenance expenditures necessary to accomplish the activities of the proposed plans and programs shall be performed.

2. By August 31, 1991 and every year thereafter, a fiscal analysis of the capital and operation and maintenance expenditures shall be submitted for review by EPA and the Regional Board.

X. DATA ANALYSIS

1. For the stormwater system monitoring program, the results of the chemical analysis and quantitative data (such as flow, precipitation, and discharge data) shall be compiled for each drainage area, each storm event, and for different times during the same storm event. The mass loading rates for the pollutants of concern shall be calculated.

VOL 16 0177

X. DATA ANALYSIS - CONT'D

2. An evaluation shall be performed for the calculated mass loading rates from the stormwater system monitoring program and the receiving water monitoring program. Any impact of the discharges from the stormwater systems on the receiving waters shall be discussed, starting with the most significantly impacted receiving water bodies. The evaluation shall be concluded with recommendations and the corrective actions proposed for any resulting discrepancies.

3. By January 31, 1993 and every year thereafter, the analysis of all the above data shall be submitted.

XI. PROGRAM ANALYSIS

1. In January of every year, the principal permittee shall conduct an analysis of the effectiveness of the overall stormwater management program. If the water quality objectives of the receiving waters are violated as a result of stormwater/urban runoff discharges, the principal permittee shall identify proposed programs which will result in the attainment of the water quality objectives, and a time schedule to implement the new programs.

2. By March 31, 1993 and every year thereafter, the analysis of the overall program and any proposed programs, to achieve compliance with water quality objectives of water bodies that have not been attained, shall be submitted.

XII. REPORTING

1. All reports shall be signed by the "principal permittee" or duly authorized representative of the dischargers and shall be submitted to EPA and the Regional Board under penalty of perjury.

2. A signed copy of the Implementation Agreement between the RCFC&WCD, the County of Riverside, and the cities shall be submitted by January 31, 1991. Any revisions to the Implementation Agreement shall be forwarded to the Executive Officer within 30 days of approval by all the dischargers.

VOL 16 0178

X. DATA ANALYSIS - CONT'D

2. An evaluation shall be performed for the calculated mass loading rates from the stormwater system monitoring program and the receiving water monitoring program. Any impact of the discharges from the stormwater systems on the receiving waters shall be discussed, starting with the most significantly impacted receiving water bodies. The evaluation shall be concluded with recommendations and the corrective actions proposed for any resulting discrepancies.

3. By January 31, 1993 and every year thereafter, the analysis of all the above data shall be submitted.

XI. PROGRAM ANALYSIS

1. In January of every year, the principal permittee shall conduct an analysis of the effectiveness of the overall stormwater management program. If the water quality objectives of the receiving waters are violated as a result of stormwater/urban runoff discharges, the principal permittee shall identify proposed programs which will result in the attainment of the water quality objectives, and a time schedule to implement the new programs.

2. By March 31, 1993 and every year thereafter, the analysis of the overall program and any proposed programs, to achieve compliance with water quality objectives of water bodies that have not been attained, shall be submitted.

XII. REPORTING

1. All reports shall be signed by the "principal permittee" or duly authorized representative of the dischargers and shall be submitted to EPA and the Regional Board under penalty of perjury.

2. A signed copy of the Implementation Agreement between the RCFC&WCD, the County of Riverside, and the cities shall be submitted by January 31, 1991. Any revisions to the Implementation Agreement shall be forwarded to the Executive Officer within 30 days of approval by all the dischargers.

VOL 16 0179

XII. REPORTING - CONT'D

3. Other reports and information required to be submitted to the Regional Board under the requirements specified above shall be reported in accordance with the following schedule:

XIII. EXPIRATION AND RENEWAL

1. This Order expires on July 1, 1995 and the discharger must file a Report of Waste Discharge in accordance with Title 23, Chapter 3, Subchapter 9 of the California Code of Regulations not later than 180 days in advance of such expiration date as application for issuance of new waste discharge requirements. This report of waste discharge shall include, but is not limited to, the following:

   a. Summary of the results of the monitoring program.

   b. Summary of the BMPs implemented and evaluations of their effectiveness.

   c. Summary of procedures implemented to detect, identify, and eliminate illegal discharges and illicit disposal practices and an evaluation of their effectiveness.

   d. Summary of enforcement procedures and actions taken to require stormwater dischargers to comply with the approved stormwater management programs.

   e. Summary of measures implemented to control pollutants in surface runoff from construction sites and an evaluation of their effectiveness.

   f. Evaluation of the need for additional BMPs, source control, and/or structural control measures.

[18] The first data analysis is due by January 31, 1994.

[19] The first program analysis is due by March 31, 1994.

VOL 16 0183

XIII. EXPIRATION AND RENEWAL - CONT'D

g. Proposed plan of stormwater/urban runoff quality management activities that will be undertaken during the term of the next permit.

h. Any significant changes to the storm drain systems, outfall locations, detention/retention basins, and structural/non-structural controls.

2. This order shall serve as a National Pollutant Discharge Elimination System permit pursuant to Section 402 of the Clean Water Act, or amendments thereto, and shall become effective 10 days after date of its adoption, provided that the Regional Administrator of the Environmental Protection Agency has no objection. If the Regional Administrator objects to its issuance, the permit shall not become effective until such objection is withdrawn.

I, Gerard J. Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on July 13, 1990.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

ORDER NO. 96-105

NPDES NO. CA 0082597

WASTE DISCHARGE REQUIREMENTS FOR COUNTY OF SACRAMENTO CITIES OF SACRAMENTO, FOLSOM, AND GALT AREA-WIDE STORM WATER DISCHARGES FROM MUNICIPAL SEPARATE STORM SEWER SYSTEMS SACRAMENTO COUNTY

The California Regional Water Quality Control Board, Central Valley Region (hereafter Board) finds that:

1. The County of Sacramento, and the cities of Sacramento, Folsom, and Galt (hereafter collectively referred to as Dischargers) have submitted a completed permit application on 3 March 1995, for re-issuance of waste discharge requirements under the National Pollutant Discharge Elimination System (NPDES) to discharge storm water runoff from storm drains and watercourses within the Dischargers' jurisdictions.

2. The Dischargers are currently subject to NPDES area-wide municipal storm water permit, Order No. 90-158 (NPDES No. CA0082597) adopted on 22 June 1990.

3. The County of Sacramento (hereafter referred to as the County) and the City of Sacramento are defined as large municipalities (with populations greater than 250,000) in Appendices H and F, respectively, of Part 122 of Title 40 of the Federal Code of Regulations (40CFR). As such, the County and the City of Sacramento must obtain an NPDES municipal storm water permit for storm water discharges associated with urbanized areas in their respective jurisdictions.

4. The Cities of Galt and Folsom are urbanized areas with populations less than 100,000. Due to their proximity to the urbanized areas of the County, and the location of their storm sewer system discharges relative to discharges from the County's system, the Cities of Galt and Folsom are designated as part of the large municipal separate storm sewer system (40 CFR 122.26(b)(7)(iii)). Attachment A shows Sacramento County and illustrates the relationship of the co-permittees in Sacramento County.

5. As directed by Section 402(p)(4)(a) of the Federal Clean Water Act (CWA), the United States Environmental Protection Agency (hereafter referred to as U.S. EPA) promulgated regulations addressing NPDES permit application requirements for storm water discharges (hereafter referred to as the regulations) on November 16, 1990. The Dischargers' current NPDES permit for storm water discharges was adopted prior to the promulgation of these regulations. The requirements of the Dischargers' current NPDES permit, and subsequent compliance with the permit requirements by the Dischargers, adequately addressed the regulations.

VOL 16

0188

VOL 16
0189

6. The regulations do not address renewal application requirements for storm water discharges from separate municipal storm sewer systems. Renewal application requirements were established by Board staff, in consultation with U.S.EPA, and the Dischargers, and consisted of the Dischargers submitting the following:

   a. USEPA General Information, Form 1, and the State of California Application for Facility Permit/Waste Discharge, Report of Waste Discharge, Form 200, submitted on 23 November 1994.
   b. Comprehensive Stormwater Management Program submitted on 21 June 1994, which provided a plan, with a schedule, for the development, implementation, and monitoring of best management practices, and other programs and activities required to reduce the discharge of pollutants in storm water discharges to the maximum extent practicable (MEP) during the life of this Order.
   c. Effectiveness Evaluation Report submitted on 3 March 1995, summarized the effectiveness of the Dischargers' Storm Water Management Program under the current Permit requirements, provided an Effectiveness Evaluation Plan on how the effectiveness of the storm water program for this Order will be evaluated, and provided an evaluation of the achievement of water quality standards through implementation of the Program to that date.

   The Comprehensive Stormwater Management Program and Effectiveness Evaluation Plan were developed, approved, and implemented during the term of the prior Order. Full and complete implementation of the programs, in accordance with the implementation schedules provided by the Dischargers, involves many years that will extend beyond the term of current and future Orders. In accordance with various Provisions and as discussed in subsequent findings of this Order, the Dischargers will review, evaluate, revise, and amend the programs, as necessary, over the implementation schedule to ensure compliance with the requirements of this Order.

7. The Dischargers have jurisdiction over, and/or maintenance responsibility for certain municipal separate storm drain systems, and/or watercourses in the County. Discharges consist of surface runoff generated from various land uses that discharge into the Sacramento and American Rivers through natural water courses or manmade conveyances. Based on monitoring data collected during the term of the current Order, the Dischargers have initially identified the pollutants of concern in runoff and receiving waters as certain heavy metals, petroleum hydrocarbons, and certain pesticides. The quality of the discharge, and resulting impact it may have on receiving waters, varies, and is affected by hydrology, geology, land use, season, and sequence and duration of rainfall events.

   Over the term of this Order, the Dischargers will continue to implement the constituent of concern identification and reduction component of the Effectiveness Evaluation Plan.

8. The permit application submitted by the Dischargers included a Comprehensive Stormwater Management Program (Program), which describes the framework for management of storm water discharges during the term of this Order. The title page and table of contents of the Program are included in Attachment B of this Order. The Program defines the priorities in development and implementation of best management practices (BMPs), and provides an implementation program which summarizes the major activities to be accomplished during the five-year term of this Order. Specific activities regarding implementation of the Program will be provided by the Dischargers on an annual basis through submittal of a work plan as part of the Annual Monitoring and Reporting Program.

   The Program has been designed to implement various MEP control measures to address the many sources pollutants in the different drainage areas covered by this Order. Continued implementation of the Program is expected to cause the Dischargers to meet the MEP discharge standard for stormwater discharges from areas regulated by this permit, at the point of discharge to the receiving waters.

   The Implementation Chapter of the Program consists of the following elements:

   a. Construction Site Management Program
   b. New Development Management Program
   c. Public Education and Awareness Program
   d. Industrial Discharge Management Program
   e. Illegal Discharge Program
   f. Illicit Connection Program
   g. Public Agency Program
   h. Monitoring Program
   i. Intra/Inter-Agency Coordination
   j. Legal Authority
   k. Program Management

9. The Program emphasizes incorporating BMPs into established programs as much as possible in order to maximize the use of existing resources, to minimize the risk of creating redundant and overlapping regulatory programs, and to expedite the implementation of the Program.

10. The permit application included an Effectiveness Evaluation Report. This report summarized the Dischargers' evaluation of the effectiveness of the Program during the current Order, and provided methodologies the Dischargers intend to implement to determine BMP and overall Program effectiveness over the term of this Order. The proposed methodologies are detailed in the Effectiveness Evaluation Plan (EEP) that was included in the Report submittal. The EEP is designed

VOL 16 0190

to gradually increase the level of sophistication used to judge the effectiveness of the Program, and consists of three principle components:

a. Identification and reduction of constituents of concern (hereafter referred to as COC)
b. Program evaluation
c. Effectiveness evaluation process

Over the course of this Order, the methods for evaluating individual BMP effectiveness will be by both qualitative and quantitative measures including evaluations of performance standards and estimates of water quality improvements by special studies of structural and non-structural BMPs. Overall Program effectiveness may be measured by sub-watershed pilot studies for COC reduction programs, statistical analysis, water quality modeling, and water quality monitoring.

The title sheet, table of contents and a summary of the EEP schedule are included in Attachment C of this Order.

11. The Program and EEP submitted as part of the permit application, all subsequent modifications or revisions to the Program and EEP that are approved in accordance with Provision D.5 of this Order, and yearly work plans submitted in accordance with Monitoring and Reporting Program requirements, are integral and enforceable components of this Order.

12. Under the current permit, the roles and responsibilities of the Dischargers are defined in a Memorandum of Understanding (MOU) that was effective through the term of the current permit, and expired on 1 June 1995. This MOU established that the individual Dischargers are separate legal entities and have the authority to develop, administer, implement, and enforce storm water management programs within their own jurisdiction. Each Discharger shall be responsible for compliance with this permit within their jurisdiction. Provision D.2.b of this Order directs the Dischargers to complete and submit to the Board a MOU that specifically defines the roles and responsibilities of each co-permittee as they relate to compliance and participation with this Order.

13. Discharges from municipal separate storm sewer systems owned or operated by the Dischargers consist of storm water runoff, and non-storm water discharges which discharge directly, or indirectly, to lakes, water-supply reservoirs, ground waters, rivers, tributary streams and water courses and contiguous water bodies in Sacramento County.

14. The regulations require storm water discharges from separate municipal storm drain systems to be subject to MEP discharge standards. Discharges of non-storm water from facilities owned or operated by the Dischargers are subject to Best Available Technology Economically Achievable (BAT) and Best Conventional Pollutant Control Technology (BCT).

VOL 16

0191

This Order regulates both storm water discharges from municipal separate storm sewer systems, and, in accordance with Provision D.4.b of this Order, non-storm water discharges from facilities that are owned or operated by the Dischargers.

15. Clean Water Act Section 402(p)(3)(B)(ii) requires that NPDES permits shall require the Dischargers to effectively prohibit non-storm water discharges into storm sewers. The Regulations [40CFR122.26(d)(2)(iv)(B)(1)] recognize that certain categories of non-storm water discharges do not have to be prohibited if the discharges have not been identified as a source of pollutants by the Dischargers. However, removing the Dischargers regulatory requirement to prohibit such discharge does not remove the liability of owners or operators of the facilities that are the source of non-storm water discharges from obtaining an NPDES permit for such discharge.

The State Water Resources Control Board (State Board) is currently conducting a study of non-storm water discharges. In addition, the Dischargers may, over the term of this Order, conduct studies to determine the threat to water quality for various non-storm water discharges. These studies may result in additional de minimis categories of non-storm water discharges being identified. Provision D.4.a.iv. allows the Program to be amended to include additional de minimis categories of non-storm water discharges.

16. The State Board has issued NPDES General Permits for the regulation of storm water discharges associated with industrial and construction activities. To effectively implement the industrial, new development, and construction elements of the Program, the Dischargers may conduct regulatory activities at industrial or construction sites currently covered by one of the State NPDES General Permits. Under the CWA, the Dischargers do not have the authority to enforce the State's NPDES General Permit. However, Board staff will to work cooperatively with the Dischargers to ensure that industries, businesses, contractors, and developers within the Dischargers' jurisdiction are not subject to duplicate or overlapping storm water regulatory activities.

17. Federal, state, or regional entities within the Dischargers' boundaries, not currently named in this Order, may operate storm drain facilities and/or discharge storm water to the storm drains and watercourses covered by this Order. The Dischargers may lack legal jurisdiction over these entities under the state and federal constitutions. Consequently, the Regional Board recognizes that the Dischargers should not be held responsible for such facilities and/or discharges. The California Department of Transportation (Caltrans) is a state agency that is currently, among others, such an entity. The Regional Board issued a separate storm water permit (Order No. 95-001, NPDES No. CA0083640), to Caltrans in January 1995, and will consider issuing separate NPDES permits for storm water discharges to other federal, state, or regional entities within the Dischargers' boundaries.

VOL 16 0192

As an alternative to a separate NPDES permit being issued to other federal, state, or regional entities, Provision D.6 allows the Dischargers to request that this Order be amended to allow these entities to be named as co-permittees to this Order.

18. On 6 June 1995, the Dischargers entered into a Memorandum of Understanding (MOU) with Caltrans. This MOU provided agreements and procedures regarding communication, coordination, cooperation, and collaboration between the Dischargers and Caltrans concerning individual or shared activities required to achieve compliance with their respective Board Orders. Attachment D provides a copy of the MOU.

As stated in Finding No. 17, there may be other federal, state or regional agencies, within the Dischargers' boundaries that may be issued separate municipal NPDES permits. Provision D.2.e directs the Dischargers to enter into an agreement that describes communication, coordination, cooperation, and collaboration with other possible future municipal storm water permittees to ensure timely compliance with this Order.

19. The Board adopted a Water Quality Control Plan, Third Edition, Sacramento River Basin and San Joaquin River Basin, (Basin Plan) which contains water quality objectives for all waters in the Basin. This Order implements the Basin Plan.

20. The beneficial uses of the receiving waters, the Sacramento, American, Cosumnes, and Mokelumne Rivers and the Delta are municipal and domestic, industrial, and agricultural supply; water contact and non-contact recreation; aesthetic enjoyment; navigation; ground water recharge; fresh water replenishment; and preservation and enhancement of fish, wildlife and other aquatic resources. Attachment E lists all of the Sacramento area surface waters that could be impacted by storm water discharges.

21. Urban storm water runoff discharges contain pollutants that may lower the quality of receiving waters and impact beneficial uses. Studies indicate there may be increases in pollutant levels and aquatic toxicity in receiving waters as a result of urban storm water discharges.

22. This Order requires evaluation of water quality impacts from urban storm water runoff discharges, and the implementation and evaluation of the Program to reduce the discharge of pollutants into storm water runoff to the maximum extent practicable (MEP) for discharges from municipal separate storm sewer systems to improve water quality and protect beneficial uses. Implementation of the Program to reduce pollutant loads from industrial and construction sites, new developments and existing urbanized areas are required as part of this permit. Additionally, this Order requires that the effectiveness of the Program in reducing the discharge of pollutants, attaining water quality objectives and protecting beneficial uses, be evaluated.

VOL 16 0193

VOL 16 0194

During the term of the prior Order the Dischargers collected and summarized monitoring data to assess and develop a list of pollutants of concern in stormwater discharges, and assess existing or potential receiving water quality impacts as a result of those pollutants. The Program being implemented through this Order had been developed, and its priorities for implementation has been based on addressing the pollutants of concern. The Program and EEP both contain processes for the Dischargers to continue to assess and develop the list of pollutants of concern, and to assess the effectiveness of the current Program. Through the annual review process, the Dischargers will determine whether the continued implementation of the Program has a reasonable likelihood of preventing exceedances of water quality standards, and ensure the protection of the beneficial uses of the receiving water. The assessment process includes steps to make revisions to the Program and EEP if results of the Dischargers' assessments warrant such action.

23. The permitted discharge is consistent with the anti-degradation provisions of 40CFR 131.12 and the State Board Resolution 68-16.

This Order requires implementation of programs (i.e., BMPs) to reduce the level of pollutants in storm water discharges from municipal separate storm sewer systems. However, given the continuing development within the area, it is possible that future degradation in water quality could occur. Any such change in water quality will not unreasonably affect the present and anticipated beneficial use of water and will not result in water quality less than that prescribed in policies of the State Board. The programs required pursuant to this Order constitute the best practicable treatment or control of discharges necessary to assure that a pollution or nuisance will not occur and the highest quality consistent with maximum benefit to people of the State will be maintained.

24. It is the Regional Board's intent that this Order shall attain and protect the beneficial uses of receiving waters. This Order, therefore, includes Receiving Water Limitations required to implement water quality objectives and to prevent nuisances and water quality impairment in receiving waters. The permit requires the implementation of control measures in accordance with the program that will reduce pollutants in storm water discharges to the MEP. The Receiving Water Limitations require the implementation of control measures that are technically and economically feasible as necessary to protect beneficial uses and water quality objectives of the receiving waters.

The Regional Board finds that the unique aspects of the regulation of storm water discharges through municipal storm sewer systems, including intermittent discharges, difficulties in monitoring and limited physical control over the discharge, will require adequate time to implement and evaluate the effectiveness of best management practices and to determine whether they will adequately protect receiving water. Therefore, the permit includes a procedure for determining whether storm water discharges are causing continuing or recurring exceedances of receiving water limitations and for evaluating whether the Program must be revised. The discharger will be in compliance with the Receiving Water Limitations so long as it complies with that procedure.

25. Congress indicated by statements made in the preamble to the Federal Storm Water Regulations published in the Federal Register on 16 November 1990, that it was aware of the difficulties in regulating discharges from municipal separate storm sewer systems solely through traditional end-of-pipe treatment and intended for EPA and NPDES states to develop permit requirements that were much broader in nature than requirements which are traditionally found in NPDES permits for industrial process discharges or waste water treatment plants. The preamble states "The legislative history indicates, municipal storm sewer system 'permits will not necessarily be like industrial discharger permits. Often, an end-of-pipe treatment technology is not appropriate for this type of discharge.' [Vol. 132 Cong.Rec.S16425(daily ed. Oct. 16, 1986)]."

26. Flexibility has been incorporated into this Order, by allowing the Dischargers to develop a Program that is specific to the water quality concerns in their jurisdiction, and to revise the Program based on annual evaluations of the Program, and based on findings of the monitoring program and special studies being conducted by the Dischargers. At this time, little is known regarding the effectiveness and implementability of various control programs for stormwater discharges, and the association between pollutants found in stormwater discharges with particular pollutant sources. Because of this, it may require many years for pollutant sources to fully identified, and for management practices to be developed, implemented, and evaluated. Due to potential costs associated with implementing an effective stormwater control program to address all pollutants of concerns associated with stormwater runoff from urbanized areas, the implementation of control measures will have to be prioritized, attempting to correct the most serious water quality threats first. Implementation schedules will also incorporate sufficient time to be allocated to research, development, special studies, or other steps deemed necessary to ensure the *best* management measure is being implemented to address pollutants of concern. As discussed in Finding No. 6, full and complete implementation of the Program will extend beyond the term of this Order.

27. It is not feasible at this time to establish numeric effluent limits for pollutants in storm water discharges from municipal storm sewer systems. Therefore, the effluent limitations in the Order are narrative, and include the requirement to reduce pollutants in storm water discharges to the MEP. This Order requires the implementation of BMPs, identified in the Program, to control and abate the discharge of pollutants in storm water discharges. Implementation of BMPs, in accordance with the Program and its schedule, the EEP, and any revisions, modifications, and amendments as approved by the Executive Officer or Board, and the provisions of this Order, constitutes compliance with MEP requirements, and ensure the achievement of the goals of the CWA.

28. It is not feasible at this time to establish numeric effluent limits for pollutants in non-storm water discharges from facilities owned or operated by the Dischargers. Therefore, the effluent limitations in the Order are narrative, and include the requirement to reduce pollutants in non-storm water discharges through implementation of BAT/BCT technologies. Until such time numeric effluent

VOL 16 0195

limits are developed, implementation of BMPs, both structural and nonstructural, constitute compliance with BAT BCT effluent limitation standards.

29. The Regulations require that the Program be implemented during the entire duration of the Permit (40CFR 122.26(d)(2)(iv)), which is 5 years. As discussed in Finding No. 6, full and complete implementation of the Program will extend beyond the term of this Order. This Order directs the Dischargers to implement the Program in accordance with the Program's schedule and annual work plans as approved by the Executive Officer.

    The Dischargers shall demonstrate substantial compliance with the Program and Permit through the information and data supplied as part of the annual review process.

30. The action to adopt an NPDES permit is exempt from the provisions of Chapter 3 of the California Environmental Quality Act (CEQA) (Public Resources Code Section 21100, et seq.), in accordance with Section 13389 of the California Water Code.

31. The Board has notified the Dischargers and interested agencies and persons of its intent to prescribe waste discharge requirements for this discharge and has provided them with an opportunity for a public hearing and an opportunity to submit their written views and recommendations.

32. The Board, in a public meeting, heard and considered all comments pertaining to the discharge.

33. This Order shall serve as an NPDES permit pursuant to Section 402 of the CWA, and amendments thereto, and shall take effect upon the date of hearing, provided EPA has no objections.

IT IS HEREBY ORDERED that Order No. 90-158 is rescinded, and that the Dischargers, their agents, successors and assigns, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Waste Act and regulations and guidelines adopted thereunder, shall comply with the following:

A. Discharge Prohibitions:

1. The Dischargers shall effectively prohibit the discharge of non-storm water into the municipal separate storm sewer system. This prohibition does not apply to the following discharges:

    a. water line flushing;
    b. landscape irrigation;
    c. diverted stream flows;
    d. rising ground waters;
    e. uncontaminated ground water infiltration [as defined in 40CFR 35.2005(20)] to separate storm sewers;

VOL 16 0196

VOL 16

f. uncontaminated pumped ground water;
g. discharges from potable water sources;
h. foundation drains;
i. air conditioning condensate;
j. irrigation water;
k. springs;
l. water from crawl space pumps;
m. footing drains;
n. lawn watering;
o. individual residential car washing;
p. flows from riparian habitats and wetlands;
q. dechlorinated swimming pool discharges;
r. discharges or flows from emergency fire fighting activities.

2. Discharges listed as 'a' through 'r' in Discharge Prohibition A.1 determined to be sources of pollutants are not exempt from this prohibition and shall be addressed in accordance with requirements established in Provision D.4.a of this Order.

3. List 'a' through 'r' in Discharge Prohibition A.1 may be amended, as approved by the Executive Officer, over the term of this Order in accordance with Provision D.4.a.iv. of this Order, to incorporate other de minimis categories of non-storm waters determined as a result of studies conducted by the State and Regional Boards, or Dischargers.

4. NPDES permitted non-storm water discharges are exempt from this prohibition, unless the Dischargers establish legal prohibitions against such discharges into their separate storm sewer systems.

5. This prohibition does not apply to discharges identified and approved by the Executive Officer in accordance with Provision D.4.b of this Order.

B. Effluent Limitations:

1. The Dischargers shall reduce the discharge of pollutants from municipal separate storm sewers to the MEP.

2. The Dischargers shall reduce or eliminate, to the extent feasible, the discharge of pollutants in non-storm water discharges from facilities owned or operated by the Dischargers. Discharges of pollutants in non-storm water discharges that cannot be eliminated shall be reduced or eliminated through implementation of Best Available Technologies Economically Achievable for toxic and nonconventional pollutants, and Best Conventional Control Technologies for conventional pollutants.

0197

VOL 16 0198

C. **Receiving Water Limitations:**

1. Receiving Water Limitations are based upon beneficial uses, water quality objectives and water quality standards contained in the Basin Plan, and amendments thereto, and on ambient water quality. The discharge of storm water, or non-storm water, from a municipal storm sewer system for which the Dischargers are responsible under the terms of this Order shall not cause any of the following conditions to continue or recur in the receiving waters. The Dischargers will not be in violation of this provision so long as they are in compliance with the requirements set forth in 1.b.

   a. Storm water discharges from municipal storm sewer systems that are owned or operated by the Dischargers, and non-storm water discharges from facilities owned or operated by the Dischargers shall not cause the following conditions to create a condition of nuisance or to adversely affect beneficial uses of surface and ground waters of the State:

      (1) Oils, greases, waxes, or other materials to form a visible film or coating on the water surface or on the stream bottom.
      (2) Oils, greases, waxes, floating material (liquids, solids, foams, and suds) or suspended material to create a nuisance or adversely affect beneficial uses.
      (3) Aesthetically undesirable discoloration.
      (4) Fungi, slime, or other objectionable growths.
      (5) Deposition of material that causes nuisance or adversely affects beneficial uses.
      (6) Toxic pollutants to be present in the water column, sediments, or biota in concentrations that adversely affect beneficial uses; that produce detrimental response in human, plant, animal or aquatic life; or that bioaccumulate in aquatic resources at levels which are harmful to human health.
      (7) Taste or odor-producing substances to impart undesirable tastes or odors to fish flesh or other edible products of aquatic origin or to cause nuisance or adversely affect beneficial uses.

   b. If the Executive Officer determines that continuing or recurring exceedance of a Receiving Water Limitations listed in C.1.a.i-vii., has been caused by discharges from the municipal storm sewer system, the following steps shall be taken:

      (1) The Executive Officer will evaluate the adequacy of the Dischargers' implementation of the Program based on the Dischargers' submitted reports. The Executive Officer will determine if implementation of the Program has a reasonable likelihood of preventing future exceedances of receiving water limitations. If the Executive Officer makes this determination, the Dischargers' are required to continue implementing the Program.

VOL 16 0199

(2) If the Executive Officer determines that implementation of the Program will not have a reasonable likelihood of preventing future exceedances of receiving water limitations, the Dischargers shall, upon notice from the Executive Officer, do the following:

(a) The Executive Officer may require the Dischargers to submit a report that includes an evaluation of the relative contribution of the storm water dischargers to the exceedance of the receiving water limitation. The report shall address the persistence and the causes of the exceedance, and evaluate, if appropriate, whether the pollutant(s) causing the exceedance(s) can be controlled by the Dischargers.

(b) The Executive Officer may require the Dischargers to submit a report reviewing the Program to determine whether it should be revised so there will be a reasonable likelihood of preventing future exceedances of receiving water limitations, or whether revisions to achieve compliance with receiving water limitations cannot be made based on technical feasibility, economic studies, and other pertinent factors. If the report recommends revision of the Program the report shall include a work plan to revise the Program so that it will have a reasonable likelihood of preventing future exceedances of receiving water limitations. If the report concludes that no revisions are necessary to achieve compliance with receiving water limitations, the report shall explain how implementation of the Program will achieve compliance. If the report determines that revisions cannot be made to achieve compliance with receiving water limitations based on technical feasibility, economic studies, and other pertinent factors, or if the Discharger determines that the pollutant(s) causing the exceedance(s) cannot be controlled by the Dischargers, the Dischargers shall continue to comply with the Program, shall fully document this determination, and shall make such recommendations, supported by the report documentation, identifying the nature of theactions that may be necessary to achieve future compliance, and identification of funding sources for such actions.

Any economic study may include evaluating the cost of implementing a control measure against its reasonable relationship to the pollution control benefits to be achieved.

When required under C.1.b.ii.2), the Dischargers shall implement the work plan and their revised Program as approved by the Executive Officer.

2. The Executive Officer shall review and approve or disapprove the reports required under Receiving Water Limitation 1. The reports may be submitted as part of the next Annual Report, or at some other time designated by the Executive Officer. So long as the Dischargers have complied with the procedures set forth in Receiving Water Limitation 1., they do not have to repeat the procedure for continuing or recurring exceedances of the same receiving water limitation. As appropriate, any determination under this part or revisions to the Program may be considered by the Regional Board in a public meeting.

D. Provisions

1. The Dischargers shall demonstrate compliance with this Order through timely implementation of the Program, EEP, and monitoring program submitted in their application, and any modifications, revisions, or amendments developed pursuant to Provisions D.5, D.9, and approved pursuant to Provision D.10 to this Order. Each Discharger needs only to comply with all requirements of this Order for storm water discharges from municipal separate storm sewers for which they are operators or owners.

2. **Storm Water Management Plan**

a. The Dischargers shall continue to implement the Storm Water Management Program as approved on 8 September 1994, and all approved revisions to the Program made subsequent to 8 September 1994 and prior to the adoption of this Order, and shall demonstrate its effectiveness and provide for necessary and appropriate revisions, modifications, and improvements in accordance with Provisions D.5, D.9, and as approved per Provision D.10 of this Order.

b. **Storm Water Program Management Activities**

The Dischargers shall complete and submit to the Board a Memorandum of Understanding (MOU), subject to Executive Officer approval, no later than 6 months from the date of adoption of this Order. The MOU should specifically identify those areas where the Dischargers share responsibilities, and other activities required to comply with the requirements of this Order. The MOU will specifically identify the roles and responsibilities of each Discharger named as a co-permittee to this Order for the activities identified.

Any changes, deletions or revisions made to the MOU subsequent to its adoption shall be reported as part of the Annual Report required by Monitoring and Reporting Program No. 96-105.

VOL 16 02000

c. **Legal Authority**

Annually the Dischargers shall review and assess their legal authority to adequately implement the Program. If the Dischargers find their legal authority is not adequate they shall submit a plan, with a schedule, on how they propose to address and change their legal authorities to cause their authority to be adequate to implement the program. Reporting of the Dischargers findings, and plan, if needed, will be submitted as part of the Annual Report required by Monitoring and Reporting Program No. 96-105.

d. **Fiscal and Staffing Analysis**

Annually the Dischargers shall provide a fiscal and staffing analysis. The fiscal analysis will detail the capital, and operation and maintenance expenditures necessary to accomplish the activities of the Program. Such analysis shall include a description of the source(s) of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds, and staffing requirements. The staffing analysis will detail the equivalent staffing required to accomplish the activities of the Program. The fiscal and staffing analysis will be submitted as part of the Annual Report required to by the Monitoring and Reporting Program No. 96-105.

e. **Local Agencies**

The Dischargers shall enter into an agreement, acceptable to the Executive Officer, that describes communication, coordination, cooperation, and collaboration of the Dischargers' Program, and other pertinent storm water quality activities, with other local, permitted municipal storm water programs that are not named to this Order

f. **Intra/Interagency Agreements**

The Program proposes to utilize agencies or departments in the jurisdiction of the Dischargers, that may not directly report, or receive direction from the storm water personnel or department, to implement some of the BMPs. Some Program BMPs address the need for intra/interagency agreements, while others do not. When necessary and appropriate, the Dischargers shall enter into intra/interagency agreements prior to implementation of all BMPs that would require the use of an agency or department other than that specifically named as the storm water program lead agency or department by each Discharger named to this Order. The agreements must be explicit and formal, and would specify the role and responsibilities of each department or agency in regards to the implementation and enforcement of the BMPs or Program.

VOL 16 0201

3. **Effectiveness Evaluation Plan (EEP)**

a. The Dischargers shall continue to implement the EEP as submitted on 3 March 1995, and shall demonstrate its effectiveness and provide for necessary and appropriate revisions, modifications, and improvements in accordance with Provisions D.5, D.9, and as approved per Provision D.10 of this Order. In addition, the Dischargers shall comply forthwith with the following:

(1) The primary emphasis in the Program is on nonstructural and source control measures. Currently there is little information statewide regarding the effectiveness of nonstructural and source controls measures. In order to ensure the Dischargers can quantify the effectiveness of such control measures, the Dischargers shall conduct at least two (2) special studies, subject to the Executive Officer approval, over the term of this Order. The studies are to validate the Dischargers selection of source control measures in their Program.

(2) Annually, the Dischargers shall submit a detailed work plan, including a schedule, subject to Executive Officer approval, of the special studies that will be conducted by the Dischargers during the subsequent fiscal year. The special study work plan will be submitted annually as part of the proposed monitoring program required by Monitoring and Reporting Program No. 96-105.

(a) The Dischargers submitted a schedule of the 1995/1996 special studies to be conducted with their proposed 1995/1996 Monitoring Program. In accordance with Provision A.2 of Monitoring and Reporting Program No. 96-105, the Dischargers shall implement the 1995/1996 special studies forthwith upon adoption of this Order.

4. **Non-Storm Water Discharges**

a. ***Discharges from facilities not owned or operated by the Dischargers and from facilities not identified and approved by the Executive Officer in accordance with Provision D.4.b:***

(1) The Dischargers shall identify and describe the categories of non-storm water discharges, including those listed in Discharge Prohibition A of this Order, which they have identified to be a source of pollutants. Such discharges will be either prohibited from being discharged to the municipal storm sewer system, or subject to a separate NPDES permit. For each category determined to be a source of pollutants, the Dischargers shall: 1) identify and describe the discharge, 2) incorporate the detection of such discharges into the Program, 3) develop and implement appropriate

VOL 16 0202

VOL 16

control measures to either eliminate the discharge, or develop reporting procedures for notifying the Regional Board of these discharges, and 4) develop and implement appropriate procedures for monitoring the implementation and effectiveness of the control measures.

(a) The Regional Board may require dischargers of non-storm water, to apply for and obtain coverage under an NPDES permit.

(b) The Regional Board may prohibit, or establish additional monitoring and reporting requirements, for any non-storm water discharges identified as a non-prohibited discharge by the Dischargers.

(c) Non-storm water discharges identified by the Dischargers as being de minimis per Discharge Prohibition A.3 cannot cause the Dischargers to be in noncompliance with Receiving Water Limitations C.1 through C.3. of this Order.

(d) The Dischargers may propose, as part of their Annual Report required by Monitoring and Reporting Program No. 96-105, additional categories of non-storm water discharges, subject to Executive Officer approval, to be included in the exemption to Discharge Prohibition A.

b. *Discharges from facilities owned or operated by the Dischargers*

(1) Certain discharges of non-storm water from sites owned or operated by the Dischargers are authorized by this Order, provided the following requirements are met:

(a) The Discharger shall provide the following:

(i) A list of the non-storm water discharges they request to be covered by this Order.

(ii) The name and location of the facility that causes the discharge(s) to occur.

(iii) A characterization of the quality and quantity of the discharge(s).

(iv) A description of the control measures, subject to Executive Officer approval, to be implemented, including an implementation schedule, to control, eliminate, or reduce pollutants in non-storm water discharges.

0203

VOL 16 0204

(v) A proposed monitoring program, subject to Executive Officer approval, to be implemented by the Dischargers to insure control measures are being implemented and are effective. The monitoring program shall include visual monitoring, and, when appropriate, sample collection and analysis.

1) The Regional Board may prohibit, or establish additional monitoring and reporting requirements, for any non-storm water discharges permitted by this Order.

(b) Obtain a letter from the Executive Officer approving such discharges to be permitted by this Order.

(2) Non-storm water discharges to be covered by this Order are subject to Effluent Limitation B.3 at the point of discharge from the facility, and cannot cause the Dischargers to be in noncompliance with Receiving Water Limitations C.1 through C.3, of this Order.

(3) Non-storm water discharges not approved to be covered by this Order are subject to Discharge Prohibition A.1 of this Order.

(4) The Dischargers may propose, as part of their Annual Report required by Monitoring and Reporting Program No. 96-105, additional non-storm water discharges to be covered by this Order in accordance with procedures established in Provision D.4.b.i.

5. It is anticipated that the Program and EEP may be modified, revised or amended as part of the annual review process to respond to changed conditions and to incorporate more effective approaches to pollutant control. Requests for changes may be initiated by the Regional Board's Executive Officer or by the Dischargers. Major revisions to the program will be brought before the Regional Board as permit amendments. Minor changes may be made with the Executive Officers' approval, and will be brought to the Board as informational items. Such proposed changes will be identified in the mid-year review meeting, or through the annual review process and shall be submitted to the Regional Board as technical reports as needed, and shall be reported as part of the Annual Report required by Monitoring and Reporting Program No. 96-105.

6. At the request of the Dischargers, this Order may be amended to name other municipalities, or federal, state, or regional entities that own or operate separate municipal separate storm sewer systems in Sacramento County, as co-permittees.

7. This Order may be modified, or alternatively, revoked or reissued, prior to the expiration date as follows:

   a. to address changed conditions identified in the required technical reports, or other sources deemed significant by the Regional Board;

   b. to incorporate applicable requirements of statewide water quality control plans adopted by the State Board or amendments to the Basin Plan; or

   c. to comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain any other requirements of the CWA then applicable; or

   d. to be consistent with any amendments to the CWA regarding the discharges from municipal separate storm sewer systems.

   e. at the request of the discharger, this Order may be modified to revise or amend the Receiving Water Limitations to achieve consistency with State or Federal laws or policies adopted subsequent to the date of this Order.

8. All applications, reports, or information submitted to the Board shall be signed and certified pursuant to signatory requirements specified in 40CFR Part 122.41(k).

9. The Dischargers shall comply with Monitoring and Reporting Program No. 96-105, which is part of this Order, and any revisions or modifications thereto as ordered by the Executive Officer.

   It is anticipated that the monitoring and reporting Program will change as the Program develops and program priorities change. To accommodate such changes, the monitoring program will be subject to review and approval on an annual basis throughout the life of this Order. The Dischargers shall submit a proposed annual monitoring and reporting program for the following year's monitoring period to the Executive Officer for review and approval, such that the proposed monitoring program is approved by 1 May of each year, and implemented by 1 September of each year.

VOL 16 0205

10. All revisions, modifications, and amendments made to the Program, EEP, and Monitoring and Reporting Program in accordance with Provisions D.5 and D.9, and as approved by the Executive Officer are integral and enforceable parts of this Order.

11. The Dischargers shall comply with all applicable items of the "Standard Provisions and Reporting Requirements for Waste Discharge Requirements (NPDES)", dated 1 March 1991, which are part of this Order. This attachment and its individual paragraphs are referred to as "Standard Provisions".

12. This Order expires on 1 May 2001. The Dischargers must file a Report of Waste Discharge in accordance with Title 23, California Code of Regulations, no later than 180 days in advance of such date in application for renewal of waste discharge requirements.

I, WILLIAM H. CROOKS, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Board, Central Valley Region, on 3 May 1996.

A. **Monitoring Program**

1. The Dischargers shall develop a monitoring program on a fiscal year basis. The Dischargers shall develop and submit their proposed monitoring program no later than 1 April of each year for review and comments by Board, and to ensure Executive Officer approval of the program by 1 May of each year for implementation by 1 September of each year. Each year's program shall be developed based on past monitoring results, program evaluation and effectiveness, program priorities and direction, and as directed by the Executive Officer. The program should be developed to ensure minor changes or revisions can be accommodated prior to implementation.

   It is recognized that the Dischargers are being directed to submit a proposed monitoring program prior to the submittal of the Monitoring Report on 1 December of each year, and prior to the Dischargers obtaining all analytical results of the current year monitoring program. Therefore, the Dischargers may request minor revisions to the approved monitoring program based on monitoring or special study results, with Executive Officer approval.

   The Monitoring Program shall be developed such that it is an integral part in the evaluation of the Plan's effectiveness, provides quantitative information regarding program priorities and direction, demonstrates the reduction in pollutants in storm water runoff, and is designed to achieve the following objectives:

   a. Characterization of representative drainage areas and storm water discharges, including land use characteristics, pollutants concentrations, and mass loadings;
   b. Assessment of existing or potential adverse impacts on beneficial uses caused by pollutants of concern in storm water discharges, including an evaluation of representative receiving waters;
   c. Identification of potential sources of pollutants of concern found in storm water discharges; and
   d. Evaluation of effectiveness of representative storm water pollution prevention or control measures.
   e. Assess and identify water quality improvements or degradation.

VOL 16

0207

2. The Dischargers submitted a draft proposed fiscal year 1995-1996 monitoring program in April 1995. The Dischargers shall implement the 1995-1996 monitoring program forthwith upon adoption of this Order.

   The Dischargers shall implement subsequent year monitoring programs by **1 September** of each year.

3. The Dischargers shall develop and implement a monitoring program such that a first flush storm event is monitored during the term of this Order.

4. **On 1 December of each year,** the Dischargers shall report the results of their monitoring program for the preceding year. The report shall be submitted such that it provides a summary of the analytical results, and provides a discussion on the findings, how the analytical results apply to the Dischargers studies towards discharge characterization, Program effectiveness, receiving water impacts, reductions in pollutants, and other pertinent areas or activities required by this Order.

B. **Annual Report and Work Plans**

1. The Annual Report is an important element of the program and reporting procedures. The report is to be formatted such that it provides both the Dischargers and Regional Board staff an opportunity to adequately evaluate and propose:

   a. Implementation progress of the Program;
   b. Summary and evaluation of the monitoring program analytical results and activities, and how these results relate to the Program's priorities and directions;
   c. Dischargers' fiscal and manpower resources, and legal authority to implement an effective Program; and
   d. The overall effectiveness of the Program and its control measures both qualitatively and quantitatively.
   e. Recommended changes, revisions, and amendments to the Program based on the findings of the annual review process and effectiveness evaluation process, and to address other issues or problems that may cause the Dischargers to not fully and completely implement all elements of the Program or approved work plan.
   f. Recommended changes, revisions, amendments to the Program, to address exceedances to receiving water limitations as required in Section C. Receiving Water Limitations of Order No.96-105.

   The Annual Report is a tool for the Dischargers to establish that, through implementing their Program, they have reduced the discharge of pollutants in storm water to the MEP and to ensure

VOL 16 0208

the goals of the Clean Water Act are being achieved through implementation of the Program. As such, the report format, and its contents, may change as the Program develops, and as the Program, EEP, and monitoring program priorities and direction change.

2. The Dischargers shall submit by **1 September** each year, an Annual Report documenting the status of all the general program and individual tasks contained in the Program and EEP. The Annual Report will be a detailed report on the status of implementation of the Program and EEP and include an evaluation of the effectiveness of the control measures, management practices, and other actions and activities described in the Program and EEP. Measures of effectiveness include, but are not limited to, quantitative monitoring to assess the effectiveness of control measures, detailed accounting of program accomplishments, funds expended and staff hours utilized. The Annual Report shall provide an overall evaluation of the Program and set forth plans and schedule of implementation for the upcoming year. The Annual Report may also include proposed modifications or revisions to the Program and EEP.

   In the report, the Dischargers shall propose pertinent updates, improvements, or revisions to the Program and EEP which shall be deemed to be incorporated into this Order as provided in Provision D.10, of Order No. 96-105.

3. Included in the Annual Report, the Dischargers shall submit a work plan for the following year which describe the proposed implementation of the Program and EEP for the next fiscal year. The work plans shall consider the status of implementation of current year activities and actions of the Dischargers, problems encountered, and proposed solutions, including proposed changes in accordance with Section C. Receiving Water Limitations of Order No. 96-105., and shall address any comments received from the Executive Officer on their previous year Annual Report. The work plans shall include clearly defined tasks, responsibilities, and schedules for implementation of Program, EEP, and Discharger actions for the next fiscal year. The work plans shall be deemed to be incorporated into the Program and EEP as provided in Provision D.10, and shall be implemented by **1 July** of each year except for those parts of the work plan determined to be unacceptable by the Executive Officer.

   All parts, if any, found to unacceptable to the Executive Officer shall be revised or amended as appropriate by the Dischargers, and resubmitted for Executive Officer approval.

4. During the month of February, the Dischargers shall present a mid-year summary and assessment to Board staff of its status in the implementation of their work plan, Program, and EEP, and provide a conceptual work plan for the subsequent year. The Dischargers presentation shall address: 1) Regional Board's comments on the previous year's Annual Reports, 2) status of Program implementation and current year work plan, 3) major and minor modifications proposed or required by the Dischargers or Regional Board, respectively, and

VOL 16 0209

proposed implementation schedule for modifications, and 4) conceptual work plan for the upcoming year.

C. **Monitoring Program Alternatives**

1. It is recognized that costs associated with storm water monitoring, determination of program effectiveness, and other activities required for the Dischargers to evaluate compliance with this Order could be significant. It is also recognized that municipalities, and other agencies state and country wide are, or will be, permitted by municipal NPDES storm water permits similar to this Order, and will be conducting storm water monitoring, and conducting other special studies similar to the Dischargers'. As such, we recognize that the Dischargers may wish to reduce their costs associated with compliance evaluation by proposing alternative monitoring methods. Alternative methods may include, but not be limited to, special projects, financial participation in regional, state or national special projects or research, literature review, visual observations, use of indicator parameters, recognition and reliance on special studies conducted by others, etc.

   a. The Dischargers may submit a written proposal of alternative monitoring methods, subject to the Executive Officer approval, as part of their work plan to be submitted in accordance with item B.3 above. Such proposal shall be detailed, and provide the Dischargers' justification for requesting the alternative method, and demonstrate how the data or information obtained is applicable and useful to the Dischargers. The proposal shall include a schedule, and define the roles and responsibilities of parties involved in the alternative monitoring proposal.

MEMORANDUM OF UNDERSTANDING BETWEEN LOCAL AGENCIES AND CALIFORNIA DEPARTMENT OF TRANSPORTATION

This is a Memorandum of Understanding entered into this 6th day of June, 1995, by and between the State of California, Department of Transportation (Caltrans), and the Local Agencies consisting of the County of Sacramento, the City of Sacramento, the City of Galt and the City of Folsom. The purpose of this MOU is to provide communication, coordination, cooperation, and collaboration between the State and Local Agencies concerning National Pollutant Discharge Elimination Systems (NPDES) stormwater requirements as directed by the California Regional Water Quality Control Board Central Valley Region. Each party in this MOU administers its own stormwater management program and is equally represented by this MOU.

This Memorandum of Understanding constitutes solely a guide to the respective intentions and policies of the parties involved. It is not intended to authorize funding or project effort nor is it a legally binding contract. Funding commitments providing for the deposit of funds for specific work phases or project effort committing either equipment or personnel time will be covered by one or more separate cooperative agreements as may be outlined herein.

AGREEMENTS AND PROCEDURES

Communication - Each individual agency has identified a specific contact person to resolve water quality issues pertaining to NPDES.

NPDES Coordinator - Caltrans - District 3	916-741-4585
Stormwater Program Manager - County of Sacramento	916-440-6851
Stormwater Program Manager - City of Sacramento	916-433-6634
Stormwater Program Manager - City of Galt	209-745-3077
Stormwater Program Manager - City of Folsom	916-355-7267

Coordination - The State and Local agencies will meet semi-annually, or more often if needed. The purpose of meeting is to coordinate on-going projects, share information to identify problem areas, discuss and resolve problem areas, and investigate possibilities of pilot programs and special studies.

Cooperation - State and Local Agencies agree to share information on approaches and conclusions on the different aspects of stormwater programs on an on-going basis. These programs would include, but are not limited to, construction activities, public information, stormwater monitoring, Best Management Practices (BMP) technology, and illicit connection programs.

Collaboration - The group of NPDES coordinators will identify and explore the available resources of the different agencies and determine a means, on a case by case basis, to jointly implement common activities of the individual stormwater programs.

AMENDMENT

This Memorandum of Understanding may be amended by written agreement of all parties.

TERMINATION

This Memorandum of Understanding may be terminated by any party upon sixty (60) days written notice.

Mokelumne River								
	Dry Creek			C, Co	64.9	predominately	C	Y, Ag

Footnotes:

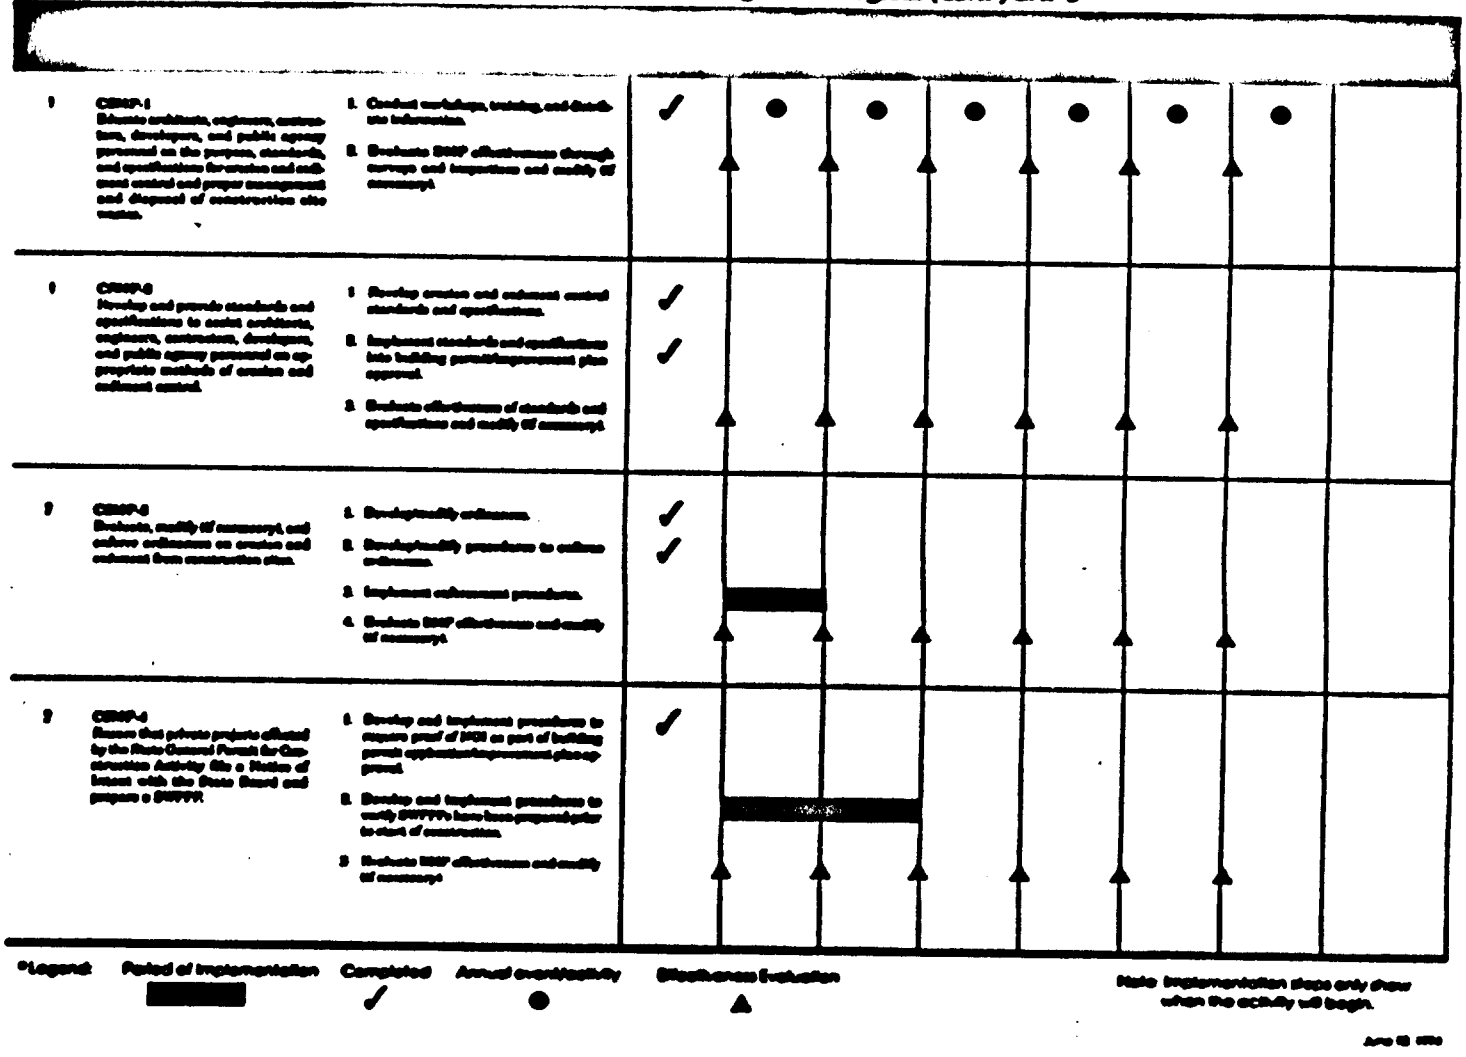
(a) Co = County of Sacramento
S = City of Sacramento
F = City of Folsom
G = City of Galt

(b) Non-urban = 0 to 30% urban
Partially urban = 30 to 70% urban
Predominantly urban = greater than 70% urban

(c) N = natural
M = man-made
C = combination or modified natural
L = lined

(d) E = ephemeral flow
Y = year-round flow
YPre = year-round flow prior to development of the watershed
YPost = year-round flow only after development of the watershed
NS = natural sources of flow (snow melt, springs, groundwater inflow)
NDO = emission water due to no gravity outfall
Ag = agricultural sources of flow

(e) These watersheds have been scheduled for master planning as described in the County of Sacramento's September 5, 1991 "Sacramento County Water Agency New Development Management Program" submitted to the Central Valley Regional Water Quality Control Board



(f) Watershed area extends beyond Sacramento County border. Only Sacramento County watershed area is shown.

VOL 76

WASTE DISCHARGE REQUIREMENTS
AREA-WIDE STORM WATER DISCHARGES FROM
MUNICIPAL SEPARATE STORM SEWER SYSTEMS
COUNTY OF SACRAMENTO,
CITIES OF SACRAMENTO, FOLSOM, AND GALT

INFORMATION SHEET

The 1972 Amendments to the Federal Clean Water Act (CWA) prohibited the discharge of any pollutants from a point source into waters of the U.S. unless permitted under the National Pollutant Discharge Elimination System (NPDES). Storm water and urban runoff discharges that occur through discreet conveyance systems are considered point sources subject to NPDES requirements. The 1987 amendments to the CWA mandated the USEPA to publish regulations establishing permit requirements for storm water discharges associated with industrial activities, and large and medium municipal storm sewer systems that service an urbanized area with a population greater than 100,000. On 16 November 1990, USEPA published these Regulations which were codified in the Federal Code of Regulations (40CFR) within Part 122.

Appendices to Part 122 of the Regulations, provide a listing of the cities and counties throughout the United States that meet threshold urbanized population criteria that requires a municipality to obtain a NPDES storm water permit. Appendix H of the Regulations lists Sacramento County (County) as a county with an unincorporated urbanized area population greater than 250,000, and Appendix F lists the City of Sacramento with an incorporated urbanized population greater than 250,000. In listing the County, and the City of Sacramento, the Regulations have identified them as large municipalities that are required to obtain a municipal NPDES storm water permit.

The Regulations allow the Board to designate owners or operators of municipal separate storm sewers, not meeting the population threshold established in the Regulations, and that are in the boundaries of a municipality that is required by the Regulations, as a medium or large municipal separate storm sewer system. This has resulted in many cities throughout California, with populations less than 100,000, or government entities, such as flood control districts or transportation districts, being required to obtain storm water permits.

There are four incorporated cities in the County of Sacramento, the Cities of Sacramento, Folsom, Galt, and Isleton. The Cities of Folsom, Galt, and Isleton have populations less than 100,000. The Cities of Folsom, and Galt are designated as urbanized areas that are subject to the storm water regulations. Designation is based on the location of each city's storm water discharges relative to storm water discharges for the County and City of Sacramento, and the nature of development and urbanization of the cities.

The City of Isleton has a population less than 1000, and is situated such that its developed area is not a contiguous, integral part of the urbanized area of the County and its incorporated cities. Therefore, it is not required to obtain a storm water permit at this time.

WASTE DISCHARGE REQUIREMENTS
AREA-WIDE STORM WATER DISCHARGES FROM
MUNICIPAL SEPARATE STORM SEWER SYSTEMS
COUNTY OF SACRAMENTO,
CITIES OF SACRAMENTO, FOLSOM, AND GALT

The Regulations allow for the issuance of area-wide municipal NPDES storm water permits. Under the area-wide approach, various municipalities and entities can be named as permittees to one NPDES permit. The Regulations recognize the differences between the permittees in regards to its responsibilities for discharges from its municipal storm sewer system, and allows permittees to develop site-specific storm water programs.

The County, and the Cities of Sacramento, Folsom, and Galt together applied for an NPDES area-wide municipal storm water permit in February 1990. Order No. 90-158 (NPDES No. CA 0082597) was subsequently adopted by the Regional Board on 22 June 1990. Order No. 90-158 expired on 1 June 1995. However, due to no fault by the Dischargers, the Regional Board did not issue a new permit prior to that date resulting in the conditions of Order No. 90-158 continuing in full force until the new order is adopted.

On 3 March 1995, the Dischargers submitted the final segment of their renewal application. The application package included U.S. EPA General Information, Form 1, the State of California Form 200, a Comprehensive Stormwater Management Program (CSMP), and an Effectiveness Evaluation Report (EER). The CSMP and EER provide the Dischargers' management plan to evaluate and reduce the discharge of pollutants in storm water discharges from the urbanized areas covered by this Order.

The CSMP is a comprehensive document that describes the framework for management of storm water discharges during the term of this Order. It defines the priorities in development and implementation of best management practices (BMPs), and provides an implementation program which summarizes the major activities to be accomplished over and beyond the five-year term of this Order. Annually the Dischargers will submit a work plan, with a schedule, that provides the specific activities to be conducted by the Dischargers.

The EER reports the Dischargers' evaluation of the effectiveness of the CSMP during the current Order, and provides methodologies the Dischargers intend to implement to determine BMP, and overall CSMP effectiveness over the term of the new order. The proposed methodologies are detailed in the Effectiveness Evaluation Plan (EEP). The primary methods provided in the EEP for evaluation of program performance and estimated water quality improvements will be special studies for structural and non-structural BMPs, sub-watershed pilot studies for COC reduction programs, and statistical methods and water quality models for predicting the effectiveness of the CSMP.

This Order requires the permittees to implement various technologies to control the discharge of pollutants in storm water discharges from municipal separate storm sewer systems to the Maximum Extent Practicable (MEP), and to control the discharge of pollutants through implementation of Best Available Technologies Economically Achievable (BAT), and Best Conventional Control Technologies (BCT) non-storm water discharges from facilities that are owned or operated by the Dischargers. In accordance with the storm water Regulations, implementation of structural and non-structural BMPs are

VOL 16 0234

R0061634

acceptable control technologies to meet MEP, BAT, and BCT standards. Timely and adequate implementation of BMPs and other program elements outlined in the CSMP and EEP will constitute compliance with MEP, BAT, and BCT standards.

Annually, the Dischargers are required to submit an Annual Report. The Annual Report is a tool for the Dischargers to establish that, through implementing their CSMP, they have reduced the discharge of pollutants in storm water discharges from storm sewer systems, and non-storm water discharges from facilities owned or operated by the Dischargers, and have effectively prohibited the discharge of non-storm water discharges to storm sewer systems from various land uses under the jurisdiction of the Dischargers. The report is to be formatted such that it provides both the Dischargers and Regional Board staff an opportunity to adequately evaluate: 1) implementation progress of the CSMP; 2) monitoring program analytical results, and how these results relate to the CSMP's priorities and direction; 3) dischargers' fiscal and manpower resources, and legal authority to implement an effective CSMP; and, 4) evaluate overall effectiveness of the CSMP and its control measures both qualitatively and quantitatively.

R0061635

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION

ORDER 95-180
NPDES PERMIT NO. CAS029718

REISSUING WASTE DISCHARGE REQUIREMENTS FOR:

SANTA CLARA VALLEY WATER DISTRICT, COUNTY OF SANTA CLARA, CITY OF CAMPBELL, CITY OF CUPERTINO, CITY OF LOS ALTOS, TOWN OF LOS ALTOS HILLS, TOWN OF LOS GATOS, CITY OF MILPITAS, CITY OF MONTE SERENO, CITY OF MOUNTAIN VIEW, CITY OF PALO ALTO, CITY OF SAN JOSE, CITY OF SANTA CLARA, CITY OF SARATOGA, AND CITY OF SUNNYVALE, which have joined together to form the SANTA CLARA VALLEY NONPOINT SOURCE POLLUTION CONTROL PROGRAM

The California Regional Water Quality Control Board, San Francisco Bay Region, (hereinafter referred to as the Regional Board) finds that:

1. The Santa Clara Valley Water District (hereinafter District), County of Santa Clara, City of Campbell, City of Cupertino, City of Los Altos, Town of Los Altos Hills, Town of Los Gatos, City of Milpitas, City of Monte Sereno, City of Mountain View, City of Palo Alto, City of San Jose, City of Santa Clara, City of Saratoga, and City of Sunnyvale (hereinafter referred to as the Dischargers) have joined together to form the Santa Clara Valley Nonpoint Source Pollution Control Program (hereinafter referred to as the Program) and have submitted a permit application (Report of Waste Discharge), dated December 20, 1994, and revised June 30, 1995, for re-issuance of waste discharge requirements under the National Pollutant Discharge Elimination System (NPDES) to discharge storm water runoff from storm drains and watercourses within the Dischargers' jurisdictions.

2. The Dischargers are currently subject to NPDES Permit No.CA0029718 issued by Order No. 90-094 on June 20, 1990, and amended by Order No. 92-021 on February 19, 1992.

3. The Dischargers each have jurisdiction over and/or maintenance responsibility for their respective municipal separate storm drain systems and/or watercourses in the Santa Clara Valley basin. (See attached location and political jurisdiction map.) The basin can be divided into eleven subbasins or watersheds including the Coyote Creek watershed on the east side of the valley, the Guadalupe River watershed which drains the south-central portion of the valley, and a series of small, relatively urbanized watersheds that drain the west side of the valley. (See attached basin watersheds map.) Discharge consists of the surface runoff generated from various land uses in all the hydrologic subbasins in the basin which discharge into watercourses which in turn flow into South San Francisco Bay. The quality and quantity of these discharges varies considerably and is affected by hydrologic, geologic, land use, season, and sequence and duration of hydrologic event. Pollutants of concern in these discharges are certain heavy metals, sediment from erosion due to anthropogenic activities, petroleum hydrocarbons from sources such as used motor oil, microbial pathogens of domestic sewage origin from illicit discharges, certain pesticides associated with in stream acute toxicity, and other pollutants which may cause aquatic toxicity in the receiving waters.

VOL 16

0236

4. Section 402(p) of the federal Clean Water Act (CWA), as amended by the Water Quality Act of 1987, requires NPDES permits for storm water discharges from separate municipal storm drain systems, storm water discharges associated with industrial activity (including construction activities), and designated storm water discharges which are considered significant contributors of pollutants to waters of the United States. On November 16, 1990, the United States Environmental Protection Agency (hereinafter US EPA) published regulations (40 CFR Part 122) which prescribe permit application requirements for municipal separate storm drain systems pursuant to Section 402(p) of the CWA. On April 7, 1995, USEPA published regulations announcing its intent to develop permit application requirements for municipal separate storm drain systems that have previously been permitted under the CWA.

   The application requirements that the Regional Board has determined to be applicable to the Dischargers include submittal of a proposed storm water management plan to reduce the discharge of pollutants in storm water to the maximum extent practicable and to effectively prohibit non-storm water discharges into municipal storm drain systems and watercourses within the Dischargers' jurisdictions.

5. The permit application submitted by the Dischargers includes the Program's Storm Water Management Plan, which describes a framework for management of storm water discharges during the term of this permit. The title page and table of contents of the Storm Water Management Plan are attached to this Order. The Storm Water Management Plan describes the Program's Goals and Objectives, Legal Authorities, Institutional Arrangements and Funding, the Annual Reporting and Program Evaluation Process, Monitoring Strategy, an Implementation Plan which summarizes major activities to be accomplished during the five-year term of this permit, and detailed Workplans of activities to be implemented by the Program and each of the Dischargers during Fiscal Year 1995-1996. Workplans for subsequent fiscal years will be prepared by the Program and each of the Dischargers and submitted to the Regional Board by the Program as part of the Annual Reporting and Program Evaluation Process.

   The Implementation Plan chapter of the Storm Water Management Plan consists of the following elements:

   - Program Management
   - Annual Reporting and Evaluation
   - Monitoring
   - Public Agency Activities
   - Public Information and Participation
   - Metals Control Measures
   - Watershed Management Measures
   - Illicit Connection / Illegal Dumping Elimination
   - Industrial and Commercial Discharges
   - New Development and Construction

   The Program's Storm Water Management Plan fulfills the Regional Board's permit application requirements subject to the condition that it will be improved and revised in

VOL 16 0237

accordance with the provisions of this Order to resolve deficiencies in it in terms of scope and detail of proposed actions and time frame for implementation.

6. The Storm Water Management Plan (Plan) and modifications or revisions to the Plan that are approved in accordance with Provision C.3 of this Order, and future fiscal year Workplans to be submitted in accordance with the Plan and Provision C.3 of this Order are incorporated into this Order by reference and are an integral and enforceable component of this Order.

7. The Program is organized, coordinated, and implemented based upon a Memorandum of Agreement signed by the Dischargers, which defines roles and responsibilities of the Dischargers. The roles and responsibilities of the Dischargers are, in part, as follows:

   a. The Management Committee, which includes representatives from all of the Dischargers, is the decision making body of the Program. It operates within the budget and policies established by the Dischargers' governing boards and councils to decide matters of budget and policy necessary to implement the Storm Water Management Plan, and provides direction to the Program Manager and staff. The Management Committee has established subcommittees to assist in planning and implementation of the Storm Water Management Plan, and may add, modify, or delete subcommittees as deemed necessary.

   b. The District's representative serves as the Chair of the Management Committee and is responsible for implementation of the Program's self-monitoring activities and preparation and submittal of Program components of the Annual Report and Workplans. In acting as the Program's NPDES Permit coordinator, the District does not assume responsibility for the obligations assigned to other Dischargers by this Order.

   c. Each of the Dischargers is individually responsible for adoption and enforcement of ordinances, implementation of assigned control measures needed to prevent or reduce pollutants in storm water, and providing funds for the capital, operation, and maintenance expenditures necessary to implement such control measures within their jurisdiction. Enforcement actions concerning this Order will, wherever possible, be pursued only against the individual Discharger(s) responsible for specific violations of this Order.

8. The Regional Board amended its Water Quality Control Plan (Basin Plan) for the San Francisco Bay Region on September 16, 1992 and June 21, 1995. The State Water Resources Control Board (hereinafter the State Board) approved the Basin Plan amendments on April 27, 1993 and July 20, 1995 respectively. The provisions of this permit are consistent with the amended Basin Plan.

9. The beneficial uses of South San Francisco Bay, its tributary streams and contiguous water bodies, and other water bodies within the drainage basin are listed in the Basin Plan.

VOL 16 0238

10. The Regional Board considers storm water discharges from the urban and developing areas in the San Francisco Bay Region, such as the Santa Clara Valley basin, to be significant sources of pollutants in waters of the Region that may be causing or threatening to cause or contribute to water quality impairment.

11. The San Francisco Estuary Project, established pursuant to CWA Section 320, culminated in June of 1993 with completion of its Comprehensive Conservation and Management Plan (CCMP) for the preservation, restoration, and enhancement of the San Francisco Bay-Delta Estuary. The CCMP includes recommended actions in the areas of aquatic resources, wildlife, wetlands, water use, pollution prevention and reduction, dredging and waterway modification, land use, public involvement and education, and research and monitoring. Recommended actions which may, in part, be addressed through implementation of the Dischargers' Storm Water Management Plan include, but are not limited to, the following:

    a. Action PO-2.1: Pursue a mass emissions strategy to reduce pollutant discharges into the Estuary from point and nonpoint sources and to address the accumulation of pollutants in estuarine organisms and sediments.

    b. Action PO-2.4: Improve the management and control of urban runoff from public and private sources.

    c. Action PO-2.5: Develop control measures to reduce pollutant loadings from energy and transportation systems.

    d. Action LU-1.1: Local General Plans should incorporate watershed protection plans to protect wetlands and stream environments and reduce pollutants in runoff.

    e. Action LU-3.1: Prepare and implement Watershed Management Plans that include the following complementary elements: 1) wetlands protection; 2) stream environment protection; and 3) reduction of pollutants in runoff.

    f. Action LU-3.2: Develop and implement guidelines for site planning and Best Management Practices.

12. On February 1, 1989, pursuant to Section 304(l) of the Clean Water Act, as amended by the Water Quality Act of 1987, the State Water Resources Control Board included South San Francisco Bay, below the Dumbarton Bridge (South Bay), on the 304(l)(1)(B) list of impaired waters for the pollutants cadmium, chromium, copper, lead, mercury, nickel, silver, selenium, and zinc (304(l) metals) and included the Dischargers on the 304(l)(1)(C) list of point sources discharging the listed pollutants. Order No. 90-094 served as an Individual Control Strategy required by Section 304(l) for point sources on the 304(l)(1)(C) list. The Individual Control Strategy was designed to produce a reduction in the discharge of toxic pollutants from storm water discharges sufficient, in combination with controls on point and nonpoint sources of pollutants, to achieve applicable water quality standards no later than three years after the date of the establishment of the Individual Control Strategy.

VOL 16 0239

The Regional Board reviewed reports submitted by the Dischargers between June of 1990 and September of 1993 and Regional Monitoring Program data and found that the Dischargers made considerable progress in reducing the discharge of pollutants, including 304(l) metals, but that the South Bay remained impaired and applicable water quality objectives had not been achieved. Consequently, on December 15, 1993, the Regional Board adopted Cease and Desist Order No. 93-164 which required the Dischargers to submit a plan identifying measures for further control of the 304(l) metals and assigning responsibilities and time schedules for implementation of such control measures. The Dischargers' Storm Water Management Plan includes an implementation plan for Metals Control Measures. This Order requires implementation of the Storm Water Management Plan and the Metals Control Measures and their annual evaluation and update and serves as a continuation of the Individual Control Strategy.

13. It is the Regional Board's intent that this Order shall ensure attainment of applicable water quality objectives and protection of the beneficial uses of receiving waters. This Order therefore includes standard requirements to the effect that discharges shall not cause violations of water quality objectives nor shall they cause certain conditions to occur which create a condition of nuisance or water quality impairment in receiving waters. Accordingly, the Regional Board is requiring that these standard requirements be addressed through the implementation of technically and economically feasible control measures to reduce pollutants in storm water discharges to the maximum extent practicable as provided in Provisions C.1 through C.9 of this Order. Compliance with Provisions C.1 through C.9 is deemed compliance with the requirements of this Order. If these measures, in combination with controls on other point and nonpoint sources of pollutants, do not result in attainment of applicable water quality objectives, the Regional Board will reopen this permit pursuant to Provisions C.1, C.9, and C.10 of this Order to impose additional conditions which require implementation of additional control measures.

14. The Regional Board considers the Program's Storm Water Management Plan (Plan) an essential component of an urban watershed management plan for the Santa Clara Valley basin and its eleven subbasins or watersheds. The Plan is intended to provide a framework for protection and restoration of the Santa Clara Valley watersheds and the South Bay in part through effective and efficient implementation of appropriate control measures for the most important sources of pollutants within the watersheds.

15. The Regional Board has issued a NPDES general permit for the regulation of storm water discharges associated with industrial activities in the Santa Clara Valley basin, and the State Board has issued a NPDES general permit for the regulation of storm water discharges associated with construction activities throughout the entire state. To effectively implement the Industrial and Commercial Dischargers and New Development and Construction elements of the Plan, the Dischargers will conduct investigations and local regulatory activities at industries or construction sites covered by these general permits. However, under the CWA, the Regional Board cannot delegate to the Dischargers its own authority to enforce these general permits. Therefore, Regional Board staff intend to work cooperatively with the Dischargers to ensure that industries and construction sites within the Discharger's jurisdiction are in compliance with applicable

VOL 16 0240

general permit requirements and are not subject to uncoordinated storm water regulatory activities.

16. Federal, state, or regional entities within the Dischargers' boundaries, not currently named in this Order, operate storm drain facilities and/or discharge storm water to the storm drains and watercourses covered by this Order. The Dischargers may lack legal jurisdiction over these entities under the state and federal constitutions. Consequently, the Regional Board recognizes that the Dischargers should not be held responsible for such facilities and/or discharges. The California Department of Transportation (Caltrans) is a state agency that is currently, among others, such an entity. The Regional Board issued a separate storm water permit (NPDES Permit No. CAS029998), to Caltrans in August of 1994, and will consider issuing separate NPDES permits for storm water discharges to other federal, state, or regional entities within the Dischargers' boundaries.

17. The action to adopt a NPDES permit is exempt from the provisions of the California Environmental Quality Act; Chapter 3 (commencing with Section 21100) of Division 13 of the Public Resources Code in accordance with Section 13389 of the California Water Code.

18. The Regional Board will notify interested agencies and interested persons of the availability of reports, plans, and schedules, including Annual Reports, Work Plans, Performance Standards, and proposed Storm Water Management Plan revisions, submitted in response to requirements of this Order and will provide them with an opportunity for a public hearing and/or an opportunity to submit their written views and recommendations. The Regional Board will consider all comments and may modify the reports, plans, or schedules or may modify this Order in accordance with the NPDES permit regulations. All submittals required by this Order conditioned with acceptance by the Executive Officer will be subject to these notification, comment, and public hearing procedures.

19. The Regional Board has notified the Dischargers and interested agencies and interested persons of its intent to prescribe waste discharge requirements and an NPDES permit for this discharge and has provided them with an opportunity for a public hearing and an opportunity to submit their written views and recommendations.

20. The Regional Board, at a properly noticed public meeting, heard and considered all comments pertaining to the discharge.

21. It is the intention of the Regional Board that this Order supersedes Order Nos. 90-094, 92-021, and 93-164.

22. This Order serves as a NPDES permit, pursuant to CWA Section 402, or amendments thereto, and shall become effective ten days after the date of its adoption provided the Regional Administrator, US EPA, Region IX, has no objections.

VOL 16 0241

IT IS HEREBY ORDERED that the Dischargers, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder and the provisions of the Clean Water Act as amended and regulations and guidelines adopted thereunder, shall comply with the following:

A. DISCHARGE PROHIBITION

1. The Dischargers shall, within their respective jurisdictions, effectively prohibit the discharge of non-storm water (materials other than storm water) into their storm drain systems and watercourses. NPDES permitted discharges are exempt from this prohibition. Compliance with this prohibition shall be demonstrated in accordance with Provisions C.1 and C.5 of this Order.

2. The discharge of stormwater from a facility or activity that causes or contributes to the violation of Receiving Water Limitations is prohibited.

B. RECEIVING WATER LIMITATIONS

1. The discharge shall not cause the following conditions to create a condition of nuisance or to adversely affect beneficial uses of waters of the State:
   a. Floating, suspended, or deposited macroscopic particulate matter, or foam;
   b. Bottom deposits or aquatic growths;
   c. Alteration of temperature, turbidity, or apparent color beyond present natural background levels;
   d. Visible, floating, suspended, or deposited oil or other products of petroleum origin; and/or
   e. Toxic or deleterious substances present in concentrations or quantities which will cause deleterious effects on aquatic biota, wildlife, or waterfowl, or which render any of these unfit for human consumption either at levels created in the receiving waters or as a result of biological concentration.

2. The discharge shall not cause a violation of any applicable water quality objective for receiving waters. If applicable water quality objectives are adopted and approved by the State Board after the date of the adoption of this Order, the Regional Board may revise and modify this Order as appropriate.

C. PROVISIONS

1. The Dischargers shall comply with Discharge Prohibition A.1 and A.2 and Receiving Water Limitations B.1 and B.2 through the timely implementation of control measures and other actions to reduce pollutants in the discharge in accordance with Provisions C.2 through C.9 and their Storm Water Management Plan (Plan) and any of its modifications, revisions, or amendments developed pursuant to this Order. If adverse impacts to beneficial uses of receiving waters persist following implementation of Provisions C.2 through C.9 and the Plan, this Order will be reopened to require the Dischargers to identify, assign, and implement additional control measures and revise the Plan, forthwith,

VOL 16 0242

to ensure compliance with Discharge Prohibitions A.1 and A.2 and Receiving Water Limitations B.1 and B.2.

2. **Storm Water Management Plan and Performance Standards**

   a. The Dischargers shall implement control measures and best management practices to reduce pollutants in storm water discharges to the maximum extent practicable. The Program's Storm Water Management Plan shall serve as the framework for identification, assignment, and implementation of such control measures. The Dischargers shall begin implementing forthwith the Program's Storm Water Management Plan as submitted on December 20, 1994 and revised on June 30, 1995, and shall subsequently demonstrate its effectiveness and provide for necessary and appropriate revisions, modifications, and improvements to reduce pollutants in storm water discharges to the maximum extent practicable and as required by Provisions C.1 through C.9 of this Order.

   b. The Storm Water Management Plan shall be revised to adopt and incorporate Performance Standards developed by the Dischargers. Performance Standards are defined as the level of implementation necessary to demonstrate the control of pollutants in storm water to the maximum extent practicable. Performance Standards shall be established for implementing control measures and best management practices contained in the Implementation Plan chapter of the Storm Water Management Plan. Performance Standards shall be developed through a process which includes opportunities for public participation and include appropriate criteria for the applicability, economic feasibility, design, operation, and maintenance or otherwise implementation of a control measure or best management practice so as to achieve pollutant reduction or pollution prevention benefits to the maximum extent practicable. Performance Standards may be based upon special studies or other activities conducted by the Dischargers, literature review, or special studies conducted by other programs or dischargers. Performance Standards shall include the baseline components to be accomplished and the method to be used to verify that the Performance Standard has been achieved. Following the addition of a Performance Standard, acceptable to the Executive Officer, to the Storm Water Management Plan, all Dischargers for which the Performance Standard is applicable shall adhere to its implementation.

      i. The following Performance Standards shall be the highest priority and shall be developed during Fiscal Year 1995-1996 or otherwise in accordance with the stated schedule:

         a) Industrial/Commercial Discharger Inspection Program -

            A Performance Standard for conducting the Industrial/Commercial Inspection Program shall be developed and submitted to the Executive Officer by January 1, 1996. The Performance Standard shall include the baseline activities and items of an inspection check list.

VOL 16 0243

R0061643

b) Municipal Separate Storm Drain System Operations and Maintenance -

A Performance Standard for conducting routine operations and maintenance of the Dischargers' municipal storm drain systems to reduce pollutants in discharges, including inlet and line maintenance, solid waste management, and opportunities for structural retrofit shall be developed and submitted to the Executive Officer by March 1, 1996.

c) Water Utility Operations and Maintenance -

A Performance Standard for discharges associated with water utility operations, including management of chlorine, biocides, and algaecides and prevention of erosion and sedimentation, shall be developed and submitted to the Executive Officer by July 1, 1996.

Discharges associated with water utility operations owned or operated by the Dischargers are authorized and permitted by this Order, to the extent they are in accordance with the conditions of this provision and Provision C.5 of this Order and the Dischargers' Storm Water Management Plan.

d) New Development and Construction -

Performance Standards for planning procedures and construction inspections shall be developed and submitted to the Executive Officer by September 1, 1996.

e) Public Streets, Roads, and Highways

Performance Standards for control measures and practices for operating and maintaining public streets, roads, and highways identified in the Storm Water Management Plan for reducing pollutants in discharges from municipal storm drain systems shall be developed and submitted to the Executive Officer by December 1, 1996.

f) Public Information and Participation

A Public Information and Participation strategy and plan, addressing general outreach, targeted outreach, education programs, and citizens participation, including Performance Standards for their implementation, shall be developed and submitted to the Executive Officer by March 1, 1996.

g) Illicit Connection and Illegal Dumping Identification and Elimination Activities

Performance Standards for implementing Illicit Connection and Illegal Dumping Identification and Elimination Activities, including residential illegal discharge elimination, illegal discharge elimination for commercial and light industrial facilities, and illegal discharge elimination for older businesses and

VOL 16 0244

heavy industrial areas shall be developed and submitted to the Executive Officer by January 1, 1996.

ii. Beginning in September of 1996, the Dischargers shall incorporate newly developed or updated Performance Standards, acceptable to the Executive Officer, in each annual revision to the Storm Water Management Plan. The draft Annual Workplan required in Provision C.3 shall identify those Performance Standards which will be developed for the upcoming fiscal year. Performance Standards shall be established for all appropriate control measures or best management practices identified in the Storm Water Management Plan by September 1, 1997, or otherwise, a proposed schedule for completing or omitting the establishment of Performance Standards with justification acceptable to the Executive Officer must be submitted by September 1, 1997. Such time schedules shall not extend beyond the term of this permit.

c. The Dischargers shall revise the Storm Water Management Plan (Plan) by September 1, 1997 for approval by the Regional Board. This approval shall be done in accordance with the NPDES permit regulations.

i. The revised Storm Water Management Plan shall be developed through a process which includes opportunities for public participation, and shall provide clear and concise identification, assignment, and time schedule for implementation of appropriate control measures and best management practices, including performance standards for their implementation, sufficient to demonstrate the reduction of pollutants in storm water discharges to the maximum extent practicable.

ii. The revised Storm Water Management Plan shall include a summary or checklist of all actions, activities, and tasks and time schedules pertinent to implementation of control measures and best management practices, which shall be presented in a concise format suitable for incorporation or attachment to this permit.

iii. The revised Storm Water Management Plan shall include consideration of comments received from the Executive Officer, and other interested parties, on the current Plan submitted on December 20, 1994 and revised on June 30, 1995 and any subsequent revisions to the Plan in the interim.

iv. The submittal of annual workplans on March 1, 1996 and March 1, 1997 and an annual report on September 1, 1996, and any interim revisions to the Storm Water Management Plan, as required and described by Provisions C.3 or C.9 of this Order, shall be considered demonstrations of progress towards compliance with this provision, and may be used in fulfillment of this Provision.

v. The Regional Board will consider amendment of this permit subsequent to submittal of the revised Storm Water Management Plan on September 1, 1997 to include specific requirements for implementation of control measures and best management practices and further revisions to the Storm Water Management Plan

VOL 16 0245

necessary to ensure reduction of pollutants in storm water discharges to the maximum extent practicable.

3. **Annual Reports and Work Plans**

a. The Dischargers shall submit an Annual Report, by September 1 of each year, beginning in 1996, documenting the status of the Program's and the Dischargers' activities, including the results of a qualitative field level assessment of activities implemented by the Dischargers, and the performance of tasks contained in the Storm Water Management Plan.

The Annual Report shall include a compilation of deliverables and milestones completed as described in the Storm Water Management Plan. As part of the Annual Report process, each of the Dischargers shall conduct an overall evaluation of the effectiveness of its applicable activities described in the Storm Water Management Plan. Direct and indirect measures of effectiveness may include, but are not limited to, conformance with established Performance Standards, quantitative monitoring to assess the effectiveness of control measures, measurements or estimates of pollutant load reductions, detailed accounting of Program accomplishments, funds expended, or staff hours utilized. Methods to improve effectiveness in the implementation of tasks and activities including development of new, or modification of existing, Performance Standards, shall be identified where appropriate.

In each Annual Report, the Dischargers shall propose pertinent updates, improvements, or revisions to the Storm Water Management Plan, which shall be deemed to be incorporated into this Order unless disapproved of by the Executive Officer or acted on in accordance with Provision C.9.

b. The Dischargers shall submit draft Workplans by March 1 of the year following the submission of each Annual Report which describes the proposed implementation of the Storm Water Management Plan for the next fiscal year.

The Workplans shall consider the status of implementation of current year activities and actions of the Dischargers, problems encountered, and proposed solutions, and shall address any comments received from the Executive Officer on their previous year Annual Report. The Workplans shall include clearly defined tasks, responsibilities, and schedules for implementation of Program and Discharger actions for the next fiscal year. The Workplans shall also include a proposal for development of new, or modification of existing, Performance Standards in accordance with Provision C.2.b and alternative monitoring activities as required in Provision C.4.

The Workplans shall be deemed to be final and incorporated into the Storm Water Management Plan and this Order as of July 1 unless determined to be unacceptable by the Executive Officer. The Dischargers shall address any comments or conditions of acceptability received from the Executive Officer on their draft Workplans prior to the submission of their Annual Report on September 1, at which time the Workplans shall

VOL 16 0246

R0061646

be deemed to be incorporated into the Storm Water Management Plan and this Order unless disapproved of by the Executive Officer.

4. **Monitoring Program**

The Dischargers shall submit by September 1 of each year, an Annual Monitoring Program Plan acceptable to the Executive Officer, that supports the development and implementation and assesses the effectiveness of the Storm Water Management Plan. The Monitoring Program Plan shall be designed to achieve the following objectives and objectives presented in the Storm Water Management Plan:

- Characterization of representative drainage areas and storm water discharges, including land use characteristics, pollutant concentrations, and mass loadings;
- Assessment of existing or potential adverse impacts on beneficial uses caused by pollutants of concern in storm water discharges, including an evaluation of representative receiving waters;
- Identification of potential sources of pollutants of concern found in storm water discharges; and
- Evaluation of effectiveness of representative storm water pollution prevention or control measures.

The Monitoring Program shall include the following:

a. Provisions for conducting and reporting the results of special studies conducted by the Program or Dischargers which are designed to determine effectiveness of best management practice or control measures, define a Performance Standard in accordance with Provision C.2, or assess the adverse impact of a pollutant or pollutants on beneficial uses.

b. Provisions for conducting watershed monitoring activities including; identification of major sources of pollutants of concern; evaluation of the effectiveness of control measures and best management practices; and use of physical, chemical, and biological parameters and indicators as appropriate; and

c Identification and justification of representative sampling locations, frequencies and methods, suite of pollutants to be analyzed, analytical methods, and quality assurance procedures. Alternative monitoring methods in place of these (special projects, financial participation in regional, state, or national special projects or research, literature review, visual observations, use of indicator parameters, recognition and reliance on special studies conducted by other programs, etc.) may be proposed with justification. Such proposed alternative monitoring methods shall be included as a component of the Program draft Workplan as required in Provision C.3.

VOL 16 0247

R0061647

5. **Non-Storm Water Discharges**

a. Exempted Discharges

In carrying out Discharge Prohibition A.1 of this Order, the following non-storm water discharges need not be prohibited unless they are identified by the Dischargers or the Executive Officer as sources of pollutants to receiving waters:

i. flows from riparian habitats or wetlands;
ii. diverted stream flows;
iii. springs;
iv. rising ground waters; and
v. uncontaminated groundwater infiltration.

If the any of the above categories of discharges, or sources of such discharges, are identified as sources of pollutants to receiving waters, then such categories or sources shall be addressed as conditionally exempted discharges in accordance with Provision C.5.b.

b. Conditionally Exempted Discharges

The following non-storm water discharges need not be prohibited if are either identified by the Dischargers or the Executive Officer as not being sources of pollutants to receiving waters or if appropriate control measures to minimize the adverse impacts of such sources are developed and implemented under the Storm Water Management Plan in accordance with Provision C.5.c.:

i. uncontaminated pumped groundwater;
ii. foundation drains;
iii. water from crawl space pumps;
iv. footing drains;
v. air conditioning condensate;
vi. irrigation water;
vii. landscape irrigation;
viii. lawn or garden watering;
ix. planned and unplanned discharges from potable water sources;
x. water line and hydrant flushing;
xi. individual residential car washing; and
xii. discharges or flows from emergency fire fighting activities.

c. The Dischargers shall identify and describe the categories of discharges b.i through b.xii which they wish to exempt from Prohibition A.1 in periodic submissions to the Executive Officer. For each such category, the Dischargers shall identify and describe as necessary and appropriate to the category either documentation that the discharges are not sources of pollutants to receiving waters or circumstances in which they are not found to be sources of pollutants to receiving waters. Otherwise, the Dischargers shall describe control measures to reduce pollutants to the maximum extent practicable

VOL 16 0248

and minimize the adverse impacts of such sources, procedures and Performance Standards for their implementation, procedures for notifying the Regional Board of these discharges, and procedures for monitoring and record management. Such submissions shall be deemed to be incorporated into the Storm Water Mangement Plan unless disapproved by the Executive Officer or acted on in accordance with Provision C.9 and the NPDES permit regulations.

d. Permit Authorization for Exempted Discharges

i. Discharges of non-storm water from sources owned or operated by the Dischargers are authorized and permitted by this Order, if they are in accordance with the conditions of this provision and the Dischargers' Storm Water Management Plan.

ii. The Regional Board may require dischargers of non-storm water other than the Dischargers to apply for and obtain coverage under a NPDES permit and comply with the control measures developed by the Dischargers pursuant to this Provision. Non-storm water discharges that are in compliance with such control measures may be accepted by the Dischargers and are not subject to Prohibition A.

iii. The Dischargers may propose, as part of their annual updates to the Storm Water Management Plan under Provision C.3 of this Order, additional categories of non-storm water discharges to be included in the exemption to Discharge Prohibition A. Such proposals are subject to approval by the Regional Board in accordance with the NPDES permit regulations.

6. Metals Control Measures

The Discharges shall submit a workplan on March 1, 1996 and a revised Metals Control Measures Plan to the Regional Board by September 1, 1996 acceptable to the Executive Officer which assigns responsibilities and establishes time schedules to define and implement short term and long term copper reduction measures and control measures for the other 304(l) metals. The Metals Control Measures Plan shall provide for implementation of control measures beginning in fiscal year 1996-97 and include provisions for conducting an annual evaluation of progress towards implementing control measures and an evaluation of their effectiveness. Upon approval by the Executive Officer the revised Metals Control Measures Plan shall be incorporated into the in accordance with Provision C.9.

In lieu of a revised Metals Control Measures Plan for certain 304(l) metals, the Dischargers may submit a report by September 1, 1996 that provides evidence that a 304(l) metal has no controllable sources associated with storm water discharges or does not result in adverse impacts to beneficial uses and justifies its removal from the Metals Control Measures Plan. The Dischargers shall notify the Executive Officer by June 1, 1996 of their intent to submit such a report including identification of the specific 304(l) metals which will be included in the report.

VOL 16 0249

VOL 16

7. **Watershed Management Measures**

The Dischargers shall submit to the Regional Board, as part of their revision of their Storm Water Management Plan pursuant to Provision C.2.c a revised Watershed Management Measures element acceptable to the Executive Officer. Watershed Management Measures embrace many of the programmatic areas of activity within the Storm Water Management Plan, such as Metals Control Measures and New Development and Construction, and are designed to coordinate and integrate the goals and tasks of these activities in a way that recognizes that there may be unique values, problems, goals, and strategies specific to individual watersheds. Watershed Management Measures also seek to develop and implement the most cost effective approaches to solving identified problems and to coordinate these activities with other related programs.

The revised Watershed Management Measures element shall include provisions for development of an area-wide watershed management strategy in fiscal year 1996-97 and implementation of the strategy beginning in fiscal year 1997-98. The scope of the Watershed Management Measures may be limited to procedures for identifying appropriate watershed characteristics, identification of control measures and other actions in the Storm Water Management Plan that are appropriately implemented on a watershed basis, and procedures for implementation of such control measures and other actions on a watershed basis. Upon approval by the Executive Officer the revised Watershed Management Measures element shall be incorporated into the Storm Water Management Plan in accordance with Provisions C.9 and C.2.c.v.

8. **Storm Water Discharges Associated With Construction Activity**

Pursuant to Provisions C.2 and C.3 of this Order, the Dischargers may submit to the Executive Officer, proposed amendments to the Storm Water Management Plan which define Best Management Practices and Performance Standards and procedures for notifying the Regional Board for Construction Activities conducted by the Dischargers. Following incorporation into the Storm Water Management Plan, the applicable Dischargers shall implement such Construction Best Management Practices in accordance with established Performance Standards pursuant to site specific Storm Water Pollution Prevention Plans to be developed pursuant to and accordance with Appendix B of this Order for all construction sites involving the disturbance of five or more acres of total land area.

Discharges of storm water from construction sites owned or operated by the Dischargers are authorized and permitted by this Order, if they are in accordance with the conditions of this provision and the Dischargers' Storm Water Management Plan.

9. It is anticipated that the Storm Water Management Plan may need to be modified, revised, or amended from time to time to respond to changed conditions and to incorporate more effective approaches to pollutant control. Requests for changes may be initiated by the Executive Officer or by the Dischargers. Minor changes may be made with the Executive Officer's approval and will be brought to the Regional Board as information items and the Dischargers and interested parties will be notified accordingly. If proposed changes imply

0250

a major revision of the Program, the Executive Officer shall bring such changes before the Regional Board as permit amendments and notify the Dischargers and interested parties accordingly.

10. This Order may be modified, or alternatively, revoked or reissued, prior to the expiration date as follows:

    a. to address significant changed conditions identified in the technical reports required by the Regional Board which were unknown at the time of the issuance of this Order;

    b. to incorporate applicable requirements of statewide water quality control plans adopted by the State Board or amendments to the Basin Plan approved by the State Board; or

    c. to comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain any other requirements of the CWA then applicable.

11. Each of the Dischargers shall comply with all parts of the Standard Provisions contained in Appendix A of this Order.

12. This Order expires on June 21, 2000. The Dischargers must file a Report of Waste Discharge in accordance with Title 23, California Code of Regulations, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

13. Order Nos. 90-094, 92-021, and 93-164 are hereby rescinded.

I, Stephen I. Morse, Acting Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, San Francisco Bay Region, on August 23, 1995.

Stephen I. Morse
Acting Executive Officer

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
81 South Higuera St. Suite 200
San Luis Obispo, California 93401-5427

ORDER NO. 94-99
NPDES NO. CAS049883

WASTE DISCHARGE REQUIREMENTS FOR CITY OF SANTA CRUZ, NEARY LAGOON STORM WATER DISCHARGE AND LAGOON MANAGEMENT, SANTA CRUZ COUNTY

The California Regional Water Quality Control Board, Central Coast Region (hereafter the Board), finds:

1. Neary Lagoon (hereafter the Lagoon) is located in the City of Santa Cruz less than one mile from the downtown area as shown on Attachment "A" of this Order. The Lagoon detains storm water and urban runoff from about 850 acres within the City limits prior to discharge to the Pacific Ocean.

2. The City of Santa Cruz (hereafter the Discharger) controls and manages Neary Lagoon and controls associated pump testing discharge from the Lagoon to the Pacific Ocean. The Discharge during gravity flow and pump testing occurs at the Cowell's Beach storm water conveyance outlet.

3. On June 10, 1994, the Discharger submitted an application for the issuance of waste discharge requirements under the National Pollutant Discharge Elimination System (NPDES). The permit application included a study conducted to determine existing Lagoon water quality. Sampling conducted by the Discharger indicates high coliform concentrations in Lagoon surface water. There were no other pollutants in the Lagoon that exceed water quality objectives for the Lagoon or the Ocean.

4. The Board has not previously regulated the discharge of storm water and urban runoff to the Lagoon, nor testing of the flood control pumps which discharge to the Ocean.

5. Areas subject to these permit requirements include all areas within the boundaries of the Neary Lagoon and storm water discharges to the Pacific Ocean.

6. In December 1991, the City completed installation of three flood control pumps (each rated at 33,600 gallon per minute) at the Lagoon. The pumps were installed to prevent flooding of urban areas adjacent to the Lagoon during intense storm events. These pumps can be operated either automatically or manually and are equipped with a standby generator to ensure operation during power outages. Winter storm water flows normally drain into the 66" gravity line that discharges to Cowell Beach. If winter storm water flows cannot be handled by the gravity drain line, as indicated by rising Lagoon water level above a specified point, the pumps are activated.

VOL 16
0252
R0061652

7. On August 4, 1992, the City conducted the first manual testing of the pumps. About 250,000 gallons were discharged to Cowell Beach. Adequate measures to mitigate impacts of the discharge were not implemented by the City and as a result, Cowell Beach was posted for three days (August 4, 5, & 6) due to nuisance conditions. Fecal coliform water-contact standards were exceeded.

8. Additional pump tests were conducted by the City on September 15, and October 14, 1992. During these tests, the City implemented conditions recommended by Board staff. Results of bacterial sampling for the September 15 and October 14, 1992, discharges showed compliance with fecal coliform standards and did not create a condition of nuisance.

9. On December 15, 1993, the City conducted another pump testing. Receiving water bacterial sampling exceeded fecal coliform standards and resulted in a nuisance condition. However, fecal coliform standards were met on the day following the test. Staff believes fecal coliform standards were exceeded primarily due to stagnant water within the storm water conveyance pipe.

10. The federal Clean Water Act Section 402 (p)(2)(E) allows the Regional Board, as an authorized state water pollution control agency, to require a permit upon determination that a storm water discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

11. On at least two occasions, discharges from the test pumping have caused fecal coliform levels in ocean waters to exceed safe limits for contact recreation. The high coliform level, odor and color of the discharge also caused a condition of nuisance. The fact that the beach had to be closed on these occasions further demonstrates that these discharges impaired beneficial uses of the ocean. Given the high coliform levels in the Lagoon, it is also possible that discharges from the gravity drain have also caused a violation of the fecal coliform water quality standard for ocean waters. These discharges will continue, on an intermittent basis, for the foreseeable future. Therefore, it is necessary to regulate these discharges pursuant to Clean Water Act Section 402(p)(2)(E) and California Water Code Section 13377.

12. The major source of odor and discoloration in the pump discharge is stagnant water that accumulates in the storm water conveyance pipe between the pumps and the ocean outlet. There is a potential for high fecal coliform levels in the Lagoon. However, the two pump discharges of Lagoon water, occurring after previous discharges had flushed out stagnant water, did not cause a condition of nuisance. No evidence exists to indicate future discharges without stagnant water will not cause impairment of body contact beneficial use of the receiving water.

13. The degree to which storm water flows and urban runoff from the storm drains contribute to elevated coliform levels within the Lagoon is unknown at this time. The sources of coliform entering storm drains and sources of coliform in the Lagoon must be investigated.

14. The Ocean Plan designates coliform water quality objectives for the contact recreation beneficial use in ocean waters. The Ocean Plan requires that:

    a. Samples of water from each sampling station must have a density of total coliform organisms less than 1,000 per 100 ml (10 per ml); provided that not more than 20 percent of the samples at any sampling station, in any 30-day period may exceed 1,000 per 100 ml (10 per ml), and provided further that no single sample, when

VOL 16 0253

verified by a repeat sample taken within 48 hours shall exceed 10,000 per 100 ml (100 per ml).

b. The fecal coliform density based on a minimum of not less than five samples for any 30-day period, shall not exceed a geometric mean of 200 per 100 ml nor shall more than 10 percent of the total samples during any 60-day period exceed 400 per 100 ml.

15. The Basin Plan has established water quality objectives for contact recreation use in inland surface waters, including Neary Lagoon. The Basin Plan provides:

> Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period shall not exceed a log mean of 200 per 100 ml, nor shall more than ten percent of total samples during any 30-day period exceed 400 per 100 ml.

16. The Clean Water Act authorizes a state to impose more stringent water quality protection than federal law requires. A Regional Water Quality Control Board may apply more stringent receiving water limitations than those required to implement the Ocean Plan if they are necessary to protect beneficial uses of the ocean. Reference the case of Southern California Edison v. State Water Resources Control Board (1981) 116 Cal.App.3d 751,172 Cal. Rptr. 306. In that case, the Ocean Plan objectives were based on repeated sampling over periods from 30 to 60 days. These sampling requirements made sense for a discharge that continues daily and occurs from an outfall located away from the shoreline. With the Neary Lagoon case, pump test discharge occurs for only one day on an intermittent basis; the discharge is very large, approximately one million gallons; and it flows directly across the beach and into shoreline waters in direct contact with people who are using the water for recreation. Therefore, the pump-test discharge impairs beneficial use whenever it causes receiving waters to exceed safe levels for contact recreation. Under the specific circumstances of this case, the Pacific Ocean's beneficial use of contact recreation will be protected if each Ocean Water shore station sample, taken in accordance with MRP No. 94-99, does not exceed a median density for total coliform of 1,000 per 100 ml and does not exceed a median density for fecal coliform of 200 per 100 ml. Receiving water limitations apply immediately after discharge commences, if the pump test discharge commences during daylight hours. If the pump test commences after dark, the limitations will apply 12 hours after the discharge or one hour before sunrise, whichever time occurs first.

17. The initial zone of dilution is at the shoreline where pump test discharge meets ocean water. The dilution ratio is considered 1:1.

18. Summer inflows to the Lagoon are primarily attributed to domestic activities within the Watershed such as, lawn watering, washing cars and from natural seeps and springs. During dry weather flows, the City diverts gravity flows to the sanitary sewage treatment facility adjacent to the Lagoon. However, winter flows during some storm events are estimated to be in excess of present treatment facility capacity.

19. Storm water discharges consist of surface runoff generated from various land uses in the hydrologic drainage basin which discharges to waters of the State. Storm water discharge quality can vary and is affected by hydrology, geology, land use, season, and sequence and duration of hydrologic events. National urban run-off data indicates pollutants of concern in storm water discharges include, but are not limited to, total suspended solids (TSS), total dissolved solids (TDS), chemical oxygen demand (COD), biochemical oxygen demand (BOD), oil and grease, total and fecal

VOL 16 0254

coliform and enterococci bacteria, heavy metals, nutrients, sediments, petroleum hydrocarbons, polycyclic aromatic hydrocarbons (PAHs), pesticides, and herbicides. To date, pollutants of primary concern in Neary Lagoon have been limited to bacteria.

20. California Water Code Section 13263(a) specifies that waste discharge requirements issued by the Regional Board include provisions to implement water quality based objectives. Numeric effluent limitations and receiving water limitations are not provided for storm water discharge to the Lagoon or for discharges from the Lagoon to the Pacific Ocean during storm events because of the enormous variability in storm water quality and quantity and the complexity of urban runoff. The requirements in this Order are designed to provide the data, which may make it possible to set some numeric effluent limitations and receiving water limitations, and concurrently achieve reductions in pollutant loads to surface waters from storm water runoff.

Coliform receiving water limitations for pump test discharges are provided because past pump test discharges have caused impairment of contact recreation beneficial uses of the Pacific Ocean and because planning and preparation is possible before pump test occurs. No numeric effluent limitations for pump test discharges are provided because of the variability in conditions in Neary Lagoon, which is itself a water of the United States.

21. The objective of Lagoon Storm Water Pollution Prevention Plan, per C.1. and C.2. contained in this Order, is to minimize pollutants in storm water discharges to surface waters, including Neary Lagoon and the Pacific Ocean, and to implement regulatory requirements prescribed in the Basin Plan; Section 402(p) of the federal Clean Water Act; and 40 CFR, parts 122, 123, and 124.

22. This permit is intended to: a) regulate future flood control pump testing; and b) develop, achieve, and implement a timely, comprehensive, and cost-effective Lagoon water pollution control program to minimize pollutants in discharges to waters of the United States.

23. The Water Quality Control Plan, Central Coastal Basin (Basin Plan), was adopted by the Board on November 17, 1989, and approved by the State Water Resources Control Board on August 16, 1990. The Basin Plan incorporates statewide plans and policies by reference and contains a strategy for protecting beneficial uses of State waters. The Water Quality Control Plan, Ocean Waters Of California (Ocean Plan), was adopted by the State Water Resources Control Board on March 22, 1990. The Ocean Plan contains water quality objectives and other requirements governing discharge to the Pacific Ocean.

24. Present and anticipated beneficial uses of Neary Lagoon include:

a. Ground water recharge;
b. Non-contact water recreation, including aesthetic enjoyment;
c. Water contact recreation;
d. Wildlife habitat;
e. Warm water habitat;
f. Fish spawning; and,
g. Rare and endangered species habitat.

25. Existing beneficial uses of the Pacific Ocean include:

a. Non-contact water recreation, including aesthetic enjoyment;
b. Water contact recreation;
c. Industrial service supply;
d. Navigation;
e. Mariculture; and,
f. Commercial and Open Sport Fishing.

VOL 16
0255
R0061655

26. Monterey Bay was officially designated as a National Marine Sanctuary on September 15, 1992. The National Marine Sanctuaries Program is mandated by Title III of the Marine Protection, Research, and Sanctuaries Act of 1972. The Program protects areas of the marine environment which possess conservation, recreational, ecological, historical, research, educational, or aesthetic qualities of special national significance. The first priority of the Program is the long term protection of resources within a sanctuary.

27. The Environmental Protection Agency and the Board classify the pump test discharge as a minor discharge.

28. These waste discharge requirements are exempt from the provisions of the California Environmental Quality Act (Public Resources Code, Section 21100, et seq.) pursuant to Section 13389 of the California Water Code.

29. This permit does not authorize discharges of fill or dredged material regulated by the U.S. Army Corps of Engineers under the Clean Water Act and does not constitute water quality certification under Clean Water Act Section 401.

30. Discharge of waste is a privilege, not a right, and authorization to discharge is conditional upon the discharge complying with provisions of Division 7 of the California Water Code and any more stringent effluent limitations necessary to implement water quality control plans, to protect beneficial uses, and to prevent nuisance. Compliance with this Order should assure this and mitigate any potential adverse changes in water quality due to the discharge.

31. On August 19, 1994, the Board notified the City and interested agencies and persons of its intent to issue these waste discharge requirements and has provided them with a copy of the proposed Order and an opportunity to submit written views and comments.

32. After considering all comments pertaining to this discharge during a public hearing on October 14, 1994, this Order was found consistent with the above findings.

IT IS HEREBY ORDERED, pursuant to authority in Sections 13263 and 13377 of the California Water Code, the City of Santa Cruz, its agents, successors, and assigns, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and regulations and guidelines adopted thereunder, shall comply with the following requirements.

(Note: Throughout these requirements footnotes are listed to indicate the source of requirements specified. Requirement footnotes are as follows:

A = Basin Plan
B = Ocean Plan
C = Code of Federal Regulations Title 40 Section 122

Requirements not referenced are based on staff's professional judgement.)

A. LIMITATIONS FOR SURFACE WATER DISCHARGES TO THE PACIFIC OCEAN

1. All dry weather surface water discharge from Neary Lagoon to the Pacific Ocean is prohibited, except for pump test discharge, conducted in accordance with Section B of this permit. "Dry weather" is generally defined as April 1 through October 31. When and if adequate capacity exists at the Santa Cruz wastewater treatment plant, discharges from Neary Lagoon to the Pacific Ocean during any other time are also prohibited. "Adequate capacity" means both hydraulic and organic loading. Diversion to the wastewater treatment plant should cease if plant staff believe it may cause a treatment plant permit violation.

VOL 16 0256

B. PUMP TEST DISCHARGE LIMITATIONS

1. All pump test discharges from the Lagoon to the Pacific Ocean are prohibited unless stagnant water within Lagoon storm water conveyance pipes has been eliminated from the discharge or adequately treated and discharged in accordance with applicable waste discharge requirements and/or an NPDES permit. This permit may be re-opened to establish effluent limitations and receiving water limitations for the discharge of treated stagnant water or other treated water discharged from Neary Lagoon to the Ocean or other surface water body. Stagnant water is defined as water and/or other material, that remains within the storm water conveyance pipe long enough to cause nuisance conditions when discharged (i.e., odor, turbidity problems and dissolved oxygen levels below 2.0 mg/l).

2. Pump test discharge may occur only after the following conditions have been met:

   i. Thirty days prior to the proposed test pumping the Discharger shall advise in writing the Regional Water Quality Control Board, Monterey Bay National Marine Sanctuary, Coastal Commission, and County Environmental Health of the testing procedure, discharge plan, and condition of any stagnant water or treatment/evacuation of any stagnant water from the conveyance pipe.

   ii. The Discharger shall submit verification of public notice in a local newspaper. The notice shall be printed at least three days prior to the proposed discharge.

   iii. The Discharger shall ensure adequate and conspicuous beach posting notifying the public in the area of the discharge and the potential health hazard associated with it. Sign posting shall be subject to the approval of the Santa Cruz County Department of Health Services.

   iv. The discharge shall be scheduled to coincide with the outgoing tide.

   v. The Discharger shall prepare the beach in front of the outfall structure to form a channel leading to the beach.

3. The Discharger shall collect and analyze water samples in accordance with Monitoring and Reporting Program No. 94-99.

4. The Discharger shall develop and implement a plan to prepare the pump pipeline conveyance system and ensure stagnant water removal prior to pump test and potential wet weather discharges, and ensure that all personnel whose decisions or activities could affect storm water, non-storm water, or pump test discharges are familiar with the contents of this Order. The plan should also include a procedure to prevent the collection of stagnant water in the pump system during the wet weather season (this plan need not be implemented if the plan documents that it is not feasible). Discharger shall submit a report to Executive Officer outlining compliance with this provision by December 15, 1994.

C. LAGOON STORM WATER POLLUTION PREVENTION PLAN

1. The Discharger shall develop and implement an effective Lagoon Storm Water Pollution Prevention Plan (PLAN). The PLAN shall identify and describe the Best Management Practices (BMPs) used to control and reduce pollutants within the Lagoon and pollutants discharged from the Lagoon to the Pacific Ocean to the maximum extent practicable. The Discharger shall submit a proposed development and implementation schedule for the PLAN by November 18, 1994.

VOL 16 0257

2. A final PLAN shall be submitted by July 15, 1995.

D. PUMP TEST DISCHARGE RECEIVING WATER LIMITATIONS

The pump test discharge shall not cause:

1. The following bacteriological limits to be exceeded at sampling stations A, B, B', C, C', D, D', (as listed in MRP No. 94-99):[B]

Parameter Applicable At Each Station	24 hr. Median Total Coliform Organisms per 100 ml	24 hr. Median Fecal Coliform Organisms per 100 ml
	1000	200

Note: These receiving water limitations apply immediately after discharge commences, if the pump test discharge commences during daylight hours. If the pump test commences after dark (at least one hour after sunset) the limitations apply 12 hours after the discharge or one hour before sunrise, whichever time occurs first.

2. Floating particulates and grease and oil to be visible on the ocean surface.[B]

3. Aesthetically undesirable discoloration of the ocean surface.[B]

4. Significant reduction of transmittance of natural light in ocean waters outside the "zone of initial dilution."[B]

5. Change in the rate of deposition of inert solids and the characteristics of inert solids in ocean sediments such that benthic communities are degraded.[B]

6. The pH outside the "zone of initial dilution" to be depressed below 7.0, raised above 8.3, or changed more than 0.2 units from that which occurs naturally.[B]

7. Objectionable aquatic growth or degradation of indigenous biota.[B]

8. Concentrations of organic materials in marine sediments to increase to a level which would degrade marine life.[B]

9. Degradation of marine communities, including vertebrate, invertebrate, and plant species.[B]

10. Alteration in natural taste, odor, and color of fish, shellfish, or other marine resources used for human consumption.[B]

11. Concentrations of organic materials in fish, shellfish or other marine resources used for human consumption to bioaccumulate to levels that are harmful to human health.[B]

12. Degradation of marine life due to radioactive waste.[A,B]

E. PROVISIONS

1. Pump Test Discharge shall not create a nuisance or pollution, as defined by Section 13050 of the California water Code.

2. Disposal during pump testing shall be in a manner that precludes public contact with storm water.

3. The Regional Board staff and the Environmental Protection Agency shall be allowed:

   a. entry upon premises where an effluent source is located or where records must be kept under the conditions of this permit;

   b. access to copy any records that must be kept under the conditions of this permit;

   c. to inspect any facility, equipment (including monitoring control equipment), practices, or operations

VOL 16 0258

regulated or required under this permit; and,

d. to photograph, sample, and monitor for the purpose of showing permit compliance.

4. After notice and opportunity for a hearing, this permit may be terminated for cause, including, but not limited to:

a. violation of any term or condition contained in this permit;

b. obtaining this permit by misrepresentation, or by failure to disclose fully all relevant facts;

c. a change in any condition or endangerment to human health or environment that requires a temporary or permanent reduction or elimination of the authorized discharge; and,

d. a substantial change in character, location, or volume of the discharge.

5. This permit does not authorize commission of any act causing injury to the property of another, does not convey any property rights of any sort, does not remove liability under Federal, State, or local laws, and does not guarantee a capacity right in receiving waters.

6. The discharger shall take all reasonable steps to minimize or prevent any discharge in violation of this permit which has a reasonable likelihood of adverse impact on human health or the environment.

7. Provisions of this permit are severable. If any provision of the permit is found invalid, the remainder of the permit shall not be affected.

8. After notice and opportunity for hearing, this permit may be modified or revoked and reissued for cause, including:

a. Promulgation of a new or revised effluent standard or limitation;

b. A material change in character, location, or volume of the discharge;

c. Access to new information that affects the terms of the permit, including applicable schedules;

d. Correction of technical mistakes or mistaken interpretations of law; and,

e. Other causes set forth under Subpart D of 40 CFR Part 122.

9. The discharger shall furnish, within a reasonable time, any information the Regional Board may request to determine compliance with this permit or to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit.

10. If more stringent applicable water quality standards are promulgated or approved pursuant to Section 303 of the Clean Water Act, or amendments thereto, the Board will revise and modify this Permit in accordance with such more stringent standards.

11. Monitoring location, minimum sampling frequency, and sampling method for each parameter shall comply with the Monitoring and Reporting Program of this permit. Monitoring must be conducted according to test procedures approved under 40 CFR Part 136, entitled "Guidelines Establishing Test Procedures for Analysis of Pollutants," unless other test procedures have been specified in this permit.

12. Water quality analyses performed in order to monitor compliance with this permit shall be by a laboratory certified by the State

VOL 16 0259

Department of Health Services for the constituent(s) being analyzed. Bioassay(s) performed in order to monitor compliance with this permit shall be in accord with guidelines approved by the State Water Resources Control Board and the State Department of Fish and Game. If the laboratory used or proposed for use by the discharger is not certified by the California Department of Health Services or, where appropriate, the Department of Fish and Game due to restrictions in the State's laboratory certification program, the discharger shall be considered in compliance with this provision provided:

a. Data results remain consistent with results of samples analyzed by the Regional Board;

b. A quality assurance program is used at the laboratory, including a manual containing steps followed in this program that is available for inspections by the staff of the Regional Board; and,

c. Certification is pursued in good faith and obtained as soon as possible after the program is reinstated.

13. If any pollutant is monitored at locations specified in the permit more frequently than required by the permit, and using approved test procedures, the results shall be included in calculations and reports.

14. The "permittee" shall maintain records of all monitoring information, including all calibration and maintenance records; the date, exact place, and time of sampling; the individual who performed the sampling; the date analysis was performed; the laboratory and individual who performed the analysis; the analytical techniques used; and results. Records shall be maintained for a minimum of five years. This period may be extended during the course of any unresolved litigation or when requested by the Board.

15. Monitoring results shall be reported at intervals and in a manner specified in the Monitoring and Reporting Program of this permit.

16. Monitoring reports shall be submitted on form either specified or approved by the Executive Officer.

17. Reports of marine monitoring surveys conducted to meet receiving water monitoring requirements of the Monitoring and Reporting Program shall include at least the following information:

a. A description of climatic and receiving water characteristics at the time of sampling (weather observations, floating debris, discoloration, wind speed and direction, swell or wave action, time of sampling, tide height, etc.).

b. A description of sampling stations, including differences unique to each station (e.g., station location, grain size, rocks, shell litter, calcarious worm tubes, evident life, etc.).

c. A description of the sampling procedures and preservation sequence used in the survey.

d. A description of the exact method used for laboratory analysis. In general, analysis shall be conducted according to paragraph B.1. However, variations in procedure are acceptable to accommodate the special requirements of sediment analysis. All such variations must be reported with the test results.

e. A brief discussion of the results of the survey. The discussion shall compare data from the control station with data from the outfall stations. All tabulations and computations shall be explained.

VOL 16

02600

18. Any noncompliance that may endanger health or the environment shall be reported orally within 24 hours from the time the discharger becomes aware of the circumstances (telephone: 805-549-3147). Unless waived by the Executive Officer of the Regional Board, a written report shall be submitted within five (5) days of awareness and shall contain a description of the noncompliance and its cause; the period of noncompliance (including exact dates, times) or anticipated duration; and steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance. This provision includes, but is not limited to violation of a discharge prohibition.

19. Reports shall be submitted in advance of any planned physical changes in the activity that may result in noncompliance with permit requirements or significantly change the nature or increase the quantity of pollutants not controlled by effluent limitations.

20. The discharger shall submit reports to the:

California Regional Water Quality Control Board, Central Coast Region
81 Higuera Street, Suite 200
San Luis Obispo, California 93401

21. Except for data determined to be confidential under Section 308 of the Clean Water Act (excludes effluent data and permit applications), all reports prepared in accordance with this permit shall be available for public inspection at the office of the Regional Board or Regional Administrator of EPA.

22. Should the discharger discover that it failed to submit any relevant facts or that it submitted incorrect information in a report, it shall promptly submit the missing or correct information.

23. All reports shall be signed by either a principle executive officer or ranking elected official or their "duly authorized representative."

24. Any person signing a report makes the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

25. The "permittee" must comply with all conditions of this permit. Permit noncompliance violates state and federal law and is grounds for enforcement action, for permit revocation, reissuance, or modification, or for denial of a permit renewal application.

26. Any person failing to file a report of waste discharge or other report as required by this permit shall be subject to a civil penalty not to exceed $5,000 per day.

27. Any person who knowingly makes any false statement, representation, or certification of any record or other document submitted or required to be maintained under this permit may, including monitoring reports or reports of compliance or noncompliance, may, upon conviction, be punished by a fine of not more than $10,000 per violation, or by imprisonment for not more than six months per violation, or both. Any person causing violation of this permit shall be subject to a civil penalty not to exceed $15,000 per day of violation. Any person who willfully or negligently causes violation of this permit is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, and by imprisonment for not more than one year.

VOL 16 0261

28. "Hazardous substance" shall be defined as meaning any substance designated under 40 CFR Part 116 pursuant to Section 311 of the Clean Water Act.

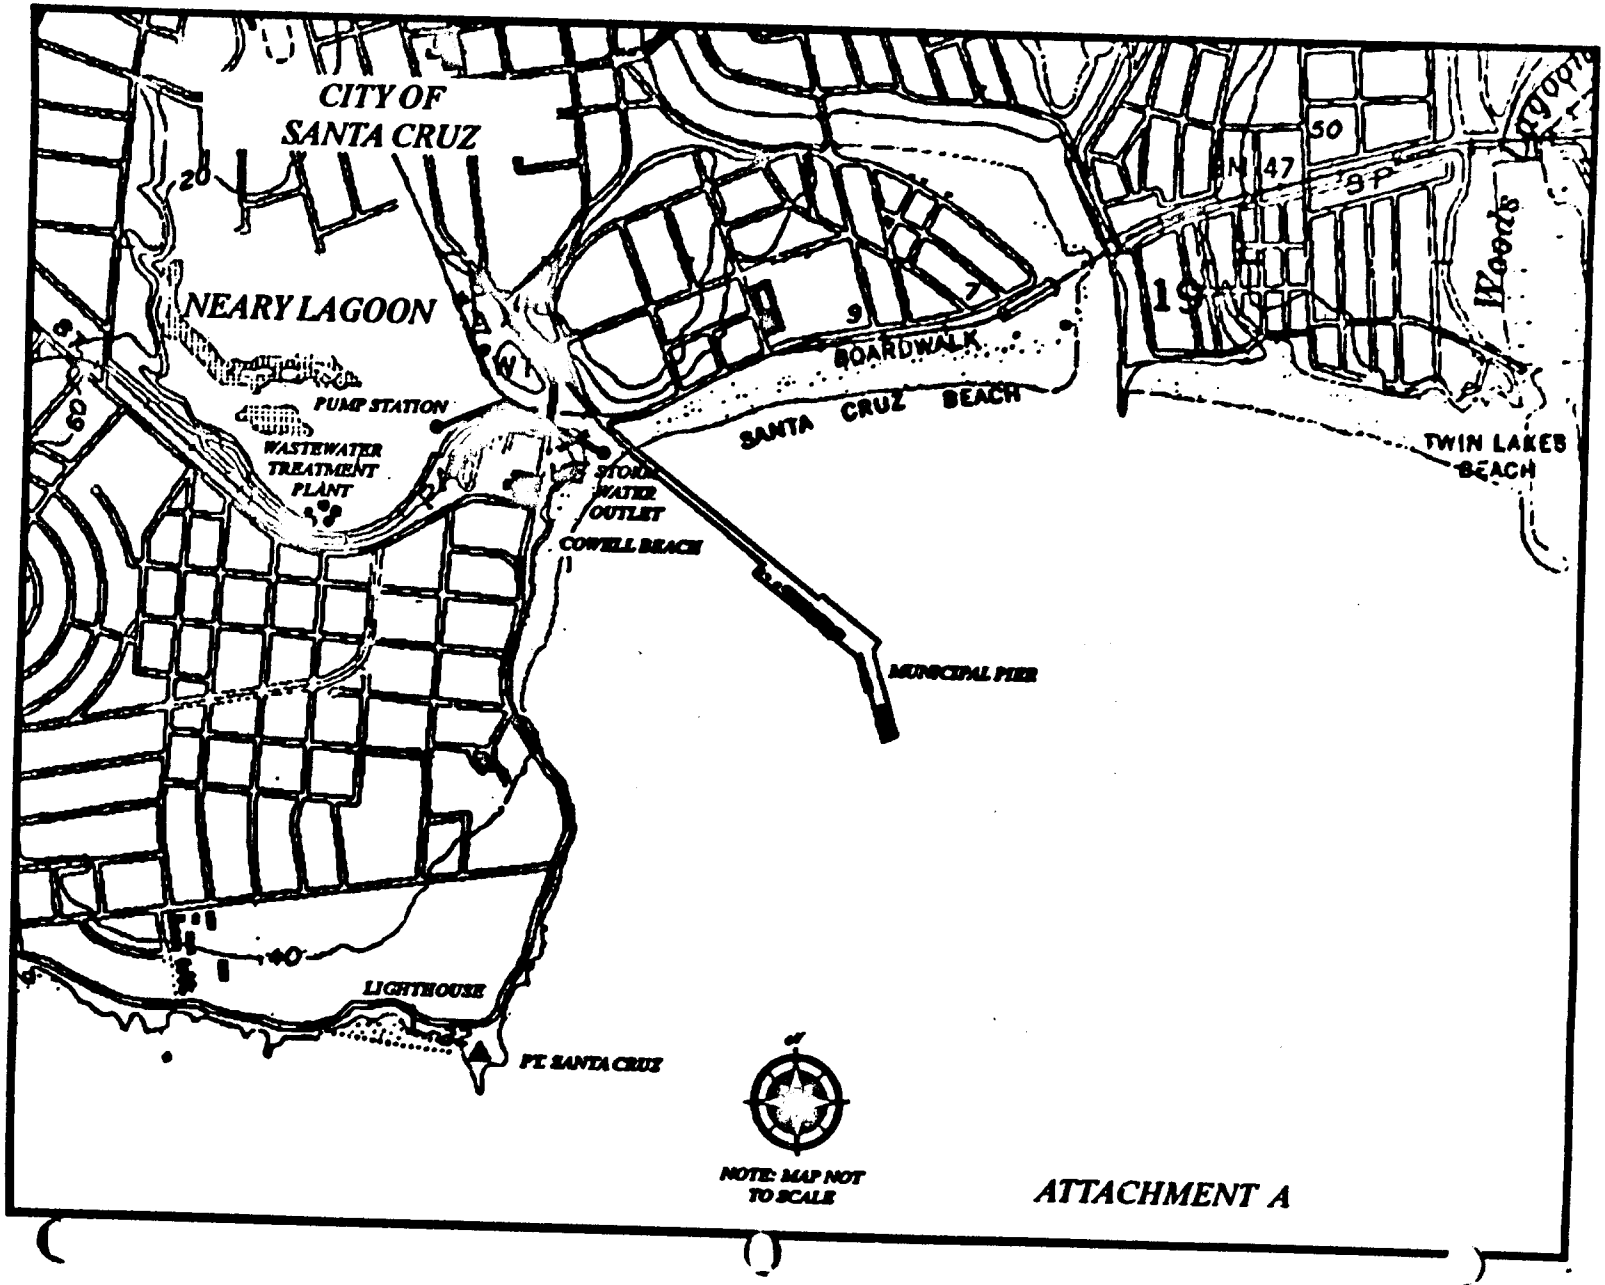
29. "Median" shall be defined as meaning the value below which half the samples (ranked progressively by increasing value) fall. It may be considered the middle value, or the average of two middle values.

30. "Zone of Initial Dilution" shall be defined as meaning the region surrounding or adjacent to the end of an outlet pipe whose boundaries are defined by the area where beneficial uses or body contact with surface waters could occur.

31. The Discharger shall comply with "Monitoring and Reporting Program No. 94-99", as specified by the Executive Officer.

32. Upon adoption, the Discharger shall comply with all conditions and limitations of this Order. Any non-compliance with this Order constitutes a violation of the federal Clean Water Act and the California Water Code and is grounds for enforcement action, Order termination, or denial of permit renewal.

33. This Order expires October 14, 1999. The Discharger shall file a complete report of Waste Discharge in accordance with Title 23, California Code of Regulations, not later than April 14, 1999, if the discharge is to continue.



34. This Board Order shall serve as a National Pollutant Discharge Elimination System permit pursuant to Section 402 of the federal Clean Water Act, as amended, and shall become effective at the end of ten (10) days from the date of the hearing at which time this Order was adopted by the Regional Water Board, provided the Regional Administrator, U.S. Environmental Protection Agency, has no objections.

I, ROGER W. BRIGGS, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Central Coast Region, on October 14, 1994.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION

MONITORING AND REPORTING PROGRAM NO. 94-99
FOR
CITY OF SANTA CRUZ
NEARY LAGOON STORM WATER DISCHARGE,
AND
LAGOON MANAGEMENT,
SANTA CRUZ COUNTY

LAGOON STORM WATER POLLUTION PREVENTION PLAN REPORTING

1. The discharger shall submit by January 15, 1995 a progress report regarding implementation of a Lagoon Storm Water Pollution Prevention Plan (PLAN) for the Executive Officer's review and comment, and subject to revision by the City.

2. The Discharger shall conduct an investigation within the Watershed identifying non-storm water discharges from the storm drains to the Lagoon which are contributing to violations of water quality standards and conditions of nuisance. Results from the investigation, and proposed measures for source reduction and elimination shall be submitted to the Executive Officer by July 15, 1995.

PUMP TEST DISCHARGE RECEIVING WATER MONITORING

The City shall establish, prior to pump test discharge, shoreline monitoring stations as described below.

Shore Stations	Location
A	Within 10 feet of the discharge point
B	100 feet from the discharge point in a direction towards Lighthouse Point
B'	100 feet from the discharge point in a direction towards the Santa Cruz Harbor
C	500 feet from the discharge point in a direction towards Lighthouse Point
C'	500 feet from the discharge point in a direction towards the Santa Cruz Harbor
D	1000 feet from the discharge point in a direction towards Lighthouse Point
D'	1000 feet from the discharge point in a direction towards the Santa Cruz Harbor

A minimum of three water samples shall be collected from each of the shore stations and analyzed according to Table 1, as follows.

Table 1

Constituents	Units	Shore Stations	Sampling Frequency
Total coliform bacteria and fecal coliform (seperate samples tested via membrane filter method)	PER 100 ml	All	Within an hour before discharge, immediately after discharge, and at 6 a.m., 12 noon and 6 p.m. until bacterial water-contact standards are met.
Enterococci	PER 100 ml	All	"
pH	Units	All	"

VOL 16
0264

DISCHARGE REPORTING

1. The City must submit a report at least one month prior to any proposed pump testing. The report must discuss steps taken by the City to insure compliance with requirements of this Order.

2. The City shall submit a report within 20 days after the pump testing discharge. The report shall contain results of receiving water monitoring required by this Order.

3. The City shall submit an annual report by May 15 of each year, specifying all wet season discharges from Neary lagoon storm water conveyance pipes to the Pacific Ocean which require pump operation or gravity flow diversion from the treatment plant. The report must contain the following information regarding the physical conditions prior to and during the discharge to provide justification for why discharges to the Pacific Ocean occurred:

   a. Pump or gravity flow discharge, or both,
   b. Estimated amount of total discharge,
   c. Estimated duration of the discharge,
   d. Time of day or night,
   e. Treatment plant influent flow rate,
   f. Weather (actual or forecasted), and,
   g. Information indicating a potential flood condition in the Lagoon area.

4. All applications, reports, or other information submitted to the Regional Board shall signed and certified pursuant to 40 CFR 122.41 (k).

5. A summary of key reporting dates and their reference within the Order is provided below:

Date	Report/Submittal
December 15, 1994	Proposed Pollution Prevention Plan development and implementation schedule (Paragraph C.1.).
December 15, 1994	Stagnant water management plan (Paragraph B.4.).
January 15, 1995	Pollution Prevention Plan progress report (M&RP paragraph 1.).
July 15, 1995	Non-storm water discharge investigation results (M&RP paragraph 2.).
July 15, 1995	Final Pollution Prevention Plan (Paragraph C.2.).

PERMIT NO. FLS000004
Major MS4

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IV

AUTHORIZATION TO DISCHARGE UNDER THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

In compliance with the provisions of the Clean Water Act, 33 U.S.C. 1251 et seq., as amended by the Water Quality Act of 1987, P.L. 100-4, the "Act",

Sarasota County - Municipal Separate Storm Sewer System Permittees:

Sarasota County
Engineering Department
Sarasota, Florida

Town of Longboat Key
Department of Public Works
Longboat Key, Florida

City of North Port
Roads and Drainage Department
North Port, Florida

City of Sarasota
Department of Public Works
Sarasota, Florida

City of Venice
Department of Public Works
Venice, Florida

Florida Department of Transportion
District One
Bartow, Florida

are authorized to discharge, in accordance with the approved Storm Water Management Program(s), effluent limitations, monitoring requirements, and other provisions as set forth in Parts I, II, III, IV, V, VI, VII, and VIII herein, from all portions of the

Municipal Separate Storm Sewer System owned or operated by any Permittee listed above,

to waters of the United States and all tributaries thereto.

This permit shall become effective on January 1, 1995.

This permit and the authorization to discharge under the National Pollutant Discharge Elimination System shall expire at midnight, on December 31, 1999.

PART I.

DISCHARGES AUTHORIZED UNDER THIS PERMIT

A. Permit Area. This permit covers all areas located within the political boundary of Sarasota County and the portion of the Town of Longboat Key within Manatee County served by municipal separate storm sewer systems owned or operated by the permittees identified in Part I.C.

B. Authorized Discharges. Except for discharges prohibited under Part I.D., this permit authorizes all existing or new storm water point source discharges to waters of the United States from those portions of the Municipal Separate Storm Sewer System (MS4) owned or operated by the permittees.

C. Permittees.

The following entities are permittees subject to the conditions of this permit:

- Sarasota County
- Town of Longboat Key*
- City of North Port
- City of Sarasota
- City of Venice
- Florida Department of Transportation, District One

* *Permit coverage includes the entire Town of Longboat Key which is located in both Sarasota and Manatee Counties*

References to "permittee" in this permit includes each of the entities above.

1. Each permittee is individually responsible for:

   a. Compliance with permit conditions relating to discharges from portions of the MS4 where they are the operator;

   b. Storm water management program implementation on portions of the MS4 where they are the operator;

   c. Where permit conditions are established for specific portions of the MS4, the permittee need only comply with the permit conditions relating to those portions of the MS4 for which they are the operator; and

   d. A plan of action to assume responsibility for implementation of storm water management and monitoring programs on their portions of the MS4 should inter-jurisdictional agreements allocating responsibility between permittees be dissolved or in default. (See Part II.G.3., page 20 of this permit also.)

VOL 16 0269

R0061669

2. Each permittee is jointly responsible for:

   a. Submission of annual reporting requirements as specified in Part V.C. (ANNUAL REPORT), page 49;

   b. Collection of monitoring data as required by Part V.B., page 47, according to such agreements as may be established between permittees;

   c. Insuring implementation of system-wide management program elements, including any system-wide public education efforts.

3. Specific permittees are jointly liable for permit compliance on portions of the MS4:

   a. Where operational or storm water management program implementation authority over portions of the MS4 has been transferred from one permittee to another in accordance with legally binding interagency or inter-jurisdictional agreements, both the owner and operator are jointly responsible for permit compliance on those portions of the MS4, unless specific responsibility provisions have been otherwise outlined in said agreements.

D. Limitations on Coverage. Section 402(p)(3)(B)(ii) of the Clean Water Act specifically requires EPA to include within this permit an effective prohibition on non-storm water entering the MS4. The following discharges are not authorized by this permit:

1. *Non-storm Water:* discharges of non-storm water, except where such discharges are:

   a. in compliance with a separate NPDES permit (or the discharger has applied for such permit); or

   b. identified by and in compliance with Part II.A.7.a., page 9 of this permit.

2. *Spills:* discharges of material resulting from a spill, except where such discharges are:

   a. the result of an Act of God where reasonable and prudent measures have been taken to minimize the impact of the discharge; or

   b. an emergency discharge required to prevent imminent threat to human health or prevent severe property damage, provided reasonable and prudent measures have been taken to minimize the impact of the discharge.

VOL 16 0270

R0061670

PART II.

STORM WATER POLLUTION PREVENTION & MANAGEMENT PROGRAMS

Each permittee covered by this permit shall contribute to the development, revision, and implementation of a comprehensive Storm Water Management Program (SWMP) including pollution prevention measures, treatment or removal techniques, storm water monitoring, use of legal authority, and other appropriate means to control the quality of storm water discharged from the Municipal Separate Storm Sewer System (MS4). The SWMP shall be implemented in accordance with Section 402(p)(3)(B) of the Clean Water Act and 40 CFR Part 122.26.

Controls and activities in the SWMP shall identify areas of permittee jurisdiction, applicability, or specific area basis. The SWMP shall include controls necessary to effectively prohibit the discharge of non-storm water into municipal separate storm sewers and reduce the discharge of pollutants from the MS4 to the MEP and shall not cause or contribute to violations of State water quality standards of the receiving stream. Compliance with this SWMP shall be reported annually in the ANNUAL REPORT discussed in Part V.C. on page 49 of this permit.

The SWMP shall cover the term of the permit and shall be updated as necessary, or as required by the Director, to ensure compliance with this statutory requirement of Clean Water Act Section 402(p)(3)(B). Modifications to the SWMP shall be made in accordance with Part II.G. of this permit. Compliance with the SWMP and the compliance schedules in Part III shall be deemed in compliance with Parts II.A. and II.B. of the permit. The Storm Water Management Program submitted by the permittees in the July 23, 1993, Part 2 Application, and all approved updates, are hereby incorporated into this permit by reference and thus are conditions of this permit. FDOT's *Statewide Storm Water Management Program for Part 2 EPA NPDES-MS4 Permit Application* dated June 1993 and all approved updates, are hereby incorporated into this permit by reference and thus are conditions of this permit. Specific components from these Storm Water Management Programs are identified in Parts II and III to serve as measurable enforcement permit conditions. Compliance dates specified in Part III of the permit shall take precedence over compliance dates which may have been proposed in Part 1 or Part 2 of the municipal applications from the permittees.

Implementation of the SWMP may be achieved through participation with other permittees, public agencies, or private entities in cooperative efforts to satisfy the requirements of Part II and Part III of the permit in lieu of creating duplicate program elements for each individual permittee. The SWMP, taken as a whole, shall achieve the "effective prohibition" and "MEP" standards from Section 402(p)(3)(B) of the Clean Water Act, and shall not cause or contribute to violations of State water quality standards of the receiving stream pursuant to the Florida Administrative Code (FAC)§62-40.420(1)-(4).

VOL 16 0271

R0061671

A. Storm Water Management Program (SWMP) Requirements.

1. *Structural Controls and Storm Water Collection System Operation:* The MS4 and any storm water structural control shall be operated in a manner to reduce the discharge of pollutants to the MEP and shall not cause or contribute to violations of State water quality standards of the receiving stream.

   a. The permittees listed in Table II.A.1.a. on pages 4 and 5 own and/or operate the structural controls identified. The maintenance activities identified for the structural controls in Table II.A.1.b. on page 6 of this permit represent suggested maintenance practices that can be implemented on an as needed basis. In addition, each shall maintain an internal record keeping system to track inspections and maintenance activities performed during the permit term. If these activities are performed by others under a contractual agreement, then the permittee shall retain copies of the contractual agreement which specifies the maintenance activities to be performed and the schedule of frequency. Inspection and maintenance records shall be retained by the permittees in accordance with Part V.G. on page 58 of this permit. Annual evaluations shall be made to assess the appropriateness of the inspection and maintenance schedule and to ensure the optimization of equipment use. A summary of the annual evaluation shall be included within each ANNUAL REPORT required under Part V.C. on page 49 of this permit.

VOL 16

1. *Structural Controls and Storm Water Collection System Operation:* (continued)

   b. Additionally, to satisfy the requirements of this section, the permittees shall develop and implement the Storm Water Management Programs identified in Part III.A.1. on pages 21 and 22 of this permit.

2. *Areas of New Development and Significant Redevelopment:* A comprehensive master planning process (or equivalent) shall be implemented to reduce, to the MEP, the discharge of pollutants from MS4s, which receive discharges from areas of new development and significant redevelopment, after construction is completed. The master planning process shall limit the increases in the discharge of pollutants in storm water as a result of new development, and shall reduce the discharge of pollutants in storm water from redeveloped areas, and shall not cause or contribute to violations of State water quality standards of the receiving stream.

   a. To satisfy the requirements of this section, the permittees shall implement the Storm Water Management Programs identified in Part III.A.2. on page 23 of this permit.

3. *Roadways:* Public streets, roads, and highways shall be operated and maintained in a manner to reduce to the MEP the discharge of pollutants and shall not cause or contribute to violations of State water quality standards of the receiving stream.

   a. As per the schedule identified in Part III.A.3. on page 24 of this permit, the permittees shall develop and implement standard road repair practices to reduce the pollutants in storm water runoff from areas associated with road repair and maintenance. The program developed shall include practices such as limiting the amount of soil disturbance to the immediate area under repair and scheduling potential pollutant-causing routine repair work during dry seasons, when possible. The program shall establish procedures that address spill prevention, material management practices, and good housekeeping measures at all municipal equipment yards & maintenance shops that support road maintenance activities.

   b. Additionally, to satisfy the requirements of this section, the permittees shall implement the Storm Water Management Programs identified in Part III.A.3. on pages 24 and 25 of this permit.

VOL 16 0275

R0061675

4. *Flood Control Projects:* Water quality impacts on receiving water shall be assessed for all flood management projects identified in the basin master planning process (or comparable planning process). The feasibility of retrofitting existing structural flood control devices to provide additional pollutant removal from storm water shall be evaluated.

   a. To satisfy the requirements of this section, the permittees shall implement the Storm Water Management Programs identified in Part III.A.4. on page 26 of this permit.

5. *Municipal waste treatment, storage, or disposal facilities not covered by an NPDES storm water permit:* The permittees shall implement a program to identify measures to monitor and reduce pollutants in storm water discharges from facilities that handle municipal waste, including sewage sludge.

   a. To satisfy the requirements of this section, the permittees shall develop and implement a program to reduce pollutants in the storm water discharges from municipally-operated solid waste transfer stations, maintenance and storage yards for waste transportation fleets and equipment, publicly owned treatment works (POTWs), and sludge application and/or disposal sites which are not covered by NPDES storm water permits. This program shall be developed and implemented in accordance with the schedule identified in Part III.A.5. on page 27 of this permit. The initial phase of the program developed shall contain procedures to evaluate, inspect, and monitor these sites. Based upon the evaluations, inspections and monitoring performed, priorities and procedures for implementing control measures for pollutant reduction at these sites shall be developed. Monitoring methodology used during the initial investigative period may be relaxed from standard protocol and may be based on experience gained during actual field activities. The goal of this investigative portion is to actively identify areas within these sites with poorer quality discharges during storm events, so that those areas will be given priority when implementing control measures.

6. *Pesticide, Herbicide, and Fertilizer Application:* Each permittee shall implement controls to reduce, to the MEP and shall not cause or contribute to violations of State water quality standards of the receiving stream, the discharge of pollutants related to the storage and application of pesticides, herbicides, and fertilizers applied, by employees or contractors, to public right of ways, parks, and other municipal property. Permittees with jurisdiction over lands shall implement programs to encourage the reduction of the discharge of pollutants related to application and distribution of pesticides, herbicides, and fertilizers.

   a. To satisfy the requirements of this section, the permittees shall implement the Storm Water Management Programs identified in Part III.A.6. on pages 28 and 29 of this permit.

VOL 16 0276

R0061676

7. *Illicit Discharges and Improper Disposal:* The permittees shall implement an ongoing program to detect and eliminate (or require the discharger to the MS4 to eliminate) illicit discharges and improper disposal into the storm sewer system.

a. *Inspection, Ordinances, and Enforcement Measures:* Non-storm water discharges to the MS4 shall be effectively prohibited by the permittees through the use of inspections, ordinances, and enforcement. The permittees, however, may allow the following non-storm water discharges to the MS4 where they are not identified as a source of pollutants to waters of the United States:

- water line flushing;
- landscape irrigation;
- diverted stream flows;
- rising ground waters;
- uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)) to separate storm sewers;
- uncontaminated pumped ground water;
- discharges from potable water sources;
- foundation drains;
- air conditioning condensate;
- irrigation water;
- springs;
- water from crawl space pumps;
- footing drains;
- lawn watering;
- individual residential car washing;
- flows from riparian habitats and wetlands;
- dechlorinated swimming pool discharges;
- street wash waters; and
- discharges or flows from emergency fire fighting activities.

To satisfy the requirements of this section, the permittee(s) identified in Part III.A.7.a. on pages 30 and 31 of the permit shall:

(1) Identify those of the non-storm water discharges listed under Part II.A.7.a. (above), as well as any other non-storm water discharges, which will be allowed to be discharged to the MS4. Describe any conditions to be placed on these allowable discharges.

VOL 16 0277

R0061677

(2) Enforce ordinances which prohibit illicit connections and illegal dumping into the MS4. As per the schedule in Part III.A.7.a. on page 30 of this permit (page 31 for FDOT), the permittees shall develop a random inspection program to uncover illicit connections. The program shall include a schedule for inspections and an allocation of staff and resources. A description of the enforcement procedures shall be detailed within the program developed. Because the potential for illicit discharges and improper disposal is generally higher for areas of older development, areas with many automobile-related industries, and areas with significant numbers of heavy industrial facilities, the permittees shall consider the specific land use and age of development when determining inspection priorities and inspection schedules for this program component. Facility inspections may be carried out in conjunction with other municipal programs (e.g. pretreatment inspections of industrial users, health inspections, fire inspections, etc.). The permittees shall maintain an internal log documenting the inspections performed.

(3) Provide in the first ANNUAL REPORT, a photocopy of the signed adopted ordinance(s) identified in Table II.A.7.a.(3) below.

Table II.A.7.a.(3)

PERMITTEE	ORDINANCE
Sarasota County	93-038
Town of Longboat Key	Chapters 33, 52, and 158.102 of the Ordinances of the Town of Longboat Key
City of Sarasota	93-3699 and Section 2-314 of the City of Sarasota Code

(4) As per the schedule in Part III.A.7.a. on page 31 of this permit, the permittees in Table II.A.7.a.(4) shall amend the identified ordinances to change the citation for the definition of *"industrial activity,"* contained within these ordinances, to 40 CFR 122.26(b)(14) from the incorrect citation of 40 CFR 122.26(a)(14).

City of Venice	93-14, Section 9-74

b. *Dry Weather Field Screening Program:* The permittees shall continue ongoing efforts to detect the presence of illicit connections and improper discharges to the MS4.

(1) To satisfy the requirements of this section, the permittees shall implement a dry weather field screening program to locate and eliminate illicit discharges and improper disposal into the MS4 in accordance with the schedule provided in Part III.A.7.b. on page 32 of this permit. This program shall include the dry weather screening activities identified in Table II.A.7.b. The minimum level of effort for the field screening program shall be based upon a 0.50-mile grid system, with each grid area containing at least one field screening location. In industrial and heavy commercial areas, the minimum level of effort shall be based upon a 0.25-mile grid system, with each grid area containing at least one field screening location. Under this program, all grid areas of the MS4 must be screened once during the permit term. Some grid areas may require more than one field screening location or a more frequent inspection schedule. In lieu of the grid system, the permittees may choose to field screen at all outfalls. Follow-up activities to eliminate illicit discharges and improper disposal may be prioritized on the basis of magnitude and nature of the suspected discharge; sensitivity of the receiving water; and/or other relevant factors. Screening methodology may be modified based on experience gained during actual field screening activities. While performing field screening activities, the permittees shall collect information on outfalls and portions of the MS4 which are not mapped, and this updated information shall be entered into the database system on an ongoing basis. An internal log documenting the results of all field screening performed shall be maintained.

VOL 16 0279

R0061679

Table II.A.7.b.	
GRID MAP COVERING AREA SERVED BY MS4 or ALL OUTFALLS	FREQUENCY OF FIELD SCREENING
Industrial Land Use	0.25-mile Grid or All Outfalls Once / 3 years
Heavy Commercial Land Use	0.25-mile Grid or All Outfalls Once / 3 years
All Other Land Uses	0.50-mile Grid or All Outfalls Once / 5 years
Entire MS4 System	⅓ of the Outfalls or ⅓ of the Grid Areas Screened During Permit Years Three, Four, & Five with the Entire MS4 Screened Once / 5 years

VOL 16

02800

R0061680

c. *Investigation of Suspected Illicits and/or Improper Disposal:* The permittees shall develop and implement standard procedures to be followed to investigate portions of the MS4 that, based on the results of the field screen or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water. Notification to EPA of any illicit connection shall be an element of the investigative standard procedures.

(1) To satisfy the requirements of this section, the permittees identified in Part III.A.7.c. on page 32 shall develop and implement standard investigative procedures to identify and terminate the source of the illicit connection or discharge in accordance with the schedule provided. The procedures developed shall require proper training for the field personnel involved in identifying conditions that may indicate the presence of illicit discharges. Upon the verification of responsible parties, the standard procedures developed shall require the immediate cessation of improper disposal practices and the elimination of the illicit connection as expeditiously as possible. Where the elimination of an illicit connection or the submittal of an NPDES application to EPA is not possible within a specified time frame determined by the permittee, the standard procedures developed shall require that the responsible parties submit for approval a written compliance schedule for the removal of the discharge. In the interim, the permittees shall require the operator of the illicit discharge to take all reasonable and prudent measures to minimize the discharge of pollutants to the MS4.

(2) To satisfy the requirements of this section, FDOT shall develop and implement standard investigative procedures to identify the source of the illicit connection or discharge to the FDOT MS4, in accordance with the schedule provided in Part III.A.7.c. on page 33 of this permit. Upon the identification of responsible parties, the standard procedures developed shall require the timely reporting of water quality violations to Florida Department of Environmental Protection (FDEP) and EPA. Until such time that the illicit connection has been eliminated or the responsible parties have submitted an NPDES application for the discharge to EPA, FDOT shall require the operator of the illicit discharge to take all reasonable and prudent measures to minimize the discharge of pollutants to the MS4. Where measures to minimize the discharge are not taken, the developed procedures shall consider the termination of the connecting entity's FDOT drainage connection permit.

VOL 16 0281

R0061681

d. *Spill Prevention and Response:* The permittees shall implement procedures to prevent, contain, and respond to spills that may discharge into the MS4.

(1) To satisfy the requirements of this section, the permittees shall adopt Sarasota County's *Hazardous Materials Emergency Plan*, FDOT's *Emergency Operations Procedures*, or a comparable plan and procedures which effectively mitigate potential pollutant discharges to surface waters. These documents shall be adopted in accordance with the schedule provided in Part III.A.7.d. on page 33 of this permit.

e. *Public Notification:* The permittees shall develop and implement a program to promote, publicize, and facilitate public reporting of illicit discharges of water quality impacts associated with discharges from the MS4.

(1) To satisfy the requirements of this section, the permittees shall develop and implement programs to facilitate public reporting of illicit discharges and improper disposal of materials into the MS4 in accordance with the schedule provided in Part III.A.7.e. on page 34 of this permit. The program shall inform the public about what to look for and how to report incidents. The program shall also enhance public awareness of the problems associated with illicit discharges and may include programs such as educating school students, using inserts in utility bills, and public service announcements in newspaper, on television, or on radio.

f. *Oils, Toxics, and Household Hazardous Waste Control:* The permittees shall effectively prohibit the discharge or disposal of used motor vehicle fluids, household hazardous wastes, grass clippings, leaf litter, and animal wastes into the MS4.

(1) To satisfy the requirements of this section, the permittees shall implement the Storm Water Management Programs identified in Part III.A.7.f. on page 35 of this permit.

VOL 16 0282

R0061682

7. *Limitation of Sanitary Sewer Seepage:* The permittees shall prevent (or require the operator of the sanitary sewer to eliminate) unpermitted discharges of dry and wet weather overflows from sanitary sewers into the MS4. Each permittee shall eliminate the infiltration of seepage from sanitary sewers into the MS4.

(1) To satisfy the requirements of this section, the permittees shall implement the Storm Water Management Programs identified in Part III.A.7.g. on page 36 of this permit.

8. *Industrial and High Risk Runoff:* The permittees shall develop and implement a program to identify and control pollutants, to the MEP and shall not cause or contribute to violations of State water quality standards of the receiving stream, in storm water discharges to the MS4 from the municipal landfill(s); hazardous waste treatment, storage, disposal and recovery facilities; facilities that are subject to EPCRA Title III, Section 313; and any other industrial or commercial discharge in which the permittees determine is contributing a substantial pollutant loading to the MS4.

To satisfy the two (2) requirements of this section, the permittees shall:

a. *Identify priorities and procedures for inspections:* Identify all targeted facilities and determine priority sites in accordance with the schedule provided in Part III.A.8.a. on pages 37 and 38 of this permit. Inspection schedules and procedures for the identified facilities shall be developed and implemented. Also, the permittees shall provide a listing in each ANNUAL REPORT of additionally identified industrial facilities which discharge storm water into the MS4 which have not been previously reported. The industrial storm water discharges that must be included in this inventory fall into the eleven (11) classes of industrial activities as defined in the November 1990 regulations under 40 CFR 122.26(b)(14).

VOL 16

0283

R0061683

b. *Monitoring for High Risk Industries:* Develop and implement a monitoring (or self monitoring) program for facilities identified under this section in accordance with the schedule provided in Part III.A.8.b. on page 38 of this permit. The monitoring program shall include the collection of quantitative data on the following constituents:

- any pollutants limited in an existing NPDES permit for an identified facility;
- oil and grease;
- chemical oxygen demand (COD);
- pH;
- biochemical oxygen demand, five-day (BOD_5);
- total suspended solids (TSS);
- total phosphorous;
- total Kjeldahl nitrogen (TKN);
- nitrate plus nitrite nitrogen; and
- any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).

Data collected by the industrial facility to satisfy the monitoring requirements of an NPDES or State discharge permit may be used to satisfy this requirement. Permittees may require the industrial facility to conduct self-monitoring to satisfy this requirement.

9. *Construction Site Runoff:* The permittees shall develop and implement a program to reduce the discharge of pollutants from construction sites to the MEP, and to shall not cause or contribute to violations of State water quality standards of the receiving stream.

a. *Site Planning and Non-structural & Structural Best Management Practices:* The permittees shall require the use and maintenance of appropriate structural and non-structural best management practices to reduce pollutants discharged to the MS4 during the time of construction.

(1) To satisfy the requirements of this section, the permittees shall implement the Storm Water Management Programs identified in Part III.A.9.a. on page 39 of this permit.

b. *Inspection and Enforcement:* The permittees shall develop and implement a program for inspecting construction sites and for enforcing the requirement for control measures.

(1) To satisfy the requirements of this section, the permittees shall implement the Storm Water Management Programs identified in Part III.A.9.b. on pages 40 and 41 of this permit.

VOL 16 0284

R0061684

c. *Site Operator Training:* The permittees shall conduct appropriate education and training measures for construction site operators and those associated with the implementation of proper sediment & erosion control measures at construction sites.

(1) To satisfy the requirements of this section, the permittees shall implement the Storm Water Management Program(s) identified in Part III.A.9.c. on pages 41 and 42 of this permit.

B. Area-specific Storm Water Management Program Requirements.

Reserved pending additional requirements which may be included as a result of State Certification of the permit. (See Section 401 of the CWA.)

C. Deadlines for Program Compliance. Except as provided in Part III, compliance with the storm water management program shall be required 90 days from the effective date of the permit.

D. Roles and Responsibilities of Permittees. The Storm Water Management Program, together with any attached interagency agreements or interagency agreements developed subsequent to the effective date of the permit, shall clearly identify the roles and responsibilities of each permittee. Following the effective date of the permit, interagency agreements developed and implemented must be included in the ANNUAL REPORT covering the permit year in which the agreement became effective.

VOL 16 0285

E. Legal Authority. To the extent allowed by law, each permittee shall ensure legal authority to control discharges to and from those portions the MS4 over which it has jurisdiction. This legal authority may be a combination of statute, ordinance, permit, contract, order or inter-jurisdictional agreements between permittees with adequate existing legal authority to accomplish Items 1 - 6 below. This legal authority for FDOT may be a combination of State statutes administered and enforced by sister agencies within the State of Florida government system which have adequate existing legal authority to accomplish Items 1 - 6 below.

1. Control the contribution of pollutants to the MS4 by Storm Water Discharges Associated with Industrial Activity and the quality of storm water discharged from sites of industrial activity;

2. Prohibit illicit discharges to the MS4;

3. Control the discharge of spills and the dumping or disposal of materials other than storm water (e.g. industrial and commercial wastes, trash, used motor vehicle fluids, leaf litter, grass clippings, animal wastes, etc.) into the MS4;

4. Control through interagency or inter-jurisdictional agreements among permittees the contribution of pollutants from one portion of the MS4 to another;

5. Require compliance with conditions in ordinances, permits, contracts or orders; and

6. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance with permit conditions.

F. Storm Water Management Program Resources. Each permittee shall provide adequate finances to implement their activities under the Storm Water Management Program. Each permittee shall also have a source of funding for implementing all other requirements included within this NPDES storm water permit.

VOL 16 0286

G. Storm Water Management Program Review and Modification.

1. *Program Review:* Each permittee shall participate in an annual review of the current Storm Water Management Program (SWMP) in conjunction with preparation of the ANNUAL REPORT required under Part V.C. of the permit.

2. *Program Modification:* The permittee(s) may modify the SWMP during the life of the permit in accordance with the following procedures:

   a. Modifications adding (but not subtracting nor replacing) components, controls, or requirements to the approved SWMP may be made by the permittee(s) at any time. A description of the modification shall be included within the subsequent ANNUAL REPORT.

   b. Modifications replacing an ineffective or unfeasible BMP specifically identified in the SWMP with an alternate BMP may be made by the permittee(s) at any time. A description of the replacement BMP shall be included in the subsequent ANNUAL REPORT along with the following information:

      (1) an analysis of why the former BMP was ineffective or infeasible (including cost prohibitive);

      (2) expectations on the effectiveness of the replacement BMP; and

      (3) an analysis of why the replacement BMP is expected to achieve the goals of the BMP which was replaced.

   c. Modifications to adjust the schedule for maintenance activities or the frequency of inspections or monitoring identified in the SWMP may be made by the permittee(s) on an annual basis. The permittees must include in the subsequent ANNUAL REPORT a description of the schedule adjustment along with the following information:

      (1) an analysis of why the former schedule was ineffective or infeasible;

      (2) expectations on the effectiveness of the replacement schedule; and

      (3) an analysis, if applicable, of why the replacement schedule will ensure the optimization of equipment use.

VOL 16 02887

R0061687

d. Modifications subtracting components, controls, or requirements of the SWMP may not be made by the permittee(s) UNLESS it can be clearly demonstrated that with the elimination of this component, the SWMP will continue to achieve a reduction in pollutants to the MEP and shall not cause or contribute to violations of State water quality standards of the receiving stream. In the case where this type of modification is appropriate, the permittee(s) may make the required modification and shall include in the subsequent ANNUAL REPORT a description of the component which has been eliminated along with the following information:

(1) an analysis of why the component was ineffective or infeasible, and

(2) a detailed explanation of why, with the elimination of this component, the SWMP will continue to achieve a reduction in pollutants to the MEP and shall not cause or contribute to violations of State water quality standards of the receiving stream.

e. Modifications included within the ANNUAL REPORT shall be signed in accordance with Part VI.H. by all directly affected permittees, and shall include a certification that all affected permittees were given an opportunity to comment on proposed changes.

3. *Transfer of Ownership, Operational Authority, or Responsibility for Storm Water Management Program Implementation:* The permittee(s) shall implement the SWMP on all new areas added to their portion of the municipal separate storm sewer system (or for which they become responsible for implementation of storm water quality controls) as expeditiously as practicable. Implementation of the program in any new area shall consider the plans in the SWMP of the previous MS4 ownership.

Prior to land annexation, the permittee shall include a schedule for extending the SWMP to the annexed areas. At least 30 days prior to transfer of operational authority or responsibility for SWMP implementation, all parties shall prepare a schedule for transfer of responsibility for SWMP implementation on the affected portions of the MS4. This schedule shall be included in the ANNUAL REPORT.

VOL 16

0288

PART III. SCHEDULES FOR IMPLEMENTATION AND COMPLIANCE

The permittee(s) shall comply with the following schedules for Storm Water Management Program implementation and augmentation, and for permit compliance.

A. IMPLEMENTATION AND AUGMENTATION OF STORM WATER MANAGEMENT PROGRAMS

STORM WATER MANAGEMENT			
1. *Operation and Maintenance of Structural Controls and Storm Water Collection System*	Sarasota County City of Sarasota City of Venice City of North Port FDOT	Perform inspections and maintenance of structural controls. Maintain an internal record keeping system to track inspections and maintenance activities performed during the permit. Conduct an annual assessment of the effectiveness of inspection & maintenance schedule and provide a summary of the assessment in each ANNUAL REPORT.	Annual Requirement
	ALL	Identify and inventory each privately-owned and maintained storm water management facility which discharges into the MS4.	Within 12 Months of the Effective Date of the Permit
		Develop a revolving inspection program for privately-owned and maintained storm water treatment systems which discharge into the MS4 to determine compliance with local permit conditions and/or local ordinances. Program developed shall include a description of the enforcement provisions for non-compliance. Following development, include a summary of the inspection program & schedule in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 12 Months of the Effective Date of the Permit
		Implement revolving inspection program for privately-owned and maintained storm water treatment systems which discharge into the MS4.	Within 24 Months of the Effective Date of the Permit.

MAI			
1. *Operation and Maintenance of Structural Controls and Storm Water Collection System* (continued)	Sarasota County	Complete Florida Water & Pollution Control Operators Association (FW&PCOA) course or equivalent.	5 employees / year
	ALL OTHERS except for FDOT		1 employee / permit

OR BOOK 3623 PAGE 76

2. *Control of Discharges from Areas of New Development and Significant Redevelopment*	ALL except for City of North Port and FDOT	Adopt as local ordinances storm water quality treatment criteria consistent, but not necessarily similar to the State of Florida Storm Water Treatment Regulations (F.A.C. 40D-4, 40D-40, 62-25).	Prior to the end of the Permit Term
	FDOT	Employ new FDOT Drainage Connection Permit requirements which include a "certification of water quality" to be provided by the connecting entity.	Effective Date of Permit
	ALL except for FDOT	Continue on the current schedule to perform master basin studies on the major watersheds identified in Table 1 on page 4A-34 of Appendix A. Develop a course of action for each as they are completed. Include in each ANNUAL REPORT a brief summary of each basin study completed during the permit year and the resulting course of action.	Effective Date of the Permit
	ALL except for City of North Port and FDOT	Evaluate land development practices to reduce the amount of impervious surfaces in future development. After completing the evaluation, include a summary of the resulting course of action in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 36 Months of the Effective Date of Permit
		Implement appropriate land development practices & incentives for the reduction of impervious surfaces.	As Determined by the Evaluation - Prior to the end of the Permit Term

VOL 16

STORM WATER MANAGEMENT PROGRAM			DATE / PERIOD
3. *Operation and Maintenance of Public Streets, Roads, and Highways*	Sarasota County City of Sarasota City of Venice	Provide a description of the municipally-operated Litter Control Program(s) for highways and streets within jurisdictional area for incorporation into the permit.	Provide in First ANNUAL REPORT
	ALL except for City of North Port and FDOT	Implement Litter Control Program(s) for highways and streets within jurisdictional area and properly dispose of collected material.	Effective Date of the Permit
	FDOT	Implement Litter Control Program for highways and streets within jurisdictional area and properly dispose of collected material. Report in each ANNUAL REPORT the approximate frequency of litter collection services performed under contractual agreements during the permit year.	Effective Date of the Permit
	ALL except for North Port WCD City of North Port & FDOT	Implement street sweeping program within jurisdictional area and properly dispose of collected material.	Effective Date of the Permit
	FDOT	Implement street sweeping program within jurisdictional area and properly dispose of collected material. Report in each ANNUAL REPORT the approximate frequency of street sweeping services performed under contractual agreements during the permit year.	
	Sarasota County	Provide the maintenance schedule for storm water structures (i.e., catch basins) and roadside ditches.	Provide in First ANNUAL REPORT

R0061692

26263

VOL 16

3. *Operation and Maintenance of Public Streets, Roads, and Highways* (continued)	ALL	Perform scheduled maintenance on catch basins, grates, and other storm water structures and roadside ditches and properly dispose of accumulated sediments. Maintain an internal log documenting maintenance activities.	Effective Date of the Permit
	ALL except for City of North Port	As described in Part II.3.a. on page 7 of the permit, develop practices to reduce to the MEP and shall not cause or contribute to violations of State water quality standards of the receiving stream regarding the pollutants from road repair and from all municipal equipment yards & maintenance shops. After development, include a summary of the practices in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 12 months of the Effective Date of the Permit
		Implement developed practices to reduce to the MEP pollutants from road repair and municipal yards.	Within 24 months of the Effective Date of the Permit
	FDOT	Coordinate the "Adopt A Highway" program for local organizations to be identified with specific highway cleanup and beautification projects.	Within 24 months of the Effective Date of the Permit
		Conduct annual routine inspections of each FDOT maintenance facility to ensure that BMPs are operational. The FDOT NPDES Coordinator or his/her representative shall perform this activity.	

R0061693

56203

VOL 76

MANAGEMENT			
4. *Ensure Flood Control Projects Comply With State Storm Water Quality Requirements*	ALL except for FDOT	Develop a priority list and construction schedule for the retrofit projects recommended by the master basin studies completed to date.	Within 12 Months of the Effective Date of the Permit
		Include a copy of the prioritized project list and construction schedule in the ANNUAL REPORT for incorporation into the permit. Provide updates to this list in future ANNUAL REPORTS as additional master basin studies are completed.	
	FDOT	Present a retrofitting program to the local Metropolitan Planning Organizations (MPO) for consideration which focuses on water quality improvement.	Within 12 Months of the Effective Date of the Permit
		Submit within the ANNUAL REPORT the list of approved retrofit projects in the MPO's work program for District One. Also provide the construction schedule for these approved projects. Provide updates to this list in future ANNUAL REPORTS as additional projects are approved.	Within 24 Months of the Effective Date of the Permit
		Begin retrofit priority projects as per the construction schedule in the approved work program for District One.	

MAN			
5. *Identification, Monitoring, and Control of Discharges from Municipal Waste Treatment, Storage, or Disposal Facilities not covered by an NPDES Storm Water Permit*	Sarasota County City of Sarasota City of North Port	Develop program to evaluate, through inspections and monitoring, the municipally-operated solid waste transfer station(s), maintenance and storage yards for waste transportation fleets, POTWs, and sludge application and/or disposal sites. The goals of the evaluation program shall be to identify these facilities, determine the necessary control measures & procedures to be employed at each, and administer an appropriate implementation schedule. After developing the evaluation program, submit a program summary in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 30 Months of the Effective Date of the Permit
		Implement developed program to reduce pollutants in storm water discharges to the MEP and shall not cause or contribute to violations of State water quality standards of the receiving stream from these facilities.	Within 36 Months of the Effective Date of the Permit

6. ***Control of Pollutants Related to Application of Pesticides, Herbicides, and Fertilizers***	**ALL**	Provide the details, for incorporation into the permit, of the specific public education program(s) designed to encourage the public to reduce their use of pesticides, herbicides and fertilizers.	Provide in First ANNUAL REPORT
		Implement public education program(s).	Effective Date of the Permit
	ALL except for FDOT	Evaluate current training requirements & certification procedures for employees who handle pesticides, herbicides and fertilizers. After completing the evaluation, include a summary of the results in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
		Implement any revised procedures for the training & certification of these employees.	As Necessary - Within 36 Months of the Effective Date of the Permit
	ALL	Require evidence of proper certification and licensing for all applicators contracted to apply pesticides, herbicides, and fertilizers on municipal and FDOT property.	Effective Date of the Permit

R0061696

5623

VOL 76

6. *Control of Pollutants Related to Application of Pesticides, Herbicides, and Fertilizers* (continued)	ALL except for FDOT	Develop a program with procedures to minimize the use of pesticides, herbicides, and fertilizers and to properly store and mix these products. The program developed should also consider including components such as providing xeriscape planning assistance and promoting voluntary use of native Florida plantings and slow-release fertilizers. After development, include a summary of the procedures in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
	ALL except for FDOT	Employ program procedures to minimize the use of pesticides, herbicides, and fertilizers and to properly store and mix these products.	Within 36 Months of the Effective Date of the Permit

7.	***Illicit Discharges and Improper Disposal***		
a.) ***Inspections, ordinances, and enforcement measures***	**ALL except for City of North Port and FDOT**	Complete the assessment of non-storm water discharges allowed to be discharged to the MS4 as detailed on page 9 of the permit. After completing the assessment, include a summary of the results in the subsequent ANNUAL REPORT for incorporation into the permit.	**Within 18 Months of the Effective Date of the Permit**
	ALL except for City of North Port and FDOT	Develop an inspection program to enforce ordinances which prohibit illicit connections and illegal dumping into the MS4. After development, include a summary of the inspection program in the subsequent ANNUAL REPORT for incorporation into the permit.	**Within 30 Months of the Effective Date of the Permit**
	Sarasota County	Implement inspection program to enforce ordinances which prohibit illicit connections and illegal dumping into the MS4. Maintain an internal log documenting inspections and enforcement actions performed and provide a summary of these reports in each ANNUAL REPORT.	**Within 36 Months of the Effective Date of the Permit**
	ALL OTHERS except for City of North Port and FDOT		**Within 36 Months of the Effective Date of the Permit**

7. *Illicit Discharges and Improper Disposal*			
a.) Inspections, ordinances, and enforcement measures **(continued)**	**FDOT**	Develop a program to inspect drainage connections after project completion to ensure continued compliance with drainage connection permit requirements and to ensure that no illicit or non-permitted connections have been made. In cases where another regulatory agency requires a periodic certification of compliance, the program developed may allow FDOT to accept this certification of compliance in lieu of further inspections by FDOT. After development, include a summary of the inspection program in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 21 Months of the Effective Date of the Permit
		Implement developed program to inspect drainage connections after project completion. Maintain an internal log documenting inspections and enforcement actions performed and provide a summary of these records in each ANNUAL REPORT.	Within 30 Months of the Effective Date of the Permit
	Sarasota County Longboat Key City of Sarasota	Provide photocopies of signed adopted storm water ordinances as identified in Table II.A.7.a.(3) on page 10 of the permit.	Provide in First ANNUAL REPORT
	City of North Port City of Sarasota City of Venice	Amend ordinances as identified in Table II.A.7.a.(4) on page 11 of the permit to reflect correct citation for *"industrial activity"* (40 CFR 122.26(b)(14)) Include a copy of the amended ordinances in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 12 Months of the Effective Date of the Permit

0076 VOL

7.	***Illicit Discharges and Improper Disposal*** **(continued)**			
	c.) ***Investigation of Suspected Illicits and/or Improper Disposal*** **(continued)**	**FDOT**	Develop standard investigative procedures to identify and report the source(s) of illicit connections or discharges. These procedures shall include notification to FDEP and EPA of illicit connections. After development, include a summary of the investigative procedures in the subsequent ANNUAL REPORT for incorporation into the permit.	**Within 24 Months of the Effective Date of the Permit**
			Implement standard investigative procedures to identify the sources(s) of illicit connections or discharges to the MS4.	**Within 30 Months of the Effective Date of the Permit**
	d.) ***Spill Prevention and Response***	**Sarasota County** **FDOT**	Provide a copy of the applicable portions of Sarasota County's *Hazardous Materials Emergency Plan* and FDOT's *Emergency Operations Procedures* which effectively mitigate potential pollutant discharges to surface waters.	**Provide in First Annual Report**
		ALL except for Sarasota County and FDOT	Adopt Sarasota County's *Hazardous Materials Emergency Plan*, FDOT's *Emergency Operations Procedures*, or a comparable plan and procedures which effectively mitigate potential pollutant discharges to surface waters.	**Within 12 Months of the Effective Date of the Permit**

R0061701

OR 716

7. *Illicit Discharges and Improper Disposal* (continued)			
e.) Public Notification	ALL	Develop a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges and improper disposal of materials into the MS4. After development, include a summary of the public program in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 30 Months of the Effective Date of the Permit
		Implement public reporting program.	Within 36 Months of the Effective Date of the Permit
		Maintain a citizen complaint log documenting all reports of illicit discharges and what actions were taken to investigate and resolve the problem. Include a summary of this log in each ANNUAL REPORT.	Within 36 Months of the Effective Date of the Permit
	FDOT	Establish a direct dial local telephone number at the District Office to be used for the reporting of illicit connections, accidental spills, illegal dumping, or other water quality violations and action as needed. This requirement may be satisfied through cooperative efforts with other permittees.	Within 36 Months of the Effective Date of the Permit

7.	***Illicit Discharges and Improper Disposal*** **(continued)**			
	f.) ***Oils, Toxics, and Household Hazardous Waste Control***	**ALL except for FDOT**	**Support and promote on a regular basis the six (6) oil recycling site locations within Sarasota County and the two (2) permanent collection centers for household hazardous waste materials.** **Continue Amnesty Days program.** **Document the total annual amount of household hazardous waste materials collected.**	**Effective date of Permit**
			Actively promote and support a voluntary stenciling program for all storm sewer inlets which discharge directly or indirectly into surface waters.	**Within 12 Months of the Effective Date of the Permit**
		FDOT	**With each FDOT Drainage Connection Permit, include information on used oil recycling, proper hazardous waste disposal, storm water regulations, and spill reporting.**	**Within 12 Months of the Effective Date of the Permit**

OFFICIAL RECORDS
VOL 16

7. *Illicit Discharges and Improper Disposal* (continued)			
g.) Limitation of Sanitary Sewer Seepage	**ALL except for City of North Port and FDOT**	Develop procedures to limit the infiltration of sanitary seepage into the MS4, in areas where wastewater infiltration is suspected. After development, include a summary of the procedures in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 30 Months of the Effective Date of the Permit
		Implement developed procedures to limit the infiltration of sanitary seepage into the MS4.	Within 36 Months of the Effective Date of the Permit
	ALL	Advise appropriate utility owner of violation if constituents common to wastewater contamination are discovered in the MS4 during dry weather field screening.	Effective Date of the Permit
		Identify areas served by septic tanks. Advise appropriate State Agency of violation if constituents common to wastewater contamination due to malfunctioning septic tank systems are discovered in the MS4 during dry weather field screening.	Within 12 Months of the Effective Date of the Permit

OR BOOK 16 PAGE 3

8.	***Industrial and High Risk Runoff***		
a.) Identification of Priorities and Procedures for Inspections	**ALL**	Develop an inventory of all existing high risk facilities discharging into the MS4. This inventory shall identify the outfall and surface waterbody into which each high risk facility drains.	Within 24 Months of the Effective Date of the Permit
		Based upon historical information and available monitoring & screening data, prioritize the identified high risk facilities.	Within 24 Months of the Effective Date of the Permit
	ALL except for FDOT	Develop procedures for inspecting high risk facilities and establish an inspection schedule. After development, include a summary of the procedures & inspection schedule in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
	FDOT	Develop procedures for the inspection of high risk facilities which hold FDOT drainage connection permits to ensure compliance with permit requirements. In cases where another regulatory agency requires a periodic certification of compliance, the program developed may allow FDOT to accept this certification of compliance in lieu of further inspections by FDOT. After development, include a summary of the procedures & inspection schedule in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
	ALL	Begin inspections of identified high risk facilities. Maintain an internal log documenting the results of the inspections performed.	Within 36 Months of the Effective Date of the Permit

5 C 3 C

VOL 76

8.	***Industrial and High Risk Runoff*** **(continued)**			
	a.)	***Identification of Priorities and Procedures for Inspections*** **(continued)**	**ALL**	**Maintain a list of all industrial storm water sources discharging to MS4 & update in ANNUAL REPORTS.**	**Effective Date of the Permit**
	b.)	***Monitoring for High Risk Industries***	**ALL except for FDOT**	**Develop a monitoring (or self monitoring) program for high risk industrial facilities. Include a description of the specific enforcement steps to be taken to require compliance with local storm water ordinances if violations are identified.** **After development, include a summary of the monitoring program in the subsequent ANNUAL REPORT for incorporation into the permit.**	**Within 24 Months of the Effective Date of the Permit**
			FDOT	**Develop a monitoring (or self monitoring) program for high risk industrial facilities which hold FDOT drainage connection permits. Include a description of the specific enforcement steps to be taken to require compliance with permit conditions if violations are identified.** **After development, include a summary of the monitoring program in the subsequent ANNUAL REPORT for incorporation into the permit.**	**Within 24 Months of the Effective Date of the Permit**
			ALL	**Implement the monitoring program for high risk industrial facilities.**	**Within 36 Months of the Effective Date of the Permit**

VOL 76

STORM MANAGEMENT			
9.	***Construction Site Runoff***		
a.)	***Site Planning & Structural and Non-structural Controls***	**ALL except for City of North Port and FDOT**	Review erosion and sediment control requirements to determine modifications necessary to correlate with SWFWMD's requirements and EPA's NPDES Construction Activity General Permit. Summarize the necessary modifications in the subsequent ANNUAL REPORT for incorporation into the permit.	**Within 12 Months of the Effective Date of the Permit**
			Incorporate necessary modifications to the erosion and sediment control requirements.	**Within 36 Months of the Effective Date of the Permit**
			In land development regulations, incorporate guidelines and recommendations for reducing the amount of sediment leaving construction sites.	**Within 36 Months of the Effective Date of the Permit**
			Track construction projects required to install erosion and sediment controls. Document the installation, maintenance, and effectiveness of the controls. Integrate these records with the education program for training the site contractors.	**Within 18 Months of the Effective Date of the Permit**
		FDOT	Employ new FDOT Drainage Connection Permit requirements which direct connecting entities subject to the NPDES storm water regulations to submit a copy of their NPDES Storm Water Pollution Prevention Plan to FDOT.	**Effective Date of the Permit**

R0061707

OFFICIAL RECORDS
VOL 716

9. *Construction Site Runoff* (continued)			
b.) *Inspection and Enforcement*	ALL except for City of North Port and FDOT	Review existing inspection policies and code enforcement programs to first identify all agencies conducting site inspections and then to determine which agency is responsible for issuing enforcement actions for which code violations. Summarize results and include in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
		Train inspectors (regardless of specialty) who are likely to be on-site during earth moving activities in erosion control techniques.	1 Inspector / Year
		Implement the use of an erosion & sediment control checklist for all inspectors. Include verification that construction sites subject to the NPDES Storm Water Regulations have NPDES permit coverage and a Storm Water Pollution Prevention Plan on site. Include developed checklist in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
	ALL except for City of North Port	Develop a program to inspect construction projects for compliance with local storm water ordinances and/or local permits.	Within 24 Months of the Effective Date of the Permit
	ALL except for City of North Port and FDOT	Implement program developed to inspect construction projects for compliance with local storm water ordinances and/or local permits.	Within 36 Months of the Effective Date of the Permit

R0061708

OR BOOK 16 PAGE 03603

STORM... MANAGE...			DA... DUE / COMPLIANCE
9. *Construction Site Runoff* (continued)			
b.) Inspection and Enforcement **(continued)**	**FDOT**	Implement program developed to inspect construction projects that propose to directly discharge storm water to the FDOT MS4 and have been granted an FDOT drainage connection permit for compliance with FDOT permit conditions. Require connection entities, who are found or suspected of discharging storm water of unacceptable quality during or following construction, to sample and test the discharge to prove compliance with FDOT permit conditions.	Within 36 Months of the Effective Date of the Permit
c.) Site Operator Training	**ALL except for City of North Port and FDOT**	Implement an annual NPDES workshop for design professionals, land developers, inspectors and contractors, including earth moving contractors. Topics to include are measures to reduce pollutants from sites, awareness of the NPDES program requirements for construction activities, and solutions to erosion and sediment problems commonly found by the inspectors during construction.	Within 24 Months of the Effective Date of the Permit
		Evaluate the feasibility of an erosion & sediment control certification program for construction site operators (contractors and developers), plan reviewers, and inspectors that work on sites that discharge to the MS4. Upon conclusion of the evaluation, include a summary of the findings in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 30 Months of the Effective Date of the Permit
		If certification program is deemed feasible, implement program for construction site operators, plan reviewers, and inspectors.	If Deemed Feasible - Within 36 Months of the Effective Date of the Permit

R0061709

6363

VOL 76

c.) *Site Operator Training* (continued)	ALL except for City of North Port and FDOT	Develop a procedure to notify building permit applicants in developments which, because of the amount of land area disturbed, are subject to the NPDES storm water regulations of their application responsibilities under the NPDES permitting program for construction site runoff. After development, include a summary of procedures in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
		Implement developed procedures to notify building permit applicants in developments which, because of amount of land area disturbed, are subject to the NPDES storm water regulations of their application responsibilities under the NPDES permitting program for construction site runoff.	Within 30 Months of the Effective Date of the Permit
		Conduct presentations to local professional organizations which are associated with the construction industry to discuss proper construction site management for water quality.	Ongoing

PART V. MONITORING AND REPORTING REQUIREMENTS

A. Seasonal Loadings and Event Mean Concentrations.

1. As per 40 CFR 122.26(d)(2)(iii)(C), the permittees shall provide estimates of the seasonal pollutant load and of the event mean concentration of a representative storm for the parameters listed in Table V.A.1. for each "major outfall" within the MS4. These constituents were detected in the sampling data reported in the Part 2 application. The location of all known major outfalls shall be inventoried in the ANNUAL REPORT for Year One of the permit, with updates describing any additionally identified major outfalls in each sequent ANNUAL REPORT. The seasonal pollutant load and event mean concentration for each major outfall may be estimated from the representative monitoring locations, from regional NURP or State data, or from pooling results from other nearby Florida MS4 monitoring activities and shall take into consideration land uses and drainage areas for the outfall. The estimates of seasonal loadings and event mean concentrations shall be included in the ANNUAL REPORT for Year Four of the permit. For the purposes of this permit, a "major outfall"is defined as follows:

   - a pipe (or closed conveyance) system with a cross-sectional area equal to or greater than 7.07 square feet (e.g., if a single circular pipe system, an inside diameter of 36 inches or greater);
   - a single conveyance other than a pipe, such as an open channel ditch, which is associated with a drainage area of more than 50 acres;
   - a pipe (or closed conveyance) system, draining *"industrial land use,"* with a cross-sectional area equal to or greater than 0.79 square feet (e.g., if a single circular pipe system, an inside diameter of 12 inches or greater); or
   - a single conveyance other than a pipe, such as an open channel ditch, which is associated with an *"industrial land use"* drainage area of more than 2 acres;

TABLE V.A.1.	
PARAMETERS	
Biochemical Oxygen Demand (BOD_5) (mg/l)	Oil & Grease (mg/l)
Chemical Oxygen Demand (COD) (mg/l)	Total Recoverable Cadmium (mg/l)
Total Suspended Solids (TSS) (mg/l)	Total Recoverable Chromium (mg/l)
Total Dissolved Solids (TDS) (mg/l)	Total Recoverable Copper (mg/l)
Total Kjeldahl Nitrogen (as N) (mg/l)	Total Recoverable Lead (mg/l)
Nitrate plus Nitrite (as N) (mg/l)	Total Recoverable Zinc (mg/l)
Total Phosphorus (mg/l)	Dissolved Phosphorus (mg/l)

2. The permittees listed in Table V.A.2. below shall conduct an investigation of the identified drainage basins to determine the sources of the following organic pollutants detected in the Part 2 application sampling data. A report summarizing the conclusions of this investigation shall be included in the ANNUAL REPORT for Year Three of the permit.

TABLE V.A.2.		
PARAMETERS	BASIN	PERMITTEE(S)
Benezo(a)anthracene	Indian Ave. - Site #5	City of Venice
Benezo(k)fluoranthene	Indian Ave. - Site #5	City of Venice

0314

R0061714

B. Monitoring Data Collection. According to the agreements established between permittees, the following monitoring program shall be developed and implemented:

1. *Monitoring:* Establish local monitoring stations in conjunction with the State of Florida's *Surface Water Ambient Monitoring Program.* (See definition of the *Surface Water Ambient Monitoring Program* in Part VIII for description of program goals and monitoring strategies.) The selection of the monitoring stations shall be the result of a cooperative effort between the permittees, EPA, and the Bureau of Surface Water Management, Florida Department of Environmental Protection (FDEP). Acceptance of the monitoring program components proposed by the permittees in the July 23, 1993, Part 2 application submittal shall be explored before any alternative monitoring programs are introduced. The number of monitoring stations as well as the type of sampling performed shall be established in accordance with the following:

   a.) The costs associated with the monitoring program developed shall not exceed the projected costs for the monitoring program proposed by the permittees in the July 23, 1993, Part 2 application submittal.

   b.) The monitoring program developed shall assist in determining the impact of storm water discharges on receiving waters located in the geographical area covered by this permit.

   c.) The monitoring program developed shall assist in determining the effectiveness of the storm water management programs being implemented under this permit and shall assist in identifying and prioritizing portions of the MS4 requiring additional controls.

   d.) The monitoring program developed shall be designed to help identify local sources and impacts of specific pollutants considered a problem in the geographic area covered by this permit. Once the source and the impacts are identified, these pollutants may be more effectively reduced or eliminated.

   e.) The selection of the monitoring stations and sampling program schedule shall be agreed upon by the permittees and the Bureau of Surface Water Management, FDEP and EPA. The monitoring program developed shall be implemented by the permittees within 24 months of the effective date of this permit or within 12 months of the date of program development, whichever is later. The details of the monitoring program shall be submitted to EPA in the subsequent ANNUAL REPORT; status reports shall be given in any Annual Reports prior to this one.

VOL 16 03 15

R0061715

It is the intent of EPA to use the monitoring information collected to evaluate any trends in the reduction in pollutant loads discharged to waters of the U.S during the term of the permit. The pollutant loading trends will be used to evaluate the effectiveness of the permittees' Storm Water Management Program to reduce the discharge of pollutants to the MEP and to shall not cause or contribute to violations of State water quality standards of the receiving stream.

2. *Monitoring Data:* For Part V.B.1., records shall be maintained of all analytical results. Additionally, for the monitoring program developed under Part V.B.1. which involves storm event sampling, the records maintained shall include: the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches or centimeters) of the storm event which generated the sampled runoff; the duration (in hours) between the storm event sampled and the end of the previous measurable (greater than 0.1 inch or 0.25 centimeter rainfall) storm event; and an estimate of the total volume (in gallons or liters) of the discharge sampled.

3. *Sample Analysis:* All samples collected for Part V.B.1. shall be analyzed in accordance with the methods specified at 40 CFR Part 136.

4. *Sampling Waiver.* When a discharger is unable to collect samples required by Part V.B.1. due to adverse climatic conditions, the discharger must submit in lieu of sampling data, a description of why samples could not be collected, including available documentation of the event. Adverse climatic conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, etc.).

VOL 16

0316

R0061716

C. Annual Report. Each permittee shall contribute to the preparation of an annual system-wide report to be submitted by no later than six months following the period covered by the report. The ANNUAL REPORT shall cover the 12 month period beginning on the effective date of this permit and annually thereafter.

The preparation and submittal of a system-wide ANNUAL REPORT shall be coordinated by a *"committee."* The *"committee"* shall include a member or designated representative from each municipal entity covered by this permit. Each permittee shall be individually responsible for providing information on the portions of the MS4 for which they are the operator and for providing information for the system-wide report in a timely manner. Joint responsibility for the ANNUAL REPORT submission shall be limited to the following: (1) participation in preparation of the overview for the entire system; and (2) inclusion of the identity of any permittee who failed to provide input to the report. Each permittee shall sign and certify the ANNUAL REPORT in accordance with Part VI.H. & VI.I. of this permit, and shall include a statement or resolution that the permittee's governing body or agency (or delegated representative) has reviewed or has been appraised of the content of the ANNUAL REPORT.

The ANNUAL REPORT shall include the following sections:

- Contacts List
- SWMP Evaluation
- Summary Table
- Narrative Report
- Monitoring Section
- Summary of SWMP and Monitoring Modifications
- Fiscal Analysis
- FDOT District Report
- Appendices

The following items describe in more detail the specific requirements for the ANNUAL REPORT.

1. Provide a list of contacts and responsible parties (e.g.: agency, name, phone number) who had input to and are responsible for the preparation of the ANNUAL REPORT.

2. Provide an overall evaluation of the Storm Water Management Program including: Objective of Program; Major Findings (e.g.: water quality improvements or degradation); Major Accomplishments; Overall Program Strengths / Weaknesses; and Future Direction of Program.

VOL 16 03117

R0061717

3. Provide a Summary Table of Storm Water Management Program Elements.

a. A Summary Table of appropriate SWMP annual activities for each permittee shall be provided. The purpose of the Summary Table is to document in a concise form the program activities and permittees' compliance status with quantifiable permit requirements. Program elements that are administrative (e.g.: planning procedures, program development and pilot studies) are inappropriate for the summary table and shall be discussed in the narrative section of the ANNUAL REPORT. The following are examples of SWMP activities to be included in the Summary Table:

(1) Structural Controls - maintenance and/or inspection activities of existing structural controls

(2) Roadway Maintenance - street sweeping, litter control activities, and maintenance on storm water structures & roadside ditches

(3) Municipal Waste TSD Facilities - inspections, monitoring, and implementation of control measures

(4) Pesticide, Herbicide, and Fertilizer Application - certification training and public education

(5) Illicits - facility inspections, investigations, enforcement actions, illicit (dry weather) screening, illicit public reporting, oil/household hazardous waste collection, and storm sewer inlet stencilling

(6) High Risk Industrial Facilities - inspection activities and monitoring

(7) Construction - training of inspectors, certification of construction site operators, inspections, and enforcement actions

(8) Storm Water Treatment Projects - description of municipal storm water treatment projects that have been completed, including a brief description of the affected drainage basin

VOL 16

0318

R0061718

b. The Summary Table shall indicate each permittee's SWMP activities and accomplishments. The format for this information shall adhere to the example shown in Table V.C.1. on page 55. Items to be reported include:

(1) Activity description;

(2) Number of activities (with frequency) that were scheduled for implementation and/or accomplishment in program element discussion (i.e., once/6 months, 100%/5 years, 6 sites monitored once/year, all sites inspected/permit term). Enter "Not Applicable" (N/A) if no specific schedule was specified;

(3) Status of schedule for year ("yes" for schedule was adhered to, or "no" for schedule was not adhered to);

(4) Number of activities which were accomplished; and

(5) The availability of documentation (i.e., inspection reports) for those activities which were accomplished and comments describing the reason(s) for any non-compliance.

4. The ANNUAL REPORT shall contain a Narrative Report to succinctly discuss the SWMP Elements which were not included within the SWMP Summary Table. Those SWMP Elements required to be developed under Parts II and III of the permit shall be discussed within this section of the ANNUAL REPORT following development.

a. The permittees shall include a brief discussion of the following applicable SWMP Elements:

(1) Structural Controls Maintenance
(2) Development Planning Procedures
(3) Roadway Maintenance
(4) Flood Management
(5) Municipal Facilities
(6) Pesticides, Herbicides, and Fertilizers
(7) Illicits Inspection/Investigation/Enforcement
(8) Field Screening
(9) Spill Response

VOL 16

0319

(10) Public Reporting of Illicit Discharges
(11) Oil and Household Hazardous Waste
(12) Sanitary Sewer Seepage
(13) High Risk Industrial Facility Inspection
(14) Construction Planing Procedures
(15) Construction Inspections
(14) Education Activities
(15) Monitoring Activities
(16) Any additional elements of Storm Water Management Program

b. The format for the Narrative Report section of the ANNUAL REPORT shall be a brief discussion of the SWMP Element. The aspects of each permittee's activities concerning a SWMP Element shall be succinctly discussed in the section of the Narrative Report dedicated to that Element. The discussion shall include the following:

(1) Objective of SWMP Element,

(2) SWMP Element activities completed and those in progress,

(3) General discussion of Element. Explanation of all Element activity deficiencies (e.g.: activities described in the program that have not been fully implemented or completed). Results of activities shall be summarized and discussed (e.g.: maintenance caused by inspection, pollutants detected by monitoring, investigations as a result of dry and wet weather screening, number and nature of enforcement items, education activities participation),

(4) Status of SWMP Element with compliance, implementation, and augmentation schedules in Part III of the permit,

(5) SWMP Element strengths and weaknesses,

(6) Assessment of controls, and

(7) Discussion of Element revisions that are summarized elsewhere in the ANNUAL REPORT.

VOL 16

03220

R0061720

5. The ANNUAL REPORT shall contain a Monitoring Section which discusses the progress and results of the monitoring programs required under Part V of the permit.

a. The Monitoring Section of the ANNUAL REPORT shall include a summary of the monitoring program developed and implemented under Part V.B.1. of the permit. The details to be discussed include:

(1) Brief summary statement of the objective of each monitoring project included under the program,

(2) Summary chart of the data from the monitoring completed,

(3) Discussion of any results or conclusions derived from the monitoring completed,

(4) Status of monitoring with respect to the compliance schedule in Part V.B.1. of the permit, and

(5) Discussion of monitoring program revisions that are summarized elsewhere in the ANNUAL REPORT.

b. The Monitoring Section of the ANNUAL REPORT shall include the following information as required in Part V.A. of the permit:

(1) The ANNUAL REPORT for Year One of the permit shall contain an inventory of all known major outfalls, with updates describing additionally identified major outfall in each sequent ANNUAL REPORT.

(2) The ANNUAL REPORT for Year Three of the permit shall include the investigation of the sources of the organic pollutants detected in the Part 2 application sampling data as required in Part V.A.2. of the permit.

(3) The ANNUAL REPORT for Year Four of the permit shall include estimates of seasonal pollutant loadings and event mean concentrations (EMC) for each major outfall required by Part V.A.1.

6. Provide a summary of SWMP and Monitoring Modifications made during the permit year.

VOL 16

0321

R0061721

7. Provide a complete fiscal analysis for each permittee's program implementation, both for the past calendar year and the next. The analysis shall indicate budgets and funding sources.

8. FDOT shall report on the status of the FDOT statewide Storm Water Management Program elements as shown in Table V.C.8.a. on page 56 and shall indicate whether the resulting program modifications have been implemented at the District Office. In addition, FDOT shall also indicate the number of District employees included in the training courses described in Table V.C.8.b. on page 57.

9. The following information shall be included as Appendices within the ANNUAL REPORT for Year Five of the permit:

   a. Analytical data collected from the monitoring program.

   b. Results of illicit connections screening or dry weather screening.

   c. Any other data specifically requested by EPA to substantiate statements and conclusions reached in the ANNUAL REPORTS.

Table V.C.8.b. - Table for FDOT Statewide Storm Water Management Program Training Status

FDOT STAFF	TRAINING CONDUCTED	DESCRIPTION OF TRAINING COURSE	NO. OF DISTRICT EMPLOYEES COMPLETING TRAINING COURSE?
Conduct training for FDOT maintenance and construction inspectors in the identification and detection of potential storm water related problems, signs of illegal dumping and illicit connections, proper containment methods, and reporting procedures.	YES / NO (If no, give anticipated schedule.)		
Conduct training for the FDOT Emergency Coordinator assigned to each FDOT maintenance facility. Training shall not only educate the FDOT Emergency Coordinator in the proper containment of spills and spill reporting procedures, but shall include storm water remediation activities, storm water regulations, and storm water retrofitting necessary to eliminate polluted storm water discharges from FDOT maintenance facilities.	YES / NO (If no, give anticipated schedule.)		
Conduct training for all FDOT personnel involved in the chemical weed and grass control program to ensure a safe and effective program. Incorporate into the training of these applicators an emphasis on storm water implications of the use of pesticides, herbicides, and fertilizers.	YES / NO (If no, give anticipated schedule.)		
Conduct training for all FDOT personnel involved in hazardous waste handling. Incorporate into the training a segment on the identification, detection, and reporting of illicit storm water connections and potential storm water related problems such as visible water quality degradation and signs of illegal dumping.	YES / NO (If no, give anticipated schedule.)

D. Certification and Signature of Reports.

All reports required by the permit and other information requested by the Director shall be signed and certified in accordance with Parts VI.H. & VI.I. of the permit.

E. Reporting: Where and When to Submit.

1. As required by Part V.C., monitoring results obtained during the reporting period running from the 12 month term beginning on the effective date of this permit and annually thereafter shall be submitted on Discharge Monitoring Report Form(s) in the ANNUAL REPORT for Year Five of the permit. A separate Discharge Monitoring Report Form is required for each event monitored.

2. Signed copies of the ANNUAL REPORT required by Part V.C. and all other reports required herein, shall be submitted to:

U.S. EPA, Region IV
Water Management Division
Water Permits and Enforcement Branch (WPEB-7)
345 Courtland Street, N.E.
Atlanta, Georgia 30365

F. Additional Notification.

In addition, the permittees shall provide a copy of each ANNUAL REPORT to:

Florida Department of Environmental Protection
Bureau of Surface Water Management
Storm Water Section
Twin Towers Office Building
2600 Blair Stone Road
Tallahassee, Florida 32399-2400

G. Retention of Records.

The permittees shall retain the latest version of the Storm Water Management Program developed in accordance with Part II of this permit for at least three years after the expiration date of this permit. The permittees shall retain all records of all monitoring information, copies of all reports required by this permit, and records of all other data required by or used to demonstrate compliance with this permit, until at least three years after the expiration date of this permit. This period may be explicitly modified by alternative provisions of this permit or extended by request of the Director at any time.

VOL 16 0326

R0061726

PART VI. STANDARD PERMIT CONDITIONS

A. Duty to Comply. The permittees must comply with all conditions of this permit insofar as those conditions are applicable to each permittee, either individually or jointly. Any permit noncompliance by a permittee constitutes a violation of the CWA and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification, or for denial of a permit renewal application for the non-complying permittee.

B. Penalties for Violations of Permit Conditions.

1. Criminal

a. Negligent Violations The CWA provides that any person who negligently violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than 1 year, or both.

b. Knowing Violations The CWA provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

c. Knowing Endangerment The CWA provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than $250,000, or by imprisonment for not more than 15 year, or both.

d. False Statement The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than 2 years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or by both. (See Section 309(c)(4) of the Clean Water Act).

VOL 16

03271

R0061727

2. Civil Penalties - The CWA provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed $25,000 per day for each violation.

3. Administrative Penalties - The CWA provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to an administrative penalty, as follows:

   a. Class I penalty Not to exceed $10,000 per violation nor shall the maximum amount exceed $25,000.

   b. Class II penalty Not to exceed $10,000 per day for each day during which the violation continues nor shall the maximum amount exceed $125,000.

C. Duty to Reapply. If a permittee(s) wishes to continue an activity regulated by this permit after the permit expiration date, the permittee(s) must apply for and obtain a new permit. The application shall be submitted at least 180 days prior to expiration of this permit. The Director may grant permission to submit an application less than 180 days in advance but no later than the permit expiration date. Continuation of expiring permits shall be governed by regulations promulgated at 40 CFR 122.6 and any subsequent amendments.

D. Need to Halt or Reduce Activity Not a Defense. It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

E. Duty to Mitigate. Each permittee shall take all reasonable steps to minimize or prevent any discharge in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.

F. Duty to Provide Information. Each permittee shall furnish to the Director, within a time specified by the Director, any information which the Director may request to determine compliance with this permit. The permittees shall also furnish to the Director upon request copies of records required to be kept by this permit.

G. Other Information. When a permittee becomes aware that he or she failed to submit any relevant facts or submitted incorrect information in any report to the Director, he or she shall promptly submit such facts or information.

VOL 16 0328

R0061728

H. Signatory Requirements. All Discharge Monitoring Reports, storm water management programs, reports, certifications or information either submitted to the Director or that this permit requires be maintained by the permittees, shall be signed by:

1. Either a principal executive officer or ranking elected official; or

2. A duly authorized representative of that person. A person is a duly authorized representative only if:

   a. The authorization is made in writing by a person described above and submitted to the Director, and

   b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of manager, operator, superintendent, or position of equivalent responsibility or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.)

If an authorization is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new written authorization satisfying the requirements of this paragraph must be submitted to the Director prior to or together with any reports, information, or applications to be signed by an authorized representative.

I. Certification. Any person signing documents under this section shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

VOL 16 0329

J. Penalties for Falsification of Reports. Section 309(c)(4) of the Clean Water Act provides that any person who knowingly makes any false material statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than 2 years, or by both.

K. Penalties for Falsification of Monitoring Systems. The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by fines and imprisonment described in Section 309 of the CWA.

L. Oil and Hazardous Substance Liability. Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittees from any responsibilities, liabilities, or penalties to which the permittee is or may be subject under section 311 of the CWA or section 106 of CERCLA.

M. Property Rights. The issuance of this permit does not convey any property rights of any sort, nor any exclusive privileges, nor does it authorize any injury to private property nor any invasion of personal rights, nor any infringement of Federal, State or local laws or regulations.

N. Severability. The provisions of this permit are severable, and if any provision of this permit, or the application of any provision of this permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this permit shall not be affected thereby.

O. Requiring an Individual Permit.

1. The Director may require any permittee authorized by this permit to obtain an individual NPDES permit. Any interested person may petition the Director to take action under this paragraph. The Director may require any owner or operator authorized to discharge under this permit to apply for an individual NPDES permit only if the owner or operator has been notified in writing that a permit application is required. This notice shall include a brief statement of the reasons for this decision, an application form (as necessary), a statement setting a deadline for the owner or operator to file the application, and a statement that on the effective date of the individual NPDES permit, coverage under this permit shall automatically terminate. Individual permit applications shall be submitted to the address of the appropriate Regional Office shown in Part V.E.2. of this permit. The Director may grant additional time to submit the application upon request of the applicant. If an owner or operator fails to submit in a timely manner an individual NPDES permit application as required by the Director, then the applicability of this permit to the individual NPDES permittee is automatically terminated at the end of the day specified for application submittal.

VOL 16 0330

R0061730

2. Any owner or operator authorized by this permit may request to be excluded from the coverage of this permit by applying for an individual permit. The owner or operator shall submit an individual application as specified by 40 CFR 122.26(d) with reasons supporting the request to the Director. Individual permit applications shall be submitted to the address of the appropriate Regional Office shown in Part V.E.2. of this permit. The request may be granted by the issuance of a individual permit if the reasons cited by the owner or operator are adequate to support the request.

P. State/Environmental Laws.

1. Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable State law or regulation under authority preserved by Section 510 of the Act.

2. No condition of this permit shall release the permittee from any responsibility or requirements under other environmental statutes or regulations.

Q. Proper Operation and Maintenance. Each permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit and with the requirements of storm water management programs. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance requires the operation of backup or auxiliary facilities or similar systems, installed by a permittee only when necessary to achieve compliance with the conditions of the permit.

R. Monitoring and Records.

1. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

2. The permittees shall retain records of all monitoring information including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of the reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least 3 years from the date of the sample, measurement, report or application. This period may be extended by request of the Director at any time.

VOL 16 0331

R0061731

3. Records of monitoring information shall include:

a. The date, exact place, and time of sampling or measurements;

b. The initials or name(s) of the individual(s) who performed the sampling or measurements;

c. The date(s) analyses were performed;

d. The time(s) analyses were initiated;

e. The initials or name(s) of the individual(s) who performed the analyses;

f. References and written procedures, when available, for the analytical techniques or methods used; and

g. The results of such analyses, including the bench sheets, instrument readouts, computer disks or tapes, etc., used to determine these results.

S. Monitoring Methods. Monitoring must be conducted according to test procedures approved under 40 CFR Part 136, unless other test procedures have been specified in this permit.

T. Inspection and Entry. The permittee shall allow the Director or an authorized representative of EPA, or the State, upon the presentation of credentials and other documents as may be required by law, to:

1. Enter the permittee's premises where a regulated facility or activity is located or conducted or where records must be kept under the conditions of this permit;

2. Have access to and copy at reasonable times, any records that must be kept under the conditions of this permit; and

3. Inspect at reasonable times any facilities or equipment (including monitoring and control equipment).

U. Permit Actions. This permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

V. Additional Monitoring by the Permittee(s). If the permittees monitor more frequently than required by this permit, using test procedures approved under 40 CFR Part 136 or as specified in this permit, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the Discharge Monitoring Report (DMR). Such increased monitoring frequency shall also be indicated on the DMR.

VOL 16 0332

R0061732

PART VII. PERMIT MODIFICATION

A. Modification of the Permit: The permit may be reopened and modified during the life of the permit to:

1. Incorporate into the permit the finalized pollutant load reduction goals agreed to by the permittees and the National Estuary Program (NEP) in the National Estuary Program Comprehensive Conservation and Management Plan for the geographical area covered by this NPDES permit;

2. Address impacts on receiving water quality caused, or contributed to, by discharges from the MS4;

3. Address changes in State or Federal statutory or regulatory requirements;

4 Include the addition of a new permittee who is the owner or operator of a portion of the Municipal Separate Storm Sewer System; or

5. Include other modifications deemed necessary by the Director to comply with the goals and requirements of the Clean Water Act.

All modification to the permit will be made in accordance with 40 CFR 122.62, 122.63, and 124.5.

B. Termination of Coverage for a Single Permittee

Permit coverage may be terminated, in accordance with the provisions of 40 CFR 122.64 and 124.5, for a single permittee without terminating coverage for other permittees.

C. Modification of Storm Water Management Program(s)

Only those portions of the Storm Water Management Programs specifically required as permit conditions shall be subject to the modification requirements of 40 CFR 124.5. Replacement of an ineffective or infeasible BMP implementing a required component of the Storm Water Management Program with an alternate BMP expected to achieve the goals of the ineffective or infeasible BMP shall be considered minor modifications to the Storm Water Management Program and not modifications to the permit. (See also Part II.G.)

VOL 16 0333

R0061733

D. Changes in Monitored Outfalls

This permit is issued on a system-wide basis in accordance with CWA §402(p)(3)(i) and authorizes discharges from all portions of the Municipal Separate Storm Sewer System. Since all outfalls are authorized, changes in monitoring outfalls, other than those with specific numeric effluent limitations, if any, shall be considered minor modifications to the monitoring program and not modifications to the permit. (See also Part V.B.1. and V.C.6.) Changes in monitoring outfalls with specific numeric effluent limitations shall be considered modifications to the permit and will be made in accordance with the procedures at 40 CFR 122.62.

R0061734

VOL 16 0334

PART VIII. DEFINITIONS

All definitions contained in Section 502 of the CWA shall apply to this permit and are incorporated herein by reference. Unless otherwise specified in this permit, additional definitions of words or phrases used in this permit are as follows:

A. "Best Management Practices" ("BMPs") means schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures, and practices to control facility site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

B. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility, which is not a designed or established operating mode for the facility.

C. "CWA" means Clean Water Act, also referred to as "the Act" (formerly referred to as the Federal Water Pollution Control Act or Federal Water Pollution Control Act Amendments of 1972) Pub.L. 92-500, as amended Pub. L. 95-217, Pub. L. 95-576, Pub. L. 6-483 and Pub. L. 97-117, 33 U.S.C. 1251 et.seq., as amended by the WQA of 1987, P.L. 100-4, the "Act."

D. "Director" means the EPA Regional Administrator or an authorized representative.

E. "Discharge" for the purpose of this permit, unless indicated otherwise, refers to discharges from the Municipal Separate Storm Sewer System (MS4).

F. "Flow-weighted composite sample" means a composite sample consisting of a mixture of aliquots collected at a constant time interval, where the volume of each aliquot is proportional to the flow rate of the discharge at the time of sampling.

G. "Illicit connection" means any man-made conveyance connecting a non-storm water discharge directly to a municipal separate storm sewer system.

H. "Illicit discharge" means any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and other discharges listed in Part II. A.7.a. of this permit.

I. "Industrial Land Use" means land utilized in connection with manufacturing, processing, or raw materials storage at facilities identified under 40 CFR 122.26(b)(14).

J. "Landfill" means an area of land or an excavation in which wastes are placed for permanent disposal, and which is not a land application unit, surface impoundment, injection well, or waste pile.

VOL 16 0335

R0061735

K. "Large Municipal Separate Storm Sewer System" means all municipal separate storm sewers that are either:

(i) located in an incorporated place (city) with a population of 250,000 or more as determined by the latest Decennial Census by the Bureau of Census (these cities are listed in Appendices F and G of 40 CFR Part 122); or

(ii) located in the counties with unincorporated urbanized populations of 250,000 or more, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties (these counties are listed in Appendices H and I of 40 CFR Part 122); or

(iii) owned or operated by a municipality other than those described in paragraph (i) or (ii) and that are designated by the Director as part of the large municipal separate storm sewer system.

L. "Medium Municipal Separate Storm Sewer System" means all municipal separate storm sewers that are either:

(i) located in an incorporated place (city) with a population of 100,000 or more as determined by the latest Decennial Census by the Bureau of Census (these cities are listed in Appendices F and G of 40 CFR Part 122); or

(ii) located in the counties with unincorporated urbanized populations of 100,000 or more, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties (these counties are listed in Appendices H and I of 40 CFR Part 122); or

(iii) owned or operated by a municipality other than those described in paragraph (i) or (ii) and that are designated by the Director as part of the medium municipal separate storm sewer system.

M. "MEP" is an acronym for "Maximum Extent Practicable," the technology-based discharge standard for Municipal Separate Storm Sewer Systems established by CWA §402(p).

N. "MS4" is an acronym for "municipal separate storm sewer system" and is used to refer to either a Large or Medium Municipal Separate Storm Sewer System (e.g. "the Atlanta MS4").

VOL 16 0336

R0061736

O. "Municipal Separate Storm Sewer" means a conveyance, or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, and storm drains):

(i) owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State Law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State Law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian Tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

(ii) designed or used for collecting or conveying storm water;

(iii) which is not a combined sewer; and

(iv) which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

P. "Permittee" means each individual co-applicant for an NPDES permit who is only responsible for permit conditions relating to the discharge that they own or operate. (Also, See 40 CFR 122.2)

Q. "Point Source" means any discernible, confined, and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

R. "Severe property damage" means substantial physical damage to property, damage to the treatment facility which causes them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.

S. "State Storm Water Quality Standards", is defined at Section 403.0891 of the Florida Statutes, and State Water Policy, Chapter 62-40, Florida Administrative Code.

T. "Storm Sewer", unless otherwise indicated, refers to a municipal separate storm sewer.

U. "Storm Water" means storm water runoff, snow melt runoff, surface runoff and drainage.

V. "Storm Water Discharge Associated with Industrial Activity" is defined at 40 CFR 122.26(b)(14). (Also, See Fact Sheet for this Permit.)

VOL 16 0337

R0061737

W. "Storm Water Management Program" refers to a comprehensive program to manage the quality of storm water discharged from the municipal separate storm sewer system. For the purposes of this permit, the Storm Water Management Program is considered a single document, but may actually consist of separate programs (e.g. "chapters") for each permittee.

X. "Surface Water Ambient Monitoring Program" refers to a comprehensive program implemented by the Florida Department of Environmental Protection, Bureau of Surface Water Management, which is designed to accomplish the following goals:

1. Identify and document the existing condition of the surface waters of the State,
2. Document potential problem areas,
3. Establish stream ecoregion reference sites for comparison purposes,
4. Collect biological data at ecoregion reference sites to establish preliminary biological integrity measurements techniques, and
5. Establish a Statewide ambient monitoring network which will eliminate duplication, share data, increase efficiency, and improve assessment and management capabilities.

To date, the monitoring strategies included within the State of Florida's Surface Water Ambient Monitoring Program have been based on:

- Ecoregion Subregionalization and the associated stream Community Bioassessment Protocols (CBA) developed for the nonpoint source program,
- Chemistry Trend Network to fulfill the need to evaluate the State's water quality over time,
- Chemistry Status Network with emphasis on water bodies with fair or poor water quality or areas which have not been recently sampled, and
- Lake Ecoregion and Community Bioassessment Projects.

Y. "SWMP" is an acronym for "Storm Water Management Program."

Z. "Time-weighted composite" means a composite sample consisting of a mixture of equal volume aliquots collected at a constant time interval.

AA. "Waters of the United States" is defined at 40 CFR 122.2.

VOL 16

FACT SHEET

for draft National Pollutant Discharge Elimination System (NPDES) Permit No. FLS000004 to discharge to waters of the United States.

Application No. FLS000004

Public Notice Date: September 1, 1994

Permit Writer: Jeannie McNeill

1. **PERMITTING AUTHORITY.** The National Pollutant Discharge Elimination System (NPDES) permitting authority is:

U.S. Environmental Protection Agency, Region IV
Water Permits and Enforcement Branch
345 Courtland Street, N.E.
Atlanta, Georgia 30365

2. **CO-APPLICANTS.** The Co-applicants are:

Sarasota County
Sarasota County Transportation Department
1301 Cattlemen Road
Sarasota, Florida 34232

City of North Port
Roads and Drainage Department
5650 North Port Boulevard
North Port, Florida 34287

City of Sarasota
Department of Public Works
1565 First Street
Sarasota, Florida 34230-1058

0339

R0061739

VOL 16 0340

City of Venice
Department of Public Works
401 West Venice Avenue
Venice, Florida 34285

Town of Longboat Key*
Department of Public Works
501 Bay Isles Road
Longboat Key, Florida 34228

Florida Department of Transportation (FDOT)
District One
Post Office Box 1249
Bartow, Florida 33830-1249

* *Permit coverage includes the entire Town of Longboat Key which is located in both Sarasota and Manatee Counties.*

3. **DESCRIPTION OF THE MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4).** As authorized by Section 402(p) of the Act, this permit is being proposed on a system basis. This permit covers all areas within the political boundary of Sarasota County served by, or otherwise contributing to discharges from municipal separate storm sewers owned or operated by the co-applicant(s) listed above. This permit also covers the portion of the Town of Longboat Key located within Manatee County.

4. **DISCHARGES AUTHORIZED BY THIS PERMIT.** This permit authorizes all existing or new storm water point source discharges to waters of the United States from the portions of the MS4 owned or operated by the co-applicants. This permit does authorize the discharge of storm water commingled with flows contributed by process wastewater, non-process wastewater, or storm water associated with industrial activity provided such discharges are authorized under separate NPDES permits.

Section 402(p)(3)(B)(iii) of the CWA requires an effective prohibition on non-storm water discharges to a MS4. In addition, Section 402(p)(3)(A) places a different standard performance, compliance with treatment technology (BAT/BCT) and water quality requirements at CWA Section 301, on discharges of storm water associated with industrial activity. Therefore, process wastewater and industrial storm water discharges cannot be legally authorized by the MS4 permit. Such discharges require a separate NPDES permit. Only the municipal storm water will be authorized by today's permit. The municipal applicants, however, will be responsible for the quality of the combined discharge; therefore, they have a vested interest in locating uncontrolled (i.e. unpermitted) illicit and industrial storm water discharges.

5. **RECEIVING STREAM SEGMENTS AND DISCHARGE LOCATIONS.** The discharges from the MS4 are discharged into the following United States water bodies and tributaries thereto within Sarasota County, Florida:

Hudson Bayou	Little Salt Creek	Cow Pen Slough
Whitaker Bayou	Matheny Creek	Deer Prairie Slough
Alligator Creek	North Creek	Sarasota Bay
Ainger Creek	Phillippi Creek	Little Sarasota Bay
Catfish Creek	Shakett Creek	Lemon Bay
Clower Creek	South Creek	Sona Bay
Curry Creek	Woodmere Creek	Roberts Bay
Forked Creek	Braden River	Intracoastal Waterway
Godfrey Creek	Myakka River	
Hatchett Creek	Big Slough	

The designated uses of the receiving streams include: potable water supplies; shellfish propagation or harvesting; propagation and maintenance of a healthy, well-balanced population of fish and wildlife; and recreation.

6. **EFFECTIVE DATE.** Compliance with permit conditions is required 90 days from the effective of the permit, except as specified in schedules for compliance contained in the permit.

VOL 16 0341

R0061741

7. **PUBLIC NOTICE.** Upon publication of the public notice and this fact sheet, a public comment period shall begin and last for 30 days thereafter. During this period, any interested persons may submit written comments on the draft permit, including the proposed storm water management program.

8. **EPA POINT OF CONTACT.** For additional information, contact:

Office of Public Affairs
Environmental Protection Agency
345 Courtland Street, NE
Atlanta, Georgia 30365

Attention: Ms. Lena Scott, Public Notice Coordinator
(404) 347-3004

9. **PERMIT CONDITIONS.**

a. **Storm Water Pollution Prevention and Management Program.**

The permittees are required to implement comprehensive pollution prevention and management programs. As required by Clean Water Act Section 402(p)(3)(B), the Storm Water Management Program (SWMP) must include controls necessary to reduce the discharge of pollutants from the Municipal Separate Storm Sewer System (MS4) to the Maximum Extent Practicable (MEP). Controls implemented under the SWMP consist of a combination of best management practices, control techniques, system design and engineering methods, and such other provisions as the permittees, Administrator or the State determines appropriate. The various components of the SWMP, taken as a whole (rather than individually), are expected to be sufficient to meet this standard. The permittees may be required to update the SWMP periodically to ensure conformance with this statutory requirement of Clean Water Act Section 402(p)(3)(B). The two proposed SWMPs prepared by the permittees, the SWMP submitted by the permittees in the July 23, 1993, Part 2 Application and FDOT's *Statewide SWMP for Part 2 EPA NPDES-MS4 Permit* dated June 1993 will be incorporated into the permit by reference, and are also available for review and public comment. A brief summary of the proposed SWMP is contained in Table 1 on pages 8 through 20.

VOL 16 0342

VOL 16 0343

(l) Pollution Prevention Measures.

One important objective within the SWMP is to reduce pollution at the source; therefore, the permit includes the following Pollution Prevention Measures:

(i) Permittees with jurisdiction over land use will be required to consider water quality impacts of new and significant redevelopment in their comprehensive master planning process. The goal for areas of new development is to limit increases in the discharge of pollutants in storm water as a result of development. The goal for areas undergoing redevelopment is reducing the discharge of pollutants to the MEP and shall not cause or contribute to violations of State water quality standards to the receiving stream.

(ii) Permittees will be required to ensure the implementation of a program to collect used motor vehicle fluids for recycle, reuse, or proper disposal. The program implemented must be readily available to all private residents and publicized and promoted on a regular basis.

(iii) The permittees will be required to ensure the implementation of a program to collect household hazardous waste materials (including paint, solvents, pesticides, herbicides, and other hazardous materials) for recycle, reuse, or proper disposal.

VOL 16 0344

b. **Monitoring.** Under the Monitoring Requirements in the permit, the permittees must:

(1) Provide estimates of the seasonal pollutant loading and event mean concentration of a representative storm for each major outfall within the MS4 for the constituents detected in the Part 2 application sampling data.

(2) Perform three different types of monitoring: (i) screening at municipal waste facilities and at industrial facilities with high risk runoff; (ii) dry weather screening to locate illicit connections and areas of improper disposal of non-storm water; (iii) monitoring in conjunction with the State of Florida's Surface Water Ambient Monitoring Program. The monitoring under this section shall be performed according to the agreements established between the permittees. It is the intent of EPA Region IV ("the Region") to use the monitoring information collected during the permit term to evaluate trends in reduction in pollutant loads discharged to waters of the U.S. The pollutant loading trends will also be used in evaluating the effectiveness of the permittees' Storm Water Management Programs. The Region is specifically requesting comment on the ability of the proposed monitoring program to detect trends in reduction of pollutant loadings and to evaluate the "success" of the Storm Water Management Program's effectiveness in reducing the discharge of pollutants to the MEP and ensuring that such discharges shall not cause or contribute to violations of State water quality standards to the receiving stream.

(i) The program to "screen" at municipal waste facilities and at industrial facilities with high risk runoff will serve to identify those facilities with poor quality storm water discharges. These identified high risk facilities may then be given priority when implementing control measures. Since this wet weather screening process is intended as a targeting and management tool for the permittee, flexibility in choosing the techniques to be used has been incorporated into the permit.

(ii) The dry weather screening program is a continuation of the efforts started under Part 1 of the permit application to locate and eliminate illicit connections to the MS4. This program is intended to support the permit requirement to effectively prohibit non-storm water discharges to the MS4. The permittees will implement an effective screening program which is best suited to their individual systems, based on the experience gained during the permit application process.

(iii) The monitoring to be performed in conjunction with the State of Florida's Surface Water Ambient Monitoring Program shall be the result of a cooperative effort between the permittees and the Bureau of Surface Water Management, Florida Department of Environmental Protection. The monitoring program established may extend beyond the present scope of the State of Florida's Surface Water Ambient Monitoring Program where necessary to address local areas of concern. The number of monitoring stations as well as the type of sampling performed shall be established to achieve the following: (a) assist in determining the impact of storm water discharges on receiving waters located in the geographical area covered by the permit; (b) assist in determining the effectiveness of the storm water management programs being implemented under the permit and assist in identifying and prioritizing portions of the MS4 requiring additional controls; and (c) help identify local sources and impacts of specific pollutants considered a problem in the geographic area covered by the permit. It is the intent of EPA to use the monitoring information collected to evaluate any trends in the reduction in pollutant loads discharged to waters of the U.S during the term of the permit. The pollutant loading trends will be used to evaluate the effectiveness of the permittees' Storm Water Management Program to reduce the discharge of pollutants to the MEP and shall not cause or contribute to violations of State water quality standards to the receiving stream.

e. **Annual Report.**

Permittees are required to contribute to the preparation of a system-wide ANNUAL REPORT which shall include: the implementation status of the storm water management programs; proposed changes to the storm water management programs; revisions, if necessary, to the assessments of controls and the fiscal analysis reported in the permit application; a summary of the data, including monitoring data, that is accumulated throughout the reporting year; annual expenditures and the budget for the year following each ANNUAL REPORT; a summary describing the number and nature of enforcement actions and inspections; a summary describing public education programs; and the identification of water quality improvements or degradation. Florida Department of Transportation (FDOT) shall include in the ANNUAL REPORT the status of the FDOT Statewide Storm Water Management Program elements and shall indicate whether the resulting program modifications have been implemented at the District Office. The ANNUAL REPORT must be submitted by no later than six months following the period covered by the report. The ANNUAL REPORT shall cover the 12 month period beginning on the effective date of this permit and annually thereafter. Copies of the ANNUAL REPORT will be available to the public.

VOL 16 0345

NOTE: Appendix A contains excerpts from the *Storm Water Management Program* submitted by the permittees in the July 23, 1993, Part 2 Application.

Appendix B contains excerpts from FDOT's *Statewide Storm Water Management Program for Part 2 EPA NPDES-MS4 Permit Application*, dated June 1993.

PRO			
1. *Operation and Maintenance of Structural Controls*	Sarasota County City of Sarasota City of Venice North Port WCD FDOT	Perform inspection and maintenance of structural controls, maintain an internal log documenting activities, and perform annual assessment of effectiveness of inspection & maintenance schedule. Provide a summary of the assessment in each ANNUAL REPORT and include any changes deemed necessary to the inspection & maintenance schedule.	Pages 4A-2 to 4A-8 of Appendix A Pages 4-6 to 4-9 of Appendix B
	ALL	Develop and implement a revolving inspection program for privately-owned and maintained storm water treatment systems which discharge into the MS4.	Page 4A-8 of Appendix A Permittees shall submit a summary of the developed program to EPA for incorporation into the permit.
	ALL except for FDOT	Complete Florida Water & Pollution Control Operators Association (FW&PCOA) course or equivalent.	Pages 4A-8 and 4A-9 of Appendix A

PROGRAM				
9.	***Construction Site Runoff*** **(continued)**			
c.)	***Site Operator Training***	**ALL except for North Port WCD and FDOT**	Expand the topics covered in the annual Sarasota County Natural Sciences Division workshop for earth moving contractors. Topics to include are measures to reduce pollutants from sites, awareness of the NPDES program requirements for construction activities, and solutions to erosion and sediment problems commonly found by the inspectors during construction.	**Pages 4D-17 and 4D-18 Appendix A**
			Evaluate the feasibility of an erosion & sediment control competency certification program for construction site operators (contractors and developers), plan reviewers, and inspectors that work on sites that discharge to the MS4.	**Pages 4D-17 and 4D-18 Appendix A**
			Develop and implement a procedure to notify building permit applicants in developments which because of their size are subject to the NPDES storm water regulations of their potential responsibilities under the NPDES permitting program for construction site runoff.	**Permittee shall submit a copy of the developed procedures to EPA for incorporation into the permit.**
			Conduct presentations to local professional organizations which are associated with the construction industry to discuss proper construction site management for water quality.	**Page 4D-18 of Appendix A**

R0061758

8563 716 VOL

10. BASIS FOR PERMIT CONDITIONS

The conditions established by this permit are based on Section 402(p)(3)(B) of the Clean Water Act (33 U.S.C. 1251 *et seq.*, as modified by the Water Quality Act of 1987, P.L. 100-4) which requires the Agency to: a.) effectively prohibit the discharge of non-storm water to the separate storm sewer system and b.) require the permittees to reduce pollutants in discharges from the MS4 to the MEP. As authorized by 40 CFR 122.44(k), the permit will be utilizing Best Management Practices, in the form of required Pollution Prevention Measures and a comprehensive Storm Water Management Program (SWMP), as the mechanism to implement the statutory requirements. While Section 402(p)(3)(B)(iii) of the CWA clearly includes structural controls as a component of MEP, the Region encourages municipalities to first explore opportunities for pollution prevention measures, reserving more costly structural controls for higher-priority watersheds or where source controls are unfeasible or ineffective. In addition, Section 403.0891 of the Florida Statutes, and State Water Policy, Chapter 62-40, Florida Administrative Code, mandates local governments to implement comprehensive storm water management programs designed to minimize adverse effects of storm water on land and water resources. Programs are to be implemented in a manner that will improve and restore the quality of waters that do not meet State water quality standards and to maintain the water quality of those waters which meet or exceed state water quality standards.

In Section 2(b) of the Pollution Prevention Act of 1990, Congress established a national policy that "[P]ollution should be prevented or reduced at the source wherever feasible; pollution that cannot be prevented should be recycled in an environmentally safe manner, whenever feasible; pollution that cannot be prevented or recycled should be treated in an environmentally safe manner whenever feasible; and disposal or other release into the environment should employed only as a last resort and should be conducted in an environmentally safe manner." In the Pollution Prevention Act, Congress specifically tied source reduction efforts to preventing pollution on a multi-media (water, air, and land) basis.

The storm water management program requirements of this permit will be implemented through the approved SWMP, as modified by applicable compliance schedules contained in the permit. Permit compliance with regard to the storm water management program requirement will be judged by the permittees' implementation of, and compliance with, the approved SWMP which is incorporated by reference. The permittees are required to conduct annual evaluations on the effectiveness of the SWMP, and institute or propose modifications necessary to meet the overall permit standard of reducing the discharge of pollutants to the MEP. The Director, however, may also require modifications to the SWMP to address impacts on receiving water quality caused, or contributed to, by discharges from the MS4; include more stringent requirements necessary to comply with new State or Federal statutory or regulatory requirements; or include such other conditions deemed necessary by the Director to comply with the goals and requirements of the Clean Water Act.

VOL 16 0359

Implementation of the Pollution Prevention Measures and the SWMP are expected to result in protection of water quality standards. The permit does, however, contain a reopener clause should new information indicate the discharges from the MS4 is causing, or significantly contributing to, a violation of the State's water quality standards.

a. **Storm Water Management Program. (SWMP)**

As part of the application process at 40 CFR 122.26(d)(2)(iv), each applicant was required to propose a comprehensive storm water management program, which is being incorporated into the permit by reference. The SWMP addresses runoff from residential and commercial areas, industrial sites, construction sites, and includes a program to eliminate illicit discharges and improper disposal of wastes into the separate storm sewer system.

The SWMP must contain program elements for each of the items in Table 11.1. 40 CFR 122.26(d)(2)(iv) authorizes differing content of the program elements for each permittee, and different controls for different areas of the MS4 on a watershed, jurisdiction, or individual outfall basis. Due to differences in climate, age, topography, historical development patterns, legal authority, sensitivity of receiving waters, and many other factors, Region IV believes some flexibility in prioritizing the scope and timing of individual program elements must be afforded the permittees. The standard of reducing the pollutants to the MEP, is therefore applied to the SWMP as a whole, rather than to each individual program element. Region IV believes this approach is in accordance with CWA Section 402(p)(3)(B)(iii) and the intent of Congress.

VOL 16 0360

Table 11.1 - Storm Water Management Program Elements

REQUIRED PROGRAM ELEMENT	REGULATORY REFERENCES
Operation and maintenance of structural controls.	40 CFR 122.26(d)(2)(iv)(A)(1)
Control of discharges from areas of new development and significant redevelopment.	40 CFR 122.26(d)(2)(iv)(A)(2)
Operation and maintenance of public streets, roads, and highways.	40 CFR 122.26(d)(2)(iv)(A)(3)
Ensuring flood control projects consider water quality impacts.	40 CFR 122.26(d)(2)(iv)(A)(4)
Identification, monitoring, and control of discharges from municipal waste treatment, storage, or disposal facilities.	40 CFR 122.26(d)(2)(iv)(A)(5)
Control of pollutants related to application of pesticides, herbicides, and fertilizers.	40 CFR 122.26(d)(2)(iv)(A)(6)
Implementation of an inspection program to enforce ordinances which prohibit illicit connections and illegal dumping into the MS4.	40 CFR 122.26(d)(2)(iv)(B)(1)
Field screening the MS4 for illicit connections and illegal dumping.	40 CFR 122.26(d)(2)(iv)(B)(2)
Implementation of standard investigative procedures to identify and terminate sources of illicit connections or discharges.	40 CFR 122.26(d)(2)(iv)(B)(3)
Prevention, containment, and response to spills that may discharge into the MS4.	40 CFR 122.26(d)(2)(iv)(B)(4)
Limit the infiltration of sanitary seepage into the MS4.	40 CFR 122.26(d)(2)(iv)(B)(7)
Identification, monitoring, and control of discharges from municipal landfills; hazardous waste treatment, storage, disposal and recovery facilities; facilities that are subject to EPCRA Title III, Section 313; and any other industrial or commercial discharge the permittee determines are contributing a substantial pollutant loading to the MS4.	40 CFR 122.26(d)(2)(iv)(C)(1)
Control of pollutants in construction site runoff	40 CFR 122.26(d)(2)(iv)(D)(1)
Public education	40 CFR 122.26(d)(2)(iv)(A)(6) 40 CFR 122.26(d)(2)(iv)(B)(5) 40 CFR 122.26(d)(2)(iv)(B)(6)

VOL 16 0361

Structural Controls: Each permittee must operate and maintain any storm water structural controls for which they are the owner or operator, in a manner so as to reduce the discharge of pollutants (including floatables).

Areas of New Development and Significant Redevelopment: Each permittee must utilize a comprehensive master planning process to develop, implement, and enforce controls to minimize the discharge of pollutants from areas of new development and significant re-development after construction is completed.

Roadways: Each permittee must operate and maintain public streets, roads, and highways under its jurisdiction in a manner so as to minimize discharge of pollutants.

Flood Control Projects: Each permittee must ensure any flood management project it undertakes assesses impacts on water quality of receiving waters. Each permittee must also evaluate the feasibility of retrofitting existing structural flood control devices to provide additional pollutant removal from storm water.

Identification, monitoring, and control of discharges from municipal waste treatment, storage, or disposal facilities: Each permittee identified in the permit must implement a program to reduce pollutants in storm water discharges from municipally-operated solid waste transfer stations, maintenance and storage yards for waste transportation fleets, POTWs and sludge application sites not covered by NPDES storm water permits. The initial phase of the program shall contain procedures to evaluate, inspect, and monitor these sites. Based upon the evaluations, inspections, and monitoring performed, priorities and procedures for implementing control measures for pollutant reduction at these sites shall be developed. Monitoring methodology used during the initial investigative period may be relaxed from standard protocol and may be based on experience gained during actual field activities. The goal of the investigative portion is to actively identify areas within these sites with poorer quality discharges during storm events, so that those areas will be given priority when implementing control measures.

Pesticide, Herbicide, and Fertilizer Application: Each permittee must implement controls to reduce the discharge of pollutants related to application of pesticides, herbicides, and fertilizers applied by the permittee's employees or contractors to public right of ways, parks, and other municipal facilities. Permittees with jurisdiction over lands not directly owned by that entity (e.g. incorporated city) must implement controls to reduce discharge of pollutants related to application and distribution of pesticides, herbicides, and fertilizers by commercial and wholesale distributors and applicators. The public education element of the SWMP must include a component aimed at private use of fertilizers, herbicides and pesticides. The Region recognizes some State statues or regulations may limit a municipality's ability to directly control commercial applicators by means other than education or ensuring the applicator is in fact licensed by the State.

VOL 16
0362

Illicit Discharges and Improper Disposal: Each permittee must implement an ongoing program to detect and remove illicit discharges and improper disposal into the storm sewer. Each permittee must effectively prohibit non-storm water discharges to the MS4, other than those authorized under a separate NPDES permit.

Unless identified by either the permittee, the Director, or the State as significant sources of pollutants to waters of the United States, the following non-storm water discharges (listed in 40 CFR 122.26(d)(2)(iv)(B)(1)) need not be prohibited from entering the MS4: water line flushing; landscape irrigation; diverted stream flows; rising ground waters; uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)) to separate storm sewers; uncontaminated pumped ground water; discharges from potable water sources; foundation drains; air conditioning condensate; irrigation water; springs; water from crawl space pumps; footing drains; lawn watering; non-commercial car washing; flows from riparian habitats and wetlands; dechlorinated swimming pool discharges; street wash waters; and discharges or flows from emergency fire fighting activities. As necessary, the permittees may incorporate appropriate control measures in the SWMP to ensure these discharges are not significant sources of pollutants to waters of the United States.

Each permittee must enforce ordinances which prohibit illicit connections and illegal dumping into the MS4. A random inspection program to detect and eliminate illicit connections shall be implemented. The table below indicates those permittees who must amend their ordinances to include the correct citation for the definition of "industrial activity," 40 CFR 122.26(b)(14) rather than 40 CFR 122.26(a)(14). Under the Part 2 application requirements, the permittees had to demonstrate that they possessed the legal authority to control the contribution of pollutants to the MS4 by storm water discharges associated with "industrial activity" and the quality of storm water discharged from sites of "industrial activity." In developing and adopting ordinances which satisfied this required legal authority, the permittees identified below inadvertently included an incorrect regulatory citation for the "industrial activity" definition.

PERMITTEE	ORDINANCE
City of Sarasota	93-3699
City of North Port	93-15, Section 180-21
City of Venice	93-14, Section 9-74

Each permittee shall conduct dry weather field screening of the MS4 for illicit discharges and improper disposal. The dry weather screening program is a continuation of the efforts started under Part 1 of the permit application to locate and eliminate illicit connections to the MS4. This program is intended to support the permit requirement to effectively prohibit non-storm water discharges to the MS4. The permittees will implement an effective screening program which is best suited to their individual systems, based on the experience gained during the permit application process.

VOL 16 03663

Illicit Discharges and Improper Disposal: (continued)

Each permittee must implement a program to prevent, contain, and respond to spills that may discharge into the MS4. The spill response program may include a combination of spill response actions by the permittee (and/or another public or private entity), and legal requirements for private entities within the permittee's municipal jurisdiction.

Each permittee must prevent (or require the operator of the sanitary sewer to eliminate) unpermitted discharges of dry and wet weather overflows from sanitary sewers into the MS4. Each permittee must limit the infiltration of seepage from sanitary sewers into the MS4.

Each permittee must prohibit the discharge or disposal of used motor vehicle fluids, household hazardous wastes, grass clippings, leaves, and animal wastes into the MS4.

Each permittee must require the elimination of illicit connections as expeditiously as possible and the immediate cessation of improper disposal practices upon identification of responsible parties. Where an expeditious elimination an illicit connection or the submittal of an NPDES application to EPA is not possible, the responsible party submit for approval a written compliance schedule for the removal of the discharge. In the interim, the permittee must require the operator of the illicit connection to take all reasonable and prudent measures to minimize the discharge of pollutants to the MS4.

Industrial & High Risk Runoff: Each permittee must implement a program to identify, monitor, and control pollutants in storm water discharges to the MS4 from municipal landfills; hazardous waste treatment, storage, disposal and recovery facilities and facilities that are subject to EPCRA Title III, Section 313; and any other industrial or commercial discharge the permittee determines are contributing a substantial pollutant loading to the MS4. The program must include: priorities and procedures for inspections and establishing and implementing control measures for such discharges; and a monitoring program for facilities identified under this section, including the collection of quantitative data on the discharges from those facilities. Data collected by the industrial facility to satisfy the monitoring requirements of an NPDES or State discharge permit may be used to satisfy this requirement. Permittees may also require the industrial facility to conduct self-monitoring to satisfy this requirement. The monitoring program shall include the collection of quantitative data on the following constituents:

- any pollutants limited in an existing NPDES permit for an identified facility;
- oil and grease;
- chemical oxygen demand (COD);
- pH;
- biochemical oxygen demand, five-day (BOD_5);
- total suspended solids (TSS);
- total phosphorous;

VOL 16 0364

- total Kjeldahl nitrogen (TKN);
- nitrate plus nitrite nitrogen; and
- any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).

40 CFR 122.21(g)(7)(iii) and (iv) require that permittees must indicate whether they know or have reason to believe that any of the pollutants in Tables II, III, or IV of Appendix D (toxic pollutants, total phenols, and certain conventional and nonconventional pollutants) are being discharged from the outfalls at these sites.

The permittees must provide a listing in each ANNUAL REPORT which contains any additionally identified industrial facilities which discharge storm water into the MS4. The industrial storm water discharges that must be included in this inventory fall into 11 classes of industrial activities as defined in the November 1990 regulations under 40 CFR 122.26(b)(14). These 11 categories are as follows:

(i) Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards under 40 CFR subchapter N (except facilities with toxic pollutant effluent standards which are exempted under the following category (xi) below;

(ii) Facilities classified as Standard Industrial Classifications 24 (except 2434), 26 (except 265 and 267), 28 (except 283), 29, 311, 32 (except 323), 33, 3441, and 373;

(iii) Facilities classified as Standard Industrial Classifications 10 through 14 (mineral industry) including active and inactive mining operations (except for areas of coal mining operations no longer meeting the definition of a reclamation area under 40 CFR 434.11(l) because the performance bond issued to the facility by the appropriate SMCRA authority has been released, or except for areas of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990, and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts or waste products located on the site of such operations; (inactive mining operations are mining sites that are not being actively mined, but which have an identifiable owner/operator; inactive mining sites do not include sites where mining claims are being maintained prior to disturbances associated with the extraction, beneficiation, or processing of mined materials, nor sites where minimal activities are undertaken for the sole purpose of maintaining a mining claim);

VOL 16 0365

(iv) Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under Subtitle C of RCRA;

(v) Landfills, land application sites, and open dumps that receive of have received any industrial wastes (wastes that is received from any of the facilities described under this subsection) including these that are subject to regulation under Subtitle D of RCRA;

(vi) Facilities involved in the recycling of materials, including metal scrap yards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as Standard Industrial Classification 5015 and 5093;

(vii) Steam electric power generating facilities, including coal handling sites;

(viii) Transportation facilities classified as Standard Industrial Classifications 40, 41, 42 (except 4221-25), 43, 44, 45, and 5171 which have vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, airport deicing operations, or which are otherwise identified under paragraphs (i)-(vii) or (ix)-(xi) of this subsections are associated with industrial activity;

(ix) Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that are located within the confines of the facility, with a design flow of 1.0 mgd or more, or required to have an approved pretreatment program under 40 CFR 403. Not included are farm lands, domestic gardens or lands used for sludge management where sludge is beneficially reused and which are not physically located in the confines of the facility, or areas that are in compliance with Section 405 of the CWA.

(x) Construction activity including clearing, grading and excavation activities except: operations that results in the disturbance of less than five acres of total land area which are not part of a larger common plan of development or sale;

(xi) Facilities under Standard Industrial Classifications 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39, 4221-25, (and which are not otherwise included with categories (ii)-(x)).

VOL 16 0366

Construction Site Runoff: Each permittee must implement a program to reduce the discharge of pollutants from constructions sites, including requirements for the use and maintenance of appropriate structural and nonstructural best management practices to reduce pollutants discharged to the MS4 during the time construction is underway; procedures for site planning which incorporates considerations for potential short and long term water quality impacts and minimizes these impacts; prioritized inspection of construction sites and enforcement of control measures; appropriate education and training measures for construction site operators; and notification of appropriate building permit applicants of their potential responsibilities under the NPDES permitting program for construction site runoff.

Public Education: Each permittee must implement a public education program including a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges of non-storm water or improper disposal of materials such as industrial and commercial wastes, household hazardous wastes, leaf litter, grass clippings, and animal wastes into the MS4; a program to promote, publicize, and facilitate the proper management and disposal of used oil and household hazardous wastes; a program to promote, publicize, and facilitate the proper use, application, and disposal of pesticides, herbicides, and fertilizers by the public and commercial and private applicators and distributors; and where applicable and feasible, the permittee should publicize those best management practices (including but not limited to the use of reformulated or redesigned products, substitution of less toxic materials, and improvements in housekeeping) used by the permittee that facilitates better use, application, and/or disposal of materials identified above. The Region believes that educating the public on the impacts of their everyday activities is a crucial component of preventing storm water pollution.

VOL 16 0367

VOL 16 0368

1. **Pollution Prevention Measures.**

Under the CWA, MS4s are subject to the MEP standard at CWA Section 402(p)(3)(B)(iii), the effective prohibition on non-storm water standard at CWA Section 402(p)(3)(B)(ii), and applicable State water quality standards for storm water found at FAC §62-40.420(1)-(4). The Region has identified four areas where pollution prevention mechanisms have been required, in addition to the Storm Water Management Programs, to address sources of pollutants entering the MS4, minimize the degradation of storm water quality as development occurs, and further implement the statutory prohibition on non-storm water discharges to the MS4.

As an urban watershed is developed, the volume of storm water and its rate of discharge increases. The distinction between new and redevelopment is made for several reasons. First, due to increases in impervious areas such as roofs, sidewalks, and roads and increases of human activities coupled with less than 100% efficiencies in any control mechanism, it is difficult to even maintain pre-development levels of pollutants, much less achieve a reduction. The Region does recognize that, depending on previous land use, reductions in certain pollutants may be possible (e.g. sediment loadings from cropland vice residential development). It is the increased flexibility of not having to work within the confines of surrounding developed property, that make more control options cost-effective for new development. In areas undergoing redevelopment, onsite controls benefiting from controls methods developed, or required, since the site was originally developed can be designed into the new project, resulting in a net reduction in pollutants.

EPA estimates that, annually, 267 million gallons of used oil, including 135 million gallons of used oil from do-it-yourself automobile oil changes, are disposed of improperly. Some of this oil is being dumped into storm sewers or onto the ground where it can contaminate storm water runoff. In order to insure that not only is the public educated on proper disposal practices, but an economical disposal/recycling alternative is provided, permittees will be required to ensure the implementation of a program to collect used motor vehicle fluids (including, at a minimum, oil and antifreeze) for recycle, reuse, or proper disposal. The program implemented must be readily available to all private residents and publicized and promoted on at least an annual basis.

According to an EPA study, an average household generates approximately 55 to 60 grams of Household Hazardous Waste or approximately 4-5 pounds per person, per year. Household Hazardous Wastes are currently exempt from regulation as a hazardous waste under Subtitle C of the Resource Conservation and Recovery Act (RCRA) (40 CFR 261.4(b)). Improper or careless disposal of household hazardous wastes (e.g. dumping or washing leftover paint into the storm sewers, throwing partially full containers of solvents into the trash where leaks may occur, flushing of unused pesticides into sanitary sewers, etc.) can result in not only storm water contamination, but also contamination of the

municipal solid waste stream, inhibition of wastewater treatment plants, or even contribute to air pollution. The magnitude of this problem is unknown, but it is reasonable to expect Household Hazardous Wastes are being discharged to MS4s. Public education on minimizing the amounts of household hazardous wastes generated (e.g. buying only the amount of pesticide you can use before it loses effectiveness), on reusing household wastes (e.g. blending leftover paints for use by charitable organizations), on recycling wastes (e.g. blending solvents for use as an energy source), and on proper disposal of other materials is only one part of the equation. In order to insure that not only is the public educated on proper disposal practices, but an economical and readily available alternative is provided, the permittees will be required to ensure the implementation of a program to collect household hazardous waste materials (including materials such as leftover paint, solvents, pesticides, herbicides, and other hazardous materials) for recycle, reuse, or proper disposal.

VOL 16
0369
R0061769

VOL 16

b. Monitoring.

As part of the application process at 40 CFR 122.26(d)(2)(iii)(C) and (D), each applicant was required to propose the following:

(1) A schedule to provide estimates for each major outfall identified of the seasonal pollutant load and of the event mean concentration (EMC) of a representative storm for any constituent detected in any sample required in the Part 2 application sampling; and

(2) A monitoring program for representative data collection for the term of the permit that describes the location of outfalls or field screening points to be sampled (or the location of instream stations), why the location is representative, the frequency of sampling, parameters to be sampled, and a description of sampling equipment.

As in (1) above, the permittees are to include a schedule to provide estimates, for each major outfall, of the seasonal pollutant load and EMC of a representative storm for any constituent detected in any sample required in the Part 2 application sampling. EPA, Region IV, reviewed the Part 2 application sampling data to determine which pollutants this requirement would include. The storm water regulation required monitoring for the 110 organic pollutants in Table II, the 15 other toxic pollutants (including metals, cyanide and total phenols) in Table III, and for the following pollutants: total suspended solids (TSS), total dissolved solids (TDS), COD, BOD_5, oil & grease, fecal coliform, fecal streptococcus, pH, total Kjeldahl nitrogen, nitrate plus nitrite, dissolved phosphorus, and total phosphorus.

- The overwhelming majority of 110 organic pollutants were never detected in the storm water sampling performed. Because of the low detection rate coupled with a very low concentration, Region IV concluded that the development of seasonal pollutant loadings and event mean concentrations for each of these detected compounds would require an inordinate expense and effort to sample enough storm events to generate an EMC above the limit of detection. In lieu of this requirement, Region IV has placed in the permit a condition requiring that the permittees conduct investigations of the identified drainage basins where specific organic pollutants were detected at levels which exceeded the acute criterion values for freshwater in the *EPA Quality Criteria for Water* (also known as the *"Gold Book"*) in an effort to determine the source(s) of these pollutant(s). The permittees are required to provide the result of these investigations in the Annual Report for Year Three of the permit.

0370

R0061770

- The pollutants in the Part 2 application for which the permittees had to provide an estimate of the annual pollutant load and EMC for the overall system are included in the permit. These pollutants are: BOD_5, COD, TSS, TDS, total Kjeldahl nitrogen, nitrite plus nitrite, total phosphorus, dissolved phosphorus, total recoverable cadmium, total recoverable copper, total recoverable lead, and total recoverable zinc. The permittees must develop seasonal pollutant loads and EMCs for each of these pollutants for each major outfall.

- The data for remaining pollutants in the Part 2 application was reviewed. If the pollutant had not been detected, it was not included under this requirement in the permit. If the pollutant had been detected in the Part 2 sampling data but at a level below the acute criterion values in the *EPA Quality Criteria for Water* (also known as the *"Gold Book"*), this pollutant was not included under this requirement in the permit. If the pollutant had been detected in the Part 2 sampling data and it was at a level above the acute criterion values in the *EPA Quality Criteria for Water*, this pollutant was included under this requirement in the permit, and the permittees must develop seasonal pollutant loads and EMCs for this pollutant for each major outfall. EPA finds this overall approach consistent with the methodology and rationale used in the National Urban Runoff Program (NURP).

Due to differences in the availability of existing water quality data, sensitivity of receiving waters, and other factors, Region IV believes some flexibility in the scope of the monitoring program elements in item (2) above must be afforded the permittees. Region IV believes that one important goal of the monitoring program is to show a trend, over the term of the permit, pollutants are reduced to the MEP from MS4 discharges and shall not cause or contribute to violations of State water quality standards to the receiving stream. Another goal of the monitoring program is to identify the sources and impacts of specific pollutants, so that these pollutants may be more effectively reduced or eliminated.

Pursuant to Section 403.0891 of the Florida Statutes, and State Water Policy, Chapter 62-40, Florida Administrative Code, local governments are to implement on a watershed-based approach, a comprehensive storm water management program designed to minimize adverse effects of storm water on land and water resources. Programs are to be implemented in a manner that will improve and restore the quality of waters that do not meet State water quality standards and to maintain the water quality of those waters which meet

VOL 16 0371

or exceed state water quality standards. State water quality standards are found at FAC 62-40.420(1)-(4), which contain facility design and performance standards.

11. Considerations under Federal Law

The discharge which is being controlled by the terms of this permit is the result of natural precipitation, and as such would continue to be discharged regardless of the federal action represented here. The terms of this permit do require that the municipality reduce to the MEP pollutants in the storm water runoff discharged from the municipal separate storm sewer system. The Region believes reduction of pollutants in the natural runoff will not result in the disturbance of any site listed or eligible for listing in the National Historic Register, nor effect any endangered species. This permit specifically does not authorize any storm water discharges which would jeopardize a listed endangered or threatened species or adversely modify a designated critical habitat; adversely effect properties listed or eligible for listing in the National Register of Historic Places; or would not be in compliance with any applicable requirements of a State's Coastal Zone Management Plan.

12. State Certification of the Draft Permit

The Region shall formally request State Certification of today's draft permit, as required by CWA Section 401 and 40 CFR 124.53. The final permit will contain any permit condition required by the State as a condition for Section 401 Certification.

VOL 16 0312

NPDES Permit No. OKS000201

AUTHORIZATION TO DISCHARGE UNDER THE
NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

In compliance with the provisions of the Clean Water Act, 33 U.S.C. 1251 et seq., as amended by the Water Quality Act of 1987, P.L. 100-4, the "Act",

City of Tulsa
Department of Public Works
200 Civic Center
Tulsa, Oklahoma 74103

is(are) authorized to discharge, in accordance with the Storm Water Management Program(s), effluent limitations, monitoring requirements, and other provisions set forth in Parts I, II, III, IV, V, VI, VII, and VIII herein,

from all portions of the City of Tulsa Municipal Separate Storm Sewer System (MS4) owned or operated by any permittee listed above, to waters of the United States.

This permit will become effective October 1, 1994

This permit and the authorization to discharge under the National Pollutant Discharge Elimination System shall expire at midnight, on September 30, 1999

Signed this 26 day of August, 1994

Monica L. Burrell
Environmental Engineer
Municipal Section (6W-PM)

Myron O. Knudson, P.E.
Director
Water Management Division (6W)

VOL 16 0373

R0061773

PART I. DISCHARGES AUTHORIZED UNDER THIS PERMIT.

A. Permit Area. This permit covers all areas located within the corporate boundary of the City of Tulsa that are served by municipal separate storm sewers owned or operated by the permittee(s).

B. Authorized Discharges.

1. Except for discharges prohibited under Part I.B.2, this permit authorizes all existing or new storm water point source discharges to waters of the United States from those portions of the Municipal Separate Storm Sewer System owned or operated by the permittee(s).

2. The following discharges, whether discharged separately or commingled with municipal storm water, are not authorized by this permit:

a. *Non-storm Water and Industrial Storm Water:* discharges of non-storm water; any Storm Water Discharge Associated with Industrial Activity; or other storm water discharges required to obtain an NPDES permit, except where such discharges are:

(1) regulated by a separate NPDES permit (or the discharger has applied for such permit); or

(2) identified by and in compliance with Part II.A.6.a.

b. *Spills:* discharges of material resulting from a spill. Where discharge of material resulting from a spill is necessary to prevent loss of life, personal injury, or severe property damage, the permittee(s) shall take, or insure the responsible party for the spill takes, all reasonable steps to minimize or prevent any adverse effects on human health or the environment. (See also Part II.A.7 and Part VI.E.) This permit does not transfer liability for a spill itself from the party(ies) responsible for the spill to the permittee(s) nor relieve the party(ies) responsible for a spill from the reporting requirements of 40 CFR Part 117 and 40 CFR Part 302.

C. Permittee Responsibilities.

1. Each permittee is responsible for:

a. Compliance with permit conditions relating to discharges from portions of the Municipal Separate Storm Sewer System where the permittee is the operator;

b. Storm Water Management Program implementation on portions of the Municipal Separate Storm Sewer System where the permittee is the operator;

c. Compliance with annual reporting requirements as specified in Part V.C.;

d. Collection of representative wet weather monitoring data required by Part V.A., according to such agreements as may be established between permittees; and

VOL 16 0374

e. A plan of action to assume responsibility for implementation of storm water management and monitoring programs on their portions of the Municipal Separate Storm Sewer System should interjurisdictional agreements allocating responsibility between permittees be dissolved or in default.

2. Permittees are jointly responsible for permit compliance on portions of the Municipal Separate Storm Sewer System where operational or Storm Water Management Program implementation authority over portions of the Municipal Separate Storm Sewer System is shared or has been transferred from one permittee to another in accordance with legally binding agreements.

B. Discharge Goals.

The following goals are established for discharges from the Municipal Separate Storm Sewer System:

1. No discharge of toxics in toxic amounts.

2. No discharge of pollutants in quantities that would cause a violation of State Water Quality Standards.

3. No discharge of floatable debris, oils, scum, foam, or grease in other than trace amounts.

4. No discharge of non-storm water from the municipal separate storm sewer system (except as provided in Part I.B.2.).

5. No degradation or loss of State-designated beneficial uses of receiving waters as a result of storm water discharges from the municipal separate storm sewer (unless authorized by the State in accordance with the State's Antidegradation Policy).

VOL 16 0375

PART II. STORM WATER POLLUTION PREVENTION & MANAGEMENT PROGRAM(S).

Each permittee shall contribute to the development, revision and implementation of a comprehensive Storm Water Management Program including pollution prevention measures, treatment or removal techniques, storm water monitoring, use of legal authority, and other appropriate means to control the quality of storm water discharged from the Municipal Separate Storm Sewer System. The Storm Water Management Program shall be implemented in accordance with Section 402(p)(3)(B) of the Act, and the Storm Water Regulations (40 CFR Part 122.26).

Controls and activities in the Storm Water Management Program shall identify areas of permittee responsibility on a jurisdiction, applicability, or specific area basis. The Storm Water Management Program shall include controls necessary to effectively prohibit the discharge of non-storm water into municipal separate storm sewers and reduce the discharge of pollutants from the Municipal Separate Storm Sewer System to the Maximum Extent Practicable (MEP).

The Storm Water Management Program shall cover the term of this permit and shall be updated as necessary, or as required by the Director, to ensure compliance with the statutory requirements of Section 402(p)(3)(B) of the Act. Modifications to the Storm Water Management Program shall be made in accordance with Parts II.G., and III. Compliance with the Storm Water Management Program and any schedules in Part III. shall be deemed compliance with Parts II.A, and II.B. The Storm Water Management Program, and all updates made in accordance with Part II.G., are hereby incorporated by reference.

Implementation of the Storm Water Management Program may be achieved through participation with other permittees, public agencies, or private entities in cooperative efforts to satisfy the requirements of Part II. in lieu of creating duplicate program elements for each individual permittee. The Storm Water Management Program, taken as a whole, shall achieve the "effective prohibition on the discharge of non-storm water" and "MEP" standards from Section 402(p)(3)(B) of the Act.

A. <u>Storm Water Management Program Requirements.</u>

1. *Structural Controls and Storm Water Collection System Operation:* The Municipal Separate Storm Sewer System and any storm water structural controls shall be operated in manner to reduce the discharge of pollutants to the Maximum Extent Practicable.

2. *Areas of New Development and Significant Redevelopment:* A comprehensive master planning process (or equivalent) to develop, implement, and enforce controls to minimize the discharge of pollutants from areas of new development and significant re-development after construction is completed shall be implemented. The goals of such controls shall be:

   a. New development - limiting increases in the discharge of pollutants in storm water as a result of development, and

   b. Re-development - reducing the discharge of pollutants in storm water.

3. *Roadways:* Public streets, roads, and highways shall be operated and maintained in a manner to minimize discharge of pollutants, including those pollutants related to deicing or sanding activities.

VOL 16 0376

4. *Flood Control Projects:* Impacts on receiving water quality shall be assessed for all flood management projects. The feasibility of retro-fitting existing structural flood control devices to provide additional pollutant removal from storm water shall be evaluated.

5. *Pesticide, Herbicide, and Fertilizer Application:* Each permittee shall implement controls to reduce the discharge of pollutants related to the permittee's storage and application of pesticides, herbicides, and fertilizers. Permittees with jurisdiction over lands not directly owned by that entity (e.g. incorporated city with authority over activities occurring anywhere within their city limits) shall also implement programs to reduce the discharge of pollutants related to commercial application and distribution of pesticides, herbicides, and fertilizers.

6. *Illicit Discharges and Improper Disposal:* Non-storm water discharges to the municipal separate storm sewer system shall be effectively prohibited.

   a. In accordance with 40 CFR 122.26(d)(2)(iv)(B)(1), certain non-storm water discharges to the municipal separate storm sewer system need not be addressed as illicit discharges or improper disposal. The Storm Water Management Program shall identify any non-storm water discharges that the permittee(s) does not prohibit, along with any conditions placed on such non-storm water discharges to the municipal separate storm sewer system. The permittee(s) shall prohibit, on a case-by-case basis, any individual non-storm water discharge (or class of non-storm water discharges) otherwise allowed under this paragraph that is determined to be contributing significant amounts of pollutants to the municipal separate storm sewer system.

   b. Each permittee shall prevent (or require the operator of the sanitary sewer to eliminate) unpermitted discharges of dry and wet weather overflows from sanitary sewers into the Municipal Separate Storm Sewer System. Each permittee shall limit the infiltration of seepage from sanitary sewers into the Municipal Separate Storm Sewer System.

   c. The permittee(s) shall ensure the implementation of a program to reduce the discharge of floatables (e.g. litter and other human-generated solid refuse). The floatables control program shall include source controls and, where necessary, structural controls.

   d. The discharge or disposal of used motor vehicle fluids, household hazardous wastes, grass clippings, leaf litter, and animal wastes into separate storm sewers shall be prohibited. The permittee(s) shall ensure the implementation of programs to collect used motor vehicle fluids (at a minimum, oil and antifreeze) for recycle, reuse, or proper disposal and to collect household hazardous waste materials (including paint, solvents, pesticides, herbicides, and other hazardous materials) for recycle, reuse, or proper disposal. Such programs shall be readily available to all private residents and shall be publicized and promoted on a regular basis.

   e. A program to locate and eliminate illicit discharges and improper disposal into the Municipal Separate Storm Sewer System shall be implemented. This program shall include dry

VOL 16 03777

weather screening activities to locate portions of the Municipal Separate Storm Sewer System with suspected illicit discharges and improper disposal. Follow-up activities to eliminate illicit discharges and improper disposal may be prioritized on the basis of magnitude and nature of the suspected discharge; sensitivity of the receiving water; and/or other relevant factors. This program shall establish priorities and schedules for screening the entire Municipal Separate Storm Sewer System at least once per five years. The permittee(s) shall utilize a consistent method (e.g. by land area, by outfall, etc.) for determining the percentage of the municipal separate storm sewer system that has been screened. Facility inspections may be carried out in conjunction with other municipal programs (e.g. pretreatment inspections of industrial users, health inspections, fire inspections, etc.), but must include random inspections for facilities not normally visited by the municipality.

f. Each permittee shall require the elimination of illicit discharges and improper disposal practices as expeditiously as reasonably possible. Where elimination of an illicit discharge within thirty (30) days is not possible, the permittee shall require an expeditious schedule for removal of the discharge. In the interim, the permittee shall require the operator of the illicit discharge to take all reasonable and prudent measures to minimize the discharge of pollutants to the Municipal Separate Storm Sewer System.

g. The permittee(s) shall maintain, and update as necessary, a list of discharges to municipal separate storm sewers that has been issued a NPDES permit. The list shall include the name, location and NPDES permit number of the discharger.

7. *Spill Prevention and Response:* A program to prevent, contain, and respond to spills that may discharge into the Municipal Separate Storm Sewer System shall be implemented. The spill response program may include a combination of spill response actions by the permittee(s) (and/or another public or private entity), and legal requirements for private entities within the permittee's municipal jurisdiction.

8. *Industrial & High Risk Runoff:* A program to identify and control pollutants in storm water discharges to the Municipal Separate Storm Sewer System from municipal landfills; other treatment, storage, or disposal facilities for municipal waste (e.g. transfer stations, incinerators, etc.); hazardous waste treatment, storage, disposal and recovery facilities; facilities that are subject to EPCRA Title III, Section 313; and any other industrial or commercial discharge the permittee(s) determines are contributing a substantial pollutant loading to the Municipal Separate Storm Sewer System shall be implemented. The program shall include:

a. priorities and procedures for inspections and establishing and implementing control measures for such discharges;

b. a monitoring program (Part II.A.11.c.); and

c. a list of industrial storm water sources discharging to the Municipal Separate Storm Sewer System shall be maintained and update as necessary.

VOL 16 0378

9. *Construction Site Runoff:* A program to reduce the discharge of pollutants from constructions sites shall be implemented. This program shall include:

   a. requirements for the use and maintenance of appropriate structural and nonstructural best management practices to reduce pollutants discharged to the Municipal Separate Storm Sewer System during the time construction is underway;

   b. inspection of construction sites and enforcement of control measures (in accordance with priorities and procedures established in the Storm Water Management Program);

   c. appropriate education and training measures for construction site operators; and

   d. notification of appropriate building permit applicants of their potential responsibilities under the NPDES permitting program for construction site runoff.

10. *Public Education:* A public education program with the following elements shall be implemented:

   a. a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or improper disposal of materials, including floatables, into the Municipal Separate Storm Sewer System;

   b. a program to promote, publicize, and facilitate the proper management and disposal of used motor vehicle fluids and household hazardous wastes.

   c. a program to promote, publicize, and facilitate the proper use, application, and disposal of pesticides, herbicides, and fertilizers by the public and commercial and private applicators and distributors.

11. *Monitoring Programs:* The following monitoring programs shall be implemented in addition to the monitoring required by Part V.:

   a. The *Dry Weather Screening Program* shall continue ongoing efforts to detect the presence of illicit connections and improper discharges to the Municipal Separate Storm Sewer System. All areas of the Municipal Separate Storm Sewer System must be screened at least once during the permit term. Screening methodology may be modified based on experience gained during actual field screening activities and need not conform to the protocol at 40 CFR 122.26(d)(1)(iv)(D). Sample collection and analysis need not conform to the requirements of 40 CFR Part 136. However, samples taken to <u>confirm</u> (e.g. in support of possible legal action) a particular illicit connection or improper disposal practice should conform to the requirements of 40 CFR Part 136.

VOL 16 0379

R0061779

b. *Wet Weather Screening Program:* The permittee(s) shall identify, investigate, and address areas within their jurisdiction that may be contributing excessive levels of pollutants to the Municipal Separate Storm Sewer System. The wet weather screening program:

(1) shall screen the Municipal Separate Storm Sewer System, in accordance with the procedures specified in the Storm Water Management Program.

(2) shall specify the sampling and non-sampling techniques to be used for initial screening and follow-up purposes. Sample collection and analysis need not conform to the requirements of 40 CFR Part 136. However, samples taken to confirm (e.g. in support of possible legal action) a particular discharger is a source of significant quantities of pollutants should conform to the requirements of 40 CFR Part 136.

c. The *Industrial and High Risk Runoff Monitoring Program* shall include monitoring for pollutants in storm water discharges to the Municipal Separate Storm Sewer System from municipal landfills; other treatment, storage, or disposal facilities for municipal waste (e.g. transfer stations, incinerators, etc.); hazardous waste treatment, storage, disposal and recovery facilities; facilities that are subject to EPCRA Title III, Section 313; and any other industrial or commercial discharge the permittee(s) determines are contributing a substantial pollutant loading to the Municipal Separate Storm Sewer System.

(1) Except as provided in (2) below, the monitoring program shall including the collection of quantitative data on the following constituents:

(a) any pollutants limited in an existing NPDES permit for a subject facility;
(b) oil and grease;
(c) chemical oxygen demand (COD);
(d) pH;
(e) biochemical oxygen demand, five-day (BOD_5);
(f) total suspended solids (TSS);
(g) total phosphorous;
(h) total Kjeldahl nitrogen (TKN);
(i) nitrate plus nitrite nitrogen; and
(j) any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).

Data collected by the industrial facility to satisfy the monitoring requirements of an NPDES or State discharge permit may be used to satisfy this requirement. Permittee(s) may require the industrial facility to conduct self-monitoring to satisfy this requirement.

(2) Alternative Certification: In lieu of monitoring, the permittee may accept a certification from a facility that raw and waste materials, final and intermediate products, by-products, material handling equipment or activities, industrial machinery or operations, or significant materials from past industrial activity are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Where the permittee(s)

VOL 16 03800

accept a "no exposure" certification, the permittee(s) shall conduct at least one site inspection of the facility every five years to verify the "no exposure" exemption.

B. Area-specific Storm Water Management Program Requirements. Reserved.

C. Deadlines for Program Implementation. Except as provided in Part III., full implementation of the Storm Water Management Program shall begin within 90 days from the effective date of the permit.

D. Roles and Responsibilities of Permittee(s). The Storm Water Management Program, together with any attached interagency agreements, shall clearly identify the roles and responsibilities of each permittee.

E. Legal Authority. Each permittee shall ensure legal authority to control discharges to and from those portions the Municipal Separate Storm Sewer System over which it has jurisdiction. This legal authority may be a combination of statute, ordinance, permit, contract, order or inter-jurisdictional agreements with permittees with existing legal authority to:

1. Control the contribution of pollutants to the Municipal Separate Storm Sewer System by Storm Water Discharges Associated with Industrial Activity and the quality of storm water discharged from sites of industrial activity;

2. Prohibit illicit discharges to the Municipal Separate Storm Sewer System;

3. Control the discharge of spills and the dumping or disposal of materials other than storm water (e.g. industrial and commercial wastes, trash, used motor vehicle fluids, leaf litter, grass clippings, animal wastes, etc.) into the Municipal Separate Storm Sewer System;

4. Control through interagency or interjurisdictional agreements among permittees the contribution of pollutants from one portion of the Municipal Separate Storm Sewer System to another;

5. Require compliance with conditions in ordinances, permits, contracts or orders; and

6. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance with permit conditions.

F. Storm Water Management Program Resources. Each permittee shall provide adequate finances, staff, equipment, and support capabilities to implement their activities under the Storm Water Management Program.

G. Storm Water Management Program Review and Update.

1. *Storm Water Management Program Review:* Each permittee shall participate in an annual review of the current Storm Water Management Program in conjunction with preparation of the annual report required under Part V.C.

2. *Storm Water Management Program Update:* The permittee(s) may change the Storm Water Management Program during the life of the permit in accordance with the following procedures:

a. The approved Storm Water Management Program shall not be changed by the permittee(s) without the approval of the Director, unless in accordance with Parts II.G.2.b. and 2.c.

VOL 16 0381

b. Changes adding (but not subtracting or replacing) components, controls, or requirements to the Storm Water Management Program may be made by the permittee(s) at any time upon written notification to the Director.

c. Changes replacing an ineffective or unfeasible BMP specifically identified in the Storm Water Management Program with an alternate BMP may be requested at any time. Unless denied by the Director, changes proposed in accordance with the criteria below shall be deemed approved and may be implemented by the permittee(s) 60 days from submittal of the request. Such requests shall include the following:

(1) an analysis of why the BMP is ineffective or infeasible (including cost prohibitive),

(2) expectations on the effectiveness of the replacement BMP, and

(3) an analysis of why the replacement BMP is expected to achieve the goals of the BMP to be replaced.

d. Changes resulting from schedules contained in Part III. may be requested following completion of an interim task or final deadline. Unless denied by the Director, proposed changes meeting the criteria contained in the applicable Part III schedule shall be deemed approved and may be implemented by the permittee(s) 60 days from submittal date.

e. Change requests and/or notifications shall be made in writing, signed in accordance with Part VI.H. by all directly affected permittees, and include a certification that all permittees were given an opportunity to comment on proposed changes.

3. *Updates Required by the Permitting Authority:* The permitting authority may require changes to the Storm Water Management Program as needed to:

a. address impacts on receiving water quality caused, or contributed to, by discharges from the Municipal Separate Storm Sewer System;

b. include more stringent requirements necessary to comply with new State or Federal statutory or regulatory requirements; or

c. include such other conditions deemed necessary by the Director to comply with the goals and requirements of the Act.

Changes requested by the Director shall be made in writing, set forth the time schedule for the permittee(s) to develop the changes, and offer the permittee(s) the opportunity to propose alternative program changes to meet the objective of the requested modification. All changes required by the Director shall be made in accordance with 40 CFR 124.5, 40 CFR 122.62, or as appropriate 40 CFR 122.63.

VOL 16 0382

4. *Transfer of Ownership, Operational Authority, or Responsibility for Storm Water Management Program Implementation:* The permittee(s) shall implement the Storm Water Management Program on all new areas added to their portion of the municipal separate storm sewer system (or for which they become responsible for implementation of storm water quality controls) as expeditiously as practicable, but not later than three years from addition of the new areas. Implementation may be accomplished in a phased manner to allow additional time for controls that cannot be implemented immediately.

   Prior to land annexation, the permittee(s) shall include a schedule for extending the Storm Water Management Program to the annexed areas in the Storm Water Management Program. At least 30 days prior to transfer of operational authority or responsibility for Storm Water Management Program implementation, all parties shall prepare a schedule for transfer of responsibility for Storm Water Management Program implementation on the affected portions of the Municipal Separate Storm Sewer System.

E. Retention of Storm Water Management Program Records. The permittee shall retain the Storm Water Management Program developed in accordance with Parts II. and III. for at least 3 years after coverage under this permit terminates.

VOL 16

0383

R0061783

PART III. SCHEDULES FOR IMPLEMENTATION AND COMPLIANCE

The Permittee(s) shall comply with the following schedules for Storm Water Management Program implementation and augmentation, and permit compliance.

A. Implementation and Augmentation of Storm Water Management Program(s)

STORM WATER MANAGEMENT PROGRAM COMPONENT	ACTIVITY	DATE DUE/FREQUENCY
1. New & Re-Development	a. Adoption of the Storm water Management Criteria Manual or another construction storm water runoff control program.	January 1, 1995
	b. Implementation of the Stormwater Management Criteria or another construction storm water runoff control program.	February 1, 1995
2. Household Hazardous Waste	a. Provide summary of evaluation and assessment of results from various collection/recycling/safe disposal program options, including those currently underway, to determine the most applicable program for long term use which meets criteria specified in b. below.	July 1, 1996
	b. Develop collection/recycling/safe disposal program which includes periodic collection events and should ensure a publicly available drop off location(s) that provides for occasional long weekday hours, or weekend operations.	August 1, 1996
	c. Implement collection/recycling/safe disposal program.	August 1, 1997

R0061784

4863

VOL 76

STORM WATER MANAGEMENT PROGRAM COMPONENT	ACTIVITY	DATE DUE/FREQUENCY
3. Floatables	a. Implement public education program.	January 1, 1995
	b. Install two floatables monitoring locations.	May 1, 1995
	c. Complete study for targeting of structural controls and develop schedule for implementation.	May 1, 1996
4. Illicit Discharges and Improper Disposal	a. Implement public education program.	January 1, 1995
	b. Complete dry weather screening of 20% of MS4.	June 1, 1995
	c. Complete dry weather screening of 40% (cumulative) of MS4	June 1, 1996
	d. Complete dry weather screening of 60% (cumulative) of MS4	June 1, 1997
	e. Complete dry weather screening of 80% (cumulative) of MS4	June 1, 1998
	f. Complete dry weather screening of 100% (cumulative) of MS4	June 1, 1999
5. Legal Authority	a. Adopt comprehensive Storm Water Ordinance	July 1, 1996
6. Wet Weather Screening Program	a. Update SWMP to include wet weather screening program.	July 1, 1995
	b. Complete wet weather screening of 50% of MS4.	July 1, 1997
	c. Complete wet weather screening of 100% (cumulative) of MS4.	July 1, 1999

R0061785

5863

VOL 76

STORM WATER MANAGEMENT PROGRAM COMPONENT	ACTIVITY	DATE DUE/FREQUENCY
7. Flood Control Projects	a. Complete evaluation of existing flood control structures for feasible water quality retrofit projects.	October 1, 1998
	b. Complete schedule for proposed water quality retrofits to existing flood control structures.	November 1, 1998
8. Industrial and High Risk	a. Develop program to identify, monitor, and control pollutants from targeted facilities	July 1, 1995
	b. Implement program	July 1, 1996
9. Pesticide, Herbicide, and Fertilizer Application	a. Implement annual training/education on pesticide and fertilizer management techniques.	January 1, 1995
	b. Establish requirement for commercial pesticide applicators to be licensed under the Oklahoma Pesticide Applicators Law.	April 1, 1995

R0061786

VOL 76

B. Compliance with effluent limitations. Reserved.

C. Reporting compliance with schedules. No later than 14 days following a date for a specific action (interim milestone or final deadline) identified in the above schedule(s), the permittee(s) shall submit a written notice of compliance or noncompliance to the Director in accordance with Parts V.E.

D. Updating Storm Water Management Program. The permittee(s) shall update the Storm Water Management Program(s), as appropriate, in response to changes required by Part III.A. Such updates shall be made in accordance with Part II.G.2.

VOL 16 0387

PART IV. DISCHARGE LIMITATIONS.

...RESERVED...

VOL 16 0388

R0061788

PART V. MONITORING AND REPORTING REQUIREMENTS.

A. Storm Event Discharges.

1. *Representative Monitoring:* Monitoring shall be conducted on representative outfalls, internal sampling stations, and/or instream monitoring locations to characterize the quality of storm water discharges from the Municipal Separate Storm Sewer System.

   a. Monitoring Requirements: Refer to Table(s) V.A.1.a(1).

   b. Outfall Descriptions: Refer to Table V.A.1.b.

   c. Alternate representative monitoring locations may be substituted for just cause during the term of the permit. Requests for approval of alternate monitoring locations shall be made to the Director in writing and include the rationale for the requested monitoring station relocation. Unless disapproved by the Director, use of an alternate monitoring location (except for outfalls with numeric effluent limitations) may commence 30 days from the date of the request. For outfalls where numeric effluent limitations have been established, the permit must be modified prior to substitution of alternate monitoring locations. Six samples shall be collected during the first year of monitoring at substitute outfalls.

VOL 16 0389

Table V.A.1.a.(1) - Representative Monitoring Requirements: Outfalls 001, 002, 003, 003, 004, & 005

PARAMETERS	REPORT FOR EACH MONITORING PERIOD (each sample type)			SAMPLE TYPE(S)		MONITORING FREQUENCY[1]
	Minimum	Average	Maximum	Grab	Composite

R0061792

2563 VOL 76

2. *Representative Monitoring - Rapid Bioassessment Option:* The permittee(s) has the option of developing and implementing a rapid bioassessment monitoring program.

   a. The permittee(s) shall obtain all necessary aquatic wildlife collection permits from appropriate State and/or Federal agencies (e.g. State Fish and Game Commission).

   b. Permittee(s) utilizing the rapid bioassessment monitoring option shall conduct monitoring of the separate storm sewer system as described in Part V.A.1., except the monitoring for years 2, 3, and 5 are no longer required. All other requirements of Part V.A.1., A.3., and A.4. (e.g.: samples types, parameters,...) remain unchanged.

   c. If the permittee(s) elects to develop and implement a rapid bioassessment monitoring program, the permittee(s) shall submit an approvable monitoring program to EPA no later than one year from the effective date of this permit. An approvable program must include:

      (1) monitoring of at least two waterbodies receiving storm water discharges from the municipal separate storm sewer system plus a reference site located within the same ecological region as the municipal separate storm sewer system;

      (2) monitoring of each station at least twice per year, with monitoring conducted at essentially the same time periods each year; and

      (3) concurrent (e.g. within a day or two) monitoring of the reference site each time a station located in the receiving waters of the municipal separate storm sewer system is monitored.

      Unless disapproved by the Director within 60 days, a proposed rapid bioassessment monitoring plan meeting the criteria herein shall be deemed approved and the permittee(s) may implement the alternate rapid bioassessment program.

   d. The permittee(s) shall notify the Director and State (addresses provided in Part V.E.), in writing, at least 14 days prior to commencing an alternate rapid bioassessment monitoring program.

3. *Storm Event Data:* For Part V.A.1. and any additional sampling conducted for Part V.A.6., quantitative data shall be collected to estimate pollutant loadings and event mean concentrations for each parameter sampled. Records shall be maintained of all analytical results, the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration (in hours) between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

4. *Sample Type, Collection, and Analysis:* The following requirements apply only to samples collected for Part V.A.1 and any additional sampling conducted for Part V.A.6.

VOL 16 0393

a. For discharges from holding ponds or other impoundments with a retention period greater than 24 hours, (estimated by dividing the volume of the detention pond by the estimated volume of water discharged during the 24 hours previous to the time that the sample is collected) a minimum of one grab sample may be taken.

b. Grab samples taken within the first two hours of discharge shall be used for the analysis (if required) of pH, temperature, cyanide, oil & grease, fecal coliform, fecal streptococcus, total phenols, residual chlorine, and (at the permittee's option) volatile organics. For all other parameters, data shall be reported for flow weighted composite samples of the entire event or, at a minimum, the first three hours of discharge.

c. Samples shall be collected from the discharge resulting from a representative storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Composite samples may be taken with a continuous sampler or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire discharge or for the first three hours of the discharge, with each aliquot being separated by a minimum period of fifteen minutes.

The required 72 hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge. The required 72 hour storm event interval may also be waived where the permittee(s) documents that less than a 72 hour interval is representative for local storm events during the season when sampling is being conducted.

d. Analysis and collection of samples shall be done in accordance the methods specified at 40 CFR Part 136. Where an approved Part 136 method does not exist, any available method may be used unless a particular method or criteria for method selection (such as sensitivity) has been specified in the permit.

5. *Seasonal Loadings and Event Mean Concentrations.* All necessary sampling data shall be collected to provide estimates for each major outfall of seasonal pollutant loadings and event mean concentrations for a representative storm event for the parameters listed in Table V.A.1.a.(1) - Representative Monitoring Requirements. This information may be estimated from the representative monitoring locations and shall take into consideration land uses and drainage areas for the outfall. The estimates of seasonal loadings and event mean concentrations shall be included in the Annual Report for year four of the permit.

B. <u>Floatables Monitoring.</u>

Shall establish two monitoring locations for removal of floatable material in discharges to or from the Municipal Separate Storm Sewer System. Floatable material shall be collected at the frequency necessary for maintenance of the removal devices, but not less that twice per year. The amount of material collected shall be estimated in cubic yards.

VOL 16 0394

C. Annual Report. Each permittee shall contribute to the preparation of an annual system-wide report to be submitted by no later than October 15, 1995, and annually thereafter by October 15th in accordance with this permit. The report shall cover the previous year from July 1 to June 30 (with first annual report period beginning on the effective date of the permit) and include the following separate sections, with an overview for the entire Municipal Separate Storm Sewer System and subsections for each permittee:

1. The status of implementing the storm water management program(s) (status of compliance with any schedules established under this permit shall be included in this section);

2. Proposed changes to the storm water management program(s) ;

3. Revisions, if necessary, to the assessments of controls and the fiscal analysis reported in the permit application under 40 CFR 122.26(d)(2)(iv) and (d)(2)(v);

4. A summary of the data, including monitoring data, that is accumulated throughout the reporting year;

5. Annual expenditures for the reporting period, with a breakdown for the major elements of the storm water management program, and the budget for the year following each annual report;

6. A summary describing the number and nature of enforcement actions, inspections, and public education programs; and

7. Identification of water quality improvements or degradation.

Preparation and submittal of a system-wide annual report shall be coordinated by the city of Tulsa. The report shall indicate which, if any, permittees have failed to provide required information on the portions of the Municipal Separate Storm Sewer System for which they are responsible to the core municipality by 45 days prior to the report due date. Joint responsibility for report submission shall be limited to participation in preparation of the overview for the entire system and inclusion of the identity of any permittee who failed to provide input to the annual report. Each individual permittee shall be individually responsible for content of the report relating to the portions of the Municipal Separate Storm Sewer System for which they are responsible and for failure to provide information for the system-wide annual report in a timely manner. Each permittee shall sign and certify the annual report in accordance with Part VI.H. and include a statement or resolution that the permittee's governing body or agency (or delegated representative) has reviewed or been appraised of the content of the Annual Report.

D. Certification and Signature of Reports. All reports required by the permit and other information requested by the Director shall be signed and certified in accordance with Part VI.H.

E. Reporting: Where and When to Submit.

1. Representative monitoring results (Part V.A.1) obtained during the reporting period running from July 1 to June 30 shall be submitted on Discharge Monitoring Report Form(s) no later than the due date for the annual report required by Part V.C.. The Discharge Monitoring Reports should be submitted along with the Annual Report. A separate Discharge Monitoring Report Form is required for each monitoring period (e.g. season) specified in Part V.A.1.

VOL 16 0395

2. Signed copies of discharge monitoring reports required under Part V., the Annual Report required by Part V.C., and all other reports required herein, shall be submitted to:

U.S. EPA, Region 6
Water Management Division
Enforcement Branch (6W-EA)
1445 Ross Avenue
Dallas, Texas 75202-2733

3. Requests for Storm Water Management Program updates, changes in monitoring locations, or application for an individual permit shall be submitted to:

U.S. EPA, Region 6
Water Management Division (6W-PM)
1445 Ross Avenue
Dallas, Texas 75202-2733

4. Additional Notification. In addition, the permittee(s) shall provide copies of discharge monitoring reports, annual reports, requests for Storm Water Management Program updates or changes in monitoring locations, and all other reports required herein, to:

Program Manager
Oklahoma Department of Environmental Quality
Water Quality Program
1000 N.E. 10th Street, WQS 0207
Oklahoma City, OK 73117-1212

VOL 16 0396

R0061796

PART VI. STANDARD PERMIT CONDITIONS.

A. Duty to Comply. The permittee(s) must comply with all conditions of this permit insofar as those conditions are applicable to each permittee, either individually or jointly. Any permit noncompliance constitutes a violation of the Act and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or for denial of a permit renewal application.

B. Penalties for Violations of Permit Conditions.

1. *Criminal Penalties.*

a. Negligent Violations: The Act provides that any person who negligently violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than 1 year, or both.

b. Knowing Violations: The Act provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

c. Knowing Endangerment: The Act provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than $250,000, or by imprisonment for not more than 15 years, or both.

d. False Statement: The Act provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than 2 years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or by both. (See Section 309(c)(4) of the Act).

2. *Civil Penalties.* The Act provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed $25,000 per day for each violation.

3. *Administrative Penalties.* The Act provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to an administrative penalty, as follows:

a. Class I penalty: Not to exceed $10,000 per violation nor shall the maximum amount exceed $25,000.

VOL 16 0397

b. Class II penalty: Not to exceed $10,000 per day for each day during which the violation continues nor shall the maximum amount exceed $125,000.

C. Duty to Reapply. If the permittee wishes to continue an activity regulated by this permit after the permit expiration date, the permittee must apply for and obtain a new permit. The application shall be submitted at least 180 days prior to expiration of this permit. The Director may grant permission to submit an application less than 180 days in advance but no later than the permit expiration date. Continuation of expiring permits shall be governed by regulations promulgated at 40 CFR 122.6 and any subsequent amendments.

D. Need to Halt or Reduce Activity Not a Defense. It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

E. Duty to Mitigate. The permittee(s) shall take all reasonable steps to minimize or prevent any discharge in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.

F. Duty to Provide Information. The permittee(s) shall furnish to the Director, within a time specified by the Director, any information which the Director may request to determine compliance with this permit. The permittee(s) shall also furnish to the Director upon request copies of records required to be kept by this permit.

G. Other Information. When the permittee becomes aware that he or she failed to submit any relevant facts or submitted incorrect information in any report to the Director, he or she shall promptly submit such facts or information.

H. Signatory Requirements. All Discharge Monitoring Reports, storm water management programs, reports, certifications or information either submitted to the Director or that this permit requires be maintained by the permittee(s), shall be signed by:

1. for a municipality, State, or other public agency: by either a principal executive officer or ranking elected official; or

2. a duly authorized representative of that person. A person is a duly authorized representative only if:

   a. The authorization is made in writing by a person described above and submitted to the Director.

   b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of manager, operator, superintendent, or position of equivalent responsibility or an individual or position having overall responsibility for environmental matters for the company. A duly authorized representative may thus be either a named individual or any individual occupying a named position.

   c. If an authorization is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new written authorization satisfying the requirements of this paragraph must be submitted to the Director prior to or together with

VOL 16 0398

any reports, information, or applications to be signed by an authorized representative.

3. Certification: Any person signing documents under this section shall make the following certification: "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

I. Penalties for Falsification of Monitoring Systems. The Act provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by fines and imprisonment described in Section 309 of the Act.

J. Oil and Hazardous Substance Liability. Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties to which the permittee is or may be subject under section 311 of the Act or section 106 of CERCLA.

K. Property Rights. The issuance of this permit does not convey any property rights of any sort, nor any exclusive privileges, nor does it authorize any injury to private property nor any invasion of personal rights, nor any infringement of Federal, State or local laws or regulations.

L. Severability. The provisions of this permit are severable, and if any provision of this permit, or the application of any provision of this permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this permit shall not be affected thereby.

M. Requiring a Separate Permit.

1. The Director may require any co-permittee authorized by this permit to obtain a separate NPDES permit. Any interested person may petition the Director to take action under this paragraph. The Director may require any co-permittee authorized to discharge under this permit to apply for a separate NPDES permit only if the co-permittee has been notified in writing that a permit application is required. This notice shall include a brief statement of the reasons for this decision, an application form (as necessary), a statement setting a deadline for the co-permittee to file the application, and a statement that on the effective date of the separate NPDES permit, coverage under this permit shall automatically terminate. Separate permit applications shall be submitted to the address shown in Part V.E. The Director may grant additional time to submit the application upon request of the applicant. If an owner or operator fails to submit in a timely manner a separate NPDES permit application as required by the Director, then the applicability of this permit to the co-permittee is automatically terminated at the end of the day specified for application submittal.

VOL 16 0399

2. Any co-permittee authorized by this permit may request to be excluded from the coverage of this permit by applying for an separate permit. The co-permittee shall submit a separate application as specified by 40 CFR 122.26(d) with reasons supporting the request to the Director. Separate permit applications shall be submitted to the address shown in Part V.E. The request may be granted by the issuance of a separate permit if the reasons cited by the co-permittee are adequate to support the request.

N. State/Environmental Laws.

1. Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable State law or regulation under authority preserved by section 510 of the Act.

2. No condition of this permit shall release the permittee from any responsibility or requirements under other environmental statutes or regulations.

O. Proper Operation and Maintenance. The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit and with the requirements of storm water management programs. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance requires the operation of backup or auxiliary facilities or similar systems, installed by a permittee only when necessary to achieve compliance with the conditions of the permit.

P. Monitoring and Records.

1. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

2. The permittee shall retain records of all monitoring information including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of the reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least 3 years from the date of the sample, measurement, report or application. This period may be extended by request of the Director at any time.

3. Records of monitoring information shall include:

a. The date, exact place, and time of sampling or measurements;

b. The initials or name(s) of the individual(s) who performed the sampling or measurements;

c. The date(s) analyses were performed;

d. The time(s) analyses were initiated;

e. The initials or name(s) of the individual(s) who performed the analyses;

f. References and written procedures, when available, for the

VOL 16 0400

analytical techniques or methods used; and

g. The results of such analyses, including the bench sheets, instrument readouts, computer disks or tapes, etc., used to determine these results.

Q. Monitoring Methods. Monitoring must be conducted according to test procedures approved under 40 CFR Part 136, unless other test procedures have been specified in this permit.

R. Inspection and Entry. The permittee shall allow the Director or an authorized representative of EPA, or the State, upon the presentation of credentials and other documents as may be required by law, to:

1. Enter the permittee's premises where a regulated facility or activity is located or conducted or where records must be kept under the conditions of this permit;

2. Have access to and copy at reasonable times, any records that must be kept under the conditions of this permit;

3. Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this permit; and

4. Sample or monitor at reasonable times, for the purposes of assuring permit compliance or as otherwise authorized by the Act, any substance or parameters at any location.

S. Permit Actions. This permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

T. Additional Monitoring by the permittee. If the permittee monitor more frequently than required by this permit, using test procedures approved under 40 CFR Part 136 or as specified in this permit, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the Discharge Monitoring Report (DMR). Such increased monitoring frequency shall also be indicated on the DMR.

VOL 16 0401

PART VII. PERMIT MODIFICATION.

A. Modification of the Permit. The permit may be reopened and modified during the life of the permit to address:

1. changes in the State's Water Quality Management Plan, including Water Quality Standards;

2. changes in State or Federal statutes or regulations;

3. add a new permittee who is the owner or operator of a portion of the Municipal Separate Storm Sewer System;

4. changes in portions of the Storm Water Management Program that are considered permit conditions; or

5. other modifications deemed necessary by the Director to meet the requirements of the Clean Water Act.

All modification to the permit will be made in accordance with 40 CFR 122.62, 122.63, and 124.5.

B. Termination of Coverage for a Single Permittee. Permit coverage may be terminated, in accordance with the provisions of 40 CFR 122.64 and 124.5, for a single permittee without terminating coverage for other permittees.

C. Modification of Storm Water Management Program(s). Only those portions of the Storm Water Management Programs specifically required as permit conditions shall be subject to the modification requirements of 40 CFR 124.5. Replacement of an ineffective or infeasible BMP implementing a required component of the Storm Water Management Program with an alternate BMP expected to achieve the goals of the original BMP shall be considered minor changes to the Storm Water Management Program (as described in Part II.G.2.b. and 2.c.) and not modifications to the permit.

D. Changes in Monitoring Outfalls. Changes in monitoring outfalls, other than those with specific numeric effluent limitations (as described in Part V.A.1.c.), shall be considered minor modifications to the permit and will be made in accordance with the procedures at 40 CFR 122.63.

VOL 16 0402

PART VIII. DEFINITIONS.

All definition contained in Section 502 of the Act shall apply to this permit and are incorporated herein by reference. Unless otherwise specified, additional definitions of words or phrases used in this permit are as follows:

A. "Best Management Practices" ("BMPs") means schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures, and practices to control facility site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

B. "CWA" or "The Act" means Clean Water Act (formerly referred to as the Federal Water Pollution Control Act or Federal Water Pollution Control Act Amendments of 1972) Pub.L. 92-500, as amended Pub. L. 95-217, Pub. L. 95-576, Pub. L. 96-483 and Pub. L. 97-117, 33 U.S.C. 1251 et.seq.

C. "Co-permittee" is defined at 40 CFR 122.26(b)(1).

D. "Core Municipality" means, for the purpose of this permit, the municipality whose corporate boundary (unincorporated area for counties and parishes) defines the municipal separate storm sewer system. (ex. City of Dallas for the Dallas Municipal Separate Storm Sewer System, Harris County for unincorporated Harris County).

E. "Director" means the Regional Administrator or an authorized representative.

F. "Discharge" for the purpose of this permit, unless indicated otherwise, refers to discharges from the Municipal Separate Storm Sewer System (Municipal Separate Storm Sewer System).

G. "Flow-weighted composite sample" means a composite sample consisting of a mixture of aliquots collected at a constant time interval, where the volume of each aliquot is proportional to the flow rate of the discharge.

H. "Illicit connection" means any man-made conveyance connecting an illicit discharge directly to a municipal separate storm sewer.

I. "Illicit discharge" is defined at 40 CFR 122.26(b)(2).

J. "Individual Residence" refers, for the purposes of this permit, to single or multi-family residences. (e.g. single family homes and duplexes, townhomes, apartments, etc.)

K. "Landfill" means an area of land or an excavation in which wastes are placed for permanent disposal, and which is not a land application unit, surface impoundment, injection well, or waste pile.

L. "Land application unit" means an area where wastes are applied onto or incorporated into the soil surface (excluding manure spreading operations) for treatment or disposal.

M. "Large or medium municipal separate storm sewer system" is defined at 40 CFR 122.26(b)(4) & (7).

N. "MEP" is an acronym for "Maximum Extent Practicable," the technology-based discharge standard for Municipal Separate Storm Sewer Systems established by CWA §402(p).

O. "MS4" is an acronym for "Municipal Separate Storm Sewer System" and is

VOL 16 0403

used to refer to either a Large or Medium Municipal Separate Storm Sewer System (e.g. "the Dallas MS4").

P. "Municipal Separate Storm Sewer" is defined at 40 CFR 122.26(b)(8).

Q. "Part '#'" refers, unless otherwise indicated, to Part "#" of this permit (e.g. Part V.E.2.).

R. "Permittee" refers to any "person," as defined at 40 CFR 122.2, authorized by this NPDES permit to discharge to Waters of the United States.

S. "Point Source" means any discernible, confined, and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharges. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

T. "Storm sewer", unless otherwise indicated, refers to a municipal separate storm sewer.

U. "Storm Water" means storm water runoff, snow melt runoff, and surface runoff and drainage.

V. "Storm Water Discharge Associated with Industrial Activity" is defined at 40 CFR 122.26(b)(14).

W. "Storm Water Management Program" refers to a comprehensive program to manage the quality of storm water discharged from the municipal separate storm sewer system. For the purposes of this permit, the Storm Water Management Program is considered a single document, but may actually consist of separate programs (e.g. "chapters") for each permittee.

X. "SWMP" is an acronym for "Storm Water Management Program."

Y. "Time-weighted composite" means a composite sample consisting of a mixture of equal volume aliquots collected at a constant time interval.

Z. "Waters of the United States" is defined at 40 CFR 122.2.

Anchorage, AK 99503

Re: NPDES Permit No. AKS052428
Port of Anchorage NPDES Municipal Storm Water Permit

Dear Ms. Adair:

A National Pollutant Discharge Elimination System (NPDES) permit has been issued to the referenced facility. Enclosed is a copy of the transmittal letter, permit, and list of changes made from the draft to the final permit.

There were no significant comments received during the public notice period. The permit will be effective 30 days after the issuance unless a request for evidentiary hearing is received.

Sincerely,

Charles E. Findley
Director, Water Division

Anchorage, Alaska 99501

Re: NPDES Permit No. AKS052426
Port of Anchorage NPDES Municipal Storm Water Permit

Dear Mr. Dietz:

We are issuing the above referenced National Pollutant Discharge Elimination System (NPDES) permit. The enclosed document is your official copy of the permit and demonstrates that the referenced facility is authorized to discharge to waters of the United States subject to certain specified requirements. Stipulations of the state's water quality certification and Coastal Management Program consistency determination have been incorporated into the permit. More specifically, the stipulations revising the monitoring conditions are in Part IV of the permit.

There were no significant comments received during the public notice period. This permit will become effective 30 days after the issuance date unless a request for an evidentiary hearing which meets the requirements of 40 CFR 124.74 is received. A copy of these requirements is enclosed for your information.

Sincerely,

Charles E. Findley
Director, Water Division

CHANGES TO DRAFT PERMIT

The following changes to the draft permit have been made for this final permit:

1) The Port of Anchorage commented that the outfall previously labelled 001, Transit Area A, was discovered by its consulting engineers to no longer exist, and asked that it be deleted from the application.

   EPA has deleted this outfall and re-numbered the remaining three outfalls as 001, 002, and 003 (see Table V.A.1.b).

2) Special requirements stipulated as part of the State of Alaska water quality certification are contained in Part IV of the permit. These special requirements include changes in monitoring, analytical test methods, and reporting requirements. Specifically:

   - The monitoring parameter "Total Aqueous Hydrocarbons" has been substituted for the parameter "Oil and Grease" found in Part II.B.9.b.

   - The analytical test methods EPA 602 and EPA 610 will be used to determine the presence of "Total Aqueous Hydrocarbons".

   - Copies of all documents, reports, and requests, required in the permit will be sent to the state offices as stipulated.

   In addition, the following changes to the permit have been made pursuant to the water quality stipulations and comments from the State:

   - Part II.A.1 has been expanded to include a statement on emphasizing source reduction techniques as a means to reduce the discharge of pollutants.

   - In Part II.B.4 the permittee is now directed to operate and maintain parking and cargo storage/staging areas in a manner to reduce, to the Maximum Extent Practicable, discharge of pollutants.

   - In Part II.B.11 the following was added as paragraph (d): a program to promote, publicize and facilitate implementation of technologies and techniques to prevent pollution through source reduction and recycling.

   - In Part II.B.7.b the items numbered 8, 12, and 13 now specify that the water be uncontaminated as found in #6.

   - The term "co-permittees" in Part II.C has been deleted.

VOL 16

0407

- In Part II.C.1 the term "port vehicles" has been clarified to mean those vehicles owned or operated by The Port.

- The citation in Part H.1 has been changed to correctly read Part II.I.

- The phrase "at the permittees option" in Part V.A.4.b has been deleted.

- The reference in Part V.B.1 has been changed to correctly read Part III.A.

AUTHORIZATION TO DISCHARGE UNDER THE

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

In compliance with the provisions of the Clean Water Act, 33 U.S.C. §1251 et seq., as amended by the Water Quality Act of 1987, P.L. 100-4, the "Act",

Port of Anchorage

is authorized to discharge from a Municipal Separate Storm Sewer System located at Port of Anchorage, 2000 Anchorage Port Road, Anchorage, Alaska,

to receiving waters named Cook Inlet,

in accordance with discharge point(s), an approved storm water management plan, monitoring requirements, and other conditions set forth herein.

This permit shall become effective March 3, 1995.

This permit and the authorization to discharge shall expire at midnight, March 3, 2000.

Signed this 1st day of February, 1995.

Director, Water Division, Region 10
U.S. Environmental Protection Agency

VOL 16

0410

R0061810

PART I. DISCHARGES AUTHORIZED UNDER THIS PERMIT

A. **Permit Area**
This permit covers all areas within the jurisdictional boundary of the Port of Anchorage within the Municipality of Anchorage, Alaska, served by, or otherwise contributing to discharges from, municipal separate storm sewers (MS4s) owned or operated by the permittee listed in Part I.C.

B. **Authorized Discharges**
This permit authorizes all existing or new storm water point source discharges to waters of the United States from the MS4. This permit also authorizes the discharge of storm water commingled with flows contributed by process wastewater, non-process wastewater, or storm water associated with industrial activity provided such discharges are authorized under separate NPDES permits. This permit will consider any and all activities conducted by lessees of the Port of Anchorage while within the jurisdictional boundaries of the Port, and which activity leads to a discharge either to or from the MS4s for which this permit is written, to be the activity of the Port and subject to the conditions of this permit.

C. **Limitations on Coverage**
The following discharges are not authorized by this permit:

1. *Non-storm Water:* storm water discharges that are mixed with non-storm water or storm water associated with industrial activity except where such discharges are:

   a. in compliance with a separate NPDES permit; or

   b. identified by and in compliance with Part II.B.7 of this permit.

2. *Endangered Species Protection:* storm water discharges whose direct, indirect, interrelated, interconnected, or interdependent impacts would jeopardize a listed endangered or threatened species or adversely modify designated critical habitat.

3. *Historic Preservation:* storm water discharges, or the permittee construction activities or implementation of storm water management controls, which adversely effect properties listed or eligible for listing in the National Register of Historic Places, unless the permittee is in compliance with requirements of the National Historic Preservation Act and has coordinated any necessary activities to avoid or minimize impacts with the appropriate State Historic Preservation Officer; and

4. *Coastal Zone Management:* storm water discharges not in compliance with any applicable requirements of a State's Coastal Zone Management Plan.

VOL 16 0411

R0061811

PART II. STORM WATER POLLUTION PREVENTION & MANAGEMENT PROGRAMS

The permittee is required to develop and implement a storm water pollution prevention and management program designed to limit, to the maximum extent practicable, the discharge of pollutants from the MS4. Either collectively, or separately, the permittee's storm water pollution prevention and management program shall satisfy the requirements of paragraphs A through I, below for all portions of the MS4 authorized to discharge under this permit.

A. POLLUTION PREVENTION REQUIREMENTS

The permittee shall develop and implement the following pollution prevention measures:

1. The permittee shall include requirements to consider water quality impacts of new and significant re-development in its comprehensive master planning process. The goal of such requirements shall be limiting, to the maximum extent practicable, the discharge of pollutants to pre-development levels.

2. The permittee shall ensure the establishment or availability of a program to collect used motor vehicle fluids (including oil and antifreeze) and batteries for recycle or reuse. Such program shall be readily available to all lessees. This program shall be publicized and promoted on a regular basis, but at least anually.

3. The permittee shall ensure the establishment or availability of a program to collect commonly-used hazardous materials (including paint, pesticides, herbicides, cleaners, solvents, and similar hazardous materials) for recycle, reuse, or safe disposal. The program shall be readily available to all lessees and include information on locations accepting such materials on a continuous basis. This program shall be publicized and promoted on a regular basis, but at least anually.

4. The permittee shall ensure the establishment of a program, including structural controls where necessary, to reduce the discharge of floatables (including solid wastes) to the maximum extent practicable.

B. SWMP SYSTEM-WIDE REQUIREMENTS

The permittee shall operate a Storm Water Management Program (SWMP) in accordance with Section 402(p)(3)(B) of the Clean Water Act, the storm water regulations (40 CFR Part 122.26) and the approved SWMP plan to be submitted to EPA by the permittee. SWMP controls and activities identified in the SWMP plan shall clearly identify areas of applicability on a system-wide basis, jurisdiction-wide basis, or specific-area basis. The SWMP, and all approved updates, are hereby incorporated into this permit by reference and shall be implemented in a manner consistent with the following requirements:

VOL 16 0412

R0061812

1. *Statutory Requirements:* SWMPs shall include controls necessary to reduce the discharge of pollutants from the MS4 to the Maximum Extent Practicable (MEP). Controls may consist of a combination of best management practices, control techniques, system design and engineering methods, and such other provisions as the permittee, Administrator or the State determines appropriate. The various components of the SWMP, taken as a whole (rather than individually), shall be sufficient to meet the statutory MEP standard. The SWMP shall be updated as necessary to ensure conformance with the statutory requirements of Clean Water Act §402(p)(3)(B)(ii) and (iii).

2. *Structural Controls:* The permittee shall operate and maintain any storm water structural controls over which it has jurisdiction, in a manner so as to reduce the discharge of pollutants (including floatables) to the MEP.

3. *Areas of New Development:* The Port of Anchorage shall utilize a comprehensive master planning process to develop, implement, and enforce controls to reduce, to the MEP, the discharge of pollutants from areas of new development and significant redevelopment after construction is completed.

4. *Roadways:* The permittee shall operate and maintain public streets, roads, highways, parking areas, and cargo storage/staging areas under its jurisdiction in a manner so as to reduce, to the MEP, discharge of pollutants (including those related to deicing or sanding activities).

5. *Flood Control Projects:* The permittee shall ensure any flood control project it undertakes assesses and minimize to the MEP the impacts on water quality of the receiving waters. The permittee shall also evaluate the feasibility of retro-fitting existing structural flood control devices to provide additional pollutant removal from storm water. If retro-fitting is found to be feasible, the permittee shall implement the retro-fitting of existing structural devices within 3 years of such determination of feasibility.

6. *Pesticide, Herbicide, and Fertilizer Application:* The permittee shall implement controls to reduce, to the MEP, the discharge of pollutants related to application of pesticides, herbicides, and fertilizers applied by Port employees, contractors, or lessees to public right of ways, parks, and all port lands and facilities.

7. *Illicit Discharges and Improper Disposal:* The permittee shall implement an ongoing program to detect and eliminate illicit discharges and improper disposal into the storm sewer. The permittee may chose to require the discharger to the MS4 to eliminate the illicit discharges or obtain a separate NPDES permit for such discharges.

VOL 16 0413

R0061813

a. The permittee shall effectively prohibit non-storm water discharges to the MS4.

b. Unless identified by either the permittee, the Administrator, or the State as significant sources of pollutants to waters of the United States, the following non-storm water discharges need not be prohibited from entering the MS4, provided the necessity of such discharge(s) and appropriate control measures (if needed) to minimize the impacts of such sources, are developed under the SWMP:

(1) water line flushing;
(2) landscape irrigation;
(3) diverted stream flows;
(4) rising ground waters;
(5) uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)) to separate storm sewers;
(6) uncontaminated pumped ground water;
(7) discharges from potable water sources;
(8) uncontaminated foundation drains;
(9) air conditioning condensate;
(10) irrigation water;
(11) springs;
(12) uncontaminated water from crawl space pumps;
(13) uncontaminated footing drains;
(14) lawn watering;
(15) individual residential car washing;
(16) flows from riparian habitats and wetlands;
(17) dechlorinated swimming pool discharges;
(18) street wash waters;
(19) NPDES permitted non-contact cooling waters and remediated ground waters, provided appropriate management practices are implemented and the discharges are in accordance with the Municipality's storm water management program; and,
(20) discharges or flows from emergency fire fighting activities.

c. The permittee shall prevent discharges of dry and wet weather overflows from sanitary sewers into the MS4. The permittee shall limit, to the maximum extent practicable, the infiltration of seepage from sanitary sewers into the MS4.

d. The permittee shall prohibit the discharge or disposal of all motor vehicle fluids and chemical wastes into separate storm sewers.

e. The permittee shall require the elimination of illicit connections as expeditiously as possible and the immediate cessation of improper disposal practices upon identification of responsible parties. Where elimination of an illicit connection within seven (7) days is not possible, the Port of Anchorage shall require an expeditious

R0061814

VOL 16 0414

schedule for elimination of the discharge. In the interim, the Port of Anchorage shall require the operator of the illicit connection to take all reasonable and prudent measures to minimize the discharge of pollutants to the MS4. Elimination schedules should not exceed ninety (90) days, except for capital intensive projects which shall not exceed 455 days (one year ninety days).

8. *Spill Prevention and Response:* The permittee shall implement a program to prevent, contain, and respond to spills that may discharge into the MS4. The spill response program may include a combination of spill response actions by the permittee and its lessees.

9. *Industrial & High Risk Runoff:* The permittee shall implement a program to identify, monitor, and control pollutants in storm water discharges to the MS4 from: hazardous waste treatment, storage and disposal facilities that are subject to EPCRA Title III, Section 313; bulk storage facilities; and, any other industrial or commercial discharges the permittee determines are contributing a substantial pollutant loading to the MS4. The program shall include:

   a. priorities and procedures for inspections and establishing and implementing control measures for such discharges;

   b. a monitoring (or self-monitoring) program for facilities identified under this section, including the collection of quantitative data on the following constituents:

      (1) any pollutants limited in an existing NPDES permit for an identified facility;
      (2) oil and grease;
      (3) chemical oxygen demand (COD);
      (4) pH;
      (5) biochemical oxygen demand, five-day (BOD_5);
      (6) total suspended solids (TSS);
      (7) total phosphorous;
      (8) total Kjeldahl nitrogen (TKN);
      (9) nitrate plus nitrite nitrogen; and
      (10) any of the metals cadmium, copper, lead, and zinc which can be reasonably expected in storm water runoff from such industrial site; and,
      (11) any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).

10. *Construction Site Runoff:* The permittee shall implement a program to reduce, to the MEP, the discharge of pollutants from constructions sites, including:

   a. requirements for the use and maintenance of appropriate structural and nonstructural best management practices to reduce pollutants

VOL 16 0415

R0061815

discharged to the MS4 upon commencement of, and during, the construction activities;

b. procedures for site planning which incorporate considerations for potential short and long term water quality impacts and minimizes, to the MEP, these impacts;

c. prioritized inspection of construction sites and enforcement of SWMP-required control measures;

d. appropriate education and training measures for construction site operators; and,

e. notification of all construction permit applicants of their potential responsibilities under the NPDES permitting program for construction site runoff.

11. *Public Education:* The permittee shall implement a public education program including:

a. a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or improper disposal of materials into the MS4;

b. a program to promote, publicize, and facilitate the proper management and disposal of used oil and commonly-used hazardous materials.

c. a program to promote, publicize, and facilitate the proper use, application, and disposal of pesticides, herbicides, and fertilizers by commercial and private applicators and distributors conducting such business within the Port of Anchorage jusrisdictional area.

C. <u>AREA-SPECIFIC STORM WATER MANAGEMENT PROGRAM REQUIREMENTS</u>
The following SWMP requirements apply only to the areas or discharges specified below. Management practices must also be developed in the SWMP for the following:

1. The Port of Anchorage (The Port) will provide an area for the washing of Port vehicles (that is, vehicles owned or operated by The Port) that will not result in the discharge of wash waters. The Port will encourage the use of detergent-free methods of vehicle washing and will require regular maintenance of the area to ensure wash waters, and resulting contaminants, will not be transported by storm water to waters of the U.S. This area is not required to be within Port jurisdictional boundaries, and does not have to be operated by the Port or Port personnel.

2. The Port may provide this area to its tenants solely for the purpose of vehicle washing. In such case, The Port accepts the responsibilty of proper operation and

VOL 16 0416

R0061816

maintenance of this area, and will ensure proper management practices are adhered to at all times.

3. All vehicle and equipment maintenance areas will be managed so as to control discharges from these areas to the maximum extent practicable. All hydrocarbon compounds used in these areas will be handled in a manner that will eliminate or minimize potential discharges to waters of the U.S.

D. DEADLINES FOR PROGRAM COMPLIANCE

1. Except as provided in PART III, compliance with the storm water management program shall be required within 120 days of the effective date of this permit.

2. Proposed modifications and updates to the SWMP, along with proposed schedules for implementation, shall be submitted with the Annual Report required under Part II.G. to EPA.

E. ROLES AND RESPONSIBILITIES OF PERMITTEE AND LESSEES

The SWMP plan shall clearly identify the roles and responsibilities of the permittee. Activities required of the lessees by the permittee must also be clearly identified.

F. LEGAL AUTHORITY

The permittee shall ensure legal authority exists to control discharges to and from those portions of the MS4 over which it has jurisdiction. This legal authority may be a combination of statute, ordinance, permit, contract, order or inter-jurisdictional agreements with entities having existing legal authority to:

1. Control the contribution of pollutants to the MS4 by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity;

2. Prohibit illicit discharges to the municipal separate storm sewer;

3. Control the discharge of spills and the dumping or disposal of materials other than storm water into the MS4;

4. Control through interagency agreements among co-permittees the contribution of pollutants from one portion of the MS4 to another;

5. Require compliance with conditions in ordinances, permits, contracts or orders; and,

6. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance with permit conditions.

VOL 16 0417

R0061817

G. **SWMP RESOURCES**
The permittee shall provide adequate finances, staff, equipment, and support capabilities to fully implement the storm water management program.

H. **SWMP REVIEW AND MODIFICATION**

1. *Program Review:* The permittee shall conduct an annual review of the current SWMP in conjunction with preparation of the annual system-wide report required under Part II.I. This annual review shall include:

   a. A review of the status of program implementation and compliance (or non-compliance) with all schedules of compliance contained in this permit;

   b. An assessment of the effectiveness of controls established by the SWMP;

   c. A review of monitoring data and any trends in estimated cumulative annual pollutant loadings; and,

   d. An assessment of any SWMP modifications needed to comply with the CWA §402(p)(3)(B)(iii) requirement to reduce the discharge of pollutants to the MEP.

2. *Program Modification:* The approved SWMP, and its plan, shall not be modified by the permittee without the prior approval of the EPA, unless in accordance with items a. through c. below:

   a. Modifications adding (but not subtracting or replacing) components, controls, or requirements to the approved SWMP may be made by the permittee at any time upon written notification to the permitting authority.

   b. Modifications replacing a failing Best Management Practice (BMP) identified in the SWMP with an alternate BMP may be requested in conjunction with the annual system-wide report required by Part II.I. below. Such requests must: 1) be made in writing; 2) provide an analysis of why the BMP is failing or ineffective (including cost prohibitive); 3) discuss the expectations of the effectiveness of the replacement BMP; and, 4) explain why the replacement BMP is expected to provide at least the same level of performance as originally expected of the BMP to be replaced.

   c. Modifications made under this paragraph shall not become enforceable permit conditions until such time as the modifications are approved by EPA.

Modification requests and/or notifications shall be signed in accordance with Part VI.H.

VOL 16 0418

R0061818

3. *Modifications Required by the Permitting Authority:* The EPA may require the permittee to modify the SWMP as needed to:

   a. Address contributions by the MS4 discharges to impacts on receiving water quality;

   b. Include more stringent requirements necessary to comply with new State or Federal statutory or regulatory requirements; or,

   c. Include such other conditions deemed necessary by the Administrator to comply with the goals and requirements of the Clean Water Act.

   Modifications requested by the Administrator shall be made in writing, set forth the time schedule for the permittee to develop the modification(s), and offer the permittee the opportunity to propose alternative program modifications to meet the objective of the requested modification.

I. **SYSTEM-WIDE REPORT**

The permittee shall prepare and submit a system-wide report no later than one year after the anniversary of the effective date of this permit (March 3, 1995), and continue to submit an updated system-wide report every year thereafter. The report shall include the following separate sections and an overview for the entire MS4:

1. The status of implementing the components of the SWMPs that are established as permit conditions (status of compliance with any schedules established under this permit shall be included in this section);

2. Proposed changes to the SWMPs that are established as permit conditions, including an update on areas added to the MS4 due to annexation or other legal means;

3. Revisions, if necessary, to the assessments of controls and management practices;

4. A summary of the data, including monitoring data, that is accumulated throughout the last reporting year;

5. Annual expenditures for the reporting period (i.e., the last year), and projected budget for the one year period comprising the next system-wide report;

6. A summary describing the number and nature of compliance actions, inspections, and public education programs; and,

7. Identification of water quality improvements or degradation, with a discussion of those management practices implemented or proposed for implementation to address identified water quality degradation.

VOL 16 0419

R0061819

PART III. SCHEDULES FOR COMPLIANCE

A. IMPLEMENTATION OF POLLUTION PREVENTION MEASURES

POLLUTION PREVENTION MEASURE	ACTIVITY DESCRIPTION	DATE DUE
Part II.A.1 - New Development & Re-Development	Implement construction-phase storm water runoff control program.	March 4, 1996
	Modify land use planning process within Port to require controls for storm water quality.	March 3, 1998
	Implement requirements for post-construction storm water quality controls for new and significant re-development.	July 30, 1998
Part II.A.2 - Vehicle Fluids	Implement public education program.	July 30, 1995
	Develop collection/recycling/safe disposal program.	March 4, 1996
	Implement collection/recycling/safe disposal program.	March 3, 1997
Part II.A.3 - Common Hazardous Waste	Implement public education program.	July 30, 1995
	Develop collection/recycling/safe disposal program.	March 4, 1996
	Implement collection/recycling/safe disposal program.	March 3, 1997
Part II.A.4 - Floatables	Implement public education program.	July 30, 1995
	Implement litter control program.	July 30, 1995
	Install floatables monitoring location (See Part V.A.2)	July 30, 1995
	Complete study for targeting of structural controls.	July 30, 1996
	Complete installation of structural controls on 100% of targeted storm sewer.	July 30, 1997

R0061820

VOL 16 0420

B. IMPLEMENTATION OF STORM WATER MANAGEMENT PLANS

SWMP ACTIVITY	ACTIVITY DESCRIPTION	DATE DUE
PART II.B - Storm Water Management Program (SWMP) plan development	Complete development of SWMP plan	June 5, 1995
Part II.B.7 - Illicit Discharges and Improper Disposal	Implement public education program.	July 30, 1995
	Complete screening of the MS4.	July 30, 1996
	Complete follow up investigations based on screening results.	July 30, 1999
Part II.I - System-wide Report	Episodic system and implementation status report	Annually: March 3

VOL 16

0421

R0061821

PART IV. SPECIAL PERMIT REQUIREMENTS

The following requirements are included in this permit as stipulations of water quality certification from the Alaska Department of Environmental Conservation (ADEC).

A. MONITORING

1. In Part II.B.9.b the parameter "Total Aqueous Hydrocarbons" will be substituted for the parameter "Oil and Grease" on the list of parameters to be monitored.

   The parameter "Total Aqueous Hydrocarbons" (TAqH) means those collective dissolved and water-accomodated monoaromatic and polynuclear aromatic petroleum hydrocarbons that are persistent in the water column; TAqH does not include floating surface oils and greases. TAqH is calculated by summing the values of the parameters Total Aromatic Hydrocarbons (TAH) and Total Polynuclear Hydrocarbons (PAH). The parameters TAqH, TAH, and PAH are all defined in the Adopted Draft Water Quality Standards, 18 AAC 70.020(b) Note #8, dated 9/13/94. The test methods to be used to determine the presence of these parameters are the EPA 602 method for TAH and the EPA 610 method for PAH. Equivalent methods may be substituted for EPA 610 that meet the performance standards, Minimum Detection Limits (MDLs), precision, and standard recoveries specified in method 610. The applicable criteria are contained in Note #8 (cited above).

2. Table V.A.1.a (Monitoring Frequency) shall be modified as follows:

   a) The monitoring frequency and the parameters listed for monitoring in years 2 and 3 shall be identical to that listed for year 4, such that the full list of parameters will be sampled in years 2, 3, and 4 at the frequency listed under YEAR 4.

   b) The parameter "Total Aqueous Hydrocarbons" will be substituted in the table for the parameter "Oil and Grease" (as discussed above).

   c) Delete "Other Water Quality Parameters" from the table.

VOL 16 0422

R0061822

B. **MISCELLANEOUS**

1. Copies of all reports required in the permit will be sent to the following ADEC offices:

   Alaska Department of Environmental Conservation
   Southcentral Regional Office
   3601 C Street, Suite 1334
   Anchorage, AK 99503
   (907) 563-6529

   Alaska Department of Environmental Conservation
   Anchorage Western District Office
   800 E. Dimond Blvd. #3-470
   Anchorage, Alaska 99515
   (907) 349-7755

2. In Part II.A.1., add the following statement: The permittee shall emphasize source reduction techniques as a means to reduce the discharge of pollutants. The permittee shall inform the lessees of the availability, through ADEC, of pollution prevention resources, technical assistance programs and other non-regulatory initiatives that will support the overall objective of eliminating the discharge of pollutants.

3. In Part II.B.11., add the following as paragraph (d): a program to promote, publicize and facilitate implementation of technologies and techniques to prevent pollution through source reduction and recycling.

VOL 16 0423

R0061823

PART V. MONITORING AND REPORTING REQUIREMENTS

A. Storm Event Monitoring

The permittee shall implement a wet-weather monitoring program for the MS4 to provide data necessary to: 1) assess the effectiveness and adequacy of control measures implemented under the SWMP; 2) estimate annual cumulative pollutant loadings from the MS4; 3) estimate event mean concentrations and seasonal pollutants in discharges from major outfalls; 4) identify and prioritize portions of the MS4 requiring additional controls; and, 5) identify water quality improvements or degradation.

1. *Representative Monitoring:*
The permittee shall monitor representative outfalls and/or instream monitoring locations to characterize the quality of storm water discharges from the MS4.

   a. Monitoring Requirements: (See Table V.A.1.a).

   b. Outfall Descriptions: (See Table V.A.1.b)

2. *Wet Weather Screening Program:*
The permittee shall implement a program to screen all areas contibuting storm water to the MS4 for the presence of excessive pollutants in discharges from the MS4. The wet weather screening program:

   a. Shall screen the entire MS4 at least once during the permit term.

   b. Shall specify the sampling and non-sampling techniques, parameters, collection techniques, and analytical methods to be used for initial screening purposes. For screening samples only, sample collection and analysis need not conform to the requirements of 40 CFR Part 136 and are not subject to the requirements of Paragraphs 3, 4, and 5 below.

VOL 16 0424

R0061824

Table V.A.1.a. - Monitoring Requirements for Outfalls 001, 002, and 003[1]

PARAMETER	MONITORING FREQUENCY				
	YEAR 1	YEAR 2	YEAR 3	YEAR 4	YEAR 5
Biochemical Oxygen Demand (BOD_5) (mg/l)	Once/year	Once/year	Once/year	Once/year	Once/year
Chemical Oxygen Demand (COD) (mg/l)	Once/year	Once/year	Once/year	Once/year	Once/year
Total Suspended Solids (TSS) (mg/l)	Once/year	Once/year	Once/year	Once/year	Once/year
Total Dissolved Solids (TDS) (mg/l)	Once/year	Once/year	Once/year	Once/year	Once/year
Total Nitrogen (mg/l)	Once/year	Once/year	Once/year	Once/year	Once/year
Total Kjeldahl Nitrogen (TKN) (mg/l)	Once/year	Once/year	Once/year	Once/year	Once/year
Total Phosphorus (mg/l)	---------	---------	---------	Once/year	---------
Dissolved Phosphorus (mg/l)	---------	---------	---------	Once/year	---------
Oil & Grease (mg/l)	Twice/year	Twice/year	Twice/year	Twice/year	Twice/year
Total Cadmium (ug/l)	---------	---------	---------	Once/year	---------
Total Copper (ug/l)	---------	Once/year	---------	Once/year	---------
Total Lead (ug/l)	---------	---------	---------	Once/year	---------
Total Zinc (ug/l)	---------	Once/year	---------	Once/year	---------
Ph (S.U.)	Twice/year	Twice/year	Twice/year	Twice/year	Twice/year
Hardness (as $CaCO_3$) (mg/l)	---------	---------	---------	Once/year	---------
Temperature (°C)	Twice/year	Twice/year	Twice/year	Twice/year	Twice/year

[1] This table represents the baseline monitoring requirements for the discharges and outfalls described in this permit. Some specific parameters and monitoring frequencies have have been modified pursuant to the special requirements as discussed in Part IV of this permit.

R0061825

5245 VOL 76

Table V.A.1.b - Representative Monitoring Outfall Descriptions

OUTFALL	LOCATION	DESCRIPTION
001	Transit Area B	Storm water drain for Transit Area B. This area is 52.0 total acres with 16.2 acres of impervious surface.
002	Transit Area D and Transit Area A	Storm water drain for Transit Area D and a portion of Transit Area A. Transit Area D is 43.4 total acres and has 7.8 acres of impervious surface. This portion of Transit Area A has 55 total acres with 15 acres covered by impervious surface. The total acreage of impervious surface draining to outfall 002 is 22.8 acres.
003	Transit Area 12-B	Storm water drain for Transit Area 12-B. Area 12-B is 36.7 total acres with 16.8 acres of impervious surface.

VOL 16 0426

R0061826

c. Shall establish three monitoring locations for removal of floatable material in discharges from the MS4. The amount of material collected shall be estimated in cubic yards. Floatable material shall be measured periodically as necessary for maintenance of the removal device.

d. Shall submit, along with the system-wide report required by Part II.I, the following information:

(1) An estimate of the amount of floatable material collected (cubic yards);

(2) A summary of results and actions taken or proposed based on the results of the wet weather screening program.

e. Any monitoring location that collects an annual average of less than 3 cubic yards of floatables over any consecutive 3 calendar-year period during the permit term will no longer be considered a mandatory monitoring location. The Port must maintain at least one monitoring location for floatables regardless of the amount of floatables collected.

3. *Storm Event Data:*
Quantitative data shall be collected to estimate pollutant loadings and event mean concentrations for each parameter sampled. In addition to the parameters listed above, The Port shall maintain records on site of the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

4. *Sample Type, Collection, and Analysis:*
a. For discharges from storm water holding ponds or other storm water impoundments with a retention period greater than 24 hours, (estimated by dividing the volume of the detention pond by the estimated volume of water discharged during the 24 hours previous to the time that the sample is collected) a minimum of one grab sample may be taken.

b. Grab samples taken during the first two hours of discharge shall be used for the analysis (if required) of pH, temperature, cyanide, oil & grease, fecal coliform, fecal streptococcus, total phenols, residual chlorine, and volatile organics. For all other parameters, data shall be reported

VOL 16 0427

R0061827

for flow weighted composite samples of the entire event or, at a minimum, the first three hours of discharge.

c. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Composite samples may be taken with a continuous sampler or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire discharge or for the first three hours of the discharge, with each aliquot being separated by a minimum period of fifteen minutes.

d. Analysis and collection of samples shall be done in accordance the methods specified at 40 CFR Part 136. Where an approved Part 136 method does not exist, any available method may be used.

5. *Sampling Waiver:*
When a discharger is unable to collect samples due to adverse climatic conditions, the discharger must submit in lieu of sampling data a description of why samples could not be collected, including available documentation of the event. Adverse climatic conditions which may prohibit the collection of samples includes weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.). Dischargers are precluded from exercising this waiver more than once during a two year period.

B. **Dry Weather Monitoring**

1. *Dry Weather Screening Program:*
The permittee shall continue ongoing efforts to detect the presence of illicit connections and improper discharges to the MS4. All portions (but not necessarily all outfalls) of the MS4 must be screened at least once during the permit term, in accordance with the schedule set forth in PART III.A.

2. *Screening Procedures:*
Screening methodology may be developed and/or modified based on experience gained during actual field screening activities and need not conform to the protocol at 40 CFR 122.26(d)(1)(iv)(D).

3. *Follow-up on Dry Weather Screening Results:*
The permittee shall implement a program to locate and

VOL 16 0428
R0061828

eliminate suspected sources of illicit connections and improper disposal identified during dry weather screening activities. Follow-up activities may be prioritized on the basis of:

a. magnitude and nature of the suspected discharge;

b. sensitivity of the receiving water; and

c. other relevant factors.

C. Certification and Signature of Reports

1. All reports required by the permit and other information requested by the Director shall be signed and certified in accordance with Parts VII.H. & VII.I. of the permit.

D. Reporting: Where to Submit

1. Monitoring results obtained during each anual reporting period shall be submitted on Discharge Monitoring Report Form(s) and included with the annual system-wide reprt. A separate Discharge Monitoring Report Form is required for each event monitored. The first report may include less than twelve months of information.

2. Signed copies of discharge monitoring reports required under Part V., the System-Wide Report required by Part II.G., SWMP modifications and modification requests, requests for changes in monitoring outfalls and all other reports required herein, shall be submitted to:

U.S. EPA, Region 10
Wastewater Management and Enforcement Branch
Municipal Storm Water Permits (WD-135)
1200 Sixth Avenue
Seattle, Washington 98101

E. Additional Notification

1. Copies of the discharge monitoring reports required under Part V., the System-Wide Report required by Part II.G., and other reports requested by the State shall be submitted to:

Alaska Department of Environmental Conservation
Southcentral Regional Office
3601 C Street, Suite 1334
Anchorage, AK 99503
(907) 563-6529

VOL 16 0429

R0061829

Alaska Department of Environmental Conservation
Anchorage Western District Office
800 E. Dimond Blvd. #3-470
Anchorage, Alaska 99515
(907) 349-7755

F. Retention of Records

1. The permittee shall retain at The Port the latest approved version of the storm water management program developed in accordance with Part II of this permit until at least three years after coverage under this permit terminates. The permittee shall retain at The Port all records of all monitoring information, copies of all reports required by this permit, and records of all other data required by or used to demonstrate compliance with this permit, until at least three years after coverage under this permit terminates. This period may be explicitly modified by alternative provisions of this permit or extended by request of the Director at any time.

VOL 16

0430

R0061830

PART VI. STANDARD PERMIT CONDITIONS

A. Duty to Comply

1. The permittee must comply with all conditions of this permit insofar as those conditions are applicable to each permittee, either individually or jointly. Any permit noncompliance constitutes a violation of CWA and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or for denial of a permit renewal application.

B. Penalties for Violations of Permit Conditions

1. Criminal

a. Negligent Violations The CWA provides that any person who negligently violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than 1 year, or both.

b. Knowing Violations The CWA provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

c. Knowing Endangerment The CWA provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than $250,000, or by imprisonment for not more than 15 year, or both.

d. False Statement The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than 2 years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4

VOL 16 0431

R0061831

years, or by both. (See Section 309(c)(4) of the Clean Water Act).

2. Civil Penalties - The CWA provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed $25,000 per day for each violation.

3. Administrative Penalties - The CWA provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to an administrative penalty, as follows:

   a. Class I penalty Not to exceed $10,000 per violation nor shall the maximum amount exceed $25,000.

   b. Class II penalty Not to exceed $10,000 per day for each day during which the violation continues nor shall the maximum amount exceed $125,000.

C. Duty to Reapply
If the permittee wishes to continue an activity regulated by this permit after the permit expiration date, the permittee(s) must apply for and obtain a new permit. The application shall be submitted at least 180 days prior to expiration of this permit. The Administrator may grant permission to submit an application less than 180 days in advance but no later than the permit expiration date. Continuation of expiring permits shall be governed by regulations promulgated at 40 CFR 122.6 and any subsequent amendments.

D. Need to halt or reduce activity not a defense
It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

E. Duty to Mitigate
The permittee shall take all reasonable steps to minimize or prevent any discharge in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.

F. Duty to Provide Information
The permittee shall furnish to the Administrator, within a time specified by the Director, any information which the

VOL 16 0432

R0061832

Administrator may request to determine compliance with this permit. The permittee shall also furnish to the Administrator upon request copies of records required to be kept by this permit.

G. Other Information
When the permittee becomes aware that he or she failed to submit any relevant facts or submitted incorrect information in any report to the Director, he or she shall promptly submit such facts or information.

H. Signatory Requirements
All Discharge Monitoring Reports, storm water pollution prevention plans, reports, certifications or information either submitted to the Administrator or that this permit requires be maintained by the permittee, shall be signed by:

1. either a principal executive officer or ranking elected official.

2. a duly authorized representative of that person. A person is a duly authorized representative only if:

   a. The authorization is made in writing by a person described above and submitted to the Director.

   b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of manager, operator, superintendent, or position of equivalent responsibility or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position).

   c. If an authorization is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new notice of intent satisfying the requirements of this paragraph must be submitted to the Director prior to or together with any reports, information, or applications to be signed by an authorized representative.

I. Certification
Any person signing documents under this section shall make the following certification:

VOL 16 0433

R0061833

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

J. **Penalties for Falsification of Reports**
Section 309(c)(4) of the Clean Water Act provides that any person who knowingly makes any false material statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than 2 years, or by both.

K. **Penalties for Falsification of Monitoring Systems**
The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by fines and imprisonment described in Section 309 of the CWA.

L. **Oil and Hazardous Substance Liability**
Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties to which the permittee is or may be subject under section 311 of the CWA or section 106 of CERCLA.

M. **Property Rights**
The issuance of this permit does not convey any property rights of any sort, nor any exclusive privileges, nor does it authorize any injury to private property nor any invasion of personal rights, nor any infringement of Federal, State or local laws or regulations.

N. **Severability**
The provisions of this permit are severable, and if any provision of this permit, or the application of any provision

VOL 16 0434
R0061834

of this permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this permit shall not be affected thereby.

O. Requiring an individual permit

1. The Administrator may require the permittee authorized by this permit to obtain an individual NPDES permit. Any interested person may petition the Administrator to take action under this paragraph. The Director may require any owner or operator authorized to discharge under this permit to apply for an individual NPDES permit only if the owner or operator has been notified in writing that a permit application is required. This notice shall include a brief statement of the reasons for this decision, an application form (as necessary), a statement setting a deadline for the owner or operator to file the application, and a statement that on the effective date of the individual NPDES permit, coverage under this permit shall automatically terminate. Individual permit applications shall be submitted to the address of the appropriate Regional Office shown in Part V.D. of this permit. The Administrator may grant additional time to submit the application upon request of the applicant. If an owner or operator fails to submit in a timely manner an individual NPDES permit application as required by the Administrator, then the applicability of this permit to the individual NPDES permittee is automatically terminated at the end of the day specified for application submittal.

2. Any owner or operator authorized by this permit may request to be excluded from the coverage of this permit by applying for an individual permit. The owner or operator shall submit an individual application as specified by 40 CFR 122.26(d) with reasons supporting the request to the Administrator. Individual permit applications shall be submitted to the address of the appropriate Regional Office shown in Part V.D. of this permit. The request may be granted by the issuance of a individual permit if the reasons cited by the owner or operator are adequate to support the request.

P. State/Environmental Laws

1. Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable State law or regulation under authority preserved by section 510 of the Act.

VOL 16 0435

R0061835

2. No condition of this permit shall release the permittee from any responsibility or requirements under other environmental statutes or regulations.

Q. Proper Operation and Maintenance

The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit and with the requirements of storm water pollution prevention plans. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance requires the operation of backup or auxiliary facilities or similar systems, installed by a permittee only when necessary to achieve compliance with the conditions of the permit.

R. Monitoring and records

1. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

2. The permittee shall retain records of all monitoring information including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of the reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least 3 years from the date of the sample, measurement, report or application. This period may be extended by request of the Administrator at any time.

3. Records of monitoring information shall include:

   a. The date, exact place, and time of sampling or measurements;

   b. The initials or name(s) of the individual(s) who performed the sampling or measurements;

   c. The date(s) analyses were performed;

   d. The time(s) analyses were initiated;

   e. The initials or name(s) of the individual(s) who performed the analyses;

   f. References and written procedures, when available, for the analytical techniques or methods used; and

VOL 16 0436

R0061836

g. The results of such analyses, including the bench sheets, instrument readouts, computer disks or tapes, etc., used to determine these results.

S. Monitoring Methods
Monitoring must be conducted according to test procedures approved under 40 CFR Part 136, unless other test procedures have been specified in this permit.

T. Inspection and Entry
The permittee shall allow the Administrator or an authorized representative of EPA, or the State, upon the presentation of credentials and other documents as may be required by law, to:

1. Enter upon the permittee's premises where a regulated facility or activity is located or conducted or where records must be kept under the conditions of this permit;

2. Have access to and copy at reasonable times, any records that must be kept under the conditions of this permit; and,

3. Inspect at reasonable times any facilities or equipment (including monitoring and control equipment).

U. Permit Actions
This permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

VOL 16 0437

R0061837

PART VII. PERMIT MODIFICATION

A. **Modification of the Permit**
The permit may be reopened and modified during the life of the permit to address:

1. changes in the State's Water Quality Management Plan, including Water Quality Standards;

2. changes in State or Federal statutes or regulations;

3. add a co-permittee who is the owner or operator of a portion of the MS4;

4. changes in portions of the storm water management program that are considered permit conditions; or

5. other modifications deemed necessary by the Administrator to meet the requirements of the Clean Water Act.

All modification to the permit will be made in accordance with 40 CFR 122.62, 122.63, and 124.5.

B. **Termination of Coverage for a Single Co-permittee**
Permit coverage may be terminated, in accordance with the provisions of 40 CFR 122.64 and 124.5, for a single co-permittee without terminating coverage for other co-permittees.

C. **Modification of Storm Water Management Program(s)**
Only those portions of the SWMPs specifically required as permit conditions shall be subject to the modification requirements of 40 CFR 124.5. Replacement of a failing BMP implementing a required component of the SWMP with an alternate BMP expected to provide at least the same level of performance initially expected of the failing BMP, shall be considered minor modifications to the permit and will be made in accordance with the procedures at 40 CFR 122.63.

D. **Changes in Monitoring Outfalls**
This permit is issued on a system-wide basis in accordance with CWA § 402(p)(3)(i) and authorizes discharges from all portions of the MS4. Since all outfalls are authorized, changes in monitoring outfalls, other than those with specific numeric effluent limitations, shall be considered minor modifications to the permit and will be made in accordance with the procedures at 40 CFR 122.63.

VOL 16 0438

R0061838

PART VIII. DEFINITIONS

"Administrator" means the Regional Administrator.

"Best Management Practices" ("BMPs") means schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures, and practices to control facility site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

"CWA" means Clean Water Act (formerly referred to as the Federal Water Pollution Control Act or Federal Water Pollution Control Act Amendments of 1972) Pub.L. 92-500, as amended Pub. L. 95-217, Pub. L. 95-576, Pub. L. (6-483 and Pub. L. 97-117, 33 U.S.C. 1251 et.seq.

"Co-permittee" means a permittee to a NPDES permit that is only responsible for permit conditions relating to the discharge for which it is operator.

"Director" means the Regional Administrator or an authorized representative.

"Discharge" for the purpose of this permit, unless indicated otherwise, refers to discharges from the Municipal Separate Storm Sewer System (MS4).

"Flow-weighted composite sample" means a composite sample consisting of a mixture of aliquots collected at a constant time interval, where the volume of each aliquot is proportional to the flow rate of the discharge.

"Illicit connection" means any man-made conveyance connecting an illicit discharge directly to a municipal separate storm sewer.

"Illicit discharge" means any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges resulting from fire fighting activities.

"Landfill" means an area of land or an excavation in which wastes are placed for permanent disposal, and which is not a land application unit, surface impoundment, injection well, or waste pile.

"Land application unit" means an area where wastes are applied onto or incorporated into the soil surface (excluding manure spreading operations) for treatment or disposal.

VOL 16 0439

R0061839

"MS4" is an acronym for "municipal separate storm sewer system" and is used to refer to either a Large or Medium Municipal Separate Storm Sewer System.

"Large or Medium municipal separate storm sewer system" means all municipal separate storm sewers that are either:

(i) located in an incorporated place (city) with a population of 100,000 or more as determined by the latest Decennial Census by the Bureau of Census (these cities are listed in Appendices F and G of 40 CFR Part 122); or

(ii) located in the counties with unincorporated urbanized populations of 100,000 or more, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties (these counties are listed in Appendices H and I of 40 CFR Part 122); or

(iii) owned or operated by a municipality other than those described in paragraph (i) or (ii) and that are designated by the Director as part of the large or medium municipal separate storm sewer system.

"Municipal Separate Storm Sewer" means a conveyance, or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains): (i) owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State Law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State Law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian Tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States; (ii) designed or used for collecting or conveying storm water; (iii) which is not a combined sewer; and (iv) which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

"Point Source" means any discernible, confined, and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharges. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

"Storm sewer", unless otherwise indicated, refers to a municipal separate storm sewer.

"Storm Water" means storm water runoff, snow melt runoff, and surface runoff and drainage.

"SWMP" is an acronym for "Storm Water Management Program."

VOL 16 0440

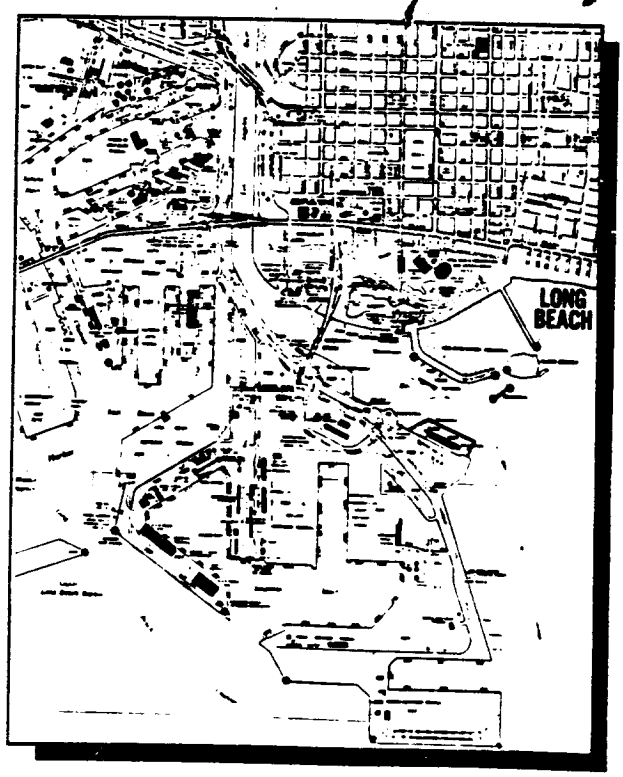
R0061840

"Time-weighted composite" means a composite sample consisting of a mixture of equal volume aliquots collected at a constant time interval.

"Waste pile" means any noncontainerized accumulation of solid, nonflowing waste that is used for treatment or storage.

"Waters of the United States" means:

(a) All waters which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
(b) All interstate waters, including interstate "wetlands";
(c) All other waters such as interstate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:
(1) Which are or could be used by interstate or foreign travelers for recreational or other purposes;
(2) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
(3) Which are used or could be used for industrial purposes by industries in interstate commerce;
(d) All impoundments of waters otherwise defined as waters of the United States under this definition;
(e) Tributaries of waters identified in paragraphs (a) through (d) of this definition;
(f) The territorial sea; and
(g) Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition.



Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA are not waters of the United States. This exclusion applies only to manmade bodies of water which neither were originally created in waters of the United States (such as disposal areas in wetlands) nor resulted from the impoundment of waters of the United States.

1993 ANNUAL REPORT
STORM WATER DISCHARGE MONITORING
IN THE LONG BEACH HARBOR DISTRICT

INTRODUCTION

This report is a summary of the results of the non-point source water quality monitoring program implemented by the Port of Long Beach (POLB), covering the monitoring period from 1 July 1992 to 30 June 1993. This program was initiated in response to the requirements for an annual report in the STATEWIDE GENERAL PERMIT - WQ ORDER NOS. 91-13-DWG & 92-12-DWG (NPDES CA000001). The annual report questionnaire from the Regional Water Quality Control Board (RWQCB) is completed and attached as Appendix 1 of this report.

The Long Beach Harbor District encompasses approximately 2,945 acres; however, 1,297 acres are federal lands and 457 acres belong to Union Pacific Resources Company. Approximately 1,191 acres are controlled and under the jurisdiction of the Port of Long Beach. This report addresses only the Long Beach Harbor District.

ENVIRONMENTAL SETTING

The Long Beach-Los Angeles Harbor complex encompasses approximately 6,000 acres at the southeastern base of Palos Verdes Peninsula in Los Angeles County (Figure 1). It is bounded on the landward side by the cities of San Pedro, Wilmington, and Long Beach and to seaward by the San Pedro, Middle, and Long Beach breakwaters. Two major drainage channels, Dominguez Channel and the Los Angeles River, discharge into the harbor, and the San Gabriel River discharges just south of Alamitos Bay.

Long Beach Harbor is composed of the Inner, Middle, and Outer Harbors. The Inner Harbor comprises Cerritos Channel, a turning basin, and Channels Two and Three. Middle Harbor consists of West Basin, which supports the Naval complex, and the East Basin, which supports Piers D, E, F, G, and H. Long Beach Outer Harbor, used for anchorage and maneuvering, is a large semi-enclosed basin contiguous with Los Angeles Outer Harbor. Queen's Gate, between Middle and Long Beach breakwaters, is the main entrance to POLB.

NON-POINT SOURCES OF POLLUTION

Terminal Island and the areas bordering the harbor serve many diverse industries including a variety of cargo terminals, the Terminal Island Treatment Plant, the Long Beach Generating Station, petroleum refineries, manufacturing plants, and other potential sources of materials that may affect the harbor water quality. Non-point or diffuse sources that carry contamination into Los Angeles-Long Beach Harbor include aerial fallout, surface runoff, advective transport, and boating and shipping activities.

A potentially large source of contaminants is surface runoff, which enters Long Beach-Los Angeles Harbor via the drainage channels of the Los Angeles and San Gabriel Rivers and the Dominguez Channel and from runoff from the piers and docks. About 70% of this discharge occurs during storms (MBC 1988) and contains organic matter, inorganic debris, dissolved minerals and nutrients, pesticides and herbicides, oils and grease, and many other industrial and domestic discharges (EPA 1977).

Contaminants from any of these sources may adversely affect the water quality of the harbor.

STATION LOCATIONS

The POLB harbor is characterized by approximately 1,000 storm water outfalls that discharge to harbor waters. The RWQCB requirements were to collect grab samples within 30 minutes of

VOL 17 000004

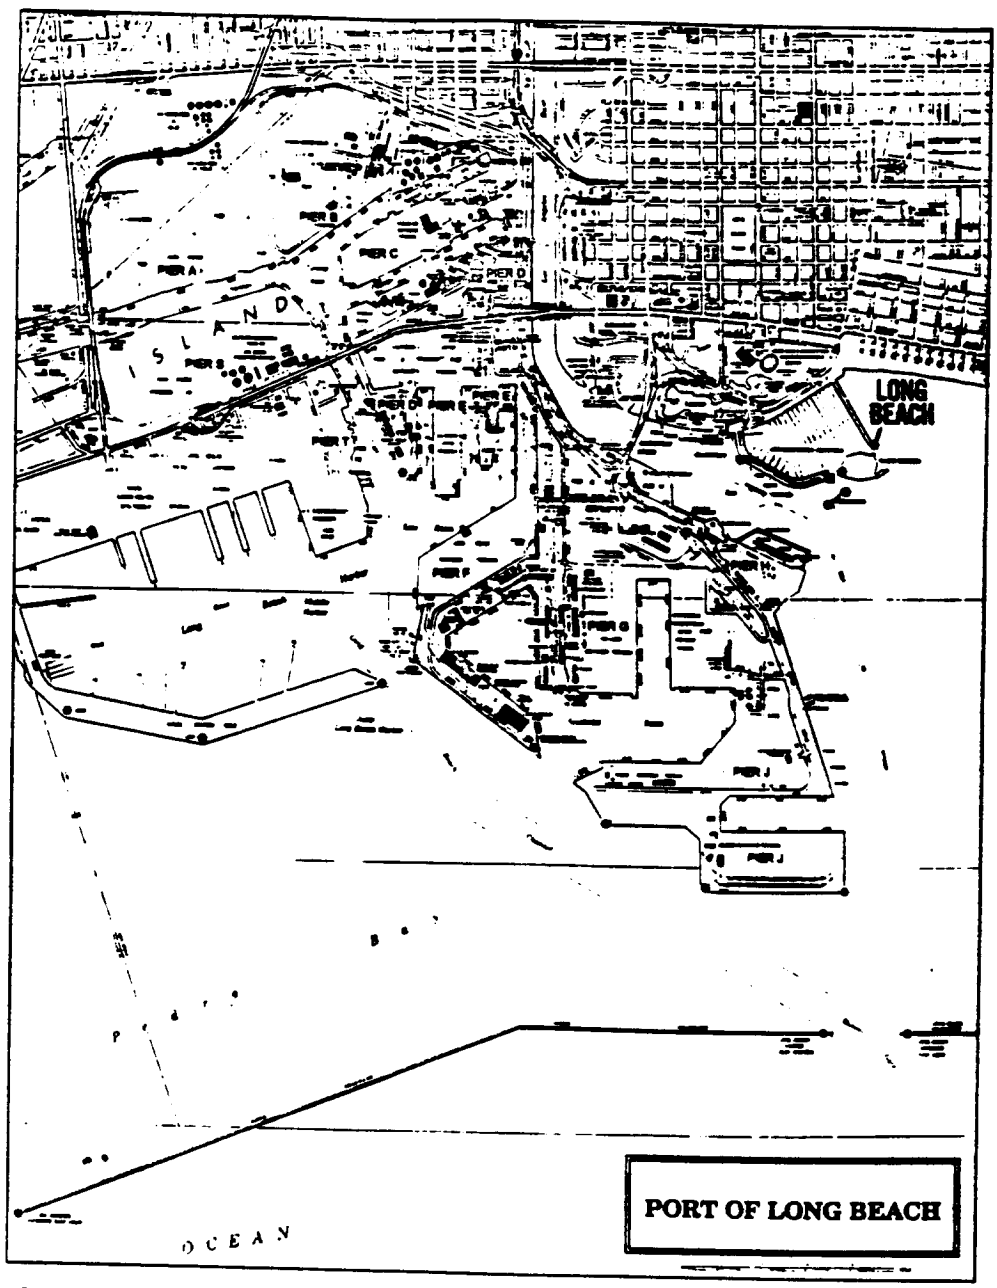

Figure 1. Vicinity map of the Port of Long Beach.

VOL 17 00000005

R0061845

a significant storm event (continuous discharge of storm water for approximately one hour or more). Because it is impracticable to sample all these outfalls within the first half hour following a major storm water event, a broad-based approach which could determine the presence or absence of contaminants in specific areas of the harbor complex following a storm was proposed and approved by the Los Angeles Regional Water Quality Control Board. Results from this receiving water sampling program could be utilized to focus an investigation into a specific area of the harbor should any contaminants be detected above permitted levels. With the concurrence of the RWQCB, a plan incorporating sampling at 20 stations throughout the harbor was proposed (Figure 2).

The appropriate analytical testing at each station necessary for the monitoring program was determined by review of all the Storm Water Runoff Facility Questionnaires submitted by the various tenants engaged in manufacturing or industrial activities. Other potential contaminants specified by the RWQCB were also included in the sampling design.

Station 1 was located at the mouth of the Los Angeles River, mid-way between the Magnolia Bridge and the Queen Mary, Station 2 was opposite the south side of Pier J, and Station 3, was located in the slip of the newly constructed Pier J facility. Six stations were located in Southeast Basin (Stations 4 through 9). Stations 10 and 11 were located in the Long Beach Channel adjacent to the channel edge of Pier F. Stations 12 through 16 were located in the Middle Harbor. Station 17 was located in the Inner Harbor between the Heim Bridge in the Cerritos Channel and the entrances to Channel Two and Three and Stations 18 and 19 were located in the middle of Channels Two and Three. Station 20 was located in the Outer Harbor south of the U.S. Navy Mole.

DATA COLLECTION AND ANALYSIS

Analytical parameters, detection limits, and stations where sampled and measured are listed in Table 1. Two wet weather sampling episodes were conducted on 17 February during the period between 1805 and 2303 hrs and 25-26 March 1993 between 2217 and 0137 hrs on 25-26 March 1993. A dry-season sampling was conducted on 12 August 1993 between 0900 and 1410 hrs. An supplementary sampling was performed on 2 September 1993. In accordance with the provisions of the storm monitoring plan at the Port of Long Beach, the storm monitoring surveys were conducted during winter storms which occurred after several days or weeks of no precipitation. Both storms produced significant water runoff in the flood control channels, the rivers, and from the various docks, wharfs, and piers within the harbor.

Samples were collected from a small mobile vessel with a crew of three deployed into Long Beach Harbor during the storms. All water samples for each parameter were collected with a van Dorn bottle from the water surface. New sample containers were cleaned and prepared prior to sampling using laboratory clean-techniques appropriate for the various parameters analyzed. All collected samples were labeled and placed on ice for immediate transport to the analytical laboratory.

Quality assurance and quality control (QA/QC) procedures were initiated prior to sampling. Approximately 10% of all samples were randomly resampled. Prior to sampling, a random number generator was used with the station designation numbers to determine which of the 20 stations would be resampled for each parameter. These QA/QC sample containers were labeled Stations A and B and were submitted with the other samples labeled Stations 1 through 20. The analytical laboratory was not apprised of the identity of the stations labeled A and B.

The field log sheets with station designations, surface observations, chemical parameters sampled, and sampling duration are archived and available at the Port of Long Beach in separate Storm Water Reports for each survey. Complete laboratory reports on parameters analyzed,

Parameter	Detection Limit	EPA Method	Stations where Measured
Total organic carbon	1.0 mg/l	415.2	all
Total suspended solids	5.0 mg/l	160.2	all
Total recoverable petroleum hydrocarbons	1.0 mg/l	418.1	all
Benzene, toluene	0.3 ug/l	CA DHS - Mod. 8020	1-10, 13-18
Ethylbenzene, xylene	0.5 ug/l	CA DHS - Mod. 8020	1-10, 13-18
Metals	0.002-0.5 mg/l	6010, 7060, 7191, 7196, 7421, 7470, 7740	1-10, 14-18
Surfactants	0.5 mg/l	425.1	1-2, 3-6, 13
Sulfide	0.1 mg/l	376.2	9
Volatile organics	2-10 ug/l	8240	17-18
Semi-volatile organics	10-100 ug/l	8270	17-18
Extractable fuel hydrocarbons	0.5 mg/l	CA DHS - Mod. 8015	17-18
Volatile fuel hydrocarbons	50 mg/l	CA DHS - Mod. 8015	17-18

including Quality Assurance/Quality Control method blanks, and spike analyses are also available at the Port of Long Beach in the separate Storm Water Reports for each survey.

RESULTS

Two wet weather and one dry season monitoring episodes have been conducted since the inception of the storm water monitoring plan. Sampling conditions and results of each of the three monitoring episodes are described in the following text.

FEBRUARY STORM SAMPLING PARAMETERS

During the February storm survey, rainfall began in the early morning and was intermittent during the day, becoming heavy in the late afternoon and on into the late evening. According to published weather service reports, approximately 1.2 inches of rain fell during the period from 0600 to 2400 hrs on 17 February.

During sampling, winds were blowing from the southeast at 15 knots and seas were 2 to 3 ft. Winds gradually became less, decreasing to 4 knots by 1930 hrs, and then increased to 18 knots and 4 ft seas by 2030 hrs. Winds alternately increased and decreased throughout the remainder of the sampling period.

February Storm Surface Obeervations

Runoff from several piers was observed; however, few streams were noted, except at Station 18. At that station a sheet of water approximately 6 ft wide by 2 in deep on the south bulkhead was flowing from the container parking area into the harbor and a 24 in pipe was discharging water into the harbor approximately 300 m west of the station on the south bulkhead.

No odors were detected at any station, and turbidity was detected only at Stations 1, 2, and 3, which are directly influenced by the Los Angeles River. Wood and trash were observed on the surface at Station 1 and styrofoam was noted at Station 12.

MARCH STORM SAMPLING PARAMETERS

During the March storm, rainfall began in the early morning and was intermittent during the day, becoming heavy in the late afternoon and on into the late evening. According to published

VOL 17 000009

R0061849

weather service reports, approximately 1.56 inches of rain fell during the period from 0800 to 0800 hrs on 25-26 March.

During sampling, winds were blowing from the west to southwest at 10 to 20 knots and seas were 3 to 5 ft from the west. Winds alternately increased and decreased throughout the sampling period.

March Storm Surface Obeservations

Runoff in the form of small streams was observed from several piers and storm drains. Water was percolating through the bulkhead at Stations 3 and 7. Water was flowing from a single storm drain each at Stations 9 and 12, two storm drains each at Stations 10 and 18, and six at Station 14. A sheet of water approximately 4 ft wide was flowing from a parking lot at Station 12 and a 3 ft wide sheet of water was flowing from the pavement and into the harbor at Station 18. Heavy water flow from the Los Angeles River was noted at Station 1.

There was a strong oily odor present at Stations 1 and 2; no odors were detected at any of the remaining stations. Visible turbidity was present at Stations 1, 2, and 3 in the path of the Los Angeles River and inside the Harbor at Stations 9, 10, 11, 12, 17, 18, and 19. Terrestrial debris, trash, and styrofoam were noted at Stations 1 and 2, located at the mouth of the Los Angeles River, and at Stations 5 and 9.

AUGUST DRY SEASON SAMPLING PARAMETERS

The dry season sampling was preceded by several months of no significant rainfall; the most recent had occurred on 5 May 1993. During sampling, winds were from the west to southwest at 3 to 10 knots most of the day and seas began flat, becoming a light chop by mid-day.

August Surface Obeservations

Due to the dry weather conditions, most drains had no visible discharges. The one exception was between Stations 6 and 7 in the southeast basin, where a 24" pipe was discharging 2 to 3 gallons per minute. Small discharges were noted from ships near Stations 9, 14, and 20.

No odors, oil, grease, or turbid or color patches were noted at any station. Floating trash (paper) was seen at Station 1, at the mouth of the Los Angeles River.

HYDROGEN ION CONCENTRATION (pH)

February storm water hydrogen ion concentrations (pH) were nearly uniform ranging narrowly from 7.98 to 8.02 among all stations, except Stations 1 (in the mouth of the Los Angeles River mouth) and 19 in Cerritos Channel (Table 2). The pH value at Station 1 was 8.14 and the value at Station 19 was 7.93. All values, including these two stations, are normal for Long Beach Harbor and the Southern California Bight in general. QA/QC results for the two stations selected were nearly identical to the values determined for the required sampling.

March storm water hydrogen ion concentrations (pH) were nearly uniform among all stations ranging from 7.90 to 8.15, except Station 1 (in the mouth of the Los Angeles River) which had a pH of 7.54 (Table 2). The slightly lower reading found at several stations is probably the result of rainwater on the surface, and the low reading at Station 1 was because of the mixture of freshwater and seawater present at the river mouth. All values are normal for Long Beach Harbor and the Southern California Bight in general. QA/QC results for the two stations selected were nearly identical to the values determined for the required sampling.

* an anomalous reading resulted from ice water leaking into the linetown jar
nd = not detected; - = not sampled

Hydrogen ion concentrations (pH) in August were nearly uniform among all stations ranging from 8.10 to 8.25 (Table 2). All values were normal for Long Beach Harbor and the Southern California Bight in general. QA/QC results were within 0.02 units between the two samples at each station.

CONDUCTIVITY

February conductivity measurements indicated that fresh water was mixed in the water column to a depth of at least 1 m at Stations 1, 2, and 3 downstream of the Los Angeles River (Table 2). Conductivity measurements at the other 17 stations taken from the surface interphase were varied narrowly, ranging from 43.8 in the Outer Harbor to 47.7 in Channel Two in the Inner Harbor. QA/QC results for the two stations selected were nearly identical to the values determined for the required sampling at the station.

March conductivity measurements again indicated that a fresh water lens was present on the surface in varying degrees at all stations; based on conductivity measurements, no station was above a salinity of 27 ppt indicating a fresh water lens was present on the surface from storm waters. Conductivity and, therefore, salinity was especially low at Stations 1 and 2, at the mouth of the Los Angeles River, and was highest at the Outer Harbor Station 20 (Table 1). All other conductivity measurements were relatively similar among the other 17 stations during the survey. Conductivity ranged from 4.3 in the mouth of the Los Angeles River to 42.4 in the Outer

VOL 17 00001
R0061851

Harbor. QA/QC results for the two stations selected did not correlate well with the values determined for the required sampling and may reflect the inherent variability in sampling a thin freshwater lens mixed with seawater.

With the exception of Station 1, conductivity measurements in August varied only slightly, from 49.2 to 50.6 (Table 2), and correspondingly, salinity ranged from 32.2 to 33.3 ppt which is normal for seawater in the Southern California Bight. Conductivity measurements indicated a fresh water lens only at Station 1 (31.1 ms/cm; 19.3 ppt) at the mouth of the Los Angeles River, and a slight influx of fresh water at Station 2 (49.2 ms/cm; 32.2 ppt). QA/QC results for the two stations selected correlated well with the values determined originally and were within 0.2 ms/cm.

TOTAL SUSPENDED SOLIDS

February storm water total suspended solids levels were similar at most stations, near 200 mg/ℓ; however, levels in the Los Angeles River mouth were markedly higher (590 mg/ℓ). QA/QC results for the two stations selected were nearly identical to the values determined for the required sampling (Table 2).

Total suspended solids levels during the March storm were similar at most stations (near 200 mg/ℓ), ranging from 190 to 220 mg/ℓ (Table 2). QA/QC results for one of the two stations selected was identical to the values determined for the required sample; however during the QA/QC audit total suspended solids were slightly higher in the Station B QA/QC sample (which was collected at Station 4) than the results recorded for the required sampling at Station 4; again, this probably reflects the variable amount of seawater and freshwater in each collection.

As might be expected, suspended solid levels in the Port were much lower during the dry season than during the rainy season. Total suspended solids levels in August varied widely in the port, ranging from 69 to 270, but averaging less than 115 mg/ℓ (Table 2). Highest levels were found at Station 3 in the new Pier J slip, Station 11 near the entrance to Middle Harbor, and Station 13 in East Basin. No spatial trends were evident in highest and lowest levels. Compared to the original samples, QA/QC results at Station 14 were similar, while at Station 4 the QA/QC sample was higher.

TOTAL ORGANIC CARBON

February storm water levels of organic carbon were below the detection level at all stations, except Station 1 in the Los Angeles River mouth, where levels of 3.5 mg/ℓ were found. QA/QC results for the two stations selected were nearly identical to the values determined for the required station samples (Table 2).

In March, total organic carbon was detected only at Station 1 at the Los Angeles River mouth at a value of 7.5 mg/ℓ (Table 1). All remaining stations had levels of organic carbon that were below the detection level of 1.0 mg/ℓ (Table 2). QA/QC results for the two stations selected were identical to the results determined for the required station samples.

Total organic carbon was detected at five stations in August, three in original samples and two in QA/QC samples taken from different stations (Table 2). Detected levels ranged from 2.0 to 3.7 mg/ℓ. All remaining stations had levels of organic carbon that were below the detection level of 1.0 mg/ℓ.

TOTAL RECOVERABLE PETROLEUM HYDROCARBONS (TRPH)

In February, petroleum hydrocarbons were detected only at Station 1 (1.4 mg/ℓ). QA/QC results for the two stations selected were identical to the values determined for the required station sampling (Table 2).

VOL 17 000012

R0061852

During the March storm survey, petroleum hydrocarbons were detected only at Stations 1 and 18, with values of 1.6 and 1.5, respectively (Table 2). QA/QC results for the two stations selected were identical to the results determined for the required station sampling.

In August, no petroleum hydrocarbons were detected at any station. QA/QC results for the two stations selected were identical to the values determined for the required station sampling (Table 2).

BENZENE, TOLUENE, ETHYLBENZENE, XYLENE (BTEX)

During the February storm survey, traces of toluene and total xylene were found at Station 1 and traces of benzene, toluene, and total xylene were found at Station 14 (in the recesses of Pier C). No other analyzed parameters were detected at any of the other stations. QA/QC results for one of the two stations selected was identical to the values determined for the station, however during the QA/QC audit no traces of toluene or total xylene were found in the Station B QA/QC sample, which was collected at Station 1 (Table 3).

* Benzene, toluene, and xylene were detected as volatile organics, not during BTEX anayses
** 1,1,1-Trichloroethane
nd = not detected; – = not sampled

VOL 17 000013
R0061853

During the March storm survey, traces of toluene and total xylene were found at Station 1 (Table 3). Benzene, toluene, ethylbenzene, and total xylene were detected at Station 15. None of these parameters were detected at any of the other stations sampled (Table 3). QA/QC results for the two stations selected were nearly identical to the values determined for the required sample.

Traces of benzene and total xylene were found at Station 3 in August and toluene was found at Stations 1 and 3 (Table 2). None of these parameters were detected at any of the other stations sampled or in the QA/QC samples (Table 3). When Station 3 was resampled in September, none of these constituents were detected.

VOLATILE ORGANICS

Solvents and other volatile organics were sampled during the storm water survey during February at two stations. No solvents were detected at either Station 17 or 18 (Table 3).

During the March storm, solvents and other volatile organics were measured at Stations 17 and 18. No solvents were detected at Station 17; however, benzene, toluene, 1,1,1 trichloroethane, and total xylene were detected at Station 18 (Table 3).

No solvents or other volatile organics were measured at either Stations 17 or 18 during the dry season August survey (Table 3).

INDUCTIVELY COUPLED ARGON PLASMA (ICAP) TRACE METALS

During the February storm survey, barium, lead, and zinc were found in the sample from Station 1 and lead was found in the sample from Station 2. No other trace metals were above detection levels at any other station. QA/QC results for the two stations selected were identical or nearly identical to the values determined for the required samples at the station (Table 4).

Results from the March survey indicated barium, lead, and zinc were found in the sample from Station 1 (Table 4). No other trace metals were above detection levels at any other station. QA/QC results for the two stations selected were identical to results determined for the required sample.

No trace metals were detected at any station, including the QA/QC stations, during the August sampling (Table 4).

METHYL BLUE ACTIVE SUBSTANCES (MBAS) SURFACTANTS

During the February storm, surfactants were recorded at four stations (Stations 4, 5, 6, and 13). Stations 4, 5, and 6 are located in the Southeast Basin and Station 13 is located between Piers A and B. Surfactants were not present at the other two stations in levels above detection. QA/QC results for the one station selected were identical or nearly identical to the value determined from the required sample taken at the station (Table 5).

During the March storm, surfactants were recorded only at Station 1 (Table 5). Surfactants were not detected at the other five stations. QA/QC results for the one station selected were identical to the result determined from the required sample taken at the station.

Surfactants were recorded in five of the six samples during the August dry season sampling including the QA/QC sample from Station 6 (Table 5).

In September, samples from three previously sampled stations and two additional stations were analyzed for surfactants. All five of these stations had detectable levels, though in lower

concentrations than found in August, indicating that surfactants were widespread in the port during this time period.

SULFIDES

Sulfides in February were measured at only one station. No sulfides were detected at Station 9 (Table 5).

During the March storm, sulfides were measured at Station 9 only. No sulfides were detected at Station 9 (Table 5).

No sulfides were measured at Station 9 during the August dry season sampling survey (Table 5).

SEMI-VOLATILE ORGANICS, EXTRACTABLE FUEL HYDROCARBONS, AND VOLATILE FUEL HYDROCARBONS

Stations 17 and 18 were sampled for semi-volatile organics, extractable fuel hydrocarbons, and volatile fuel hydrocarbons in February, March, and August 1993. No levels of any of these parameters were present above detection limits at either of the two stations during any of the three surveys (Table 5).

EFFECTIVENESS OF STORM WATER POLLUTION PREVENTION PLAN

Two wet season and one dry season monitoring episodes, each sampling 20 discrete receiving water points, have been conducted. Both storm water episodes detected contaminants in the harbor waters at several locations. As two of the sampling periods were conducted during periods of heavy storm water runoff, it is likely that the detected contaminants (semi-volatile organics characteristic of motor fuels, and heavy metals) reflected the input of non-point source runoff. Two of the locations are in the Los Angeles River mouth, and probably not affected by runoff from the Port. The other locations, Stations 14, 15, and 18, are located in dead-end slips within the harbor proper.

The summer dry season sampling found that none of the drains going into the harbor were flowing (with the exception of a single drain in the southeast basin know to the RWQCB). Therefore, the detection of surfactants throughout the harbor in low levels, and of semi-volatile organics at Station 3 is an indication that sources other than surface runoff are responsible for the dry season detection of contaminants.

The presence of contaminants in harbor waters indicated that current operational practices and control measures, including those incorporated into the POLB SWPPP, are not totally effective at preventing receiving water contamination. However, the detection of contaminants at a few stations should not overshadow the analytical results indicating that no contaminants were detected at most stations. This indicates that the program, while not perfect, is, nevertheless, highly effective.

VOL 17 000016

R0061856

The Port is undertaking an investigation of possible sources of the detected contaminants. The results of that investigation will be included in the 1994 Annual Report.

SANTA CLARA COUNTY GENERAL PERMIT - BOARD ORDER NOS. 92-011 & 92-116 (NPDES CAG12001)

Please provide the following information. ***Provide a brief explanation, on a separate sheet(s), to all questions you have answered with a NO response, and to those questions that request additional information. Attach the separate sheets as an addendum to your report.*** If you have any questions regarding this report please contact your local Regional Water Quality Control Board (Regional Board), or the State Water Resources Control Board (State Board) (see Attachment I).

This report requires that you provide an accurate and honest assessment of your facility's status of compliance with the storm water program. All incidents of non-compliance are to be reported. Provide a brief explanation of the incident that resulted in the non-compliance. Include in this discussion what you will do, or how you intend to bring your facility into compliance along with a time schedule for implementation of your actions.

This report must be certified and signed, under penalty of perjury, that the information provided in this report is true and complete. The certification must be signed by an appropriate official of your company (see Section C.9).

GENERAL OWNER/FACILITY INFORMATION

A. Facility WDID No: **4B198003828**

B. Facility/Site Information:

Name: **The Port of Long Beach** County: **Los Angeles**

Street Address: **925 Harbor Plaza**

City: **Long Beach** State: **California** Zip: **90802**

SIC Code(s): **Various - see POLB NOI (NPDES Stormwater Management System)**

Describe your business activities: **Oversee shipping and commerce in the POLB**

Mailing Address: **925 Harbor Plaza**

City: **Long Beach** State: **CA** Zip: **90802**

Contact Person: **Geraldine Knatz, Ph.D.** Phone: **(310) 590-4154**

C. Is your facility part of a Group Monitoring Plan? __ Yes X No **Port of Long Beach conducts monitoring for itself and all of its tenants but is not considered a "Group Monitoring Plan"**

If Yes, please answer the following questions:

- What is the Group Monitoring Plan's name:
- Is your facility designated to collect storm water samples? __ Yes __ No

D. Has your facility been approved for exemption to storm water sample collection (Section B.9.a,b and c)?

__ Yes X No **Port of Long Beach currently conducts the required storm water monitoring**

If Yes, were you: __ self-certified __ certified by a local agency?

Provide the date you submitted your certification to the Regional Board office: _____

ANNUAL REPORT

STATEWIDE GENERAL PERMIT - WQ ORDER NOS. 91-13-DWQ & 92-12-DWQ (NPDES CA000001)
OR THE
SANTA CLARA COUNTY GENERAL PERMIT - BOARD ORDER NOS. 92-011 & 92-116 (NPDES CAG12001)

1. Is all the information contained in your NOI current and correct, i.e., facility address, contact name, phone number, etc.? X Yes __ No
   If No, please submit a revised NOI to the State Board with a copy to your Regional Board.
2. Have you prepared a Storm Water Pollution Prevention Plan (SWPPP) as required in Section A of the Permit?
   X Yes __ No
3. Have you implemented all elements of your SWPPP? X Yes __ No
4. Have all non-storm water discharges been permitted or eliminated (Section A.6)? __ Yes X No
   If No, have you reported all the non-storm water discharges to the appropriate Regional Board office?
   __ Yes X No **One unpermitted industrial discharge occurs as a result of a faulty pump. Alternatives for insuring reliable operation for this system, given the acidic nature of the discharge, are currently being investigated by Port of Long Beach Engineering Staff.**
5. Have you developed a monitoring program as required in Section B of the Permit? X Yes __ No
6. Have your implemented all the elements of your monitoring plan? X Yes __ No
7. Did you conduct an annual site inspection (Section B.5.a)? X Yes __ No
   If Yes, what date was it conducted: various, and by whom POLB staff. Please provide a brief summary of your inspection findings. **POLB staff visits each site included in the NOI on an annual basis.**
8. Did you conduct monthly visual wet weather inspections (Section B.5.c)? __ Yes X No
   If Yes, please indicate the storm water discharge points that were inspected, and provide the following information for each point: **Due to the extent and complexity of this facility, it is impractical to inspect all stormwater discharge locations during the first hour of one storm event each month.**
   - Date and time of inspection. Include a sketch or site plan of the facility showing all the points of discharge. Indicate on this sketch or plan which points of discharge were monitored.
   - Storm water flow characteristics observed per discharge point. For example was the flow discolored, very turbid; did it have an odor, evidence of floating or suspended material; did it have a sheen; or any other unusual characteristics? If none of these types of flow characteristics were observed, please proceed to the next question. If they were, please discuss the corrective actions taken or to be taken.
9. Did you conduct dry season site inspections (Section B.5.b)? X Yes __ No
   If Yes, please provide the number of storm water discharge points observed, and provide the following for each point:
   a. Date and time of inspection, and a sketch or site map as indicated under Question No. 8.
   b. Was there a dry weather (non-storm water) flow occurring at the time of inspection?
      If Yes, please provide the following:
      i. Is the flow subject to a NPDES permit? __ Yes __ No
         If No, proceed to item ii. If Yes, what is the Board Order No. _____, proceed with discussion of next discharge.
      ii. Did you report the non-storm water discharge to the Regional Board? __Yes __ No
         If No, did you address this flow under Question No. 4? __ Yes __ No
         If Yes, and you have addressed items iii-v below, proceed with discussion of next discharge. Otherwise amend your answer to No. 4 to include a discussion of items ii-v, and proceed.
      iii. Description of the flow characteristics, i.e., odor, color, etc.
      iv. Possible source of flow.
      v. Corrective action taken. If no action has been taken, please discuss what actions will be taken to eliminate the non-storm water discharge.

VOL 17 000020

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD

ANNUAL REPORT

STATEWIDE GENERAL PERMIT - WQ ORDER NOS. 91-13-DWQ & 92-12-DWQ (NPDES CA000001)
OR THE
SANTA CLARA COUNTY GENERAL PERMIT - BOARD ORDER NOS. 92-011 & 92-116 (NPDES CAG12001)

10. On a separate sheet, evaluate the effectiveness of the facility's SWPPP and Best Management Practices (BMPs). Discuss specific areas or elements of the SWPPP that are or are not effective. For plans that were not effective, provide alternatives or proposed revisions to the SWPPP that will be implemented as a result of your monitoring program.

    Examples of the types of questions this discussion should answer are: Did the SWPPP work? Where did it fail? Are there more discharge points than originally identified? Did the BMPs work effectively; if not why? What types of pollutants are present in the facility's storm water runoff, and what are their potential sources; and did you implement appropriate BMPs to control these pollutants? **The SWPPPs prepared by the Port of Long Beach and its tenants appear to be effective since receiving water monitoring conducted in accordance with an agreement with the Regional Water Quality Control Board - Los Angeles Region (RWQCB - LA) identified only two locations at which storm water runoff may have adversely affected receiving water quality. Those two areas are currently under investigation by Port of Long Beach Staff. The results of that investigation will be communicated to the RWQCB-LA when they are available. If that investigation confirms that receiving waters have been affected by storm water discharges, all SWPPPs and BMPs will be re-evaluated and revised as appropriate.**

11. a. Did you collect storm water samples (Section B.5.d)? X Yes __ No
    If No, explain why you were unable to collect samples.

    b. How many storm water discharge points does your facility have? **Per an agreement with RWQCB-LA, the Port of Long Beach monitors storm water discharges at 20 stations in the receiving waters.**

    c. If you collected samples, did you monitor all storm water discharge points (Section B.11)? __ Yes X No **See 11(b).** If No, have you documented in your monitoring program that the storm water discharges from different locations are substantially identical? __ Yes X No **See 11(b).**
    If No, please update your monitoring program and provide the documentation as an addendum to this report.

    d. Please complete the table provided on page 5 of this report for each discharge point monitored. You should copy page 5 if you will need additional blank tables. Add to the list of constituents any toxic or other pollutants included in your monitoring program.

    e. Is your facility identified under Category 1 of Attachment 1 of the General Permit as a facility that is subject to Federal Effluent Storm Water Guidelines? __ Yes X No **None of the facilities covered by the Port of Long Beach NOI are identified under Category 1 of Attachment 1.**

    If Yes, please provide the following information. If No, please proceed to the next question.

    - The Guidelines for your facility are listed in 40 CFR Subchapter N, Part ___.
    - Were samples collected in accordance with the Federal requirements? ___ Yes ___ No

    If No, please provide an explanation. If Yes, please answer the following:

    Did the sample analytical results indicate that any of the applicable effluent limits had been exceeded?
    X Yes __ No

    If Yes, please provide the following information for each pollutant exceeding the effluent limitation:

    - Storm Water Discharge Point sample collected
    - Constituent analyzed
    - Federal Storm Water Effluent Guidelines
    - Sample Result
    - A brief explanation

12. Do you certify (as indicated on page 4) that, based on your annual site inspection, your facility is in compliance with the requirements of the Permit and your SWPPP? X Yes __ No

Subject: Storm Water Discharge Monitoring Annual Report

Reference: 4B19S003628

Dear Mr. Pumford:

Attached is the Port of Long Beach Storm Water Discharge Annual Report for the period July 1, 1993 to June 30, 1994. The report summarizes the Port's visual monitoring program and sampling results, and certifies the Port's compliance with the General Permit.

If you have any questions, please contact Stacey Crouch, Project Manager, at (310) 590-4160.

Sincerely,

Geraldine Knatz, Ph.D.

1994 ANNUAL REPORT
STORM WATER DISCHARGE MONITORING
IN THE LONG BEACH HARBOR DISTRICT

INTRODUCTION

This report is a summary of the results of the non-point source water quality monitoring program implemented by the Port of Long Beach (POLB), covering the monitoring period from 1 July 1993 to 30 June 1994. This program was initiated in response to the requirements for an annual report in the STATEWIDE GENERAL PERMIT - WQ ORDER NOS. 91-13-DWG & 92-12-DWG (NPDES CA000001). The completed annual report questionnaire from the Regional Water Quality Control Board (RWQCB) is attached as Appendix 1 of this report.

The Long Beach Harbor District encompasses approximately 2,945 acres; however, 525 acres are federal lands, while approximately 2,420 acres are controlled and under the jurisdiction of the Port of Long Beach. This report addresses only the Long Beach Harbor District.

ENVIRONMENTAL SETTING

The Long Beach-Los Angeles Harbor complex encompasses approximately 6,000 acres at the southeastern base of Palos Verdes Peninsula in Los Angeles County (Figure 1). It is bounded on the landward side by the cities of San Pedro, Wilmington, and Long Beach and to seaward by the San Pedro, Middle, and Long Beach breakwaters. Two major drainage channels, Dominguez Channel and the Los Angeles River, discharge into the harbor, and the San Gabriel River discharges just south of Alamitos Bay.

Long Beach Harbor is composed of the Inner, Middle, and Outer Harbors. The Inner Harbor comprises Cerritos Channel, a turning basin, and Channels Two and Three. Middle Harbor consists of West Basin, which supports the Naval complex, and East Basin, which supports Piers D, E, F, G, and H. Long Beach Outer Harbor, used for anchorage and maneuvering, is a large semi-enclosed basin contiguous with Los Angeles Outer Harbor. Queen's Gate, between Middle and Long Beach breakwaters, is the main entrance to the Port of Long Beach.

NON-POINT SOURCES OF POLLUTION

Terminal Island and the areas bordering the harbor serve many diverse industries including a variety of cargo terminals, the Terminal Island Treatment Plant, the Long Beach Generating Station, petroleum refineries, manufacturing plants, and other potential sources of materials that may affect the harbor water quality. Non-point or diffuse sources that carry contamination into Los Angeles-Long Beach Harbor include aerial fallout, surface runoff, advective transport, and boating and shipping activities.

A potentially large source of contaminants is surface runoff, which enters Long Beach-Los Angeles Harbor via the drainage channels of the Los Angeles and San Gabriel Rivers and the Dominguez Channel and from runoff from the piers and docks. About 70% of this discharge occurs during storms (MBC 1988) and contains organic matter, inorganic debris, dissolved minerals and nutrients, pesticides and herbicides, oils and grease, and many other industrial and domestic discharges (EPA 1977).

Contaminants from any of these sources may adversely affect the water quality of the harbor.

STATION LOCATIONS

The POLB harbor complex is characterized by 164 storm water outfalls that discharge to harbor waters. The RWQCB requirements are to collect grab samples within 30 minutes of a

VOL 17
00030
R0061870

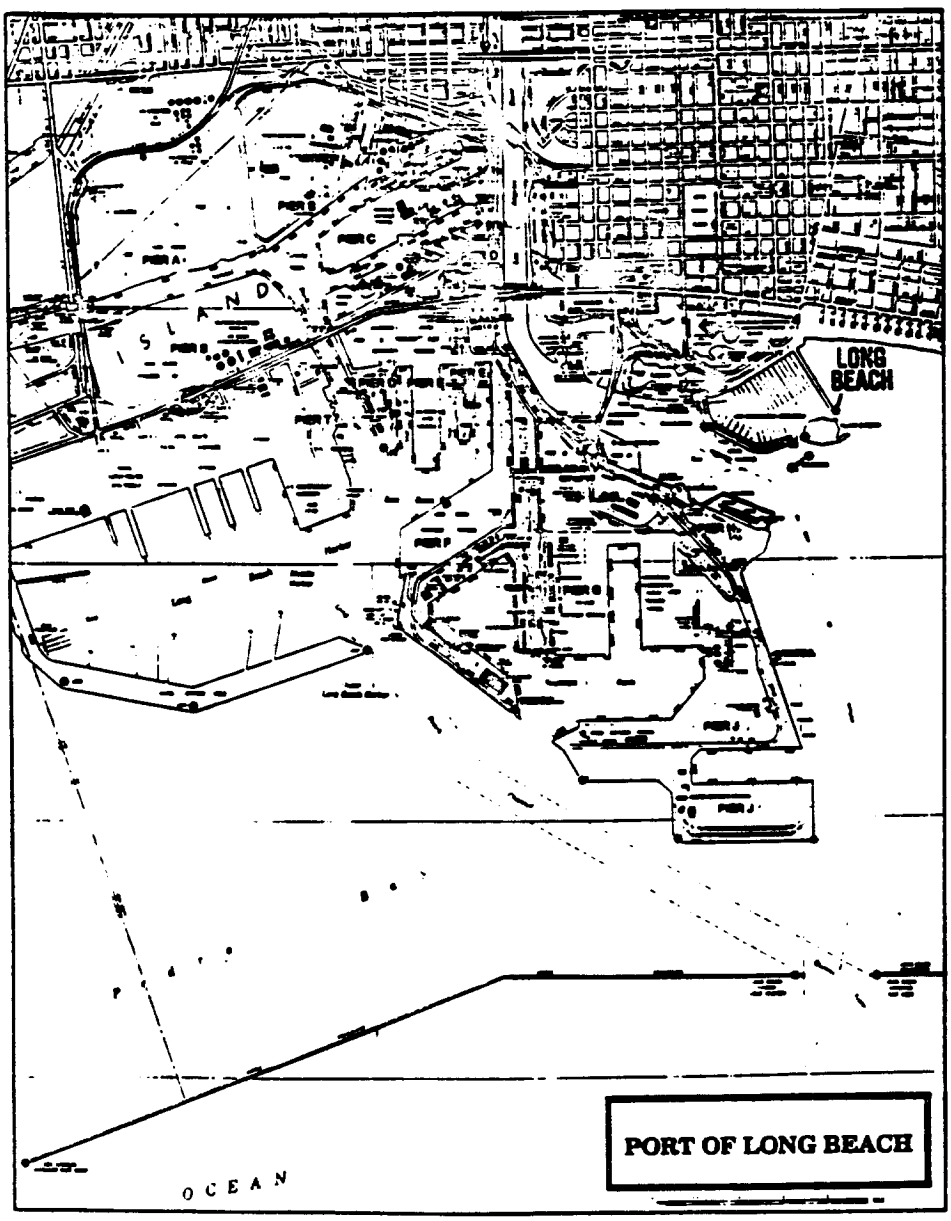

Figure 1. Map of the vicinity of the Port of Long Beach.

VOL 17 00003 1

R0061871

significant storm event (continuous discharge of storm water for approximately one hour or more). Because it is impractical to sample every outfall within the first half hour following a major storm water event, a broad-based approach which could determine the presence or absence of contaminants in specific areas of the harbor complex following a storm was proposed to and approved by, the Los Angeles Regional Water Quality Control Board. This receiving water sampling program will not only determine areas of the harbor that may receive contaminants from storm drains, but will also identify contaminants that may run off the piers and wharfs in the harbor. Results from this program may be utilized to focus an investigation into a specific area of the harbor should any contaminants be detected above RWQCB permitted levels. With the concurrence of the RWQCB, a plan incorporating sampling at 20 stations throughout the harbor was developed (Figure 2).

The appropriate analytical testing at each station necessary for the monitoring program was determined by review of all the Storm Water Runoff Facility Questionnaires submitted by the various tenants engaged in manufacturing or industrial activities. Other potential contaminants specified by the RWQCB were also included in the sampling design.

Station 1 is located at the mouth of the Los Angeles River, mid-way between the Magnolia Bridge and the Queen Mary, Station 2 is opposite the south side of Pier J, and Station 3 is located in the slip of the newly constructed Pier J facility. Six stations are located in Southeast Basin (Stations 4 through 9). Stations 10 and 11 are located in the Long Beach Channel adjacent to Pier F. Stations 12 through 16 are located in the Middle Harbor. Stations 17 and 18 are located in the middle of Channels Three and Two and Station 19 is located in the Inner Harbor between the Heim Bridge in the Cerritos Channel and the entrances to Channel Two and Three. Station 20 is located in the Outer Harbor south of the U.S. Navy Mole.

DATA COLLECTION AND ANALYSIS

Analytical parameters, the stations where each was measured, and detection limits are listed in Table 1. The first of two dry-season samplings was preceded by several months of no rainfall and was conducted on 12 August 1993 between 0900 and 1410 hrs. The second dry season survey was performed on 2 September between 0910 and 1530 hours. Two wet weather sampling episodes were conducted during winter 1994. The first took place between 2248 hrs on 24 January and 0128 hrs on 25 January, and the second between 1143 and 1418 hrs on 7 February. In accordance with the provisions of the POLB storm monitoring plan, the storm monitoring surveys were conducted during winter storms which occurred after several days or weeks of no precipitation. Both storms produced significant water runoff into the flood control channels and the rivers, and from the various docks, wharfs, and piers within the harbor.

Samples were collected by a trained crew familiar with analytical chemistry collection techniques in a small vessel deployed into Long Beach Harbor. All water samples for each parameter were collected with a Van Dorn bottle from the water surface. New sample containers were cleaned and prepared prior to sampling using laboratory clean-techniques appropriate for the various parameters analyzed. All collected samples were labeled and placed on ice for immediate transport to the analytical laboratory.

Quality assurance and quality control (QA/QC) procedures were initiated prior to sampling. Approximately 10% of all samples were randomly resampled. Prior to sampling, a random number generator was used with the station designation numbers to determine which of the 20 stations would be resampled for each parameter. These QA/QC sample containers were labeled Stations A and B and were submitted to the analytical laboratory with the other samples labeled Stations 1 through 20. The laboratory was not apprised of the sampling location for the QA/QC bottles labeled A and B.

Table 1. Analyses parameters, detection limits, EPA Method and stations where each was measured.

Parameter	Detection Limit	EPA Method	Stations where measured
Total organic carbon	1.0 mg/l	415.2	all
Total suspended solids	5.0 mg/l	160.2	all
Total recoverable petroleum hydrocarbons	1.0 mg/l	418.1	all
Benzene, toluene	0.3 µg/l	CA DHS - Mod. 8020	1-10, 13-18
Ethylbenzene, xylene	0.5 µg/l	CA DHS - Mod. 8020	1-10, 13-18
Metals	0.002-0.5 mg/l	6010, 7060, 7191, 7196, 7421, 7470, 7740	1-10, 14-18
Surfactants	0.5 mg/l	425.1	1-2, 4-6, 13 (Sept: 3, 4, 6, 11, 15)
Sulfide	0.5 mg/l	376.2	9
Volatile organics	2-10 µg/l	8240	17-18
Semi-volatile organics	10-100 µg/l	8270	17-18
Extractable fuel hydrocarbons	0.5 mg/l	CA DHS - Mod. 8015	17-18
Volatile fuel hydrocarbons	5.0 mg/l	CA DHS - Mod. 8015	17-18

The field log sheets with station designations, surface observations, chemical parameters sampled, and sampling duration are archived and are available at the POLB in separate Storm Water Reports for each survey. Complete laboratory reports on parameters analyzed, including QA/QC method blanks, and spike analyses are also available in the Storm Water Reports.

RESULTS

Two dry season and two wet weather monitoring episodes are included in this annual report for the storm water monitoring plan. Sampling conditions and results of each of the monitoring episodes are described in the following text.

DRY SEASON MONITORING

August Sampling Parameters

The dry season sampling on 12 August 1993 was preceded by several months of no significant rainfall; the most recent had occurred three months before on 5 May 1993. During sampling, winds were from the west to southwest at 3 to 10 knots (kn) most of the day and seas were flat in the morning, increasing to a light chop by mid-day.

August Surface Observations

Due to the dry weather conditions, most drains had no visible discharges. The one exception was between Stations 6 and 7 in the Southeast Basin, where a 24 inch pipe was discharging 2 to 3 gallons per minute. Small discharges were noted from ships near Stations 9, 14, and 20.

No odors, oil, grease, or turbid or color patches were noted at any station. Floating trash (paper) was seen at Station 1, at the mouth of the Los Angeles River.

VOL 17
000034
R0061874

September Sampling Parameters

The dry season sampling on 2 September 1993 was preceded by several months of no significant rainfall; the most recent had occurred four months prior. During sampling, winds were calm during the morning, but increased to 10 knots in the afternoon. Swells were non-existent in the morning, but increased to a light chop by mid-day.

September Surface Observations

Due to the dry weather conditions, no drains seen during the survey had visible discharges.

No odors, oil, grease, or turbid or color patches were noted at any station. Floatables in the form of styrofoam trash were seen at Stations 1, 3, and in the Southeast Basin.

WINTER STORM MONITORING

The early winter storm season was characterized by a series of fast moving storms that either skirted the edge of the Los Angeles basin or moved through so fast that little rain and almost no runoff occurred.

Based on NOAA weather information, indicating approaching storms expected to produce significant runoff, and contact with the Harbor Masters office in Long Beach Harbor, sampling crews were placed on standby and dispatched to the harbor on 11 and 23 November 1993. Rainfall was predicted to be significant; however, in each case the storm lost strength and produced inadequate rainfall to cause storm drains to flow or cause runoff from the piers and wharfs. Again on 11, 18, and 27 December 1993 crews were placed on standby. Samples were collected during the 11 December cruise, but based on the insignificant amount of rain (much less than 0.25 inches) and the absence of fresh water in any of the samples, which would have indicated runoff in the harbor, the samples were discarded. The next predicted-to-be-major storm occurred on 24 and 25 of January 1994. Crews were again dispatched to the harbor and deployed to collect samples. Although rainfall was light, approximating 0.25 inches, the storm was deemed relevant as it characterized the first three months of the winter sampling period and the potential for a much stronger storm appeared remote. Two weeks later, on 7 February, the first large storm of the season hit the Los Angeles Basin. This storm was also sampled as it produced substantial runoff.

January Storm Sampling Parameters

During the day on Monday, 24 January, there was a light drizzle for several hours, which increased to heavy rain around 2100 hrs, and then decreased to a drizzle or light rain later that evening and during most of the sampling period. According to published weather service reports, approximately 0.22 inches of rain fell during the storm.

Winds were blowing from the west at 1 to 6 kn during most of the sampling but were up to 15 to 18 kn just after midnight and 8 to 10 kn around 0130 hrs. Seas were mostly flat with 1 to 2 ft chop when winds were greatest.

January Storm Surface Observations

Runoff was observed from several piers and storm drains. Water was dripping through or off the wharfs at Stations 4, 6, 7, and 14 and was flowing from drains at Stations 2, 5, 10, 12, 13, 14, 15, and 18.

VOL 17 000035

R0061875

A petroleum odor was present near a fuel barge at Stations 8 and 9; no odors were detected at any of the remaining stations. Visible turbidity was present at most stations while clear water was noted at Stations 3, 4, 7, 8, 9, 17, and 19. Floating trash was observed at Stations 5, 11, 12, and 15.

February Storm Sampling Parameters

A light rain fell on Saturday, 5 February, followed by intermittent rain beginning Sunday evening and continuing into Monday, 7 February. A heavy rain began around 1100 hrs on Monday which decreased to a light rain during sampling in the afternoon. Published weather service reports on rainfall totaled 1.58 inches for the storm.

February Storm Surface Observations

Runoff was flowing from drains at most stations and dripping through wharfs in some areas. Greatest flow from drains was seen at Stations 6 and 19 (approx. 100 gal/min) and Station 18 (approx. 50 gal/min). Most areas of the harbor were turbid from the runoff and many areas contained trash or floating wood and algae.

HYDROGEN ION CONCENTRATION (pH)

Hydrogen ion concentrations (pH) in August were nearly uniform among all stations ranging from 8.10 to 8.25 (Table 2). All values were normal for Long Beach Harbor and the Southern California Bight in general. QA/QC results were within 0.02 units between the two samples at each station.

In January, pH values were again nearly uniform among all stations ranging from 8.13 to 8.25 (Table 2). The slightly lower readings found at several stations in East Basin and Inner Harbor, (i.e., Stations 12 through 19) were probably the result of rainwater on the surface. QA/QC results for the two stations randomly selected were nearly identical to the values determined for the station samples.

Values were lower in February than in August and January due to the influx of rainwater. With the exception of Station 1, pH values were very similar among all stations, ranging from 7.91 to 8.09 (Table 2). Station 1 is influenced by flow from the Los Angeles River and the lower pH (7.37) is due to the greater input of fresh water. The QA/QC results verified the lower pH recorded at that station.

CONDUCTIVITY and SALINITY

With the exception of Station 1, conductivity measurements in August varied only slightly, from 49.2 to 50.6 (Table 2), and correspondingly, salinity ranged from 32.3 to 33.3 ppt which is normal for seawater in the Southern California Bight. Measurements indicated a fresh water lens only at Station 1 (31.1 ms/cm; 19.4 ppt) at the mouth of the Los Angeles River, and a slight influx of fresh water at Station 2 (49.2 ms/cm; 32.3 ppt). QA/QC results for the two stations selected correlated well with the values determined originally and were within 0.2 ms/cm (0.2 ppt).

During the January storm, measurements were lowest at Station 1 and indicated that a fresh water lens was present on the surface (Table 2). Conductivity, and therefore, salinity, were also slightly lower at Stations 2 and 3 near the mouth of the Los Angeles River, and at Station 18 in Channel Two. All other measurements were relatively similar among the remaining 16 stations during the survey. No station other than Station 1 had a salinity below 31 ppt. QA/QC results for the two stations randomly selected were similar to those determined for the station samples.

PHYSICAL AND CHEMICAL ANALYTICAL RESULTS

* an anomalous reading resulted from ice water leaking into the broken jar
nd = not detected

Conductivity measurements indicated that a fresh water lens was present on the surface in varying degrees at many stations during the February storm; salinity ranged from 6.8 ppt at Station 1 near the Los Angeles River mouth to 32.6 ppt at Station 20 in the Outer Harbor. Measurements were also low at Station 6 where one of the largest drain flows was found. QA/QC results for the two stations randomly selected were almost identical to the values determined for the station samples.

TOTAL SUSPENDED SOLIDS

Total suspended solids (TSS) levels in August varied widely in POLB, ranging from 69 to 270 mg/ℓ, but averaging less than 115 mg/ℓ (Table 2). Highest levels were found at Station 3 in the new Pier J slip, Station 11 near the entrance to Middle Harbor, and Station 13 in East Basin. No spatial trends were evident in highest and lowest levels. Compared to the original samples, QA/QC results at Station 14 were similar, while at Station 4 concentration in the QA/QC sample was higher.

TSS in January ranged from 38 to 70 mg/ℓ (Table 2). Station 18, which had second lowest salinity, had the highest TSS indicating the influence of turbid runoff. QA/QC results corroborated the station analytical results.

During the February storm, TSS levels ranged from 32 mg/ℓ at Station 3 near Pier J to 140 mg/ℓ at Station 18 near one of the drains with greatest flow (Table 2). The QA/QC result for

VOL 17 000371
R0061877

one of the two stations randomly selected was lower than the station sample results, probably reflecting the overall variability and incomplete mixing of the runoff with the seawater.

TOTAL ORGANIC CARBON

Total organic carbon (TOC) was detected at five stations in August, three in original samples and two in QA/QC samples taken from different stations (Table 2). Detected levels ranged from 2.0 to 3.7 mg/ℓ and were from several areas in the POLB. All remaining stations had levels of organic carbon that were below the detection level of 1.0 mg/ℓ.

In January, TOC was detected only at Stations 1 and 2 near the Los Angeles River mouth (Table 2). All remaining stations had levels of organic carbon that were below the detection level of 1.0 mg/ℓ. QA/QC results were also below detection levels.

TOC was detected in February at Stations 1, 2, and 3 near the Los Angeles River mouth and near Pier J (Table 2). QA/QC sample results corroborated station analytical results, as TOC was also detected in the QA/QC sample from Station 3, but not in that from Station 19.

BENZENE, TOLUENE, ETHYLBENZENE, XYLENE (BTEX)

Traces of benzene and xylene were found at Station 3 in August and toluene was found at Stations 1 and 3 (Table 3). None of these parameters were detected at any of the other stations sampled or in the QA/QC samples. When Station 3 was resampled during the September dry season sampling, none of these constituents were detected.

During the January storm, traces of benzene, toluene, ethylbenzene, and xylenes were found at many of the stations (Table 3). Highest levels were found at Station 1 near the Los Angeles River mouth, Station 10 outside Southeast Basin, and at Station 14 in East Basin. None were detected at Stations 17 and 18 in the Inner Harbor. QA/QC results for the two stations randomly selected were similar to the values determined for the station samples.

Traces of benzene, toluene, ethylbenzene, and xylenes were also found during the February storm at stations near the Los Angeles River mouth, and in the Southeast and East Basins (Table 3). QA/QC results corroborated well with the original samples, having similar levels or being undetected.

TOTAL RECOVERABLE PETROLEUM HYDROCARBONS (TRPH)

No petroleum hydrocarbons were detected in August or January at any station. QA/QC results were also undetected (Table 3).

In February, petroleum hydrocarbons were detected at Stations 6, 12, and 18 (Table 3), and were highest at Station 18 in the Inner Harbor. QA/QC results were undetected, confirming results from the corresponding station samples.

METALS

Of the seventeen metals assayed, none were detected during the August sampling at any station, including the QA/QC stations.

In January only zinc was detected (Table 4). Detected levels were similar among the stations, but were slightly higher near the Los Angeles River mouth at Stations 1 and 2 and near Pier G at Station 6. QA/QC results corresponded well with those for the station samples.

nd = not detected; - = not sampled

Again in February, zinc was the only metal detected in water samples (Table 4). Highest levels were at Stations 6 and 18 which had rapidly flowing drains. The QA/QC result was nearly identical to that determined for the station samples.

SURFACTANTS

Surfactants (methyl blue active substances) were recorded at five of the six stations analyzed during the August dry season sampling including the QA/QC sample from Station 6 (Table 4). During the September dry season sampling, samples from three previously sampled stations and two additional stations were analyzed for surfactants. All five of these stations had detectable levels, though in lower concentrations than found in August, indicating that surfactants were widespread in the POLB during this time period.

Surfactants were detected in January at all six stations, at similar levels (Table 4). The QA/QC results for the one station randomly selected was close to the result determined from the sample taken at that station.

In February five of the six stations had detectable levels ranging from 0.55 to 0.71 mg/l (Table 4). Surfactants were undetected at Station 1 and in the corresponding QA/QC sample.

SULFIDES

Sulfides, measured only at Station 9, were not detected in any of the three surveys (Table 4).

VOLATILE AND SEMI-VOLATILE ORGANICS EXTRACTABLE AND VOLATILE FUEL HYDROCARBONS

Stations 17 and 18 were sampled for volatile and semi-volatile organics and extractable and volatile fuel hydrocarbons in August, January, and February. No levels of any of these parameters were present above detection limits at either of the two stations during August or January.

In February a fuel hydrocarbon with a chain length of between 14 and 40 carbons was detected at Station 18 (Table 4). A semi-volatile organic compound, pentachlorophenol, was also found at this station.

EFFECTIVENESS OF STORM WATER POLLUTION PREVENTION PLAN

Two dry season and two wet season monitoring episodes have been conducted, three of which, in addition to making surface observations, sampled 20 discrete receiving water points in the harbor. Both the dry season and the storm water episodes detected contaminants in the harbor waters at several locations. As two of the sampling periods were conducted during periods of heavy storm water runoff, it is likely that the detected contaminants reflected the input of non-point source runoff. Two of the locations are near the Los Angeles River mouth, and are probably not affected by runoff from POLB. The detection of surfactants during the first dry season survey at many of selected stations resulted in several stations being randomly resampled during the September dry season monitoring survey. The results from the September survey indicated that surfactants were throughout the harbor and probably did not emanate from a single source. The

VOL 17 000040

R0061880

detection of traces of benzene and xylene at Station 3 during the August monitoring survey and toluene at both Stations 1 and 3 also resulted in the areas being resampled during the September dry season monitoring survey. The absence of any discharge into the slip area at Station 3, and the detection of toluene, also, at the river station and the subsequent non-detection of these contaminants during the resampling indicated these contaminants probably did not originate from the POLB facilities. The probable sources of these contaminants are unauthorized bilge discharges which contain such contaminants as oil, fuel, soap and other cleaning fluids from the thousands of boats and ships that utilize the harbor on a daily basis.

Stations nearest the Los Angeles River had highest levels of many contaminants and the greatest influx of runoff as indicated by lower salinity. Concentrations of zinc (in January and February) and of toluene and xylene (in January) were higher near the River than at most other stations. Organic carbon was found almost exclusively near the River. Lower salinity, indicating the influx of fresh water, characterized Stations 1, 2, and 3, and was apparent even during the dry season at Station 1 as well as during the winter storms.

Stations 10 (in the channel outside Pier F) and 14 (in East Basin near Pier E) in January had the highest levels of benzene, toluene, ethylbenzene and xylene, although flowing drains were noted near these stations, salinity was not noticeably affected by a fresh water influx indicating a source other than runoff.

Station 6, in Southeast Basin near Pier G, had reduced salinity in February and the highest concentration of zinc, and detectable levels of toluene, xylene, and petroleum hydrocarbons.

Total suspended solids (TSS) were higher during the dry season August sampling (69 to 270 mg/l) than during the winter 1994 storm sampling (41 to 107 mg/l). However these surveys all had lower TSS than those found during the 1993 storm sampling (160 to 590 mg/l).

Some contaminants were detected exclusively or primarily during storm episodes. These include zinc, benzene, toluene, ethylbenzene, xylene, petroleum hydrocarbons, and single occurrences of pentachlorophenol and a fuel hydrocarbon. During the summer dry season sampling none of the drains going into the harbor were found to be flowing (with the exception of a single drain in the southeast basin known to the RWQCB). Therefore, the detection of surfactants throughout the harbor and of benzene, toluene, and xylene at Station 3, is an indication that sources other than surface runoff are responsible for the dry season detection of some contaminants. That surfactants occurred less often at Station 1 in the River Mouth than at stations within the harbor further indicates sources within the POLB.

The POLB has undertaken an investigation of the possible sources of these contaminants. This investigation will also assist the POLB in determining if the SWPPP needs to be revised to prevent potential future discharges. The results of this investigation will be communicated to the RWQCB when it is concluded.

APPENDIX

State of California & State Water Resources Control Board
Annual Report
for
Storm Water Discharges Associated with Industrial Activities

VOL 17 - 00000042

State of California
STATE WATER RESOURCES CONTROL BOARD

ANNUAL REPORT
for
STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES
1993-1994

An annual report is required to be submitted to your local Regional Water Quality Control Board (Regional Board) by July 1 of each year. This document must be certified and signed, under penalty of perjury, by the appropriate official of your company that the information provided in this report is true and complete (see Section C.9 of the General Permit). Retain a copy of the completed Annual Report for your records.

Many of the Annual Report questions, when answered "NO", require an explanation. Please provide explanations on a separate sheet as an attachment. As necessary, include a discussion of what actions have or will be taken to bring the facility into compliance along with a time schedule for implementation of planned actions. If convenient, you may provide a single sketch or site plan that combines the sketch or site plan requirements under items 6, 7, 8, and 9(c) on pages 3 and 4.

If any information contained in items A, B, and C below is incorrect, please cross out or highlight the incorrect information (do not white out or erase) and provide the correct information next to or above the incorrect information.

If you have questions, please contact your Regional Board Storm Water Program Contact. The address of your Regional Board (where the Annual Report must be filed) along with the name and telephone number of the contact person is indicated below.

GENERAL INFORMATION (CONTINUED)

D. Is your facility part of a Group Monitoring Plan?

___ Yes _x_ No ***Port of Long Beach conducts monitoring for itself and all of its tenants but is not considered a "Group Monitoring Plan"***

If Yes, please answer the following questions:

- What is the Group Monitoring Plan's name: _____
- Is your facility designated to collect storm water samples?

___ Yes ___ No

E. Is your facility exempt from sample collection (Section B.9. of the General Permit?

___ Yes _x_ No ***Port of Long Beach currently conducts the required storm water monitoring***

If Yes, which of the following apply (check one):

___ Submitted Self-Certification to Regional Board. Date Submitted: _____

___ Received certification of local agency.

___ Received exemption by the Regional Board.

Attach, as appropriate, the first page of either the submitted self-certification, the local agency certification letter, or the Regional Board exemption letter.

R0061884

State of California
STATE WATER RESOURCES CONTROL BOARD

ANNUAL REPORT
for
STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES
1993-1994

SPECIFIC INFORMATION

1. Have you prepared a Storm Water Pollution Prevention Plan (SWPPP) as required in Section A of the Permit?
   _X_ Yes ___ No If No, attach explanation.

2. Have you implemented all elements of your SWPPP?
   _X_ Yes ___ No If No, attach explanation.

3. a. Have all non-storm water discharges (see page 10 for examples) been permitted or eliminated (Section A.6)?
   _X_ Yes ___ No
   If No, describe the non-storm water discharges that have not been permitted or eliminated.

   b. Have you reported all non-storm water discharges described above to the appropriate Regional Board office?
   _X_ Yes ___ No If No, attach report (see page 10 for instructions).
   If Yes, attach a copy of the first page of the previously submitted report.

   c. Does your SWPPP include Best Management Practices (BMPs) that address existing non-storm water discharges described above?
   _X_ Yes ___ No
   If No, revise your SWPPP and attach a brief description of the revisions.

4. Have you developed a monitoring program as required in Section B of the Permit?
   _X_ Yes ___ No If No, attach explanation.

5. Have you implemented all the elements of your monitoring plan?
   _X_ Yes ___ No If No, attach explanation.

6. Did you conduct an annual site inspection (Section B.5.a)?
   _X_ Yes ___ No If No, attach explanation. ***POLB staff will visit each site included in the NOI on an annual basis.***
   If Yes, attach a sketch or site plan of the facility showing areas inspected and provide the following for each area inspected: (you may use FORM 1 to report findings)

   - Date and time of inspection: See FORM 1
   - Name and title of inspector: Stacey E. Crouch, Environmental Specialist Associate
     Michael Jenkins, Administrative Intern
   - Summary of inspection findings. Evaluate if BMPs, as identified in the SWPPP, are in place and if additional BMPs are needed. Discuss corrective actions that are necessary.
     See FORM 1

R0061885

State of California
STATE WATER RESOURCES CONTROL BOARD

ANNUAL REPORT
for
STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES
1993-1994

SPECIFIC INFORMATION (CONTINUED)

7. Did you conduct at least one wet weather visual observation per month (Section B.5.c)?

___ Yes _x_ No If No, attach explanation.

Due to the extent and complexity of this facility, it is impractical to inspect all stormwater discharge locations during the first hour of one storm event each month. See FORM 2.

Attach a sketch or site plan of the facility showing the discharge locations observed, and provide the following information for each location: (You may use FORM 2 to report findings)

- Date and time of observation: See FORM 2
- Name and title of inspector
- Storm water flow characteristics observed. For example, was the flow discolored, very turbid; did it have an odor, evidence of floating or suspended material; did it have a sheen; or any other unusual characteristics? If any were observed, discuss the corrective actions taken or to be taken.

8. Did you conduct at least two dry season visual observations (Section B.5.b)?

_x_ Yes ___ No If No, attach explanation. ***Two surveys were conducted, the first in August and the second in September. See FORM 3.***

Attach a sketch or site plan of the facility showing the locations inspected, and provide the following for each location: (You may use FORM 3 to report observations)

- Date and time of observation: See FORM 3
- Name and title of inspector
- Observations of non-storm water flow or indications of prior non-storm water flow. Describe the flow characteristics, i.e., odor, color, etc., and possible source of flow, and corrective action taken. If no action has been taken, discuss what and when actions will be taken to eliminate the non-storm water discharge. Report these discharges in Item 3 above.

9. a. Did you collect storm water samples from at least two different storm events (Section B.5.d)?

_x_ Yes ___ No If No, attach explanation.

b. Did you collect samples from all storm water discharge points (Section B.11)?

___ Yes _x_ No

Due to the extent and complexity of this facility, it is impractical to inspect or monitor all stormwater discharge locations. A broad-based approach, approved by the RWQCB-LA, samples 20 stations in the harbor complex.

If No, have you documented in your monitoring program that the storm water discharges from different locations are substantially identical?

___ Yes _x_ No ***See above***

If No, revise your Monitoring Program and attach a brief description of the revisions.

c. How many storm water discharge points does your facility have? 164

Attach a sketch or site plan of the facility showing all storm water discharge points. If you did not sample all discharge points, indicate which discharge points were and were not sampled. **Refer to maps submitted with POLB NOI.**

d. Were all samples collected no more than 30 minutes after the storm water discharge began (Section B.12)?

___ Yes _x_ No If No, attach explanation. ***See 9(b)***

ANNUAL REPORT
for
STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES
1993-1994

SPECIFIC INFORMATION (CONTINUED)

10. Provide a summary of your sampling results. You may use FORM 4 to report findings. The summary should include the date and time of sample, constituents tested, who did the testing, the testing results, test method used, and test detection limit. Copies of the analytical results from the laboratory may also be provided, but are not required. For facilities subject to Federal Storm Water Effluent Limitation Guidelines, separately report the Federal Guidelines and the corresponding monitoring results. *See FORM 4*

11. Attach an evaluation of the overall effectiveness of the facility's SWPPP in reducing pollutants in storm water discharge. Consider the results of sampling and visual observation in this evaluation. Discuss specific areas or elements of the SWPPP that are not effective or need improvement. Provide a brief description of alternatives or proposed revisions to the SWPPP. *See attached report.*

12. Attach an evaluation of your monitoring program in detecting pollutants in storm water discharge. Discuss areas of the monitoring program that are not effective or need improvement. Provide a brief description of proposed revisions to the monitoring program. *See attached report.*

13. Do you certify that, based on your annual site inspection, your facility is in compliance with the requirements of the General Industrial Activities Storm Water Permit?

    _x_ Yes ___ No If No, attach explanation.

CERTIFICATION

I am duly authorized to sign reports required by the GENERAL INDUSTRIAL ACTIVITIES STORM WATER PERMIT (see Provisions C.9) and I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

1993-1994

SUPPLEMENTAL QUESTIONNAIRE (OPTIONAL)

We have received over 8000 NOIs for coverage under the STATEWIDE INDUSTRIAL GENERAL PERMIT. We have tried to make the program understandable and provide a workable means of implementing a complex set of new regulations. You may wish to spend a few minutes answering the following questions to tell us how we are doing.

You may send this form with your annual report. If you wish to submit it anonymously, please submit it separately.

1. Do you understand the GENERAL PERMIT and what it requires you to do?

   ___ Yes ___ No

2. Do you consider the GENERAL PERMIT an efficient and workable means to comply with the Clean Water Act and the Storm Water Permitting Regulations?

   ___ Yes ___ No

3. Have you had any contact (inspections, informational workshops, telephone inquiries) with staff of the Regional Water Boards or your local storm water management agency?

   ___ Yes ___ No
   If Yes, please indicate the type of contact made, and the date (if available) it was made. You may also wish to discuss the context in which the contact was made and if you were satisfied with the help or guidance received in response to your inquiry.

4. Did you (or your accounting office) understand the last ANNUAL FEE INVOICE?

   ___ Yes ___ No DID NOT RECEIVE INVOICE

5. Please use the space provided below (or an attachment) to suggest ways that we can improve and/or streamline our management of this program, or explain your responses made to the preceding questions.

FORM 4
SAMPLING RESULTS

DISCHARGE POINT: POLB

DATE AND TIME OF SAMPLE: 12 August 1993 0911-1410 TIME DISCHARGE STARTED: _____

CONSTITUENT TESTED	TESTED BY: LAB/SELF[1]	RESULTS [2]	TEST METHOD USED[3]	DETECTION LIMIT
pH		See following pages.		
TOTAL SETTLEABLE				
SPECIFIC CONDUCTANCE				
OIL & GREASE		mg/l		
TOTAL ORGANIC CARBON		mg/l		
ADDITIONAL POLLUTANTS:				
FLOW [4]		gallons		
SIZE OF STORM (IF AVAILABLE)		inches		

(1) If testing was done by a certified laboratory, indicate "lab"; otherwise, indicate "self".
(2) If analytical results indicate a value less than the detection limit (or non detect), show the value as less than the numerical value of the detection limit.
(3) Indicate the test method used to determine result. In cases where analyzers are used, indicate with an "A"
(4) Dischargers subject to the Santa Clara County General Permit are required to provide estimates or calculations of the volume of storm water discharged from each point. Describe, on a separate sheet, how the flow measurement was calculated.

SAMPLING RESULTS

DISCHARGE POINT: POLB

DATE AND TIME OF SAMPLE: 2 September 1993 1100-1330 TIME DISCHARGE STARTED: _____

CONSTITUENT TESTED	TESTED BY: LAB/SELF[1]	RESULTS [2]	TEST METHOD USED[3]	DETECTION LIMIT
pH		See following pages.		
TOTAL SETTLEABLE				
SPECIFIC CONDUCTANCE		umhos/cm		
OIL & GREASE		mg/l		
TOTAL ORGANIC CARBON		mg/l		
ADDITIONAL POLLUTANTS:				
FLOW [4]		gallons		
SIZE OF STORM IF AVAILABLE		inches		

(1) If testing was done by a certified laboratory, indicate "lab"; otherwise, indicate "self".
(2) If analytical results indicate a value less than the detection limit (or non detect), show the value as less than the numerical value of the detection limit.
(3) Indicate the test method used to determine result. In cases where analyzers are used, indicate with an "A"
(4) Dischargers subject to the Santa Clara County General Permit are required to provide estimates or calculations of the volume of storm water discharges from each point. Describe, on a separate sheet, how the flow measurement was calculated.

FORM 4
SAMPLING RESULTS

DISCHARGE POINT: POL8

DATE AND TIME OF SAMPLE: 7 February 1994 1202-1418 TIME DISCHARGE STARTED: _____

CONSTITUENT TESTED	TESTED BY: LAB/SELF(1)	RESULTS (2)	TEST METHOD USED(3)	DETECTION LIMIT
pH	See following pages.			
TOTAL SETTLEA				
SPECIFIC CONDUCTANCE		umhos/cm		
OIL & GREASE		mg/l		
TOTAL ORGANIC CARBON		mg/l		
ADDITIONAL POLLUTANTS:				
FLOW (4)		gallons		
SIZE OF STORM (IF AVAILABLE)		inches		

(1) If testing was done by a certified laboratory, indicate "lab"; otherwise, indicate "self".
(2) If analytical results indicate a value less than the detection limit (or non detect), show the value as less than the numerical value of the detection limit.
(3) Indicate the test method used to determine result. In cases where analyzers are used, indicate with an "A"
(4) Dischargers subject to the Santa Clara County General Permit are required to provide estimates or calculations of the volume of storm water discharged from each point. Describe, on a separate sheet, how the flow measurement was calculated.

Name of person collecting sample: DONALD D. JOHNSTON Title: SENIOR TECHNICIAN

FOR
STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITY
1993-1994

NON-STORM WATER DISCHARGES

The General Permit requires reporting of all unpermitted non-storm water discharges (discharges) to the appropriate Regional Board. If you answered "NO" in Item 3(b) of the Annual Report, you should report these discharges as an attachment to the Annual Report. Below is a brief description of what should be included in your report depending on if the discharges are associated with industrial activity.

Discharges Associated With Industrial Activity:
The General Permit is intended to prohibit discharges associated with industrial activity (e.g., vehicle/equipment wash water). If it is infeasible to immediately eliminate these discharges, you are required to report these discharges to the Regional Board. The report should identify and describe each discharge, explain why each discharge is infeasible to eliminate, include a time schedule for the elimination of each discharge (cannot exceed three years after your NOI submittal date), and include a justification for the time needed to eliminate the discharge. Regional Board staff may review your report and make modifications as appropriate.

Discharges Not Associated With Industrial Activity:
The General Permit was not intended to prohibit discharges that are not associated with industrial activity if the conditions provided by the General Permit Fact Sheet are met. Examples of discharges that may meet these conditions are landscape/lawn irrigation, air conditioning condensate, and fire hydrant testing. If the discharge does not meet the Fact Sheet conditions, the discharge is prohibited and must be reported as described above. If the discharge does meet the Fact Sheet conditions, the report should identify and describe the discharge, and explain briefly why the discharge meets the conditions. A permitting strategy for such discharges is being developed by the Regional Boards. Regional Board staff will review your report and notify you of any permitting requirements or discharge prohibitions as they are developed.

The list below contains examples of some common non-storm water discharges:

Boiler blow-down	Construction rinse down	Car washing
Floor washing	Non-contact cooling water	Tank drains
Boiler drains	Cooling tower back wash	Filter drains
Pavement washing	Evaporative cooling water	Window and building washing
Vehicle washing	Vehicle steam cleaning	Hydrostatic pressure vessel testing
Dust control water	Truck & Trailer washing	Aggregate pile cooling water
Ground water infiltration	Landscape/lawn irrigation	Fire Auxiliary (building sprinklers)
Foundation Drainage	Air compressor condensate	Water line cleaning
Collected rainwater	Air conditioning condensate	Fire Fighting (emergency only)
Well test pumping	Refrigeration unit condensate	Ground water discharges
Fire hydrant testing	Municipal water supply well development

SUPPLEMENTAL QUESTIONNAIRE (OPTIONAL)

We have received over 8000 NOIs for coverage under the STATEWIDE INDUSTRIAL GENERAL PERMIT. We have tried to make the program understandable and provide a workable means of implementing a complex set of new regulations. You may wish to spend a few minutes answering the following questions to tell us how we are doing.

You may send this form with your annual report. If you wish to submit it anonymously, please submit it separately.

1. Do you understand the GENERAL PERMIT and what it requires you to do?

   ____ Yes ____ No

2. Do you consider the GENERAL PERMIT an efficient and workable means to comply with the Clean Water Act and the Storm Water Permitting Regulations?

   ____ Yes ____ No

3. Have you had any contact (inspections, informational workshops, telephone inquiries) with staff of the Regional Water Boards or your local storm water management agency?

   ____ Yes ____ No
   If Yes, please indicate the type of contact made, and the date (if available) it was made. You may also wish to discuss the context in which the contact was made and if you were satisfied with the help or guidance received in response to your inquiry.

4. Did you (or your accounting office) understand the last ANNUAL FEE INVOICE?

   ____ Yes ____ No DID NOT RECEIVE INVOICE

5. Please use the space provided below (or an attachment) to suggest ways that we can improve and/or streamline our management of this program, or explain your responses made to the preceding questions.

ANNUAL REPORT

FOR
STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES

Reporting Period July 1, 1995 through June 30, 1996

An annual report is required to be submitted to your local Regional Water Quality Control Board (Regional Board) by July 1 of each year. This document must be certified and signed, under penalty of perjury, by the appropriate official of you company. Many of the Annual Report questions require an explanation. Please provide explanations on a separate sheet as an attachment. **Retain a copy of the completed Annual Report for your records.**

If any information contained in Items A, B, and C below is incorrect, please cross out or highlight the incorrect information (do not white out or erase) and provide the correct information next to or above the incorrect information.

If you have any questions, please contact your Regional Board Storm Water Program Contact. The address of your Regional Board (where the Annual Report must be filed) along with the name and telephone number of the contact person is indicated below.

ANNUAL REPORT

FOR
STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES

SPECIFIC INFORMATION

STORM WATER POLLUTION PREVENTION PLAN

1. Have you developed (and updated) a Storm Water Pollution Prevention Plan (SWPPP), as required in Section A of the General Permit?

   _X_ Yes ___ No If No, attach an explanation and time schedule for SWPPP development.

2. Have you implemented all elements of your SWPPP?

   _X_ Yes ___ No If No, attach an explanation and time schedule for SWPPP implementation.

NON-STORM WATER DISCHARGES

3. Section A.6 of the General Permit requires that non-storm water discharges be eliminated or permitted.

   a. Does your facility have any non-storm water discharges (see page 7 for examples)?

      _X_ No Go to Question 4.

      ___ Yes Please list: _____

      _____

   b. Have any of the non-storm water discharges been permitted by a State or local agency?

      ___ No ___ Yes If yes, on a separate sheet, identify the non-storm water discharge, agency that permitted the non-storm water discharge, and the permit number.

   c. Attach a description for each non-storm water discharges listed in 3.a that has <u>not</u> been permitted. At a minimum, this description should answer the following:

      - What is the source of the non-storm water discharge?
      - What are the characteristics of the non-storm water discharge (odor, color, frequency, flow rate, potential pollutants, etc.)?
      - What areas of your facility does the non-storm water discharge contact?
      - Has the non-storm water discharge been previously reported to the Regional Board?
      - Why hasn't the non-storm water discharge been eliminated?
      - When is the non-storm water discharge scheduled to be eliminated?

   d. Does your SWPPP include Best Management Practices (BMPs) that address the non-storm water discharges described in 3.c?

      _X_ Yes ___ No If No, revise you SWPPP and attach a brief description of the revisions.

STATE WATER RESOURCES CONTROL BOARD

1995-1996

ANNUAL REPORT

FOR
STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES

MONITORING AND REPORTING PLAN

4. Section B.5.a of the General Permit requires you to conduct an annual site inspection. Did you conduct an annual site inspection?

   _X_ Yes If Yes, use FORM 1 (page 9) to report findings or provide the following for each area inspected:

   - Date and time of inspection.
   - Name and title of inspector.
   - Summary of inspection findings. Evaluate if all sources of storm water pollutants have been identified in the SWPPP; if the BMPs identified in the SWPPP to address these sources of pollutants are in place and effective; and whether additional BMPs are needed. Discuss corrective actions that are necessary.

   ___ No If No, attach an explanation.

5. Section B.5.b of the General Permit requires you to conduct visual observations of all discharge locations at least twice during the dry season (May through September). How many dry season observations did you conduct?

   ___ None, attach an explanation why no dry season visual observations were conducted.

   ___ One, attach an explanation why only one dry season visual observation was conducted.

   ___ Two

   _X_ More than two

   For each dry season visual observation conducted, use FORM 2(page 10) to report observations or provide the following for each discharge location:

   - Date and time of observation.
   - Name and title of inspector.
   - Observations of non-storm water discharge or indications of prior non-storm water discharge. Describe the discharge characteristics, i.e. odor, color, etc., and possible source of discharge, and corrective action taken. If no action has been taken, discuss what and when actions will be taken to eliminate the non-storm water discharge. Report all non-storm water discharges in item 3 above.

6. Section B.5.c of the General Permit requires you to conduct visual observations of all discharge locations for at least one storm per month during the wet season (October through April). How many months during the wet season did you conduct visual observations? _12_. If you did not conduct visual observations in each month of the wet season, attach an explanation.

   For each wet season visual observation, use FORM 3 (page 11) to report observations or provide the following information for each discharge location:

   - Date and time of observation.
   - Name and title of inspector.
   - Storm water discharge characteristics observed. For example, was the discharge discolored, very turbid; did it have an odor, evidence of floating or suspended material; did it have a sheen; or any other unusual characteristics? If any were observed, discuss the corrective actions taken or to be taken.

SAMPLING AND ANALYSIS

7. a. Is your facility part of a Group Monitoring Plan? (Only facilities that have received prior approval are part of a group monitoring plan.)

___ Yes _X_ No

If No, go to Question 8.
If Yes, answer the following questions:

Port of Long Beach conducts monitoring for itself and all of its tenants but is not considered part of a "group monitoring plan."

b. What is the Group Monitoring Plan's name? _____

c. Is your facility designated to collect storm water samples?

___ Yes ___ No

If Yes, go to Question 9.
If No, go to Question 10.

8. a. Is your facility exempt from sample collection (Section B.9 of the General Permit)? (Only facilities that have received prior Self-certification approval are exempt from sampling. Facilities participating in a Group Monitoring Plan cannot be self-certified)

___ Yes _X_ No

Port of Long Beach currently conducts the required storm water monitoring.

If No, go to Question 9.

b. If Yes, which of the following apply (check one):

___ Submitted Self-certification to Regional Board. Date Submitted: _____
___ Received certification of local agency.
___ Received exemption by the Regional Board.

Attach, as appropriate, the first page of either the submitted self-certification, the local agency certification letter, or the Regional Board exemption letter.

9. Section B.5.d of the General Permit requires that storm water samples from at least two storms be collected and analyzed.

a. How many storms did you sample? _2_
If you did not sample any storms, or only sampled one storm, attach an explanation.

b. How many storm water discharge points are located at your facility? _125_
Did you sample from every discharge point?

___ Yes _X_ No

If you did not sample from every discharge point, attach an explanation why you did not or attach a justification as to why certain discharge points are substantially identical.

ANNUAL REPORT

FOR
STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES

SAMPLING AND ANALYSIS (cont'd)

Due to the extent and complexity of this facility, it is impractical to inspect or monitor all stormwater discharge locations. A broad-based approach, approved by the RWQCB-LA, samples 20 stations in the harbor complex.

c. For each storm sampled, provide the following information:

	Number of Samples Taken	Number of Samples Analyzed and Reported	Constituents Tested and Reported
First Storm		See December sampling results in this report.	
Second Storm		See January sampling results in this report.	
Additional Storms			

If all samples from the first and/or second storms were not analyzed, provide an explanation.

d. Provide a summary of your sampling and analysis results. You may use Form 4 (page 12) to report your findings. The summary should include the date and time of sample, constituents tested, who did the testing, the testing results, test method used, and test detection limit. Copies of the analytical results from the laboratory should also be attached. Include a completed Form 4, or equivalent, for each sample analyzed.

For facilities subject to Federal Storm Water Effluent Limitation Guidelines, separately report the Federal Guidelines and the corresponding monitoring results. ***See Form 4.***

If past years analytical results are available, on a separate sheet, compare and evaluate the analytical results from the 1994-95 testing period with the analytical results from past years (are the pollutant concentrations increasing or decreasing and why; if a reason is known?). ***See Attached Report***

e. For each storm sampled, provide the following information:

	Was sample taken during the first 30 minutes?	Were there 3 days of dry weather before the storm?
First Storm	See report	See report
Second Storm	See report	See report
Additional Storms		

If you responded no to either of the above questions for the first or second storm, attach an explanation.

Due to the extent and complexity of the Port, it is impractical to sample all stations in the first 30 minutes of a storm.

STATE WATER RESOURCES CONTROL BOARD

1995-1996

ANNUAL REPORT

FOR
STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES

STORM WATER POLLUTION PREVENTION PLAN EVALUATION

10. Based upon the comparison and analysis of analytical data, visual observations, etc. from the time you submitted your Notice of Intent to comply with the General Permit; is your Storm Water Pollution Prevention Plan effective in reducing pollutants in your facility's storm water discharge? Discuss specific areas or elements of the SWPPP that are not effective or need improvement. Provide a brief description of alternatives or proposed revisions to the SWPPP. ***See Attached Report***

11. Provide a written evaluation of your monitoring program in detecting pollutants in storm water discharge. Discuss areas of the monitoring program that are not effective or need improvement. Provide a brief description of proposed revisions to the monitoring program. ***See Attached Report***

12. The General Industrial Activities Storm Water Permit requires that:

    - a Storm Water Pollution Prevention Plan be developed and implemented (Questions 1 and 2)
    - non-storm water discharges be eliminated, reported to the Regional Board, or permitted (Question 3)
    - an annual site inspection be conducted to determine the effectiveness of BMP's in reducing and/or eliminating sources of storm water pollution (Question 4)
    - two dry weather visual observations be conducted (Question 5)
    - wet weather visual observations be made once each month during the wet season (Question 6)
    - unless specifically exempted, samples be collected and analyzed from at least two storms (Question 9)

    If you have not completed all of the above requirements, please make sure you have attached an explanation for each requirement you have not completed.

    Do you certify, based on your annual site inspection that, your facility is in compliance with the requirements of the General Industrial Activities Storm Water Permit?

    _X_ Yes ___ No

13. Attach an updated site map showing the areas of industrial activity; the areas where visual inspections were done; all storm water discharge locations; and all storm water sampling locations.

Visual observations were conducted at all 125 discharge points. On maps previously submitted to the Board, the areas of visual observation coincide with the discharge points and areas of industrial activity. All storm water sampling locations are depicted and described in the attached report.

CERTIFICATION

I am duly authorized to sign reports required by the GENERAL INDUSTRIAL ACTIVITIES STORM WATER PERMIT (see Provisions C.9) and I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

VOL 17 000172

State of California
STATE WATER RESOURCES CONTROL BOARD

1995-1996

ANNUAL REPORT

FOR
STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES

NON-STORM WATER DISCHARGES

The list below contains examples of some common non-storm water discharges:

Boiler blow-down	Construction rinse down	Car washing
Floor washing	Non-contact cooling water	Tank drains
Boiler drains	Cooling tower back wash	Filter drains
Pavement washing	Evaporative cooling water	Window and building washing
Vehicle washing	Vehicle steam cleaning	Hydrostatic pressure vessel testing
Dust control water	Truck & trailer washing	Aggregate pile cooling water
Ground water infiltration	Landscape/lawn irrigation	Fire auxiliary (building sprinklers)
Foundation drainage	Air compressor condensate	Water line cleaning
Collected rainwater	Air conditiong condensate	Fire fighting (emergency only)
Well Test pumping	Refrigeration unit condensate	Ground water discharges
Fire hydrant testing	Well water discharges	

The General Permit requires reporting of all unpermitted non-storm water discharges (discharges) to the appropriate Regional Board. You should report these discharges as an attachment to the Annual Report (see item 3.c). Regional Board staff may review your report and make modifications as appropriate. When preparing your schedule for the elimination of each discharge, please remember that the General Permit requires the discharge to be eliminated within three years of NOI submittal date.

The General Permit was not intended to prohibit discharges that are not associated with industrial activity if the conditions provided by the General Permit Fact Sheet are met. Examples of discharges that may meet these conditions are landscape/lawn irrigation, air conditioning condensate, and fire hydrant testing. If the discharge meets the Fact Sheet conditions, the report should also explain briefly why the discharge meets the Fact Sheet conditions. A permitting strategy for such discharges is being developed by the Regional Boards. Regional Board staff will review your report and notify you of any permitting requirements or discharge prohibitions as they are developed.

1995-1996

ANNUAL REPORT

FOR
STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES

DESCRIPTION OF CONSTITUENTS TO BE MONITORED

The General Industrial Permit requires you to analyze storm water samples for at least four constituents. These are pH, Total Suspended Solids (TSS), Specific Conductance (SC), and Total Organic Carbon (TOC). Oil and Grease (O&G) may be substituted for TOC. In addition, you must monitor for any other pollutants which you believe to be present in your storm water discharge as a result of industrial activity. There are no numeric limitations for the constituents you test for.

The four constituents which the Permit requires to be tested are considered *indicators*. In other words they are nonspecific tests that will provide enough information to indicate whether or not pollutants are present in your storm water discharge. The following briefly explains what these parameters mean:

ph is a numeric measure of the hydrogen-ion concentration. The neutral, or acceptable range can be defined as 6.5 to 6.5. At values less than 6.5, the water is considered acidic; above 8.5 it is considered alkaline or basic. An example of an acidic substance is vinegar and a alkaline or basic substance is liquid antacid. Pure rain fall tends to have a pH of less than 7. There may be sources of materials or industrial activities which could increase or decrease the pH of your storm water discharge. If the pH levels of your storm water discharge are high or low, you should conduct a thorough evaluation of all sources at your site.

Total Suspended Solids (TSS) is a measure of the undissolved solids that are present in your storm water discharge. Sources of TSS include sediment from erosion of exposed land, and dirt form impervious (i.e. paved) areas. Sediment by itself can be very toxic to aquatic life because it covers feeding and breeding grounds, and can smother organisms living on the bottom of a water body. Toxic chemicals and other pollutants also adhere to sediment particles. This provides a medium by which toxic or other pollutants end up in our water ways and ultimately in human and aquatic life. TSS levels vary in runoff from undisturbed land. It has been shown that TSS levels increase significantly due to land development.

Specific Conductance (SC) is a numerical expression of the ability of the water to carry an electric current. SC can be used to assess the degree of mineralization, or estimate the total dissolved solids concentration of a water sample. Because of air pollution, most rain water has a SC above zero. A high SC could affect the usability of waters for drinking and other commercial or industrial use.

Total Organic Carbon (TOC) is a measure of the total organic matter present in water. (All organic matter contains carbon) This test is sensitive and able to detect small concentrations of organic matter. Organic matter is naturally occurring in animals, plants, and man. Organic matter may also be man made (so called synthetic organic). Synthetic organic include pesticides, fuels, solvents, and paints. Natural organic matter utilizes the oxygen in a receiving water to biodegrade. Too much organic matter could place a significant oxygen demand on the water, and possibly impact its quality. Synthetic organics either do not biodegrade or biodegrade very slowly. Synthetic organics are a source of toxic chemicals that can have adverse affects at very low concentrations. Some of these chemicals bioaccumulate in aquatic life. If your levels of TOC are high, you should evaluate all sources of natural or synthetic organics you may use at you site.

Oil and Grease (O&G) is a measure of the amount of oil and grease present in your storm water discharge. At very low concentrations, O&G can cause a sheen (that floating"rainbow") on the surface of water (1 qt. of oil can pollute 250,000 gallons of water). O&G can adversely affect aquatic life and create unsightly floating material and film on water, thus making it undrinkable. Sources of O&G include maintenance shops, vehicles, machines and roadways.

If you have any questions regarding whether or not your constituent concentrations are too high, please contact your local Regional Board office.

Annual Report
for
Storm Water Discharges Associated with Industrial Activities

RECORD OF WET SEASON VISUAL OBSERVATIONS
DECEMBER 1995

R0062086

State of California
STATE WATER RESOURCES CONTROL BOARD

1995-19505

ANNUAL REPORT
FOR
STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES

FORM 3 - RECORD OF WET SEASON VISUAL OBSERVATIONS

- Wet season observations are required to be done during the first hour of discharge for at least one storm per month between October 1 and April 30.

Month: _____ Approximate time storm water discharge began: _____

DISCHARGE LOCATION	DATE/ TIME	DISCHARGE OBSERVATIONS (CIRCLE ALL THAT APPLY)		DESCRIBE DISCHARGE	DESCRIBE SOURCE OF DISCHARGE
POLB	Dec 1995	Floating Materials?	Suspended materials?	**See following pages.**	
		Odors?	Oil/grease sheen?		
		Discolorations?	Cloudiness?		

Comments/Corrective Actions Taken for above: _____

STORM WATER DISCHARGES ASSOCIATED WITH INDUSTRIAL ACTIVITY

FORM 4 - SAMPLING RESULTS

DISCHARGE POINT:_____

DATE AND TIME OF SAMPLE:_____ TIME DISCHARGE STARTED:_____

CONSTITUENT TESTED	TESTED BY: LAB/SELF[1][3]	RESULTS [2][3]	TEST METHOD USED[4]	DETECTION LIMIT
pH		See following pages.		
TOTAL SUSPENDED SOLIDS				
SPECIFIC CONDUCTANCE		umhos/cm		
OIL & GREASE		mg/l		
TOTAL ORGANIC CARBON		mg/l		
ADDITIONAL POLLUTANTS:				
FLOW [5]		gallons		
SIZE OF STORM (IF AVAILABLE)		inches		

(1) If testing was done by a certified laboratory, indicate "lab"; otherwise, indicate "self".
(2) If analytical results indicate a value less than the detection limit (or non detect), show the value as less than the numerical value of the detection limit.
(3) If you did not analyze for a particular constituent, do not report "0". Instead leave the appropriate box blank.
(4) Indicate the test method used to determine result. In cases where analysis was conducted in the field, using portable analyzers (portable pH meters, portable EC meters, etc.), indicate with an "A"
(5) Dischargers subject to the Santa Clara County General Permit are required to provide estimates or calculations of the volume of storm water discharged from each point. Describe, on a separate sheet, how the flow measurement was calculated.

Name of person collecting sample: Eric Lindsay Title: Technical Coordinator

If analysis conducted by certified laboratory, enter name of laboratory: West Coast Analytical Service, Inc.

FORM 4 - SAMPLING RESULTS

DISCHARGE POINT:_____

DATE AND TIME OF SAMPLE:_____ TIME DISCHARGE STARTED:_____

CONSTITUENT TESTED	TESTED BY: LAB/SELF[1]	RESULTS [2][3]	TEST METHOD USED[4]	DETECTION LIMIT
pH				
TOTAL SUSPENDED SOLIDS				
SPECIFIC CONDUCTANCE		umhos/cm		
OIL & GREASE		mg/l		
TOTAL ORGANIC CARBON		mg/l		
ADDITIONAL POLLUTANTS:				
FLOW [5]		gallons		
SIZE OF STORM (IF AVAILABLE)		inches		

See following pages.

(1) If testing was done by a certified laboratory, indicate "lab"; otherwise, indicate "self".
(2) If analytical results indicate a value less than the detection limit (or non detect), show the value as less than the numerical value of the detection limit.
(3) If you did not analyze for a particular constituent, do not report "0". Instead leave the appropriate box blank.
(4) Indicate the test method used to determine result. In cases where analysis was conducted in the field, using portable analyzers (portable pH meters, portable EC meters, etc.), indicate with an "A"
(5) Dischargers subject to the Santa Clara County General Permit are required to provide estimates or calculations of the volume of storm water discharged from each point. Describe, on a separate sheet, how the flow measurement was calculated.

Name of person collecting sample: Eric Lindsay Title: Technical Coordinator

If analysis conducted by certified laboratory, enter name of laboratory: West Coast Analytical Service, Inc.

Dear Mr. Workman:

Attached is the Annual Report for Storm Water Discharge Monitoring in the Port of Long Beach for the period July 1, 1995 to June 30, 1996. The report summarizes the Port's visual monitoring program, site inspections, sampling results, and certifies the Port's compliance with the General Permit.

If you have any questions, please contact Stacey Crouch, Project Manager, at (310) 590-4160.

Sincerely,

Geraldine Knatz

Attention: **Frank Kuo, AICP**

Dear Mr. Hildebrand:

In compliance with the provisions of the area-wide NPDES Permit, and as a Co-Permittee under the permit, the following document is submitted as specified in the third year activities plan for Phase III cities:

City of Long Beach
Evidence of Progress of Implementation of BMPs

The City of Long Beach believes that this submittal fully meets the requirements and submittal schedule set forth in the workplan.

If you have any questions, please contact Barbara Muñoz, Senior Civil Engineer at (310) 570-7454.

Sincerely,

Richard Schacht
Division Engineer

STORM WATER MANAGEMENT CITY of LONG BEACH

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: PUBLIC EDUCATION AND OUTREACH PROGRAM

This BMP involves educating the public regarding the nature of urban runoff pollution and the behavioral modifications and actions that can be made by individuals to prevent it.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- ■ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to inform city residents, commercial/industrial establishments and school children about the environmental problem of runoff pollution and the means to prevent this form of water pollution.

The public education program is integral to the successful implementation of many other BMPs in the City's Stormwater/Urban Runoff Management Program. To the extent possible, this program coordinates with ongoing educational efforts in the City in order to reach the largest audience in an efficient and cost-effective manner. The program also functions as a tool for the effective implementation of related BMPs.

GENERAL PROGRESS:

The first year activities included: (1) identify a city NPDES education program coordinator; (2) establish a steering committee composed of representatives of city agencies who are already involved in pollution prevention and/or public education, or represent non-municipal stakeholders in the community;(3) inventory existing city publications, brochures, events and other media forms; (4) develop a program logo and mascot; (5) survey city employees to establish a baseline by which to measure education program success; (6) prepare and/or modify public education/information materials that will be disseminated through existing City venues to reach the target groups identified; (7) coordinate press releases, mayoral participation, and other forms of publicity for kicking-off related BMPs, such as catch basin stenciling. All the first-year activities were accomplished.

VOL 17 000324

R0062164

GENERAL PROGRESS (contd.):

A critical component of this program is the ease with which the program can be identified through a symbol or slogan. The city's public education steering committee developed a logo to accompany all publications and communications about the storm water program (see top lefthand corner of this report). Also, a mascot was created to be used at public venues and for education targeted primarily to schoolchildren. A pelican was chosen for the program mascot. This character clearly represents marine environments, and, because of past history (near extinction in California), is already perceived as being especially sensitive to ocean pollution.

The public education program includes several target groups, such as residents, commercial and industrial establishments, and school-age children which are addressed separately below. The target group consisting of city managers and employees is covered under the Municipal Training BMP. The public education program assessment is based on the comprehensiveness of the educational effort. This is accomplished by tracking the number of events/presentations, including attendance and quantity of informational material distributed.

The following is a summary of the actions that were carried out for the specific target groups:

General Public/Residents

The City, on an ongoing basis, publishes newsletters, brochures, and fact sheets which reach all sectors of the City. Many of these publications are general enough for the insertion of articles, columns, or questionnaires on various runoff pollution related issues. Some are specifically tailored to pollution prevention issues that are directly related to urban runoff, e.g., proper household hazardous waste disposal, used motor oil recycling, and water conservation, green waste program. In addition, the City sponsors or participates in public events on a regular basis, such as Coastal Awareness Day, the Los Angeles County Fair and Beach Clean Up days. These events (venues) provide excellent opportunities for the dissemination of information regarding urban runoff pollution.

Long Beach makes a consistent effort at promoting recycling used oil. The curbside collection program is well advertised as part of the household recycling program, and several educational pamphlets used by the city discuss proper disposal and recycling of used motor oil; oil recycling is specified in the Marina Environmental Policies, published in the Long Beach Marina Rules and Regulations. Here's a run down on some of the materials distributed this past year for curbside recycling: 150,000 utility inserts, 150,000 publications, 12 ads, and hundreds of flyers.

VOL 17 000325

R0062165

GENERAL PROGRESS (contd.)

The Intergrated Resources Bureau combined forces with the City's Nature Center to offer several classes through the Parks, Recreation and Marine Department. Here's a list of classes that are offered: Composting - "Turn Your Yard Leaves into Gold"; Vermipost - "Worms and You"; Nature's Recyclers -"Closing The Loop"; Plant It Earth; and Reduce-Reuse - Recycle (a Resource Management Series).

In addition to printed materials, a successful public campaign drive took place last year to kick off the commencement of the City's Stenciling Program. The City decided to exercise this program to its fullest extent. The City chose to employ community volunteers to perform the stenciling work instead of hiring a contractor to do the work. What better way to educate the community than to get them involved in painting the warning symbols on the catch basins. The City orchestrated the stenciling program with it's public education program by issuing press releases which described the program's purpose, by conducting special events and by distributing informational flyers.

A campaign "kick-off" event was held on Earth Day, April 22, 1995. The Department of Public Works partnered with the Department of Parks, Recreation and Marine to sponsor a Beach Clean Up and Catch Basin Stenciling event. At the event, in front of a crowd of volunteers and some dignitaries, the City's Mayor stenciled the first catch basin. Prior to this event, a press release was prepared for distribution to all the local newspapers, radio stations and the local cable company. Flyers were mailed to all the schools in the Long Beach Unified School District and to all the homeowners and business associations in the city.

The City's Engineering Bureau conducted nine stenciling events at different city parks throughout the community, one in each city council district. Each City Council member was notified about the stencil event within their council district. Some council members rolled up their sleeves and joined the stenciling work force in their district. Thus far, we had over 370 volunteers paint more than 4000 catch basins!! Participants were very enthusiastic about the project. We had some individuals volunteer more than once. We also received a lot of positive feedback from the non-participants. For a list of community groups that participated in Catch Basin Stenciling Program, refer to the evidence of progress report for that specific BMP.

Industrial and Commercial Establishments

An extensive educational site visit model program will be developed by the County under the new permit. The City expects to participate in this development process. Establishing and implementing a city educational program for industrial/commercial establishments has been postponed and will take place after the countywide model program is developed.

VOL 17 000326

GENERAL PROGRESS (contd.)

Schoolchildren

There are many environmental outreach programs for City schoolchildren, including outreach by the City Water Department related to Water Conservation, and by Integrated Resources Bureau and the Nature Center.

The Intergrated Resources Bureau combined forces with the City's Nature Center to staff the Travelling Recycling Education Center (TREC). TREC visits all the Long Beach School District's 4th graders to teach them about recycling, urban run-off, and resource conservation.

Another program which took off this past year is the Moveable Musuem. This program was developed by Surfrider Foundation and co-sponsored by L.A. County Natural History Musuem and the City's Nature Center. Upon request, the Moveable Musuem visits the Long Beach School District schools and teaches the children about the environment. Three programs are offered. One program is called "Protect our Watery World" which gives an exploration of how our actions at home can help aquatic wildlife.

In addition, the City's Parks and Recreation Department Nature Center runs school tours and teacher workshops that are specifically related to ocean pollution prevention. The Nature Center's "Adopt-A-Gutter" Program, is a very effective method of reaching schoolchildren as well as entire neighborhoods regarding the runoff pollution prevention issue.

SCHEDULE:

Continue existing program and refine it to fit, as necessary, the countywide model program which will soon be developed.

NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: MUNICIPAL STAFF TRAINING

This BMP involves establishing a municipal staff awareness and training program embracing all applicable facets of City activities relating to storm water concerns.

APPLICABLE PROGRAM AREA(S):

- RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- CONSTRUCTION
- ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective of this BMP is to educate municipal management and staff about the causes of stormwater pollution and the BMPs being implemented by the City of Long Beach for stormwater pollution control/prevention. By increasing awareness and understanding of the problems and offering suggested changes to alter the behavioral actions which lead to stormwater pollution, the City will come closer to its objective of decreasing the amount of pollutants entering the storm drain system.

GENERAL PROGRESS:

City staff are composed of individuals from a broad spectrum of the City's economic and cultural sectors. Many of them will be responsible for implementing the BMPs. Consequently, at the outset of the Education Program, a survey was conducted to establish a baseline for the level of understanding City employees have of urban runoff pollution and methods to prevent it. The survey questionnaire was included with the paycheck distribution packet. After a few years, after the Education Program has been fully launched, the employee survey will be repeated to determine whether the education efforts have been successful.

Disseminating information to City employees has begun. Several articles have been published in the City's Employee Newsletter and the first issue of "The Flowline", which is a newsletter for city management, was published. Many City employees

VOL 17 000328

GENERAL PROGRESS (contd.):

participated in hosting the Los Angeles County Fair informational booth. In order to participate, the employees were educated about the storm water quality program and its purpose.

The education of appropriate staff members to recognize how construction operations can contribute to runoff pollution and to recognize stormwater quality violations on construction sites has begun. Several city staff members attended the day-long seminar conducted by APWA regarding NPDES Construction permits and were trained to recognize stormwater quality violations such as vehicle management, on-site debris handling and other matters pertinent to NPDES program. An internal city training program will be developed from materials obtained at the seminar as well as from the countywide model program which is soon to be developed. The development of city inspectors' checklists to include stormwater pollution prevention elements has been postponed until the countywide model checklist is developed.

In coordination with the countywide model program for public agencies, the City's current information dissemination system will be expanded to include information relating to stormwater pollution prevention techniques and good housekeeping practices. City employees will be given information on how their actions and activities at work and home can contribute pollutants to storm drain system and what actions can reduce stormwater pollution. The City also plans to hold training workshops for employees whose jobs are directly related to Stormwater BMPs to explain each applicable BMP, its purpose, and its implementation.

SCHEDULE:

Development and implementation of employee training workshops will follow the implementation schedule outlined in the new permit which is soon to be adopted.

Continue existing program.

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: PUBLIC REPORTING OF ILLEGAL DISCHARGES AND/OR ILLEGAL DUMPING

This BMP involves promoting, publicizing, and facilitating public reporting of illegal discharges and/or dumping which includes utilizing the County 24-hour hotline.

APPLICABLE PROGRAM AREA(S):

- RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- CONSTRUCTION
- ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing or mitigating illegal discharges and dumping into the storm drain system.

In order to facilitate and coordinate public reporting, the Los Angeles County Department of Public Works has implemented a 24-hour telephone Hotline. The storm drain Hotline is a "1-800" number which citizens can call to report suspected illegal discharges and dumping to the storm drain system. The Hotline number is 1-800-303-0003.

Long Beach has been a partner in the Hotline since September 1993 and has published the Hotline number in a Department of Public Works flood control flier which is mailed to all Long Beach utility customers (approximately 180,000) on an annual basis. The County Hotline number has also been published in brochures, informational flyers and pamphlets. In addition to the County Hotline, spills and/or dumping incidents are reported directly to the City via the Police Department or the Public Services Bureau.

GENERAL PROGRESS:

The assumptions used in evaluating the effectiveness of this BMP are: (1) the public reporting system will deter illegal and illicit dumping of materials into the storm drain system; (2) the reporting will allow for quick responses to dumping incidents which will minimize the extent and amount of contamination to the storm drain system.

VOL 17 000330

R0062170

GENERAL PROGRESS (contd.):

The number of calls received from the County dispatchers was approximately 23. This is a slight increase from the calls received the previous year. The number of direct calls received by 911 dispatchers and the Long Beach Public Service Bureau operators is 1500 phone calls. Of the 1500 phone calls, 220 were calls regarding hazardous waste. Most of the calls were relating to cleaning the debris out of the catch basins. Compared to the previous year, there has definitely been an increase in reporting. This may be attributed to the City's extensive public education program which was implemented this past year. A response reporting system has yet to be developed; therefore, an examination of the City's response has not been conducted.

SCHEDULE:

Develop a city response reporting system.

Continue existing program.

STORM WATER MANAGEMENT CITY of LONG BEACH

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: HOUSEHOLD HAZARDOUS WASTE COLLECTION

This BMP involves the collection and proper disposal of household hazardous wastes, such as pesticides, paints, lubricants, and solvents.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing household hazardous wastes from entering the storm drain system through illegal dumping, illegal discharges, or contaminated runoff.

The City of Long Beach participates in the Household Hazardous Waste Roundup Program sponsored by the County of Los Angeles. The roundup is completely run and managed by the County. The role of the City of Long Beach is to advertise and inform residents on the roundup dates and locations, and when necessary, provide personnel to direct traffic at the roundup.

Several County roundup events are held each year at various locations. Long Beach City hosted a county roundup event for each of the past six years. The City very actively advertises the roundup event. A four-language brochure is mailed out with all utility bills to inform customers of the city-hosted events. To assist the City in spreading the word, the local newspapers advertise the events. Flyers are also distributed at many retail stores especially to all the major paint and hardware stores. County records show that Long Beach hosted events are among the highest attended in the County.

The City of Long Beach also promotes source reduction as a way of minimizing household hazardous waste. Promotion methods include distribution of source reduction guides, alternative product lists, and public education and information events. Many of the published items are multi-lingual, which makes the information more accessible to the entire Long Beach community.

VOL 17 00032

GENERAL PROGRESS:

The assumption used in evaluating the effectiveness of the household hazardous waste collection program is that the material collected through the program is properly disposed of and is thus unavailable to be illegally or illicitly disposed of in the storm drain system.

The quantity of hazardous material collected, and properly disposed of, include: 4,700 gallons of oil; 15,000 gallons of paint; about 450 car batteries; and about 400 drums of miscellaneous waste. This past year 3,300 people participated.

SCHEDULE:

Continue existing program.

VOL 17 000333

STORM WATER MANAGEMENT CITY of LONG BEACH

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: LITTER RECEPTACLES

This BMP involves the placement and servicing of receptacles used for control of litter and refuse.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing litter and refuse from collecting in the storm drain system.

The City of Long Beach controls incidental litter through the placement and servicing of litter receptacles. Litter receptacles are generally located in business areas, bus stops, parks, the marinas, the beach front, and at public facilities where people tend to congregate. Approximately 2500 litter receptacles are located throughout the city.

The City also encourages business associations to place additional litter receptacles in major retail areas. These receptacles are paid for by the associations and serviced by the City's Refuse Division.

The City has developed a Neighborhood Improvement Strategy program. Through this program, the city provides residents with litter receptacles for placement at locations in their neighborhood where litter accumulates. The residents service the receptacles by dumping them into their residential container which is then serviced by the city.

The City is host to many special events throughout the year. The City requires event sponsors to provide an adequate number of litter receptacles and that they be serviced. Special event litter receptacles are serviced by the City or by contract haulers.

VOL 17 000334

GENERAL PROGRESS (contd.):

By providing receptacles, people are given an alternative to littering which they will generally use. As evidence, areas around litter receptacles appear reasonably clean and litter-free.

The assumption used in evaluating the effectiveness of litter receptacles is that refuse placed in the receptacles is refuse which may have otherwise collected in the storm drain system.

Use and service of the litter receptacles are adequate. This past year, the 450 receptacles placed on residential and commercial streets collected over 290 tons of trash and were serviced on a weekly basis. The City's use of field supervisors and refuse investigators works well to make sure receptacles do not overfill. Disposal patterns have been recognized which the Refuse Division uses to properly size receptacles for weekly service. With supervisors in the field, needs for larger or repairing receptacles is reasonably quick.

SCHEDULE

Develop a reporting system to monitor the amount of waste collected in the parks, marinas, and beaches.

Continue existing program.

VOL 17 000335

R0062175

STORM WATER MANAGEMENT CITY of LONG BEACH

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: CLEAN SWEEP OPERATION PROGRAM

This BMP involves a one-time collection of refuse to city residents, free of charge.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing the accumulation of trash and debris, which may eventually wash into the storm drain system.

The City annually conducts Clean Sweep Operations for city residents in the spring. Clean Sweep events are scheduled with the Refuse Division by city councilpersons for their district. The City consists of nine council districts; thus, nine events are conducted. Residents are requested to set out allowable refuse for a free, one-time collection. This is an opportunity for residents to dispose of old furniture, tree trimmings, yard waste, appliances and other bulky items for free.

A notice is mailed out with utility bills to advertise the event. The schedule of Clean Sweep events is usually publicized in local newspapers or community newsletters. Flyers are also sent to neighborhood associations. Some communities take advantage of these free pick-ups to conduct neighborhood cleanup activities to remove litter and debris from their streets and alleys.

GENERAL PROGRESS:

The assumption used in evaluating the effectiveness of the Clean Sweep program is that litter and debris collected and disposed of through this program is material which may have otherwise washed into the storm drain system, or contributed contaminants to stormwater runoff. The program assessment is based on showing how much material is being properly disposed of.

VOL 17 00336

GENERAL PROGRESS (contd.):

The clean sweep program is a great community program. It seems to serve as a "spring cleaning" event for residents. Those communities which take advantage of this opportunity by conducting neighborhood cleaning campaigns definitely impact storm water quality. Community clean-ups remove refuse from areas which are not otherwise maintained.

This past year, the amount of debris and litter collected was 770 tons.

SCHEDULE:

Continue existing program.

VOL 17 000337

STORM WATER MANAGEMENT CITY of LONG BEACH

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: HOUSEHOLD RECYCLING

This BMP includes collecting glass, plastic, newspaper, corrugated cardboard, aluminum and steel cans.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing the collection of refuse in the storm drain system.

Curbside collection of recyclables is available to all single family residences and multi-family dwellings with ten or fewer units. Participants in the household recycling program separate recyclables from their refuse, and deposit the recyclable materials into a separate container. Recyclables are collected weekly, on the same schedule as regular refuse collection. It is collected by a firm under contract to the City of Long Beach.

Recyclables are set out in plastic open containers provided by the city. Items collected include corrugated cardboard, newspaper, glass, aluminum and steel cans, and plastic (#1-4). All items are mixed in the same container, except newspaper and cardboard, which are to be bundled. Residents are asked to rinse containers before placing them in the recycling bin.

Multi-family residences larger than ten units are not required to have a recycling program. The city fully supports any efforts by multi-family units to start their own program by providing educational material and advice, when requested. Permitted waste haulers are required to offer recycling services upon request.

VOL 17 000338

GENERAL PROGRESS:

The assumptions used in evaluating the effectiveness of the household recycling program are: (1) material collected is material which may otherwise have been illegally disposed of in the storm drain system; (2) material collected is material which may otherwise have been improperly stored outdoors in a way that would contribute contaminants to stormwater runoff. The program assessment is based on showing how much material is being properly collected.

The City's household recycling program is adequate. Implementation of a curbside collection program exercises this program to the fullest extent practical to the majority of Long Beach residents. This past year, the quantity of material collected include: 5,825 tons of newspaper; 1,446 tons of corrugated cardboard; and a combined total of 4,718 tons of aluminum/metal cans, glass bottles, and plastics.

SCHEDULE:

Continue existing program.

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: SPECIAL COLLECTION PROGRAM

This BMP involves providing a service to residents for collection of bulky items for disposal.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing the accumulation and improper disposal of refuse. The City of Long Beach offers a special collection service for Long Beach residents. Residents can request special collection of bulky items such as furniture, appliances, tires, yard waste, or tree trimmings for disposal. Residents are charged a nominal fee of $6.00 for each special collection. This program provides a year-round service to pick up items which might otherwise be improperly stored or disposed of.

GENERAL PROGRESS:

The assumptions used in evaluating the effectiveness of the special collection program are: (1) items collected are items which may otherwise have been illegally dumped; (2) items collected are items which may otherwise have been improperly stored outdoors in a way that would contribute contaminants to stormwater runoff. The program assessment is based on showing how much material is being properly disposed of.

The special collection program is generally adequate. The city received approximately 8,320 calls this past year, with furniture and yard waste being the most common items collected. The amount of waste collected was 2300 tons.

SCHEDULE:

Continue existing program.

VOL 17 000340

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: USED OIL RECYCLING PROGRAM

This BMP involves collecting and recycling used motor oil.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing the improper disposal of used motor oil into the storm drain system.

The City of Long Beach has a curbside collection program for used motor oil. This collection program is for single family residences and multi-family dwellings with ten or fewer units. Residents are supplied with special oil storage containers designed to prevent spillage during curbside collection. Oil is collected by the contracted recycling service used for the household recycling program. Oil is collected on the same schedule as the other recyclables, on a weekly basis, using the same collection vehicle.

The City also has a separate used oil collection program for the marinas. The City maintains a storage tank where marina residents can deposit their motor oil. The tank is emptied as needed by an outside contractor.

The City has encouraged development of a network of state certified drop-off centers where used oil can be taken for recycling. The certified drop-off centers are completely managed and maintained by the business owners. These drop-off centers supplement the City's programs by providing a place where persons not able to participate in the curbside program can take their oil. The city does not collect or maintain records of the oil collected at drop-off centers.

VOL 17 000341

R0062181

GENERAL PROGRESS:

The assumption used in evaluating the effectiveness of the used oil recycling program is that oil collected and disposed of properly is oil which may have otherwise been illegally or illicitly disposed of in the storm drain system. The program assessment is based on showing how much used oil is being diverted by this collection program.

This past year, the amount of used-oil collected through curbside collection was 43,779 gallons. The amount collected from the marina was not available at this time of writing.

The City's used-oil recycling program is a comprehensive program of outstanding quality. Especially notable is the curbside collection program, which is rare for used oil recycling. Using curbside collection and supplying residents with containers is practicing this program to the maximum extent. Combined with the oil collection program in at the marinas and the certified drop-off centers, the City of Long Beach offers a very comprehensive collection program to its community.

SCHEDULE:

Continue existing program.

R0062182

STORM WATER MANAGEMENT CITY of LONG BEACH

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: GREEN WASTE PROGRAM

This BMP involves composting and proper disposal of green waste.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing the collection and decomposition of organic material (green waste) in the storm drain system.

There are three aspects to the green waste program: proper disposal of green waste, household composting, and city grounds keeping practices.

- Proper disposal of green - The city requires property owners to tie all tree limbs, shrubs, trimmings, and other green waste of a similar nature in compact bundles for disposal. Materials likely to become airborne upon disposal are required to be securely wrapped. The city encourages proper disposal through its Special Collection program and Clean Sweep Operation program.
- Household composting - The city sponsors and/or participates in seminars on composting and distributes literature explaining methods of green waste composting. Monthly composting education classes are offered through the Parks, Recreation and Marine Department.
- City grounds keeping - In city parks, grass clippings are left on the turf for natural decomposition and re-incorporation. Traffic islands are cut with mulching mowers which grind lawn clippings and then leave them in place. About fifty percent of the city tree trimmings are transported to a recycling facility and the other half is hauled to a proper disposal facility.

VOL 17 000343

GENERAL PROGRESS:

The assumptions used in evaluating the effectiveness of the green waste program is that keeping the storm drain system free of organic matter will improve the quality of stormwater and urban runoff on the system. The program assessment is based on examining how comprehensive and effective the program is at keeping organic matter out of the storm drain system. The methods for assessing this BMP include:

- Evaluating promotion and participation in the residential composting program
- Evaluating landscape maintenance in terms of mulching, lawn trimming and irrigation, and collection of trimmings

The green waste program has been evaluated and found to be generally adequate. Through city ordinances the program includes measures to keep green waste out of the storm drain system. The composting education classes are effective. The classes are advertised in the quarterly Parks & Recreation Schedule. This past year, attendance at quarterly classes typically varied between 7 and 19. This indicates that there is consistent and on-going interest in home composting. Stormwater quality issues have been incorporated into the composting education classes.

This past year, the amount of waste collected from the special collection program was 2300 tons which includes yard waste. Through the clean sweep operation, the amount of debris and yard waste collected was 770 tons.

The refinement of the City's grounds keeping procedures will begin after the development of the countywide model program for Landscape and Recreational Facilities Management.

SCHEDULE:

The schedule for refining the City's grounds keeping procedures will follow the implementation schedule outlined in the new permit which is soon to be adopted.

Continue existing program.

VOL 17 000344

R0062184

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: FACILITY INSPECTIONS

This BMP will involve conducting "site visits" at industrial or commercial businesses which have potential for contributing pollutants to stormwater runoff or the storm drain system.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by minimizing the contribution of pollutants from industrial and commercial businesses which may eventually wash into the storm drain system.

The scope for this BMP has changed since the last reporting period due to the new permit negotiations. This BMP will involve educational site visits rather than inspections.

As reported previously, the city conducts a variety of inspection programs of businesses within the city. The Hazardous Waste Operations Division conducts annual inspections of approximately 700 hazardous waste generating businesses. The Fire Department conducts several programs, including: hazardous materials inspections of about 1700 facilities; code enforcement inspections; and new construction inspections. The Health Department conducts routine inspections on approximately 1,150 food preparation facilities twice per year.

The program is, in its present state, a combination of several inspection programs. As they currently now stand, specific inspection items are not established to educate the businesses about storm water quality or look for potential stormwater quality concerns. However, many of the inspection items do incidentally address stormwater concerns. For example, proper storage of some hazardous materials often require that they be stored in a covered area with containment for safety and public health reasons; at the same time, keeping hazardous materials covered also provides stormwater quality benefits.

VOL 17 000345

GENERAL PROGRESS:

The program assessment was based on the extent of which existing inspections cover stormwater quality issues. It was determined that the city's facility inspection program needed to be modified to include a focus on storm water quality. The methods for assessing this BMP included:

- Modifying the content of city inspection programs
- Examine city efforts towards educating the business owner on appropriate "housekeeping" practices

There is sufficient number and variety of inspection programs performed by the city to adequately cover industrial and commercial businesses. Some existing inspection programs will be better suited than others to address storm water issues. What needs to be developed is an educational program addressing storm water issues for the various types of facilities along with suggested BMPs to be implemented.

The new permit which is soon to be adopted outlines the minimum requirements that should be included in the Industrial/Commercial Educational Program. One requirement is the use of a checklist of specific storm water BMPs for each industrial/commercial SIC group. This list will be developed by the County and used on a countywide basis. The modification of the City's exiting inspection programs will begin after the approval of the new permit since it specifies the minimum program requirements.

SCHEDULE:

The schedule for modifying the City's existing inspection programs and implementing the educational site visits will follow the implementation schedule outlined in the new permit which is soon to be adopted.

STORM WATER MANAGEMENT CITY of LONG BEACH

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: MONITORING POLLUTION IN PUBLIC WATERS

This BMP involves the bacteriological testing of public waters.

APPLICABLE PROGRAM AREA(S):

- ☐ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- ☐ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

To improve the quality of stormwater runoff by monitoring the receiving waters of the storm drain system runoff.

The city monitors for evidence of pollution in public water contact sport areas. This covers beaches, the marina, Alamitos Bay, and the harbor. Water samples are taken from various locations and tested for the presence of coliform bacteria. Testing is done once a month at a minimum. Testing frequency is increased during storms or if contamination from a spill or dumping incident is suspected. In the instance of a coliform test result indicating an unacceptably high concentration of coliform bacteria, a second water sample is taken from the area. Typically, four tests need to show a high concentration before the water body is closed and investigation of the cause taken. This testing procedure is consistent with the testing protocols of Los Angeles County and other surrounding cities.

Results of bacteriological tests are maintained by the Bureau of Environmental Health and are reported monthly to the Los Angeles Regional Water Quality Control Board, the Long Beach Parks and Recreation Department, and the Long Beach Marine Bureau.

Health investigations are conducted as a result of high bacteria concentrations, or other indications of pollution, such as oil in the water, or in response to complaints. Initial investigations done by the health department will typically determine the type and cause of the pollution. Once the initial investigation is done, it is determined which Long Beach agency is best suited to further investigate and resolve the incident. For example, the Environmental Crimes unit for a dumping incident, or the Water Department for sewage leaks. The appropriate department will then complete the investigation.

VOL 17 000347

R0062187

GENERAL PROGRAM:

The assumptions used in evaluating the effectiveness of the public water monitoring program are: (1) that the quality of public waters is indicative of the quality of water in the storm drain system which drains into the public water; and (2) that the routine monitoring can help detect and eliminate inappropriate discharges to the storm drain system.

Testing on a monthly basis is generally adequate. The testing frequency is supplemented by emergency testing following potential spills or during storms when the storm drain system is flushed. No beaches were closed this past year.

SCHEDULE:

Continue the existing program to the maximum extent practicable.

VOL 17 000348

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: STORM DRAIN MASTER PLAN

This BMP involves updating the city's computerized storm drain facilities management system and developing the system to assist the city in meeting their NPDES requirements.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to optimize the city's efforts in meeting the NPDES permit requirements by using the city's geographical information system (GIS).

Long Beach has a computerized storm drain facilities management system. The system integrates several computer models/systems through a menu driven application in dBASE. The data base consists of land use maps, drainage maps, storm drain alignments, hydrology data, hydraulic data, and storm drain design data.

A major consideration in the use of the storm drain facilities management system is to integrate it with the city's GIS system. Currently the city is in the process of integrating some of the storm drain facilities management system onto the GIS platform. The GIS platform offers an excellent basis to assist the city in meeting the challenges of storm water management. The GIS system will provide a coherent database of several city departments' information. This information can be queried and manipulated to fit any type of application. Ultimately, the system will be used in scheduling, tracking and reporting the city's NPDES compliance efforts.

GENERAL PROGRESS:

The entire storm drain system is on the GIS platform including the catch basins. This past year, the drainage boundaries in the facilities mapping system have been transferred on

VOL 17 000349

R0062189

GENERAL PROGRESS (contd.)

to the city's GIS platform. An new identification system for the storm drain system components have been implemented to correlate with the drainage boundaries.

The system has been very useful in tracking progress of the catch basin stenciling program. The system identifies those catch basins stenciled by volunteers. Other tracking system that will be developed are for illegal connection field activities, types of industrial and commercial sites in each watershed.

SCHEDULE:

Continue to update the storm drain data and develop applications to assist the city in meeting the NPDES requirements.

VOL 17 000350

R0062190

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: CATCH BASIN STENCILING

This BMP involves stenciling the City catch basins with prohibitive language and graphic icons to discourages the illegal dumping of unwanted materials into the storm drain system.

APPLICABLE PROGRAM AREA(S):

- RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- CONSTRUCTION
- ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective of the storm drain stenciling program is to enhance public awareness of the connection between the storm drain system and our receiving waters. Another objective is to discourage individuals' habitual waste disposal actions, e.g. dumping of automobile fluids and landscaping wastes into the storm drain system.

These objectives were accomplished by stenciling a sign adjacent to storm drain inlets which contains a message that discourages the dumping of improper materials into the storm drain system because they drain directly to the ocean. The City adopted the Los Angeles County/Heal the Bay standard stencil design as a matter of consistency.

The primary purpose of the stencil program is to have a message stenciled on the catch basins in the City of Long Beach and secondarily, but most importantly, to educate the public about non-point source pollution. The City decided to exercise this program to its fullest extent. The City chose to employ community volunteers to perform the stenciling work instead of hiring a contractor to do the work. What better way to educate the community than to get them involved in painting the warning symbols on the catch basins.

The City orchestrated the stenciling program with it's public education program by issuing press releases which described the program's purpose, by conducting special events and by distributing informational flyers.

VOL 17 000351

R0062191

GENERAL PROGRESS:

THANKS to all the hard working volunteers, the City's Catch Basin Stenciling Program has been a BIG SUCCESS !!! Thus far, we had over 370 volunteers paint more than 4000 catch basins!!! Participants were very enthusiastic about the project. We had some individuals volunteer more than once. We also received a lot of positive feedback from the non-participants.

A campaign "kick-off" event was held on Earth Day, April 22, 1995. The Department of Public Works partnered with the Department of Parks, Recreation and Marine to sponsor a Beach Clean Up and Catch Basin Stenciling event. At the event, in front of a crowd of volunteers and some dignitaries, the City's Mayor stenciled the first catch basin. Prior to this event, a press release was prepared for distribution to all the local newspapers, radio stations and the local cable company. Flyers were mailed to all the schools in the Long Beach Unified School District and to all the homeowners and business associations in the city.

From that day forward, the City's Engineering Bureau conducted nine stenciling events at different city parks throughout the community, one in each city council district. Each City Council member was notified about the stencil event within their council district. Some council members rolled up their sleeves and joined the stenciling work force in their district.

The City supplied the volunteers with all the necessary materials and maps. An educational briefing was conducted for each group prior to beginning their stenciling work. Informational material was also available to educate the non-participants about storm water pollution and the storm drain system. At the events, refreshments were generously donated by the International Longshoremen's and Warehousemen's Union, Locals 13, 63, 94, and their Southern California District Council. Certificates of participation were also provided to all the volunteers.

The Catch Basin Stenciling program is still ongoing. Although no more "formal" stenciling events are being conducted, the City receives several calls from various groups and individuals, who want to carry on the task. They are supplied with everything they need and proceed to organize themselves into teams to stencil the catch basins.

Many Long Beach citizens and friends from other communities participated. The following list of organizations demonstrates the diversity of the people who participated in this program:

Boy Scouts of America, Troops 77 & 693, Pack 77 and Others

Cub Scouts of America, Pack 67 & Others

SCHEDULE:

Continue existing program.

VOL 17 00353

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: RUNOFF CONTROL ORDINANCE: CONSTRUCTION

Adopt a runoff control ordinance requiring the use of BMPs during and after construction for the reduction of runoff and pollutants leaving a property or properties.

APPLICABLE PROGRAM AREA(S):

- ☐ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- ■ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to require those who are disturbing land and building projects to include elements of stormwater pollution control. The program will provide an enhanced focus on stormwater pollution while establishing legal authority necessary to require compliance with the provisions of the NPDES State Construction Permit and the city's Municipal Stormwater permit and avoiding a perceived bias against construction and redevelopment.

Although existing city codes, policies and practices address many activities with indirect stormwater benefit, they could be strengthened with a focus towards stormwater quality. The approach to achieve this objective will require the following steps:

1. Identify specific relevant existing construction permit requirements and enforcement procedures;
2. Target specific mandatory and conditional practices deemed necessary to address stormwater concerns;
3. Coordinate with City Attorney, Planning and Building and utilities (water, sewer and gas) to modify existing in-house processing, and enforcement;
4. Obtain Council approval of ordinance, if necessary;
5. Implement with checklists, revised forms, and pertinent staff training.

GENERAL PROGRESS:

VOL 17 00034

R0062194

GENERAL PROGRESS (contd):

The first two steps of the five step process, listed above, will be accomplished by the County upon the development of the countywide model program. The city expects to participate in this development process. Refinement of the City's existing codes, policies and procedures will commence after the development of the countywide model program which involves steps 3 through 5.

SCHEDULE:

Commencement of activities have been delayed approximately four months. The implementation schedule will follow the schedule outlined in the new permit which is soon to be adopted.

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: PROPER DISPOSAL OF LITTER, YARD WASTE, AND PET FECES

This BMP involves discouraging improper disposal practices and to provide viable alternatives.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The primary objective of this BMP is to educate the public about the viable alternatives for improper disposal practices and about the water quality impacts of pollutants. By educating the public, this may improve the quality of stormwater runoff by preventing the accumulation of trash and debris on public streets, which may eventually wash into the storm drain system.

The City of Long Beach has in place several programs designed to reduce litter from public areas within the City and from private residential and commercial areas.

In conjunction with the Litter Receptacles BMP, the City has approximately 2500 litter receptacles. Litter receptacles are generally located in business areas, bus stops, parks, the marinas, the beach front, and at public facilities where people tend to congregate. The City also encourages business associations to place additional litter receptacles in major retail areas. These receptacles are paid for by the associations and serviced by the City's Refuse Division. The City also has programs for providing temporary waste receptacles at special events, such as the Long Beach Grand prix, parades, and street fairs, as well as special janitorial service/ litter control and cleanup programs in the City's business districts.

The City has developed a Neighborhood Improvement Strategy program. Through this

VOL 17 00356

R0062196

BACKGROUND(contd.):

program, the city provides residents with litter receptacles for placement at locations in their neighborhood where litter accumulates. The residents service the receptacles by dumping them into their residential container which is then serviced by the city.

The City annually conducts Clean Sweep Operations for city residents in the spring. Clean Sweep events are scheduled with the Refuse Division by city councilpersons for their district. The City consists of nine council districts: thus, nine events are conducted. Residents are requested to set out allowable refuse for a free, one-time collection. This is an opportunity for residents to dispose of old furniture, tree trimmings, yard waste, appliances and other bulky items for free. Many communities take advantage of these free pick-ups to conduct neighborhood cleanup activities to remove litter and debris from their streets and alleys.

Curbside collection of recyclables is available to all single family residences and multi-family dwellings with ten or fewer units. Participants in the household recycling program separate recyclables from their refuse, and deposit the recyclable materials into a separate container. Recyclables are collected weekly, on the same schedule as regular refuse collection. Multi-family residences larger than ten units are not required to have a recycling program. The city fully supports any efforts by multi-family units to start their own program by providing educational material and advice, when requested. Permitted waste haulers are required to offer recycling services upon request.

The City of Long Beach offers a special collection service for Long Beach residents. Residents can request special collection of bulky items such as furniture, appliances, tires, yard waste, or tree trimmings for disposal. Residents are charged a nominal fee of $6.00 for each special collection. This program provides a year-round service to pick up items which might otherwise be improperly stored or disposed of.

As discussed in the Green Waste Program, BMP, there are three aspects to the green waste program: proper disposal of green waste, household composting, and city grounds keeping practices.

- Proper disposal of green - The city requires property owners to tie all tree limbs, shrubs, trimmings, and other green waste of a similar nature in compact bundles for disposal. Materials likely to become airborne upon disposal are required to be securely wrapped. The city encourages proper disposal through its Special Collection program and Clean Sweep Operation program.
- Household composting - The city sponsors and/or participates in seminars on composting and distributes literature explaining methods of green waste composting. Composting education classes are advertised in the Parks, Recreation and Marine Department quarterly schedule which is distributed to every resident and made available at public counters. The City's Nature Center display exhibits on composting and vermaposting for the general public to view.

VOL 17 000357

R0062197

BACKGROUND(contd.):

- City grounds keeping - In city parks, grass clippings are left on the turf for natural decomposition and re-incorporation. Traffic islands are cut with mulching mowers which grind lawn clippings and then leave them in place. About fifty percent of the city tree trimmings are transported to a recycling facility and the other half is hauled to a proper disposal facility.

The City intended to conduct a pilot project for the proper disposal of pet feces by installing 2 plastic bag dispensers in selected areas in which residents tend to walk their pets (e.g., parks, or beach boardwalks). These dispensers were going to include language urging residents to be responsible pet owners by cleaning up and depositing pet feces in a proper garbage receptacle. This pilot project is on hold until the new permit requirements are known at which time the City will have a better understanding about the countywide model program and will be able to focus its resources on the priority areas.

GENERAL PROGRESS:

The assumption used in evaluating the effectiveness this BMP is that by discouraging improper disposal practices to residents and businesses and providing them with viable alternatives, there will be less debris collected in the storm drain system. The program assessment is based on showing how much material is being properly collected which is an indication of the amount of waste that is properly disposed of.

This past year, the 450 receptacles placed on residential and commercial streets collected over 290 tons of litter and were serviced on a weekly basis. Through the clean sweep operation, the amount of debris and yard waste collected was 770 tons. The quantity of material collected from the City's household recycling program include: 5,825 tons of newspaper; 1,446 tons of corrugated cardboard; and a combined total of 4,718 tons of aluminum/metal cans, glass bottles, and plastics. The amount of waste collected from the special collection program was 2300 tons which includes yard waste.

By providing these programs, people are given viable alternatives for improper disposal practices which the community of Long Beach generally use. This is confirmed by the amount of debris collected.

SCHEDULE:

Continue the on-going City programs.

Implementation of the pilot project for the Pet Feces Reduction program has been postponed until the countywide model program for this BMP is developed.

VOL 17 000358

R0062198

STORM WATER MANAGEMENT CITY of LONG BEACH

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: LAND DEVELOPMENT

Augment existing land development policies and procedures to include a focus on storm water runoff quality concerns.

APPLICABLE PROGRAM AREA(S):

- ☐ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- ■ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective of this BMP is to minimize and possibly eliminate pollutants from entering the City's storm drain system by incorporating control measures and establishing standard conditions for development projects.

Although existing city codes, policies and practices address many activities with indirect stormwater benefit, they could be strengthened with a focus towards stormwater quality. The approach to achieve this objective will require the following steps:

1. Determine appropriate size and type of development/redevelopment that should receive stormwater management conditions.
2. Establish standard conditions of approval addressing the State construction permitting.
3. Redefine intended purpose of on-site drainage facilities to address stormwater pollutant interception and removal, as appropriate.
4. Formulate a set of minimum BMPs to be suggested for implementation by building permit applicants.
5. Increase awareness of pertinent staff about stormwater pollution.
6. Incorporate stormwater quality control measures and requirements into city codes, policies and procedures where applicable and determined necessary.

VOL 17 000359

R0062199

GENERAL PROGRESS:

The first four steps of the six step process, listed above, will be accomplished by the County upon the development of the countywide model program. The city expects to participate in this development process. Refinement of the City's existing codes, policies and procedures will commence after the development of the countywide model program.

SCHEDULE:

Commencement of activities have been delayed approximately four months. The implementation schedule will follow the schedule outlined in the new permit which is soon to be adopted.

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: PUBLIC EDUCATION AND OUTREACH PROGRAM

This BMP involves educating the public regarding the nature of urban runoff pollution and the behavioral modifications and actions that can be made by individuals to prevent it.

APPLICABLE PROGRAM AREA(S):

- RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- CONSTRUCTION
- ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to inform city residents, commercial/industrial establishments and school children about the environmental problem of runoff pollution and the means to prevent this form of water pollution.

The public education program is integral to the successful implementation of many other BMPs in the City's Stormwater/Urban Runoff Management Program. To the extent possible, this program coordinates with ongoing educational efforts in the City in order to reach the largest audience in an efficient and cost-effective manner. The program also functions as a tool for the effective implementation of related BMPs.

GENERAL PROGRESS:

The first year activities included: (1) identify a city NPDES education program coordinator; (2) establish a steering committee composed of representatives of city agencies who are already involved in pollution prevention and/or public education, or represent non-municipal stakeholders in the community;(3) inventory existing city publications, brochures, events and other media forms; (4) develop a program logo and mascot; (5) survey city employees to establish a baseline by which to measure education program success; (6) prepare and/or modify public education/information materials that will be disseminated through existing City venues to reach the target groups identified; (7) coordinate press releases, mayoral participation, and other forms of publicity for kicking-off related BMPs, such as catch basin stenciling. All the first year activities were accomplished.

VOL 17 000364

R0062204

GENERAL PROGRESS (contd.):

A critical component of this program is the ease with which the program can be identified through a symbol or slogan. The city's public education steering committee developed a logo to accompany all publications and communications about the storm water program (see top lefthand corner of this report). Also, a mascot was created to be used at public venues and for education targeted primarily to schoolchildren. A pelican was chosen for the program mascot. This character clearly represents marine environments, and, because of past history (near extinction in California), is already perceived as being as being especially sensitive to ocean pollution.

The public education program includes several target groups, such as residents, commercial and industrial establishments, and school-age children which are addressed separately below. The target group consisting of city managers and employees is covered under the Municipal Training BMP. The public education program assessment is based on the comprehensiveness of the educational effort. This is accomplished by tracking the number of events/presentations, including attendance and quantity of informational material distributed.

The following is a summary of the actions that were carried out for the specific target groups:

General Public/Residents

The City, on an ongoing basis, publishes newsletters, brochures, and fact sheets which reach all sectors of the City. Many of these publications are general enough for the insertion of articles, columns, or questionnaires on various runoff pollution related issues. Some are specifically tailored to pollution prevention issues that are directly related to urban runoff, e.g., proper household hazardous waste disposal, used motor oil recycling, and water conservation, green waste program. In addition, the City sponsors or participates in public events on a regular basis, such as Coastal Awareness Day, the Los Angeles County Fair and Beach Clean Up days. These events (venues) provide excellent opportunities for the dissemination of information regarding urban runoff pollution.

Long Beach makes a consistent effort at promoting recycling used oil. The curbside collection program is well advertised as part of the household recycling program, and several educational pamphlets used by the city discuss proper disposal and recycling of used motor oil; oil recycling is specified in the Marina Environmental Policies, published in the Long Beach Marina Rules and Regulations. Here's a run down on some of the materials distributed this past year for curbside recycling: 150,000 utility inserts, 150,000 publications, 12 ads, and hundreds of flyers.

The Intergrated Resources Bureau combined forces with the City's Nature Center to offer several classes through the Parks, Recreation and Marine Department. Here's a list of classes that are offered: Composting - "Turn Your Yard Leaves into Gold"; Vermipost -

VOL 17 000365

R0062205

GENERAL PROGRESS (contd.)

"Worms and You"; Nature's Recyclers -"Closing The Loop"; Plant It Earth; and Reduce-Reuse - Recycle (a Resource Management Series).

In addition to printed materials, a successful public campaign drive took place last year to kick off the commencement of the City's Stenciling Program. The City decided to exercise this program to its fullest extent. The City chose to employ community volunteers to perform the stenciling work instead of hiring a contractor to do the work. What better way to educate the community than to get them involved in painting the warning symbols on the catch basins. The City orchestrated the stenciling program with it's public education program by issuing press releases which described the program's purpose, by conducting special events and by distributing informational flyers.

A campaign "kick-off" event was held on Earth Day, April 22, 1995. The Department of Public Works partnered with the Department of Parks, Recreation and Marine to sponsor a Beach Clean Up and Catch Basin Stenciling event. At the event, in front of a crowd of volunteers and some dignitaries, the City's Mayor stenciled the first catch basin. Prior to this event, a press release was prepared for distribution to all the local newspapers, radio stations and the local cable company. Flyers were mailed to all the schools in the Long Beach Unified School District and to all the homeowners and business associations in the city.

The City's Engineering Bureau conducted nine stenciling events at different city parks throughout the community, one in each city council district. Each City Council member was notified about the stencil event within their council district. Some council members rolled up their sleeves and joined the stenciling work force in their district. Thus far, we had over 370 volunteers paint more than 4000 catch basins!! Participants were very enthusiastic about the project. We had some individuals volunteer more than once. We also received a lot of positive feedback from the non-participants. For a list of community groups that participated in Catch Basin Stenciling Program see the evidence of progress report for that specific BMP.

Industrial and Commercial Establishments

An extensive educational site visit model program will be developed by the County under the new permit. The City expects to participate in this development process. Establishing and implementing a city educational program for industrial/commercial establishments has been postponed and will take place after the countywide model program is developed.

Schoolchildren

There are many environmental outreach programs for City schoolchildren, including outreach by the City Water Department related to Water Conservation, and by Integrated Resources Bureau and the Nature Center.

VOL 17 000366

R0062206

GENERAL PROGRESS (contd.)

The Intergrated Resources Bureau combined forces with the City's Nature Center to staff the Travelling Recycling Education Center (TREC). TREC visits all the Long Beach School District's 4th graders to teach them about recycling, urban run-off, and resource conservation.

Another program which took off this past year is the Moveable Musuem. This program was developed by Surfrider Foundation and co-sponsored by L.A. County Natural History Musuem and the City's Nature Center. Upon request, the Moveable Musuem visits the Long Beach School District schools and teaches the children about the environment. Three programs are offered. One program is called "Protect our Watery World" which gives an exploration of how our actions at home can help aquatic wildlife.

In addition, the City's Parks and Recreation Department Nature Center runs school tours and teacher workshops that are specifically related to ocean pollution prevention. The Nature Center's "Adopt-A-Gutter" Program, is a very effective method of reaching schoolchildren as well as entire neighborhoods regarding the runoff pollution prevention issue.

SCHEDULE:

Continue existing program and refine it to fit, as necessary, the countywide model program which will soon be developed.

NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: MUNICIPAL STAFF TRAINING

This BMP involves establishing a municipal staff awareness and training program embracing all applicable facets of City activities relating to storm water concerns.

APPLICABLE PROGRAM AREA(S):

- RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- CONSTRUCTION
- ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective of this BMP is to educate municipal management and staff about the causes of stormwater pollution and the BMPs being implemented by the City of Long Beach for stormwater pollution control/prevention. By increasing awareness and understanding of the problems and offering suggested changes to alter the behavioral actions which lead to stormwater pollution, the City will come closer to its objective of decreasing the amount of pollutants entering the storm drain system.

GENERAL PROGRESS:

City staff are composed of individuals from a broad spectrum of the City's economic and cultural sectors. Many of them will be responsible for implementing the BMPs. Consequently, at the outset of the Education Program, a survey was conducted to establish a baseline for the level of understanding City employees have of urban runoff pollution and methods to prevent it. The survey questionnaire was included with the paycheck distribution packet. After a few years, after the Education Program has been fully launched, the employee survey will be repeated to determine whether the education efforts have been successful.

Disseminating information to City employees has begun. Several articles have been published in the City's Employee Newsletter and the first issue of "The Flowline", which is a newsletter for city management, was published. Many City employees participated in hosting the Los Angeles County Fair informational booth. In order to participate, the employees were educated about the storm water quality program and its purpose.

VOL 17 000368

R0062208

GENERAL PROGRESS (contd.):

The education of appropriate staff members to recognize how construction operations can contribute to runoff pollution and to recognize stormwater quality violations on construction sites has begun. Several city staff members attended the day-long seminar conducted by APWA regarding NPDES Construction permits and were trained to recognize stormwater quality violations such as vehicle management, on-site debris handling and other matters pertinent to NPDES program. An internal city training program will be developed from materials obtained at the seminar as well as from the countywide model program which is soon to be developed. The development of city inspectors' checklists to include stormwater pollution prevention elements has been postponed until the countywide model checklist is developed.

In coordination with the countywide model program for public agencies, the City's current information dissemination system will be expanded to include information relating to stormwater pollution prevention techniques and good housekeeping practices. City employees will be given information on how their actions and activities at work and home can contribute pollutants to storm drain system and what actions can reduce stormwater pollution. The City also plans to hold training workshops for employees whose jobs are directly related to Stormwater BMPs to explain each applicable BMP, its purpose, and its implementation.

SCHEDULE:

Development and implementation of employee training workshops will follow the implementation schedule outlined in the new permit which is soon to be adopted.

Continue existing program.

VOL 17 000369

R0062209

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: PUBLIC REPORTING OF ILLEGAL DISCHARGES AND/OR ILLEGAL DUMPING

This BMP involves promoting, publicizing, and facilitating public reporting of illegal discharges and/or dumping which includes utilizing the County 24-hour hotline.

APPLICABLE PROGRAM AREA(S):

- RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- CONSTRUCTION
- ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing or mitigating illegal discharges and dumping into the storm drain system.

In order to facilitate and coordinate public reporting, the Los Angeles County Department of Public Works has implemented a 24-hour telephone Hotline. The storm drain Hotline is a "1-800" number which citizens can call to report suspected illegal discharges and dumping to the storm drain system. The Hotline number is 1-800-303-0003.

Long Beach has been a partner in the Hotline since September 1993 and has published the Hotline number in a Department of Public Works flood control flier which is mailed to all Long Beach utility customers (approximately 180,000) on an annual basis. The County Hotline number has also been published in brochures, informational flyers and pamphlets. In addition to the County Hotline, spills and/or dumping incidents are reported directly to the City via the Police Department or the Public Services Bureau.

GENERAL PROGRESS:

The assumptions used in evaluating the effectiveness of this BMP are: (1) the public reporting system will deter illegal and illicit dumping of materials into the storm drain system; (2) the reporting will allow for quick responses to dumping incidents which will minimize the extent and amount of contamination to the storm drain system.

VOL 17 000370

R0062210

GENERAL PROGRESS (contd.):

The number of calls received from the County dispatchers was approximately 23. This is a slight increase from the calls received the previous year. The number of direct calls received by 911 dispatchers and the Long Beach Public Service Bureau operators is 1500 phone calls. Of the 1500 phone calls, 220 were calls regarding hazardous waste. Most of the calls were relating to cleaning the debris out of the catch basins. Compared to the previous year, there has definitely been an increase in reporting. This may be attributed to the City's extensive public education program which was implemented this past year. A response reporting system has yet to be developed; therefore, an examination of the City's response has not been conducted.

SCHEDULE:

Develop a city response reporting system.

Continue existing program.

VOL 17 000371

R0062211

STORM WATER MANAGEMENT CITY of LONG BEACH

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: CLEANING CATCH BASINS

This BMP involves cleaning catch basins, stormwater pump station forebays, earth ditches, and stormwater inlets on an annual basis.

APPLICABLE PROGRAM AREA(S):

- RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- CONSTRUCTION
- ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by minimizing the buildup of debris and pollutants in catch basins and other storm drain structures.

The City of Long Beach has an existing program to clean catch basins, stormwater inlets, stormwater pump station forebays, and earth ditches on an annual basis. The catch basins, 3200 in quantity, are scheduled for cleaning a few months prior to the onset of the wet season. Cleaning of catch basins and inlets are contracted out, with inspection done by the city's Street Maintenance Division. The City owns and maintains 22 pump stations and approximately 4 miles of open-ditches which are cleaned manually by The city's Street Maintenance Division. In addition to the annual cleaning, these facilities are cleaned on an "as needed" basis in response to reports from residents and businesses.

GENERAL PROGRESS:

The assumption used in evaluating the effectiveness of cleaning the catch basins and the storm drain facilities is that litter and debris allowed to build up would contribute pollution to stormwater runoff. The program assessment is based on how well the catch basins and storm drain facilities are kept clean and the amount of debris collected.

The catch basin cleaning program is generally effective. The city's program provides the optimum benefit of minimizing stormwater pollution by cleaning the catch basins prior to the wet season, which lessens the pollution impact of the initial storm drain flush from the first storm of the season. At the time of this writing, the amount of debris collected by the

VOL 17 000372

R0062212

GENERAL PROGRESS (contd.):

outside contractor was not known. The build up of material after the initial cleaning is then cleaned out on an "as-needed" basis. The amount of debris collected by city staff was 50 tons.

The amount of debris collected from the storm drain pump stations was 600 tons. The amount of debris collected from the open-ditches was 200 tons. The total amount of debris diverted from the storm drain system was 850 tons plus the amount collected by the outside contractor.

SCHEDULE:

Continue existing program.

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: STREET SWEEPING

This BMP involves the regular sweeping of city streets.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- □ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by reducing the buildup of dirt, debris, and other pollutants on city streets.

The City of Long Beach has a very good sweeping program which requires most public areas to be swept on a weekly basis. The public areas include residential streets, major arterials, beach parking lots, bike paths, marina parking lots and airport areas. The areas are swept according to the following schedule:

LOCATION		SWEEPING FREQUENCY
Residential Streets		Weekly
Downtown Streets		Weekly or more frequently
Major Arterials		Weekly or more frequently
Beach Parking Lots		Weekly
Bike Paths		Weekly
Marina Parking Lots		Weekly
Airport:	Public Areas	Weekly or more frequently
	Roads	Weekly or more frequently

The City of Long Beach practices source reduction by prohibiting the disposal of waste of any kind upon any street or alley. This prohibition includes the dumping, depositing, sweeping or blowing of debris into the street or alley. By practicing source reduction, the City of Long Beach minimizes the amount of material that is picked up in the sweeping program.

VOL 17 000374

R0062214

GENERAL PROGRESS:

The assumption used in evaluating the effectiveness of the street sweeping program is that dirt and debris which is collected by sweeping would otherwise be washed into the storm drain system by stormwater or non-storm related urban runoff. The program assessment is based on the frequency of sweeping and amount of debris collected.

According to the California Stormwater Best Management Practice Handbook, to achieve 50% removal of street dirt, the sweeping interval must occur ½ to 1 times the average interval between storms. By sweeping, at a minimum, on a weekly basis, the City of Long Beach exceeds this average interval and utilizes the effectiveness of street cleaning to the maximum extent practical. The time allowed for build-up of pollutants is kept to a minimum, which assures a low level of contaminants being washed off during storms.

This past year the City sweepers covered over 160,000 curb-miles and collected more than 13,000 tons of debris. This represents debris which is not being washed into the storm drain system.

SCHEDULE

Continue existing program.

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: HOUSEHOLD HAZARDOUS WASTE COLLECTION

This BMP involves the collection and proper disposal of household hazardous wastes, such as pesticides, paints, lubricants, and solvents.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing household hazardous wastes from entering the storm drain system through illegal dumping, illegal discharges, or contaminated runoff.

The City of Long Beach participates in the Household Hazardous Waste Roundup Program sponsored by the County of Los Angeles. The roundup is completely run and managed by the County. The role of the City of Long Beach is to advertise and inform residents on the roundup dates and locations, and when necessary, provide personnel to direct traffic at the roundup.

Several County roundup events are held each year at various locations. Long Beach City hosted a county roundup event for each of the past six years. The City very actively advertises the roundup event. A four-language brochure is mailed out with all utility bills to inform customers of the city-hosted events. To assist the City in spreading the word, the local newspapers advertise the events. Flyers are also distributed at many retail stores especially to all the major paint and hardware stores. County records show that Long Beach hosted events are among the highest attended in the County.

The City of Long Beach also promotes source reduction as a way of minimizing household hazardous waste. Promotion methods include distribution of source reduction guides, alternative product lists, and public education and information events. Many of the published items are multi-lingual, which makes the information more accessible to the entire Long Beach community.

VOL 17 000376

R0062216

GENERAL PROGRESS:

The assumption used in evaluating the effectiveness of the household hazardous waste collection program is that the material collected through the program is properly disposed of and is thus unavailable to be illegally or illicitly disposed of in the storm drain system.

The quantity of hazardous material collected, and properly disposed of, include: 4,700 gallons of oil; 15,000 gallons of paint; about 450 car batteries; and about 400 drums of miscellaneous waste. This past year 3,300 people participated.

SCHEDULE:

Continue existing program.

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: LITTER RECEPTACLES

This BMP involves the placement and servicing of receptacles used for control of litter and refuse.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing litter and refuse from collecting in the storm drain system.

The City of Long Beach controls incidental litter through the placement and servicing of litter receptacles. Litter receptacles are generally located in business areas, bus stops, parks, the marinas, the beach front, and at public facilities where people tend to congregate. Approximately 2500 litter receptacles are located throughout the city. The City also encourages business associations to place additional litter receptacles in major retail areas. These receptacles are paid for by the associations and serviced by the City's Refuse Division.

The City has developed a Neighborhood Improvement Strategy program. Through this program, the city provides residents with litter receptacles for placement at locations in their neighborhood where litter accumulates. The residents service the receptacles by dumping them into their residential container which is then serviced by the city.

The City is host to many special events throughout the year. The City requires event sponsors to provide an adequate number of litter receptacles and that they be serviced. Special event litter receptacles are serviced by the City or by contract haulers.

By providing receptacles, people are given an alternative to littering which they will generally use. As evidence, areas around litter receptacles appear reasonably clean and litter-free.

VOL 17 000378

R0062218

GENERAL PROGRESS:

The assumption used in evaluating the effectiveness of litter receptacles is that refuse placed in the receptacles is refuse which may have otherwise collected in the storm drain system.

Use and service of the litter receptacles are adequate. This past year, the 450 receptacles placed on residential and commercial streets collected over 290 tons of trash and were serviced on a weekly basis. The City's use of field supervisors and refuse investigators works well to make sure receptacles do not overfill. Disposal patterns have been recognized which the Refuse Division uses to properly size receptacles for weekly service. With supervisors in the field, needs for larger or repairing receptacles is reasonably quick.

SCHEDULE

Develop a reporting system to monitor the amount of waste collected in the parks, marinas, and beaches.

Continue existing program.

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: CLEAN SWEEP OPERATION PROGRAM

This BMP involves a one-time collection of refuse to city residents, free of charge.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing the accumulation of trash and debris, which may eventually wash into the storm drain system.

The City annually conducts Clean Sweep Operations for city residents in the spring. Clean Sweep events are scheduled with the Refuse Division by city councilpersons for their district. The City consists of nine council districts; thus, nine events are conducted. Residents are requested to set out allowable refuse for a free, one-time collection. This is an opportunity for residents to dispose of old furniture, tree trimmings, yard waste, appliances and other bulky items for free.

A notice is mailed out with utility bills to advertise the event. The schedule of Clean Sweep events is usually publicized in local newspapers or community newsletters. Flyers are also sent to neighborhood associations. Some communities take advantage of these free pick-ups to conduct neighborhood cleanup activities to remove litter and debris from their streets and alleys.

GENERAL PROGRESS:

The assumption used in evaluating the effectiveness of the Clean Sweep program is that litter and debris collected and disposed of through this program is material which may have otherwise washed into the storm drain system, or contributed contaminants to stormwater runoff. The program assessment is based on showing how much material is being properly disposed of.

VOL 17 000380

R0062220

GENERAL PROGRESS (contd.):

The clean sweep program is a great community program. It seems to serve as a "spring cleaning" event for residents. Those communities which take advantage of this opportunity by conducting neighborhood cleaning campaigns definitely impact storm water quality. Community clean-ups remove refuse from areas which are not otherwise maintained.

This past year, the amount of debris and litter collected was 770 tons.

SCHEDULE:

Continue existing program.

VOL 17 000381

R0062221

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: HOUSEHOLD RECYCLING

This BMP includes collecting glass, plastic, newspaper, corrugated cardboard, aluminum and steel cans.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing the collection of refuse in the storm drain system.

Curbside collection of recyclables is available to all single family residences and multi-family dwellings with ten or fewer units. Participants in the household recycling program separate recyclables from their refuse, and deposit the recyclable materials into a separate container. Recyclables are collected weekly, on the same schedule as regular refuse collection. It is collected by a firm under contract to the City of Long Beach.

Recyclables are set out in plastic open containers provided by the city. Items collected include corrugated cardboard, newspaper, glass, aluminum and steel cans, and plastic (#1-4). All items are mixed in the same container, except newspaper and cardboard, which are to be bundled. Residents are asked to rinse containers before placing them in the recycling bin.

Multi-family residences larger than ten units are not required to have a recycling program. The city fully supports any efforts by multi-family units to start their own program by providing educational material and advice, when requested. Permitted waste haulers are required to offer recycling services upon request.

VOL 17 000382

R0062222

GENERAL PROGRESS:

The assumptions used in evaluating the effectiveness of the household recycling program are: (1) material collected is material which may otherwise have been illegally disposed of in the storm drain system; (2) material collected is material which may otherwise have been improperly stored outdoors in a way that would contribute contaminants to stormwater runoff. The program assessment is based on showing how much material is being properly collected.

The City's household recycling program is adequate. Implementation of a curbside collection program exercises this program to the fullest extent practical to the majority of Long Beach residents. This past year, the quantity of material collected include: 5,825 tons of newspaper; 1,446 tons of corrugated cardboard; and a combined total of 4,718 tons of aluminum/metal cans, glass bottles, and plastics.

SCHEDULE:

Continue existing program.

BMP: SPECIAL COLLECTION PROGRAM

This BMP involves providing a service to residents for collection of bulky items for disposal.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing the accumulation and improper disposal of refuse. The City of Long Beach offers a special collection service for Long Beach residents. Residents can request special collection of bulky items such as furniture, appliances, tires, yard waste, or tree trimmings for disposal. Residents are charged a nominal fee of $6.00 for each special collection. This program provides a year-round service to pick up items which might otherwise be improperly stored or disposed of.

GENERAL PROGRESS:

The assumptions used in evaluating the effectiveness of the special collection program are: (1) items collected are items which may otherwise have been illegally dumped; (2) items collected are items which may otherwise have been improperly stored outdoors in a way that would contribute contaminants to stormwater runoff. The program assessment is based on showing how much material is being properly disposed of.

The special collection program is generally adequate. The city received approximately 8,320 calls this past year, with furniture and yard waste being the most common items collected. The amount of waste collected was 2300 tons.

SCHEDULE:

Continue existing program.

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: USED OIL RECYCLING PROGRAM

This BMP involves collecting and recycling used motor oil.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing the improper disposal of used motor oil into the storm drain system.

The City of Long Beach has a curbside collection program for used motor oil. This collection program is for single family residences and multi-family dwellings with ten or fewer units. Residents are supplied with special oil storage containers designed to prevent spillage during curbside collection. Oil is collected by the contracted recycling service used for the household recycling program. Oil is collected on the same schedule as the other recyclables, on a weekly basis, using the same collection vehicle.

The City also has a separate used oil collection program for the marinas. The City maintains a storage tank where marina residents can deposit their motor oil. The tank is emptied as needed by an outside contractor.

The City has encouraged development of a network of state certified drop-off centers where used oil can be taken for recycling. The drop-off centers are typically located at gas stations and auto parts stores. The certified drop-off centers are completely managed and maintained by the business owners. These drop-off centers supplement the City's programs by providing a place where persons not able to participate in the curbside program can take their oil. The city does not collect or maintain records of the oil collected at drop-off centers.

VOL 17
000385
R0062225

GENERAL PROGRESS:

The assumption used in evaluating the effectiveness of the used oil recycling program is that oil collected and disposed of properly is oil which may have otherwise been illegally or illicitly disposed of in the storm drain system. The program assessment is based on showing how much used oil is being diverted by this collection program.

This past year, the amount of used-oil collected through curbside collection was 43,779 gallons. The amount collected from the marina was not available at this time of writing.

The City's used-oil recycling program is a comprehensive program of outstanding quality. Especially notable is the curbside collection program, which is rare for used oil recycling. Using curbside collection and supplying residents with containers is practicing this program to the maximum extent. Combined with the oil collection program in at the marinas and the certified drop-off centers, the City of Long Beach offers a very comprehensive collection program to its community.

SCHEDULE:

Continue existing program.

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: GREEN WASTE PROGRAM

This BMP involves composting and proper disposal of green waste.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by preventing the collection and decomposition of organic material (green waste) in the storm drain system.

There are three aspects to the green waste program: proper disposal of green waste, household composting, and city grounds keeping practices.

- Proper disposal of green - The city requires property owners to tie all tree limbs, shrubs, trimmings, and other green waste of a similar nature in compact bundles for disposal. Materials likely to become airborne upon disposal are required to be securely wrapped. The city encourages proper disposal through its Special Collection program and Clean Sweep Operation program.
- Household composting - The city sponsors and/or participates in seminars on composting and distributes literature explaining methods of green waste composting. Monthly composting education classes are offered through the Parks, Recreation and Marine Department.
- City grounds keeping - In city parks, grass clippings are left on the turf for natural decomposition and re-incorporation. Traffic islands are cut with mulching mowers which grind lawn clippings and then leave them in place. About fifty percent of the city tree trimmings are transported to a recycling facility and the other half is hauled to a proper disposal facility.

GENERAL PROGRESS:

The assumptions used in evaluating the effectiveness of the green waste program is that keeping the storm drain system free of organic matter will improve the quality of

VOL 17 000387

stormwater and urban runoff on the system. The program assessment is based on examining how comprehensive and effective the program is at keeping organic matter out of the storm drain system. The methods for assessing this BMP include:

- Evaluating promotion and participation in the residential composting program
- Evaluating landscape maintenance in terms of mulching, lawn trimming and irrigation, and collection of trimmings

The green waste program has been evaluated and found to be generally adequate. Through city ordinances the program includes measures to keep green waste out of the storm drain system. The composting education classes are effective. The classes are advertised in the quarterly Parks & Recreation Schedule. This past year, attendance at quarterly classes typically varied between 7 and 19. This indicates that there is consistent and on-going interest in home composting. Stormwater quality issues have been incorporated into the composting education classes.

This past year, the amount of waste collected from the special collection program was 2300 tons which includes yard waste. Through the clean sweep operation, the amount of debris and yard waste collected was 770 tons.

The refinement of the City's grounds keeping procedures will begin after the development of the countywide model program for Landscape and Recreational Facilities Management.

SCHEDULE:

The schedule for refining the City's grounds keeping procedures will follow the implementation schedule outlined in the new permit which is soon to be adopted.

Continue existing program.

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: FACILITY INSPECTIONS

This BMP will involve conducting "site visits" at industrial or commercial businesses which have potential for contributing pollutants to stormwater runoff or the storm drain system.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by minimizing the contribution of pollutants from industrial and commercial businesses which may eventually wash into the storm drain system.

The scope for this BMP has changed since the last reporting period due to the new permit negotiations. This BMP will involve educational site visits rather than inspections.

As reported previously, the city conducts a variety of inspection programs of businesses within the city. The Hazardous Waste Operations Division conducts annual inspections of approximately 700 hazardous waste generating businesses. The Fire Department conducts several programs, including: hazardous materials inspections of about 1700 facilities; code enforcement inspections; and new construction inspections. The Health Department conducts routine inspections on approximately 1,150 food preparation facilities twice per year.

The program is, in its present state, a combination of several inspection programs. As they currently now stand, specific inspection items are not established to educate the businesses about storm water quality or look for potential stormwater quality concerns. However, many of the inspection items do incidentally address stormwater concerns. For example, proper storage of some hazardous materials often require that they be stored in a covered area with containment for safety and public health reasons; at the same time, keeping hazardous materials covered also provides stormwater quality benefits.

VOL 17 000389

R0062229

GENERAL PROGRESS:

The program assessment was based on the extent of which existing inspections cover stormwater quality issues. It was determined that the city's facility inspection program needed to be modified to include a focus on storm water quality. The methods for assessing this BMP included:

- Modifying the content of city inspection programs
- Examine city efforts towards educating the business owner on appropriate "housekeeping" practices

There is sufficient number and variety of inspection programs performed by the city to adequately cover industrial and commercial businesses. Some existing inspection programs will be better suited than others to address storm water issues. What needs to be developed is an educational program addressing storm water issues for the various types of facilities along with suggested BMPs to be implemented.

The new permit which is soon to be adopted outlines the minimum requirements that should be included in the Industrial/Commercial Educational Program. One requirement is the use of a checklist of specific storm water BMPs for each industrial/commercial SIC group. This list will be developed by the County and used on a countywide basis. The modification of the City's exiting inspection programs will begin after the approval of the new permit since it specifies the minimum program requirements.

SCHEDULE:

The schedule for modifying the City's existing inspection programs and implementing the educational site visits will follow the implementation schedule outlined in the new permit which is soon to be adopted.

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: WATER CONSERVATION AND PROPER USE

This BMP includes the implementation of water conservation and proper use measures.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- □ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to improve the quality of stormwater runoff by reducing non-storm related urban runoff which may carry pollutants into the storm drain system.

The city has an on-going program to promote the conservation and proper use of water. The Water Department actively promotes this message through distribution of informational brochures and through presentations to schools and other civic organizations.

Water conservation and proper use program which minimize the amount of non-storm surface runoff are being practiced by city agencies. They include: (1) water shutoff nozzles are required on all hoses used in the marina area; (2) car washing in the marina area is prohibited;(3) moisture sensors have been installed in vegetated street medians to prevent over irrigation and unnecessary runoff; (4) the irrigation system for street medians is gradually being refitted with more water efficient sprinkler heads.

GENERAL PROGRESS:

The assumptions used in evaluating the effectiveness of the water conservation program is that minimizing the volume of non-storm related runoff will minimize the amount of contaminants washed into the storm drain system. The program assessment is based on the comprehensiveness of the conservation and proper use education effort.

VOL 17 000391

R0062231

The water conservation program has been evaluated and found to be generally adequate. The emphasis of this program is on education. The Water Department distributed many brochures and nearly 85, 000 utilty inserts. The Department actively conducted a Water Awarenes Campaign for the month of May which include utility inserts and newspaper advertisements.

SCHEDULE:

Continue the existing program to the maximum extent practicable and to revise the educational program to include an element on surface water runoff.

STORM WATER MANAGEMENT CITY of LONG BEACH

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: STORM DRAIN MASTER PLAN

This BMP involves updating the city's computerized storm drain facilities management system and developing the system to assist the city in meeting their NPDES requirements.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective is to optimize the city's efforts in meeting the NPDES permit requirements by using the city's geographical information system (GIS).

Long Beach has a computerized storm drain facilities management system. The system integrates several computer models/systems through a menu driven application in dBASE. The data base consists of land use maps, drainage maps, storm drain alignments, hydrology data, hydraulic data, and storm drain design data.

A major consideration in the use of the storm drain facilities management system is to integrate it with the city's GIS system. Currently the city is in the process of integrating some of the storm drain facilities management system onto the GIS platform. The GIS platform offers an excellent basis to assist the city in meeting the challenges of storm water management. The GIS system will provide a coherent database of several city departments' information. This information can be queried and manipulated to fit any type of application. Ultimately, the system will be used in scheduling, tracking and reporting the city's NPDES compliance efforts.

GENERAL PROGRESS:

The entire storm drain system is on the GIS platform including the catch basins. This past year, the drainage boundaries in the facilities mapping system have been transferred on to the city's GIS platform. An new identification system for the storm drain system components have been implemented to correlate with the drainage boundaries.

VOL 17 000393

GENERAL PROGRESS (contd.)

The system has been very useful in tracking progress of the catch basin stenciling program. The system identifies those catch basins stenciled by volunteers. Other tracking system that will be developed are for illegal connection field activities, types of industrial and commercial sites in each watershed.

SCHEDULE:

Continue to update the storm drain data and develop applications to assist the city in meeting the NPDES requirements.

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: CATCH BASIN STENCILING

This BMP involves stenciling the City catch basins with prohibitive language and graphic icons to discourages the illegal dumping of unwanted materials into the storm drain system.

APPLICABLE PROGRAM AREA(S):

- RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- CONSTRUCTION
- ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objective of the storm drain stenciling program is to enhance public awareness of the connection between the storm drain system and our receiving waters. Another objective is to discourage individuals' habitual waste disposal actions, e.g. dumping of automobile fluids and landscaping wastes into the storm drain system.

These objectives were accomplished by stenciling a sign adjacent to storm drain inlets which contains a message that discourages the dumping of improper materials into the storm drain system because they drain directly to the ocean. The City adopted the Los Angeles County/Heal the Bay standard stencil design as a matter of consistency.

The primary purpose of the stencil program is to have a message stenciled on the catch basins in the City of Long Beach and secondarily, but most importantly, to educate the public about non-point source pollution. The City decided to exercise this program to its fullest extent. The City chose to employ community volunteers to perform the stenciling work instead of hiring a contractor to do the work. What better way to educate the community than to get them involved in painting the warning symbols on the catch basins.

The City orchestrated the stenciling program with it's public education program by issuing press releases which described the program's purpose, by conducting special events and by distributing informational flyers.

VOL 17 000395

R0062235

GENERAL PROGRESS:

THANKS to all the hard working volunteers, the City's Catch Basin Stenciling Program has been a BIG SUCCESS !!! Thus far, we had over 370 volunteers paint more than 4000 catch basins!!! Participants were very enthusiastic about the project. We had some individuals volunteer more than once. We also received a lot of positive feedback from the non-participants.

A campaign "kick-off" event was held on Earth Day, April 22, 1995. The Department of Public Works partnered with the Department of Parks, Recreation and Marine to sponsor a Beach Clean Up and Catch Basin Stenciling event. At the event, in front of a crowd of volunteers and some dignitaries, the City's Mayor stenciled the first catch basin. Prior to this event, a press release was prepared for distribution to all the local newspapers, radio stations and the local cable company. Flyers were mailed to all the schools in the Long Beach Unified School District and to all the homeowners and business associations in the city.

From that day forward, the City's Engineering Bureau conducted nine stenciling events at different city parks throughout the community, one in each city council district. Each City Council member was notified about the stencil event within their council district. Some council members rolled up their sleeves and joined the stenciling work force in their district.

The City supplied the volunteers with all the necessary materials and maps. An educational briefing was conducted for each group prior to beginning their stenciling work. Informational material was also available to educate the non-participants about storm water pollution and the storm drain system. At the events, refreshments were generously donated by the International Longshoremen's and Warehousemen's Union, Locals 13, 63, 94, and their Southern California District Council. Certificates of participation were also provided to all the volunteers.

The Catch Basin Stenciling program is still ongoing. Although no more "formal" stenciling events are being conducted, the City receives several calls from various groups and individuals, who want to carry on the task. They are supplied with everything they need and proceed to organize themselves into teams to stencil the catch basins.

Many Long Beach citizens and friends from other communities participated. The following list of organizations demonstrates the diversity of the people who participated in this program:

Boy Scouts of America, Troops 77 & 693, Pack 77 and Others

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The primary objective of this BMP is to educate the public about the viable alternatives for improper disposal practices and about the water quality impacts of pollutants. By educating the public, this may improve the quality of stormwater runoff by preventing the accumulation of trash and debris on public streets, which may eventually wash into the storm drain system.

The City of Long Beach has in place several programs designed to reduce litter from public areas within the City and from private residential and commercial areas.

In conjunction with the Litter Receptacles BMP, the City has approximately 2500 litter receptacles. Litter receptacles are generally located in business areas, bus stops, parks, the marinas, the beach front, and at public facilities where people tend to congregate. The City also encourages business associations to place additional litter receptacles in major retail areas. These receptacles are paid for by the associations and serviced by the City's Refuse Division. The City also has programs for providing temporary waste receptacles at special events, such as the Long Beach Grand prix, parades, and street fairs, as well as special janitorial service/ litter control and cleanup programs in the City's business districts.

The City has developed a Neighborhood Improvement Strategy program. Through this program, the city provides residents with litter receptacles for placement at locations in

VOL 17 000398

R0062238

BACKGROUND(contd.):

their neighborhood where litter accumulates. The residents service the receptacles by dumping them into their residential container which is then serviced by the city.

The City annually conducts Clean Sweep Operations for city residents in the spring. Clean Sweep events are scheduled with the Refuse Division by city councilpersons for their district. The City consists of nine council districts; thus, nine events are conducted. Residents are requested to set out allowable refuse for a free, one-time collection. This is an opportunity for residents to dispose of old furniture, tree trimmings, yard waste, appliances and other bulky items for free. Many communities take advantage of these free pick-ups to conduct neighborhood cleanup activities to remove litter and debris from their streets and alleys.

Curbside collection of recyclables is available to all single family residences and multi-family dwellings with ten or fewer units. Participants in the household recycling program separate recyclables from their refuse, and deposit the recyclable materials into a separate container. Recyclables are collected weekly, on the same schedule as regular refuse collection. Multi-family residences larger than ten units are not required to have a recycling program. The city fully supports any efforts by multi-family units to start their own program by providing educational material and advice, when requested. Permitted waste haulers are required to offer recycling services upon request.

The City of Long Beach offers a special collection service for Long Beach residents. Residents can request special collection of bulky items such as furniture, appliances, tires, yard waste, or tree trimmings for disposal. Residents are charged a nominal fee of $6.00 for each special collection. This program provides a year-round service to pick up items which might otherwise be improperly stored or disposed of.

As discussed in the Green Waste Program, BMP, there are three aspects to the green waste program: proper disposal of green waste, household composting, and city grounds keeping practices.

- Proper disposal of green - The city requires property owners to tie all tree limbs, shrubs, trimmings, and other green waste of a similar nature in compact bundles for disposal. Materials likely to become airborne upon disposal are required to be securely wrapped. The city encourages proper disposal through its Special Collection program and Clean Sweep Operation program.
- Household composting - The city sponsors and/or participates in seminars on composting and distributes literature explaining methods of green waste composting. Composting education classes are advertised in the Parks, Recreation and Marine Department quarterly schedule which is distributed to every resident and made available at public counters. The City's Nature Center display exhibits on composting and vermaposting for the general public to view.

VOL 17 00399

R0062239

BACKGROUND(contd.):

- City grounds keeping - In city parks, grass clippings are left on the turf for natural decomposition and re-incorporation. Traffic islands are cut with mulching mowers which grind lawn clippings and then leave them in place. About fifty percent of the city tree trimmings are transported to a recycling facility and the other half is hauled to a proper disposal facility.

The City intended to conduct a pilot project for the proper disposal of pet feces by installing 2 plastic bag dispensers in selected areas in which residents tend to walk their pets (e.g., parks, or beach boardwalks). These dispensers were going to include language urging residents to be responsible pet owners by cleaning up and depositing pet feces in a proper garbage receptacle. This pilot project is on hold until the new permit requirements are known at which time the City will have a better understanding about the countywide model program and will be able to focus its resources on the priority areas.

GENERAL PROGRESS:

The assumption used in evaluating the effectiveness this BMP is that by discouraging improper disposal practices to residents and businesses and providing them with viable alternatives, there will be less debris collected in the storm drain system. The program assessment is based on showing how much material is being properly collected which is an indication of the amount of waste that is properly disposed of.

This past year, the 450 receptacles placed on residential and commercial streets collected over 290 tons of litter and were serviced on a weekly basis. Through the clean sweep operation, the amount of debris and yard waste collected was 770 tons. The quantity of material collected from the City's household recycling program include: 5,825 tons of newspaper; 1,446 tons of corrugated cardboard; and a combined total of 4,718 tons of aluminum/metal cans, glass bottles, and plastics. The amount of waste collected from the special collection program was 2300 tons which includes yard waste.

By providing these programs, people are given viable alternatives for improper disposal practices which the community of Long Beach generally use. This is confirmed by the amount of debris collected.

SCHEDULE:

Continue the on-going City programs.

Implementation of the pilot project for the Pet Feces Reduction program has been postponed until the countywide model program for this BMP is developed.

VOL 17 000400

R0062240

STORM WATER MANAGEMENT CITY of LONG BEACH

DATE: MAY 30, 1996
CO-PERMITTEE: LONG BEACH CITY
NAME: EDWARD T. PUTZ, CITY ENGINEER

EVIDENCE OF PROGRESS AND REVISED PLAN AND SCHEDULE

BMP: SIDEWALK AND ALLEY CLEANING

This BMP involves the removal of dirt, rubbish, litter and debris from sidewalks and alleyways to prevent these pollutants from being washed into the storm drain system.

APPLICABLE PROGRAM AREA(S):

- ■ RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL
- □ CONSTRUCTION
- ■ ILLICIT DISCHARGE AND ILLEGAL DUMPING

BACKGROUND:

The objectives of this BMP are to educate the citizenry through its Public Outreach Program about reducing pollutants in stormwater by providing clean sidewalks and alleys, and to enforce the City's ordinances governing litter control as is necessary. The City also commits to continuing the use of service organizations, such as the Conservation Corps, to pick up litter and manually clean sidewalks in certain areas of the City.

City Cleanup Programs:

In conjunction with the Clean Sweep Operation Program BMP and the Neighborhood Improvement Strategy Program, the residential communities take advantage of free refuse pickups to conduct neighborhood cleanup activities to remove litter and debris from their local sidewalks and alleys.

Many Long Beach residents take full advantage of the Special Collection Program BMP for minimal cost. This program provides a year-round service to pick up items such as yard waste or tree trimmings which may otherwise be improperly disposed of.

The City no longer cleans improved (i.e., paved or asphalt) alleyways due to budget constraints. In 1994 over 100,000 miles of public alleys were swept as part of the City's street sweeping activities. The Refuse Collection Department still deploys a Special Crew of 2 "spotters" which patrol the City to look for people dumping garbage on streets and in alleys, and reports these areas to the Department for further action.

The City utilizes the services of several organizations and private companies to keep sidewalks and alleyways clean. Local Conservation Corps participants are often called

VOL 17 00401
R0062241

BACKGROUND (contd.):

in to pick up litter and manually clean alleyways. The Community Development Department hires private janitorial services to weekly clean sidewalks in the downtown business district.

Each of these City programs lessen the amount of litter and debris which could otherwise enter the storm drain system.

Through the Public Education and Outreach BMP, the City will inform the public about proper sidewalk cleaning methods, and proper disposal methods for sweepings, litter and debris.

GENERAL PROGRESS:

The assumption used in evaluating the effectiveness of this BMP is the amount of debris collected through the programs listed above may have been improperly disposed on the city sidewalks or alleys and ultimately captured in the in the catch basins. The City recognizes the importance of sidewalk and alley cleaning in maintaining a pollutant-free and aesthetically pleasing municipal environment.

A side from terminating the monthly alley sweeping due financial constraints, the City is fully committed in implementing the other programs. Through the clean sweep program, over 770 tons of debris were collected which may have otherwise been diverted into the storm drain system and carried directly to the ocean. In addition, 2300 tons of waste was collected through the special collection program.

SCHEDULE:

Continue existing programs and refine them to fit the new permit requirements. The modifications, if any, will follow the implementation schedule outlined in the new permit.

VOL 17 000402

R0062242

Best Management Practices: Defined as any practices or procedures that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

CATCH BASIN STENCILING

Description:

This ABMP includes stenciling the catch basins with prohibitive language and graphic icons which discourage the illegal dumping of unwanted materials into the storm drain system.

Objectives:

The objective of the storm drain system stenciling program is to enhance public awareness of the pollutant effect on local receiving waters from stormwater/urban runoff and to discourage individuals' habitual waste disposal actions, e.g. dumping automobile fluids and landscaping wastes into the storm drain system. This objective is accomplished by stenciling a sign adjacent to storm drain inlets which contains a message that discourages the dumping of improper materials into the storm drain system.

Approach:

1. Select a stencil design. Long Beach adopted the Los Angeles County standard stencil design..
2. Inventory the catch basins to be stenciled. This work is complete and maps indicating their locations are being prepared.
3. Determine type of work force to be used. In coordination with the public

VOL 17 0004006

Approach (cont'd.):

outreach program, the City has decided to use a combination of City forces and volunteer groups. For major arterials, City personnel will perform the stencil work, and for other areas, volunteers will be used.

4. Dissect the City into reasonable size areas. The City will be conducting 9 events, one in each council district.
5. Set a reasonable implementation schedule. The volunteer work will commence in April 1995 and be completed by early August 1995.
6. Contact environmental groups and volunteer organizations. This work has been done through phone calling and sending out letters to several local organizations.
7. Conduct a pilot project with the volunteer leaders. The pilot project has been scheduled for April 8, 1995.
8. Determine a kickoff campaign date. The kickoff campaign date has been scheduled for April 22, 1995. We are combining the Catch Basin Stenciling Program kick-off day with our Beach Clean-Up Program to emphasize the connection.
9. Advertise the events. For the April 22nd event, flyers have been mailed to more than 3,000 volunteers. Over a 1,000 flyers have been disbursed to the Long Beach Schools for posting. Flyers will be available at all City public counters. One announcement about the Catch Basin Stenciling Program has been published in the local City newspaper and another will follow a week before the event. Two weeks before each event, notification letters will be mailed to the homeowner associations within that council district.
10. In coordination with the Public Education and Outreach BMP, informational material will be available at the stenciling events to educate the public about storm water pollution and the storm drain system.

Schedule: Program is in progress.

Legal Authority: Not required

ADDITIONAL BEST MANAGEMENT PRACTICES RESIDENTIAL, COMMERCIAL AND INDUSTRIAL

Best Management Practices: Defined as any practices or procedures that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

PROPER DISPOSAL OF LITTER, YARD WASTE, AND PET FECES

Description:

This ABMP involves discouraging improper disposal practices by residents and business operators of solid waste, particularly placing or leaving litter, yard waste, and pet feces in the streets or areas where runoff may carry pollutants from these forms of solid waste into the storm drain system.

Objectives:

The primary objective of this BMP is to educate the public about the water quality impacts of pollutants contained in litter, yard waste, and pet feces and about viable alternatives to prohibited disposal practices.

Approach:

Through the Public Education and Outreach BMP, the City will attempt to educate the public about the laws requiring proper disposal methods that were passed to prevent pollutants from reaching the storm drain system, and to provide viable alternatives to prohibited behaviors.

VOL 17 000408

Approach (cont'd.) :

1. Litter/Yard Waste Reduction Programs - The City of Long Beach has in place several programs designed to reduce litter from public areas within the City and from private residential and commercial areas.

   a. Litter Receptacles. In conjunction with the Litter Receptacles BMP, the City will determine the location of approximately 350 existing litter receptacles. In coordination with the City's Neighborhood Improvement Strategy and Facility Inspections, the City will evaluate current distribution in an effort to target priority areas such as bus stops, convenience and grocery stores, gas stations, public buildings, parks and other high pedestrian traffic areas. The City also has programs for providing temporary litter receptacles at special events, such as the Long Beach Grand prix, parades, and street fairs, as well as special janitorial service/ litter control and cleanup programs in the City's business districts.

   b. Green Waste Program. Through the City's Green Waste Program BMP, the City will review ways to improve the program participation and effectiveness in reducing green waste pollution. The City will also provide information to residents through its Public Education and Outreach BMP about the advantages of backyard composting, vermaposting and grass-cycling. Within the City, the Parks and Recreation Department and the Nature Center offer classes and display exhibits on composting and vermaposting.

   c. Special Collection Program. Under the Special Collection Program BMP, the City will review the current program and make appropriate changes in the frequency and location of the Special collections, if necessary.

VOL 17 00409

Approach (cont'd.):

2. Implement Pet Feces Reduction Program - In conjunction with the Public Education and Outreach BMP, the public will be given information on the stormwater problems associated with improperly disposed pet feces. The City will conduct a pilot project by installing 2 plastic bag dispensers in selected areas in which residents tend to walk their pets (e.g., parks, or beach boardwalks). These dispensers will include language urging residents to be responsible pet owners by cleaning up and depositing pet feces in a proper garbage receptacle.

Schedule: Continue on-going Litter/Yard Waste Reduction Programs. Implement pilot project for the Pet Feces Reduction program by the Spring of 1996.

ADDITIONAL BEST MANAGEMENT PRACTICES RESIDENTIAL, COMMERCIAL AND INDUSTRIAL

Best Management Practices: Defined as any practices or procedures that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

SIDEWALK AND ALLEY CLEANING

Description:

This ABMP involves the removal of dirt, rubbish, litter and debris from sidewalks and alleyways to prevent these pollutants from being washed into storm drain system.

Objectives:

The objectives of this ABMP are to educate the citizenry through its Public Outreach Program about reducing pollutants in stormwater by providing clean sidewalks and alleys, and enforce the City's ordinances governing litter control as is necessary.

Approach:

The City of Long Beach recognizes the importance of sidewalk and alley cleaning in maintaining a pollutant-free and aesthetically pleasing municipal environment.

Existing City Cleanup Programs

- The City cleans all improved (i.e., concrete or asphalt) alleyways at least once a month as part of the Street Sweeping program. About 6,000 miles of public alleys were swept in 1994 as part of the City's street sweeping activities. Logs of alley miles will be maintained and reported.

VOL 17 00411

Approach (cont'd.):

- The City also commits to continuing the use of service organizations to pick up litter and manually clean sidewalks in certain areas of the City. The City currently utilizes the services of several organizations and private companies to keep sidewalks and alleyways clean. Local Conservation Corps participants are often called to pick up litter and manually clean alleyways. The Community Development Department hires private janitorial services to weekly clean sidewalks in the downtown business district. A tracking system needs to be developed to record and report the amount of City effort.
- In conjunction with the Clean Sweep Operation Program BMP, residential communities can take advantage of free pickups to conduct neighborhood cleanup activities to remove litter and debris from their local sidewalks and alleys.
- Through the Public Education and Outreach BMP, the City will inform the public about proper sidewalk cleaning methods, and proper disposal methods for sweepings, litter and debris.

Schedule: Programs are currently in progress. Develop a tracking system to monitor the effectiveness by December 1995.

Task 3.1.2 - Plan and Schedule for Residential, Commercial, & Industrial BMPs

G-05 **Stormwater Information Maintenance Management System (SWIMMS)** - This BMP is a continuation of the City of Los Angeles' Early Action BMP Improved Catch Basin Record Keeping. The SWIMMS data base will hold and process field data gathered during the enhanced catch basin cleaning program. It is anticipated that with a systematic catch basin record keeping, a more efficient system of catch basin cleaning will evolve. Thus, catch basins which tend to accumulate debris will be cleaned more frequently. Also, future education programs and modified or new Best Management Practices can be directed towards detected problem debris accumulation areas. City of Los Angeles, Stormwater Management Division is in the final stages of developing a pilot SWIMMS. The pilot SWIMMS database is being developed for a project area located within the Santa Monica Bay Drainage Basin. The pilot project is expected to be completed in the Winter of 1996. If the findings from the pilot project prove to be successful, the program is expected to expand on a City-wide basis.

G-07 **Street Cleaning Pilot Program** - This pilot project will provide for cleaning of the City of Los Angeles' public streets using two different types of vacuum sweepers, used at varying frequencies. The project will also examine the effectiveness of street washing as a method to reduce pollutants from entering into the storm drain system. The project will be conducted for a period of twelve months. A report will then be prepared describing the monitoring results, the pollutant removal efficiency, all associated costs, and the general effectiveness of the program. The project is scheduled to begin in the Fall of 1995.

G-08 **Roadside Trash Receptacle Project** - An existing City of Los Angeles, Bureau of Engineering program is already accomplishing the objective of this BMP. The existing program is the Transit Shelter Program being administered by the Central District. Under this Program, the transit shelter contractor is allowed to build and maintain transit shelters in the City of Los Angeles jurisdiction. The contractor is in turn required to provide trash receptacles near the transit shelters and to maintain the trash receptacles at least twice a week. This program has currently built 980 shelters. Of these, 942 shelters have trash receptacles which are being emptied twice a week. It is estimated that the volume of trash taken from these trash receptacles is about 110 cubic yards per week. The program is to add around 50 shelters every year until the present contract expires in March 1997.

G-11 **Closed Circuit Television (CCTV) of Storm Drain Lines** - This BMP will use closed circuit television to survey underground storm drain lines within the City of Los Angeles to determine their physical condition. These determinations will enable the City to prescribe repair and/or replacement of damaged storm drain segments; thus, preventing infiltration into the storm drain line. These efforts are now critical in some areas due to the possible damage caused by the Northridge earthquake. The CCTV will also be used as necessary to find and locate connections to the storm drain line that exhibit signs of illicit discharges. Locating connections into the storm drain line will help the City in detecting and eliminating illicit discharges. The CCTV contract was awarded in April 1994, for a term of three years.

VOL 17 00415

R0062255

G-13 **Revise General Plan to Address Stormwater Quality** - The City of Los Angeles' Stormwater Management Division and Planning Department have worked together in the preparation of the Stormwater Drainage component of the City's General Plan. The revised component identifies the general requirements of Federal and State stormwater regulatory programs. The new Plan also contains general policies and programs with which the City will be involved as part of its stormwater pollution abatement efforts. Due to budget restraints and a shift in priority, the Planning Department had to postpone the review and adoption of all elements of the General Plan, with the exception of the framework element. Therefore, the addition of the Stormwater Drainage Component to the City's General Plan has been temporarily postponed.

G-15 **Stormwater Quality Modifications to the Department of Public Works/Bureau of Engineering's Storm Drain Design Manual (SDDM) and Standard Plans, where applicable** - An important consideration in processing revisions to the City of Los Angeles SDDM and Standard Plans is the need to identify stormwater pollutant reduction as a part of drainage systems design and design of other public works projects. Staff are beginning the development of Standard Plans which address specific stormwater pollution abatement BMPs or activities. Review of the California BMP Manuals, along with other reference sources, continues as staff identify management practices which could be developed as standards and incorporated into Standard Plans, or perhaps a new manual. Staff level modification and revision of sections of the SDDM will continue through December 1995. Draft design standards should be available by June 1996.

G-18 **Private Industry Outreach: General Industrial Stormwater Permit (GISP)** - Fact sheets were sent out to 2,700 facilities within the City of Los Angeles which had Standard Industrial Classification codes required to be covered by a GISP under categories i to ix and 8,300 facilities with SIC codes required to be covered under category xi. These facilities were identified from a Department of Water and Power database. The fact sheets informed the facility operators about the need for their facility to be covered by the GISP. Currently information is made available, by request, to industries on a case by case basis. This is an on-going activity.

G-20 **Propagation of Proper Management and Disposal of Used Oil and Toxic Materials** - This BMP promotes the proper disposal of used oil and toxic materials. The City of Los Angeles, Bureau of Sanitation operates a Hazmobile collection program. The Hazmobile operates at a location for a two-week period, three days each week. The Bureau operates a toll free number which can be used to make reservations for the Hazmobile up to three months in advance. This hotline also provides callers with a variety of waste disposal information, including where to take old tires and used motor oil. Based upon their zip code, callers are provided with the locations of certified and uncertified oil disposal centers in their area. In addition, a total of 42 Unocal service stations have been designated as State certified used motor oil recycling centers. This oil recycling program is a result of the City of Los Angeles, American Oceans Campaign and Unocal forming an alliance. The program is funded by a grant from the California Integrated Waste Management Board, which collects a four-cent

VOL 17 0041 6

R0062256

deposit charge on each quart of motor oil sold in the state. The money is used to cover recycling center site costs and for a City-wide public education program. Hopefully, promoting the existence of appropriate means of disposal will prevent illegal disposal. Several printed materials such as general information brochures, posters and a variety of industry specific pieces are being produced and distributed to the other Co-Permittee cities. These are on-going activities for the City of Los Angeles.

G-22 **Stormwater Pollution Abatement Pilot Projects for City Facilities** - Within the City of Los Angeles, a variety of structural and non-structural BMPs could be implemented and studied at appropriate City-owned facilities. The Stormwater Management Division would like to use City-owned sites as locations for pilot projects. Staff have been working with the City's Bureau of Street Maintenance in determining a suitable facility for developing a stormwater pollution abatement pilot project. Currently, four of the Bureau's asphalt plants and maintenance yards are being considered. This is an on-going activity.

G-23 **Abandoned Waste Removal/Emergency Response Program** - The City of Los Angeles' Stormwater Management Division receives calls form citizens and public agencies regarding nonhazardous and hazardous waste abandoned in the public rights-of-way. The Division's Enforcement Unit responds to the calls by supervising cleanup efforts made by the City's contractor, or coordinating efforts with City agencies which conventionally handle the disposal of such wastes. Additionally, the Unit also handles reports of emergency spills into the public rights-of-way and the City's storm drain system by ensuring that adequate and immediate mitigation is done to minimize the spill's impact on the storm drain system and/or Waters of the State. The Unit also identifies responsible parties and issues Notices of Violations for failure to provide containment for uncontrolled discharges. This is an on-going activity.

PLAN FOR ADDITIONAL BEST MANAGEMENT PRACTICES

RESIDENTIAL, COMMERCIAL AND INDUSTRIAL BMP's

Best Management Practices: Defined as any practices or procedures that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

Procedure:

It is illegal for any person to discharge, deposit, or suffer to be discharged or deposited any industrial waste or effluent in or upon incorporated territory of the City or into streams, bodies of water, storm drains or flood control channels without first securing a permit therefore from the City Engineer as provided in this subsection and at all times having an unrevoked permit therefore.

Under Section 14-9 of The Code of The City of Lynwood, the City Engineer, his designee or the Health Officer is allowed to inspect all industries for any non-storm water discharges.

- Establish an area-wide catch basin stenciling program with a universal stencil to discourage dumping, discarding, and/or discharge of pollutants, carriers, and/or debris into storm drainage system county wide.
- Develop programs to promote, publicize and facilitate public reporting of illegal discharges and/or dumping.
- Augment public education and outreach programs with regard to catch basins and storm drainage systems and their intended purpose.
- Create or augment a program to eliminate the improper disposal of litter, lawn/garden clippings, and per faces into the street or areas where runoff may carry these pollutants to the storm drainage system.
- Encourage owners and occupants of homes or businesses to remove dirt, rubbish, and debris from their sidewalks and alleys which may contribute pollutants to urban runoff.

ADDITIONAL BEST MANAGEMENT PRACTICES (BMPS) RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL SITES

Best Management Practices:

Defined as any practices or procedures that directly or indirectly reduce storm water or urban pollution into storm drain system.

Procedure:

Implement facility inspections of auto repair shops, auto body shops, auto parts and accessory shops, gasoline stations, and restaurants as the accumulation of pollutants, garbage, and/or debris tends to concentrate in these areas.

Facility inspections will be contracted with the County.

Legal Authority/Implementation Date(s):

County Code Title 20, Div. 2 / F.Y. 95-96

VOL 17 000423

Co-Permittee City of Maywood Name Matthew J. Binder

Date 3/31/95 Title City Engineer

ADDITIONAL BEST MANAGEMENT PRACTICES (BMPS) RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL SITES

Best Management Practices:

Defined as any practices or procedures that directly or indirectly reduce storm water or urban pollution into storm drain system.

Procedure:

Encourage owners and persons in control of homes or businesses to remove dirt, rubbish, and debris from their sidewalks and alleys which may contribute pollutants to urban runoff.

Program will be implemented to increase community awareness of stormwater pollution and steps that can be taken to protect our oceans.

Legal Authority/Implementation Date(s):

Maywood Municipal Code Sections 5-22.01, 5-22.02, 6-2.106, 6-404 (0)(1) / F.Y. 95-96

VOL 17 00424

Co-Permittee City of Maywood Name Matthew J. Binder

Date 3/31/95 Title City Engineer

ADDITIONAL BEST MANAGEMENT PRACTICES (BMPS) RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL SITES

Best Management Practices:

Defined as any practices or procedures that directly or indirectly reduce storm water or urban pollution into storm drain system.

Procedure:

Encourage recycling of oil, glass, plastic, and other materials to prevent their improper disposal into the storm drainage system. Each municipality should insure that receptacles are provided in strategic areas.

Program will be implemented to increase community awareness of recycling household disposables.

The City's contract trash hauler is formulating plans for a Materials Recycling Facility.

Legal Authority/Implementation Date(s):

Integrated Waste Management Act / F.Y. 95-96

ADDITIONAL BEST MANAGEMENT PRACTICES (BMPS) RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL SITES

Best Management Practices:

Defined as any practices or procedures that directly or indirectly reduce storm water or urban pollution into storm drain system.

Procedure:

Encourage the proper disposal of household hazardous wastes to prevent the improper disposal of such materials to the storm drainage system. Each municipality should establish disposal centers in strategic areas.

The City participates as a co-sponsor of the County of Los Angeles' Household Hazardous Waste Round Up. Program will be implemented to increase community awareness of household hazardous waste.

Legal Authority/Implementation Date(s):

Integrated Waste Management Act of 1989 / F.Y. 1995-96

LOS ANGELES COUNTY AREA-WIDE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM MUNICIPAL STORM WATER DISCHARGE PERMIT (NPDES NO. CA0061654, CI File No. 6968)

The Los Angeles Regional Water Quality Control Board adopted an NPDES Municipal Storm Water Discharge Permit (Order No. 90-079), June 18, 1990. The City of Montebello (City) is a Co-Permittee under this permit with Los Angeles County being Principal Permittee.

The City, as a Co-Permittee to the Los Angeles County area-wide NPDES Municipal Storm Water Discharge Permit, currently participates under Phase II and Phase III of the permit due to the City's drainage patterns. This Regional Board has received your letter dated June 4, 1993, in which the City requests permission to combine its Phase II and Phase III efforts under the deadlines for Phase II. Regional Board staff has considered the request and finds it to be acceptable. The Regional Board now recognizes that the City will follow all deadlines under Phase II of the permit.

If you have any questions please call me at (213) 266-7596, or have your staff contact Carlos Urrunaga at (213) 266-7598.

ADDITIONAL BEST MANAGEMENT PRACTICES (BMPs)

RESIDENTIAL, COMMERCIAL AND INDUSTRIAL SITES

Additional Best Management Practices: Defined as any practices or procedures not previously described in the City's Existing BMP and Early Action BMP documents that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

Procedure: ADOPT A STORMWATER/URBAN RUNOFF CONTROL ORDINANCE

Description: Adopt a runoff control ordinance requiring the use of BMPs at selected commercial and industrial establishments.

Background: This is one of the 13 Baseline BMPs mandated by the Regional Water Quality Control Board (RWQCB).

Implementation: By May 31, 1995, the Norwalk City Council will adopt Ordinance No. 1437, "An Ordinance of the City of Norwalk Relating to Stormwater and Urban Runoff Pollution, Amending chapters VI, XI and XII of the Norwalk Municipal Code". Section 3 of the Ordinance will add Section 11-4.4, "Commercial and Industrial Activity", to the Municipal Code. Section 11-4.4 requires all commercial and industrial facilities to obtain an NPDES Permit if required to do so by State regulations. Section 11-4.4 also requires all commercial and industrial facilities to comply with the applicable BMPs adopted by the City. The City plans to collect data on the implementation of the ordinance during Fiscal Year 1995/96. The ordinance will be reevaluated after RWQCB issues the new NPDES permit to determine the need for revision.

Legal Authority: N/A

Implementation Dates: The City will issue progress reports on the implementation of this BMP as required by its NPDES Permit. Within twelve months of the RWQCB issuance of the new NPDES Permit, the ordinance will be reevaluated to identify any needed revisions.

ADDITIONAL BEST MANAGEMENT PRACTICES (BMPs)

RESIDENTIAL, COMMERCIAL AND INDUSTRIAL SITES

Additional Best Management Practices: Defined as any practices or procedures not previously described in the City's Existing BMP and Early Action BMP documents that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

Procedure: ENCOURAGE WATER CONSERVATION

Description: Encourage the proper use and conservation of water to minimize runoff from landscaped areas, lawns, golf courses, etc.

Background: This is one of the 3 Baseline BMPs mandated by the Regional Water Quality Control Board (RWQCB).

Implementation: The City plans to prepare and distribute public education materials which include information on the importance of water conservation in the context of the City's NPDES Program. These public education materials may be in the form of brochures, cable T.V. broadcasts, radio broadcasts, utility bill inserts or some other format. Some of these public education pieces will suggest water conservation BMPs for specific residential, commercial and industrial groups.

Legal Authority: Water Conservation Ordinance (City Ordinance No. 1378) Water Efficient Landscape Ordinance (NMC 27-56.1).

Implementation Dates: Public education materials will be prepared and distributed during Fiscal Year 1995/96.

ADDITIONAL BEST MANAGEMENT PRACTICES (BMPs)

RESIDENTIAL, COMMERCIAL AND INDUSTRIAL SITES

Additional Best Management Practices: Defined as any practices or procedures not previously described in the City's Existing BMP and Early Action BMP documents that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

Procedure: **PUBLIC REPORTING OF ILLEGAL DISCHARGES/DUMPING**

Description: The City will develop programs to promote, publicize and facilitate public reporting of illegal discharges and/or dumping. The programs will include emphasis on the reporting of illegal discharges and dumping at residential, commercial and industrial sites.

Bakground: This is one of the 13 Baseline BMPs mandated by the Regional Water Quality Control Board (RWQCB) for implementation by all Co-Permittees. Although the scope of this procedure encompasses all three BMP categories established under the NPDES Permit, the BMP described herein focuses on residential, commercial and industrial sites.

Implementation: The City will prepare and distribute public education materials which promote the use of Los Angeles County's 1-800 NPDES hotline telephone number. The public education materials will target each of the three land use types - residential, commercial, industrial - indicating common illegal discharges, NPDES permitted discharges, and NPDES exempt discharges for each.

Legal Authority: N/A

Implementation Date(s): The public education materials will be prepared and distributed during Fiscal Year 1995/96.

ADDITIONAL BEST MANAGEMENT PRACTICES (BMPs)

RESIDENTIAL, COMMERCIAL AND INDUSTRIAL SITES

Additional Best Management Practices: Defined as any practices or procedures not previously described in the City's Existing BMP and Early Action BMP documents that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

Procedure: **PUBLIC EDUCATION AND OUTREACH ON THE STORM DRAIN SYSTEM**

Description: The City will develop public education and outreach programs with regard to catch basins and storm drainage systems and their intended purpose.

Background: This is one of the 13 Baseline BMPs mandated by the Regional Water Quality Control Board (RWQCB). The scope of this procedure includes all three BMP categories established by the NPDES Permit; however, only that aspect which addresses residential, commercial and industrial sites is covered under this BMP.

Implementation: The City will prepare and distribute public education materials, targeting each of the three land use types. The public educational materials will contain the following elements: (1) a description of the storm drain system and its intended use; and (2) a list of common illegal discharges to the storm drain.

Legal Authority: N/A

Implementation Dates: Public educational materials will be prepared and distributed during the course of Fiscal Year 1995/96. Educational materials will be included with new business licenses on an ongoing basis.

ADDITIONAL BEST MANAGEMENT PRACTICES (BMPs)

RESIDENTIAL, COMMERCIAL AND INDUSTRIAL SITES

Additional Best Management Practices: Defined as any practices or procedures not previously described in the City's Existing BMP and Early Action BMP documents that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

Procedure: **CLEANING OF SIDEWALKS AND ALLEYS BY OWNERS/OCCUPANTS OF HOMES AND BUSINESSES**

Description: The City will encourage the owners and occupants of homes and businesses to remove dirt, rubbish, and debris from their sidewalks and alleys which may contribute pollutants to urban runoff.

Background: This is one of the 13 Baseline BMPs mandated by RWQCB for implementation by all Co-Permittees.

Implementation: The City will prepare and distribute public educational materials which promote the cleaning of sidewalks and alleys as a means to support the City's NPDES Program. The City will evaluate the feasibility of using its street sweeper contractor to sweep alleys also.

Legal Authority: N/A

Implementation Dates: The public outreach materials will be prepared and distributed during the course of Fiscal Year 1995/96. The feasibility study will be conducted and completed during Fiscal Year 1995/96.

ADDITIONAL BEST MANAGEMENT PRACTICES (BMPs)

RESIDENTIAL, COMMERCIAL AND INDUSTRIAL SITES

Additional Best Management Practices: Defined as any practices or procedures not previously described in the City's Existing BMP and Early Action BMP documents that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

Procedure: HOUSEHOLD HAZARDOUS WASTE PROGRAM

Description: The City will encourage the proper disposal of Household Hazardous Wastes (HHW) to prevent the improper disposal of such materials to the storm drain system.

Background: This is one of the 13 Baseline BMPs mandated by the Regional Water Quality Control Board (RWQCB) for implementation by all Co-Permittees. Although the City currently participates in the Los Angeles County-wide HHW Program, the City's program has never been promoted in the context of NPDES goals and has not been identified in previous NPDES documents as an Existing or Early Action BMP. Therefore, it is described herein as an Additional BMP.

Implementation: Through the use of public education materials, such as public counter fliers and community newsletter articles, the City will describe the importance of proper HHW disposal in terms of NPDES objectives.

Legal Authority: N/A

Implementation Dates: Public education materials will be distributed during the course of Fiscal Year 1995/96.

ADDITIONAL BEST MANAGEMENT PRACTICES (BMPs)

RESIDENTIAL, COMMERCIAL AND INDUSTRIAL SITES

Additional Best Management Practices: **Defined as any practices or procedures not previously described in the City's Existing BMP and Early Action BMP documents that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.**

Procedure: HOUSEKEEPING PRACTICES

Description: The City will promote efficient and safe storage, use, disposal and cleanup of potentially harmful materials. The targeted audience will include City staff as well as the general public.

Background: Although this procedure has been promoted from other perspectives, such as safety and aesthetics, it has not had as much emphasis as a means to achieve NPDES goals. This BMP will emphasize the NPDES aspect.

Implementation: The City will prepare and distribute educational material on housekeeping practices and NPDES requirements for City staff who are involved in the outdoor handling of hazardous substances. The educational materials will emphasize the importance of keeping work areas clean, following all applicable safety precautions, prompt cleanup of chemical spills, etc. The importance of these activities will be explained in terms of NPDES objectives. The City will also prepare and distribute similar educational material for the general public.

Legal Authority: N/A

Implementation Dates: The above-described educational materials will be prepared and distributed during 1996.

ADDITIONAL BEST MANAGEMENT PRACTICES (BMPs)

RESIDENTIAL, COMMERCIAL AND INDUSTRIAL SITES

Additional Best Management Practices: Defined as any practices or procedures not previously described in the City's Existing BMP and Early Action BMP documents that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

Procedure: VEHICLE USE REDUCTION

Description: The City will encourage vehicle use reduction as a means to achieve NPDES goals. this BMP will be targeted at City staff and the general public.

Background: Vehicle use reduction has traditionally been promoted as a means to mitigate problems such as traffic congestion and air pollution. However, vehicle use is also a significant contributing factor in stormwater pollution. The pollutants associated with this activity include motor oil, transmission fluid, ethylene glycol, zinc (from tire wear), and asphalt (from road wear). In a city such as Norwalk, where roadways comprise a major land use, vehicle use reduction may be an important BMP.

Implementation: The City will prepare and distribute educational material for the general public and City staff which explains and promotes vehicle use reduction as a means to achieve NPDES goals. The City will examine existing vehicle use reduction programs to identify opportunities for adding this BMP to them.

Legal Authority: N/A

Implementation Date(s): The above-described activities will be accomplished during Fiscal Year 1995/96.

ADDITIONAL BEST MANAGEMENT PRACTICES
RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL BMP'S

Best Management Practices: Defined as any practices or procedures that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

Procedure:

USED OIL RECOVERY PROGRAM. Prior to initiating a used oil recycling program the procedure used by citizens of the City was to dispose of used crankcase auto oil by participating in the County's hazardous waste collection program. The City advised its citizens through it's quarterly newsletters of upcoming collection dates. In July 1994, the city applied for and was approved to receive Used Oil Opportunity Grant and Used Oil Block Grant funds. The City initiated the Used Oil Recycling Program in August 1994. The elements of the program are as follows: 1) Only residential uses are included in the program (no commercial uses). 2) The program provides participating residents with a 1 gallon container to store used oil. 3.) There are three certified collection centers within the city where citizens could turn in used oil. 4) Citizens could obtain from the City a rebate coupon worth $3.00 for them to have a oil change performed by participating gas stations. 5) The City is presently arranging to have curb pickup services performed once a month. It is anticipated to start in the summer of 1995.

Legal Authority/Implementation Date(s):

Municipal Code Article VI Discharge of Hazardous Material regulating the proper disposal of waste. Program initiated by the City in August, 1994.

ADDITIONAL BEST MANAGEMENT PRACTICES
RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL BMP'S

Best Management Practices: Defined as any practices or procedures that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

Procedure:

DISCHARGE OF HAZARDOUS MATERIAL-SEMINAR PROGRAM. In an effort to assist commercial enterprises to comply with NPDES requirements the City has initiated a seminar/workshop program. The seminars are intended to inform companies doing business in the city of what will be required of them to comply with newly adopted NPDES regulations. The first seminar addresses hazardous waste disposal. The workshop cosponsored by the City and the Paramount Chamber of Commerce was titled "What you don't know could cost you!" and held on February 16, 1995.

Legal Authority/Implementation Date(s):

Municipal Code Article VI. Discharge of Hazardous Material, regulating the proper disposal of waste. Program initiated by the City in October 1994.

VOL 17 000447

Co-Permittee City of Paramount

Date February 22, 1995

Title Assistant City Engineer

ADDITIONAL BEST MANAGEMENT PRACTICES
RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL BMP'S

Best Management Practices: Defined as any practices or procedures that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

Procedure:

Part of the Early Action BMP's proposed by the City was the establishment of an inspection program of all auto related and restaurant businesses doing business within the City. Prior to establishment of program an enabling ordinance authorizing such inspection is presently being processed. In anticipation of the inspection program it is proposed that the City prepare a brochure advising businesses of the program and inviting their volunteer participation in it by offering to provide city personnel to inspect their premises to assist the businesses in developing effective methods of preventing pollutants originating from their property from entering the city's storm drain system. Brochure to be mailed out with annual business licenses issued each fiscal year.

Legal Authority/Implementation Date(s):

Budgeting Process presently practiced by City/Part of Public Outreach Program adopted by the City. Brochure will be prepared and available to be mailed by July 31, 1995.

Rancho Palos Verdes, CA 90274-5391

LOS ANGELES COUNTY AREA-WIDE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM MUNICIPAL STORM WATER DISCHARGE PERMIT (NPDES NO. CA0061654, CI File No. 6948)

The Los Angeles Regional Water Quality Control Board adopted an NPDES Municipal Storm Water Discharge Permit (Order No. 90-079) on June 18, 1990. The City of Rancho Palos Verdes (City) is a Co-Permittee under this permit with the County of Los Angeles being Principal Permittee.

The City, as a Co-Permittee to the Los Angeles County area-wide NPDES Municipal Storm Water Discharge Permit, currently participates under Phase I and Phase III of the permit due to the City's drainage patterns. This Regional Board has received your letter in which the City requests permission to combine its Phase I and Phase III efforts under the deadlines for Phase I. Regional Board staff has considered the request and finds it to be acceptable. The Regional Board now recognizes that the City will follow all deadlines under Phase I of the permit.

If you have any questions please call Carlos Urrunaga at (213) 266-7598.

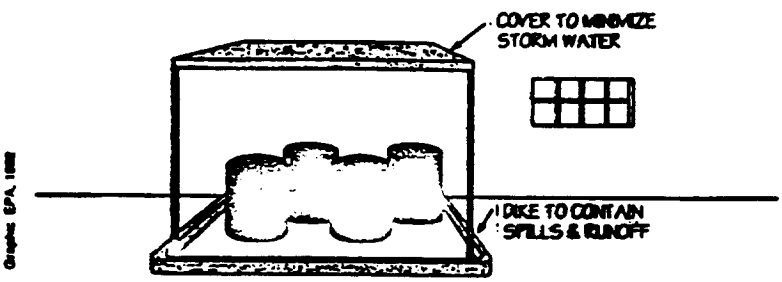
PLAN FOR ADDITIONAL BEST MANAGEMENT PRACTICES

RESIDENTIAL, COMMERCIAL AND INDUSTRIAL BMP'S

Best Management Practices: Defined as any current practices or procedures that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

MATERIAL STORAGE CONTROL
HOUSEKEEPING PRACTICES
VEHICLE LEAK AND SPILL CONTROL Procedure:

The City has a transit facility where buses and city vehicles are maintained, washed and serviced. Materials such as fertilizer for the parks division are also stored at this location. All automotive fluids are changed in a confiled area which drains to a clarifier. All fluids and materials are properly stored and recycled or disposed of.



This facility has a separate NPDES permit and has a Storm Water Pollution Prevention Plan. BMP's for this facility are addressed in the SWPPP.

VOL 17

000463

R0062303

BMP: MATERIAL STORAGE CONTROL

Program Elements

- *New Development*
- *Residential*
- *Commercial Activities*
- *Industrial Activities*
- *Municipal Facilities* (circled)
- *Illegal Discharges*

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from material delivery and storage by minimizing the storage of hazardous materials on-site, storing materials in a designated area, installing secondary containment, conducting regular inspections, and training employees and subcontractors.

This best management practice primarily covers material delivery and storage for municipal operations. For material storage related to the general public (e.g., storage of pesticides) refer to SC10 Housekeeping Practices. For other information on municipality handling of materials, see Spill Prevention and Cleanup BMPs (SC40/SC41) and Material Disposal and Recycling BMPs (SC30-SC32). The Industrial Handbook also contains material management information for industrial activities at municipal facilities.

APPROACH

- The key is to design and maintain material storage areas that reduce exposure to storm water:
  - Store materials inside or under cover on paved surfaces.
  - Use secondary containment.
  - Minimize storage and handling of hazardous materials.
  - Inspect storage areas regularly.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.1, SC50, Illegal Dumping Control.

REQUIREMENTS

- Cost Considerations
  - Will vary depending on the size of the facility and the necessary controls.
- Regulations
  - Storage of reactive, ignitible, or flammable liquids must comply with the Uniform Fire Code and the National Electric Code.
- Administrative / Staffing
  - Accurate and up-to-date inventories should be kept of all stored materials.
- Equipment
  - Keep an ample supply of spill cleanup materials near the storage area.
- Training
  - Employees should be well trained in proper material storage.

PUBLIC EDUCATION / PARTICIPATION

- Employee education is paramount for successful BMP implementation.

LIMITATIONS

- Storage sheds often must meet building and fire code requirements.

Targeted Constituents

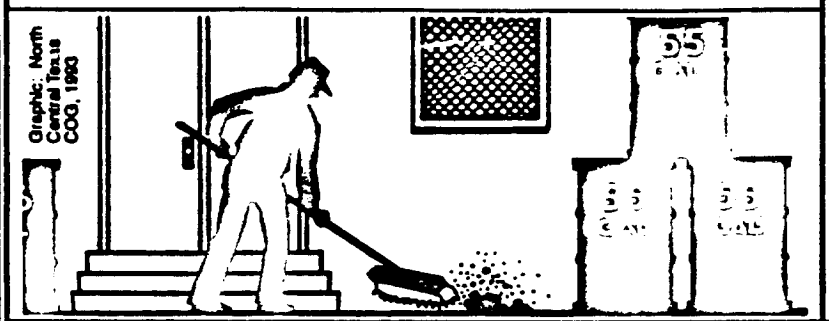
- ○ *Sediment*
- ● *Nutrients*
- ○ *Heavy Metals*
- ● *Toxic Materials*
- ○ *Floatable Materials*
- ○ *Oxygen Demanding Substances*
- ● *Oil & Grease*
- ○ *Bacteria & Viruses*

- ● *Likely to Have Significant Impact*
- ○ *Probable Low or Unknown Impact*

Implementation Requirements

- ◒ *Capital Costs*
- ◒ *O&M Costs*
- ○ *Regulatory*
- ○ *Staffing*
- ● *Training*
- ◒ *Administrative*

● *High* ○ *Low*



SC20

Best Management Practices

VOL 17 000464

R0062304

BMP: HOUSEKEEPING PRACTICES

Program Elements

- New Development
- (Residential)
- Commercial Activities
- Industrial Activities
- (Municipal Facilities)
- Illegal Discharges

DESCRIPTION

Promote efficient and safe housekeeping practices (storage, use, and cleanup) when handling potentially harmful materials such as fertilizers, pesticides, cleaning solutions, paint products, automotive products, and swimming pool chemicals. Related information is provided in BMPs SC11, Safer Alternative Products; SC31, Household Hazardous Waste Collection; SC32, Used Oil Recycling; and the Spill Prevention and Cleanup BMPs (SC40/SC41). For information on specific activities at municipal facilities, see Chapter 4, Industrial Handbook.

APPROACH

- Pattern a new program after the many established programs from municipalities around the state and country. Integrate this best management practice as much as possible with existing programs at your municipality.
- This BMP has two key audiences, municipal employees and the general public.
- Implement this BMP in conjunction with SC11, Safer Alternative Products.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.1, SC50, Illegal Dumping Control.

REQUIREMENTS

- Cost Considerations
  - The primary cost is for staff time as noted below.
- Regulations
  - There are no regulatory requirements to this BMP. Existing regulations already require municipalities to properly store, use, and dispose of hazardous materials.
- Administrative / Staffing
  - Staff to train municipal employees and to coordinate public education efforts.
- Equipment
  - There are no major equipment requirements to this BMP.
- Training
  - Municipal employees who handle potentially harmful materials should be trained in good housekeeping practices. Personnel who use pesticides must be trained in their use. The California Department of Pesticide Regulation license pesticide dealers, certify pesticide applicators and conduct on-site inspections.

PUBLIC EDUCATION / PARTICIPATION

- Public awareness is a key to this BMP.

LIMITATIONS

- There are no major limitations to this best management practice.

Targeted Constituents

- ● Sediment
- ● Nutrients
- ○ Heavy Metals
- ● Toxic Materials
- ○ Floatable Materials
- ● Oxygen Demanding Substances
- ● Oil & Grease
- ○ Bacteria & Viruses

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

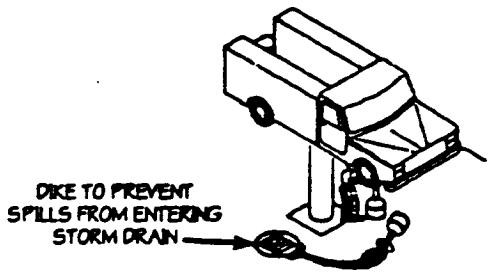
- ● Training
- ○ Administrative

● High ○ Low



SC10

Best Management Practices

VOL 17 000465

R0062305

BMP: VEHICLE LEAK AND SPILL CONTROL

Program Elements

- *New Development*
- *Residential*
- *Commercial Activities*
- *Industrial Activities*
- ***Municipal Facilities*** (●)
- *Illegal Discharges*

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from vehicle leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, properly disposing of spill materials, and training employees.

This BMP covers only prevention and cleanup of spills from vehicles. SC41 contains information on prevention and cleanup of spills from aboveground storage tanks. See SC4 in the Industrial Handbook for more information regarding BMPs for vehicle maintenance shops (such as municipal service centers or corporation yards).

APPROACH

Vehicles will leak and spill fluids. The key is to reduce the frequency and severity of leaks and spills, and when they do occur, to prevent or reduce the environmental impacts.

- Perform fluid removal and changes inside or under cover on paved surfaces.
- Properly store hazardous materials and waste.
- Have spill cleanup supplies readily available.
- Clean up spills and leaks immediately.
- Use dry cleanup methods.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.1, SC50, Illegal Dumping Control.

REQUIREMENTS

- Cost Considerations
  - Prevention of leaks and spills is inexpensive. Treatment and/or disposal of contaminated soil or water can be quite expensive.
- Regulations
  - This is not a major element of this best management practice.
- Administrative / Staffing
  - This BMP has no major administrative or staffing requirements.
- Equipment
  - Keep ample supplies of spill control and cleanup materials at municipal facilities, near storage and maintenance areas.
  - Update spill cleanup materials as changes occur in the types of chemicals on-site.
- Training
  - Training is crucial to reducing the frequency, severity, and impacts of leaks and spills.

PUBLIC EDUCATION / PARTICIPATION

- Encourage the general public to regularly inspect and maintain their vehicles.

LIMITATIONS

- For larger spills, a private spill cleanup company or Hazmat team may be necessary.

Targeted Constituents

- ○ *Sediment*
- ○ *Nutrients*
- ● *Heavy Metals*
- ● *Toxic Materials*
- ○ *Floatable Materials*
- ○ *Oxygen Demanding Substances*
- ● *Oil & Grease*
- ○ *Bacteria & Viruses*

- ● *Likely to Have Significant Impact*

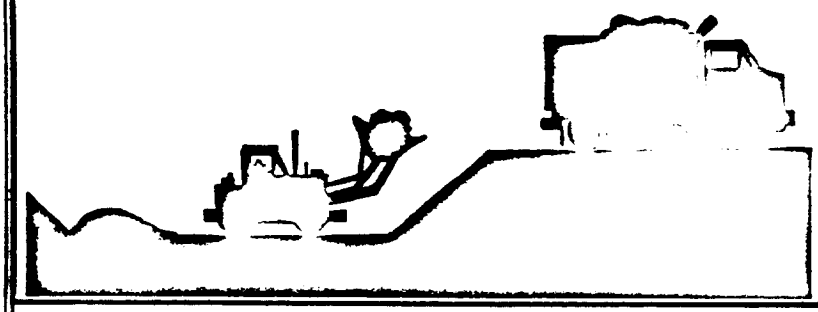
PLAN FOR ADDITIONAL BEST MANAGEMENT PRACTICES

RESIDENTIAL, COMMERCIAL AND INDUSTRIAL BMP'S



Best Management Practices: Defined as any current practices or procedures that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

DETENTION/INFILTRATION DEVICE MAINTENANCE
STORM DRAIN FLUSHING Procedure:

The City contracts with the County or private contractors to clean and maintain the city's catch basins, debris basins and storm drain systems. The stormwater master plan when completed will evaluate the existing system and provide recommendations for cleaning and maintenance of these systems.

VOL 17 000467

BMP: DETENTION/INFILTRATION DEVICE MAINTENANCE

Program Elements

- *New Development*
- *Residential*
- *Commercial Activities*
- *Industrial Activities*
- ***Municipal Facilities***
- *Illegal Discharges*

DESCRIPTION

Proper maintenance and siltation removal is required on both a routine and corrective basis to promote effective storm water pollutant removal efficiencies for wet/dry detention pond and infiltration devices.

APPROACH

- Remove silt after sufficient accumulation.
- Periodically clean accumulated sediment and silt out of pre-treatment inlets.
- Infiltration device silt removal should occur when the infiltration rate drops below 1/2 inch per hour.
- Removal of accumulated paper, trash, and debris should occur every six (6) months or as needed to prevent clogging of control devices.
- Vegetation growth should not be allowed to exceed 18 inches in height.
- Mow the slopes periodically and check for clogging, erosion and tree growth on the embankment.
- Corrective maintenance may require more frequent attention (as required).

REQUIREMENTS

- Cost Considerations
  - Frequent sediment removal can be labor intensive and costly. However, properly designed ponds allow for easy removal of accumulated sediments at relatively minor cost.
  - Cost of waste material for transport and disposal.
- Administrative/Staffing
  - Two-person teams may be needed for routine silt removal and excavation.
  - Program manager needed to track maintenance activities and provide field assistance.
  - Staff team needed for corrective maintenance activities.
- Regulations
  - Permits may be required by Corps or Engineers, Fish & Wildlife or State Fish & Game.
- Equipment
  - Vehicles, dump trucks, bulldozers, trackhoes, excavators, mowers, weed trimmers, sickles, machetes, shovels, rakes, and personal protective equipment (PPE), (goggles, dust masks, coveralls, boots, gloves).
- Training
  - Appropriate excavation and maintenance procedures.
  - Proper waste disposal procedures.

Targeted Constituents

- ● *Sediment*
- ○ *Nutrients*
- ● *Heavy Metals*
- ○ *Toxic Materials*
- ○ *Floatable Materials*
- ● *Oxygen Demanding Substances*
- ○ *Oil & Grease*

SC75

Best Management Practices

VOL 17 000468

R0062308

BMP: STORM DRAIN FLUSHING

Program Elements

- *New Development*
- *Residential*
- *Commercial Activities*
- *Industrial Activities*
- *Municipal Facilities* (●)
- *Illegal Discharges*

DESCRIPTION

A storm drain is "flushed" with water to suspend and remove deposited materials. Flushing is particularly beneficial for storm drain pipes with grades too flat to be self-cleansing. Flushing helps ensure pipes convey design flow and removes pollutants from the storm drain system.

APPROACH

- Locate reaches of storm drain with deposit problems and develop a flushing schedule that keeps the pipe clear of excessive buildup.
- Whenever possible, flushed effluent should be collected and pumped to the sanitary sewer for treatment.

REQUIREMENTS

- Cost Considerations
  - Unless flushing to a dry/wet detention area, the collection of liquid and sediments may be costly in terms of pollutant removal benefits.
- Regulations
  - Municipal codes should include sections prohibiting the discharge of soil, debris, refuse, hazardous waste, and other pollutants that may hinder the designed conveyance capacity of the storm drain system.
- Administrative/Staffing
  - Minimum 2-person teams needed for routine sediment removal and flush water collection.
  - Equipment operators required.
- Equipment
  - Water source (water tank truck, fire hydrant).
  - Sediment collector (eductor/vacuum truck, dredge).
  - Inflatable devices to block flow.
  - Sediment/turbidity containment/treatment equipment required if flushing to an open channel.

PUBLIC EDUCATION/PARTICIPATION

- If large scale flushing activities are undertaken, local residents should be informed in advance.
- The public should be educated about the purpose of storm drains and the problems created by illegal dumping.

Targeted Constituents

- ● *Sediment*
- ● *Nutrients*
- ● *Heavy Metals*
- ○ *Toxic Materials*
- ○ *Floatable Materials*
- ● *Oxygen Demanding Substances*
- ○ *Oil & Grease*
- ● *Bacteria & Viruses*

- ● *Likely to Have Significant Impact*
- ○ *Probable Low or Unknown Impact*

Implementation Requirements

- ⊖ *Capital Costs*
- ● *O&M Costs*

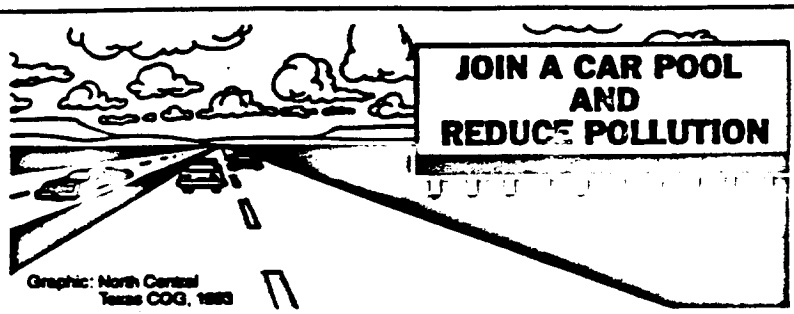
Title: Associate Engineer

PLAN FOR ADDITIONAL BEST MANAGEMENT PRACTICES

RESIDENTIAL, COMMERCIAL AND INDUSTRIAL BMP'S

Best Management Practices: Defined as any current practices or procedures that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.



VEHICLE USE REDUCTION Procedure:

The City has submitted a trip reduction program to the South Coast Air Quality Management District. The City has also established a rideshare committee which assisted in the development and review of our Trip Reduction Plan.

VOL 17 000470

R0062310

BMP: VEHICLE USE REDUCTION

Graphic: North Central Texas COG, 1993

Program Elements

- New Development
- Residential
- Commercial Activities
- Industrial Activities
- Municipal Facilities
- Illegal Discharges

DESCRIPTION

Reduce the discharge of pollutants to storm water from vehicle use by highlighting the storm water impacts, promoting the benefits to storm water of alternative transportation, and integrating initiatives with existing or emerging regulations and programs.

APPROACH

- Integrate this best management practice as much as possible with efforts being developed and implemented by government agencies and businesses to reduce vehicle use and improve air quality (e.g. County Congestion Management Agency). Integration will help avoid redundant and/or conflicting programs and be more effective and efficient.
- Establish trip reduction programs at major employers (government, large businesses).

REQUIREMENTS

- Cost Considerations
  - The primary cost is for staff time as noted below.
- Regulations
  - Support efforts to pass reasonable regulations at the State and local level (General Plans, land use plans, and zoning ordinances) aimed at reducing vehicle use and developing transit-oriented communities.
  - Support development of regional governing bodies to address the issue in a comprehensive way (multi-media, watershed-based approach).
- Administrative / Staffing
  - Requires at least one staff person to track, review, and comment on emerging legislation and programs.
- Equipment
  - There are no major equipment requirements for this BMP.
- Training
  - There are no training requirements for this BMP.

PUBLIC EDUCATION / PARTICIPATION

- Make the association in the public's mind that air pollution = water pollution.
- Educate the public and municipal employees about the water quality benefits of reduced vehicle use.
- Help coordinate public participation in ride sharing programs.

LIMITATIONS

- "Turf battles" may limit the level of cooperation and integration between departments and programs.
- The use of alternative transportation is highly dependent on its convenience and relative cost.

Targeted Constituents

- ○ Sediment
- ○ Nutrients
- ● Heavy Metals
- ● Toxic Materials
- ○ Floatable Materials
- ○ Oxygen Demanding Substances
- ● Oil & Grease
- ○ Bacteria & Viruses

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

ADDITIONAL BEST MANAGEMENT PRACTICES

RESIDENTIAL, COMMERCIAL AND INDUSTRIAL BMP'S

Best Management Practices: Defined as any current practices or procedures that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

Procedure:

- Public education programs, involving any NPDES requirement areas, will be reviewed and updated to meet latest standards.

- Educational materials regarding water conservation, housekeeping, vehicle maintenance, and general yard care and their relation to NPDES requirements will be made available to residents and contractors, and shall be included in water bills and new business licenses.

Plan for Additional BMP's

Dear Mr. Kuo:

A plan of the City's additional best management practices (BMP's) has been prepared, and the following information is submitted:

No. of Copies	Description	Deadlines for Submittal
1 Set	Construction Site BMP's	April 13, 1995
1 Set	Illegal Discharge/Illicit Disposal Practices	April 13, 1995
1 Set	Residential, Commercial and Industrial BMP's	April 13, 1995

This material is being sent in conjunction with NPDES permit requirements.

If you have any questions, please call George H. O'Brien at (310) 868-0511, Extension 267.

Very truly yours,

John R. Price

PLAN FOR ADDITIONAL BEST MANAGEMENT PRACTICES (BMP'S) FOR RESIDENTIAL, COMMERCIAL, & INDUSTRIAL

Best Management Practices: Defined as any practices or procedures that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

Procedure:

The City of Signal Hill is operating an Industrial Waste Inspection Program which inspects restaurants, industrial and commercial businesses 1-12 times annually. Inspections include identifying conditions which may lead to contaminated run-off. Any such conditions are required to be mitigated.

Based on inspection results, target areas are identified and rain water run-off quality is monitored during rain storms.

PLAN FOR ADDITIONAL BEST MANAGEMENT PRACTICES (BMP'S) FOR RESIDENTIAL, COMMERCIAL, & INDUSTRIAL

Best Management Practices: Defined as any practices or procedures that directly or indirectly reduce stormwater/urban runoff pollution into the storm drain system.

Procedure:

The City is continuing its public outreach efforts by:

1. Airing NPDES video developed by the City of Los Angeles.
2. Publishing articles related to storm water pollution and methods of prevention in City publications. Publications are distributed to all residences and businesses.
3. Publishing notices informing residents of upcoming Los Angeles County Haz-Mat roundups.

ADDITIONAL BEST MANAGEMENT PRACTICES RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL

Additional Best Management Practices:
Defined as any additional practices or procedures that are planned to the maximum extent practicable in efficiency for the control of stormwater runoff pollution.

Existing Procedure:

City has a volunteer conservation of water program in which they discourage residences from washing cars on the lawn and side walks, leaving the hose unattended, and using a bucket to wash cars instead of running water.

Bilingual brochures and pamphlets are provided.

Additional BMP:

Coloring books and pamphlets are distributed at schools.

ADDITIONAL BEST MANAGEMENT PRACTICES RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL,

Additional Best Management Practices:
Defined as any additional practices or procedures that are planned to the maximum extent practicable in efficiency for the control of stormwater runoff pollution.

Existing Procedure:

Almost all storm drain catch basins and storm drain lines are owned by the Los Angeles County and they are maintained by this agency. There are a few drains that are owned by the City and there is one line that is a private owned. The City lines are maintained regularly by the City.

Additional BMP:

City now has a regular schedule of once per year to inspect and clean the catch basins. Records for all catch basin cleanings will be held at the City's file.

Date:
BMP now in place

Legal Authority:

ADDITIONAL BEST MANAGEMENT PRACTICES RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL

Additional Best Management Practices:
Defined as any additional practices or procedures that are planned to the maximum extent practicable in efficiency for the control of stormwater runoff pollution.

Existing Procedure:

Household hazardous waste roundups are held on a regular basis by the L. A. County Sanitation District. City's personnel inform the residences where to properly dispose their hazardous waste at the available round-ups.

Additional BMP:

Continue to publicize and participate in the Household Hazardous-Waste Round-ups.

Date:
BMP in place

Legal Authority:

ADDITIONAL BEST MANAGEMENT PRACTICES RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL

Additional Best Management Practices:
Defined as any current practices or procedures that is optimized to the maximum extent practicable in efficiency for the control of stormwater runoff pollution.

Existing Procedure:

Trash containers are provided at the bus stations and the busy streets. City has contracts with the Western Waste to empty the trash containers. The containers are emptied as often as needed. This will encourage people to dispose of their litter in the street properly.

Additional BMP:

City personnel patrol every street in the city. Sites with excessive litter are recorded and the number of trash containers are increased as needed.

Date:
BMP in place

ADDITIONAL BEST MANAGEMENT PRACTICES RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL

Additional Best Management Practices: Defined as any additional practices or procedures that are planned to the maximum extent practicable in efficiency for the control of stormwater runoff pollution.

Existing Procedure:

Maintenance Division performs street sweeping once per week of all residential streets and two to three times per week in commercial areas to reduce debris from washing into storm drains. City owns an vacuum air sweeper which functions by suction of debris instead of the regular broom function. Debris are then hauled and dumped at a local landfill site.

All the residential and commercial streets are being swept on the regular schedule. Records of the amount of debris collected are kept at the Public Work's Yards office.

Additional BMP:

City personnel inspect streets on a regular basis. Street sweeping will be increased on an as needed bases.

Date:
BMP in place

Additional Best Management Practices:
Defined as any current practices or procedures that is optimized to the maximum extent practicable in efficiency for the control of stormwater runoff pollution.

Existing Procedure:

City has contracts with Western Waste to provide trash containers for the residences. Separate trash receptacles are provided for recyclable materials and refuse. This will encourage the public to recycle as much as possible which will reduce the amount of trash generated.

Optimized Procedure:

This procedure is ongoing and no change is anticipated.

Additional BMP:

The number of recyclable trash cans will be increased as needed.

Date:
BMP in place

ADDITIONAL BEST MANAGEMENT PRACTICES RESIDENTIAL, COMMERCIAL, AND INDUSTRIAL

Additional Best Management Practices:
Defined as any current practices or procedures that is optimized to the maximum extent practicable in efficiency for the control of stormwater runoff pollution.

Existing Procedure:
City has a preventive mainteaance program for all 120 miles of sewer line city owns. This program is consisted of using a hydroblaster and maintaining all line once a year. This will prevent sewers from over flowing and creating excessive water run-off in the street which could then discharge in to the storm drains.

Problem sewers are inspected and cleaned more frequently. Records will be kept at the City's Public Work's yard for the number of overflows and their locations.

Additional BMP:

1:The number of sewer inspections will be increased on an as needed basis.

2: Approximately 150 industrial and commercial sites with the potential for causing sewer stoppages are inspected 1 to 4 times per year.

Date:
BMPs in place

LOS ANGELES COUNTY AREA-WIDE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM MUNICIPAL STORM WATER DISCHARGE PERMIT (NPDES NO. CA0061654, CI 6948)

The Los Angeles Regional Water Quality Control Board adopted NPDES Municipal Storm Water Discharge Permit No. CA0061654 (Order No. 90-079) on June 18, 1990. The City of South Pasadena (City) is a Co-Permittee under this permit, with Los Angeles County being Principal Permittee.

The City, as a Co-Permittee to the Los Angeles County area-wide NPDES Municipal Storm Water Discharge Permit, currently participates under Phase II and Phase III of the permit due to the City's drainage patterns. This Regional Board has received your letter, in which the City requests permission to combine its Phase II and Phase III efforts under the deadlines for Phase II. Regional Board staff has considered the request and finds it acceptable. The Regional Board now recognizes that the City will follow all deadlines under Phase II of the permit.

If you have any questions please contact Carlos Urrunaga at (213) 266-7598.

Torrance, CA 90509-2970

LOS ANGELES COUNTY AREA-WIDE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM MUNICIPAL STORM WATER DISCHARGE PERMIT (NPDES NO. CA0061654, CI 6948)

The Los Angeles Regional Water Quality Control Board adopted an NPDES Municipal Storm Water Discharge Permit (Order No. 90-079) on June 18, 1990. The City of Torrance (City) is a Co-Permittee under this permit with Los Angeles County being Principal Permittee.

The City, as a Co-Permittee to the Los Angeles County area-wide NPDES Municipal Storm Water Discharge Permit, currently participates under Phase I and Phase III of the permit due to the City's drainage patterns. This Regional Board has received your letter, in which the City notifies this Board of its decision not to submit the following information under Phase III because what was submitted for Phase I also applies to Phase III:

a) Submittal of Existing Rainfall Data
b) Submittal of Existing Flow Data
c) Submittal of Existing Water Quality Data
d) Determination of Existing BMPs
   1. Construction Site BMPs
   2. Illegal Discharge/Illicit Disposal Practices
   3. Residential Commercial and Industrial BMPs
e) Identification of Waste Disposal Facilities
f) Development of Early Action BMP Plans
g) Determination of the Required Legal Authority
h) Stormwater Permit Implementation Agreement
i) Additional BMP Plans

VOL 17 00496

Regional Board staff has considered the request and finds it to be acceptable. Items submitted by the City for Phase I, that are also applicable to Phase III, will be considered as having satisified the identical submittal requirements for Phase III.

If you have any questions, please contact Carlos Urrunaga at (213) 266-7598.

BMP 16: REQUIRE ON SITE STORM DRAIN INSPECTION MANHOLES

On June 1, 1993, the Vernon City Council passed Ordinance Number 1013 which amended Chapter 7 of the Vernon Municipal Code. Part of this ordinance amended Appendix D of the Uniform Plumbing Code. This Appendix regulates rainwater piping for building construction. The City of Vernon added specific language that requires a plumbing permit for any on site stormwater piping, not just roof drains. In addition, this amendment requires a Vernon Standard storm drain inspection manhole to be placed at an approved point in any stormwater piping system that connects to the storm drain via an underground connection. Furthermore, properties that have existing underground storm drain connections will be required to retroactively install an inspection manhole if the property remains vacant for a period of one year. Our policy is to require this box to be placed such that it is improbable that any illicit connections to the storm water system could be made on private property. Since passage of this ordinance, several of these inspection manholes have been installed. These inspection manholes will prove to be an effective tool for tracing the source of any future stormwater contamination.

BMP 9: INSPECT AUTOMOBILE USES AND RESTAURANTS

The City of Vernon Municipal Code Chapter 13 Article IV established a Hazardous Materials Monitoring Program in which any facility that handles any substance that could pose a threat to the environment have a permit issued by the City of Vernon Health Department. This permit requires the facility to provide secondary containment for all stored materials and also requires any use of such substances to be performed in such a manner that the possibility of a release to the storm drain is minimized. Automobile repair shops, gas stations, and body shops often handle substances that could pose a threat to the environment and as such are required to obtain a permit. All permitted facilities are inspected by a Registered Environmental Health Specialist annually or more often if necessary.

The City of Vernon Health Department also requires all food facilities to obtain a permit in accordance with Chapter 13 Article II of the City of Vernon Municipal Code. This ordinance requires all permitted food facilities (restaurants, food processors, meat packing plants, etc.) to keep their facilities in a clean, sanitary condition. Refuse control and disposal requirements are strictly enforced during frequent inspections by Registered Environmental Health Specialists.

BMP 10:ENCOURAGE REMOVAL OF DIRT, RUBBISH, AND DEBRIS FROM SIDEWALKS AND ALLEYS

The City of Vernon Municipal Code Section 12.5 requires property owners to maintain the sidewalk area in front of their property free from weeds, rubbish, garbage, or dirt of any kind. This ordinance is enforced by the Department of Community Services. If a sidewalk area is found to be a public nuisance due to debris, the property owner is given a notice to abate the nuisance and if said nuisance is not abated immediately, the City will clean up the nuisance and bill the property owner.

A public outreach program has been developed to inform the public about their responsibility to keep the sidewalk area clean. A utility bill insert will be distributed to all customers by June 1995. This insert encourages the public to keep Vernon clean and describe how rubbish can affect the storm drain system.

BMP 11: RECYCLING PROGRAM

The City of Vernon has a comprehensive recycling and waste minimization program that is administered by the City Health Department. This program has been in place for a number of years and has been an unconditional success. Since implementation, a tremendous volume of waste has been diverted for recycling rather than being dumped in landfills. By some estimates, over 51% of the total volume of waste generated in the City daily has now been diverted from landfills. This has been accomplished by an aggressive outreach program that is administered by the City of Vernon Health Department. Informational pamphlets have been mailed to all industrial and commercial sites and reminders are handed out during inspections. These pamphlets are also prominently displayed in public areas in City Hall. The pamphlet encourages businesses to recycle what they can and also to reduce the volume of waste generated in order to reduce the demand for landfill space.

BMP 13: ENCOURAGE WATER CONSERVATION

The City of Vernon has developed public education program involving water conservation, and while this program has not yet been fully implemented, several elements are already in place. Posters that encourage water conservation have been displayed at City Hall. Many of the City's public works vehicles have bumper stickers that encourage water conservation. A water bill insert will include information about the problems that the misuse of water through overwatering and vehicle washing can cause in the storm drain system. This water bill insert will be distributed by July 1995.

ADDITIONAL BEST MANAGEMENT PRACTICES
Residential, Commercial, and Industrial
Permit Task 3.1.2

Best Management Practice: *Defined as any practice or procedure that directly or indirectly reduces storm water/urban runoff pollution into the municipal storm drain system.*

Practice/Procedure:

ABMP #1:	City-wide Catch Basin Stenciling Program

All 500 catch basins in residential, commercial, and industrial areas of the City shall be stenciled using Heal the Bay's "No Dumping" message. The purpose of this BMP is to discourage the dumping of any material to the municipal storm water system other than storm water, unless otherwise exempted.

The City has already begun its catch basin stenciling program. Using City crews and Boy Scouts, the City has, to date, stenciled 60 catch basins in its Uptown commercial area. The remaining catch basins shall be stenciled over the next two years, starting with those situated in industrial and commercial areas of the City.

Implementation Schedule:	All catch basins shall be stenciled by June 30, 1997 or by a date specified in the 1995-2000 Municipal NPDES Permit.
Legal Authority:	Administrative directive pursuant to NPDES municipal permit.

ADDITIONAL BEST MANAGEMENT PRACTICES
Residential, Commercial, and Industrial
Permit Task 3.1.2

Best Management Practice: *Defined as any practice or procedure that directly or indirectly reduces storm water/urban runoff pollution into the municipal storm drain system.*

Practice/Procedure:

ABMP #2:	Illegal Discharge/Illicit Disposal Reporting Program

The City currently participates in the Los Angeles County Department of Public Works Illegal Discharge/Dumping toll-free hotline to report suspected illegal discharges and dumping to the municipal storm drain system, including streets, catch basins, gutters, and flood control conveyances. It should be noted, however, that the City does not have full legal authority to control illicit discharges to the municipal storm water system (e.g., non-storm water discharges). It will, however, have such authority once it adopts a storm water/runoff control ordinance which shall be in conformance with **Code of Federal 40, §122.26(d)(2)(i)** provisions. This requirement is mandated by the next five year permit which will take effect this year.

Once the City adopts the ordinance, it shall implement a storm water/urban runoff pollution prevention public information program (PIP), which among other things, is intended to promote citizen awareness of the hotline and encourage reporting of "in progress" and "after-the-fact" illegal disposal and illicit discharges to the municipal storm water system. In general, this shall be achieved by listing the toll-free hotline number and City enforcement agency numbers in all storm water/urban runoff pollution prevention materials (e.g., articles, flyers, special mailers, etc.). In the meantime, the City shall continue to respond to reports of illegal dumping/illicit discharges that violate current City codes and other laws.

VOL 17 000507

R0062347

Specific internal procedures for investigating and resolving reports of illegal dumping/illicit discharge is also a requirement associated with the next permit that shall be dealt with in the City's forthcoming Storm Water Management Plan.

Implementation Schedule:	On-going for illicit discharges and illegal dumping practices that violate current City code and other statutes. City shall act on reports of all unpermitted non-storm water discharges to the municipal storm water system that will be illegal once the 1995-2000 permit takes effect on January 1, 1996 or the deadline for complying with legal authority requirements to be estabtished in the final NPDES permit.
Legal Authority:	Administrative directive.

Practice/Procedure:

ABMP #3:	Adoption of Runoff Ordinance Requiring Use of BMPs During and After Construction and at Selected Commercial and Industrial Sites

The legal authority requirements associated with next five year NPDES permit that is scheduled to take effect this year will include this and other provisions containing BMP requirements for construction sites. At this time, the City is considering the following provisions pertaining to construction site discharges:

(a) No person shall commence or continue any construction activity in the City that causes the disturbance of five acres or more of soil by clearing, grading, and excavating without demonstrating to the City's Building Division that such person has obtained an NPDES General Construction Activity Storm Water Permit (hereinafter "construction permit") from the State Water Resources Control Board of the California Environmental Protection Agency (hereinafter "SWRCB"). NPDES construction activity does not include (i) routine maintenance to maintain original line and grade, (ii) hydraulic capacity, (iii) the original purpose of the facility, or (iv) emergency construction activities required to protect the public health and safety.

(b) Any person engaged in a construction activity in the City requiring an NPDES construction permit shall retain at the construction site the following documents (i) a copy of the Notice of Intent to Comply with Terms of the General Permit to Discharge Water Associated with Construction Activity; (ii) a waste discharge identification number issued by the SWRCB; and (iii) a Storm Water Pollution Prevention Plan and Monitoring Program Plan for the construction activity requiring the construction permit.

VOL 17 000509

R0062349

(c) Any person engaged in a construction activity in the City requiring a construction permit shall, upon request from a duly authorized officer of the City, provide any of the documents described in paragraph (b) of this section.

(d) Any person engaged in any building or construction activity requiring a permit from the City shall require the owner of the property to prevent, to the maximum extent practicable, such activity from causing the discharge of (i) sediment to the municipal storm water system; and (ii) pollutants in or on significant materials associated with such activity from entering the municipal storm water system.

(g) Prior to the construction of any new structure or facility, or rehabilitation any existing structure or facility, irrespective of land use, such project shall be:

(i) Evaluated for its potential to generate significant quantities of pollutants contained in runoff once construction is completed; and

(ii) Based on such evaluation, the Director of Public Works or Building Official may require the developer/contractor to incorporate BMPs for reducing pollutant loads in urban runoff associated with the project's land use. The assignment of BMPs shall be based on cost-effectiveness, applicable water quality standards for the sub-watershed, sound engineering practices, and health and safety considerations.

Implementation Schedule:	Adoption of Storm Water/Urban Runoff Pollution Prevention Ordinance containing the above-cited provision shall be completed by the deadline specified in the next five year permit. (Note: The deadline for this requirement as specified in the draft permit -- dated February 14, 1995 -- is January 1, 1996.
Legal Authority:	Forthcoming City ordinance.

ADDITIONAL BEST MANAGEMENT PRACTICES
Residential, Commercial, and Industrial
Permit Task 3.1.2

Best Management Practice: *Defined as any practice or procedure that directly or indirectly reduces storm water/urban runoff pollution into the municipal storm drain system.*

Practice/Procedure:

ABMP #4:	Development of Storm Water/Urban Runoff Pollution Public Education and Outreach Program

The City shall develop and implement a public education/outreach program in keeping with the new NPDES municipal permit. As it is now written the draft version of the new permit requires a 5-year urban runoff education strategy," which targets such audiences as "municipal employees, local construction contractors, businesses in the area, and the general public." To that end, the City shall develop and implement a public education and outreach program consisting of various media, including written material, audio material, visual material.

The City's public education/outreach program shall focus on preventing the discharge of targeted pollutants to the municipal storm water system which have been identified as being responsible for impairing beneficial uses of receiving and ocean waters. Such pollutants may include, for example, oil and grease, heavy metals, and debris. To that end, the City shall consider utilizing the following media:

- ***Newsprint***

Storm water/urban runoff pollution prevention articles could be presented in the *Whittier Community Services Activity Guide*, a quarterly community newsletter that is sent to 23,000 residential address in the City. This print medium could be used to promote various residential-oriented Best Management Practices (e.g., avoiding disposal of lawn clippings and leaves into catch basins).

VOL 17 000511

R0062351

- ***Special Mailers***

Storm water/urban runoff pollution prevent-related articles or messages could be incorporated into the City Water Division's *Annual Water Quality Report* which lists water quality sampling results for Proposition 65 constituents. Pollutant-specific BMPs could also be inserted in water/utility bills which are sent to 16,000 customer addresses.

- ***Public Outreach***

Presentation of storm water/urban pollution prevention topics to public and private schools and community organizations including but not limited to the Chamber of Commerce, Kiwanas and Lions Club, PTA, etc. Presentations could include use of storm water management-related video-tapes such as "Urban Runoff," produced by the City of Santa Monica, and "Fantastic Journey," produced by the City of Los Angeles. Beyond this, speakers from Heal the Bay and other organizations interested in storm water management may be invited to discuss storm water/urban runoff pollution prevention at various community meetings and other forums.

- ***Community Events***

Storm water/urban runoff pollution prevention materials may be presented and distributed at community events such as the Annual Uptown Festival.

Last year, the City distributed storm water/urban runoff pollution prevention flyers and other materials from a booth at the Uptown Festival.

- ***Cable Television***

City intends to air various storm water/runoff pollution prevention video-tapes on City's cable channel including *"Urban Runoff,"* produced by the City of Santa Monica, and *"Fantastic Journey,"* produced by the City of Los Angeles.

- ***Generic Brochure***

Although the City has not yet developed its own brochure, it recently distributed several storm water management-related brochures at the City's Annual Uptown Festival. The brochures included: (1) Heal the Bay's *"Twenty Ways to Heal the Bay;"* (2) *"Heal the Bay's Dirty Words Every Kid*

VOL 17 00512

R0062352

Should Know;" (3) Los Angeles County's *"Storm Water/Urban Runoff Quality Management Program,"* and (4) Los Angeles County's *"The Ocean Begins at Your Front Door."* The City also intends to adopt a "generic" brochure that is currently being developed by the Los Angeles County NPDES Co-Permiteee Public Outreach Committee for use by all cities, as recommended in the Woodward-Clyde/UCLA Study. Actually, the City intends to use all brochures, flyers, and other storm water/urban runoff pollution prevention materials developed by the Public Outreach Committee of the Storm Water Management Task Force.

In an effort to avoid "wheel reinventing," the City intends to share with subject industrial and commercial dischargers in the City BMPs acquired from various resources. Industrial and commercial BMPs have been developed by a number of organizations, including USEPA, State Water Resources Control Board, California Integrated Waste Management Board, Sanitation Districts of Los Angeles County, Alameda County, Los Angeles County, the City of Los Angeles, the City of Santa Monica, and the American Public Works Association Storm Water Task Force. For example, the Los Angeles County NPDES Public Outreach Committee has already obtained pamphlets describing BMPs for a number of activities, including:

- *Food Services Best Management Practices (City of Los Angeles)*
- *Automotive Maintenance and Car Care Best Management Practices (City of Los Angeles)*
- *Best Management Practices for Automotive-Related Industries: Practices for Sanitary Sewer Dischargers and Storm Water Pollution Control (Santa Clara Valley Nonpoint Source Pollution Control Program).*
- *General Construction and Site Supervision (City of Los Angeles)*
- *Best Management Practices for the Construction Industry: Painting and Application of Solvents and Adhesives (City of Los Angeles)*
- *Best Management Practices for the Construction Industry: Roadwork and Paving (City of Los Angeles)*
- *Best Management Practices for the Construction Industry: Heavy Equipment Operation and Earth Moving Activities (City of Los Angeles)*

VOL 17 000513

- *Best Management Practices for the Construction Industry: Fresh Concrete and Mortar Application (City of Los Angeles)*
- *Best Management Practices for the Construction Industry: Earth Moving Activities and Erosion Control Methods (City of Los Angeles)*

Such BMPs – as well as other stormwater/urban runoff management-related public information – could be disseminated through the City's Waste Reduction and Recycling Coordinator.

Implementation Schedule:	Aforementioned program activities not performed will be implemented by December 15, 1995.
Legal Authority:	May be authorized by administrative directive or Council resolution.

VOL 17 000514

R0062354

Co-Permittee:	City of Whittier	Name:	Leon Yehuda
Date:	April 13, 1995	Title:	Assistant Director of Public Works

ADDITIONAL BEST MANAGEMENT PRACTICES
Residential, Commercial, and Industrial
Permit Task 3.1.2

Best Management Practice: *Defined as any practice or procedure that directly or indirectly reduces storm water/urban runoff pollution into the municipal storm drain system.*

Practice/Procedure:

ABMP #5:	Catch Basin Cleaning

As stated in its Early Action Best Management Practices Plan, the City provides annual catch basin maintenance prior to the start of the wet season (October 1), to reduce first flush pollutant concentrations. Catch basins may be cleaned more frequently or on an "as needed" basis, either in response to citizen requests or clogging detected by City field crews. Given the relatively debris-free appearance of catch basins, there is no need to increase the frequency of catch basin cleaning at this time. In addition, the also uses a "Vac-Jet" truck which is used to remove sludge accumulated inside catch basins. Caked-on sludge is removed by a high-pressure hose and is then vacuumed into an on-board reservoir. This BMP is highly effective to the extent that it removes pollutants such as lead and other heavy metals that builds-up in catch basins.

Implementation Schedule:	On-going administrative practice.

VOL 17
00515
R0062355

Legal Authority:	City's catch basin maintenance program is based on administrative policy.

VOL 17 000516

Co-Permittee:	City of Whittier	Name:	Leon Yehuda
Date:	April 13, 1995	Title:	Assistant Director of Public Works

ADDITIONAL BEST MANAGEMENT PRACTICES
Residential, Commercial, and Industrial
Permit Task 3.1.2

Best Management Practice: *Defined as any practice or procedure that directly or indirectly reduces storm water/urban runoff pollution into the municipal storm drain system.*

Practice/Procedure:

ABMP #6:	Increasing number of roadside trash receptacles and maintenance frequency in areas where needed.

As stated in its City's *Early Action Best Management Practices Plan*, the City's dedication to maintaining a clean environment is evidenced by the relative absence of litter in public or private places in the City. This is the planned result of weekly street sweeping and deployment of an adequate number of trash receptacles in heavily congested areas.

Implementation Schedule:	This is an on-going City practice.
Legal Authority:	Administrative policy.

VOL 17 000517

R0062357

Co-Permittee:	City of Whittier	Name:	Leon Yehuda
Date:	April 13, 1995	Title:	Assistant Director of Public Works

ADDITIONAL BEST MANAGEMENT PRACTICES
Residential, Commercial, and Industrial
Permit Task 3.1.2

Best Management Practice: *Defined as any practice or procedure that directly or indirectly reduces storm water/urban runoff pollution into the municipal storm drain system.*

Practice/Procedure:

ABMP #7:	Increasing frequency of street sweeping in areas where needed.

Streets in all zones are swept at least twice monthly monthly, with the exception of (a) the Uptown commercial district of the City, which is swept at least three time a week; (b) selected residential areas, which are swept once a week; and (c) street medians, which are swept once a week. This frequency exceeds the *Proposed Minimum Compliance Levels for California Regional Water Quality Control Board's Recommend BMPs for Phase I permittees*, which calls for monthly street sweeping. It should be noted that this document is used to evaluate ABMP compliance for all permittees, calls for sweeping of all streets within a co-permittee's jursidiction at least once a month.

Implementation Schedule:	On-going practice.
Legal Authority:	Administrative practice.

VOL 17 00051 8

Co-Permittee:	City of Whittier	Name:	Leon Yehuda
Date:	April 13, 1995	Title:	Assistant Director of Public Works

ADDITIONAL BEST MANAGEMENT PRACTICES
Residential, Commercial, and Industrial
Permit Task 3.1.2

Best Management Practice: *Defined as any practice or procedure that directly or indirectly reduces storm water/urban runoff pollution into the municipal storm drain system.*

Practice/Procedure:

ABMP #8:	Creating or augmenting of a program to eliminate improper disposal of litter, lawn/garden clippings, and pet feces into the street or areas where runoff may carry such pollutants to the storm drainage system

City has legal authority to discourage improper disposal of the following pollutant materials:

- **Litter/Vegetative Matter**

City prohibits by ordinance littering of any refuse or debris within the City as specified in §8.040.010 which incorporates by reference Los Angeles County Code Title II, Division, which also prohibits littering in the County. City ordinance against the disposal of refuse and trash is further strengthened under §8.12.210, which makes it unlawful for anyone to deposit refuse or non-combustible trash (i.e., all waste and rubbish including vegetative matter) from residences and places of business to any "any lot or upon any public or private drive, alley or street, or in any building, or any other public or private place within the City."

This prohibition will be strengthened even further once the City adopts its storm water/urban runoff pollution control ordinance which shall, among things, make unlawful the discharge of any material to components fo the municipal strom water system that is not entirely comprised of storm water and is not exempted non-storm water discharge.

VOL 17 000519

R0062359

- **Pet Waste:**

City ordinance incorporates by reference *Title 10 of the Los Angeles County Code*, as adopted in §6.04.020, which prohibits the deposition of animal waste on pubic property, including streets and gutters -- components to the municipal storm water system.

Implementation Schedule:	On-going practice.
Legal Authority:	Whittier Municipal Code provisions cited above.

VOL 17
000520
R0062360

Co-Permittee:	City of Whittier	Name:	Leon Yehuda

ADDITIONAL BEST MANAGEMENT PRACTICES
Residential, Commercial, and Industrial
Permit Task 3.1.2

Best Management Practice: *Defined as any practice or procedure that directly or indirectly reduces storm water/urban runoff pollution into the municipal storm drain system.*

Practice/Procedure:

ABMP #9:	Implementing inspections of auto repair shops, auto body shops, auto parts and accessory shops, gasoline stations, and restaurants.

Developing and implementing this activity as an ABMP will not be necessary once the new municipal NPDES permit takes effect. The new permit will require inspections of <u>all</u> facilities within a permittee's jurisdiction for possible illicit discharges to the municipal storm water system and adherence to pollution prevention BMPs such as good housekeeping practices, proper storage and handling of materials containing pollutants, and spill prevention and response – to name a few. These requirements shall be achieved through the City's storm water/urban runoff pollution prevention ordinance.

Implementation Schedule:	January 1, 1996 or date specified in final permit.
Legal Authority:	Forthcoming City ordinance.

VOL 17 000521

R0062361

Co-Permittee:	City of Whittier	Name:	Leon Yehuda
Date:	April 13, 1995	Title:	Assistant Director of Public Works

ADDITIONAL BEST MANAGEMENT PRACTICES
Residential, Commercial, and Industrial
Permit Task 3.1.2

Best Management Practice: *Defined as any practice or procedure that directly or indirectly reduces storm water/urban runoff pollution into the municipal storm drain system.*

Practice/Procedure:

ABMP #10:	Encouraging owners and occupants of homes or businesses to remove dirt, rubbish and debris from sidewalks and alleys which may contribute to pollutants in urban runoff.

Although Whittier Municipal Code prohibits the placement of refuse and miscellaneous debris (including dirt) in any street, alley, parkway or other public place or in or upon any vacant or unimproved lot, it does not compel residents or businesses to clean sidewalks and alleys of such materials. Whittier residents and businesses, however, are very conscientious of the appearance of their premises and proximate rights of way. This is evident throughout Whittier where debris is seldom found. Nevertheless, the importance of keeping sidewalks and alleys free of litter and other debris as a BMP shall be mentioned in the City's storm water/urban pollution prevention public education/outreach program plan

Implementation Schedule:	By December 15, 1995,
Legal Authority	Administrative practice pursuant to 1995-2000 NPDES municipal permit.

Permit Task 3.1.2

Best Management Practice: *Defined as any practice or procedure that directly or indirectly reduces storm water/urban runoff pollution into the municipal storm drain system.*

Practice/Procedure:

ABMP #12:	Encouraging proper disposal of household hazardous wastes to prevent improper disposal of such materials to the storm drainage system.

Residents and businesses are encouraged to take hazardous wastes to Household Hazardous Waste Round-ups (see above ABMP #11) as part of the City's recycling program. The storm water/urban runoff pollution prevention public education/outreach program shall emphasize the importance of recycling to reducing pollutant concentrations in storm water runoff.

Implementation Schedule:	On-going.
Legal Authority:	AB 939.

VOL 17 000524

R0062364

Co-Permittee:	City of Whittier	Name:	Leon Yehuda
Date:	April 13, 1995	Title:	Assistant Director of Public Works

ADDITIONAL BEST MANAGEMENT PRACTICES
Residential, Commercial, and Industrial
Permit Task 3.1.2

Best Management Practice: *Defined as any practice or procedure that directly or indirectly reduces storm water/urban runoff pollution into the municipal storm drain system.*

Practice/Procedure:

ABMP #13:	Encouraging the proper use and conservation of water to minimize runoff from vegetated areas.

City may not be able to encourage proper water use and conservation as a means of minimizing runoff to the municipal storm water system. The increase in the City's ground water supplies due to above average rainfall this and last year makes it unncessary and difficult to enforce existing water conservation ordinance. In addition, the 1995-2000 municipal NPDES permit will obviate the need for this ABMP because it requires conformance with CFR 40 requirements for establishing legal authority which calls for the elimination of non-storm water discharges (i.e., any material that is not entirely composed of storm water) to the municipal storm water system.

Implementation Schedule:	By January 1, 1996 or other compliance date for establishing legal authority required by the new permit.
Legal Authority:	By forthcoming City ordinance.

VOL 17 000525

Report Regarding Proposed Permit from the California Regional Water Quality Control Board, Los Angeles Region, for the Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges Within the County of Los Angeles

BACKGROUND

In 1987, Congress amended portions of the Clean Water Act and established requirements for permitting stormwater runoff.

This amendment established the framework of the National Pollutant Discharge Elimination System (NPDES) program for the storm water discharges from municipalities, industries, and construction activities entering waters in the United States.

California is one of 38 states granted authority by the Environmental Protection Agency (EPA) to administer the NPDES Storm Water Program. This program is administered through the State Water Resources Control Board (SWRCB) and the Regional Boards.

The SWRCB issued an "early" 5-year Municipal Storm Water NPDES permit to Los Angeles County as the Principal Permittee which included 86 "Co-Permittee" cities. This permit outlined requirements to develop a Stormwater/Urban Runoff Management Program and was to expire on June 18, 1995. The existing NPDES permit remains in effect until a new permit is issued.

EXISTING PERMIT

Long Beach, together with staff and an environmental consultant, have met the following permit requirements:

- Defined drainage areas and identified drainage facilities;
- Prepared storm drain flow maps;
- Determined Best Management Practices (BMPs) to enhance storm water quality;
- Developed early action BMPs;
- Determined required legal authority for regulating stormwater/urban runoff;
- Developed a database for the storm drain system components;
- Submitted evidence of progress in implementing early action BMPs;
- Submitted evidence of having legal authority to regulate storm water/urban runoff; and
- Submitted evidence of progress implementing early action BMPs and additional BMPs.

VOL 17 000526

The annual cost of the City's existing program is $12,400,000. The program consists of several BMPs which include services such as street sweeping, catch basin stenciling, public education, encouraging the proper disposal of litter, household recycling, conserving water, and cleaning catch basins. Exhibit A lists all of the BMPs included in the City's program and their associated costs.

NEW PERMIT

PERMIT DEVELOPMENT

The City of Long Beach has been an active participant in the development of this new permit. An Executive Advisory Committee (EAC), consisting of 1 County and 15 City officials, was formed in March 1994 to work on developing a new 5-year permit. Long Beach serves on this committee.

In an attempt to reach a consensus among the affected agencies, the Department of Public Works has been working for over a year with the California Regional Water Quality Control Board (RWQCB) staff along with L.A. County staff. The City Attorney's Office has also been intensely involved in this process.

To date, there are still major concerns regarding the permit requirements and their impacts on limited City resources.

MAJOR CONCERNS

1. **The permit contains findings that are not based on relevant, sound scientific data specific to the receiving waters of Long Beach.**

   Problems in Santa Monica Bay, causing the closure of beaches, have received extensive press coverage recently. The order correlates the problems in Santa Monica Bay to be equivalent to perceived problems in the receiving waters in Long Beach. Long Beach does not have the same problems as Santa Monica Bay. Santa Monica Bay is negatively impacted by the Hyperion sewage treatment facility. The City of Long Beach Department of Health and Human Services regularly tests the water at our beaches and reports that beach closures are rare, usually related to a sewer pipe break.

   Findings and requirements which do not comply with the Clean Water Act or which lack a sound scientific basis and would therefore expose the City of Long Beach to unreasonable risks of suit by third parties should be deleted.

VOL 17 000527

R0062367

2. **The permit exceeds the conditions set forth in the Clean Water Act.**

The City Attorney's office has numerous concerns regarding the legality of this permit as drafted. The RWQCB, in our opinion, has exceeded the requirements of the Federal Clean Water Act.

3. **The "site visit" program specified in this permit creates unfunded mandates.**

Under the disguise of the Public Education Program, the State is attempting to shift its responsibility onto the cities to inspect and enforce industrial facilities that are covered under either a General Industrial Activities Storm Water Permit (GIASP) or a General Construction Activity Permit (GCAP) issued by the State Water Resources Control Board.

In addition, the permit requires cities to "visit" approximately 3,800 facilities every two years including restaurants, gas stations, vehicle repair shops, vehicle body shops, and vehicle parts and accessories stores. The site visit, at a minimum, would require cities to:

a) consult with a facility representative about the local storm water codes, regulations and ordinances;
b) review the facility for compliance;
c) take action against problematic facilities; and
d) if necessary, identify and report problem facilities to the Regional Board.

This requirement is premature at this time. The State has yet to fully implement their Industrial NPDES program and the pollutants of concern have not been identified to link these facilities as significant contributors.

4. **The permit contains provisions that would allow additional requirements to be imposed after its adoption.**

Several areas in the draft permit allow the RWQCB to impose additional requirements on cities as it sees fit. One glaring example is that each permittee must implement the Countywide Storm Water Management Plan which has yet to be developed. The draft permit does not clearly state what the plan requirements will be which makes it impossible to determine the fiscal impact on the cities. Cities would not have the ability to plan or budget expenses. The RWQCB would, therefore, be able to impose additional requirements, after adoption of this permit, without a public hearing process, denying the City the opportunity to comment or to effectively plan or budget for expenses.

VOL 17 000528

5. **Compliance dates are not realistic and reporting requirements are excessive.**

Compliance dates must take into consideration the government process in policy making and budgeting. Given the number of cities (86), the time frame to coordinate this program needs to be considered as well.

The amount of reporting outlined in this permit is too expensive, laborious and unreasonable. For example, cities must report annually a program budget summary which shall include: capital, operation and maintenance expenditures; funding sources; staff resources, equipment and support capabilities; contract services; cost sharing arrangements; and any foreseeable shortfalls.

6. **Some program requirements are so specific as to prevent any flexibility.**

The City should be allowed to develop its own procedures in a creative, cost effective way as long as the goals of the permit are accomplished. If the goals are met, the means and the amount spent should not matter to the RWQCB.

7. **Permit does not provide for future revisions to the Clean Water Act.**

The permit should be written such that the RWQCB agrees to reopen negotiations on the requirements imposed on cities if Congress modifies the Clean Water Act during the term of this permit.

ESTIMATED COSTS

This proposed permit will have an impact on City resources. Since the details of the Countywide model program have not been developed yet, the estimated program costs were difficult to determine. The cost estimates are based on the minimum program requirements outlined in the proposed permit. The total estimated cost for the new permit is $3,470,000 in start-up costs for the first year and $2,550,000 for on-going costs thereafter. These costs are not included in the proposed City budget.

Staff from the Public Works Department and City Attorney's office met with each affected department to determine the permit requirements. The various departments then developed their associated costs for compliance which are shown in Exhibit B. The individual departments permit responsibilities are shown in Exhibit C.

SCHEDULE

The proposed permit does not appear to recognize that cities have limited fiscal and

VOL 17 000529

R0062369

administrative resources for implementing unfunded mandates. Nevertheless, the RWQCB staff issued a Tentative Order on May 23, 1996.

This Tentative Order may be adopted by the RWQCB on the scheduled Board Hearing date of July 15, 1996, and would be effective within 90 days from its adoption date.

SUMMARY

This Technical Memorandum No. 6 (TM6) presents an interim status of the Remedial Investigation (RI) for the Long Beach Harbor West Basin (West Basin). The RI was conducted to assess potential environmental contamination in marine sediment and organism tissue in the West Basin. TM6 discusses the rationale of the RI with respect to the design of the sample location/analysis and data analysis plan, describes the field activities and procedures including sampling conducted as part of the RI, summarizes the laboratory analytical methods and test results, and outlines the work in progress. Following completion of laboratory analysis, and data analysis and interpretation, the general contents of TM6 will be incorporated into the RI Report. The RI Report will be prepared in accordance with the Installation Restoration Program, the Facilitywide Risk Assessment Work Plan, CLEAN I Work Plan, Sediment and Fish Sampling/Analysis Implementation Plans, and the Risk Assessment Work Plan.

A review of previous investigations performed within the West Basin specifically, and the general Los Angeles/Long Beach Harbor areas and coastal southern California in general, was conducted. Scientific surveys were reviewed and summarized to define chemical and biological regional ambient conditions. The ambient conditions provide a basis for comparison and interpretation of the results of this investigation. Reports of past dredging activities were also reviewed to provide information for the ensuing Feasibility Study.

As part of the review of previous investigations, an attempt was made to identify sources of discharge with respect to areas of contamination within the West Basin. Source identification included points of discharge origin, facility operations, discharge generators, and locations of discharge points within the receiving waters of the West Basin. This information will be utilized to further delineate the nature and extent of contamination.

During the summer of 1994, sediment and tissue samples were collected from 45 locations in the West Basin and three reference stations. The collected sediment samples consisted of surface (10 centimeter depth) and subsurface (maximum of 5 meter depth) sediment samples. Benthic infaunal invertebrates were also collected from the sediment samples. Bottom-dwelling fish, such as California halibut and white croaker, were collected. Whole fish, fish tissue, and fish bile were used for laboratory analysis.

Surface sediment samples were analyzed for physical parameters (grain size and total organic carbon [TOC]), chemical parameters (metals, sulfides, butyltin, polynuclear aromatic hydrocarbons [PAHs], polychlorinated biphenyls [PCBs], pesticides and semi-volatile organic compounds [SVOCs]), toxicity (bioassay) and benthic infauna. Subsurface sediment samples were analyzed for physical parameters (grain size and TOC) and chemical parameters (metals, butyltin, PAHs, PCBs, pesticides, and SVOCs). Bioaccumulation data were obtained by analyzing fish tissue for metals, butyltin, PAHs, PCBs, and pesticides. Clam bioaccumulation tests, conducted using sediment samples, were analyzed for metals, butyltin, PAHs, PCBs, and pesticides.

VOL 18

Summary

Preliminary results indicate that the distributions of sediment physical, chemical, and biological characteristics in the West Basin generally appear to follow a predictable pattern, based on sediment deposition and proximity to specific shore-based features, such as piers, seawalls, ship moorings, and stormwater outfalls. Sediments beneath the piers appear to be generally finer, contain greater levels of sulfides, and are higher in organic content than sediments from open water areas of the West Basin.

Preliminary results indicate concentrations of chemical contaminants in sediments beneath the piers generally higher than those of the open areas of the West Basin and project reference data. Contaminants may be accumulating in sediment beneath the piers as these areas are generally favorable for sedimentation and generally remained undisturbed. Sediments in areas along the northern seawall and the Navy Mole appear to contain chemical contaminant concentrations greater than those of the central areas of the West Basin, and somewhat greater than project reference concentrations.

At the time of this writing, the following tasks were in progress:

- chemical data evaluation, pending completion of statistical data analysis;
- biological data evaluation, pending completion of benthic community analysis and completion of statistical analysis of bioassay results; and
- ecological and human health risk assessment.

Following completion of these tasks, the results of this investigation, including recommendations and conclusions, will be included in the RI Report.

SECTION 1

INTRODUCTION

VOL 18

Section 1
INTRODUCTION

This document, Technical Memorandum No. 6 (TM6), has been prepared by Bechtel National, Inc. (BNI) under the Comprehensive Long-Term Environmental Action Navy (CLEAN) II Program. BNI is conducting a Remedial Investigation/Feasibility Study (RI/FS) of the Long Beach Harbor West Basin (West Basin), located within the Long Beach Naval Complex (LBNC). As a substantial portion of the Remedial Investigation (RI), BNI conducted an extensive site assessment during the summer of 1994. The purpose of the site assessment was to provide site-specific data relating to potential environmental contamination in marine sediment and organism tissue in the West Basin, which are the target media for this RI.

At the present time, the analytical data have been validated, and data evaluation is in progress. The discussions presented herein, as well as the results of the evaluations being conducted, will be contained in the RI Report to be prepared and issued at the conclusion of the work.

TM6 was prepared as an informational document to provide an interim status of the RI in progress for the West Basin. It describes the purpose of the work and activities already completed, such as sampling and analysis. It also discusses the findings of the field sampling and laboratory analysis programs. Essentially, most of the TM6 contents will be incorporated as part of the RI Report.

The West Basin is confined by the Long Beach Naval Shipyard (LBNSY) and the former Long Beach Naval Station (NAVSTA) which comprise the overall LBNC, as shown on Figure 1-1. The West Basin has been jointly used by the LBNSY and the former NAVSTA and, as such, it is the subject of this RI under the CLEAN II Program.

1.1 BACKGROUND DOCUMENTS

Southwest Division Naval Facilities Engineering Command (BNI 1994c) issued a facilitywide Risk Assessment Work Plan on 30 January 1994, which provided a conceptual framework for assessing ecological and human health risk potentially associated with the sediment and fish of West Basin. Subsequently, a Fish Sampling and Analysis Plan (FSAP) for the West Basin, dated 30 January 1994 (BNI 1994b), was submitted both to the California Environmental Protection Agency (Cal-EPA) and the United States Environmental Protection Agency (U.S. EPA) Region IX. The FSAP discusses the approach planned for assessing potential human health effects associated with consumption of contaminated fish.

Subsequent to the issuance of these documents, a series of discussions and workshops were held with the oversight agencies comprising Cal-EPA, U.S. EPA Region IX, the United States Fish and Wildlife Service (U.S. FWS), and the National Oceanographic and Atmospheric Administration (NOAA). These discussions were held for the purpose of refining the conceptual framework related to investigating the reported sediment contamination in the West Basin and to determine data needed to support this framework. One of the key developments of these discussions was the agreement that the water column in the West Basin need not be evaluated; water column analysis is included in the CLEAN I Work Plan (JEG 1993a). The oversight agencies agreed to the concept of

0464

R0062399

"triggering" water column investigations, based on findings from the sediment investigation. The agencies also agreed to limit the proposed investigation relating to trophic interactions (e.g., food web modeling contained in the CLEAN I Work Plan). In summary, it was agreed with the oversight agencies that the focus of the RI for the West Basin would remain on the sediment, with limited fish collection as well, and that additional characterization would be required only if these data indicate a potential problem.

As a result of these discussions, the oversight agencies deemed that the two documents referred to above provided only general guidance for addressing the conceptual framework for investigating and evaluating risk in the West Basin. In response to these concerns, BNI issued TM4 and TM5 as implementation plans in June 1994 (BNI 1994d) and August 1994 (BNI 1994e), which provided detailed procedures to be used for sampling and analysis of bottom sediments and fish, respectively.

The sampling and analysis implementation plans (BNI 1994d,e) which described how sediment and fish samples would be collected and analyzed, were followed by a comprehensive document entitled Addendum to RI/FS Work Plan and Risk Assessment Work Plan (RAWP; BNI 1995). The RAWP described how the acquired data would be evaluated and used to support the focused ecological risk assessment and human health risk assessment. The objectives of the RAWP are to:

- bring together elements individually discussed in the earlier plans and memoranda;
- provide guidelines for evaluating project data;
- provide insight into how ecological and human health risk assessment could best be conducted; and,
- discuss how findings and conclusions will be integrated into the RI and subsequently the feasibility study (FS) as well.

Cumulatively, these five documents (Risk Assessment Work Plan, CLEAN I Work Plan, but more significantly the latter three: sediment and fish sampling/analysis implementation plans, and the RAWP) comprise the essence of how the RI, including both the ecological and human health risk assessments, would be conducted for West Basin.

1.2 PURPOSES AND SCOPE OF THE REMEDIAL INVESTIGATION

The purposes of the RI are to: (1) identify chemicals of potential concern (COPCs) associated with the West Basin sediments; (2) identify areas of potential concern (AOPCs); (3) rank these AOPCs; (4) assess which of the AOPCs need sediment remediation and identify appropriate cleanup levels, and (5) assess whether further investigation is warranted for the remaining AOPCs. The planned approach to achieve these objectives involves conducting focused ecological risk assessment and baseline human health risk assessment, using standardized procedures to the extent they are available.

VOL 18
0465
R0062400

The purpose of the ecological and human health risk assessment is to evaluate whether chemical contaminants associated with the West Basin sediments could potentially represent a hazard to the environment or human health. Where such potential hazards exist, the risk assessment is further intended to determine whether adverse effects resulting from ecological or human health exposures to chemical contaminants would warrant remediation of West Basin sediments.

The focal point of the ecological risk assessment is to provide a basis for decisions related to whether sediment remediation is warranted. The human health risk assessment will be used to evaluate potential effects associated with consumption of fish caught from West Basin waters.

1.3 FACILITY LOCATION AND DESCRIPTION

The LBNC is situated on the south side of Terminal Island within the Los Angeles and Long Beach Harbor districts, approximately 3 miles west of downtown Long Beach, California. The LBNC is bounded by the oil fields and container yards of Terminal Island to the north, parts of Los Angeles Harbor to the west, San Pedro Bay to the south, and Long Beach Harbor Channel to the east. The Long Beach Harbor West Basin, which has been jointly used by the NAVSTA and the LBNSY, is bounded to the west by the former NAVSTA, to the south by the Navy Mole, to the north by LBNSY, and to the east by the ship turning basin, which is part of the Port of Long Beach (POLB) complex. Figure 1-2, Facility Plan, shows the specific location of West Basin.

Eleven piers, constructed for the purpose of ship docking for maintenance and loading, are present in the West Basin. These piers are generally constructed with concrete pilings, and are approximately 30 to 125 feet wide and 250 to 1,200 feet long. Piers 1, 2, and 3 are located along the northern seawall of the West Basin and used by the LBNSY. The other eight piers are used by the NAVSTA and include: Piers 5 and 7 located along the northern seawall of the West Basin; Pier 9 located in the northwest corner of the West Basin; and, Piers 10, 11, 12, 15, and 16 located in the southern portion of the West Basin along the Mole. A pipeline system delivers fuel from the Defense Fuels Supply Point in San Pedro to Pier 12. A marina is located near the southwest corner of the West Basin. Three dry docks are located at the LBNSY.

1.4 OPERABLE UNIT DESIGNATION

The LBNC has been divided into 13 sites under the Installation Restoration (IR) Program, which have been grouped into three operable units (OUs). Operable units represent areas in which discrete remedial response actions may be implemented to manage migration of contaminants, eliminate or mitigate releases of contaminants, which in turn is intended to reduce or eliminate potential pathways of exposure. Operable units are typically defined as:

- areas with similar media or found to have similar types of contaminants,
- areas that are geographically contiguous,

VOL 18

0466

R0062401

- areas that could be remediated using similar techniques,
- areas which could be remediated within a parallel time frame, and
- areas that are amenable to being managed in a single RI/FS.

The RI/FS Work Plan for LBNC (JEG 1993a) identified the West Basin as Site 7, comprising OU-3, since harbor sediments are unique among the 13 IR Program sites. With the exception of Site 7, all IR Program sites are land-based sites, wherein the media of concern consist of soil and groundwater. Site 7, however, is defined as those subtidal sediments found in the West Basin of Long Beach Harbor, representing an area of approximately 700 acres.

1.5 FACILITY HISTORY AND PREVIOUS INVESTIGATIONS

This section discusses the history of operation and previous environmental investigations conducted at the LBNC in general, and the West Basin in particular.

1.5.1 History

In 1935, the U.S. Navy negotiated a 30-year lease with the City of Los Angeles for property to be developed into a naval facility. In 1938, construction of the NAVSTA main base began. The majority of the LBNC land was reclaimed through hydraulic fill operations conducted between 1938 and the early 1940s. During this time, the Mole was extended out into San Pedro Bay and completed in 1944. Construction of NAVSTA and the Mole created the West Basin in its present form.

By 1946, the NAVSTA was chartered to maintain facilities for the operation and berthing of tugboats, barges, and similar vessels. In 1948, the NAVSTA changed its name from the U.S. Naval Base, Terminal Island, to the U.S. Naval Station Long Beach. At that time, the NAVSTA provided support for active service ships and inactive ships of the Reserve Fleet. The NAVSTA, which closed 30 September 1994, was one of the 11 military installations in California scheduled for closure under the Base Realignment and Closure Act (BRAC) II. The LBNSY provided logistical support for assigned ships, performed authorized work on ships, and performed manufacturing research, development and test work.

1.5.2 Previous Investigations

Since the 1950s, several environmental investigations have been conducted at the Los Angeles/Long Beach (LA/LB) Harbor Complex. Few, however, have related specifically to West Basin sediment. An overview of the key investigations relevant to the IR Program is provided below in chronological order.

1.5.2.1 1954-1975 BENTHIC COMMUNITY STUDIES

Benthic biological data using invertebrates as biomarkers specific to West Basin were collected in 1970-1971 (Hill and Reish 1975). These data complemented or were

VOL 18
0467
R0062402

comparable to benthic data collected during earlier years from other locations of the LA/LB Harbor Complex. These and other similar environmental studies concluded that the inner harbor waters, including West Basin, were severely polluted, (i.e., that specific benthic taxa were either absent or showed evidence of severe stress, and that dissolved oxygen [DO] levels, another direct indicator of water and sediment quality, were depressed). These investigations also found that outer harbor stations indicated healthy benthic communities and adequate DO levels.

The pollution abatement program within the LBNC, following a similar program conducted LA/LB Harbor-wide, was initiated in the mid-1970s. Prior to implementing this program (e.g., in the 1950s and 1960s), wastes discharged within LBNC included petroleum products, wastewater from naval ships, and stormwater runoff. Following its implementation, these wastes, except stormwater, were collected, treated, and discharged elsewhere. As an example of surface water discharges contributing to changes or degradation in benthic communities, prior to 1971, much of the benthos in the West Basin was dominated by the pollution-tolerant polychaete worm *Capitella capitata*. Following the implementation of the pollution abatement program, this species virtually disappeared and the benthos became dominated by a wide variety of species, with healthy zone indicators dominating benthic communities (Hill and Reish 1975; Reish 1978). This important finding is consistent with many similar investigations conducted within the LA/LB Harbor during this period (e.g., Soule and Oguri et al. 1974).

1.5.2.2 1969 INDUSTRIAL WASTE STUDY

The Department of Navy (DON), Southwest Division (SWDIV), conducted an Industrial Waste Study at LBNC (SWDIV 1969). Among the objectives of this study was to determine the nature and amount of all liquid and solid industrial wastes being discharged into the storm drain system, directly into the harbor, or buried into the ground. This was the first known environmental investigation of "industrial" (now generally considered "hazardous") waste at LBNC. This study reported the discharge of industrial wastewater into the West Basin, burial of industrial waste liquids and sludges in disposal pits on the Mole, and the landfilling of solid waste and sandblast grit to enlarge the Mole.

1.5.2.3 1983 INITIAL ASSESSMENT STUDY

An Initial Assessment Study (IAS) for the LBNC was completed in August 1983 (NEESA 1983). The IAS was similar to a Preliminary Assessment (PA) under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) process. The purpose of this IAS was to identify and assess potential threats to human health and the environment caused by past hazardous materials storage, handling, or disposal practices at Naval installations. As such, the IAS was the first comprehensive study by the DON to identify contaminated areas at LBNC resulting from past operations. The study included information on waste generating sources, waste handling practices, storage and transportation procedures, waste processing practices, and descriptions of disposal sites and potentially contaminated areas.

VOL 18
0468
R0062403

The IAS included a review of available records, aerial photographs, surface and aerial surveys, and personnel interviews. Based on information obtained from the study, 12 potentially contaminated sites were identified at LBNC (JEG 1993a), one of which was Site 7, West Basin sediments. Each of the 12 sites was assessed with regard to contamination characteristics, migration pathways, and potential receptors. The study concluded that none of the 12 sites posed a sufficient threat to human health or the environment to warrant a confirmation study, but recommended various precautionary measures (JEG 1993a).

1.5.2.4 1989 RCRA FACILITY ASSESSMENT

The Resource Conservation and Recovery Act of 1976 (RCRA) Facility Assessment (RFA) of the LBNC, was prepared by the Cal-EPA Department of Toxic Substances Control (DTSC), formerly the Department of Health Services (DHS 1989). The RFA was performed to identify and evaluate solid waste management units (SWMUs) and other areas of concern at LBNC. A records review, evaluation of existing data, personnel interviews, and a visual site inspection were conducted to evaluate the potential for releases of hazardous constituents from identified SWMUs. The RFA recommended further action at the 12 SWMUs identified in the IAS.

1.5.2.5 1992 SITE INSPECTION

Two Site Inspections (SIs) were conducted concurrently in 1991 at the NAVSTA and LBNSY; reports for these SIs were finalized in November 1992 (JEG 1992a and 1992b). The objectives of the SI, which typically follows the PA in the CERCLA process, were as follows:

- Verify the presence of hazardous substance contamination at the 12 sites identified by the IAS.
- Assess whether contamination at the sites exists at concentrations which warrant further action.
- Evaluate potential contaminant migration pathways and potential targets for scoring under the U.S. EPA Hazard Ranking System (HRS).

The NAVSTA SI addressed Sites 1 through 7, which lie within the NAVSTA's boundaries, and the LBNSY SI addressed Sites 7 through 12, which lie within the LBNSY's boundaries. Site 7 is shared by both the NAVSTA and LBNSY; therefore, portions of the site contiguous with the NAVSTA and the LBNSY were designated as Sites 7A and 7B, respectively, and were addressed in separate SI reports.

To accomplish the SI objectives at Site 7, a total of 15 sediment core samples were collected as part of the field effort. No surface sediment collections (uppermost 10 cm or less) or biological samples were collected as part of this effort. No sediment sampling was conducted under the piers in the West Basin. Fourteen of the sampling locations were targeted to be as close to the stormwater outfalls as possible (along the northern seawall), and a background sample was taken just off the end of the Mole. Sampling locations and

VOL 18
0469
R0062404

results of the laboratory analyses are described in the RI/FS Work Plan (JEG 1993a). The results of the laboratory analyses conducted on these samples were used to evaluate contaminant releases via various pathways in accordance with U.S. EPA guidance. Field data indicated the presence of numerous organic contaminants in sediments, in particular polynuclear aromatic hydrocarbons (PAHs), at moderate to high levels, and several metals in sediments at low to moderate levels. Because of the limited number of samples collected and the restricted spatial coverage, further investigation was recommended for Site 7.

1.5.2.6 1993 RI/FS WORK PLAN

The RI/FS Work Plan (JEG 1993a) is a facilitywide document which outlines a program for evaluating potentially contaminated areas at the NAVSTA as part of a RI/FS process. The following tasks were performed to develop a RI/FS approach for each of the sites identified within the LBNC:

- Review of existing data;
- Development of a conceptual model representing site conditions and potential exposure pathways;
- Performance of a screening-level assessment to identify where risk-based or regulatory-based protectiveness criteria may have been exceeded; and
- Determination of whether the site required further investigation or warranted a removal action.

The Work Plan detailed the data evaluation and reporting activities necessary to complete the RI/FS. Tasks included developing conceptual site models, assessing the baseline risk, developing screening levels, evaluating remedial alternatives, and preparing both RI and FS reports.

Existing sediment chemistry data specific to West Basin (JEG 1992b and 1993a) were reviewed as part of the Work Plan development process. Field work, conducted as part of the SI, resulted in the identification of potential compounds of concern, such as PAHs, polychlorinated biphenyls (PCBs), pesticides [e.g., dichloro-diphenyl-trichloroethane (DDT)], arsenic, copper, lead, mercury, and zinc. The SI results indicated that measured concentrations of these chemicals in sediment exceeded sediment screening-level criteria. The screening levels included: effects range - low (ER-L), effects range - median (ER-M), and equilibrium partitioning (EP) (Long and Morgan 1990); and the Puget Sound Standards of minimum cleanup levels (MCL) and screening levels (SL). As a result of this screening evaluation, it was determined that further evaluation of sediment toxicity would be required prior to specifying remediation of sediment.

The conceptual site model prepared for West Basin sediments identified potential exposure pathways via bottom sediments and surface water. Potential human receptors were identified as those individuals who consume fish caught in West Basin. Significant aquatic receptors were identified as invertebrates (including polychaete worms and

VOL 18
0470
R0062405

crustaceans) and fish. A sediment transport conceptual model was also developed to describe sediment mobilization and transport within West Basin.

The Work Plan also presented an approach to characterize risk associated with contaminated sediments. This approach was based on evaluation of sediment chemical analysis, bioassay, and tissue bioaccumulation test results to determine the need for sediment remediation. Potential remediation scenarios proposed in the Work Plan included capping, dredging and disposal, and natural recovery.

1.6 LAND USE

General land use in the vicinity of the LBNC consists primarily of port-related, commercial, industrial, or recreational activities. Facilities in the vicinity of the LBNC include tank farms, automobile terminals, cement terminal, cargo handling and storage, and cargo terminals. On Terminal Island, the areas west and east of the facility are used for commercial shipping, liquid bulk handling, heavy industrial activities, and commercial fishing activities. The area north of the LBNC (on Terminal Island) is used for oil production activities. Terminal Island is west of POLB and east of the Port of Los Angeles (POLA). These ports participate in heavy shipping traffic, container storage, cargo handling, dredging activities, and loading/offloading operations.

1.7 COMMUNITY RELATIONS

The DON has initiated an environmental investigation and cleanup effort at the LBNC, commonly referred to as the IR Program. A Community Relations Plan (CRP) was prepared in August 1993 to be implemented concurrently with the RI/FS phases of work performed under the IR Program. The CRP describes the public participation program designed to assure involvement by the local community.

In April 1992, a Technical Review Committee (TRC) was formed for the IR Program at the LBNC. The TRC was comprised of the DON and environmental regulatory agency representatives. The purpose of this TRC was to review IR Program documents and comment on the cleanup activities.

In April 1994, the LBNC formed a Restoration Advisory Board (RAB) to invite members of the public to become involved in the environmental restoration program. The RAB expanded the TRC by including members of the public in the existing committee of regulatory agency representatives and Navy personnel. Since April 1994, the 20-member RAB has met regularly, and has participated in site tours and educational workshops.

1.8 REGULATORY STATUS

Although the West Basin (Site 7) is not listed on the U.S. EPA National Priorities List (NPL), the DON's current policy is that response actions at both NPL and non-NPL sites be accomplished in accordance with the National Contingency Plan (NCP)/CERCLA. The DTSC has agreed to accept CERCLA remedial action documents under the corrective action provisions of the LBNSY's RCRA permit (RCRA Corrective Action Program),

VOL 18
0471
R0062406

since these provisions will be addressed in the environmental response actions taken at the West Basin. The DON is the lead federal agency for the implementation of these actions, and the DTSC is the lead state agency.

1.9 REPORT ORGANIZATION

TM6 is divided into 13 sections. The following paragraphs introduce the main topic of each section, followed by the focus of the subsections.

Section 1 is the introduction to TM6. Section 1.1 discusses background documents. Section 1.2 introduces the RI and presents the purpose. Section 1.3 describes the facility location and a general overview of the facility. Section 1.4 identifies the Operable Unit Designation. Section 1.5 summarizes facilitywide history and previous investigations related to dredging, oceanographic surveys, environmental monitoring, or remedial activities. Section 1.6 summarizes land use; Section 1.7 presents an overview of the community relations strategy; and Section 1.8 discusses the regulatory status of the facility.

Section 2 presents a description of the West Basin, including its operational history, use of the harbor, and vessel operations (Section 2.1). Section 2.2 provides an overview of regional climate and Section 2.3 of geology and how it relates to the West Basin. Section 2.4 provides an overview on the oceanography of Site 7 and the surrounding area, including physical (e.g., bathymetric properties and circulation patterns), chemical, and biological oceanography. Section 2.5 presents a discussion on sedimentology.

Section 3 provides a discussion of source identification issues related to the West Basin and the LA/LB Harbor areas. Section 3.1 discusses discharges to the LA/LB Harbor areas in general. Section 3.2 discusses historical sources of contamination, including land-based discharges, ship-related discharges, spills occurring into or adjoining the West Basin, and dredging projects where dredged materials could constitute a contaminant source to West Basin sediments.

Section 4 summarizes previous investigations related to West Basin sediments. Such investigations are comprised of scientific surveys that define regional ambient conditions related to physical oceanography, and chemical and biological surveys (Section 4.1). Section 4.2 provides an overview of dredging investigations conducted both in the outer LA/LB Harbors and within the West Basin.

Section 5 includes a rationale for the sampling design (Section 5.1), review of sample collection plan (Section 5.2), laboratory analysis (Section 5.3), and selection of project reference areas and a discussion of chemical and biological performance criteria used to evaluate the applicability of project reference data used as part of the project (Section 5.4).

Section 6 provides an overview of the field methods used to conduct the sampling, including mobilization, which involves site clearance and health and safety practices (Section 6.1), navigation and positioning (Section 6.2), and collection of sediment and biological samples (Section 6.3). Section 6.4 discusses sample documentation procedures.

VOL 18

0472

R0062407

Section 6.5 discusses sampling equipment decontamination procedures and Section 6.6 discusses collection, storage, and disposal of investigation-derived waste.

Section 7 provides an overview of the laboratory methods, including those used to analyze surface sediment (Section 7.1), including physical and chemical analyses, bioassay testing, and benthic community analysis. Section 7.2 discusses analysis of subsurface sediment, and Section 7.3 provides a discussion of methods used to analyze clam and fish tissue.

Section 8 provides an overview of how data quality was assured throughout various aspects of the project, including data quality objectives (Section 8.1), field measures (Section 8.2), and laboratory Quality Assurance/Quality Control (QA/QC) measures (Section 8.3). Section 8.4 describes the verifications and validation of chemical data, and Sections 8.5 and 8.6 discuss the validation and verification measures taken to assure quality of biological data. Section 8.7 discusses data usability issues with reference to conducting the RI and risk assessment, and Section 8.8 provides an overview of database management issues.

Section 9 presents preliminary results of the site assessment. An overview of the nature and extent of contamination is presented in Section 9.1. Section 9.2 provides the results for sediment physical data, Section 9.3 for sediment chemistry data, Section 9.4 for sediment toxicity data, Section 9.5 for benthic community data, and Section 9.6 for fish and clam tissue bioaccumulation data.

Section 10 presents preliminary evaluation results and identifies the work in progress. Section 10.1 describes chemical data evaluation methodology. Section 10.2 describes preliminary biological data evaluation results. Section 10.3 provides a preliminary evaluation matrix. Section 10.4 describes the work in progress which comprises the benthic community analysis, data evaluation, statistical analyses, ecological risk assessment, human health risk assessment, and preparation of the RI Report. Section 11 contains a listing of the references, and Section 12 provides a glossary of terms used in TM6.

SITE DESCRIPTION

R0062409

VOL 18
0475

Section 2
SITE DESCRIPTION

This section describes the operational history of the LBNC and the West Basin, and provides a description of the setting of Site 7 with respect to climate, geology, oceanography, and sedimentology.

2.1 OPERATIONAL HISTORY / HARBOR USE

Approximately 60 percent of the land occupied by the LBNSY and NAVSTA has been reportedly reclaimed through fill operations. After taking ownership of Terminal Island in 1938, the DON proceeded to construct the seawall that currently forms the northern boundary of the West Basin. The area between the seawall and the former shoreline was filled with dredged material.

The West Basin was created when the Mole was extended out into San Pedro Bay between 1938 and the early 1940s. The Mole forms the western and southern boundaries of the West Basin. Construction activities of the Mole were completed in 1944 (NEESA 1983). Since the creation of the West Basin, dredging has been conducted during construction or relocation of the piers (see Figure 2-1). Maintenance dredging has also been conducted between the piers. The piers and dry docks were constructed for ship maintenance activities and fueling (JEG 1993a).

In the late 1940s, NAVSTA provided support for active service ships and inactive ships of the Reserve Fleet (SWDIV 1994). From the early 1940s to the mid-1970s, drainage from various industrial areas and from cleaning and process tanks was discharged into the West Basin. Wastes were discharged through the storm drain system and from flushing of the dry docks (JEG 1993a). These past practices, along with leaks and spills from ships, may have resulted in areas potentially hazardous to human health and the environment (JEG 1993b).

Currently, the West Basin harbors an active berthing and repair shipyard. The primary use of the West Basin is for Naval and other activities such as providing maintenance facilities for the berthing operations of tugboats, barges, and similar vessels. A small craft marina is also located in the southwest corner. The West Basin is not used for recreational swimming. The Mole and other areas within the harbor are used for recreational fishing. The LBNSY provides logistical support for assigned ships, performing work in connection with construction conversion, overhaul, repair, alteration, drydocking, and fitting out of ships. Manufacturing research, development, and test work has also been conducted at the LBNSY (JEG 1993a). Ships leaving the POLB use the entrance to the West Basin as a turning basin.

2.2 CLIMATE

The climate is classified as Mediterranean, characterized by warm, dry summers and mild winters. Most of the precipitation throughout the year occurs between the months of November and March, with an average annual rainfall of about 12 inches. Heavy rains occasionally contribute to flooding and significant sediment discharge from adjoining

R0062410

VOL 18 0476

streams and rivers. Because of the relatively arid climate, annual evaporation is 63.6 inches (National Weather Service 1982). The dominant wind direction is westerly, with prevailing winds blowing off the ocean. At night, air cooled from the surrounding hills typically produces a gentle offshore flow (JEG 1993a).

The Eastern Pacific high (EPH) pressure system, and the moderating effect of the cool Pacific Ocean are the major influences on the regional climate (LA/LB Harbor Departments and U.S. Army Corps of Engineers [U.S. ACOE] 1990). In the summer, the EPH is at its strongest, most northerly position and is centered west of northern California. The EPH shelters southern California from polar storm systems. Descending air due to the EPH produces an elevated temperature inversion with a base of (1,000 to 3,000 feet). Marine air trapped within the inversion is condensed into fog and stratus clouds by the cool temperature of the ocean, which typifies summer weather in San Pedro Bay. Stratus clouds formed offshore move onshore during the evening hours, but burn off to the coastline during the morning hours when land temperatures rise. Summer tropical storms may also infrequently move in from the west coast of Mexico.

During winter, the EPH weakens and shifts to the south, thereby allowing polar storm systems to pass through the region. The storms are characterized by strong, shifting winds and occasionally heavy precipitation. Winter storms are followed by low pressure troughs that are characterized by clear skies, cool temperatures, and gusty west to north winds as the systems move eastward. Simultaneously with the EPH, a thermal low persists in the interior desert region of southern California which results in a westerly, onshore flow of air for most of the year. Easterly winds are due to nocturnal and wintertime land breezes; daytime heating reverses the flow back onshore. During the fall and winter, the EPH often combines with high pressure over the continent resulting in extended periods of light winds and inversion conditions. Excessive buildup of high pressure can produce "Santa Ana" conditions characterized by warm, dry, northeasterly winds.

The average high and low temperatures, recorded from the Long Beach Airport, are 83°F and 63°F in July and 66°F and 44°F in January (LA/LB Harbor Departments and U.S. ACOE 1990).

2.3 GEOLOGY

Fill material used to reclaim land represents a significant unit which overlays the stratigraphic column in the Long Beach Harbor area. Very little native material, whether subtidal or terrestrial, is exposed because of extensively using nonnative materials as fill material.

The West Basin is located in the northern portion of the Peninsular Range Geomorphic Province which is dominated by northwest trending geologic structures. The dominant structural feature in the Long Beach area is the Newport-Inglewood Structural Zone (NISZ). Data indicate that geologic structures associated with the NISZ have a tendency to act both as groundwater barriers and structural oil traps.

R0062411

The influence of the NISZ is locally expressed at the surface by the presence of a chain of elongated low hills and fault scarps caused by northwest-trending, left-stepping, en-echelon faulting (Randell et al. 1983). Some of the smaller northwest-trending faults are believed to pass through the eastern portion of the NAVSTA.

2.4 OCEANOGRAPHY

Understanding the physical processes (e.g., currents, tides, and waves), chemical characteristics (e.g., naturally occurring chemical constituents in water and sediment), biological habitats, and indigenous organisms allows for a comprehension of the specific oceanographic characteristics of the West Basin. Physical characteristics, such as transparency and temperature, may reflect overall water quality. Currents, tides, and waves are responsible for water circulation patterns, which in turn affect the concentration and distribution of chemical compounds within West Basin. Water chemistry, including dissolved oxygen, pH, salinity, metals and organic compound concentrations, is also an indication of overall water quality and is closely related to biological activity. Important marine biological components of West Basin include plankton, plant life, benthic invertebrates, fish, and marine birds.

The West Basin is located in the San Pedro Bay region of the Southern California Bight. This region, which lies southeast of Santa Monica Bay, is defined oceanographically as the submarine shelf bounded by the Palos Verdes peninsula to the north, the Newport Submarine Canyon to the south, and the mainland shelf break extending 18 miles seaward (south) of Long Beach. The Bight itself is a 100,000 square mile submerged continental borderland of the Pacific Ocean bounded on the north, east and southeast by a large mountainous reach of the North American coastline. The Bight extends from Point Conception, California, south 575 km (360 miles) to Cabo Colnett, Baja California, Mexico (Dailey et al. 1993). The west is bounded by the inner border of the southward-flowing California Current and by the outer edge of the continental shelf. The prominent distinguishing feature of the Bight is the eastward indentation of the coastline that allows for a northward flowing return eddy, the Southern California Countercurrent. As a result of its unique circulation patterns and complex bathymetry, the Bight acts as a trap for warm, equatorial water, a reservoir for chemical components entering from the land, air and sea, that together form an enclave of region-specific populations of marine life.

2.4.1 Physical Oceanography

Very few physical oceanographic surveys of the West Basin area have been conducted. Of these, the principal ones have been conducted by the U.S. ACOE's Waterways Experiment Station (McAnally, Jr. 1975; Seabergh and Outlaw 1984; Sargent 1989; Vemulakonda, Chou, and Hall 1991). In general, these studies found that water circulation in the West Basin is restricted due to: 1) the relative absence of sedimentation from riverine inputs due in part to low rainfall levels, and, 2) seawalls, breakwaters, and other obstructions which impede circulation.

VOL 18
0477
R0062412

Depths within the West Basin range from 9 meters close to the shore to 21 meters at the entrance to West Basin. This entrance also acts as a turning basin for Navy and POLB ships. Water depths at the piers within West Basin average about 14 meters, except at Pier 9, where the water depth averages 11 meters. Figure 2-1 shows bathymetric contours in the West Basin.

Tidal currents create water circulation patterns. Rising tides, which vary with the phase of the moon, enter Long Beach Harbor and flow up the various channels and basins; flows reverse during falling tides. Little circulation occurs in the West Basin; its configuration and location results in less mixing of water than in the outer harbor. The tidal range is greatest during spring tides, (i.e., during new and full moons) resulting in the strongest currents. Tidal range is least during neap tides (i.e., during first and third quarter moons) resulting in the weakest currents. The mean ebb and flood flow volume during one tidal cycle for the West Basin is estimated at 277 x 10^6 ft^3 (LA/LB Harbor Departments and U.S. ACOE 1990).

Sediments within most of the West Basin are subject to disturbance by vessel operations (JEG 1993a). The net effect appears to be transport out of the West Basin, although sediments disturbed by vessels turning at the entrance to the West Basin may produce inward transport from that location. Properties influencing the movement of sediment particles are size, shape, and composition.

The temperature within the West Basin water column varies by season. It is cooler in the winter and warms up during the spring and summer. In addition to climatic conditions, water temperature of the West Basin reflects the proximity of open ocean, port facilities, and surface water discharges. Temperatures measured in the West Basin during June 1988 (POLB 1988) indicate a water surface temperature of 16.3°C and a 20-foot depth temperature of 14.0°C. Mean water temperatures, as measured by the POLB at two stations within West Basin between 1971 and 1991, were 17.6°C at the surface and 16.6°C at a 20-foot depth (JEG 1993a).

Water transparency, a measure of vertical visibility in depth below surface, is affected by suspended materials from runoff, dredging activities, and shipping operations. It is also affected seasonally by plankton blooms. As a representative data point for the West Basin, transparency was measured to be 12 feet during June 1988 (POLB 1988). As recorded monthly by POLB between 1971 and 1991 in West Basin mean transparency, was measured at 12.2 feet (JEG 1993a).

Southern California coastal tides are semidiurnal, with two low and two high tides of unequal height every 25 hours. The mean tidal maximum velocity is about 0.6 ft/s (LA/LB Harbor Departments and U.S. ACOE 1990). Minimal velocities, representative of limited circulation patterns of up to 0.46 ft/s, occur in the inner areas of Long Beach Harbor. Waves and swells in the Long Beach Harbor are small due to abundant seawalls and breakwaters throughout the harbor complex, with wave periods of 1 to 3 seconds and swell periods of 10 to 20 seconds. Seiche waves occur in the Long Beach Harbor with periods of 30 seconds to greater than 1 hour. Regular seiching is estimated to occur at

VOL 18
0478
R0062413

intervals of 1.25 hours and equals 5 percent of the total tidal exchange (LA/LB Harbor Departments and U.S. ACOE 1990).

2.4.2 Chemical Oceanography

Aspects of chemical oceanography considered in this section include: DO, pH, salinity, nutrients, and metals. These measurements provide background levels with which to compare potentially adverse effects caused by discharges to the West Basin.

DO levels vary by area, water depth, and season. Low levels of DO may occur due to a number of factors, including eutrophication (e.g., localized phytoplankton blooms) as a result of various types of discharge. In June 1988, the DO concentration of West Basin surface waters was found to be 9.3 mg/L and 7.0 mg/L at 20 feet below surface (POLB 1988). Mean DO levels within West Basin, as recorded monthly between 1971 and 1991 by POLB, have been reported as 8.4 mg/L at the surface and 8.1 mg/L at 20 feet. These DO levels are above the 5 mg/L level recommended for marine environments to maintain a healty aquatic habitat (U.S. EPA 1986).

The pH of Long Beach Harbor waters ranges from 7.0 to 8.7 (LA/LB Harbor Departments and U.S. ACOE 1990). Higher values occur at the surface during warm weather periods and lower readings are found in deeper, cooler water. The measured pH levels in the Long Beach Harbor are within the pH range of 6.5 and 8.5 necessary in marine waters to maintain a healthy aquatic habitat (U.S. EPA 1986).

Salinity in harbors is influenced by the influx of ocean water, evaporation, precipitation, freshwater runoff, and wastewater discharges. The salinity of Long Beach Harbor waters ranges from 10.0 to 34.2 parts per thousand (ppt) (LA/LB Harbor Departments and U.S. ACOE 1990). Mean salinity of the inner harbors of Los Angeles and Long Beach has been reported as 33.5 ppt (Allan Hancock Foundation 1975), which is similar to the salinity of open ocean water. This is reflective of relatively little freshwater input into the receiving waters of LA/LB Harbor.

Nutrient levels are highly variable in harbor waters due to varying types of discharges and climatic conditions. Nutrient concentrations tend to increase dramatically during periods of heavy rainfall, and may provide a nutrient base for localized algal blooms. This phenomenon, in turn, may lead to eutrophication and severe pollution episodes. During a survey of nutrient concentrations conducted in 1978, concentrations in Long Beach Harbor ranged from 0.12 to 120 mg/L for ammonia, up to 5.4 mg/L for nitrite, up to 83 mg/L for nitrate, and 0.17 to 12 mg/L for phosphate (LA/LB Harbor Departments and U.S. ACOE 1990). Some of these concentrations could be problematic if sustained over a period of time, but no time-series measurements of nutrients in water are known to have been made in the LA/LB Harbor Complex.

Concentrations of U.S. EPA priority pollutant metals have been measured in the past in association with different surveys, including the receiving waters of eastern Long Beach Harbor in support of the Pier J expansion project (LA/LB Harbor Departments and U.S. ACOE 1990). These measurements provide a backdrop for more current water column

VOL 18
0479
R0062414

measurements, should such measurements be taken at a later date. Values ranged from 1.9 to 16 µg/L for chromium, 8.7 to 14 µg/L for copper, 0.21 to 0.26 µg/L for lead, up to 0.4 µg/L for nickel, up to 0.7 µg/L for silver, and 6.2 to 9.6 µg/L for zinc. Some of these metals concentrations, especially copper, exceed federal ambient water quality criteria (2.9 µg/L for copper). Without time-series measurements, however, it is difficult to determine changes in such concentrations over time.

2.4.3 Biological Oceanography

The Long Beach Harbor area contains a variety of marine habitats and marine life. The various marine habitats may be subdivided into hard substrate, soft bottom, water column and specially designated habitats. Hard substrate habitat is abundant due to riprap (boulders, concrete rubble), walls, and wood and cement pilings. These different habitats support diverse types of biota, which are dominated by invertebrates. Barnacles, mussels, echinoderms and seaweed dominate hard-substrate habitat in the Southern California Bight, while polychaetes, amphipods, and other burrowing infaunal invertebrates dominate sandy or soft bottom substrates. The water column generally is inhabited by fish and various plankton species. A variety of bird species also inhabit the West Basin area, the most common of which include Hermann's gull (*Larus hermanni*), California brown pelican (*Pelicanus occidentalis californicus*), and Western gull (*Larus occidentalis*).

The West Basin and the outer areas of LA/LB Harbor are characterized as soft bottom and open water greater than 9 meters (30 feet) deep. The outer Mole may generally be characterized as rocky shoreline with some soft bottom. Kelp beds associated with hard substrate habitats constitute nursery habitats for fish such as blacksmith (*Chromis punctipinnis*), kelp bass (*Paralabrax clathratus*), barred sand bass (*Paralabrax nebulifer*), senorita (*Oxyjulius californica*), and surfperches (*Embiotocidae*).

The soft bottom habitat supports organisms that burrow into sediment (infauna), such as worms, and those that inhabit on the surface of the harbor floor (epifauna), such as starfish and sea urchins. Diverse benthic species typical of other southern California bays and harbors exist in the Long Beach Harbor. Annelid worms dominate the soft bottom habitat with other abundant phyla, including molluscs, arthropods, and echinoderms. The inner harbors of LA/LB generally have a reduced number of taxa, higher densities, and more stress-tolerant species than the outer harbor areas. The inner Los Angeles Harbor benthic organism densities average 75 g/m^2 wet weight (LA/LB Harbor Departments and U.S. ACOE 1990). This may be compared to organism densities in the outer Long Beach Harbor (78 g/m^2), outer Los Angeles Harbor (127 g/m^2), Fish Harbor (35 g/m^2), and outer LA/LB Harbor breakwaters (78 to 197 g/m^2). Annual seasonal infaunal densities are expected due to physical and climatic changes, as well as influences from chemical discharges.

The water column habitat is defined as the area of water from the surface to the harbor bottom. Plankton can be characterized as small floating or weakly swimming organisms. The outer harbor exhibits seasonal phytoplankton patterns with diatoms dominating in the spring and dinoflagellates in the fall. The most dominant phytoplankton species found in

VOL 18
04800
R0062415

Long Beach Harbor include *Chaetoceros sp.*, *Asterionella japonica*, and *Skeletonema costatum*; while red tides are mainly attributed to *Gonyaulax polyhedra*. Dominant zooplankton organisms include copepods and cladocerans (JEG 1993a). The average density of zooplankton in the outer harbor is 3,000 to 4,000 organisms/m^3.

Long Beach Harbor contains a large and diverse population of fish. Both pelagic and demersal fish are well-represented by this population. The dominant fish in terms of both abundance and biomass is the white croaker (*Genyonemus lineatus*). The distribution and abundance of fish varies by season and location within the harbor. Population peaks generally occur in the spring and early summer, while populations tend to decrease in the late summer and fall. A greater diversity of fish species is found in the outer portion of Long Beach Harbor than in the inner and middle areas (JEG 1993a).

The productivity of Long Beach Harbor ichthyofauna is estimated at being 1.7 to 1.9 g/m^2 dry weight of water surface per year. Other in-shore and estuarine habitats yield one-fifth to one-half the productivity of Long Beach Harbor. Long Beach Harbor is a nursery for all species of fish that reside there as adults (MEC 1988a), as all fish collected as adults have also been collected as larvae.

The Harbor habitat is used by both marine and land birds, especially migratory and wintering water birds. The greatest abundance of birds occurs between September and March. MBC Applied Environmental Sciences documented 85 species of birds (67 water- and 18 land-associated) during a 1983 -1984 Long Beach Harbor biological survey (MBC 1984). The most abundant bird species were Hennann's gull, California brown pelican, western gull, surf scoter, Brandt's and double-crested cormorants, ring-billed gull, black-bellied plover, and western grebe. This high diversity is due to a variety of habitat and food resources within Long Beach Harbor.

A few of the bird species known to reside in or that frequent the LA/LB Harbor area are endangered. The California least tern (*Sterna antillarum browni*) is on the federal endangered species list. It migrates from Mexico to southern and central California in the spring (early April) to breed and migrates again in August. Least tern's migration is linked to onshore movement of the Northern anchovy, topsmelt, and jacksmelt. It nests in coastal areas adjacent to shallow marine and estuarine habitats. California least tern nests have been reported to exist on Terminal Island, and they are known to forage in Long Beach Harbor (LA/LB Harbor Departments and U.S. ACOE 1990).

The California brown pelican is on both the state and federal endangered species lists. It forages along the California coast year-round. The highest densities of the pelican occur in the LA/LB Harbor area from early July through early November (LA/LB Harbor Departments and U.S. ACOE 1990). The American peregrine falcon (*Falco peregrinus*) is a state and federal endangered species. Long Beach Harbor is also part of their habitat range, but they are rarely sighted (LA/LB Harbor Departments and U.S. ACOE 1990).

The Western snowy plover (*Charadrius alexandrinus nivosus*) is a candidate species for the federal threatened or endangered list. It resides on coastal sandy beaches and shores of salt ponds and alkaline lakes. It feeds at the water's edge or among scattered debris on

VOL 18
0481
R0062416

sandy beaches, but sightings of this bird near Long Beach Harbor are sporadic and infrequent (LA/LB Harbor Departments and U.S. ACOE 1990). The long-billed curlew (*Numenius americanus*) is a candidate species for the federal threatened or endangered list also which, during migration and in the winter, can be found near marshes, mudflats, sand bars, and shorelines. It is an infrequent transient to the Long Beach Harbor area (LA/LB Harbor Departments and U.S. ACOE 1990).

2.5 SEDIMENTOLOGY

The redistribution of bottom sediments requires the initial mobilization of sediment, which may be caused by a number of factors such as resuspension caused by propellor action and subsequent transport by currents. The intensity of currents required to initiate sediment motion is far greater than that required for subsequent transport. For the West Basin, the overall circulation (i.e., persistent currents) in the area is not strong enough to mobilize sediment. However, there are other mechanisms that can mobilize the bottom sediments and make them available for transport by relatively weak currents (JEG 1993a).

Vessel operations and dredging activities form the major mechanisms for suspension or resuspension of harbor sediments. The induced turbulence from ship propellers are capable of mobilizing bottom sediments. The maneuvering of large cargo ships at the entrance of the West Basin by vessels entering or leaving POLB may result in disturbance of these sediments by the ships' propellers. Construction and dredging activities are relatively localized and of short duration. Once sediments are mobilized and suspended in the water column, currents caused by tides and wind are potentially capable of transporting the sediments. The suspended sediments susceptible to such transport generally consist of silts and fine sands (JEG 1993a).

Sediment particle size is a characteristic that determines the extent of sediment dispersion throughout the West Basin as a result of ship propeller disturbance, storm events, tides and currents, and other phenomena. Particle size characteristics throughout the West Basin have been observed to be highly variable, ranging from depositional areas characterized by fine particulates to coarse sands in open areas, especially where maintenance dredging is conducted. Part of this sediment may have as its origin the fill materials brought in during the 1930s and 1940s to construct the Mole and other portions of the LBNC.

The areas beneath the piers of the West Basin represent the most significant depositional areas within the harbor, with accumulated shell hash observed due to concentrated mussel populations colonizing pier pilings. These depositional areas are characterized by fine surface particles, the presence of shell hash, and a strong odor probably caused by anaerobic degradation of organic matter. In general, sediments have been described as dark, wet, micaceous silt with some sand, gravel, and shell fragments (JEG 1993a).

SECTION 3

SOURCE IDENTIFICATION

0483

VOL 18
04884

Section 3
SOURCE IDENTIFICATION

Source identification is a major element of the RI as it attempts to identify sources of discharge with respect to areas of contamination within the West Basin. Source identification includes points of origin, facility operations, discharge generators, and locations of discharge points within the receiving waters of the West Basin. This information is utilized to further delineate the nature and extent of contamination because it specifically relates to the sources of such potential contaminants.

References investigated to identify potential contamination sources to the West Basin included: CLEAN I RI/FS Work Plan (JEG 1993a), RCRA Facility Assessment (DHS 1989), Site Investigation (JEG 1992a and 1992b), Initial Assessment Study (NEESA 1983), Stormwater Pollution Prevention Plan (Brown and Caldwell 1992b), Stormwater Discharge Management Plan (WWC 1993), Historical and Recent Water Quality Conditions in the Port of Long Beach (MBC 1992), and various other historical documents and navy personnel interviews. The types of data collected and which formed the basis of source identification for West Basin included:

- LBNC operations, land-based or ship-based, that identified the source location, potential releases, and engineering characteristics that could be important in the evaluation of remedial actions;
- records relating to waste characteristics, to the extent possible, such as the types and quantities of contaminants that may be contained in or released to the harbor;
- water quality conditions in the LA/LB Harbor areas with respect to the various industries operating in the area; and,
- the physical or chemical characteristics of hazardous wastes present at these sources.

3.1 DISCHARGES TO THE LA/LB HARBOR AREAS

Southern California's large, diverse urban population has facilitated input of many types of contaminants into the waters of the Southern California Bight. Contaminant inputs have resulted through spills, sewage discharges, power plant cooling water discharges, various industrial discharges, atmospheric deposition, and runoff from flood control channels. Historically, sewage outfalls have been considered the principal sources of contaminants to the Bight due to limited levels of required treatment of effluent. Inputs from sewage discharges have significantly decreased over the past two decades, however, as a result of enforcement of the 1972 Clean Water Act and its statewide counterpart, the Porter-Cologne Act by the California State Water Resources Control Board (SWRCB) and the U.S. EPA Region IX. This enforcement has resulted in much greater regulation of effluent discharge into the receiving waters of the Bight. Consequently, sources such as dredge material disposal, atmospheric deposition, and surface runoff have surpassed those of sewage outfalls, and are currently considered of greater importance to Bight water quality (Mearns et al. 1991).

Various industries present in areas surrounding the LBNC are capable of adversely affecting the water quality as well as the biological community of the LA/LB Harbor.

R0062419

VOL 18

04885

These include point sources such as the Terminal Island Treatment Plant (TITP), the Long Beach Generating Station, petroleum refineries, and manufacturing plants that may affect the LA/LB Harbor area. Nonpoint sources would include aerial fallout, advective transport, ocean dumping, and boating and shipping activities. Specifically, the following sources which could potentially impact the LA/LB Harbor waters were identified:

- surface runoff from piers and docks;
- surface runoff from storm drains that drain the Los Angeles basin; drainage channels of the Los Angeles and San Gabriel rivers and the Dominguez Channel;
- industrial wastes that have been discharged into San Pedro Bay; and
- ballast water and other contaminants that may be introduced into the LA/LB Harbor by marine traffic (recreational, commercial, and naval) operating in the LA/LB Harbors (MBC 1992).

Bioassay tests of TITP effluent conducted in the early 1980s indicate no evidence of toxicity or bioaccumulation. No adverse effects to the biological community in the LA/LB Harbor receiving waters, due to potential contaminants in the effluent, have been found. Monitoring surveys, conducted and reported since 1979 under the National Pollutant Discharge Elimination System (NPDES) program, do not indicate adverse impacts to the receiving water or associated biota as a result of cooling water being discharged by the Long Beach Generating Station (MBC 1992).

Various types of dredging equipment are used to remove sediment for routine maintenance. The type of dredging equipment used would affect the amount of resuspension of sediments. The extent of sediment resuspension associated with dredging activities is of concern in areas where sediments have been contaminated with chemicals. Resuspended sediments are capable of migrating due to water currents. This effect is of particular concern when contaminated sediment is being dredged.

Dredging operations are frequently associated with increases in turbidity, resuspension, and migration of contaminated sediment, and decreases in dissolved oxygen. Contaminated sediments mobilized during dredging activities are capable of migrating and settling in unimpacted areas. In addition, resuspension of such sediment could affect the water column when the contaminants desorb from sediment particles (U.S. ACOE 1983).

Dredging activities in the LA/LB Harbor are conducted in accordance with monitoring requirements dictated by the particular dredging permit. During dredging activities, water column samples are collected and analyzed for various chemicals in accordance with U.S. EPA, U.S. ACOE, and the Regional Water Quality Control Board (RWQCB) requirements. The appropriate regulatory agency is notified if specific chemical concentrations exceed the permit requirements (RWQCB - Los Angeles Region, [LARWQCB] 1994).

As a result of such monitoring, it is not expected that significant quantities of sediments become resuspended and mobilized during dredging activities since additional attention is given to using equipment and methods which collectively act to minimize resuspension

R0062420

Dredging of contaminated sediment is, therefore, not expected to significantly affect the water column and thereby contaminate other portions of West Basin, or the LA/LB Harbor.

3.2 DISCHARGES TO THE WEST BASIN

Primary sources of contamination in the West Basin were found to occur from numerous land- and ship-based activities, such as lead caulking, painting or paint removal, boiler cleaning, and pipe-flushing operations (JEG 1992b and 1993a). Stormwater discharge and flushing of dry docks represent past primary release mechanisms and sources of chemicals of potential concern in West Basin sediments.

As a result of disposal and accidental releases of hazardous substances used in support of the LBNC operations (Figure 3-1), some areas of the West Basin may have been contaminated from approximately the mid-1930s to 1980. Hazardous substances have, in the past, been discharged to the harbor via the outfalls of the storm drain system. These past practices, together with leaks and spills, may have resulted in some areas of contamination that may potentially pose some level of risk to human health or the environment (WESTDIV 1991a).

Most of the sources of contamination entering the West Basin are historical, whereas currently identifiable sources are generally under permit. Pollution control measures during the past years, including the California Porter-Cologne Act and federal Clean Water Act, have been enacted to reduce or eliminate new contaminant sources into the marine environment.

The identified sources of contamination, discussed within this section, are presented according to the following general categories:

- land-based discharges,
- ship-related discharges,
- accidental spills, and
- dredging activities.

3.2.1 Land-Based Discharges

Land-based discharges are identified as the stormwater drainage system and the sewer system. Both point and non-point sources are included in land-based sources. This investigation included long-term and short-term sources, as well as historical and current sources, as discussed below.

3.2.1.1 POINT SOURCES

The single largest source of wastes discharged to the West Basin was from the blowdown and flushing of utility shop boilers, water softeners, and cooling systems. The majority of contaminants in these waste streams, which are expected to have contained disinfectants

VOL 18
04886
R0062421

(e.g., chlorine) to prevent algal growth, are easily dispersed, soluble in water, and considered nonhazardous at low concentrations (WESTDIV 1991b).

According to an Environmental Engineering Survey conducted in 1976 at the NAVSTA, untreated sanitary and industrial wastewaters from the Mole were disposed into the West Basin at that time under a U.S. EPA permit, or into the ground by means of septic tanks and leach fields. Wastewater discharges into the West Basin were discontinued when facilities were constructed in late 1976 to collect and transport sanitary, industrial, and shipboard wastewater from the Mole and the piers northerly for disposal through the pumping facilities located on the mainland. These Navy construction projects (P-122 - Mole Sewer and P-131 - Ship Wastewater Collection Ashore, Piers 9, 11, and 15) extended the sewage collection system to include the Mole and adjoining piers (WESTDIV 1991b).

On 31 December 1973, and in accordance with provisions of the Water Pollution Control Act, the DON was granted a conditional permit (CA 0002356) by the U.S. EPA, authorizing temporary discharge of untreated sewage from 12 individual installations located at the LBNC and the Mole to the waters of the United States at the Long Beach Harbor. Based on the permit conditions, the cessation of all untreated sewage discharge into Long Beach Harbor was required by 30 September 1975. Elimination of discharge from locations associated with the Mole was delayed due to the construction of the sewer improvements on the Mole.

During the early 1970s, after passage and implementation of the Federal Water Pollution Control Act, the DON began connecting some industrial discharges to the sanitary sewer system. By 1975, all industrial discharge outfalls to the West Basin were connected to sanitary sewer lines, thus reducing or eliminating the discharge of industrial waste to the West Basin. The NPDES program, administered through the LARWQCB, manages the discharge of stormwater related to the industrial activity at the LBNC. Direct ocean discharges have been regulated since July 1977 under NPDES Permit No. CA0003786. This permit limits both the total discharge flow and concentrations of specified pollutants carried in effluent streams.

The LBNSY has reduced its discharge from a maximum of 8.0 million gallons per day (mgd) to a maximum of 6.2 mgd by eliminating some discharges. As a result, eight outfalls have been eliminated, and one outfall has been re-routed. As of July 1993, only seven outfalls into the harbor remain. The LBNSY NPDES permit, dated 19 July 1993, specifies that up to 6.2 mgd of wastes, associated with the operation of three dry docks for ship repair and refitting, can be discharged into the West Basin. The discharged wastes consist of single-pass, noncontact cooling seawater from air compressors, single-pass cooling water from docked ships, groundwater and seawater seepage from hydrostatic pressure relief wells, and caisson seawater leakage from dry docks. The seawater used for cooling is drawn from the shipyard's fire protection system which contains zinc plumbing fixtures for corrosion prevention (LARWQCB 1993).

VOL 18
0481
R0062422

3.2.1.2 NON-POINT SOURCES

From the early 1940s until the mid-1970s, unregulated drainage from the various industrial areas and from cleaning and process tanks were discharged to the West Basin, directly through the stormwater system and from flushing of the dry docks. As of 1987, there were 16 stormwater outfalls from the LBNC discharging directly into the West Basin. Historically, these 16 outfalls released wastes, such as unknown quantities of PCBs, acid, solvents, oil and grease, from various industrial areas directly into West Basin. Solvents, such as 1,3-dichlorobenzene used as a cleaning agent for ordnance on ships, may have been inadvertently discharged from ships docked at the LBNC into the harbor.

Much of the waste discharged from these stormwater system outfalls may have sorbed onto the harbor sediments and settled to the harbor bottom. About 350,000 gallons annually (from 1963 through 1978) of sodium nitrite, hydrazine, solvents, and other chemicals were discharged to the stormwater system. Prior to 1960, about 300 to 400 gallons of rust preventative and up to 60 gallons of red lead caulking material from dry dock operations were discharged into the harbor (JEG 1992b).

In 1992, a stormwater discharge survey was conducted for the LBNSY to identify illicit connections and discharges to the stormwater drainage system. Sixty-two illicit surface and subsurface discharge connections were identified at the LBNSY. The majority of these discharges are aboveground and often involve steam condensate from leaking plumbing, or inappropriate releases to the ground surface. All subsurface discharges were reportedly of a steam/water nature, and did not appear to be potentially significant in terms of introducing pollutants to stormwater runoff (Brown and Caldwell 1992a). Some of these illicit discharges are related to Dry Dock No. 1 operations (SWDIV 1992a).

Other nonstorm water discharges to the storm water drainage system include vehicle washing, direct discharge of bulk water to the storm drain system, cooling water discharges to the ground surface, and equipment washing near a storm drain inlet (SWDIV 1992a).

LBNC is founded on soils which are mainly fill material deposited after 1938. Soils and groundwater characterization of the LBNC was conducted as part of the RIs conducted for NAVSTA and LBNSY. In general, groundwater at NAVSTA reportedly does not contain high levels of contamination, based on analysis of groundwater samples collected from the monitoring wells installed along the periphery of the West Basin. Groundwater flow direction at the LBNSY was reported to be in a northeasterly direction, away from the West Basin. It can be inferred from this information that contaminants entering the groundwater regime beneath LBNSY would tend to move in a direction away from the West Basin. On the basis of these observations, it is not anticipated that groundwater along the periphery of the West Basin would have a significant impact on the harbor bottom sediments.

VOL 18
0488
R0062423

3.2.2 Ship-Related Discharges

Ship-related sources are identified as resulting from dry dock operations and ship-related activities conducted at the piers, including welding, painting, loading, and other operations. The sources reviewed included long-term and short-term sources, as well as historical and current sources, as discussed in the following paragraphs.

3.2.2.1 DRY DOCK OPERATIONS

Drydocking operations are conducted at LBNSY as part of the routine and emergency operations on naval vessels. These operations involve the flooding and dewatering of the dry dock to perform maintenance below the water line of ships. The dock is opened to the West Basin by removing the caisson between the dock and the West Basin. After the docking operations are complete, the caisson is put back into place, and the water in the dock is pumped out (SWDIV 1992b).

The dry docks at the LBNSY are potentially major long-term sources of chemical contamination. The dry docks are used to repair and paint vessels. Paint chip fragments, as well as chemicals and solvents used in the maintenance and decommissioning of vessels, may have a direct path to West Basin sediments as the water level in the dry docks are lowered and raised during its operation. Chemical products used at the dry docks, including a wide range of organic compounds and metals, may potentially be evident in the sediments found near these areas. Discussions with shipyard personnel indicate that sediments in the vicinity of the dry docks and several of the piers are believed to contain elevated chemical concentrations due to historical shipyard activities.

Before 1975, discharges to the West Basin included hydrostatic leakage, cooling tower blowdowns, sanitary wastewater, and industrial waste associated with maintenance of vessels. Hydrostatic leakage is infiltration of water through dry dock walls and floor; this water drains to a sump and is discharged to the local receiving water. Hose-down and general cleanup of the dry dock floor results in significant amounts of wastewater. Analyses conducted in 1975 on the hydrostatic leakage, hose-downs, and cleaning of the dry docks indicate high concentrations of copper and zinc. Concentrations of copper and zinc could indicate leaching from the copper slag sandblast and zinc-containing paint residue. Samples from various locations on Dry Dock Nos. 1, 2, and 3 taken in 1975 also indicate concentrations of biochemical oxygen demand (BOD), total suspended solids, settleable solids, oil and grease, and fecal coliform, possibly indicating discharge of sanitary wastes onto the dry dock floor (Chan and Saam 1975).

Studies conducted by the naval environmental support office confirm that significant amounts of zinc and copper leach from the sandblast residue in contact with seawater. Two possible sources for the sandblast residue are the paint chips from sandblasting operation and the sandblast material itself. The volume of water in contact with the sandblast residue appears to have little effect on leaching rate. Heavy metals are more readily leached out in seawater than in freshwater. Relatively high concentrations occur when small amounts of seawater are exposed to residue (Chan and Saam 1975).

3.2.2.2 PIER ACTIVITIES

Historically, ship-based sources are attributed to maintenance and repair operations while docked at various piers at the LBNC. According to information provided by representatives of NAVSTA, current industrial activities conducted onboard U.S. Naval vessels (with exception of repair ships or tenders) are limited to minor repairs of ship facilities. Typical activities conducted on the ships include chipping and painting, valve maintenance, electrical motor repair, pipe and pump repair, and welding. Waste generated during the repair activities primarily consists of bilge water which is removed from ships by barge or waste oil raft for appropriate treatment or recycling (WESTDIV 1991b).

Current maintenance and repair operations conducted on ships home-ported at LBNC require that all industrial wastewater generated onboard be transferred from the ship's holding and collection tanks to the pier through a flexible hose to a pier rise, where it flows into the sanitary sewer collection system. A 1991 industrial wastewater discharge report prepared by SCS Engineers found that the wastewater generated from ships contained elevated concentrations of total metals, copper, zinc, and dissolved sulfide. These concentrations, however, fall below the City of Los Angeles Bureau of Sanitation specific limitations for discharges to Publicly-Owned Treatment Works (POTWs). It has been suggested that the source of elevated concentrations of copper and zinc in ship wastewater may be from natural deterioration of shipboard piping or seawater carrying elevated concentrations of copper and zinc which is introduced into the ship's wastewater stream through flushing (toilet) water (WESTDIV 1991b).

When a ship arrives in port, the oily waste holding tank, the contaminated oil storage tank, the waste oil tank, and the ship's bilges typically contain substantial volumes of waste oil and oily waste. Upon berthing, these tanks are off-loaded, usually within the first 24 hours in port. During the period of time the vessel remains docked, oily wastes continue to be produced from daily ship operations. Leaky seals, accidental oil spills, and ship washdown waters all eventually drain to the bilge. The bilges are pumped out daily. Before July 1991, the oily wastes and the bilge water were pumped directly into a "donut" (oil disposal raft) on a daily basis (WESTDIV 1984). After July 1991, the use of donuts was eliminated, and the oily wastes and bilge water were removed by submersible or diaphragm pump through a piping system which transferred the wastes to a holding facility, which in turn tests the quality of the liquid wastes for disposal.

Two types of donuts, with open and closed bottoms, were used at the LBNSY. The open-bottom donut was a 4.5-meters (15-foot) deep oval-shaped steel raft that floated, and it was open to the West Basin waters through 46-cm (18-inch) diameter holes in its bottom plates. As the oily waste was discharged into the open-bottom donut, it mixed with seawater partially filling the donut. The oil separated from the waste water and floated to the top while the water, containing emulsified and dissolved oily wastes, escaped through the bottom of the donut Closed-bottom donuts generally operated on the same principle as open-bottom donuts However, water was accumulated inside the donut and discharged through a collector pipe extending to the bottom of the donut, whereas oily waste floating on top of the water was discharged through separate piping.

VOL 18
0490
R0062425

Once the donut was filled, it was towed to Pier 6 where an oil barge was permanently moored. The oily waste in the donut was then pumped into an oil/water separator, with the oil being discharged to an oil storage compartment on the barge and, the water separated from the oily waste being discharged to another donut and ultimately to the West Basin. The use of the donuts, whether open- or closed-bottom, may have been a pathway of hydrocarbons and soluble chemicals into the West Basin sediments, via West Basin waters.

Another type of waste that is generated by ships and that may have been historically discharged into the harbor is boiler cleaning and tank cleaning waste. When a ship comes into port for servicing, repair, or overhaul, its tanks and boilers are drained, repaired and cleaned prior to the ship leaving the harbor. This type of waste is normally generated shoreside by an outside contractor who is responsible for the removal of the waste from the LBNSY. When the boilers of the ships are heavily scaled after returning to the LBNSY, highly acidic solutions are used to remove the scale (WESTDIV 1984).

3.2.3 Accidental Spills

The piers at the NAVSTA and LBNSY are used primarily for ship moorage and less intensive repair and fabrication. Based on the various types of activities conducted on the piers, incidental spills, such as fuel spills, may have occurred over the years. Based on the review of documents listed in the reference section, no reports of major accidental spills in the West Basin were found.

3.2.4 Dredging Activities

Since 1979, the West Basin has been dredged every 2 to 3 years, and fairly regularly prior to 1979. Sediment samples reportedly have been collected and analyzed for pesticides, heavy metals, organohalides, and bioassay. No record of chemical analysis of West Basin sediment was found during a review of available WESTDIV files, conducted as part of the IR Program. No relevant information was available from the Los Angeles office of the U.S. ACOE (JEG 1992b).

SECTION 4

SUMMARY OF PREVIOUS INVESTIGATIONS

0492

VOL 18

Section 4
SUMMARY OF PREVIOUS INVESTIGATIONS

This section provides a summary of previous investigations conducted either within the West Basin specifically or the LA/LB Harbor area and coastal southern California in general. First, scientific surveys are reviewed and summarized to define chemical and biological regional ambient conditions. The ambient conditions provide a basis for comparison and interpretation of the results of this investigation. Secondly, previous dredging investigations are reviewed to provide support for the ensuing Feasibility Study.

4.1 SCIENTIFIC SURVEYS AND RESULTS

This section presents an overview of some of the key scientific investigations, emphasizing physicochemical or biological characterization, conducted specifically within the West Basin or, where available, those conducted within the LA/LB Harbor area and the southern California Bight. Areas within the southern California Bight, outside the LA/LB Harbor area, are appropriately comparable to West Basin, especially those areas with similar land/water use and contaminant sources/inputs, (e.g., San Diego Bay). The Bight's unique geography and hydrography results in a regionally specific marine ecosystem that extends from Point Conception, Santa Barbara County, California to Cabo Colnett, Baja California, Mexico.

Regional ambient (background) conditions are discussed in this section. The discussion is focused, as is the overall RI, upon data from sediment and biological tissue and provides an understanding of environmental conditions:

- prevailing in the surrounding area at the present time, and
- as they have changed relative to past years.

Dailey et al. (1993) report that the LA/LB Harbor area may have been studied and characterized more thoroughly and for a longer time than any other similar body of water in the world. The first comprehensive survey of environmental conditions in the LA/LB Harbor area was performed in 1951 (Anon 1952) and included analyses of water, sediment, and benthic populations. A more detailed seasonal study was conducted in 1954 (Reish 1959) using bottom conditions, species composition, and water characteristics as a basis for documenting environmental quality at the time. This survey distinguished "polluted" zones and "very polluted" zones through identification of specific benthic organisms inhabiting the bottom. Generally, the most "polluted" zones occurred in the slips within the NAVSTA as well as other locations within the LA/LB Harbor area.

Various pollution abatement programs were initiated by the state of California, beginning in Dominguez Channel in 1968, which extended throughout the LA/LB Harbor area during the 1970s. Complying with these orders, the improvement in biological conditions was immediate (Dailey et al. 1993). One factor contributing to the recovery was that many of the local species have extended reproductive periods throughout the year as a result of the mild climate, and such reproductive capability undoubtedly played an important role in the rapid recovery of the polluted harbor. Benthic species which were

0493

R0062428

formerly dominant and known to be resistant to pollution gave way to more sensitive species; species diversity increased dramatically as well during this time. This improvement has been documented by a series of publications edited by Soule and Oguri (Soule and Oguri 1974; 1975; 1976; 1978a, 1978b; 1979; 1980; 1986; 1987; 1990). Improvements in biological conditions were accompanied by decreases in chemical and total organic carbon concentrations in sediment as a result of discontinuing waste discharges into LA/LB Harbor receiving waters and sediment. Investigations conducted between 1973 and 1978 have chronicled changes over time in the LA/LB Harbor, with decreases in cadmium, nickel, lead, and total PCB concentrations. Other contaminants remained about the same, although arsenic concentrations were shown to increase to a small extent.

4.1.1 Physical Oceanographic Surveys

As previously discussed, relatively few investigations of physical oceanography have been conducted within the West Basin and its environs. The most extensive investigation of LA/LB Harbor hydrodynamics has been conducted by the U.S. ACOE. This investigation involved the use of a two-dimensional, depth-averaged, second order finite-difference model to determine tidal circulation patterns for spring, mean, and neap tidal conditions (Seabergh and Outlaw 1984); tidal verification was previously conducted by McAnally Jr. (1975). The fluid flow equations used in the numerical tidal circulation model, the Waterways Experiment Station Implicit Flooding Model (WIFM), were derived from the Navier-Stokes equations. Based on the model verification and simulation, the mean tide within the West Basin was determined to have a maximum range of 5.5 feet, a maximum tidal discharge of 23,333 ft^3/s (flood flow discharge) and 19,444 ft^3/s (ebb flow discharge), an average flow volume of 278 x 10^6 ft^3/tidal cycle and 277 x 10^6 ft^3/tidal cycle (flood and ebb flow, respectively), and a net flood flow volume per tidal cycle of 1 x 10^6 ft^3. The maximum velocity at the entrance to the LA/LB Harbor was estimated at 0.54 ft/s for ebb tide and 0.46 ft/s for flood tide. Velocity magnitudes throughout the LA/LB Harbor Complex in general are small, usually less than 1 ft/s (Seabergh and Outlaw 1984). Circulation patterns within West Basin were identified as clockwise. The small differences in tidal elevations (5.5 feet for West Basin), which normally govern water flow patterns, led Seabergh and Outlaw (1984) to propose other factors (e.g., wind), as having influence on circulation within inner LA/LB Harbor areas such as West Basin. The WIFM predictions were verified using dye tests conducted in the outer LA/LB Harbor Complex (Seabergh and Outlaw 1984).

The U.S. ACOE also investigated harbor oscillations caused by long waves using a finite element numerical model (Sargent 1989) and determined where ship motion problems were most likely to develop. Numerical modeling of tide- and wind-driven circulation of LA/LB Harbor was conducted by applying a three-dimensional, hydrodynamic model called CH3D (Vemulakonda et al. 1991), the results of which were used to drive a water quality model. Flushing rates, water circulation, and DO levels were compared at various stations throughout the LA/LB Harbor. The CH3D model was calibrated and verified using field data collected in 1987 (surface elevation data, current measurements, current

VOL 18
04994
R0062429

velocities, drogue study) (McGehee et al. 1989). Comparison of the CH3D model results with the 1987 observed surface elevation and currents indicated that the model reproduced prototype behavior (i.e., the calibration and verification proved successful [U.S. ACOE 1990]).

Tracer studies of the LA/LB Harbor were conducted by the U.S. ACOE to determine flushing rates of the inner basins. The flushing studies consisted of inserting a tracer and observing its movement and dilution with time. Results of the tracer simulation for West Basin indicated that dilution to 20 percent of the initial tracer concentration was achieved in 16 days (Hall 1990). This moderate level of dilution is suggestive of the flushing rates predicted by the models summarized above. Tracer simulations for the East Basin channel of LA Harbor, which is more restricted by land than West Basin, and Seaplane Anchorage (the area between West Basin of Middle Harbor and Fish Harbor) of LA Harbor, which is less restricted by land than West Basin, were conducted; results revealed 20 percent of initial tracer concentration remained after 25 and 10 days, respectively.

4.1.2 Chemical Surveys

The following section provides an overview of water column chemical surveys and sediment and marine fish tissue contaminant monitoring studies conducted both within and in areas surrounding West Basin.

4.1.2.1 WATER COLUMN SURVEYS

A general summary of what is known of chemical oceanography in West Basin was provided above. This discussion summarized data on DO, pH, salinity, nutrient levels, and trace metals concentrations in surface water sampled from the West Basin during various periods of time. The literature review conducted for water column data indicated that the POLA and POLB, with their corresponding Harbor Departments, have most frequently taken these measurements, although most were taken outside of the immediate West Basin area. It is difficult to apply historical water column data to the understanding of current conditions in the West Basin due to its dynamic state, and the fact that most of the contaminant inputs have changed over time as well.

4.1.2.2 SEDIMENT SURVEYS

In 1973, Chen and Lu (1974) analyzed surface sediment samples for trace metals and organochlorine compounds (DDT, PCBs and dieldrin) within the LA/LB Harbors as part of the Harbors Environmental Projects sponsored by the University of Southern California's Allan Hancock Foundation. More sampling and analysis within the Harbor Complex was conducted for trace metals, DDT, and PCBs in 1974 (Allan Hancock Foundation 1975), and Soule and Oguri (1980) produced analytical data for metals, DDT, and PCBs from the LA/LB Harbor Complex in 1978. The general trend, as documented by the Allan Hancock studies, in chemical concentrations over time is that while arsenic and zinc concentrations seem to be increasing, cadmium, chromium, lead, total PCBs, and

VOL 18

0495

R0062430

total DDT concentrations have actually decreased within the LA/LB Harbor Complex. Copper and mercury levels remained the same throughout the 1970s.

The Southern California Coastal Water Research Project (SCCWRP), a scientific body established to study the effects of pollution in the southern California marine environment, has conducted several major surveys of chemical and biological conditions in reference areas off the coast of southern California in the last 15 years (1977, 1985, and 1990). The objectives of these surveys were to determine distribution of marine pollutants within the Southern California Bight, to evaluate potential biological effects, and to evaluate potential sources of these problems. Sampling stations are located along the 30-, 60-, and 150-meter isobaths of the mainland shelf and bracket the major ocean municipal wastewater discharges (Thompson 1992). As a result of these surveys, SCCWRP has found that trace metal concentrations are at or near background levels and are similar among the different depths sampled. Concentrations of total DDT, as measured in 1990, were highest at the northern 60-meter and 150-meter sites. Total PCB (Aroclor 1254 + Aroclor 1260) concentrations were highest off Point Dume and Dana Point. Total PAH concentrations resulting from the 1990 survey were highest off Oxnard (Thompson 1992).

The State Water Resources Control Board (SWRCB), through its Bay Protection and Toxic Cleanup Program (BPTCP), and National Oceanic and Atmospheric Administration (NOAA) (SWRCB and NOAA 1994) undertook a 3-year cooperative study effort to characterize the magnitude and extent of potential contaminant-induced biological effects in LA/LB Harbor and other areas of southern California. The BPTCP used 35 replicated sampling sites, including both chemical and sediment bioassay testing, to determine which areas could be potentially impacted by chemical contaminants. Part of the significance of this study is that three of the established study sites (Sites 40010, 40018, 40032) in the BPTCP were adapted as reference stations for the present RI. These stations are situated in the outer portion of San Pedro Bay, outside of the West Basin. The concentrations of several sediment contaminants were significantly correlated with amphipod survival and abalone development using a sediment porewater test.

Observed PAH concentrations were higher, relative to threshold exposure limits (TEL) and permissible exposure limits (PEL) screening levels, in samples from the LA/LB Harbor than in samples collected from other southern California areas. The highest levels of PAHs were measured in samples from Los Angeles and Long Beach inner harbors; Fish Harbor and Long Beach outer harbor (Station 40018) had lower levels of PAHs (Figure 4-1). Significant amphipod toxicity was also observed at many LA/LB inner harbor sampling sites (Figure 4-2). Undiluted porewater toxicity was widespread throughout the 35 sampling stations (Figures 4-3, Abalone 100 percent porewater toxicity tests). Most of the pore water toxicity at 50 percent dilution was observed in Long Beach middle harbor, (entrance to West Basin) and off Cabrillo Beach (Station 40010) (Figure 4-4). The amphipod and diluted pore water bioassays collectively identified Huntington Harbor, the entrance to West Basin, Los Angeles Harbor Consolidated Slip, and portions of Alamitos Bay as areas that were most toxic (SWRCB and NOAA 1994).

VOL 18

0496

R0062431

NOAA is currently monitoring a surface sediment station in Long Beach Harbor as part of its National Status & Trends (NS&T) Mussel Watch program. The NS&T program's objectives include defining the geographic distribution of contaminant concentrations in tissues of marine organisms and sediments, and evaluating potential biological responses to contamination. Samples have been collected since 1984 under the Benthic Surveillance Project, and since 1986 under the Mussel Watch Project, the two components of the NS&T program. Surface sediment samples have been collected and analyzed at all sites for both components (Mearns et al. 1991). Chemicals and related parameters measured in sediment include chlorinated pesticides, PCBs, PAHs, trace elements, grain size, and TOC (NOAA 1991). Figures 4-5 and 4-6 show total PAH and metals concentrations in southern California Bight surficial sediments collected between 1984 and 1986. The NS&T program concentrates considerable effort in southern California, with 20 of its approximately 200 sampling sites nationwide located within the Bight.

As a result of data gathered during 1986 through 1988, NOAA found 14 chemicals, sampled from stations located within the Bight, whose mean concentrations were at the "high" end of the overall, national log-normal distribution (i.e., greater than one standard deviation above the geometric mean). West Santa Monica Bay had the greatest number of chemicals with "high" concentrations (11), with South San Diego Bay having 10 chemicals and Palos Verdes having 9 chemicals exhibiting "high" concentrations in surface sediments. The Long Beach station had "high" concentrations of lead, total DDT, and total PCB.

4.1.2.3 FISH TISSUE SURVEYS

Several investigators have surveyed and continue to survey fish tissue concentrations within the LA/LB Harbor Complex and the Bight in general. This extensive database is expected to provide a viable means of comparing project-specific data and evaluating ecological conditions within the West Basin. In 1972, as part of a nationwide program, Butler and Schutzmann (1978) began a 4-year analysis of organochlorines (PCBs and DDT) in whole juvenile estuarine fish from three southern California sites including LA/LB Harbors. Species collected included California halibut (*Paralichthys californicus*), queenfish (*Seriphus politus*), white croaker (*Genyonemus lineatus*), walleye surfperch (*Hyperprosopon argenteum*), and northern anchovy (*Engraulis mordax*). In 1978, SCCWRP launched the first of several studies to examine the potential for biomagnification of organochlorine compounds, trace elements, and other chemicals in various marine ecosystems of the Bight. Kelp, clam, and three fish species from LA Harbor were sampled and analyzed for metals and benzo(a)pyrene in 1979 as part of the Harbor Ecosystem Survey (Mearns and Young 1980; Goeders 1982). At the same time, Gadbois and Maney (1983) analyzed PCBs in fin fish muscle collected by the University of Southern California within and outside of LA Harbor as part of the nationwide NOAA Microconstituents Survey. Organic contaminants in Los Angeles area fish muscle and liver were analyzed for PCBs, DDT, other pesticides, and metals by the LARWQCB in 1985 (Risebrough 1987).

VOL 18
0497
R0062432

More recently, the U.S. EPA's National Study of Chemical Residues in Fish (previously referred to as the National Bioaccumulation Study) was initiated in 1986 as an outgrowth of U.S. EPA's National Dioxin Study. Composite fish samples were collected primarily in 1987 from approximately seven sites along the southern California coast, including the LA/LB Harbor area. The fish were analyzed for dioxins, furans, PCBs, pesticides, and mercury (U.S. EPA 1992b). Cal-EPA's Office of Environmental Health Hazard Assessment (OEHHA) conducted a comprehensive study and risk assessment of chemical contaminants (PCBs, DDT, chlordane, mercury, and tributyltin) in fish species, including California halibut and white croaker, in Southern California (Cal-EPA 1991). Fish were collected in 1987 from numerous sampling sites along the Southern California coast, with several sites located within the LA/LB Harbor Complex. California halibut contained very low levels of chemical contaminants; few composite samples had quantifiable levels of DDT or PCBs (Aroclor 1254 + Aroclor 1260). The highest levels of DDT or PCB in white croaker were found at White's Point, Point Vicente, and Malibu. White croaker sampled from Belmont Pier and Pier J of Long Beach Harbor had the lowest DDT and PCB concentrations. Concentrations of chlordane in white croaker were relatively high at Point Dume, Malibu, White's Point, Point Vicente, and Cabrillo Pier. Mercury concentrations in California halibut were low. Tributyltin was detected in white croaker tissues collected from Marina del Rey. NOAA also surveys fish liver for metals, PAHs, PCBs, and pesticides from six sampling sites located between Santa Monica Bay and San Diego Harbor as part of their NS&T benthic surveillance program.

4.1.3 Fish and Benthic Biological Surveys

Numerous marine biological investigations have been conducted in LA/LB Harbor and surrounding areas. This section focuses on those surveys which evaluate potential biological effects in benthic biota and demersal (bottom-dwelling) fish rather than those inhabiting the upper water column. As noted in the previous section, the University of Southern California's Allan Hancock Foundation published a series of comprehensive studies on LA/LB Harbor biota, called the Harbors Environmental Projects, including a detailed 1971-1974 biological baseline assessment of LA/LB Harbor (Allan Hancock Foundation 1976). This assessment was supplemented and updated by Soule and Oguri in 1980.

A number of investigators have conducted fish surveys as part of biological studies, including Chamberlain (1973), Long Beach Harbor Consultants (1976), and Horn and Allen (1981). Specific harbor development projects were frequently preceded by biological studies including those by Reish (1971), Environmental Quality Analysts and MBC (1978), Hill and Reish (1975), Loi (1981), and MBC (1984). In addition to summarizing earlier studies of the two harbors, the biological baseline surveys of Long Beach outer harbor and Queensway Bay by MBC Applied Environmental Sciences (1984) and of Los Angeles Harbor and adjacent waters by MEC (1988a) included sampling methods and quantitatively described biological communities found in the Harbor Complex.

VOL 18

0498

R0062433

SCCWRP has conducted three surveys of biological conditions in reference areas off the coast of southern California in the last 15 years (1977, 1985, and 1990). The results of the biological component of these studies indicate that the macrobenthic communities (organisms greater than 1 mm in length) of the Southern California mainland shelf are dominated by variations of the *Amphiodia urtica-Spiophanes missionensis* assemblage. Megabenthic invertebrates (large, motile invertebrates) are dominated by asteroids (*Astropecten verrilli*), sea urchins (*Lytechinus pictus and Allocentrotus fragilis*), and prawns (*Sicyonia ingentis*). Speckled, longfin, and Pacific sanddabs (*Citharichthys sp.*) represent the majority of demersal fish at the 30-meter and 60-meter isobaths. The species composition of macro- and megabenthic invertebrates and demersal fishes collected in 1990 were similar to those collected in the 1977 and 1985 reference surveys (Thompson 1992).

Benthic samples have been collected throughout the LA/LB Harbor Complex from 1951 through 1968, and benthic data specific to West Basin were collected in 1970-1971. At that time, these and other environmental studies concluded that the inner LA/LB Harbor waters, including West Basin, were severely polluted (i.e., benthic communities were either absent or stressed) (e.g., dominated by the polychaete *Capitella capitata*), and there was little to no available dissolved oxygen (see Figure 4-7). The outer LA/LB Harbor, however, indicated adequate DO levels and benthic communities were rich, diverse, and healthy. These general benthic conditions remained static until the late 1960s.

In 1968, a pollution abatement program was initiated by the State of California to control industrial, domestic, and storm water wastes; this program was initiated within the LBNC during the mid-1970s. Benthic studies of the Los Angeles Long Beach Harbor Complex began again in 1971 and continued on a regular basis throughout the 1970s (Soule and Oguri 1975, 1976, 1978a, 1978b, 1979). As a result of the pollution abatement program, benthic conditions greatly improved except for the West Basin of Los Angeles Harbor, Dominguez Channel, Fish Harbor, and a few blind-ending slips in the LA/LB Harbor Complex. West Basin of Long Beach Harbor was resampled in 1978 and was found to support a healthy benthic community more in common with the relatively unpolluted outer LA/LB Harbor Complex than those associated with traditional polluted marine harbor areas, as shown on Figure 4-8 (WESTDIV 1986). Benthic conditions of this post-pollution abatement period may be considered a more recent basis for defining baseline conditions and evaluating possible environmental changes within the LA/LB Harbor Complex, including West Basin of Long Beach Harbor.

4.1.4 Summary of Survey Results

This section describes regional chemical concentrations in sediment and fish tissue. West Basin benthic biological data most recently characterized in 1978, are also presented. Data deemed appropriate to describe regional ambient conditions are those which have been obtained from the West Basin itself, LA/LB Harbor, and certain areas of the Southern California Bight (i.e., areas with similar land/water use and contaminant sources/inputs like San Diego Bay). These data define regional ambient conditions for

VOL 18
0499
R0062434

West Basin, and provide a basis for comparing to project-specific sediment and tissue data.

4.1.4.1 CHEMISTRY

Contaminant concentrations in the Southern California Bight have been measured in sediments, invertebrates, and fish tissue since the early 1960's as a result of at least 150 local, state, and federal surveys. The most current, comprehensive contaminant monitoring program is conducted by NOAA under the NS&T Program for Marine Environmental Quality.

As a result of the data collected through the NS&T Program as well as from various other monitoring programs, Mearns et al. (1991) identified contaminants of greatest potential concern within the Southern California Bight in general, and LA/LB Harbors specifically. Contaminants causing the most concern are those that have the following characteristics:

- the ability to accumulate to toxic levels in water or sediments;
- the ability to accumulate to excess amounts in living organisms either to the detriment of fish or to human consumers;
- the ability to biomagnify (i.e., show higher levels in organisms that are higher in the food chain); and,
- inputs of such chemicals are currently increasing or, in the case of persistent compounds, have caused concern during past years.

Contaminants determined by Mearns et al. (1991) to be of regional concern for both sediment and marine organisms include DDT, PCBs, PAHs, mercury, arsenic and lead. Specific metals in LA/LB Harbor sediment were identified as having exceeded the effects range low (ER-L) or effects range median (ER-M) concentrations: chromium, copper, and zinc. In addition, data from NS&T and other surveys reveal total tin concentrations to be elevated in fish livers taken from various areas of the Bight, including the LA/LB Harbor, and thus is considered a regional contaminant of concern. Cal-EPA's OEHHA identified DDT, PCBs, tributyltin (TBT), and mercury as being chemicals of concern in fish based on a comprehensive study of chemical contamination of marine fish from southern California (Cal-EPA 1991).

The remainder of this section provides a brief review of ambient contaminant concentrations in surface sediment and fish tissue. Several key documents were reviewed to define regional ambient chemical concentrations (NOAA 1991; Cal-EPA 1991; Thompson 1992; U.S. EPA 1992b). One document in particular, prepared by NOAA, provided a comprehensive synopsis of key contaminant monitoring studies to date conducted within the Southern California Bight: "Contaminant Trends in the Southern California Bight: Inventory and Assessment" (Mearns, et al. 1991). This key document provided much of the regional data presented in this section. Tables 4-1, 4-2, and 4-3 provide an overview of contaminant concentrations measured in surface sediment, white croaker tissue, and California halibut tissue, respectively.

R0062435

VOL 18

05000

PAHs

Historical sources of PAHs into the LA/LB Harbor have included spillage and discharge of drilling wastes and refinery effluents. A review of the literature has revealed high PAH contamination in LA/LB and San Diego Bay, with concentrations in the sediment well exceeding the background levels of 1 to 100 µg/kg (Mearns et al. 1991). Low molecular weight PAHs (LPAHs) are generally more prevalent in LA/LB Harbor, while high molecular weight PAHs (HPAHs) are more prevalent in San Diego Bay. PAH concentrations ranged from less than 0.09 to 69 µg/kg at SCCWRP reference station sediments during 1990 (Thompson 1992), with the highest concentrations found at stations near Oxnard. PAH concentrations are low in fish tissue analyzed from the Bight (2 µg/kg, Mearns and Young 1980), although these contaminants have been found in the fish stomach contents. In addition to high sediment concentrations, PAH metabolites have been found in the bile of fish collected from LA/LB Harbors and San Diego Bay.

PCBs

There are three areas of the Southern California Bight where PCB concentrations in sediment are elevated. These consist of San Diego Bay, the coastal shelf along the Palos Verdes peninsula, and LA/LB Harbor. The lowest sediment concentration of PCBs was found at Point Loma shelf in 1985 (0.0002 mg/kg dry weight [dw], Mearns et al. 1991), and the highest concentrations were found at San Diego Harbor in 1983 (34.2 mg/kg dw, Ladd et al. 1984). PCB concentrations in sediment from the NS&T Long Beach station were found to be high (greater than 0.20 mg/kg) by NOAA (1991). SCCWRP found PCB concentrations to average between less than 0.005 to 0.031 mg/kg at their reference stations during 1990 (Thompson 1992), with the highest concentrations found at Point Dume and Dana Point. Concentrations in white croaker fish tissue range from 0 to 10 mg/kg wet weight (ww) in the Bight. The highest concentrations were found in fish from Palos Verdes during a 1975 survey by Young et al. (1978). Fish (all species) collected at southern California sites during 1987 as part of U.S. EPA's National Study of Chemical Residues in Fish were analyzed for PCBs, and concentrations ranged from 0 to 1.0 mg/kg (U.S. EPA 1992b).

DDT

DDT has been a major contaminant of marine organisms of the Bight for more than 40 years. The highest DDT concentrations in fish were found in white croaker collected in 1975 from Palos Verdes (Young et al. 1978). Maximum concentrations were as high as 175 mg/kg wet weight (ww). A later survey conducted by Schafer et al. (1982) in 1980 indicated that maximum concentrations had decreased to 13 mg/kg ww.

The highest sediment concentrations were found along the mainland shelf, with the Palos Verdes shelf samples collected in 1977 being the highest (175 mg/kg dw, Word and Mearns 1979), although these concentrations decreased by a factor of 3 by 1985 (Mearns et al. 1991). The lowest DDT concentrations detected in sediment were found at Marina del Rey in 1987 (0.001 mg/kg dw, Soule and Oguri 1987). High concentrations (greater

VOL 18
0501
R0062436

than 0.04 mg/kg) of DDT were measured at the NS&T Long Beach sampling station by NOAA in 1984/1985 (NOAA 1991). SCCWRP reference stations during 1990 were found to have DDT concentrations ranging from less than 0.005 to 0.039 mg/kg; concentrations were highest at the northern stations (Thompson 1992).

Butyltin

Relatively few data from California Bight sediment and fish tissue exists because contamination by butyltins has only recently been acknowledged. Analytical techniques have been developed more quickly for water than for sediment and tissue and have not yet been standardized (Richard and Lillebo 1988). Butyltin concentrations ranged up to 0.056 mg/kg dw within Bight sediments (Marina del Rey county dock). Most harbor sites were found to be below 0.01 mg/kg dw except Marina del Rey, Santa Barbara Harbor (0.038 mg/kg dw), Channel Islands Harbor (0.014 mg/kg dw), and Redondo Beach King Harbor (0.0014 mg/kg dw).

Arsenic

Limited sediment data suggest that major point or non-point sources of arsenic have resulted in sediment contamination at the Palos Verdes shelf and possibly in the LA/LB Harbor area, where concentrations average 2 to 5 times higher than background of 10 mg/kg dw. The highest concentration of arsenic found in sediments was from the Palos Verdes shelf in 1974 at 130 mg/kg dw (Stull and Baird 1985) and the lowest concentration was 2.7 mg/kg dw from sediments at upper Newport Bay in 1971 (Young et al. 1975). In California halibut tissue, concentrations of arsenic ranged from 0.18 mg/kg ww at Palos Verdes in 1976 (Goeders 1982) to 1.65 mg/kg ww from the San Diego area in 1976 (Goeders 1982). High concentrations of arsenic were found in marine organisms in remote areas just as frequently as those found near Palos Verdes. No correspondence is apparent between arsenic concentrations in sediments and tissues. Arsenic levels tend to be lower in marine organisms residing near shore and higher in organisms residing offshore; the trend in sediment concentrations is reversed (Mearns et al. 1991).

Chromium

The Southern California coastal shelf estimate of a natural background concentration of total chromium along the 60 m isobath is 29 mg/kg dw (Word and Mearns 1979). Background levels for bays, lagoons, and harbors are much lower, near 6 mg/kg dw (Mearns et al. 1991); chromium concentrations vary with sediment type and increase with depth of water. Most areas sampled within the Bight were at or near background levels, except for Palos Verdes, San Diego Bay and Los Angeles Harbors, Santa Monica Bay, and Marina del Rey. Concentrations in these locations were elevated above background greater than 10 times, 3 times, 2.5 times, and 7 times, respectively. The lowest sediment concentrations of chromium have been measured in the Tijuana Estuary in 1988 (0.05 mg/kg dw, Gersberg et al. 1989) and the highest has been from the Palos Verdes shelf in 1977 (60 mg/kg dw, Word and Mearns 1979), but these concentrations declined

VOL 18
05002
R0062437

50 percent in 1985 (Mearns et al. 1991). Seven reference stations from Word and Mearns' 60-meter survey (1979) and Thompson et al.'s 1985 reference survey (1987) were resampled by SCCWRP for their 1990 reference survey; average chromium concentrations in sediment were 26 mg/kg (Thompson 1992). There is no apparent correspondence between chromium concentrations in sediment and fish; contaminant trends do not follow the same gradient. Also, there is no evidence of biomagnification; data indicate that concentrations decrease with trophic level.

Copper

The highest levels of copper have been reported in harbors and at Palos Verdes. The high levels found in harbors are due to vessel activities and boat yards, locally dominant sources, because copper is found in vessel coatings. Background concentrations were estimated at being 10 mg/kg dw along the coastal shelf. The lowest copper concentrations were found at the Santa Barbara shelf in 1977 (2.3 mg/kg dw, Word and Mearns 1979) and the highest concentrations were found at the Newport shipyards in 1972 (20,300 mg/kg dw, Liu and Schneider 1988). A later survey in 1986 revealed concentrations had decreased in the shipyards by a factor of 35 (Liu and Schneider 1988). Average copper concentrations were found to be 9.2 mg/kg in sediments collected during the 1990 SCCWRP survey (Thompson 1992). There are no indications of fish contamination corresponding to major sediment contamination areas. Also, the data do not show biomagnification; copper concentrations actually decrease with trophic level.

Lead

The highest concentrations of lead are reported in marinas and harbors at which the primary source is atmospheric deposition and the secondary source is sewage and surface runoff. Katz and Kaplan (1981) estimate a background level of 10 mg/kg dw in sediments. After reviewing data from all sites within the Bight, the lowest concentrations of lead were found at inner Bolsa Bay in 1978 (1 mg/kg dw, Riznyk and Mason 1979) and the highest concentrations were found at San Diego Harbor in 1974 (4,440 mg/kg dw, Young et al. 1975). However, levels had decreased by a factor of 14 by 1984 (Ladd et al. 1984). NOAA found high concentrations of lead (greater than 89 mg/kg dw) in sediments from the NS&T Long Beach station collected in 1984/1985 (NOAA 1991). SCCWRP data, collected in 1990, indicate average lead concentrations in sediment of about 6.9 mg/kg dw (Thompson 1992). It is difficult to evaluate lead data for fish tissue, since the quality of past local and regional monitoring surveys are reportedly unreliable for lead analysis as a result of sample contamination in the laboratory. It can be determined, however, that lead undergoes biodepletion in the food web. Mean concentrations of lead in fish livers range from 0.01 mg/kg ww in white croaker at Dana Point to 0.10 mg/kg ww in hornyhead turbot at San Diego Bay (Varanasi et al. 1988).

Mercury

Areas most contaminated by mercury are located near sewage discharges in Santa Monica Bay and Palos Verdes, and in areas of LA/LB Harbor, Marina del Rey, and San Diego

VOL 18
0503
R0062438

Bay. The sediment background level has been determined by Eganhouse et al. (1976) to be 0.05 mg/kg dw. The lowest concentrations of mercury are found at Point Loma shelf (0.01 mg/kg [Eganhouse et al. 1976]) and the highest concentrations were found at the Newport shipyards in 1972 (157 mg/kg dw); these values had decreased by a factor of 13 by 1986 (Liu and Schneider 1988). Mercury biomagnifies and occurs at elevated concentrations in large fish and sharks near known point sources. Concentrations of mercury in relevant fish tissue range from less than 0.050 mg/kg ww for California halibut at Point Dume to 0.437 mg/kg ww in white croaker at Dana Point (Cal-EPA 1991). Average mercury concentrations in fish collected as part of U.S. EPA's 1987 National Study of Chemical Residues in Fish, were somewhat elevated above regional background levels at 0.5 mg/kg ww.

Nickel

High concentrations of nickel, defined as greater than 69 mg/kg dw by NOAA (1991), have not been found in sediments analyzed as part of current monitoring programs. However, nickel is one of the heavy metals consistently present in oily sludges generated at naval installations (Lysyj and Karr 1983). Concentrations of nickel in surface sediment collected in 1986 through the NS&T Program ranged up to 58 mg/kg dw in San Pedro Harbor. The mean surface sediment concentration at the NS&T Long Beach station in 1984 was 27 mg/kg dw.

Silver

Although not considered a regional chemical of concern by NOAA (Mearns et al. 1991), high concentrations of silver, defined as greater than 1.2 mg/kg dw by NOAA (1991), have been measured in sediments throughout the Bight, particularly in Central San Diego Bay, Palos Verdes, West Santa Monica Bay, Marina del Rey, and Point Dume. High concentrations of silver are generally associated with sewage outfall areas; background concentrations at non-outfall areas range from 0.01 to 0.10 mg/kg dw (Mearns et al. 1991). A review of the literature indicated that sediment silver concentrations in southern California range from 0.01 mg/kg dw in sediments collected from Port Hueneme in 1985 (Thompson et al. 1987) to 18 mg/kg dw in sediments collected from the Palos Verdes shelf in 1977 (Word and Mearns 1979). Biological tissue data provide no evidence that silver biomagnifies (U.S. EPA 1986). Given the limited data on silver concentrations in fish, there is no indication that silver is a major contaminant of fish muscle tissue in the Bight.

Zinc

Although not usually considered to be highly toxic, zinc is an indicator of anthropogenic contamination. This metal has accumulated in sediments at Palos Verdes, Rhine Channel, Newport Bay, and areas of Central San Diego Bay 100 to 1,000 times above background levels. Background levels of zinc in sediments are considered to be 40 to 72 mg/kg dw at the 60-meter isobath from rural coastal shelf areas. The lowest concentrations of zinc have been found at the mouth of the Tijuana Estuary in 1988 (4.2 mg/kg dw, Gersberg et

VOL 18
0504
R0062439

al. 1989), and the highest levels were found at the Newport shipyard in 1972 (13,700 mg/kg dw), with levels decreasing by a factor of 53 by 1986 (Liu and Schneider 1988). Zinc concentrations averaged 45 mg/kg dw at SCCWRP reference stations collected as part of their 1990 survey (Thompson 1992).

4.1.4.2 BENTHIC BIOLOGY

The Long Beach Harbor area contains a variety of marine habitats and marine life. A vertical zonation exists, with 503 taxa of algae and macroinvertebrates inhabiting the intertidal and shallow subtidal zones along the outside of the Mole (LA/LB Harbor Departments and U.S. ACOE 1990). The mid-intertidal assemblage is dominated by acorn barnacles (*Balamus glandula*) and limpets (*Acmala sp.*), while the low intertidal to shallow subtidal area is apparently high in species richness, diversity, and biomass.

The soft bottom habitat of West Basin supports a benthic community most recently characterized by Reish in 1978. The results of this survey may be considered a baseline for evaluating possible recent and future environmental changes to West Basin, since benthic invertebrates are widely accepted indicators of marine pollution.

The benthos within West Basin was found by Reish to generally consist of a community of animals dominated by the polychaetes *Capitata ambiseta, Tharyx* sps., and *Haploscoloplos elongatus* (WESTDIV 1986). Although these species predominated, specific trends within this basic community were noted during the 1978 survey: 1) some species were limited to the outer regions of West Basin and were not present between Piers 7 and 9 (piers are shown on Figure 5-1) (e.g., *Cossura candida and Amphideutopus oculatus*); and 2), some species were limited to the region between Piers 7 and 9 (e.g., *Pseudopolydora paucibranchiata, Tagelus subteres, Tellina modesta*, and *Mayarella banksi*). The most diverse benthic population was found at the West Basin entrance. There was also a decreasing trend in the diversity index from the outer to inner reaches of West Basin, where reduced water circulation results in lower DO levels.

4.2 DREDGING ACTIVITIES

The following section describes past dredging activities that have occurred within West Basin specifically and LA/LB Harbor generally.

4.2.1 Los Angeles/Long Beach Harbor Complex

During recent years, numerous dredging activities have been conducted by the POLA and POLB within the LA/LB Harbor Complex. These dredging activities are related to development of harbor facilities (e.g., construction of new piers), maintenance of harbor facilities which requires deepening of channels, or sampling investigations conducted in support of development or maintenance activities.

The steady growth of the POLA over the past 100 years to the present complex of several thousand acres of docks, piers, channels, basins, and anchorages has changed the character of the natural environment. Dredging and filling have converted former wetlands and

VOL 18
0505
R0062440

shallow open water areas to deep channels and slips. Breakwater construction has converted the San Pedro Bay from exposed coastline to a protected embayment with restricted circulation. In addition to these physical changes, the increased urbanization and industrialization of the area and, consequently, the increased discharges of various contaminants, have altered sediment and water quality in the LA/LB Harbor area (MEC 1988a).

Harbor development activities conducted during the 1980s have substantially altered the Los Angeles Harbor. These development activities included deepening of the Main Channel in the Inner and Outer Harbors, filling (approximately 190 acres) of shallow water on the south side of Terminal Island, relocating the Terminal Island Treatment Plant outfall within the Outer Harbor, constructing a marina complex near Cabrillo Beach, creating a salt marsh near Cabrillo Beach, and establishing a kelp bed directly inboard of the San Pedro Breakwater (MEC 1988a).

Very large development projects, collectively known as the POLA 2020 Plan, are currently being planned and implemented to meet anticipated future cargo demands. New terminals are being constructed over land created by dredging and filling areas within the LA/LB Harbor. The channels, basins, and slips are routinely dredged to promote navigation of larger ships.

Sediment sampling and analysis are generally conducted prior to dredging activities. For those dredged materials that are expected to be open water disposed at LA-2, a U.S. EPA dredge material disposal site located 4.7 nautical miles south of the San Pedro Breakwater, chemical and biological testing were conducted in accordance with guidance criteria in the 'Green Book" (U.S. EPA/U.S. ACOE 1991). Only chemical analyses are required for dredged materials suspected not to pass these criteria (Smith 1994).

The following paragraphs summarize a number of dredging activities, associated sampling, and disposition of the dredged materials, conducted in the Ports of LA/LB.

4.2.1.1 PIER E, BERTH 121-122 (RELOCATION OF ARCO TANKER TERMINAL) (1981)

The relocation of the ARCO tanker terminal on Pier E from Berth 118 to the vicinity of Berths 121 and 122, located in the Back Channel of Long Beach Harbor, commenced in June 1981. This relocation activity included dredging and disposal of dredged material, and resulted in a larger facility capable of accepting the larger mid-range tankers. The berthing area was dredged to a depth of -66 feet MLLW, exceeding the adjacent Back Channel depth which varies from -60 to -62 feet MLLW, thereby providing more vessel clearance and increasing available maneuvering room in the Back Channel. A total of 650,000 cubic yards of bottom sediments were removed from the vicinity of Berths 121 and 122 in the Back Channel via dredging. Of this total, approximately 150,000 cubic yards were used as fill material at the project site. The remaining dredged material, approximately 400,000 cubic yards of sediments, were dredged and disposed of at LA-2, the designated U.S. EPA open water ocean disposal site.

VOL 18
0506
R0062441

4.2.1.2 SEDIMENT SAMPLING FOR THE PORT OF LONG BEACH COAL TERMINAL PROJECT (1982)

Sediment samples were collected at three dredging areas adjacent to the proposed coal terminal facility along the north shore of Cerritos Channel by the POLB. The three sampling areas consisted of the Cerritos Channel (north side), the Turning Basin, and the Back Channel. Samples were collected and bioassays conducted to assess potential impacts of the disposal of dredged material derived from construction dredging of a berthing slip adjacent to the proposed coal terminal facility. The bioassays were performed on the three phases of dredge material (liquid phase, suspended particulate, and solid phase), as well as chemical analyses of the liquid and solid phases, and assessment of bioaccumulation potential. A control sediment sample was also collected along the perimeter of the LA-2 open water disposal site. Trace metals, petroleum hydrocarbons, and halogenated hydrocarbons (pesticides and PCBs) were detected in the samples. Bioassays conducted using the three phases demonstrated little statistically significant evidence of mortality or other toxic effects. The sediment samples demonstrated statistically significant bioaccumulation potential for specific trace metals and petroleum hydrocarbons (MBC 1982).

4.2.1.3 SEDIMENT SAMPLING IN THE VICINITY OF PROPOSED PIER 400 (1990)

An environmental study in support of the POLA 2020 Plan was conducted to identify regions within the potential dredge areas harboring contaminated sediment or sediment with significant acute or chronic toxicity to marine organisms. Sediment samples were collected at various locations in the vicinity of the proposed Pier 400 for analysis. Metals detected included chromium, copper, lead, mercury, nickel, silver, and zinc. Organics detected included PCBs, PAHs, and DDTs. Test results indicated that concentrations were above action thresholds and the sediments would not pose a problem if they needed to be disposed of at an uplands site (landfill) (Kinnetic Laboratories, Inc. 1991).

4.2.1.4 SEDIMENT SAMPLING FOR THE PORT OF LONG BEACH PIER J EXPANSION SITE (1991)

Sediment samples were collected from the East Channel and the area east of Pier J. Sediment and elutriate chemical analyses, grain-size analyses, liquid/suspended phase bioassays, solid phase bioassays, and an evaluation of the bioaccumulation potential were conducted according to Green Book methods (U.S. ACOE/U.S. EPA 1991). The sediment samples were similar in chemical constituent composition and concentration to other sites within the LA/LB Harbor. Elutriate chemistry analysis indicated no substantial leaching of chemical constituents from sediments to water, and no dissolved concentrations which exceeded water quality standards. Based on these results, the dredge materials were deemed to present no long-term degradation potential if disposed of at the LA-2 open water disposal site (MEC 1992).

VOL 18 0507

R0062442

4.2.1.5 SEDIMENT SAMPLING FOR PIER 400 MAINTENANCE DREDGING AND DESIGN PROGRAM (1993)

Sediment samples were collected at various locations within Los Angeles Harbor and its adjoining basins where future maintenance dredging will be required in relation to the Pier 400 design program. Sample analysis results indicated that no single area was highest for all constituents measured. Test results indicated no consistent horizontal trend in the distribution of contaminants between areas or within an area, or vertically throughout the length of the core. This was attributed to the different sources of inputs each of the areas has received and historical deposition of contaminants each has accumulated. No biological testing was conducted as part of this sampling program. Metals detected in the samples included arsenic, cadmium, chromium, copper, lead, mercury, and nickel. Organics detected included total PAHs, DDTs, and PCBs (Kinnetic Laboratories, Inc. 1993).

4.2.1.6 CONSTRUCTION OF PIER 400, POLA (1994)

The POLA current expansion project involves the construction of Pier 400, south of Pier 300. Dredging activities and associated sampling and analysis for the construction of Pier 400 started in September 1994 and are ongoing. During dredging, the water quality is monitored on a weekly basis for dissolved oxygen, light transmittance, temperature, and pH at 2-meter increments throughout the water column. Suspended solids are monitored on a bimonthly basis at the water surface, mid-depth, and bottom. Quarterly monitoring of the water column is conducted at three sample locations, at mid-depth of the water column. The samples are collected at 30.5 meters up-current, and 30.5 and 91.5 meters down-current of the dredge operation. Samples are analyzed for trace metals (arsenic, chromium, copper, lead, mercury, nickel, silver, selenium, and zinc) and organics (DDE, PCBs, PAHs, phthalates, tributyltin, and oil and grease). As part of Pier 400 construction activities, a permanent shallow water habitat will be constructed as mitigation for project-related impacts to the existing shallow water habitat site. The permanent shallow water habitat will be located adjacent to the San Pedro Breakwater and constructed using contaminated sediments, which will capped with clean sediments (LARWQCB 1994).

4.2.2 West Basin

Several dredging activities have occurred in the West Basin within the last 15 years; some of these dredging activities may have impacted bottom conditions of sediments through changes in depth or resuspension, and resettlement of particulates. Most dredging activities were associated with the construction or maintenance of LBNC piers supporting vessel operations within the West Basin. Known dredging activities that have occurred within the last 15 years in the West Basin are summarized in this section. To research and investigate each of these dredging activities, a number of historical files were reviewed. These files were obtained from NAVSTA, the LBNSY, the POLB, the Coast Guard, the U.S. ACOE, and the CLEAN I contractor.

VOL 18
0508
R0062443

4.2.2.1 MAINTENANCE DREDGING AT PIERS 7 AND 9 (1982)

In October of 1982, approximately 400,000 cubic yards of sediments were dredged from the West Basin at Piers 7 and 9 to conduct a periodic removal of accumulated silt and sediment from the berthing areas. Bioassay results indicated that the dredged material between Piers 7 and 9 should not have a significantly adverse effect on the marine environment after ocean disposal. The dredged material was disposed of at the U.S. EPA open water ocean disposal site, LA-2. The project deepened the area between Piers 7 and 9 to -30 to -35 feet MLLW, plus 2 feet overdredge.

4.2.2.2 FUEL PIER RELOCATION (PIER 12) (1984)

This project included the construction of both a new fuel pier (Pier 12) extending into the West Basin from the Navy Mole at the LBNC, and a pipeline system to deliver fuel from the Defense Fuels Support Point in San Pedro to the new fuel pier. The pipeline system presently crosses the Los Angeles Main Channel in a trench. Dredging was reported conducted at the location of Pier 12 and in the Main Channel. Dredging of approximately 40,700 cubic yards of material from the channel bottom was required for the pipeline construction. Following chemical and biological testing according to "Green Book" (U.S EPA/U.S. ACOE 1977) criteria, the dredged sediments were disposed of at the LA-2 open water ocean disposal site. The project was completed during September 1986.

4.2.2.3 MAINTENANCE DREDGING AT PIER 6 (1986)

This project, known as Project M1-85, involved the maintenance dredging of both sides of Pier 6 to accommodate operational schedules and required berthing for deep-draft vessels. Dredging to a depth of -45 feet MLLW was found to be necessary to prevent fouling of battleships and amphibious landing ships. Bioassay tests were conducted as required by U.S. EPA and U.S. ACOE (1977) regulations to assess the potential toxicity associated with ocean disposal. These tests indicated that the dredged material was acceptable for ocean disposal. Approximately 46,000 cubic yards of dredged material were removed. This dredged material was disposed at the LA-2 open water ocean disposal site. he project was completed in the spring of 1987.

4.2.2.4 MAINTENANCE DREDGING AT THE SOUTH FACE OF PIER E (1991)

This LBNSY project, conducted in 1991, is referred to as Project MI-87 by the DON. This project involved maintenance dredging along the south face of Pier E to prevent the fouling or grounding of battleships and oiler class vessels. The harbor bottom along the south face of Pier E was dredged to an elevation of -47 feet mean lower low water (MLLW) (-45 feet plus 2 feet over depth). The total volume of dredged material was approximately 18,300 cubic yards. The dredging project area extended for about 1,400 feet in the west-east direction along the south face of Pier E, and for a distance of 200 feet in the north-south direction (WESTDIV 1989).

Activities conducted in conjunction with this dredging project included a geotechnical investigation as well as sediment sampling and analysis (chemical, physical, and bioassay

VOL 18
0509
R0062444

testing). These pre-dredging activities were required under the Ocean Disposal Program to provide results for submittal to the U.S. ACOE and the U.S. EPA to determine whether the dredged material was suitable for open water disposal.

The geotechnical investigation at Pier E showed that the bottom soil strata between -5 and -18 feet MLLW depth consisted of very loose to loose sandy/clayey soils with some shell hash, and very soft clay layers. These loose and soft soils were found beneath the east end of the pier; they are underlain below the 18-foot depth by medium dense to very dense sands with shell hash. As a result of a geotechnical model, it was concluded that the maintenance dredging project would not significantly affect the stability of the pier (WESTDIV 1989).

Results of the sediment sampling and analysis indicated that sediments were contaminated with moderately elevated levels of heavy metals and petroleum hydrocarbons. PAH concentrations ranged from moderate to high. Bioassay and bioaccumulation results indicated that sediment at the two test sites caused a reduction in sea urchin (echinoderm) development, affected mortality of worms and mysids, and was associated with elevated tissue concentrations of zinc, PAHs, and chromium (WESTDIV 1990). Based on a review of these data, the California Department of Fish and Game and the U.S. EPA determined the dredged material was not suitable for ocean disposal. Upon comparing the sampling results with U.S. EPA ocean dumping criteria in 40 CFR Part 227, the top 7-foot layer of the harbor bottom represented the zone of contamination, and it was determined that the contaminated sediments must first be removed and then transported to an alternative disposal site.

As a result, the dredging project involved dredging at two different locations within the dredging project area, and disposal of the dredged materials in the POLB Ford/Melamed Landfill, according to LBNSY records. According to the dredging permit application filed with the U.S. ACOE, the dredged material that was unsuitable for ocean disposal (3,000 cubic yards) was removed by clam-shell dredge to a depth of -47 feet MLLW, placed on a barge, and disposed of at the landfill. The 3,000 cubic yards of unsuitable material was capped at the landfill with the addition of 15,300 cubic yards of uncontaminated dredged material from the project area. The Navy-dredged material was further capped by 50,000 cubic yards of material suitable for open water disposal.

SECTION 5

RATIONALE FOR SITE ASSESSMENT

0511

VOL 18 0512

Section 5
RATIONALE FOR SITE ASSESSMENT

This section describes the rationale and design of the site assessment and discusses the various types of samples and data collected. It includes a discussion of the individual design elements, a review of specific data collected, designation of West Basin sampling locations, and selection of project reference stations.

5.1 SAMPLING PROGRAM DESIGN

The overall sampling program for collection of sediment, benthic invertebrates, and tissue from the West Basin was designed on the basis of using statistical methods to enhance the usability and effectiveness of data elements. To accomplish these objectives, three major elements of statistical representativeness were taken into consideration: randomness; adequate representation of reference conditions; and sample replication. The discussion below provides a summary of the rationale for each of these elements which are intended to strengthen the overall statistical basis of the study design.

5.1.1 Randomness

Randomness is an important statistical element because it enhances the representativeness of conditions encountered in the field and reduces sampling bias. The basic program is comprised of a stratified random design. This means that elements of both biased and random sampling were incorporated into the site assessment. Two key examples of random design include the randomly placed point of origin for the sediment sampling grid and the selection of locations of trawl transects used to collect fish within the West Basin. Biased sampling was necessary for example, in order to evaluate whether the piers constitute a potential secondary source of contaminants.

5.1.2 Adequate Representation of Reference Conditions

Adequate representation of reference conditions is important because reference data provide a regional perspective for comparing test station data to a local benchmark. The sampling program was designed for statistical comparison between West Basin test stations and reference stations, providing a site-specific evaluation of potential impact. To this effect, reference conditions were characterized by collecting samples from three reference stations located within San Pedro Bay.

5.1.3 Replication

Replication in an environmental sampling program is important because it represents the variability inherent in physical and biological systems. Therefore, although test stations were generally sampled only once for chemical and biological measurements, two field measures were taken to represent variability between test stations and reference stations. These measures included: 1) replicating, in triplicate, all chemical measurements at one of the West Basin test stations, Station 1; and, 2) replicating all chemical and biological measurements at reference locations. These replications were conducted to obtain a

R0062447

measure of the field variability encountered. In other words, the more intensive sampling conducted at Station 1 and reference locations provided a more complete insight into the natural variability of physical and biological conditions in sediment. When the complete data set becomes available, sediment evaluation zones will be defined, wherein individual test stations will be treated as field replicates within specific areas (sediment evaluation zones) using chemical, physical, or other characteristics to define areas of homogeneity. West Basin test stations will represent replicates within each sediment evaluation zone, and replicates at reference locations will provide an estimate of variation encountered at specific reference locations.

5.2 SAMPLE COLLECTION

This section summarizes the rationale used in designating locations for sampling of surface sediment, subsurface sediment, and fish tissue, including both test and reference locations, by data set. This section also provides a review of the samples collected at West Basin and reference stations. Figures 5-1 and 5-2 show the locations from which each sample was collected.

5.2.1 Surface Sediment

The objective of surface sediment sampling was to characterize the toxicity and ecological impact of surface sediments in West Basin. To achieve this objective, sediment samples were collected from 45 West Basin sampling stations, nine of which were taken from under Piers 1, 2, 3, 6, 7, 9, 12, 15, and 16, for the purposes of physical and chemical analyses, a suite of sediment bioassays, and benthic community analysis. Some of these stations were sampled for analysis of bioaccumulation in clams as well. Sediment samples were also collected from reference stations 40010, 40018, and 40032, and were subjected to the same testing procedures as the test samples.

The overall sampling design for surface sediment within West Basin, where sediment was collected to a depth of 10 cm to represent conditions in surficial layers, was established as a grid (Figure 5-1), with individual stations placed about 300 meters apart. The point of origin for this sampling grid was randomly selected to enhance statistical representativeness; this selection complied with the procedures described in the RI/FS Sampling and Analysis Plan (JEG 1993b).

5.2.2 Subsurface Sediment

The basic purpose of subsurface sampling was to characterize the vertical extent of contamination within different areas of West Basin and at the reference stations, and to assess possible adverse effects associated with potential remedial actions such as dredging. The sampling design included collecting subsurface sediment core samples from 3-meter and 5-meter sediment cores. For this purpose, four 3-meter and 5-meter cores each (total of 8 cores) were taken from within the West Basin. Three of the 5-meter cores were taken from underneath Piers 2, 12, and 15. In addition, two 5-meter core samples were intended to be taken at reference stations 40010 and 40018. However, as a result of

VOL 18
0513
R0062448

encountering refusal to penetration of corer because of dense sediment at Station 40010, one 5-meter and one 3-meter core were actually collected. The sediment samples were obtained from the cores in the following manner:

- two subsamples (one from 0 to 1 meter and the other from 1 to 2 meters) each from four 3-meter cores (total of 8 samples),
- five subsamples each (one per 1-meter horizon) from four 5-meter cores (total of 18 samples because one of the cores yielded only 3 samples), and
- five subsamples from one 5-meter reference area core and two subsamples from one 3-meter reference area core (total of 7 samples).

5.2.3 Fish Tissue

The purpose of collecting and analyzing fish tissue from the West Basin and reference stations was to determine whether chemicals of potential concern associated with LBNC activities could have potentially contributed to contaminants reported in fish tissue which, in turn, could contribute to ecological or human health hazards. To achieve this purpose it was first necessary to identify appropriate fish species that could be collected in the required numbers. Several key selection criteria were used to select fish species to be evaluated in order to reduce the chances that some species could contribute to underestimation of risk. Potential fish species to be collected were pre-selected based on the following criteria: (1) commonly caught and eaten by human consumers or marine predators at or near the study site; (2) have commercial, recreational, or subsistence fishing value; (3) at least partially bottom feeders in relatively close contact with potentially contaminated sediments, and are therefore more likely to take contaminant residues directly from bed sediments; (4) have a propensity to bioaccumulate contaminants (i.e., have a relatively high tissue lipid content), and (5) are relatively localized rather than highly mobile or seasonally migratory.

Table 5-3 presents the fish species pre-selected for collection, including specific rationale for each species selected. Barred sand bass (*Paralabrax nebulifer*), hornyhead turbot (*Pleuronichthys verticalis*), and California halibut (*Paralichthys californicus*) were identified as the most appropriate species to meet the objectives of the fish sampling and analysis program. Once in the field, however, the actual fish catch was dominated by white croaker (*Genyonemus lineatus*) and California halibut, both of which were therefore retained for whole body and muscle fillet chemical analysis.

Collection of fish from the West Basin was conducted using an otter trawl operated from a sampling vessel, from trawl transects selected using stratified random approach within the West Basin (Figure 5-1). At least one trawl transect each was selected within three areas of West Basin: the NAVSTA, the LBNSY, and the main channel, each representing distinct areas of land or Naval activities within West Basin, with distinct physicochemical characteristics. For example, circulation within the innermost portions of the West Basin is limited and, therefore, particle size distributions are markedly different from other areas of the West Basin, thereby affecting the biological habitat. The trawl transects were

VOL 18
0514
R0062449

selected randomly with the intent of preventing bias factors (e.g., contamination levels, land use, and characteristics of bottom sediments), but were also selected in partial consideration of logistics (e.g., where space was available adjacent to piers or other structures). Trawl transects at reference stations 40010 and 40018, however, were not randomly generated, but placed with the intent of representing reference conditions at the same locations from which sediments were collected. A total of 72 fish were collected, both from West Basin and reference stations, in groups of three, in consideration of the need for statistical representativeness (see Table 5-2).

5.3 LABORATORY ANALYSES

The evaluation of potential West Basin sediment toxicity relies on chemical analysis, bioassays, tissue bioaccumulation data, and benthic community analysis. The results of these tests are then used to evaluate ecological risk, human health risk, and to determine whether sediment requires remediation. Thus, the rationale for obtaining laboratory analyses of samples included:

- Chemical and physical data from surface sediment to be used in the interpretation of the bioassay, tissue bioaccumulation, and benthic community tests;
- Sediment solid and aqueous (porewater) phase bioassay data to determine if toxicity is associated with West Basin sediments;
- Chemical residue data from fish and clam tissue to determine if potential sediment contaminants have a significant bioaccumulation potential (evaluation of long-term effects);
- Benthic community analyses data to provide a direct index of *in situ* effects of potential sediment contamination to native benthic biological communities; and,
- Chemical and physical data from subsurface sediment to evaluate possible adverse effects associated with potential remedial actions involving dredging.

Figure 5-1 shows the locations of both sediment samples and fish collection transects inside the West Basin; Figure 5-2 shows the locations of reference stations within San Pedro Bay. Table 5-1 summarizes the types of data with associated numbers of samples collected by location within the West Basin, as well as at reference stations. All of the samples described below were collected at both test and reference stations. Data collection included:

- **Surface Sediment Chemistry.** Modified U.S. EPA priority pollutant chemistry, organotins, moisture content, acid volatile sulfide/simultaneously extracted metals (AVS/SEM), total sulfides, and physical characteristics (total organic carbon [TOC] and grain size) of surface sediments were measured (one suite per station, for a total of 56 samples).
- **Subsurface Sediment Chemistry.** Modified U.S. EPA priority pollutant chemistry, organotins, moisture content, and physical characteristics (TOC and grain size) of several subsurface sediment cores to 3-meter and 5-meter depths, with discrete 1-meter horizons taken from most of the cores, were measured (total of 33 samples

VOL 18
0515
R0062450

taken from 10 cores). Bioassay and bioaccumulation tests were not conducted on subsurface sediment because of the naturally occurring toxicity associated with anaerobic conditions.

- **Bioassays.** Three invertebrate bioassays were conducted measuring six independent toxicity endpoints. Solid phase sediment and porewater samples were collected at a frequency of one suite per station, for a total of 60 samples. Endpoints measured by the bioassays included mortality (using a suitably representative amphipod, polychaete, and echinoderm), growth (polychaete only), and developmental abnormalities (echinoderm only). Reburial of amphipods was also measured, because it provides information concerning the sublethal response of amphipods. The amphipod and polychaete tests evaluated the solid phase sediment, while the echinoderm development tests evaluated the toxicity of porewater extracted from sediment.

- **Benthic Infaunal Invertebrate Analysis.** Benthos was sieved from sediments (1.0 mm sieve size) and analyzed in the laboratory (one benthic grab per station, for a total of 60 samples).

- **Tissue Residue Analysis.** A 28-day laboratory clam bioaccumulation test was conducted using modified U.S. EPA priority pollutant chemical measurements in tissue (total of 14 samples taken at a frequency of approximately 1 in 4 test stations).

- **Bottom-dwelling Fish Analysis.** California halibut and white croaker were collected, using modified U.S. EPA priority pollutant measurements of whole body tissues, and PAH and metabolite measurements of fish bile (total of 45 whole body samples, 18 bile samples) were collected to address potential ecological concerns. California halibut and white croaker were also collected to address potential human health concerns, using modified U.S. EPA priority pollutant measurements of whole body and muscle fillet tissues (total of 45 discrete whole body samples and 18 muscle fillet samples) (see Table 5-2).

5.4 SELECTION OF REFERENCE STATIONS

A two-phased approach was taken to support final selection of reference stations. The approach included: (1) selection of candidate reference stations in the field and sampling the candidate stations; and (2) evaluation of data from each of the candidate reference stations to determine which were most applicable for statistical comparison with West Basin stations. This section summarizes how each of these activities was conducted.

BNI and the DON held a series of meetings with the LARWQCB and telephone conversations with SWRCB and California Department of Fish and Game (CDFG) for the purpose of identifying stations within San Pedro Bay, located in less urbanized settings, for the purpose of defining regional reference conditions. This involved obtaining chemical and biological data from the state-sponsored BPTCP to evaluate whether bioassay organisms appeared to survive and whether chemical contamination was absent. These candidate stations are shown on Figure 5-2. During field activities, sediments collected from these candidate stations were visually inspected to assess whether the

VOL 18
0516
R0062451

texture (particle size) appeared to be similar to that of the West Basin (test) sediments. Based on this evaluation in the field, BPTCP stations 40010, 40018, and 40032 were selected as candidate reference stations and sampled (Figure 5-2).

After the laboratory data were obtained, the candidate reference stations were again evaluated for appropriateness in supporting statistically defensible comparisons with data collected from West Basin stations, as follows:

- Grain size and TOC data from candidate reference stations were evaluated for similarity with test stations to determine the applicability for evaluating chemical and biological data.
- Chemical data from candidate reference stations were scanned for the presence of contaminants, and ultimately grouped together to create a pooled project reference database.
- Biological (bioassay) data from candidate reference stations was subjected to comparison with biological performance criteria, based on survival of control organisms, to determine whether the station could be appropriately used as a reference station.

Defining reference conditions for the site assessment is important because they provide a regional benchmark with which physicochemical and biological data from the West Basin can be compared. Reference stations were selected for suitable physical parameters (especially sediment TOC, grain size, and water depth) to assure comparability with specific test stations. These parameters are important because they: 1) determine the nature of the benthic habitat (e.g., through mechanisms of oxidation/reduction, sunlight, currents, and tidal action); and, 2) such properties play a significant role in determining sediment toxicity through mediation of contaminant bioavailability in sediment. In this manner, reference stations most similar in physical characteristics to corresponding West Basin test stations were selected and incorporated into the study design to promote statistically defensible comparisons between test and reference stations. Based on the above process, all reference stations were pooled (n=9) to create a project reference data set for chemical analytes. Of the possible fifteen reference samples collected and tested with the battery of bioassay tests, only those samples which passed the reference sediment performance criterion were retained for further statistical comparison with West Basin samples. The reference sediment performance criteria used in selecting project reference stations are described in subsequent sections.

5.4.1 Chemical Performance Screening Criteria

The purpose of pre-defined chemical performance criteria is to determine whether chemical concentrations at regional reference locations are adequate to define ambient chemical conditions. Appropriate chemical criteria would include preliminary remediation goals (PRGs) based on specific exposure pathways or existing numerical criteria. If regional reference concentrations exceed these concentrations, they may not be appropriately regarded as representing reference conditions.

VOL 18
0517
R0062452

No such chemical criteria were available or were defined for project reference stations at Site 7, because the stations selected were recommended by the state-sponsored BPTCP as defining reference conditions. Chemical concentrations were generally low, which corresponded to the less urbanized setting encountered in outer San Pedro Bay. In addition, biological performance criteria were defined (see below) to determine whether proposed reference locations appeared to be toxic.

5.4.2 Bioassay Performance Criteria

Technical Memorandum No. 4 (BNI 1994b) specifies biological performance criteria for sediment bioassays, presented as a tiered hierarchy for interpreting bioassay test results. These criteria were developed for negative controls to determine whether individual laboratory tests were valid, for positive controls (reference toxicants) to establish the sensitivity of test animals, for reference sediment to determine whether candidate reference locations are appropriate for statistical comparisons with test stations, and for test sediment to determine whether test data are statistically significantly different from reference data. Table 5-4 shows specific biological performance criteria for each test organism.

These criteria are valid assuming a laboratory control organism survival rate greater than 90 percent. Exceeding both of the above performance criteria constitutes a definitive "hit" for bioassay tests, implying that natural variability is screened out as a potential "cause" or indicator of toxicity. As an example, Figure 5-3 shows how biological performance results would be evaluated through a dichotomous key to ultimately lead to a "hit" or "negative" result.

5.4.2.1 NEGATIVE CONTROL PERFORMANCE CRITERION

Table 5-4 shows that mean mortality in control amphipod and polychaete organisms greater than 10 percent or abnormal echinoderm development of greater than 30 percent constitutes a test failure. In addition, individual replicate mortality in control polychaete organisms must be less than 20 percent.

5.4.2.2 POSITIVE CONTROL PERFORMANCE CRITERION

Control organisms were also exposed to a standard reference toxicant for 96 hours and concentration-response data (lethal concentration for 50 percent of test organisms, LC_{50}) evaluated and compared to the overall laboratory mean for that particular species. The reference toxicant used for the purposes of this project was cadmium chloride. The LC_{50} results for each control batch must fall within 2 standard deviations of the overall laboratory mean in order for the bioassay test to be considered valid.

5.4.2.3 REFERENCE SEDIMENT PERFORMANCE CRITERION

Table 5-4 shows that the relative difference between reference station and laboratory control values for mean mortality and abnormality (echinoderm) must be less than or equal to 20 percent; the relative difference between mean individual weight (polychaete) in

VOL 18
0518
R0062453

reference station and laboratory controls must be less than or equal to 30 percent (see Figure 5-3). Relative mean differences greater than 20 percent or 30 percent, as appropriate, constitute a reference failure and such "failed" reference data cannot be further used in the bioassay data evaluation process.

5.4.2.4 TEST SEDIMENT PERFORMANCE CRITERION

Table 5-4 shows that evaluation of the test sediment, or data interpretation, performance criterion actually involves a two-step evaluation process for each bioassay endpoint. First, the relative mean difference of mortality, mean individual weight (polychaete), and abnormality (echinoderm) between test and reference stations must be determined. The relative mean difference must be less than or equal to 20 percent for mortality and abnormality and less than or equal to 30 percent for mean individual weight in order for the test sediment to have "passed" the bioassay, i.e., relatively little difference between test and reference station toxicity. Second, test and reference station results are statistically compared at the α=0.05 level. The results of these two analyses (relative mean difference and statistical comparisons) are then evaluated for each test station to determine the ultimate bioassay test result, i.e., "hit" or "no hit".

SECTION 6

FIELD METHODS

0520

VOL 18 0521

Section 6
FIELD METHODS

This section describes the field equipment and procedures used to collect sediment and tissue samples within the West Basin and at the project reference locations. Discussions also include sample documentation procedures, decontamination procedures, and handling of Investigation Derived Waste (IDW).

6.1 MOBILIZATION

Activities conducted prior to mobilization for commencement of field operations included obtaining site clearance and developing site specific Health and Safety procedures. These activities are described in subsequent sections.

6.1.1 Site Clearance

As part of mobilization for sampling, clearance was obtained from Naval authorities to assure that Naval activities would not conflict with those planned for sampling, and that known physical obstructions which could prevent the collection of sediment and tissue samples were identified. The appropriate authorities at LBNC were contacted to obtain clearance to sample both sediment and fish tissue within the West Basin, whether by sampling vessel, land-based drilling rig, or by divers. Clearance was obtained through the SWDIV Remedial Project Manager, the Environmental Coordinators for both NAVSTA and LBNSY, the Naval Diving unit at LBNSY, the Operator of the Fuel Pier, and the Shipyard Control Tower which monitors and directs all ship movements within West Basin. All sampling activities were cleared with the appropriate officers prior to undertaking of any sampling.

6.1.2 Health and Safety

Field activities were conducted in accordance with the site-specific Health and Safety Plan and the BNI CLEAN II Health and Safety Standard Operating Procedures. A copy of the Health and Safety Plan, excerpted from the Health and Safety Close-Out Report, is included as an Appendix. Health and Safety coverage was provided continuously during field activities, focusing on areas of greatest potential hazards to safety and health such as work over water, extended time periods away from land, heat stress, and exposure to airborne contaminants. Personnel involved in field operations attended a mandatory Health and Safety briefing at the onset of field work. A Health and Safety officer accompanied the field team in its work.

During sediment sampling activities, air monitoring was conducted to assess potential airborne exposures. No air monitoring was conducted during fish collection. Use of appropriate personal protective equipment was required where personnel were expected to handle potentially contaminated sediments.

R0062456

6.2 NAVIGATION AND POSITIONING

The RV Crusader, a 40-foot survey vessel provided by MEC Analytical Systems, Inc., was used as the sampling vessel. It was equipped with a Magnavox MX 200 differential global positioning system (GPS) unit, and a six-channel receiver/navigator augmented with the Pinpoint AccuPoint differential GPS FM radio band correction for continual tracking. Accuracy was improved with real-time differential correction signal by AccuPoint, which provided ± 2 meter accuracy. A few station locations were slightly shifted during sampling at the request of the field sampling manager (e.g., when moored ships blocked access to stations along piers). To assure the highest degree of accuracy, the antenna receiving the GPS signal was mounted at the apex of an A frame mounted on the stern of the survey vessel, directly above the point from which the sampler is suspended during sample collection. GPS readings were recorded at each sampling location, and are shown on Table 6-1. Readings from the GPS system were recorded at both the beginning and end of each sampling day at the same location (point of departure and arrival at the dock) to serve as a point of calibration for the system.

6.3 SAMPLE COLLECTION

Both sediment and fish samples were collected during several sampling events. Depth of sediment samples ranged between the upper 10 cm (surface sediment) and depths of 3 to 5 meters (subsurface sediment).

Surface sediment samples were collected using two different procedures as dictated by site conditions. A box corer, deployed from the RV Crusader, was used in open waters, and divers were used for sampling under piers. The 3-meter subsurface sediment cores and some of the 5-meter subsurface sediment cores were collected using a Vibra-corer deployed from the RV Crusader. For those piers requiring subsurface sediment sampling (5-meter cores at Piers 2, 12, 15), a Vibra-corer operated from a land-based drilling rig was used to sample sediments because of lack of accessibility to the sampling point beneath the piers by the vessel. All fish tissue was collected using an otter trawl deployed from the survey vessel.

6.3.1 Surface Sediment

The following discussion summarizes the equipment and procedures used to sample surface sediment.

6.3.1.1 EQUIPMENT

Box Corer

A box corer sampling device, having a surface area of 0.1 m^2, was used for all surface sediment samples collected using the survey vessel using procedures described below. Box corers are acknowledged to provide an excellent means of yielding undisturbed sediment samples (Mudroch and MacKnight 1991). The box corer was deployed from the A-frame at the stern of the RV Crusader using a hydraulic winch. The box corer operated

VOL 18
0522
R0062457

mechanically and was pre-coated with Teflon® inserts to eliminate potential contamination from the sampler surfaces.

Diver Collection

Surface sediment samples located under the piers (eleven stations from beneath nine piers, shown on Figure 5-1) were collected manually using divers, as outlined below. The hand-held samplers were fitted with lids to reduce disturbance of sediment samples as the divers ascended to the water surface. The hand-held rectangular plastic scoops, 10 cm deep with a surface area of 0.06 m^2, were designed to collect sediment samples with minimal disturbance.

6.3.1.2 PROCEDURES

Box Corer

Surface sediment samples were collected from the top 10 cm at each of the 45 sampling locations within the West Basin and reference stations, and prepared aboard the vessel for chemical, physical, and biological analysis. These samples were collected using the box corer described above. Pre-measured Teflon® inserts were placed inside the box corer to assure that sediment samples were not contaminated by contacting the metal surfaces of the sampler.

Sampling procedures using the box corer are summarized below:

- The vessel first depolyed a marker buoy at the sampling location, using pre-established GPS coordinates for positioning.
- The vessel was then maneuvered to within a 3-meter radius of the marker buoy and the box corer deployed using an on-board winch and stern-mounted A-frame.
- The GPS coordinates were recorded upon deployment of the sampler, along with the depth of the sampling location.
- Deployment procedures included first dropping the box corer to the bottom of the water column. Upon reaching the sediment surface, the box corer penetrated into the sediment due to its weight. As the sampler was retrieved from the sediment surface, the weight of the sample forced its jaw mechanism to close, thereby extracting a sample of the sediments. The box corer was then lifted to the surface and sealed in a frame mounted on the deck to facilitate sample processing.
- Water overlying the sample was siphoned off from the box corer and discarded overboard.
- The first drop of the box corer at each sampling location was always used for collection of benthic infaunal invertebrates to assure that sediments were undisturbed by previous drops at that location. The surface of each sediment sample was photographed and the field log annotated with the film roll number and frame number. Visual observations concerning the presence of items such as detritus, larger organisms, seaweed, were recorded in the field logbook at the time of sampling. A corer insert, used to sieve benthic invertebrates and to provide a

VOL 18
00523
R0062458

sample of 0.06 m^2 in surface area and 10 cm in depth, was then pressed into the sediment to assure a standard sample size and depth.

- The sediment from within the insert was removed and placed on the wash table and washed (with a hose) through both 1.0 and 0.5 mm mesh stainless steel sieves. The 1.0 mm sieve was placed on top of the 0.5 mm sieve to assure retention of the entire sample. Once the samples were thoroughly washed through both sieves, the benthic organisms retained on each sieve were collected with forceps and placed in separate jars with 7 percent magnesium chloride salt solution for approximately 30 minutes to promote relaxation of the organisms. The samples were then transferred to a 10 percent formalin solution to preserve the animals. The jars were double labeled, inside the jar and on the lid, (e.g., station location, time of sampling, date, sampler, and sieve mesh size) and placed in storage until transferred to the benthic laboratory.
- Both the box corer and the insert were then rinsed clean with seawater prior to redeployment; the rinse water discarded overboard.
- The box corer was then dropped as many times as needed to achieve the specific sample volumes required for physical, chemical, and bioassay analyses. At each sampling location, the insert was used to measure the amount of sediment sample collected (top 10 cm, 0.06 m^2 surface area). A sediment volume of 1,250 mL was collected at each station using large Teflon® spoons for chemistry, 1,000 mL for TOC and grain size, and 5.5 gal for bioassay testing. Sediment collected for the solid phase bioassay (approximately 5 gal) was placed in a clean sample bag, contained in a gallon-calibrated bucket on deck. Sediments collected for the porewater bioassay (approximately 0.5 gal) were sealed in an airtight bucket following nitrogen purging to assure that samples were maintained in an oxygen-free environment.
- For stations requiring bioaccumulation testing, an additional 5 gal of sediment was collected in the same manner as above.
- At the completion of sampling at each station, personnel washed down their boots and gloves with fresh seawater. Chemical sampling implements were decontaminated following the procedures described in a subsequent section.

Diver Collection

For diver-collected surface sediment samples located below the piers, sampling stations (identified on Figure 5-1) were located visually using on-shore landmarks. Divers utilized hand-held rectangular plastic scoops to collect the sediment samples. The sediment samples were collected with minimal disturbance and in a uniform manner, by pressing the scoop into the sediment to the 10 cm mark, gently removing the full scoop from the bottom and covering it with a fitted cap. The diver then brought the filled and capped scoop to the surface. Each sample was inspected at the surface by field personnel to assure that an undisturbed sample was retrieved and that adequate volume had been collected. As with sediment collected from the survey vessel, sediment samples used for benthic infauna were taken first. All samples were processed in the same manner as

VOL 18
0524
R0062459

described above for samples collected from the survey vessel, to minimize or eliminate differences caused by the sediment sample collection methods.

6.3.2 Subsurface Sediment

The following discussion summarizes the equipment and procedures used to sample subsurface sediment.

6.3.2.1 EQUIPMENT

Subsurface sediment samples were collected using a Vibra-corer deployed from both the survey vessel in open waters (3-meter or 5-meter cores) and from the top of piers using land-based drill rigs (5-meter cores only).

The coring system used for vessel-deployed subsurface sediment sampling was the Impact Driven Coring System (IDCS). The IDCS is a hydraulically operated sediment sampling system with a uniquely designed hammer to drive an aluminum core tube assembly into the sediment. The core tube assembly is driven incrementally into the sediment with very high instantaneous velocity. During the coring operation, the penetration of the core pipe was continuously monitored and recorded. The percentage of material recovered for penetration interval was also directly available from the core-acquired data.

The impact-generating hammer was mounted on a lightweight guide/support assembly. An integral, hydraulically operated core-extraction winch was mounted in the base of the guide/support assembly, which generated up to 15,000 pounds of pull-out force after the core tube assembly was driven to the desired depth. The integral core-extraction winch allowed extraction of the core tube without bending, prior to lifting the coring system off the bottom with the vessel-mounted winch. The sampler was equipped with a core-retention device at its leading edge to aid in sample recovery.

The coring system used for sampling sediments located beneath piers comprised a Vibra-corer operated from a Mobile B-61 drill rig. At each pier designated for subsurface sediment sampling, access through the pier deck was cleared and the drill rig positioned over the opening. The access openings at various piers comprised a stillwell for a former tide gauge, a manhole, and an expansion joint. These deck openings eliminated coring through the pier decks.

Stainless steel casing, with 4-inch inside diameter (ID), was advanced through the deck opening and into the sediment below by the vibrating hammer operating at 80 to 150 Hertz. The hammer and the deployment of the casing were hydraulically operated from the drill rig. Upon completion of the desired depth of penetration into the sediment, the casing containing the sediment sample was retrieved.

6.3.2.2 PROCEDURES

Sediment samples retrieved using the land-based and vessel-deployed coring systems were uniformly homogenized and combined either for each of the five 1-meter intervals (5-meter cores only) or the upper two 1-meter intervals (3-meter cores only) These

VOL 18
00525
R0062460

samples were retained for physical and chemical analyses only; no biological analyses were conducted. Observations of sediment physical properties, such as texture, color and odor, were also recorded during sampling.

3- and 5-Meter Cores Using Survey Vessel

Field sampling procedures for subsurface sediment collected using the survey vessel are summarized below:

- A marker buoy was deployed at the sampling location (Stations 6, 8, 14, 24, 29, and two reference stations; see Figure 5-1), in a manner similar to that used for surface sediment sampling described earlier.
- The vessel was then maneuvered to within a 3-meter radius of the marker buoy. The GPS coordinates were recorded.
- The hydraulic system on the vessel was connected to the corer with hydraulic hose and safety rope, and the corer was driven into the sediment to the appropriate depth (3 or 5 meters).
- When the appropriate depth of penetration was reached, coring was stopped, and the core sleeve assembly, made of disposable aluminum, was then extracted by the guide-assembly-mounted extraction winch.
- After core samples were retrieved, the core was extruded on board the vessel, carefully measured using a tape measure to indicate the depths from which each subsample was taken, and cut into 1-meter long sections. The core was cut using decontaminated equipment to avoid cross-contamination. Sample boring logs were kept to record all observations by specific depth.
- For 3-meter cores, the two upper 1-meter sections were homogenized and sampled, with the lower meter (2- or 3-meter in depth) photographed and recorded in the boring log.
- Each section was placed in a clean 5-gallon bag and homogenized by hand, using sterile gloves. The homogenized samples were then placed into the appropriate sample containers.

5-Meter Cores Using Drill Rig (Piers 2, 12, and 15)

Procedures for sampling of subsurface sediments using the land-based drilling rig were similar to the procedures used for subsurface sediment sampling in open waters, except that the drill rig replaced the survey vessel and the GPS or other navigational system was not used. Sample locations on the three piers requiring drilling had been identified and noted earlier when the divers had collected surface samples from beneath the same piers. Prior to commencement of drilling activities, piers were inspected from both above and below for evidence of piping, structural supports, or other obstructions potentially impeding sampling. Following this reconnaissance, the appropriate authorities were contacted before beginning sampling operations.

VOL 18
0526
R0062461

The casing containing the sediment sample was retrieved and placed on a Visqueen® covered surface on the pier deck. The sediment inside the casing was extruded, using compressed nitrogen at a pressure of 10 psi, directly into an aluminum foil covered trough of approximately 4-inch ID and slightly longer than the core expected to be inside the casing. The use of a trough allowed observation of the complete sediment core for purposes such as photography, measurements, and description. Following these tasks, sediment samples were extracted from the core in the same manner as described above for ship-based operation.

One-meter long core sections were scooped into a 5-gallon bucket lined with a disposable plastic bag. The sediment sample was homogenized using disposable trowels and by hand using sterile gloves. The homogenized sample was then placed into the appropriate sample container.

Sample information recorded on the sample data sheet included the sampling date and time, core number, sample interval, vertical distribution of visible contamination (if discernible), description of layering, description of soil (following American Society for Testing and Materials [ASTM] Method D2488-84), lithology, sorting, color, structure, presence of debris or detritus, relative density or consistency, relative moisture content, remarks, and the name of the observer.

6.3.3 Fish Sample Collection

The following discussion summarizes the equipment and procedures used to sample fish tissue and collect fish bile.

6.3.3.1 EQUIPMENT

Fish were collected using an otter trawl deployed from the RV Crusader using a hydraulic winch. The otter trawl used was a 4.9-meter headrope trawl net with a 2.5-cm mesh and a 1.3-cm mesh cod end liner.

6.3.3.2 PROCEDURES

Pre-established transects within the West Basin were trawled for 5 minutes of bottom time (timed from the end of cable payout to start of retrieval) at a speed of approximately 2.0 knots. Wire scope was set according to water depth and the guidelines of Mearns and Allen (1978). Bottom distances trawled were approximately 300 to 380 meters in length plus the distance covered to let out winch wire and retrieve the nets. Thus, about 500 to 700 meters was needed for each trawl, which in the West Basin required extensive maneuvering of the sample vessel. Upon retrieval of the trawling nets, individual fish were identified and enumerated for comparison against the expected numbers and types of each species (see Table 5-2). This approach was used to assure that adequate numbers of each species were collected as replicates for statistical purposes. An attempt was made to collect three species from each transect at which fish were collected, including those taken from the West Basin and from reference areas as well.

VOL 18
0527
R0062462

Planning of trawl paths included considerations of the desired sampling area, bathymetry, and the total distance required to deploy, trawl, and recover the net. Positions and times were recorded for initial net deployment, where the net began to "fish" along the bottom, and where the net recovery was started. In several cases, significant debris was collected by the net, but slight variations in the subsequent trawl tracks permitted valid sampling.

Upon retrieval of the net, the trawl sample was emptied into a large tray. After the fish were identified by species, they were weighed and measured, using standard length measurements, and visually inspected by an on-board specialist for the presence of lesions, parasites, or deformities. These visual observations were recorded in the field logbook. This sampling was conducted by maneuvering the sampling vessel away from cables, avoiding areas which appeared contaminated, and performing sections away from areas potentially exposed to airborne stack exhaust. Whole body samples were taken by sacrificing the animal using impact to avoid blood loss, and muscle fillet samples were taken using sterile, disposable scalpels. Both types of samples were wrapped in clean aluminum foil, bagged in Ziploc® baggies, appropriately labeled, and immediately cooled on blue ice in coolers.

Quality control in the field was maintained by visual examination of the net and the samples, in particular, checking for invertebrates in the net (benthic invertebrates which could only be collected by proper trawling of the net along the bottom) and ensuring proper scope of trawl line to depth ratio (5:1) was used.

Fish Species Collected

Collection of fish tissue was based on (1) pre-determined candidate species, and (2) the availability of these species during the sampling time period (August-September 1994). During the sampling event, predominantly two species of fish, the California halibut *Paralichthys californicus* and the white croaker *Genyonemus lineatus*, were found in the trawl net at all transects. On the basis of selecton criteria described above, these two species of fish were collected and sampled for whole body (45 samples) and muscle fillet (18 samples). In addition, 18 halibut were used for the purpose of extracting bile from the gall bladder of each specimen.

An attempt was made to collect three specimens of the desired species per trawl. If after three attempts this number of specimens had not been collected, the sampling vessel was instructed to proceed to the next transect.

Fish Bile

Of the 18 California halibut used to obtain samples of bile, nine were used to obtain samples of muscle fillet as well. This reduced the numbers of fish sacrificed and improved the database by providing additional information (muscle tissue body burden and bile concentrations) from the same nine fish. Fish were carefully resected in the field using a sterile, disposable scalpel and a visual determination made by inspection of the gall bladder to determine whether a minimum of 50 µL of bile, a bright green fluid, appeared to reside within the gall bladder. If so, the bile was extruded from the gall bladder of the live fish

VOL 18
0528
R0062463

using a sterile, disposable syringe and transferred into 3 mL amber vials for chemical analysis of PAH metabolites. Sample vials were immediately labeled and frozen on dry ice in preparation for immediate shipment to the chemical laboratory.

6.4 SAMPLE DOCUMENTATION

This section describes the field logs and chain-of-custody (COC) forms used to document sample collection, description, and shipment.

6.4.1 Field Logs

Relevant sampling information was documented in the field logbooks, including detailed visual observations. Sample logs included:

- date and time of sampling;
- sampling conditions;
- visual observations of the sediment collected (both surface and subsurface), including the presence of detritus, detectable odors, and physical characteristics;
- obstructions, such as logs, ships, or buoys, affecting sample placement or retrieval;
- detailed boring logs for the sediment cores collected;
- activities at or adjacent to the piers where sampling was conducted;
- water depth, turbidity, the presence of sheens or other characteristics; and
- Naval or other ship traffic.

6.4.2 Chain-of-Custody Forms

COC forms were filled out at the time of sampling for every sample taken. These forms accompanied the samples from the sampling location to the respective laboratories, depending on the type of sample collected and the type of analysis required. BNI retained a copy of the COC forms for completeness of records, and transmitted the original form to the laboratory representative for shipment along with the samples to the laboratory.

6.5 SAMPLING EQUIPMENT DECONTAMINATION

For many types of sampling, disposable equipment was used whenever possible because it precludes the need for decontamination and because the chances for cross-contamination are virtually eliminated. Disposable equipment was used for vessel-deployed subsurface sediment sampling (disposable core barrel) and for all of the fish tissue sampling (scalpels and syringes). The remainder of the surface and subsurface sampling required decontamination of implements used to sample for sediment chemistry. Minimal decontamination was required for biological samples; it was necessary only to remove visible sediment particles from the implements that could affect the results of biological testing.

VOL 18
0529
R0062464

The typical decontamination sequence for surface and subsurface sediment sampling (chemical samples only) was as follows:

- seawater rinse of all visible residual sediment (rinse discarded overboard),
- wash with nonphosphate detergent (i.e., Liquinox, discarded overboard),
- tap water rinse of all exposed surfaces (rinse discarded overboard),
- deionized/distilled water rinse (rinse discarded overboard),
- pesticide grade methanol rinse of all surfaces for organic chemical scans only (rinseate retained onboard in carboy), and
- organic-free water (HPLC grade) deionized/distilled water rinse (twice, rinse discarded overboard).

After decontamination, implements were wrapped with oil-free aluminum foil and/or plastic to prevent recontamination before further sampling. Two decontamination pads, one for the NAVSTA and one for LBNSY, were set up to decontaminate coring sleeves separately. All IDW was retained separately at the NAVSTA and LBNSY pads for ultimate disposal.

6.6 COLLECTION, STORAGE, AND DISPOSAL OF INVESTIGATION DERIVED WASTE

The two types of IDW obtained during sampling activities consisted of methanol-based rinseate, obtained from decontamination of sediment sampling equipment, and sediment cuttings obtained during drilling and sampling operations performed from Piers 2, 12, and 15. Because the latter was classified as a hazardous waste activity, gloves, Tyvek® outerwear, Visqueen® tarpaulins, and miscellaneous sampling detritus were also discarded as IDW. Disposable equipment was used exclusively for the fish sampling; therefore, no decontamination was required. All IDW from Site 7 sampling operations was stored in 55-gallon barrel drums, and disposed of after analysis of contents.

SECTION 7

SUMMARY OF LABORATORY METHODS

R0062466

VOL 18

Section 7
SUMMARY OF LABORATORY METHODS

Laboratory analyses involved physical, chemical, and biological tests performed on sediment, benthic infaunal invertebrate, fish tissue, and fish bile samples. Tests for physical properties included total organic carbon and grain size determinations. Concentrations of U.S. EPA priority pollutant metals, butyltin compounds, total sulfides, acid volatile sulfides, simultaneously extracted metals, pesticides, semi-volatile organic compounds (SVOCs), and PCBs were measured in sediment samples. Fish tissue samples (whole body homogenate and muscle fillet) were analyzed for concentrations of lipids, U.S. EPA priority pollutant metals, butyltin compounds, PAHs, pesticides and PCBs. Fish bile samples were analyzed for equivalent concentrations of selected PAH compounds. Clams that were exposed to sediment samples in the laboratory were tested for concentrations of lipids, U.S. EPA priority pollutant metals, pesticides, PCBs, and PAHs, along with butyltin compounds.

In addition to these analyses, biological testing was conducted on sediment samples. Biological tests included acute and chronic bioassays using collected sediment samples, and benthic community analysis using benthic infaunal invertebrates sieved from sediment.

This section summarizes the procedures used to conduct laboratory analyses. Analytical methods described in Test Methods for Evaluating Solid Wastes (SW-846) (U.S. EPA 1990) were used where applicable. Other methods were used for tests that are not described in SW-846. Laboratory methods and any method modifications, where applicable, are summarized in this section and listed in Tables 7-1 and 7-2 for sediment and fish tissue testing, respectively.

7.1 SURFACE SEDIMENT ANALYSIS

Sediment chemical analyses were performed by Pace Environmental Laboratories, Inc. (Pace), located in Camarillo, California. Pace is a California state-certified environmental testing laboratory (Department of Health Services). Chemical analyses were performed at Pace using methods and quality control criteria specified in SW-846 (U.S. EPA 1990). Sediment physical analyses were performed by MEC Analytical Systems, Inc. located in Carlsbad, California. A list of analytes by method of analysis is shown in Table 7-3.

7.1.1 Physical Methods

All physical testing of surface sediment samples was conducted at the MEC Analytical Systems, Inc. laboratory in Carlsbad, California. Following is a brief summary of the analytical protocols used to measure TOC and grain size distributions in test and reference sediment.

7.1.1.1 TOTAL ORGANIC CARBON

Sediment samples were analyzed for TOC following the method described by Menzel and Vaccaro (1964). Homogenized sediment samples (0.018 to 0.02 g) were digested in concentrated phosphoric acid at room temperature and diluted with distilled water followed by potassium persulfate. Samples were then heated to 259°F at 17 to 19 psi for 6 hours after purging with purified oxygen and cooled overnight in a sealed ampoule.

0532

R0062467

Ampoules were then broken, and the carbon dioxide released from the remaining organic carbon was measured with an infrared detector.

7.1.1.2 GRAIN SIZE

Methods developed by Plumb (1981) were used for grain size analysis. A 30 to 40 g wet weight (ww) subsample was transferred to a 240 mL bottle, mixed with 150 mL of deflocculent (sodium hexametaphosphate), and allowed to stand overnight. The deflocculated sediment sample was sieved through a 64 micron sieve (U.S.A. Standard Testing Sieve No. 230) to separate the sand size fraction from the silt-clay size fraction. The sand size fraction was dried and shaken through a series of eleven U.S.A. Standard Testing Sieves, which ranged from -1.0 to +4.0 phi in 0.5 phi intervals. The phi value describes the grain size diameter and it is calculated as $-\log_2$ of grain size in micros. The fraction of the sample retained on each sieve was weighed on a digital electronic balance. The silt-clay size fraction, between +4.0 to >9.0 phi, was measured in whole phi intervals by standard pipette timed-withdrawal methods, and weights for each phi interval were calculated. These two methods provided fractional weights for each interval measured.

7.1.2 Chemical Analyses

All chemical analyses of surface sediment samples were conducted at the Pace laboratories in Camarillo, California. Following are brief summaries of the analytical protocols used to measure chemical contaminants in test and reference sediment.

7.1.2.1 PRIORITY POLLUTANT TRACE METALS

Sediments were analyzed for the standard U.S. EPA suite of 13 priority pollutant metals (Table 7-1). Approximately 40 g of sediment was acid digested (U.S. EPA Method 3050A). Beryllium, cadmium, chromium, copper, lead, nickel, and zinc were analyzed using inductively coupled plasma emission spectrometry (ICP) (U.S. EPA Method 6010). Antimony, arsenic, selenium, silver, and thallium were analyzed using atomic absorption with a graphite furnace (AA/GF). Mercury was analyzed using the cold-vapor extraction following U.S. EPA Method 7470. The method references are shown in Table 7-1.

7.1.2.2 AVS/SEM AND TOTAL SULFIDES

Acid volatile sulfides (AVS) were analyzed following a U.S. EPA draft method (Allen et al. 1993) for determination of acid volatile sulfide in sediment. The AVS in sediment was first converted to hydrogen sulfide (H_2S) by acidification with concentrated hydrochloric acid at room temperature. The H_2S was purged from the sample and trapped in a sodium hydroxide aqueous solution. Once in solution, the sulfide reacted with n-n-dimethyl-p-phenylenediamine to form methylene blue. Quantification of AVS was performed by measuring the spectrophotometric determination of methylene blue.

Simultaneously extracted metals (SEM) were analyzed following the same U.S. EPA protocol as used for AVS. Sediment samples were analyzed for five divalent priority pollutant trace metals which consisted of cadmium, copper, zinc, lead, and mercury.

VOL 18
0533
R0062468

Metal analysis was performed on the acid digest from the AVS procedure, referred to as the SEM fraction. After release of the H_2S, the acidified sediment sample was membrane filtered. The sample digest was then analyzed for the trace metals using the same method as summarized above for the analysis of total metals.

Total sulfides extracts were prepared following U.S. EPA Method 9030. The impingate collected using this method was quantitated according to U.S. EPA Method 376.2 on a Lachat Flow Injection Analyzer Model 80.

7.1.2.3 BUTYLTINS

Butyltins were analyzed from sediment samples using a GC equipped with a flame photoionization detector (FPD) following the method of Uhler and Durell (1989). Secondary confirmation was performed using gas chromatograph/mass spectrometer (GC/MS). Sediment extraction procedures followed a modification of U.S. EPA Method 3550. After extraction by sonication in hexane-tropolone chelation, the sample was filtered and the filtrate concentrated in a Kuderna-Danish apparatus. The concentrate was then spiked with the surrogate, tripentyltin chloride, and derivatized with a Grignard reagent. The Grignard reaction was quenched after 15 to 20 minutes using acidified water. The organic layer containing the derivatized organotins was collected in a 30 mL screw-topped vial and concentrated using a nitrogen blow-down apparatus. The sample was then subjected to gel permeation chromatography (GPC) or florisil column chromatography cleanup using hexane as the extraction solvent. The sample was concentrated to 0.200 mL and analyzed by GC/FPD.

7.1.2.3 SVOCS, PESTICIDES, AND PCBS

Sediment samples were prepared for both SVOC (U.S. EPA Method 8270) and pesticides and PCBs (U.S. EPA Method 8080) analyses by ultrasonic extraction (U.S. EPA Method 3550). Aliquots of 40 to 100 g of sediment were extracted with methylene chloride. The extracts were concentrated in a Kuderna-Danish apparatus. The pesticides/PCBs extract was solvent-exchanged into hexane. Procedural blanks, matrix spikes, matrix spike duplicates, and standard reference materials were analyzed in the laboratory at a frequency of one per 20 samples. Deuterated surrogates and internal standards were analyzed for every sample.

Sediment samples were analyzed for 19 chlorinated pesticides and seven PCB Aroclors using a gas chromatograph (GC) equipped with an electron capture detector (ECD) (U.S. EPA Method 8080). Compound confirmation was performed using GC/MS. U.S. EPA priority pollutant SVOCs were analyzed by GC/MS following U.S. EPA Method 8270.

7.1.3 Bioassay Methods

All bioassay and bioaccumulation testing was conducted at the MEC Analytical Systems, Inc. laboratory in Tiburon, California. Following is a brief summary of each bioassay test protocol used to measure toxicity caused by sediments (solid phase or pore water).

VOL 18
0534
R0062469

7.1.3.1 POREWATER ACUTE TEST (ECHINODERM)

The purpose of this test was to determine the percent of abnormally developed echinoderm larvae over a 72-hour test period, using sand dollar (*Dendraster excentricus*) larvae as the test organism. Porewater was extracted from collected sediment within 24 hours of collection using centrifugation, and five test concentrations (6.25, 12.5, 25, 50, and 100 percent) in 5 mL samples were used for each test. Each dilution was run with three replicates. Clean seawater was used for sample dilutions. The passing performance criterion for each test was $\geq$ 70 percent normal development in the control. Survival and development data were used to estimate LC_{50} values (lethal concentration for 50 percent of test organisms), IC_{50} (inhibitory concentration for 50 percent of test organisms), and NOEC (no observable effects concentration) for each level of dilution.

7.1.3.2 SOLID PHASE ACUTE TEST (AMPHIPOD)

The purpose of this test was to determine the percent mortality in adult marine amphipods over a 10-day test period, using the standard sediment test amphipod, *Rhepoxynius abronius*, as the test organism. The solid phase was used as collected, with five laboratory replicates run per sample, using 2 cm of test sediment per container. Because it was an acute test and survival rates in test organisms were expected to be relatively high, the passing performance criterion for each test was $\geq$80 percent survival in the negative control. Because bulk sediment was used, no serial dilutions were necessary, and therefore, LC_{50} or IC_{50} values were not calculated as for the porewater acute test. Instead, the percentage of organisms surviving was averaged over the five laboratory replicates. As an additional data point, the percentage of surviving organisms which were capable of reburying in the sediment was also reported as a measure of the vigor of the surviving organisms. Reburial is often considered to be a viable toxicological endpoint for assessing sediment infaunal organisms.

7.1.3.3 SOLID PHASE CHRONIC TEST (POLYCHAETE)

The purpose of this test was to determine the percent mortality in adult polychaete worms and their growth rates over a chronic (28-day) exposure period. This test was conducted using the standard sediment test polychaete worm, *Neanthes arenaceodentata*, as the test organism. The solid phase was used as collected, with five laboratory replicates run per sample. Because it was a chronic test, survival rates in control organisms were expected to be low relative to those used in an acute test; thus the passing performance criterion for each test was $\geq$ 70 percent survival in the negative control. Because bulk sediment was used, no serial dilutions were necessary, and therefore, LC_{50} or IC_{50} values were not calculated as for the porewater acute test. Instead, the percentage of organisms surviving was averaged over the five laboratory replicates. As an additional data point, somatic growth rates were also reported by averaging the weights of dried organisms at the conclusion of the 28-day exposure period. Growth is considered to be a viable toxicological endpoint for assessing the health and viability of sediment infaunal organisms.

VOL 18
0535
R0062470

7.1.3.4 CLAM BIOACCUMULATION TEST

The purpose of this test was to determine the tissue residues of select chemical analytes in clams which have been exposed to site sediments for a 28-day exposure period. This test was conducted using the standard sediment test clam, *Macoma nasuta*, as the test organism. The solid phase was used as collected, with five laboratory replicates run per sample. Although the primary purpose of the test was to conduct chemical analyses, the test was a bioassay and included a measurement of the toxicological response of the clams as well. Because it was a chronic test, survival rates in control organisms were expected to be low relative to those used in an acute test; thus the passing performance criterion for each test was $\geq$ 70 percent survival in the negative control. Because bulk sediment was used, no serial dilutions were necessary, and therefore, LC_{50} or IC_{50} values were not calculated as for the porewater acute test. Instead, the percentage of organisms surviving was averaged over the five laboratory replicates. At the end of the exposure period, the clams were sacrificed, the tissue extracted (see chemical method below), and subjected to chemical residue analysis in tissue.

7.1.4 Benthic Infauna

At the time of preparation of this document, data for benthic infaunal invertebrates were not yet generated. Findings will be included in the RI Report.

7.2 SUBSURFACE SEDIMENT ANALYSIS

The chemical procedures followed for surface sediment chemical analyses, described above, were also followed for the subsurface sediment samples. However, biological tests, total sulfides, and AVS/SEM analyses were not conducted on subsurface sediments because of the naturally occurring toxicity associated with anaerobic conditions. A list of analytes by method of analysis is shown in Table 7-4.

7.3 TISSUE CHEMISTRY

Fish tissue (whole body and muscle fillet) and clam tissue samples were analyzed for bioaccumulation of chlorinated pesticides, PCB Aroclors, PAH, butyltins, priority pollutant trace metals, and percent lipids (Table 7-5). Analyses were also performed on fish bile material for parent PAH metabolite compounds.

7.3.1 Fish Tissue Analyses

Chemical analyses were performed on fish and clam (*Macoma nasuta*) tissue by Pace. Analyses consisted of the following suite of organic and inorganic analytes: chlorinated pesticides, PCB Aroclors, PAH, butyltins, priority pollutant trace metals and percent lipids. Extraction and analytical methodologies followed the methods and quality control criteria specified in SW-846 (U.S. EPA 1990) with appropriate modifications for tissue, as mentioned in the following subsections.

VOL 18

0536

R0062471

7.3.1.1 LIPID ANALYSIS

Lipid analysis in fish was conducted using a Soxhlet extractor with freon to digest the tissue, following U.S. EPA Method 9071. This method specifies 20 g of tissue, but this amount was not always available, especially when analyzing clams. A gravimetric determination was used to calculate percent lipids for both clam and fish.

7.3.1.2 PRIORITY POLLUTANT TRACE METALS

Tissue samples were analyzed for the same 13 priority pollutant metals quantified in sediment samples. The same U.S. EPA methods described above for sediments were utilized for tissue except for lead. Lead was analyzed using AA/GF following U.S. EPA Method 7421. A 5 to 10 g tissue sample was homogenized and digested with concentrated nitric and perchloric acids prior to analysis by ICP or AA/GF (Tetra Tech 1986).

7.3.1.3 BUTYLTINS

Tissue samples were analyzed for organotins using the GC/FPD method described in the above sediment section. In addition, a gel permeation chromatography or florisil clean-up was performed to achieve the practical quantitation limit of 1 µg/kg and reduce viscosity of the extract for injection onto the GC.

7.3.1.4 SVOCS, PESTICIDES, AND PCBS

The methods for tissue extraction and analysis generally followed those used for sediment, except that additional cleanup methods and changes in instrumentation were made to minimize interferences from salts and non-polar fatty acids. Tissue samples were prepared for both SVOC, pesticide, and PCB analyses by Soxhlet extraction (U.S. EPA Method 3540). Aliquots of 10 to 100 g of tissue mixed with anhydrous sodium sulfate were prepared with a 1:1 mixture of methylene chloride and acetone. The extracts were then passed through a large anhydrous sodium sulfate column and concentrated in a Kuderna-Danish apparatus. The sample extracts were then subjected to alumina column (U.S. EPA Method 3610) and GPC (U.S. EPA Method 3640) cleanup.

Chlorinated pesticides and seven PCB Aroclors were analyzed in tissue samples, using the same U.S. EPA method (U.S. EPA Methods 8080) used for sediment samples. Analysis of PAH was performed using GC/MS (U.S. EPA Method 8270) and modified by operating the GC/MS in the selective ion monitoring mode. The SW-846 methods were modified to include use of the Soxhlet extraction, alumina cleanup, and GPC cleanup with the tissue sample matrix (Tetra Tech 1986).

7.3.2 Fish Bile Analysis

Fish bile analysis was performed by Battelle Ocean Sciences located in Duxbury, Massachusetts. All PAH metabolite analyses were performed in accordance with Battelle Standard Operating Procedure (SOP) 5-199 (Polynuclear Aromatic Hydrocarbon Metabolite Analysis of Bile and Tissue Samples using a high performance liquid

VOL 18
0537
R0062472

chromatograph [HPLC]). This method is based on Krahn et al. (1986), and has been applied in a series of PAH metabolite investigations over the past several years. Quality assurance requirements specified in the protocol were followed throughout the testing procedure.

Four PAH homologues were analyzed, which included, two-, three-, four- and five-ring compounds and their metabolites represented by the surrogates: naphthalene, phenanthrene, pyrene and benzo(a)pyrene, respectively. The initial instrument calibration was established and the correlation coefficient of the calibration was determined by analyzing a continuing calibration check standard approximately every 12 samples. Pure methanol "samples" were analyzed as method blanks to monitor background signal. The methanol blank was considered acceptable if no resolved analytes, or unresolved components, were detected at greater than three times the detection limit in the chromatographic region of interest. A set of matrix spike and matrix spike duplicate samples were analyzed with the field samples, as was one set of field sample triplicates.

The samples were logged into the laboratory according to Battelle standard protocols (Battelle SOP 5-199). Samples were stored in a freezer at approximately -20°C until the day they were removed for analysis. Residual samples are currently stored at -20°C at the Battelle.

Following extraction from halibut gall bladders in the field, bile samples were placed in 2 mL glass sample vials. The samples were submitted for instrumental analysis with minimal sample preparation. The sample was vortexed and a subsample transferred to a 200 mL autosampler vial prior to analysis. An average density of the bile was determined, which can be used to convert the data to a weight basis by accurately weighing a 50 or 100 mL subsample from four separate bile samples.

The PAH metabolite analysis was performed using a HPLC. The method employs a gradient HPLC separation on a 25-cm long, 4.6-mm inner diameter, octadecylsilane (i.e., C-18), reverse-phase column with acetic acid/water and methanol as the mobile phases (Battelle SOP 5-199; Krahn et al. 1986a, 1986b, 1987). A Hewlett-Packard 1050 series quaternary gradient HPLC system, coupled with a Hewlett-Packard 1046A fluorescence detector, was used for the analysis. A sample injection volume of 5 mL was used. The instrument was calibrated with multilevel calibration. Two-, three-, four-, and five-ring metabolites, represented by naphthalene, phenanthrene, pyrene, and benzo(a)pyrene, were determined by four separate HPLC analyses of the samples using detector wavelength settings applicable to the four target PAHs.

Detector excitation and emission wavelengths were pre-selected to levels of high sensitivity and specificity on the fluorescence detector, each optimized specifically for the four parent PAH homologues. The analysis of primarily two-ring metabolites, expressed as naphthalene equivalents, was performed with a detector wavelength pair setting of 286/328 nm (excitation/emission). The analysis of primarily three-, four-, and five-ring metabolites, as phenanthrene, pyrene, and benzo(a)pyrene equivalents was accomplished with detector wavelength pair settings of 258/359, 318/378, and 364/430 nm, respectively.

VOL 18

05380

R0062473

PAH metabolites were quantified by an external standard method, using the response of the parent PAH for quantification. The detection limit was approximately 0.01 to 0.05 µg/mL for the unresolved PAH metabolite component. The total PAH metabolite concentrations determined and reported in this study are based on the total resolved and unresolved area in the applicable chromatographic region.

SECTION 8

OVERVIEW OF QUALITY ASSURANCE / QUALITY CONTROL PROCEDURES

VOL 18
0541

Section 8

OVERVIEW OF QUALITY ASSURANCE / QUALITY CONTROL PROCEDURES

Quality assurance and quality control (QA/QC) were consistently emphasized throughout every phase of the RI, including data collection in the field, transmittal of samples to laboratories, and verification of procedures and findings. Physical and chemical data were subject to validation using these procedures by the Naval Energy and Environmental Support Activity (NEESA).

At the time of this writing, data validation had just been completed, and the findings of the validators were in the process of being transmitted to BNI. Consequently, the data validation results are not included in TM6 and will, therefore, be incorporated in the RI Report. Brief discussions and an overview of the QA/QC procedures employed in this RI are presented in this section.

8.1 DATA QUALITY OBJECTIVES

Data quality objectives (DQOs) are qualitative and quantitative statements that specify the quality of data required to support important decisions needed as part of RI/FS activities. DQOs are determined based on the end use of the data to be collected.

The DQO process, undertaken during the planning stage, resulted in a sampling and analysis plan that detailed the sampling approach and stated the confidence required to make the appropriate decisions using the field data. This process involved identification of the minimum quantity of data required to attain the stated objectives, development of a conceptual site model, and refinement of decision types required during the RI/FS process. The process also involved determining criteria for making decisions, and identifying and selecting analytical and sampling approaches required to support those decisions. These components were then integrated into an overall sampling design to achieve statistical objectives.

8.2 FIELD SAMPLING

Field QA/QC procedures followed those specified in the Sampling and Analysis Plan (JEG 1993b) and Quality Assurance Project Plan (QAPP, JEG 1993b). These procedures included taking field duplicates for surface and subsurface sediment samples, and rinsate and field blanks for subsurface sediment samples. Other field QA/QC procedures included decontamination of sediment sampling implements as well as rinsing implements used to conduct biological sampling with seawater.

Samples were placed into jars or other appropriate containers in the field, and stored in coolers with blue ice until shipped to the laboratory. COC forms were carefully filled out and accompanied each sample until its analysis was complete. COC forms represent an important QA step because they represent a record of all entities handling or receiving the sample into custody at every stage of sample processing.

R0062476

8.3 LABORATORY ANALYSIS

Each of the laboratories implemented internal laboratory-specific QA/QC procedures for physical, chemical, and biological tests, and followed standard protocols which specified laboratory QA/QC procedures to improve precision and accuracy from these analyses. For example, all chemical analyses of surface/subsurface sediment and tissue required the use of laboratory procedural blanks, matrix spikes, matrix spike duplicates, and standard reference materials analyzed at a frequency of one per 20 samples. Deuterated surrogates and internal standards were used as additional QA procedures as well. For bile analysis, matrix spike, matrix spike duplicates, and internal standards were analyzed with the field samples, as was one set of field sample triplicates.

8.4 CHEMICAL DATA VERIFICATION / VALIDATION

In addition to compliance with internal laboratory QA procedures, physical and chemical test results were subjected to formal data validation following NEESA guidelines. This validation procedure was conducted by an independent contractor (Laboratory Data Consultants in Carlsbad, California) to assure objectivity in evaluating laboratory-generated data.

Separately from validation of data, internal data verification for physical, chemical, and biological data was also conducted. The hard copy database was checked against the electronic database for transcription or other errors which could affect data quality, since the electronic database would be used extensively during data evaluation and calculations. In addition to internal QA verification conducted by the individual laboratories, verification of calibration curves, where appropriate, and evaluation of matrix spike (surrogate recovery) were conducted to assess that these data met project DQOs, as specified in the Data Management Plan (BNI 1994e).

The project QAPP (JEG 1993b) notes that both NEESA Levels C and D (U.S. EPA Level III and Level IV, respectively) data support packages would be prepared for harbor sediments, although it is not possible to report both levels for the same data. Because it was inappropriate to report Level D for sediments, due in part to the use of certain non-standard analytical methods, Level C was used as a reporting level for all sediment chemistry data. This is consistent with U.S. EPA guidelines (1992b), which state that Level C is adequate to support baseline risk assessment and delineate remedial action objectives. Nevertheless, 10 percent of the data were subjected to Level D validation and the remaining 90 percent were subjected to Level C validation. This level of validation provided an additional rigorous spot check for laboratory data. Validation included a check of the adequacy of sensitivity for individual testing sequences (i.e., whether analytical detection limits were adequate).

Analyses of AVS metals, total sulfide, and butyltin in sediment were also reviewed by Laboratory Data Consultants, Inc. using NEESA Levels C and D guidelines, as appropriate. The results were validated following generally accepted methodology for

R0062477

VOL 18 0542

conducting data validation, as documented in NEESA (1988), U.S. EPA (1988), U.S. EPA. (1991a), and Allen et al. (1993).

8.5 BIOASSAY DATA VERIFICATION

Bioassay test data were verified using a project-specific, multi-step approach designed to identify potential data inaccuracies or inconsistencies. The verification approach included:

- a spot check to verify that raw data were accurately transferred to the data summaries,
- a check of test water quality data (e.g., DO levels, temperature, salinity, ammonia, sulfides),
- a check of exposure conditions, including acclimation of the organisms, length of exposure, feeding protocols, and
- a check of the survival data for test organisms, using both negative and positive control tests, to assure the viability of each test.

8.6 BENTHIC COMMUNITY DATA VERIFICATION

At the time of preparation of this document, data for benthic infaunal invertebrates were not yet generated. Findings will be included in the RI Report.

8.7 DATA USABILITY

Guidance for overall data usability in risk assessment was based on U.S. EPA (1992d) Guidance for Data Usability in Risk Assessment. This guidance document, designed to address chemical analytical data, identifies several data quality issues which are frequently encountered and need to be addressed in risk assessments. Five criteria are defined by the U.S. EPA and used to evaluate data usability for risk assessment, which include:

- data sources,
- documentation,
- analytical methods and adequate detection limits,
- data review, and
- reports to the risk assessor.

The manual provides guidance on interpreting the impact of sample collection, analytical techniques, and data review procedures on the usability of analytical data in risk assessment.

These data usability criteria were applied in RI planning to guide the design of sampling plans and select analytical methods for the data collection effort. This includes guidance concerning how to determine the degree of confidence in the risk assessment based on the

VOL 18

0543

R0062478

level of uncertainty of the analytical data determined, using the usability criteria. For the data generated and validated for Site 7, data usability criteria extend to:

- how far outside the method-specified QC limits the various parameters were measured,
- the fraction of samples affected by any specific excursion,
- accuracy and reliability of the data estimates,
- adherence to detection limits were met during analysis,
- whether data precision goals were met (e.g., a relative percent difference [RPD] between matrix spike and spike duplicates of less than or equal to 35 percent), and
- whether independent methods for analysis of specific compounds were confirmatory e.g., analyzing specific metals by both AA/GF and ICP).

8.8 DATABASE MANAGEMENT

Following verification and validation, the data generated during the course of the Site 7 RI were input into a centralized, relational database maintained by BNI. This database houses physical, chemical, and biological data, and is designed to allow queries by specific data fields for the purpose of conducting the functions required to complete the RI and the risk assessment. The format and structure of this database are compatible with those of other Contract Task Orders being performed by BNI for CLEAN II. Any changes required for project data would be input through this centralized location in order to eliminate the possibility of conflicting data sources.

SECTION 9

PRELIMINARY RESULTS OF SITE ASSESSMENT

VOL 18

Section 9

PRELIMINARY RESULTS OF SITE ASSESSMENT

Sediment and fish tissue samples were collected from locations within the West Basin and at three reference locations in outer San Pedro Bay. Samples were analyzed for physical characteristics, U.S. EPA Priority Pollutants, toxicity, infaunal community structure, and bioaccumulation. This section presents the results of the data collection effort and includes a discussion of the distribution and spatial patterns of the physical, chemical, and biological data found at Site 7. The results presented herein are based on preliminary and unvalidated data. Validation of data has just been completed at the time of this writing, and thus the results of validation had not yet been reviewed and incorporated into the database. All results of sediment analyses are presented below as dry weight units, and all results of tissue analyses are presented as wet weight units.

9.1 NATURE AND EXTENT OF CONTAMINATION

Sediment data were analyzed for physical, chemical, and toxicological parameters, which will be used to describe the nature and extent of sediment contamination. Physical measurements (i.e. TOC and grain size), which are known to influence both sediment toxicity and contaminant distribution in sediment, provide an understanding of the character of the sediment. While chemical analytes provide direct measures of contaminant distribution, bioassay toxicity tests are used to evaluate the potential toxicological effect of sediment contamination. Benthic community analysis evaluates the infaunal invertebrates found in the sediment, which are sensitive to and useful indicators of various disturbances to the benthic environment. Tissue bioaccumulation tests of resident fish and bioassay clams are useful in evaluating the potential for contaminant uptake in the tissues of marine organisms from the sediment.

This section reviews the data collected during the site assessment, and provides a preliminary assessment of the magnitude and distribution (nature and extent) of sediment contamination. This evaluation was conducted both by area within the West Basin and also by data type (surface sediment, subsurface sediment, toxicity data, fish tissue, clam tissue), and it was intended to provide direct support for the risk assessment process.

The distributions of physical, chemical, and biological characteristics of sediment in the West Basin generally appeared to follow a predictable pattern, based on factors such as sediment deposition patterns and proximity to specific shore-based features such as piers, seawalls, ship moorings, and stormwater outfalls. Sediments beneath the piers generally exhibited fine-grained particles (consisting of higher percent silt and clay), contained greater levels of sulfides, and were higher in organic content than sediment from open water areas of the West Basin. This latter observation is consistent with sediments that are not well oxidized, and may be associated with poor light penetration and water circulation.

Concentrations of chemical contaminants in sediments underneath the piers were generally higher than those of the open areas of the West Basin and project reference stations Contaminants probably accumulated in sediment beneath the piers because these areas are low energy locations and generally favorable for sedimentation; these sediments have remained relatively undisturbed after the piers have been constructed, and numerous

0546

R0062481

activities which occur on or near piers (fueling, loading, painting, and ship repair) likely contribute to contaminant discharge into the sediment beneath the piers as well as into the overall West Basin.

The sediments in areas along the seawall of the NAVSTA, the LBNSY, and the Navy Mole contained concentrations of chemical contaminants generally higher than those of the central areas of the West Basin, and somewhat greater than project reference concentrations as well. Higher levels of contaminants in sediments near the seawall may be related to local stormwater drains or discharges associated with activities conducted near the seawall and piers.

9.2 SEDIMENT PHYSICAL DATA

Sediment physical data were obtained for all surface sediment and subsurface sediment samples collected from West Basin stations. Sediment physical data include the results of total organic carbon (TOC) and grain size analyses.

9.2.1 Surface Sediment Physical Data

Surface sediment from beneath 11 pier stations, from 34 other stations in the West Basin, and from ten reference stations were analyzed for TOC and grain size (Table 9-1).

Results of analyses for TOC in sediments from the West Basin (excluding piers) range from 0.07 to 1.8 percent. Concentrations of TOC in sediments from beneath the piers range from 1.3 to 2.3 percent. The highest concentrations of TOC were detected at test stations beneath piers and at stations near land and the Mole. TOC in sediments at reference stations ranges from 0.43 to 1.9 percent.

Surface sediment grain size for West Basin ranged widely from fine-grained sediments (93 percent fines) to coarse-grained sediments (79 percent sand). Grain size data are presented in Table 9-1 as percent clay, silt, sand, and fines (the sum of percent clay and silt). Two other parameters of grain size distribution are also presented, which are median phi and mean phi. The phi value describes the grain size diameter and is calculated as $-\log_2$ of grain size in microns.

Grain size data were evaluated to identify areas of similar sediment physical characteristics. Because historical dredging activities have altered the normal distribution of sediment grain size, median phi and mean phi values are not consistently representative of the sediments. The percentage of fine sediments was used as an indicator of sediment grain size characteristic.

Sediments from stations near Piers 1, 2, 3, 15, and 16 had similar levels of percent fines, ranging from 82 to 94 percent, and exhibited the finest sediment grain size (greatest percentage of fines) inside the West Basin. The coarsest sediment grain size in the West Basin were found in the northwest section (Stations 1, 2, 5, 6, 7, and 8) and at the eastern opening of the West Basin (Stations 24, 25, and 32).

VOL 18
0547
R0062482

The grain size of sediments beneath the piers has a range similar to the range of grain size of sediments of the open areas of the West Basin. The fraction of fine-grained sediments at stations located beneath the piers ranged from 38 to 94 percent.

Sediments at two of the reference areas, Stations 40010 and 40018, exhibited predominantly fine-grained sediments; percent fines ranged from 67 to 96 percent and 68 to 83 percent, respectively. Sediments at the reference area represented by Station 40032 exhibited coarser grain size than sediments at the other two reference areas, where fine grain size ranged from 15 to 17 percent.

9.2.2 Subsurface Sediment Physical Data

Subsurface sediment from beneath three pier stations, from five other stations in the West Basin, and from two reference stations were analyzed for TOC and grain size (Table 9-2).

Results of subsurface sediment TOC analysis in West Basin samples (excluding piers) range from 0.06 percent for the 1- to 2-meter sample at Station 29, to 0.43 percent for the 0- to 1-meter sample at Station 24. TOC was higher in the 0- to 1-meter sample than the 1- to 2-meter sample at all stations. TOC levels in the top two meters of sediment were lowest at Station 29. At Station 6, TOC percentage decreased with depth of sample, except that the 2- to 3-meter sample had a higher TOC percentage than the other core samples at this station.

Subsurface sediment from beneath the piers showed TOC levels ranging from 0.20 percent for the 4- to 5-meter sample at Station 46 (Pier 12), to 2.39 percent for the 2- to 3-meter sample at Station 51 (Pier 2). Sediment core samples at stations beneath the piers showed a general trend of decreasing TOC with depth of core sample.

Reference stations generally had similar TOC levels (0.05 percent at 4- to 5-meter depth to 3.63 percent at 0- to 1-meter depth) as the West Basin stations, but lower TOC levels than the pier stations.

Subsurface sediment in the top 1-meter core ranged from 8 percent fines at Station 8 to 66 percent fines at Station 24. In the 1- to 2-meter core of subsurface sediment, sediment fines ranged from 6 percent at Station 8 to 70 percent at Station 14. Sediment at Station 8 had higher sand content in the upper two meters than the other West Basin Stations. Station 14 showed lower sand content in the upper two meters than the other West Basin Stations. Station 6, which was sampled to a depth of 5 meters, showed a high percentage of sand in the 2-meter core of subsurface sediment and a low percentage of sand in the 3-meter range. The highest clay percentage and the highest silt percentage were both reported from Station 24.

Subsurface sediment beneath the piers had a higher percent of fine grain size than sediment from the other West Basin areas. Percent fines ranged from 34 percent at Station 46 (Pier 12) to 84 percent at Station 51 (Pier 2). Sediment core samples taken from Station 46 generally had higher percentages of sand than did the core samples from Stations 43 and 51. Subsurface sediment from beneath the piers had a higher content of gravel than did the subsurface sediment taken from the other West Basin areas. Gravel content was

VOL 18
0548
R0062483

higher in the mid-depth core sample (3-meter) than in the upper two core samples (1-meter, 2-meter) or the lower two core samples (4-meter, 5-meter). Gravel content at the 3-meter depth was 30 percent at Station 43 and 21 percent at Station 51.

Subsurface sediment grain size in West Basin samples showed more variation with sample depth than those from the project reference areas. Sediment fines content in core samples ranged from 83 percent to 99 percent at Station 40010, and from 50 percent to 65 percent at Station 40018. Grain size distribution at the project reference stations appears to change little with depth of the core sample.

9.3 SEDIMENT CHEMICAL DATA

Surface sediment and subsurface sediment samples were analyzed for metals, butyltins, polynuclear aromatic hydrocarbons, PCBs, pesticides, and semivolatile organic compounds. Surface sediment samples were also analyzed for total sulfides and acid volatile sulfides with simultaneously extracted metals.

9.3.1 Surface Sediment Chemical Data

This section presents the general distribution of chemical compounds in surface sediments of the West Basin by location (station number) and analyte. The analytical results indicate the presence of 35 chemical compounds in West Basin sediments, including ten high molecular weight PAHs (HPAH), three low molecular weight PAHs (LPAH), eleven priority pollutant trace metals, two butyltin isomers, one PCB Aroclor, five chlorinated pesticides, phenol, and two phthalate esters (Table 9-1).

Surface sediments beneath the piers harbor 34 individual chemical compounds, including ten HPAH, six LPAH, ten trace metals, three butyltin isomers, one PCB, two chlorinated pesticides, phenol, and one phthalate ester. Preliminary analytical results of physical and chemical analyses of surface sediments in West Basin and reference stations are summarized in Table 9-1.

9.3.1.1 METALS

Arsenic levels were detected in all of the sediment samples from the West Basin. Concentrations of arsenic ranged from 7.7 to 15 mg/kg in sediments beneath the piers and from 1.6 to 19 mg/kg in sediments from the open area of the West Basin. Higher concentrations were detected in samples beneath Pier 7, from stations near the seawall along the northern portion of the West Basin, and along the north side of the Mole. The lowest concentrations were reported from Station 6 sediment samples in the northwest area of the West Basin and from Stations 24, 25, and 29 near the opening to the West Basin.

Chromium was detected in sediments at all the stations in the West Basin. Levels of chromium ranged from 34 to 330 mg/kg in sediments beneath the piers and from 10 to 88 mg/kg in sediments from the open area of the West Basin. Higher concentrations of chromium were detected in samples beneath the piers, from stations near the seawall along the northern portion of the West Basin, and along the north side of the Mole.

VOL 18
0549
R0062484

Copper was detected at all stations in West Basin ranging from 120 to 330 mg/kg in sediments from beneath the piers and from 13 to 530 mg/kg in sediments in the open areas of the West Basin. Copper was detected at higher concentrations in samples beneath the piers, from stations near the seawall along the northern portion of the West Basin, and along the north side of the Mole. The highest concentration (530 mg/kg) was reported from Station 17 along the seawall near Piers 2 and 3.

Concentrations of lead were detected at all stations in the West Basin ranging from 54 to 94 mg/kg in sediments from beneath the piers and from 5 to 180 mg/kg in sediments in the open areas of the West Basin. The higher concentrations of lead were detected in samples from beneath the piers, from stations near the seawall along the northern portion of the West Basin, and along the north side of the Mole. The highest concentration (180 mg/kg) was reported from Station 17 along the seawall near Piers 2 and 3.

Mercury was detected at all stations in the West Basin, except Station 24 located near the center of the West Basin. Concentrations of mercury range from 0.27 to 0.88 mg/kg in sediments from beneath the piers and up to 1.8 mg/kg in sediments in the open areas of the West Basin. Mercury was detected at higher concentrations in samples beneath the piers, from stations near the seawall along the northern portion of the West Basin, and along the north side of the Mole. The highest concentration (1.8 mg/kg) was reported from Station 17 along the seawall near Piers 2 and 3.

Concentrations of nickel were detected at all stations in the West Basin (Table 9-1) ranging from 19 to 35 mg/kg in sediments from beneath the piers and from 8 to 41 mg/kg in sediments in the open areas of the West Basin. Nickel was detected at higher concentrations in samples beneath the piers, from stations near the seawall along the northern portion of the West Basin, and along the north side of the Mole. The highest concentration (41 mg/kg) was reported from Station 22 along the seawall near Piers 1 and 2.

Selenium was detected in only one sediment sample from West Basin stations. Station 21, located along the northern side of the Mole between Piers 15 and 16, reported a concentration of 1.6 mg/kg.

Concentrations of silver were detected at all stations in the West Basin, except at Station 24 near the center of the West Basin. Silver concentrations ranged from 1.5 to 4.1 mg/kg in sediments from beneath the piers and up to 19 mg/kg in sediments in the open areas of the West Basin. Concentrations of silver were higher in samples from beneath the piers, from stations near the seawall along the northern portion of the West Basin, and along the north side of the Mole. The highest concentration (19 mg/kg) was reported from Station 26 near Pier 16 and the Mole.

Zinc was detected at all stations in the West Basin ranging from 190 to 620 mg/kg in sediments from beneath the piers and from 33 to 480 mg/kg in sediments in the open areas of the West Basin. Zinc was detected at higher concentrations in samples beneath the piers, from stations near the seawall along the northern portion of the West Basin, and along the north side of the Mole. The highest concentration (620 mg/kg) was reported from Station 50 beneath Pier 3.

VOL 18 0550

R0062485

VOL 18

9.3.1.2 TOTAL SULFIDES AND AVS/SEM

The results of total sulfide analysis of sediments from the West Basin sampling sites range from 1 to 5,400 mg/kg (Table 9-1). Concentrations of total sulfide were greatest at sites beneath piers, ranging from 360 to 5,400 with a mean of 3,800 mg/kg. Concentrations of total sulfide in West Basin sediments, excluding pier sites, ranged from 1 to 400 mg/kg. Concentrations of total sulfide in sediments from the reference areas ranged from 17 to 250 mg/kg.

9.3.1.3 BUTYLTINS

Monobutyltin and dibutyltin were each only detected in one surface sediment sample from the West Basin. Tributyltin was not detected in surface sediment of the West Basin. Monobutyltin was detected at Station 43 beneath Pier 15. Dibutyltin was detected in sediments from Station 47 beneath Pier 9.

9.3.1.4 POLYNUCLEAR AROMATIC HYDROCARBONS

Sediments from the West Basin were analyzed for 16 PAHs, including ten HPAH and six LPAH compounds. Summary results are presented for total LPAH and total HPAH (Table 9-1).

Total PAH concentrations ranged from nondetected to 3,900 µg/kg in sediments from the West Basin, and from nondetected to 23,000 µg/kg in sediments located beneath the piers. While most of the sediment samples from beneath the piers had concentrations of total PAH greater than 1,000 µg/kg, the sediment samples from beneath the ends of Piers 12 and 16 had no detectable levels. The lowest levels of total PAH were found in samples from the center of the West Basin and near its eastern opening. Stations near the seawall along the northern portion of the West Basin and along the north side of the Mole had concentrations of total PAH greater than the those in sediments from the central area of the West Basin.

Total HPAH concentrations show a pattern similar to the total PAH concentrations. The higher levels of total HPAH were found in sediment samples from beneath the piers, except that none were found in sediments beneath the ends of Piers 12 and 16. Total HPAH levels were not detected at most of the stations near the opening to the West Basin. Concentrations of HPAH ranged from non-detected to 18,000 µg/kg beneath the piers, and from non-detected to 3,600 µg/kg in sediments from the open areas of the West Basin. Stations near the seawall along the northern portion of the West Basin and along the north side of the Mole had concentrations of total HPAH greater than the concentrations in sediments from the central area of the West Basin.

Total LPAH concentrations showed a pattern similar to the total PAH and total HPAH concentrations, except that the concentrations were lower for LPAH and more stations in the central area of the West Basin had no detectable levels of LPAH. The higher levels of total LPAH were found in sediment samples from beneath the piers. Total LPAH levels were not detected at most of the stations in the central area of the West Basin

0551

R0062486

Concentrations of LPAH ranged from non-detected to 5,600 µg/kg beneath the piers, and from non-detected to 350 µg/kg in sediments from the open areas of the West Basin.

9.3.1.5 PCB

Surface sediment samples were analyzed for concentrations of seven PCB compounds. The only PCB compound detected in any of the surface sediment samples was Aroclor 1260. PCBs were detected in most of the sediment samples, however, PCBs were not detected at five stations near the opening of the West Basin, nor were PCBs detected in sediments from beneath seven of the nine sampled piers. Concentrations of PCBs ranged up to 390 µg/kg in sediments from beneath the piers and up to 880 µg/kg in sediments in the open areas of the West Basin. PCBs were detected at higher concentrations in samples from stations near the seawall along the northern portion of the West Basin.

9.3.1.6 PESTICIDES

The analysis of surface sediments for chlorinated pesticides showed that aldrin, lindane, DDD, DDE, and DDT were present in many of the samples. Aldrin was only detected in sediments from Sta 28 (2.3 µg/kg). Lindane (gamma-BHC) was only detected in sediments from Sta.. 10 (6.8 µg/kg) and Station 26 (2.5 µg/kg). DDE was the only DDT related compound that was detected in sediments from every station in the West Basin. Concentrations of DDD ranged from 13 to 110 µg/kg in sediments from beneath the piers and from 6 to 180 µg/kg in sediments in the open areas of the West Basin. Concentrations of DDE ranged up to 36 µg/kg in sediments from beneath the piers and up to 42 µg/kg in sediments in the open areas of the West Basin. DDT was only detected in sediments from Station 16 (34 µg/kg) along the north side of the Mole. The highest concentrations of total DDTs were detected from stations near the seawall along the northern portion of the West Basin and along the north side of the Mole.

9.3.1.7 SEMIVOLATILE COMPOUNDS

Analysis of surface sediment samples for SVOCs detected phenol, bis(2-ethylhexyl)phthalate, and di-n-octylphthalate. Phenol was detected in two samples from the West Basin. Bis(2-ethylhexyl)phthalate was detected in one surface sediment sample. Di-n-octylphthalate was found at 17 of the 45 West Basin stations. Highest concentrations of phenol and di-n-octylphthalate were found in sediment beneath the piers near the NAVSTA and the LBNSY.

9.3.2 Subsurface Sediment Chemistry

Subsurface sediment samples were collected in the West Basin and analyzed for metals, butyltins, PAHs, PCBs, pesticides, and semivolatile organic compounds. Subsurface samples were collected at Stations 6, 8, 14, 24, 29, 43 (Pier 15), 46 (Pier 12), and 51 (Pier 2).

The analytical results indicate the presence of 24 chemical compounds in the West Basin subsurface sediment: eight HPAH compounds, ten metals, two butyltin compounds, two PCB compounds, one chlorinated pesticide, and one phthalate compound. Subsurface

VOL 18
0552
R0062487

sediment beneath the piers contained 37 chemical compounds: ten HPAH compounds, five LPAH compounds, eleven metals, two PCB compounds, five chlorinated pesticides, one phthalate ester, trichlorobenzene, and three dichlorobenzenes. Results of the subsurface sediment analyses are summarized in Table 9-2.

9.3.2.1 METALS

Arsenic concentrations in the subsurface 1-meter sediment ranged from 2.2 mg/kg at Station 29 to 9.1 mg/kg at Station 43 (Pier 15). Concentrations were generally higher in subsurface sediment beneath Piers 15, 12, and 2 (Stations 43, 46, and 51) than the other West Basin stations (6, 8, 14, 24, 29). Arsenic levels were higher in the top 1-meter sample than in the other core samples at most stations. At Station 6, arsenic concentrations were highest in the 4-meter sample. Arsenic levels in subsurface sediment beneath the piers were generally higher in the 1-meter sample and decreased with depth of the core sample. Subsurface sediment samples taken at project reference locations show arsenic concentrations ranging from 2.2 to 13 mg/kg, with higher concentrations in the 1-meter depth core sample.

Beryllium was detected in all subsurface sediment samples and ranged from 0.12 mg/kg in the 2-meter sample at Stations 6 and 24 to 1.1 mg/kg in the 1-meter sample at Station 43 and the 2-meter sample at Station 51. Beryllium concentrations at most stations decreased with depth of the core sample. However, at Station 6, the 3-meter sample had a higher concentration of beryllium than the other core samples. Highest concentrations of subsurface sediment beryllium occurred in the top two meters at Stations 43 and 51, ranging from 1.0 to 1.1 mg/kg. Beryllium was detected in samples taken at the project reference stations ranging from 0.24 to 0.77 mg/kg, with concentrations varying with depth of core sample.

Cadmium levels in subsurface sediment ranged from 0.07 mg/kg to 0.73 mg/kg in the West Basin stations (6, 8, 14, 24, 29). In subsurface sediment beneath the piers (Stations 43, 46, and 51), cadmium ranged from 0.13 mg/kg to 2.8 mg/kg. Cadmium concentrations at Station 6 were higher in the 3-meter sample than in the other core samples. Higher cadmium concentrations at Station 43 were found in the 2-meter sample and at Station 51 in the 3-meter sample. Subsurface sediment at project reference stations show cadmium levels that range from 0.11 mg/kg to 1.8 mg/kg.

Chromium concentrations in subsurface sediment samples ranged from 10 mg/kg in the 2-meter sample at Stations 8 and 24 to 70 mg/kg in the 1-meter sample at Station 43 (Pier 15). Chromium was detected in all subsurface sediment samples. Samples taken at stations beneath the piers had higher levels of chromium than the other West Basin stations. Chromium showed a general trend of decreasing concentration with depth of core sample. However, higher levels of chromium were found in the 3-meter sample than in the other core samples at Stations 6 and 51 (Pier 2). Chromium was found at project reference sites at concentrations ranging from 16 to 65 mg/kg.

Copper was detected in all of the subsurface sediment samples from West Basin stations and concentrations ranged from 7 mg/kg in the 2-meter sample at Station 24 to 50 mg/kg

VOL 18
0553
R0062488

in the 3-meter sample at Station 6. Copper concentrations in the top 1-meter samples were highest at Station 24 (45 mg/kg). Subsurface sediment copper at Station 6 was highest in the 3-meter sample and lowest in the 2-meter sample and 4-meter sample. Copper in the subsurface sediment at Station 43 (Pier 15) ranged from 35 to 260 mg/kg, decreasing with depth of core sample. Copper levels ranged from 1 to 64 at Station 46 (Pier 12). The copper concentrations at Station 51 (Pier 2) ranged from 84 to 200 mg/kg, with highest concentrations occurring in the 3-meter and 4-meter samples. Project reference locations show concentrations of copper that range up to 98 mg/kg.

Subsurface sediments in the West Basin were analyzed for lead concentrations, which range from undetectable in the 2-meter sample at Stations 8 and 24 to 33 mg/kg in the 1-meter sample at Station 24. Highest lead levels in the 1-meter core samples were detected at Station 24. Lead levels in the 2-meter core samples range up to 7 mg/kg. Core samples at 3-meter and 4-meter depths at Station 6 showed higher levels of lead than the other Station 6 core samples. Subsurface sediment lead concentrations detected in samples taken beneath Piers 15, 12, and 2 (Stations 43, 46, and 51, respectively) range from 9 mg/kg in the 5-meter sample at Station 46 to 170 mg/kg in the 4-meter sample at Station 51. Highest concentrations of lead at Stations 43 and 46 were found in the 2-meter sample, while the highest lead levels at Station 51 were found in the 4-meter sample. Lead concentrations were found at the project reference stations ranging from 6 to 65 mg/kg in the subsurface sediment samples.

Most of the subsurface sediment samples taken in the West Basin showed no detectable levels of mercury. None of the 2-meter samples reported mercury. Mercury in the top 1-meter core sample ranges from undetectable at Stations 14 and 29 to 0.21 mg/kg at Station 24. Subsurface sediment at Station 6 shows detectable mercury only at the 1-meter and 3-meter samples. Mercury was detected in all the subsurface sediment samples taken beneath the piers. Concentrations of mercury were highest in the 2-meter sample at Stations 43 (Pier 15) and 46 (Pier 12) and decreased with depth of core sample. Mercury at Station 51 (Pier 2) increased with depth of core sample until the 4-meter sample (1.78 mg/kg). Project reference stations show mercury levels in the subsurface sediment ranging up to 0.86 mg/kg.

Nickel concentrations in the subsurface sediment samples taken in the West Basin range from 8 mg/kg in the 2-meter sample at Station 8 to 33 mg/kg in the 3-meter sample at Station 6. Nickel levels were higher in the 1-meter core sample than in the 2-meter sample for all West Basin stations. However, the 3-meter sample at Station 6 contained higher nickel levels (33 mg/kg) than the other core samples at that station. The highest level of nickel in the top 1-meter samples was found at Station 24. Concentrations of nickel at Stations 43, 46, and 51 were slightly higher in the 2-meter sample than in the 1-meter core sample and decreased with depth of core sample. Nickel was detected at the project reference locations at concentrations from 12 to 63 mg/kg.

Selenium was not detected in any of the subsurface sediment samples taken at West Basin stations (6, 8, 14, 24, 29). Selenium was only detected in the 3-meter sample at Station 43 (Pier 15) and Station 51 (Pier 2). Selenium was not detected in any subsurface

VOL 18
0554
R0062489

sediment sample taken at Station 46 (Pier 12). Selenium was detected in the 1-meter and 2-meter core samples at the project reference stations, ranging from 1.5 to 2.8 mg/kg.

Silver concentrations in the top 1-meter subsurface sediment samples were higher (2.3 mg/kg) at Station 24 than at Stations 6, 8, 14, or 29. Silver levels were higher in the top 1-meter core sample than in the 2-meter core sample for the West Basin stations. The highest level of silver in subsurface sediment at Station 6 was found in the 3-meter sample. Silver concentrations in subsurface sediment at Stations 43, 46, and 51 decreased with depth of core sample. Highest silver levels for Stations 43, 46, and 51 were found in the 1-meter samples for Station 43 (0.6 mg/kg) and Station 46 (0.4 mg/kg). Silver was found in the subsurface sediment samples at the project reference locations at concentrations ranging from 0.8 to 2.8 mg/kg.

Zinc was detected in all subsurface sediment samples taken at West Basin stations. Zinc concentrations in the top 1-meter core samples range from 42 mg/kg at Station 8 to 170 mg/kg at Station 24. Zinc levels were generally greater in the 1-meter core samples than in the 2-meter core samples. Station 6 showed a greater zinc level in the 3-meter core sample than in the other core samples at the station.

All the subsurface sediment samples taken beneath the piers showed detectable levels of zinc. Concentrations of zinc were highest in the 2-meter sample at Stations 43 (Pier 15) and 46 (Pier 12) and decreased with depth of core sample. Zinc at Station 51 (Pier 2) increased with depth of core sample until the 4-meter sample (540 mg/kg). Subsurface sediment samples taken at the project reference stations contained zinc concentrations ranging from 36 to 200 mg/kg. Concentrations of zinc at the project reference stations were higher in the 1-meter core samples than in the other core samples.

9.3.2.2 BUTYLTINS

Dibutyltin was detected in only two of the subsurface sediment samples from the West Basin, 3.4 µg/kg in the 1-meter sample at Station 8 and 4.1 µg/kg in the 2-meter sample at Station 29. Dibutyltin was not detected in any of the subsurface sediment samples taken beneath the piers. No dibutyltin was detected at the project reference locations.

Tributyltin was detected in all of the subsurface sediment samples taken at West Basin stations, but not detected at any of the samples taken beneath the piers. Tributyltin levels in the top 1-meter core samples range from 2.9 µg/kg at Station 24 to 8.0 µg/kg at Station 8. In the 2-meter core samples, tributyltin levels range from 3.3 µg/kg at Station 14 to 8.9 µg/kg at Station 29. Station 6 samples show higher tributyltin levels in the 4-meter sample than in the other core samples. Tributyltin was detected in the subsurface sediment samples at the project reference stations, ranging up to 7.1 µg/kg.

9.3.2.3 POLYNUCLEAR AROMATIC HYDROCARBONS

Samples from the cores of the West Basin stations were analyzed for PAHs in two categories, LPAH and HPAH. No LPAHs were detected at any of the West Basin stations. None of the PAHs were detected at Stations 24 or 29. Also, none of the PAHs were detected in core samples from the 3-meter, 4-meter, or 5-meter depth ranges.

VOL 18

0555

R0062490

Eight HPAHs were detected in the 1-meter sample at Station 6 ranging from 14 µg/kg to 68 µg/kg. These HPAHs were benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(ghi)perylene, chrysene, indeno(1,2,3-cd)pyrene, and pyrene. The 2-meter core sample at Station 6 contained three PAHs at 12 µg/kg: benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene. Three PAHs were detected in the 1-meter samples from Stations 8 and 14 ranging from 13 µg/kg to 27 µg/kg.

PAH compounds were analyzed in core samples from stations beneath the piers, Stations 43, 46, and 51 (Piers 15, 12, and 2). PAHs were found in more subsurface sediment samples and at higher concentrations at stations beneath the piers than at other stations in the West Basin. Ten HPAHs and two LPAHs were detected in the subsurface sediment at Station 43, seven HPAHs and one LPAH were detected at Station 46, and ten HPAHs and five LPAHs were detected at Station 51.

Concentrations of detected PAHs in subsurface sediment at Station 43 ranged from 73 µg/kg of anthracene for the 1-meter sample to 1200 µg/kg of pyrene for the 2-meter sample. The highest concentrations of seven PAHs at Station 43 were found in the 2-meter sample. These seven PAHs were benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(ghi)perylene, indeno(1,2,3-cd)pyrene, pyrene, and anthracene. Highest concentrations at Station 43 of four PAH compounds (benz(a)anthracene, chrysene, fluoranthene, and phenanthrene) were found in the 4-meter sample. The 5-meter sample at Station 43 showed no detectable PAHs.

PAHs were only detected in the 2-meter and 4-meter samples at Station 46. Concentrations of PAHs in Station 46 subsurface sediment ranged from 34 µg/kg of anthracene in the 2-meter sample to 210 µg/kg of benzo(k)fluoranthene in the 4-meter sample.

Subsurface sediment at Station 51 had higher concentrations of 12 PAHs in the 3-meter sample than in the other core samples, ranging from 1400 µg/kg of fluorene to 17,000 µg/kg of methylnaphthalenes. Benzo(b)fluoranthene and fluoranthene had higher concentrations in the 4-meter sample than in the other cores, 1500 and 13,000 µg/kg, respectively. Dibenzo(a,h)anthracene was only detected in the 5-meter sample at 100 µg/kg.

Seven HPAHs (benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, benzo[ghi]perylene, chrysene, dibenzo[a,h]anthracene, indeno[1,2,3-cd]pyrene) were detected in subsurface sediment samples at the project reference locations. Concentrations of the HPAHs at the project reference stations range from 19 to 130 µg/kg, and were only detected in the 1-meter and 2-meter depth core samples.

9.3.2.4 PCBS

Three PCBs (Aroclor 1248, Aroclor 1254, and Aroclor 1260) were detected in subsurface sediment samples. No PCB compounds were detected at the project reference sites. Aroclor 1248 was detected only in the 3-meter sample at Station 51 (Pier 2). Aroclor 1254 was only detected in the 1-meter sample at Station 24.

VOL 18

0556

R0062491

Aroclor 1260 was detected only in the 1-meter sample at Station 6 for the West Basin stations. In subsurface sediments taken beneath the piers, Aroclor 1260 was detected in the 1-meter and 2-meter samples at Station 43 (Pier 15) and in the 4-meter sample at Station 46 (Pier 12).

9.3.2.5 PESTICIDES

Four chlorinated pesticides were detected in subsurface sediment samples. These pesticides were delta-benzene hexachloride, endosulfan II, p,p'-dichloro-diphenyl-dichloroethane (DDD), and p,p'-dichloro-diphenyl-ethane (DDE). Delta-benzene hexachloride was only detected in the 5-meter sample at Station 46 (7 µg/kg). Endosulfan II was only detected in the 2-meter sample at Station 43 (37 µg/kg). Delta-benzene hexachloride and endosulfan II were not detected in subsurface sediment at the project reference stations.

The DDT derivative, p,p'-DDD, was detected at samples taken beneath the piers (4 to 46 µg/kg), but not detected in samples taken at the West Basin stations. Another DDT derivative, p,p'-DDE, was detected in two of the 1-meter samples at West Basin stations (7 to 17 µg/kg), and in all of the samples taken beneath the piers (4 to 1100 µg/kg). At the stations beneath the piers, the DDE concentrations were higher in the 3-meter sample than in the other core samples. The subsurface sediment at the project reference stations showed no p,p'-DDD, and concentrations of p,p'-DDE that range up to 30 µg/kg.

9.3.2.6 SEMIVOLATILE ORGANICS

Bis(2-ethylhexyl)phthalate was detected in two core samples at Station 43 (140 to 740 µg/kg) and two core samples at Station 51 (310 to 580 µg/kg). Di-n-octylphthalate was only detected in the 5-meter sample at Station 6 (37 µg/kg). Subsurface sediment at project reference stations showed no bis(2-ethylhexyl)phthalate, and di-n-octylphthalate that ranged up to 84 µg/kg.

Four chlorobenzenes, 1,2,4-trichlorobenzene, 1,2-dichlorobenzene, 1,3-dichlorobenzene, and 1,4-dichlorobenzene, were detected only at Station 51 (Pier 2). Concentrations of all four chlorobenzenes were higher in the 3-meter sample (8,000 to 60,000 µg/kg) than in the other core samples. None of the chlorobenzene compounds were found in subsurface sediment at project reference stations.

9.4 SEDIMENT TOXICITY

This section describes the preliminary results of sediment toxicity (bioassay) testing. Results of biological performance criteria and the preliminary distribution of toxicity by specific area within the West Basin are discussed below.

9.4.1 Results of Bioassay Performance Criteria

Results of the bioassay tests were compared to project-specific performance criteria (BNI 1994b) that were used to determine the acceptance of bioassay data. Results of these comparisons are summarized below. The performance criteria were used to assess the

VOL 18
0551
R0062492

laboratory method control samples (negative and positive responses) and the project reference station acceptability.

9.4.1.1 ECHINODERM DEVELOPMENT TEST

All echinoderm development tests passed both the negative and positive control performance criteria. However, three of the reference stations (40018.1, 40018.3, 40032.1) did not pass the reference station performance criterion (Table 9-3). Results of the echinoderm development test for these three reference stations were therefore not included in the statistical data analysis, which is summarized in the subsequent section. All other reference station data were accepted for the echinoderm test.

9.4.1.2 AMPHIPOD SURVIVAL TEST

All amphipod survival tests passed both the negative and positive control performance criteria. However, two of the reference stations (40010.2, 40018.1) did not pass the reference station performance criterion (Table 9-3). Results of the amphipod survival test for these two reference stations were not included in statistical data analysis, which is summarized in the subsequent section. All other reference station data were accepted for the amphipod test.

9.4.1.3 POLYCHAETE GROWTH TEST

Results from two of the polychaete method control samples did not meet all the negative control performance criteria. The polychaete test negative performance criteria includes both a replicate criterion and a replicate mean criterion. For these two method control samples, the replicate mean criterion was met and four of the five replicates met the criterion. Because the mean replicate criterion, which was met, is a better estimate of test performance than the replicate criterion, and because only one of the five replicates did not meet the criterion, the data were considered acceptable for further data analyses.

None of the results from the reference station polychaete growth tests met the project-specific performance criterion for reference stations (Table 9-3). Growth measurements were greater for both the laboratory control samples and the West Basin test stations than for the project reference stations. Although the RAWP does not include a provision for data analysis when reference station performance criteria are not met, preliminary data analysis was conducted using the reference station data. Results from the West Basin test stations appear to be acceptable, and will be evaluated further before being included in the description of toxicity patterns within the West Basin, if appropriate.

9.4.2 Distribution of Sediment Toxicity

Results of the surface sediment bioassay tests are summarized in Table 9-4. Values represent the average biological response of the laboratory replicates: percent mortality and reburial for the amphipod, percent mortality and growth for the polychaete, and percent mortality and abnormal development for the echinoderm. The percent response reported and discussed for the echinoderm is that of the bioassay conducted using 100 percent porewater concentration.

VOL 18

0558

R0062493

VOL 18

9.4.2.1 WEST BASIN STATIONS

Mean amphipod mortality ranged from 1 percent (Station 11) to 43 percent (Station 41). Mean reburial ranged from 78 percent to 100 percent. The lowest reburial percentage resulted from Station 41 sediment. Station 41, located in close proximity to Pier 12 (fuel pier), indicated the highest level of adverse response from amphipod (43 percent).

Mean polychaete mortality ranged from 0 percent to 16 percent (Station 24). No mortality occurred at approximately one-third of the West Basin sampling stations: 1, 2, 4, 12, 14, 19, 23, 25, 27, 28, and 41. Average growth ranged from 0.066 mg/d (Stations 21 and 28) to 0.134 mg/d (Stations 1 and 24).

Adverse biological responses from the echinoderm occurred with exposure to porewater from most stations within the open areas of West Basin, especially from stations located at the eastern area and mouth of the Basin. Overall, there were no stations within the West Basin in which no abnormality occurred. Mean echinoderm mortality ranged from 0 percent to 68 percent (station 5). Mortality was found to be greater than 80 percent at the following stations: 2, 4, 5, 6, 7, 8, 12, 14, 17, 24, 25, 31 and 33. Percent abnormal development ranged from 4 percent (station 29) to 100 percent (stations 2, 4, 6, 7, 12, 13, 14, 17, 24, 25, 31 and 33). In addition, abnormal development of the echinoderm organisms occurred at a frequency of greater than 20 percent when exposed to porewater collected from the following stations: 1, 5, 8, 9, 15, 32, and 41.

9.4.2.2 PIER STATIONS

Adverse biological response was observed by the amphipod and the echinoderm at nearly all stations located underneath piers. Mean mortality for the amphipod bioassay ranged from 17 percent (Station 52) to 84 percent (Station 44). Mortalities greater than 20 percent occurred from exposure to all pier samples except for Station 52 (Pier 1). Mean reburial ranged from 25 percent (Station 44; Pier 12) to 96 percent (Station 43; Pier 15). Percent amphipod reburial was less than 80 percent for the following stations: 42 (Pier 16), 44, 45, and 46 (Pier 12), 48 (Pier 7), and 49 (Pier 6).

Polychaete mean mortality ranged from 0 percent (Station 50; Pier 3) to 24 percent (Station 48; Pier 7). Polychaete growth rates on average were highest when exposed to sediment collected from underneath the piers. Average growth ranged from 0.083 mg/d (Station 47; Pier 9) to 0.164 mg/d (Station 43; Pier 15).

Mean echinoderm mortality ranged from 9 percent (Station 48; Pier 7) to 64 percent (Station 45; Pier 12). All pier stations resulted in greater than 20 percent echinoderm mortality except for the following: 43 (Pier 15), 44 (Pier 12), and 48 (Pier 7). All stations from underneath the piers resulted in 100 percent abnormal development.

9.4.2.3 REFERENCE STATIONS

Exposure to sediment or porewater collected from each reference station resulted in some form of adverse biological response. Mean mortality for the amphipod bioassay ranged from 8 percent (Station 40010.2) to 36 percent (Station 40018.1). Two of the replicates at Station 40010.1 and one of the replicates at Station 40010.2 resulted in mortality of

0559

R0062494

greater than 20 percent in addition to Station 40018.1. Mean reburial ranged from 92 percent (Station 40010.1) to 100 percent (Station 40010.3).

Polychaete mean mortality ranged from 0 percent (stations 40010.1, 40010.2, 40010.3 and 40018.3) to 12 percent (Station 40010.3). Mean growth ranged from 0.056 mg/d (Station 40018.2) to 0.129 mg/d (Station 40010.3). Growth was suppressed to less than 0.080 mg/d in samples taken from stations 40018.1, 40018.2 and 40032.1.

Mean echinoderm mortality ranged from 2 percent (Station 40018.1) to 31 percent (Station 40018.3). Mortality was greater than 20 percent for two of the replicates from Station 40010.3, all three replicates from Station 40018.3, and at Station 40032.1. Percent abnormal development ranged from 8 percent (Station 40010.3) to 100 percent (Station 40032.1). One replicate from Station 40010.2, Station 40018.1, two replicates from Station 40018.3, and Station 40032.1 all resulted in greater than 20 percent abnormally developed organisms.

9.5 BENTHIC INFAUNA

At the time of preparation of this document, data for benthic infaunal invertebrates were not yet generated. Findings will be included in the RI Report.

9.6 BIOACCUMULATION DATA

This section discusses the bioaccumulation data obtained from demersal fish caught in trawl samples and bioassay clam tissue analyses. All tissue samples were analyzed for lipids, metals, butyltins, polynuclear aromatic hydrocarbons, PCBs, and pesticides.

9.6.1 Fish Tissue Analyses

Fish trawls were conducted at seven transects within the West Basin. Because the target fish species are mobile, and likely to move about the West Basin area, the analytical results of the seven West Basin locations were pooled for data analyses. Analytical results of the reference station samples were also pooled. Project reference Stations 40010 and 40018 were sampled for fish tissue bioaccumulation tests. The number of samples analyzed at project reference stations as well as at test stations depended largely on the availability of the target fish species (the white croaker [*Genyonemus lineatus*] and California halibut [*Paralichthys californicus*]) in the trawl catch. At Station 40010, three samples of white croaker muscle fillet were collected, three of the California halibut fillet, and six of the California halibut whole body. At Station 40018, six California halibut whole-body samples were also collected.

Tissues analyzed included muscle fillet and whole body homogenates of white croaker and California halibut (Table 9-5). In addition, bile removed from the California halibut was analyzed for parent compounds of PAHs (Table 9-6).

9.6.1.1 METALS

Arsenic concentrations of white croaker fillet collected in the West Basin ranged up to 1.4 mg/kg, and from 0.9 to 1.2 mg/kg for the project reference. Halibut fillet arsenic levels

VOL 18
0560
R0062495

from the West Basin and project reference stations ranged up to 0.6 mg/kg. Whole body samples of white croaker showed arsenic levels at 0.8 to 1.8 mg/kg for fish in the West Basin, and at 0.6 to 1.3 mg/kg for fish at the project reference site. Halibut whole body samples showed that arsenic concentrations ranged up to 0.7 mg/kg for West Basin fish and project reference fish.

Beryllium was not detected in white croaker filet, halibut filet, or halibut whole body samples at West Basin or project reference stations. Beryllium was found in one sample of white croaker whole body from the West Basin at a concentration of 0.1 mg/kg. No beryllium was found in the project reference samples of whole body white croaker.

Chromium was not detected in white croaker filet, halibut filet, or halibut whole body samples at West Basin or project reference stations. Chromium was found in three samples of croaker whole body from the West Basin at concentrations of 0.5 to 0.7 mg/kg. No chromium was found in project reference samples of croaker whole body.

Copper concentrations ranged up to 2 mg/kg for white croaker fillet at the West Basin, and were undetected at the project reference locations. Copper values ranged up to 2 mg/kg for halibut fillet from both the West Basin and project reference stations. Copper was found in white croaker whole body samples from the West Basin ranging from 1 to 4 mg/kg, and in the project reference samples ranging up to 2 mg/kg. Concentrations of copper in the halibut whole body samples from the West Basin range up to 4 mg/kg, and up to 57 mg/kg for samples from the project reference locations.

Lead was detected in one of the six samples of white croaker fillet from the West Basin at 4.2 mg/kg, but undetected in samples from the project reference stations. Lead was not detected in any of the halibut fillet or white croaker whole body samples from the West Basin or from the project reference stations. Lead concentrations in halibut whole body samples from the West Basin ranged up to 1.7 mg/kg, and ranged up to 2 mg/kg for halibut whole body project reference samples.

Concentrations of mercury ranged from 0.03 to 0.07 mg/kg for West Basin samples of white croaker filet, while ranging from 0.02 to 0.04 mg/kg for project reference samples of white croaker filet. Mercury was found in all halibut fillet samples ranging from 0.03 to 0.17 mg/kg for West Basin samples, and from 0.01 to 0.08 for project reference samples. White croaker whole body samples showed concentrations of mercury ranging from 0.02 to 0.14 mg/kg from the West Basin, while project reference samples showed 0.04 to 0.07 mg/kg of mercury. Similarly, halibut whole body samples showed mercury at 0.01 to 0.05 mg/kg for the West Basin, and at 0.01 to 0.04 mg/kg for the project reference.

Nickel was not detected in white croaker filet, halibut filet, or white croaker whole body samples from the West Basin or project reference. Nickel concentrations were found in project reference samples of halibut whole body ranging up to 9 mg/kg, while none was found in the West Basin halibut whole body samples.

Selenium was found in one white croaker fillet sample from the West Basin at 0.6 mg/kg, and none was found in project reference white croaker filet. Halibut fillet samples showed only one sample from the project reference with selenium (0.7 mg/kg), and none of the West Basin samples having detectable selenium. Concentrations of selenium in white croaker whole body

VOL 18 0561

R0062496

ranged up to 1.3 mg/kg for West Basin samples, and up to 0.7 mg/kg for project reference samples. Halibut whole body samples showed selenium at one sample from the West Basin (0.9 mg/kg), while no selenium was detected in the project reference samples.

Zinc was found in white croaker fillet samples ranging from 6 to 10 mg/kg for West Basin samples, and from 6 to 12 mg/kg for project reference samples. Halibut fillet samples showed zinc concentrations ranging from 5 to 9 mg/kg for West Basin samples, and from 6 to 9 mg/kg for project reference samples. Whole body samples of white croaker showed zinc levels ranging from 10 to 14 mg/kg for the West Basin, and ranging from 9 to 15 mg/kg for the project reference. Concentrations of zinc in halibut whole body samples ranged from 8 to 33 mg/kg for the West Basin, and from 7 to 48 mg/kg for the project reference.

9.6.1.2 BUTYLTINS

Dibutyltin was not detected in any white croaker fillet samples, but tributyltin concentrations ranged from 2.9 to 6.5 µg/kg for the West Basin and from 6 to 11 µg/kg for the project reference. Dibutyltin and tributyltin were each detected in one sample from West Basin halibut filet, but not at the project reference. Concentrations of dibutyltin and tributyltin in white croaker whole body ranged up to 17 µg/kg at the West Basin, and up to 6.1 µg/kg at the project reference. Dibutyltin and tributyltin found in halibut whole body samples ranged up to 20 µg/kg at the West Basin and up to 13 µg/kg at the project reference.

9.6.1.3 POLYNUCLEAR AROMATIC HYDROCARBONS

Fish tissue samples, including whole body homogenate and muscle fillet of California halibut and white croaker, were analyzed for PAH compounds. None of the 63 fish tissue samples showed detectable levels of PAH compounds.

Samples of bile were collected from 18 California halibut taken within the West Basin. The bile was analyzed for the HPAH compounds benzo(a)pyrene and pyrene, and for the LPAH compounds naphthalene and phenanthrene (Table 9-6). Bile concentrations for the fish taken in the West Basin of benzo(a)pyrene ranged from 2.73 µg/mL to 58.8, while bile concentrations of benzo(a)pyrene for project reference fish ranged from 1.94 to 16.7 µg/mL. Pyrene concentrations ranged from 21.4 to 469 µg/mL for West Basin fish, and from 13.2 to 118 µg/mL for project reference fish. The LPAH, naphthalene, ranged from 58.4 to 655 µg/mL for fish in the West Basin, and from 72.4 to 312 µg/mL for fish from the project reference stations. Phenanthrene ranged from 43.6 to 535 µg/mL for West Basin fish bile, and from 45 9 to 250 µg/mL for project reference fish bile. Highest concentrations of the PAH compounds were found in bile from fish collected in the West Basin, while the lowest concentrations of PAHs were found in bile from fish taken at project reference locations.

9.6.1.4 PESTICIDES

Five chlorinated pesticides were found in fish tissue samples, alpha-benzene hexachloride, endosulfan II, endrin, p,p'-DDD, and p,p'-DDE. The DDT derivative, p,p'-DDE, was the most commonly detected of these compounds. White croaker fillet samples showed concentrations of endosulfan II, endrin, p,p'-DDD, and p,p'-DDE ranging up to 860 µg/kg in West Basin samples, while only p,p'-DDD and p,p'-DDE were found in project reference samples ranging

VOL 18
0562
R0062497

up to 1700 µg/kg. Halibut fillet samples showed only p,p'-DDE concentrations, ranging from 17 to 200 µg/kg for the West Basin and from 8.3 to 35 µg/kg for the project reference.

White croaker whole body samples showed concentrations of alpha-benzene hexachloride, endosulfan II, endrin, p,p'-DDD, and p,p'-DDE for the West Basin, ranging up to 1000 µg/kg. Project reference samples of white croaker whole body showed endosulfan II, p,p'-DDD, and p,p'-DDE at concentrations ranging up to 490 µg/kg. Endosulfan II, p,p'-DDD, and p,p'-DDE were found in halibut whole body samples ranging up to 380 µg/kg for the West Basin, and up to 220 µg/kg for the project reference.

9.6.2 Clam Bioaccumulation Results

After exposure to sediment samples during the clam bioassay, clam (*Macoma nasuta*) tissue was analyzed for lipids, metals, butyltins, PAHs, PCBs, and pesticides. A total of five samples were collected from the project reference locations: three samples were collected from Station 40010 (40010.1, 40010.2, and 40010.3), one from Station 40018.3, and one from Station 40032.1. Nine samples were collected from West Basin stations. The results of the clam tissue analyses are summarized in Table 9-7.

9.6.2.1 METALS

Arsenic was detected in all of the clam tissue samples, ranging from 2.6 mg/kg for Station 43 to 3.3 mg/kg for Station 24. Arsenic levels were generally similar among the clam tissue samples for the West Basin and pier stations. Clam tissue for project reference stations showed arsenic levels ranging from 2.5 to 3.2 mg/kg.

Chromium was only detected in clam tissue for sediment at Station 14 (0.4 mg/kg). Clam tissue for project reference stations showed chromium levels ranging up to 0.4 mg/kg.

Concentrations of copper were detected in all of the clam tissue samples, ranging from 1.1 mg/kg at Station 29 to 2.4 mg/kg at Station 43. Generally, copper levels were similar among the clam tissue samples for the West Basin and pier stations (1.1 to 1.7 mg/kg), except for Station 43 (2.4 mg/kg). Copper was detected in clam tissue for project reference stations ranging from 1.0 to 1.6 mg/kg.

Mercury was detected in three of the clam tissue samples. Mercury was found in clam tissue from Stations 6, 14, and 51 at 0.02 mg/kg. Clam tissue for project reference stations showed mercury concentrations that range up to 0.04 mg/kg.

Zinc levels, detected in all of the clam tissue samples, were generally similar among clam tissue samples from the West Basin and pier stations (11 to 16 mg/kg). Zinc was detected in clam tissue for project reference stations ranging from 11 to 14 mg/kg.

9.6.2.2 BUTYLTINS

Tributyltin concentrations were found in all clam tissue samples, ranging from 1.5 mg/kg for Stations 29 and 43 to 3.4 µg/kg for Station 6. The higher concentrations of zinc in clam tissue samples were found for Stations 6, 8, 14, and 24. Tributyltin concentrations in clam tissue for project reference stations ranged up to 1.9 µg/kg

VOL 18
0563
R0062498

9.6.2.3 POLYNUCLEAR AROMATIC HYDROCARBONS

The only PAH that was detected in the clam tissue is pyrene. Pyrene was detected at concentrations of 20 to 30 µg/kg in the clam tissue for Stations 43, 49, and 51 (Piers 15, 6, 2, respectively). None of the PAH compounds were detected in clam tissue for project reference stations.

9.6.2.4 PESTICIDES

The chlorinated pesticide DDT derivative, p,p'-DDE, was found in all clam tissue samples. Concentrations of p,p'-DDE ranged from 5.4 µg/kg for Station 49 (Pier 6) to 88 µg/kg for Station 46 (Pier 12). Concentrations of p,p'-DDE in clam tissue for project reference stations ranged from 4.8 to 59 µg/kg.

Section 10
PRELIMINARY EVALUATION AND WORK IN PROGRESS

Even though a significant portion of the RI work has been completed, as discussed in TM6, the ecological and human health risk assessments are in various stages of progress. This section presents preliminary evaluations and describes the work in progress for the purposes of providing an insight into key issues which play a significant role in evaluation of data, development of conclusions and recommendations, and preparation of the RI Report. These issues are: developing a validated electronic database; completing benthic community analysis; and acceptance of the Addendum to the RI/FS Work Plan and Risk Assessment Work Plan (RAWP) by the oversight agencies. These issues are in various stages of resolution and, once resolved, the following critical assessments will be completed: physical and chemical data evaluation, biological data evaluation, and ecological and human health risk assessment, as briefly discussed below. These assessments will be followed by the completion of the RI Report.

Chemical and biological data evaluations are currently underway using data from individual test and reference stations. Preliminary results of these analyses are presented in this section. The evaluation methodology for identifying COPCs, following the completion of the validated electronic database, is also presented.

Sampling stations will be evaluated and pooled to generate sediment evaluation zones based on physical and/or chemical data. Following definition of sediment evaluation zones, more detailed evaluation of both chemical and biological data, consisting of bioassay and benthic community data, will be conducted by zone. Results of this evaluation will be used to complete the data evaluation matrix which, in turn, will be used to identify the AOPCs.

10.1 CHEMICAL DATA EVALUATION

Generation of a validated electronic database of physical and chemical data for surface sediment, subsurface sediment, fish tissue, and clam tissue was in progress at the time this document was in preparation. Once this database becomes available, the evaluation of physical and chemical data, including integration into and support for the ecological risk assessment and the human health risk assessment will be conducted. For example, chemical data from nine reference stations will be pooled to determine sediment reference values for the project. The nine pooled reference stations will be used to calculate a statistically representative value for each chemical analyte. However, undetected concentrations of semivolatile compounds for one replicate at Station 40010 will be omitted because of unusually high practical quantitation limit (PQL) values.

For those compound-specific data sets at the project reference stations that were normally distributed, or normally distributed after a natural log transformation (log-normally distributed), the 95 percent upper confidence limit (UCL) will be used as the project reference value. For compounds that were detected at less than four of the nine project reference stations, one half of the typical PQL will be used as the project reference value. For compound-specific data sets which are not normally or log-normally distributed at the project reference stations, the 90th percentile value will be used as the project reference value.

R0062501

VOL 18

Concentrations of analyte-specific chemical data for each sampling station will be compared to the analyte-specific project reference values to determine whether the compound was statistically elevated above reference concentrations. If the analyte-specific concentration from an individual data set exceeds the project reference value, that compound will be judged to be elevated relative to reference conditions.

The 95 percent UCL will be calculated as a one-sided upper confidence limit of the mean value for the pooled reference station data (nine individual data points; i.e., n=9). The formula to be used for the one-sided 95 percent UCL is:

$$UCL_{95\%} = x + t_{(0.95,\, n-1)}\, \sigma/\sqrt{n}$$

where:

x = mean analyte-specific concentration of reference data set,

σ = analyte-specific standard deviation of reference data set,

n = number of samples from project reference data set, and

t = value of the t-distribution (α=0.05) at n-1 degrees of freedom.

Upon completion of similar statistical evaluations of West Basin stations chemical data, comparisons with reference data will be made in support of developing AOPCs and COPCs.

10.2 BIOLOGICAL DATA EVALUATION

Benthic community analysis of the sediment samples, which have been collected and archived, is currently in progress. Completion of this analysis will allow conducting more complete biological evaluations, as described in the RAWP. Benthic community analysis provides the basis for performing the ecological risk assessment in support of delineating AOCs at Site 7.

Toxicity data are currently being evaluated and the following discussion describes this task. In order to compare bioassay results of reference station and West Basin sediment, the sediment physical characteristics were reviewed to select suitable reference station matches for each of the test stations. Reference sediment with similar textural properties as the test stations was selected because grain size is known to affect toxicity to some benthic organisms (DeWitt, et al. 1988). The percent fines (silt plus clay) composition of each test station was compared to each reference station (40010, 40018, 40032). Reference station matches were chosen for each test station based on similar grain size (Table 10-1). Reference Stations 40010 and 40018 were then pooled together and treated as one reference station because they differed by less than 20 percent in mean grain size.

Interpretation of bioassay results were based on two criteria (BNI 1994c): 1) the relative difference between test station data and reference station data; and 2) a statistically significant difference between test data and reference data. Bioassay data meeting both criteria were considered a 'hit". Results of the bioassay tests that did not meet the relative

0567

R0062502

difference criterion are summarized in Table 10-2 for the amphipod test and polychaete test, and in Table 10-3 for the echinoderm test. Similarly, results of the bioassay tests that did not meet the statistical difference criterion are summarized in Table 10-4 for the amphipod and polychaete tests, in Table 10-5 for the echinoderm test.

Overall results of the bioassay statistical testing are summarized in Tables 10-6 and 10-7, showing the determination of significant bioassay "hits." The distribution of bioassay "hits" is presented on Figure 10-1, showing statistically significant bioassay data in the West Basin area.

10.3 PRELIMINARY EVALUATION MATRIX

Table 10-8 shows a preliminary evaluation matrix for West Basin surface sediments, organized by individual sampling location. For each location, the physical properties of bathymetry, TOC, and grain size are provided. Results of each bioassay test by station is also provided based on a statistical comparison with reference data sets (reported as significant or non-significant based on α=0.05). The evaluation matrix presents preliminary data for the toxicity tests and ratio to reference for those chemical compounds found to exceed project reference values. The following discussion summarizes the key features of the chemical and biological data shown on Table 10-8.

10.3.1 West Basin Stations with Elevated Chemical Compounds

Station 10 (between Piers 6 and 7) indicated 11 HPAH, LPAH, metals, and pesticide compounds that were statistically elevated above reference concentrations, although no evidence of toxicity was apparent. Station 17 (adjacent to Pier 3) indicated 13 HPAH, PCB, metals, and pesticide compounds which were statistically elevated above reference concentrations, with echinoderm mortality and abnormality statistically elevated relative to reference values. Stations 21 and 22 (adjacent to Pier 15 and Pier 1, respectively) both indicated 11 HPAH, LPAH, metals, and PCB compounds that were statistically elevated above reference concentrations. No evidence of toxicity was observed at either station with the exception of polychaete growth inhibition noted at Station 21. Concentrations of HPAH, LPAH, metals, and PCB compounds were also elevated at Stations 1, 3, 7, and 11, located in the northwest region of the West Basin. However, only Stations 1 and 7 showed sediment toxicity, detected as elevated echinoderm abnormality.

Stations 15 and 16 located between Piers 12 and 15 showed elevated levels of PCB, metals, and pesticide compounds, while only Station 15 indicated sediment toxicity (elevated echinoderm abnormality). Station 41, located in the same area, showed elevated levels of HPAH, LPAH, PCB, metals, and pesticide compounds, as well as, sediment toxicity noted as elevated amphipod mortality and echinoderm abnormality.

Several stations (2, 4, 9, 13, 20, 26, 27, 28), generally representing areas along the seawall, showed elevated levels of metals and PCB compounds. Stations 2, 4, 9, and 13 showed sediment toxicity as either elevated echinoderm mortality or echinoderm

VOL 18
0568
R0062503

abnormality. Stations 20, 26, and 27 showed no evidence of sediment toxicity, while Station 8 indicated sediment toxicity as decreased polychaete growth.

10.3.2 Other West Basin Stations

Four stations showed no statistically elevated chemical concentrations. These were Stations 24, 25, 29, and 32 (open water near the turning basin). Stations 24, 29, and 32 showed no evidence of toxicity based on sediment bioassays, while Station 25 indicated statistically elevated echinoderm mortality and abnormality. Five stations had a single elevated chemical compound. Stations 8, 14, 19, and 30 indicated elevated concentrations of PCBs. Station 31 showed elevated levels of phenol. Stations 8 and 14 also indicated statistically elevated echinoderm abnormality levels, while Stations 19, 30, and 31 have no strong evidence of sediment toxicity.

Concentrations of HPAH and PCB were elevated at Stations 5 and 23. Station 5 indicated statistically elevated echinoderm mortality and abnormality, while Station 23 showed no evidence of sediment toxicity.

10.3.3 Sediments Beneath the Piers

Toxicity (echinoderm abnormality) was consistently observed beneath the piers (Stations 42 through 52), with other evidence of toxicity also apparent (e.g., amphipod mortality) on a relatively consistent basis. This evidence of toxicity appeared to coincide with elevated levels of various contaminants. Metals were consistently detected at low to moderate levels, and PAH homologues were detected at moderate to high levels under the piers. Sediment toxicity was reported by four of the six toxicity end points for Stations 42, 45, and 46 (Piers 16, 12, and 12, respectively). The third sediment sample at Pier 12 (Station 44) showed sediment toxicity for three of the six toxicity end points.

Sediment beneath Pier 7 (Station 48) showed sediment toxicity for all three bioassay test species (amphipod mortality and reburial, polychaete mortality, and echinoderm abnormality). In addition to elevated levels of HPAH, LPAH, and metals, Station 48 was the only station beneath the piers to show elevated levels of pesticides.

Stations that showed greater elevations of HPAH, LPAH, and PCB compounds (Stations 43, 47, 49, 50, 51) showed the least indication of sediment toxicity (only elevated echinoderm abnormality). However, Station 48, which showed the greatest elevation of HPAH and LPAH, showed several indications of sediment toxicity.

10.3.4 Summary of Statistical Testing of Bioassay Data

Echinoderm abnormality was the most frequently detected form of sediment toxicity in the West Basin, detected at 26 of the 45 sampling stations. Other evidence of toxicity was detected at a far lower frequency. For example, elevated amphipod mortality occurred 4 out of 45 stations (all were sediment from beneath the piers) and reduced polychaete growth occurred at 2 of 45 stations. Stations that showed elevated echinoderm

VOL 18
0569
R0062504

abnormalities were more likely to show other elevated toxicity and chemical concentrations than were stations that did not show elevated echinoderm abnormality.

The evaluations and results presented in this section are preliminary and subject to change as more data becomes available. The RI Report will contain a more complete assessment of data and conclusions.

10.4 PREPARATION OF THE RI REPORT

The RI Report will include all or most of the contents of TM6. In addition, the evaluations described in this section, as well as the results of ongoing assessments, will be incorporated into the overall project RI Report with the following considerations:

- the text presented in TM6 may be modified when incorporated into the RI Report as more complete information becomes available,
- the RI Report, when issued, will replace in its entirety the contents of TM6, and
- analytical data presented in TM6 are preliminary, have not been validated, and are subject to revision following the incorporation of data validation qualifiers and other information; therefore, no final data evaluation and conclusions are presented in TM6.

The RAWP, currently being reviewed by the oversight agencies, provides a template for evaluating data, conducting ecological and human health risk assessment, and formulating conclusions from these analyses. Agency concurrence with this document will allow for the evaluation of data, using the rationale and methodologies specified in the RAWP, to proceed.

SECTION 12

GLOSSARY OF TERMS

VOL 18

Section 12
GLOSSARY OF TERMS

ABUNDANCE — The number of individuals in a population of a species in a given unit of area.

ACUTE TOXICITY — Death or physiological disorder in an organism resulting from a single dose of, or exposure to, a compound or compound mixture. All acute exposures occur over a small portion of an organism's lifespan or life cycle; see CHRONIC TOXICITY and SUBCHRONIC TOXICITY. Most acute toxicity testing is conducted over a short exposure period, *e.g.*, 72 or 96 hours.

ADSORPTION — Physical adhesion of molecules, colloids, or other chemical substances to solid particulate surfaces without chemical reaction. Adsorption is an important factor affecting environmental movement and fate of chemicals; see DESORPTION and SORPTION.

ADVECTION — Removal or transport of suspended materials via currents or other oceanographic processes.

ADVERSE EFFECT — A condition caused by a specific action that results in harm to an organism or its habitat.

APPARENT EFFECTS THRESHOLD — A chemical concentration in sediment above which an adverse toxic effect would always be expected.

AQUATIC LIFE — Organisms inhabiting water for all or part of their lifecycle.

AQUEOUS PHASE — Referring to the dissolved phase in water rather than the solid phase.

ASSESSMENT ENDPOINT — The ecological resource which requires evaluation and, ultimately, protection. For example, the viability of a population is a commonly used assessment endpoint requiring evaluation. Also see MEASUREMENT ENDPOINT.

BENTHIC/BENTHOS — Refers to the ocean or harbor bottom, including the sediments and biota inhabiting the bottom.

BENTHIC COMMUNITY ANALYSIS — Numerical evaluation of infaunal invertebrate communities inhabiting a site/location; data are used to evaluate the potential effects of contaminated sediments on native biota.

0583
R0062518

BIOACCUMULATION	The process whereby exposure of an organism to chemical residues results in concentrated levels of that chemical in specific receptor tissue. Exposure may occur through dermal, respiratory, and ingestion routes; see BIOCONCENTRATION.
BIOASSAY	A test using organisms to determine the toxicity of a compound or chemical mixture; primary function is to provide case-specific information regarding the toxicity of such compound or chemical mixture.
BIOCONCENTRATION	The process whereby exposure of an organism to chemical residues results in concentrated levels of that chemical relative to the surrounding aquatic environment. Exposure normally occurs through passive accumulation from the water column; see BIOACCUMULATION.
BIOCONCENTRATION FACTOR (BCF)	The ratio of concentration of a chemical within the tissue of an organism to that of the surrounding aquatic medium.
BIODEGRADATION	Decomposition of a chemical contaminant which is catalyzed or aided by the action of microorganisms, *e.g.*, bacteria.
BIODEPLETION	A reduction or depletion of a chemical substance from an organism specifically or food chain in general; see BIOMAGNIFICATION
BIOLOGICAL IMPACT	Any impact to a population of organisms; the impact may be measured using species abundance, species diversity, or other measurement indices.
BIOMAGNIFICATION	The process by which a chemical compound concentrates with increasing trophic level as it moves through the food chain; see BIOACCUMULATION and BIOCONCENTRATION.
BIOMARKERS	Test organisms used as indicators of environmental conditions.
BIOMASS	Refers to the amount of biotic matter within a specific area. For example, when sampling benthos, one of the indices used to evaluate benthic communities is the total amount of biomass present within a fixed volume.

VOL 18

0584

R0062519

BIOTA/BIOTIC	Relating to living organisms, including plants and animals, i.e., as opposed to inaminate or nonliving matter.
CHRONIC TOXICITY	An adverse biological response, such as mortality or an effect on growth or reproductive success, resulting from repeated or long term exposures to a compound, usually at low concentrations; see ACUTE TOXICITY and SUBCHRONIC TOXICITY.
CONCENTRATION	An amount of a chemical compound in a specified amount of medium, *e.g.*, water, sediment. Measured in standard units such as milligrams per liter (mg/L), microgram per kilogram (µg/kg), or other appropriate units.
CONTAMINATION	Refers to the presence of specific chemical compounds, typically those included on U.S. EPA's Priority Pollutant list, present in special media of concern. Does not refer to or imply the occurrence of a toxic effect or adverse impact associated with the chemical or group of chemicals.
DEGRADATION	Transformation of a chemical compound by physicochemical or biochemical processes into its basic components.
DEMERSAL	Fish which dwell at or near the sea bottom.
DESORPTION	Dissociation of a chemical from a surface to which it had previously adhered; also see ADSORPTION and SORPTION.
DOSE	An amount of substance administered per unit of animal body weight. Measured in milligrams of substance per kilogram of animal body weight (mg/kg), or other appropriate units. Useful for calculating risk in a receptor organism.
EC_{50}	MEDIAN EFFECTIVE CONCENTRATION; concentration eliciting a sublethal response in 50 percent of the organisms tested; see LC_{50}.
ECOLOGICAL COMMUNITY	Any assemblage of populations living in a specific habitat.
ECOLOGICAL HAZARD	Actual or potential adverse effects of chemical substances on aquatic biota (plants or animals).

VOL 18
0585
R0062520

ECOLOGICAL RISK ASSESSMENT	An evaluation of the actual or potential long-term or short-term effects of chemical compounds on aquatic receptors.
ED_{50}	MEDIAN EFFECTIVE DOSE; dose eliciting a non-lethal response in 50 percent of the organisms tested; see LD_{50}.
ENDPOINT	A toxicological response or measured effect.
ENVIRONMENTAL FATE	The result of natural processes acting upon a substance, including transport (*e.g.*, sedimentation), physical transformation (*e.g.*, volatilization, precipitation), chemical transformation (*e.g.*, photolysis) and biological transformations (*e.g.*, oxidation and reduction).
EQUILIBRIUM PARTITIONING	Refers to a theoretically based process whereby chemical agents reach equilibrium between the sediment solid phase and its interstitial water; the theory holds that total organic carbon (TOC) is one of the key driving factors for governing this distribution, especially for organic chemicals.
EPIBENTHIC	Organisms inhabiting the sediment surface; i.e., living on top of the sediment. Also see INFAUNAL ORGANISMS.
EXPOSURE	Also EXPOSURE ANALYSIS; an evaluation of potential ASSESSMENT likelihood that humans, non-target wildlife, or biological habitats will be exposed to potentially harmful effects of a chemical.
EXPOSURE PATHWAY	The route by which exposure to a toxicant occurs. A complete exposure pathway consists of contaminant source(s), transport media (*e.g.*, surface water or sediments), the contact point between the transport medium and the receptor (*e.g.*, water supply system), and the receptor route or mechanism of entry (*e.g.*, ingestion of water, biota, or inhaled dust). If an exposure pathway is incomplete, it does not warrant further consideration in the risk assessment.
EXPOSURE SCENARIO	Overall description of the potential contact of an organism or population with a chemical substance under specified conditions, *i.e.*, routes of contact, life history of the organism, *etc.*

VOL 18
0586
R0062521

HABITAT	An environment that provides the requirements (*i.e.*, food, water, and shelter) essential to development and sustained existence of a species.
HALF-LIFE ($t_{1/2}$)	The time necessary for the concentration of a chemical to decrease by 50 percent. Provides a measure of the persistence of a chemical in a given medium. The greater the half-life, the more persistent a chemical is likely to be.
HAZARD	A potential adverse effect associated with exposure to a chemical substance.
HAZARD QUOTIENT	Risk expressed as a ratio of dose (exposure) to toxicity for a specific exposure duration. HQ values are used to address both acute and chronic risk.
HENRY'S LAW CONSTANT	Provides a measure of the extent of chemical partitioning between air and water at equilibrium. The higher the constant, the more likely a chemical is to volatilize than to remain in solution.
HOMOLOGUE	Specific chemical compound within a larger group of chemical compounds (e.g., benzo(a)pyrene is a homologue within the PAH class of organic chemicals).
HUMAN HEALTH RISK ASSESSMENT	Appraisal of the actual or potential short-term or long-term effects of chemical compounds on humans, such as fishermen or residents.
HYDROLYSIS	The decomposition of chemical compounds resulting from a reaction with water.
INDICATOR SPECIES	A species thought to be biologically representative of the reproductive success of other key species within a particular population or biological community.
INDIGENOUS SPECIES	Biota which are native to a specific habitat.
INFAUNAL INVERTEBRATES/ ORGANISMS	Organisms living within the sediments (usually within 10 cm of the surface) rather than on top of the sediments. Also see EPIBENTHIC ORGANISMS.
INTERTIDAL ZONE	Sediments lying between the high- and low-tidal marks.

VOL 18
0587
R0062522

K_d	SEDIMENT-WATER DISTRIBUTION COEFFICIENT; the ratio of concentrations of a specific chemical substance sorbed to sediment versus the concentration dissolved in water. The higher the K_d value, the more likely the chemical will adsorb to sediment than dissolve in water.
K_{oc}	The ratio of concentrations of a specific chemical substance sorbed to the organic carbon fraction of sediment versus the concentration dissolved in water. The higher the K_{oc} value, the more likely the chemical will adsorb to organic carbon in sediment rather than dissolve in water.
K_{ow}	OCTANOL/WATER PARTITION COEFFICIENT; a ratio that provides a measure of the extent of chemical partitioning between water and octanol at equilibrium. Octanol is used as a surrogate for lipids, *e.g.*, fatty tissue or other organic substrate.
LC_{50}	MEDIAN LETHAL CONCENTRATION; a calculated concentration of a substance expected to kill 50 percent of laboratory test organisms.
LD_{50}	MEDIAN LETHAL DOSE; a calculated dose of a substance expected to kill 50 percent of laboratory test organisms.
LOCALIZED SPECIES	Species which does not seasonally migrate.
LOEC	LOWEST OBSERVED EFFECT CONCENTRATION; the lowest exposure level, or concentration at which an observable toxic effect occurs.
LOEL	LOWEST OBSERVED EFFECT LEVEL; the lowest exposure level (dose) at which an observable toxic effect occurs.
LYOPHILIZATION	A laboratory freeze-drying technique.
MEASUREMENT ENDPOINT	Specific measurable data taken to evaluate whether assessment endpoints (e.g., the viability of a specific population) have been potentially affected by the presence of chemical contaminants; also see ASSESSMENT ENDPOINT.

VOL 18
0588
R0062523

MINERALOGY	The chemical constitution of sediment particles occurring in the aquatic environment.
NEGATIVE CONTROL	Bioassay in which test organisms are exposed to clean sediments. Used to obtain a measure of biological response associated with exposure to clean sediment.
NOEC	NO OBSERVED EFFECT CONCENTRATION; the highest concentration level tested at which no observable difference between the test and control population occurs.
NOEL	NO OBSERVED EFFECT LEVEL; the highest dose tested at which no observable difference between the test and control population occurs.
NON-POINT SOURCE	Discharge that originates from a number of undefined sources, including stormwater runoff, precipitation, or accidental spills or releases.
NUMBER OF SPECIES	The number of species in a specific area. Often compared to an equivalent area at a reference location.
NUMERICAL SEDIMENT QUALITY GUIDELINES/CRITERIA	Chemical analyte-specific toxicity-based values, normally expressed as a chemical concentration, used to establish concentrations in sediment which are expected to be protective of aquatic organisms.
PARTITION COEFFICIENT	A chemical-specific property describing the ratio in one substrate or phase compared to another, *e.g.*, the amount of a chemical sorbed to sediment compared to the amount dissolved in water.
PELAGIC	Organisms inhabiting the water column rather than the benthic environment.
PERSISTENCE	The ability of a chemical compound to remain intact following its release into the environment.
PHOTOLYSIS	Also PHOTODEGRADATION; the decomposition or dissociation of a molecule resulting from ultraviolet light absorption.

VOL 18

0589

R0062524

POINT SOURCE	Discharge that originates from a well-defined location, typically a wastewater discharge, subject to regulation under the Clean Water Act.
POLLUTION	Refers to the presence of specific chemical compounds present in specific media of concern. Differs from the term "contamination" in that it does imply the occurrence of a toxic effect associated with the presence of the chemical or group of chemicals.
POPULATION	A group of organisms belonging to the same species which inhabits a specific area or habitat.
POREWATER	The water residing in the interstices or pores between sediment particles.
POSITIVE CONTROL	Bioassay in which a known quantity of toxicant (reference toxicant) is spiked into the test matrix; used to measure the sensitivity of test organisms.
PREDATOR	An animal that hunts, kills and consumes another (prey) organism.
PREPONDERANCE OF EVIDENCE	Using all available site-specific chemical and biological data to evaluate the potential for ecological effects associated with the presence of specific chemical compounds.
PREY	An organism which is hunted, killed, and consumed by another (predatory) organism.
RECEPTOR ORGANISM	Organisms potentially exposed to a chemical compound of potential concern via any of a number of potential pathways.
RESECTION	Removal of specific organs or tissues from organisms (e.g., fish) captured for the purpose of sampling.
RISK	A potential adverse effect associated with exposure to a chemical substance.
SEDIMENT QUALITY OBJECTIVE	A site-specific term used to define cleanup goals for specific chemical compounds of potential concern.
SEDIMENTOLOGY	The dynamics associated with erosion, deposition, transport/advection, or other behavior of sediment particles in an aqueous environment.

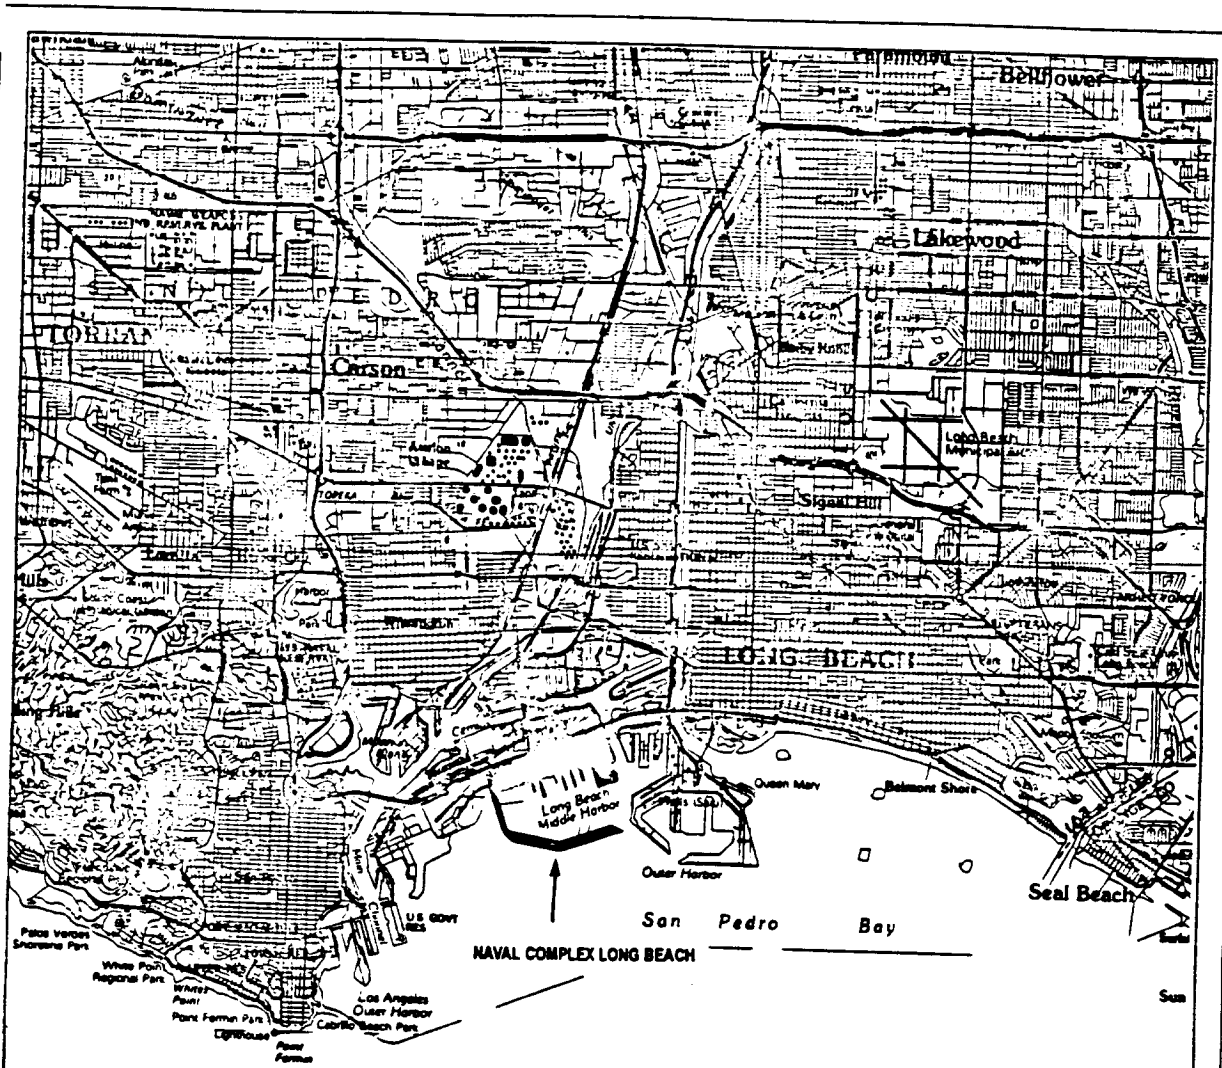
VOL 18

0590

R0062525

SEDIMENTATION	The deposition of sediment particles in an aqueous environment resulting from a number of oceanographic processes.
SEICHE	An oscillation of the surface of a lake or landlocked sea that varies in period from a few minutes to several hours. The regular resonating waves pass from one edge of the body of water to the other and back.
SOLID PHASE BIOASSAYS	Bioassays conducted on the bulk phase of sediment (i.e., not from the interstitial water or other phase).
SOLUBILITY	The amount or ratio of a solute (a dissolved substance) that will saturate a fixed volume of solvent under static conditions. Solubility is important to understanding a chemical's mobility in water. More soluble substances are potentially more bioavailable but also will be distributed more efficiently through the water column (less concentrated).
SONICATION	An ultrasound-based laboratory technique used to separate or extract specific chemical analytes.
SORPTION	A generalized term referring to both adsorption and desorption.
SUBCHRONIC TOXICITY	Adverse biologic response of an organism, such as mortality or an effect on reproductive success, resulting from relatively short term exposure to a test sample or compound.
SUBLETHAL RESPONSE	Toxicological response which is less severe that mortality, such as growth inhibition or reproductive impairment.
SUBTIDAL ZONE	Sediments lying below the lowest tide level.
SYNERGISTIC EFFECT	The result of a combined action of two or more chemical substances to achieve an effect (either positive or negative) which is greater than that of which the individual chemical is capable.
THREATENED/ENDANGERED (T&E) SPECIES	A species in danger of extinction throughout all of its native range.
TOXICANT	A chemical substance capable of inducing a toxic effect.

VOL 18
0591
R0062526



TOXICITY	The ability or capacity of a chemical substance to induce an adverse effect.
TOXICOLOGICAL BENCHMARK	A guideline value derived as a measure of sensitivity to acute or chronic exposure for the purpose of protecting aquatic life; may be derived for the protection of individual species or species groups.
TOXICOLOGICAL EVALUATION	An assessment of the potential adverse effects of specific compounds of potential concern.
UNCERTAINTY	Inherent error resulting from any activity relating to sampling or analysis of data.
UNCERTAINTY ANALYSIS	Estimation or evaluation of the contributions or magnitudes of errors resulting from analysis of environmental or other data.
UNCERTAINTY FACTOR	A factor which quantifys the numerical relative uncertainty in deriving toxicological benchmarks, especially when compound-specific data are based on non-project specific toxicological testing. Such uncertainty can arise from overall data quality, interspecies variability, endpoint sensitivity, endpoint extrapolation, and many other sources.
VAPOR PRESSURE	The pressure exerted by a chemical in its solid or liquid phase to convert to its gas (vapor) phase in equilibrium at a given temperature.
VOLATILIZATION	Conversion of a solute from solid or liquid phase to vapor phase; e.g., converting liquid water into steam.

Common Name	Advantages	Disadvantages
Human Health Only		
Barred sand bass *Paralabrax nebulifer*	Abundant Predatory benthic and pelagic feeder Non-migratory local species Frequently caught Well documented in similar studies High lipid content	Low catch frequency by trawl
Rubberlip surfperch *Rhacochilus toxotes*	Abundant in harbors, bays and around piers Non-migratory local species Frequently caught	Pelagic feeder Not well studied
Kelp bass *Paralabrax clathratus*	Abundant Frequently caught Non-migratory local species Well studied locally Recommended by EPA for contaminant studies High lipid content	Predatory pelagic feeder Seldom caught/observed away from kelp beds
Opaleye *Girella nig*	Abundant in water depths of about 20 ft Frequently caught	Omnivorous pelagic feeder, especially feeds on seaweeds and the animals that live on them
Queenfish *Seriphus politus*	Caught locally Non-migratory local species	Water column feeder Not well studied
Barred surfperch *Amphistichus argenteus*	Occasionally caught in Long Beach Harbor Recommended by EPA for contaminant studies Predatory benthic feeder Non-migratory local species	Most abundant in breaking surf along sandy beaches
Ecological Only		
Hornyhead turbot *Pleuronichthys verticalis*	Abundant Predatory benthic feeder Non-migratory local species Life history well understood Probably common prey species	Not frequently caught by fishermen
Spotted turbot *Pleuronichtys ritteri*	Predatory benthic feeder Non-migratory local species Probably common prey species	Not frequently caught by fishermen

Table 5-1 (continued)

Common Name	Advantages	Disadvantages
Ecological Only		
Diamond turbot *Hypsopetta guttulata*	Predatory benthic feeder Non-migratory local species Probably common prey species	Not frequently caught by fishermen
Speckle-finned sanddab *Citharichthys stigmaeus*	More abundant than turbot Predatory bottom-feeder Prey to large fish, diving birds and marine mammals	Not frequently caught by fishermen
Blue rockfish *Sebastes mystinus*	Recommended by EPA for contaminant studies Abundant in shallow water in and around rocky areas Benthic and pelagic feeder	Low catch frequency in Long Beach Harbor, but occasionally caught
Human Health and Ecological		
California halibut *Paralichthys californicus*	Abundant on sandy bottoms in water shallower than 60 ft Benthic dweller Used by State of California for major contaminant study Frequently caught Prey to sharks, rays and marine mammals Desirable game fish	Pelagic feeder May migrate as adults
Fantail sole *Xystreurys lioledis*	Occasionally caught locally Benthic feeder Common prey species	Not well studied Locally migratory
Dover sole *Microstomus pacificus*	May occur as far south as Baja California Benthic feeder Recommended by EPA for contaminant studies	Resides in water depths up to 3,000 ft Not frequently caught in Long Beach Harbor Locally migratory
White croaker *Genyonemus lineatus*	Abundant in shallow bays Omnivorous benthic feeder Non-migratory local species Frequently caught Well documented in similar studies Abundant reference data Fish consumption advisory has been issued locally

Table 5-2
Numbers of Fish Collected and Analyzed by Tissue Type and Species

Target Species	Whole Body			Fillet			Bile		
	Number of Sampling Areas	Fish Required per Area	Number of Fish Required	Number of Sampling Areas	Fish Required per Area	Number of Fish Required	Number of Sampling Areas	Fish Required per Area	Number of Fish Required
Species 1 - Human Health Only									
Study site (NAVSTA pier)	2	3	6	2	3	6			NA[a]
Reference (reference pier)	1	3	3	1	3	3			NA
Species 2 - Ecological Only									
Study site (trawling transects)	3	4	12			NA			NA
Reference (trawling transects)	2	3	6			NA			NA
Species 3 - Human Health and Ecological									
Study site (human health/ecological)	2	3	6	2	3	6			
Study site (ecological only)	2	3	6			NA	3	4[b]	12
Reference (human health/ecological)	1	3	3	1	3	3			
Reference (ecological only)	1	3	3			NA	2	3	6
	Total Whole Body = 45			Total Fillet = 18			Total Bile = 18		

Total Number of Fish to be Sampled = 72
(minus 9 fish from human health/ ecological group that can be used to collect bile samples)

Total Number of Analyses = 81

Notes:
[a] NA – not applicable
[b] Assume one fish per bile sample, but may be composited if insufficient bile is available in a given fish

R0062557

Table 5-3
West Basin Samples Collected and Analyzed by Type and Location

Sample Type	Site 7	Reference	Total	Chemical Analytes/Biological Endpoints
Sediment Chemistry				
Surface	47[a]	9[a]	56	SVOCs[b], pesticides, PCB[c] Aroclors, moisture content, priority pollutant metals, butyltins, AVS/SEM[d], total sulfides, particle size, TOC[e]
Subsurface	26 (8 cores)	7 (2 cores)	33 (11 cores)	SVOCs, pesticides, PCB Aroclors, moisture content, priority pollutant metals, butyltins, particle size, TOC
Tissue Chemistry				
Clam Bioaccumulation	9	5	14	SVOCs, pesticides, PCB Aroclors, priority pollutant metals, butyltins
Fish Whole Body	30	15	45	SVOCs, pesticides, PCB Aroclors, lipid content, priority pollutant metals, butyltins
Muscle Fillet	12	6	18	SVOCs, pesticides, PCB Aroclors, lipid content, priority pollutant metals, butyltins
Fish Bile	12	6	18	PAH[g] parent compounds and metabolites, normalized to specific PAH equivalents
Biological Testing				
Bioassay	45	15[h]	60	Sediment solid phase: amphipod mortality and polychaete growth/mortality Interstitial water (aqueous phase): echinoderm development/mortality
Benthic Community Analysis (not yet analyzed)	45	15[h]	60	Specific indices relating to benthic community structure

Notes:

[a] Includes two additional field replicates at Station 1 and Reference Station 101
[b] SVOC – semivolatile organic compound
[c] PCB – polychlorinated biphenyls
[d] AVS/SEM – acid volatile sulfides/simultaneously extracted metals
[e] TOC – total organic carbon
[f] NA – not applicable
[g] PAH – polynuclear aromatic hydrocarbon
[h] Includes two additional field replicates at Reference Stations 101, 102, 103, and 183

R0062558

Table 5-4
Biological Performance Criteria

Test Organism	Negative Control Performance Criterion	Reference Sediment Performance Criterion	Data Interpretation Performance Criterion			Other Observations
Amphipod *R. abronius* Mortality	Mortality (control) ≤ 10%	Mortality (reference vs. control) ≤ 20%	Mortality (test - reference) ≤ 20%	and	Mortality (test vs. reference) statistically significant ($P^a = 0.05$)	Reburial
Polychaete *N. arenaceodentata* Mortality	Mortality (control) ≤ 10%	Mortality (reference - control) ≤ 20%	Mortality (test - reference) ≤ 20%	and	Mortality (test vs. reference) statistically significant (P = 0.05)	–
Polychaete *N. arenaceodentata* Biomass	Mortality (control) ≤ 10%	Mean individual weight (reference + negative control) ≤ 30%	Mean individual weight (test - reference) ≤ 30%	and	Mean individual weight (test vs. reference) statistically significant (P = 0.05)	–
Echinoderm *D. excentricus* Larval Development	Abnormal Development (control) ≤ 30%	Abnormal development (reference - control) ≤ 20%	Abnormal development (test - reference) ≤ 20%	and	Abnormal development (test vs. reference) statistically significant (P = 0.05)	Mortality
Benthic Community Analysis		Richness and abundance within normal range of natural variability; pollution-sensitive taxa present; pollution-tolerant taxa not numerically dominant	Mean abundance of any one group < 50% of reference and significantly different (P < 0.05); follow draft guidelines of EMAP/EPA[b] programs			Abundance Diversity Evenness Species richness

Notes:
[a] P – probability
[b] EMAP/EPA – Environmental Management Action Plan/Environmental Protection Agency
