Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

As a business operator in the Los Angeles Area, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures. I am pleased that the business community was included in the negotiations–as were representatives of all the effected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

Robert A. Finkelstein

Dear Chairman Keston and Members of the Board:

I'm a businesswoman in the Los Angeles area and care about the quality of our coastline. The beaches are important economically to this region and we must take reasonable, cost-effective action to protect them.

The Los Angeles Times has recently written about people getting sick from storm drain polluted waters in the Santa Monica Bay, and we have been hearing about it from other sources for years. For this reason, I'm writing with a request that the Board adopt the proposed storm water permit. It is clearly a wonderfully effective means for addressing the problem, and the whole community will benefit.

Please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Dear Chairman Keston and Members of the Board:

The rain storm runoff is severely damaging our oceans.

How dare we question the need for the storm water permit? Is environmental protection and maintenance not our responsibility? Doesn't it require immediate action?

If your house had a leak in the roof and dripped "rainwater runoff" into your bed, wouldn't you have it repaired immediately? Now, imagine that it's acid rain and it's burning a hole through your bed and then through your floor. How long would it take you before you called the roofer? Not more than one day.

Thank you for your time.

Warm regards,

Dianna Friedman

101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

As a resident and business consultant I am very interested in seeing that the quality of our coastal waters and beaches is improved. For business and asesthetic reasons I believe we must take smart, reasonable, and cost effective action to protect our resources for current and future generations.

I urge you and the Board adopt the proposed storm water permit as soon as possible. The LA Times on May 7 reported that people are getting sick from storm drain polluted waters. The permit is clearly the most effective way to address the problem with a strong scientific basis to support such measures.

I sincerely hope that you will take this opportunity to demonstrate that government can act in the interest of its constituents by adopting public policy that make good economic and environmental sense.

Thank you for your consideration in this regard.

Sincerely,

Steve Bornstein

LOS ANGELES REGION

Dear Chairman Question and Members of the Board,

As a businessperson in the Los Angeles Area, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96 front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measure. I am pleased that the business community was included in the negotiations--as were representatives of all the effected parties.

In an era when government is so often criticized for not taking actions, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense. I urge you to adopt the proposed permit on July 15th without any further delays.

Thank you for your consideration.

Sincerely,

Flody Suarez

Dear Chairman Keston and Members of the Board:

Environmental issues are of great concern to me, particularly the quality of our coastal waters. It is with this in mind that I am writing to you. We must make every effort to implement regulations that will aid in improving our waters and beaches.

Voting on new regulations that would allow for a more extensive pollution program for storm water runoff is vital in preserving our coastal economic and natural resources. The storm water permit is clearly the most effective means to reduce the hazards and ensure a safer coastline.

I urge you to adopt the proposed permit on July 15 without any further delays. This policy makes good environmental sense, please be a part of the solution.

Sincerely,

Steve McPherson

Dear Chairman Keston and Board Members;

I am a resident of and businessman in the Los Angeles Area and am concerned about improving the quality of our local coastline. Our beaches are an important economic driver for the region, and, I believe, we must take action that is smart, reasonable, and cost-effective in order to protect our resources.

After the L.A. Times article on people getting sick from storm-drain polluted waters in the Santa Monica Bay (5/7/96), I have been moved to write this letter to request that you and the Board adopt the proposed storm water permit as soon as possible.

The permit is clearly the most effective means to address the problem, and there is obviously strong scientific basis to support such measures. I am pleased that the business community was included in the negotiations -- as were representatives of all the effected parties.

In an era when government is so often criticized for not taking actions, please take advantage of this opportunity to adopt public policy that makes good economic sense as well as good environmental sense. I urge you to adopt the proposed permit on July 15th without any further delays.

Thank you for your consideration.

California Regional Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

The Venice Chamber of Commerce takes great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

I am writing on behalf of the Chamber to urge the Board to adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem of pollution in Santa Monica Bay, and there is obviously strong scientific bases to support such measures. We are pleased that the business community was included in the negotiations as were representatives of all the effected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense. We urge you to adopt the proposed permit on July 15 without any further delays.

Thank you for your consideration.

Sincerely,

James R. Merlino
President

Dear Chairman Keston and Members of the Board,

As a businessperson and resident in the Los Angeles area, I take great interest in the quality of our local coastline. Smart, reasonable and cost-effective action is of the essence to protect our natural resources.

It is my understanding that people are getting sick due to polluted storm drains in Santa Monica Bay (Los Angeles Times, May 7, 1996). In light of this situation, I am lodging my support for adoption of the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is strong scientific basis to support such measures.

Please take advantage of this opportunity to adopt public policy that makes good economic and environmental sense. I urge you to adopt the proposed permit on July 15, 1996.

Thank you for your consideration.

VOL 21

June 17, 1996

Mr. Michael Keston
Chairman
Regional Water Quality Control Board
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Mr. Keston:

I wish to strongly urge you and the other members of the RWQCB to enact the strongest possible storm-water pollution prevention regulations when you vote on this matter on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that those who swim in the Bay near the storm drains' outlets are twice as likely to get a whole plethora of terrible diseases as those who swim elsewhere. One of 25 people swimming near the drain get sick. And those who swim there often, such as L.A. County Lifeguards -- of whom my son is one -- get sick with monotonous regularity.

This is simply not acceptable. Our beaches must not be polluted.

Please protect them as best you can, no matter what special-interest pressures may be brought to bear on you and your colleagues on the RWQCB.

Thank you.

Sincerely,

Dr. T. A. Dolotta

RE: SUPPORT FOR STRONG NEW STORMWATER REGULATIONS

Dear Mr. Keston,

It has come to my attention that you and the other members of the Water Quality Control Board will be voting on new controls for storm water run off in the Santa Monica Bay. I am appalled to think that I and my children may continue to be exposed to pollution associated with the storm drains at the beach. Enjoying the environment should NOT be hazardous to one's health!

I urge you to adopt strong regulations to provide the environmental protections necessary to protect those who enjoy the beach and the Bay. You are the guardians of that duty. Please consider public health over special interests when you make your decision. Affected cities can and will adjust to the demands of the law.

I look forward to hearing your views on this matter and to learn how you cast your vote.

Very truly yours,

Sabrina S. Schiller

Monterey Park, CA 91754-2156

Dear Mr. Keston,

I'm writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea or other illness. One of every 25 people that swim in front of a drain will get sick.

That's simply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps, and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

Please do not give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

Scott Harris

Re: Storm Water Quality Regulations

Dear Mr. Keston:

We have been reading with great interest the recent news reports indicating that people are getting sick because of bacteria and viruses released into the ocean through storm drains. Of course this is not news to those of us who surf in the Santa Monica Bay. We have known this for years because our physicians have repeatedly told us that our earaches and sinus problems would be greatly reduced or disappear entirely if we would stay out of the ocean. In fact, we have quit surfing for the first few days after it has rained, and we pay a great deal of attention to the report card designations given to the areas near where we surf.

Whatever steps are required to remediate this situation should be taken. We need strong new storm water pollution prevention regulations and we encourage you to vote that way.

Very truly yours,

COLLINS, ROBILLARD & KATZ

Dear Chairman Keston and Members of the Board:

For the sake of our economy, our health, and our precious natural resources, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures. I am pleased that the business community was included in the negotiations–as were representatives of all the effected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

Bruce Watkins

Dear Chairman Keston and Members of the Board:

The rainforests of the world are thousands of miles away from where I sit to write this letter. The Santa Monica Bay however, is not. I can see it, and the thousands of bathers that flock to its shores annually, right from my office window.

I recently found out that people are getting sick from storm drain polluted waters in the Santa Monica Bay. This concerns me greatly. It is impossible for me to work on behalf of rainforest preservation without looking at local issues as well that are occurring in my own back yard. I am writing to ask that the Board adopt the proposed storm water permit as soon as possible. The permit is the most effective means to address the problem that is threatening our beautiful coastline, the health of the Bay, and our local tourist industry.

Please do the right thing by our environment and tourist trade, and adopt the proposed storm water permit.

Thank you for considering this request.

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do your part to clean up the Bay and approve the Waste Discharge Requirements for the Municipal Storm Water Dischargee within the County of Los Angeles on July 18, 1996.

Sincerely,

cc: Governor Pete Wilson
Mayor Richard Riordan

Dear Mr. Keston:

This letter is in response to the recent USC / Santa Monica Bay Restoration Project study of the Santa Monica Bay which concluded that you've got a good chance of getting sick if you take a swim. Who wants to go jump in the water down there when you know you're plunging into a bacteria/virus spiced soup. I, for one, don't even bother going to Santa Monica Beaches any more with my kids. I travel farther north or farther south, hoping that my kids will be safer.

I urge you and the other members of the Regional Water Quality Control Board to pass strong storm water pollution prevention regulations when it votes on July 15. Please don't weaken the regulations. I want my kids to enjoy the ocean, not just look at it.

Sincerely,

Jim Kouf

Re: **Storm Water Permit for the Santa Monica Bay**

Dear Mr. Slezak:

I would like you to add my name to the list of concerned citizens urging you to adopt the proposed storm water permit for the Santa Monica Bay.

Taking action on this issue is long over due. It is high time we address the environmental problems we have created through our negligence and erroneous financial concerns. This issue will have to be dealt with sooner or later. If we address it now there will be considerably less damage to kick ourselves for later.

Very truly yours,

Dear Mr Keston.

As a dermatologist I have seen, first hand, the oozing running green pus sores all over the body of someone who swam in the Santa Monica Bay by a storm drain. It was disgusting and unnecessary. (and uncivilized).

Please stop untreated pollution from storm drains into our Bay. It isn't healthy for living things. Please help heal the Bay.

Thank you

Re: Municipal Storm Water Permit for the County of Los Angeles (CAS614001)

Dear Mr. Keston:

We are writing to you to express our support for the passage of strong storm water pollution prevention regulations at your July 15th meeting.

Polluted storm water is of special concern to those of us in the Santa Clarita Valley because the Santa Clara River is the source of 50% to 80% of our drinking water supply. It is also the surface receiver of all the storm drains in the Santa Clarita Valley. It is imperative that storm water pollution control become a reality to insure a continued safe and reliable drinking water supply to our Valley. The cost of having to treat our ground water supplies before delivery far outweighs the expense of reducing the pollution through your regulations.

We are also concerned about pollution to the Santa Monica Bay and recent epidemiological studies indicating a link between polluted storm water and illness in swimmers. For the sake of our health, we must clean up this pollution!

Our concern, of course, extends to the effects of pollution on various riparian and marine habitats. We are part of a web of life. We cannot destroy that web's interconnectedness and remain healthy ourselves.

We request that you consider all these aspects of the new storm water permit and vote for strong regulations that will reduce pollution and its impacts on human health.

Thank-you for your time.

Sincerely,

Lynne A. Plambeck

LOS ANGELES REGION

VOL 21

June 5, 1996

Michael Keston, Chair
and Members
California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

As a business operator in the Los Angeles Area, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures. I am pleased that the business community was included in the negotiations-as were representatives of all the effected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

Ginny Durkin

Dear Mr. Drane,

Please vote on July 15th for the proposed storm water permit.

I am a 56 year old businessman. I swim in our ocean a quarter mile about four times a week. I've done so all year round for the past three years. I've come to respect and love the ocean as a living being. It affords me pleasure, emotional well-being and physical fitness. It has become a part of my life-style. I wish to protect it. I am not alone in my feelings on this matter.

Thanks in advance for your consideration and affirmative vote on July 15th for the proposed water permit.

Dear Chairman Keston and Members of the Board:

As citizens and business owners in the Los Angeles area, we take a great interest in protecting and improving the quality of our local environment. We are concerned about the continuing damage to the Southern California coastline, and believe that our beaches are an important economic driver for the region and should be protected through effective and economically sound practices.

After reading in the Los Angeles Times that people are getting ill from storm drain polluted waters in the Santa Monica Bay (Front Page, May 7, 1996), we are moved to write and request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there are strong scientific bases to support such measures. We are pleased that the business community was included in the negotiations, as were representatives of other affected parties.

We urge you to please take advantage of this opportunity to adopt public policy that makes good economic and environmental sense.

Dear Mr. Keston;

The board and members of the Ballona Lagoon Marine Preserve urge you and your fellow Board members to exhibit the courage and concern necessary to protect the waters and wildlife of Santa Monica Bay, and adopt the NPDES storm water runoff permit.

This organization is actively engaged in the restoration of a small wetland in Venice. Our experience has been that education is the key to understanding that leads to public stewardship of our natural resources.

And education is a key component of the subject permit. The economic argument is repeated over and over but surely the losses that will occur with the continued pollution of Santa Monica Bay will be far greater than the costs of embarking on a concerned region-wide effort to stop polluted storm water runoff.

Sincerely,
BALLONA LAGOON MARINE PRESERVE

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do <u>your</u> part to clean up the Bay and <u>approve</u> the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 18, 1996.

Sincerely,

Barry Schlesinger

June 25, 1996

Mr. Keston,

The control of urban run off pollution into Los Angeles area beaches is an immense problem that will not be solved quickly, cheaply or easily. We understand that the document **Waste Discharge Requirements for Municipal Stormwater and Urban Run Off in Los Angeles County** represents a tremendous amount of negotiation and compromise.

We endorse this document as a first small step in the long journey that will lead to cleaner beaches in our area.

We, of course, are disappointed that there is no inspection or enforcement built into this agreement. Like so many of our environmental laws, these guidelines are meaningless if they are not enforced. We look forward to more substance in the future.

For the Ocean,

Gordon Labedz, M.D.

Dear Mr. Keston

I had to write to urge you to vote for strong storm water pollution protection regulations for our bay. I am a native of Los Angeles and I think it is insane that myself and every friend I know will not swim in our beautiful bay because of the toxicity levels and health risks. I know a surfer friend who was infected by the bacteria after a storm and suffered a severe ear infection. His illness is not an isolated incident.

Anything we can do must be done to restore the bay to a safe habitat for humans and sealife alike.

Please imagine our children and our childrens children. The stronger we fight to protect our bay today, the healthier and cleaner it will be for the generatios follow us.

Thank you very much for you attention,

Jim Hagopian

RE: Regional Water Quality Control

Dear Mr. Keston:

I'm writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick!

That's simply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps, and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

Eric Lawton

THE MALIBU FOUNDATION
FOR ENVIRONMENTAL EDUCATION

CA Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754

Dear Board Members,

Please vote YES on the Los Angeles Countywide Municipal Storm Water Permit on July 15th.

The Malibu Foundation has gone to almost 300 schools in Los Angeles and talked to 120,000 children about environmental issues. We have talked about recycling, the dangers of plastic and debris in the world's oceans, storm drains and how litter makes it way from the neighborhoods to the beaches and oceans. We get the schools and kids involved in community service recycling and Adopt-A-Beach clean-up programs. Almost 15,000 kids have actually earned their way to the beach by recycling aluminum cans for bus money. Our 3rd annual Earth Day Clean-up at Dockweiler State Beach saw 1,500 kids on the beach.

All of these children, the citizens of Los Angeles and I am sure, yourselves, share the same vision of clean beaches and ocean. You have the opportunity to take action and clean up the run-off that is polluting our Bay.

Vote YES.

Thank you very much.

Michael D. Klubock
Executive Director

Michael Keston, Chair
Regional Water Quality Control Board
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Mr. Keston,

I'm writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick with a cold, sore throat, fever, diarrhea and nausea. One of every 25 people that swim in front of a drain will get sick!

That's simply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life and leaves our beaches looking like trash dumps. Not to mention the contaminated material that is dumped into the ports and marina creating both environmental and boating safety hazards.

Please do not succumb to the pressures of weakening the regulations. We need you to fight for our beaches!!

Thank you for your time and efforts.

Cordially,

Amy Jordan

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do your part to clean up the Bay and approve the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

Monterey Park, CA 91754-2156

Dear Mr. Keston:

I hope that you and other board members will vote to pass storm drain measures on July 15 to prevent further pollution of our valuable resource, the Pacific. First fish and now humans are getting sick from swimming in the ocean along our beautiful beaches.

As a child I remember catching fresh perch off the Santa Monica pier, eating it and swimming frequently in the water. Now I and everyone I know is afraid to go into the water, not to mention eating anything caught locally. My brother used to skin dive and catch beautiful halibut at Malibu. Our ocean has become a dump for waste and chemicals.

Please do everything you can to bring back clean waters to Santa Monica, so perhaps the fish will come back, and my future grandchildren can one day feel safe to swim in our bay.

Sincerely,

Darlene Lancer

Quality Control Board
Los Angeles Region
101 Center Plaza Drive
Monterey Park, CA 91754-2156

Dear Dr. Rogers:

The purpose of this letter is to urge to adopt the proposed storm water permit.

I am a frequent user of the Santa Monica Bay and have personally witnessed the significant improvement to water quality brought about by the Sanitation Districts' efforts in complying with the Clean Water Act.

I am also regularly afflicted with minor ailments resulting from dirty storm water being discharged into some of the best surfing areas in the Santa Monica Bay. As such, I urge you to follow the letter and spirit of the law in adopting a workable storm water permit.

It appears that the largest source of pollution in the Santa Monica Bay now comes from storm water and a storm water permit such as is on the agenda would address that issue.

Please vote to adopt the permit on July 15, 1996, and urge your fellow board members to do so too thus helping protect the health of residents and tourists who fish, swim and surf in the Santa Monica Bay.

Very truly yours,

David C. Lederer

Dear Chairman Keston and Members of the Board:

As a business operator in the Los Angeles Area, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures. I am pleased that the business community was included in the negotiations–as were representatives of all the effected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

Phil Swain

101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Mr. Keston,

This letter is recommend that you support the issuance of a permit, July 15, 1996, calling upon the 88 cities within Los Angeles County to adopt practices that will reduce urban runoff.

This is the only way to enhance the water quality in Southern California to any degree.

As a contractor, we have come under certain jurisdictions that already require "storm water runoff pollution plans" most notable the city of Mission Viejo.

This extra effort on a job of any scope, was insignificant, and actually enhanced the housekeeping aspects of the job.

While their plan had the contractor list materials utilized, hire consultants, etc, the general idea could be brought about very easily.

Catch basins should be cut off on construction sites, and most notably packaging of materials prior to their use, and during their use, and disposal after use could easily be set up to cut off the potential pollution.

If you would like further input, or to see a site, please call.

Sincerely,

Wiley C. Possell

Dear Dr. Rogers,

As a 24 year resident of Pacific Palisades near Sunset Boulevard and Pacific Coast Highway, a homeowner who has raised a family "at the beach" I have long been concerned about the effluent that is dramatically visible on our beaches during winter storms. Sadly, my children grew up having to become increasingly aware of the health hazards of swimming in the Santa Monica Bay. They and their friends who were surfers seemed to get an inordinate number of infections.

I hope that you will add this household to your list of concerned citizens who strongly urge you to adopt the proposed storm water permit on July 15. Our Los Angeles mountains, beaches and ocean are our most precious natural resource, crucial to the physical and mental well-being of our resident community as well as those who come to take refuge at the seashore from elsewhere in the city.

Please vote to adopt the permit on July 15!!

Sincere regards,

Harriet Wrye

Dear Mr. Keston,

I am writing to urge you to vote to adopt the proposed storm water permit.

As CEO of an advertising agency in the Los Angeles area and as someone who is very concerned about the health of our oceans and our economy, I take a great interest in improving the quality of our local coastline.

Our agency has been involved with Heal the Bay over the past year, donating our time and services to this worthy organization. As such, I have become very aware of the pollution continually dumping out along the coast from Los Angeles storm drains. And, as I'm sure you are aware, the end result is serious contamination of the water which poses a health threat to all those who swim in it. Not to mention an economic threat, as coastal tourism and recreation businesses which generate billions of dollars annually, are largely dependent on the Bay as the primary attraction for their customers.

I am now moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means of addressing the problem. Environmental leaders have worked hard to achieve consensus on all the measures of the permit, now it's up to you.

Sincerely,

Scott

Dear Mr. Keston:

Urban runoff in the Los Angeles Basin, poses one of the deadliest challenges for the near ocean coastal environment from Santa Monica, to Newport Beach. Like the flooding of the Nile, our annual storm season is beginning to establish itself as an "Epic Event," however, one of very negative and detrimental consequences to all who live in Southern California.

To surfers, beachgoers, fishermen, sailors and the tourism industry, the fast deteriorating conditions of our local public beaches and near ocean environment is a topic that is showing up on front pages of our local newspapers far too often. Since all citizens who live in the LA Basin contribute to this "Deadly Urban Brew," we must work together in all communities, both upstream, and downstream, to stop this toxic runoff to our local ocean environment!!

I urge you to support the concept of calling upon all 88 cities within LA County to adopt practices that will reduce URBAN RUNOFF. We also need to work with Ventura, Orange and San Diego Counties to make this a concerted Southern California effort to preserve our precious California Coastal Environment for future generations.

Please support a comprehensive pollution prevention program for "Storm-Water-Runoff."

Sincerely,
Don Slaven

Dear Mr. Keston,
As a life long surfer, I can't emphasize enough the importance of a comprehensive pollution prevention and storm drain runoff plan to the Regional Water Quality Control Board. The health of all of us and generations to come is directly related to the quality of our water. Please help us keep our oceans alive.

Sincerely,

96 JUL 11 PM 1:33

Michael Keston, Chair
California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Dr.
Monterey Park, CA 91754-2156

Dear Mr. Keston,

I am writing you to express my support of a comprehensive pollution prevention program for storm water runoff to the RWQCB. I know I am speaking for, not only myself, but for thousands that have, unfortunately, witnessed the rapid decline of water quality at our local beaches over the years. It is very disturbing to continually warn and discourage my sons from surfing the same waves at Malibu that I was able to ride and enjoy many years ago without the immediate concerns for my health. The Malibu/Santa Monica Bay continues to produce some of the best waves in California, however the probable health risks are frightening. My sons have experienced sickness after surf sessions and their surfing lives have just begun. This is not fair and something must be done now!

We should support the issuance of a permit to call upon the cities of L.A. County to adopt practices that will reduce urban runoff. New regulations are needed to implement a comprehensive pollution prevention program for storm water runoff. We owe this to this generation and the many to follow. We must act NOW!

Thank you for your time, consideration, and, hopefully, support of this program.

Sincerely,

Mark Richard

Monterey Park, CA 91754-2156

Dear Mr. Keston,

I am aware of the problem of urban water runoff. I surf two to three days a week at Huntington Beach. I am very concerned and support the effort to reduce urban water runoff and to minimize its affects. That is why I believe a comprehensive pollution prevention program for storm water runoff is needed. Please vote on July 15th to issue a permit calling upon the 88 cities within Los Angeles Country to adopt practices that will reduce urban runoff. I believe the costs should be borne as close to the originating source as possible. Thanks for your attention.

Sincerely,

Mike Rivney

Attn: Michael Keston, Chair

Subj: Comprehensive Storm Water Runoff Program for Los Angeles County

Dear Mr. Keston:

I am writing you today to urge your support of a comprehensive pollution prevention program for storm water runoff in Los Angeles County. I am sure you are aware of the adverse environmental, social, and economic impacts that contaminated urban runoff has on Los Angeles County's beaches, which include but are not limited to: serious ocean water quality degradation, harm and loss of sea life, health risks to ocean users, and ultimately fewer tourists or beach users.

Please use your authority to help uphold the intent of the Federal Clean Water Act. Failure to do so may render our beaches useless, with minimal sea life, reduced recreational opportunities, and a significant loss of coastal business/tourism dollars. I also suggest that such a program include stringent monitoring, enforcement, and penalties for those who fail to comply.

Sincerely,

Geoff A. Reilly

California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

Safeguarding our ocean, bays and waterways from potentially harmful storm drain runoff is vital. For economic, environmental and aesthetic reasons we simply cannot proceed with the status quo.

On July 15, the Regional Board will have an opportunity to determine the future of Los Angeles County's coastal waters. On that date, the Board will consider approval of the proposed Storm Water Pollution Prevention Permit. If adopted, the permit will require implementation of a far-reaching pollution prevention education and outreach program that will go a long way in reducing coastal pollution.

For more than 15 years, Norris Environmental Services, a Vernon-based waste treatment and recycling company, has incorporated the goals of environmental enhancement, improved public safety, and public education and communication into our corporate strategic planning. We recognize that achievement of those goals is key to helping better the quality of life in the Los Angeles region.

Because the proposed Permit will achieve similar goals, Norris Environmental Services supports approval of the Municipal Storm Water Pollution Prevention Permit and urges the Regional Water Quality Control Board to approve it on July 15.

Sincerely,

Rick Henninger

Dear Mr. Keston and Boardmembers:

The Westside Council of Chambers of Commerce (WC³) is a consortium of 17 chambers on the Westside of Los Angeles County, and represents approximately 7,000 businesses. Some of our communities are a part of the City of Los Angeles, and others are not.

The WC³ recognizes the vitality of the business community on the Westside. We also appreciate the unique and exciting environment enjoyed by millions of residents and tourists. The WC³ believes that a thriving business community and a protected environment can coexist. In fact, tourism and other industries would benefit from a cleaner environment.

We support, in theory, the environmental protections for Santa Monica Bay sought through the proposed storm water permit. We urge you to implement protection for the Bay and our beaches.

Sincerely,

Donald W. Savoie, *President*

Dear Chairman Keston and Members of the Board:

As a business operator in the Los Angeles Area, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures. I am pleased that the business community was included in the negotiations–as were representatives of all the effected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Michael Keston, Chair
California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Dr.
Monterey Park, CA 91754-2156

Dear Michael:

This letter is in support of a comprehensive pollution prevention program for storm water runoff.

The Regional Water Quality Control Board will vote on July 15th whether to issue a permit calling upon the 88 cities within LA County to adopt practices that will reduce urban runoff. This runoff, the primary source of coastal pollution, is filled with pathogens, toxics and debris that poison our coastal waters, contaminates fish, afflicts marine mammals, and sickens surfers and swimmers.

The new regulations are needed to implement a comprehensive pollution prevention program for storm water runoff. What is at stake is nothing less than the health of thousands of beachgoers, the quality of nearshore coastal waters, the beauty of miles of County beaches and the economic benefit of the coastal economy of Southern California.

Sincerely,

Ryan Kelly - Principal
Chairman, Surfrider Newport Chapter

Monterey Park, CA 91754
Fax: (213) 266-7600

Dear Mr. Keston:

I have never written a public official before, but the urban runoff problem is so severe in the Santa Monica Bay that you must do something NOW to help the situation. I have lived on the beach for sixteen years, and I have seen the water deteriorate Last year, I had visitors to the beach and their two small children swam in the ocean. At the end of the day, both kids had severe blotches all over their bodies from the pollution in the Santa Monica Bay Ocean. The ocean waters are used mostly by people who do not live at the beach, but who make daily visits. It is mostly locals and tourists.

The Santa Monica Bay Restoration Plan, which will reduce stormwater pollution, is vital. The beaches and its visitors are suffering. My neighbors and my friends are afraid to swim in these polluted waters off our coast. The clogged catch basins and the urban runoff dumps huge amounts of contaminants into the L.A. River, the San Gabriel River, and Ballona Creek here close to Marina Del Rey. You must help with this problem.

Please protect me, the health of beach visitors, marine life, our local real estate, as well as our huge coastal tourism business by supporting the Municipal Storm Water NPDES permit for Los Angeles County.

I hope you are not too far away to understand the severity of the problem. Please help.

Most sincerely,

Jerry Reger

Dear Mr. Keston:

Urban runoff is the largest source of coastal pollution to Santa Monica and San Pedro Bays. As you know, the Santa Monica Bay Restoration Plan targets reducing storm water pollution. I'm asking for your support of the Municipal Storm Water NPDES permit because:

- Los Angeles County has suffered from a reduction in beach visitors (from 80+ million to less than 50 million) due in part to water pollution
- Clogged catch basins cause property damage
- Contaminated runoff poses a health and safety risks to human and marine life

Thank you for your support in the past and your continued support.

Sincerely,

Dear Chairman Keston:

I am concerned about an article in the Los Angeles Times (3/26/96) that describes the debate about cleaning up the region's urban runoff. I urge you to deal with this situation by adopting the stormwater permit now undergoing review and comment.

As the article notes, urban runoff is the primary source of pollution in Santa Monica Bay. Urban runoff results from a vast array of activities and we must begin to address these systematically or lose the tremendous ecological and economic benefits deriving from Southern California's coast. The stormwater permit offers the only reasonable method to ensure the continued enjoyment of these benefits.

I am looking to the Regional Board to exercise leadership in this area.

Sincerely,

Barbara Kohn

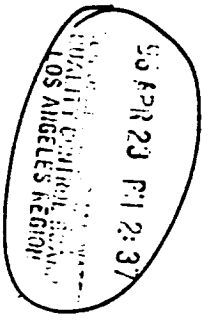
Dear Mr. Keston:

I am the volunteer Chairperson of HEAL THE BAY's Speakers Bureau, which means I train new speakers and schedule dates for talks. These fine citizens, mostly full time professionals busy with their own careers, donate their time and talented effort to address approximately 25,000 people, each year.

The primary point we make in our program is that storm drains run straight from the gutter to the beach and into the ocean. We tell them there are many ways they can help -- don't litter, tell ten other people, report full catch basins, Adopt A Beach, come to International Beach Clean Up Day, join our Gutter Patrol volunteers who have stenciled warning signs on 65,000 catch basins Do Not Dump This Drains To Ocean, remember to Reduce, Reuse Recycle.

Many of the people to whom we speak are students. We get letters, and pictures, thank you notes, and vows to do better.



I believe our government should do as well.

Please help us by supporting the Municipal Storm Water NPDES permit for Los Angeles County.

Yours truly,

Jean Howell

Addendum

4.21.96

DEAR CHAIRMAN KESTON

URBAN RUNOFF IS THE LARGEST SOURCE OF COASTAL POLLUTION TO SANTA MONICA AND SAN PEDRO BAYS. AS YOU KNOW THE SANTA MONICA BAY RESTORATION PLAN TARGETS REDUCING STORM WATER POLLUTION AS THE PLAN'S MOST IMPORTANT GOAL. LOS ANGELES COUNTY HAS SUFFERED THROUGH A DRASTIC REDUCTION IN THE NUMBER OF BEACH VISITORS (FROM OVER 80 million PER YEAR TO LESS THAN 50 MILLION) TO L.A. COUNTY BEACHES LARGELY BECAUSE MANY PEOPLE ARE AFRAID TO SWIM IN THE RUNOFF POLLUTED WATERS OFF OUR COAST. ALSO, CLOGGED CATCH BASINS CAUSE HUNDREDS OF THOUSANDS OF DOLLARS IN PROPERTY DAMAGE EVERY YEAR. URBAN RUNOFF DUMPS TONS OF CONTAMINATED SEDIMENTS AT THE MOUTHS OF THE L.A. AND SAN GABRIEL RIVERS AND BALLONA CREEK NEXT TO MARINA DEL REY. THE END RESULT IS A BEACH SAFETY PROBLEM AND A CONTAMINATED SEDIMENT HOT SPOT PROBLEM THAT POSES SEVERE HEALTH RISKS TO LOCAL MARINE LIFE AND COSTLY SITE REMEDIATION PROBLEMS.

PLEASE PROTECT THE PUBLIC HEALTH, MARINE LIFE, LOCAL REAL ESTATE

April, 20, 96
Mr. Michael Keston, President
California Regional Water
Quality Control Board
101 Centre Plaza Dr.
Montery park, CA 91754

Dear Mr. Keston,

Urban runoff is the largest source of costal pollution to Santa Monica and San Pedro Bays. As you know, the Santa Monica Bay Restoration Plan targets reducing storm water pollution as the plan's most important goal. Los Angeles county has suffered through a drastic reduction in the number of beach visitors (form over 80 million per year to less than 50 million) to LA County beaches largely because many people are afraid to swim in the runoff polluted waters off our coast. Also, clogged catch basins cause hundreds of thousands of dollars in property damage every year. Urban runoff dumps tons of contaminated sediments at the mouths of LA and San Gabriel Rivers and Ballona Creek next to Marina Del Rey. The end result is a boater safety problem and a contaminated sediment hot spot problem that poses severe health risks to local marine life and costly site remdiation problems.

Please protect the public health, marine life, local real estate, and the county's $2 billion a year coastal tourism economy by supporting the Municipal Storm Water NPDES permit or Los Angeles County.

Sincerely,

Brent Matschke

Dear Mr. Keston:

I live on the Santa Monica Bay and have for nearly 40 years. I am a member of Heal the Bay because I would like to see this body of water as clean as it is beautiful. It would certainly help if urban runoff could be reduced and it seems as though the most logical step is approval of the County storm water permit in July.

Please support the Municipal Storm Water NPDES permit for Los Angeles County.

Thank you,

Charles E. Bloomquist

Mr. Michael Keston, Chair
California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 917544-2156,

Dear Chairman Keston:

I am concerned about an article in the Los Angeles Times (3/26/96) that describes the debate about cleaning up the region's urban runoff. I urge you to deal with this situation by adopting the stormwater permit now undergoing review and comment.

As the article notes, urban runoff is the primary source of pollution in Santa Monica Bay. Urban runoff results from a vast array of activities and we must begin to address these systematically or lose the tremendous ecological and economic benefits deriving from Southern California's coast. The stormwater permit offers the only reasonable method to ensure the continued enjoyment of these benefits.

I am looking to the Regional Board to exercise leadership in this area.

Sincerely,

Russell Kohn

Monterey Park, CA 91754

Dear Michael Keston,

The largest source of coastal pollution to Santa Monica and San Pedro Bays is urban runoff. The Santa Monica Bay Restoration Project's goal is to reduce storm water pollution from many cities in the County, allowing beach visitors to enjoy the beauty of our beaches instead of being afraid of polluted waters.

Urban runoff dumps tons of contaminated sediments into the L.A. and San Gabriel Rivers resulting in health problems for beachgoers, boaters, and marine life.

Please help protect the public health, marine life, local real estate, and the County's $2 billion a year coastal tourism economy. We urge you to support the Municipal Storm Water NPDES permit for Los Angeles County.

Sincerely,

Mark and Cassandra Pierson

VOL 21 0212

Michael Keston, President
California Regional Water Quality
Control Board
101 Centre Plaza Dr.
Monterey Park, CA 91754

Dear Chairman Keston,

As you are aware, a storm water management permit for Los Angeles County is up for approval by the Regional Water Quality Control Board on July 15th. It is important to the physical, environmental and economic health of our state that the proposal receive your full support. The health of beachgoers, the beauty of our coastal lands, marine life that people eat or admire, and money and jobs created by the tourist industry are all put at risk if storm water pollution is not reduced.

Because urban runoff is the largest source of coastal pollution to the Santa Monica and San Pedro Bays, the Santa Monica Bay Restoration Plan targets reducing this source as the plan's most important goal. Because people are afraid to swim in the runoff contaminated waters, Los Angeles County has seen the number of beach visitors fall by over 30 million. Clogged catch basins cause hundreds of thousands of dollars in property damage each year, and urban runoff dumps tons of contaminated sediments at the mouths of the LA and San Gabriel Rivers and Ballona Creek near Marina Del Rey. Boater safety is threatened and a contaminated hot spot problem is created that poses severe health risks to local marine life and creates costly site remediation problems.

Please support the Municipal Storm Water NPDES Permit for Los Angeles County and help protect public health, marine life, local real estate and the County's $2 billion a year coastal tourism economy.

Thank you,

Monterey Park, CA 91754

Dear Mr. Keston:

Regarding the Los Angeles NPDES permit, I must tell you that I live in the City of Los Angeles, yet I always drive to the beaches of Ventura County to enjoy surfing and SCUBA diving in cleaner waters. I will not step foot in the Santa Monica Bay as it unfortunately is a threat to my health. No chance would I eat anything that dwells in the bay either. In telephone conversations, my friend in Germany tells me that he has read and seen on German television how polluted the Bay is. The Santa Monica Bay needs immediate action.

Urban runoff is the largest source of coastal pollution to Santa Monica and San Pedro Bays. As you know, the Santa Monica Bay Restoration Plan targets reducing storm water pollution as the Plan's most important goal. Los Angeles County has suffered through a drastic reduction in the number of beach visitors (from over 80 million per year to less than 50 million per year) to L.A. Dear Mr. Keston:

I am writing to urge adoption of the stormwater permit that has been under consideration by your board. The recently released epidemiological study regarding the health effects of stormwater only adds to the evidence supporting action without further delay.

I write as a recently returned California native and as a long-time student of marine and coastal pollution. One of the principal reasons my wife and I have settled in Redondo Beach is access to Santa Monica Bay for recreation. Continued stormwater pollution compromises our ability to enjoy the bay and undermines the attractiveness of the bay to tourists, whose expenditures are so important to the local economy.

In researching my book, *The Wealth of Oceans: Environment and Development on Our Ocean Planet*, I found overwhelming evidence that a chief problem facing recreation and fishing in coastal areas is runoff, including litter, oil, pet droppings, garden chemicals, and grass clippings, that are collected in stormdrains and discharged into coastal waters. This problem is the cumulative result of decisions by millions of people, who do not practice basic housekeeping at home or at work, often because they don't see the connection between their individual actions and pollution of coastal waters.

Although engineering better sewer systems can remove some of the pollutants in this runoff, it cannot cost-effectively remove most of the 160 toxic chemicals that have been found in stormwater flowing into Santa Monica Bay. Furthermore, it appears that proposed efforts to divert stormwater to the Hyperion Plant will not include several major storm channels, including Ballona Creek, and will divert stormwater only during the summer months when flows are low. We need a basinwide approach that will reduce pollution at its source, not simply afterwards.

VOL 21 0224

People will continue to disregard the cumulative effects of their individual decisions to pollute, unless there is an aggressive public education and outreach campaign, and there is authority to compel good housekeeping by those who resist, for whatever reason. I believe that the stormwater permit that has been developed meets these two important criteria. For this reason, I urge your swift adoption of the permit.

Let's get on with helping people change their behavior. The Los Angeles area can draw upon educational and public outreach materials and approaches that have proved successful in other areas of the country. We don't have to start from scratch.

Sincerely,

Michael L. Weber

Dear Chairman Keston:

I am very concerned about the pollution of Santa Monica Bay and the effect of that pollution on the health not only of the Bay but on the health of our economy. I encourage you to adopt the pending stormwater permit. It offers the only way to restore the Bay to health and to ensure the prosperity of coastal and tourism businesses.

The Bay has developed a reputation as being polluted and, as a result, visitation has declined. The soon-to-be released epidemiological study showing the health effects of swimming near storm drains could exacerbate this trend. I understand that the epidemiological study deals only with the impact of pathogens on one-time swimmers during dry weather; it does not address the impact of regular swimmers, those who swim in wet weather when flows are greatest, or the impact of toxic pollutants (scores of which have been identified and are known or suspected carcinogens or mutagens). The release of the epidemiological study is likely to raise many questions. If the regulatory authority has no compelling response about how to reduce pollutants from urban runoff flowing to the Bay, people will stay away. This will have enormous short and long-term economic consequences.

As the regulatory authority charged with protecting our waters, I urge you not to delay in adopting the pending stormwater permit.

Sincerely,

xx R. Saledo

Re: Proposed Stormwater Permit

Dear Chairman Keston:

I am writing to urge the Water Board to issue the proposed stormwater permit. Stormwater is the single greatest contributor to pollution of Southern California coastal waters. It contains toxins, pathogens, and debris that harms marine life and afflicts swimmers with an array of ailments.

Some cities are concerned about the costs, but opportunities for cooperation among cities reduce costs considerably. The permit simply calls for education and ordinary good housekeeping practices.

Without leadership from the Board in addressing stormwater, growth and development will lead to increased degradation of coastal waters. More illness, beach closures, and heart rending ailments among marine mammals will result. Such degradation threatens our economic prosperity and our very identity as Southern Californians.

Sincerely,

Amy Ota

Dear Mr. Kestor:

Let me urge your Board to issue the proposed stormwater permit.

More people means more storm water pollution of the ocean. Already, we cannot eat the costal fish that surf fishermen catch. A bad reputation for the local ocean water hurts every city.

Sincerely,

J. Gordon Bateman M.D.

Dear Mr. Keston:

Urban runoff is the largest source of coastal pollution to Santa Monica and San Pedro Bays. As you know, the Santa Monica Bay Restoration Plan targets reducing storm water pollution as the plan's most important goal. Los Angeles County has suffered through a drastic reduction in the number of beach visitors (from over 80 million per year to less than 50 million) to L.A. county beaches largely because many people are afraid to swim in the runoff polluted waters off our coast. Also, clogged catch basins cause hundreds of thousands of dollars in property damage every year. Urban runoff dumps tons of contaminated sediments at the mouths of the L.A. and San Gabriel Rivers and Ballona Creek next to Marina Del Rey. The end result is a boater safety problem and a contaminated sediment hot spot problem that poses severe health risks to local marine life and costly site remediation problems.

Please protect the public health, marine life, local real estate, and the County's $2 billion a year coastal tourism economy by supporting the Municipal Storm Water NPDES permit for Los Angeles County.

Sincerely,

Laurie Gooch

Dear Chairman Keston,

I am writing to ask that you support the proposed stormwater permit. Stormwater is a terrific contaminator of our coastal and bay waters. It is damaging marine life and causing swimmers to catch all matter of bacterial and viral infections.

Without leadership from the Board on the issue of stormwater, our coastal waters will grow more and more polluted. More illness will occur in both the marine life and humans and beach closures will hurt our tourist industry. And I will not be able to enjoy sailing or SCUBA diving as much. Please help save our coastal waters.

Sincerely,

Dear Chairman Keston:

I am writing to urge the Water Board to issue the proposed stormwater permit. Stormwater is the single greatest contributor to pollution of Southern California coastal waters. It contains toxics, pathogens, and debris that harms marine life and afflicts swimmers with an array of ailments.

Some cities are concerned about the costs, but opportunities for cooperation among cities reduce costs considerably. The permit simply calls for education and ordinary, good housekeeping practices.

Without leadership from the Board in addressing stormwater, growth and development will lead to increased degradation of coastal waters. More illness, beach closures, and heart-rendiing ailments among marine mammals will result. Such degradation threatens our economic prosperity and our very identity as Southern Californians.

Monterey Park, CA 91754

Dear President Keston,

About a week ago Tuesday my wife and I drove out to Santa Monica to take a walk along the ocean just south of Pico Blvd. We both find the ocean to have great restorative powers and never tire of watching and listening to the waves come rolling in.

Although the shoreline has become progressively trashy over the years, we were appalled on this recent trip by the amount of litter that ran along the high tide border -- an uninterrupted line of plastic and paper containers of every description -- the worst we could ever recall seeing in all our years of shore strolling. (We're both natives of Los Angeles.)

It was so bad that I stopped at one of the lifeguard stands to ask what had caused it. The guard said it largely came from the storm drains. "Whatever goes down the storm drain comes out here," he said. As it hadn't rained for some time I was surprised by that answer, but he said the garbage keeps pouring out of the drains regardless of the rain. The weekend crowds contribute to the litter, he said, but as this was Tuesday, it would not seem that this was a major factor in the string of filth that lined the seashore. I can't imagine anyone seeing that sickening sight who would want to get into the water.

This example of desecration underscores the need for the adoption of the Storm Water Management program for the Santa Monica and San Pedro Bays. There must be some way to control that urban runoff. The destruction of the aesthetic appeal of the seashore is readily apparent. The invisible damage to the quality of the water and the life in it must assuredly be every bit as severe. Please do all you can to restore one of the simplest but most satisfying pleasures that Southern California has to offer -- a stroll along the surf, without the unsightly scars of urban pollution.

Sincerely,

Harold D. Watkins

Dear Governor Wilson,

Please support the Municipal Storm Water NPDES permit for Los Angeles County. It is necessary to protect the public health, marine life, local real estate and the County's $2 billion/year coastal tourism economy.

Urban runoff into the bay is the largest source of coastal pollution to Santa Monica and San Pedro Bays. As you know, the Santa Monica Bay Restoration Plan targets reduction of storm water pollution as the Plan's most important goal.

L.A. County has suffered through a drastic reduction of beach visitors because people are afraid to swim in the bays. Clogged catch-basins cause costly damage to property each year. And urban run-off dumps tons of contaminated sediments at the mouths of the L.A. and San Gabriel Rivers and Ballona Creek near Marina Del Rey. The end result is beach unsafety, contaminated sediment deposits, and severe health risks for residents and visitors.

Thank you for your consideration of this matter.

Ronald Amen

Dear Chairman Keston:

I am writing to urge the Water Board to issue the proposed storm water permit. Storm water is the single greatest contributor to pollution of Southern California coastal waters. It contains toxins, pathogens, and debris that harms marine life and afflicts swimmers with an array of ailments.

Some cities are concerned about the costs, but opportunities for cooperation among cities reduce costs considerably. The permit simply calls for education and ordinary, good housekeeping practices.

Without leadership from the Board in addressing storm water, growth and development will lead increased degradation of coastal waters. More illness, beach closures, and heart-rending ailments among marine mammals will result. Such degradation threatens our economic prosperity and our very identity as Southern Californians.

Sincerely,

May 21, 1996

Mr. Michael Keston, Chair
California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston:

I would like to add my voice to those that are urging the Water Board to issue the proposed stormwater permit. As you are aware, stormwater is the single greatest polluter of Southern California's coastal waters. It contains toxic materials, pathogens, and debris that harms marine life and afflicts swimmers with an array of ailments, from mild irritants to potentially life-threatening illnesses.

I am aware that some cities are concerned about the cost of this but cooperation among cities will reduce costs considerably. The permit simply encourages education and a practical approach to dealing with potential pollutants.

I would encourage the Water Quality Control Board to address stormwater issues so that there is not increased degradation of coastal waters. Illness, beach closures, and diseases among marine mammals will result if we do not pay attention these issues. Such degradation threatens our economic prosperity and the future of Southern California.

Thank you for your attention to this matter.

Sincerely,

Gale Anne Hurd

Dear Chairman Keston:

The intent of this letter is to urge the California Regional Water Quality Control Board to issue the proposed storm water permit. Storm water is the single greatest contributor to pollution of Southern California coastal waters. It contains toxins, pathogens, and debris that harms marine life and afflicts swimmers with an array of ailments.

Some cities are concerned about the costs, but opportunities for cooperation among cities reduce costs considerably. The permit calls for education and ordinary, good housekeeping practices, something we all should want.

Without leadership from the Board in addressing storm water, growth and development will lead to increased degradation of coastal waters. More illness, beach closures, and heart-rending ailments among marine mammals will result. Such degradation threatens our economic prosperity and our very identity as Southern Californians.

Re: Runyon Canyon Park Crisis

Dear Mr. Keston:

The actions of the MTA in Runyon Canyon Park, divining for water essential to the life of the park and planning to tunnel beneath the canyon, are unconscionable. I am shocked the permission to destroy one of our valuable natural treasures has been granted by the very officials responsible for its preservation.

There is no question that the fragile ecosystem of this area will not survive the monstrous violations the MTA intends. Already signs of distress are evident. I question the greed and indifference that must motivate those who feign blindness to the true nature of their actions and their inevitable consequences.

We are all charged with the care and healing of the Earth which sustains us — all around us and within us the signs of neglect can no longer be ignored. We must begin to take responsibility for ourselves in our environment, and value those things which feed our soul as highly as those which serve a function in our material world. Los Angeles is a city desperately needing balance, and Runyon Canyon is the kind of beautiful wilderness where it is found. Walking at sunset through sage-scented hills, listening to the wind... here we remember who we are, and our connection to each other and our world becomes clear.

Walk through the silence as twilight falls soft all around it will be easy then to choose reverence over destruction.

Please use your office wisely, and save Runyon Canyon Park.

Respectfully,

Heather Brovsky

I am writing to urge the Water Board to issue the proposed stormwater permit. Stormwater is the single greatest contributor to pollution of Southern California coastal waters. It contains toxics, pathogens, and debris that harms marine life and afflicts with an array of ailments.

Some cities are concerned about the costs, but opportunities for cooperation among cities reduce costs considerably. The permit simply calls for education and ordinary good housekeeping practices.

Without leadership from the Board in addressing stormwater, growth and development will lead to increased degradation of costal waters. More illness, beach closures, and heart-rending ailments among marine mammals will result. Such degradation threatens our economic prosperity and our very identity as Southern Californians.

Sincerely,

Earnest Hilborn

Furthermore, primary treatment of effluent with chlorine + ammonia is a pitiful effort that only reduces bacteria counts. This is Not an acceptable substitution for reducing contaminated water as it only adds to the chemical load in Santa Monica Bay. Do not allow this treatment level to take the place of actually removing the bacteria and chemicals.

California Regional Water Quality Control Board, Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston:

I am writing to urge the Water Board to issue the proposed stormwater permit. Stormwater is the single greatest contributor to pollution of Southern California coastal waters. It contains toxics, pathogens, and debris that harms marine life and afflicts with an array of ailments.

Some cities are concerned about the costs, but opportunities for cooperation among cities reduce costs considerably. The permit simply calls for education and ordinary good housekeeping practices.

Without leadership from the Board in addressing stormwater, growth and development will lead to increased degradation of costal waters. More illness, beach closures, and heart-rending ailments among marine mammals will result. Such degradation threatens our economic prosperity and our very identity as Southern Californians.

Sincerely,

Abel Pinedo Jr.

Dear Chairman Keston

Urban runoff is the largest source of coastal pollution to Santa Monica and San Pedro Bays. As you know, the Santa Monica Bay Restoration Plan targets reducing storm water pollution as the plan's most important goal. Los Angeles County has suffered through a drastic reduction in the number of beach visitors (from over 80 million per year to less than 50 million) to L.A. County beaches largely because many people are afraid to swim in the runoff polluted waters off our coast. Also, clogged catch basins cause hundreds of thousands of dollars in property damage every year. Urban runoff dumps tons of contaminated sediments at the mouths of the L.A. and San Gabriel Rivers and Ballona Creek next to Marina Del Rey. The end result is a boater safety problem and a contaminated sediment hot spot problem that poses severe health risks to local marine life and costly site remediation problems.

Please protect the public health, marine life, local real estate, and the County's $2 billion a year coastal tourism economy by supporting the Municipal Storm Water NPDES permit for Los Angeles County.

Dear Chairman Keston and Members of the Board:

For the sake of our economy, our health, and our precious natural resources, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures. I am pleased that the business community was included in the negotiations-as were representatives of all the effected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

Esme Janss Gregson

ACTION ALERT

May 6, 1996

VOL 21

PROTECT SOUTHERN CALIFORNIA WATERS FROM POISONED RUNOFF !!!

PLEASE XEROX OR TYPE LETTER ON REVERSE SIDE ON YOUR LETTERHEAD AND SEND IT!

Stormwater

Water washes pollutants from land into streams and stormdrains. This "stormwater" is a lethal cocktail of toxics, pathogens, and debris that collects in coastal waters; it is the single greatest menace to the ocean.

This cocktail consists of contaminated petroleum products and heavy metals that flow from streets and parking lots; industrial wastes from illicit connections to storm drains; paint and residues cleaned from buildings and cars; pesticides used in agriculture and landscaping; construction rubble, infectious human, animal, and food wastes, etc.

It ruins the beauty of our beaches; smothers, ensnares and poisons marine life escalating rates of cancer among marine mammals; and afflicts swimmers with an array of strange ailments.

Population growth and development are worsening contaminated runoff; and although discharges from industrial facilities and sewage treatment plants are carefully regulated, **runoff is not!**

The Permit Controversy...

The Los Angeles Regional Water Quality Control Board is responsible for issuing a stormwater permit that would apply to the 85 cities in Los Angeles County. The proposed permit calls on cities to develop educational programs, consult with businesses, and adopt practices themselves to reduce runoff.

Some cities object to the costs; others maintain that cooperation among cities can dramatically reduce costs.

We must act now to sway the Water Board! At stake is the health of our coast, a several billion dollar coastal tourism industry, and the source of our distinctively Southern California identity.

California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

As a business operator in the Los Angeles Area, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures. I am pleased that the business community was included in the negotiations–as were representatives of all the effected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

Kelli Abraham

Dear Chairman Keston,

I am writing to urge the Water Board to issue the proposed stormwater permit. Stormwater is the single greatest contributor to pollution of Southern California coastal waters. It contains toxics, pathogens, and debris that harms marine life and afflicts swimmers with an array of ailments.

Some cities are concerned about the costs, but opportunities for cooperation among cities reduce costs considerably. The permit simply calls for education and ordinary, good housekeeping practices.

Without leadership from the Board in addressing stormwater, growth and development will lead to increased degradation of coastal waters. More illness, beach closures, and heart-rending ailments among marine mammals will result. Such degradation threatens our economic prosperity and our very identity as Southern Californians.

Sincerely,

Robert Stillwell

Dear Mr. Keston -

On behalf of hundreds of friends, neighbors and beach-goers, I urge you to please support the Municipal Storm Water NPDES permit for Los Angeles Co. This permit is a critical step in the on-going process of restoring our precious ocean in the city limits.

I'm one who has continued to swim despite the years of warnings & the withdrawal of some of my companions. But I never go in after a rain storm, for at least 3 days, because the ocean is literally filthy. It is brown & dirty & literally full of sewage.

For me, the ocean has always been one of the best things in life, and continues to be. It is like the sky or the earth or the sun: essential. Please use your respected power to protect and preserve our beautiful Pacific.

Thanking you in advance,

Wendy Raebeck

Dear Chairman Keston & Members of the Board:

Our beautiful coastline deserves to be one of the best places to visit in the world--but not enough is being done to protect this resource.

Not only is protection of the ocean and the beaches needed, but we cannot as a society allow dangers to the health and safety of our fellow citizens to continue unabated.

Please adopt the proposed storm water permit immediately. You have a duty to all of us and to future generations of Angelenos to do nothing less.

REGIONAL BOARD
QUALITY CONTROL BOARD
LOS ANGELES REGION

June 17, 1996

Dear Mr. Keston,

I'm writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick!

That's simply not acceptable! I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps, and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

Sally Reeder

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do **your** part to clean up the Bay and **approve** the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

Sincerely,

Michelle Carson

Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do <u>your</u> part to clean up the Bay and <u>approve</u> the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

Sincerely,

Heidi Hadden

R0064654

Dear Mr. Keston,

I'm writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick!

That's simply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps, and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

101 Centre Plaza Drive
Monterey Park, CA. 91754-2156

June 18, 1996

Dear Mr. Keston,

I would like to urge you and the Regional Water Quality Control Board to take strong action against the flow of polluted water from storm drains into the Santa Monica Bay. I and many, many others in my neighborhood and around the city will be watching with great interest the results of your vote on July 15. You have a great responsibility to do the right thing for our beaches and for our city.

I entertained a group of youngsters visiting from the midwest, and I took them to see the Pacific Ocean for the first time, here by my house in Santa Monica Canyon. Excited, they took off their shoes and waded in the surf. But the water was filled with paper and plastic debris, which clung to their feet. God knows where it came from or what it was. It was truly sickening.

This region is blessed with magnificent resources, and the beach is one of our most beautiful. Please do your part to help maintain it and keep it, because if you don't I don't know who else will.

Sincerely,

David Tausik

Re: Heal The Bay

Dear Mr. Keston:

I am the mother of a six year old named Kathleen. We live in Venice and we spend every weekend at the beach. Kathleen loves going to the beach, and she's an avid boggie boarder! Nothing makes her happier than playing in the water and collecting sea shells and rocks. She prides herself on being a "planeteer" and picks up any trash that she finds floating in the water. I can't imagine having to tell her that she can't play in the ocean because of harmful bacteria and pollution, it would break her heart.

Because of her and all the other children who go to the beach and find it one of the last places they are allowed to run free, I am writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when you vote on July 15. I understand that a recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick. One of every 25 people that swim in front of a drain will get sick!

That is simply unacceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming. Please don't give in to pressure to weaken the regulations. Please think of the children, some of who will have no other place to run wild in the surf than at our local beaches. And no child should run the risk of becoming sick from a day of playing at the beach.

Very truly yours,

Mary Beth Lowman

I am writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick!

That's simply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps, and dumps contaminated material in the ports and marina, which poses both environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

Jan Schwab

California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do <u>your</u> part to clean up the Bay and approve the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

Sincerely,

Tom Rodden

MICHAEL KESTON, CHAIR
REGIONAL WATER QUALITY CONTROL BOARD
101 CENTRE PLAZA DRIVE
MONTEREY PARK CA 91754-2156

DEAR MR KESTON:

I FAVOR STRONG NEW STORM WATER POLLUTION PREVENTION REGULATIONS WHICH I WANT YOU AND THE REGIONAL WATER QUALITY CONTROL BOARD TO PASS WHEN YOU VOTE AT THE BOARD MEETING JULY 15.

I GREW UP ON THE WESTSIDE AND REMEMBER DISCOVERING THE BEACH AND BODY SURFING WHEN I WAS 10. I TOOK THE #7 BUS DOWN PICO EVERY DAY THAT SUMMER AND SPENT HOURS IN THE WATER. I CONTINUED SURFING FOR 25 YEARS BUT NOW I AM FIFTY, LIVING RIGHT AT THE SAME BEACH IN SANTA MONICA, AND AM RELUCTANT TO GO IN THE WATER DUE TO THE POLLUTION. THAT IS A SAD STATEMENT ABOUT ONE OF THE GREATEST NATURAL RESOURCES IN LOS ANGELES COUNTY.

I HAVE JOINED HEAL THE BAY TO VOLUNTEER MY HELP BUT THE VOTES OF THE REGIONAL WATER QUALITY CONTROL BOARD I CAN SEE ARE CRITICAL TO CONTINUE IMPROVING CONDTIONS OF THE OCEAN IN SANTA MONICA BAY.

THANKS FOR YOUR CONSIDERATION, BUT EVEN MORE THANKS FOR YOUR VOTES TO KEEP REGULATIONS STRONG TO LIMIT BAY POLLUTION.

SINCERELY,

R. Grant Ramey

Dear Mr. Keston,

I am writing to you regarding the storm water permit vote. I urge you and other members of the Board to vote on my behalf to pass strong new storm water pollution prevention regulations when the Board votes on July 15.

As an avid swimmer and surfer, I am concerned about my health and the health of others like me. I grew up near the ocean and I have always enjoyed swimming in the ocean. As I became interested in surfing, I began to enter the water during the wet months, when the waves are often at their best.

I became ill after swimming in the Santa Monica Bay once, flu-like symptoms plagued me for three days. I wasn't sure whether or not it was the Bay that made me sick or not, but I had a strong feeling that it was due to the pollution in the Bay. After reading the L.A. Times article about the recent epidemiological study of the health affects of swimming in the Bay, I realized my conscience was correct. So, I am writing this letter to you because I believe that the Board can make the Bay safe by passing strong storm water pollution prevention regulations.

Our society's attitude towards pollution, particularly ocean pollution, is in a sad state of affairs. We have businesses that dump paint and oil down storm drains that lead directly to the ocean without concern. There are also businesses that are disposing of all kinds of toxins illegally via the storm drains without concern. And we have community members that aren't concerned with the pollution they create through their illegal sewage hook-ups. You and the other Board members have an opportunity to change this. You can show these people that they should be concerned about the health of their fellow community members.

In addition to the health issues, the pollution is making an enormous impact on the ocean and the beaches, the largest tourist attraction in our area. Our community is showing poor economic judgment when we pollute our most valuable resource. We don't want tourists leaving L.A. and spreading the word that they got sick from swimming in the Santa Monica Bay and that the beaches look like trash dumps.

I hope this short letter urging you and the Board to vote for strong storm water pollution prevention regulations on July 15 works. My health and the health of our community is depending on it. Thank you for your consideration.

Sincerely,

John Theodore

Dear Mr. Keston:

Please, please, please -- I am urging you and other members of the Board to pass the new storm water pollution prevention regulations when it votes on July 15th.

I have been working with the water quality coordinator of Manhattan Beach on ways to inform residents about storm drain runoff. We have been publishing articles in our local paper called "Tips from the Gutter." The response from the articles have been incredibly positive. People are genuinely concerned about the ocean and would like to see as much done as possible to ensure that the ocean is clean and safe -- not only for us, but for all the creatures that live and rely on the many resources the ocean provides.

I believe that if there is not immediate action taken to divert the runoff, more people will become sick, more marine life will die, real estate values will decline, and our environment will look trashy.

I urge you, please vote for a clean, safe environment. Do it for the future generations so that they may enjoy the beaches we have all come to know and love.

Sincerely,

Vikki McMahon

Dear Mr. Keston,

I am writing as a resident of Santa Monica with three young boys. Because we live less than a mile from the beach in the Sunset Park/Ocean Park area, we use the beach as an almost daily part of our lives---for recreation, science education, exercise, spiritual reflection, etc. My family and neighbors are all really dismayed that the health of the Bay has gotten so bad that we can't allow our young children to freely play in it without negative health repercussions. Although a study has recently come out that has shown health problems, we have had firsthand experience of these and feel ashamed and horrified that our rich and powerful City and County governments have let things get this bad.

My family and I therefore urge you to pass and enforce the propsed storm water pollution prevention regulations that will help to correct and prevent the unhealthy state of our Pacific coast beaches that are so beautiful in appearance, but deceptively so...

Please know that you have the support of thousands of residents of our neighborhood and those of like-minded citizens throughout the City and County... even though not everyone will write you a letter. DON'T cave in to the pressures that want the strong regulations weakened. Thank you for taking my perspective into account and helping to make the shoreline and coastal waters healthy places for my young children and our future generations to enjoy and explore our natural treasures.

Sincerely,

Kathleen West

Dear Mr. Keston:

I am writing in regard to the July 15 meeting of the Regional Water Quality Control Board to urge the Board to pass strong storm water pollution prevention regulations at that meeting.

I believe that every beach should be safe for swimming and that swimmers and surfers have a right to enjoy the water without getting sick from pollution. I am also worried about marine wildlife, not to mention the appearance of our beaches and safety of our harbors.

The study I have read about indicates serious problems around storm drains and regulating what goes into those drains seems basic good sense.

Thank you for your consideration and I want to thank you and your fellow board members for your public service.

Very truly yours,

Nancy Holloman

Dear Chairman Keston:

I am writing to urge the Water Board to issue the proposed stormwater permit. Stormwater is the single greatest contributor to pollution of Southern California coastal waters. It contains toxics, pathogens, and debris that harms marine life and afflicts swimmers with an array of ailments.

Some cities are concerned about the costs, but opportunities for cooperation among cities reduce costs considerably. The permit simply calls for education and ordinary, good housekeeping practices.

Without leadership from the Board in addressing stormwater, growth and development will lead to increased degradation of coastal waters. More illness, beach closures, and heart-rending ailments among marine mammals will result. Such degradation threatens our economic prosperity and our very identity as Southern Californians.

Sincerely,

Mrs. Richard H. Anderson

Dear Mr. Keston:

My family and I urge you to pass strong storm water pollution regulations when you vote on July 15,1996. I plead with you to take a stand to protect our beaches, our children's safety and the environment.

I live in Venice and walk on the beach daily. However, it's become such a burden as it breaks my heart to constantly see dead wildlife and trash beyond description. I now walk with tennis shoes, gloves and a trash bag in order to protect myself as well as pick up all the trash I possibly can. Nevertheless, their is so much trash, that it is overwhelming. One day alone I picked up 1,541 Styrofoam cups, and still there were thousands more littering the beach Also, I have also come across three sea birds wrapped in plastic bags, and six hypodermic needles. Now my children and I must wear shoes in order to protect our feet from this and other hidden dangers.

What world is it that children have to wear shoes, and trash litters the beach as far as the eye can see? I tell you it is one I do not wish to live in. I pay my taxes and I resent the fact that my government cares so little about our health and the environment. If we do not fix this problem now, I promise you in the future it will be impossible to so.

If you and the Quality Control Board do not step up to the plate and correct this problem, then you better be ready to explain to our children why. The only reason you could possibly give is money, and that is not good enough! As a tax payer I demand that my hard earned money be accounted for.

God gave us a beautiful world, and it is up to us to keep it that way. Please vote to have Los Angeles's Storm Drains redirected to Hyperian, and pass new laws to protect us from illegal dumping. If you do not see the urgency of this plea, then I invite you to walk on the beach with me before July 15th and see for yourself what Los Angeles citizens, and the environment have to live with every day.

Please feel free to contact me at: (310) 568-1237.

Sincerely Yours,

Jennifer Hagaman

Dear Mr. Keston,

I'm writing to urge you & the members of the Regional Water Quality Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

Recent studies show that swimming near storm drains causes illness. This is unacceptable and avoidable. In addition to humans; marine life and ~~our~~ our beaches are marred by runoff.

We must and can prevent this danger. Please don't give into pressure to weaken regulations.

Sincerely,
Don Gentile

101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Mr. Keston,

I'm writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick!

That's simply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps, and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

Nancy Lindsey

California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do your part to clean up the Bay and approve the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

Sincerely,

Carly Breitbart

Re: Storm Water Quality Regulations

Dear Mr. Keston:

I understand that the Regional Water Quality Control Board will be voting on new storm water pollution regulations soon. I want to encourage you to pass the strongest legislation you can. For years my doctor has attributed my chronic sinus problems to the fact that I surf in the Santa Monica Bay. Now I read news reports of a scientific study which supports my doctor's conclusion.

It is each of our duty to clean up the environment we live in. Please vote to require storm drain runoff to be diverted away from the ocean.

Thank you.

Dear Mr. Keston,

When you vote on July 15 I urge you & other members of the Regional Water Quality Control Board to pass strong new regulations to prevent storm water pollution.

The reality of our Santa Monica Bay being unsafe to swim in is horrifying & shameful. We all know that "urban run-off" is toxic & that it ends up in our bay. There should be no excuse for not dealing with it immediately so that all of us can safely use our beaches & so that marine life can thrive.

Do not weaken the regulations.

Thank-you

Dear Chairman Keston and Members of the Board:

As a resident of the Los Angeles Area, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem and there is obviously strong scientific basis to support such measures. I am pleased that the business community was included in the negotiations-as were representatives of all the affected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem and there is obviously strong scientific basis to support such measures. I am pleased that the business community was included in the negotiations-as were representatives of all the affected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

Ida Shusterman

Dear Chairman Keston and Members of the Board:

As a resident of the Los Angeles Area, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem and there is obviously strong scientific basis to support such measures. I am pleased that the business community was included in the negotiations-as were representatives of all the affected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

Dalin Webster

Dear Chairman Keston and Members of the Board:

As a resident of the Los Angeles Area, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem and there is obviously strong scientific basis to support such measures. I am pleased that the business community was included in the negotiations-as were representatives of all the affected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

Robert Sherman

Re: Support for Strong New Storm Water Pollution Regulations

Dear Mr. Keston:

This is to urge you and the other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15, 1996. A recent study by USC and the Santa Monica Bay Restoration Project proves that if people swim in areas where storm drains empty into the Bay, they are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea, nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick!

That is simply not acceptable. I believe no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life and leaves our beaches looking like trash dumps. Worse yet, the run off sends material into the ports and marina which magnify the environmental and safety hazards.

Do not give in to pressure to weaken the regulations. We are counting on you to do the <u>right thing</u>!

Very truly yours,

BRET R. CARTER

Dear Mr. Keston,

I'm writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea, and nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick!

That's simply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

It is so important that we stop abusing the environment for the sake of corporate financial gain (i.e. Chevron dumping toxic waste into the Bay with minimal fines). Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

Shelley Clark

Re: Santa Monica Bay

Dear Mr. Keston:

I am writing you to tell you and the other powers that be, to pass new strong storm drain pollution regulations when you vote on July 15.

Urban runoff is one of the largest sources of pollution in the Santa Monica Bay. Government should do all it can to reduce urban runoff and keep the Bay clean.

Don't cave in to special interests, do the right thing and keep Santa Monica Bay clean and safe to swim in.

Thanking you in advance for your efforts to keep the bay clean.

6/20/96

Dear Mr. Keston,

In July 15 please save our beloved ocean! Don't let us be victims anymore! Please pass strong storm water pollution prevention measures when it comes time to vote. As an avid surfer and ocean lover, too many times I have seen the devastating effects that storm runoff can have. A friend of mine contracted hepatitis after repeated surfing at Will Rogers State Beach. We, as a community, have made great strides in improving our water quality over the last decade - let's continue to do so. More than any other ecosystem, the ocean is our bellweather of planetary health. If we screw it up - were all dead. - period.

Consider that.

Sincerely.

June 21, 1996

Dear Mr. Keston,

This letter on behalf of my wife, myself and the concerned citizens of Santa Monica, strongly urge you and the members of the Regional Water Quality Control Board to put through new legislation to prevent storm water pollution.

I understand that recent studies show that swimming in areas where storm drains empty into Santa Monica Bay a swimmer has more than a fifty percent chance of getting seriously ill. Speaking for myself, I have reliquished the pleasure of ocean swimming because I don't like the odds of protracting diarrhea, fever, nausea or something more serious. Our beaches are meant for people to use and enjoy in safety; not to be used as trash dumps filled with contaminated material. Not only is that poisonus material harmful to we humans, but it also fouls marine life and scews up the eco-system.

Finally, Mr. Keston, I appeal to you to be of firm resolve and not dilute the current regulations.

Sincerely,

Michael R. David

Dear Mr. Keston:

I have two sons and five grandsons who spend a lot of time at the beach in Santa Monica. We are all members of the Bel Air Bay Club. The boys are in the water a lot, and it worries me. As you must know, a person is 50% more likely to get sick with a cold, sore throat, fever, diarrhea and nausea or other illnesses if he/she swims in Santa Monica Bay than if he/she doesn't.

How different from when I was a child. We didn't have to worry about illnesses from the water then. We are not (yet) a third world country. Let's keep out coastal waters clean enough to swim in. Please don't weaken any regulations. Work to strengthen them. Thank you.

Best regards,

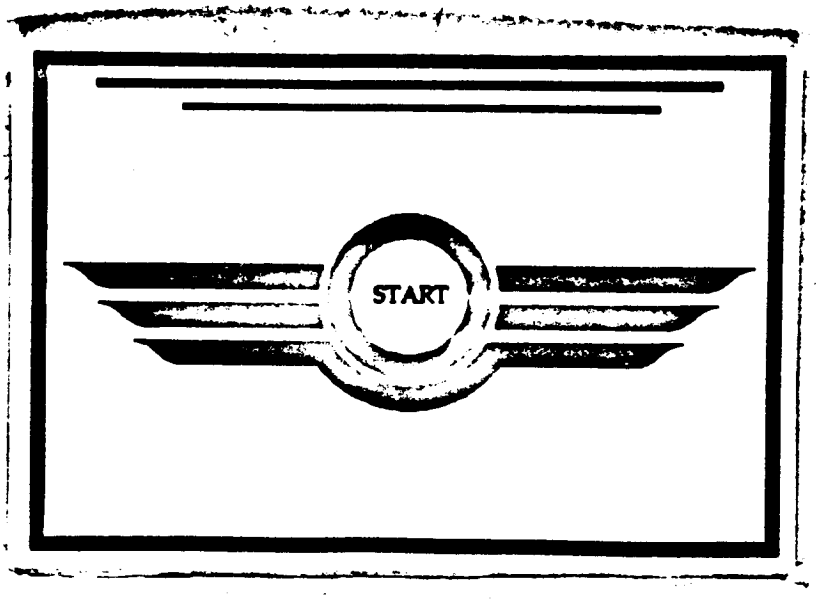
Dear Mr. Keston,

Now that the scientific evidence is in, it's time to take swift and effective action. I urge you and the other members of the Regional Water Quality Control Board to pass stringent new storm water pollution prevention regulations when you vote on July 15.

Living and playing near and in the ocean was a big part of my childhood. As a new father, I feel it's vitally important to leave a healthy and vital ocean as a legacy to the next generation. If you don't, who will? Certainly not private industry. The bottom line is this: children should not have to risk illness of any sort in order to play and swim on our coastline.

I urge you to adopt strict measures greatly limiting urban runoff, and to resist the pressure to weaken the regulations. Thank you for your consideration.

Sincerely,



Brad Gann

James L. Denison Received June 25

[redacted]

Dear Mr. Koston June 24, 1986.

We are among the millions of Californians who enjoy using our beaches -- that's why we live here. And we are very concerned about the flows of pollutants from storm drains into our bays & beaches.

We urge you and other members of the Regional Water Quality Control Board to pass strong, new Stormwater pollution prevention regulations when you vote on July 15.

No one should suffer a greater chance of getting sick just because they want to swim in the bay. Every beach should be safe for swimming.

Urban run-off is a top issue to our environment. Please don't give in to pressure to weaken the regulations

Thank you. Sincerely,

Mr. & Mrs. L.L. Denison

Dear Mr Keston,

What is the use of having beautiful beaches if the young people can't go in the water. If that water is unhealthy, fences should be built along the bike path with fancy piers built out into the water a little way, so I can take my grandchildren out to at least look at the waves, without the danger of them going in the water.

The ocean was source of great fun and education to my three children growing up in the Seventies. They used to go to "Toes Beach" It is the section south of the La Ballona Creek. When they were littles, we could look for crabs and other sea life among the rocks

VOL 21

05222

R0064776

lining the creek. If we crossed the stone bridge we could watch the sailboats in the adjacent channel. Now, I think of that whole area as blighted, and the people who go there as risk takers.

We have to drive to Leo Carrillo before I feel the water is clean enough to go into. Even that is probably dangerous after a storm as more and more building is going on in the Malibu area.

Each year I help the school children clean up the La Ballona drainage channel. I see the debris coming out of the visible drainage pipes.

How many fines were handed out this year for dumping and pollution in the Culver City area? If none, it's because no one is in charge of patrolling and citing violators.

VOL 21 0523

R0064777

3.

a while, until people stopped polluting. Fines could finance a lot of clean up projects at the beach. Like the kids, especially middle school age, to go out in teams and pick up the trash. Sift the sand with machinery, especially area close to the boardwalk and volleyball courts. A friend of mine was seriously injured while playing volleyball so he can't walk for a while. Some one broke a bottle and threw it in the sand.

Glass bottles should be prohibited in beach areas.

I have heard that the water is so bad that $\frac{1}{3}$ to $\frac{1}{2}$ of people who swim near a storm drain will get sick.

The industrial coast from Culver City to Redondo and San Pedro on South is even worse

VOL 21 0524

R0064778

Santa Monica
People get sick from the bottom fish that eat the pollated foods. "Crabbing" is a thing of the past.

Urban runoff is not only bad for the beaches but we need the water. It needs to be channelled into low spots in the county where it can sink into the ground water and leave its impurities behind in the sand and clay. Someday we may be smart enough to recycle that soil and extract the mercury and lead. But shunting it out to the ocean every year is poisoning our local marine life.

The regulations should be increased not relaxed. Please do the right thing for the people now, and for the next generation.

Thank you -

Mary Ellen Clark

REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

Dear Mr. Keston,

My name is Tyler Ladinsky, and I've been surfing in the Santa Monica Bay for almost four years now. I'm writing to encourage you and other members of the Regional Water Quality Control Board to pass regulations on storm water prevention, when it is voted on July 15. I know that I personally have gotten sick from surfing Topanga, Malibu and other parts of the bay. The water quality is so bad at Surfrider Beach, in Malibu, that my parents will not let me surf surfrider. The water at Bay Street is even worse, I have heard that a couple of lifeguards that worked at Bay Street now have cancer. Some say that the cancer is not related to the water quality, but a study by USC shows that people who swim near storm drains are 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and other sicknesses. I hate to get sick, but I love to surf. I know that there are thousands like me, who will surf through this water, yet at the age of sixty will have some mysterious illness. Why should I have to risk my heath to surf in the Santa Monica Bay?

I remember one time when I was surfing Topanga, I was about to duck-dive under a wave, when I glanced up at the lip of the wave. I paused in the middle of the duck dive, and froze with disgust. The lip of the wave was completely black, from some type of oil or chemical. After I saw that lip I paddled into the beach and stood under the shower for a while.

This must stop! Nobody should walk down to the beach after traveling all the way from Ohio and see a huge sign reading beach closed from dangerous run-off or getting sick in the middle of their vacation. The pier and the Santa Monica Bay attract thousands of people, when they find out how dirty the water is, maybe they'll go to Hawaii or some other place and Los Angles will lose tourists.

Please make the runoff have some kind of limits, if their is no limits, people will get sick, sea animals will die and Los Angles may lose tourists. Thank you for taking time to read my letter.

Sincerely,

Tyler Ladinsky

Tyler Ladinsky

P.S. My whole family and many of my friends feel as I do, but I was the only one who had time to write a letter.

Monterey Park, CA 91754-2156

Dear Mr. Keston:

It is essential that when the Regional Water Quality Control Board meets to vote on July 15th that it pass strong storm water pollution prevention regulations. I am writing to urge you and other members of the Board to do so in the interest of the health and recreational needs of the beach going public.

The recent USC / Santa Monica Bay Restoration Project study showed that if you swim in areas where storm drains empty into the Bay, you are significantly more likely to get sick and one in 25 that swim in front of a drain will get sick. As a person who swims in Santa Monica Bay every summer, this study only confirmed what I have already experienced.

People are being subjected to this because of irresponsible and negligent behavior with respect to LA basin-wide storm drain usage. Urban runoff is also toxic to marine life and leaves trash on our beaches.

It is your responsibility, and the responsibility of the other board members, to introduce and enforce strict and adequate regulations that will control and reverse this unacceptable situation and behavior. I urge you to do so on July 15th.

Sincerely yours,

Jim Conlon

Monterey Park, CA 91754-2156

Attention: Mr. Michael Keston, Chairman

Dear Mr. Keston:

I urge you and the Regional Water Quality Control Board to pass effective storm water pollution prevention regulations on July 15.

As you know, the recent USC study shows that those who swim near storm drains that empty into the Santa Monica Bay are in strong danger of getting sick.

We must prevent this dreadful condition.

We must keep our ocean waters clean not only for our residents but for the thousands of visitors who come here to enjoy our Southern California amenities. Swimming in the ocean is high on their lists of activities to include. If they thought they were to enter polluted waters, they would stay away in droves.

We have a strong tourist industry here. Let's keep those visitors coming in!

Please prove we're civilized and vote to control the pollution.

With thanks,

Elinor Oswald

Dear Mr. Keston:

I am writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15th.

A recent study by USC and the Santa Monica Bay Restoration Project shows that swimmming in areas near storm drains increases the likelihood of getting sick by almost 50%. I personally have become ill from swimming in Santa Monica Bay and have not been in the water since. Having spent all my summers at the beach as a child, it saddens me to feel I can no longer swim in the ocean for fear of becoming ill.

My concern not only extends to the human population but to the effects on marine life. As a resident of Santa Monica, a city heavily depended on tourist dollars, I am also concerned about the effect on our tax base should you fail to take strong measures to clean up the bay. It would be extremely short sighted indeed!

Please do not give in to pressure to weaken the regulations. Your future and that of your children is at stake.

Sincerely,

Madeline Farris

I'm writing to you to urge you and the other members of the Regional Water Control Board to pass strong new storm water pollution regulations when you vote on July 15.

My family and I live close to the ocean. My grandchildren and their parents and friends spend many days at the beach and in the water. We do as much as we can to keep the gutters clean because we know what ever goes into the gutters will end up in the ocean. They do not want to swim in a sewer.

We strongly support Heal The Bay and their efforts to keep Santa Monica Bay clean. But I cannot police all of Southern California. It is up to you and the members of the RWQB to issue strict regulations to control the urban runoff. With strict regulations in force violators can be punished with fines where it hurts.

Please don't give in to pressure to weaken the regulations. Thank you for your help! WE'LL SEE YOU AT THE BEACH!!

Dear Chairman Keston and Members of the Board:

For the sake of our economy, our health, and our precious natural resources, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures. I am pleased that the business community was included in the negotiations–as were representatives of all the effected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

Connie Jenkins

Monterey Park, CA 91754-2156

Dear Mr. Keston:

I am writing to express my concern and indignation at the abject failure of the Board to recognize the crisis facing the people and the economy of Southern California. The waters of the Santa Monica Bay must be rehabilitated and made healthy for bathers. Yes, it will cost money to do it. But it will cost far more in dollars to allow the Bay to be a source of disease and illness. Tourism is a vital element in Southern California's coastal counties. Fear of coastal waters threatens tourism. Only the ignorant or foolhardy now chance the waters of Santa Monica Bay. I now must go to Zuma to find waters clean enough to swim and feel safe from disease causing pollutants.

The Board must develop a comprehensive plan for cleaning up the runoff from the area's storm drains before that runoff is allowed to enter Santa Monica Bay.

Very truly yours,

Norman Harriton

DEAR MR. KOSTOW,

I'M A RESIDENT OF HERMOSA BEACH AND A PARENT OF A BABY GIRL. I'M WRITING YOU FOR MY DAUGHTER AND MYSELF TO URGE YOU AND OTHER BOARD MEMBERS OF THE REGIONAL WATER QUALITY CONTROL BOARD TO PASS STRONG NEW STORM WATER POLLUTION PREVENTION [redacted] REGULATIONS WHEN IT VOTES ON JULY 15, 1996.

A RECENT STUDY BY USC AND THE SANTA MONICA BAY RESTORATION PROJECT SHOWS THAT IF YOU OR I SURFED IN AREAS WHERE STORM DRAINS EMPTY INTO THE BAY, YOU AND I ARE ALMOST 50% MORE LIKELY TO GET SICK, WITH A COLD, SORE THROAT, FEVER, DIARRHEA AND NAUSEA OR OTHER ILLNESSES. ONE OF EVERY 25 PEOPLE THAT SURFS IN FRONT OF A DRAIN WILL GET SICK!

THATS SIMPLY NOT ACCEPTABLE TO ME OR MY DAUGHTER. I FEEL NO ONE SHOULD SUFFER A GREATER CHANCE OF GETTING SICK JUST BECAUSE THEY SURF IN THE BAY. EVERY BEACH SHOULD BE SAFE FOR SWIMMING EVEN HERMOSA BEACH.

URBAN RUNOFF IS ALSO TOXIC TO THE MARINE LIFE IN THE BAY. IT LEAVES OUR BEACHES LOOKING LIKE TRASH DUMPS FOR OUR

VOL 21

0543

R0064797

EVENTUALLY TOURISM INDUSTRY. IT ALSO DUMPS CONTAMINATED MATERIAL IN THE BAYS AND MARINAS THAT POSES BOTH ENVIRONMENTAL AND BOATING SAFETY HAZARDS.

PLEASE THINK OF THE YOUNG PEOPLE THAT ARE GOING TO SWIM IN OUR BAY AND THE LOST ECONOMIC EFFECT OF TOURISM IF YOU GIVE INTO PRESSURE TO WEAKEN THE REGULATIONS. I HOPE YOU WILL THINK ABOUT ALL THE SPECIES FROM WHALES TO SAND CRABS THAT ARE AFFECTED BY THESE REGULATIONS. THANK YOU FOR YOUR CONSIDERATION AND TIME.

Sincerely,

RICHARD D. SUTTON AND ALEXANDRA J. SUTTON.

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do <u>your</u> part to clean up the Bay and <u>approve</u> the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

Sincerely,

Ron Fujieharo

Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do <u>your</u> part to clean up the Bay and <u>approve</u> the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

Sincerely,

Deborah L Deming

Mr. Charles Vernon
Calif. Regional Water Quality Control Board

Dear Mr. Vernon,

I am writing to urge you to adopt the proposed storm water permit. As a former user of the Santa Monica Bay area, I can tell you that such action would influence me and many of my family and friends from the midwest and east coast to come to visit and spend time on the Santa Monica beaches once again.

Adopting the proposed storm water permit will go a long way to improving the quality of the bay waters that are used by so many people each year.

Sincerely yours,

Rocco L. Motto, MD

Rec June 26

Dear Mr. Keston,

I'm writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick!

That's simply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps, and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

Irene Joseph

Dear Mr. Keston:

I'm writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15th.

I used to swim in Santa Monica Bay, but gave it up after noticing that I didn't feel well after a few days. I miss having the freedom to utilize a public ocean (unless I'm in a designated area!)

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea or other illnesses. QUALITY CONTROL BOARD
LOS ANGELES REGION

June 24, 1996

Dear Mr. Keston,

I'm writing you to urge you and the other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

As a resident of the Santa Monica Canyon I have first hand experience with the detrimental health affects of swimming near the storm drain that flows into Will Rogers State Beach. Since learning of the USC study that documents the 50% probability of getting a cold, sore throat, or other illness I have not been swimming at my neighborhood beach in 3 years.

When I did go swimming at State Beach during the summer, I would regularly feel sick and nauseous. Since I've stopped swimming, I no longer have these "summer colds". I live at the beach and love to swim in the ocean, yet due to the proximity of the storm drain I can no longer safely do that.

I urge you to enact the strongest possible regulations to curb runoff that contains toxins damaging to humans, marine life and leaves the shore line looking like a garbage dump. Please help make it possible to swim safely at beaches like mine in the Santa Monica Bay.

Sincerely,

James C. Birch

STATE WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

Dear Ms. Craven

Please add my name to the growing list of concerned citizens urging you to adopt the proposed storm water permit.

By now, you have undoubtedly heard arguments that implementing this permit will cost money—money that many of the affected cities claim they either don not have or cannot spare. Tight budgets are something we all understand. But if these protests are making you think twice about adopting this permit I would ask you to consider the following questions:

How can we afford not to protect the health of the fifty million people who will swim in the Bay this summer?

How can we afford not to protect the economic health of the coastal tourism and recreation businesses which generate literally billions of dollars for our area?

How can we turn away from the single most effective step we can take as a community to create a cleaner, healthier Bay?

For the last 16 months, civic and environmental leaders have worked hard to achieve consensus on all the measures included in this permit. Their diligent work is done—now it's up to you. Please vote to adopt the permit on July 15.

Sincerely,

Diane Kahan

How can we afford not to protect the health of the fifty million people who will swim in the Bay this summer?

How can we afford not to protect the economic health of the coastal tourism and recreation businesses which generate literally billions of dollars for our area?

How can we turn away from the single most effective step we can take as a community to create a cleaner, healthier Bay?

For the last 16 months, civic and environmental leaders have worked hard to achieve consensus on all the measures included in this permit. Their diligent work is done—now it's up to you. Please vote to adopt the permit on July 15.

Sincerely,

Diane Kahan

Dear Mr Hetzak,

Please add my name to the growing list of concerned citizens urging you to adopt the proposed storm water permit.

By now, you have undoubtedly heard arguments that implementing this permit will cost money—money that many of the affected cities claim they either don not have or cannot spare. Tight budgets are something we all understand. But if these protests are making you think twice about adopting this permit I would ask you to consider the following questions:

How can we afford not to protect the health of the fifty million people who will swim in the Bay this summer?

How can we afford not to protect the economic health of the coastal tourism and recreation businesses which generate literally billions of dollars for our area?

How can we turn away from the single most effective step we can take as a community to create a cleaner, healthier Bay?

Dear Mr Sugnet

I have volunteered for our local "Gutter Patrol" to remind people that what they trash on to the street goes in to the ocean. The reaction I found from all I came into contact with has been universal support. I feel that close to the surface of this enthusiasm is a suspicion that government agencies will once more jerk us around, in order to meet the needs of interests which find environmental responsibility too expensive.

I am sure that you have detailed technical points of view regarding storm drain permit requirements: my purpose here is to remind you of the fury that California citizens have expressed in recent history over license for pollution.

I suggest that the major influence over your decision be your sworn trust to protect the health and welfare of the people.

Sincerely,

TR McLean

Dear Mr. Keston,

I'm writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea and/or other illnesses. One out of every 25 people that swim in front of a drain will get sick!

That's simply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

Chuck Kloeris
Third Point, Malibu

P.S. I am an avid surfer and there is no greater feeling than being out in the water, except maybe when you are out in the water and dolphins or other marine life swim by. We have a responsibility to keep our waters clean. Thank you.

Re: Storm Water Pollution Prevention

Dear Mr. Keston,

Living where I overlook the ocean, I'm very aware of its state of cleanliness. There is a dock where fish are caught which are not fit to eat. There is an inner beach whose water ir fouled by motor oil and gas fumes. I have never known our storm drains to be cleaned from the trash which piles up. The whole area is covered by a fine dust of coke which gets washed off into the drains.

We, in San Pedro, like all beach cities, are dependent on tourists for income. That means clean water and edible fish are imperative. Please work to pass strong water polution prevention regulations.

Thank you for your attention.

Sincerely,

Goldie Otters

How can we afford not to protect the health of fifty million people who will swim in the Bay this summer?

How can we afford not to protect the economic health of the coastal tourism and recreation businesses which generate literally billions of dollars for our area?

How can we turn away from the single most effective step we can take as a community to create a cleaner, healthier Bay?

For the last 16 months, civic and environmental leaders have worked hard to achieve consensus on all the measures included in this permit. Their diligent work is done - now it's up to you. Please vote to adopt the permit on July 15, 1996.

Sincerely,

Linda M. Kaplan

LOS ANGELES REGION

Dear Mr. Keston::

I am writing to urge you and the Water Quality Control Board to pass strong new storm water pollution prevention regulations at the meeting on July 15, 1996.

A recent study by the University of Southern California and Santa Monica Bay Restoration Project shows that people who swim in areas where storm drains empty into the Bay are almost 50% more likely to become ill with a cold, sore throat, fever, diarrhea and nausea. One person out of every 25 people that swim in front of a drain will become sick.

This is not acceptable. Personally, I do not swim in the ocean for this reason, although I would like to do so. Many people feel the same way. Every beach should be safe for swimming. Also, the ocean is one reason why tourists visit Los Angeles and tourist dollars are endangered because of unhealthy beaches.

Urban runoff is toxic to marine life, trash our beaches and dumps contaminated material in the ports and marina, posing environmental and boating safety hazards.

Please don't give into pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

Heidi Pickman

Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do <u>your</u> part to clean up the Bay and <u>approve</u> the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles. I urge you to adopt the proposed permit on July 15th without any further delays.

Sincerely,

cc: Governor Pete Wilson
Mayor Richard Riordan

Dear Chairman Keston and Members of the Board:

For the sake of our economy, our health, and our precious natural resources, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures. I am pleased that the business community was included in the negotiations–as were representatives of all the effected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,
Regina Birdsell

REGIONAL BOARD
LOS ANGELES REGION

June 12, 1996

Dear Chairman Keston:

I am concerned about recent articles appearing in the Los Angeles Times that describe the debate about cleaning up the region's urban runoff. I therefore want to urge you to deal with this problem by adopting the stormwater permit now undergoing review and comment.

Urban runoff is the primary source of pollution in Santa Monica Bay. Urban runoff results from a vast array of activities and we must begin to address these systematically or lose the tremendous ecological and economic benefits deriving from Southern California's coast. The stormwater permit offers the only reasonable method to ensure the continued enjoyment of these benefits.

Despite the reluctance of cities to take on new responsibilities, it is imperative for our economic well-being, our health, and our very identity to take action to safeguard our waterbodies from the contaminated runoff to which we all contribute.

We are looking to the Regional Board to exercise leadership in this area. Our future depends it.

Sincerely,

Michael P. Ryan

Dear Mr. Keeton,

I have been a resident of Pacific Palisades since 1965. One of the most delightful features of Los Angeles is that it is on the coast. Our family of six has enjoyed beach activities all this time - boogie boarding, swimming, windsurfing, rowing, and sailing. I am deeply disturbed that the water quality in Santa Monica Bay is so bad in many locations that these activities are now hazardous to health. I believe that everything possible should be done to eliminate, or decrease, the sources of pollution. Certainly diverting the storm drains to sewage treatment plants is one of the more obvious solutions. Of course, there are others. Please strengthen, rather than weaken, all the existing regulations. I am willing to pay more in taxes to safeguard our beautiful natural resource, our ocean and coastline.

Sincerely Yours,
Mrs Barbara G. Taylor

Dear Chairman Keston:

I am very concerned about the health of our coastal waters and Santa Monica Bay, in particular, and hope that you will approve the stormwater permit now under review.

The Water Quality Control Board has taken significant strides in controlling pollution from industrial sources and sewage treatment plants. Nonetheless, our coastal waters are still polluted.

I read with great concern the articles appearing in the Los Angeles Times about illnesses to people resulting from pollution. They have described the ailments afflicting surfers who swim in the Bay. These range from runny eyes, skin rashes, colds, ear aches, and stomach problems to indeterminate "strange strains of infection."

Urban runoff is the culprit. It is the primary source of pathogens and toxics that cause illnesses among swimmers. If its effects are so pronounced on swimmers, what is it doing to the fish? to the marine mammals?

I hope that just as the Water Quality Control Board addressed the "point sources" of pollution, it will now take the lead in addressing the "nonpoint sources"--urban runoff.

Sincerely,

Pam Sarvis

Dear Chairman Keston and Members of the Board:

As someone who lives and works in the Los Angeles Area, I have a great interest in the health and quality of our beautiful beaches and coastline. Our beaches are an enormous economic and social resource for the entire Los Angeles region and we must therefore take informed, reasonable and cost-effective action to protect them.

As a parent and resident of the area, I am aware that people are getting sick from storm drain polluted waters in Santa Monica Bay as the Los Angeles Times confirmed in a front page article in May of this year. That is why I believe it is imperative that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is without doubt very strong scientific data to support the passage of such a measure. I am particularly pleased that the business community was included in the negotiations because they are affected by the quality of our beaches and coastline as much as the general populace. If the degradation of our beaches continues tourism will inevitably suffer.

At a time when government is often criticized for not taking action, I urge you to take advantage of this unique opportunity to adopt public policy that makes both good economic sense and good environmental sense.

Thank you for your consideration.

VOL 21 0635

R0064889

June 28, 1996

Dear Chairman Keston

As a friend of Palos Verdes/South Bay Audubon Society, I am writing to urge the Water Board to issue the proposed stormwater permit. Storm-water is the single greatest contributor to pollution of Southern California Coastal waters. It contains toxins, pathogens, and debris that harms marine life and afflicts swimmers with an array of ailments.

Some cities are concerned about the costs, but opportunities for cooperation among cities reduces costs considerably. The permit simply calls for education and ordinary good housekeeping practices.

Without leadership from the Board in addressing stormwater runoff, growth and development will lead to increase degradation of coastal waters. More illness, beach closures, and heart-rending ailments among marine mammals will result. Such degradation threatens our economic prosperity and our very identity as Southern Californians.

Sincerely,
Jane Nishimura

Dear Chairman Keston and Members of the Board

The Municipal Storm Water Permit is a basic imperative for all the cities in Los Angeles County to comply with the Clean Water Act requirements. We must minimize the pollution carried by water or rain from industrial and domestic sources, such as gas stations, auto repair facilities and restaurants. The Permit requires cities to minimize pollutants from entering the storm drain system from construction sites and building projects. We must control the dumping that drains into the ocean from pollutants that are carried in storm drain water system. The permit is the most important step to improve the health of our local coastline and the health of our important tourist industry.

Sincerely yours,

Jacob I. Green

June 27, 1996

Dear Mr. Keston.

I'm writing to ask you and the Regional Water Quality Board to pass better and much stronger storm water pollution prevention regulations. It is unconscionable that we cannot swim (or let our children swim) in Santa Monica Bay. It has historically been a place of recreation, and now I read in the paper that a study by USC and a local bay restoration project confirms what we know from our own experience - if you swim in the bay near a storm drain, you are 50% more likely to get sick with a cold or diarrhea or a sore throat or worse. Not only do people get sick, but storm drain runoff is also poisonous to marine life, and trashes our beaches so they look like garbage dumps. The Bay should not be a dumping ground for the detritus that people sweep into the drains, or that storm water carries there. Please do not allow anyone to weaken the current regulations, and please vote instead to strengthen the storm water pollution regulations. Thanks for your help - Sincerely,

S. Swim O

Dear Mr. Keston:

I'm writing to urge you and other members of the Regional Water Quality Board to pass strong new storm water pollution prevention regulations when it votes on 7/15/96.

It is simply not acceptable that there are so many illnesses created by the storm drains emptying into the ocean, as the recent USC and Santa Monica Bay Restoration Project studies show. As I live near the Santa Monica beach, it would be nice for my grandchildren to be able to swim in the ocean, but the fear of the them getting sick is too great. Every beach should be safe for swimming.

Marine life also suffers from this dangerous runoff. Our beaches and the marina look like trash dumps with materials that pose health and environmental hazards.

Please pass strong measures to protect us form this pollution.

Sincerely,

Rose Freeman

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do <u>your</u> part to clean up the Bay and <u>approve</u> the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

Sincerely,

J. Bartel

Dear Mr. Keston.

In writing to urge [illegible] and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by U.S.C. and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick. That's simply not acceptable. Every beach should be safe for swimming.

Urban runoff is also posing environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely yours,

Mary Semenas

Monterey Park, CA 91754-2156

Dear Mr. Keston,

I'm writing to urge you and other members of thw Regional Water Quality Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Mnica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea abd nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick!

That'ssimply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps, and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,
Mrs. Sylvia Lindenberg
1147 El Medio Avenue

Dear Sir:

This letter is in support of strong storm water pollution regulations, an issue that is scheduled for voting on July 15, 1996. As found in recent research by the Santa Monica Bay Restoration Project, contaminated sea water from storm drain run-off directly correlates with the level of illness of swimmers. Santa Monica, and all Southern California areas, are popular vacation areas due in a large part to our beaches. To further allow pollution and waste to contaminate the Bay is short-sighted and self-defeating.

Please assist organizations such as Heal the Bay in reducing storm drain outflow. I ask that you strengthen the regulations when the issue is decided. Thank you for your consideration.

Sincerely,

Carole Rosenberger

Dear Mr. Keston,

I urge you to please pass stronger storm water pollution regulations in your vote later this month. Please don't bend from pressure to maintain or even weaken current regulations. The recently published article in the L.A. Times about the USC study only confirms once again what many of us have feared for years, storm drain run-off increasing the likeliness of illness by 50% is completely unacceptable. We obviously have a right to expect our government(s) (federal, state, county and local) to protect our health from such matters. Given that our beaches and ocean are a major attraction to tourists and tourism is one of the few growing areas in our local economy it is economically responsible to improve the cleanliness of our ocean shoreline waters. Please vote to toughen current regulations for cleaner ocean waters in Los Angeles. Thank you for your help.

Sincerely,

Peter Standish

Dear Mr. Coe:

Please add my name to the growing list of concerned citizens urging you to adopt the proposed storm water permit.

By now, you have undoubtedly heard arguments that implementing this permit will cost money - money that many of the affected cities claim they either do not have or cannot spare. Tight budgets are something we all understand. But if these protests are making you think twice about adopting this permit I would ask you to consider the following questions:

How can we afford not to protect the health of the fifty million people who will swim in the Bay this summer?

How can we afford not to protect the economic health of the coastal tourism and recreation businesses which generate literally billions of dollars for our area?

How can we turn away from the single most effective step we can take as a community to create a cleaner, healthier Bay?

For the last 16 months, civic and environmental leaders have worked hard to achieve consensus on all the measures included in this permit. Their diligent work is done - now it's up to you. Please vote to adopt the permit on July 15.

Sincerely,

Sharon L. Adcock

Dear Chairman Kanter

We need you to write letters NOW!

SAMPLE LETTER

Dear Governor Wilson or Dear Chairman Kanter
(please send separate letters)

Urban runoff is the largest source of coastal pollution to Santa Monica and San Pedro Bays. As you know, the Santa Monica Bay Restoration Plan targets reducing storm water pollution as the plan's most important goal. Los Angeles County has suffered through a drastic reduction in the number of beach visitors (from over 80 million per year to less than 50 million) to L.A. County beaches largely because many people are afraid to swim in the runoff polluted waters off our coast. Also, clogged catch basins cause hundreds of thousands of dollars in property damage every year. Urban runoff dumps tons of contaminated sediments at the mouths of the L.A. and San Gabriel Rivers and Ballona Creek next to Marina Del Rey. The end result is a beaster safety problem and a contaminated sediment hot spot problem that poses severe health risks to local marine life and costly site remediation problems.

Please protect the public health, marine life, local real estate, and the County's $2 billion a year coastal tourism economy by supporting the Municipal Storm Water NPDES permit for Los Angeles County.

Sincerely

Dear Mr. Vernon,

I am writing to encourage you to adopt the proposed storm water permit on July 15.

I know this is a tough decision, but one that you HAVE to make. At some point this city has to come to terms with cleaning up the Santa Monica Bay and KEEPING it clean.

With other strong statements made in the past few years by the city to upgrade the Hyperion Treatment plant and adequately treat its sewage and other discharges into the bay, storm water runoff into the ocean is now THE main obstacle to having a clean Bay. Failure to vote for the provisions of this permit will mean that the city is not totally committed to clean water. Like so many key environmental decisions before it, failure to adopt this one will mean continued steady degradation of the Bay and its beaches.

I realize this decision would have significant economic impact for local cities. However, the impact on tourist and recreation businesses, fish and sealife populations and the overall quality of life of one of the world's great cities, would unquestionably be greater.

Please, take a bold step. Vote FOR the permit.

Sincerely,

Matt Moody

Dr. Mr. Vernon:

Please add my name to the list of people urging you to adopt the proposed storm water permit system.

For my family, Cabrillo Beach in San Pedro is a unique recreational resource in that it is the only place in the area where the whole family can go wind surfing. While my expert son takes on the waves and wind outside the breakwater, my daughter and I enjoy the flatter, alas less windy, water inside the breakwater, and my wife practices the basics near the beach. It is the only windy location for those without the skill to sail through the surf this side of Lake Isabella past Bakersfield.

Unfortunately, Cabrillo Beach is also an unhealthy place to wind surf because of water pollution. Cabrillo Beach was rated an "F" in the most recent Heal-the-Bay report. As a community, we need to take steps to clean up Cabrillo Beach and the other beaches that are the driving force behind much of California's tourism.

Please vote to adopt the proposed storm water permit system when it comes up for a vote on 15 July '96.

Very truly yours,

Michael Ernstoff

Dear Dr. Rogers,
We urge you to adopt the storm water permit for Santa Monica Bay. Although some cities have objected that the permit is too costly, not cleaning up the bay could be even costlier in the long run, by increased health care costs from sick swimmers, surfers + boaters, declining fishing, + tourism resulting from a polluted bay. Tourism generates billions in revenue for our economy, + should be protected, too.

Please add my name to the growing list of concerned citizens urging you to adopt the proposed storm water permit.

How can we afford NOT to protect the health of the sixty million people who will swim in the Bay this summer?

How can we afford NOT to protect the economic health of the coastal tourism and recreation businesses which generate literally billions of dollars for our area?

How can we TURN AWAY from the single most effective step we can take as a community to create a cleaner, healthier Bay?

For the last 16 months, civic and environmental leaders have worked hard to achieve consensus on all the measures included in this permit. Their diligent work is done - now it's up to YOU.

PLEASE vote to adopt the permit on July 15.

Sincerely,

Susanne K. Gillies

Dear Michael - I don't think I could say it any better. Pls. help heal our Bay. Thank you!

Write a letter!

Your letter to the Regional Water Quality Control Board could help persuade the Board to stop the flow of pollution from storm drains into the Bay. Please feel free to modify this sample letter, but please send it soon – the Board will vote July 15 at the L.A. County Supervisors' Hearing Room.

If you'd like to attend the July 15 hearing to show your support of a clean and healthy Bay, please contact Heal the Bay at 1-800-HEALBAY for the location and directions.

Sample Letter:

Dear Mr. Keston,

I'm writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick!

That's simply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps, and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

Vicki A. Bye

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do <u>your</u> part to clean up the Bay and <u>approve</u> the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

Sincerely,

Tammy Uedoi

Dear Mr. Keston

I am writing to you to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick. That is simply unacceptable. I am a native Californian, having been born and raised in the San Francisco Bay Area. I am a graduate of the University of California, Santa Cruz, and I have lived here in Los Angeles County for over 20 years. In the middle of these past 20 years I lived in New York for 5 years, right in the middle of Manhattan. I can't tell you how many times I said to people as I boarded a train to get far enough away from the city so that it was safe to go in the water, "I can't wait to get back to California where I can swim safely in the waters of Santa Monica Bay." Now what am I going to do; where is my six-year-old daughter going to have to go in order to enjoy the pleasure of swimming and playing in the sea? I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps, and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Monterey Park, CA 91754-2156

Dear Mr. Keston,

I am strongly in favor of implementing a comprehensive pollution prevention program for storm water runoff. It would greatly benefit our coastal environment.

Excessive amounts of pavement in our urban environment are allowing much of our societies waste to flow directly to the ocean untouched by streams, marshes, microorganisms and plant matter that help to purify and absorb runoff. Urban runoff along with our ludicrous waste of water in homes, businesses, and industry is contributing to high amounts of contaminated runoff that is the primary source of coastal pollution. This water contains pathogens, toxins and debris that poison our coastal waters.

As a surfer I visit the ocean often and I have seen what poor solutions to water management does. I'll paddle around in brown mucky foam, plastic bags and Styrofoam. I will take a deep breath hoping to smell that thick salty air only to catch a whiff of a not so fresh toilet. Needless to say I have become ill simply from going in the polluted ocean to enjoy my favorite activity. As a Landscape Architect and environmental designer, I know that there are several better ways to deal with our runoff. I hope that you will support sustainable development by backing a comprehensive pollution prevention program.

Sincerely

Jeff Meyer

LOS ANGELES REGION

Michael Keston, Chair
Regional Water Quality Control Board
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Mr. Keston:

I'm writing to ask you and the other board members of the Regional Quality Control Board to please pass strong, new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick with various ailments. I've lived here about 27 years and both my sons are surfers and I can attest to how often they are sick when they surf in the Bay.

This really is unacceptable - nobody should get sick just because they swim in the Bay. People don't understand that everything they throw out of their cars or along the curbs ends up in the Bay after a rainstorm.

I cannot believe that intelligent people believe that weakening the present regulations is a good thing for the people of this area and the Bay itself. Surely the Board will pass new anti-water pollution legislation on July 15th.

Thank you.

Dear Dr. Rogers:

Please add my name to the growing list of concerned citizens urging you to adopt the proposed storm water permit.

By now, you have undoubtedly heard arguments that implementing this permit will cost money - money that many of the affected cities claim they either do not have or cannot spare. Tight budgets are something we all understand. But if these protests are making you think twice about adopting this permit, I would ask you to consider the following questions:

How can we afford not to protect the health of the sixty million people who will swim in the Bay this summer?

How can we afford not to protect the economic health of the coastal tourism and recreation businesses which generate literally billions of dollars for our area?

How can we turn away from the single most effective step we can take as a community to create a cleaner, healthier Bay?

Over the last few years we have made great progress in cleaning up the Bay, but on July 15 the next move is up to you. Please vote to adopt the permit.

Sincerely,

Lyn Lear

Monterey Park, CA 91754-2156

July 3, 1996

Dear Dr. Rogers:

It's my understanding that, on July 15, the Water Quality Control Board will vote on the proposal to adopt a storm-drain permit. As a concerned, frequent user of Santa Monica Bay, I urge that the Board adopt this crucial proposal for improving the quality of water that, ultimately, finds it way into the Bay.

I'm but one of the citizens who uses that Bay regularly for recreation, and it's obviously important to me that the ocean be preserved for the usage of all citizens. There's even an economic angle as well: the millions who use Santa Monica Bay as a recreation destination will no longer use it if measures are not taken to safeguard the quality of the water--which means lost revenue for coastal businesses, local cities and the state.

I urge you to adopt the storm-drain permit policy at the July 15 meeting.

Sincerely,

Gene Sculatti

July 3, 1996

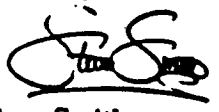
Michael Keston
California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA. 91754-2156

Dear Mr. Keston,

As a very young boy, I remember my parents taking me and my brothers and sisters to South Laguna Beach. We would wind down a narrow stone pathway that led to the most beautiful beach I have ever seen. We would be greeted by a pristine stretch of sand, and crystal clear water. That little stretch of beach provided countless hours of entertainment and education, and was the genesis of a love affair with the California coastline that continues to this day, some 35 years later.



Imagine today young parents wanting to provide their children the same opportunity to experience California's greatest natural resource - it's breathtaking coastline. Instead of a beautiful beach with clear, clean water, they are greeted by signs that tell them the beach is closed because of harmful water. Or a sign that indicates swimming in the water may be hazardous to your health. This is a scene that takes place all too often on our Los Angeles County beaches. Fortunately we have the power to prevent these scenes from occurring in the future. Hopefully, we will have the wisdom and foresight to use this power now to ensure that generations to come will be able to enjoy a clean ocean like we have.

I understand that the Regional Water Quality Control Board will vote on July 15th to issue a permit calling on the eighty-eight cities within Los Angeles County to adopt practices that will reduce urban runoff. Urban runoff is the primary source of the pathogens, toxins and debris that pollute our coastal waters. Our fish are contaminated, our marine mammals are afflicted, and those that use the water, swimmers, sailors and surfers, risk various illnesses.

VOL 21 0690

We simply cannot allow this to continue. I urge you and the Regional Water Quality Control Board to issue the permit that will reduce urban runoff. Millions of people visit Los Angeles County's beautiful coastline every year. The health of these millions as well as the health of the Southern California coastal economy is at stake. So is the future memory of a little boy or girl. Will that memory cherish a pristine beach with clear, clean water, or one with signs warning of the dangers of swimming or playing in the waves? It's up to you and the Board. I urge you to vote so that our beaches are clean for everyone's memory - now and forever.

Sincerely,

Steve Smith

July 3, 1996

Dear Mr. Keston,

I am writing you on behalf of my family and the millions of residents of Los Angeles County who swim in Santa Monica Bay to request your support for a comprehensive pollution prevention program and Municipal Stormwater Permit on July 15, 1996.

Urgent and effective action is necessary to address the significant health risks identified in the recent USC epidemiology study for individuals who swim within 400 ft of a stormdrain discharge. In addition, there are hundreds of sources of pollution entering the bay from our neighborhoods and city streets. I have often observed waste oil and antifreeze running off the property of an automotive repair shop into a nearby stormdrain.

In my professional judgement as an inspector for a local agency, the monitoring, business educational components, and enforcement of an effective stormwater management program could easily and cost effectively be incorporated within existing inspectional programs currently operating within local sanitation districts, fire departments, health departments, and building and safety programs.

Allowing urban runoff that is hazardous to our children, toxic to marine life, and costly to our local tourism industry is not acceptable.

Please understand the economic and health benefits of strong stormwater pollution prevention. A vote on July 15 is the right thing to do! Thank you for your consideration.

Sincerely,

Roger B. Kints

Dear Chairman Keston and Members of the Board,

As a Los Angeles area resident, I have a vested interest in improving the quality of our local coastline. Our beaches are a precious natural resource, and we must take smart, reasonable and cost-effective measures to protect them.

After reading the *Los Angeles Times* article (5/7/96, page 1) citing that beach-goers are becoming sick from storm drain polluted waters in the Santa Monica Bay, I am moved to write to you, requesting that the Board adopt the proposed storm water permit immediately. The permit is clearly the most effective means to address the pending problem, and there is obviously a strong scientific basis to support such measures.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes both good economic sense and good environmental sense.

Thank for your serious consideration of this matter.

Dear Chairman Keston and Members of the Board:

As a Urban Planning and Law student at UCLA, and likewise as a lifetime resident of Los Angeles, I have come to know the value of having a healthy and vibrant coastline here in Southern California. The cleaner that the are beaches and bays are, the better image people will have of Los Angeles. With a better image, more people will come here and spend valuable tourist dollars to support our economy. Further, residents will spend more vacation hours at the coastline versus traveling away from our area—again creating benefits for our economy. Any decisions and action taken in respect to protecting our resources must take those two factors into consideration.

Working as an intern in the Natural Resources Defense Council office in Los Angeles has opened my eyes to the importance of your committee and the decisions you are about to make on the proposed Los Angeles permit. This may be the single most important decision you will face as Members of this Board. I urge you to adopt the proposed storm water permit without any more delay. All the parties involved in the negotiation of the permit, including the business partners, will echo my sentiment when I say this permit is the most effective means to address the problem of an unhealthy and polluted coastline.

Los Angeles will reap the rewards of a wise decision in favor of the permit. Now it is up to you to sew the seeds of environmental sustainability.

Thank you for your consideration.

Sincerely,

Scott Daniel McVarish

Monterey Park, CA 91754-2156

Dear Mr. Keston:

The Regional Water Quality Control Board will vote on July 15 whether to issue a permit calling upon the 88 cities within LA County to adopt practices that will reduce urban runoff. This runoff, the primary source of coastal pollution, is filled with pathogens, toxins and debris that poison our coastal waters, contaminate fish, afflicts marine mammals, and sickens surfers and swimmers.

As an avid surfer and beachgoer for over 40 years, I urge you to support this initiative for new regulations needed to implement a comprehensive pollution prevention program for storm water runoff.

Sincerely,

Ken A. Estrella

Dear Chairman Keston and Members of the Board,

As a Los Angeles area resident, I have a vested interest in improving the quality of our local coastline. Our beaches are a precious natural resource, and we must take smart, reasonable and cost-effective measures to protect them.

After reading the *Los Angeles Times* article (5/7/96, page 1) citing that beach-goers are becoming sick from storm drain polluted waters in the Santa Monica Bay, I am moved to write to you, requesting that the Board adopt the proposed storm water permit immediately. The permit is clearly the most effective means to address the pending problem, and there is obviously a strong scientific basis to support such measures.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes both good economic sense and good environmental sense.

Thank for your serious consideration of this matter.

Dear Mr. Keston,

I'm writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick!

That's simply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps, and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

Elizabeth Woolley

Dear Mr. michael Keston,

I am writing in regards to the Regional Quality Control Boards vote on July 15th to adopt practices that will reduce urban runoff. People who don't go in our oceans every day do not realize how polluted they really are. You can't see all the garbage and pollution in the water unless your in it. That is why the Surfrider Foundation along with all the thousands of surfers who use the ocean as their playground are taking such a firm stand. We dont want people to have to worry about getting a disease every time they step into our ocean.

Urban street runoff contributes to nearly 80% of coastal pollution. If we can adopt practices that will reduce urban runoff, then we can start to enjoy our mother ocean and not destroy her. If things continue the way they are going, it wont be long before our ocean turns into the worlds largest garbage dump.

I ask you to please spend one weekend down at the beach and go out in the water. Take your kids out there or your wife, so you to can see up close and personal all the garbage and sewege that we as surfers deal with every day. And please, pass the permit to start cleaning up our ocean.

sincerely,

Steven McCrosky

Monterey Park, CA 91754-2156

Dear Mr. Keston,

I am taking this opportunity to urge you, and other members of the Regional Water Quality Control Board, to pass strong new storm water pollution prevention regulations when it votes on July 15.

I read a report in the Los Angeles Times about recent study by USC and the Santa Monica Bay Restoration Project which shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea or other illnesses. I use the Bay and I would much rather swim and boat in areas which are relatively free of pollution.

The current situation is simply not acceptable. No one should suffer a greater chance of getting sick just because they swim, or even boat, in the Bay. The waters at our beaches should be safe for swimming and other recreational uses!

Storm drain runoff from our cities is toxic to marine life, leaves our beaches looking like filthy trash dumps, and dumps contaminated materials in our waters. The present situation causes both environmental damage and boating safety hazards, which you must certainly agree is not acceptable.

Please take appropriate steps to clean up our waters.

Sincerely yours,

Richard P. Berg

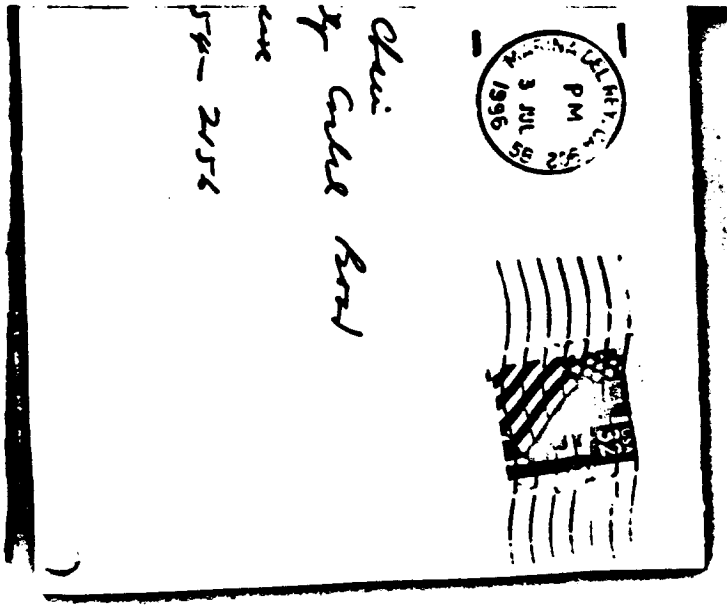
Dear Mr. Xeston:



I understand the Board will be meeting on July 15. Since I cannot attend the meeting, I am writing this letter to urge that stronger pollution regulations be enacted to clean up Santa Monica Bay.

I was surprised and distressed to read in the L.A. Times some weeks ago that the very beach I use, Will Rogers State Beach was rated D for unhealthy dangerous pollution. Although the pollution is obviously worse right by the exit of the storm drains the whole beach was rated dirty and likely to cause illness.

I do not have the technical expertise to recommend any particular measures to stop the flow of pollution from storm drains into the Bay but I am sure that the situation could be vastly improved and I urge you and the other members of the Board to strengthen, rather than weaken, pollution controls.

Thank you
Sincerely, Betty S.Hoffenberg

VOL 21

Dear Mr. Keston,

I am writing this letter in regards to a comprehensive pollution prevention program to combat the problem of coastal runoff. I have lived within minutes of plentiful coastline my entire life and it completely blows me away to see the actions, or actually the lack of, that are taken when it comes to saving our oceans. The ocean has supplied us with resources necessary to the survival of man for generations and in a day and age where sciene is now so advanced I would think that we would be doing all that we could to preserve this beautiful gift. In Revelations it is stated that we only get one ocean. That's like getting only one car your entire existance. Would you mistreat that car, or would you do all that you could to keep it in its best condition?I I know that if I were there on July 15th when that ballot was passed out I would be voting yes for the urban runoff permit and I hope that you will do the same! After all, this world is not ours but something that we inherit from our grandchildren.

Sincerly,

That's simply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps, and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

James Crawford

Dear Mr. Keston,

With regard to the July 15 vote on practices to reduce urban runoff, I want the board to know I am wholeheartedly in favor of a comprehensive pollution prevention program. The waters off our city beaches are a mess and need all the help you can give them.

Thank you for your attention and consideration in improving the situation for everyone.

Yours truly,

Les Oreck

Dear Mr. Keston,

I simply don't believe that we, as a society or an urban area, have the right to pollute our own natural environment. I believe we owe it to ourselves to do all we can to clean-up and return to a natural state our local habitat.

The recent study showing increased illness to those who swim near storm drains emphasizes the priority of mitigating this problem to the best of our ability.

I urge you to maintain and to strengthen measures to control and reduce the problem of polluted urban run-off into our local ocean.

Thank you for your thoughtful attention & consideration to this matter.

Sincerely,

DALE SHERO

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

Mr. Michael Keston, Chair
Regional Water Quality Control Board
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Mr. Keston:

I am writing to urge you and the other members of the Regional Water Quality Board to pass strong new storm water pollution prevention regulations during the 15 July 1996 vote.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick. Illnesses include colds, sore throats, fever, diarrhea and nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick. I personally have suffered from sinus and ear infections from exposure to storm drain runoff during the dry season as well as the rainy season. During the rainy season, I follow the 72 hour waiting period before going into the water. However, I have still have experienced the illnesses previously mentioned.

This is not acceptable. I strongly believe no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safer for swimming. In addition, urban runoff is toxic to marine life. It also results in trash on the beaches as well as dumping contaminated material in the ports and marina. This poses a serious environmental as well as a boating safety hazard. I have seen the results of this run of during local beach clean ups and LA River clean ups. Without strengthening regulations, this runoff will continue to contaminate coastal waters with pathogens, toxics and debris.

Please don't give in to pressure to weaken the regulations. These new regulations are needed to implement a comprehensive pollution prevention program for storm water runoff. What is at stake is nothing less than the health of thousands of beachgoers, the quality of nearshore coastal waters, the beauty of miles of County beaches, and the economic benefit of the coastal economy of Southern California. Thank you for your consideration.

Sincerely,

DEAR SIR,

ON JULY 15, 1996 THE RWQCB WILL VOTE ON ADOPTING PRACTICES THAT WILL REDUCE URBAN RUNOFF. AS SOMEONE THAT IS IN THE OCEAN FREQUENTLY I SEE THE EFFECTS THAT RUNOFF HAS ON THE QUALITY OF THE WATER. AFTER STORMS THE AMOUNT OF POLLUTION IS TREMENDOUS, IT IS FILLED WITH PATHOGENS, TOXICS AND OTHER DEBRIS THAT POISONS OUR COASTAL WATERS, CONTAMINATES FISH AND AFFLICTS OTHER MARINE LIFE AS WELL AS SURFERS AND SWIMMERS.

THESE NEW REGULATIONS ARE NEEDED TO PROTECT OUR OCEAN AND THE ANIMALS AND PEOPLE THAT USE IT. THIS WILL ALSO BENEFIT THE ECONOMIC BASE OF SOUTHERN CALIFORNIA BY KEEPING THE WATERS OF OUR COASTLINE CLEAN.

PLEASE VOTE TO IMPLEMENT THESE NEW REGULATIONS AND SAVE LIVES.

Dear Mr. Keston,

I am a thirty-year resident of Southern California and a Long Beach homeowner. I spend a lot of time at the beach with my family — swimming, surfing, fishing and kayaking. I would like you to know that I strongly support a comprehensive pollution prevention program for stormwater runoff in Los Angeles County.

Every year I suffer from several ear, throat and sinus infections that seem to develop immediately after surfing or swimming in the ocean. These illnesses may or may not be directly attributable to pollution in the water, but I'd sure like to clean up the ocean and find out.

Sometimes I force myself to stay out of the water after a rainstorm, even if the waves are good, because I'm afraid of the contaminants and the effects they may have on my health. This is a frustrating and regrettable loss of recreational use of our natural resources, but I am especially fearful of what may happen to my children and grandchildren due to their lifelong exposure to these toxins.

You have a chance to help solve this major problem, to preserve a safe and clean environment for us now and for the future. Please make the right decision and reduce urban runoff before it's too late.

Thank you.

Monterey Park, Ca. 91754-2156

Dear Mr. Keston:

I urge you and the other members of the Regional Water Quality Control Board to pass strong, enforceable storm water pollution prevention regulations when the matter comes up on July 15th.

A recent study by USC and the Santa Monica Bay restoration Project reflects that those who swim in areas where storm drains empty into the Bay, stand nearly a 50% chance of becoming ill with a cold, a sore throat, a fever, diarrhea, nausea or other illnesses!

Such a situation is not only not acceptable, but is inconscionable as well. Our entire coastline should be totally safe for swimming and other aquatic activities.

Urban runoff is also toxic to marine life, makes our beaches mere trash dumps, and contaminates our ports and marinas which poses both environmental and boating safety hazards.

Our beach and ocean areas must be kept safe and clean so that your children and mine, as well as their children, will be able to recreate without fear of illness or toxic poisoning. Do not allow political and economic pressure groups, in their greed, to pressure you and the Board into weakening the needed regulations. Thank you.

Sincerely,

Richard Seeley

Attn: Michael Keston & Board Members

Dear Regional Board,

Vote YES on the Los Angeles Countywide Municipal Storm water Permit on July 15. I have the right to swim and surf without getting sick.

Here are the facts:

- Contaminated runoff from storm drains is the main cause of pollution in Southern California.
- A recent health study showed that swimming near flowing storm drains during the summer greatly increases my chances of getting sick, even if I only swim once a week. To make matters worse, the ocean is full of trash and polluted with fecal waste after every storm.
- Without a strong storm water pollution prevention permit, we have no chance of cleaning up runoff and making beaches safe.

Please no more delays. Pass the permit on July 15. I want to enjoy our ocean once again.

Sincerely,

Jane Gullette

Dear Mr. Keston,

I am greatly concerned about pollution of Santa Monica Bay waters by street run-off from storm drains. Since the W.Q.C.B. is at least partially concerned with coastal waters, it should recognize the great danger to public health that storm drain effluent presents. It is well established that swimming within 100 yards of a storm drain outlet to the bay will greatly increase one's chances of incurring a gastro-intestinal infection, sore throat, nausea and other unpleasant illnesses.

Therefore I urge you to pass strong new storm-water pollution prevention regulations on July 15 to help protect public health.

Sincerely,

James L. Campbell, Ph.D.

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do your part to clean up the Bay and approve the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

7/6/96

Dear Mr Keston, and otner board members,

We, of the South Bay really need to nave our ocean water clean and free of pollution from storm drains emptying in it. This runoff is not only a health hazzard to swimmers but to marine life as well. The beaches get littered with trash and debrie that is contaminated, otten, and unsightly.

Recently, my son, who is a County Lifeguard stationed at Manhatten Beach got a bacterial infection from the water. This is a conatant worry and very upsetting. Every beach should be safe for swiming and for marine life.

A USC study claims if one swims in areas where storm drains empty into the Bay, sickness follows in 50% of the time.

I urge you to vote to tighten regulations to protect our waters and beaches.

Sincerely,

Mrs R. Patterson

RE: Proposal to Adopt a Storm Drain Permit to Save the Santa Monica Bay

Dear Dr. Rogers:

It's easy to say not to think about money and the economic factors involved in the decision to vote for or against the Storm Drain Permit. Cities and businesses stating the price is too high have probably inundated every member of your board with reasons to vote no.

I have a better reason: Ten years from now, when you walk along the beach with your grandchild, what will be your answer be when she asks if she can swim in the Bay? I'd like to think you could look her in the eye and tell her to get her boogie board and go play in the surf.

Voting no gives us all a lousy future. In the long run, this really isn't about economics, it's about making the right decision for all of us in the State of California. Voting for the Storm Drain Permit sends a message to everyone that we treasure our land and our waters. The price isn't too high now. It will be later. *And there will be a "later."* By then, there will be talk of closing beaches, loss of the big bucks tourist trade and an angry group of taxpayers who in years to come will have to foot the bill for cleaning up the Bay.

Forget the quick fix and plan for a clean, healthy future. We need the protection this permit gives to our waters. California has always been a leader in our ecological heritage. Don't change the record now. Vote yes.

Sincerely,

RE: Proposal to Adopt a Storm Drain Permit to Save the Santa Monica Bay

Dear Mr. Vernon:

It's easy to say not to think about money and the economic factors involved in the decision to vote for or against the Storm Drain Permit. Cities and businesses stating the price is too high have probably inundated every member of your board with reasons to vote no.

I have a better reason: Ten years from now, when you walk along the beach with your grandchild, what will be your answer be when she asks if she can swim in the Bay? I'd like to think you could look her in the eye and tell her to get her boogie board and go play in the surf.

Voting no gives us all a lousy future. In the long run, this really isn't about economics, it's about making the right decision for all of us in the State of California. Voting for the Storm Drain Permit sends a message to everyone that we treasure our land and our waters. The price isn't too high now. It will be later. *And there will be a "later."* By then, there will be talk of closing beaches, loss of the big bucks tourist trade and an angry group of taxpayers who in years to come will have to foot the bill for cleaning up the Bay.

Forget the quick fix and plan for a clean, healthy future. We need the protection this permit gives to our waters. California has always been a leader in our ecological heritage. Don't change the record now. Vote yes.

Sincerely,

VOL 21 0749

Dear Mr. Coe:

As I was growing up in Santa Monica, I spent more time at the beach than in my own backyard. I played in the surf nearly every day of every summer, and, in my teens, even braved an occasional stormy winter day. I did ocean swims in my youth with the Santa Monica AAU swim team, and later with fellow YMCA swim instructors. I have since been a SCUBA diver, an ocean rower, a windsurfer, and a passionate lover of the sea.

In my early twenties, I stopped going in the Santa Monica Bay. I had become ill and did not have the strength to continue with these sports. Doctors could not pinpoint what my illness was, or what was causing it, but it was clear that my middle and inner ear were involved and that my immune system was not functioning at its usual level. My life was interrupted for five years by this mystery illness, and I continue to this day to experience minor chronic ailments.

Although there is no proof that my exposure from the 1960s to the 1980s to the waters of the Santa Monica Bay (and to the myriad toxins that flow into the Bay from the storm drains) had contributed to my health problems, I ceased entering these waters. For me, it was too much of a risk. My decision has held fast, and is fortified each time I hear of the ear infections and rashes, and even hepatitis, contracted by those who continue to swim in the Bay. Most of my friends have sworn off the Bay's water, as well.

I miss the Santa Monica Bay. I am an ocean person with no clean ocean to swim in. A fish out of water.

<u>On July 15, when you cast your vote regarding the proposed storm water permit, please keep us in mind.</u> Not only those of us who have sworn off the Bay to avoid illness--the fish out of water--but also the fifty million who <u>will</u> swim in the Santa Monica Bay, and risk illness, this summer.

Sincerely,

Nomi Isak Kleinmuntz

Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do <u>your</u> part to clean up the Bay and <u>approve</u> the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

RE: Pollution Prevention Program for Storm Water Runoff.

Dear Mr. Kester,

New regulations are needed to implement a comprehensive pollution prevention program for storm water runoff. Not only the safety of beach goers is at stake but also the coastal economy of Southern California. I strongly urge that LA County adopt practices that will reduce urban runoff. It can be done. The safety of our citizens, and the protection of precious wildlife is at stake. We can't turn back the clock but we can create our future. Please attend to this issue, it is urgent.

Sincerely,

David Lindquist

Dear Chairman Keston and Members of the Board:

For the sake of our economy, our health, and our precious natural resources, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures. I am pleased that the business community was included in the negotiations–as were representatives of all the effected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

Philippa Calnan

Mr. Michael Keston
Chair
California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA. 91754-2156

Dear Chairman Keston and Members of the Board,

As a Los Angeles area resident, I have a vested interest in improving the quality of our local coastline. Our beaches are a precious natural resource, and we must take smart, reasonable and cost-effective measures to protect them.

After reading the *Los Angeles Times* article (5/7/96, page 1) citing that beach-goers are becoming sick from storm drain polluted waters in the Santa Monica Bay, I am moved to write to you, requesting that the Board adopt the proposed storm water permit immediately. The permit is clearly the most effective means to address the pending problem, and there is obviously a strong scientific basis to support such measures.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes both good economic sense and good environmental sense.

Thank for your serious consideration of this matter.

C: Governor Pete Wilson
Mayor Richard Riordan

California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do your part to clean up the Bay and approve the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

Sincerely, Harvey Hcenter

VOL 21

Michael Keston, Chair
California Regional Water Quality Control Board
Los Angeles Region

Dear Mr. Keston,

I am writing to you in concern of our ocean waters. Being one who loves to spend my teen age years at the beaches, I have a concern for the "health" of the beach. Thus, I support the comprehensive pollution prevention program for storm water runoff.

This act seems to be so helpful for the environment. The protection of the swimmers and surfers will be increased, as well as the protection of marine animals. What more can you ask for? Please, help us in doing our part for keeping the environment clean.

Sincerely,

Theo Fedoruk

Dear Chairman Keston and Members of the Board:

As a business operator in the Los Angeles Area, I take a great interest in improving the quality of our local coastline. Our beaches are an important economic driver for the region, and we must take smart, reasonable, cost-effective action to protect our resources.

After reading in the Los Angeles Times that people are getting sick from storm drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures. I am pleased that the business community was included in the negotiations–as were representatives of all the effected parties.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes good economic sense and good environmental sense.

Thank you for your consideration.

Sincerely,

Mary Luevano

Dear Mr. Keaton,

It has been brought to my attention that the Regional Water Quality Control Board will vote on a permit calling for the cities in LA County to adopt practices that will reduce urban runoff. I strongly support this action. These new regulations are needed to help prevent pollution from storm water runoff. Water quality is tremendously important here in Southern California. With the southland's oceans being used for recreational, educational, economic, and ecological purposes it is vital that the oceans be protected, and the permit that will come to vote on July 15 will do just that. Thank you for your time.

Sincerely,

Dear Dr. Rogers:

I urge you to fight water pollution in Santa Monica Bay. Please adopt a storm water permit, to have Los Angeles County and its cities treat water from storm drains, before that water enters the ocean.

Water pollution threatens the health of approximately 50 million swimmers a year, in the Santa Monica Bay.

Water pollution harms marine animals.

Water pollution can be harmful economically to Southern California, by decreasing tourism.

Thank you for your help.

Sincerely,

Dear Mr. Michael Keston:

I am writing this letter with strong support of a comprehensive pollution prevention program for storm water runoff infecting our ocean. I, my brothers, parents ,friends, and neighbors all sincerely hope and will be extremely appreciative if methods are adopted that will reduce urban debris that poison our precious coastal enviorment. We all love to surf swim fish and play in our beautiful ocean that we are so lucky to have, therefore we have a big responsibility.

I am an 18 year old surfer and have been sick with ear, nose, and throat infections three times in the last year. I was sick for a good week to two weeks. Every time it was directly from the dirty ocean water. All my friends and acquaintances have been similarly affected, some more severely than others.

Thank you for taking the time to read this and I know you'll do the right thing for our fragile,irreplaceable enviornment and for the health of countless beachgoers.

Sincerely,

Thomas D Tabbert

Dear Mr. Keston,

I am in support of a comprehensive pollution prevention program for storm water runoff to the RWQCB. The runoff is a primary source of coastal pollution affecting waters, fish, marine mammals, surfers, swimmers, and ME. The new regulations are needed to remedy the current poor situation. My health as a beachgoer is in jeopardy. I want something to be done to improve the quality of nearshore coastal waters, the beauty of miles of County beaches, and the economic benefit of the coastal economy of Southern California.

I hope that my best interest is considered in making this crucial decision.

Sincerely,

Melinda A. Nelson

Dear Mr. Keston:

Re: July 15th vote to issue a permit to adapt practices to reduce urban runoff.

Pollution, be it air or water, is taking it's toll on mankind as we know it.

I personally get sick or develop various reactions to the ocean on a somewhat regular basis and I'm very healthy to begin with. What's being done to our youth and seniors is criminal. The toxins and other pollutants are causing long term diseases in all people and animals, not just oceangoers. This comes from the fish we eat and the air we breath.

I am in complete support of a comprehensive pollution prevention program for storm water runoff.

Please allow future generations to live in a healthy and envoirmentally friendly world. Your support can and will set an example to other politicians who are indecisive or apathetic.

Thank you very much for your consideration.

Dear Mr. Keston:

I am writing in support of the Storm Water Pollution Prevention Regulations which are due for vote on July 15, 1996. I would appreciate if you would not only vote for this legislation, but would also use your influence on the other board members to vote for these regulations.

As you know, recent USC studies have shown that people are 50% more inclined to become ill after swimming near where a storm drain empties into the ocean. This not only impacts the swimmers directly, but also affects the economy with lost work time and Medical benefits outpayments.

I live in Manhattan Beach where there are many good programs to support a cleaner environment and bay. Please give your support to this important legislation so that all of our efforts will be as fruitful as possible.

Thank you for your time and consideration.

Sincerely,

Andrea Valcourt

RECE
96 JUL -9
IFORNIA
QUALITY CON
LOS ANGELE

Mr. Keston,

I write to you due to the fact that I am a surfer, a high school Biology/Marine Science teacher, and a fisherman.

At 62 years of age, I have been truly blessed to have dived Laguna in the 1950's when abalone and lobster were plentyful. Taught myself to SCUBA dive in 1958 in order to steal an occasional lobster from the commercial traps at Diver's Cove (UGH). In the 1940's, my father would take me fishing on the Redondo barge, and even earlier we would stay at Hermosa for a month in the summer and I would fish off the pier. This is undoubtedly where I acquired my interest in the ocean.

Now, I would be hard pressed to eat any fish taken from Santa Monica Bay.

I have been a surfer for almost 36 years; I am also President of the Malibu Surfing Association. Perhaps due to the latter, I spend a great amount of time surfing Malibu Surfrider Beach. My right eye is like the coal miner's canary; it often indicates when excessive pathogens are in the ambient surfzone. Many times it has become infected due to polluted ocean water.

Thus I write to you regarding the July 15 deadline as to whether to issue a permit calling for the 88 cities within L.A.County to better control runoff.

I have had many experiences with pathogens from runoff. I have heard of a large number more from friends and acquaintances, particularly in our club. The L.A. Times has had horror stories of the life guards that have worked near a storm drain. This must cease. Our near shore pollution is an issue we can control. The people should not have to go to the initiative process as we did in 1971 in order to get to vote on a proposed Coastal Commission, since the legislators were afraid to deal with the issue.

The pollution is unacceptable. Please start the process. Hopefully, it will roll on from there.

Yours,

Gary Stellern

101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do <u>your</u> part to clean up the Bay and <u>approve</u> the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

Sincerely,

Joe Pearson

Dear Mr Michael Keston

Please do your very best to see the vote on July 15th go the way of improved Ocean water quality!

There are way to many beaches in L.A. County and surrounding Counties with Ocean water unsuitable for Human Recreational uses.

This is a sad reality that for some reason is being ignored by our political leaders. We know where the majority of our Ocean pollution comes from and

VOL 21

0804

R0065058

Michael Kost C/

from it finds its way to our Ocean. It comes from the streets and its conduit is the storm drains.

Mr Keston, make your's the administration who does something about this. What a wonderful thing to do for your children and my children and their children.

Sincerely

John Willson

Dear Mr. Keston,

This letter is written on behalf of support of a comprehensive pollution prevention program for L. A. County Beaches. Storm water runoff is the main source of pollution along our coast. This runoff is full of debris, toxics, and pathogens that contaminate our water, the fish, and marine mammals. It also sickens swimmers and surfers and the health of thousands of beachgoers. There is a phenominal risk to our beautiful County beaches not to mention the risk of economic benefit of the Coastal economy of Southern California.

We need new regulations for a tougher pollution prevention program NOW. We are depending on you to do all you can to move ahead with this vital program. Please VOTE YES on July 15 to Reduce Urban Runoff!!

Sincerely,

Dear Chairman Keston and Members of the Board:

As a surfer and avid beachgoer in the Los Angeles Area, I take a great interest in improving the quality of our local coastline. I am sure that you are all aware that the primary source of coastal pollution is urban runoff. This runoff is filled with pathogens, toxics and debris that poison our coastal waters, contaminates fish, afflicts marine mammals, and sickens surfers and swimmers. New regulations are needed to implement a comprehensive pollution program for storm water runoff.

Furthermore, after reading in the Los Angeles Times that people are definitely getting sick from drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am even more moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures.

Speaking from the many personal experiences I have had with ear infections caused by surfing in polluted waters, I strongly urge and support you to please take advantage of this opportunity to adopt public policy that will help the health of thousands of beachgoers, the quality of nearshore coastal waters, the beauty of miles of County beaches and the economic benefit of the coastal economy of Southern California.

Thank you for your consideration.

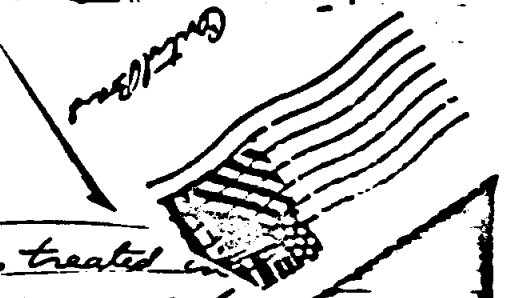
Dear Mr. Keston,

I am in support of a comprehensive pollution prevention program for storm water runoff. I am one of the members of the Seaside Foundation that volunteers at Long Beach's El Dorado Nature Center's Moveable Museum Program POWW - Protect Our Watery World. POWW teaches youngsters about urban runoff and the dangers it creates in our waters both to us and the plants and animals that live there.



Since my volunteering in this program I have become aware that many adults and children

VOL 21

0809

R0065063

951

think our street runoff is treated in the sewer system. Most people have no idea that whatever is on their streets ends up in our waters. I believe that an educational aspect needs to be included in the pollution prevention program.

Also, I am a resident of Seal Beach. I run on the beach almost daily. The contents and the amount of pollution that washes ashore there from the San Gabriel River is unbelievable! I am glad to see that the L.A. Regional Water Quality Control Board is moving in the right direction to diminish this problem. I support and applaud your efforts to clean up our waters.

Sincerely,

Wendy Morris

VOL 21

08-10

R0065064

VOL 21

Dear Mr. Keston,

I'm writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick!

That's simply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps, and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

Leslie Goldstein (Malibu Ca.

Dear Mr. Keston,

We have recently become aware of the scheduled July 15, 1996 vote of the Regional Water Quality Control Board concerning the adoption of regulations requiring Los Angeles cities to reduce urban runoff. We strongly support the proposed regulations, and believe enforcement of such codes will benefit the health of individual's utilizing the beaches as well as the beach communities in general. Our beliefs regarding the importance of this initiative stem from personal experiences; as frequent beachgoers we have suffered several bouts of polluted water related illnesses, including a severe eye infection. We implore the Regional Water Quality Control Board to vote in favor of regulations that will both decrease the public health risk and enhance the quality of the coastal environment, therefore upholding the responsibilities of this Board.

Dear CRWQCB,

I urge you to support a comprehensive pollution prevention program for stormwater runoff, it is something that is desporately needed in L.A county. I am one who enjoys to play in the ocean, but am able to leave the ocean when pollution occurs, unlike the living creatures in the ocean. We all suffer when our oceans are polluted and something must be done. Education is the key to an effective pollution prevention program, so please ~~ate~~ act without Haste and help to save out oceans.

Thank you

TO ALL LOS ANGELES COUNTY BEACH USERS:

The Regional Water Quality Control Board will vote on July 15th whether to issue a permit calling upon the 88 cities within LA County to adopt practices that will reduce urban runoff. This runoff, the primary source of coastal pollution, is filled with pathogens, toxics and debris that poison our coastal waters, contaminates fish, afflicts marine mammals, and sickens surfers and swimmers.

Monterey Park, Ca. 91754

Dear Sir:

This letter is to encourage you to support a comprehensive pollution prevention program for stormwater runoff. I realize that this is a difficult problem - costly and difficult to enforce. However, if we don't do it here, who will? Who else has more to lose? The beaches and surf of California are world-wide symbols of our enviable life-style. When we can no longer swim in the ocean, Los Angeles will be a much less attractive place to work in and visit.

Ignorance is bliss, but we cannot plead ignorance any more. This is our problem. Our generation must <u>begin</u> the fight against pollution so that our children will have something to build upon.

ACTION ALERT!!!

Sincerely,

R0065071

101 Centre Plaza Drive
Monterey Park, CA. 91754-2156

Dear Chairman Keston and Members of the Board,

As a Los Angeles area resident, I have a vested interest in improving the quality of our local coastline. Our beaches are a precious natural resource, and we must take smart, reasonable and cost-effective measures to protect them.

After reading the *Los Angeles Times* article (5/7/96, page 1) citing that beach-goers are becoming sick from storm drain polluted waters in the Santa Monica Bay, I am moved to write to you, requesting that the Board adopt the proposed storm water permit immediately. The permit is clearly the most effective means to address the pending problem, and there is obviously a strong scientific basis to support such measures.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes both good economic sense and good environmental sense.

Thank for your serious consideration of this matter.

Rocco Matone

Dear Sir,

8 July 1996

I am writing you regarding an upcoming decision you will be involved in. The issue is whether or not to permit the reduction of urban runoff to the cities of LA County.

If you are not aware, the runoff from LA cities runs directly into the LA area beaches, unfiltered and uncleaned! This runoff contains various types of pollution, including toxins, feces, oils, trash, chemicals, etc.

LA urban runoff often causes harm to both humans and animals. I frequently use LA area beaches and I am a resident of LA County. I, as well as most of my friends, have gotten sick, on more than one occasion, due to current allowed runoff levels. I have also seen local marine life wounded or dead because of the results of urban runoff.

If anything, the LA runoff standards need to be stronger and enforced with higher priority.

The LA beaches are currently a major source of income, fun, and relaxation for LA area residents. This all will be negatively affected if this permit is passed.

I am against this permit being passed and encourage you to vote in the same way, when you get the chance. Thank you for your time.

Sincerely,

Hawthorne, CA

Michael Keston, Chair
California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, California 91754-2156

Dear Mr. Keston,

I write for myself and as an active member of the Surfrider Foundation.

The cities of Los Angeles County need to care for their neighboring oceans. Runoff is now becoming more polluted than treated sewage: This is not a good sign. While there is no substitute for full public awareness and participation to ensure the reduction of runoff pollution, someone must show leadership somewhere. You're an awfully good start.

I ask you to vote on July 15 in favor of a permit calling on cities in the county to control and/or reduce urban runoff. This water currently is uncontrolled, and is replete with toxins, debris of who knows what origin, and pathogens, including staphylococcus aureus and various deadly bacilli. Marine biologists still are unsure how many and what kinds of viruses inhabit this soup, but they are sure that they are there. The last time I ventured with my board into the ocean at Malibu, I noticed the water temperature in the murky water just as I heard someone remark, "Gee this brown water is really warm." One cold and one ear infection later, I still think that that's a heavy price to pay for warm water in January. I hope you agree.

For the last two centuries, settlers have been attracted to this area largely due to the pleasant climate and proximity to the ocean. While others battle the smog that smears not only the landscape but our fair county's reputation, we (and you) must battle the runoff pollution that besmirches the water.

Please vote to reduce urban runoff. Increasing it doesn't make sense.

Very truly yours,

Andrew M. Porterfield

Dear Mr. Heston,

When I was a boy in Massachusetts I used to watch trash barges, their cargoes aflame, being towed out to sea. This probably is not a viable alternative for getting rid of waste materials in Los Angeles, but surely more up-to-date scientific procedures must be available to eliminate this waste and reduce the runoff that pollutes the waters of our beautiful coastal areas.

As you know, some of the most beautiful beaches in the world are here in Southern California. I hope that your Board will rebuff pressures that would reduce restrictions designed to keep these beaches clean, free from pollution, healthy, and accessible to the public.

Respectfully yours,
Robert M. Lewenberg

Re: Letter in Support of RWQCB Permit Controlling Storm Drain Run-Off

Gentlemen:

I am writing to urge each of you to support the Regional Water Quality Control Board ("RWQCB") to permit calling upon the 88 cities within Los Angeles County to adopt practices that will reduce urban run-off in the Santa Monica Bay and surrounding coastal areas. I understand that the RWQCB will be voting on this issue on July 15, 1996. I urge each of you to support the permit. As each of you well know, urban run-off is the primary source of coastal pollution and contaminates fish and sickens marine mammals and people.

The pollution is so bad that if you go in the water within 100 yards of the Santa Monica Canyon storm drain, you expose yourself to toxic levels of bacteria. This madness has got to stop. We must work together to save one of the most valuable assets this region has from turning into poison.

The new regulations are needed to implement a comprehensive pollution prevention program for storm water run-off. What is at stake is nothing less than the health of beach-goers and the survival of the Santa

Dear Dr. Rogers:

Please add my name to the growing list of concerned citizens urging you to adopt the proposed storm water permit.

By now, you have undoubtedly heard arguments that implementing this permit will cost money-money that many of the affected cities claim they either do not have or cannot spare. Tight budgets are something we all understand. But if these protests are making you think twice about adopting this permit I would ask you to consider the follow questions:

How can we afford not to protect the health of the fifty million people who will swim the Bay this summer?

How can we afford not to protect the economic health of the coastal tourism and recreation businesses which generate literally billions o f dollars for our area?

How can we turn away from the single most effective step we can take as a community to create a cleaner, healthier Bay?

For the last 16 months, civic and environmental leaders have worked hard to achieve consensus on all the measures included in this permit. Their diligent work is done-now it's up to you. Please vote to adopt the permit on July 15.

Sincerely,

Kevin Reilly

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do <u>your</u> part to clean up the Bay and <u>approve</u> the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

Michael Keston, Chair
and Members
California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Chairman Keston and Members of the Board:

Fact: Scientific studies have proven that contaminated runoff from storm drains can make you sick, is toxic to marine life, and is the main cause of pollution in Santa Monica Bay from Malibu to Palos Verdes.

Fact: Storm drain runoff pollution causes flooding leading to property damage, contaminates sediments, and creates boater safety hazards in ports and harbors.

Fact: Reduce storm water pollution and you take the single largest step you can to protect public health at the beach and clean up the Bay.

Fact: The tentative municipal storm water permit is clearly the most effective means to reduce storm water pollution.

Fact: Approve the municipal storm water permit and you protect public health, reduce storm water pollution, and ensure a strong coastal economy.

Please do your part to clean up the Bay and approve the Waste Discharge Requirements for the Municipal Storm Water Discharges within the County of Los Angeles on July 15, 1996.

Sincerely,

cc: Governor Pete Wilson
Mayor Richard Riordan

96 JUL 11 PM 1:17

Dr. Robert Ghirelli
California Regional Water Quality Board
1001 Centre Plaza Dr.
monterey Park, CA 91754-2156

Dr. Ghirelli,

Hello, my name is Stephanie Coats-Arnold. I am writing you to urge you to vote against Southern Pacific Milling Company's strip mine proposal of Sycamore Ranch in Fillmore. My parents moved our family to Fillmore over 29 years ago from Orange County. My Mother recalls coming to Fillmore for drives and longing to live here. Eventually they did and now along with my husband we are raising our two sons here. We have both lived here for over 20 years.

Our family takes along walk each Sunday that takes us to our new Central Park. This park is to be centered around our growing Short Line train. We are so glad to see how many people are coming into Fillmore to take advantage of the train. Admittedly the train does give Fillmore some much needed income. Our town lacks other major retail stores that can provide a city with some of their tax money. We do fall short on this, however with the train running through our orchards tourists do linger and spend a few of their dollars at our stores. This money is badly needed.

If S.P. Milling Company does go through with their plans our small town will be devastated. Not only with the tourism but local agriculture and highway traffic. At our new Vons on Highway 126 we can buy produce grown right here in Fillmore, this might not be possible otherwise.

In our local newspaper SMIRF (Stop Mining In Rural Fillmore) states that the county feels that the western end of the county does not have enough quality sand and gravel , SMIRF points out that the county's general plan says that there is already a 50-year supply on hand. if this is true why the need for more? Granted we already have 3 rock and gravel companies. One on HWY 126 and two on Grimes Canyon Road. This should be enough for such a small town, shouldn't it?

Please consider my plea, I feel as though our town deserves so much more than to grow up and be a gravel pit.

Thank You for your consideration.

Sincerely,

Stephanie Coats-Arnold

Monterey Park, CA 91754-2156

Dear John:

Please add my name to the growing list of concerned citizens urging you to adopt the proposed storm water permit.

How can we afford NOT to protect the health of the sixty million people who will swim in the Bay this summer?

How can we afford NOT to protect the economic health of the coastal tourism and recreation businesses which generate literally billions of dollars for our area?

How can we TURN AWAY from the single most effective step we can take as a community to create a cleaner, healthier Bay?

For the last 16 months, civic and environmental leaders have worked hard to achieve consensus on all the measures included in this permit. Their diligent work is done - now it's up to YOU.

PLEASE vote to adopt the permit on July 15.

Sincerely,

Susanne K. Filkins

Monterey Park, CA 91754
Attn: **Michael Keston & Board Members**

Dear Regional Board,

Vote YES on the Los Angeles Countywide Municipal Storm water Permit on July 15. I have the right to swim and surf without getting sick.

Here are the facts:

- Contaminated runoff from storm drains is the main cause of pollution in Southern California.
- A recent health study showed that swimming near flowing storm drains during the summer greatly increases my chances of getting sick, even if I only swim once a week. To make matters worse, the ocean is full of trash and polluted with fecal waste after every storm.
- Without a strong storm water pollution prevention permit, we have no chance of cleaning up runoff and making beaches safe.

Please no more delays. Pass the permit on July 15. I want to enjoy our ocean once again.

Sincerely,

(Your name and signature)

ACTION ALERT

THIS SUMMER, 50 MILLION PEOPLE WILL SWIM IN SANTA MONICA BAY.
ON JULY 15, 8 PEOPLE WILL DECIDE HOW SAFE THE WATER IN THE BAY IS GOING TO BE.

THEY NEED TO HEAR FROM YOU !!!

Join Heal the Bay and the environmental community in passing the County Storm Water permit—our best chance for a safe Bay. We need to pack the hearing room with people like you, who don't want to get sick fom swimming or surfing in the Bay.

Monday, July 15th 9:00am
REGIONAL WATER BOARD MEETING
Board of Supervisors Hearing Room
500 W. Temple Street (Corner of Grand Ave.), Downtown Los Angeles

Getting There: The Santa Monica Blue Bus Express ($1.25) leaves Pico & Bundy at 8:25am and we'll be on it!
Join us for the ride downtown or at the Hearing Room.
If you drive, parking in surrounding lots is about $8.

CALL 1-800 HEAL BAY EXT. 116 FOR MORE INFO.

FREE T-SHIRT FOR ALL ATTENDING!

VOL 21

11319 Dronfield Ave,
Pacoima, CA 91331
July 7, 1996

Dear Mr. Keston:

Please pass strong new storm water pollution prevention regulations when you vote on July 15. Even more than the danger to swimmers, is the lunacy of polluting the ocean, the source of life on earth. No pollution is acceptable. Any kid knows that when the ocean dies, we all die. The most "primitive" people knew that it is insanity to destroy your own life source. Why can't we, the richest and most technologically advanced people in the world, protect the ocean we depend on? Please look at the long view and don't cave in to pressure to weaken environmental regulations.

Sincerely,

Norah Cunningham

Dear Mr. Keston,

I am writing to encourage you to vote in favor of issuing a permit requiring the coastal cities in LA County to reduce the amount and frequency of their urban runoff. I seldom write a letter such as this, but I wanted my opinion know. We have done such severe damage to our coastline in the past - please take this opportunity to help in healing our ocean waters and coastline. I am one of many Southern California residents that regularly enjoy the beach. It's been a part of my life since I was born, and hope it always will be. Please vote to enforce strict guidelines for LA County cities, so we can begin the much needed process of healing from decades of damage.

Thank you for your consideration.

Sincerely,

Mark Salamon

Dear Chairman Keston and Members of the Board

As a Los Angeles County resident and beach goer for over forty years, I have a vested interest in improving the quality of our local coastline. Our beaches are a precious natural resource, and we must take smart, and reasonable action to protect them.

I read the article in the Los Angeles Times (5/7/96 page 1) citing that beach goers are getting sick from stromm drain polluted waters. I am writing to you that your Board adopt the proposed storm water permit immediately. The permit is clearly the most effective means to handle the pending problems, and there seems to be strong scientific basis to support such measures.

Please consider this request as a way for a government agency to take action, that makes sense, both economically and environmentally.

Thank you for your consideration in this matter

Michael Keston, Chair
Calif. Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Dr.
Monterey Park, CA 91754-2156

Dear Sir:

I would like to urge you to adopt the measure to be voted on on the 15th pertaining to urban runoff.

I am a longtime surfer and am intimately acquainted with the health hazards of runoff. Surfing not only puts one ON the water, but one must go THROUGH and frequently UNDER it in this sport. Any water-borne pathogen that is in the water at a surfing spot has the potential to infect any riders in the water at that site. There is no way to be "cautious" or take preventive measures.

I belong to Surfrider Foundation. We are uncompromised in the belief that clean ocean waters are our birthright.

I know from a period of living inland that people who aren't regular beach-goers are not well-educated on these specifics. The same may go for officials of some of the inland communities, and this is why this measure is so important.

Please support these new regulations.

Sincerely,

John Mark Ferris

Mr. Michael Keston, Chair
Regional Water Quality Control Board
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Mr. Keston:

I'm writing to urge you and other members of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulations when it votes on July 15.

A recent study by USC and the Santa Monica Bay Restoration Project shows that if you swim in areas where storm drains empty into the Bay, you are almost 50% more likely to get sick, with a cold, sore throat, fever, diarrhea and nausea or other illnesses. One of every 25 people that swim in front of a drain will get sick!

That's simply not acceptable. I feel that no one should suffer a greater chance of getting sick just because they swim in the Bay. Every beach should be safe for swimming.

Urban runoff is also toxic to marine life, leaves our beaches looking like trash dumps, and dumps contaminated material in the ports and marina that poses both environmental and boating safety hazards.

Please don't give in to pressure to weaken the regulations. Thank you for your consideration.

Sincerely,

Dear Mr. Keston:

I am concerned citizen in Los Angeles county that uses many of the beaches for surfing. I have become sick after surfing many of L.A.'s beaches over the past years, specifically south Hermosa Beach, El Porto and Malibu.

Our beaches our sick and extremely polluted. They are also one of our main tourist attractions. If L.A.'s beaches get the reputation that you will be sick if you play in them, it will be disastrous for our local economy.

I strongly urge the RWQCB to adopt a comprehensive pollution prevention program for storm water runoff. It will be good for the health of L.A.'s citizens and visitors.

Sincerely,

Monterey Park, CA 91754-2156

Dear Mr. Keston:

I am writing to urge you to use the considerable resources of the Water Quality Control Board to regulate urban runoff, the primary source of coastal pollution, in all 88 cities in Los Angeles County. As a county voter and taxpayer, I am deeply concerned about the quality of water throughout the Los Angeles Basin. The hidden costs of pollution -- medical expenses, lost recreation dollars and the like -- are bad enough. But the destruction of our beautiful California coast by pathogens and toxins would be unforgivable even if it cost us nothing in dollars. I support a comprehensive pollution prevention program for all water runoff, and expect the Water Quality Control Board to enact and enforce just such a program.

Best regards,

Lysbeth B. Chuck

96 JUL 11 PM 1:29

Dear Regional Board,

Vote YES on the Los Angeles Countywide Municipal Storm water Permit on July 15th. I have the right to enjoy clean ocean waters without getting sick.

The fact of the matter is, the main cause of pollution in Southern California is contaminated runoff. A recent health study showed that swimming near flowing storm drains during the summer greatly increases my chances of getting sick, even if I only swim ONCE a week. If that is not enough, the ocean is full of trash and polluted with fecal waste after every storm.

With out a strong water pollution prevention permit, we have no chance of cleaning up runoff and making beaches safe.

Please no more delays. PASS the permit on July 15th. I am sick and tired of getting sick when I go to the ocean.

Thank you for you time.

96 JUL 11 PM 1:30

Dear Mr. Keston:

It has come to our attention that the Regional Water Quality Control Board (RWQCB) will vote on July 15 whether to issue a permit calling upon the cities within Los Angeles County to adopt practices that will reduce urban runoff. We applaud the RWQCB for entertaining this concept and urge the adoption of a comprehensive pollution prevention program for storm water runoff.

We utilize the beaches along the Los Angeles County coast, and are proud of the beauty our area has to offer not only to its residents but to visitors from all over the world. It is imperative that our coast and ocean be protected from the toxins and contaminants found in storm water runoff.

As you know, industry has been required by the Clean Water Act to carefully monitor the potential for storm water runoff. Such monitoring programs should be extended to municipalities. We are all responsible for the future of our environment.

We thank you for your attention.

Mr. Keston!

REDUCE URBAN RUNOFF!

We, the citizens of Southern California need a comprehensive pollution prevention program for storm water runoff. Our coastline is very important to all of us that live in Southern California. Storm water runoff has a direct effect on the quality of the coastline, and the quality of the coastline has a direct effect on the quality of life of those that live near it.

The health of those who swim, surf or play in the water see the effect of the runoff, and want the polluted runoff stopped! Even those that don't have direct contact with the Coastline are effected by the water quality through fish harvested in the area. The visual litter of "Contaminated Water" signs is experienced by beach-goers, including tourists that visit our beaches from around the world. Surely this cannot leave a positive image in their minds.

I visit the beaches of Southern California throughout the year. I want the amount of pollution being dumped into the ocean to be reduced as much as possible.

Please, do all you can to reduce urban runoff.

Sincerely

Kirk Maes

Dear Chairman Keston and Members of the Board:

As a surfer and avid beachgoer in the Los Angeles Area, I take a great interest in improving the quality of our local coastline. I am sure that you are all aware that the primary source of coastal pollution is urban runoff. This runoff is filled with pathogens, toxics and debris that poison our coastal waters, contaminates fish, afflicts marine mammals, and sickens surfers and swimmers. New regulations are needed to implement a comprehensive pollution program for storm water runoff.

Furthermore, after reading in the Los Angeles Times that people are definitely getting sick from drain polluted waters in the Santa Monica Bay (5/7/96, front page), I am even more moved to write to request that the Board adopt the proposed storm water permit as soon as possible. The permit is clearly the most effective means to address the problem, and there is obviously strong scientific bases to support such measures.

Since several of my friends, as well as many people in general, have been afflicted with certain illnesses caused by surfing/swimming in polluted waters, I strongly urge and support you to please take advantage of this opportunity to adopt public policy that will help the health of thousands of beachgoers, the quality of nearshore coastal waters, the beauty of miles of County beaches and the economic benefit of the coastal economy of Southern California.

Thank you for your consideration.

Sincerely,

Dear Mr. Keston,

I am writing regarding the vote that will be taken next Friday, July 15, on the storm drain issue. I urge you to pass strong storm water pollution prevention regulations when you vote.

As I am sure you are aware, recent studies have verified the dangers present in the Santa Monica Bay due to pollution from the storm drains emptying into the Bay. The studies confirm that bacteria and trash reaching the ocean through storm drains are threatening ocean life as well as creating a health risk to humans. I have children who swim in the Santa Monica Bay and are at risk due to these conditions. I have an additional concern regarding the economy of this area. Even with the recent renovations of the Santa Monica Pier and surrounding areas, beach users and tourists may choose to go elsewhere if they know the waters are unsafe here.

Realizing this is a complex issue, I hope you will be able to resist the pressure to weaken regulations when you vote on July 15.

Thank you for your consideration.

Mr. John Slezak
California Regional Water Quality Control Board

Dear Mr. Slezak:

I grew up in Bayonne, New Jersey, a town located on a peninsula of land jutting into New York Harbor. Our town was surrounded on three sides by unswimmable water polluted by chemical wastes from dye factories, raw sewerage and runoff from hundreds of storm drains. I can remember my parents telling me, a young child, that I would become ill if I swam in the waters of the bay. I decided that I when an adult would leave my home town and move to an area where the land would offer me something. Fifteen years ago I moved to Hermosa Beach, married and now have two children. Our oldest child, aged 10 is on a swim team getting strong so she can participate in the Beachsports program. Our youngest child, aged five will be studying marine life in the Manhattan Beach Roundhouse program so she too can enjoy the benefits of living at the beach -- something I, as a child, was not able to do.

I understand that fixing the pollution caused by the runoff from the storm drains will cost money, but the rewards that the families of Los Angeles get from a clean bay are priceless, not just the families who live in the South Bay but all the people of southern California.

Please help us clean up the mess we have caused by adopting the storm water permit. I would like our children to be able to enjoy the greatest natural resource of Los Angeles with getting sick.

Sincerely,

Dear Mr. Keston:

I strongly urge you to support a comprehensive pollution prevention program for storm water run-off in the Los Angeles River watershed. Please issue a permit calling for the 88 cities within Los Angeles County to adopt practices that would reduce non-point source pollution.

California's beaches are out greatest asset. People come from all over the world to visit them. Unfortunately, out beaches are considered the dirties in the world. It is appalling to me that cities are allowed to use the ocean as a dump for their toxic waste. I do not even enjoy swimming and surfing in them anymore because they are so dirty. I also appear to get sick alot when I spend time in the water.

I am aware that it would be impossible to completely eliminate all non-point source runoff. However, we need to start somewhere by reducing the volume and toxicity of material being flushed in the ocean.

I am interested in hearing your views on this matter. Please let me know of any developments.

Very truly yours,

Michael Barnes

REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

Dear Mr. Keston:

I am writing to urge you and other member of the Regional Water Quality Control Board to pass strong new storm water pollution prevention regulation when it votes.

These regulations are needed to keep our beaches and water safe today and in the future. Dirty oceans cause illness today and kill species. The damage of all this is forever.

Please vote to protect our waters for today and the future. Thank you for your consideration.

Sincerely,

Clara Beard

Re: Re: Support of Comprehensive Pollution Prevention For Storm Water Runoff

Dear Mr. Keston:

I wholeheartedly endorse any measure to control urban runoff. Please give your support on July 15, to any legislation that can improve our coastal waters by decreasing the amount of urban runoff.

I have spent many years in and around the ocean. As a surfer I have experienced the effects of contaminated water; each season sewage-spills close beaches up and down the coast. I personally have suffered many upper respiratory infections due to surfing unknowingly in contaminated water. Sometimes you hear of beach closures after the fact,and you wait in fear of picking up a respiratory or a gastrointestinal infection. I believe beaches are monitored for coliform counts only. What about all of the toxins carried from urban areas to our beaches via the storm drains? I feel that thousands of beachgoers expose themselves to dangerous contaminants without realizing it.

California is blessed with beauty in land and sea. Let us come to understand how our urban pollution policies can help us create healthy beaches that Californians -and tourists alike- will trust and enjoy. It makes economic sense to solve this problem because so much of our tax revenue comes from tourism. Thank you for your support . Please feel free to contact me if I can be of any help.

Sincerely,

James L. Johnson, M.D.

Mr. Michael Keston
Chair
California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA. 91754-2156

Dear Chairman Keston and Members of the Board,

As a Los Angeles area resident, I have a vested interest in improving the quality of our local coastline. Our beaches are a precious natural resource, and we must take smart, reasonable and cost-effective measures to protect them.

After reading the *Los Angeles Times* article (5/7/96, page 1) citing that beach-goers are becoming sick from storm drain polluted waters in the Santa Monica Bay, I am moved to write to you, requesting that the Board adopt the proposed storm water permit immediately. The permit is clearly the most effective means to address the pending problem, and there is obviously a strong scientific basis to support such measures.

In an era when government is so often criticized for not taking action, please take advantage of this opportunity to adopt public policy that makes both good economic sense and good environmental sense.

Thank for your serious consideration of this matter.

Scott Davison

Dear Mr. Keston,

Please vote on July 15th to pass strong new storm water pollution regulations.

I urge you and other members of the Regional Water Quality Board when considering your vote to heed the results of the recent Santa Monica Bay Restoration Project/USC study which found that people who swim in areas where storm drains empty into the Bay are 50% more likely to get sick! All Southern California beaches MUST be safe for swimming! Urban runoff poses serious Environmental & boating safety hazards.

The health of our Community is in your hands - please vote to pass strong pollution prevention regulations!

Memorandum of Understanding
To Coordinate Industrial/Business Storm Water Pollution Control Activities
Conducted by the Alameda County Urban Runoff Clean Water Program and the
California Regional Water Quality Control Board
San Francisco Bay Region

I. BACKGROUND AND PURPOSE

This memorandum of understanding (MOU) is entered into between the Alameda County Urban Runoff Clean Water Program (ACURCWP) and the San Francisco Bay Regional Water Quality Control Board (Regional Board) staff to define their mutual roles and responsibilities in implementing industrial/business storm water pollution control activities. There are parallel and overlapping responsibilities placed on both agencies in regulating storm water discharges from business and industry. This MOU addresses the need to describe the working relationship between the ACURCWP's and Regional Board staff's programs for the mutual benefit of the two programs and for the benefit of the industrial/business facilities being regulated.

The benefits to the ACURCWP member agencies and to the Regional Board staff include sharing information, coordinating the implementation of the industrial/business storm water program so that the limited resources available to both groups are used effectively, and communicating a clear and consistent message to industry/business about what the expectations and requirements are of both programs.

The following describes the basis for the Regional Board's involvement in regulating the discharge of pollutants in storm water from industrial/business facilities.

1. EPA's storm water regulations define storm water associated with industrial activity to include storm water from specific categories of industrial facilities which are required to obtain industrial storm water NPDES permit coverage.

2. The Regional Water Quality Control Boards and the State Water Resources Control Board (SWRCB) of the State of California are authorized by EPA to issue general or individual NPDES permits to regulate industrial storm water discharges as well as other types of discharges.

3. The California State Water Resources Control Board (SWRCB) adopted a General Industrial Storm Water NPDES permit on November 19, 1991 which provides a mechanism for industries subject to the EPA regulations to obtain NPDES permit coverage and as part of the NPDES permit these facilities are required to do the following:

    - Eliminate non-storm water discharges (including illicit connections) to storm water systems;

    - Develop and implement a storm water pollution prevention

VOL 22

plan; and

- Perform monitoring of discharges to storm water systems.

4. The Regional Board already regulates certain categories of industry and business such as Publicly Owned Treatment Works (POTWs), municipal landfills, federal and state facilities (such as the Lawrence Livermore National Laboratory and U.C. and state university campuses), and certain NPDES permitted facilities which would be wasteful for the ACURCWP to try to duplicate, and which in some cases it may be pre-empted from regulating by state and federal regulations.

5. The Regional Board staff is responsible for implementation of the NPDES program and cannot delegate that authority to local agencies, but it can define its working relationships with other groups and agencies with similar programs.

The following describes the basis for the ACURCWP's involvement in regulating the discharge of pollutants from industrial/business facilities.

1. The Clean Water Act and EPA's storm water regulations require that municipalities obtain NPDES permit coverage to effectively prohibit illicit discharges to their storm drain system and to regulate the discharge of pollutants in storm water from all sources including commercial, retail, and industrial facilities to the maximum extent practicable.

2. The ACURCWP was formed in 1991 by the fourteen cities in Alameda County, Alameda County, the Alameda County Flood Control and Water Conservation District (District) and Zone 7 of the District to obtain a municipal storm water NPDES permit and to implement a Storm Water Management Plan.

3. The Storm Water Management Plan for the ACURCWP describes pollutant control activities that will be performed to as part of the industrial discharger identification and runoff control program component to include in part the following:

   - Maintain and update an industrial/business database;
   - Develop annually a preliminary list of industries/businesses to be inspected;
   - Develop minimum qualifications, standards, and procedures for conducting industrial/business inspections;
   - Notify and survey industries/businesses about the ACURCWP's program, current BMPs being used, and the role of the Regional

0003

R0065239

VOL 22

Board;

- Develop inspection plans and implement an inspection program on a preliminary, partial basis in FY 1992-93 (July 1 - June 30) and fully in FY 1993-94;
- Develop BMP guidelines using available information and information developed as part of surveys and distribute these to the municipal agencies conducting inspections; and
- Develop and distribute educational material about target industrial/business groups to municipalities and to the target groups.

2. UNDERSTANDINGS REACHED

A. The Regional Board staff will be the lead regulatory contact in controlling the quality of storm water runoff from POTWs, municipal landfills, existing individual NPDES-permitted facilities, state and federal facilities and from any other industrial discharges which it so chooses. For purposes of this agreement the lead regulatory contact means the public agency which will have the primary role in inspecting, communicating, and enforcing storm water pollution prevention requirements as described either in the Storm Water Management Plan for ACURCWP member agencies or as described in available agreements, procedures, and guidance for the Regional Board staff.

B. The ACURCWP member agencies will be the lead regulatory contact for other business and industrial facilities which it has assigned a high priority for regulating as determined on an annual basis by each of the responsible ACURCWP member agencies and as reported to the Regional Board staff.

C. The Regional Board staff and the ACURCWP member agencies will share information when requested as follows:

1. The Regional Board staff will supply public information on Notifications of Intent that have been filed, storm water pollution prevention plans received, monitoring results submitted, inspections it has conducted, and any other public information it has that the ACURCWP member agencies request for the specific purpose of implementing its storm water program.

2. The ACURCWP member agencies will supply public information on industrial storm water NPDES permitted facilities it is acting as the lead regulatory contact for which is requested by the Regional Board staff for the specific purpose of implementing its storm water program.

0004

R0065240

VOL 22

D. During ACURCWP member agencies' current municipal NPDES permit period (until October 16, 1996), the Regional Board staff and the ACURCWP member agencies will focus their resources on requiring that industries and businesses implement Best Management Practices (BMPs) to reduce pollutants to the maximum extent practicable and on effectively eliminating illicit discharges. The BMPs which will be implemented will include those developed by the Stormwater Quality Task Force in the BMP Handbook and other lists of BMPs proposed by industry, proposed by either the Regional Board staff or the ACURCWP member agencies which are acceptable to both parties.

E. The Regional Board staff and the ACURCWP member agencies agree to emphasize efforts to notify and educate the owners and operators of industries and businesses as the primary means of beginning to achieve reductions in pollutants in storm water runoff. Where information about the requirements of the storm water program has been provided and this has failed to result in the reduction of pollutant discharges or the activities being conducted require an immediate or more active response, the lead regulatory contact will take appropriate enforcement actions. The enforcement procedures contained in the ACURCWP's October 1991 (or as amended) "Minimum Procedures, Qualifications, and Standards for Conducting Industrial Inspections for the Alameda County Urban Runoff Clean Water Program" will be used by the ACURCWP member agencies and these procedures are acceptable to the Regional Board staff.

F. The Regional Board staff and the ACURCWP member agencies agree to coordinate enforcemant activities so as to maximize the use of existing resources and minimize the chance for regulatory overlap. To achieve this coordination the lead regulatory contact will conduct the enforcement activity. Nonetheless, either agency can request that the other take over the lead enforcement if more effective and expeditious enforcement is likely to result. These requests may be rejected by the agency being requested to take over the lead enforcement.

G. The Regional Board staff and the ACURCWP member agencies agree that this agreement will be effective when signed by representatives from the Regional Board and the ACURCWP. The agreement is expected to be amended and revised as the relationship between the Regional Board staff and the ACURCWP becomes better defined through actual experience implementing this new program.

H. The Regional Board staff agrees to explore the possibility of reimbursing ACURCWP member agencies under the following conditions:

1. The ACURCWP member agency has an industrial and business regulatory program acceptable to the Regional Board staff.

0005

R0065241

VOL 22

2. The activities being conducted by the ACURCWP member agency supplant industrial storm water NPDES permit activities which the Regional Board staff would otherwise have to conduct.

I. The ACURCWP member agencies agree to continue to assist industries to become informed about their responsibilities for obtaining industrial storm water NPDES permit coverage.

J. The ACURCWP member agencies agree to work with interested industrial storm water dischargers to coordinate pollutant monitoring of storm water runoff from their industrial facilities with the ACURCWP.

The Chairperson of the ACURCWP is authorized by the unanimous vote of all the representatives or alternates present at the June 23, 1992 Management Committee meeting to sign this MOU on their behalf.

Jack Lindley, Chairperson ACURCWP
Management Committee

Memorandum

To: Storm Water Permit Program Coordinators

Date: September 8, 1994

From: Thomas Mumley
California Regional Water Quality Control Board
San Francisco Bay Region
2101 Webster Street, Suite 500, Oakland, 94612

Subject: MUNICIPAL STORM WATER MANAGEMENT PLAN COMPONENTS

The attached draft Municipal Storm Water Management Plan Components is intended to provide a starting point for establishing a consistent framework for such plans for all municipal programs in the State. I have proposed the categorical program action areas based on experiences with existing programs and existing plans in the San Francisco Bay Region. As proposed, the categorical areas and sub-areas would be essential components of a Municipal Storm Water Management Plan. It would be the responsibility of a municipality to demonstrate that a specific area does not apply to their program or to propose equivalent alternatives with justification.

The categorical areas represent elements integral to the establishment of a storm water management program, as well as specific sources, specific areas of activities, or specific activities that need to managed. The actual management action, such as the type of control measures that would be implemented, or level of implementation of the control measure, would be determined mostly at the discretion of the municipal program. We should also recognize that at this time the appropriate action, in a specific area for a specific municipal program, may be to propose the steps that they will take to scope alternative control measures, prepare for implementation, implement on a reduced or pilot scale, and ultimately select and implement a control measure on a full scale. In such cases the plan would identify milestones and evaluation techniques that will be met and used in the process of progressing through the proposed steps.

Over time we would identify specific control measures that apply in each area and categorize the measure as mandatory, optional, or mandatory under specific conditions. (Mandatory would be interpreted to allow for implementation of equivalently effective alternative measures.) Over time we would also develop information of the effectiveness of specific control measures and develop performance standards for their design, operation, and maintenance. These performance standards would be developed through monitoring programs and serve as the building blocks for defining maximum extent practicable.

By establishing a consistent framework of action areas, we also provide a basis for coordination and collaboration of all municipal programs, and consistent reporting and evaluation standards.

VOL 22
0007
R0065243

MUNICIPAL STORM WATER MANAGEMENT PLAN COMPONENTS

The Municipal Storm Water Early Permit renewal process requires the submittal of a Storm Water Management Plan for the permitted area covering the entire five year period of the permit. A single plan is expected for each permit, with each of the permittees contributing to the plan. The plan should address all of the following components, including a discussion of how each of the components fit into a single unified program. Every element of the plan must contain compliance schedules with firm dates that will be met. The permittees should suggest schedules for submittals that are realistic for their particular fiscal year. The management plans should emphasize pollution prevention rather than relying solely on pollution control.

This document has been prepared by the staff of the State Water Resources Control Board and the Regional Water Control Boards, in an effort to assist permittees who hold municipal separate storm sewer permitsto comply with those permits. This document has not been adopted by either of the Boards. Its provisions, with the exception of the federal regulations, in italics, are not mandatory, and are provided solely as an aid to permittees.

122.26(d)(1)(i) General information. The applicants' name, address, telephone number of contact person, ownership status and status as a State or local government entity.

122.26(d)(1)(v) Management programs. (A) A description of the existing management programs to control pollutants from the municipal separate storm sewer system. The description shall provide information on existing structural and source controls, including operation and maintenance measures for structural controls, that are currently being implemented. Such controls may include, but are not limited to: Procedures to control pollution resulting from construction activities; floodplain management controls; wetland protection measures; best management practices for new subdivisions; and emergency spill response programs. The description may address controls established under State law as well as local requirements.

122.26(d)(2)(iv) Proposed management program. A proposed management program covers the duration of the permit. It shall include a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program shall also include a description of staff and equipment available to implement the program. Separate proposed programs may be submitted by each coapplicant. Proposed programs may impose controls on a systemwide basis, a watershed basis, a jurisdiction basis, or on individual outfalls. Proposed programs will be considered by the Director when developing permit conditions to reduce pollutants in discharges to the maximum extent practicable. Proposed management programs shall describe priorities for implementing controls.

I. PROGRAM MANAGEMENT - Area wide permits are permits that are issued to a group of municipal governments. The governments are given a single permit and pay a single fee. It is anticipated that although each governmental entity will have their own program, they will function as a unified entity in their permit responses. The area wide permits require cooperation by a number of government entities including cities, counties, agencies such as flood control districts or water districts, and state agencies such as CALTRANS. Each governmental entity will have, in addition, a variety of agencies that have responsibilities either directly, or indirectly for storm water related activities. The plan must include a discussion of who is involved in the program, how they will function together, what kind of interagency funding arrangements are made. For each permittee, the plan must also outline the funding and funding mechanism to be used, and the legal authority that will be used to enforce the program.

A. PROGRAM STRUCTURE - Each permit will require a structure for the participatory agencies to work together under a unified plan. While each permittee will have an individual program to address the particular needs of their city or agency, a framework must be developed to allow cooperation between them. In addition, cities will have common problems that will be more efficiently addressed as a whole rather than individually. For most area-wide permits, a city or county acts as the lead agency or coordinator for day to day business, setting meetings and preparing submittals. They assume no responsibility for any other city's program, and are not viewed as the responsible agency for the permit. Each area-wide permit will require a mechanism to make decisions for the permittees, develop program guidlines for each of the permit areas, assess the adequacy and consistency of each permittees submittals in each of the program areas, address the inadequate program areas with each of the permitteees, and prepare unified submittals for the Regional Boards. The mechanism can either be a single government entity such as a county, or it can be a Management Committee made up of representatives of the permittees.

1. Management Committee - An overall decision making body that is representative of all of the permittees.
   a. Describe the purpose of the committee, and how its responsibilities fit into the overall program framework.
   b. Describe the makeup of the committee, how the committee will communicate, and how it will coordinate its activities.

VOL 22

0008

c. Describe what the authority of the committee will be and its procedures for decision making.

2. Subcommittees - We expect that programs will have the need to establish focused subcommittees specific to program action areas. List the subcommittees to be formed (or that already exist), tell the focus of the group, the participants, the tasks to be accomplished, the products to come out of the group, and the time frame to be followed. These committees should develop guidelines for program implementation for each of the program areas and a methodology for determining the adequacy of each permittee's program. All of the permittees should participate on at least one of the committees.
   a. Roles/responsibilities - Develop methodology for compliance with the permit elements, and set levels of expected effort. Review the submittals of each permittee for adequacy according to the criteria established for each program element- submit the reviews as part of the annual report.

B. INSTITUTIONAL ARRANGEMENTS - Management of the storm water program will require the cooperation of all of the governmental entities named on the permit. No one agency within a city or county has the authority to assume the responsibility of all activities within the municipality. Consequently, the permit is issued to a city or county, and not to a specific agency within the municipality. (Although, certain agencies, such as flood control agencies, may be cited as a permittee.) It is expected that all of the organizations within each municipality who have programs that have an impact on storm water quality will be educated about the storm water program and actively participate in implementation of it. There must be formal arrangements whereby all municipalities can participate in the same permit program, share costs and work jointly. The agencies within a municipality must also be able to communicate with each other and work jointly.

122.26(d)(2)(i)(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;

122.26(d)(2)(vii) Where more than one legal entity submits an application, the application shall contain a description of the roles and responsibilities of each legal entity and procedures to ensure effective coordination.

1. Program Participant Arrangements - Describe the relationship and formal arrangements among all permittees.
   a. City-City-County - Identify all of the governmental authorities involved, and who the lead agency will be within each of those authorities for the storm water program. Identify the lead agency for coordination of the permit. The lead agency provides no more than coordination, they do not assume responsibility for the adequacy of any city's program. Identify the responsibilities of each agency, how decisions will be made, and what communication protocols will be used. Identify what method will be used to develop a responsible management committee, or similar mechanism, and vest it with decision making powers.
   b. Format - What institutional arrangements have been used to formalize the agreement between the government entities, what arrangements have been made to allow cost sharing.
      i. Joint Powers Authority
      ii. Memorandum of Agreement/Understanding
2. Area-wide Interagency - Describe the function of each agency as it relates to the storm water program. Tell how each agency will be made aware of their responsibilities under the storm water program, and what they will do to comply with the regulations. Describe any responsibility or activity that impacts or overlaps the storm water program. Describe each activity/responsibility, how it impacts or overlaps the storm water program, how the agency will coordinate their activity with the storm water program, and how pertinent information will be exchanged. Describe the formal institutional arrangements or mechanisms that will be used to oversee or coordinate with each agency.
   a. County Hazmat - Waste regulations, Household hazardous waste program, Industrial Inspections
   b. County Health - Inspections of Restaurants and other food handling establishments.
   c. Flood Control - Operation and maintenance of the storm system
   d. Local Transportation/Congestion Management
   e. County (Regional) Parks
   f. Mosquito Abatement
   g. Fruit Fly Abatement
   h. Water Districts
   i. County Agricultural Agencies

VOL 22

0009

R0065245

j. Others

3. City-specific Interagency Arrangements - This should reflect the structure in each city.
   a. Public works
      i. Engineering
      ii. Operations & Maintenance
      iii. Streets/roads - by law, these are part of the storm water conveyance system
      iv. Others
   b. Planning - New Construction and Redevelopment, coordination with CEQA and local permitting. Retrofit of existing structures.
   c. Parks and Recreation
   d. POTWs
   e. Others

C. FISCAL RESOURCES - Every permittee must have a mechanism for funding their storm water program. The plan should show what the funding is, the source of the funding, and how it will be distributed. The regulations require a budget for every year of the five year permit period. While it may not be possible for a city to commit to a set budget for future years, it is possible to make estimates about the cost of the program that is proposed. This should include an estimate of the cost of each of the elements, the personnel or contracts that will be required to implement the program, the anticipated funding source, and process and time schedule for establishing detailed annual budgets. Include a detailed budget for the first year.

122.26(d)(1)(vi) Fiscal resources. (A) A description of the financial resources currently available to the municipality to complete part 2 of the permit application. A description of the municipality's budget for existing storm water programs, including an overview of the municipality's financial resources and budget, including overall indebtedness and assets, and sources of funds for storm water programs.

122.26(d)(2)(vi) Fiscal analysis. For each fiscal year to be covered by the permit, a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the programs under paragraphs (d)(2) (iii) and (iv) of this section. Such analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds.

1. Area-wide
   a. Funding source(s)
   b. Staff resources
   c. Contract services
   d. Cost share (funds associated with existing activities/related programs) - if management practices currently in place under another program are to be included as part of the storm water program, the costs associated with those practices should be included as part of the budget. The program should also have a demonstrable water quality perspective.
2. City-specific
   a. Funding source(s)
   b. Staff resources
   c. Contract services
   d. Cost share (funds associated with existing activities/related programs) - if management practices currently in place under another program are to be included as part of the storm water program, the costs associated with those practices should be included as part of the budget. The program should also have a demonstrable water quality perspective.

D. LEGAL AUTHORITY - The regulations require permittees to demonstrate adequate legal authority to carry out the storm water program, including controls on industry and construction. You must cite your legal authority, or where it does not yet exist, give a plan and timetable for developing it.

122.26(d)(1)(vii) Legal authority. A description of existing legal authority to control discharges to the municipal separate storm sewer system. When existing legal authority is not sufficient to meet the criteria provided in paragraph (d)(2)(vi) of this section, the description shall list additional authorities as will be necessary to meet the criteria and shall include a schedule and commitment to seek such additional authority that will be needed to meet the criteria.

122.26(d)(2)(vi) Adequate legal authority. A demonstration that the applicant can operate pursuant to legal authority

VOL 22

0010

R0065246

established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:
(A) Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity;
(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;
(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;
(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;
(E) Require compliance with conditions in ordinances, permits, contracts or orders; and
(F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

1. List of essential authorities - Describe how the authority already existing in your municipality fills the requirements in the regulations. The ordinances must be adequate and they must be enforced.
2. Ordinance
   a. Exists
   b. Planned
3. Implementation procedures
4. Responsible parties

II. ILLICIT DISCHARGES - The regulations require every permittee to have a plan for finding and preventing illegal discharges, and a mechanism for enforcing against illegal dischargers.

122.26(d)(1)(iii) Source identification. (A) A description of the historic use of ordinances, guidance or other controls which limited the discharge of non-storm water discharges to any Publicly Owned Treatment Works serving the same area as the municipal separate storm sewer system.

122.26(d)(2)(v)(B) A description of the existing program to identify illicit connections to the municipal storm sewer system. The description should include inspection procedures and methods for detecting and preventing illicit discharges, and describe areas where this program has been implemented.

122.26(d)(1)(iv)(D) Field screening. Results of a field screening analysis for illicit connections and illegal dumping for either selected field screening points or major outfalls covered in the permit application.

122.26(d)(2)(iv)(B) A description of a program, including a schedule to detect and remove (or require the discharger ... to obtain a ... NPDES permit for) illicit discharges and improper disposal into the storm sewer.

A. ILLICIT CONNECTIONS - The storm drain system should have been surveyed during the first permit period to ensure that all of the connections made to the system are both legal and appropriate. If the system has not yet been surveyed the plan should contain a proposed plan for doing it. The plan should contain a proposal for how the system will be surveyed, who will do the survey and a time table for completion. It should also specify what will be done with the illicit connections that are found. In addition, there should be a plan for ongoing system inspections.
   1. System survey
   2. Ongoing system inspections - The extent of this program would vary widely based on the needs of an individual city.
   3. Reporting

B. ILLEGAL DUMPING - It is important to stop illegal dumping. Unfortunately, it is difficult to detect, because it is usually done both irregularly and covertly. The best method for stopping illegal dumping is educating the public, both to raise the awareness of what is illegal dumping so that people are not doing it, and to encourage the public to contact the authorities if they witness illegal dumping. All city inspectors and police and fire personnel should be trained to recognize and respond to illegal dumping. There should be a clear response mechanism, such as a hotline that anyone can use to report incidence of illegal dumping. In addition there should be ongoing system surveillance. If illegal dumping or spills are reported and responded to, there should be some follow up mechanism.
   1. Outreach

VOL 22

0011

R0065247

2. System surveillance
3. Spill response - When a spill is identified, it must be cleaned up. The city must have the legal authority to act against the discharger, and the ability to handle the clean up or require the discharger to clean it up. The Regional Water Board and other State agencies can be brought in if a spill occurs that is beyond the ability of the city to the clean up.
4. Complaint response - When a complaint is made, it must be responded to. The city must have the legal authority to act against the discharger, and the ability to handle the clean up or require the discharger to clean it up. The Regional Water Board and other State agencies can be brought in if a spill occurs that is beyond the ability of the city to the clean up.
5. Coordination of alternative disposal - Household hazardous waste recycling programs are mandated for many of the items that are routinely illegally dumped, such as used oil. Describe these programs and any other alternative disposal programs that are available.
6. Reporting - Incidents of illegal dumping and spills should be reported to the Regional Board on a regular basis in writing. All complaint response should be tracked in writing and submitted to the Regional Board.

C. ENFORCEMENT PROCEDURES - Cite your local legal authority and describe your mechanism for enforcing against dischargers who are illegally dumping or who have illicit connections.

D. COORDINATION WITH STATE NON-STORM WATER PERMITS - All other state laws and programs that overlap with or are in conflict with the storm water program must be addressed. Non-storm water discharges are prohibited unless authorized by NPDES permit. Even if the Regional Board issues a permit for a discharge, the city can refuse to accept the discharge into their system. The regulations exclude certain non-storm water discharges from the prohibition unless a municipality identifies them as sources of pollutants. Permittees must identify the discharges they will allow, and the management measures that they will require on these discharges. However, all discharges that are prohibited by a Regional Board must also be prohibited by a municipality. A municipality cannot be less stringent than the state.
1. Identification of permissible/permitable discharges
2. Appropriate management practices
3. Reporting

III. INDUSTRIAL/COMMERCIAL SOURCES - Municipalities are responsible for all discharges from commercial facilities as well as industries and construction sites within their jurisdiction regardless of coverage under the statewide general permits. This includes facilities required to be permitted under the State Industrial Storm Water Program and industries and commercial facilities that are not required to be permitted. Pollution prevention should be emphasized. The Regional Water Board will enforce the General Permits and municipalities are expected to enforce their local ordinances.

122.26(d)(2)(ii) Source identification. The location of any major outfall that discharges to waters of the United States that was not reported under paragraph (d)(1)(iii)(B)(1) of this section. Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity;

122.26(d)(2)(iv)(A) A description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls.

122.26(d)(2)(C) A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program shall:
(1) Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges;
(2) Describe a monitoring program for storm water discharges associated with the industrial facilities identified in paragraph (d)(2)(iv)(C) of this section, to be implemented during the term of the permit, including the submission of quantitative data on the following constituents: any pollutants limited in effluent guidelines subcategories, where applicable; any pollutant listed in an existing NPDES permit for a facility; oil and grease, COD, pH, BOD5, TSS, total phosphorus, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen, and any information on discharges required under 40 CFR 122.21(g)(7) (iii) and (iv).

VOL 22

0012

R0065248

A. IDENTIFICATION OF SOURCES - Indicate what sources were identified during the first permit period. Tell what measures will be taken to identify other sources, what agency will do the source identification, what methods of source identification will be used, and the time table for completing this investigation. This source identification should allow cities to prioritize industrial and commercial sources and to determine the schedule for inspection. At the minimum all potential sources should be inspected at least once during the permit period. Some facilities will require more frequent inspections.
   1. Categorical list
   2. Ranking
   3. Update procedure

B. CONTROL MEASURES (identification) - For each pollutant source, either by industrial or commercial category or specific activity, determine what measures are applicable for control of the source; which, of these measures, are technically and financially feasible, and which measures will be used. Indicate who will implement the measures, how they will be implemented and the time table for implementation. The plan should include a tiered approach. Describe what measures either have been implemented already, or can be immediately implemented, other measures that can be implemented over the short term and measures that are more costly or difficult that can be used if necessary in the long term. Describe any studies or pilot projects that are contemplated to study these measures.
   1. Pollution prevention measures - Education on source minimization and pollution prevention is an important control measure.
      a. Site design options
      b. Housekeeping/maintenance practices
   2. Structural (treatment) measures
      a. Applicability
      b. Effectiveness
      c. Retrofit opportunities

C. OUTREACH - Indicate the purpose of the outreach, the target audience, the intended messages, who will be responsible for the outreach, how the outreach will be done, and the time table for implementation.
   1. General guidance - All potential industrial and commercial dischargers should be informed of their obligations under the storm water program. Dischargers should also be informed of ways of complying with the storm water program, including general outreach on pollution prevention measures.
   2. Industrial category guidance - Specific outreach should be developed for industrial or commercial categories that permittee identify as high priority industries.
   3. Industrial activity guidance - Specific outreach should be developed for high priority activities such as loading docks or vehicle washing and maintenance.

D. INSPECTIONS - Most municipalities already have programs in which they inspect businesses, these include HAZMAT, Health and Pretreatment Programs among others. Inspections for the storm water program can either be incorporated into these other inspection programs, or they can be done as a stand alone program with separate inspectors. Indicate the purpose of the inspections, the priority for inspections, how the facilities were chosen for inspection, what the inspection will consist of, how the inspection will be carried out, who will be responsible for the inspections, how the inspectors will be trained, when the inspection program will be implemented and a schedule for completion of the inspections. Indicate also how the results will be reported and to whom. If an immediate problem is found how will it be handled? To whom will it be reported? How will follow up to these inspections be handled? Will there be a mechanism for a revisit inspection?
   1. Checklist
   2. Schedule
   3. Reports
   4. Follow-up procedures

E. LOCAL PERMITS / INCENTIVE PROGRAM - While not required by the Regulations, a municipality should consider controlling industrial and commercial sources through the use of local storm water permits, or clean business incentive programs.

F. TRAINING - Implementation of an industrial storm water program will require an informed and aware staff. All

VOL 22

0013

R0065249

public employees should be trained in the storm water regulations, both so that they abide by the regulations in the course of their work day and so that they can tell if an activity that they witness is legal. In addition inspectors who visit commercial or industrial facilities, or who go to construction sites can determine compliance with the storm water regulations and educate the facilities about the requirements of the program.

1. Public employees
2. Inspectors

G. COORDINATION WITH STATE INDUSTRIAL STORM WATER PERMIT - It is anticipated that the municipalities will have regulations through ordinance or other legal mechanisms that would be written such that compliance with a municipality's regulations would cause an industrial discharger to be in compliance with the State General Permit. It is anticipated that coordination between the Regional Boards and the municipalities will be required. As such, the municipalities should discuss the anticipated relationship or agreement they would have with the Regional Board, and the mechanism they will pursue to enact such an agreement or relationship.

1. Memorandum of Understanding - An MOU can be used to formalize the agreement between municipalities and the Regional Board on the industrial compliance program.
2. Reports
3. Other issues

IV. NEW DEVELOPMENT AND RE-DEVELOPMENT - Each permittee must have a plan for managing storm water runoff from new construction and re-development. The plan must cover both construction covered by the State Construction Storm Water General Permit and construction under five acres. The plan should emphasize pollution prevention, especially erosion prevention.

122.26(d)(2)(iv)(A)(2) A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed.

122.26(d)(2)(iv)(D) A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system, which shall include:
(1) A description of procedures for site planning which incorporate consideration of potential water quality impacts;
(2) A description of requirements for nonstructural and structural best management practices;
(3) A description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality; and
(4) A description of appropriate educational and training measures for construction site operators.

A. PLANNING PROCESS - The planning process for new development and re-development must address a comprehensive plan to develop, implement and enforce controls to reduce the discharge of pollutants from areas of new development and significant redevelopment. Master planning and other studies regarding flood management must assess the impact on water quality.

1. Watershed protection policies
2. Coordination with CEQA
3. Site planning practices
4. General Plan changes
5. Use of master plans
6. Other policies
7. Planning - public works interface
8. Implementation procedures

B. CONSTRUCTION SITES - Construction site management must consider the requirements of the State Construction Storm Water General Permit. Erosion prevention using vegetation, soil stabilization and timing of grading should be emphasized.

1. Erosion control requirements
2. Chemical and waste management requirements
3. Inspections
   a. Checklist
   b. Schedule
   c. Reports

VOL 22

0014

R0065250

d. Follow-up procedures

C. LOCAL PERMITS - Optional
1. Coordination with existing permits
2. New permit issues

D. TRAINING
1. Planning personnel
2. Public Works personnel
3. Inspectors

E. CONTROL MEASURES - Permanent measures to be installed during construction to control runoff from the final development or redevelopment.
1. Pollution prevention measures
   a. Site design - inlet design to allow easy and frequent cleaning.
   b. Education/training
   c. Other
2. Post construction (treatment) measures - grassy swales, extended detention basins, sand filters, constructed wetlands, oil/water separators.
   a. Applicability
   b. Effectiveness
   c. Retrofit opportunities
3. Operation and maintenance - It must be clear who is responsible for the long term maintenance, and who will pay for it.
   a. Requirements
   b. Responsible party
4. Conflicts with other mandates - Regulations from other agencies can conflict with recommended practices in the storm water program. An example of this is the storage of materials. While the storm water program recommends covering materials, fire codes will not allow some materials to be covered. In another area, the minimization of impervious areas and design of landscaping to allow flow to the vegetated areas are recommended practices in storm water. Often local building ordinances dictate the amount of impervious areas and the configuration of the landscaping. These conflicts should be identified and an attempt made to resolve them.
   a. Identification of conflicts
      i. Landscaping
      ii. Pavement/curbs
   b. Conflict resolution

F. OUTREACH
1. Developers
2. Contractors
3. Other parties

G. ENFORCEMENT - Municipalities must enforce their ordinances, including their grading ordinances.

H. COORDINATION WITH STATE CONSTRUCTION STORM WATER PERMIT - It is anticipated that the municipalities will have regulations through ordinance or other legal mechanisms that would be written such that compliance with a municipality's regulations would cause a construction project to be in compliance with the State General Construction Permit. Coordination between the Regional Boards and the municipalities will be necessary. As such, the municipalities should discuss the anticipated relationship or agreement they would have with the Regional Board, and the mechanism they will pursue to enact such an agreement or relationship.

1. Memorandum of Understanding - An MOU can be used to formalize the agreement between municipalities and the Regional Board on the construction compliance program.
2. Reports

VOL 22 0015

R0065251

3. Other issues

V. PUBLIC AGENCY ACTIVITIES - All municipalities perform functions that have an impact on storm water quality. These include among other things, vehicle maintenance, landscape maintenance and weed control, water body maintenance including swimming pool maintenance, construction and maintenance of streets and roads, and construction and maintenance of the flood control system. Since municipalities must address all significant sources of pollutants, all of these activities must be examined and if appropriate, controlled.

122.26(d)(2)(v) Management programs. (A) A description of the existing management programs to control pollutants from the municipal separate storm sewer system. The description shall provide information on existing structural and source controls, including operation and maintenance measures for structural controls, that are currently being implemented. Such controls may include, but are not limited to: Procedures to control pollution resulting from construction activities; floodplain management controls; wetland protection measures, best management practices for new subdivisions; and emergency spill response programs. The description may address controls established under State law as well as local requirements.

122.26(d)(2)(iv)(A)(1) A description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers;

122.26(d)(2)(iv)(A)(3) A description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities;

122.26(d)(2)(iv)(A)(4) A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible;

122.26(d)(2)(iv)(A)(5) A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage, or disposal facilities for municipal waste, which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges;

122.26(d)(2)(iv)(A)(6) A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides, and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.

A. SEWAGE SYSTEMS - Sewage spills must not be allowed to go into the storm drain. Sewage must be contained and vacuum pumped. Storm drains must be protected during a sewage spill.

B. CORPORATION YARDS - Corporation yards include any area or facility that is used for vehicle maintenance or washing, other maintenance, chemical storage or use, such as a paint facility, and waste management. Identify all corporation yards and give their locations and describe their functions.

1. Storm Water Pollution Prevention Plans - SWPPP are not required, however, municipalities are required to control any potential source of pollution, and SWPPP are a good vehicle for compliance. Identify what the potential storm water problems are, who is responsible for implementing the storm water measures, what management practices will be used, and how they will be implemented. For measures that are not already in place give a timetable for implementation. Tell how the effectiveness of the BMPs will be judged. If a municipality chooses not to use SWPPP, they must use an equivalent method to handle their corporation yard discharges.

C. PARKS AND RECREATION - Park Departments manage landscaping and swimming pools. Both of these activities involve the use of chemicals, waste management, and non-storm water discharges. Their use of chemicals must be addressed in the storm water management plan. In addition maintenance of swimming pools requires the periodic discharge of large quantities of swimming pool water.

1. Fertilizers/Pesticides
   a. Use / Application management
   b. Storage
2. Facility Management
   a. Wash waters
   b. Maintenance
   c. Swimming pool waters

VOL 22

0016

R0065252

D. STORM DRAIN SYSTEM OPERATION AND MANAGEMENT - The maintenance and operation of the storm drain system has an impact on storm water quality and must be addressed in the management plan. Material clogging storm drains can not be discharged into drains. It must be removed and disposed of properly.
   1. Inlet maintenance
   2. Drain maintenance
   3. Waste management
   4. New system designs
   5. Retro-fit opportunities

E. STREETS AND ROADS - Construction, operation, and maintenance of roads has an impact on storm water quality and must be addressed in the management plan..
   1. Sweeping - Street sweeping waste cannot be dumped in storm drain.
      a. Storm water quality based operation
      b. Waste management
   2. Street/pavement washing - Wash waters must be managed as non-storm water discharges.
   3. Maintenance
      a. Saw-cut slurry management
      b. Paving practices
      c. Waste management
      d. Medians/Landscaped Right of Way
         i. Irrigation
         ii. Fertilizer/pesticides

F. FLOOD CONTROL - Flood control practices have an impact on storm water quality and must be addressed in the management plan. Flood control managers must be educated about storm water quality requirements. Water quality must be a consideration in moving the water through the system.
   1. Coordination with new projects
   2. Coordination of maintenance activities
      a. Desilting/sediment removal
      b. Vegetation management
      c. Waste management
   3. Operation of facilities
      a. Detention basins - BMPs must be implemented when draining or pumping detention basins. Risers should not be directed into storm drain inlets.
      b. Other
   4. Retrofit opportunities

G. PUBLIC FACILITIES - Storm water runoff and non-storm water discharges from other public facilities must be addressed. Chemical use by these facilities should also be included. Address pressure blasting/cleaning sidewalks and concrete.
   1. Parking facilities
   2. Golf courses
   3. Schools
   4. Hospitals
   5. Parks / Landscapes
   6. Other buildings/plazas/etc.

H. PONDS, FOUNTAINS, AND OTHER PUBLIC WATER BODIES - Maintenance practices used on public water bodies, including waste management and non-storm water discharges, must be addressed in the plan.
   1. Algae control
      a. Use of chemicals
   2. Chlorine management
   3. Maintenance

VI. RESIDENTIAL (Not Elsewhere Covered) - Residential activities including private vehicle washing and maintenance; use of chemicals such as pesticides, herbicides and paints; private swimming pool maintenance; and other household

VOL 22

0017

R0065253

and landscape maintenance can contribute to storm water pollution. Identify measures that can be taken to improve the quality of the runoff from residential area. Emphasize pollution prevention and the identification and use of safe substitutes.

VII. PUBLIC INFORMATION AND PARTICIPATION - It is necessary to involve the public in the storm water program in order to have an effective municipal program. The outreach program should be focused on the specific needs of individual cities. Tell how the public education needs were determined, who is responsible for developing and implementing the education program, what program and what materials will be developed, give a timetable for implementing the program, and the method to be used to determine its effectiveness.

122.26(d)(2)(iv) Proposed management program. A proposed management program covers the duration of the permit. It shall include a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate.

122.26(d)(2)(iv)(B)(5) A description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers;

122.26(d)(2)(iv)(B)(6) A description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials; and

A. GENERAL OUTREACH - Describe your outreach materials developed for the general public. Tell what the focus of the materials are, and how you arrived at that focus. Tell what materials have already been developed and how they are distributed. Tell what materials are still to be produced, what they address, who is producing them, how they will be distributed, what kind of follow up opportunities are provided, and the timetable for production and distribution.
   1. Written material
   2. Audio material
   3. Video material
   4. Distribution plan

B. FOCUSED OUTREACH - Describe your outreach materials developed for specific groups. Tell how these groups were identified and prioritized. Tell what the focus of the materials are, and how you arrived at that focus. Tell what materials have already been developed and how they are distributed. Tell what materials are still to be produced, what they address, who is producing them, how they will be distributed, what kind of follow up opportunities are provided, and the timetable for production and distribution.
   1. Pollutant specific
   2. Practice/activity specific
   3. Business specific

C. EDUCATION PROGRAMS
   1. Public employees - It is important to educate all of the public employees about the storm water program both so that they do not continue with practices that are counter productive and so that they can participate in its implementation and enforcement. Describe your public employee outreach programs. Tell what the focus of the training is, how it is implemented, who is implementing it, the schedule for training, and the opportunities for continuing education.
   2. K-12 - Describe programs developed for schools. These programs should include storm water awareness, illegal dumping awareness, source minimization and pollution prevention.
   3. Other

D. CITIZENS PARTICIPATION
   1. Volunteer monitoring
   2. Cooperative outreach
   3. Complaint procedures - Describe any mechanism available for citizen reports of illegal discharge illicit connections or potential pollution problems.

E. EFFECTIVENESS EVALUATION - Quantifying the effectiveness of education and outreach efforts may be

VOL 22 0018

R0065254

difficult. Municipalities must develop a process by which they can evaluate the effectiveness of their program, and recommend changes to it.

VIII. PROGRAM EVALUATION - The storm water program developed under this plan must be evaluated for its effectiveness on a regular basis. The plan for this evaluation must include a schedule for evaluation, a methodology for the evaluation, a discussion of who will carry out the evaluation, and what will be evaluated. In addition, there must be a mechanism to follow up on the information generated by the evaluation. The plan should be adjusted based on the program evaluation.

122.26(d)(2)(v) Assessment of controls. Estimated reductions in loadings of pollutants from discharges of municipal storm sewer constituents from municipal storm sewer systems expected as the result of the municipal storm water quality management program. The assessment shall also identify known impacts of storm water controls on ground water.

A. PERFORMANCE STANDARDS - The permittees, possibly through management-committee sub-committees, must develop standards to judge the effectiveness of their activities and control measures. As an example, for street sweeping, permittees must devise a way of determining if the street sweeping has an impact on water quality. This could include determining what kind of pollutants are removed by the sweeping, measuring the size of the pollutants and the amount removed. Methodologies should be developed for each, which if followed, will assure that each control measure or action is implemented to the maximum extent practicable. For street sweeping, this would include the frequency of sweeping, the method of sweeping, the equipment used, how the equipment is cleaned and maintained, and the method of disposal for the material collected. Contol measure studies can be coordinated on a larger scale, such as statewide, so that each municipality is studying a different procedure.
   1. Development procedure
   2. Role of subcommittees
   3. Activity/source/action area specific

B. ANNUAL REPORTS - Reports must be submitted after the end of each fiscal year. Permittees should propose a date for submittals that works for them. The reports should be more than a simple compilation of activities. Rather, they should be used to evaluate the program and the effectiveness of the management measures. Each annual report should contain a report on the program implemented during the previous year and a plan that will be implemented during the current year. In addition, the findings of the evaluation of the previous years program should be used to suggest changes that are appropriate for implementation during the next year. Any revisions to the five year plan should be addressed here.
   1. Format/Structure - Each group of permittees under an area wide permit should develop a format that all the permittees will use for the annual report.
   2. Effectiveness measures - The co-permittees are responsible for developing methods for determining the effectiveness of the BMPs that they implement, for their particular program, and developing a level of effort that will be required in each area.
   3. Content

C. SUB-ANNUAL REPORTS - Each year, before the end of the fiscal year, the permittees should submit a report that contains a draft preliminary report addressing the implementation of that years program, a preliminary budget for the next year program addressing the funding issues for the upcoming budget process, and a preliminary plan for the next year showing what revisions to the five year plan will be required. In some regions, rather than a sub-annual report, the permittees will meet with the Regional Board to discuss these issues.
   1. Purpose
   2. Format/Structure
   3. Content

D. INTERNAL REPORTING - We suggest the development of a process for interagency - intragency exchange information among themselves and to develop the annual and semiannual reports
   1. Standard forms
   2. Procedures
   3. Record keeping - The Regional Board does not need to see all of the extraneous information, but there should be a mechanism for storage of records in case they are needed.

VOL 22

0019

R0065255

E. STORM WATER MANAGEMENT PLAN REVISIONS - There should be a review process which will allow you to revise the plan for the next year and for the rest of the permit period.
   1. Process
   2. Reporting

IX. MONITORING - Monitoring serves several purposes. It allows a baseline characterization of storm water/urban runoff from the permitted area, it identifies the problems and their sources and evaluates impacts on receiving waters, it allows the permittee to determine what are appropriate, and it allows a permittee to judge the effectiveness of its control measures. Monitoring is not limited to water sampling. It can include such elements as visual inspections of above and underground systems or compilation of chemical use data.

Characterization of the permitted area, the watershed, the storm drain system, the receiving waters, and the land use was required in the previous permits. The information collected from previous efforts should be used in baseline characterization. This plan should also tell what the future monitoring objectives are, what information will be collected, the purpose of the information, how it will be collected and used, and how the information will be analyzed, reported and stored.

122.26(d)(1)(B) Existing quantitative data describing the volume and quality of discharges from the municipal storm sewer, including a description of the outfalls sampled, sampling procedures and analytical methods used.

122.26(d)(2)(F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

122.26(d)(2)(ii) Source identification. The location of any major outfall that discharges to waters of the United States that was not reported under paragraph (d)(1)(iii)(B)(1) of this section. Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity;

122.26(d)(1)(iii)(C) A list of water bodies that receive discharges from the municipal separate storm sewer system, including downstream segments, lakes and estuaries, where pollutants from the system discharges may accumulate and cause water degradation and a brief description of known water quality impacts

122.26(d)(2)(D) A proposed monitoring program for representative data collection for the term of the permit that describes the location of outfalls or field screening points to be sampled (or the location of instream stations), why the location is representative, the frequency of sampling, parameters to be sampled, and a description of sampling equipment.

122.26(d)(2)(B) Estimates of the annual pollutant load of the cumulative discharges to waters of the United States from all identified municipal outfalls and the event mean concentration of the cumulative discharges to waters of the United States from all identified municipal outfalls during a storm event (as described under Section 122.21(c)(7)) for BOD5, COD, TSS, dissolved solids, total nitrogen, total ammonia plus organic nitrogen, total phosphorus, dissolved phosphorus, cadmium, copper, lead, and zinc. Estimates shall be accompanied by a description of the procedures for estimating constituent loads and concentrations, including any modelling, data analysis, and calculation methods;

122.26(d)(2)(C) A proposed schedule to provide estimates for each major outfall identified in either paragraph (d)(2)(ii) or (d)(1)(iii)(B)(1) of this section of the seasonal pollutant load and of the event mean concentration of a representative storm for any constituent detected in any sample required under paragraph (d)(2)(iii)(A) of this section;

A. SYSTEM CHARACTERIZATION - The previous permit required a complete characterization of the entire system. This included the storm drain system, the receiving waters and the land use activities.
   1. Watershed - Characterize each watershed including the storm drain system, the land uses and the particular problems of the receiving waters.
   2. Storm drain system - Characterize the system including all major outfalls.
      a. Inlets
      b. Outlets
   3. Receiving waters - Identify and evaluate water bodies. Use existing water quality data along with current monitoring efforts to characterize and prioritize the receiving waters. Perform additional monitoring as necessary to characterize the receiving waters.
      a. Streams
      b. Lakes
      c. Bays
      d. Wetlands

VOL 22
0020
R0065256

e. Other habitat

4. Land use - Characterize the land use in the permitted area. Characterize the storm water discharges from specific land use categories and mixed land use.
   a. General categories
   b. Specific features/sources

B. SOURCE IDENTIFICATION - Do focused monitoring on pollutants of concern.
   1. Specific land-use
   2. Specific activities

C. CONTROL MEASURE EFFECTIVENESS - Monitor to determine the effectiveness of control measures. Identify what control measure studies will be done and how they will be prioritized. Give a schedule for doing the studies.
   1. Specific Sources (e.g., corp yards)
   2. Specific Activities (e.g., waste management)
   3. Special Studies

D. POLLUTANT LOADING - An initial determination of the pollutant loading, both system wide and specific to land use types should be made through monitoring and modeling. Once the initial determination is made, it is important to continue a minimal long term monitoring program to track trends in the pollutant loading over time.

   1. System-wide
   2. Land-use specific
   3. Long-term stations

E. COMPONENTS OF A MONITORING PROGRAM PLAN - These are the expected elements of a monitoring plan. The elements suggested here do not replace any directions from the regulating Regional Board.
   1. Monitoring/sampling points with map
      a. rationale for sampling points
   2. Dry weather sampling
      a. frequency
      b. monitored parameters
      c. method for documentation of outfall field inspections
   3. Storm sampling plan
      a. number of storm events to be samples
      b. method for determining representative event

MUNICIPAL STORM WATER MANAGEMENT PLAN COMPONENTS

The Municipal Storm Water Early Permit renewal process requires the submittal of a Storm Water Management Plan for the permitted area covering the entire five year period of the permit. A single plan is expected for each permit, with each of the permittees contributing to the plan. The plan should address all of the following components, including a discussion of how each of the components fit into a single unified program. Every element of the plan must contain compliance schedules with firm dates that will be met. The permittees should suggest schedules for submittals that are realistic for their particular fiscal year. The management plans should emphasize pollution prevention rather than relying solely on pollution control.

This document has been prepared by the staff of the State Water Resources Control Board and the Regional Water Control Boards, in an effort to assist permittees who hold municipal separate storm sewer permits to comply with those permits. This document has not been adopted by either the State Water Resources Control Board or the Regional Water Control Boards. Its provisions, with the exception of the federal regulations, in italics, are not mandatory, and are provided solely as an aid to permittees.

122.26(d)(1)(i) General information. The applicants' name, address, telephone number of contact person, ownership status and status as a State or local government entity.

122.26(d)(1)(v) Management programs. (A) A description of the existing management programs to control pollutants from the municipal separate storm sewer system. The description shall provide information on existing structural and source controls, including operation and maintenance measures for structural controls, that are currently being implemented. Such controls may include, but are not limited to: Procedures to control pollution resulting from construction activities; floodplain management controls; wetland protection measures; best management practices for new subdivisions; and emergency spill response programs. The description may address controls established under State law as well as local requirements.

122.26(d)(2)(iv) Proposed management program. A proposed management program covers the duration of the permit. It shall include a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program shall also include a description of staff and equipment available to implement the program. Separate proposed programs may be submitted by each coapplicant. Proposed programs may impose controls on a systemwide basis, a watershed basis, a jurisdiction basis, or on individual outfalls. Proposed programs will be considered by the Director when developing permit conditions to reduce pollutants in discharges to the maximum extent practicable. Proposed management programs shall describe priorities for implementing controls.

VOL 22

00023

I. PROGRAM MANAGEMENT - Area wide permits are permits that are issued to a group of municipal governments. The governments are given a single permit and pay a single fee. It is anticipated that although each governmental entity will have their own program, they will function as a unified entity in their permit responses. The area wide permits require cooperation by a number of government entities including cities, counties, agencies such as flood control districts or water districts, and state agencies such as CALTRANS. Each governmental entity will have, in addition, a variety of agencies that have responsibilities either directly, or indirectly for storm water related activities. The plan must include a discussion of who is involved in the program, how they will function together, what kind of interagency funding arrangements are made. For each permittee, the plan must also outline the funding and funding mechanism to be used, and the legal authority that will be used to enforce the program.

A. PROGRAM STRUCTURE - Each permit will require a structure for the participatory agencies to work together under a unified plan. While each permittee will have an individual program to address the particular needs of their city or agency, a framework must be developed to allow cooperation between them. In addition, cities will have common problems that will be more efficiently addressed as a whole rather than individually. For most area-wide permits, a city or county acts as the lead agency or coordinator for day to day business, setting meetings and preparing submittals. They assume no responsibility for any other city's program, and are not viewed as the responsible agency for the permit. Each area-wide permit will require a mechanism to make decisions for the permittees, develop program guidlines for each of the permit areas, assess the adequacy and consistency of each permittees submittals in each of the program areas, address the inadequate program areas with each of the permittees, and prepare unified submittals for the Regional Boards. The mechanism can either be a single government entity such as a county, or it can be a Management Committee made up of representatives of the permittees.

1. Management Committee - An overall decision making body that is representative of all of the permittees.
   a. Describe the purpose of the committee, and how its responsibilities fit into the overall program framework.
   b. Describe the makeup of the committee, how the committee will communicate, and how it will coordinate its activities.
   c. Describe what the authority of the committee will be and its procedures for decision making.
2. Subcommittees - We expect that programs will have the need to establish focused subcommittees specific to program action areas. List the subcommittees to be formed (or that already exist), tell the focus of the group, the participants, the tasks to be accomplished, the products to come out of the group, and the time frame to be followed. These committees should develop guidelines for program implementation for each of the program areas and a methodology for determining the adequacy of each permittee's program. All of the permittees should participate on at least one of the committees.
   a. Roles/responsibilities - Develop methodology for compliance with the permit elements, and set levels of expected effort. Review the submittals of each permittee for adequacy according to the criteria established for each program element- submit the reviews as part of the annual report.

B. INSTITUTIONAL ARRANGEMENTS - Management of the storm water program will

VOL 22 0024

R0065260

require the cooperation of all of the governmental entities named on the permit. No one agency within a city or county has the authority to assume the responsibility of all activities within the municipality. Consequently, the permit is issued to a city or county, and not to a specific agency within the municipality. (Although, certain agencies, such as flood control agencies, may be cited as a permittee.) It is expected that all of the organizations within each municipality who have programs that have an impact on storm water quality will be educated about the storm water program and actively participate in implementation of it. There must be formal arrangements whereby all municipalities can participate in the same permit program, share costs and work jointly. The agencies within a municipality must also be able to communicate with each other and work jointly.

122.26(d)(2)(i)(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system.

122.26(d)(2)(vii) Where more than one legal entity submits an application, the application shall contain a description of the roles and responsibilities of each legal entity and procedures to ensure effective coordination

1. Program Participant Arrangements - Describe the relationship and formal arrangements among all permittees.
   a. City-City-County - Identify all of the governmental authorities involved, and who the lead agency will be within each of those authorities for the storm water program. Identify the lead agency for coordination of the permit. The lead agency provides no more than coordination, they do not assume responsibility for the adequacy of any city's program. Identify the responsibilities of each agency, how decisions will be made, and what communication protocols will be used. Identify what method will be used to develop a responsible management committee, or similar mechanism, and vest it with decision making powers.
   b. Format - What institutional arrangements have been used to formalize the agreement between the government entities, what arrangements have been made to allow cost sharing.
      i. Joint Powers Authority
      ii. Memorandum of Agreement/Understanding
2. Area-wide Interagency - Describe the function of each agency as it relates to the storm water program. Tell how each agency will be made aware of their responsibilities under the storm water program, and what they will do to comply with the regulations. Describe any responsibility or activity that impacts or overlaps the storm water program. Describe each activity/responsibility, how it impacts or overlaps the storm water program, how the agency will coordinate their activity with the storm water program, and how pertinent information will be exchanged. Describe the formal institutional arrangements or mechanisms that will be used to oversee or coordinate with each agency.
   a. County Hazmat - Waste regulations, Household hazardous waste program, Industrial Inspections
   b. County Health - Inspections of Restaurants and other food handling establishments.
   c. Flood Control - Operation and maintenance of the storm system
   d. Local Transportation/Congestion Management
   e. County (Regional) Parks
   f. Mosquito Abatement
   g. Fruit Fly Abatement
   h. Water Districts

VOL 22

0025

R0065261

i. County Agricultural Agencies
j. Others

3. City-specific Interagency Arrangements - This should reflect the structure in each city.
   a. Public works
      i. Engineering
      ii. Operations & Maintenance
      iii. Streets/roads - by law, these are part of the storm water conveyance system
      iv. Others
   b. Planning - New Construction and Redevelopment, coordination with CEQA and local permitting. Retrofit of existing structures.
   c. Parks and Recreation
   d. POTWs
   e. Others

C. FISCAL RESOURCES - Every permittee must have a mechanism for funding their storm water program. The plan should show what the funding is, the source of the funding, and how it will be distributed. The regulations require a budget for every year of the five year permit period. While it may not be possible for a city to commit to a set budget for future years, it is possible to make estimates about the cost of the program that is proposed. This should include an estimate of the cost of each of the elements, the personnel or contracts that will be required to implement the program, the anticipated funding source, and process and time schedule for establishing detailed annual budgets. Include a detailed budget for the first year.

122.26(d)(1)(vi) Fiscal resources. (A) A description of the financial resources currently available to the municipality to complete part 2 of the permit application. A description of the municipality's budget for existing storm water programs, including an overview of the municipality's financial resources and budget, including overall indebtedness and assets, and sources of funds for storm water programs.

122.26(d)(2)(vi) Fiscal analysis. For each fiscal year to be covered by the permit, a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the programs under paragraphs (d)(2) (iii) and (iv) of this section. Such analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds.

1. Area-wide
   a. Funding source(s)
   b. Staff resources
   c. Contract services
   d. Cost share (funds associated with existing activities/related programs) - if management practices currently in place under another program are to be included as part of the storm water program, the costs associated with those practices should be included as part of the budget. The program should also have a demonstrable water quality perspective.
2. City-specific
   a. Funding source(s)
   b. Staff resources
   c. Contract services
   d. Cost share (funds associated with existing activities/related programs) - if management practices currently in place under another program are to be included as part of the storm water program, the costs associated with those practices should be included as

VOL 22

0026

R0065262

part of the budget. The program should also have a demonstrable water quality perspective.

D. LEGAL AUTHORITY - The regulations require permittees to demonstrate adequate legal authority to carry out the storm water program, including controls on industry and construction. You must cite your legal authority, or where it does not yet exist, give a plan and timetable for developing it.

122.26(d)(1)(iii) Legal authority. A description of existing legal authority to control discharges to the municipal separate storm sewer system. When existing legal authority is not sufficient to meet the criteria provided in paragraph (d)(2)(ii) of this section, the description shall list additional authorities as will be necessary to meet the criteria and shall include a schedule and commitment to seek such additional authority that will be needed to meet the criteria.

122.26(d)(2)(i) Adequate legal authority. A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:
(A) Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity.
(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;
(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;
(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;
(E) Require compliance with conditions in ordinances, permits, contracts or orders; and
(F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal seporate storm sewer.

1. List of essential authorities - Describe how the authority already existing in your municipality fills the requirements in the regulations. The ordinances must be adequate and they must be enforced.
2. Ordinance
   a. Exists
   b. Planned
3. Implementation procedures
4. Responsible parties

...OGRAM POSITION PAPER

PREFACE

...rce, a coalition of stormwater interests from the regulatory and regulated communities, is recognized by the State Water Resources Control Board as its principle advisor on stormwater quality program issues. Since its inception, the Task Force has guided the development of the State's stormwater regulatory framework, including early permitting of major metropolitan areas, adoption of general permits for industrial activities and construction, and completion of permittee guidance manuals.

In 1993 the Task Force formed a Monitoring Committee which defined its mission as:

1. Facilitating the exchange of information related to urban runoff monitoring,
2. Promoting statewide coordination of urban runoff monitoring activities, and
3. Establishing a Task Force consensus on the future direction of urban runoff monitoring efforts.

This paper presents this Committee's review and analysis of stormwater monitoring practices among municipal stormwater permittees in California, and identifies options for Task Force assistance in the continued development and implementation of municipal stormwater monitoring programs.

PURPOSE AND ORGANIZATION OF THIS PAPER

The purpose of this paper is to identify ways in which the Task Force can assist municipalities in developing monitoring programs which are cost-effective and which address real needs within municipal stormwater management programs. The paper reviews current municipal monitoring efforts in the context of the regulatory requirements, the findings of NURP, and recent municipal experience of stormwater monitoring. Recommendations are then made for steps which could be taken by the Task Force to assist municipal permittees in developing a diversified, useful, coordinated and cost effective monitoring programs.

INTRODUCTION

Municipalities regulated under the NPDES stormwater permitting program have invested considerable amounts of time, effort, and public funds in monitoring programs to characterize stormwater discharge quality and its impact upon receiving waters (Monitoring Committee Report, 1993). Despite this effort, there remains, however, no regulated discharge about which less is known than stormwater (Harrison, 1993).

Further, as municipalities prepare for permit renewal, the experience of other NPDES permitted dischargers, with respect to monitoring, needs to be considered by stormwater management agencies. In 1994, the Water Resource Task Force Report (SWRCB, 1994) reported that a twenty year investment of over $200,000,000 in coastal monitoring, mostly in compliance with the requirements of NPDES permits, had failed to provide environmental decision makers with the information they require. Perhaps more significantly, the report contended that the entire

VOL 22

0028

VOL 22

structure of permit imposed monitoring requirements had failed to foster the higher level planning and coordination needed to assess cumulative and large scale environmental problems

Stormwater monitoring should ideally provide practical, useful information in furtherance of the overall stormwater program goal of reducing stormwater pollution to the maximum extent practicable. As the first stormwater permits near the end of their first five year term, it is therefore appropriate to review past and current monitoring practices, and evaluate future monitoring needs and priorities given the salutory experience of other NPDES permitees.

Regulatory Background

The 1987 Water Quality Act added to the Clean Water Act (CWA) a provision that directed the USEPA to establish final regulations governing stormwater discharges under the National Pollutant Discharge Elimination System (NPDES) Program. Final regulations, promulgated in 1990, established a two part permit application process for municipal separate storm sewer systems. The application requirements applied initially to systems serving populations greater than 250,000, and then one year later to populations greater than 100,000 but less than 250,000.

Prior to EPA's final 1990 rule, staff of EPA Region IX and the California State Water Resources Control Board worked with many municipalities to obtain early NPDES stormwater permitting. This action was taken to give municipalities and their respective Regional Water Quality Control Boards the flexibility to develop permits specific to the climate and conditions of the region. The central tenets of the federal regulations are, however, reflected in these permits.

0029

Part 1 of the permit application requires information on types and characteristics of stormwater discharges, including a proposed characterization plan for more intensive investigation of discharges from 5-10 representative outfalls. Part 2 of the application requires inclusion of the monitoring results for the designated outfalls, and preparation of a monitoring program covering the term of the permit.

The regulations and the Part 1 and Part 2 permit application guidance manuals are specific in the types of water quality monitoring data to be collected for the initial year of discharge characterization, and the methodologies to be used in its collection. A long list of physical and chemical monitoring parameters is specified. Further, for each of the 5-10 representative outfalls, samples must be collected from at least three separate storm events at least one month apart, and flow weighed composite samples (three discrete aliquots per hour) must be taken for the majority of the pollutants. The outfalls must be representative of the commercial, industrial, and residential land use activities of the drainage area.

In contrast to the initial (Part 1) monitoring, municipalities have considerable latitude in developing their long-term (permit) monitoring program. For the Part II stormwater permit application, 40 CFR 122.26(d)(2)(iii) states:

VOL 22

The applicant must provide information characterizing the quality and quantity of discharges covered in the permit application, including:

(D) *A proposed monitoring program for representative data collection for the term of the permit that describes the location of outfalls or field screening points to be sampled (or the location of instream stations), why the location is representative, the frequency of sampling, parameters to be sampled, and a description of sampling equipment.*

Neither section 122.26(d)(2)(iii)(D) nor the EPA guidance manual for Part 2 applications (USEPA, 1992) specifies the number of sampling locations or storm events to be monitored, nor the pollutants to be analyzed for the permit monitoring program. The regulation requires only that the applicant submit a proposed monitoring program to collect representative data for the five year term of the permit. "Representative data collection" is generally taken to mean outfall monitoring for the purpose of discharge characterization.

As with holders of early permits, the Part II applicant is given the opportunity to propose a monitoring program for stormwater discharge characterization which is appropriate for the climatic characteristics and stormwater drainage patterns within the regulated area. The development of the permit monitoring program typically is based on an assessment of the characteristics of stormwater discharges in the metropolitan area, together with the initial monitoring results.

However, the EPA Part II application guidance for the development of the permit monitoring program discusses a more diverse range of needs for monitoring data, extending beyond "representative data collection". Specifically, the guidance recommends:

- continued discharge characterization,
- evaluating sources of specific pollutants,
- evaluating the performance of specific source controls, and
- identifying the full range of chemical, physical, and biological water quality impacts on receiving waters.

These four monitoring needs categories were used to varying degrees by California municipalities in preparing Part II NPDES stormwater permit applications.

MONITORING METHODS

The four EPA monitoring needs categories can provide a framework for diversification of municipal monitoring efforts, help make monitoring programs more responsive to management program needs, and provide a basis for integration of stormwater monitoring into the overall municipal stormwater management program. This section discusses each of EPA's four monitoring needs categories separately, under the following subtitles:

00330

VOL 22

- Discharge Characterization/Outfall Monitoring,
- Pollutant Source Identification,
- Source Control Effectiveness, and
- Receiving Water Impacts.

Included are suggestions for ways in which permittees can adapt the various elements of their monitoring programs to be of more practical use within the municipal stormwater management program.

I. Discharge Characterization/Outfall Monitoring

Discharge characterization is what typically comes to mind when one thinks of stormwater monitoring. The Nationwide Urban Runoff Program (NURP), completed in 1983, was the first major investigation of urban runoff. NURP included an evaluation of stormwater quality from 28 representative cities throughout the United States. The investigation was prompted by an EPA review of 93 Section 208 Areawide Agency Workplans that commonly cited urban runoff as an issue of concern, albeit with little local understanding of its nature or impact. The intent of NURP, a support function to water quality planning efforts, and its methodological approach form the foundation of current municipal monitoring programs. It therefore appropriate to consider regulatory expectations of monitoring in the context of NURP's findings

Following the lead of the NURP study, the NPDES permit application regulations require that the monitoring be designed to determine the discharge characteristics of single land uses (i.e., commercial, industrial, residential). It involves collection and analysis of samples from representative watersheds to characterize wet weather discharges from the permitted area. Watershed monitoring data is used to estimate mass loadings from the permitted area and can serve as input to water quality modeling efforts.

The selection of representative outfall sampling locations must balance two fundamental criteria: the sites must be representative of stormwater discharges within the regulated area, and they must be compatible with the practical constraints of sample collection and flow measurement. To be representative of specific land uses, monitoring sites ideally will be at the discharge points of small to medium sized watersheds (generally less than 300 acres) of homogeneous land use. In this way, monitoring results can be extrapolated to other watersheds of similar land use. The practical constraints to site selection include the feasibility of properly installing sampling and flow monitoring equipment, vehicular and pedestrian access during storm conditions, field crew safety, and site security.

It has been widely assumed that outfall monitoring data would be useful in evaluating long term trends in stormwater discharge quality. This has in fact proven to be problematic because the improvements wrought by stormwater management programs have not generally been adequate to overcome the inherent variability in the monitoring data. Although in one instance, it has been possible to show a differences between average NURP data and contemporary data for lead

0031

VOL 22

(Larry Walker Associates, 1992). This difference is thought to derive from the benefits of strict air quality controls on lead in gasoline. Also, in climates with a strongly seasonal rainfall pattern (such as California), within-season trends in pollutant concentrations can sometimes be detected, and the influence of precipitation factors can be determined using statistical techniques (Bumgardner et al., 1993).

Ordinarily discharge characterization may serve only to validate the transferability of the NURP data to a particular catchment. In an assessment of stormdrain sources of contaminants to Santa Monica Bay, Stenstrom and Strecker (1993), for example, used the median site concentrations of local water quality data to select the most representative NURP data for use in calculating contaminant mass emissions.

In an effort to gain some insight into the scope of stormwater monitoring activities in California, the Monitoring Committee conducted a survey of the monitoring practices of permitted municipalities in 1993. Among the notable results of this survey was the annual investment in 1993 of $3.6 million in monitoring reported by survey respondents. It is widely felt that this level of expenditure warrants careful scrutiny to ensure that data collection strategies are appropriate to the stipulated goals of the program.

The Monitoring Committee survey highlighted the propensity of municipalities during the first permit term to invest heavilly in discharge characterization. The limited utility of discharge characterization now needs to be recognized by stormwater management agencies in order to ensure that it is not the pre-eminent element of all municipal monitoring programs. Also, that the utility of discharge characterization data may be maximised by coordination with adjacent municpal monitoring initiatives.

0032

II. Pollutant Source Identification

EPA guidance recommends monitoring to improve the understanding of sources of stormwater pollution. Based on the results of the outfall monitoring program, the illicit discharge program, land use maps, and other available information, samples can be collected downstream of suspected sources of pollutants during storm events. The samples can be analyzed for the specific constituent(s) thought to be present, or for suitable indicator parameters.

In contrast to the outfall monitoring sites, the sites selected for monitoring as potential significant pollutant sources tend to be upstream of the typical stormwater outfall points in the watersheds, and characterize the discharge from a smaller area. Whereas the outfall monitoring data is used to develop a long term characterization of stormwater discharges, the pollutant source identification program is designed to identify significant pollutant sources over a shorter term, with the hope that remedial action can be undertaken to reduce any significant stormwater quality impacts.

Monitoring of municipal waste facilities, hazardous waste facilities, and industrial facilities typically is required separately under the Part II application requirements as part of the

R0065268

VOL 22

stormwater management program. Monitoring of such facilities is appropriate given that these land uses may contribute relatively high proportions of select pollutant loadings in urban runoff.

Municipalities also typically are required to identify illegal storm drain discharges or locations of illegal disposal practices. While this task typically involves monitoring in some form, many permittees meet this requirement through a separate illicit discharge program.

The data generated by both the waste facilities monitoring and the illicit discharge program can be useful in identifying sources of specific pollutants, and should be incorporated within the data review process for identification of specific pollutant sources. The most extensive body of water quality data relating to the quality of runoff from particular facilities is, however, being generated by industrial facilities subject to the monitoring requirements of General permit No. CAS000001 which encompasses the categories of acitivity that municipal programs are required to investigate. Municipalities should therefore be party to this information before being separately required to duplicatethis effort.

III. Source Control Effectiveness

It may be difficult to demonstrate the effectiveness of source control best management practices (BMPs) and other stormwater management program elements through outfall monitoring, because of the inherent variability of storm water quality data and the difficulty in achieving statistically valid demonstrations of watershed-wide BMP performance. The NPDES stormwater permit guidelines define a representative storm as one that has a rainfall greater than 0.1 inch, is preceded by at least 72 hours of dry weather (less than 0.1 inches of rainfall), and does not vary by more than 50% from the average rainfall volume and duration when feasible. Depending on how many representative storms occur or are monitored during a season, the collection of enough samples to demonstrate statistically significant improvements may take many years to complete.

The NURP study concluded that the site-to-site variability in runoff water quality could not be explained in terms of land use or other factors such as precipitation characteristics. This conclusion supports the broader contention in the State BMP Manual (CDM et al. 1993) that catchment discharge water quality integrates so many factors that the specific influence of a single determinant may be impossible to elucidate.

Determining the effectiveness of specific BMPs by spatial (watershed to watershed) comparison of water quality is also problematic. For typical outfall monitoring stations, the effect of the BMP is likely to be masked by the variability of the data. Similarly, before and after comparisons of watershed-wide BMP implementation can be extremely difficult to demonstrate with normal outfall monitoring. In addition to the expense and time required to obtain representative event concentrations, scheduling can be problematic. Collection of baseline information may be occurring at nearly the same time BMP implementation is required. As a result, it may not be possible to collect adequate

0033

VOL 22

pre-BMP data to test the before and after conditions, making demonstration of the true effectiveness of the implemented BMPs impossible.

For these reasons, the effectiveness of BMPs are more effectively assessed through other means, including indirect measurements, as well as monitoring in the form of special studies.

Two general types of methods are available to assess the effectiveness of stormwater management program elements: direct water quality (conventional) monitoring and indirect (non-conventional) monitoring.

Direct Monitoring

Direct water quality monitoring in this case refers to research (or special study) projects used to determine pollutant reductions by a specific facility, device, or set of source controls. This technique is commonly used for treatment controls, such as detention basins and constructed wetlands, where there is an accessible inflow and outflow. Inflow and outflow results can then be compared synoptically to determine pollutant removal and thus effectiveness.

Direct water quality monitoring of site runoff before and after implementation of source controls is also possible. However, it is difficult to demonstrate source control effectiveness at a statistically significant level, because of the high degree of variability in stormwater pollutant concentrations and mass loadings. The water quality improvement due to source controls is generally expected to be less dramatic than that achieved through treatment controls; a larger number of samples is therefore required to produce a statistically significant result.

0034

This is especially problematic in relation to the monitoring of the pre-source control conditions. Collection of adequate baseline information is necessary prior to the implementation of source controls. Direct monitoring of source control effectiveness is feasible typically only under experimentally controlled conditions (e.g., selection of small, well-defined watersheds; control of BMP implementation; effective siting and timing of monitoring activities), including a sufficient number of samples to achieve statistical significance.

For municipal stormwater programs, it is important to design studies that are both scientifically sound and cost-effective. Two key elements of this involve controlling the experimental conditions as fully as is practical, and maximizing the effectiveness of the data produced by the study.

A study intended to evaluate BMP effectiveness following implementation of BMPs must minimize other differences in the "before" and "after" conditions. That is, all conditions other than the implemented control measures ideally should be held constant, so as not to confound the

VOL 22

before and after comparison. Typically such studies are conducted over two or more rainy seasons, so that both the pre- and post-implementation phases have the benefit of samples from throughout at least one full wet season, including the seasonal first flush storms.

To maximize data effectiveness, it is especially important to consider the issue of statistical significance in the experimental design. The ability to discern statistically significant differences between two data sets (such as stormwater data collected before and after implementation of BMPs) hinges on the variability within each of the two data sets and the number of data points in each set, as well as the differences in the before and after numbers. When data variability is high, it is necessary to have either correspondingly large data sets or a relatively large difference in their average values to demonstrate a statistically significant difference. Experience has shown that storm to storm and site to site variability tend to be quite high among stormwater samples. An effective strategy may involve collection and analysis of samples from the maximum number of storms, but with a focus on the pollutants that are known or expected to be present. In this way, money is spent where it can produce the most useful data.

As with outfall monitoring, it is also crucial to prepare a monitoring plan that contains state-of-the-art sampling and analytical protocols, including "clean" sampling techniques and extensive Quality Assurance/Quality Control (QA/QC) throughout all stages of the operation.

Indirect Monitoring

Indirect monitoring currently is the primary method of choice for assessment of the effectiveness of management programs. The techniques typically involve verification of stormwater management program implementation and pollutant removal inventories.

Verification of program implementation is a method that can be used to provide indirect evidence that stormwater pollution is being reduced to the maximum amount practicable. The technique involves verification of the extent to which management program elements are being implemented. While qualitative in nature, this method provides essentially anecdotal evidence of pollutant reductions.

Pollutant removal inventories can be used to indicate the amount of pollutant that has been prevented from entering the municipal storm drain system. This involves quantitative measurements or estimates of actual material removed from urban runoff, such as pounds of silt removed from catch basins. Provided data are available on the concentrations of particular pollutants in catch basin silt and appropriate assumptions regarding fate and transport, it is possible to estimate loading reductions achieved by the specific BMP.

"Indirect monitoring" techniques for assessment of existing management programs can be evaluated and selected using the following criteria:

- Ease of acquiring data,

0035

VOL 22

- Acquisition of data appropriate for a database system, and
- Relative usefulness in assessing BMP effectiveness.

IV. Receiving Water Impacts

All discharges to surface waters in California, including stormwater discharges, must comply with the water quality objectives of the local Basin Plan, as well as the Inland Surface Waters Plan and the Enclosed Bays and Estuaries Plan (or other applicable water quality regulations in the absence of a valid statewide plan). Municipal monitoring programs often include sampling and analysis to characterize the quality of selected receiving waters. The receiving water data may then be used in conjunction with the results of the ongoing outfall monitoring program to assess, in terms of compliance/non-compliance with objectives, the impact of county-wide stormwater discharges upon receiving water quality.

NURP noted that end-of-pipe metals concentrations, particularly copper, lead, and zinc, frequently exceeded EPA's water quality criteria and drinking water standards. These end-of-pipe exceedences also translated into frequent exceedence of heavy metals ambient water quality criteria for freshwater aquatic life in receiving waters. The Denver NURP project, for example, found that concentrations of copper, lead, zinc, and cadmium exceeded ambient water quality standards during "essentially all" storm events.

Citing an extensive bioassay-based investigation into the impact of urban runoff on the Hillsborough River in Florida, NURP also recognized, however, that the frequency of ambient criteria exceedence does not always match the observed level of beneficial use impairment. This conclusion is qualified by the recognition that urban runoff impacts on receiving waters will necessarily be highly site-specific. More recent commentators (Lee and Jones-Lee, 1994) also advise caution in attaching significance to exceedences of water quality standards.

The identification of control program priorities, such as an impaired beneficial use, is a necessary early step in the implementation of an effective control program (State BMP Manual, 1993). It appears evident, however, that identification of water quality standard exceedences alone may be insufficient basis for justifying a major pollutant control initiative. Indeed, EPA (1992) recognizes the implementation of complementary monitoring strategies including bioassessments, biosurveys, receiving water monitoring, and sediment testing as necessary for effective receiving water impact evaluation.

Biological methods for determining the impact of urban runoff on receiving waters include toxicity testing, biotic community analysis, and exposure measures (bioaccumulation and biomarker studies). Toxicity testing involves the exposure of test organisms, on an acute or chronic basis, to runoff or receiving water samples. The tests are quick, relatively inexpensive, and may be performed according to well established protocols. Further, such testing may readily indicate the adverse effect of particular pollutants on sensitive species. Since the test does not

0036

VOL 22

mimic natural conditions the response of the test organism may be difficult to relate to field conditions. This disadvantage may further be compounded by test protocols that specify the use of organisms not typically found at the site. Also, the test will not recognize the potential impact bioaccumulatory substances that may impart subtle detrimental effects over a long period of time.

Biotic community analysis involves the examination of physically similar sites in terms of the number of species and the number of individuals representing each species present in the community. Although this method may provide a direct measure of the environmental effect of a discharge it has a number of significant disadvantages notably its considerable cost and ultimately a possible an inability to distinguish extraneous environmental factors from pollutant effects. Jones and Jones-Lee (1992), for example, caution that the goal of defining receiving waters impacts in terms of eco-system functioning or biotic community diversity may, even with massive funding, be rarely attained.

Exposure monitoring techniques include tissue analysis for the presence of bioaccumulatory substances such PAHs and DDT or enzymes (biomarkers) that are produced by organisms in response to the presence of pollutants such as metals. Bioaccumulation monitoring provides a direct measure of bioavailability although subsequent biologic effects may be difficult to determine. Similarly, with biomarkers analysis although it measures actual biological response the significance of the ecological effects may be unknown.

Monitoring receiving waters for exceedence of water quality standards due to stormwater discharges is best accomplished by simultaneously monitoring upstream of an urban area to obtain background concentrations, and downstream of the urban area to determine water quality impacts due to urban runoff. If possible, the upstream location should be relatively unaffected by urban runoff, so downstream changes can be more easily quantified. The downstream site should be located at the downstream limit of the targeted urban area to prevent inflow of extraneous runoff from other jurisdictions or undeveloped areas.

0037

To ensure that the samples collected are useful to the stormwater management program, the drainage area should be located within a permitted jurisdiction and should be comprised primarily of urban land uses. The drainage area also should contain a minimum of point source discharges to facilitate the process of identifying the water quality impacts of urban runoff. The sites should be monitored during storm events for the same duration and with similar chemical analyses as the urban runoff sites. This will permit a direct assessment of the impact of urban runoff from a specific urban area on receiving water quality, as well as build a database describing receiving water quality during storm events. The information gathered in this program should be used in conjunction with receiving water quality monitoring programs, utilizing the biological methods discussed earlier, to assess the contribution of stormwater discharges to loss of beneficial uses

The use of biological methods of monitoring may be necessary to determine the impact of stormwater discharges on beneficial uses. Given the uncertainty regarding methodologies, the

VOL 22

Intergovernmental Task Force on Water Quality's (ITFWQ, 1994) recognition of the need to develop comparable biological methods for use by monitoring agencies as a priority task is therefore timely.

Jones and Jones-Lee (1992) caution, however, that the goal of defining receiving water impacts in terms of eco-system functioning or biotic community diversity may, even with massive funding, be rarely attained. A watershed approach to monitoring, that integrates the efforts of point and non-point source dischargers, may thus be the only means of overcoming the potentially prohibitive costs likely to be associated with single agency efforts to implement monitoring programs that fulfill all of EPA's monitoring needs. Further, it may represent the only means of ensuring that the monitoring data that is generated is relevant to the needs of environmental managers.

RECOMMENDATIONS

The Monitoring Committee recommends that the Task Force work to make stormwater monitoring more cost-effective and of greater practical usefulness within municipal stormwater management programs by supporting the following goals:

I. Coordinate Monitoring Efforts Within California, By State or Region

Municipal permittees can minimize unnecessary duplication of effort and reduce monitoring program costs by coordinating monitoring programs on a regional or perhaps even statewide basis. This is particularly true in the case of outfall monitoring for discharge characterization, wherein each municipal permittee likely already possesses adequate data to effectively confirm or dispute the NURP conclusions for urban land uses.

II. Encourage Diversification of Monitoring Programs

Permittees should direct stormwater program resources to areas which will provide the most useful information for program management, and be more directly applicable to the goal of reducing stormwater pollution to the maximum extent practicable. In many cases this means a redirection of program resources away from outfall monitoring and towards other types of monitoring.

III. Facilitate Technology Transfer/Information Exchange

Both of the preceding recommendations can be made more effective by increasing efforts to disseminate information on all types of monitoring programs amongst municipal permittees.

To help further these goals, the following specific activities could be undertaken by the Task Force:

0038

- Encourage permittees to form regional associations (such as BAASMA), and meet together with regional water quality control board personnel for the purpose of coordinating outfall monitoring and special study/research efforts.

- Consider funding a comparative study of outfall monitoring results. Using statistical methods, modern stormwater monitoring data (collected since circa 1990) can be evaluated to determine whether significant differences in runoff quality or pollutant loadings exist among municipalities in California. The study could include in-depth investigation of the question of land use differences, regional patterns, and differences between modern data and the NURP results. If, as expected, statistically significant water quality differences among urban runoff discharge sources are rare, such a study could provide support for reduced outfall monitoring requirements.

- Consider sponsoring a monitoring workshop to explore alternative monitoring strategies. The workshop should be designed to provide permittees with tools to develop monitoring programs which have practical usefulness in the overall stormwater management program. The workshop could cover a variety of monitoring methods, to address the several goals expressed in EPA guidance, as described previously. Topics should include study planning and design, data analysis, and providing feedback loops from project results to program management.

- Include recently completed, ongoing, and planned research as a regular agenda item for the monthly Task Force meetings.

- Consider establishing a statewide database for stormwater research projects and special studies.

R0065276

VOL 22

DEFINTION OF

MUNICIPAL SEPARATE STORM SEWER SYSTEM

Proposed Regulations Included:

i) storm sewers owned or operated by cities with a population of 100,000 or more.

ii) interrelated municipal storm sewers designated by Director.

Final Regulations include:

i) publicly owned storm sewers within boundaries of cities with population of 100,000 or more.

ii) publicly owned storm sewers within boundaries of counties having unincorporated urbanized areas with a population of 100,000 or more.

iii) interrelated municipal storm sewers designated by Director.

iv) as an alternative to (i), (ii) and (iii), the Director may designate a storm sewer system based on the boundaries of a storm water management regional authority.

0041

VOL 22

STORM WATER ASSOCIATED WITH INDUSTRIAL ACTIVITY
WHICH IS DISCHARGED TO A MUNICIPAL SYSTEM

Proposed Regulations:

- discharges to large and medium systems would be covered by municipal permit.
- discharges to small systems would be addressed in 402(p)(5) studies.

Final Regulations:

- all discharges must be permitted.

0042

R0065278

VOL 22

DEFINITION OF STORM WATER ASSOCIATED WITH INDUSTRIAL ACTIVITY

Proposed definition: storm water runoff from industrial areas of specified industries.

Final definition: deletes certain industries where industrial activity is usually indoors; however, if industrial activity is exposed to rainfall, regulations would apply.

0043

R0065279

VOL 22

NON-ILLICIT DISCHARGES TO STORM SEWER

Unless identified as significant sources of pollutants, discharges such as the following need not be prohibited by storm water management programs:

fire hydrant flushing

landscape irrigation

uncontaminated ground water

foundation drains

air conditioning condensation

lawn watering

individual residential car washing

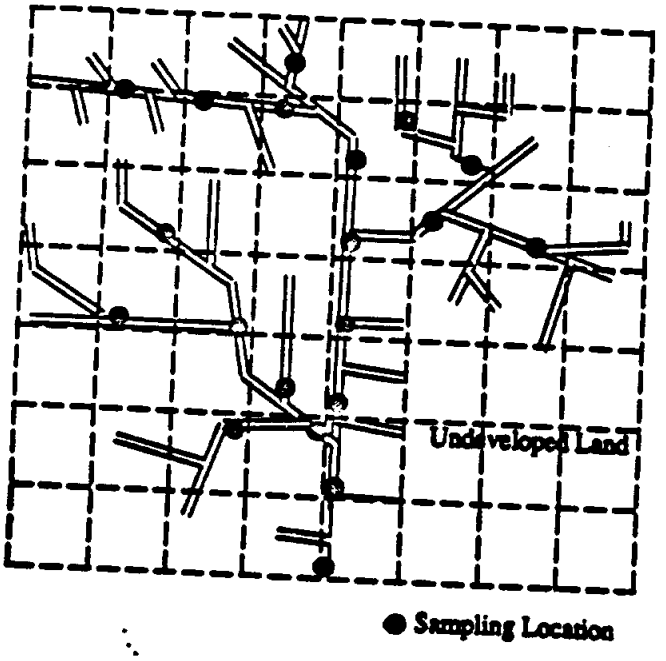
fire fighting runoff

dechlorinated swimming pool discharges

0044

FIELD SCREENING SURVEY TO DETECT ILLICIT CONNECTIONS AND ILLEGAL DUMPING

Proposed Regulations:



- field screening survey required for all major outfalls.

Final Regulations Provide Two Options:

- screen all major outfalls, or
- sample strategic points established within a grin overlayed onto a map of the storm sewer system. Grid would consist of north-south and east-west lines 1/4 mi. apart. If grid is used, a maximum of 250 points (medium systems) or 500 points (large systems) would be sampled.

R0065282

VOL 22

APPLICATION REQUIREMENTS FOR MINING OPERATIONS

Proposed Regulations:

- would require an application if discharge exceeds background concentration.

Final Regulations:

- would require an application if runoff contacts overburden, raw material, intermediate product, finished product, by-product or waste product at the site.

- include active mines, and inactive mines for which an owner/operator can be identified.

- do not include undisturbed sites where claims are being maintained prior to land disturbance.

0047

VOL 22

APPLICATION REQUIREMENTS FOR CONSTRUCTION

Proposed regulations required application for:

- commercial or industrial developments of 1 or more acres.

- residential developments of 5 or more acres.

Final regulations require application for:

- developments of all kinds of 5 or more acres.

Final regulations also specify that applications must be received 90 days prior to commencement of discharge (proposal was 180 days).

0048

VOL 22

STORM WATER SAMPLING REQUIREMENTS

Proposed regulations required:

- first flush grab sample taken in the first 20 minutes of discharge, and
- flow-weighted composite sample.

Final regulations require:

- for industrials, first flush grab sample (taken in the first 30 minutes of discharge), and a flow-weighted composite sample.
- for municipals, only a flow-weighted composite sample.

R0065286

NPDES PERMIT APPLICATION REQUIREMENTS FOR STORM WATER

FACT SHEET

ACTION: National Pollutant Discharge Elimination System (NPDES) permit application requirements for storm water discharges - Final Regulation.

PURPOSE: This regulation defines the initial scope of the NPDES permit program for storm water discharges. It defines the terms "storm water discharges associated with industrial activity", and "large and medium municipal separate storm sewer systems" and the permit application requirements for these discharges.

COVERAGE: Operators of large and medium municipal separate storm sewer systems including 173 cities with a population of 100,000 or more, and 47 counties which EPA has identified as having large populations in unincorporated, urbanized areas. (see attached lists)

Operators of storm water discharges associated with industrial activity, including those discharging to municipal separate storm sewers. (see attached list).

REQUIREMENTS: Operators of large and medium-sized municipal separate storm sewer systems must submit two part permit applications. For large municipal separate storm sewer systems, Part 1 must be submitted within 12 months of the date of publication of the final rule. Part 2 must be submitted within 24 months of the date of publication of the final rule. Medium municipal separate storm sewer systems must submit Part 1 within 18 months from the date of publication of the final rule. Part 2 must be submitted within 30 months of the date of publication of the final rule.

Part one of the application requires information regarding existing programs and the means available to the municipality to control pollutants in storm water discharges. In addition, part one requires field screening of major outfalls to detect illicit connections. Part two of the permit application requires a limited amount of representative quantitative data and a description of proposed storm water management plans. The purpose of the two-part application process is to develop information, in a reasonable time frame, that builds successful municipal storm water management programs and allows permit writers to make informed decisions with regard to developing permit conditions.

EPA is developing a strategy for permitting storm water discharges associated with industrial activity. In developing this strategy, the Agency recognizes that the CWA provides flexibility in the manner in which NPDES permits are issued. EPA intends to use this flexibility in designing a workable and reasonable permitting system that emphasizes reduction of risk to human health and aquatic resources.

VOL 22 0051

STRATEGY: For storm water discharges associated with industrial activity which require an individual permit, applicants must submit an individual application within one year of the date that the final rule is published in the Federal Register or participate in a group application. Part one of the group applications are to be submitted within four months of publication of the final rule, and part two within 15 months of publication of the final rule.

For operators of storm water discharges associated with industrial activity, the NPDES regulatory scheme provides three potential options for applying for permit coverage for storm water discharges associated with industrial activity: (1) individual permit applications; (2) group applications; and (3) filing a notice of intent requirements to be covered by an established general permit. A general permit is a permit that covers discharges from more than one facility within a State. General permits are either issued by EPA or, in States with authorized NPDES programs, by the State. Notices of intent requirements are established in general permits, and generally only require information such as the type of industry, location and name of receiving waters.

VOL 22

0052

CLASSES OF FACILITIES THAT DISCHARGE STORM WATER ASSOCIATED WITH INDUSTRIAL ACTIVITY

- Facilities subject to National effluent limitation guidelines;
- Facilities classified as Standard Industrial Codes (SIC) 24 (except 2434), 26 (except 265 and 267), 28, 29, 30, 311, 32, 33, 3441, and 373 (including lumber; paper; chemical; petroleum; rubber; leather tanning and finishing; stone, clay, glass, and concrete; metal; enameled iron and metal sanitary ware; and ship/boat manufacturers);
- Facilities classified as SIC codes 10 through 14 (including active and inactive mining and oil and gas operations with contaminated storm water discharges, except for areas of coal mining operations which have been reclaimed and the performance bond has been released by the appropriate SMCRA authority, or non-coal mining operations which have been released from applicable State or Federal reclamation requirements after 30 days after publication of the final regulation;
- Hazardous waste treatment, storage, or disposal facilities;
- Landfills, land application sites, and open dumps that receive industrial wastes;
- Recycling facilities (including metal scrapyards, battery reclaimers salvage yards, and automobile junkyards (classified as SIC codes 501 and 5093 only));
- Steam electric power generating facilities (including coal handling sites);
- Transportation facilities classified as SIC Codes 40, 41, 42, 44, and 45 (including vehicle maintenance, equipment cleaning, and airport de-icing areas);
- Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage, treatment, recycling, and reclamation of sewage (including land used for the disposal of sludge located within the confines of the facility) with a design flow of 1.0 mgd or more;
- Construction activity (except for disturbances of less than 5 acres of total land area which are not part of a larger common plan of development or sale); and
- For the following facilities, if materials are exposed to storm water: facilities classified under SIC codes 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 31 (except 311), 34 (except 3441), 35, 36, 37 (except 373), 38, 39, and 4221-25 (including food; tobacco; textile; apparel; wood kitchen cabinets; furniture; paperboard containers and boxes; converted paper/paperboard products; printing; drugs; leather; fabricated metal products; industrial and commercial machinery and computer equipment; electronic equipment; transportation equipment; measuring, analyzing, and controlling instruments and photographic, medical, and optical goods, and watches and clocks; miscellaneous; and certain warehousing and storage manufacturers).

Municipal NPDES Stormwater Permit Comparison

Scale 1=Much Less; 2=Less; 3=Same; 4=More; 5=Much M

Los Angeles County December 18, 1995 Draft		Riverside County November 1995 Draft		
Section	Title of Section	Page	Level	Comments
A.	Discharge Prohibitions and Receiving Water Limitations		2	SLIGHTLY LESS TO SIMILAR
A.I	Discharge Prohibition	12	3	
A.II	Receiving Water Limitations	14	3	Language is still under negotiation. Permittee to determine impact.
B.	Compliance with Discharge Prohibitions and Receiving Water Limitations	14	2	More clearly states BMPs = compliance. Defines MEP.
C.	Stormwater Management Program Requirements		2	Average of Overall Level Sections I through VI.
I.	Requirements for Program Management		2	SIMILAR
I.A.	Principal Permittee	9	2	Not as specific
I.B.	Permittees	11	2	Not as specific
I.C.	EAC External Agency Coordination		3	
I.D.	Executive Advisory Committee (EAC)	N/A	1	Does not exisit, have other subcommittees
I.E.	Watershed Management Committees (WMCs)	N/A	1	Committees established more like focus groups
I.F.	Watershed Management Subcommittees		5	The subcommittees develop most of the programs.
I.G.	Fiscal Resources	20	2	Not as specific
I.H.	Legal Authority	17	2	40 CFR. and model ordinance or equivalent.
I.I.	Program Substitution		1	Define MEP in many other places.
I.J.	Administrative Review		N/A	
I.K.	Public Review	8	4	Must solicit public comments and include them in the reports.
II.	Requirements for Illicit Connections/Discharges		4	MOST SIMILAR - S.D. SURVEY IS SIGNIFICANTLY MORE
II.A.	Illicit Connections	SURVEY	5	An extensive survey was already conducted.
	Model	11	5	Conduct SD inspections in accord w/ Principal Perm. criteria. Must physically remove all illicit connections.
II.B.	Illicit Discharges	DAMP 3-14	3	Public Education and Hotline efforts. Similar training reqs.
	Model		3	
II.C.	Other Prohibited Activities		1	Based on Analysis of Ordinance
II.D.	Non-stormwater Discharges		1

Municipal NPDES Stormwater Permit Comparison
Development and Implementation of Planning and Construction Programs

Los Angeles County December 18, 1995 Draft		Riverside County - Art Diaz (909) 275-1329	Orange County - Richard Boon (714) 567-6371
Section	Title of Section	Comments	Comments
IV.	Program Requirements for Development Planning/Construction	Modified the program from Orange County's. It is much more flexible.	The subcommittee worked for 2 yrs in developing the process. It has been in implementation for 3 yrs now.
IV.A.	Development Planning	During the tentative planning process, applicable BMPs are suggested to the developer. But are not yet required. They could be put into the conditions of approval.	
IV.A.1	Prioritization of Development Projects	Each jurisdiction should develop criteria for determining which projects will be subject.	All new development and significant redevelopment regardless of size. Ind/comm construction greater than 1 acre and residential const. greater than 5 acres.
IV.A.2	Countywide Guidelines	Currently, they are working on implementation guidelines which are also very flexible.	Tables list BMPs to be implemented based on the type of development. Some are source control measures and some are structural BMPs.
IV.A.3	Planning Process	It is up to the plan checker or reviewer to suggest BMPs. But, to date, none of these people have been trained.	One person in the planning dept. is responsible for all sw issues. She uses a checklist to make sure all required BMPs are included in plan.
IV.A.4	Planning Control Measures	Use the same table of source control and "routine" structural BMPs that Orange County does. But, no plan or BMPs are required. (Only proof of GCSP)	The tables are given to the developers and the BMPs must be included, but no design standards are given. The developer must propose the BMP design.
IV.B.	Development Construction	GSCP projects must show proof of coverage prior to receiving a building or grading permit.	Construction activities greater than 5 acres are required to comply with GCSP.
IV.B.1	Identification of Development Construction Sites	Only sites greater than 5 acres and those determined by the individual jurisdictions.	Field screening is conducted at 90 locations w/in the drainage system, if a problem is found and may be related to construction, follow up is conducted.
IV.B.2	Countywide Guidelines	Have developed a model ordinance, but most have simply modified their grading ordinance to better address erosion control.	
IV.B.3	Best Management Practices (BMPs)		The planning person is responsible for seeing that the required BMPs are being implemented.
IV.B.4	Source Inspection	During the current inspection process, inspectors ask to see the SWPPP and report facilities without one.	Inspectors will only commit to informing the Board of stormwater related issues at construction sites. They will not enforce GCSP in any way.

R0065302

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 6
1445 ROSS AVENUE
DALLAS, TEXAS 75202-2733

VOL 22

December 22, 1994
FACT SHEET

for draft National Pollutant Discharge Elimination System (NPDES) Permit No. OKS000101, for the Oklahoma City Municipal Separate Storm Sewer System to discharge to waters of the United States.

1. **NOTICE OF INTENT TO ISSUE A PERMIT.** The Environmental Protection Agency (EPA) has made a tentative determination to issue a permit, after consultation with the State of Oklahoma, for the discharge of storm water from the Municipal Separate Storm Sewer System described in the application. Permit requirements are based on the Clean Water Act (33 U.S.C. 1251 *et seq.)*, hereafter referred to as the Act, and NPDES regulations (40 CFR Parts 122 and 124).

2. **PERMITTING AUTHORITY.** The NPDES permitting authority is: U.S. Environmental Protection Agency, Region 6, Permits Branch, 1445 Ross Avenue, Dallas, Texas 75202-2733.

3. **APPLICANT(S).** The Applicant(s) is(are): City of Oklahoma City. Oklahoma Department of Transportation (ODOT) and Oklahoma Turnpike Authority (OTA) also own/operator portions of the Oklahoma City Municipal Separate Storm Sewer System. Oklahoma City, ODOT, and OTA have been working on co-applicant status for some time and the Agency wishes to encourage, and not hinder, the cooperative efforts of these owners of portions of the Oklahoma City Municipal Separate Storm Sewer System. The Agency proposes to include ODOT; and OTA as co-permittees in the final permit provided (1) Oklahoma City, ODOT, and OTA provide an agreement in principle to be co-permittees; (2) Oklahoma City, ODOT, and OTA commit to expeditious schedules to complete interjurisdictional agreements; and (3) ODOT, and OTA provide initial Storm Water Management Programs for their portions of the Municipal Separate Storm Sewer System (subject to appropriate schedules for program implementation and augmentation) prior to issuance of the Agency's final permit decision. Oklahoma City, ODOT, and OTA are to be commended for their consensus, cooperation, and partnership building efforts necessary to be co-permittees.

4. **PERMIT WRITER.** The permit writer is: Brent Larsen, Municipal Permits Section (6W-PM).

5. **DESCRIPTION OF THE MUNICIPAL SEPARATE STORM SEWER SYSTEM.** As authorized by Section 402(p) of the Act, this permit is being proposed on a system basis. This permit covers all areas within the corporate boundary of the City of Oklahoma City (hereafter referred to as Oklahoma City) served by, or otherwise contributing to discharges from municipal separate storm sewers owned or operated by the applicant(s) listed above.

6. **DISCHARGES AUTHORIZED BY THIS PERMIT.**

a. Storm water. This permit authorizes all existing or new storm water point source discharges to waters of the United States from the Municipal Separate Storm Sewer System (MS4).

b. Non-storm water. This permit does authorize the discharge of storm water commingled with flows contributed by process wastewater, non-process wastewater, or Storm Water Associated with Industrial Activity provided such discharges are authorized under, or applied for, separate NPDES permits. In addition, certain types of non-storm waters listed in 40 CFR 122.26(d)(2)(iv)(B)(1) are allowable if appropriately addressed in the Storm Water Management Program (SWMP).

The following demonstrates the difference between the Act's statutory requirements for

0067

discharges from municipal storm sewers and industrial sites:

i. Section 402(p)(3)(B) of the Act required an effective prohibition on non-storm water discharges to a MS4 and controls to reduce the discharge of pollutants from the MS4 to the maximum extent practicable (MEP).

ii. Section 402(p)(3)(A) of the Act requires compliance with treatment technology (BAT/BCT) and Section 301 water quality requirements on discharges of Storm Water Associated with Industrial Activity.

Because of the difference in the statutory requirements, and the fact that the Act does not exempt Storm Water Associated with Industrial Activity from the requirement to obtain a separate NPDES permit, these storm water discharges can not be authorized by the MS4 permit. Such discharges would require a separate NPDES permit. However, the permittees are responsible for the quality of the combined discharge, and have a vested interest in locating uncontrolled and unpermitted illicit and industrial storm water discharges.

c. Spills. This permit does not authorize discharges of material resulting from a spill. If discharges from a spill are necessary to prevent imminent threat to human life, personal injury, or severe property damage, the permittees have the responsibility to take (or insure the party responsible for the spill takes) reasonable and prudent measures to minimize the impact of discharges on human health and the environment.

7. **RECEIVING STREAM SEGMENTS AND DISCHARGE LOCATIONS.** The discharges from the MS4 are into Cimarron River, Deer Creek, Canadian River, W. Elm Creek, E. Elm Creek, Little River, Sprink Creek, Cow Creek, Deer Creek, Walnut Creek, Chisolm Creek, Bluff Creek, Deep Fork River, Arkansas River and tributaries thereto in the North Canadian River Basin (Water Quality Management Basin 5 - Segments 520510, 520520, 520810, 520610, et. al.) and the Upper Arkansas River Basin (Water Quality Management Basin 6 - Segment 620910). The discharges are located on those waters in the City of Oklahoma City, in Oklahoma, Canadian, Pottawatomie, and Cleveland Counties, Oklahoma. The designated uses of the receiving streams include: Public and Private Water Supply, Warm Water Aquatic Community, Habitat Limited Aquatic Community Agriculture, Municipal and Industrial Process and Cooling Water, Primary Recreation, Secondary Recreation, and Aesthetics.

8. **EFFECTIVE DATES.** Compliance with permit conditions is required 30 days from the issuance of the permit, except:

a. as specified in the Part III compliance schedules; and

b. for SWMP conditions in Part II.A (refer to section 13 of this fact sheet).

9. **PUBLIC NOTICE.** Upon publication of the public notice and this fact sheet, a 30 day public comment period shall begin. During this period, any interested persons may submit written comments on the draft permit, including the proposed SWMP, to the EPA point of contact listed below. Also during this period any person may request a public hearing to clarify issues involved in the permit decision. A request for a public hearing shall be in writing and shall state the nature of the issues proposed to be raised in the hearing.

10. **EPA POINT OF CONTACT.** For additional information contact Ms. Ellen Caldwell at (214) 665-7513, Permits Branch (6W-PS), U.S. Environmental Protection Agency, 1445 Ross Ave, Dallas, Texas 75202-2733

11. **BASIS FOR PERMIT CONDITIONS.**

a. Statutory basis for permit conditions. The conditions established by this permit are based on Section 402(p)(3)(B) of the Act which mandates that a permit for discharges from MS4s must: effectively prohibit the discharge of non-storm water to the MS4; and require controls to reduce pollutants in discharges from the MS4 to the maximum extent practicable including best management practices, control techniques, and system, design and engineering methods, and such other provisions determined to be appropriate. MS4s are not exempt from compliance with Water Quality Standards. Section 301(b)(1)(C) of the Act requiring that NPDES permits include limitations, including those necessary to meet water quality standards, applies. The intent of the permit conditions is to meet the statutory mandate of the Act.

As authorized by 40 CFR 122.44(k), the permit will be utilizing Best Management Practices, a comprehensive SWMP, as the mechanism to implement the statutory requirements. Section 402(p)(3)(B)(iii) of

VOL 22 0068

the Act clearly includes structural controls as a component of maximum extent practicable requirement. The EPA has encouraged permittees to explore opportunities for pollution prevention measures, while reserving the more costly structural controls for higher priority watersheds, or where pollution prevention measures are unfeasible or ineffective.

b. Regulatory basis for permit conditions. As a result of the statutory requirements of the Act the EPA promulgated the MS4 Permit application regulations, 40 CFR 122.26(d). These regulations described in detail the permit application requirements for operators of MS4s. The information in the application (Part 1 and 2) was utilized by the EPA to develop the permit conditions and determine permittees status in relationship to these conditions.

c. Discharge goals and limitations.

i. Discharge Goals: The following goals apply to discharges from MS4s and were considered in review of the SWMP and in preparation of the draft permit. In implementing the SWMP, the permittees are required to espire to these goals. The goals are included to further define the intent of the permit, but are not to be directly interpreted as discharge limitations independent of the SWMP and any numeric or narrative limitations under Parts II and IV of the permit.

No discharge of toxics in toxic amounts. It is the National Policy that the discharge of toxics in toxic amounts be prohibited (Section 101(a)(3) of the Act). The Oklahoma Water Quality Standards (Section 785:45-5-12(e)(6)) states "Surface waters of the state shall not exhibit acute toxicity and shall not exhibit chronic toxicity outside the mixing zone."

No discharge of pollutants in quantities that would cause a violation of State water quality standards. Section 301(b)(1)(C) of the Act and 40 CFR 122.44(d) require that NPDES permits include "...any more stringent limitations, including those necessary to meet water quality standards, treatment standards, or schedule of compliance, established pursuant to State law or regulations..." Implementation of the SWMP is reasonably expected to provide for protection of State water quality standards.

No discharge of floatable debris, oils, scum, foam, or grease in other than trace amounts. The Oklahoma Water Quality Standards (OAC 785:45-5-19) require waters of the State to "...be maintained so as to be essentially free of floating debris, bottom deposits, scum, foam and other materials, including suspended substances of a persistent nature, from other than natural sources."

No discharge of non-storm water from the municipal separate storm sewer system, except in accordance with Part I.B.2. Permits issued to MS4s are specifically required by Section 402(p)(3)(B) of the Act to "...include a requirement to effectively prohibit non-storm water discharges into the storm sewers..." The regulation (40 CFR 122.26(d)(2)(iv)(B)(1)) allows the permittee to accept certain non-storm water discharges where they have not been identified as significant sources of pollutants. Any discharge subject to its own NPDES permit is not subject to the ban on non-storm water.

No degradation or loss of State-designated beneficial uses of receiving waters as a result of storm water discharges from the municipal separate storm sewer (unless authorized by the State in accordance with the State's Antidegradation Policy). The State of Oklahoma has adopted an Antidegradation Policy as part of their Water Quality Standards (OAC 785:45-3-1) which provides for maintenance of: existing instream water uses; existing water quality levels where existing water quality exceeds the levels necessary to support propagation of fish, shellfish, and wildlife and recreation in and on the water (except where the State has determined that lowering water quality is necessary to accommodate important economic or social development in the area where the waters are located); existing water quality where high quality waters constitute an outstanding natural resource (e.g. waters of National and State parks and wildlife refuges or exceptional recreational or ecological significance); and compliance with Section 316 of the Act where potential water quality impairment is associated with a thermal discharge.

ii. Discharge Limitations: No numeric limitations are proposed at this time. In accordance with 40 CFR 122.44(k), the EPA has required a series of Best Management Practices, in the form of a comprehensive SWMP, in lieu of numeric limitations. Numeric limitations will be included in the final permit if required by the State es e condition for certification of the permit under Section 401 of the Act.

VOL 22 0069

12. **STORM WATER MANAGEMENT PROGRAM.** The SWMP submitted by the permittees was required to contain program elements for each of the items in **Table A.**

Table A - Storm Water Management Program Elements

Required Program Element	Permit Parts	Regulatory References (40 CFR 122.26)
Structural Controls	II.A.1	(d)(2)(iv)(A)(1)
Areas of new development & significant redevelopment	II.A.2	(d)(2)(iv)(A)(2)
Roadways	II.A.3	(d)(2)(iv)(A)(3)
Flood Control Projects	II.A.4	(d)(2)(iv)(A)(4)
Pesticides, Herbicides, & Fertilizers Application	II.A.5, A.10.c	(d)(2)(iv)(A)(6)
Illicit Discharges and Improper Disposal	II.A.6, A.10.a-.b	(d)(2)(iv)(B)(1)-(3), (iv)(B)(7)
Spill Prevention and Response	II.A.7	(d)(2)(iv)(B)(4)
Industrial and High Risk Runoff	II.A.8, A.11.c	(d)(2)(iv)(C), (iv)(A)(5)
Construction Site Runoff	II.A.9	(d)(2)(iv)(D)
Public Education	II.A.10	(d)(2)(iv)(A)(6), (iv)(B)(5), (iv)(B)(6)
Monitoring Program	II.A.11, V	(d)(2)(iv)(B)(2), (iii), (iv)(A), (iv)(C)(2)

Federal regulations [40 CFR 122.26(d)(2)(iv)] authorize separate proposed programs for co-permittees, and imposition of controls for different areas of the MS4 on a watershed, jurisdiction, or individual outfall basis. Due to differences in climate, topography, historical development patterns, legal authority, sensitivity of receiving waters, and many other factors; the EPA believes some flexibility in prioritizing the scope and timing of individual program elements must be afforded the permittees. The standard of reducing the pollutants to the maximum extent practicable, is therefore applied to the SWMP as a whole, rather than to each individual program element. The EPA believes this approach is in accordance with Section 402(p)(3)(B) of the Act and the intent of Congress. For the purposes of this document the SWMP is considered a single document attached to the permit with each permittee's individual SWMP constituting a "chapter". All references to SWMP refer to this single "combined" document.

The following summarize the SWMP elements submitted by the permittee(s) to satisfy the requirements. Where elements were deemed by the EPA to require augmentation, or where significant submittals were indicated in the SWMP, schedules were included in Part III of the permit. Dates contained in the Part III schedules were based on the assumption that the permit will have an effective date of March 1, 1995, and may be adjusted appropriately if this date is significantly delayed or if comments received on the draft permit during the public comment period warrant.

a. Structural Controls: The MS4 and any storm water structural controls shall be operated in manner to reduce the discharge of pollutants to the Maximum Extent Practicable.

Oklahoma City will maintain and inspect the MS4's structural controls owned or operated by the City. Permittees will update the SWMP to include operation and maintenance procedures and schedules for storm water structural controls by July 1, 1996

b. Areas of New Development and Significant Redevelopment: A comprehensive master planning process (or equivalent) to develop, implement, and enforce controls to minimize the discharge of pollutants from areas of new development and significant re-development after construction is completed.

Oklahoma City has existing ordinances regulating development, and is in the process of updating these ordinances to better address water quality concerns. The policy described in the SWMP includes reliance on existing and proposed policies for permitting development and construction. The City is currently working on revisions to local ordinances and procedures for new and significant redevelopment. The permit requires the

VOL 22 0070

City to complete any necessary revisions to ordinances or rules and update the SWMP to include criteria and procedures for determining end enforcing requirements for structurel and non-structural controls on new and significent by July 1, 1997. The City has proposed establishment of e master plan for development, which would be developed on a besin by besin basis. Education of building inspectors and the regulated community on current and future locel requirements hes already begun.

ODOT end OTA, if included as permittees, will be required to adopt programs for controlling runoff from new roadwey drainage systems by July 1, 1996.

The permit requires the City and any co-permittees to develop (or adopt) a guidence manual of planning technical criterie to address weter quality concerns for davelopment projects after construction by July 1, 1997, end implement the development control progrems by July 1, 1998.

c. Roadways: Public streets, roeds, and highways shall be operated and maintained in a manner to minimize discharge of pollutants, including those pollutants related to deicing or sanding activities.

Oklahoma City has a progrem for the operation and maintenance of public roadweys to minimize the discharge of pollutents. The current progrem includes sweeping of streets for the removal of trash, litter, and sediment and a litter and debris removal program. Oklehoma City's Public Education Program will include elements for litter prevention.

The permit requires updating the SWMP to include specific procedures and schedules for roadway operation and maintenance, by all co-permittees, by July 1, 1995, but actual implementation of this program would be required to start by July 1, 1995. ODOT and OTA would also be responsible for preperation of additional information on the roedway storm sewers they operate, primarily for management and planning purposes, during the first year of the permit.

d. Flood Control Projects: Impacts on receiving water quality impacts shall be assessed for all flood control projects. The feasibility of retro-fitting existing structural flood control devices to provide additional pollutant removal from storm water shall be evaluated.

Permittees are required to prepare criteria to assure that flood control projects are assessed for the projects' impact on water quality; and evaluete existing flood control devices to determine if retrofitting is feasible. The Flood Control Program will added to the SWMP by July 1, 1996, with implementation beginning by July 1, 1996.

e. Pesticide, Herbicide, and Fertilizer Application: Each permittee shall implement controls to reduce the discharge of pollutants related to the storage and application of pesticides, herbicides, and fertilizers applied, by the permittee's employees or contractors, to public property.

A public education program is under development to increase public awereness on the impacts of improper storege and use of herbicides, fertilizers end pesticides. The permit requires permittees implement annual training and education on herbicide, pesticide, and fertilizer use by July 1, 1995.

f. Illicit Discharges and Improper Disposal: An ongoing program to detect and eliminate illicit discharges and improper disposal into the MS4. Non-storm water discharges shall be effectively prohibited. However, the permittee may allow certain non-storm water discharges as listed in 122.26(d)(2)(iv)(B)(1). The SWMP shall identify any allowed non-storm water discharges, along with any conditions placed on discharges.

Implementation of a public education progrem on illicit discharges and improper disposal is required by July 1, 1995. Oklahoma City, and any co-permittees will be required to submit e list of non storm water discharges that are allowed or not allowed to discharge to the MS4 and reasons for these determinations by October 15, 1995.

Each permittee shall prevent (or require the operator of the sanitary sewer to eliminate) unpermitted discharges of dry and wet weather overflows from sanitary sewers into the MS4. Each permittee shall limit

VOL 22

0071

the infiltration of seepage from sanitary sewers into the MS4.

Oklahoma City currently implements a program for maintenance of the sanitary sewer system. The City is required to update the SWMP to include a program for limiting seepage from sanitary sewers into separate storm sewers by October 15, 1995. Neither OTA nor ODOT operate any sanitary sewers.

The discharge of floatables (e.g.: litter and other human generated solid refuse) into the MS4 shall be reduced.

The permittees have litter control programs. The permit requires permittees to implement a floatables control education program by July 1, 1995, install two floatables monitoring stations by July 1, 1995, and complete a study for targeting of floatables controls and a schedule for implementation by July 1, 1997.

The discharge or disposal of used motor vehicle fluids, household hazardous wastes, grass clippings, leaf litter, and animal wastes into the MS4 shall be prohibited. The permittees shall ensure the implementation of programs to collect used motor vehicle fluids (at a minimum, oil and antifreeze) for recycle, reuse, or proper disposal and to collect household hazardous waste materials (including paint, solvents, pesticides, herbicides, and other hazardous materials) for recycle, reuse, or proper disposal.

Oklahoma City plans to implement a public education program aimed at proper management and disposal of household hazardous waste and used motor fluids. Semi-annually, the City will be having a collection event for household hazardous wastes and by July 1, 1997, will be completing a study on alternatives for a long term plan which will also include opportunities for dropoff of certain materials on a more frequent basis.

ODOT and OTA address used motor vehicle fluids at their vehicle maintentance yards. It is anticipated that OTA and ODOT would participate in public education on household hazardous waste, but would serve in more of a support capacity (e.g. traffic control, signs, public service announcements, other contributions of resources, etc.) for collection events.

A program to locate and eliminate illicit discharges and improper disposal into the MS4 shall be implemented. This program shall include dry weather screening activities to locate portions of the MS4 with suspected illicit discharges and improper disposal. Follow-up activities to eliminate illicit discharges and improper disposal may be prioritized on the basis of magnitude and nature of the suspected discharge; sensitivity of the receiving water; and/or other relevant factors. This program shall establish priorities and schedules for screening (described in Part II.A.11.a and b.) the entire MS4 at least once per five years. Facility inspections may be carried out in conjunction with other permittee programs (e.g. pretreatment inspections of industrial users, health inspections, fire inspections, etc.), but must include random inspections for facilities not normally visited by the permittee.

Oklahoma City will conduct an on-going system wide dry weather screening program for the MS4, with at least 20% of the system screened each year. ODOT and OTA would be included in this program. Oklahoma City will also be inspecting industrial and commercial facilities.

Each permittee shall require the elimination of illicit discharges as expeditiously as possible and the immediate ending of improper disposal practices upon identification of responsible parties. Where elimination of an illicit discharge within thirty (30) days is not possible, the permittee shall require an expeditious schedule for removal of the discharge.

By October 15, 1995, the permittee(s) must update the SWMP to include follow-up activities, with priorities and schedules, for suspected illicit discharges, and expeditious elimination of identified sources of such discharges.

g. Spill Prevention and Response: A program to prevent, contain, and respond to spills that may discharge into the MS4 shall be implemented. The spill response program may include a combination of spill response actions by the permittee (and/or another public or private entity), and legal requirements for private

VOL 22 0072

entities within the permittees' jurisdiction.

Oklahoma City currently implements a spill response program as part of general public protection. ODOT and OTA also participate in spill response on their roadway rights of way. The permit requires incorporation of spill response procedures as part of the SWMP by October 1, 1995.

h. Industrial & High Risk Runoff: A program to identify and control pollutents in storm water discharges to the MS4 from municipal landfills; other treatment, storage, or disposal facilities for municipal waste (e.g. transfer stations, incinerators, etc.); hazardous waste treatment, storage, disposal and recovery facilities and facilities that are subject to EPCRA Title III, Section 313; and any other industrial or commercial discharge the permittee determines are contributing a substantial pollutant loading to the MS4 shall be implemented. The program shall include inspections, a monitoring program (described in Part II.A.11.c), and a list of industrial storm water sources discharging to the MS4 shall be maintained and update as necessary.

Oklahoma City will be implementing a storm water permitting program for high risk runoff, complete with enforcement and inspection programs. The permit contains compliance schedules for the implementation of this program by July 1, 1996. ODOT and OTA are not expected to have any high risk facilities discharging into their storm sewers that are not addressed under the Oklahoma City program.

I. Construction Site Runoff: A program to reduce the discharge of pollutants from constructions sites shall be implemented. This program shall include: requirements for the use and maintenance of appropriate structural and nonstructural control measures to reduce pollutants discharged to the MS4 from construction sites; inspection of construction sites and enforcement of control measures requirements; appropriate education and training measures for construction site operators; and notification of appropriate building permit applicants of their potential responsibilities under the NPDES permitting program for construction site runoff.

Oklahoma City has already begun educations efforts aimed at both City personnel and the regulated community. A formalized construction site runoff pollution prevention program, including permitting of construction site operators, is under development. The program will be fully implemented by July 1, 1998.

OTA and ODOT are already subject to Federal storm water permitting requirements for construction sites disturbing over five acres. Incorporation of a comprehensive program for controlling runoff form roadway projects during construction would follow the same schedule proposed for Oklahoma City, but would not delay ongoing activities.

J. Public Education: A public education program with the following elements shall be implemented: (a) a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or improper disposal of materials into the MS4; (b) a program to promote, publicize, and facilitate the proper management and disposal of used oil and household hazardous wastes; and (c) a program to promote, publicize, and facilitate the proper use, application, and disposal of pesticides, herbicides, and fertilizers by public, commercial, and private applicators and distributors.

Oklahoma City plans a series of public education activities on the following topics: general awareness on storm water quality; proper use and storage of pesticides, fertilizers, etc.; compliance with local development and construction site controls; illicit discharges and improper disposal (including a storm water hotline); and implementation of the Storm Water Management Program. The City anticipates using public meetings, brochures, public access TV, classroom instruction materials, etc. as part of the public education program. ODOT and OTA would be expected to cooperate in these efforts.

k. Monitoring Programs: The following monitoring programs shall be implemented in eddition to the monitoring required by Part V. of the permit:

Dry Weather Screening Program; Discussed above under Illicit Discharges and Improper Disposal.

Wet Weather Screening Program; Oklahoma City anticipates using a simple biological indicator for screening the relative quality of storm water from different portions of the MS4. This program will be

VOL 22 0073

developed by July 1, 1995.

Industrial and High Risk Runoff Monitoring Program. Oklahoma City will develop an Industrial and High Risk Monitoring Program. The program will be completed by July 1, 1995, with screening of the entire system by July 1, 1999.

13. **STORM WATER MANAGEMENT PROGRAM COMPLIANCE.** Compliance with Part II.A will be accomplished by the implementation of and compliance with the described activities of the various elements of the permittees' SWMP, as modified by compliance schedules contained in the Part III. Permittees' must fully implement the SWMP, except as indicated Part III, within 90 days from permit issuance. At the end of the 90 days all the required support and initiation procedures for Program elements should be established, and the elements' activities performed as described and scheduled.

The SWMP contains implementation schedules for some of the program elements. In addition there are SWMP augmentation schedules in Part III of the permit. The schedules in Part III will take precedence in the case of any conflict between the Part III schedules and the SWMP schedules. Permittees adherence to the SWMP, including implementation schedules contained in the SWMP, and schedules contained in Part III will be considered compliance with Part II.A of the permit.

14. **ROLES AND RESPONSIBILITIES OF PERMITTEES.** The regulation 40 CFR 122.26(d)(2)(vii) requires permittees to describe the roles and responsibilities of each entity applying for the permit to ensure effective coordination. Interagency Agreements are the means by which the permittees propose to implement the SWMP and monitoring program. Each of the permittees plan to implement their individual programs on the portion of the system which they own and operate. Permittees are accountable for understanding their role and responsibilities regarding permit conditions.

15. **PERMITTEES LEGAL AUTHORITY.** The permittees are required to have the legal authority necessary to successfully enforce, implement, and complete the various activities described in the permit and SWMP. Oklahoma City stated in the application that adequate legal authority exists or is being sought for the following requirements: control the contribution of pollutants to, and quality of storm water from industrial sites contributing to the storm sewer system; prohibit illicit discharges to the storm sewer system; control spills, dumping or improper disposal to the storm sewer system; control of the contribution of pollutants from one portion of the storm sewer system to the other; require compliance with ordinances; perform site inspections and monitoring.

16. **PERMITTEES RESOURCES.** Part II.F. of the permit requires permittees to provide adequate support capabilities to implement their activities under the SWMP. Compliance with Part II.F. will be demonstrated by the permittees ability to fully implement the SWMPs, monitoring programs, and other permit requirements. The permit does not require specific funding or steffing levels, thus providing the permittees the ability, and incentive, to adopt the most efficient and cost effective methods to comply with permit requirements.

17. **TYPE AND QUANTITY OF POLLUTANT PARAMETERS DISCHARGED.** Table B is a summary of some of the permittees' application representative monitoring deta.

Table B - Representative Monitoring Data

Parameter (pounds/year)	Annual Loading Estimates from Permit Application MS4 and Major Watershed Totals				
	System Annual Loading	Deer Creek	Deep Fork	North Canadian	South Canadian
Biochemical Oxygen Demand (BOD_5)	113,563	12,100	36,800	47,700	17,000
Chemical Oxygen Demand (COD)	777,853	114,000	192,000	319,000	153,000
Total Suspended Solids (TSS)	694,337	42,000	220,000	378,000	54,900
Dissolved Solids	19,200,000	3,000,000	3,410,000	6,710,000	6,100,000

VOL 22 0074

Parameter (pounds/year)	Annual Loading Estimates from Permit Application MS4 and Major Watershed Totals				
	System Annual Loading	Deer Creek	Deep Fork	North Canadian	South Canadian
Nitrate + Nitrite	24,148	2,280	3,260	13,700	4,930
Ammonia + Organic Nitrogen (TKN)	36,515	4,830	8,810	13,500	9,380
Total Phosphorus	8442	943	1,270	3,860	2,380
Total Cadmium	16.1	2.4	3.6	6.4	3.7
Total Copper	276.5	26.7	54.1	138.6	57
Total Lead	715.6	68.4	132.5	378	136.6
Total Zinc	1683.0	198.1	401	820	263.5
Oil & Grease	1,340,000	116,500	156,000	579,000	485,000
Total Thallium	117.9	31.7	41.2	64.4	40.6
Total Mercury	7.4	0.7	0.9	5.0	0.9

The permittees sampled five locations which were selected to provide representative data on the quality and quantity of discharges from the Oklahoma City MS4 as a whole. Parameters sampled included conventional, non-conventional, organic toxics, and other toxic pollutants. The EPA reviewed this information during the permitting process. Monitoring data was intended to be used by the permittees to assist in their determination of appropriate storm water management practices. EPA used the data to review the application and to determine pollutants of concern discharging from the MS4 that should be monitored during the permit term.

18. MONITORING AND REPORTING.

a. Reports Required: Permittees are required (40 CFR 122.42(c)(1)) to contribute to the preparation of an annual system-wide report including status of implementing the SWMP; proposed changes to the SWMPs; revisions, if necessary, to the assessments of controls and the fiscal analysis reported in the permit application; a summary of the data, including monitoring data, that is accumulated throughout the reporting year; annual expenditures and the budget for the year following each annual report; a summary describing the number and nature of enforcement actions, inspections, and public education programs; and identification of water quality improvements or degradation. The permittees are required to do annual evaluations on the effectiveness of the SWMP, and institute or propose modifications necessary to meet the overall permit standard of reducing the discharge of pollutants to the maximum extent practicable. In order to allow the orderly collection of budgetary and monitoring data it was determined to allow the annual report due date to relate to the permittees' annual fiscal year and monitoring seasons. Oklahoma City's fiscal year and first dry season ends on June 31st, the annual report is due October 15th. Copies of these reports will be available to the public.

b. Monitoring: The permittees are required (40 CFR 122.26(d)((2)(iii)(C) and (D)) to monitor the MS4 to provide data necessary to assess the effectiveness and adequacy of SWMP control measures; estimate annual cumulative pollutant loadings from the MS4; estimate event mean concentrations and seasonal pollutants in discharges from major outfalls; identify and prioritize portions of the MS4 requiring additional controls, and identify water quality improvements or degradation. The permittees are responsible for conducting any additional monitoring necessary to accurately characterize the quality and quantity of pollutants discharged from the MS4.

Due to the variability of storm water discharges, the cost of the monitoring program needs to be balanced with the monitoring objectives and the more important goal of actually implementing controls that will directly effect the quality of the storm water discharged. However, the municipalities must realize that the EPA will have to make future permitting decisions based on the monitoring data collected during the permit

VOL 22 0075

term. The public will also be looking for evidence of pollutant reductions. Where the required permit term monitoring proves insufficient to show pollutant reductions, the EPA may be forced to resort to limitations in the next permit. Two types of monitoring are required by the permit: storm event representative monitoring and floatables monitoring.

i. Representative monitoring. The monitoring of the discharge of representative outfalls during actual storm events will provide information on the quality of runoff from the MS4, a basis for estimating annual pollutant loads, and a mechanism to evaluate reductions in pollutants discharged from the MS4. Results from the monitoring program will be submitted annually on Discharge Monitoring Reports.

(1) Requirements: The permittees are required to monitor for the parameters listed in Table V.A.1.a of the permit throughout the permit term. Monitoring will be conducted at the five monitoring locations indicated in Table V.A.1.b. of the permit.

(a) Parameters: The EPA established permit parameter monitoring requirements based on the information available regarding storm water discharges and potential impacts of these discharges. The basic parameter list allows satisfaction of the regulatory requirement [40 CFR 122.26(d)(2)(iii)] to provide estimates of pollutant loadings for each major outfall. Total mercury for all outfalls, total thallium for outfalls 001 and 005, and priority pollutants listed at 40 CFR 122, Appendix D, Table II for outfalls 002, 004, and 005 were added based on review of application monitoring results that indicate the need for additional information.

The monitoring of Diazinon is required due to the EPA's experience with other MS4 and POTW treatment plant discharge monitoring data. It was not included in the application monitoring requirements and therefore it was not indicated if Diazinon is a problem for the Oklahoma City MS4 but it is reasonable to assume that it is present in the MS4's discharge. Diazinon will serve as an indicator of the effectiveness of public education programs designed to reduce pollution from pesticides, fertilizer, and herbicide use.

(b) Frequency: The frequency of annual monitoring is based on monitoring at least one representative storm event per season. The four seasons in the Oklahoma City area are as follows: July - October, November - February, and March - June. The permittees are to monitor once per season. Monitoring frequency is based on permit year, not a calendar year. The first complete calendar year monitoring could be less than the stated frequency.

(2) Representative Monitoring - Rapid Bioassessment Option. Biological monitoring techniques offer the ability to indirectly assess the quality of storm water discharges from the municipal separate storm sewer system by assessing the "health" of the receiving water. Rapid bioassessment protocols evaluate the number, diversity, and relative "pollution tolerance" of aquatic species in the receiving waterbodies (e.g. streams, rivers, lakes, estuaries, etc.). Either fish or benthic organisms (bottom-dwelling insects, etc. that serve as food supply for higher organisms) can be studied. Comparing the types and numbers of organisms collected from waterbodies receiving discharges from the MS4 to those collected from a "reference site" relatively un-impacted by urban runoff, provides an indication of how degraded the waterbody is. For example, a healthy stream would typically have greater species diversification and a higher number of species that require clean water to survive and reproduce. A degraded stream would have relatively fewer species and a larger proportion of species that are tolerant of pollution.

While rapid bioassessments do not directly measure the quality of storm water discharges, they can be an important (and cost effective) tool in tracking trends in water quality. The permittees will be given the option of replacing a portion of the parameter representative monitoring required by the permit with a rapid bioassessment monitoring program. Upon approval by the EPA, the permittees may

VCI 22

0076

R0065312

replace the representative monitoring for years 2, 3, and 5 with rapid bioassessment of at least two receiving waters plus a reference site. Representative monitoring of actual storm water discharges will still be required during years 1 and 4.

ii. Floatebles Monitoring. Installation of two floatables monitoring stations will be accomplished to investigate trends in water quality issues related to manmade debris and floatables. The comparison of yearly monitoring results should allow the permittees and the EPA to assess the impact of the SWMP elements as they relate to the reduction and elimination of floatables discharge from the MS4.

19. **PERMIT MODIFICATIONS.**

a. Reopener Clause: The EPA may reopen and require modifications to the permit (including the SWMP) based on the following factors: changes in the State's Water Quality Management Plan and State or Federal requirements; adding permittees; SWMP changes impacting compliance with permit requirements; other modifications deemed necessary by the EPA to adhere to the requirements of the Act. Implementation of the SWMP is expected to result in the protection of water quality standards. The permit does, however, contain a reopener clause should new information indicate the discharges from the MS4 are causing, or significantly contributing to, a violation of the State's water quality standards.

b. Other changes: The EPA has attempted to develop permit language to clarify the permit requirements concerning possible changes to the SWMP, permittees status, and other changes.

i. Terminated Permittees: The process for terminating coverage for an existing permittee shall adhere to the regulations 40 CFR 122.64. A notice of intent to terminate will be issued in accordance with draft permit procedures.

ii. SWMP Changes: The SWMP is intended as a functioning mechanism for the permittees' use. Therefore minor changes and adjustments to the various SWMP elements are expected. Incorporating this form of document into an NPDES permit has some inherent conflicts. The regulatory rules concerning permit changes and modifications do not easily translate to the minor changes that will be necessary to occur to the various elements during the permit term. The changes may be necessary to more successfully adhere to the goals of the permit. The EPA has determined that these minor changes that are specifically described in the permit shall not be considered permit modifications as defined in the regulations. Part II.G.2. of the permit describes the allowable procedure for the permittees to perform additions and minor changes to the SWMP. This section in no way implies that the permittees are allowed to impact or change elements that directly relate to permit conditions for the SWMP. Any changes requested by the permittees shall be reviewed by the EPA. The EPA has 60 days to respond to the permittees and inform them if the suggested changes will impact or change the SWMP's compliance with a permit requirement and therefore are either disallowed or requires a formal permit modification procedure.

iii. Additions: The EPA's intent is to allow the permittees to annex lands and accept the transfer of operational authority over portions of the MS4 without mandating a permit modification. Implementation of appropriate SWMP elements for these additions (annexed land or transferred authority) is required. Upon notification of the additions in the Annual Report the EPA may require a modification to the permit based on the new information.

iv. Monitoring outfalls: The permit is issued on a system-wide basis in accordance with Section 402(p)(3)(i) of the Act and authorizes discharges from all portions of the MS4 owner or operated by the permittees. Since all outfalls are authorized, changes in monitoring locations, other than those with specific numeric effluent limitations, shall be considered minor modifications to the permit and will be made in accordance with the procedures at 40 CFR 122.63.

VOL 22

0071

20. **CONSIDERATIONS UNDER FEDERAL LAW.** The discharge which is being controlled by the terms of this permit is the result of natural precipitation, and as such would continue to be discharged regardless of the federal action represented here. The terms of this permit do require that the municipalities minimize or reduce to the maximum extent practicable the pollutants in the storm water runoff from the municipality. We believe therefore that this permit will not effect any listed endangered or threatened species, and/or critical habitat.

Based on the information provided to date no sites listed or eligible for listing in the National Historic Register will be effected by proposed activities to reduce pollutants in the permittees' natural runoff. The applications for this permit were forwarded to the Oklahoma State Historical Preservation Officer (SHPO) for comment. No comments were received. Standard permit condition Part VI.U. in the draft permit requires the permittees to provide information to the SHPO thirty days prior to commencing earth disturbing activities. Only activities meeting all of the following criteria are subject to this permit condition: 1) is a permittee conducted activity for implementing permit requirements; 2) excavation and/or construction; and 3) disturbance of previously undisturbed land. Assuming they meet the criteria listed above some examples of activities subject to the permit condition include, but are not limited to: retention/detention basin construction; storm drain line construction; infiltration basin construction; dredging; and stabilization projects (e.g., retaining walls, gabions). The requirement to submit information on plans for future earth disturbing is not intended for activities such as: maintenance; and private development construction projects.

21. **STATE CERTIFICATION OF THE DRAFT PERMIT.** Concurrently with Public Notice of today's draft permit, the EPA is formally requesting State Certification of the permit, as required by Section 401(a)(1) of the Act, and 40 CFR 124.53. The final permit will contain any condition required by the State as a condition for Certification.

NPDES Permit No. OKS000101

AUTHORIZATION TO DISCHARGE UNDER THE
NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

In compliance with the provisions of the Clean Water Act, 33 U.S.C. 1251 *et seq.*, as amended by the Water Quality Act of 1987, P.L. 100-4, the "Act",

Oklahoma City
Department of Public Works
420 West Main, 7th Floor
Oklahoma City, Oklahoma 73102

is(are) authorized to discharge, in accordance with the Storm Water Management Program(s), effluent limitations, monitoring requirements, and other provisions set forth in Parts I, II, III, IV, V, VI, VII, and VIII herein,

from all portions of the Oklahoma City Municipal Separate Storm Sewer System (MS4) owned or operated by any permittee listed above, to waters of the United States.

This permit will become effective <insert effective date>.

This permit and the authorization to discharge under the National Pollutant Discharge Elimination System shall expire at midnight, on <insert date 5 years from the effective date>.

Signed this day of

Brent E. Larsen
Environmental Scientist
Municipal Section (6W-PM)

Myron O. Knudson, P.E.
Director
Water Management Division (6W)

VOL 22 0080

R0065316

PART I. DISCHARGES AUTHORIZED UNDER THIS PERMIT.

A. **Permit Area.** This permit covers all areas located within the corporate boundary of the city of Oklahoma City that are served by municipal separate storm sewers owned or operated by the permittee(s).

B. **Authorized Discharges.**

1. Except for discharges prohibited under Part I.B.2, this permit authorizes all existing or new storm water point source discharges to waters of the United States from those portions of the Municipal Separate Storm Sewer System owned or operated by the permittee(s).

2. The following discharges, whether discharged separately or commingled with municipal storm water, are not authorized by this permit:

a. *Non-storm Water and Industrial Storm Water:* discharges of non-storm water; any Storm Water Discharge Associated with Industrial Activity; or other storm water discharges required to obtain an NPDES permit, except where such discharges are:

(1) regulated by a separate NPDES permit (or the discharger has applied for such permit); or

(2) identified by and in compliance with Part II.A.6.a.

b. *Spills:* discharges of material resulting from a spill. Where discharge of material resulting from a spill is necessary to prevent loss of life, personal injury, or severe property damage, the permittee(s) shall take, or insure the responsible party for the spill takes, all reasonable ateps to minimize or prevent any adverse effects on human health or the environment. (See also Part II.A.7 and Part VI.E.) This permit does not transfer liability for a spill itself from the party(ies) responsible for the spill to the permittee(s) nor relieve the party(ies) responsible for a spill from the reporting requirements of 40 CFR Part 117 and 40 CFR Part 302.

C. **Permittee Responsibilities.**

1. Each permittee is responsible for:

a. Compliance with permit conditions relating to discharges from portions of the Municipal Separate Storm Sewer System where the permittee is the operator;

b. Storm Water Management Program implementation on portions of the Municipal Separate Storm Sewer System where the permittee is the operator;

c. Compliance with annual reporting requirements as specified in Part V.C.;

d. Collection of representative wet weather monitoring data required by Part V.A., according to such agreements as may be established between permittees; and

VOL 22 0081

R0065317

e. A plan of action to assume responsibility for implementation of storm water management and monitoring programs on their portions of the Municipal Separate Storm Sewer System should interjurisdictional agreements allocating responsibility between permittees be dissolved or in default.

2. Permittees are jointly responsible for permit compliance on portions of the Municipal Separate Storm Sewer System where operational or Storm Water Management Program implementation authority over portions of the Municipal Separate Storm Sewer System is shared or has been transferred from one permittee to another in accordance with legally binding agreements.

D. **Discharge Goals.**

The following goals are established for discharges from the Municipal Separate Storm Sewer System:

1. No discharge of toxics in toxic amounts.

2. No discharge of pollutants in quantities that would cause a violation of State Water Quality Standards.

3. No discharge of floatable debris, oils, scum, foam, or grease in other than trace amounts.

4. No discharge of non-storm water from the municipal separate storm sewer system (except as provided in Part I.B.2.).

5. No degradation or loss of State-designated beneficial uses of receiving waters as a result of storm water discharges from the municipal separate storm sewer (unless authorized by the State in accordance with the State's Antidegradation Policy).

VOL 22

00082

R0065318

PART II. STORM WATER POLLUTION PREVENTION & MANAGEMENT PROGRAM(S).

Each permittee shall contribute to the development, revision and implementation of a comprehensive Storm Water Management Program including pollution prevention measures, treatment or removal techniques, storm water monitoring, use of legal authority, and other appropriate means to control the quality of storm water discharged from the Municipal Separate Storm Sewer System. The Storm Water Management Program shall be implemented in accordance with Section 402(p)(3)(B) of the Act, and the Storm Water Regulations (40 CFR Part 122.26).

Controls and activities in the Storm Water Management Program shall identify areas of permittee responsibility on a jurisdiction, applicability, or specific area basis. The Storm Water Management Program shall include controls necessary to effectively prohibit the discharge of non-storm water into municipal separate storm sewers and reduce the discharge of pollutants from the Municipal Separate Storm Sewer System to the Maximum Extent Practicable (MEP).

The Storm Water Management Program shall cover the term of the permit and shall be updated as necessary, or as required by the Director, to ensure compliance with the statutory requirements of Section 402(p)(3)(B) of the Act. Modifications to the Storm Water Management Program shall be made in accordance with Parts II.G., and III. Compliance with the Storm Water Management Program and any schedules in Part III. shall be deemed compliance with Parts II.A, and II.B. The Storm Water Management Program, and all updates made in accordance with Part II.G., are hereby incorporated by reference.

Implementation of the Storm Water Management Program may be achieved through participation with other permittees, public agencies, or private entities in cooperative efforts to satisfy the requirements of Part II. in lieu of creating duplicate program elements for each individual permittee. The Storm Water Management Program, taken as a whole, shall achieve the "effective prohibition on the discharge of non-storm water" and "MEP" standards from Section 402(p)(3)(B) of the Act.

A. <u>Storm Water Management Program Requirements.</u>

1. *Structural Controls and Storm Water Collection System Operation:* The Municipal Separate Storm Sewer System and any storm water structural controls shall be operated in manner to reduce the discharge of pollutants to the Maximum Extent Practicable.

2. *Areas of New Development and Significant Redevelopment:* A comprehensive master planning process (or equivalent) to develop, implement, and enforce controls to minimize the discharge of pollutants from areas of new development and significant re-development after construction is completed shall be implemented. The goals of such controls shall be:

   a. New development - limiting increases in the discharge of pollutants in storm water as a result of development, and

   b. Re-development - reducing the discharge of pollutants in storm water.

3. *Roadways:* Public streets, roads, and highways shall be operated and maintained in a manner to minimize discharge of pollutants,

VOL 22 0083

R0065319

including those pollutants related to deicing or sanding activities.

4. *Flood Control Projects:* Impacts on receiving water quality shall be assessed for all flood management projects. The feasibility of retro-fitting existing structural flood control devices to provide additional pollutant removal from storm water shall be evaluated.

5. *Pesticide, Herbicide, and Fertilizer Application:* Each permittee shall implement controls to reduce the discharge of pollutants related to the storage and application of pesticides, herbicides, and fertilizers applied, by the permittee's employees or contractors, to public right of ways, parks, and other municipal property. Permittee(s) with jurisdiction over lands not directly owned by that entity (e.g. incorporated city) shall implement programs to reduce the discharge of pollutants related to commercial application and distribution of pesticides, herbicides, and fertilizers.

6. *Illicit Discharges and Improper Disposal:* Non-storm water discharges to the municipal separate storm sewer system shall be effectively prohibited.

   a. In accordance with 40 CFR 122.26(d)(2)(iv)(B)(1), certain non-storm water discharges to the municipal separate storm sewer system need not be addressed as illicit discharges or improper disposal. The Storm Water Management Program shall identify any non-storm water discharges that the permittee(s) does not prohibit, along with any conditions placed on such non-storm water discharges to the municipal separate storm sewer system. The permittee(s) shall prohibit, on a case-by-case basis, any individual non-storm water discharge (or class of non-storm water discharges) otherwise allowed under this paragraph that is determined to be contributing significant amounts of pollutants to the municipal separate storm sewer system.

   b. Each permittee shall prevent (or require the operator of the sanitary sewer to eliminate) unpermitted discharges of dry and wet weather overflows from sanitary sewers into the Municipal Separate Storm Sewer System. Each permittee shall limit the infiltration of seepage from sanitary sewers into the Municipal Separate Storm Sewer System.

   c. The permittee(s) shall ensure the implementation of a program to reduce the discharge of floatables (e.g. litter and other human-generated solid refuse). The floatables control program shall include source controls and, where necessary, structural controls.

   d. The discharge or disposal of used motor vehicle fluids, household hazardous wastes, grass clippings, leaf litter, and animal wastes into separate storm sewers shall be prohibited. The permittee(s) shall ensure the implementation of programs to collect used motor vehicle fluids (at a minimum, oil and antifreeze) for recycle, reuse, or proper disposal and to collect household hazardous waste materials (including paint, solvents, pesticides, herbicides, and other hazardous materials) for recycle, reuse, or proper disposal. Such programs shall be readily

VOL 22 0084

R0065320

available to all private residents and shall be publicized and promoted on a regular basis.

e. A program to locate and eliminate illicit discharges and improper disposal into the Municipal Separate Storm Sewer System shall be implemented. This program shall include dry weather screening activities to locate portions of the Municipal Separate Storm Sewer System with suspected illicit discharges and improper disposal (described in Part II.A.11.a.). Follow-up activities to eliminate illicit discharges and improper disposal may be prioritized on the basia of magnitude and nature of the suspected discharge; sensitivity of the receiving water; and/or other relevant factors. This program shall establish priorities and schedules for screening the entire Municipal Separate Storm Sewer System at least once per five years. Facility inspections may be carried out in conjunction with other municipal programs (e.g. pretreatment inspections of industrial users, health inspections, fire inspections, etc.), but must include random inspections for facilities not normally visited by the municipality.

f. Each permittee shall require the elimination of illicit discharges and improper disposal practices as expeditiously as reasonably possible. Where elimination of an illicit discharge within thirty (30) days is not possible, the permittee shall require an expeditioua schedule for removal of the discharge. In the interim, the permittee shall require the operator of the illicit discharge to take all reasonable and prudent measures to minimize the discharge of pollutants to the Municipal Separate Storm Sewer System.

g. The permittee(s) shall maintain, and update as necessary, a list of discharges to municipal separate storm sewers that has been issued a NPDES permit. The list shall include the name, location and NPDES permit number of the discharger.

7. *Spill Prevention and Response:* A program to prevent, contain, and respond to spills that may discharge into the Municipal Separate Storm Sewer System shall be implemented. The spill response program may include a combination of spill response actions by the permittee(s) (and/or another public or private entity), and legal requirements for private entities within the permittee's municipal jurisdiction.

8. *Industrial & High Risk Runoff:* A program to identify and control pollutants in storm water discharges to the Municipal Separate Storm Sewer System from municipal landfills; other treatment, storage, or disposal facilities for municipal waste (e.g. transfer stations, incinerators, etc.); hazardous waste treatment, storage, disposal and recovery facilities; facilities that are subject to EPCRA Title III, Section 313; and any other industrial or commercial discharge the permittee(s) determines are contributing a substantial pollutant loading to the Municipal Separate Storm Sewer System shall be implemented. The program shall include:

a. priorities and procedures for inspections and establishing and implementing control measures for such discharges;

b. a monitoring program (Part II.A.11.c.); and

VOL 22 0085

R0065321

c. a list of industrial storm water sources discharging to the Municipal Separate Storm Sewer System shall be maintained and update as necessary.

9. *Construction Site Runoff:* A program to reduce the discharge of pollutants from constructions sites shall be implemented. This program shall include:

a. requirements for the use and maintenance of appropriate structural and nonstructural best management practices to reduce pollutants discharged to the Municipal Separate Storm Sewer System during the time construction is underway;

b. inspection of construction sites and enforcement of control measures (in accordance with priorities and procedures established in the Storm Water Management Program);

c. appropriate education and training measures for construction site operators; and

d. notification of appropriate building permit applicants of their potential responsibilities under the NPDES permitting program for construction site runoff.

10. *Public Education:* A public education program with the following elements shall be implemented:

a. a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or improper disposal of materials, including floatables, into the Municipal Separate Storm Sewer System;

b. a program to promote, publicize, and facilitate the proper management and disposal of used motor vehicle fluids and household hazardous wastes.

c. a program to promote, publicize, and facilitate the proper use, application, and disposal of pesticides, herbicides, and fertilizers by the public and commercial and private applicators and distributors.

11. *Monitoring Programs:* The following monitoring programs shall be implemented in addition to the monitoring required by Part V.:

a. The *Dry Weather Screening Program* shall continue ongoing efforts to detect the presence of illicit connections and improper discharges to the Municipal Separate Storm Sewer System. All areas of the Municipal Separate Storm Sewer System must be screened at least once during the permit term. Screening methodology may be modified based on experience gained during actual field screening activities and need not conform to the protocol at 40 CFR 122.26(d)(1)(iv)(D). Sample collection and analysis need not conform to the requirements of 40 CFR Part 136. However, samples taken to confirm (e.g. in support of possible legal action) a particular illicit connection or improper disposal practice should conform to the requirements of 40 CFR Part 136.

VOL 22 0086

R0065322

b. *Wet Weather Screening Program:* The permittee(s) shall identify, investigate, and address areas within their jurisdiction that may be contributing excessive levels of pollutants to the Municipal Separate Storm Sewer System. The wet weather screening program:

(1) shall screen the Municipal Separate Storm Sewer System, in accordance with the procedures specified in the Storm Water Management Program.

(2) shall specify the sampling and non-sampling techniques to be used for initial screening and follow-up purposes. Sample collection and analysis need not conform to the requirements of 40 CFR Part 136. However, samples taken to confirm (e.g. in support of possible legal action) a particular illicit connection or improper disposal practice should conform to the requirements of 40 CFR Part 136.

c. The *Industrial and High Risk Runoff Monitoring Program* shall include monitoring for pollutants in storm water discharges to the Municipal Separate Storm Sewer System from municipal landfills; other treatment, storage, or disposal facilities for municipal waste (e.g. transfer stations, incinerators, etc.); hazardous waste treatment, storage, disposal and recovery facilities; facilities that are subject to EPCRA Title III, Section 313; and any other industrial or commercial discharge the permittee(s) determines are contributing a substantial pollutant loading to the Municipal Separate Storm Sewer System.

(1) Except as provided in (2) below, the monitoring program shall including the collection of quantitative data on the following constituents:

(a) any pollutants limited in an existing NPDES permit for a subject facility;
(b) oil and grease;
(c) chemical oxygen demand (COD);
(d) pH;
(e) biochemical oxygen demand, five-day (BOD_5);
(f) total suspended solids (TSS);
(g) total phosphorous;
(h) total Kjeldahl nitrogen (TKN);
(i) nitrate plus nitrite nitrogen; and
(j) any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).

Data collected by the industrial facility to satisfy the monitoring requirements of an NPDES or State discharge permit may be used to satisfy this requirement. Permittee(s) may require the industrial facility to conduct self-monitoring to satisfy this requirement.

(2) Alternative Certification: In lieu of monitoring, the permittee(s) may accept a certification from a facility that raw and waste materials, final and intermediate products, by-products, material handling equipment or activities, industrial machinery or operations, or significant materials from past industrial activity are not presently exposed to storm water and are not expected to be exposed to storm

VOL 22 0087

R0065323

water for the certification period. Where the permittee(s) accept a "no exposure" certification, the permittee(s) shall conduct at least one site inspection of the facility every five years to verify facility's "no exposure" exemption.

B. **Area-specific Storm Water Management Program Requirements.** Reserved.

C. **Deadlines for Program Implementation.** Except as provided in Part III., full implementation of the Storm Water Management Program shall begin within 90 days from the effective date of the permit.

D. **Roles and Responsibilities of Permittee(s).** The Storm Water Management Program, together with any attached interagency agreements, shall clearly identify the roles and responsibilities of each permittee.

E. **Legal Authority.** Each permittee shall ensure legal authority to control discharges to and from those portions the Municipal Separate Storm Sewer System over which it has jurisdiction. This legal authority may be a combination of statute, ordinance, permit, contract, order or inter-jurisdictional agreements with permittees with existing legal authority to:

1. Control the contribution of pollutants to the Municipal Separate Storm Sewer System by Storm Water Discharges Associated with Industrial Activity and the quality of storm water discharged from sites of industrial activity;

2. Prohibit illicit discharges to the Municipal Separate Storm Sewer System;

3. Control the discharge of spills and the dumping or disposal of materials other than storm water (e.g. industrial and commercial wastes, trash, used motor vehicle fluids, leaf litter, grass clippings, animal wastes, etc.) into the Municipal Separate Storm Sewer System;

4. Control through interagency or interjurisdictional agreements among permittees the contribution of pollutants from one portion of the Municipal Separate Storm Sewer System to another;

5. Require compliance with conditions in ordinances, permits, contracts or orders; and

6. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance with permit conditions.

F. **Storm Water Management Program Resources.** Each permittee shall provide adequate finances, staff, equipment, and support capabilities to implement their activities under the Storm Water Management Program.

G. **Storm Water Management Program Review and Update.**

1. *Storm Water Management Program Review:* Each permittee shall participate in an annual review of the current Storm Water Management Program in conjunction with preparation of the annual report required under Part V.C.

2. *Storm Water Management Program Update:* The permittee(s) may change the Storm Water Management Program during the life of the permit in accordance with the following procedures:

VOL 22

0088

R0065324

a. The approved Storm Water Management Program shall not be changed by the permittee(s) without the approval of the Director, unless in accordance with Parts II.G.2.b., c., or d.

b. Changes adding (but not subtracting or replacing) components, controls, or requirements to the Storm Water Management Program may be made by the permittee(s) at any time upon written notification to the Director.

c. Changes replacing an ineffective or unfeasible BMP specifically identified in the Storm Water Management Program with an alternate BMP may be requested at any time. Unless denied by the Director, changes proposed in accordance with the criteria below shall be deemed approved and may be implemented by the permittee(s) 60 days from submittal of the request. Such requests shall include the following:

(1) an analysis of why the BMP is ineffective or infeasible (including cost prohibitive),

(2) expectations on the effectiveness of the replacement BMP, and

(3) an analysis of why the replacement BMP is expected to achieve the goals of the BMP to be replaced.

d. Changes resulting from schedules contained in Part III. may be requested following completion of an interim task or final deadline. Unless denied by the Director, proposed changes meeting the criteria contained in the applicable Part III schedule shall be deemed approved and may be implemented by the permittee(s) 60 days from submittal date.

e. Change requests or notifications shall be made in writing, signed in accordance with Part VI.H. by all directly effected permittees, and include a certification that all permittees were given an opportunity to comment on proposed changes prior to submittal to the Director.

3. *Storm Water Management Program Updates Required by the Director:* The Director may require changes to the Storm Water Management Program as needed to:

a. address impacts on receiving water quality caused, or contributed to, by discharges from the Municipal Separate Storm Sewer System;

b. include more stringent requirements necessary to comply with new State or Federal statutory or regulatory requirements; or

c. include such other conditions deemed necessary by the Director to comply with the goals and requirements of the Clean Water Act.

Changes requested by the Director shall be made in writing, set forth the time schedule for the permittee(s) to develop the changes, and offer the permittee(s) the opportunity to propose

VOL 22 0089

R0065325

alternative program changes to meet the objective of the requested modification. All changes required by the Director shall be made in accordance with 40 CFR 124.5, 40 CFR 122.62, or as appropriate 40 CFR 122.63.

4. *Transfer of Ownership, Operational Authority, or Responsibility for Storm Water Management Program Implementation:* The permittee(s) shall implement the Storm Water Management Program on all new areas added to their portion of the municipal separate storm sewer system (or for which they become responsible for implementation of storm water quality controls) as expeditiously as practicable, but not later than three years from addition of the new areas. Implementation may be accomplished in a phased manner to allow additional time for controls that cannot be implemented immediately.

   Prior to land annexation, the permittee(s) shall include a schedule for extending the Storm Water Management Program to the annexed areas in the Storm Water Management Program. At least 30 days prior to transfer of operational authority or responsibility for Storm Water Management Program implementation, all parties shall prepare a schedule for transfer of responsibility for Storm Water Management Program implementation on the affected portions of the Municipal Separate Storm Sewer System.

H. <u>Retention of Storm Water Management Program Records.</u> The permittee shall retain the Storm Water Management Program developed in accordance with Parts II. and III. for at least 3 years after coverage under this permit terminates.

VOL 22 0090

R0065326

PART III. SCHEDULES FOR IMPLEMENTATION AND COMPLIANCE.

The Permittee(s) shall comply with the following schedules for Storm Water Management Program implementation and augmentation, and permit compliance.

A. Implementation and Augmentation of Storm Water Management Program(s).

STORM WATER MANAGEMENT PROGRAM COMPONENT	ACTIVITY	RESPONSIBLE PERMITTEE(S)	DATE DUE/FREQUENCY
1. SWMP Document	a. Provide copy of each permittee's SWMP revised as necessary to reflect final permit conditions.	All[1]	June 1, 1995
2. New and Re-Development	a. Submit criteria and procedures for determining and enforcing requirements for structural and non-structural controls on new and significant re-development.	Oklahoma City	March 1, 1996
	b. Complete any necessary revisions to ordinances or rules and update SWMP to include criteria and procedures for determining and enforcing requirements for structural and non-structural controls on new and significant re-development.	Oklahoma City	July 1, 1997
	c. Submit criteria and procedures for determining requirements for structural and non-structural controls on new and significant re-construction of roads and highways.	All	Sept. 1, 1995
	d. Update SWMP to include criteria and procedures for determining requirements for structural and non-structural controls on new and significant re-construction of roads and highways.	All	July 1, 1996
	e. Prepare or adopt development criteria manual(s) for use by the permittee(s) and the regulated development/construction community.	All	July 1, 1997
	f. Begin implementation of program(s) for new and significant re-development.	All	July 1, 1998
3. Flood Control Projects and Structural Controls	a. Submit schedule and criteria for evaluating placement of structural controls (or retrofitting existing structures) on developed areas.	All	June 1, 1995

R0065327

0000

22 NOV

STORM WATER MANAGEMENT PROGRAM COMPONENT	ACTIVITY	RESPONSIBLE PERMITTEE(S)	DATE DUE/FREQUENCY
	b. Complete any necessary revisions to ordinances or rules and update SWMP to include schedule and criteria for evaluating placement of structural controls (or retro-fitting existing structures) on developed areas and a schedule for inspection and maintenance of such structural controls.	All	July 1, 1996
	c. Begin implementation of program to evaluate, prioritize, and install structural controls (or retro-fitting existing structures) on developed areas.	All	July 1, 1996
4. Construction Site Runoff	a. Submit updated construction site runoff pollution prevention program, while continuing ongoing education, control, and enforcement efforts.	All	March 1, 1996
	Complete update to construction site runoff pollution prevention program (including necessary modificaitons to local ordinances) regulating runoff from construction sites.	All	July 1, 1997
	Implement enhancements to construction site runoff program.	All	July 1, 1998
4. Roadway Operation and Maintenance	a. Submit program, including priorities and schedules, for operation and maintenance of roadways and associated separate storm sewers.	All	June 1, 1995
	b. Update SWMP to include roadway operation and management program.	All	July 1, 1995
	c. Begin implementation of roadway operation and management program.	All	July 1, 1995
5. Household Hazardous Wastes/Used Motor Vehicle Fluids	a. Provide summary of evaluation and assessment of results from various collection/recycling/safe disposal program options, including those currently underway, to determine the most applicable program for long term use which meets the criteria in b. below.	All	April 1, 1997
	b. Develop collection/recycling/safe disposal program which includes periodic collection events and should ensure a publicly available drop off location(s) that provides for occasional long weekday hours, or weekend operations.	All	July 1, 1997
	c. Implement collection/recycling/safe disposal program.	All	July 1, 1998

R0065328

R006528

22 NOV

STORM WATER MANAGEMENT PROGRAM COMPONENT	ACTIVITY	RESPONSIBLE PERMITTEE(S)	DATE DUE/FREQUENCY
6. Floatables	a. Implement public education program.	All	July 1, 1995
	b. Install two floatables monitoring locations and commence monitoring (See Part V.B.).	All	July 1, 1995
	d. Complete study for targeting of structural controls for floatables and develop schedule for implementation.	All	July 1, 1997
7. Illicit Discharges and Improper Disposal	a. Implement public education program.	All	July 1, 1995
	b. Complete assessment of allowable non-storm water discharges to the Municipal Separate Storm Sewer System (see Part II.A.7.b).	All	July 1, 1995
	c. Submit, with the Annual Report, the results of the allowable non-storm water discharge assessment for each of the non-storm water discharges listed at Part II.A.7.b.1-19. and any proposed modifications to the Storm Water Management Program to implement necessary prohibitions or conditions for acceptance of non-storm water discharges to the Municipal Separate Storm Sewer System.	All	Oct. 15, 1995
	d. Complete field screening 20% of the Municipal Separate Storm Sewer System for illicit discharges and improper disposal.	All	March 1, 1996
	e. Complete field screening 40% (cumulative) of the Municipal Separate Storm Sewer System for illicit discharges and improper disposal.	All	March 1, 1997
	f. Complete field screening 60% (cumulative) of the Municipal Separate Storm Sewer System for illicit discharges and improper disposal.	All	March 1, 1998
	g. Complete field screening 80% (cumulative) of the Municipal Separate Storm Sewer System for illicit discharges and improper disposal.	All	March 1, 1999
	h. Complete field screening 100% of the Municipal Separate Storm Sewer System for illicit discharges and improper disposal.	All	Feb. 28, 2000
	i. Update SWMP to include follow-up activities, with prioritiesw and schedules, for suspected illicit discharges, and expeditious elimination of identified sources of such discharges.	All	Oct. 15, 1995

R0065329

STORM WATER MANAGEMENT PROGRAM COMPONENT	ACTIVITY	RESPONSIBLE PERMITTEE(S)	DATE DUE/FREQUENCY
	j. Update SWMP to include procedures for spill response and cleanup.	All	Oct. 15, 1995
	k. Update SWMP to include program to limit seepage from sanitary sewers into separate storm sewers.	Oklahoma City	Oct. 15, 1995
8. Wet Weather Screening Program	a. Update SWMP to include wet weather screening program.	All	July 1, 1995
	b. Complete wet weather screening of 50% of the MS4.	All	July 1, 1997
	c. Complete wet weather screening of 100% (cumulative) of the MS4.	All	July 1, 1999
9. Industrial and High Risk Runoff	a. Develop program to identify, monitor, and control pollutants from targeted facilities.	All	July 1, 1995
	b. Implement program.	All	July 1, 1996
10. Pesticide, Herbicide, and Fertilizer Application	a. Implement annual training/education on pesticide and fertilizer management techniques.	All	July 1, 1995
11. Supporting Permit Conditions, Monitoring Programs, and Documents	a. Submit completed interjurisdictional agreement(s) between permittees.	All	April 1, 1995
	b. Submit revised summary of Event Mean Concentrations (EMCs) for outfalls 001 - 005 from results of representative monitoring to date. Submittal shall include description of storm events monitored.	Oklahoma City	April 1, 1995
	c. Submit schedule for preparation and submittal of estimates of annual loadings and EMCs for all major outfalls by no later than the due date of the Annual Report for the fourth year of the permit.	All	April 1, 1995
	d. Establish representative monitoring site (Outfall 006) for roadway runoff.	All	June 1, 1995
	e. Commence representative monitoring of roadway runoff.	All	July 1, 1995
	f. Adopt comprehensive Storm Water ordinance.	Oklahoma City	July 1, 1995

[1]All - Oklahoma City and any co-permittees.

R0065330

B. Compliance with effluent limitations. Reserved.

C. Reporting compliance with schedules. No later than 14 days following a date for a specific action (interim milestone or final deadline) identified in the above schedule(s), the permittee(s) shall submit a written notice of compliance or noncompliance to the Director in accordance with Parts V.E.

D. Updating Storm Water Management Program. The permittee(s) shall update the Storm Water Management Program(s), as appropriate, in response to changes required by Part III.A. Such updates shall be made in accordance with Part II.G.2.

VOL 22

0095

R0065331

PART IV. DISCHARGE LIMITATIONS.

A. Discharge Limitations. Reserved.

VOL 22

00096

R0065332

PART V. MONITORING AND REPORTING REQUIREMENTS.

A. Storm Event Discharges.

1. *Representative Monitoring:* Monitoring shall be conducted on representative outfalls, internal sampling stations, and/or instream monitoring locations to characterize the quality of storm water discharges from the Municipal Separate Storm Sewer System.

   a. Monitoring Requirements: Refer to Table(s) V.A.1.a(1) and (2).

   b. Outfall Descriptions: Refer to Table V.A.1.b.

   c. Alternate representative monitoring locations may be substituted for just cause during the term of the permit. Requests for approval of alternate monitoring locations shall be made to the Director in writing and include the rationale for the requested monitoring station relocation. Unless disapproved by the Director, use of an alternate monitoring location (except for outfalls with numeric effluent limitations) may commence 30 days from the date of the request. For outfalls where numeric effluent limitations have been established, the permit must be modified prior to substitution of alternate monitoring locations. Six samples shall be collected during the first year of monitoring at substitute outfalls.

R0065337

-- 03 -- 03

NOV 22

2. *Representative Monitoring - Rapid Bioassessment Option:* The permittee(s) has the option of developing and implementing a rapid bioassessment monitoring program.

   a. The permittee(s) shall obtain all necessary aquatic wildlife collection permits from appropriate State and/or Federal agencies (e.g. State Fish and Game Commission).

   b. Permittee(s) utilizing the rapid bioassessment monitoring option shall conduct monitoring of the separate storm sewer system as described in Part V.A.1., except the monitoring for years 2, 3, and 5 are no longer required. All other requirements of Part V.A.1., A.3., and A.4. (e.g.: samples types, parameters,...) remain unchanged.

   c. If the permittee(s) elects to develop and implement a rapid bioassessment monitoring program, the permittee(s) shall submit an approvable monitoring program to EPA no later than one year from the effective date of this permit. An approvable program must include:

      (1) monitoring of at least two waterbodies receiving storm water discharges from the municipal separate storm sewer system plus a reference site located within the same ecological region as the municipal separate storm sewer system;

      (2) monitoring of each station at least twice per year, with monitoring conducted at essentially the same time periods each year; and

      (3) concurrent (e.g. within a day or two) monitoring of the reference site each time a station located in the receiving waters of the municipal separate storm sewer system is monitored.

      Unless disapproved by the Director within 60 days, a proposed rapid bioassessment monitoring plan meeting the criteria herein shall be deemed approved and the permittee(s) may implement the alternate rapid bioassessment program.

   d. The permittee(s) shall notify the Director and State (addresses provided in Part V.E.), in writing, at least 14 days prior to commencing an alternate rapid bioassessment monitoring program.

3. *Storm Event Data:* For Part V.A.1. and any additional sampling conducted for Part V.A.6., quantitative data shall be collected to estimate pollutant loadings and event mean concentrations for each parameter sampled. Records shall be maintained of all analytical results, the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration (in hours) between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

VOL 22

0102

R0065338

4. *Sample Type, Collection, and Analysis:* The following requirements apply only to samples collected for Part V.A.1 and any additional sampling conducted for Part V.A.6.

   a. For discharges from holding ponds or other impoundments with a retention period greater than 24 hours, (estimated by dividing the volume of the detention pond by the estimated volume of water discharged during the 24 hours previous to the time that the sample is collected) a minimum of one grab sample may be taken.

   b. Grab samples taken within the first two hours of discharge shall be used for the analysis of pH, temperature, cyanide, oil & grease, fecal coliform, fecal streptococcus, total phenols, residual chlorine, and (at the permittee's option) volatile organics. Multiple grab samples, collected (and individually analyzed) at least once per hour for at least the first three hours of discharge, may be used to prepare a flow weighted average for the above parameters. For all other parameters, data shall be reported for flow weighted composite samples of the entire event or, at a minimum, the first three hours of discharge.

   c. Samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Composite samples may be taken with a continuous sampler or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire discharge or for the first three hours of the discharge, with each aliquot being separated by a minimum period of fifteen minutes.

      The required 72 hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge. The required 72 hour storm event interval is also waived where the permittee(s) documents that less than a 72 hour interval is representative for local storm events during the season when sampling is being conducted.

   d. Analysis and collection of samples shall be done in accordance the methods specified at 40 CFR Part 136. Where an approved Part 136 method does not exist, any available method may be used unless a particular method or criteria for method selection (such as sensitivity) has been specified in the permit.

5. *Seasonal Loadings and Event Mean Concentrations.* All necessary sampling data shall be collected to provide estimates for each major outfall of seasonal pollutant loadings and event mean concentrations for a representative storm event for the parameters listed in Table V.A.1.a.(1) - **Representative Monitoring Requirements**. This information may be estimated from the representative monitoring locations and shall take into consideration land uses and drainage areas for the outfall. The estimates of seasonal loadings and event mean concentrations shall be included in the Annual Report for year four of the permit.

VOL 22 0103

R0065339

B. Floatables Monitoring. The permittee(s) shall establish two monitoring locations for removal of floatable material in discharges to or from the Municipal Separate Storm Sewer System. Floatable material shall be collected at the frequency necessary for maintenance of the removal devices, but not less than twice per year. The amount of material collected shall be estimated in cubic yards and shall be reported in the Annual Report required by Part V.C.

C. Annual Report. Each permittee shall contribute to the preparation of an annual system-wide report to be submitted no later than October 15th. The report shall cover the previous year from July 1st to June 30th and include the following separate sections, with an overview for the entire Municipal Separate Storm Sewer System and subsections for each permittee:

1. The status of implementing the storm water management program(s) (status of compliance with any schedules established under this permit shall be included in this section);

2. Proposed changes to the storm water management program(s) ;

3. Revisions, if necessary, to the assessments of controls and the fiscal analysis reported in the permit application under 40 CFR 122.26(d)(2)(iv) and (d)(2)(v);

4. A summary of the data, including monitoring data, that is accumulated throughout the reporting year;

5. Annual expenditures for the reporting period, with a breakdown for the major elements of the storm water management program, and the budget for the year following each annual report;

6. A summary describing the number and nature of enforcement actions, inspections, and public education programs; and

7. Identification of water quality improvements or degradation.

Preparation and submittal of a system-wide annual report shall be coordinated by the city of Oklahoma City. The report shall indicate which, if any, permittee(s) have failed to provide required information on the portions of the Municipal Separate Storm Sewer System for which they are responsible to the core municipality by 45 days prior to the report due date. Joint responsibility for report submission shall be limited to participation in preparation of the overview for the entire system and inclusion of the identity of any permittee who failed to provide input to the annual report. Each individual permittee shall be individually responsible for content of the report relating to the portions of the Municipal Separate Storm Sewer System for which they are responsible and for failure to provide information for the system-wide annual report in a timely manner. Each permittee shall sign and certify the annual report in accordance with Part VI.H. and include a statement or resolution that the permittee's governing body or agency (or delegated representative) has reviewed or been appraised of the content of the Annual Report.

D. Certification and Signature of Reports. All reports required by the permit and other information requested by the Director shall be signed and certified in accordance with Part VI.H.

VOL 22

0104

R0065340

E. **Reporting: Where and When to Submit.**

1. Representative monitoring results (Part V.A.1) obtained during the reporting period running from July 1st to June 30th shall be submitted on Discharge Monitoring Report Form(s) along with the annual report required by Part V.C. A separate Discharge Monitoring Report Form is required for each monitoring period (season) specified in Part V.A.1.

2. Signed copies of discharge monitoring reports required under Part V., the Annual Report required by Part V.C., and all other reports required herein, shall be submitted to:

U.S. EPA, Region 6
Water Management Division
Enforcement Branch (6W-EA)
1445 Ross Avenue
Dallas, Texas 75202-2733

3. Requests for Storm Water Management Program updates, changes in monitoring locations, or application for an individual permit shall be submitted to:

U.S. EPA, Region 6
Water Management Division
Municipal Permits Section (6W-PM)
1445 Ross Avenue
Dallas, Texas 75202-2733

4. Additional Notification. In addition, the permittee(s) shall provide copies of discharge monitoring reports, annual reports, requests for Storm Water Management Program updates, or changes in monitoring locations, and all other reports required herein, to:

Oklahoma Department of Environmental Quality
Program Manager
Water Quality Program
1000 N.E. 10th Street, WQS 0207
Oklahoma City, OK 73117-1212

VOL 22 0105

R0065341

PART VI. STANDARD PERMIT CONDITIONS.

A. Duty to Comply. The permittee(s) must comply with all conditions of this permit insofar as those conditions are applicable to each permittee, either individually or jointly. Any permit noncompliance constitutes a violation of the Act and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or for denial of a permit renewal application.

B. Penalties for Violations of Permit Conditions.

1. *Criminal Penalties.*

a. Negligent Violations: The Act provides that any person who negligently violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than 1 year, or both.

b. Knowing Violations: The Act provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

c. Knowing Endangerment: The Act provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than $250,000, or by imprisonment for not more than 15 years, or both.

d. False Statement: The Act provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than 2 years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or by both. (See Section 309(c)(4) of the Act).

2. *Civil Penalties.* The Act provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed $25,000 per day for each violation.

3. *Administrative Penalties.* The Act provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to an administrative penalty, as follows:

VOL 22 0106

R0065342

a. Class I penalty: Not to exceed $10,000 per violation nor shall the maximum amount exceed $25,000.

b. Class II penalty: Not to exceed $10,000 per day for each day during which the violation continues nor shall the maximum amount exceed $125,000.

C. Duty to Reapply. If the permittee wishes to continue an activity regulated by this permit after the permit expiration date, the permittee must apply for and obtain a new permit. The application shall be submitted at least 180 days prior to expiration of this permit. The Director may grant permission to submit an application less than 180 days in advance but no later than the permit expiration date. Continuation of expiring permits shall be governed by regulations promulgated at 40 CFR 122.6 and any subsequent amendments.

D. Need to Halt or Reduce Activity Not a Defense. It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

E. Duty to Mitigate. The permittee(s) shall take all reasonable steps to minimize or prevent any discharge in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.

F. Duty to Provide Information. The permittee(s) shall furnish to the Director, within a time specified by the Director, any information which the Director may request to determine compliance with this permit. The permittee(s) shall also furnish to the Director upon request copies of records required to be kept by this permit.

G. Other Information. When the permittee becomes aware that he or she failed to submit any relevant facts or submitted incorrect information in any report to the Director, he or she shall promptly submit such facts or information.

H. Signatory Requirements. All Discharge Monitoring Reports, storm water management programs, reports, certifications or information either submitted to the Director or that this permit requires be maintained by the permittee(s), shall be signed by:

1. for a municipality, State, or other public agency: by either a principal executive officer or ranking elected official; or

2. a duly authorized representative of that person. A person is a duly authorized representative only if:

   a. The authorization is made in writing by a person described above and submitted to the Director.

   b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of manager, operator, superintendent, or position of equivalent responsibility or an individual or position having overall responsibility for environmental matters for the company. A duly authorized representative may thus be either a named individual or any individual occupying a named position.

VOL 22

0107

R0065343

c. If an authorization is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new written authorization satisfying the requirements of this paragraph must be submitted to the Director prior to or together with any reports, information, or applications to be signed by an authorized representative.

3. Certification: Any person signing documents under this section shall make the following certification: "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

I. **Penalties for Falsification of Monitoring Systems.** The Act provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by fines and imprisonment described in Section 309 of the Act.

J. **Oil and Hazardous Substance Liability.** Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties to which the permittee is or may be subject under section 311 of the Act or section 106 of CERCLA.

K. **Property Rights.** The issuance of this permit does not convey any property rights of any sort, nor any exclusive privileges, nor does it authorize any injury to private property nor any invasion of personal rights, nor any infringement of Federal, State or local laws or regulations.

L. **Severability.** The provisions of this permit are severable, and if any provision of this permit, or the application of any provision of this permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this permit shall not be affected thereby.

M. **Requiring an Separate Permit.**

1. The Director may require any co-permittee authorized by this permit to obtain a separate NPDES permit. Any interested person may petition the Director to take action under this paragraph. The Director may require any co-permittee authorized to discharge under this permit to apply for a separate NPDES permit only if the co-permittee has been notified in writing that a permit application is required. This notice shall include a brief statement of the reasons for this decision, an application form (as necessary), a statement setting a deadline for the co-permittee to file the application, and a statement that on the effective date of the separate NPDES permit, coverage under this permit shall automatically terminate. Separate permit applications shall be submitted to the address shown in Part V.E.

VOL 22

0108

R0065344

The Director may grant additional time to submit the application upon request of the applicant. If an owner or operator fails to submit in a timely manner a separate NPDES permit application as required by the Director, then the applicability of this permit to the co-permittee is automatically terminated at the end of the day specified for application submittal.

2. Any co-permittee authorized by this permit may request to be excluded from the coverage of this permit by applying for an separate permit. The co-permittee shall submit a separate application as specified by 40 CFR 122.26(d) with reasons supporting the request to the Director. Separate permit applications shall be submitted to the address shown in Part V.E. The request may be granted by the issuance of a separate permit if the reasons cited by the co-permittee are adequate to support the request.

N. **State/Environmental Laws.**

1. Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable State law or regulation under authority preserved by section 510 of the Act.

2. No condition of this permit shall release the permittee from any responsibility or requirements under other environmental statutes or regulations.

O. **Proper Operation and Maintenance.** The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit and with the requirements of storm water management programs. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance requires the operation of backup or auxiliary facilities or similar systems, installed by a permittee only when necessary to achieve compliance with the conditions of the permit.

P. **Monitoring and Records.**

1. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

2. The permittee shall retain records of all monitoring information including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of the reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least 3 years from the date of the sample, measurement, report or application. This period may be extended by request of the Director at any time.

3. Records of monitoring information shall include:

a. The date, exact place, and time of sampling or measurements;

b. The initials or name(s) of the individual(s) who performed the sampling or measurements;

VOL 22 0109

R0065345

c. The date(s) analyses were performed;

d. The time(s) analyses were initiated;

e. The initials or name(s) of the individual(s) who performed the analyses;

f. References and written procedures, when available, for the analytical techniques or methods used; and

g. The results of such analyses, including the bench sheets, instrument readouts, computer disks or tapes, etc., used to determine these results.

Q. Monitoring Methods. Monitoring must be conducted according to test procedures approved under 40 CFR Part 136, unless other test procedures have been specified in this permit.

R. Inspection and Entry. The permittee shall allow the Director or an authorized representative of EPA, or the State, upon the presentation of credentials and other documents as may be required by law, to:

1. Enter the permittee's premises where a regulated facility or activity is located or conducted or where records must be kept under the conditions of this permit;

2. Have access to and copy at reasonable times, any records that must be kept under the conditions of this permit;

3. Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this permit; and

4. Sample or monitor at reasonable times, for the purposes of assuring permit compliance or as otherwise authorized by the Act, any substance or parameters at any location.

S. Permit Actions. This permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the permittee for a permit modification, revocation and reisauance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

T. Additional Monitoring by the Permittee. If the permittee monitor more frequently than required by this permit, using test procedures approved under 40 CFR Part 136 or as specified in this permit, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the Discharge Monitoring Report (DMR). Such increased monitoring frequency shall also be indicated on the DMR.

U. Archeological and Historical Sites.

1. Where municipal excavation and/or construction projects implementing requirements of this permit will result in the disturbance of previously undisturbed land, the permittee shall, thirty (30) days prior to commencing land disturbance, submit the following to the State Historic Preservation Officer (SHPO) for evaluation of possible effects on properties listed or eligible for listing on the National Register of Historic Places:

VOL 22 0110

R0065346

a. a description of the construction or land disturbing activity and the potential impact that this activity may have upon the ground, and

b. a copy of a USGS topographic map outlining the location of the project and other ancillary impact areas.

The address of the SHPO is:

Historical Archeologist
Oklahoma State Historical Preservation Office
621 North Robinson, Suite 375
Oklahoma City, Oklahoma 73102

2. If the permittee receives a request for an archeological survey or notice of adverse effects from the SHPO, the permittee shall delay such activity until:

a. a determination of no adverse effect has been made, or

b. measures to minimize harm to historic properties have been agreed upon.

3. If the permittee does not receive notification of adverse effects or a request for an archeological survey from the SHPO within thirty (30) days, the permittee may proceed with the activity.

VOL 22 0111

R0065347

PART VII. PERMIT MODIFICATION.

A. Modification of the Permit. The permit may be reopened and modified during the life of the permit to address:

1. changes in the State's Water Quality Management Plan, including Water Quality Standards;
2. changes in State or Federal statutes or regulations;
3. add a new permittee who is the owner or operator of a portion of the Municipal Separate Storm Sewer System;
4. changes in portions of the Storm Water Management Program that are considered permit conditions; or
5. other modifications deemed necessary by the Director to meet the requirements of the Act.

All modification to the permit will be made in accordance with 40 CFR 122.62, 122.63, and 124.5.

B. Termination of Coverage for a Single Permittee. Permit coverage may be terminated, in accordance with the provisions of 40 CFR 122.64 and 124.5, for a single permittee without terminating coverage for other permittees.

C. Modification of Storm Water Management Program(s). Only those portions of the Storm Water Management Programs specifically required as permit conditions shall be subject to the modification requirements of 40 CFR 124.5. Addition of components, controls, or requirements by the permittee(s); replacement of an ineffective or infeasible BMP implementing a required component of the Storm Water Management Program with an alternate BMP expected to achieve the goals of the original BMP; and changes required as a result of schedules contained in Part III shall be considered minor changes to the Storm Water Management Program and not modifications to the permit. (See also Part II.G.)

D. Changes in Monitoring Outfalls. Changes in monitoring outfalls, other than those with specific numeric effluent limitations (as described in Part V.A.1.c.), shall be considered minor modifications to the permit and will be made in accordance with the procedures at 40 CFR 122.63.

VOL 22

0112

R0065348

PART VIII. DEFINITIONS.

All definition contained in Section 502 of the Act shall apply to this permit and are incorporated herein by reference. Unless otherwise specified, additional definitions of words or phrases used in this permit are as follows:

A. "Best Management Practices" ("BMPs") means schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures, and practices to control facility site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

B. "CWA" or "The Act" means Clean Water Act (formerly referred to as the Federal Water Pollution Control Act or Federal Water Pollution Control Act Amendments of 1972) Pub.L. 92-500, as amended Pub. L. 95-217, Pub. L. 95-576, Pub. L. 96-483 and Pub. L. 97-117, 33 U.S.C. 1251 et.seq.

C. "Co-permittee" is defined at 40 CFR 122.26(b)(1).

D. "Core Municipality" means, for the purpose of this permit, the municipality whose corporate boundary (unincorporated area for counties and parishes) defines the municipal separate storm sewer system. (ex. City of Dallas for the Dallas Municipal Separate Storm Sewer System, Harris County for unincorporated Harris County).

E. "Director" means the Regional Administrator or an authorized representative.

F. "Discharge" for the purpose of this permit, unless indicated otherwise, refers to discharges from the Municipal Separate Storm Sewer System (MS4).

G. "Flow-weighted composite sample" means a composite sample consisting of a mixture of aliquots collected at a constant time interval, where the volume of each aliquot is proportional to the flow rate of the discharge.

H. "Illicit connection" means any man-made conveyance connecting an illicit discharge directly to a municipal separate storm sewer.

I. "Illicit discharge" is defined at 40 CFR 122.26(b)(2).

J. "Individual Residence" refers, for the purposes of this permit, to single or multi-family residences. (e.g. single family homes and duplexes, townhomes, apartments, etc.)

K. "Landfill" means an area of land or an excavation in which wastes are placed for permanent disposal, and which is not a land application unit, surface impoundment, injection well, or waste pile.

L. "Land application unit" means an area where wastes are applied onto or incorporated into the soil surface (excluding manure spreading operations) for treatment or disposal.

M. "Large or medium municipal separate storm sewer system" is defined at 40 CFR 122.26(b)(4) & (7).

N. "MEP" is an acronym for "Maximum Extent Practicable," the technology-based discharge standard for Municipal Separate Storm Sewer Systems established by CWA §402(p).

VOL 22 0113

R0065349

O. "MS4" is an acronym for "Municipal Separate Storm Sewer System" and is used to refer to either a Large or Medium Municipal Separate Storm Sewer System (e.g. "the Dallas MS4").

P. "Municipal Separate Storm Sewer" is defined at 40 CFR 122.26(b)(8).

Q. "Part '#'" refers, unless otherwise indicated, to Part "#" of this permit (e.g. Part V.E.2.).

R. "Permittee" refers to any "person," as defined at 40 CFR 122.2, authorized by this NPDES permit to discharge to Waters of the United States.

S. "Point Source" means any discernible, confined, and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharges. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

T. "Storm sewer", unless otherwise indicated, refers to a municipal separate storm sewer.

U. "Storm Water" means storm water runoff, snow melt runoff, and surface runoff and drainage.

V. "Storm Water Discharge Associated with Industrial Activity" is defined at 40 CFR 122.26(b)(14).

W. "Storm Water Management Program" refers to a comprehensive program to manage the quality of storm water discharged from the municipal separate storm sewer system. For the purposes of this permit, the Storm Water Management Program is considered a single document, but may actually consist of separate programs (e.g. "chapters") for each permittee.

X. "SWMP" is an acronym for "Storm Water Management Program."

Y. "Time-weighted composite" means a composite sample consisting of a mixture of equal volume aliquots collected at a constant time interval.

Z. "Waters of the United States" is defined at 40 CFR 122.2.

VOL 22 0114

R0065350

DRAFT

May 19, 1995

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN DIEGO REGION

ORDER NO. 95-76
NPDES NO. CA0108758

WASTE DISCHARGE REQUIREMENTS
FOR
STORM WATER AND URBAN RUNOFF
FROM THE
COUNTY OF SAN DIEGO,
THE INCORPORATED CITIES OF SAN DIEGO COUNTY,
AND THE
SAN DIEGO UNIFIED PORT DISTRICT

The California Regional Water Quality Control Board, San Diego Region (hereinafter SDRWQCB), finds that:

1. On July 16, 1990, the SDRWQCB issued Order No. 90-42, NPDES NO. CA0108758, **WASTE DISCHARGE REQUIREMENTS FOR STORM WATER AND URBAN RUNOFF FROM THE COUNTY OF SAN DIEGO THE INCORPORATED CITIES OF SAN DIEGO COUNTY AND THE SAN DIEGO UNIFIED PORT DISTRICT.** Order No. 90-42 established waste discharge requirements for the discharge of storm water[1] and urban runoff to waters of the United States from storm water conveyance systems[2] owned and operated by the County of San Diego, the San Diego Unified Port District and the incorporated cities of San Diego County. Order No. 90-42 expires on July 16, 1995.

2. On January 17, 1995 the SDRWQCB received a joint National Pollutant Discharge Elimination System (NPDES) permit renewal application from the following entities:

   a. the County of San Diego;

   b. the incorporated cities of San Diego County:

Carlsbad	Escondido	Poway
Chula Vista	Imperial Beach	San Diego
Coronado	La Mesa	San Marcos
Del Mar	Lemon Grove	Santee
El Cajon	National City	Solana Beach
Encinitas	Oceanside	Vista; and

   c. the San Diego Unified Port District.

3. The above entities are hereinafter referred to in this Order as copermittees or dischargers. The City of San Diego is also referred to in this Order as principal copermittee. The terms and conditions of this Order are applicable to all lands within:

VOL 22

0115

a. the unincorporated urban areas of San Diego County within the boundaries of the San Diego Region;

b. the above incorporated cities of San Diego County; and

c. the jurisdiction of the San Diego Unified Port District.

4. Clean Water Act (CWA) Section 402(a)(l) provides that any person discharging, or proposing to discharge, pollutants from any point source to waters of the United States must apply for and obtain an NPDES Permit. Applicable United States Environmental Protection Agency (USEPA) regulations are contained in Title 40 Code of Federal Regulations (CFR) Part 122.

5. Storm water discharges are point source discharges of pollutants and as such they are also discharges of waste that could affect the quality of the waters of the state. California Water Code (CWC) Section 13376 provides that any person discharging or proposing to discharge pollutants to waters of the United States must apply for and obtain waste discharge requirements. (The term waste discharge requirements is equivalent to the term NPDES permits as used in the Clean Water Act). Furthermore, California Water Code Section 13260 provides that persons discharging waste that could affect the quality of waters of the state must file a report of waste discharge in application for waste discharge requirements. Applicable State of California regulations are contained in Title 23, Division 3, Chapter 9, Articles 3 and 9.

6. All storm water conveyance systems discharge into waters of the United States or tributaries thereto. Each copermittee owns and operates a storm water conveyance system which discharges into one or more surface water bodies in the San Diego Region including creeks, rivers, reservoirs, lakes, lagoons, estuaries, harbors, bays, the Pacific Ocean and tributaries thereto. These surface waters are waters of the United States as defined in 40 CFR 122.2.

7. Urban storm water runoff has two major components: (1) storm water (wet weather flows) and (2) non-storm water illicit discharges (dry weather flows).

8. Storm water (wet weather flows) consists of precipitation only and is defined in 40 CFR 122.26(b)(13) as storm water runoff, snow melt runoff, and surface runoff and drainage. During storm events in urban areas, rain water picks up and transports pollutants through storm water conveyance systems to waters of the United States.

9. Non-storm water (dry weather flows) is defined in 40 CFR 122.26(b)(2) as illicit discharges consisting of any discharge to a storm water conveyance system that is not composed entirely of storm water. The definition specifically excludes discharges pursuant to an NPDES permit and discharges resulting from fire fighting activities.

10. Pollutants occur in both storm water and non-storm water runoff. The sources of these pollutants occur primarily in commercial, industrial, and residential urban land use areas. The most important pollutant sources include motor vehicles; construction site runoff; industrial site runoff; sewage spills; illegal dumping; illicit connections or improper plumbing of sewage; commercial and industrial discharges; paved surfaces; animal waste; and home and garden care. The most important pollutant categories include metals (copper, lead and zinc), pathogens (bacteria and viruses), synthetic organics (petroleum products,

VOL 22 0116

pesticides, PCBs and PAHs), sediment; nutrients (nitrogen and phosphorus fertilizers), and oxygen demanding substances (decaying vegetation, animal waste, and other organic matter).

11. Clean Water Act Section 402(p) provides, in part, that the following categories of municipal storm water discharges are required to obtain an NPDES permit:

    a. A discharge from a municipal separate storm water conveyance system serving a population of 250,000 or more (large system);

    b. A discharge from a municipal separate storm water conveyance system serving a population of 100,000 or more but less than 250,000 (medium system); and

    c. A discharge from a municipal storm water conveyance system which contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

    Applicable USEPA regulations are contained in Title 40 Code of Federal Regulations Part 122.26.

12. The unincorporated areas of the County of San Diego, the Cities of Chula Vista, Escondido, Oceanside and San Diego each have a current population in excess of 100,000. These copermittees operate large or medium storm water conveyance systems as defined by 40 CFR 122.26(b)(4) and (7).

13. The Cities of Carlsbad, Coronado, Del Mar, El Cajon, Encinitas, Imperial Beach, La Mesa, Lemon Grove, National City, Poway, San Marcos, Santee, Solana Beach and Vista have populations of less than 100,000 and operate small storm water conveyance systems.

14. All copermittees with populations less than 100,000 (small systems) are part of large or medium separate storm water conveyance systems. This is because discharges from the small systems are "interrelated" to discharges from the large or medium systems as provided in 40 CFR 122.26(b)(4)(iii). The determination of "interrelation" is based on the following factors:

    a. physical interconnections between the municipal storm water conveyance systems of some copermittees;

    b. the nature of the pollutants discharged to waters of the United States as described in previous findings;

    c. the nature of the receiving waters as described in findings 15 and 16 below; and

    d. the location of discharges from the smaller municipal systems relative to discharges from the large or medium systems. The following copermittees jointly and cumulatively discharge storm water pollutants into the same water body:

VOL 22

0117

i. The County of San Diego; the Cities of San Diego, Coronado, National City, Chula Vista, Imperial Beach, La Mesa, Lemon Grove; and the San Diego Unified Port District jointly and cumulatively discharge storm water pollutants into San Diego Bay;

ii. The County of San Diego and the Cities of Oceanside, Vista, and Carlsbad jointly and cumulatively discharge storm water pollutants into Buena Vista Lagoon;

iii. The Cities of Carlsbad and San Marcos jointly and cumulatively discharge storm water pollutants into Agua Hedionda Lagoon;

iv. The County of San Diego; the Cities of Carlsbad, Encinitas, and San Marcos jointly and cumulatively discharge storm water pollutants into Batiquitos Lagoon;

v. The County of San Diego; the Cities of Encinitas, Escondido, and Solana Beach jointly and cumulatively discharge storm water pollutants into San Elijo Lagoon;

vi. The County of San Diego, the Cities of San Diego, Del Mar, Solana Beach, and Escondido jointly and cumulatively discharge storm water pollutants into Los Penasquitos Lagoon;

vii. The Cities of San Diego and Imperial Beach jointly and cumulatively discharge storm water pollutants into the Tijuana River Estuary;

viii. The County of San Diego; the Cities of San Diego, La Mesa, El Cajon, and Santee jointly and cumulatively discharge storm water pollutants into the San Diego River;

ix. The Cities of El Cajon and Santee jointly and cumulatively discharge storm water pollutants into Forester Creek; and

x. The Cities of San Diego, Escondido, and Poway jointly and cumulatively discharge storm water pollutants into Lake Hodges;

15. Certain water bodies receiving storm water discharges are designated by the State Water Resources Control Board (SWRCB) and USEPA as Clean Water Act Section 303(d) water bodies. A "Section 303(d) water body" is an impaired water body in which water quality does not meet applicable water quality standards and/or is not expected to meet water quality standards, even after the application of technology based pollution controls required by the Clean Water Act. The discharge of storm water pollutants by the copermittees are significant because these discharges contribute to violations of applicable water quality standards as summarized in Table 1 below:

VOL 22 0118

TABLE 1
COPERMITTEES DISCHARGING TO CWA SECTION 303(D) WATER BODIES

Clean Water Act Section 303(d) Impaired Water Body	Pollutants Causing Impairment	Copermittee Discharging Storm Water
San Diego Bay	Synthetic organics, metals	County of San Diego; Cities of San Diego, Coronado, National City, Chula Vista, Imperial Beach, La Mesa, Lemon Grove; and San Diego Unified Port District
Mission Bay	Metals, pathogens, nutrients	City of San Diego
Santa Margarita Lagoon	Nutrients	County of San Diego
Agua Hedionda Lagoon	Pathogens	Cities of Carlsbad and San Marcos
Batiquitos Lagoon	Nutrients, sediment	County of San Diego; Cities of Carlsbad, Encinitas, and San Marcos
San Elijo Lagoon	Nutrients	County of San Diego, Cities of Encinitas, Escondido, and Solana Beach
Los Penasquitos Lagoon	Nutrients, sediment	County of San Diego; Cities of San Diego, Del Mar and Poway
Tijuana River Estuary	Pathogens, synthetic organics, metals	Cities of San Diego and Imperial Beach
Tijuana River	Pathogens, nutrients, synthetic organics, metals	City of San Diego
Oceanside Harbor	Metals	City of Oceanside

16. Each of the copermittees are significant contributors of pollutants to waters of the United States in the San Diego Region based on the following considerations:

a. Limited wet weather monitoring data collected by the San Diego copermittees indicate that storm water discharges in San Diego County contain metals, pathogens, sediment, and nutrients in concentrations that could adversely affect receiving waters.

b. Because the semiarid San Diego Region has an extended dry season, pollutant loads during the first several storms of the wet season may be significantly higher than pollutant loads from storms later in the season.

c. In the semiarid San Diego Region, most receiving water streams are essentially ephemeral in nature. Non-storm water flows containing pollutants discharge into these streams during dry weather conditions. During the dry weather season these streams have no reliable dilution waters available to aid in protection of the public health and wildlife and to provide sufficient assimilative capacity to ensure that

VOL 22
0119
R0065355

discharges do not contribute to violations of receiving water quality objectives. Accordingly, non-storm water flows to these streams during dry weather periods can cause pollution and nuisance conditions.

d. All watercourses in the San Diego Region terminate in bays, estuaries, or lagoons, most of which have poor flushing characteristics and little assimilative capacity.

17. Based on the foregoing findings, as summarized below, each copermittee is required to obtain an NPDES Permit for the discharge of storm water runoff to waters of the United States.

a. Each copermittee owns and operates a storm water conveyance system which conveys storm water and non-storm water flows containing pollutants to waters of the United States.

b. Five copermittees (the County of San Diego; the Cities of Chula Vista, Escondido, Oceanside, and San Diego) have a current population exceeding 100,000.

c. Each small copermittee (having a population of less than 100,000), owns and operates a storm water conveyance system whose discharges are "interrelated" to discharges from large or medium size storm water conveyance systems within the meaning of 40 CFR 122.26(b)(iii). Accordingly, small storm water conveyance systems are part of large or medium size conveyance systems.

d. Each copermittee, except the Cities of El Cajon, Santee, and Vista, discharge storm water and non-storm water flows to a Clean Water Act Section 303(d) impaired water body and thus are contributing to a violation of a water quality standard.

e. Each copermittee is a significant contributor of pollutants to waters of the United States within the meaning of 40 CFR 122.26(a)(1)(v).

18. The copermittees have requested that the SDRWQCB regulate them under a single NPDES permit. The SDRWQCB believes that issuance of a single NPDES permit to the copermittees will:

a. provide for a unified regional approach to storm water management in contiguous urban areas and shared watersheds;

b. reduce copermittee costs and administrative burden associated with storm water NPDES permit fees, applications, monitoring and reporting, implementation of required best management practices plans, and other activities; and

c. reduce the Regional Board's administrative burden of issuing individual NPDES permits to each copermittee.

Therefore, each copermittee is named as a discharger in this Order.

19. The copermittees have entered into a memorandum of understanding (MOU) in order to establish the joint and separate responsibilities of the copermittees with respect to compliance with this Order. The MOU provides that certain programs (e.g., wet weather

VOL 22

0120

monitoring and reporting, public education) required under this Order be conducted jointly by the copermittees. The conduct of a joint wet weather monitoring program will facilitate the collection and analysis of storm water samples in a uniform and cost effective manner.

20. USEPA regulations contained in 40 CFR 122.26(d)(2)(i)(A)-(F) provide that the copermittees must demonstrate adequate legal authority, through ordinance or other means, to control discharges of pollutants to their storm water conveyance system.

21. Order No. 90-42 required the copermittees to demonstrate adequate legal authority to control discharges of pollutants to their storm water conveyance system in conformance with 40 CFR 122.26(d)(2)(i)(A)-(F). As of August 10, 1995, all copermittees, except the Cities of Carlsbad, Oceanside, and Santee have adopted storm water ordinances.

22. Clean Water Act Section 402(p)(3)(B)(iii) requires that NPDES permits for discharges from municipal storm water conveyance systems ".....shall include a requirement to effectively prohibit non-storm water discharges into storm water conveyance systems." USEPA regulations implementing Section 402 recognize that certain classes of non-storm water discharges, on a case by case basis, may not be sources of pollutants to waters of the United States. These special classes of non-storm water discharges are listed in 40 CFR 122.26(d)(2)(iv)(B)(1).

23. Clean Water Act Section 402(p)(3)(B)(ii) requires that NPDES permits for discharges from municipal storm water conveyance systems ".....shall require controls to reduce the discharge of pollutants to the maximum extent practicable[3] (MEP) including management practices, control techniques and system, design and engineering methods....." Copermittees can reduce pollutants to the maximum extent practicable through the effective implementation of Best Management Practices[4] (BMPs).

24. Pursuant to 40 CFR 122.26(d)(2)(vi), the SDRWQCB may require each copermittee to prepare and submit a fiscal analysis demonstrating sufficient financial resources have been appropriated to implement the conditions of this Order.

25. Pollution prevention is defined as practices and processes which reduce or eliminate the generation of pollutants at their source. Under Section 6602(B) of the federal Pollution Prevention Act of 1990, Congress established a national policy that: ".....pollution should be prevented or reduced at the source, whenever feasible; pollution that cannot be prevented should be recycled in an environmentally safe manner, whenever feasible; pollution that cannot be prevented or recycled should be treated in an environmentally safe manner, whenever feasible; and disposal or other releases into the environment should be employed only as a last resort and should be conducted in an environmentally safe manner...." The SDRWQCB fully supports pollution prevention as a fundamental principle of the SDRWQCB's mission to protect the quality of the Region's ground and surface waters and encourages its maximum use by the copermittees.

26. The "Water Quality Control Plan, San Diego Basin (9)" (hereinafter Basin Plan) was adopted by the SDRWQCB on September 8, 1994 and subsequently approved by the SWRCB on December 13, 1994. Subsequent revisions to the Basin Plan have also been adopted by the SDRWQCB and approved by the SWRCB. The Basin Plan designates beneficial uses, narrative and numeric water quality objectives, and includes prohibitions which are applicable to the storm water and urban runoff discharges regulated under this

VOL 22

0121

Order. The Basin Plan also incorporates by reference all SWRCB water quality control plans and policies including the 1990 Water Quality Control Plan for Ocean Waters of California (Ocean Plan) and the 1974 Water Quality Control Policy for Enclosed Bays and Estuaries of California (Enclosed Bays and Estuaries Policy). The discharges regulated by this Order must be in compliance with the prohibitions and water quality standards of the Basin Plan and all referenced SWRCB water quality control plans and policies.

27. The beneficial uses of inland surface waters in San Diego County designated in the Basin Plan are: Municipal and Domestic supply; Agricultural supply; Industrial process supply; Industrial service supply; Freshwater Replenishment; Hydropower generation; Contact water recreation; Non-contact water recreation; Warm freshwater habitat; Cold freshwater habitat; Wildlife habitat; Preservation of biological habitats of special significance; and Rare, threatened, or endangered species. Beneficial uses of inland surface waters vary. The beneficial uses for specific inland surface waters are described in the Basin Plan. Inland surface waters consist of all waters exclusive of the waters of the Pacific Ocean, enclosed bays and estuaries, coastal lagoons, and ground waters.

28. The beneficial uses of coastal waters in San Diego County designated in the Basin Plan are: Industrial service supply; Navigation; Contact water recreation; Non-contact water recreation; Commercial and sport fishing; Estuarine habitat; Wildlife habitat; Preservation of biological habitats of special significance; Rare, threatened, or endangered species; Marine habitat; Aquaculture; Migration of aquatic organisms; Spawning, reproduction, and/or early development; Warm freshwater habitat; and Shellfish harvesting. Beneficial uses of coastal waters vary. The beneficial uses for specific coastal waters are described in the Basin Plan. Coastal waters are defined as waters subject to tidal action and include ocean waters and enclosed bays and estuaries.

29. The Basin Plan contains the following general antidegradation water quality objective which applies to all waters of the State within the San Diego Region:

"Wherever the existing quality of water is better than the quality of water established herein as objectives, such existing quality shall be maintained unless otherwise provided by the provisions of the State Water Resources Control Board Resolution No. 68-16, "Statement of Policy with Respect to Maintaining of Waters in California", including any revisions thereto, or the federal antidegradation policy, 40 CFR 131.12 (for surface waters only)."

Discharges of storm water in compliance with the terms and conditions of this Order will not degrade surface water quality. Furthermore, the purpose of this Order is to reduce pollutants in storm water discharges to the maximum extent practicable in conformance with Clean Water Act Section 402(p)(3)(B)(ii). Therefore, the Regional Board finds that this Order is in conformance with SWRCB Resolution No. 68-16 and the federal antidegradation policy described in 40 CFR 131.12.

30. The SDRWQCB, in establishing the requirements contained in this Order, considered factors including, but not limited to, the following:

a. Beneficial uses to be protected and the water quality objectives reasonably required for that purpose;
b. Other waste discharges;
c. The need to prevent nuisance;

VOL 22

0122

d. Past, present, and probable future beneficial uses of the waters under consideration;
e. Environmental characteristics of the waters under consideration, including the quality of water available thereto;
f. Water quality conditions that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area;
g Economic considerations;
h The need for developing housing within the region; and
i. The need to develop and use recycled water.

31. This Order shall serve as an NPDES permit pursuant to Clean Water Act Section 402, and waste discharge requirements pursuant to California Water Code Section 13260 for the discharge of storm water and urban runoff to surface waters of San Diego County.

32. The issuance of this Order for the discharge of storm water and urban runoff is exempt from the requirement for preparation of environmental documents under the California Environmental Quality Act (Public Resources Code, Division. 13, Chapter 3, Section 21000 et seq.) in accordance with the California Water Code Section 13389.

33. The SDRWQCB has notified the copermittees and all known interested parties of its intent to renew an NPDES permit for the existing discharge of storm water and urban runoff.

34. The SDRWQCB has, at a public meeting on August 10, 1995, held, or provided an opportunity for, a public hearing, and heard and considered all comments pertaining to the terms and conditions of this Order.

IT IS HEREBY ORDERED that the copermittees, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act and regulations adopted thereunder, shall each comply with the following:

A. PROHIBITIONS

1. Any discharge to a storm water conveyance system that is not composed entirely of "storm water" is prohibited unless authorized by the SDRWQCB. The federal regulations, 40 CFR 122.26(b)(13), define storm water as runoff, snow melt runoff, and surface runoff and drainage. An illicit discharge is defined in 40 CFR 122.26 (b)(2) as any discharge to a storm water conveyance system that is not composed entirely of storm water except discharges pursuant to an NPDES permit and discharges resulting from fire fighting activities. [Section 122.26 amended at FR 56553, November 5, 1991; 57 FR 11412, April 2, 1992].

2. The discharge of storm water to waters of the United States containing pollutants which have not been reduced to the maximum extent practicable is prohibited.

3. The unauthorized discharge of treated or untreated sewage to waters of the state or to a storm water conveyance system is prohibited.

VOL 22

0123

R0065359

4. The discharge of pollutants, or dredged or fill material, to waters of the United States, except as authorized by an NPDES permit or a dredged or fill material permit (subject to the exemption described in California Water Code §13376), is prohibited.

5. The discharge of waste to waters of the state in a manner causing, or threatening to cause, a condition of pollution, contamination, or nuisance as defined in California Water Code Section 13050, is prohibited.

6. The dumping, deposition, or discharge of waste (e.g., oil, rubbish, refuse) directly into waters of the state, or adjacent to such waters in any manner which may permit its being transported into the waters, is prohibited unless authorized by the SDRWQCB.

7. The discharge of treated or untreated waste to lakes or reservoirs used for municipal water supply, or to inland surface waters tributary thereto, is prohibited.

8. The discharge of waste to inland surface waters, except in cases where the quality of the discharge complies with applicable receiving water quality objectives, is prohibited.

9. The discharge of any radiological, chemical, or biological warfare agent into waters of the state is prohibited.

10. The discharge of sand, silt, clay, or other earthen materials from any activity, including land grading and construction, in quantities which cause deleterious bottom deposits, turbidity or discoloration in waters of the state or which unreasonably affect, or threaten to affect, beneficial uses of such waters, is prohibited.

B. **DISCHARGE SPECIFICATIONS – NON-STORM WATER**

1. Each copermittee shall forthwith effectively prohibit non-storm water discharges into its storm water conveyance systems unless such discharges are authorized by a separate NPDES permit.

2. Copermittees may, but need not, prohibit a non-storm water discharge that is currently authorized under a separate NPDES permit.

3. Copermittees may, but need not, prohibit the following classes of non-storm water discharges. If the copermitee proposes not to prohibit any of the following classes of non-storm water discharges, the copermitee must first comply with the requirements of section B.4. below to the satisfaction of the SDRWQCB Executive Officer.

   a. water line flushing;
   b. landscape irrigation;
   c. diverted stream flows;
   d. rising ground waters;

VOL 22

0124

e. uncontaminated ground water infiltration [as defined at 40 CFR 35.2005(20)] to storm water conveyance systems;
f. uncontaminated pumped ground water;
g. discharges from potable water sources;
h. foundation drains;
i. air conditioning condensation;
j. irrigation water springs;
k. water from crawl space pumps;
l. footing drains;
m. lawn watering;
n. individual residential car washing;
o. flows from riparian habitats and wetlands;
p. dechlorinated swimming pool discharges; and
q. street wash water.

4. Each copermittee shall submit the following information to the SDRWQCB for each non-storm water discharge class in section B.3. above which the copermittee proposes not to prohibit:

a. identification of the non-storm water discharge class listed in section B.3. above which the copermitee proposes not to prohibit;

b. identification of the BMPs which the copermitee will require to prevent or reduce pollutant discharges from the proposed non-prohibited class of non-storm water discharges;

c. a monitoring program to access the volume, concentration and types of pollutants discharged as a result of the proposed non-prohibited class of non-storm water discharge; and

d. a program to document and track compliance with the BMPs required for the non-prohibited class of non-storm water discharges.

5. Each copermittee shall prohibit, on a case by case basis, any individual non-storm water discharge listed in section B.3. above (or any class of non-storm water discharges listed above) that is determined by the copermittee to be a source of pollutants to waters of the United States.

6. Discharges or flows from emergency fire fighting activities shall be prohibited only when such flows are determined by the copermittee to be significant sources of pollutants to waters of the United States.

C. DISCHARGE SPECIFICATIONS -- STORM WATER

1. Each copermittee shall forthwith reduce the discharge of pollutants to its storm water conveyance systems to the maximum extent practicable.

2. Copermittees shall reduce pollutants to the maximum extent practicable through implementation of the Comprehensive Storm Water and Urban Runoff Management Program described in section E.

VOL 22

0125

R0065361

D. **RECEIVING WATER LIMITATIONS**

The discharge of storm water and non storm water (subject to the limitations described in section B. above) shall not cause or contribute to a violation of any applicable receiving water quality objective contained in the Basin Plan or any SWRCB water quality control plan or policy.

E. **COMPREHENSIVE STORM WATER AND URBAN RUNOFF MANAGEMENT PROGRAM**

1. Each copermittee shall effectively implement a Comprehensive Storm Water and Urban Runoff Management Program to achieve compliance with the Prohibitions (section A.), Discharge Specifications (sections B. and C.), and Receiving Water Limitations (section D.) of this Order.

2. The Comprehensive Storm Water and Urban Runoff Management Program shall contain the components listed below and described in sections F. through K. of this Order.

   a. Legal authority (section F.);
   b. Illicit Connection / Illegal Discharge Detection Program (section G.);
   c. Best Management Practices Program (section H.)
      (1) Existing Minimum Best Management Practices Program
      (2) Municipal Best Management Practices Program
      (3) Construction Best Management Practices Program
      (4) Commercial Best Management Practices Program
      (5) Industrial Best Management Practices Program;
   d. Wet Weather Monitoring and Reporting Program (section I.);
   e. Assessment of Management Program Effectiveness (section J.); and
   f. Fiscal Analysis (section K.).

3. Each copermittee shall fully implement each component of the Comprehensive Storm Water and Urban Runoff Management Program as expeditiously as possible, but in no event later than the deadline dates specified in sections F. through K. of this Order.

F. **LEGAL AUTHORITY**

1. Pursuant to 40 CFR 122.26(d)(2)(i)(A-F), each copermittee shall establish and maintain adequate legal authority through ordinance, statute, permit, contract or other means to control discharges to and from those portions of the storm water conveyance system over which it has jurisdiction. This authority must, at a minimum, authorize the copermittee to:

   a. Control the discharge of storm water from industrial (including construction) sites to the copermittee's storm water conveyance system;

   b. Prohibit illicit discharges into the copermittees storm water conveyance system in accordance with sections A., B., C., D., and E. of this Order;

VOL 22

0126

c. Control spills, dumping, and disposal of materials other than storm water into the copermittees storm water conveyance system;

d. Control through interagency agreements among copermittees the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;

e. Require compliance with conditions in ordinances, permits, contracts or orders; and

f. Carry out all inspection, surveillance and monitoring necessary to determine compliance and noncompliance with the applicable conditions of this Order, including the prohibition on illicit discharges in Discharge Specifications - Non-Storm Water (section B.) of this Order.

2. The Cities of Carlsbad, Oceanside, and Santee shall, by **September 10, 1995**, submit a report to the SDRWQCB indicating that legal authority has been obtained to implement and enforce each of the key regulatory requirements contained in 40 CFR 122.26(d)(2)(i)(A-F) and summarized in F.1. above.

3. Each copermittee shall, by **December 15, 1995**, provide to the SDRWQCB a statement certified by its chief legal counsel that the copermittee has adequate legal authority to implement and enforce each of the key regulatory requirements contained in 40 CFR 122.26(d)(2)(i)(A-F) and summarized in F.1. above. The copermittee shall develop and submit a matrix that compares, in a side by side format, the regulatory requirements in 40 CFR 122.26(d)(2)(i)(A-F) to the copermittee's legal authority. Furthermore, the matrix shall also illustrate where the authority to mandate compliance is vested. In order to support the assertion of adequate legal authority, the copermittee shall include the complete text of the applicable storm water, grading, or other ordinances. The copermittee shall also provide a specific explanation of why and how the language of the storm water and grading ordinance or other authority meets the requirements of 40 CFR 122.26(d)(2)(i)(A-F). The copermittee shall indicate to whom the ordinance applies and how it will operate to control, prevent or stop discharges that violate the terms and conditions of this Order.

G. ILLICIT CONNECTION AND ILLEGAL DISCHARGE DETECTION PROGRAM

The purpose of the Illicit Connection and Illegal Discharge (IC/ID) Detection Program is to detect and eliminate illicit connections and illegal discharges (IC/ID) to the storm water conveyance system. The IC/ID Detection Program consists of the following three major components/activities:

a. Detection of IC/IDs;
b. Followup investigation of each IC/ID; and
c. Elimination of each IC/ID.

1. Each copermittee shall forthwith, in conjunction with its local ordinance, implement the IC/ID Detection Program described below to comply with sections A., B., C., D., and E. of this Order.

VOL 22

0127

R0065363

2. Each copermittee shall implement each component of the IC/ID Detection Program in accordance with sections G.3 - G.6. below.

3. **Detection of IC/IDS**

Each copermittee shall, at a minimum, detect illicit connections and illegal discharges by way of (1) dry weather field screening; and the (2) public complaint and information hotline as described in Attachment A.

4. **Followup Investigation of IC/IDs**

Each copermittee shall conduct followup investigations of every IC/ID detected (regardless of means of detection) as follows:

a. Each copermittee shall, by **December 15, 1995**, submit to the SDRWQCB written followup procedures to investigate and confirm the source of each IC/ID. Followup procedures may include, but are not limited to, further field screening (observations and field analyses), collection and laboratory analysis of samples (upstream and downstream), smoke or dye tests, and video taping with a remote control camera.

b. Each copermittee shall, as expeditiously as possible, conduct followup investigations to identify the source of each IC/ID detected by any means.

c. Each copermittee shall, by **December 15, 1995**, submit to the SDRWQCB written procedures for documenting the findings of each investigation, for making recommendations, and setting projected time schedules to eliminate each IC/ID. The procedures should include notification to the complainant of the findings and subsequent planned actions.

5. **Elimination of IC/IDs**

Each copermittee shall eliminate each IC/ID using its legal authority as follows:

a. Each copermittee shall establish and submit to the SDRWQCB, by **December 15, 1995**, written procedures to eliminate IC/IDs by means of a gradually escalating level of enforcement (e.g., flyers, letters, notices of violation, monetary penalties, referral to County/City District Attorney). The failure of a responsible party to achieve compliance with an initial enforcement action should result in the prompt escalation to a higher level of enforcement; and

b. Each copermittee shall eliminate all IC/ID's as expeditiously as possible but in no event later than **August 10, 1998.**

H. BEST MANAGEMENT PRACTICES PROGRAMS

The purpose of each of the following five BMP Programs is to reduce pollutants in storm water discharges to the maximum extent practicable in compliance with the Prohibitions

VOL 22 0128

(section A.), Discharge Specifications (sections B. and C.), and Receiving Water Limitations (section D.) of this Order.

1. **Existing Minimum Best Management Practices Program**

   a. Each copermittee shall continue to effectively implement its existing BMP programs for municipal, construction, commercial, and industrial runoff sources. These existing programs must include, at a minimum, the BMPs described in Attachment B of this Order.

   b. Each copermittee shall, by **December 15, 1995**, submit a report to the SDRWQCB describing the implementation status of its current BMP programs for municipal, construction, commercial and industrial sources.

2. **Municipal Best Management Practices Program**

   The purpose of the Municipal Best Management Practices Program is to reduce pollutants in storm water runoff from municipal activities, facilities and land uses.

   The Municipal Best Management Practices Program shall consist of the following components and activities:

   (1) Land Use Planning, Management and Zoning;
   (2) Targeted Municipal Pollutant Sources;
   (3) BMPs Required For Municipal Land Uses;
   (4) Education of Municipal Departments and Employees;
   (5) Education of the Public;
   (6) Copermittee Implementation of Municipal Facility Storm Water Pollution Prevention Plan (SWPPPs);
   (7) Copermittee Inspections of Municipal Facilities; and
   (8) Copermittee Enforcement at Municipal Facilities.

   a. Each copermittee shall submit to the SDRWQCB by **August 10, 1996**, a Municipal Best Management Practices Program in accordance with sections H.2.c. - H.2.j. to achieve compliance with sections A., B., C., D., and E. of this Order.

   b. Each copermittee shall implement the Municipal Best Management Practices Program in accordance with sections H.2.c. - H.2.j. no later than **November 10, 1996**, unless otherwise directed by the SDRWQCB Executive Officer.

   c. <u>Land Use Planning, Management And Zoning</u>

      Land use planning, management, and zoning presents an important opportunity to reduce pollutants in storm water runoff by integrating water quality concerns into the development and redevelopment planning process. It is applicable to all types of land use. The objective is to guide decisions regarding existing and future uses of land to protect water quality. This component shall include measures to:

VOL 22

0129

(1) Direct heavy development away from environmentally sensitive areas where possible;
(2) Establish design criteria and performance standards for new development and redevelopment such as buffer zones, open space preservation, limits on impervious surfaces and erosion and sediment control;
(3) Adopt local codes and ordinances to protect storm water quality; and
(4) Approve storm water management plans for new development.

d. Targeted Municipal Pollutant Sources

Each copermittee shall, at a minimum, target the following municipal sources:

(1) New development and redevelopment areas;
(2) Commercial and residential land use areas;
(3) Public streets, roads and highways under its jurisdiction;
(4) Flood control management projects;
(5) Landfills and sewage treatment plants;
(6) Municipal Corporate Yards; and
(7) Pesticides, herbicides and fertilizers at public parks, golf courses, landscaping around public schools, cemeteries and other public right-of-ways.

e. Municipal BMPs Required For Land Uses

Each copermittee shall describe the BMPs that it will implement to reduce pollutants in runoff from the targeted municipal sources described in H.2.d. above. Each copermittee shall include pollution prevention, source control, and treatment control BMPs as appropriate. Pollution prevention shall always be emphasized. Examples of each BMP category are described below:

(1) Pollution Prevention (non-structural) measures reduce or eliminate the generation of pollutants, or waste. The most important municipal pollution prevention measure is land use planning.

(2) Source control BMPs (non-structural) control pollutants once they are generated. Examples include:

a. public education;
b. household hazardous waste collection;
c. used oil recycling;
d. vehicle use reduction (congestion management); material storage controls;
f. catch basin cleaning;
g. safer alternative products;
h. leaking sanitary sewer control;
i. prevention of sewage spills into storm drains

VOL 22

0130

j. roadway/bridge maintenance;
k. illicit connection detection and elimination;
l. illegal dumping detection and elimination;
m. storm channel maintenance;
n. detention/infiltration device maintenance;
o. leak and spill control;
p. street cleaning;
q. vegetation controls;
r. pesticide, herbicide and fertilizer use controls; and
s. good housekeeping practices.

(3) Treatment control measures (structural) remove pollutants from storm water runoff. Examples include constructed wetlands, detention basins, biofilters, infiltration, oil water separators and media filtration devices.

f. Education Of Municipal Departments And Employees

Each copermittee shall develop and implement an educational program for all municipal departments and employees. The objective of the education program is to inform municipal departments and employees about pollution prevention, pollution sources, pollution controls, and water quality impacts. This program shall describe and schedule educational products and activities such as brochures and workshops. Education outreach shall target high priority municipal sources such as sewage spills entering storm drains, disposal of street sweeping or other waste, and municipal corporate yards.

g. Education Of The Public

Each copermittee shall implement a public education program. The objective of the education program is to inform the public about pollution prevention, sources, controls, and water quality impacts from storm water and urban runoff. This program shall describe and schedule educational products and activities such as brochures and workshops. Education outreach shall target political leaders, the general public, commercial and industrial businesses, trade associations, developers, contractors and the media.

(1) The copermittees shall establish a Public Education Subcommittee which reports to the copermittee management committee (as described in the MOU) made up of at least five copermittees and a representative from each of the following eight groups: other municipal departments, construction, media, community, schools, commercial business, industrial business, and decision makers/elected officials.

(2) The Public Education Subcommittee shall establish a public education program addressing municipal, residential, commercial, industrial and construction sources of storm water pollutants.

VOL 22

0131

R0065367

(Residential includes all residents, both owners and renters, as well as managers of multifamily dwellings and permanent and temporary residents of boats in marinas.) The goal of the subcommittee is to develop cooperative watershed based public education programs emphasizing pollution prevention. Public education programs should be communicated in both English and Spanish.

h. Copermittee Implementation Of Municipal Facility SWPPPs.

Each copermittee shall implement a site specific Storm Water Pollution Prevention Plans (SWPPPs) at each industrial facility owned by the municipality, including all corporate yards.

i. Copermittee Inspections Of Municipal Facilities

Each copermittee shall inspect each industrial facility owned by the municipality, including all corporate yards. Each facility should be inspected for compliance with its SWPPP and the storm water ordinance. This component shall describe inspection priorities, frequency, procedures and documentation.

j. Copermittee Enforcement At Municipal Facilities

Each copermittee shall enforce its local storm water ordinance at all municipal facilities and activities. This component shall describe enforcement priorities, penalties and other remedies to deter infractions and correct violations.

3. CONSTRUCTION BEST MANAGEMENT PRACTICES PROGRAM

The purpose of the Construction Best Management Practices Program is to (1) reduce pollutants in storm water runoff from construction sites and activities, and (2) maintain pre-construction hydrologic conditions. The Construction Best Management Practices Program shall consist of the following major components and activities:

(1) Site Planning;
(2) BMPs Required For Construction Sites;
(3) Education for Construction Site Owners and Operators;
(4) Copermittee Review of Construction Site SWPPPs;
(5) Copermittee Inspections of Construction Sites; and
(6) Copermittee Enforcement at Construction Sites.

a. Each copermittee shall submit to the SDRWQCB by **August 10, 1996**, a Construction Best Management Practices Program in accordance with sections H.3.c. - H.3.j. to achieve compliance with sections A., B., C., D, and E. of this Order.

b. Each copermittee shall implement the Construction Best Management Practices Program in accordance with sections G.3.c. - G.3.j. no later than

VOL 22

0132

November 10, 1996, unless otherwise directed by the SDRWQCB Executive Officer.

c. Site Planning

The objective of site planning is for the copermittee and the construction site owner to address potential water quality problems early in the site design process. Each copermittee shall require the following:

(1) Phased grading and development to minimize exposure and to coincide with seasonal dry periods;
(2) Site stabilization and revegetation as early as possible; and
(3) Review and approval of engineering plans and issuance of local permits.

d. BMPS Required For Construction Sites

Each copermittee shall describe the BMPs that it will require construction site owner/operator to implement to reduce pollutants in runoff. Each copermittee shall include pollution prevention, source control, and treatment control best management practices as appropriate. Pollution prevention shall always be emphasized. Examples of each BMP category are described below:

(1) Pollution Prevention (non-structural) measures reduce or eliminate the generation of pollutants or waste. At construction sites, pollution prevention primarily means erosion prevention. Examples include revegetation, matting, mulching, or other soil stabilization processes.

(2) Source control BMPs (non-structural) control pollutants once they are generated. At construction sites, source controls are primarily sediment controls. Examples include sand bags, hay bales, check dams, riprap, storm drain inlet protection, and silt fences.

(3) Treatment control BMPs (structural) remove pollutants, such as sediment, from storm water runoff. Examples include retention ponds, sediment basins, and filtration devices.

e. Each copermittee shall require maintenance and replacement of all source and treatment control BMPs.

f. Each copermittee shall require appropriate post construction BMPs. Each copermittee shall require maintenance and replacement of all post construction BMPs.

g. Each copermittee is responsible for storm water runoff from all construction sites within its jurisdiction, including those which are currently regulated under the statewide NPDES General Construction Storm Water Permit and those which are not subject to the general permit at this time. This includes all construction sites, regardless of size (i.e., sites less than five acres).

VOL 22 0133

h. Education for Construction Site Owners and Operators

Each copermittee shall implement an educational program for construction site owners and operators. The objective of the education program is to inform construction site owners and operators about pollution prevention (i.e., erosion prevention), pollution sources, pollution controls, and water quality impacts. This program shall describe and schedule educational products and activities such as brochures and workshops. Education outreach shall target high priority construction sites.

i. Copermittee Review of Construction Site SWPPPS.

Each copermittee shall review construction site Storm Water Pollution Prevention Plans (SWPPPs) for compliance with its local grading and storm water ordinances.

j. Copermittee Inspections of Construction Sites

Each copermittee shall inspect construction sites for compliance with its grading ordinance and permits. This component should describe inspection priorities, frequency, procedures, and documentation. Each copermittee shall inspect all construction sites for proper maintenance and replacement of all source and treatment controls.

k. Copermittee Enforcement at Construction Sites

Each copermittee shall enforce its local storm water ordinance, grading ordinance and permits at construction sites. This component shall describe enforcement priorities, penalties and other remedies to deter infractions and correct violations.

4. **COMMERCIAL BEST MANAGEMENT PRACTICES PROGRAM**

The purpose of the Commercial Best Management Practices Program is to reduce pollutants in storm water runoff from commercial sites. The Commercial Best Management Practices Program shall consist of the following major components and activities:

(1) Prioritization of Commercial Categories;
(2) BMPs Required For Commercial Sites;
(3) Education for Commercial Site Owners and Operators;
(4) Copermittee Inspections of Commercial Sites; and
(5) Copermittee Enforcement at Commercial Sites.

a. Each copermittee shall submit to the SDRWQCB by **August 10, 1997**, a Commercial Best Management Practices Program in accordance with sections H.4.c. - H.4.g., to achieve compliance with sections A., B., C., D., and E. of this Order.

VOL 22

0134

b. Each copermittee shall implement the Commercial Best Management Practices Program in accordance with sections H.4.c. - H.4.g., no later than **November 10, 1997**, unless otherwise directed by the SDRWQCB Executive Officer.

c. Prioritization of Commercial Categories

Each copermittee shall identify all commercial categories and prioritize the categories based on their threat to water quality.

(1) In evaluating threat to water quality each copermittee shall consider (1) type of commercial activity; (2) materials used in the commercial activity and the likelihood that storm water discharges will be contaminated; (3) non-storm water discharges; (4) proximity to water bodies; and (5) sensitivity of water bodies.

(2) At a minimum the priority categories shall include gas stations, vehicle repair and maintenance shops, car dealerships, commercial car washes, dry cleaners, cement mixing businesses, concrete cutting businesses, and restaurants.

d. BMPs Required for Commercial Sites

Each copermittee shall describe the BMPs that it will require commercial sites to implement to reduce pollutants in runoff. Each copermittee shall include pollution prevention, source control, and treatment control BMPs as appropriate. Pollution prevention shall always be emphasized. Examples of each BMP category are described below:

(1) Pollution Prevention measures (non-structural) reduce or eliminate the generation of pollutants or waste. Examples include: substitution of nontoxic materials for toxic; improvements in operation and maintenance efficiency; recycling within production process; and replacement or upgrade of production equipment and technologies;

(2) Source control BMPs (non-structural) control pollutants once they are generated by preventing the contact of pollutants with storm water or preventing the discharge of pollutants. Examples include berms, covers, and good housekeeping practices such as prompt cleanup of spills; and

(3) Treatment control BMPs (structural) remove pollutants from storm runoff and include on-site pretreatment, filtration, and oil water separators.

e. Education for Commercial Site Owners and Operators

Each copermittee shall implement an educational program for commercial site owners and operators. The objective of the education component is to

VOL 22 0135

VOL 22

inform commercial site owners and operators, particularly those in high priority commercial categories, about pollution prevention, pollution sources, controls, and water quality impacts. This component shall describe and schedule educational products and activities such as brochures and workshops. Education outreach shall target high priority commercial sites and activities.

f. Copermittee Inspections of Commercial Sites

Each copermittee shall develop a program to inspect high priority categories of commercial sites for compliance with its storm water ordinance. This component shall describe inspection priorities, frequency, procedures, and documentation.

g. Copermittee Enforcement of Commercial Sites

Each copermittee shall enforce its storm water ordinance at commercial sites. This component shall describe enforcement priorities, penalties and other remedies to deter infractions and correct violations.

5. **INDUSTRIAL BEST MANAGEMENT PRACTICES PROGRAM**

The purpose of the Industrial Best Management Practices Program is to reduce pollutants in storm water runoff from industrial sites. The Industrial Best Management Practices Program shall consist of the following major components and activities:

(1) Prioritization of Industrial Categories;
(2) BMPs Required for Industrial Sites;
(3) Education for Industrial Site Owners and Operators;
(4) Copermittee Inspections of Industrial Sites; and
(5) Copermittee Enforcement at Industrial Sites.

a. Each copermittee shall submit to the SDRWQCB by **February 10, 1998**, a Industrial Best Management Practices Program in accordance with sections H.5.c. - H.5.h. to achieve compliance with sections A., B., C., D., and E. of this Order.

b. Each copermittee shall implement the Industrial Best Management Practices Program in accordance with sections H.5.c. - H.5.h. no later than **May 10, 1998**, unless otherwise directed by the SDRWQCB Executive Officer.

c. Prioritization of Industrial Categories

Each copermittee shall identify all industrial categories and prioritize the categories based on their threat to water quality.

(1) In evaluating threat to water quality each copermittee shall consider (1) type of industrial activity including SIC Code; (2) materials used in industrial processes and the potential for storm water

0136

contamination; (3) non-storm water discharges; (4) proximity to water bodies; and (5) sensitivity of water bodies.

(2) At a minimum, the priority categories shall include hazardous waste treatment, disposal or recovery facilities; industries subject to effluent limitations under 40 CFR Subchapter N; industries subject to SARA Title III; shipyards; heavy manufacturing facilities (e.g. aircraft); oil and gas/mining facilities; landfills; recycling facilities; electric power generating facilities; transportation facilities; light manufacturing facilities; industrial sewage treatment plants; and military bases.

(3) Each copermittee is responsible for storm water runoff from all industrial sites within its jurisdiction, including those which are currently regulated under the statewide NPDES General Industrial Storm Water Permit and those which are not subject to the general permit at this time.

d. BMPS Required for Industrial Sites

Each copermittee shall describe the BMPs that it will require industrial sites to implement to reduce pollutants in runoff. Each copermittee shall include pollution prevention, source control, and treatment control BMPs as appropriate. Pollution prevention shall be emphasized. Examples of each BMP category are described below:

(1) Pollution Prevention measures (non-structural) reduce or eliminate the generation of pollutants or waste. Examples include: substitution of nontoxic materials for toxic; improvements in operation and maintenance efficiency; recycling within production process; and replacement or upgrade of production equipment and technologies;

(2) Source control BMPs (non-structural) control pollutants once they are generated by preventing the contact of pollutants with storm water or preventing discharge of pollutants. Examples include: . berms, covers, and good housekeeping practices such as prompt cleanup of spills; and

(3) Treatment control BMPs (structural) remove pollutants from storm water runoff and include on-site pretreatment, filtration and oil-water separators.

e. Education for Industrial Site Owners and Operators

Each copermittee shall implement an educational program for industrial site owners and operators. The objective of the education component is to inform industrial site owners and operators about pollution prevention, pollution sources, pollution controls, and water quality impacts. This component shall describe and schedule educational products and activities

VOL 22

0137

such as brochures and workshops. Education outreach shall target high priority industrial sites and activities.

f. Copermittee Review of Industrial SWPPPs

Each copermittee shall review industrial Storm Water Pollution Prevention Plans (SWPPPs) for compliance with its local storm water ordinance.

g. Copermittee Inspection of Industrial Sites

Each copermittee shall develop a program to inspect high priority categories of industrial sites for compliance with its local storm water ordinance. This component shall describe inspection priorities, frequency, procedures, and documentation.

h. Copermittee Enforcement at Industrial Sites

Each copermittee shall enforce its storm water ordinance at industrial sites. This component shall describe enforcement priorities, penalties and other remedies to deter infractions and correct violations.

I. WET WEATHER MONITORING AND REPORTING PROGRAM

The purpose of the Wet Weather Monitoring Program is to characterize storm water pollutant loading and concentrations, including long term trends, during the wet weather season. Each copermittee shall, beginning with the 1995-96 wet weather season, conduct wet weather monitoring and reporting in accordance with Attachment C of this Order.

J. ASSESSMENT OF MANAGEMENT PROGRAM EFFECTIVENESS

Each copermitee shall, by **January 31, 1996**, submit a report to the SDRWQCB describing estimated reductions in storm water pollutant loads expected as a result of the implementation of the Comprehensive Storm Water and Urban Runoff Management Program. Estimates of storm water pollutant load reductions shall be based on direct and indirect measurements of the effectiveness of the Comprehensive Storm Water and Urban Runoff Management Program. The report shall identify the direct and indirect measurements which will be used to track the long term effectiveness of the Comprehensive Storm Water and Urban Runoff Management Program.

1. Direct measurements of program effectiveness may include:

   a. Removal efficiencies of BMPs that control storm water quality;
   b. Reductions in the volume of storm water discharged;
   c. Reductions in the event mean concentrations; or
   d. Reductions in seasonal pollutant loadings.

2. Indirect measurements of program effectiveness may include changes in:

   a. Level of enforcement activity;
   b. Public awareness;

VOL 22 0138

c. Number of reports of illicit discharges or illegal dumping;
d. Gallons of used oil recycled;
e. Amount of household hazardous waste collected;
f. Number of spill cleanups;
g. Number of storm drains stenciled;
h. Acres of open space; and
i. Number of construction and erosion and sediment control plans submitted and approved.

K. FISCAL ANALYSIS

Each copermittee shall develop and submit to the SDRWQCB by **January 31, 1996** a fiscal analysis demonstrating that sufficient financial resources have been appropriated to implement the conditions of this Order. This Order will be effective on August 10, 1995 and expires on August 10, 2000. For each of the five fiscal years to be covered by this Order, the fiscal analysis must describe the necessary capital and operation and maintenance expenditures necessary to accomplish the activities required under this Order. The analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures including legal restrictions on the use of such funds. The fiscal analysis shall contain the following information:

1. Identification of the major tasks for each component required under this Order;
2. Development of a schedule outlining when each of the tasks for each component will be undertaken;
3. An estimate of the personnel and capital expenses necessary to accomplish each task for each component;
4. An estimate of other non-capital costs to implement the tasks for each component;
5. Identification of funding sources to cover total expenditures (e.g. general revenues, storm water utilities, plan review fees, permit fees, industrial/commercial user fees, special assessment district funds, special assessments on property tax bills and revenue bonds);
6. A comparison of the funding sources with the funding needs; and
7. Identification of alternative funding sources if adequate funding is not available.

L. PROVISIONS

1. Duty To Comply [40 CFR 122.26(a)(3)(vi)

   Each copermitees need only comply with conditions of this Order relating to (1) discharges from storm water conveyance systems for which they are operators; and (2) the Wet Weather Monitoring and Reporting Program described in Attachment C of this Order to be conducted jointly by all copermittees pursuant to the copermittees Memorandum of Understanding.

2. Duty To Comply [40 CFR 122.41(a)]

   The discharger must comply with all conditions of this Order. Any permit noncompliance constitutes a violation of the Clean Water Act and the California Water Code and is grounds for enforcement action; for permit termination,

VOL 22
0139

revocation and reissuance, or modification; or denial of a report of waste discharge submitted in application for permit modification or reissuance.

3. Duty To Comply [40 CFR 122.41(a)(1)]

The discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the Clean Water Ac for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the Clean Water Act within the time provided in the regulations that establish these standards or prohibitions or standards for sewage sludge use or disposal, even if this Order has not yet been modified to incorporate the requirement.

4. Need to Halt or Reduce Activity Not a Defense [40 CFR 122.41(c)]

It shall not be a defense for the discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order. Upon reduction, loss, or failure of a treatment facility, the discharger shall, to the extent necessary to maintain compliance with this Order, control production or all discharges, or both, until the facility is restored or an alternative method of treatment is provided. This provision applies, for example, when the primary source of power of a treatment facility fails, is reduced, or is lost.

5. Duty to Mitigate [40 CFR 122.41(d)]

The discharger shall take all reasonable steps to minimize or prevent any discharge or prevent any discharge or sludge use or disposal in violation of this Order which has a reasonable likelihood of adversely affecting human health or the environment.

6. Proper Operation and Maintenance [40 CFR 122.41(e)]

The discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems which are installed by the discharger only when the operation is necessary to achieve compliance with the conditions of this Order.

7. Permit Actions [40 CFR 122.41(f)] [California Water Code § 13381]

This Order may be modified, revoked and reissued, or terminated for cause including, but not limited to, the following:

a. Violation of any terms or conditions of this Order;

b. Obtaining this Order by misrepresentation or failure to disclose fully all relevant facts;

VOL 22

0140

c. A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge; or

d. A determination that the permitted activity endangers human health or the environment and can only be regulated to acceptable levels by permit modification or termination.

The filing of a request by the discharger for modification, revocation and reissuance, or termination of this Order, or a notification of planned changes or anticipated noncompliance does not stay any condition of this Order.

8. Property Rights [40 CFR 122.41(g)] [California Water Code §13263(g)]

This Order does not convey any property rights of any sort or any exclusive privilege. The requirements prescribed herein do not authorize the commission of any act causing injury to persons or property, nor protect the discharger from liabilities under federal, state, or local laws, nor create a vested right for the discharger to continue the waste discharge.

9. Inspection and Entry [40 CFR 122.41(i)] [California Water Code § 13267(c)]

The discharger shall allow the SDRWQCB, or an authorized SDRWQCB representative, or an authorized representative of the USEPA (including an authorized contractor acting as a representative of the SDRWQCB or USEPA), upon presentation of credentials and other documents as may be required by law, to:

a. Enter upon the discharger's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this Order;

b. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order;

c. Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; and

d. Sample or monitor at reasonable times, for the purposes of assuring compliance with this Order or as otherwise authorized by the Clean Water Act or California Water Code, any substances or parameters at any location.

10. Bypass of Treatment Facilities [40 CFR 122.41(m)]

a. Definitions

(1) "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility.

VOL 22

0141

(2) "Severe property damage" means substantial physical damage to property, damage to the treatment facilities which causes them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.

b. Bypass not Exceeding Limitations

The discharger may allow any bypass to occur which does not cause effluent limitations of this Order or the concentrations of pollutants set forth in Ocean Plan Table A or Table B to be exceeded, but only if it also is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions of paragraphs c. and d. of this provision.

c. Notice

(1) Anticipated bypass. If the discharger knows in advance of the need for a bypass, it shall submit prior notice, if possible, at least ten days before the date of the bypass.

(2) Unanticipated bypass. The discharger shall submit notice of an unanticipated bypass as required in Reporting Requirement N.9.

d. Prohibition of Bypass

(1) Bypass is prohibited, and the SDRWQCB may take enforcement action against the discharger for bypass, unless:Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage;

(2) There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgement to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance; and

(3) The discharger submitted notices as required under paragraph c. of this section.The SDRWQCB Executive Officer may approve an anticipated bypass, after considering its adverse effects, if the SDRWQCB Executive Officer determines that it will meet the three conditions listed above in paragraph d.(1) of this section.

VOL 22

0142

11. Upset [40 CFR 122.41(n)]

a. Definition

"Upset" means an exceptional incident in which there is unintentional and temporary noncompliance with technology based effluent limitations because of factors beyond the reasonable control of the discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.

b. Effect of an Upset

An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of paragraph c. of this section are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review.

c. Conditions Necessary for a Demonstration of Upset

A discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:

(1) An upset occurred and that the discharger can identify the cause(s) of the upset;

(2) The permitted facility was at the time being properly operated;

(3) The discharger submitted notice of the upset as required in Reporting Requirement N.9.(24 hour notice) of this Order; and

(4) The discharger complied with any remedial measures required under Provision L.5. of this Order.

d. Burden of Proof

In any enforcement proceeding the discharger seeking to establish the occurrence of an upset has the burden of proof.

12. Other Effluent Limitations and Standards [40 CFR 122.44(b)(1)]

If any toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under Section 307(a) of the Clean water Act for a toxic pollutant which is present in the discharge and that standard or prohibition is more stringent than any limitation on the pollutant in this Order, the SDRWQCB Executive Officer may institute proceedings under these regulations to modify or revoke and reissue the Order to conform to the toxic effluent standard or prohibition.

VOL 22

0143

R0065379

13. The discharger shall take all reasonable steps to minimize or correct any adverse impact on the environment resulting from noncompliance with this Order, including such accelerated or additional monitoring as may be necessary to determine the nature and impact of the noncomplying discharge.

14. The provisions of this Order are severable, and if any provision of this Order, or the application of any provision of this Order to any circumstances, is held invalid, the application of such provision to other circumstances, and the remainder of this Order, shall not be affected thereby.

15. The discharger shall comply with any interim effluent limitations as established by addendum, enforcement action, or revised waste discharge requirements which have been, or may be, adopted by this SDRWQCB.

M. MONITORING REQUIREMENTS

1. Wet Weather Monitoring Annual Report

Pursuant to the Memorandum of Understanding, the copermitees shall jointly conduct the wet weather monitoring program described in Attachment C. of this Order. A single wet weather monitoring report shall be submitted by August 10 of each year.

2. Monitoring and Records [40 CFR 122.41(j)(1)]

Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

3. Monitoring and Records [40 CFR 122.41(j)(2)] [California Water Code § 13383(a)]

The discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least three years from the date of the sample, measurement, report or application. This period may be extended by request of the SDRWQCB Executive Officer at any time.

4. Monitoring and Records [40 CFR 122.21(j)(3)]

Records of monitoring information shall include the information requested in Attachments A. and C. and the following:

a. The date, exact place, and time of sampling or measurements;
b. The individual(s) who performed the sampling or measurements;
c. The date(s) analyses were performed;
d. The individual(s) who performed the analyses;
e. The analytical techniques or methods used; and
f. The results of such analyses.

VOL 22
0144

5. Monitoring and Records [40 CFR 122.21(j)(4)]

Monitoring results must be conducted according to test procedures approved under 40 CFR part 136 unless other test procedures have been specified in the permit.

6. Monitoring and Records [40 CFR 122.21(j)(5)]

The Clean Water Act provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than two years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by imprisonment of not more than four years, or both.

7. Monitoring and Records [40 CFR 122.41(k)(2)]

The Clean Water Act provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or non-compliance shall, upon conviction, be punished by a fine of not more than $10,000 per violation, or by imprisonment for not more than six months per violation, or by both.

8. Monitoring Reports [40 CFR 122.41(l)(4)

Monitoring results shall be reported at the intervals specified elsewhere in this Order.

9. Monitoring Reports [40 CFR 122.41(l)(4)(ii)]

If the discharger monitors any pollutant more frequently than required by the permit using test procedures approved under 40 CFR part 136, unless otherwise specified in the permit, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the reports requested by the SDRWQCB Executive Officer.

10. Monitoring Reports [40 CFR 122.41(l)(4)(iii)]

Calculations for all limitations which require averaging of measurements shall utilize an arithmetic mean unless otherwise specified by the SDRWQCB Executive Officer in the permit.

N REPORTING REQUIREMENTS

1. **Memorandum of Understanding**

Each copermittee shall submit a signed and executed copy of the Memorandum of Understanding (MOU) to the SDRWQCB no later than **August 10, 1995.**

VOL 22

0145

2. **Annual Report** [40 CFR 122.42(c)]

Each copermittee must submit an annual report to the SDRWQCB Executive Officer by **August 10** of each year. The report shall include a detailed discussion on the status of implementing the Comprehensive Storm Water and Urban Runoff Management Program described in section E. through K. of this Order. The discussion shall address the following:

a. Non-Prohibited Non-Storm Water Discharges (section B.)

Provide a status report on each non-prohibited class of non-storm water discharges described in section B.3. containing the following information:

(1) identification of the non-storm water discharge class(es) ;

(2) identification of the BMPs which have been implemented to prevent or reduce pollutant discharges from the non-prohibited class of non-storm water discharges;

(3) the data results of the monitoring program to access the volume, concentration and types of pollutants discharged as a result of the proposed non-prohibited class of non-storm water discharge; and

(4) A summary describing the number and nature of enforcement actions, inspections, and public education related to these non-storm water discharge classes.

b. Legal Authority (section F.)

Provide confirmation of continuing adequate legal authority as required in Section F. of this Order.

c. Illicit Connection / Illegal Discharge Detection Program (section G.);

(1) Provide a status report on all IC/ID detection activities including:

(a) number of IC/IDs detected by field screening;summary of field screening data including a frequency distribution of data to identify stations at which elevated levels of pollutants are consistently found. (Field screening data report is due every January 31).; and
(b) number of IC/IDs reported by public hotline .

(2) Provide a status report on all IC/ID elimination activities

(a) including:number of IC/IDs eliminated;
(b) number of enforcement actions taken

d. Best Management Practices Program (section H.)

Provide a status report on the implementation of each of the following five BMP programs:

VOL 22
0146
R0065382

(1) Existing Minimum Best Management Practices Program;
(2) Municipal Best Management Practices Program;
(3) Construction Best Management Practices Program;
(4) Commercial Best Management Practices Program; and
(5) Industrial Best Management Practices Program.

e. Assessment of Management Program Effectiveness (section J.);

Using direct and indirect measures selected as long term indicators of management program effectiveness, provide an assessment of overall reductions in storm water pollutant loads, occurring during the past year, attributable to implementation of the Comprehensive Storm Water and Urban Runoff Management Program. Provide a summary describing the number and nature of enforcement actions, inspections, public education programs, and identification of water quality improvements or degradation.

f. Fiscal Analysis (section K.).

Update the projected five year fiscal analysis required in section K. of this Order, if necessary. At a minimum documentation should be submitted demonstrating that sufficient financial resources have been appropriated for the upcoming fiscal year to implement the conditions of this Order. Also include a description of the annual expenditures for the previous fiscal year.

3. Duty to Reapply [40 CFR 122.41(b)]

This Order expires on August 10, 2000. If the discharger wishes to continue any activity regulated by this Order after the expiration date of this Order, the discharger must apply for and obtain new waste discharge requirements. The discharger must file a Report of Waste Discharge in accordance with Title 23, California Code of Regulations not later than 180 days in advance of the expiration date of this Order as application for issuance of new waste discharge requirements.

4. Duty to Provide Information [40 CFR 122.41(h)]

The discharger shall furnish to the Executive Officer, SWRCB Executive Director, or USEPA, within a reasonable time, any information which the Executive Officer, SWRCB Executive Director, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order, or to determine compliance with this Order. The discharger shall also furnish to the SDRWQCB Executive Officer, SWRCB Executive Director, or USEPA, upon request, copies of records required to be kept by this Order.

5. Planned Changes [40 CFR 122.41(l)(1)]

The discharger shall give notice to the SDRWQCB Executive Officer as soon as possible of any planned physical alterations or additions to the permitted facility.

Notice is required only when:

a. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR Part 122.29(b);

VOL 22

0147

R0065383

b. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which are subject neither to effluent limitations in this Order, nor to notification requirements under 40 CFR 122.42(a)(l); or

c. The alteration or addition results in a significant change in the discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of conditions in this Order that are different from or absent in the existing Order, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan.

6. Anticipated Non-Compliance [40 CFR 122.41(l)(2)]

The discharger shall give advance notice to the Executive Officer of any planned changes in the permitted facility or activity which may result in noncompliance with the requirements of this Order.

7. Transfers [40 CFR 122.41(l)(3)]

This Order is not transferable to any person except after notice to the SDRWQCB Executive Officer. The SDRWQCB Executive Officer may require modification or revocation and reissuance of this Order to change the name of the discharger and

incorporate such other requirements as may be necessary under the Clean Water Act or the California Water Code in accordance with the following:

a. Transfers by Modification [40 CFR 122.61(a)]

Except as provided in paragraph b. of this reporting requirement, this Order may be transferred by the discharger to a new owner or operator only if this Order has been modified or revoked and reissued, or a minor modification made to identify the new discharger and incorporate such other requirements as may be necessary under the Clean Water Act or California Water Code.

b. Automatic Transfers [40 CFR 122.61(b)]

As an alternative to transfers under paragraph a. of this reporting requirement, any NPDES permit may be automatically transferred to a new discharger if:

(1) The current discharger notifies the SDRWQCB Executive Officer at least 30 days in advance of the proposed transfer date in paragraph b.(2) of this reporting requirement;

(2) The notice includes a written agreement between the existing and new dischargers containing a specific date for transfer of permit responsibility, coverage, and liability between them; and

(3) The SDRWQCB Executive Officer does not notify the existing discharger and the proposed new discharger of his or her intent to modify or revoke and reissue the Order. A modification under this

VOL 22

0148

subparagraph may also be a minor modification under 40 CFR Part 122.63. If this notice is not received, the transfer is effective on the date specified in the agreement mentioned in paragraph b.(2) of this reporting requirement.

8. Compliance Schedules [40 CFR 122.41(l)(5)]

Written reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order shall be submitted to the SDRWQCB no later than 14 days following each schedule date.

9. Twenty-four Hour Reporting [40 CFR 122.41(l)(6)]

The discharger shall report any noncompliance which may endanger health or the environment. Any information shall be provided orally to the SDRWQCB Executive Officer within 24 hours from the time the discharger becomes aware of the circumstances. A written description of any noncompliance shall be submitted to the SDRWQCB Executive Officer within five days of such an occurrence and contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance. The following shall be included as information which must be reported within 24 hours under this reporting requirement:

a. Any unanticipated bypass which exceeds any effluent limitation in this Order;

b. Any discharge of treated or untreated wastewater resulting from pipeline breaks, obstruction, surcharge or any other circumstance;

c. Any upset which exceeds any effluent limitation in this Order; and

d. Any violation of the prohibitions of this Order.

10. Other Non-Compliance [40 CFR 122.41(l)(7)]

The discharger shall report all instances of noncompliance not reported under Monitoring Requirements M.7., M.8., and M.9., and Reporting Requirements N.8. and N.9. of this Order, at the time monitoring reports are submitted. The reports shall contain the information listed in Reporting Requirement N.9. of this Order.

11. Other Information [40 CFR 122.41(l)(8)]

Where the discharger becomes aware that it failed to submit any relevant facts in a Report of Waste Discharge, or submitted incorrect information in a Report of Waste Discharge, or in any report to the SDRWQCB, it shall promptly submit such facts or information.

VOL 22

0149

R0065385

12. Signatory Requirements [40 CFR 122.41(k)(1) and 40 CFR 122.22]

All applications, reports, or information submitted to the SDRWQCB Executive Officer shall be signed and certified.

a. All Reports of Waste Discharge shall be signed as follows:

(1) **For a corporation**: by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (a) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation; or (b) the manager of one or more manufacturing, production, or operating facilities employing more than 250 persons or having gross annual sales or expenditures exceeding $25 million (in second-quarter 1980 dollars), if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures.

(2) **For a partnership or sole proprietorship**: by a general partner or the proprietor, respectively; or

(3) **For a municipality, State, Federal or other public agency:** by either a principal executive officer or ranking elected official. For purposes of this section, a principal executive officer of a Federal agency includes: (a) the chief executive officer of the agency; or (b) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of USEPA).

b. All reports required by this Order, and other information requested by the SDRWQCB Executive Officer shall be signed by a person described in paragraph a. of this reporting requirement, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

(1) The authorization is made in writing by a person described in paragraph a. of this reporting requirement;

(2) The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.); and,

(3) The written authorization is submitted to the SDRWQCB Executive Officer.

c. If an authorization under paragraph b. of this reporting requirement is no longer accurate because a different individual or position has responsibility

VOL 22 0150

for the overall operation of the facility, a new authorization satisfying the requirements of paragraph b. of this reporting requirement must be submitted to the SDRWQCB Executive Officer prior to or together with any reports, information, or applications to be signed by an authorized representative.

d. Any person signing a document under paragraph a. or b. of this reporting requirement shall make the following certification:

> "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

13. Except for data determined to be confidential under 40 CFR Part 2, all reports prepared in accordance with the terms of this Order shall be available for public inspection at the offices of the California Regional Water Quality Control Board, San Diego Region. As required by the Clean Water Act, Reports of Waste Discharge, this Order, and effluent data shall not be considered confidential.

14. The discharger shall submit reports and provide notifications as required by this Order to the following:

a. Storm Water Unit
California Regional Water Quality Control Board
San Diego Region
9771 Clairemont Mesa Blvd, Suite B
San Diego, California 92124-1331

Phone - (619) 467-2952 or
Fax - (619) 571-6972

b. U.S. Environmental Protection Agency
Region IX
Permits Issuance Section (W-5-1)
75 Hawthorne Street
San Francisco, California 94105

15. Unless otherwise directed, the discharger shall submit three copies of each report required under this Order to the SDRWQCB and one copy to USEPA.

VOL 22

0151

O. NOTIFICATION

1. California Water Code Section 13263(g) states:

No discharge of waste into the waters of the state, whether or not such discharge is made pursuant to waste discharge requirements, shall create a vested right to continue such discharge. All discharges of waste into waters of the state are privileges, not rights.

2. Enforcement Provisions [40 CFR 122.41(a)(2)] [California Water Code Sections 13385 and 13387]

The Clean Water Act provides that any person who violates section 301, 302, 306, 307, 308, 318 or 405 of the Act, or any condition or limitation of this Order, is subject to a civil penalty not to exceed $25,000 per day for each violation. The Clean Water Act provides that any person who negligently violates sections 301, 302, 306, 307, 308, 318, or 405 of the Act, or any condition or limitation of this Order, is subject to criminal penalties of $2,500 to $25,000 per day of violation, or imprisonment of not more than one year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than $50,000 per day of violation, or by imprisonment of not more than two years, or both. Any person who knowingly violates such sections, or such conditions or limitations is subject to criminal penalties of $5,000 to $50,000 per day of violation, or imprisonment for not more than three years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than $100,000 per day of violation, or imprisonment of not more than six years, or both. Any person who knowingly violates section 301, 302, 303, 306, 307, 308, 318 or 405 of the Act, or any condition or limitation of this Order, and who knows at that time that he or she thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of not more than $250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than $500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in section 309(c)(3)(B)(iii) of the Clean Water Act, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than $1,000,000 and can be fined up to $2,000,000 for second or subsequent convictions.

3. Except as provided in Provisions L.10. and L.11. nothing in this Order shall be construed to relieve the discharger from civil or criminal penalties for noncompliance.

4. Nothing in this Order shall be construed to preclude the institution of any legal action or relieve the discharger from any responsibilities, liabilities, or penalties to which the discharger is or may be subject to under Section 311 of the Clean Water Act.

5. Nothing in this Order shall be construed to preclude institution of any legal action or relieve the discharger from any responsibilities, liabilities, or penalties established pursuant to any applicable State law or regulation under authority preserved by Section 510 of the Clean Water Act.

VOL 22

0152

6. This Order shall become effective on August 10, 1995, provided the USEPA Regional Administrator has no objection. If the Regional Administrator objects to its issuance, this Order shall not become effective until such objection is withdrawn.

7. This Order supersedes Order No. 90-42 upon the effective date of this Order.

I, Arthur L. Coe, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Diego Region, on August 10, 1995.

ARTHUR L. COE
Executive Officer

VOL 22

0153

R0065389

END NOTES

1 **Storm water (wet weather flows)** consists of precipitation only and is defined in 40 CFR 122.26(b)(13) as storm water runoff, snow melt runoff, and surface runoff and drainage.

2 **Storm Water Conveyance System** - A discernable, confined, and discrete conveyance or system of conveyances, including but not limited to, natural channels, storm drains, gutters, ditches, pipes, tunnel, conduit, highways, and roads under the jurisdiction of a city, town, borough, county, parish, or other public body.

3 **Maximum extent practicable** - Maximum extent practicable is a performance standard for municipalities to reduce the discharge of pollutants from storm water conveyance systems as much as practicable. Under the MEP standard municipalities are required to employ the Best Management Practices that are technically and economically feasible. The selection of specific BMPs to achieve the MEP standard must be based upon the following factors:

a. The effectiveness of the BMP in reducing pollutants;
b. The degree of regulatory compliance with this Order and other federal, state and local laws and regulations;
c. The degree of public acceptance;
d. The cost of implementing the BMP in relationship to the pollution control benefit; and
e. The technical feasibility of the BMP.

4 **Best Management Practices** - Best Management Practices (BMPs) are defined in 40 CFR 122.2 as schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SANTA ANA REGION

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT
NPDES NO. CAS 618033
AND
WASTE DISCHARGE REQUIREMENTS
ORDER NO. 95-47
FOR
THE RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT, THE COUNTY OF RIVERSIDE, AND THE INCORPORATED CITIES OF RIVERSIDE COUNTY WITHIN THE SANTA ANA REGION
AREAWIDE URBAN STORM WATER RUN-OFF

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Board), finds that:

1. On January 3, 1995, the Riverside County Flood Control and Water Conservation District (RCFC&WCD), in cooperation with the County of Riverside, and the incorporated cities of Beaumont, Corona, Calimesa, Canyon Lake, Hemet, Lake Elsinore, Moreno Valley, Norco, Perris, Riverside, and San Jacinto (hereinafter collectively referred to as "permittees"), have jointly submitted a National Pollutant Discharge Elimination System (NPDES) Application No. CAS 618033 to renew their areawide NPDES permit for urban storm water run-off.

2. The 1987 amendments to the Clean Water Act required the United States Environmental Protection Agency (EPA) to develop permitting regulations for storm water discharges from municipal separate storm sewer systems serving a population of 100,000 or more and for storm water discharges associated with industrial activities, including construction sites. The EPA published proposed storm water regulations on December 7, 1988 and promulgated the final regulations on November 16, 1990. Prior to the EPA's promulgation of the final storm water regulations, the three counties (Orange, Riverside, and San Bernardino) and the incorporated cities within the jurisdiction of the Santa Ana Regional Board requested areawide NPDES permits for urban storm water run-off.

3. On July 13, 1990, the Regional Board adopted Order No. 90-104 for urban storm water run-off from urban areas in Riverside County within the Santa Ana Region. Order No. 90-104 expired on July 1, 1995. The Riverside County Flood Control and Water Conservation District was named as the principal permittee and Riverside County and the incorporated cities were named as the co-permittees. In order to more effectively carry out the requirements of this order, the permittees have agreed that the RCFC&WCD will continue as principal permittee and Riverside County and the incorporated cities will continue as co-permittees. However, the Regional Board, in exercising its enforcement discretion, will take action only against the individual permittee responsible for specific violations of this order, whenever possible.

VOL 22 0155

R0065391

4. Order No. 90-104 required the permittees to develop and implement a drainage area management plan (DAMP); develop and implement storm water and receiving water monitoring plans; to eliminate illegal and illicit discharges to the storm drain systems; and, to enact the necessary legal authority to effectively prohibit illegal and illicit discharges. The overall goal of these requirements was to reduce pollutant loadings to surface waters from urban run-off to the maximum extent practicable.

5. The Report of Waste Discharge (the permit renewal application) included the following major components:

   a. A map of the drainage area and maps of existing storm drain facilities
   b. A summary of the storm water management program
   c. A Consolidated Program for Water Quality Monitoring
   d. A copy of a Proposed Storm Water/Urban Run-off Management and Discharge Control Ordinance
   e. A copy of the current Implementation Agreement
   f. A copy of each of the Interagency Agreements
   g. The Drainage Area Management Plan (DAMP)
   h. A copy of Proposed Riverside County Grading and Erosion Control Ordinance

   ~~These and other documents submitted as part of the Report of Waste Discharge are hereby made a part of this order.~~

6. Within the Santa Ana Region, the permittees serve a population of approximately 930,000, occupying an area of approximately 1,360 square miles. The permitted area is shown on Appendix 1. This order regulates storm water run-off from areas under the jurisdiction of the permittees. The term storm water as used in this order includes storm water run-off, snow melt run-off, and surface run-off and drainage. The average annual rainfall in the urbanized area of Riverside County ranges from 10 to 12 inches. The permittees have jurisdiction over and/or maintenance responsibility for storm water conveyance systems within Riverside County. The storm drain system includes an estimated 200 miles of open and closed storm drains owned and operated by RCFC&WCD and an estimated 57 miles of open and closed storm drains owned and operated by the remaining permittees. The permittees have identified major outfalls(with a pipe diameter of 36 inches or greater or drainage areas draining 50 acres or more) and have submitted maps of existing storm drain facilities.

7. Approximately one quarter (1/4) of the entire Riverside County area drains into water bodies within the Santa Ana Region. Most of the urbanized areas of Riverside County lie within this Regional Board's jurisdiction. Storm water run-off from other portions of Riverside County is regulated by the San Diego and Colorado River Basin Regional Boards. The discharges consist of run-off from rainfall, snow melt, and surfacing ground water from various land use areas which either discharge directly to the Santa Ana River or to watercourses tributary to the Santa Ana River. Other major rivers in the area

VOL 22

0156

R0065392

include the San Jacinto River and Temescal Creek. The San Jacinto Mountain areas drain into the San Jacinto River, which discharges into Lake Elsinore. Any overflow from Lake Elsinore is tributary to Temescal Creek, which flows into Reach 3 of the Santa Ana River in the Prado Flood Control Basin.

8. The Santa Ana River Basin is the major watershed within this Region. This watershed is divided into the upper and lower Santa Ana watersheds. The lower Santa Ana River Basin (downstream from Prado Dam) includes the Orange County drainage areas and the Upper Santa Ana River Basin includes the San Bernardino County and the Riverside County drainage areas. The San Bernardino County drainage areas are generally upstream of the Riverside County drainage areas.

9. The three county areas within this Region are regulated under three areawide permits for urban storm water run-off. These areawide NPDES permits are:

   a. Orange County, NPDES No. CA 8000180, Order No. 90-71 (upon renewal Order No. 95-52)

   b. Riverside County, NPDES No. CA 8000192, Order No. 90-104 (upon renewal Order No. 95-47)

   c. San Bernardino County, NPDES No. CA 8000200, Order No. 90-136 (upon renewal Order No. 95-53)

10. Run-off from the San Bernardino County drainage areas is generally conveyed to the Riverside County drainage areas through the Santa Ana River or other drainage channels tributary to the Santa Ana River. These flows are then discharged to Reach 2 of the Santa Ana River through Prado Dam (Reach 3 of the Santa Ana River). Most of the flow in Reach 2 is recharged in Orange County. During wet weather, some of the flow is discharged to the Pacific Ocean through Reach 1 of the Santa Ana River.

11. In addition to the Regional Board, a number of other stakeholders are involved in the management of the water resources of the Region. These include, but are not limited to, the incorporated cities in the Region, publicly owned treatment works, the three counties, and the Santa Ana Watershed Project Authority and its member agencies. The entities listed in Appendix 2 are considered as potential dischargers of storm water to the Riverside County drainage areas. It is expected that these entities will also work cooperatively with the permittees to manage urban run-off. The Regional Board has the discretion and authority to require non-cooperating entities to participate in this areawide permit or to issue individual storm water permits, pursuant to 40 CFR 122.26(a). Cooperation and coordination among all the stakeholders are critical to optimize the use of limited resources and insure economical management of the watershed. Recognizing this fact, this order focusses on watershed management and seeks to integrate the

VOL 22
0157
R0065393

VOL 22
0158

programs of all the stakeholders, especially the three municipal storm water permit holders, within this watershed.

12. The 1989, 1991, and 1994 Water Quality Assessments by the Regional Board identified impairment of a number of water bodies within the permitted area. The beneficial uses of these water bodies are threatened or impaired in part due to urban storm water run-off and non-storm water flows from urbanized areas. Preliminary results from urban storm water monitoring programs within the Region indicate that major pollutants of concern in urban run-off are certain heavy metals, sediment, coliform bacteria, pesticides, and nutrients. Municipal storm water run-off is a source of pollutants to waters of the Region that may be causing or contributing to water quality impairment. It is recognized that instream or end-of-channel treatment of storm water is difficult and expensive. Therefore, it is critical to identify the pollutant sources and to develop management practices necessary to reduce pollutant loading to storm water. The quality of these discharges varies considerably and is affected by land use activities, basin hydrology and geology, season, the frequency and duration of storm events and point source discharges permitted by the Regional Board under individual permits.

13. Studies conducted by the EPA, the states, flood control districts and other entities indicate the following major sources of urban storm water pollution nationwide:

    a. Industrial sites where appropriate pollution control and best management practices (BMPs) are not implemented,

    b. Construction sites where erosion and siltation controls and BMPs are not implemented, and

    c. Urban run-off where the drainage area is not properly managed.

14. To address the industrial and construction sites, the State Water Resources Control Board (State Board) issued two statewide general NPDES permits: one for storm water run-off from industrial sites (NPDES No. CAS000001, General Industrial Activities Storm Water Permit) and the second one for storm water run-off from construction sites (NPDES No. CAS000002, General Construction Activity Storm Water Permit). Most industrial activities (some light industrial activities are exempt) and construction activities on five acres or more are required to get individual NPDES permits for storm water discharges, or get coverage under these statewide general permits by completing and filing a Notice of Intent (NOI) with the State Board.

15. In addition, the Regional Board adopted Order No. 94-005, NPDES NO. CA 8000279, for storm water run-off from facilities owned and/or operated by Caltrans, which includes freeways and highways, and Order No. 94-7, NPDES NO. CA 8000336, for concentrated animal feeding operations, including dairies (General Dairy Permit). The Regional Board

R0065394

has issued and continues to issue individual storm water permits for certain industrial facilities within the Region.

16. One of the major components of these statewide permits, the Caltrans permit, and the General Dairy Permit is the requirement for the development and implementation of a storm water pollution prevention plan (SWPPP) for each facility.

17. The Regional Board is the enforcing authority for the two statewide general permits. However, in most cases, the industrial and construction sites discharge directly into storm drains and/or flood control facilities owned and operated by the permittees. These industrial and construction sites are also regulated under local laws and regulations. Therefore, a coordinated effort between the permittees and the Regional Board is critical to avoid duplicative storm water regulatory activities. A memorandum of understanding between the permittees and the Regional Board may be appropriate to efficiently implement the storm water regulations for industries and construction sites at the local level.

18. The permittees generally conduct inspections of industrial and commercial facilities and construction sites within their jurisdiction to determine compliance with local storm water ordinances and regulations as well as for other regulatory purposes. The permittees have established a subcommittee to develop an enforcement/compliance strategy for industrial and commercial facilities and construction sites. The permittees have agreed to notify Regional Board staff ~~of industrial and construction facilities which are not in compliance with the storm water regulations.~~ when conditions are observed during such inspections which result in a threat or potential threat to water quality. This also includes failure to obtain coverage under the general storm water permits.

19. The permittees have agreed not to issue grading and/or building permits without proof of compliance for projects subject to the General Permit for Storm Water Discharges Associated with Construction Activity.

20. The permittees own/operate facilities where industrial or related activities take place that may have an impact on storm water quality. Some of the permittees also enter into contracts with outside parties to carry out activities that may also have an impact on storm water quality. These facilities and related activities include, but are not limited to, street sweeping, catch basin cleaning, maintenance yards, vehicle and equipment maintenance areas, waste transfer stations, corporation and storage yards, parks and recreational facilities, landscape and swimming pool maintenance activities, storm drain system maintenance activities and the application of herbicides, algaecides and pesticides. As part of this order, the permittees will assess public agency activities and facilities for potential impact to storm water quality and develop and implement best management

VOL 22
0159
R0065395

practices to reduce pollutant discharges from those activities/facilities found to be sources of pollutants. Non-storm water discharges from these facilities and/or activities also affect water quality. This order prohibits non-storm water discharges from public facilities unless the discharges are exempt under Section III., Discharge Limitations, 3 of this order or are permitted by the Regional Board under an individual NPDES permit.

21. The major focus of storm water pollution prevention is the development and implementation of an appropriate drainage area management plan (DAMP) including best management practices (BMPs). The ultimate goal of the urban storm water management program is to attain water quality consistent with the water quality objectives for the receiving waters in order to protect beneficial uses. The permittees developed and submitted a DAMP, which was approved on January 18, 1994.

22. The DAMP is a dynamic document and the permittees have implemented, or are in the process of implementing its various elements. The Regional Board also recognizes other drainage area management plans such as the Drainage Water Quality Plan for Lake Mathews (DWQPLM), which includes structural BMPs for pollution control. The RCFC & WCD and Riverside County are involved in the DWQPLM.

23. There is some contribution of pollutants in urban run-off from privately owned and operated facilities such as residences, businesses and commercial establishments and public and private institutions. Therefore, a successful storm water management plan should include the participation and cooperation of the public, businesses, and institutions. Therefore, the DAMP has a strong emphasis on public education.

24. The DAMP included 34 BMPs and a time schedule for implementation. These BMPs are organized into two components: BMPs for existing facilities and BMPs for new development. Both components include regulatory activities, public education programs and operations and maintenance activities.

25. In order to characterize storm water discharges, to identify problem areas, and to determine the effectiveness of the various BMPs, an effective monitoring program is critical. From 1990 through 1995, the principal permittee administered the monitoring program for the permittees which included storm water monitoring, receiving water monitoring, dry weather monitoring and sediment monitoring. The Report of Waste Discharge included a Consolidated Program for Water Quality Monitoring.

26. In order to make the best use of limited resources of all the permittees (including other municipal permittees in San Bernardino and Orange Counties), and to derive maximum benefit from the storm water management programs, future programs should consider and explore approaches and program elements common to all three counties. An integrated

VOL 22
0160
R0065396

management program may be developed with the cooperation of all the stakeholders, including the permittees in the three counties, and the Regional Board. The Regional Board will coordinate the activities within the watershed and seek participation of the permittees

27. The permittees have agreed to revise the implementation agreement that was developed in 1990 as required under Order No. 90-104 to coordinate the activities of the principal and co-permittees.

28. Illegal dumping and illicit/illegal connections and discharges to the storm drains are contributors to storm water and other surface water contamination. Except for the City of Riverside, all the permittees have completed a reconnaissance survey of the municipal storm drain systems (open channels and underground storm drains). The permittees are required to detect, identify and eliminate illicit/illegal discharges. Additionally, the permittees are required to develop a program to prohibit illegal/illicit connections to their storm drains and flood control facilities.

29. This order requires the permittees to continue to implement the BMPs listed in the DAMP and to effectively prohibit illegal and illicit discharges to the storm drain system. One of the major elements of the DAMP, the Storm Water/Urban Run-off Management and Discharge Controls Ordinance, was adopted by Riverside County on May 9, 1995. The purpose of this ordinance is to reduce pollutant discharges in storm water, and to regulate illicit connections and non-storm water discharges to the storm drain system.

30. Early identification of potential storm water impacts and mitigation measures can significantly reduce storm water pollution problems. The permittees should consider these impacts and appropriate mitigation measures in planning procedures, in the California Environmental Quality Act (CEQA) review process for specific projects, Master Plans, etc.

31. Successful implementation of the provisions and limitations in this order will require the cooperation of all the public agency organizations within Riverside County having programs/activities that have an impact on storm water quality (e.g., Fire Department, Department of Environmental Health, Planning Department, Building and Safety, Code Enforcement, etc.). As such, these organizations are expected to actively participate in implementing this areawide storm water program.

32. The permittees may lack legal jurisdiction over storm water discharges into their systems from some of the State and federal facilities, agricultural land, utilities and special districts, and Native American tribal lands. The Regional Board recognizes that the permittees should not be held responsible for such facilities and/or discharges.

VOL 22
0161
R0065397

33. The permittees may petition the Regional Board to issue a NPDES permit to any discharger of non-storm water into storm drain systems that the permittees own or operate.

34. A revised Water Quality Control Plan (Basin Plan) was adopted by the Regional Board and became effective on January 24, 1995. The Basin Plan contains water quality objectives and beneficial uses for water bodies in the Santa Ana Region.

35. The requirements contained in this order are necessary to implement the Basin Plan.

36. In accordance with the Clean Water Act and its implementing regulations, this order requires the permittees to develop and implement programs and policies necessary to control the discharge of pollutants to waters of the United States to the maximum extent practicable.

37. The legislative history and the preamble to the federal storm water regulations indicate that Congress and the U.S. EPA were aware of the difficulties in regulating urban storm water run-off solely through traditional end-of-pipe treatment. However, the U.S. EPA and the State Water Resources Control Board have determined that the NPDES permits for urban storm water run-off must contain effluent limitations based on water quality standards (beneficial uses and water quality objectives) The development and implementation of best management practices (BMPs), which will achieve compliance with applicable standards, are generally considered to be acceptable as effluent limitations. In accordance with Section 402 (p) of the Clean Water Act, this order requires the permittees to develop controls to reduce the discharge of pollutants to the maximum extent practicable. If urban storm water discharges cause an exceedance of the water quality standards in the receiving waters, the BMPs must be reevaluated, revised and implemented as appropriate to eliminate any exceedances of receiving water quality standards. Numeric and narrative water quality objectives are contained in the Basin Plan for the water bodies in this Region. This order does not contain numeric effluent limitations for any constituents because the impact of the storm water discharges on the water quality of the receiving waters has not yet been fully determined. Extensive water quality monitoring and analysis of the data are essential to make that determination. Due to the high cost associated with monitoring, and due to the variability that exists in the current storm water monitoring efforts being conducted by the permittees and other municipal permittees in Orange and San Bernardino Counties under their municipal storm water permits, a tri-county monitoring program to develop and implement effective monitoring procedures and strategies will be considered.

38. The storm water regulations require public participation in the storm water management program development and implementation. As such the permittees are required to solicit and consider all comments received from the public and submit copies of the comments

VOL 22
0162
R0065398

to the Executive Officer of the Regional Board. In considering the public comments, the permittees may modify reports, plans, or schedules prior to submittal to the Regional Board.

39. In accordance with California Water Code Section 13389, the issuance of waste discharge requirements for this discharge is exempt from those provisions of the California Environmental Quality Act contained in Chapter 3 (commencing with Section 21100), Division 13 of the Public Resources Code.

40. The Regional Board has considered anti-degradation requirements, pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16, for this discharge. The Regional Board finds that the storm water discharges are consistent with the federal and state anti-degradation requirements and a complete anti-degradation analysis is not necessary.

41. The Regional Board has notified the permittees and interested parties of its intent to issue waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

42. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

IT IS HEREBY ORDERED that the permittees, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and the regulations and guidelines adopted thereunder, shall comply with the following:

I. RESPONSIBILITIES OF THE PRINCIPAL PERMITTEE:

The principal permittee shall be responsible for managing the overall storm water program and shall:

1. Conduct water quality and hydrographic monitoring of the municipal separate drain system outfalls as agreed upon by the Executive Officer of the Regional Board.

2. Develop ~~uniform~~ criteria for inspections of the municipal separate storm drain systems.

3. Conduct inspections of the storm drain systems owned and operated by the RCFC&WCD.

VOL 22
0163
R0065399

4. Implement management programs, monitoring programs, and related plans as required by this order.

5. Enact and revise policies and ordinances necessary to establish and maintain adequate legal authority within the scope of the Riverside County Flood Control and Water Conservation District Act, as required by the Federal Storm Water Regulations, 40CFR, Part 122.26(d)(2)(i).

6. Respond and/or arrange for responding to emergency situations such as accidental spills, leaks, illicit discharges/illegal connections, etc., to prevent or reduce the discharge of pollutants to the municipal separate storm drain systems and to waters of the United States.

7. Prepare and submit to the Executive Officer of the Regional Board, unified reports, plans, and programs necessary to comply with this order.

The activities of the principal permittee should include, but not limited to, the following:

8. Coordinate permit activities and participate in any committees/subcommittees formed to coordinate permit compliance activities.

9. Provide technical and administrative support and inform the co-permittees of the progress of other pertinent municipal programs, pilot projects, research studies, etc.

10. Coordinate the implementation of areawide storm water quality management activities such as monitoring programs, public education, other pollution prevention measures, household hazardous waste collection, etc.

11. Gather and disseminate information on the progress of statewide municipal storm water programs and evaluate the information for potential use in the execution of this order.

12. Monitor the implementation of the plans and programs required by this order and determine their effectiveness in reducing pollutant loadings to surface waters to the maximum extent practicable.

13. Coordinate activities pertaining to implementation of this order with the Regional Board.

14. Solicit and coordinate public input for any major proposed storm water management programs and implementation plans.

VOL 22
0164
R0065400

15. Develop and implement mechanisms, performance standards, etc., to promote consistent implementation of BMPs among the permittees.

16. In conjunction with the co-permittees, implement the BMPs listed in the approved DAMP.

II. RESPONSIBILITIES OF THE CO-PERMITTEES

Each co-permittee shall be responsible for managing the storm water program within its jurisdiction and shall:

1. Adopt the Grading and Erosion Control Ordinance or its equivalent, within 120 days of adoption of this order.

2. Conduct storm drain system inspections in accordance with the uniform criteria developed by the principal permittee.

3. Enact and revise policies and ordinances necessary to establish and maintain adequate legal authority as required by the Federal Storm Water Regulations, 40CFR, Part 122.26(d)(2)(i).

4. Implement management programs, monitoring programs, and related plans as required by this order.

The co-permittees' activities should include, but not limited to, the following:

5. Administer the storm water and erosion control ordinances adopted pursuant to Item 1., above.

6. Conduct and coordinate with the principal permittee any surveys, monitoring and characterizations needed to identify the pollutant sources and drainage areas.

7. Review and comment on all plans, strategies, management programs, monitoring programs, as developed by the principal permittee or any subcommittee to comply with this order.

8. Co-operate in committees and/or subcommittees formed by the principal permittee to address compliance with this order.

9. In conjunction with the principal permittee, implement the BMPs listed in the approved DAMP.

VOL 22
0165
R0065401

VOL 22
0166

10. Submit to the principal permittee any information necessary to develop unified report submittals to the Executive Officer of the Regional Board.

11. Prepare and submit any specific reports/information related to the permittees' storm water program as deemed necessary by the Executive Officer of the Regional Board.

12. The City of Riverside shall complete the reconnaissance survey of the City's storm drain systems and eliminate all illegal and/or illicit connections and submit a report of the findings by January 30, 1996.

III. DISCHARGE LIMITATIONS

1. The permittees shall prohibit illicit discharges from entering into the municipal separate storm sewer systems (municipal storm drain systems) and require controls to reduce the discharge of pollutants to the maximum extent practicable.

2. This order authorizes storm water discharges to waters of the State from the permittees' existing municipal separate storm drain systems provided that the permittees implement the BMPs (structural and/or non-structural control measures) necessary to reduce the pollutants in the discharge to the maximum extent practicable. All other discharges are prohibited except those listed under Item 3., below, those for which the Regional Board has issued individual permits, and those discharges which are in accordance with Item 5., below.

3. The following discharges or flows shall be addressed by the permittees where such discharges are identified by the permittees as sources of pollutants to the waters of the United States.

   a. Discharges not covered by an NPDES permit, or for which a written clearance has been issued by the Regional Board office;

   b. Discharges from potable water line flushing and other potable water sources;

   c. Discharges from fire fighting and fire hydrant testing and flushing;

   d. Discharges from landscape irrigation, lawn watering and other irrigation activities;

R0065402

e. Diverted stream flows;

f. Rising ground waters and natural springs;

g. Uncontaminated groundwater infiltration (as defined in 40 CFR 35.2005(20)) and uncontaminated pumped groundwater;

h. Passive foundation drains;

i. Air conditioning condensate;

j. Water from crawl space pumps;

k. Passive footing drains;

l. Discharges from individual residential vehicle washing (not including discharges from mobile sources such as automobile/equipment detailing or washing);

m. Flows from riparian habitats and wetlands;

n. Dechlorinated swimming pool discharges;

o. Waters not otherwise containing wastes as defined in California Water Code Section 13050 (d); and

p. Other types of discharges identified and recommended by the permittees and approved by the Regional Board.

For purposes of this order, a discharge may include storm water and other types of discharges as indicated above.

4. The permittees shall take necessary steps as required under Item 1., above, to ensure that non-storm water discharges to the municipal storm drain system do not cause or contribute to violations of water quality objectives or discharge pollutants to waters of the United States.

5. Non-storm water discharges from public agency activities into waters of the state are prohibited unless the non-storm water discharges are permitted by an NPDES permit or are included in Item 3., above. If permitting or immediate elimination of the non-storm water discharges is impractical, the permittees shall include in

VOL 22
0167
R0065403

the storm water pollution prevention strategy, required under Section V., Provision 13., of this order, a proposed plan to eliminate the non-storm water discharges.

6. The discharge shall not cause or contribute to degradation of groundwaters.

7. Pollutants in storm water discharges from the municipal separate storm sewer system shall be reduced to the maximum extent practicable.

IV. RECEIVING WATER LIMITATIONS

1. The discharge shall not cause or contribute to a violation of any applicable water quality standards for receiving waters adopted by the Regional Board or the State Water Resources Control Board. However, a receiving water condition not in conformance with this limitation is not necessarily a violation of this order. The permittees shall investigate the cause of such conditions and shall reevaluate their BMPs/DAMP. The BMPs/DAMP shall be revised and implemented, if necessary, in accordance with a time schedule approved by the Executive Officer. If more stringent applicable water quality standards are promulgated or approved pursuant to Section 303 of the Clean Water Act, or amendments thereto, the Board will revise and modify this order in accordance with such more stringent standards.

V. PROVISIONS

GENERAL

1. Permittees shall demonstrate compliance with all the requirements in this order and specifically with Section III., Discharge Limitations, and Section IV., Receiving Water Limitations, through timely implementation of their approved Drainage Area Management Plan and any approved modifications, revisions, or amendments thereto, which are developed pursuant to this order. The Drainage Area Management Plan and any amendments thereto are hereby made an enforceable part of this order.

2. Permittees shall implement all elements of the approved DAMP. Any proposed revisions to the DAMP shall be submitted to the Executive Officer of the Regional Board for review and approval. All revisions to the DAMP approved by the Executive Officer shall be implemented in a timely manner.

3. The permittees shall comply with Monitoring and Reporting Program No. 95-47, which is hereby made a part of this order, and any revisions thereto. The

VOL 22
0168
R0065404

VOL 22
0169

Executive Officer is authorized to revise the Monitoring and Reporting Program and also to allow the permittees to participate in regional, statewide, national, or other monitoring programs in lieu of Monitoring and Reporting Program No. 95-47.

4. Upon approval by the Executive Officer of the Regional Board, all plans and reports required by this order, including any subsequent amendments, shall be implemented and shall become an enforceable part of this order.

5. The permittees shall report to the Executive Officer of the Regional Board:

   a. Any enforcement actions and known discharges of storm or wastewaters to facilities owned or operated by the permittees which may impair domestic water supply sources (e.g., discharges due to a levee break, illegal discharges to the street, etc.) or which may have an impact on human health or the environment; if the discharge is to Canyon Lake or any tributary to Canyon Lake, Elsinore Valley Municipal Water District shall also be notified immediately;

   b. Any industrial and/or construction facilities found not to be in compliance with the State's General Storm Water Permits or where the activities may be contributing pollutants to the waters of the U.S.; and

   c. Any suspected or reported activities on federal, state, or other entity's land or facilities, where the permittees do not have any jurisdiction, and where the suspected or reported activities may be contributing pollutants to waters of the United States.

6. The permittees shall not issue occupancy permits unless the applicant is informed of his obligation under the State's NPDES industrial general permit. The permittees shall not issue grading or building permits to developments on five acres or more unless the applicant shows proof of compliance with the State's General Permit for Storm Water Discharges Associated with Construction Activities. The proof of compliance may include a letter from the Regional Board office, a copy of the Notice of Intent, etc. The permittees shall coordinate the activities of the various departments/sections within each permittee's jurisdiction to insure consistent implementation of storm water regulations.

IMPLEMENTATION AGREEMENT

7. No later than June 4, 1996, the permittees shall submit to the Executive Officer of the Regional Board an updated copy of an implementation agreement with authorized signatures of each of the permittees. Any subsequent revisions to the

R0065405

implementation agreement shall be forwarded to the Executive Officer of the Regional Board within 30 days of approval by the permittees. At a minimum, the implementation agreement should include all the essential elements of the existing agreement, developed in accordance with Order No. 90-104.

LEGAL AUTHORITY

8. The permittees shall adopt the proposed Storm Water/Urban Run-off Management and Discharge Control Ordinance, or its equivalent. No later than April 26, 1996, each permittee shall certify to the Regional Board that it has adequate legal authority to control the discharges of pollutants into the municipal storm drain system and that it has satisfied the requirements of 40 CFR Section 122.26(d)(2)(i). At a minimum, each permittee's certification shall include a statement attesting that the ordinance adopted provides the permittee the legal authority to enforce storm water regulations within its jurisdiction.

ENFORCEMENT/COMPLIANCE STRATEGY

9. Permittees shall develop and implement an enforcement strategy to enforce storm water and erosion control ordinances. This enforcement strategy should include a mechanism to determine compliance of industrial facilities and construction sites, and notification to the Executive Officer of any finding of non-compliance and any proposed local enforcement action. The enforcement/compliance strategy shall be submitted to the Executive Officer of the Regional Board by August 27, 1996.

PUBLIC EDUCATION AND OUTREACH

10. The permittees shall continue to implement the public education efforts already underway and shall implement all of the proposed efforts identified in the Report of Waste Discharge.

11. When feasible, the permittees shall participate in joint outreach with other programs including, but not limited to, other municipal storm water programs to ensure that a consistent message on storm water pollution prevention is brought to the public.

12. The permittees shall develop public education materials to encourage the public to report illegal dumping from residential, industrial, construction and commercial sites into public streets, storm drains and other water bodies.

MUNICIPAL FACILITIES

VOL 22
0170
R0065406

VOL 22
011

13. The permittees shall develop a pollution prevention strategy to address public agency facilities and activities which are determined by the permittees (with the approval of the Executive Officer of the Regional Board) to be activities of concern regarding storm water pollution. The pollution prevention strategy shall be developed to ensure that the public agency facilities and/or activities that are currently not required to obtain coverage under the State's general storm water permits are not sources of pollutants into the waters of the United States. The pollution prevention strategy shall be submitted to the Executive Officer of the Regional Board by October 9, 1996. In developing the pollution prevention strategy, the permittees shall consider the following:

a. Identification of public agency facilities and activities that are potential contributors of pollutants to waters of the United States.

b. Potential pollutants of concern that are associated with the facilities and/or activities;

c. Proposed BMPs and a schedule for their implementation to ensure that these facilities are not sources of pollutants into the waters of the United States;

d. A monitoring program to measure the effectiveness of the BMPs;

e. A schedule for training of public agency staff to ensure proper implementation of the BMPs; and

f. Identification of any non-storm water discharges from the public agency facilities/activities, frequency of the discharge, characterization of the discharge, volume, flow and duration of the discharge, short term source control BMPs to mitigate the impacts from the discharge, and a schedule for elimination or permitting of the discharge.

MUNICIPAL CONSTRUCTION PROJECTS/ACTIVITIES

14. This Order authorizes the discharge of storm water run-off from construction projects that may result in land disturbance of 5 acres or more or that are part of a common plan of development or sale and that are under ownership and/or direct responsibility of any of the permittees.

R0065407

15. Thirty (30) days prior to commencement of construction activities, the permittees shall notify the Executive Officer of the Regional Board of the proposed construction project. Upon completion of the project, the Executive Officer shall be notified of the completion of the project.

16. The permittees shall develop and implement a storm water pollution prevention plan and a monitoring program that is specific for the construction project prior to the commencement of any of the construction activities. The SWPPP and monitoring program shall be implemented throughout the duration of the construction project. The SWPPP shall be kept at the construction site and released to the public and/or Regional Board staff upon request.

17. The SWPPP and the monitoring program for the construction projects shall be consistent with the requirements of the most recent version of the State's General Permit for Storm Water Discharges Associated with Construction Activities.

18. The permittees shall give advance notice to the Executive Officer of the Regional Board of any planned changes in the construction activity which may result in non-compliance with the current version of the State's General Permit for Storm Water Discharges Associated with Construction Activities.

NEW DEVELOPMENT (INCLUDING RE-DEVELOPMENT)

19. Within 90 days of the issuance of this order, the permittees shall begin implementation of the new development BMPs (DAMP Supplement A) that were developed pursuant to Order No. 90-104.

20. Within 120 days of the issuance of this order, the permittees shall review their General Plan update and CEQA document preparation processes to insure that storm water-related issues are properly considered. If necessary, these processes shall be revised to include requirements for evaluation of storm water-related impacts and identification of appropriate mitigation measures.

21. The permittees shall establish a mechanism to insure proper maintenance and operation of all permanent flood control structures.. For new developments, the parties responsible for the maintenance of the flood control structures and funding sources for maintenance and operation of the facilities shall be identified prior to issuance of grading permits.

VOL 22
0173

22. The permittees shall prepare and submit a unified fiscal analysis report to the Executive Officer of the Regional Board. The fiscal analysis report shall be submitted no later than November 15, of each year and shall at a minimum include the following:

a. Each permittee's expenditures for the previous fiscal year;
b. Each permittee's budget for the current fiscal year;
c. A description of the source of funds;
~~d. A description of contract services (relating to the NPDES program), including the service provided and the amount charged for the service;~~
~~e. A list of staff, type of work, estimated time dedicated to the storm water program and estimated cost; and~~
d.f. Each permittee's estimated budget for the next fiscal year.

PERMIT EXPIRATION AND RENEWAL

23. This order expires on December 1, 2000 and the permittees must file a Report of Waste Discharge (permit application) no later than 180 days in advance of such expiration date as application for issuance of new waste discharge requirements. The Report of Waste Discharge shall, at a minimum, include the following:

a. Any revisions to the Drainage Area Management Plan including, but not limited to, all the activities the permittees propose to undertake during the next permit term, goals and objectives of such activities, an evaluation of the need for additional source control and/or structural BMPs, any proposed pilot studies, etc.;

b. Changes in land use and/or population including map updates; and

c. Any significant changes to the storm drain systems, outfalls, detention or retention basins or dams, and other controls, including map updates of the storm drain systems.

24. This Order may be modified, revoked or reissued prior to its expiration date for the following reasons:

a. To address significant changes in conditions identified in the technical reports required by the Regional Board which were unknown at the time of the issuance of this order;

b. To incorporate applicable requirements of statewide water quality control plans and policies adopted by the State Water Resources Control Board or

R0065409

any amendments to the Basin Plan approved by the Regional Board, the State Board, and, if necessary, by the Office of Administrative Law; or

c. To comply with any applicable requirements, guidelines, or regulations issued or approved under the Clean Water Act, if the requirements, guidelines, or regulations contain different conditions or additional requirements than those included in this order.

25. This order shall serve as a National Pollutant Discharge Elimination System (NPDES) permit pursuant to Section 402 (p) of the Clean Water Act, or amendments thereto, and shall become effective ten days after the date of its adoption provided the Regional Administrator of the U. S. EPA has no objections. If the Regional Administrator objects to its issuance, the permit shall not become effective until such objection is withdrawn.

26. Order No. 90-104 is hereby rescinded.

I, Gerard Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on December 1, 1995.

Monitoring and Reporting Program No. 95-47

NPDES NO. CAS 618033
for
RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT, THE COUNTY OF RIVERSIDE, AND THE INCORPORATED CITIES OF RIVERSIDE COUNTY WITHIN THE SANTA ANA REGION
AREAWIDE URBAN STORM WATER RUN-OFF

TENTATIVE

I. GENERAL

1. Revisions of the monitoring and reporting program may be necessary to ensure that the discharger is in compliance with requirements and provisions contained in this order. Revisions may be made by the Executive Officer at any time during the term of this order, and may include a reduction or increase in the number of parameters to be monitored, the frequency of monitoring, or the number and size of samples collected.

2. All sample collection, handling, storage, and analyses shall be in accordance with 40 CFR Part 136 or other methods approved by the Executive Officer.

3. The permittees are authorized to complement their monitoring data with data from other sources provided those sources are similar ~~identical~~ to sources in the Santa Ana Watershed.

4. The permittees shall implement the Consolidated Program for Water Quality Monitoring (submitted ~~as part of the~~ Report of Waste Discharge) until development and implementation of an other acceptable ~~watershed~~ monitoring programs.

II. OBJECTIVES

The overall goal of this monitoring program is to provide feedback in direction for and in support of an effective watershed management program. The following are the major objectives:

1. To define water quality status, trends, and pollutants of concern.

2. To characterize pollutants and to assess the influence of land use on water quality.

3. To identify significant water quality problems related to storm water discharges within the watershed.

VOL 22 0177

R0065413

4. To identify other sources of pollutants in storm water run-off to the extent possible (e.g., atmospheric deposition, contaminated sediments, other non-point sources, etc.).

5. To verify and to control illicit discharges.

6. To identify those waters which without additional action to control pollution from storm water discharges cannot reasonably be expected to attain or maintain applicable water quality objectives or the goals and requirements of the Basin Plan.

7. To evaluate the effectiveness of existing management programs, including an estimate of pollutant reductions achieved by the structural and nonstructural BMPs.

8. To evaluate costs and benefits to the stakeholders including the public.

The Regional Board recognizes that these objectives may not be attainable during this permit period and authorizes the Executive Officer to evaluate and to determine adequate progress toward meeting each objective.

III. MONITORING PROGRAM REQUIREMENTS

The lead permittee shall develop and submit for the approval of the Executive Officer an integrated monitoring program to achieve the above stated objectives. In developing this program, the lead permittee is encouraged to seek cooperation with the permittees from San Bernardino and Orange counties. The Executive Officer or his/her designated representative(s) shall facilitate the coordination meetings or subcommittees formed to achieve this goal. The development and implementation of the monitoring program shall be in accordance with the time schedule prescribed by the Executive Officer. At a minimum, the program shall consider the following:

1. Uniform guidelines for quality control, quality assurance, data collection and data analyses.

2. A mechanism for the collection, analysis and interpretation of existing data from Orange, Riverside, and San Bernardino County monitoring programs. These and other data from local, regional or national sources should be utilized to characterize different storm water sources; to determine pollutant generation, transport and fate; to develop a relationship between land use, development size, storm size and the event mean concentration of pollutants; to determine spatial and temporal variances in storm water quality and seasonal and other bias in the collected data; and to identify any unique features of the Santa Ana Watershed. The permittees are encouraged to use data from similar studies, if available.

VOL 22 0178

R0065414

VOL 22

3. A description of the monitoring program including:

   a. The number of monitoring stations;
   b. Environmental indicators (e g., ecosystem, biological, habitat, chemical, sediment, stream health, etc.) chosen for monitoring;
   c. Parameters selected for field screening and for laboratory work; and
   d. Total number of samples to be collected from each station, receiving water and major outfall monitoring, frequency of sampling during dry weather and short or long duration storm events, type of samples (grab, 24-hour composite, etc.), and the type of sampling equipment.

4. A mechanism for analyzing the collected data and interpreting the results including an evaluation of the effectiveness of the management practices, and need for any refinement of the management practices.

5. A description of the responsibilities of all the participants in this program including cost sharing.

IV. REPORTING

1. All progress reports and proposed strategies and plans required by this order shall be signed by the principal permittee and copies shall be submitted to the Executive Officer of the Regional Board under penalty of perjury.

2. The permittees shall submit an **ANNUAL PROGRESS REPORT** to the Executive Officer of the Regional Board and to the Regional Administrator of U. S. EPA, Region 9, no later than November 15, of each year. This progress report may be submitted in a mutually agreed upon electronic format. At a minimum, the annual progress report shall include the following:

   a. A review of the status of program implementation and compliance (or non-compliance) with the schedules contained in this order.

   b. An assessment of the effectiveness of control measures established under the illicit discharge elimination program and the Drainage Area Management Plan. The effectiveness may be measured in terms of how successful the program has been in eliminating illicit/illegal discharges and in reducing pollutant loads in storm water discharges.

   c. An analysis of the feasibility and usefulness of using structural BMPs based on data collected from the Drainage Water Quality Plan for Lake Mathews and/or other similar programs..

0179

R0065415

d. An assessment of any storm water management program modifications made to comply with Clean Water Act requirements to reduce the discharge of pollutants to the maximum extent practicable.

3. Co-permittees shall be responsible for the submittal of all required information/materials needed to comply with this Monitoring and Reporting Program in a timely manner to the principal permittee. All such submittals shall be signed by a duly authorized representative of the co-permittee under penalty of perjury.

V. REPORTING SCHEDULE

All reports required by this order shall be submitted to the Executive Officer of the Regional Board in accordance with the following schedule:

ITEM	*DUE DATE*
Report on Illicit/Illegal Discharges (City of Riverside)	January 30, 1996
Legal Authority Certification	April 26, 1996
Revised Implementation Agreement	June 4, 1996
Enforcement Strategy	August 27, 1996
Municipal Activities Pollution Prevention Strategy	October 9, 1996
Annual Report including the Fiscal Analyses Report	November 15 of each year (next report due in 1996)

REVISED DRAFT OF WASTE DISCHARGE REQUIREMENTS FOR THE SAN BERNARDINO COUNTY TRANSPORTATION/FLOOD CONTROL DEPARTMENT, THE COUNTY OF SAN BERNARDINO AND INCORPORATED CITIES, ORDER NO. 95-53, NPDES NO. CAS008036, URBAN STORM WATER RUN-OFF, SAN BERNARDINO COUNTY

Dear Mr. Miller:

Enclosed is a revised copy of tentative Order No. 95-53. A draft copy of this order was mailed to you on July 21, 1995. This revised draft incorporates changes based on the comments we received from you and the co-permittees, and the changes agreed upon during our September 12, 1995 meeting with representatives of the permittees. For your convenience, all major changes are indicated by highlighting or strikeouts. This tentative order is now scheduled for the Regional Board's consideration at the December 1, 1995 Board meeting.

If you have any concerns about the terms and conditions in the tentative order, we would like to meet with you during the second week of November '95.

If you have any other questions, please contact me at (909) 782-3238 or Ray Akhtarshad at (909) 320-2024.

Sincerely,

Michael J. Adackapara, Chief
Storm Water Program

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SANTA ANA REGION

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT AND WASTE DISCHARGE REQUIREMENTS NPDES NO. CAS008036 ~~CA 8000200~~ ORDER NO. 95-53 FOR THE SAN BERNARDINO COUNTY TRANSPORTATION/FLOOD CONTROL DEPARTMENT, THE COUNTY OF SAN BERNARDINO, AND THE INCORPORATED CITIES OF SAN BERNARDINO COUNTY WITHIN THE SANTA ANA REGION AREAWIDE URBAN STORM WATER RUN-OFF

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Board), finds that:

1. On April 4, 1995, the San Bernardino County Transportation/Flood Control Department (SBCFCD), in cooperation with the County of San Bernardino, and the incorporated cities of Big Bear Lake, Chino, Chino Hills, Colton, Fontana, Grand Terrace, Highland, Loma Linda, Montclair, Ontario, Rancho Cucamonga, Redlands, Rialto, San Bernardino, Upland, and Yucaipa (hereinafter collectively referred to as "permittees") jointly submitted National Pollutant Discharge Elimination System (NPDES) Application No. CAS008036 ~~CA 8000200~~ to renew their areawide NPDES permit for urban storm water run-off ~~runoff~~.

2. The 1987 amendments to the Clean Water Act required the United States Environmental Protection Agency (EPA) to develop permitting regulations for storm water discharges from municipal separate storm sewer systems serving a population of 100,000 or more and for storm water discharges associated with industrial activities including construction sites. The EPA published proposed storm water regulations on December 7, 1988 and promulgated the final regulations on November 16, 1990. Prior to the EPA's promulgation of the final storm water regulations, the three counties (Orange, Riverside, and San Bernardino) and the incorporated cities within the jurisdiction of the Santa Ana Regional Board requested early areawide NPDES permits for urban storm water run-off.

3. On October 19, 1990, the Regional Board adopted Order No. 90-136 for urban storm water run-off from urban areas in San Bernardino County within the Santa Ana Region. Order No. 90-136 expires on October 1, 1995. The San Bernardino County Transportation/Flood Control Department was named as the principal permittee and San Bernardino County and the incorporated cities were named as the co-permittees. In

VOL 22 0183
R0065419

order to more effectively carry out the requirements of this order, the permittees have agreed that the SBCFCD will continue as principal permittee and San Bernardino County and the incorporated cities will continue as co-permittees. However, the Regional Board, in exercising its enforcement discretion, will take action only against the individual permittee responsible for specific violations of this order, whenever possible.

4. San Bernardino County Municipal Permit required the permittees to develop and implement a Drainage Area Management Plan (DAMP), a receiving and storm water monitoring program, reconnaissance survey program, a plan for prosecution of illegal dischargers, and to establish legal authority to effectively prohibit illegal/illicit discharges. The overall goal of these requirements was to effectively reduce the pollutant loadings to surface waters from urban run-off to the maximum extent practicable (MEP).

5. The Report of Waste Discharge (the permit renewal application) included the following components:

~~a. A map of the drainage area and maps of existing storm drain facilities~~
~~b. A summary of the storm water management program~~
~~c. A Consolidated Program for Water Quality Monitoring~~
~~d. A copy of the Proposed Storm Water/Urban Runoff Management and Discharge Control Ordinance~~
~~e. A copy of the current Implementation Agreement~~
~~f. A copy of each of the Interagency Agreements~~
~~g. The Drainage Area Management Plan (DAMP)~~
~~h. A copy of Proposed San Bernardino County Grading and Erosion Control Ordinance~~

a. A Municipal Storm Water Management Program which is an extension of the October, 1993 Drainage Area Management Plan.
b. Letters of intent for compliance with San Bernardino County Municipal Storm Water Permit by all the co-permittees.

6. Within the Santa Ana Region, the permittees serve a population of approximately 1.11 million, occupying an area of approximately 985 square miles. The latest figures obtained from the Reconnaissance Progress Report estimated 384 miles of above-ground and 334 miles of below-ground storm drain channels in the project area. Approximately seven percent (7%) of the San Bernardino County area drains into water bodies within this Regional Board's jurisdiction. The project area is shown on Attachment 1. This order regulates storm water run-off from areas under the jurisdiction of the permittees. The term storm water as used in this order includes

VOL 22 0184

R0065420

storm water run-off, snow melt run-off, and surface run-off and drainage. The permittees have jurisdiction over and/or maintenance responsibility for storm water conveyance systems within San Bernardino County. Approximately 50% of the remaining San Bernardino County drainage areas is within the jurisdiction of the Lahonton Regional Board and the other 43% is within the jurisdiction of the Colorado River Basin Regional Board. However, urbanization in these areas is minimal compared to areas within the Santa Ana Regional Board's jurisdiction.

7. The Santa Ana River Basin is the major watershed within this Region. This watershed is divided into the upper and lower Santa Ana watersheds. The lower Santa Ana River Basin (downstream from Prado Dam) includes the Orange County drainage areas and the Upper Santa Ana River Basin includes the San Bernardino County and the Riverside County drainage areas. The San Bernardino County drainage areas are generally upstream of the Riverside County drainage areas.

8. The three county areas within this Region are regulated under three areawide permits for urban storm water run-off. These areawide NPDES permits are:

   a. Orange County, NPDES No. CA 8000180, Order No. 90-71 (upon renewal Order No. 95-52)

   b. Riverside County, NPDES No. CA 8000192, Order No. 90-104 (upon renewal Order No. 95-47)

   c. San Bernardino County, NPDES No. CA 8000200, Order No. 90-136 (upon renewal Order No. 95-53)

9. Storm water discharges in San Bernardino County within the jurisdiction of Santa Ana Region are tributary to various water bodies. These water bodies are listed in Attachment 2.

10. Run-off from the San Bernardino County drainage areas is generally conveyed to the Riverside County drainage areas through the Santa Ana River or other drainage channels tributary to the Santa Ana River. These flows are then discharged to Reach 2 of the Santa Ana River through Prado Basin (Reach 3 of the Santa Ana River). Most of the flow in Reach 2 is recharged in Orange County. During wet weather, some of the flow is discharged to the Pacific Ocean through Reach 1 of the Santa Ana River.

11. The entities listed in Attachment 3 are considered as potential dischargers of storm water to the San Bernardino County drainage areas. It is expected that these entities will also work cooperatively with the permittees to manage urban run-off. The

VOL 22
01185
R0065421

Regional Board has the discretion and authority to require non-cooperating entities to participate in this areawide permit or obtain individual storm water permits, pursuant to 40 CFR 122.26(a).

12. The 1989, 1991, and 1994 Water Quality Assessments by the Regional Board identified impairment of a number of water bodies within the permitted area. The beneficial uses of these water bodies are threatened or impaired in part due to urban storm water run-off and non-storm water flows from urbanized areas. Preliminary results from urban storm water monitoring programs within the Region indicate that major pollutants of concern in urban run-off are certain heavy metals, sediment, coliform bacteria, pesticides, and nutrients. Municipal storm water run-off is a source of pollutants to waters of the U.S. ~~Region~~ that may be causing or contributing to water quality impairment. It is recognized that instream or end-of-channel treatment of storm water is difficult and expensive. Therefore, it is critical to identify the sources and to develop management practices necessary to reduce pollutant loading to storm water. The quality of these discharges varies considerably and is affected by land use activities, basin hydrology and geology, season, the frequency and duration of storm events and point source discharges permitted by the Regional Board under individual permits.

13. Studies conducted by the EPA, the states, flood control districts and other entities indicate the following major sources for urban storm water pollution:

    a. Industrial sites where appropriate pollution control and best management practices (BMPs) are not implemented,

    b. Construction sites where erosion and siltation controls and BMPs are not implemented, and

    c. Urban run-off where the drainage area is not properly managed.

14. To address the industrial and construction sites, the State Board issued two statewide general NPDES permits: one for storm water run-off from industrial sites (NPDES No. CAS000001, General Industrial Activities Storm Water Permit) and the second one for storm water run-off from construction sites (NPDES No. CAS000002, General Construction Activity Storm Water Permit). In addition, the Regional Board adopted Order No. 94-005, NPDES NO. CA 8000279, for storm water run-off from facilities owned and/or operated by Caltrans, which includes freeways and highways, and Order No. 94-7, NPDES No. CA 8000336, for concentrated animal feeding operations, including dairies (General Dairy permit). The Regional Board has and continues to issue individual storm water permits for industrial facilities within the Region.

VOL 22
01186
R0065422

15. One of the major components of these statewide permits, the Caltrans permit, and the General Dairy Permit is the development and implementation of a storm water pollution prevention plan (SWPPP) for each facility.

16. Most industrial activities (some light industrial activities are exempt) and construction activities on five acres or more are required to get individual NPDES permits for storm water discharges or get coverage under these statewide general permits.

17. The Regional Board is the enforcing authority for the two statewide general permits. However, in most cases, the industrial and construction sites discharge directly into storm drains and/or flood control facilities owned and operated by the permittees. These industrial and construction sites are also regulated under local laws and regulations. Therefore, a coordinated effort between the permittees and the Regional Board staff is critical to avoid duplicative storm water regulatory activities. A memorandum of understanding between the permittees and the Regional Board may be appropriate to efficiently implement the storm water regulations for industries and construction sites at the local level.

18. The permittees or other agencies generally conduct inspections of most industrial and commercial facilities and construction sites within their jurisdiction to determine compliance with local storm water ordinances and regulations, as well as for other regulatory purposes. The permittees have agreed to notify Regional Board staff ~~of industrial and construction facilities which are not in compliance with the storm water regulations, including their coverage under the general storm water permits.~~ when conditions are observed during such inspections which result in threat or potential threat to water quality. This also includes failure to obtain coverage under the general storm water permits.

19. The permittees have agreed not to issue grading and/or building permits without proof of ~~intent to comply with the~~ filing for a Notice of Intent (NOI) for sites subject to State's General Construction Activity Storm Water Permit.

20. The permittees own/operate facilities where industrial or related activities take place that may have an impact on storm water quality. Some of the permittees also enter into contracts with outside parties to carry out municipal related activities that may also have an impact on storm water quality. These facilities and related activities include, but are not limited to, street sweeping, catch basin cleaning, maintenance yards, vehicle and equipment maintenance areas, waste transfer stations, corporation and storage yards, parks and recreational facilities, landscape and swimming pool maintenance activities, storm drain system maintenance activities and the application of herbicides, algaecides and pesticides. As part of this order, the permittees ~~are required to~~ will assess ~~all of~~

VOL 22
0187
R0065423

~~the~~ public agency ~~related~~ activities and facilities for potential impact to storm water quality and develop and implement best management practices to reduce pollutant discharges from those ~~these~~ activities that are found to be pollutant sources. Non-storm water discharges from these facilities and/or activities also affect water quality. This order prohibits non-storm water discharges from public facilities unless the discharges are exempt under Section III., Discharge Limitations, 5., of this order or are permitted by the Regional Board under an individual NPDES permit.

21. The major focus of storm water pollution prevention is the development and implementation of an appropriate drainage area management plan (DAMP) including best management practices (BMPs). The ultimate goal of the urban storm water management program is to attain water quality consistent with the water quality objectives for the receiving waters in order to protect beneficial uses. The permittees developed and submitted a DAMP, which was approved on May 2, 1994. The Municipal Storm Water Management Program (MSWMP) is an extension of the DAMP.

22. The MSWMP provides a framework for continuing the implementation of DAMP elements for the term of the renewed permit. ~~DAMP is a dynamic document and the permittees have implemented, or are in the process of implementing, the various elements of the DAMP.~~

23. There is some contribution of pollutants in urban run-off from privately owned and operated facilities such as residences, businesses and commercial establishments and public and private institutions. Therefore, a successful storm water management plan should include the participation and cooperation of the public, businesses, the permittees and the regulators. Therefore, the DAMP has a strong emphasis on public education.

24. The ~~DAMP~~ MSWMP included ~~20~~ numerous BMPs under nine major program elements ~~BMPs~~ and a time schedule for implementation. These BMPs are organized into various ~~three~~ components such as BMPs for existing residential, commercial and industrial areas; BMPs for construction sites; ~~and~~ BMPs for new developments, etc. These components include regulatory activities, public education programs and operations and maintenance activities.

25. In order to characterize storm water discharges, to identify problem areas, and to determine the effectiveness of the various BMPs, an effective monitoring program is critical. San Bernardino County monitoring program commenced in January of 1994 which included storm water monitoring, receiving water monitoring, dry weather monitoring and sediment monitoring. The Report of Waste Discharge included a Consolidated Program for Water Quality Monitoring.

VOL 22 0188

R0065424

26. In addition to the Regional Board, a number of other stakeholders are involved in the management of these water resources which includes, but is not limited to, the incorporated cities in the Region, publicly owned treatment works, the three counties, Santa Ana Watershed Project Authority and its member agencies. The cooperation and coordination between all the stakeholder are critical for an efficient and most economical management of the watershed. The Regional Board will coordinate the activities within the watershed and seek participation of the permittees. ~~This order focusses on watershed management and seeks to integrate the programs of all the stakeholders, especially the three municipal storm water permit holders within this watershed. In order to make the best use of limited resources of all the permittees (including other municipal permittees in Riverside and Orange Counties), and to derive maximum benefit from the storm water management programs, future programs should focus on a watershed approach. An integrated management program will be developed with the cooperation of all the stakeholders, including the permittees in the three counties, and the Regional Board.~~

27. The permittees have agreed to revise the implementation agreement that was developed in 1990 as required under Order No. 90-136.

28. Illegal dumping and illicit/illegal connections and discharges to the storm drains are ~~major~~ contributors to storm water and other surface water contamination. Most of the cities have completed their reconnaissance survey of the municipal storm drain systems (open channels and underground storm drains) and the remaining cities have scheduled the completion prior to expiration of their municipal permit (October 1, 1995). The permittees were required to detect, identify and eliminate illicit/illegal discharges. Additionally, the permittees are also required to develop a program to prohibit ~~prevent~~ any future illegal/illicit connections to their storm drains and flood control facilities.

29. As part of Order No. 90-136, the permittees were required to develop and implement a plan to eliminate the illicit connections and to prosecute the illegal dischargers. This order requires the permittees to continue the implementation and enforcement required under this plan.

30. This order requires the permittees to continue to implement the BMPs listed in the ROWD ~~DAMP~~ and to effectively prohibit illegal and illicit discharges to the storm drain system. One of the major elements of the DAMP was the establishment of legal authority. The permittees within San Bernardino County have already adopted ordinances to establish their legal authority. This task was completed as of April 1995.

31. Successful implementation of the provisions and limitations in this order will require the cooperation of all the involved agencies and organizations within San Bernardino

VOL 22 0189
R0065425

County (e.g. Fire Department, Department of Environmental Health, Planning Department, Building and Safety, Code Enforcement, etc.). As such, these agencies and organizations are expected to actively participate in implementing this areawide storm water program. Early identification of potential storm water impacts and mitigation measures can significantly reduce storm water pollution problems. The permittees should consider these impacts and appropriate mitigation measures in the ~~development~~ planning procedures, ~~of General Plans,~~ in the California Environmental Quality Act (CEQA) review process for specific projects, Master Plans, etc.

32. The permittees may lack legal jurisdiction over storm water discharges into their systems from some of the State and federal facilities, agricultural land, utilities and special districts, and Native American tribal lands. The Regional Board recognizes that the permittees should not be held responsible for such facilities and/or discharges.

33. The permittees may petition the Regional Board to issue a separate NPDES permit to any discharger of non-storm water into storm drain systems that they own or operate.

34. A revised Water Quality Control Plan (Basin Plan) was adopted by the Regional Board and became effective on January 24, 1995. The Basin Plan contains water quality objectives and beneficial uses for water bodies in the Santa Ana Region.

35. The requirements contained in this order are necessary to implement the Basin Plan.

36. In accordance with the Clean Water Act and it's implementing regulations, this order requires the permittees to develop and implement programs and policies necessary to control the discharge of pollutants to waters of the U.S. ~~nation~~ to the maximum extent practicable.

37. The legislative history and the preamble to the federal storm water regulations indicate that the Congress and the U.S. EPA were aware of the difficulties in regulating urban storm water run-off solely through traditional end-of-pipe treatment. However, the U.S. EPA and State Water Resources Control Board have determined that the NPDES permits for urban storm water run-off must contain effluent limitations based on water quality standards (beneficial uses and water quality objectives). The development and implementation of best management practices (BMPs), which will achieve compliance with applicable standards, are generally considered to be acceptable as effluent limitations. In accordance with Section [illegible] (p) of the Clean Water Act, this order requires the permittees to develop controls to reduce the discharge of pollutants to the maximum extent practicable. If urban storm water discharges cause an exceedance of the water quality standards in the receiving waters, the BMPs will be reevaluated, revised, and implemented, as appropriate, to eliminate any exceedance of receiving

VOL 22
0190
R0065426

water quality standards. Numeric and narrative water quality objectives are contained in the Basin Plan for the water bodies in this Region. This order does not contain numeric effluent limitations for any constituents because the impact of the storm water discharges on the water quality of the receiving waters has not yet been fully determined. Extensive water quality monitoring and analysis of the data are essential to make that determination. Due to the high cost associated with monitoring, and due to the variability that exists in the current storm water monitoring efforts being conducted by the permittees and other municipal permittees in Orange and Riverside Counties under their municipal storm water permits, a tri-county monitoring program will be considered to develop and implement effective monitoring procedures and strategies.

38. The storm water regulations require public participation in the storm water management program development and implementation. As such the permittees are required to solicit and consider all comments received from the public and submit copies of the comments to the Executive Officer of the Regional Board. In considering the public comments, the permittees may modify reports, plans, or schedules prior to submittal to the Regional Board.

39. In accordance with California Water Code Section 13389, the issuance of waste discharge requirements for this discharge is exempt from those provisions of the California Environmental Quality Act contained in Chapter 3 (commencing with Section 21100), Division 13 of the Public Resources Code.

40. The Regional Board has considered anti-degradation requirements, pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16, for this discharge. The Regional Board finds that the storm water discharges are consistent with the federal and state anti-degradation requirements and a complete anti-degradation analysis is not necessary.

41. The Regional Board has notified the permittees and interested parties of its intent to issue waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

44. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

IT IS HEREBY ORDERED that the permittees, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and the regulations and guidelines adopted thereunder, shall comply with the following:

VOL 22
0191
R0065427

VOL 22

I. RESPONSIBILITIES OF THE PRINCIPAL PERMITTEE:

The principal permittee shall be responsible for managing the overall storm water program and shall:

1. Conduct water quality and hydrographic monitoring of the municipal separate storm sewer system outfalls as agreed upon by the Executive Officer of the Regional Board.

2. Develop uniform criteria to inspect the municipal separate storm sewer systems.

3. Develop ~~uniform~~ minimum criteria for inspections at industrial facilities and construction sites, and reporting ~~non-compliance with the storm water regulations~~ to the Regional Board of observed non-compliance discharges, as well as non-compliance with local ordinances at sites which fall under the general construction or industrial storm water permits.

4. Conduct inspections of the storm drain systems owned and operated by the SBCFCD.

5. Implement management programs, monitoring programs, and related plans as required by this order.

6. Prepare and submit to the Executive Officer of the Regional Board, unified reports, plans, and programs necessary to comply with this order.

7. Enact and revise policies and ordinances necessary to establish and maintain adequate legal authority within the scope of the San Bernardino County Transportation/Flood Control Department Act, as required by the Federal Storm Water Regulations.

8. Respond and/or arrange for responding to emergency situations such as accidental spills, leaks, illicit discharges/illegal connections, etc., to prevent or to reduce the discharge of pollutants to the municipal separate storm sewer systems and to waters of the U.S. ~~nation~~.

In addition, the activities of the principal permittee should, ~~include, but not limited to,~~ at a minimum, include the following:

9. Coordinate permit activities and participate in any subcommittees formed as necessary, to coordinate compliance activities with this order.

0192

R0065428

10. Provide technical and administrative support and inform the co-permittees of the progress of other pertinent municipal programs, pilot projects, research studies, etc.

11. Coordinate the implementation of areawide storm water quality management activities such as monitoring program, public education, pollution prevention, household hazardous waste collection, etc.

12. Gather and disseminate information on the progress of statewide municipal storm water programs and evaluate the information for potential use in the execution of this order.

13. Monitor the implementation of the plans and programs required by this order and determine their effectiveness in attaining water quality standards ~~objectives~~.

14. Coordinate activities pertaining to implementation of this order with the Regional Board.

15. Solicit and coordinate public input for any major proposed storm water management programs and implementation plans.

16. Develop and implement mechanisms, performance standards, etc., to promote ~~uniform and~~ consistent implementation of BMPs among the permittees.

17. In conjunction with the other permittees, implement the BMPs listed in the approved DAMP, as amended by the Report of Waste Discharge (ROWD).

18. ~~Coordinate~~ Participate with other counties (Orange and Riverside counties) in the development and implementation of a tri-county monitoring program coordinated by the Regional Board.

II. RESPONSIBILITIES OF THE CO-PERMITTEES

The co-permittees shall be responsible for managing the storm water program within their jurisdiction and shall:

1. Enact and revise policies and ordinances necessary to establish and maintain adequate legal authority as stated in Section V(10) of this order and required by the Federal Storm Water Regulations.

2. Conduct storm drain system inspections in accordance with the uniform criteria

VOL 22
0193
R0065429

developed by the principal permittee.

3. Submit to the principal permittee any information necessary to develop unified report submittal to the Exccutive Officer of the Regional Board.

4. In conjunction with the principal permittee, implement the BMPs listed in the approved DAMP, as amended by the ROWD.

Co-permittees activities should at a minimum include~~, but not limited to,~~ the following:

5. Administer the storm water and erosion control ordinances.

6. Conduct and coordinate with the principal permittee any surveys and characterizations needed to identify the pollutant sources and drainage areas.

7. Review and comment on all plans, strategies, management programs, monitoring programs, as developed by the principal permittee or any subcommittee to comply with this order.

8. Participate in ~~any~~ committees or subcommittees formed to address storm water related issues to comply with this order.

~~9. Share all pertinent information regarding the progress of statewide municipal storm water programs and evaluate any information obtained for potential use in the execution of this order.~~

9. ~~10.~~ Participate in the tri-county (Orange, Riverside and San Bernardino) efforts for watershed ~~management~~ monitoring program coordinated by the Regional Board.

III. DISCHARGE LIMITATIONS

1. The permittees shall prohibit illicit discharges from entering into the municipal separate storm sewer systems (municipal storm drain systems) and require controls to reduce the discharge of pollutants to the maximum extent practicable.

2. This order authorizes storm water discharges to waters of the U.S. ~~State~~ from the permittees' existing municipal separate storm drain systems provided that the permittees implement the BMPs (structural and/or non-structural control measures) necessary to reduce the pollutants in the discharge to the maximum extent practicable. Discharges other than those listed under Item 5., below, and those for which the Regional Board has issued individual permits are prohibited.

VOL 22
0194
R0065430

~~3. The DAMP is hereby made an enforceable component of this order.~~

3. ~~4.~~ The following discharges need not be prohibited by the permittees unless identified by the permittees as a source of pollutants to the receiving waters. ~~provided that such discharges are identified and appropriate control measures to minimize the adverse impacts of such discharges are developed and implemented.~~

~~a. Discharges composed entirely of storm water,~~

a. ~~b.~~ Discharges ~~covered by an NPDES permit, or~~ for which a written clearance has been issued by the Regional Board office,

b. ~~c.~~ Discharges from potable water line flushing and other potable water sources,

c. ~~d.~~ Discharges from fire fighting and fire hydrant testing and flushing,

d. ~~e.~~ Discharges from landscape irrigation, lawn watering and other irrigation activities,

e. ~~f.~~ Diverted stream flows,

f. ~~g.~~ Rising ground waters and natural springs,

g. ~~h.~~ Uncontaminated groundwater infiltration (as defined in 40 CFR 35.2005(20)) and uncontaminated pumped groundwater,

h. ~~i.~~ Passive foundation drains,

i. ~~j.~~ Air conditioning condensate,

j. ~~k.~~ Water from crawl space pumps,

k. ~~l.~~ Passive footing drains,

l. ~~m.~~ Discharges from individual residential vehicle washing (not including discharges from mobile sources such as automobile/equipment detailing or washing),

m. ~~n.~~ Flows from riparian habitats and wetlands,

VOL 22

0195

R0065431

n. ~~e.~~ Dechlorinated swimming pool discharges,

o. ~~p.~~ Waters not otherwise containing wastes as defined in California Water Code Section 13050 (d) and,

p. ~~q.~~ Other types of discharges identified and recommended by the permittees and approved by the Regional Board.

For purposes of this order, a discharge may include storm water and other types of discharges as indicated above.

4. The permittees shall take necessary steps to ensure that non-storm water discharges to the municipal storm water system do not cause or contribute to violations of water quality standards or degrade the waters of the U.S. ~~Region (including groundwater).~~

5. Non-storm water discharges from public agency activities into waters of the U.S. ~~state~~ are prohibited unless the non-storm water discharges are permitted by an NPDES permit or are included in Item 3. ~~5.~~, above. If permitting or immediate elimination of the non-storm water discharges is impractical, the permittees shall include in the storm water pollution prevention strategy, required under Section V. Provision 18., of this order, a proposed plan to eliminate the non-storm water discharges.

~~7. Pollutants in storm water discharges from the municipal separate storm sewer system shall be reduced to the maximum extent practicable.~~

6. The MSWMP, as outlined in the ROWD, is hereby made an enforceable component of this order.

IV. RECEIVING WATER LIMITATIONS

The discharge shall not cause or contribute to a violation of any applicable water quality standards ~~objectives~~ for receiving waters adopted by the Regional ~~Water Quality Control~~ Board or the State Water Resources Control Board. However, a receiving water condition not in conformance with this limitation is not necessarily a violation of this order. The permittee shall investigate the cause of such conditions and shall reevaluate their BMPs/DAMP (MSWMP). The BMPs/DAMP shall be revised and implemented, if necessary, in accordance with a time schedule approved by the Executive Officer. If more stringent applicable water quality standards ~~objectives~~ are promulgated or approved pursuant to Section 303 of the Clean Water Act and amendments thereto, the Regional Board will revise and modify this order in

VOL 22
0196
R0065432

accordance with such more stringent standards ~~objectives~~.

V. PROVISIONS

GENERAL

1. Permittees shall demonstrate compliance with all the requirements in this order.

2. The Report of Waste Discharge, including the MSWMP, submitted as application for renewal of the NPDES permit is hereby made a part of this order.

3. Permittees shall implement all elements of the approved DAMP, as amended by the ROWD (MSWMP). Any proposed revisions to the ~~DAMP~~ MSWMP shall be submitted to the Executive Officer of the Regional Board or included in the Annual Report for review and approval. All revisions to the ~~DAMP~~ MSWMP, approved by the Executive Officer, shall be implemented in a timely manner.

4. The permittees shall comply with Monitoring and Reporting Program No. 95-53, which is hereby made a part of this order and any revisions thereto. The Executive Officer is authorized to revise the Monitoring and Reporting Program and also to allow the permittees to participate in regional, statewide, national, or other monitoring programs in lieu of Monitoring and Reporting program for Order No. 95-53.

5. Upon approval by the Executive Officer of the Regional Board, all plans and reports required by this order, including any subsequent amendments, shall be implemented and shall become an enforceable part of this order.

6. The permittees shall report to the Executive Officer of the Regional Board:

   a. Any enforcement actions and discharges of storm or wastewaters, known to the permittees, which may have an impact on human health or the environment; ~~Any unusual discharge of storm or wastewaters to facilities owned or operated by the permittees or to any waters of the Region (e.g., discharges due to a levee break, illegal discharges to the street, etc.).~~

   b. Any industrial or construction facilities observed to potentially be not in compliance with the storm water regulations or where the activities may be contributing pollutants to the waters of the U.S.; and

VOL 22
0197
R0065433

c. Any observed activities on federal, state, or other lands or facilities, where the permittees do not have any jurisdiction, and where the observed activities may be contributing pollutants to waters of the U.S. ~~Region~~.

7. The permittees shall not issue occupancy permits unless the applicant is informed of his obligation under the State's NPDES industrial general permits. The permittees shall not issue grading or building permits to developments on 5 acres or more unless the applicant shows proof of filing a Notice of Intent in accordance with the State's General Construction Activities Storm Water Permit. ~~any permits for new businesses and/or construction activities until compliance with the State's General Storm Water Permits is verified.~~ The proof of ~~compliance~~ filing may include a letter from the Regional Board office, a copy of the Notice of Intent ~~, etc.~~ or other acceptable proof of coverage under the general permit. The permittees shall coordinate the activities of the various departments/sections within each permittee's jurisdiction to ensure consistent implementation of storm water ~~regulations~~ program.

IMPLEMENTATION AGREEMENT

8. No later than March 1, 1996, the permittees shall submit to the Executive Officer of the Regional Board an updated copy of an implementation agreement with authorized signatures of each of the permittees. Any subsequent revisions to the implementation agreement shall be forwarded to the Executive Officer of the Regional Board within 30 days of approval by the permittees. At a minimum, the implementation agreement should include all the essential elements of the existing agreement and a mechanism for active participation of all permittees in the committees and subcommittees to ensure uniform co-operation and involvement of the permittees in the decision making process.

LEGAL AUTHORITY

9. The permittees ~~shall adopt the proposed Storm Water/Urban Runoff Management Ordinance, or its equivalent. No later than November 30, 1995, each permittee shall certify to the Regional Board that it has adequate legal authority to control discharges of pollutants into the municipal storm drain system and that satisfied~~ adopted the Storm Water Run-off Management Ordinance. This task was completed as of April, 1995. The permittees shall establish a mechanism for periodic review and update of their ordinances to ensure compliance with the requirements of 40 CFR Section 122.26(d)(2)(i). ~~At a minimum, it should include a statement attesting that the ordinances adopted~~

VOL 22
0198
R0065434

~~provides the permittee the legal authority to enforce storm water regulations within its jurisdiction.~~

ENFORCEMENT STRATEGY

10. Permittees ~~shall develop and implement~~ have developed an enforcement strategy as outlined in the ROWD (submitted on April 4, 1995) to enforce storm water and erosion control ordinances. ~~This~~ The permittees shall implement the enforcement strategy ~~should include~~ which includes a mechanism for the inspection of industrial facilities and construction sites, notification to the Executive Officer of any finding of non-compliance with the storm water regulations and any proposed local enforcement action. ~~The enforcement strategy shall be submitted for approval to the Executive Officer of the Regional Board by March 30, 1996.~~

11. The enforcement strategy shall include enforcement and control of discharges from facilities not ~~included in the Phase I of the EPA's NPDES storm water regulations~~ covered under the State's existing General Storm Water Permits.

12. Permittees have completed ~~shall complete~~ the reconnaissance survey of their storm drain conveyance systems as of ~~by~~ October 1, 1995 and will eliminate all illegal and/or illicit connections by December 1, ~~1995 and~~ 1996. Permittees shall submit a report of the findings by ~~January 30, 1996~~ April 30, 1997 and each year thereafter (including the detection, elimination and prosecution of illegal dischargers).

PUBLIC EDUCATION AND OUTREACH

13. The permittees shall continue to implement the public education efforts already underway and shall implement all of the proposed efforts contained in the Report of Waste Discharge. Any proposed changes shall be submitted to the Executive Officer of the Regional Board for approval.

14. When feasible, the permittees shall participate in joint outreach with other programs including, but not limited to, other municipal storm water programs to ensure that a consistent message on storm water pollution prevention is brought to the public.

15. The permittees shall develop public education materials to encourage the public to report illegal dumping from residential, industrial, construction and commercial sites into public streets, storm drains and other water bodies.

VOL 22
0199
R0065435

16. The permittees shall develop a public education program geared toward the industrial facilities and construction sites through active participation of the county and city departments.

17. Permittees shall develop an educational program targeted toward educating the staff at the county and city departments/agencies under their jurisdiction about storm water program and utilize their assistance in enforcing the requirements of this order. Example of these departments/agencies include Fire Department, Department of Health and Safety, Pre-treatment Programs, Hazardous Waste Collection, Building and Safety, etc.

MUNICIPAL FACILITIES

18. The permittees ~~shall~~ have developed a pollution prevention strategy to address public agency facilities and activities not currently required to obtain coverage under the State's general storm water permits. The pollution prevention strategy ~~shall be developed~~ is to ensure that the public agency facilities and/or activities that are currently not required to obtain coverage under the State's general storm water permits are not sources of pollutants into the waters of the U.S. ~~state~~. The pollution prevention strategy shall be implemented in accordance with the time schedule proposed in the ROWD. ~~submitted for approval to the Executive Officer of the Regional Board by September 1, 1996 and shall at a minimum include the following:~~

~~a. Identification of all public agency facilities and activities that are potential contributors of pollutants to waters of the state;~~

~~b. Potential pollutants of concern that are associated with the facilities and/or activities;~~

~~c. Proposed BMPs and a schedule for implementation to ensure that these facilities are not sources of pollutants into the waters of the state;~~

~~d. A monitoring program to measure the effectiveness of the BMPs;~~

~~e. A schedule for training of public agency staff to ensure proper implementation of the BMPs and;~~

~~f. Identification of any non-storm water discharges from the public agency facilities/activities, frequency of the discharge;~~

VOL 22
0200
R0065436

~~characterization of the discharge, volume, flow and duration of the discharge, short-term source control BMPs to mitigate the impacts from the discharge, and a schedule for elimination or permitting of the discharge.~~

MUNICIPAL CONSTRUCTION PROJECTS/ACTIVITIES

19. This Order authorizes the discharge of storm water run-off from construction projects that may result in land disturbances of 5 acres or more or that are part of a common plan of development and sale and that are under ownership and/or direct responsibility of any of the permittees.

20. Thirty (30) days prior to commencement of construction activities, the permittees shall notify the Executive Officer of the Regional Board of the proposed construction project. Upon completion of the construction activities, the Executive Officer shall be notified of the completion of the construction project.

21. The permittees shall develop and implement a storm water pollution prevention plan and a monitoring program that is specific for the construction project prior to the commencement of any of the construction activities. The SWPPP and the monitoring program shall be implemented throughout the duration of the construction activities on site. The SWPPP shall be kept at the construction site and released to the public and/or Regional Board Staff upon request.

22. The SWPPP and the monitoring program for the construction projects shall be consistent with the requirements of the most recent version of the State's General Permit for Storm Water Discharges Associated with Construction Activities.

23. The permittees shall give advance notice to the Executive Officer of the Regional Board of any planned changes in the construction activities which may result in non-compliance with the current version of the State's General Permit for Storm Water Discharges Associated with Construction Activities.

NEW DEVELOPMENTS (INCLUDING RE-DEVELOPMENT)

24. ~~19 Within 90 days of the issuance of this order, t~~ The permittees shall begin implementation of the new development BMPs as described ~~program outlined~~ in Section 4 of the ROWD in accordance with the schedule provided in the ROWD. ~~which was developed under Order No. 90-136.~~

VOL 22

0201

R0065437

25. ~~20 Within 120 days of the issuance of this order,~~ By April 30, 1997, the permittees shall update their General Plan and CEQA document preparation processes to ensure that storm water-related issues are properly considered. If necessary, these processes shall be revised to include requirements for evaluation of storm water-related impacts and identification of appropriate mitigation measures.

26. ~~21~~ The permittees shall establish a mechanism to ensure proper maintenance and operation of all permanent flood control structures. For new developments, the parties responsible for the maintenance of the flood control structures and funding sources for maintenance and operation of the facilities shall be identified prior to issuance of grading permits.

FISCAL RESOURCES

27. ~~22~~ The permittees shall prepare and submit a unified fiscal analyses report to the Executive Officer of the Regional Board. The fiscal analysis report shall be submitted no later than ~~September 1,~~ August 31, of each year and shall, at a minimum, include the following:

a. Each permittee's expenditures for the previous fiscal year;
b. Each permittee's budget for the current fiscal year;
c. A description of the source of funds.
~~d. Contract services (relating to the NPDES program) describing the service provided and the amount charged for the service;~~
~~e. A list of staff, type of work, estimated time dedicated to the storm water program and estimated cost and;~~
~~f. Each permittee's estimated budget for next fiscal year.~~

PERMIT EXPIRATION AND RENEWAL

28. ~~23~~ This order expires on ~~September 1,~~ December 1, 2000 and the permittees must file a Report of Waste Discharge (permit application) no later than 180 days in advance of such expiration date as application for issuance of new waste discharge requirements. The Report of Waste Discharge shall, at a minimum, include the following:

a. Any revisions to the ~~Drainage Area~~ Municipal Storm Water Management Program ~~Plan~~ including, but not limited to, all the activities the permittees propose to undertake during the next permit term, goals and objectives of such activities, an evaluation of the need for additional source control and/or structural BMPs, any proposed pilot studies, etc.;

VOL 22
02202
R0065438

b. Changes in land use and/or population including map updates; and

c. Any significant changes to the storm drain systems, outfalls, detention or retention basins or dams, and other controls including map updates of the storm drain systems.

29. ~~24~~ This Order may be modified, revoked or reissued prior to its expiration date for the following reasons:

a. To address significant changes in conditions identified in the technical reports required by the Regional Board which were unknown at the time of the issuance of this order,

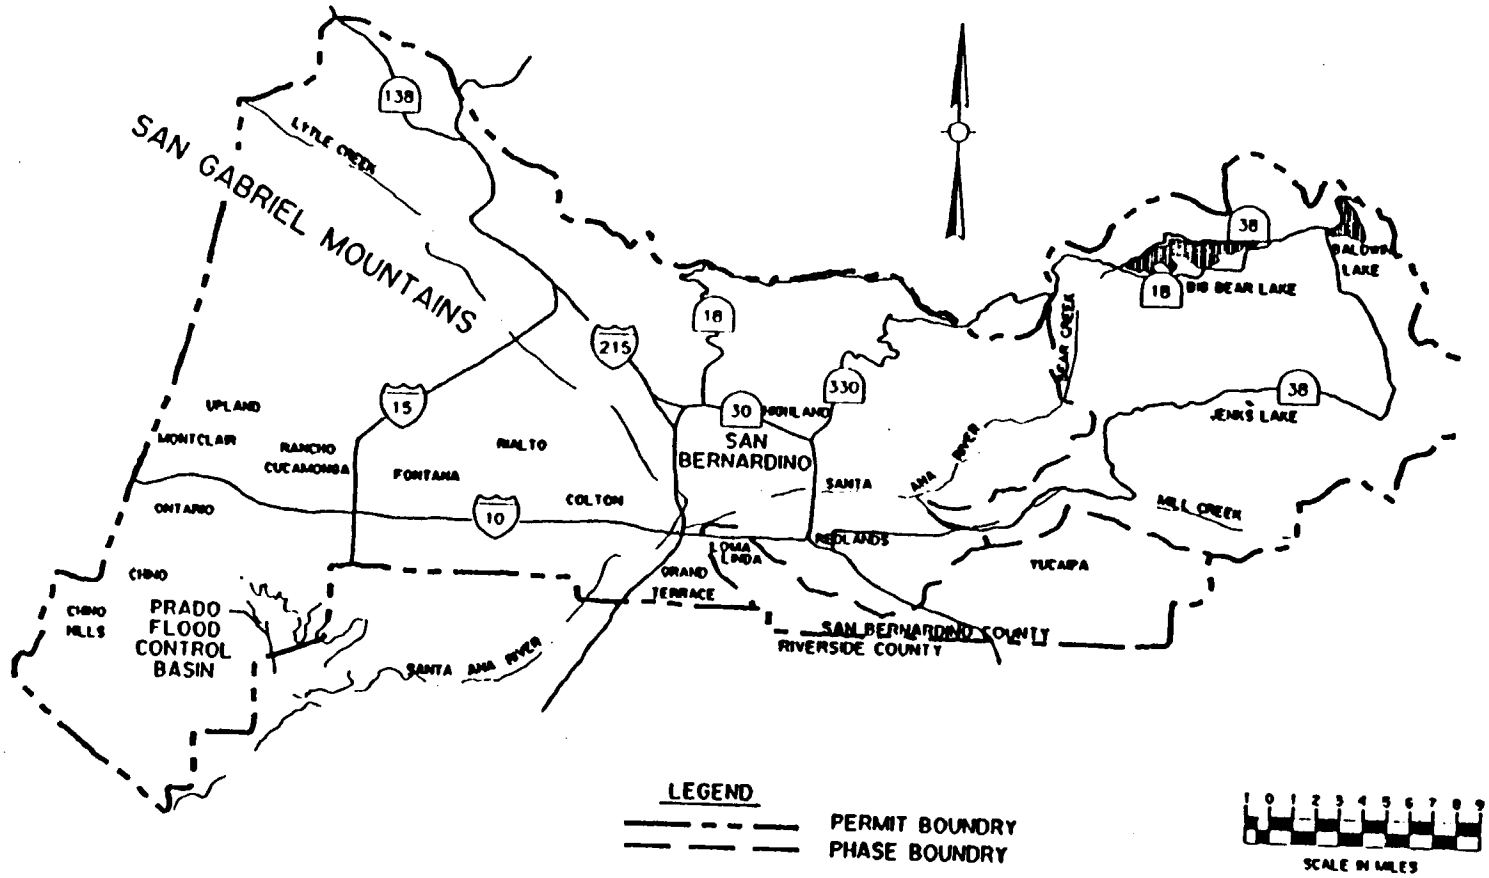
b. To incorporate applicable requirements of statewide water quality control plans and policies adopted by the State Water Resources Control Board or any amendments to the Basin Plan approved by the Regional Board, the State Board, and, if necessary, by the Office of Administrative Law; or

c. To comply with any applicable requirements, guidelines, or regulations issued or approved under the Clean Water Act, if the requirements, guidelines, or regulations contain different conditions or additional requirements than those included in this order.

30. ~~25~~ This order shall serve as a National Pollutant Discharge Elimination System (NPDES) permit pursuant to Section 402 (p) of the Clean Water Act, or amendments thereto, and shall become effective ten days after the date of its adoption provided the Regional Administrator of the U. S. EPA has no objections. If the Regional Administrator objects to its issuance, the permit shall not become effective until such objection is withdrawn.

31. ~~27~~ Order No. 90-136 is hereby rescinded.

I, Gerard Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on ~~September 1, 1995~~ December 1, 1995.



Gerard J. Thibeault
Executive Officer

MONITORING AND REPORTING PROGRAM NO. 95-53
NPDES NO. CAS008036 ~~CA 8000300~~
FOR
THE SAN BERNARDINO COUNTY TRANSPORTATION/FLOOD CONTROL DEPARTMENT, THE COUNTY OF SAN BERNARDINO, AND THE INCORPORATED CITIES OF SAN BERNARDINO COUNTY WITHIN THE SANTA ANA REGION
AREAWIDE URBAN STORM WATER RUN-OFF

TENTATIVE

I. GENERAL

1. Revisions of the monitoring and reporting program may be necessary to ensure that the discharger is in compliance with requirements and provisions contained in this order. Revisions may be made by the Executive Officer at any time during the term of this order, and may include a reduction or increase in the number of parameters to be monitored, the frequency of monitoring, or the number and size of samples collected.

2. All sample collection, handling, storage, and analyses shall be in accordance with 40 CFR Part 136.

3. The permittees are authorized to complement monitoring data from other sources provided those sources are identical to sources in the Santa Ana Watershed.

4. The permittees shall implement the Consolidated Program for Water Quality Monitoring (submitted as part of the Report of Waste Discharge) until development and implementation of an acceptable watershed monitoring program.

II. OBJECTIVES

The overall goal of this monitoring program is to develop and support an effective watershed management program. The following are the major objectives:

1. To define water quality status, trends, and pollutants of concern.

2. To characterize pollutants and to assess the influence of land use on water quality.

3. To identify significant water quality problems related to storm water discharges within the watershed.

4. To identify other sources of pollutants in storm water run-off to the extent possible (e.g., atmospheric deposition, contaminated sediments, other nonpoint sources, etc.).

5. To verify and to control illicit discharges.

6. To identify those waters which without additional action to control pollution from storm water discharges cannot reasonably be expected to attain or maintain applicable water

VOL 22 0210

R0065446

water quality standards ~~objectives~~ or the goals and requirements of the Basin Plan.

7. To evaluate the effectiveness of existing management programs, including an estimate of pollutant reductions achieved by the structural and nonstructural BMPs.

8. To evaluate costs and benefits to the stakeholder including the public.

The Regional Board recognizes that these objectives may not be attainable during this permit period and authorizes the Executive Officer to evaluate and determine adequate progress toward meeting each objective.

III. MONITORING PROGRAM REQUIREMENTS

The permittees shall develop and submit for approval of the Executive Officer an integrated ~~watershed~~ monitoring program geared towards achieving the above stated objectives ~~goals~~. In developing this program, the principal permittee is encouraged to seek ~~This program shall be developed in~~ cooperation with the permittees from the Riverside and Orange counties. The Executive Officer or his/her designated representative(s) shall facilitate the coordination meetings or subcommittees formed to achieve this goal. The development and implementation of the monitoring program shall be in accordance with the time schedules prescribed by the Executive Officer. At a minimum, the program shall include the following:

1. Uniform guidelines for quality control, quality assurance, data collection and data analyses.

2. A mechanism for the collection, analyses and interpretation of existing data from Orange, Riverside, and San Bernardino County monitoring programs. These and other data from local, regional or national sources should be utilized to characterize different storm water sources; to determine pollutant generation, transport and fate; to develop a relationship between land use, development size, storm size and the event mean concentration of pollutants; to determine spatial and temporal variances in storm water quality and seasonal and other bias in the collected data; and to identify any unique features of the Santa Ana Watershed. The permittees are encouraged to use data from similar studies, if available.

3. A description of the monitoring program including:

   a. The number of monitoring stations;
   b. Environmental indicators (e. g., ecosystem, biological, habitat, chemical, sediment, stream health, etc.) chosen for monitoring;
   c. Parameters selected for field screening and for laboratory work; and

   d. Total number of samples to be collected from each station, receiving water and major outfall monitoring, frequency of sampling during wet and dry weather, short duration or long duration storm events, type of samples (grab, 24-hour composite, etc.), and the type of sampling equipment.

VOL 22
021
R0065447

4. A mechanism for analyzing the collected data and interpreting the results including an evaluation of the effectiveness of the management practices, and need for any refinement of the management practices.

5. A description of the responsibilities of all the participants in this program including cost sharing.

IV. REPORTING

1. All progress reports and proposed strategies and plans required by this order shall be signed by the principal permittee and copies shall be submitted to the Executive Officer of the Regional Board under penalty of perjury.

2. The permittees shall submit an **ANNUAL PROGRESS REPORT** to the Executive Officer of the Regional Board and to the Regional Administrator of U.S. EPA, Region 9, no later than ~~September 1,~~ November 30, of each year. This progress report may be submitted in a mutually agreed upon electronic format. At a minimum, the annual progress report shall include the following:

   a. A review of the status of program implementation and compliance (or non-compliance) with the schedules contained in this order.

   b. An assessment of the effectiveness of control measures established under the illicit discharge elimination program and the MSWMP. ~~Drainage Area Management Plan~~ The effectiveness may be measured in terms of how successful the program has been in eliminating illicit/illegal discharges and in reducing pollutant loads in storm water discharges.

   c. An assessment of any storm water management program modifications made to comply with Clean Water Act requirements to reduce the discharge of pollutants to the maximum extent practicable.

   d. An analysis and discussion on the monitoring results and any impacts on the receiving waters. Also, recommendations for corrective actions during the upcoming year of MSWMP ~~DAMP~~ implementation and monitoring.

   e. An analysis and the effectiveness of the overall storm water management program. The permittees identification of proposed programs which will result in the attainment of the water quality standards ~~objectives~~, and a time schedule to implement the new programs.

   f. An assessment of the public education program (including industrial facilities and construction sites) and educational activities proposed for the upcoming year.

   g. A progress report on the prosecution of illegal dischargers and reduction

VOL 22
0212
R0065448

or elimination of illegal discharges.

3. ~~Co-p~~Permittees shall be responsible for the submittal of all required information/materials needed to comply with this order in a timely manner to the principal permittee. All such submittal shall be signed by a duly authorized representative of the ~~co~~-permittee under penalty of perjury.

V. REPORTING SCHEDULE

All reports required by this order shall be submitted to the Executive Officer of the Regional Board in accordance with the following schedule:

ITEM	DUE DATE
Revised Implementation Agreement	March 1, 1996
Municipal Activities Pollution Prevention Strategy	~~June 6,~~ September 1, 1996
~~Legal Authority Certification~~	~~November 30, 1995~~
Report on illegal/illicit connections	~~January 30, 1996~~ April 30, 1997
~~Enforcement Strategy~~	~~March 30, 1996~~
Fiscal Analyses Report	~~September 1~~ August 31 of each year
Report on Illicit/Illegal Discharges	~~January~~ April 30 of each year
Annual Report	~~September 1~~ November 30 of each year

Ordered by_____

RENEWAL OF WASTE DISCHARGE REQUIREMENTS FOR THE ORANGE, RIVERSIDE, AND SAN BERNARDINO COUNTY AREAS, URBAN STORM WATER RUNOFF

(To the attached mailing list)

Ladies and Gentlemen:

The following NPDES permits for areawide storm water runoff are scheduled for consideration by the Regional Board at the September 1, 1995 Board meeting;

1. Orange County, Order No. 95-71, NPDES No. CA 8000180
2. Riverside County, Order No. 95-47, NPDES No. CA 8000192
3. San Bernardino County, Order No. 95-53, NPDES No. CA 8000200

The requirements specified in these tentative orders are substantially the same. Therefore, a copy of one of these tentative orders is enclosed for your review. If you need copies of any of the other tentative orders, please contact Liz Vera at 909-320-2067.

If you have any questions regarding the tentative order for Orange County, please contact Laurie Nevils at 909-320-2067, for Riverside County, please contact Pavlova Vitale at 909-782-4920, and for San Bernardino County, please contact Reza Akhtarshad at 909-320-2024.

Sincerely,

Joanne E. Schneider

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SANTA ANA REGION

95 JUL 25 PM 1:18

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT
NPDES NO. CA 8000192
AND
WASTE DISCHARGE REQUIREMENTS
ORDER NO. 95-47
FOR
THE RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT, THE COUNTY OF RIVERSIDE, AND THE INCORPORATED CITIES OF RIVERSIDE COUNTY WITHIN THE SANTA ANA REGION
AREAWIDE URBAN STORM WATER RUNOFF

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Board), finds that:

1. On January 3, 1995, the Riverside County Flood Control and Water Conservation District (RCFC&WCD), in cooperation with the County of Riverside, and the incorporated cities of Beaumont, Corona, Calimesa, Canyon Lake, Hemet, Lake Elsinore, Moreno Valley, Norco, Perris, Riverside, and San Jacinto (hereinafter collectively referred to as "permittees"), have jointly submitted a National Pollutant Discharge Elimination System (NPDES) Application No. CA 8000192 to renew their areawide NPDES permit for urban storm water runoff.

2. The 1987 amendments to the Clean Water Act required the United States Environmental Protection Agency (EPA) to develop permitting regulations for storm water discharges from municipal separate storm sewer systems serving a population of 100,000 or more and for storm water discharges associated with industrial activities, including construction sites. The EPA published proposed storm water regulations on December 7, 1988 and promulgated the final regulations on November 16, 1990. Prior to the EPA's promulgation of the final storm water regulations, the three counties (Orange, Riverside, and San Bernardino) and the incorporated cities within the jurisdiction of the Santa Ana Regional Board requested areawide NPDES permits for urban storm water runoff.

3. On July 13, 1990, the Regional Board adopted Order No. 90-104 for urban storm water runoff from urban areas in Riverside County within the Santa Ana Region. Order No. 90-104 expired on July 1, 1995. The Riverside County Flood Control and Water Conservation District was named as the principal permittee and Riverside County and the incorporated cities were named as the co-permittees. In order to more effectively carry out the requirements of this order, the permittees have agreed that the RCFC&WCD will continue as principal permittee and Riverside County and the incorporated cities will continue as co-permittees. However, the Regional Board, in exercising its enforcement discretion, will take action only against the individual permittee responsible for specific violations of this order, whenever possible.

VOL 22 0226

R0065462

VOL 22

4. Order No. 90-104 required the permittees to develop and implement a drainage area management plan (DAMP); develop and implement storm water and receiving water monitoring plans; to eliminate illegal and illicit discharges to the storm drain systems; and, to enact the necessary legal authority to effectively prohibit illegal and illicit discharges. The overall goal of these requirements was to reduce pollutant loadings to surface waters from urban runoff to the maximum extent practicable.

5. The Report of Waste Discharge (the permit renewal application) included the following major components:

   a. A map of the drainage area and maps of existing storm drain facilities
   b. A summary of the storm water management program
   c. A Consolidated Program for Water Quality Monitoring
   d. A copy of a Proposed Storm Water/Urban Runoff Management and Discharge Control Ordinance
   e. A copy of the current Implementation Agreement
   f. A copy of each of the Interagency Agreements
   g. The Drainage Area Management Plan (DAMP)
   h. A copy of Proposed Riverside County Grading and Erosion Control Ordinance

   These and other documents submitted as part of the Report of Waste Discharge are hereby made a part of this order.

0227

6. Within the Santa Ana Region, the permittees serve a population of approximately 930,000, occupying an area of approximately 1,360 square miles. The permitted area is shown on Appendix 1. This order regulates storm water runoff from areas under the jurisdiction of the permittees. The term storm water as used in this order includes storm water runoff, snow melt runoff, and surface runoff and drainage. The average annual rainfall in the permitted area ranges from 10 to 12 inches. The permittees have jurisdiction over and/or maintenance responsibility for storm water conveyance systems within Riverside County. The storm drain system includes an estimated 200 miles of open and closed storm drains owned and operated by RCFC&WCD and an estimated 57 miles of open and closed storm drains owned and operated by the remaining permittees. The permittees have identified major outfalls (outfalls with a pipe diameter of 36 inches or greater or drainage areas draining 50 acres or more) and have submitted maps of existing storm drain facilities.

7. Approximately one quarter (1/4) of the entire Riverside County area drains into water bodies within the Santa Ana Region. Most of the urbanized areas of Riverside County lie within this Regional Board's jurisdiction. Storm water runoff from other portions of Riverside County is regulated by the San Diego and Colorado River Basin Regional

R0065463

Boards. The discharges consist of runoff from rainfall, snow melt, and surfacing ground water from various land use areas which either discharge directly to the Santa Ana River or to watercourses tributary to the Santa Ana River. Other major rivers in the area include the San Jacinto River and Temescal Creek. The San Jacinto Mountain areas drain into the San Jacinto River, which discharges into Lake Elsinore. Any overflow from Lake Elsinore is tributary to Temescal Creek, which flows into Reach 3 of the Santa Ana River in the Prado Flood Control Basin.

8. The Santa Ana River Basin is the major watershed within this Region. This watershed is divided into the upper and lower Santa Ana watersheds. The lower Santa Ana River Basin (downstream from Prado Dam) includes the Orange County drainage areas and the Upper Santa Ana River Basin includes the San Bernardino County and the Riverside County drainage areas. The San Bernardino County drainage areas are generally upstream of the Riverside County drainage areas.

9. The three county areas within this Region are regulated under three areawide permits for urban storm water runoff. These areawide NPDES permits are:

   a. Orange County, NPDES No. CA 8000180, Order No. 90-71 (upon renewal Order No. 95-52)

   b. Riverside County, NPDES No. CA 8000192, Order No. 90-104 (upon renewal Order No. 95-47)

   c. San Bernardino County, NPDES No. CA 8000200, Order No. 90-136 (upon renewal Order No. 95-53)

10. Runoff from the San Bernardino County drainage areas is generally conveyed to the Riverside County drainage areas through the Santa Ana River or other drainage channels tributary to the Santa Ana River. These flows are then discharged to Reach 2 of the Santa Ana River through Prado Dam (Reach 3 of the Santa Ana River). Most of the flow in Reach 2 is recharged in Orange County. During wet weather, some of the flow is discharged to the Pacific Ocean through Reach 1 of the Santa Ana River.

11. In addition to the Regional Board, a number of other stakeholders are involved in the management of the water resources of the Region. These include, but are not limited to, the incorporated cities in the Region, publicly owned treatment works, the three counties, and the Santa Ana Watershed Project Authority and its member agencies. The entities listed in Appendix 2 are considered as potential dischargers of storm water to the Riverside County drainage areas. It is expected that these entities will also work cooperatively with the permittees to manage urban runoff. The Regional Board has the

VOL 22 0228
R0065464

VOL 22

discretion and authority to require non-cooperating entities to participate in this areawide permit or to issue individual storm water permits, pursuant to 40 CFR 122.26(a). Cooperation and coordination among all the stakeholders are critical to optimize the use of limited resources and insure economical management of the watershed. Recognizing this fact, this order focusses on watershed management and seeks to integrate the programs of all the stakeholders, especially the three municipal storm water permit holders, within this watershed.

12. The 1989, 1991, and 1994 Water Quality Assessments by the Regional Board identified impairment of a number of water bodies within the permitted area. The beneficial uses of these water bodies are threatened or impaired in part due to urban storm water runoff and non-storm water flows from urbanized areas. Preliminary results from urban storm water monitoring programs within the Region indicate that major pollutants of concern in urban runoff are certain heavy metals, sediment, coliform bacteria, pesticides, and nutrients. Municipal storm water runoff is a source of pollutants to waters of the Region that may be causing or contributing to water quality impairment. It is recognized that instream or end-of-channel treatment of storm water is difficult and expensive. Therefore, it is critical to identify the pollutant sources and to develop management practices necessary to reduce pollutant loading to storm water. The quality of these discharges varies considerably and is affected by land use activities, basin hydrology and geology, season, the frequency and duration of storm events and point source discharges permitted by the Regional Board under individual permits.

13. Studies conducted by the EPA, the states, flood control districts and other entities indicate the following major sources of storm water pollution:

    a. Industrial sites where appropriate pollution control and best management practices (BMPs) are not implemented,

    b. Construction sites where erosion and siltation controls and BMPs are not implemented, and

    c. Urban runoff where the drainage area is not properly managed.

14. To address the industrial and construction sites, the State Water Resources Control Board (State Board) issued two statewide general NPDES permits: one for storm water runoff from industrial sites (NPDES No. CAS000001, General Industrial Activities Storm Water Permit) and the second one for storm water runoff from construction sites (NPDES No. CAS000002, General Construction Activity Storm Water Permit). Most industrial activities (some light industrial activities are exempt) and construction activities on five acres or more are required to get individual NPDES permits for storm water discharges, or get coverage under these statewide general permits by completing and filing a Notice of Intent (NOI) with the State Board.

0229

R0065465

15. In addition, the Regional Board adopted Order No. 94-005, NPDES NO. CA 8000279, for storm water runoff from facilities owned and/or operated by Caltrans, which includes freeways and highways, and Order No. 94-7, NPDES NO. CA 8000336, for concentrated animal feeding operations, including dairies (General Dairy Permit). The Regional Board has issued and continues to issue individual storm water permits for certain industrial facilities within the Region.

16. One of the major components of these statewide permits, the Caltrans permit, and the General Dairy Permit is the requirement for the development and implementation of a storm water pollution prevention plan (SWPPP) for each facility.

17. The Regional Board is the enforcing authority for the two statewide general permits. However, in most cases, the industrial and construction sites discharge directly into storm drains and/or flood control facilities owned and operated by the permittees. These industrial and construction sites are also regulated under local laws and regulations. Therefore, a coordinated effort between the permittees and the Regional Board is critical to avoid duplicative storm water regulatory activities. A memorandum of understanding between the permittees and the Regional Board may be appropriate to efficiently implement the storm water regulations for industries and construction sites at the local level.

18. The permittees generally conduct inspections of industrial and commercial facilities and construction sites within their jurisdiction. The permittees have established a subcommittee to develop an enforcement/compliance strategy for industrial and commercial facilities and construction sites. The permittees have agreed to notify Regional Board staff of industrial and construction facilities which are not in compliance with the storm water regulations.

19. The permittees have agreed not to issue grading and/or building permits without proof of compliance for projects subject to the General Permit for Storm Water Discharges Associated with Construction Activity.

20. The permittees own/operate facilities where industrial or related activities take place that may have an impact on storm water quality. Some of the permittees also enter into contracts with outside parties to carry out activities that may also have an impact on storm water quality. These facilities and related activities include, but are not limited to, street sweeping, catch basin cleaning, maintenance yards, vehicle and equipment maintenance areas, waste transfer stations, corporation and storage yards, parks and recreational facilities, landscape and swimming pool maintenance activities, storm drain system maintenance activities and the application of herbicides, algaecides and pesticides. As part of this order, the permittees are required to assess all of the public agency related

VOL 22
0230
R0065466

activities and facilities for potential impact to storm water quality and develop and implement best management practices to reduce pollutant discharges from these activities/facilities. Non-storm water discharges from these facilities and/or activities also affect water quality. This order prohibits non-storm water discharges from public facilities unless the discharges are exempt under Section III., Discharge Limitations, 3 of this order or are permitted by the Regional Board under an individual NPDES permit.

21. The major focus of storm water pollution prevention is the development and implementation of an appropriate drainage area management plan (DAMP) including best management practices (BMPs). The ultimate goal of the urban storm water management program is to attain water quality consistent with the water quality objectives for the receiving waters in order to protect beneficial uses. The permittees developed and submitted a DAMP, which was approved on January 18, 1994.

22. The DAMP is a dynamic document and the permittees have implemented, or are in the process of implementing its various elements. The Regional Board also recognizes other drainage area management plans such as the Drainage Water Quality Plan for Lake Mathews (DWQPLM), which includes structural BMPs for pollution control. The RCFC & WCD and Riverside County are involved in the DWQPLM.

23. There is some contribution of pollutants in urban runoff from privately owned and operated facilities such as residences, businesses and commercial establishments and public and private institutions. Therefore, a successful storm water management plan should include the participation and cooperation of the public, businesses, and institutions. Therefore, the DAMP has a strong emphasis on public education.

24. The DAMP included 34 BMPs and a time schedule for implementation. These BMPs are organized into two components: BMPs for existing facilities and BMPs for new development. Both components include regulatory activities, public education programs and operations and maintenance activities.

25. In order to characterize storm water discharges, to identify problem areas, and to determine the effectiveness of the various BMPs, an effective monitoring program is critical. From 1990 through 1995, the principal permittee administered the monitoring program for the permittees which included storm water monitoring, receiving water monitoring, dry weather monitoring and sediment monitoring. The Report of Waste Discharge included a Consolidated Program for Water Quality Monitoring.

VOL 22
0231
R0065467

26. In order to make the best use of limited resources of all the permittees (including other municipal permittees in San Bernardino and Orange Counties), and to derive maximum benefit from the storm water management programs, future programs should focus on a watershed approach. An integrated management program may be developed with the cooperation of all the stakeholders, including the permittees in the three counties, and the Regional Board.

27. The permittees have agreed to revise the implementation agreement that was developed in 1990 as required under Order No. 90-104 to coordinate the activities of the principal and co-permittees.

28. Illegal dumping and illicit/illegal connections and discharges to the storm drains are major contributors to storm water and other surface water contamination. Except for the City of Riverside, all the permittees have completed a reconnaissance survey of the municipal storm drain systems (open channels and underground storm drains). The permittees are required to detect, identify and eliminate illicit/illegal discharges. Additionally, the permittees are required to develop a program to prevent any future illegal/illicit connections to their storm drains and flood control facilities.

29. This order requires the permittees to continue to implement the BMPs listed in the DAMP and to effectively prohibit illegal and illicit discharges to the storm drain system. One of the major elements of the DAMP, the Storm Water/Urban Runoff Management and Discharge Controls Ordinance, was adopted by Riverside County on May 9, 1995. The purpose of this ordinance is to reduce pollutant discharges in storm water, and to regulate illicit connections and non-storm water discharges to the storm drain system.

30. Early identification of potential storm water impacts and mitigation measures can significantly reduce storm water pollution problems. The permittees should consider these impacts and appropriate mitigation measures in the development of General Plans, in the California Environmental Quality Act (CEQA) review process for specific projects, Master Plans, etc.

31. Successful implementation of the provisions and limitations in this order will require the cooperation of all the public agency organizations within Riverside County having programs/activities that have an impact on storm water quality (e.g., Fire Department, Department of Environmental Health, Planning Department, Building and Safety, Code Enforcement, etc.). As such, these organizations are expected to actively participate in implementing this areawide storm water program.

VOL 22
02332
R0065468

32. The permittees may lack legal jurisdiction over storm water discharges into their systems from some of the State and federal facilities, agricultural land, utilities and special districts, and Native American tribal lands. The Regional Board recognizes that the permittees should not be held responsible for such facilities and/or discharges.

33. The permittees may petition the Regional Board to issue a NPDES permit to any discharger of non-storm water into storm drain systems that the permittees own or operate.

34. A revised Water Quality Control Plan (Basin Plan) was adopted by the Regional Board and became effective on January 24, 1995. The Basin Plan contains water quality objectives and beneficial uses for water bodies in the Santa Ana Region.

35. The requirements contained in this order are necessary to implement the Basin Plan.

36. In accordance with the Clean Water Act and its implementing regulations, this order requires the permittees to develop and implement programs and policies necessary to control the discharge of pollutants to waters of the United States to the maximum extent practicable.

37. Numeric and narrative water quality objectives are contained in the Basin Plan for the water bodies in this Region. This order does not contain numeric effluent limitations for any constituents because the impact of the storm water discharges on the water quality of the receiving waters has not yet been fully determined. Extensive water quality monitoring and analysis of the data are essential to make that determination. Due to the high cost associated with monitoring, and due to the variability that exists in the current storm water monitoring efforts being conducted by the permittees and other municipal permittees in Orange and San Bernardino Counties under their municipal storm water permits, a tri-county monitoring program to develop and implement effective monitoring procedures and strategies will be considered.

38. The storm water regulations require public participation in the storm water management program development and implementation. As such the permittees are required to solicit and consider all comments received from the public and submit copies of the comments to the Executive Officer of the Regional Board. In considering the public comments, the permittees may modify reports, plans, or schedules prior to submittal to the Regional Board.

VOL 22

0233

R0065469

39. In accordance with California Water Code Section 13389, the issuance of waste discharge requirements for this discharge is exempt from those provisions of the California Environmental Quality Act contained in Chapter 3 (commencing with Section 21100), Division 13 of the Public Resources Code.

40. The Regional Board has considered anti-degradation requirements, pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16, for this discharge. The Regional Board finds that the storm water discharges are consistent with the federal and state anti-degradation requirements and a complete anti-degradation analysis is not necessary.

41. The Regional Board has notified the permittees and interested parties of its intent to issue waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

42. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

IT IS HEREBY ORDERED that the permittees, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and the regulations and guidelines adopted thereunder, shall comply with the following:

I. RESPONSIBILITIES OF THE PRINCIPAL PERMITTEE

The principal permittee shall be responsible for managing the overall storm water program and shall:

1. Conduct water quality and hydrographic monitoring of the municipal separate storm drain system outfalls as agreed upon by the Executive Officer of the Regional Board.

2. Develop uniform criteria for inspections of the municipal separate storm drain systems.

3. Conduct inspections of the storm drain systems owned and operated by the RCFC&WCD.

4. Implement management programs, monitoring programs, and related plans as required by this order.

VOL 22
0234
R0065470

5. Enact and revise policies and ordinances necessary to establish and maintain adequate legal authority within the scope of the Riverside County Flood Control and Water Conservation District Act, as required by the Federal Storm Water Regulations, 40CFR, Part 122.26(d)(2)(i).

6. Respond and/or arrange for responding to emergency situations such as accidental spills, leaks, illicit discharges/illegal connections, etc., to prevent or reduce the discharge of pollutants to the municipal separate storm drain systems and to waters of the United States.

7. Prepare and submit to the Executive Officer of the Regional Board, unified reports, plans, and programs necessary to comply with this order.

The activities of the principal permittee should include, but not be limited to, the following:

8. Coordinate permit activities and participate in any committees/subcommittees formed to coordinate permit compliance activities.

9. Provide technical and administrative support and inform the co-permittees of the progress of other pertinent municipal programs, pilot projects, research studies, etc.

10. Coordinate the implementation of areawide storm water quality management activities such as monitoring programs, public education, other pollution prevention measures, household hazardous waste collection, etc.

11. Gather and disseminate information on the progress of statewide municipal storm water programs and evaluate the information for potential use in the execution of this order.

12. Monitor the implementation of the plans and programs required by this order and determine their effectiveness in reducing pollutant loadings to surface waters to the maximum extent practicable.

13. Coordinate activities pertaining to implementation of this order with the Regional Board.

14. Solicit and coordinate public input for any major proposed storm water management programs and implementation plans.

VOL 22
0235
R0065471

15. Develop and implement mechanisms, performance standards, etc., to promote uniform and consistent implementation of BMPs among the permittees.

16. In conjunction with the co-permittees, implement the BMPs listed in the approved DAMP.

II. RESPONSIBILITIES OF THE CO-PERMITTEES

Each co-permittee shall be responsible for managing the storm water program within its jurisdiction and shall:

1. Adopt the Grading and Erosion Control Ordinance or its equivalent, within 120 days of adoption of this order.

2. Conduct storm drain system inspections in accordance with the uniform criteria developed by the principal permittee.

3. Enact and revise policies and ordinances necessary to establish and maintain adequate legal authority as required by the Federal Storm Water Regulations, 40CFR, Part 122.26(d)(2)(i).

4. Implement management programs, monitoring programs, and related plans as required by this order.

The co-permittees' activities should include, but not be limited to, the following:

5. Administer the storm water and erosion control ordinances adopted pursuant to Item 1., above.

6. Conduct and coordinate with the principal permittee any surveys, monitoring and characterizations needed to identify the pollutant sources and drainage areas.

7. Review and comment on all plans, strategies, management programs, monitoring programs, as developed by the principal permittee or any subcommittee to comply with this order.

8. Participate in any committees or subcommittees formed to address compliance with this order.

9. In conjunction with the principal permittee, implement the BMPs listed in the approved DAMP.

VOL 22
0236
R0065472

VOL 22

10. Share all pertinent information regarding the progress of statewide municipal storm water programs and evaluate any information obtained for potential use in the execution of this order.

11. Participate in the tri-county (Orange, Riverside, and San Bernardino counties) efforts for watershed management.

12. Submit to the principal permittee any information necessary to develop unified report submittals to the Executive Officer of the Regional Board.

13. Prepare and submit any specific reports/information related to the permittees' storm water program as deemed necessary by the Executive Officer of the Regional Board.

14. The City of Riverside shall complete the reconnaissance survey of the City's storm drain systems and eliminate all illegal and/or illicit connections by September 29, 1995. The City shall submit a report of the findings by October 30, 1995.

III. DISCHARGE LIMITATIONS

1. The permittees shall prohibit illicit discharges from entering into the municipal separate storm sewer systems (municipal storm drain systems) and require controls to reduce the discharge of pollutants to the maximum extent practicable.

2. This order authorizes storm water discharges to waters of the State from the permittees' existing municipal separate storm drain systems provided that the permittees implement the BMPs (structural and/or non-structural control measures) necessary to reduce the pollutants in the discharge to the maximum extent practicable. All other discharges are prohibited except those listed under Item 3., below, those for which the Regional Board has issued individual permits, and those discharges which are in accordance with Item 5., below.

3. The following discharges need not be prohibited by the permittees provided that such discharges are identified and appropriate control measures to minimize the adverse impacts of such discharges are developed and implemented.

   a. Discharges composed entirely of storm water;

   b. Discharges covered by an NPDES permit, or for which a written clearance has been issued by the Regional Board office;

0237

R0065473

c. Discharges from potable water line flushing and other potable water sources;

d. Discharges from fire fighting and fire hydrant testing and flushing;

e. Discharges from landscape irrigation, lawn watering and other irrigation activities;

f. Diverted stream flows:

g. Rising ground waters and natural springs;

h. Uncontaminated groundwater infiltration (as defined in 40 CFR 35.2005(20)) and uncontaminated pumped groundwater;

i. Passive foundation drains;

j. Air conditioning condensate;

k. Water from crawl space pumps;

l. Passive footing drains;

m. Discharges from individual residential vehicle washing (not including discharges from mobile sources such as automobile/equipment detailing or washing);

n. Flows from riparian habitats and wetlands;

o. Dechlorinated swimming pool discharges;

p. Waters not otherwise containing wastes as defined in California Water Code Section 13050 (d); and

q. Other types of discharges identified and recommended by the permittees and approved by the Regional Board.

For purposes of this order, a discharge may include storm water and other types of discharges as indicated above.

VOL 22
02238
R0065474

VOL 22

4. The permittees shall take necessary steps as required under Item 1., above, to ensure that non-storm water discharges do not cause or contribute to violations of water quality objectives or discharge pollutants to waters of the United States.

5. Non-storm water discharges from public agency activities into waters of the state are prohibited unless the non-storm water discharges are permitted by an NPDES permit or are included in Item 3., above. If permitting or immediate elimination of the non-storm water discharges is impractical, the permittees shall include in the storm water pollution prevention strategy, required under Section V., Provision 13., of this order, a proposed plan to eliminate the non-storm water discharges.

6. The discharge shall not cause or contribute to degradation of groundwaters.

7. Pollutants in storm water discharges from the municipal separate storm sewer system shall be reduced to the maximum extent practicable.

IV. RECEIVING WATER LIMITATIONS

The discharge shall not cause a violation of any applicable water quality objectives for receiving waters adopted by the Regional Board or the State Water Resources Control Board. If more stringent applicable water quality objectives are promulgated or approved pursuant to Section 303 of the Clean Water Act, or amendments thereto, the Board will revise and modify this order in accordance with such more stringent standards.

V. PROVISIONS

GENERAL

1. Permittees shall demonstrate compliance with all the requirements in this order and specifically with Section III., Discharge Limitations, and Section IV., Receiving Water Limitations, through timely implementation of their approved Drainage Area Management Plan and any approved modifications, revisions, or amendments thereto, which are developed pursuant to this order. The Drainage Area Management Plan is hereby made an enforceable part of this ordrer.

2. Permittees shall implement all elements of the approved DAMP. Any proposed revisions to the DAMP shall be submitted to the Executive Officer of the Regional Board for review and approval. All revisions to the DAMP approved by the Executive Officer shall be implemented in a timely manner.

02399

R0065475

VOL 22

3. The permittees shall comply with Monitoring and Reporting Program No. 95-47, which is hereby made a part of this order, and any revisions thereto. The Executive Officer is authorized to revise the Monitoring and Reporting Program and also to allow the permittees to participate in regional, statewide, national, or other monitoring programs in lieu of Monitoring and Reporting Program No. 95-47.

4. Upon approval by the Executive Officer of the Regional Board, all plans and reports required by this order, including any subsequent amendments, shall be implemented and shall become an enforceable part of this order.

5. The permittees shall report to the Executive Officer of the Regional Board:

   a. Any unusual discharge of storm or wastewaters to facilities owned or operated by the permittees or to any waters of the Region (e.g., discharges due to a levee break, illegal discharges to the street, etc.); if the discharge is to Canyon Lake or any tributary to Canyon Lake, Elsinore Valley Municipal Water District shall also be notified immediately;

   b. Any industrial and/or construction facilities not in compliance with the storm water regulations; and

   c. Any activities on federal, state, or other entity's land or facilities, where the permittees do not have any jurisdiction, and where the activities may be contributing pollutants to waters of the United States.

6. The permittees shall not issue any permits for new businesses and/or construction activities until proof of intent to comply with the State's General Storm Water permits is verified. The proof of compliance may include a letter from the Regional Board office, a copy of the Notice of Intent, etc. The permittees shall coordinate the activities of the various departments/sections within each permittee's jurisdiction to insure consistent implementation of storm water regulations.

IMPLEMENTATION AGREEMENT

7. No later than March 1, 1996, the permittees shall submit to the Executive Officer of the Regional Board an updated copy of an implementation agreement with authorized signatures of each of the permittees. Any subsequent revisions to the implementation agreement shall be forwarded to the Executive Officer of the Regional Board within 30 days of approval by the permittees. At a minimum, the implementation agreement should include all the essential elements of the existing agreement, developed in accordance with Order No. 90-104.

0240

R0065476

VOL 22

LEGAL AUTHORITY

8. The permittees shall adopt the proposed Storm Water/Urban Runoff Management and Discharge Control Ordinance, or its equivalent. No later than November 30, 1995, each permittee shall certify to the Regional Board that it has adequate legal authority to control the discharges of pollutants into the municipal storm drain system and that it has satisfied the requirements of 40 CFR Section 122.26(d)(2)(i). At a minimum, each permittee's certification shall include a statement attesting that the ordinance adopted provides the permittee the legal authority to enforce storm water regulations within its jurisdiction.

ENFORCEMENT/COMPLIANCE STRATEGY

9. Permittees shall develop and implement an enforcement strategy to enforce storm water and erosion control ordinances. This enforcement strategy should include a mechanism to determine compliance of industrial facilities and construction sites, and notification to the Executive Officer of any finding of non-compliance and any proposed local enforcement action. The enforcement/compliance strategy shall be submitted to the Executive Officer of the Regional Board by March 30, 1996.

PUBLIC EDUCATION AND OUTREACH

10. The permittees shall continue to implement the public education efforts already underway and shall implement all of the proposed efforts identified in the Report of Waste Discharge. Any proposed changes shall be submitted to the Executive Officer of the Regional Board for approval.

11. When feasible, the permittees shall participate in joint outreach with other programs including, but not limited to, other municipal storm water programs to ensure that a consistent message on storm water pollution prevention is brought to the public.

12. The permittees shall develop public education materials to encourage the public to report illegal dumping from residential, industrial, construction and commercial sites into public streets, storm drains and other water bodies.

0241

R0065477

MUNICIPAL FACILITIES

13. The permittees shall develop a pollution prevention strategy to address public agency facilities and activities not currently required to obtain coverage under the State's general storm water permits. The pollution prevention strategy shall be developed to ensure that the public agency facilities and/or activities that are currently not required to obtain coverage under the State's general storm water permits are not sources of pollutants into the waters of the United States. The pollution prevention strategy shall be submitted to the Executive Officer of the Regional Board by June 6, 1996 and shall at a minimum include the following:

    a. Identification of all public agency facilities and activities that are potential contributors of pollutants to waters of the United States.

    b. Potential pollutants of concern that are associated with the facilities and/or activities;

    c. Proposed BMPs and a schedule for implementation to ensure that these facilities are not sources of pollutants into the waters of the United States;

    d. A monitoring program to measure the effectiveness of the BMPs;

    e. A schedule for training of public agency staff to ensure proper implementation of the BMPs; and

    f. Identification of any non-storm water discharges from the public agency facilities/activities, frequency of the discharge, characterization of the discharge, volume, flow and duration of the discharge, short term source control BMPs to mitigate the impacts from the discharge, and a schedule for elimination or permitting of the discharge.

NEW DEVELOPMENT (INCLUDING RE-DEVELOPMENT)

14. Within 90 days of the issuance of this order, the permittees shall begin implementation of the new development BMPs (DAMP Supplement A) that were developed pursuant to Order No. 90-104.

VOL 22
0242
R0065478

VOL 22

15. Within 120 days of the issuance of this order, the permittees shall review their General Plan update and CEQA document preparation processes to insure that storm water-related issues are properly considered. If necessary, these processes shall be revised to include requirements for evaluation of storm water-related impacts and identification of appropriate mitigation measures.

16. The permittees shall establish a mechanism to insure proper maintenance and operation of all permanent flood control structures.. For new developments, the parties responsible for the maintenance of the flood control structures and funding sources for maintenance and operation of the facilities shall be identified prior to issuance of grading permits.

FISCAL RESOURCES

17. The permittees shall prepare and submit a unified fiscal analysis report to the Executive Officer of the Regional Board. The fiscal analysis report shall be submitted no later than September first of each year and shall at a minimum include the following:

    a. Each permittee's expenditures for the previous fiscal year;
    b. Each permittee's budget for the current fiscal year;
    c. A description of the source of funds;
    d. A description of contract services (relating to the NPDES program), including the service provided and the amount charged for the service;
    e. A list of staff, type of work, estimated time dedicated to the storm water program and estimated cost; and
    f. Each permittee's estimated budget for the next fiscal year.

PERMIT EXPIRATION AND RENEWAL

18. This order expires on September 1, 2000 and the permittees must file a Report of Waste Discharge (permit application) no later than 180 days in advance of such expiration date as application for issuance of new waste discharge requirements. The Report of Waste Discharge shall, at a minimum, include the following:

    a. Any revisions to the Drainage Area Management Plan including, but not limited to, all the activities the permittees propose to undertake during the next permit term, goals and objectives of such activities, an evaluation of the need for additional source control and/or structural BMPs, any proposed pilot studies, etc.;

0243

R0065479

b. Changes in land use and/or population including map updates; and

c. Any significant changes to the storm drain systems, outfalls, detention or retention basins or dams, and other controls, including map updates of the storm drain systems.

19. This Order may be modified, revoked or reissued prior to its expiration date for the following reasons:

a. To address significant changes in conditions identified in the technical reports required by the Regional Board which were unknown at the time of the issuance of this order;

b. To incorporate applicable requirements of statewide water quality control plans and policies adopted by the State Water Resources Control Board or any amendments to the Basin Plan approved by the Regional Board, the State Board, and, if necessary, by the Office of Administrative Law; or

c. To comply with any applicable requirements, guidelines, or regulations issued or approved under the Clean Water Act, if the requirements, guidelines, or regulations contain different conditions or additional requirements than those included in this order.

20. This order shall serve as a National Pollutant Discharge Elimination System (NPDES) permit pursuant to Section 402 (p) of the Clean Water Act, or amendments thereto, and shall become effective ten days after the date of its adoption provided the Regional Administrator of the U. S. EPA has no objections. If the Regional Administrator objects to its issuance, the permit shall not become effective until such objection is withdrawn.

21. Order No. 90-104 is hereby rescinded.

I, Gerard Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on September 1, 1995.

Gerard J. Thibeault

California Regional Water Quality Control Board
Santa Ana Region

Monitoring and Reporting Program No. 96-47

NPDES NO. CA 8000192
for
THE RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT, THE COUNTY OF RIVERSIDE, AND THE INCORPORATED CITIES OF RIVERSIDE COUNTY WITHIN THE SANTA ANA REGION
AREAWIDE STORM WATER RUNOFF

TENTATIVE

I. GENERAL

1. Revisions of the monitoring and reporting program may be necessary to ensure that the discharger is in compliance with requirements and provisions contained in this order. Revisions may be made by the Executive Officer at any time during the term of this order, and may include a reduction or increase in the number of parameters to be monitored, the frequency of monitoring or the number and size of samples collected.

2. All sample collection, handling, storage, and analyses shall be in accordance with 40 CFR Part 136.

3. The permittees are authorized to complement their monitoring data with data from other sources provided those sources are identical to sources in the Santa Ana Watershed.

4. The permittees shall implement the Consolidated Program for Water Quality Monitoring (submitted as part of the Report of Waste Discharge) until development and implementation of an acceptable watershed monitoring program.

II. OBJECTIVES

The overall goal of this monitoring program is to develop and support an effective watershed management program. The following are the major objectives:

1. To define water quality status, trends, and pollutants of concern.

2. To characterize pollutants and to assess the influence of land use on water quality.

0247

R0065483

VOL 22

3. A description of the monitoring program including:

   a. The number of monitoring stations;
   b. Environmental indicators (e. g., ecosystem, biological, habitat, chemical, sediment, stream health, etc.) chosen for monitoring;
   c. Parameters selected for field screening and for laboratory work; and
   d. Total number of samples to be collected from each station, receiving water and major outfall monitoring, frequency of sampling during dry weather and short or long duration storm events, type of samples (grab, 24-hour composite, etc.), and the type of sampling equipment.

4. A mechanism for analyzing the collected data and interpreting the results including an evaluation of the effectiveness of the management practices, and need for any refinement of the management practices.

5. A description of the responsibilities of all the participants in this program including cost sharing.

IV. REPORTING

1. All progress reports and proposed strategies and plans required by this order shall be signed by the principal permittee and copies shall be submitted to the Executive Officer of the Regional Board under penalty of perjury.

2. The permittees shall submit an **ANNUAL PROGRESS REPORT** to the Executive Officer of the Regional Board and to the Regional Administrator of U. S. EPA, Region 9, no later than September 1, of each year. This progress report may be submitted in a mutually agreed upon electronic format. At a minimum, the annual progress report shall include the following:

   a. A review of the status of program implementation and compliance (or non-compliance) with the schedules contained in this order.

   b. An assessment of the effectiveness of control measures established under the illicit discharge elimination program and the Drainage Area Management Plan. The effectiveness may be measured in terms of how successful the program has been in eliminating illicit/illegal discharges and in reducing pollutant loads in storm water discharges.

0249

R0065484

c. An analysis of the feasibility and usefulness of using structural BMPs based on data collected from the Drainage Water Quality Plan for Lake Mathews and/or other similar programs..

d. An assessment of any storm water management program modifications made to comply with Clean Water Act requirements to reduce the discharge of pollutants to the maximum extent practicable.

3. Co-permittees shall be responsible for the submittal of all required information/materials needed to comply with this Monitoring and Reporting Program in a timely manner to the principal permittee. All such submittals shall be signed by a duly authorized representative of the co-permittee under penalty of perjury.

V. REPORTING SCHEDULE

All reports required by this order shall be submitted to the Executive Officer of the Regional Board in accordance with the following schedule:

ITEM	DUE DATE
Report on Illicit/Illegal Discharges (City of Riverside)	October 30, 1995
Legal Authority Certification	November 30, 1995
Revised Implementation Agreement	March 1, 1996
Enforcement Strategy	March 30, 1996
Municipal Activities Pollution Prevention Strategy	June 6, 1996
Fiscal Analyses Report	September 1 of each year (next report due in 1996)
Annual Report	September 1 of each year (next report due in 1996)

VOL 22

California Regional Water Quality Control Board
Santa Ana Region
2010 Iowa Avenue, Suite 100
Riverside, CA 92507-2409

FACT SHEET

September 1, 1995

ITEM:

SUBJECT: Waste Discharge Requirements for the Riverside County Flood Control & Water Conservation District, the County of Riverside and Incorporated Cities of Riverside County within the Santa Ana Region, Storm Water Runoff Management Program, Riverside County, Order No. 95-47 (NPDES No. CA 8000192)

PROJECT

The attached pages contain information concerning an application for waste discharge requirements and a National Pollutant Discharge Elimination System (NPDES) permit, Order No. 95-47, NPDES No. CA 8000192, which prescribes waste discharge requirements for urban storm water runoff from the cities and the unincorporated areas in Riverside County within the jurisdiction of the Santa Ana Regional Board. On January 3, 1995 the Riverside County Flood Control and Water Conservation District (RCFC&WCD), the County of Riverside, the Cities of Beaumont, Calimesa, Canyon Lake, Corona, Hemet, Lake Elsinore, Moreno Valley, Norco, Perris, Riverside, and San Jacinto (hereinafter collectively referred to as the permittees), submitted NPDES Application No. CA 8000192 for an areawide stormwater permit. The permit application was submitted in accordance with the requirements specified in the previous NPDES permit (Order No. 90-104, NPDES No. CA 8000192) which expired on July 1, 1995. Additionally, the permit application follows guidance provided by staff of the State Water Resources Control Board (State Board) and the Regional Water Quality Control Board (Regional Board).

PROJECT AREA

The permitted area is delineated by the San Bernardino-Riverside County boundary line on the north and northwest, the Orange-Riverside County boundary line on the west, the Santa Ana-San Diego Regional Board boundary line on the south, and the Santa Ana-Colorado River Basin Regional Board boundary line on the east (see Appendix 1). For the following areas/facilities, the permittees may lack legal jurisdiction over storm water discharges into their systems:

- federal lands and state properties, including, but not limited to, military bases, national forests, hospitals, schools, colleges and universities, and highways;
- Native American tribal lands;
- open space and rural (non-urbanized) areas;

0251

- agricultural lands; and
- utilities and special districts.

CLEAN WATER ACT REQUIREMENTS

The Federal Clean Water Act (CWA) allows the United States Environmental Protection Agency (USEPA) to delegate its NPDES permitting authority to states with an approved environmental regulatory program. The State of California is one of the delegated states. The Porter-Cologne Water Quality Control Act (California Water Code) authorizes the State Board, and the nine Regional Boards to regulate and control the discharge of pollutants into waters of the State and tributaries thereto. Section 405 of the Water Quality Act (WQA) of 1987 added Section 402(p) to the CWA. Pursuant to Section 402(p)(4) of the CWA, the USEPA promulgated regulations for stormwater permit applications for stormwater discharges associated with industrial activities and municipal separate storm drain systems serving a population of 100,000 or more. This permit governing municipal stormwater discharges meets both the statutory requirements of Section 402(p) and all requirements applicable to an NPDES permit issued under the issuing authority's discretionary authority in accordance with Section 401(a)(1)(B) of the CWA.

AREAWIDE STORMWATER PERMIT

To regulate and control stormwater discharges from the Riverside County area to the municipal storm drain systems, an areawide approach is essential. The entire storm drain system is not controlled by a single entity; the RCFC&WCD, the County, several Cities, the State Department of Transportation (Caltrans), and the U.S. Army Corps of Engineers, in addition to other smaller entities, manage the systems. In addition to the Cities, the County and the RCFC&WCD, there are a number of other significant contributors of urban stormwater runoff to these storm drain systems. These include: large institutions such as the State university system, schools, hospitals, etc.; federal facilities such as military sites, etc.; State agencies such as Caltrans; water and wastewater management agencies such as Metropolitan Water District, Eastern Municipal Water District and Western Municipal Water District; the National Forest Service and State parks. The Regional Board has issued a separate NPDES permit to Caltrans. In addition, Caltrans and the other contributors identified are not under the jurisdiction of the permittees. The management and control of the entire flood control system cannot be effectively carried out without the cooperation and efforts of all these entities. Also, it would not be meaningful to issue a separate stormwater permit to each of the entities within the permitted area whose land/facilities drain into the storm drain systems operated by the permittees. The Regional Board has concluded that the best management option for the Riverside County area is to issue an areawide stormwater permit to the RCFC&WCD, County of Riverside, and the cities in Riverside County. Stormwater discharges from other state, federal, utility, or special district facilities and state or federal lands will either be added to the Riverside County permit or permitted separately.

VOL 22 02252

Some of the RCFC&WCD storm drain systems discharge into storm drain systems controlled by other entities, such as the Orange County Flood Control District, which is regulated by the Regional Board under NPDES No. CA 8000180. Some areas within Riverside County are within the Colorado River Basin and San Diego Regional Boards' jurisdictions. Permit requirements for storm water runoff from the drainage areas of Riverside County within the jurisdiction of the San Diego and Colorado River Basin Regional Boards are addressed by these Regional Boards.

COORDINATION WITH OTHER REGIONAL AGENCIES

In developing best management practices and monitoring programs, consultation/coordination with other drainage management entities and other Regional Boards is essential. Regional Board staff will coordinate the program with other Regional Boards and other flood control entities/cities on an "as needed" basis. The permit/program process is at the same stage of development in both the Santa Ana and San Diego Regional Board areas of Riverside County. Common programs, reports, implementation schedules and efforts are desirable and will be utilized to the maximum extent practicable.

EXISTING FACILITIES AND PROGRAMS

Within the Santa Ana Region, the RCFC&WCD serves a population of approximately 930,000, occupying an area of approximately 1,360 square miles. The RCFC&WCD's system includes an estimated 200 miles of open and closed storm drains. The storm drain systems operated by the remaining permittees include an estimated 57 miles of open and closed storm drains. Approximately one-quarter (1/4) of Riverside County drains into water bodies within this Regional Board's jurisdiction. Storm water discharges from urbanized areas consist mainly of surface runoff from residential, commercial, and industrial developments. In addition, there are storm water discharges from agricultural land uses, including dairy operations. However, the WQA specifically excludes agricultural discharges from regulation under this program. Storm water runoff from the dairies is regulated under the General Dairy Permit, Order No. 94-7, NPDES No. CA 8000336, and Order No. 94-5, Npdes No. CA 8000279 regulates the discharge of storm water from Caltrans facilities within the Region.

The constituents of concern and significance in storm water discharges are: total suspended solids, biochemical oxygen demand (BOD), chemical oxygen demand (COD), oil and grease (O&G), heavy metals, nutrients and organic chemicals such as base/neutral and acid extractables, pesticides and herbicides, and petroleum hydrocarbon components.

To protect the beneficial uses of waters of the State, the pollutants from all sources need to be controlled. Recognizing this, and the fact that storm water discharges contain pollutants, the permittees and the Regional Board have all agreed that an areawide storm water permit is the most effective way to develop and implement a comprehensive storm water management program in a timely manner. This areawide stormwater permit contains requirements that will allow the permittees to continue to address water quality problems caused by urban storm water runoff

VOL 22
0253

through their management programs to reduce pollutants in storm water discharges to the maximum extent practicable.

PERMIT REQUIREMENTS

In accordance with Section 402(p)(3), as part of a program to reduce the pollutants in storm water discharges to the maximum extent practicable, the permittees have been required to submit existing management plans and programs which are being implemented or developed as per the previous municipal storm water NPDES permit to reduce pollutants in storm water discharges. In addition, the permittees will be required to report, review and/or revise the management programs and control measures in accordance with a time schedule approved by the Executive Officer of the Regional Board.

If existing management programs are not effective in controlling pollutant loading and in achieving the water quality objectives of the receiving waters, additional programs shall be developed and implemented upon consultation and approval of the Executive Officer.

The permit also requires the development and implementation of management programs and/or best management practices (BMPs) during the life of the permit such that the quality of storm water discharged can be improved and the water quality objectives of the receiving waters ultimately can be met. It is also expected that through implementation of these programs and/or BMPs, the beneficial uses of the receiving waters will be protected.

BENEFICIAL USES

Storm water flows which are discharged to municipal storm drain systems in Riverside County are tributary to various water bodies (inland surface streams and lakes and reservoirs) of the Region. The beneficial uses of these water bodies include municipal and domestic supply, agricultural supply, industrial service supply, industrial process supply, groundwater recharge, water contact recreation, non-contact water recreation, warm freshwater habitat, cold freshwater habitat, wildlife habitat, and preservation of rare and endangered species. The ultimate goal of this storm water management program is to protect the beneficial uses of the receiving waters.

ANTIDEGRADATION ANALYSIS

The Regional Board has considered whether a complete antidegradation analysis, pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16, is required for these storm water discharges. The Regional Board finds that the pollutant loading rates to the receiving waters will be reduced with the implementation of the requirements in this order. As a result, the quality of storm water discharges and receiving waters will be improved, thereby protecting the beneficial uses of waters of the United States. This is consistent with the federal and state antidegradation requirements and a complete antidegradation analysis is not necessary.

VOL 22 0254

PUBLIC WORKSHOP

The Regional Board recognizes the significance of Riverside County's Storm Water Protection Program and will conduct, participate, and/or assist with any public hearing/workshop to solicit public input into this process. The details of any such workshop will be published in local newspapers and mailed to interested parties. Persons wishing to be included in the mailing list for any of the items related to this permit may register their name, mailing address and phone number with the Regional Board office at the address given below.

PUBLIC HEARING

The Regional Board will hold a public hearing regarding the proposed waste discharge requirements. The public hearing is scheduled to be held on September 1, 1995, starting at 8:00 a.m. at the City Council Chambers, City of Loma Linda. Further information regarding the conduct and nature of the public hearing concerning these waste discharge requirements may be obtained by writing or visiting the Santa Ana Regional Board office, 2010 Iowa Avenue, Suite 100, Riverside, CA 92507.

WRITTEN COMMENTS

Interested persons are invited to submit written comments on the proposed waste discharge requirements and the Executive Officer's proposed determinations. Comments should be submitted by August 11, 1995 either in person or by mail to:

Pavlova Vitale
California Regional Water Quality Control Board
Santa Ana Region
2010 Iowa Avenue, Suite 100
Riverside, CA 92507

INFORMATION AND COPYING

Persons wishing further information may write to the above address or call Pavlova Vitale at 909/782-4920. Copies of the application, proposed waste discharge requirements, and other documents (other than those which the Executive Officer maintains as confidential) are available at the Regional Board office for inspection and copying by appointment scheduled between the hours of 10:00 a.m. and 4:00 p.m., Monday through Thursday (excluding holidays).

REGISTER OF INTERESTED PERSONS

Any person interested in a particular application or group for applications may leave his name, address and phone number as part of the file for an application. Copies of tentative waste discharge requirements will be mailed to all interested parties.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SANTA ANA REGION

95 JUL 25 PM 1:18

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT
NPDES NO. CA 8000192
AND
WASTE DISCHARGE REQUIREMENTS
ORDER NO. 95-47
FOR
THE RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT, THE COUNTY OF RIVERSIDE, AND THE INCORPORATED CITIES OF RIVERSIDE COUNTY WITHIN THE SANTA ANA REGION
AREAWIDE URBAN STORM WATER RUNOFF

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Board), finds that:

1. On January 3, 1995, the Riverside County Flood Control and Water Conservation District (RCFC&WCD), in cooperation with the County of Riverside, and the incorporated cities of Beaumont, Corona, Calimesa, Canyon Lake, Hemet, Lake Elsinore, Moreno Valley, Norco, Perris, Riverside, and San Jacinto (hereinafter collectively referred to as "permittees"), have jointly submitted a National Pollutant Discharge Elimination System (NPDES) Application No. CA 8000192 to renew their areawide NPDES permit for urban storm water runoff.

2. The 1987 amendments to the Clean Water Act required the United States Environmental Protection Agency (EPA) to develop permitting regulations for storm water discharges from municipal separate storm sewer systems serving a population of 100,000 or more and for storm water discharges associated with industrial activities, including construction sites. The EPA published proposed storm water regulations on December 7, 1988 and promulgated the final regulations on November 16, 1990. Prior to the EPA's promulgation of the final storm water regulations, the three counties (Orange, Riverside, and San Bernardino) and the incorporated cities within the jurisdiction of the Santa Ana Regional Board requested areawide NPDES permits for urban storm water runoff.

3. On July 13, 1990, the Regional Board adopted Order No. 90-104 for urban storm water runoff from urban areas in Riverside County within the Santa Ana Region. Order No. 90-104 expired on July 1, 1995. The Riverside County Flood Control and Water Conservation District was named as the principal permittee and Riverside County and the incorporated cities were named as the co-permittees. In order to more effectively carry out the requirements of this order, the permittees have agreed that the RCFC&WCD will continue as principal permittee and Riverside County and the incorporated cities will continue as co permittees. However, the Regional Board, in exercising its enforcement discretion, will take action only against the individual permittee responsible for specific violations of this order, whenever possible.

VOL 22 0259

R0065494

4. Order No. 90-104 required the permittees to develop and implement a drainage area management plan (DAMP); develop and implement storm water and receiving water monitoring plans; to eliminate illegal and illicit discharges to the storm drain systems; and, to enact the necessary legal authority to effectively prohibit illegal and illicit discharges. The overall goal of these requirements was to reduce pollutant loadings to surface waters from urban runoff to the maximum extent practicable.

5. The Report of Waste Discharge (the permit renewal application) included the following major components:

   a. A map of the drainage area and maps of existing storm drain facilities
   b. A summary of the storm water management program
   c. A Consolidated Program for Water Quality Monitoring
   d. A copy of a Proposed Storm Water/Urban Runoff Management and Discharge Control Ordinance
   e. A copy of the current Implementation Agreement
   f. A copy of each of the Interagency Agreements
   g. The Drainage Area Management Plan (DAMP)
   h. A copy of Proposed Riverside County Grading and Erosion Control Ordinance

   These and other documents submitted as part of the Report of Waste Discharge are hereby made a part of this order.

6. Within the Santa Ana Region, the permittees serve a population of approximately 930,000, occupying an area of approximately 1,360 square miles. The permitted area is shown on Appendix 1. This order regulates storm water runoff from areas under the jurisdiction of the permittees. The term storm water as used in this order includes storm water runoff, snow melt runoff, and surface runoff and drainage. The average annual rainfall in the permitted area ranges from 10 to 12 inches. The permittees have jurisdiction over and/or maintenance responsibility for storm water conveyance systems within Riverside County. The storm drain system includes an estimated 200 miles of open and closed storm drains owned and operated by RCFC&WCD and an estimated 57 miles of open and closed storm drains owned and operated by the remaining permittees. The permittees have identified major outfalls (outfalls with a pipe diameter of 36 inches or greater or drainage areas draining 50 acres or more) and have submitted maps of existing storm drain facilities.

7. Approximately one quarter (1/4) of the entire Riverside County area drains into water bodies within the Santa Ana Region. Most of the urbanized areas of Riverside County lie within this Regional Board's jurisdiction. Storm water runoff from other portions of Riverside County is regulated by the San Diego and Colorado River Basin Regional

VOL 22
02600
R0065495

Boards. The discharges consist of runoff from rainfall, snow melt, and surfacing ground water from various land use areas which either discharge directly to the Santa Ana River or to watercourses tributary to the Santa Ana River. Other major rivers in the area include the San Jacinto River and Temescal Creek. The San Jacinto Mountain areas drain into the San Jacinto River, which discharges into Lake Elsinore. Any overflow from Lake Elsinore is tributary to Temescal Creek, which flows into Reach 3 of the Santa Ana River in the Prado Flood Control Basin.

8. The Santa Ana River Basin is the major watershed within this Region. This watershed is divided into the upper and lower Santa Ana watersheds. The lower Santa Ana River Basin (downstream from Prado Dam) includes the Orange County drainage areas and the Upper Santa Ana River Basin includes the San Bernardino County and the Riverside County drainage areas. The San Bernardino County drainage areas are generally upstream of the Riverside County drainage areas.

9. The three county areas within this Region are regulated under three areawide permits for urban storm water runoff. These areawide NPDES permits are:

   a. Orange County, NPDES No. CA 8000180, Order No. 90-71 (upon renewal Order No. 95-52)

   b. Riverside County, NPDES No. CA 8000192, Order No. 90-104 (upon renewal Order No. 95-47)

   c. San Bernardino County, NPDES No. CA 8000200, Order No. 90-136 (upon renewal Order No. 95-53)

10. Runoff from the San Bernardino County drainage areas is generally conveyed to the Riverside County drainage areas through the Santa Ana River or other drainage channels tributary to the Santa Ana River. These flows are then discharged to Reach 2 of the Santa Ana River through Prado Dam (Reach 3 of the Santa Ana River). Most of the flow in Reach 2 is recharged in Orange County. During wet weather, some of the flow is discharged to the Pacific Ocean through Reach 1 of the Santa Ana River.

11. In addition to the Regional Board, a number of other stakeholders are involved in the management of the water resources of the Region. These include, but are not limited to, the incorporated cities in the Region, publicly owned treatment works, the three counties, and the Santa Ana Watershed Project Authority and its member agencies. The entities listed in Appendix 2 are considered as potential dischargers of storm water to the Riverside County drainage areas. It is expected that these entities will also work cooperatively with the permittees to manage urban runoff. The Regional Board has the

VOL 22
0261
R0065496

discretion and authority to require non-cooperating entities to participate in this areawide permit or to issue individual storm water permits, pursuant to 40 CFR 122.26(a). Cooperation and coordination among all the stakeholders are critical to optimize the use of limited resources and insure economical management of the watershed. Recognizing this fact, this order focusses on watershed management and seeks to integrate the programs of all the stakeholders, especially the three municipal storm water permit holders, within this watershed.

12. The 1989, 1991, and 1994 Water Quality Assessments by the Regional Board identified impairment of a number of water bodies within the permitted area. The beneficial uses of these water bodies are threatened or impaired in part due to urban storm water runoff and non-storm water flows from urbanized areas. Preliminary results from urban storm water monitoring programs within the Region indicate that major pollutants of concern in urban runoff are certain heavy metals, sediment, coliform bacteria, pesticides, and nutrients. Municipal storm water runoff is a source of pollutants to waters of the Region that may be causing or contributing to water quality impairment. It is recognized that instream or end-of-channel treatment of storm water is difficult and expensive. Therefore, it is critical to identify the pollutant sources and to develop management practices necessary to reduce pollutant loading to storm water. The quality of these discharges varies considerably and is affected by land use activities, basin hydrology and geology, season, the frequency and duration of storm events and point source discharges permitted by the Regional Board under individual permits.

13. Studies conducted by the EPA, the states, flood control districts and other entities indicate the following major sources of storm water pollution:

    a. Industrial sites where appropriate pollution control and best management practices (BMPs) are not implemented,

    b. Construction sites where erosion and siltation controls and BMPs are not implemented, and

    c. Urban runoff where the drainage area is not properly managed.

14. To address the industrial and construction sites, the State Water Resources Control Board (State Board) issued two statewide general NPDES permits: one for storm water runoff from industrial sites (NPDES No. CAS000001, General Industrial Activities Storm Water Permit) and the second one for storm water runoff from construction sites (NPDES No. CAS000002, General Construction Activity Storm Water Permit). Most industrial activities (some light industrial activities are exempt) and construction activities on five acres or more are required to get individual NPDES permits for storm water discharges, or get coverage under these statewide general permits by completing and filing a Notice of Intent (NOI) with the State Board.

VOL 22
02662
R0065497

15. In addition, the Regional Board adopted Order No. 94-005, NPDES NO. CA 8000279, for storm water runoff from facilities owned and/or operated by Caltrans, which includes freeways and highways, and Order No. 94-7, NPDES NO. CA 8000336, for concentrated animal feeding operations, including dairies (General Dairy Permit). The Regional Board has issued and continues to issue individual storm water permits for certain industrial facilities within the Region.

16. One of the major components of these statewide permits, the Caltrans permit, and the General Dairy Permit is the requirement for the development and implementation of a storm water pollution prevention plan (SWPPP) for each facility.

17. The Regional Board is the enforcing authority for the two statewide general permits. However, in most cases, the industrial and construction sites discharge directly into storm drains and/or flood control facilities owned and operated by the permittees. These industrial and construction sites are also regulated under local laws and regulations. Therefore, a coordinated effort between the permittees and the Regional Board is critical to avoid duplicative storm water regulatory activities. A memorandum of understanding between the permittees and the Regional Board may be appropriate to efficiently implement the storm water regulations for industries and construction sites at the local level.

18. The permittees generally conduct inspections of industrial and commercial facilities and construction sites within their jurisdiction. The permittees have established a subcommittee to develop an enforcement/compliance strategy for industrial and commercial facilities and construction sites. The permittees have agreed to notify Regional Board staff of industrial and construction facilities which are not in compliance with the storm water regulations.

19. The permittees have agreed not to issue grading and/or building permits without proof of compliance for projects subject to the General Permit for Storm Water Discharges Associated with Construction Activity.

20. The permittees own/operate facilities where industrial or related activities take place that may have an impact on storm water quality. Some of the permittees also enter into contracts with outside parties to carry out activities that may also have an impact on storm water quality. These facilities and related activities include, but are not limited to, street sweeping, catch basin cleaning, maintenance yards, vehicle and equipment maintenance areas, waste transfer stations, corporation and storage yards, parks and recreational facilities, landscape and swimming pool maintenance activities, storm drain system maintenance activities and the application of herbicides, algaecides and pesticides. As part of this order, the permittees are required to assess all of the public agency related

VOL 22
02263
R0065498

activities and facilities for potential impact to storm water quality and develop and implement best management practices to reduce pollutant discharges from these activities/facilities. Non-storm water discharges from these facilities and/or activities also affect water quality. This order prohibits non-storm water discharges from public facilities unless the discharges are exempt under Section III., Discharge Limitations, 3 of this order or are permitted by the Regional Board under an individual NPDES permit.

21. The major focus of storm water pollution prevention is the development and implementation of an appropriate drainage area management plan (DAMP) including best management practices (BMPs). The ultimate goal of the urban storm water management program is to attain water quality consistent with the water quality objectives for the receiving waters in order to protect beneficial uses. The permittees developed and submitted a DAMP, which was approved on January 18, 1994.

22. The DAMP is a dynamic document and the permittees have implemented, or are in the process of implementing its various elements. The Regional Board also recognizes other drainage area management plans such as the Drainage Water Quality Plan for Lake Mathews (DWQPLM), which includes structural BMPs for pollution control. The RCFC & WCD and Riverside County are involved in the DWQPLM.

23. There is some contribution of pollutants in urban runoff from privately owned and operated facilities such as residences, businesses and commercial establishments and public and private institutions. Therefore, a successful storm water management plan should include the participation and cooperation of the public, businesses, and institutions. Therefore, the DAMP has a strong emphasis on public education.

24. The DAMP included 34 BMPs and a time schedule for implementation. These BMPs are organized into two components: BMPs for existing facilities and BMPs for new development. Both components include regulatory activities, public education programs and operations and maintenance activities.

25. In order to characterize storm water discharges, to identify problem areas, and to determine the effectiveness of the various BMPs, an effective monitoring program is critical. From 1990 through 1995, the principal permittee administered the monitoring program for the permittees which included storm water monitoring, receiving water monitoring, dry weather monitoring and sediment monitoring. The Report of Waste Discharge included a Consolidated Program for Water Quality Monitoring.

VOL 22
0264
R0065499

26. In order to make the best use of limited resources of all the permittees (including other municipal permittees in San Bernardino and Orange Counties), and to derive maximum benefit from the storm water management programs, future programs should focus on a watershed approach. An integrated management program may be developed with the cooperation of all the stakeholders, including the permittees in the three counties, and the Regional Board.

27. The permittees have agreed to revise the implementation agreement that was developed in 1990 as required under Order No. 90-104 to coordinate the activities of the principal and co-permittees.

28. Illegal dumping and illicit/illegal connections and discharges to the storm drains are major contributors to storm water and other surface water contamination. Except for the City of Riverside, all the permittees have completed a reconnaissance survey of the municipal storm drain systems (open channels and underground storm drains). The permittees are required to detect, identify and eliminate illicit/illegal discharges. Additionally, the permittees are required to develop a program to prevent any future illegal/illicit connections to their storm drains and flood control facilities.

29. This order requires the permittees to continue to implement the BMPs listed in the DAMP and to effectively prohibit illegal and illicit discharges to the storm drain system. One of the major elements of the DAMP, the Storm Water/Urban Runoff Management and Discharge Controls Ordinance, was adopted by Riverside County on May 9, 1995. The purpose of this ordinance is to reduce pollutant discharges in storm water, and to regulate illicit connections and non-storm water discharges to the storm drain system.

30. Early identification of potential storm water impacts and mitigation measures can significantly reduce storm water pollution problems. The permittees should consider these impacts and appropriate mitigation measures in the development of General Plans, in the California Environmental Quality Act (CEQA) review process for specific projects, Master Plans, etc.

31. Successful implementation of the provisions and limitations in this order will require the cooperation of all the public agency organizations within Riverside County having programs/activities that have an impact on storm water quality (e.g., Fire Department, Department of Environmental Health, Planning Department, Building and Safety, Code Enforcement, etc.). As such, these organizations are expected to actively participate in implementing this areawide storm water program.

VOL 22

0265

R0065500

VOL 22

32. The permittees may lack legal jurisdiction over storm water discharges into their systems from some of the State and federal facilities, agricultural land, utilities and special districts, and Native American tribal lands. The Regional Board recognizes that the permittees should not be held responsible for such facilities and/or discharges.

33. The permittees may petition the Regional Board to issue a NPDES permit to any discharger of non-storm water into storm drain systems that the permittees own or operate.

34. A revised Water Quality Control Plan (Basin Plan) was adopted by the Regional Board and became effective on January 24, 1995. The Basin Plan contains water quality objectives and beneficial uses for water bodies in the Santa Ana Region.

35. The requirements contained in this order are necessary to implement the Basin Plan.

36. In accordance with the Clean Water Act and its implementing regulations, this order requires the permittees to develop and implement programs and policies necessary to control the discharge of pollutants to waters of the United States to the maximum extent practicable.

37. Numeric and narrative water quality objectives are contained in the Basin Plan for the water bodies in this Region. This order does not contain numeric effluent limitations for any constituents because the impact of the storm water discharges on the water quality of the receiving waters has not yet been fully determined. Extensive water quality monitoring and analysis of the data are essential to make that determination. Due to the high cost associated with monitoring, and due to the variability that exists in the current storm water monitoring efforts being conducted by the permittees and other municipal permittees in Orange and San Bernardino Counties under their municipal storm water permits, a tri-county monitoring program to develop and implement effective monitoring procedures and strategies will be considered.

38. The storm water regulations require public participation in the storm water management program development and implementation. As such the permittees are required to solicit and consider all comments received from the public and submit copies of the comments to the Executive Officer of the Regional Board. In considering the public comments, the permittees may modify reports, plans, or schedules prior to submittal to the Regional Board.

0266

R0065501

39. In accordance with California Water Code Section 13389, the issuance of waste discharge requirements for this discharge is exempt from those provisions of the California Environmental Quality Act contained in Chapter 3 (commencing with Section 21100), Division 13 of the Public Resources Code.

40. The Regional Board has considered anti-degradation requirements, pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16, for this discharge. The Regional Board finds that the storm water discharges are consistent with the federal and state anti-degradation requirements and a complete anti-degradation analysis is not necessary.

41. The Regional Board has notified the permittees and interested parties of its intent to issue waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

42. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

IT IS HEREBY ORDERED that the permittees, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and the regulations and guidelines adopted thereunder, shall comply with the following:

I. RESPONSIBILITIES OF THE PRINCIPAL PERMITTEE

The principal permittee shall be responsible for managing the overall storm water program and shall:

1. Conduct water quality and hydrographic monitoring of the municipal separate storm drain system outfalls as agreed upon by the Executive Officer of the Regional Board.

2. Develop uniform criteria for inspections of the municipal separate storm drain systems.

3. Conduct inspections of the storm drain systems owned and operated by the RCFC&WCD.

4. Implement management programs, monitoring programs, and related plans as required by this order.

VOL 22

0267

R0065502

5. Enact and revise policies and ordinances necessary to establish and maintain adequate legal authority within the scope of the Riverside County Flood Control and Water Conservation District Act, as required by the Federal Storm Water Regulations, 40CFR, Part 122.26(d)(2)(i).

6. Respond and/or arrange for responding to emergency situations such as accidental spills, leaks, illicit discharges/illegal connections, etc., to prevent or reduce the discharge of pollutants to the municipal separate storm drain systems and to waters of the United States.

7. Prepare and submit to the Executive Officer of the Regional Board, unified reports, plans, and programs necessary to comply with this order.

The activities of the principal permittee should include, but not be limited to, the following:

8. Coordinate permit activities and participate in any committees/subcommittees formed to coordinate permit compliance activities.

9. Provide technical and administrative support and inform the co-permittees of the progress of other pertinent municipal programs, pilot projects, research studies, etc.

10. Coordinate the implementation of areawide storm water quality management activities such as monitoring programs, public education, other pollution prevention measures, household hazardous waste collection, etc.

11. Gather and disseminate information on the progress of statewide municipal storm water programs and evaluate the information for potential use in the execution of this order.

12. Monitor the implementation of the plans and programs required by this order and determine their effectiveness in reducing pollutant loadings to surface waters to the maximum extent practicable.

13. Coordinate activities pertaining to implementation of this order with the Regional Board.

14. Solicit and coordinate public input for any major proposed storm water management programs and implementation plans.

VOL 22

02268

R0065503

15. Develop and implement mechanisms, performance standards, etc., to promote uniform and consistent implementation of BMPs among the permittees.

16. In conjunction with the co-permittees, implement the BMPs listed in the approved DAMP.

II. RESPONSIBILITIES OF THE CO-PERMITTEES

Each co-permittee shall be responsible for managing the storm water program within its jurisdiction and shall:

1. Adopt the Grading and Erosion Control Ordinance or its equivalent, within 120 days of adoption of this order.

2. Conduct storm drain system inspections in accordance with the uniform criteria developed by the principal permittee.

3. Enact and revise policies and ordinances necessary to establish and maintain adequate legal authority as required by the Federal Storm Water Regulations, 40CFR, Part 122.26(d)(2)(i).

4. Implement management programs, monitoring programs, and related plans as required by this order.

The co-permittees' activities should include, but not be limited to, the following:

5. Administer the storm water and erosion control ordinances adopted pursuant to Item 1., above.

6. Conduct and coordinate with the principal permittee any surveys, monitoring and characterizations needed to identify the pollutant sources and drainage areas.

7. Review and comment on all plans, strategies, management programs, monitoring programs, as developed by the principal permittee or any subcommittee to comply with this order.

8. Participate in any committees or subcommittees formed to address compliance with this order.

9. In conjunction with the principal permittee, implement the BMPs listed in the approved DAMP.

VOL 22
0269
R0065504

10. Share all pertinent information regarding the progress of statewide municipal storm water programs and evaluate any information obtained for potential use in the execution of this order.

11. Participate in the tri-county (Orange, Riverside, and San Bernardino counties) efforts for watershed management.

12. Submit to the principal permittee any information necessary to develop unified report submittals to the Executive Officer of the Regional Board.

13. Prepare and submit any specific reports/information related to the permittees' storm water program as deemed necessary by the Executive Officer of the Regional Board.

14. The City of Riverside shall complete the reconnaissance survey of the City's storm drain systems and eliminate all illegal and/or illicit connections by September 29, 1995. The City shall submit a report of the findings by October 30, 1995.

III. DISCHARGE LIMITATIONS

1. The permittees shall prohibit illicit discharges from entering into the municipal separate storm sewer systems (municipal storm drain systems) and require controls to reduce the discharge of pollutants to the maximum extent practicable.

2. This order authorizes storm water discharges to waters of the State from the permittees' existing municipal separate storm drain systems provided that the permittees implement the BMPs (structural and/or non-structural control measures) necessary to reduce the pollutants in the discharge to the maximum extent practicable. All other discharges are prohibited except those listed under Item 3., below, those for which the Regional Board has issued individual permits, and those discharges which are in accordance with Item 5., below.

3. The following discharges need not be prohibited by the permittees provided that such discharges are identified and appropriate control measures to minimize the adverse impacts of such discharges are developed and implemented.

   a. Discharges composed entirely of storm water;

   b. Discharges covered by an NPDES permit, or for which a written clearance has been issued by the Regional Board office;

VOL 22 0270

R0065505

c. Discharges from potable water line flushing and other potable water sources;

d. Discharges from fire fighting and fire hydrant testing and flushing;

e. Discharges from landscape irrigation, lawn watering and other irrigation activities;

f. Diverted stream flows:

g. Rising ground waters and natural springs;

h. Uncontaminated groundwater infiltration (as defined in 40 CFR 35.2005(20)) and uncontaminated pumped groundwater;

i. Passive foundation drains;

j. Air conditioning condensate;

k. Water from crawl space pumps;

l. Passive footing drains;

m. Discharges from individual residential vehicle washing (not including discharges from mobile sources such as automobile/equipment detailing or washing);

n. Flows from riparian habitats and wetlands;

o. Dechlorinated swimming pool discharges;

p. Waters not otherwise containing wastes as defined in California Water Code Section 13050 (d); and

q. Other types of discharges identified and recommended by the permittees and approved by the Regional Board.

For purposes of this order, a discharge may include storm water and other types of discharges as indicated above.

VOL 22
0271
R0065506

4. The permittees shall take necessary steps as required under Item 1., above, to ensure that non-storm water discharges do not cause or contribute to violations of water quality objectives or discharge pollutants to waters of the United States.

5. Non-storm water discharges from public agency activities into waters of the state are prohibited unless the non-storm water discharges are permitted by an NPDES permit or are included in Item 3., above. If permitting or immediate elimination of the non-storm water discharges is impractical, the permittees shall include in the storm water pollution prevention strategy, required under Section V., Provision 13., of this order, a proposed plan to eliminate the non-storm water discharges.

6. The discharge shall not cause or contribute to degradation of groundwaters.

7. Pollutants in storm water discharges from the municipal separate storm sewer system shall be reduced to the maximum extent practicable.

IV. RECEIVING WATER LIMITATIONS

The discharge shall not cause a violation of any applicable water quality objectives for receiving waters adopted by the Regional Board or the State Water Resources Control Board. If more stringent applicable water quality objectives are promulgated or approved pursuant to Section 303 of the Clean Water Act, or amendments thereto, the Board will revise and modify this order in accordance with such more stringent standards.

V. PROVISIONS

GENERAL

1. Permittees shall demonstrate compliance with all the requirements in this order and specifically with Section III., Discharge Limitations, and Section IV., Receiving Water Limitations, through timely implementation of their approved Drainage Area Management Plan and any approved modifications, revisions, or amendments thereto, which are developed pursuant to this order. The Drainage Area Management Plan is hereby made an enforceable part of this ordrer.

2. Permittees shall implement all elements of the approved DAMP. Any proposed revisions to the DAMP shall be submitted to the Executive Officer of the Regional Board for review and approval. All revisions to the DAMP approved by the Executive Officer shall be implemented in a timely manner.

VOL 22
02712
R0065507

3. The permittees shall comply with Monitoring and Reporting Program No. 95-47, which is hereby made a part of this order, and any revisions thereto. The Executive Officer is authorized to revise the Monitoring and Reporting Program and also to allow the permittees to participate in regional, statewide, national, or other monitoring programs in lieu of Monitoring and Reporting Program No. 95-47.

4. Upon approval by the Executive Officer of the Regional Board, all plans and reports required by this order, including any subsequent amendments, shall be implemented and shall become an enforceable part of this order.

5. The permittees shall report to the Executive Officer of the Regional Board:

   a. Any unusual discharge of storm or wastewaters to facilities owned or operated by the permittees or to any waters of the Region (e.g., discharges due to a levee break, illegal discharges to the street, etc.); if the discharge is to Canyon Lake or any tributary to Canyon Lake, Elsinore Valley Municipal Water District shall also be notified immediately;

   b. Any industrial and/or construction facilities not in compliance with the storm water regulations; and

   c. Any activities on federal, state, or other entity's land or facilities, where the permittees do not have any jurisdiction, and where the activities may be contributing pollutants to waters of the United States.

6. The permittees shall not issue any permits for new businesses and/or construction activities until proof of intent to comply with the State's General Storm Water permits is verified. The proof of compliance may include a letter from the Regional Board office, a copy of the Notice of Intent, etc. The permittees shall coordinate the activities of the various departments/sections within each permittee's jurisdiction to insure consistent implementation of storm water regulations.

IMPLEMENTATION AGREEMENT

7. No later than March 1, 1996, the permittees shall submit to the Executive Officer of the Regional Board an updated copy of an implementation agreement with authorized signatures of each of the permittees. Any subsequent revisions to the implementation agreement shall be forwarded to the Executive Officer of the Regional Board within 30 days of approval by the permittees. At a minimum, the implementation agreement should include all the essential elements of the existing agreement, developed in accordance with Order No. 90-104.

VOL 22

0213

R0065508

VOL 22

LEGAL AUTHORITY

8. The permittees shall adopt the proposed Storm Water/Urban Runoff Management and Discharge Control Ordinance, or its equivalent. No later than November 30, 1995, each permittee shall certify to the Regional Board that it has adequate legal authority to control the discharges of pollutants into the municipal storm drain system and that it has satisfied the requirements of 40 CFR Section 122.26(d)(2)(i). At a minimum, each permittee's certification shall include a statement attesting that the ordinance adopted provides the permittee the legal authority to enforce storm water regulations within its jurisdiction.

ENFORCEMENT/COMPLIANCE STRATEGY

9. Permittees shall develop and implement an enforcement strategy to enforce storm water and erosion control ordinances. This enforcement strategy should include a mechanism to determine compliance of industrial facilities and construction sites, and notification to the Executive Officer of any finding of non-compliance and any proposed local enforcement action. The enforcement/compliance strategy shall be submitted to the Executive Officer of the Regional Board by March 30, 1996.

PUBLIC EDUCATION AND OUTREACH

10. The permittees shall continue to implement the public education efforts already underway and shall implement all of the proposed efforts identified in the Report of Waste Discharge. Any proposed changes shall be submitted to the Executive Officer of the Regional Board for approval.

11. When feasible, the permittees shall participate in joint outreach with other programs including, but not limited to, other municipal storm water programs to ensure that a consistent message on storm water pollution prevention is brought to the public.

12. The permittees shall develop public education materials to encourage the public to report illegal dumping from residential, industrial, construction and commercial sites into public streets, storm drains and other water bodies.

0274

R0065509

VOL 22

0275

MUNICIPAL FACILITIES

13. The permittees shall develop a pollution prevention strategy to address public agency facilities and activities not currently required to obtain coverage under the State's general storm water permits. The pollution prevention strategy shall be developed to ensure that the public agency facilities and/or activities that are currently not required to obtain coverage under the State's general storm water permits are not sources of pollutants into the waters of the United States. The pollution prevention strategy shall be submitted to the Executive Officer of the Regional Board by June 6, 1996 and shall at a minimum include the following:

    a. Identification of all public agency facilities and activities that are potential contributors of pollutants to waters of the United States.

    b. Potential pollutants of concern that are associated with the facilities and/or activities;

    c. Proposed BMPs and a schedule for implementation to ensure that these facilities are not sources of pollutants into the waters of the United States;

    d. A monitoring program to measure the effectiveness of the BMPs;

    e. A schedule for training of public agency staff to ensure proper implementation of the BMPs; and

    f. Identification of any non-storm water discharges from the public agency facilities/activities, frequency of the discharge, characterization of the discharge, volume, flow and duration of the discharge, short term source control BMPs to mitigate the impacts from the discharge, and a schedule for elimination or permitting of the discharge.

NEW DEVELOPMENT (INCLUDING RE-DEVELOPMENT)

14. Within 90 days of the issuance of this order, the permittees shall begin implementation of the new development BMPs (DAMP Supplement A) that were developed pursuant to Order No. 90-104.

R0065510

15. Within 120 days of the issuance of this order, the permittees shall review their General Plan update and CEQA document preparation processes to insure that storm water-related issues are properly considered. If necessary, these processes shall be revised to include requirements for evaluation of storm water-related impacts and identification of appropriate mitigation measures.

16. The permittees shall establish a mechanism to insure proper maintenance and operation of all permanent flood control structures.. For new developments, the parties responsible for the maintenance of the flood control structures and funding sources for maintenance and operation of the facilities shall be identified prior to issuance of grading permits.

FISCAL RESOURCES

17. The permittees shall prepare and submit a unified fiscal analysis report to the Executive Officer of the Regional Board. The fiscal analysis report shall be submitted no later than September first of each year and shall at a minimum include the following:

    a. Each permittee's expenditures for the previous fiscal year;
    b. Each permittee's budget for the current fiscal year;
    c. A description of the source of funds;
    d. A description of contract services (relating to the NPDES program). including the service provided and the amount charged for the service;
    e. A list of staff, type of work, estimated time dedicated to the storm water program and estimated cost; and
    f. Each permittee's estimated budget for the next fiscal year.

PERMIT EXPIRATION AND RENEWAL

18. This order expires on September 1, 2000 and the permittees must file a Report of Waste Discharge (permit application) no later than 180 days in advance of such expiration date as application for issuance of new waste discharge requirements. The Report of Waste Discharge shall, at a minimum, include the following:

    a. Any revisions to the Drainage Area Management Plan including, but not limited to, all the activities the permittees propose to undertake during the next permit term, goals and objectives of such activities, an evaluation of the need for additional source control and/or structural BMPs, any proposed pilot studies, etc.;

VOL 22 0276

R0065511

b. Changes in land use and/or population including map updates; and

c. Any significant changes to the storm drain systems, outfalls, detention or retention basins or dams, and other controls, including map updates of the storm drain systems.

19. This Order may be modified, revoked or reissued prior to its expiration date for the following reasons:

a. To address significant changes in conditions identified in the technical reports required by the Regional Board which were unknown at the time of the issuance of this order;

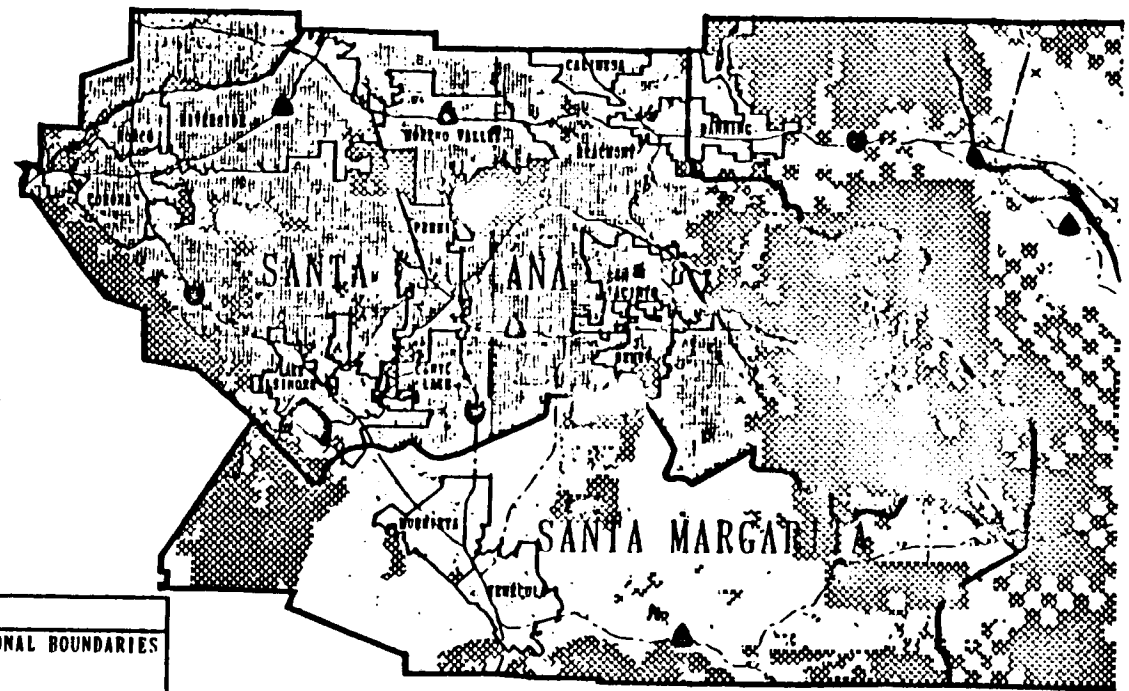
b. To incorporate applicable requirements of statewide water quality control plans and policies adopted by the State Water Resources Control Board or any amendments to the Basin Plan approved by the Regional Board, the State Board, and, if necessary, by the Office of Administrative Law; or

c. To comply with any applicable requirements, guidelines, or regulations issued or approved under the Clean Water Act, if the requirements, guidelines, or regulations contain different conditions or additional requirements than those included in this order.

20. This order shall serve as a National Pollutant Discharge Elimination System (NPDES) permit pursuant to Section 402 (p) of the Clean Water Act, or amendments thereto, and shall become effective ten days after the date of its adoption provided the Regional Administrator of the U. S. EPA has no objections. If the Regional Administrator objects to its issuance, the permit shall not become effective until such objection is withdrawn.

21. Order No. 90-104 is hereby rescinded.

I, Gerard Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on September 1, 1995.



Gerard J. Thibeault

NPDES NO. CA 8000192
for
THE RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT, THE COUNTY OF RIVERSIDE, AND THE INCORPORATED CITIES OF RIVERSIDE COUNTY WITHIN THE SANTA ANA REGION
AREAWIDE STORM WATER RUNOFF

TENTATIVE

I. GENERAL

1. Revisions of the monitoring and reporting program may be necessary to ensure that the discharger is in compliance with requirements and provisions contained in this order. Revisions may be made by the Executive Officer at any time during the term of this order, and may include a reduction or increase in the number of parameters to be monitored, the frequency of monitoring or the number and size of samples collected.

2. All sample collection, handling, storage, and analyses shall be in accordance with 40 CFR Part 136.

3. The permittees are authorized to complement their monitoring data with data from other sources provided those sources are identical to sources in the Santa Ana Watershed.

4. The permittees shall implement the Consolidated Program for Water Quality Monitoring (submitted as part of the Report of Waste Discharge) until development and implementation of an acceptable watershed monitoring program.

II. OBJECTIVES

The overall goal of this monitoring program is to develop and support an effective watershed management program. The following are the major objectives:

1. To define water quality status, trends, and pollutants of concern.

2. To characterize pollutants and to assess the influence of land use on water quality.

VOL 22
0280
R0065515

VOL 22

3. To identify significant water quality problems related to storm water discharges within the watershed.

4. To identify other sources of pollutants in storm water runoff to the extent possible (e.g., atmospheric deposition, contaminated sediments, other nonpoint sources, etc.).

5. To verify and to control illicit discharges.

6. To identify those waters which without additional action to control pollution from storm water discharges cannot reasonably be expected to attain or maintain applicable water quality objectives or the goals and requirements of the Basin Plan.

7. To evaluate the effectiveness of existing management programs, including an estimate of pollutant reductions achieved by the structural and nonstructural BMPs.

8. To evaluate costs and benefits to the stakeholders including the public.

III. MONITORING PROGRAM REQUIREMENTS

The permittees shall develop and submit for the approval of the Executive Officer an integrated watershed monitoring program to achieve the above stated objectives. This program shall be developed in cooperation with the permittees from San Bernardino and Orange counties. The Executive Officer or his/her designated representative(s) shall facilitate the coordination meetings or subcommittees formed to achieve this goal. The development and implementation of the monitoring program shall be in accordance with the time schedule prescribed by the Executive Officer. At a minimum, the program shall include the following:

0281

1. Uniform guidelines for quality control, quality assurance, data collection and data analyses.

2. A mechanism for the collection, analysis and interpretation of existing data from Orange, Riverside, and San Bernardino County monitoring programs. These and other data from local, regional or national sources should be utilized to characterize different storm water sources; to determine pollutant generation, transport and fate; to develop a relationship between land use, development size, storm size and the event mean concentration of pollutants; to determine spatial and temporal variances in storm water quality and seasonal and other bias in the collected data; and to identify any unique features of the Santa Ana Watershed. The permittees are encouraged to use data from similar studies, if available.

R0065516

VOL 22

3. A description of the monitoring program including:

   a. The number of monitoring stations;
   b. Environmental indicators (e. g., ecosystem, biological, habitat, chemical, sediment, stream health, etc.) chosen for monitoring;
   c. Parameters selected for field screening and for laboratory work; and
   d. Total number of samples to be collected from each station, receiving water and major outfall monitoring, frequency of sampling during dry weather and short or long duration storm events, type of samples (grab, 24-hour composite, etc.), and the type of sampling equipment.

4. A mechanism for analyzing the collected data and interpreting the results including an evaluation of the effectiveness of the management practices, and need for any refinement of the management practices.

5. A description of the responsibilities of all the participants in this program including cost sharing.

IV. REPORTING

1. All progress reports and proposed strategies and plans required by this order shall be signed by the principal permittee and copies shall be submitted to the Executive Officer of the Regional Board under penalty of perjury.

2. The permittees shall submit an **ANNUAL PROGRESS REPORT** to the Executive Officer of the Regional Board and to the Regional Administrator of U. S. EPA, Region 9, no later than September 1, of each year. This progress report may be submitted in a mutually agreed upon electronic format. At a minimum, the annual progress report shall include the following:

   a. A review of the status of program implementation and compliance (or non-compliance) with the schedules contained in this order.

   b. An assessment of the effectiveness of control measures established under the illicit discharge elimination program and the Drainage Area Management Plan. The effectiveness may be measured in terms of how successful the program has been in eliminating illicit/illegal discharges and in reducing pollutant loads in storm water discharges.

0282

R0065517

c. An analysis of the feasibility and usefulness of using structural BMPs based on data collected from the Drainage Water Quality Plan for Lake Mathews and/or other similar programs..

d. An assessment of any storm water management program modifications made to comply with Clean Water Act requirements to reduce the discharge of pollutants to the maximum extent practicable.

3. Co-permittees shall be responsible for the submittal of all required information/materials needed to comply with this Monitoring and Reporting Program in a timely manner to the principal permittee. All such submittals shall be signed by a duly authorized representative of the co-permittee under penalty of perjury.

V. REPORTING SCHEDULE

All reports required by this order shall be submitted to the Executive Officer of the Regional Board in accordance with the following schedule:

ITEM	*DUE DATE*
Report on Illicit/Illegal Discharges (City of Riverside)	October 30, 1995
Legal Authority Certification	November 30, 1995
Revised Implementation Agreement	March 1, 1996
Enforcement Strategy	March 30, 1996
Municipal Activities Pollution Prevention Strategy	June 6, 1996
Fiscal Analyses Report	September 1 of each year (next report due in 1996)
Annual Report	September 1 of each year (next report due in 1996)

Ordered by_____
Gerard J. Thibeault

VOL 22

California Regional Water Quality Control Board
Santa Ana Region
2010 Iowa Avenue, Suite 100
Riverside, CA 92507-2409

FACT SHEET

September 1, 1995

ITEM:

SUBJECT: Waste Discharge Requirements for the Riverside County Flood Control & Water Conservation District, the County of Riverside and Incorporated Cities of Riverside County within the Santa Ana Region, Storm Water Runoff Management Program, Riverside County, Order No. 95-47 (NPDES No. CA 8000192)

PROJECT

The attached pages contain information concerning an application for waste discharge requirements and a National Pollutant Discharge Elimination System (NPDES) permit, Order No. 95-47, NPDES No. CA 8000192, which prescribes waste discharge requirements for urban storm water runoff from the cities and the unincorporated areas in Riverside County within the jurisdiction of the Santa Ana Regional Board. On January 3, 1995 the Riverside County Flood Control and Water Conservation District (RCFC&WCD), the County of Riverside, the Cities of Beaumont, Calimesa, Canyon Lake, Corona, Hemet, Lake Elsinore, Moreno Valley, Norco, Perris, Riverside, and San Jacinto (hereinafter collectively referred to as the permittees), submitted NPDES Application No. CA 8000192 for an areawide stormwater permit. The permit application was submitted in accordance with the requirements specified in the previous NPDES permit (Order No. 90-104, NPDES No. CA 8000192) which expired on July 1, 1995. Additionally, the permit application follows guidance provided by staff of the State Water Resources Control Board (State Board) and the Regional Water Quality Control Board (Regional Board).

PROJECT AREA

The permitted area is delineated by the San Bernardino-Riverside County boundary line on the north and northwest, the Orange-Riverside County boundary line on the west, the Santa Ana-San Diego Regional Board boundary line on the south, and the Santa Ana-Colorado River Basin Regional Board boundary line on the east (see Appendix 1). For the following areas/facilities, the permittees may lack legal jurisdiction over storm water discharges into their systems:

- federal lands and state properties, including, but not limited to, military bases, national forests, hospitals, schools, colleges and universities, and highways;
- Native American tribal lands;
- open space and rural (non-urbanized) areas;

0284

- agricultural lands; and
- utilities and special districts.

CLEAN WATER ACT REQUIREMENTS

The Federal Clean Water Act (CWA) allows the United States Environmental Protection Agency (USEPA) to delegate its NPDES permitting authority to states with an approved environmental regulatory program. The State of California is one of the delegated states. The Porter-Cologne Water Quality Control Act (California Water Code) authorizes the State Board, and the nine Regional Boards to regulate and control the discharge of pollutants into waters of the State and tributaries thereto. Section 405 of the Water Quality Act (WQA) of 1987 added Section 402(p) to the CWA. Pursuant to Section 402(p)(4) of the CWA, the USEPA promulgated regulations for stormwater permit applications for stormwater discharges associated with industrial activities and municipal separate storm drain systems serving a population of 100,000 or more. This permit governing municipal stormwater discharges meets both the statutory requirements of Section 402(p) and all requirements applicable to an NPDES permit issued under the issuing authority's discretionary authority in accordance with Section 401(a)(1)(B) of the CWA.

AREAWIDE STORMWATER PERMIT

To regulate and control stormwater discharges from the Riverside County area to the municipal storm drain systems, an areawide approach is essential. The entire storm drain system is not controlled by a single entity; the RCFC&WCD, the County, several Cities, the State Department of Transportation (Caltrans), and the U.S. Army Corps of Engineers, in addition to other smaller entities, manage the systems. In addition to the Cities, the County and the RCFC&WCD, there are a number of other significant contributors of urban stormwater runoff to these storm drain systems. These include: large institutions such as the State university system, schools, hospitals, etc.; federal facilities such as military sites, etc.; State agencies such as Caltrans; water and wastewater management agencies such as Metropolitan Water District, Eastern Municipal Water District and Western Municipal Water District; the National Forest Service and State parks. The Regional Board has issued a separate NPDES permit to Caltrans. In addition, Caltrans and the other contributors identified are not under the jurisdiction of the permittees. The management and control of the entire flood control system cannot be effectively carried out without the cooperation and efforts of all these entities. Also, it would not be meaningful to issue a separate stormwater permit to each of the entities within the permitted area whose land/facilities drain into the storm drain systems operated by the permittees. The Regional Board has concluded that the best management option for the Riverside County area is to issue an areawide stormwater permit to the RCFC&WCD, County of Riverside, and the cities in Riverside County. Stormwater discharges from other state, federal, utility, or special district facilities and state or federal lands will either be added to the Riverside County permit or permitted separately.

VOL 22 0285

Some of the RCFC&WCD storm drain systems discharge into storm drain systems controlled by other entities, such as the Orange County Flood Control District, which is regulated by the Regional Board under NPDES No. CA 8000180. Some areas within Riverside County are within the Colorado River Basin and San Diego Regional Boards' jurisdictions. Permit requirements for storm water runoff from the drainage areas of Riverside County within the jurisdiction of the San Diego and Colorado River Basin Regional Boards are addressed by these Regional Boards.

COORDINATION WITH OTHER REGIONAL AGENCIES

In developing best management practices and monitoring programs, consultation/coordination with other drainage management entities and other Regional Boards is essential. Regional Board staff will coordinate the program with other Regional Boards and other flood control entities/cities on an "as needed" basis. The permit/program process is at the same stage of development in both the Santa Ana and San Diego Regional Board areas of Riverside County. Common programs, reports, implementation schedules and efforts are desirable and will be utilized to the maximum extent practicable.

EXISTING FACILITIES AND PROGRAMS

Within the Santa Ana Region, the RCFC&WCD serves a population of approximately 930,000, occupying an area of approximately 1,360 square miles. The RCFC&WCD's system includes an estimated 200 miles of open and closed storm drains. The storm drain systems operated by the remaining permittees include an estimated 57 miles of open and closed storm drains. Approximately one-quarter (1/4) of Riverside County drains into water bodies within this Regional Board's jurisdiction. Storm water discharges from urbanized areas consist mainly of surface runoff from residential, commercial, and industrial developments. In addition, there are storm water discharges from agricultural land uses, including dairy operations. However, the WQA specifically excludes agricultural discharges from regulation under this program. Storm water runoff from the dairies is regulated under the General Dairy Permit, Order No. 94-7, NPDES No. CA 8000336, and Order No. 94-5, Npdes No. CA 8000279 regulates the discharge of storm water from Caltrans facilities within the Region.

The constituents of concern and significance in storm water discharges are: total suspended solids, biochemical oxygen demand (BOD), chemical oxygen demand (COD), oil and grease (O&G), heavy metals, nutrients and organic chemicals such as base/neutral and acid extractables, pesticides and herbicides, and petroleum hydrocarbon components.

To protect the beneficial uses of waters of the State, the pollutants from all sources need to be controlled. Recognizing this, and the fact that storm water discharges contain pollutants, the permittees and the Regional Board have all agreed that an areawide storm water permit is the most effective way to develop and implement a comprehensive storm water management program in a timely manner. This areawide stormwater permit contains requirements that will allow the permittees to continue to address water quality problems caused by urban storm water runoff

VOL 22
0286
R0065521

through their management programs to reduce pollutants in storm water discharges to the maximum extent practicable.

PERMIT REQUIREMENTS

In accordance with Section 402(p)(3), as part of a program to reduce the pollutants in storm water discharges to the maximum extent practicable, the permittees have been required to submit existing management plans and programs which are being implemented or developed as per the previous municipal storm water NPDES permit to reduce pollutants in storm water discharges. In addition, the permittees will be required to report, review and/or revise the management programs and control measures in accordance with a time schedule approved by the Executive Officer of the Regional Board.

If existing management programs are not effective in controlling pollutant loading and in achieving the water quality objectives of the receiving waters, additional programs shall be developed and implemented upon consultation and approval of the Executive Officer.

The permit also requires the development and implementation of management programs and/or best management practices (BMPs) during the life of the permit such that the quality of storm water discharged can be improved and the water quality objectives of the receiving waters ultimately can be met. It is also expected that through implementation of these programs and/or BMPs, the beneficial uses of the receiving waters will be protected.

BENEFICIAL USES

Storm water flows which are discharged to municipal storm drain systems in Riverside County are tributary to various water bodies (inland surface streams and lakes and reservoirs) of the Region. The beneficial uses of these water bodies include municipal and domestic supply, agricultural supply, industrial service supply, industrial process supply, groundwater recharge, water contact recreation, non-contact water recreation, warm freshwater habitat, cold freshwater habitat, wildlife habitat, and preservation of rare and endangered species. The ultimate goal of this storm water management program is to protect the beneficial uses of the receiving waters.

ANTIDEGRADATION ANALYSIS

The Regional Board has considered whether a complete antidegradation analysis, pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16, is required for these storm water discharges. The Regional Board finds that the pollutant loading rates to the receiving waters will be reduced with the implementation of the requirements in this order. As a result, the quality of storm water discharges and receiving waters will be improved, thereby protecting the beneficial uses of waters of the United States. This is consistent with the federal and state antidegradation requirements and a complete antidegradation analysis is not necessary.

VOL 22 0287

VOL 22

PUBLIC WORKSHOP

The Regional Board recognizes the significance of Riverside County's Storm Water Protection Program and will conduct, participate, and/or assist with any public hearing/workshop to solicit public input into this process. The details of any such workshop will be published in local newspapers and mailed to interested parties. Persons wishing to be included in the mailing list for any of the items related to this permit may register their name, mailing address and phone number with the Regional Board office at the address given below.

PUBLIC HEARING

The Regional Board will hold a public hearing regarding the proposed waste discharge requirements. The public hearing is scheduled to be held on September 1, 1995, starting at 8:00 a.m. at the City Council Chambers, City of Loma Linda. Further information regarding the conduct and nature of the public hearing concerning these waste discharge requirements may be obtained by writing or visiting the Santa Ana Regional Board office, 2010 Iowa Avenue, Suite 100, Riverside, CA 92507.

WRITTEN COMMENTS

Interested persons are invited to submit written comments on the proposed waste discharge requirements and the Executive Officer's proposed determinations. Comments should be submitted by August 11, 1995 either in person or by mail to:

Pavlova Vitale
California Regional Water Quality Control Board
Santa Ana Region
2010 Iowa Avenue, Suite 100
Riverside, CA 92507

0288

INFORMATION AND COPYING

Persons wishing further information may write to the above address or call Pavlova Vitale at 909/782-4920. Copies of the application, proposed waste discharge requirements, and other documents (other than those which the Executive Officer maintains as confidential) are available at the Regional Board office for inspection and copying by appointment scheduled between the hours of 10:00 a.m. and 4:00 p.m., Monday through Thursday (excluding holidays).

REGISTER OF INTERESTED PERSONS

Any person interested in a particular application or group for applications may leave his name, address and phone number as part of the file for an application. Copies of tentative waste discharge requirements will be mailed to all interested parties.

RECOMMENDATION

Adopt Order 95-47, NPDES No. CA 8000192, as presented.

In addition to the permittees, comments were solicited from the following agencies and/or persons:

- U. S. Environmental Protection Agency - Robert Wills/Eugene Bromley, Pretreatment, Sludge, and Storm Water Section
- U. S. Environmental Protection Agency - Terry Oda, Permits Issuance Section
- U. S. Environmental Protection Agency - Kenneth Greenberg, Enforcement Section
- U.S. Army, Los Angeles District, Corps of Engineers - Permits Section

DRAFT

P.N. 8/25/95

Permit No. AZS000003

AUTHORIZATION TO DISCHARGE UNDER THE
NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

In compliance with the provisions of the Federal Water Pollution Control Act, as amended, (33 U.S.C. 1251 et. seq.; the "Act"),

City of Phoenix
200 West Washington Street
Phoenix, Arizona 85003-1611

is authorized to discharge storm water runoff from the municipal separate storm sewer system (MS4) operated by the City of Phoenix to waters of the United States from all MS4 outfalls within the city limits of the City of Phoenix

in accordance with effluent limitations, monitoring requirements and other conditions set forth in Part I, and in the attached 11 pages of EPA Region IX "Standard Federal NPDES Permit Conditions for MS4 Discharges," dated August 15, 1995.

This permit shall become effective on

This permit and the authorization to discharge shall expire at midnight, July 31, 2000.

Signed this day of 1995

For the Regional Administrator

Director, Water Management Division

VOL 22

02992

A. EFFLUENT LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning the effective date of this permit and lasting through the expiration date of this permit, the permittee is authorized to discharge storm water from all outfalls of the permittee's MS4.

2. Storm Water Management Program

The permittee shall control pollutants in storm water discharges to the maximum extent practicable, and to demonstrate compliance with this requirement, the permittee shall implement in its entirety the proposed storm water management program (SWMP) described in the documents listed in Part I.E.12 of this permit. All storm water pollution control measures identified in the SWMP shall be implemented, including existing measures and proposed measures. Proposed control measures shall be implemented in accordance with the implementation schedules provided in the SWMP, with the effective date of the permit serving, at a minimum, as the starting date for the implementation schedule. Existing controls shall be continued throughout the entire term of the permit.

The permittee shall also implement the additional control measures related to the SWMP set forth in Appendix 1 to this permit in the time frame set forth in Appendix 1.

3. Storm Water Monitoring Program

The permittee shall implement the storm water monitoring program described in the document listed in Part I.E.13 of this permit. The time frame for implementation of this program shall be as specified in the storm water monitoring program.

The permittee shall also implement the additional provision of Appendix 1 to this permit related to monitoring activities, in the time frame set forth in Appendix 1.

VOL 22

0293

4. Compliance with Arizona Water Quality Standards.

Will be revised to not preclude WQS from applying

During the term of this permit, no compliance schedules shall be established to require compliance with the water quality standards of the State of Arizona (Arizona Administrative Code, Title 18, Chapter 11, Articles 1 and 2).

B. SOURCE IDENTIFICATION AND INSPECTION PRIORITIZATION

1. The permittee shall maintain and update annually, at a minimum, a list of the following facilities within the jurisdiction of the permittee: municipal landfills (operating and closed); hazardous waste treatment, disposal and recovery facilities; and industrial facilities (from those listed at 40 CFR 122.26(b)(14)) which are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986.

2. The list shall also include other industrial facilities, and non-industrial sources or categories of sources which the permittee believes may discharge significant quantities of pollutants in storm water runoff. In addition, the list shall be prioritized to indicate the individual sources, or categories of sources which the permittee believes are the most significant sources of pollutants.

3. Where the permittee believes that the non-industrial sources identified in Part I.B.2 above may be more significant sources of pollutants than those identified in Part I.B.1, the permittee may inspect such sources as an alternative for inspections of sources which would have otherwise taken place in accordance with the permittee's SWMP.

VOL 22

0294

C. MODIFICATIONS TO THE SWMP AND MONITORING REQUIREMENTS

During the term of this permit, the permittee may propose modifications of the SWMP or the monitoring requirements. The modifications may be proposed with the annual report (Part I.F of this permit), or any time when such modifications are necessary.

Significant modifications (based on the judgment of Region 9 and ADEQ) which are proposed by the City shall follow the procedures of 40 CFR 124. Other modifications shall be considered minor modifications and shall be made following the procedures of 40 CFR 122.63.

Modifications other than those proposed by the City, or those listed as 40 CFR 122.63, shall not be considered minor modifications.

D. ANNUAL REPORT

The permittee shall submit an annual report summarizing the storm water program activities including, at a minimum, the following items:

1. The status of implementing the components of the SWMP required by this permit; at a minimum, the report shall include a description of the status of each program element listed in Table 1 of the fact sheet accompanying this permit, and activities of the permittee during the previous year.
2. Any proposed changes to the SWMP;
3. Any revisions or updates to the assessment of controls and fiscal analysis reported in the permit application;
4. A summary of the data, including monitoring data, that is accumulated throughout the reporting year;
5. Annual expenditures and budget and the year following each annual report;
6. A summary describing the number and nature of enforcement actions, inspections, and public education programs; and
7. Identification of water quality improvement or degradation.

The first report is due on , 1996 and subsequent reports are due on of each year thereafter.

VOL 22

R0065530

E. REQUIREMENTS FOR STATE OF ARIZONA 401 CERTIFICATION

{reserved pending state action}

VOL 22

0296

R0065531

F. DEFINITIONS

(1) Best Management Practices (BMPs) refer to schedules of activities, prohibition of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures, and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

(2) "CWA" means the Clean Water Act (formerly referred to as the Federal Water Pollution Control Act or Federal Water Pollution Control Act Amendments of 1972) Pub. L. 92-500, as amended by Pub. L. 95-217, Pub. L. 95-576, Pub. L. 96-483 and Pub. L. 97-117, 33 U.S.C. 1251 et seq.

(3) "Illicit Discharge" means any discharge to a municipal separate storm sewer system that is not composed entirely of storm water except discharges pursuant to an NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges from fire fighting activities.

(4) "Major Outfall" means a municipal separate storm sewer outfall from a single pipe with an inside diameter of 36 inches or more or its equivalent (discharge from a single conveyance other than circular pipe which is associated with a drainage area of more than 50 acres); or for municipal separate storm sewers that receive storm water from lands zoned for industrial activity (based on comprehensive zoning plans or the equivalent), an outfall that discharges from a single pipe with an inside diameter of 12 inches or more, or from its equivalent (discharge from other than a circular pipe associated with a drainage area of 2 acres or more).

(5) "Municipal Separate Storm Sewer" means a conveyance, or system of conveyances (including roads with drainage systems, municipal streams, catch basins, curbs, gutters, ditches, man-made channels, or storm drains):
(i) owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal or sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized tribal organization, or a designated and approved

VOL 22 0297

management agency under section 208 of the CWA that discharges to water of the United States;
(ii) designed or used for collecting of conveying storm water;
(iii) which is not a combined sewer; and
(iv) which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

(6) "Outfall" means a point source where a municipal separate storm sewer discharges to water of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.

(7) "Permittee" means the City of Phoenix.

(8) "Point Source" means any discernible, confined and discrete conveyance, including but not limited to , any pipe, ditch, channel tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharged.

(9) "Representative Storm" means a storm event of greater than 0.1" of rainfall and at least 72 hours after the previously measurable (greater than 0.1" rainfall) storm event. Where feasible, the variance in the duration of the event and the total rainfall of the event should not exceed 50 percent from the average or median rainfall event in the area.

(10) "Significant sources of pollutants" includes, but is not limited to: discharges which could cause or contribute to violations of water quality standards of the State of Arizona, and discharges which could include releases of oil or hazardous substances in excess of reportable quantities under section 311 of the Clean Water Act (see 40 CFR 110.10 and 40 CFR 117.21) or section 102 of CERCLA (see 40 CFR 302.4).

(11) "Storm water" means storm water runoff, snow melt runoff, and surface runoff and drainage.

VOL 22 0298

VOL 22

(12) The "storm water management program" (SWMP) consists of the following documents:

SWMP identified in section 4.0 of the document entitled "City of Phoenix NPDES Part 2 Permit Application for EPA, dated November 10, 1992, and updated by the following documents:

a) Description of maintenance of drainage facilities in the City of Phoenix found in the letter of May 31, 1994 from the City of Phoenix to Region 9;
b) Description of spill prevention and response procedures in the City of Phoenix found in the letter of May 31, 1994 from the City of Phoenix to Region 9;
c) Description of procedures for controlling exfiltration from the sanitary sewer system into the storm drains in the City of Phoenix found in the letter of May 31, 1994 from the City of Phoenix to Region 9; and
d) Description of BMPs implemented by the City of Phoenix at the City's vehicle maintenance facilities enclosed in letter dated August 11, 1995 from the City of Phoenix to Region 9.

(13) The "storm water monitoring program" consists of the following document:

storm water monitoring program identified in section 3.5 of the document entitled "City of Phoenix Part 2 NPDES Permit Application which was submitted on November 10, 1992.

(14) "Waters of the United States means:
(a) all waters which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which ar subject to the ebb and flow of the tide;
(b) all interstate waters, including interstate "wetlands;"
(c) all other waters such as intrastate lakes, rivers, streams (including intermittent streams, mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:
(1) which are or could be used by interstate or foreign travelers for recreational or other purposes;
(2) from which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or

02999

(3) which are used or could be used for industrial purposes by industries in interstate commerce;
(d) all impoundments of waters otherwise defined as waters of the United States under this definition;
(e) tributaries of waters identified in paragraphs (a) through (d) of this definition;
(f) the territory sea; and
(g) wetlands adjacent to areas (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition.
Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.11(m) which also meet the criteria of this definition) are not waters of the United States. This exclusion applies only to man-made bodies of water which neither were originally created in waters of the United States (such as disposal area in wetlands) nor resulted from the impoundment of waters of the United States.

Appendix 1 - Permit Requirements in Addition to Those Set Forth in the City of Phoenix Part 2 Permit Application

I. Storm Water Management Program Requirements

a) Additional Field Screening Activities for Illicit Connections

The permittee shall implement an ongoing program to re-evaluate major outfalls for illicit discharges. At a minimum, this program shall include rescreening of each major outfall once during the five year term of the permit. Twenty percent of the outfalls shall be screened in each year. The screening procedure shall be as set forth at 40 CFR 122.26(d)(1)(iv)(D).

The permittee shall prohibit non-storm water discharges into the MS4. NPDES permitted discharges are exempt from this prohibition. In addition, the following types of discharges need only be prohibited when the permittee determines that the discharges are a source of pollutants:

water line flushing
landscape irrigation
diverted stream flows
rising ground waters
uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)) to separate storm sewers
uncontaminated pumped ground water
discharges from potable water sources
foundation drains
air conditioning condensate
irrigation water
springs
water from crawl space pumps
footing drains
lawn watering
individual residential car washing
flows from riparian habitats and wetlands
dechlorinated swimming pool discharges
street wash water

Discharges from fire fighting activity shall be prohibited only when the discharges are identified as significant sources of pollutants to waters of the United States.

VOL 22

b) Additional Industrial Facilities to be Addressed Under the Industrial Storm Water Program

The list of industrial facilities to be addressed under the permittee's industrial storm water pollution control program shall also include the following additional facilities which are located within the jurisdiction of the permittee: municipal landfills (operating and closed), and hazardous waste storage, treatment, and recovery facilities.

c) Review of Industrial Storm Water Pollution Prevention Plans (SWPPPs)

As part of the permittee's inspection program for industrial facilities covered by an individual or general NPDES storm water permit, the permittee shall review SWPPPs (if SWPPP preparation is required by the NPDES permit) to assist the permittee in determining the compliance status of the facility with the requirements of relevant local ordinances and permittee's storm water management program. SWPPPs may be reviewed prior to or during inspections. The permittee shall also take appropriate actions to ensure compliance by industrial facilities with local authorities and the permittee's storm water management program.

When the permittee observes significant deficiencies (based on the judgment of the permittee) in the SWPPPs, or their implementation at a particular facility, which the permittee believes would constitute noncompliance with the general or individual NPDES permit, such noncompliance shall be reported to ADEQ and Region 9 unless, in the process of obtaining compliance with the local requirements, the permittee is also successful in obtaining compliance with the general permit. However, it shall not be the responsibility of the permittee to assume responsibility for enforcing the requirements of the general NPDES permit.

d) Review of Construction Site Storm Water Pollution Prevention Plans (SWPPPs)

As part of the permittee's inspection program for construction sites covered by a general or individual storm water NPDES permit, the permittee shall review SWPPPs (if SWPPP preparation is required by the NPDES permit) to assist the permittee in ensuring compliance by construction sites with the objectives of the permittee's storm water management program. SWPPPs may be reviewed prior to or during inspections. The permittee shall also take appropriate actions to ensure compliance with local authorities and the permittee's storm water management program.

0302

R0065537

When the permittee observes significant deficiencies (based on the judgment of the permittee) in the SWPPPs, or their implementation at a particular construction site, which the permittee believes would constitute noncompliance with the general or individual NPDES permit, the permittee shall report such noncompliance to ADEQ and Region 9 unless, in the process of obtaining of compliance with local requirements by the construction site, the permittee is also successful in obtaining compliance with the general NPDES permit. However, it shall not be the responsibility of the permittee to assume responsibility for enforcing the requirements of the general NPDES permit.

II. Monitoring Program Requirement

a) Seasonal Loading Estimates for Infrequently Detected Parameters

The permittee shall submit seasonal loading estimates for each pollutant detected in the permittee's Part 2 monitoring report, but for which the permittee is not conducting additional monitoring during the term of the permit. These estimates shall be submitted concurrently with the seasonal pollutant loadings estimates discussed in section 3.2.3 of the Part 2 application. These additional estimates may be based on NURP data, the monitoring results obtained by the permittee for the Part 2 application or other appropriate data.

FACT SHEET
NPDES PERMIT No. AZS000003

CITY OF PHOENIX MUNICIPAL SEPARATE STORM SEWER SYSTEM

VOL 22 0304

SUMMARY

The City of Phoenix has applied to the U. S. Environmental Protection Agency (EPA), Region 9 for a National Pollutant Discharge Elimination System (NPDES) permit to discharge storm water runoff from the City's municipal separate storm sewer system (MS4). The NPDES storm water permit is required in accordance with the provisions of the 1987 Water Quality Act (WQA) which require an NPDES permit for storm water discharges from MS4s serving a population of 100,000 or more. Final regulations were promulgated by EPA on November 16, 1990 (55 Federal Register 47990) which set forth permit application requirements for municipal storm water dischargers affected by the 1987 WQA.

EPA's permit application regulations require a two-part permit application for MS4s. Part 1 requires the submittal of general information about the MS4, certain discharge characterization data, information concerning sources of pollutants and existing pollution control programs, and the legal authority of the municipality to regulate storm water discharges into the MS4. Part 2 requires additional programmatic information, additional information concerning sources of pollutants, storm water monitoring data, a proposed storm water management program and monitoring program (to be implemented over the term of the permit), and a fiscal analysis.

The 1987 WQA requires that pollutants in storm water discharges from MS4s be controlled to the maximum extent practicable (MEP). The storm water management program (required by Part 2 of the application) is the means by which a municipality complies with the MEP standard. However, EPA recognizes that storm water issues and methods for controlling pollutants vary considerably with climatic and other differences around the country. Therefore, while the regulations set forth the basic requirements of a storm water management program, the regulations also provide flexibility in that municipalities are given an opportunity to propose their own storm water management program.

Region 9 has reviewed the permit application submitted by the City of Phoenix and believes that the City's proposals for the storm water management program, monitoring program and other program elements comply (with certain minor exceptions) with the regulations. Region 9 has prepared and proposes to issue a draft permit based on the application. The draft permit basically requires that the City implement its own proposals which are

VOL 22

discussed in more detail in the application. Appendix 1 of the draft permit sets forth certain additional pollution control measures which Region 9 believes are needed to ensure compliance with the regulations. The draft permit requires that these additional controls be implemented by the City as well as the City's own proposals.

03005

VOL 22

I. BACKGROUND

A. Water Quality Act of 1987

The 1987 Water Quality Act (WQA) amended the Clean Water Act (CWA) by adding section 402(p) which requires that NPDES permits be issued for the following five categories of storm water discharges:

(1) Facilities which have been issued a permit prior to February 4, 1987.

(2) Facilities which discharge storm water associated with industrial activity.

(3) Municipal separate storm sewer systems (MS4s) which serve a population of 250,000 or more (large systems).

(4) MS4s which serve a population of 100,000 or more, but less than 250,000 (medium systems).

(5) Storm water discharges which the Director determines contribute to a violation of a water quality standard or are significant contributors of pollutants to waters of of the United States.

The five categories listed above are generally referred to as Phase I of the storm water program. The program also includes a Phase II, which includes all discharges not included in Phase I. EPA has recently promulgated a final rule which sets forth the Agency's regulatory program for Phase II sources (60 Federal Register 40230, August 7, 1995). The program calls for development of draft permit application regulations for Phase II sources by September 1, 1997, final regulations by March 1, 1999 and submittal of permit applications by specified sources by August 7, 2001. EPA is also committed to a participatory process in which stakeholders would be invited to assist in the development of the new regulations.

The 1987 WQA also clarified that industrial storm water runoff is subject to the BAT/BCT requirements of the CWA and applicable water quality standards. For MS4s, the WQA specifies a new technology-related level of control for pollutants in the discharges - control to the maximum extent practicable (MEP). However, the WQA is silent on the issue of compliance with water quality standards for municipal discharges and this has given rise to the argument that perhaps Congress did not intend for water quality standards to apply. In January, 1991, EPA's Office

0306

VOL 22

of General Counsel reviewed this issue and concluded that the best reading of the CWA is that water quality standards apply to municipal as well as industrial storm water discharges.

B. Water Quality Concerns

The 1987 decision by Congress to require NPDES permitting for the storm water discharges listed above was based a growing awareness of the environmental significance of nonpoint sources of pollutants. For example, EPA's report entitled "National Water Quality Inventory, 1992 Report to Congress" shows that nonpoint sources, including storm water runoff, are the leading cause of existing water quality impairments. The study also shows that approximately one-third of the nation's waterbodies are currently impaired. EPA estimates that storm water runoff itself from urbanized areas and industries is responsible for approximately 30% of existing water quality impairments.

The Nationwide Urban Runoff Program (NURP), which was sponsored by EPA in the years 1978 through 1983, also showed that storm water runoff is a significant source of pollutants (EPA, 1983). The study identified 77 priority toxic pollutants in storm water discharged from residential, commercial and light industrial areas. Of these toxic pollutants, heavy metals such as copper, lead and zinc were detected most frequently and at levels of greatest concern. Nearly half the end-of-pipe storm water samples from the study contained copper at a concentration exceeding EPA's acute toxicity criteria for fresh water.

Although the NURP study investigated urban runoff at 28 locations around the country, none of these locations was in Arizona where many of the receiving waters are ephemeral. As a result, Arizona municipalities have questioned the applicability of the conclusions of the NURP study to Arizona. However, the NURP study itself recognizes that the effects of urban runoff are quite site-specific. For Arizona specifically, the State's 1994 Water Quality Assessment Report (ADEQ, 1994) provides an assessment of the significance of urban runoff discharges in Arizona. The report shows that urban runoff is a contributor of concern to the degradation of Arizona's receiving waters.

C. History of Storm Water Permitting

In amending the CWA to include specific permitting provisions for storm water discharges, Congress was also mindful of the fact that although the NPDES permit program is 20 years old, implementation of the program for storm water discharges has proceeded very slowly and storm water discharges are still

0307

VOL 22

largely unregulated. EPA's first regulations applicable to storm water discharges were promulgated in 1973. These regulations basically exempted all discharges which were not judged to be significant sources of pollutants. This approach was challenged by the Natural Resources Defense Council (NRDC) and in 1975, the U. S. District Court for the District of Columbia ruled that such an exemption was not allowable under the NPDES permit program.

In the years following the District Court ruling, additional regulations applicable to storm water discharges were promulgated or proposed by EPA. However, these regulations prompted additional challenges from dischargers and environmental groups, and little progress has been made in controlling the pollutants in the discharges. Accordingly, to deal with the impasse, the CWA was amended to include specific permitting requirements for storm water discharges.

On November 16, 1990, as a first step in implementing the requirements of the 1987 WQA, EPA promulgated final permit application regulations for storm water discharges from MS4s serving a population of 100,000 or more, and for storm water discharges associated with industrial activity (55 Federal Register 47990).

II . STORM WATER PERMIT APPLICATION REGULATIONS FOR MUNICIPALITIES

A. Definition of a Large or Medium MS4

EPA considered a number of options for defining a large or medium MS4, including systems based on urbanized areas, watersheds, boundaries of cities or counties, and systems owned or operated by cities or counties. The final definition or a large or medium MS4 includes systems which are:

1) located within an incorporated place having a population or 250,000 or more (large systems), or 100,000 or more but less than 250,000 (medium systems);

2) located in counties having unincorporated urbanized areas (as defined by the Census Bureau) with a population of 250,000 or more (large systems), or 100,000 or more but less than 250,000 (medium systems);

3) owned or operated by a municipality other than those identified in (i) or (ii) above, but are designated by

0 3 0 0 8

R0065543

VOL 22

the Director of the NPDES permit program due to physical interconnections with the systems identified in (i) or (ii) above, or are designated for other relevant factors such as the nature of the pollutant loadings or the receiving water;

4) in lieu of defining a system as described in (i), (ii) or (iii) above, the Director may designate as a system any municipal storm sewers located within boundaries of a region defined by a storm water management regional authority. The regional authority and/or its co-applicants must have the necessary authority to comply with permit requirements.

Nationally, there are 173 cities and 47 counties which have the minimum necessary population to be considered large or medium MS4s (based on the 1980 census). In Arizona, the affected cities and counties are Phoenix and Tucson (large systems), and Tempe, Mesa and Pima County (medium systems). In the near future, EPA also plans to permit additional municipalities based on the 1990 census. In Arizona, the additional municipalities to be permitted are the cities of Glendale and Scottsdale.

B. Municipal Storm Water Permit Application Requirements

The storm water permit application regulations require a 2-part application for storm water discharges from large and medium MS4s. Part 1 focuses on existing information such as the current legal authority of the municipality to regulate storm water discharges, existing storm water management practices, existing data on the sources, volume and quality of storm water runoff, and funding mechanisms available to the municipality for the storm water program.

Part 1 also requires a field investigation at up to 500 major outfalls (large systems) or 250 outfalls (medium systems) to detect illicit connections to the storm sewer and evidence of illegal dumping. In addition, Part 1 requires a discharge characterization plan in which the municipality selects five to ten representative major outfalls for sampling and analysis of selected conventional pollutants and EPA's priority toxic pollutants. The sampling results are submitted with Part 2 of the application.

Part 2 of the application also requires additional information concerning sources, funding mechanisms, administrative capabilities and a demonstration of adequate legal authority to control pollutants in municipal discharges. In addition, Part 2

03099

requires the submittal of a storm water management program which is the single most important component of the municipal application. The storm water management program is the discharger's proposal for the MEP level of control of pollutants in the municipality's storm water runoff. By allowing a municipality to propose its own storm water management program, the regulations ensure flexibility and input from municipalities regarding the most appropriate controls for pollutants in storm water at the local level.

There are four key elements in a storm water management program which are: (1) a program to reduce pollutants from commercial and residential areas, (2) a program to control illicit connections and illegal dumping, (3) a program to reduce pollutants in industrial discharges and (4) a program to reduce pollutants in construction site runoff.

Structural and non-structural controls must both be considered in developing the storm water management program. EPA expects that initially the programs will focus on non-structural controls (e.g., public awareness programs, recycling programs, catch basin cleaning, street cleaning, programs to control illegal dumping, and implementation of source controls by major dischargers). However, structural controls (e.g. detention basins, infiltration basins, grassy swales) must also be considered and included in the plan if found to be reasonable. As noted earlier, storm water discharges must comply with water quality standards. If the non-structural controls prove insufficient to meet water quality standards, structural controls or additional non-structural controls may be necessary.

Compliance with water quality standards for municipal storm water discharges could prove to be difficult and costly. A recent study by the American Public Works Association (James M. Montgomery Consulting Engineers, 1992) estimated that the costs could range into the hundreds of billions of dollars nationally if numeric effluent limits based on water quality standards were applied. In view of such results, Arizona's recently adopted water quality standards provide up to 10 years (from February 18, 1992) to achieve compliance for storm water discharges.

C. Municipal Permit Application Deadlines

The permit application deadlines for municipal storm water discharges are summarized below:

VOL 22 0310

	Part 1	Review Period	Part 2
Medium MS4s	May 18, 1992	90 Days	May 17, 1993
Large MS4s	Nov. 18, 1991	90 Days	Nov. 16, 1992

All municipalities in Arizona including the City of Phoenix submitted timely Part 1 and Part 2 applications. The City also provided additional descriptive information concerning the SWMP in letters to Region 9 dated May 31, 1994, and August 11, 1995.

III. PROPOSED MS4 PERMIT FOR THE CITY OF PHOENIX

A. Proposed Storm Water Management Program

As noted above, EPA's permit application regulations require that municipal storm water dischargers propose a storm water management program to control pollutants in storm water discharges in accordance with the MEP standard. However, the regulations do not provide specific numeric criteria which set forth precisely when the MEP level of control has been attained. In this respect, NPDES permits for discharges from an MS4 differ from most other types of discharges commonly regulated through the NDPES permit program. Since numeric criteria are not available, the permitting authority must use a certain amount of judgment in evaluating whether the proposed storm water management program complies with the MEP standard. EPA's manual entitled "Guidance Manual for the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems" ("Guidance Manual") (EPA, 1992) also provides benchmark information from which to evaluate a proposed program.

NPDES regulations at 40 CFR 122.26(d)(2)(iv) set forth the basic required components of a storm water management program. These requirements are summarized in Table 1. In its Part 2 application, the City of Phoenix proposed a storm water management program which addresses most of the requirements of Table 1. Region 9 has reviewed the City's proposal and with the relatively minor exceptions which are discussed below, Region 9 believes that the City's proposal is consistent with the MEP standard.

Region 9 has prepared a supplement to the proposed storm water management program and monitoring program (Appendix 1 to the draft permit) which includes certain additional conditions which we believe are necessary to ensure compliance with MEP for the storm water discharges. The proposed permit requires that the permittee implement the proposed storm water management program, monitoring program and other program elements found in

VOL 22 0311

TABLE 1

SUMMARY OF REQUIREMENTS FOR A STORM WATER MANAGEMENT PROGRAM

(A) Measures to Reduce Pollutants from Residential and Commercial Areas (40 CFR 122.26(d)(iv)(A))

(1) Drainage system maintenance
(2) Controls for new development and significant redevelopment
(3) Maintenance of public streets, road and highways
(4) Flood management projects
(5) Controls for municipal waste facilities
(6) Controls for pesticides, herbicides and fertilizers

(B) Measures to Control Illicit Connections and Illegal Dumping to the Storm Drain (40 CFR 122.26(d)(iv)(B))

(1) Preventing illicit discharges
(2) Ongoing field screening activities
(3) Investigating potential illicit discharges
(4) Spill prevention and response
(5) Public awareness and reporting program
(6) Proper management of used oils and toxics
(7) Controlling exfiltration of sanitary sewage

(C) Measures to Control Pollutants from Municipal Landfills and Industrial Facilities (40 CFR 122.26(d)(iv)(C))

(1) Identifying priorities and implementing controls
(2) Inspections and monitoring

(D) Measures to Control Pollutants from Construction Sites (40 CFR 122.26(d)(iv)(D))

(1) Reviewing construction site plans
(2) Requiring nonstructural and structural BMPs
(3) Site inspections and enforcement
(4) Education of construction site operators

VOL 22 0312

R0065547

VOL 22

the Part 2 permit application, and the additional measures included in Appendix 1. As noted in section II.C, the City's original proposals of November 10, 1992 were also supplemented by several letters to Region 9 from the City. The documents which constitute the SWMP and the monitoring program are listed in Parts I.F.12 and I.F.13 of the draft permit, respectively.

1. Controls for Commercial and Residential Areas

Item A.1 of Table 1 requires a description of the drainage system maintenance activities which the permittee would implement. Region 9 believes that the City's response to the requirements of item A.1 (including the additional information in the letter of May 31, 1994) is adequate to comply with the MEP standard. The original application of November 10, 1992 did not include specific information concerning a program of regular inspection and maintenance of the drainage system to remove miscellaneous debris. Debris such as car bodies and batteries, tires, and miscellaneous wastes and litter could constitute a significant source of pollutants to downstream receiving waters. However, the City's letter of May 31, 1994 did provide information concerning the City's inspection and maintenance program for the drainage system which Region 9 believes is adequate to comply with the MEP standard. The proposed permit includes the inspection and maintenance program as part of the SWMP which would be implemented.

Item A.2 of Table 1 requires that the permittee consider longer term storm water quality impacts associated with new developments and significant redevelopment. The storm water ordinance which was adopted by the City on November 4, 1992 requires that developers submit storm water management plans to the City for new residential, commercial and industrial developments. These plans must include in the design of the projects practicable control measures to reduce storm water pollution after the project is completed. Region 9 believes that the City's procedures will comply with the intent of item A.2.

The City's original responses of November 10, 1992 to item A.3 and A.5 in Table 1 were judged to be adequate with the exception that no BMPs were proposed to reduce pollutants from the City's maintenance and storage yards for road maintenance equipment and waste transportation equipment. The Guidance Manual recommends that municipal permittees consider BMPs for maintenance equipment yards since these yards may be significant sources of pollutants. However, the City's letter of August 11, 1995 describes BMPs which are implemented by the City at its vehicle maintenance facilities. These BMPs were judged to be

0313

R0065548

adequate to comply with the MEP standard and are considered to be part of the SWMP which would be implemented.

Item A.4 of Table 1 requires that storm water quality be factored into the planning of flood control projects. This item also requires a review of existing structural flood control devices for possible retrofit for improved storm water pollution control. The Part 2 permit application notes that the Maricopa County Flood Control District (MCFCD) has primary responsibility for flood control planning in Maricopa County, including within the City of Phoenix. However, the existing flood control structures occur in waters of the United States rather within the storm drain system. As such, these structures are outside the scope of this permit program. In addition, the MCFCD is working on a manual through which storm water quality could be addressed in the planning of future flood control projects. Region 9 believes that for future flood control projects which are not in waters of the United States (if any), the requirements of item A.4 will be adequately addressed via cooperation between the City and the MCFCD.

The City's responses to item A.6 of Table 1 was judged to be adequate to comply with the MEP standard. The City's proposal includes adequate controls and educational programs to address pollution stemming from the use of pesticides, herbicides and fertilizers.

2. Controls for Illicit Connections and Illegal Dumping

The storm water regulations at 40 CFR 122.26(d)(iv)(B) require an ongoing program of various activities related to the prevention of illicit connections and illegal dumping. The City has proposed on ongoing program for locating and eliminating illicit connections which Region 9 believes will generally satisfy the requirements of items B.1, B.2 and B.3 of Table 1. However, the precise scheduling and the number of inspections for illicit discharges was not established. As such, Appendix 1 requires that all major outfalls be rescreened (in accordance with the procedure at 40 CFR 122.26(d)(1)(iv)(D)) at least once during the 5 year term of the permit. Twenty percent of the outfalls would be rescreened during each of the 5 years. Region 9 believes that this schedule is appropriate considering the relatively few instances of illicit discharges which were detected for the Part 1 application. Appendix 1 also clarifies that although the City must address all types of non-storm water discharges to the MS4, certain types of minor discharges which are listed at 40 CFR 122.26(d)(iv)(B)(1) need not be addressed unless the City determines that they are a source of pollutants. Such non-storm water

VOL 22

0314

discharges may be permitted separately by Region 9 in the future, however.

With regards to item B.4 (spill prevention and response), the original application of November 10, 1992 was unclear with regards to the nature of the spill prevention and response activities which are currently being implemented within the City of Phoenix. However, additional clarifying information was submitted by the City with its letter May 31, 1994, and Region 9 believes that the City's program satisfies the requirements of item B.4. This program is considered to be part of the SWMP which would be implemented.

The City has proposed a program to promote public reporting of illicit discharges which Region 9 believes is adequate to addresses item B.5 in Table 1. With regards to item B.6, a broad program for facilitating the proper management of used motor oil and other toxic materials has been initiated in the City of Phoenix and several surrounding communities in response to the requirements of the NPDES permits for the 91st Avenue and 23rd Avenue sewage treatment plants which are operated by the City of Phoenix (NPDES permit Nos AZ0020524 and AZ0020559). We believe that this program adequately satisfies the requirements of item B.6.

With regards to item B.7, the City's application of November 10, 1992 described the City's procedures for preventing future improper connections to the storm sewer system; however, a program was not proposed for regular inspection of the existing sanitary sewer system to detect and control possible seepage into the storm sewer. The City's letter of May 31, 1994 does provide a description of the City's procedures which Region 9 believes to be adequate and are considered part of the SWMP.

The Guidance Manual also includes a recommendation that municipalities investigate malfunctioning septic systems within the permitted area for the possibility that such systems may be contributing pollutants to the MS4. Within Maricopa County, however, this item is addressed by the Maricopa County Health Department and the existing program appears to be adequate.

3. Controls for Municipal Landfills and Industries

EPA's storm water regulations of November 19, 1990 envision a cooperative effort between municipal permittees and NPDES permit authorities regarding the regulation of industrial facilities which discharge storm water associated with industrial activity into an MS4. The Guidance Manual lists the types of

VOL 22 0315

activities which should be included in the municipal program to assist in the implementation of the industrial storm water program. These activities include:

a) identifying priority industrial facilities
b) reviewing storm water pollution prevention plans (SWPPPs) developed by industries
c) requiring implementation of BMPs
d) monitoring and inspection of industrial facilities

The City's application includes a program which generally addresses the above activities. However, Appendix 1 does add the two items discussed below.

First, the storm water regulations at 40 CFR 122.26(b)(2)(iv)(C)(1) specifically require that permittees address the following types of industrial facilities: municipal landfills (operating and closed), hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and other facilities which the permittee believes may be contributing significant quantities of pollutants to the MS4. The City's proposal had only mentioned the SARA 313 facilities and the "other" industrial facilities on its core list of facilities. As such, Appendix 1 clarifies that the municipal landfills (operating and closed) and hazardous waste treatment, disposal and recovery facilities must also be included on the core list.

As discussed below in section III.E, the proposed permit would require that the City also include on the list non-industrial facilities or categories of facilities which the City believes may contribute significant quantities of pollutants to the MS4. The overall list of sources would be prioritized with regards to storm water pollution risks and the City's inspection activities would focus on the sources believed to pose the greatest risks to storm water.

Secondly, reviewing SWPPPs was not specifically mentioned in the application, and Appendix 1 clarifies that SWPPPs must be reviewed by the City as part of the inspection program. SWPPPs are most commonly required by the general NPDES permit for Arizona (NPDES permit No. AZR000000), but may also be required by other general permits or individual permits. In addition to assisting with the implementation of the NPDES permits, review of SWPPPs will also assist the City in assessing compliance with the intent of local ordinances which are much less detailed than the SWPPPs. The City would also be required to report to ADEQ and

VOL 22

0316

VOL 22

Region 9 significant deficiencies (based on the judgment of the City) in the SWPPPs, or their implementation, unless the City is successful in obtaining compliance on its own by a facility. However, it is not the intent of the municipal storm water permit to require the City to assume responsibility for enforcing the general NPDES storm water permit for industries.

4. Controls for Construction Sites

Items D.1 through D.4 of Table 1 require a comprehensive program to control pollutants in storm water discharges from construction sites, including a program for reviewing construction sites plans and requiring appropriate BMPs for erosion and pollution control during construction, inspections and enforcement of municipal policies and regulations, and education of construction site operators. The City has proposed a program which Region 9 believes will largely meet the intent of the regulations. However, as with industrial facilities, review of SWPPPs which are required by the general NPDES permit for construction site runoff in Arizona (NPDES permit No. AZR100000) was not included in the proposal. As such, Appendix 1 to the proposed permit would require that during (or prior to) inspections of construction sites, the City would be required to review the SWPPPs which are required by the general NPDES permit for construction sites, and SWPPPs which may be required by other NPDES permits for construction sites. Region 9 believes that these reviews will assist the City in assessing the compliance of a facility with the objectives of the storm water management program, as well as assisting with the implementation of the NPDES construction site runoff program. However, as noted in section III.C.3 above, it is not the intent of the municipal permit to require the City to assume responsibility for enforcing the general construction storm water permit. It should also be noted that the construction permit only applies to construction sites which disturb 5 or more acres and thus only these sites would be required by develop and implement SWPPPs.

B. Storm Water Monitoring Program

The Part 2 permit application regulations for MS4s require the following items to be submitted (or implemented during the term of the permit) which are related to storm water monitoring:

(1) Storm water monitoring data collected during the permit application phase.
(2) Annual pollutant load estimates.

0311

VOL 22

(3) Development of seasonal pollutant load estimates during the term of the permit for any pollutant detected in any sample collected during the application phase.
(4) Proposed storm water monitoring program to be implemented during the term of the permit.

Region 9 has reviewed the materials submitted pursuant to items (1) and (2) above and we that the City has complied with the requirements of the regulations.

With regards to item (3) above, the City does propose to gather additional data during the term of the permit to develop seasonal load estimates. However, the additional monitoring during the term of the permit would only cover the more commonly detected parameters. The regulations require seasonal load estimates for all pollutants detected during the monitoring required by the Part 2 permit application regulations. Therefore, Appendix 1 of the permit clarifies that seasonal estimates must be provided for all pollutants detected for the Part 2 permit application. NURP data or the Part 2 results could be used for estimating seasonal loads for the parameters which would not be monitored during the term of the permit. The application does not specify precisely when the seasonal estimates would be provided; presumably the estimates would be provided toward the end of the 5-year permit term, which is acceptable since considerable time will be required to acquire the necessary data in the desert environment.

With regards to item (4) above, the City proposes monitoring for 6 sites which would be representative of residential, commercial and industrial land uses. In addition, 2 receiving water locations would be monitored to assess the effects of the discharges on the receiving water. We have reviewed the proposal and believe that it is in accord with the intent of the storm water regulations for monitoring activities to be implemented during the term of the permit.

The City's program would focus on chemical monitoring for the parameters which were detected most frequently in the Part 2 application. However, EPA is also currently evaluating a list of 28 proposed storm water environmental indicators which were developed by the Center for Watershed Protection (EPA, 1995). A broad range of indicators is under consideration including the chemical monitoring which is the focus of the proposal by the City, and other types of indicators such as biological indicators, physical and hydrological indicators, and programmatic indicators.

0318

VOL 22

Part I.C of the draft permit provides that the City may propose modifications to the monitoring program (or storm water management program) during the term of the permit. This provision could be utilized to modify the monitoring requirements of the permit to incorporate (or substitute for existing monitoring activities) selected environmental indicators or measures of success which are under development. The proposed permit would not require the City to use any of the alternate storm water environmental indicators. However, Region 9 would like to encourage the City to consider the use of these indicators and the proposed permit clarifies that the City may propose appropriate modifications during the term of the permit. EPA recently co-sponsored a conference in Crested Butte, CO (ASCE, 1995) to consider storm water monitoring needs and how to obtain the most meaningful results based on limited monitoring dollars. A general conclusion from the conference was that alternate indicators of the types being developed by EPA should be considered when designing storm water monitoring programs.

C. Storm Water Toxicity

Region 9 has recently funded a study (which was conducted by the U.S. Geological Survey) of storm water toxicity in Maricopa County. Although a final report is not yet available, the preliminary results showed that 50% (14 of 28 samples) of the first flush samples were toxic (with toxicity defined as 20% mortality in 100% storm water) and 25% (7 of 28 samples) of the composite samples were toxic. Similar results have been obtained in other areas such as Alameda County, California.

NPDES regulations at 40 CFR 122.44 require effluent limits for discharges with a reasonable potential to cause or contribute to a violation of a water quality standard, including the narrative standards related to toxicity found in Arizona water quality standards. As noted earlier, however, the Arizona standards provide until the year 2002 for compliance for storm water discharges. The proposed permit would expire in the year 2000, prior to the date on which compliance with the standards is required. The Arizona municipalities subject to the storm water program have also pointed out that the test species used in the Maricopa County study (water flea, Ceriodaphnia dubia), and the fathead minnow (Pimaphales promelas) are not indigenous to the receiving waters. As a result, the municipalities question the applicability of the results to Arizona receiving waters. However, EPA's basic policy regarding test species as set forth in the document entitled "Technical Support Document for Water

0319

Quality-based Toxics Control" (EPA, 1991) is to discourage the use of resident species unless required pursuant to state requirements. Current Arizona water quality standards do not provide guidance regarding the particular test species which should be used.

Given the above factors, the proposed permit does not include any specific requirements related to storm water toxicity. However, Region 9 anticipates that additional studies will be conducted during the term of the permit to further investigate storm water toxicity and its implications for Arizona receiving waters. We anticipate that such studies will be conducted in Arizona, or other states such as California where the results may be transferable to Arizona. Funding for such studies could come from section 104(b)(3) of the CWA or from other sources. For example, the CWA reauthorization bill approved by the House of Representatives on May 16, 1995 would provide $20 million annually for 5 years for storm water research, including research directed at identifying the specific pollutants causing impacts in storm water discharges. The Maricopa County study identified the principal class of compounds believed to be responsible for the toxicity as acid/base/neutral organic compounds, with dissolved metals thought to be a secondary source. The specific toxicants were not identified, however.

Region 9 anticipates working with the Arizona municipalities (including the City of Phoenix) regarding the design of additional storm water toxicity studies to be conducted in Arizona. We also anticipate that these studies will eventually yield the type of information necessary for the City to achieve timely compliance with the toxicity requirements of the Arizona water quality standards.

D. Legal Authority

The City's Part 1 permit application indicated that the City already had the necessary legal authority to comply with the requirements of the regulations at 40 CFR 122.26(d)(2)(i). In responding to the City's Part 1 application on February 12, 1992, Region 9 recommended that the City adopt an ordinance specifically directed toward controlling storm sewer system pollution. Such an ordinance was adopted by the City Council on November 4, 1992. We believe that the City has now adequately responded to the requirements of the regulations regarding necessary legal authority. Therefore, the draft permit includes no new provisions related to this matter.

VOL 22 0320

VOL 22

F. Permit Modifications During the Term of the Permit

The proposed permit includes by reference the SWMP and storm water monitoring program which were proposed by the City. However, these programs are quite lengthy and detailed and Region 9 anticipates that modifications of the programs may be necessary during the term of the permit. The annual report requirements (see Section G below) specifically provide an opportunity for the City to propose modifications of the SWMP. The proposed permit provides that minor changes (based on the judgment of Region 9 and ADEQ) will be treated as minor permit modifications under NPDES regulations at 40 CFR 122.62; significant modifications will be made following the procedures at 40 CFR 124.5, which includes public notice of the proposal. Also, all modifications other than those proposed by the City, or those listed at 40 CFR 122.63 would be handled following the procedures at 40 CFR 124.5.

Region 9 recognizes that these procedures would differ from the strict requirements of NPDES regulations. However, we also believe that municipal NPDES storm water permits differ substantially from most other types of NPDES permits and that these alternate procedures are appropriate since a substantial number of changes might occur during the term of the permit (many of which would be minor) and following the procedures at 40 CFR 124.5 for all such changes would not be justified.

G. Annual Reporting

In accordance with NPDES regulations at 40 CFR 122.42(c), the draft permit requires the submittal of an annual report describing the pollutant control and monitoring activities of the permittee during the previous year. The report must include the following information at a minimum:

1. The status of implementing the components of the storm water management program required by the permit. The City must describe its activities undertaken for each component listed in Table 1 for a storm water management program;
2. Any proposed changes to the storm water management program;
3. Any revisions or updates to the assessment of controls and fiscal analysis reported in the permit application;
4. A summary of the data, including monitoring data, that is accumulated throughout the reporting year;
5. Annual expenditures and budget for the year following each annual report;
6. A summary describing the number and nature of enforcement actions, inspections, and public education programs; and

0321

VOL 22

E. Source Identification and Inspection Prioritisation

The proposed permit would require that the City maintain (and update at least annually) a list of the following facilities which are located within the jurisdiction of the permittee: municipal landfills (operating and closed); hazardous waste treatment, disposal and recovery facilities; and industrial facilities (from those listed at 40 CFR 122.26(b)(14)) which are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act (SARA) of 1986, and other industrial facilities which the City believe may be discharging significant quantities of pollutants into the MS4. The storm water regulations at 40 CFR 122.26(d)(2)(iv)(C)(1) require that permittees address runoff from industrial facilities in their SWMPs and focus on these facilities in particular.

The proposed permit would also require the City to include on the list non-industrial sources or categories of sources which the City believes may discharge significant quantities of pollutants. In addition, the proposed permit would require a general assessment by the City regarding the individual facilities, or categories or facilities, which are believed to be the most significant sources of pollutants in storm water runoff.

The City has proposed an industrial storm water control program which would focus on facilities subject to SARA 313 requirements, and "other" industrial facilities which may contribute significant quantities of pollutants. As discussed above in section III.A.3, the permit would require that the City also include landfills, hazardous waste treatment, disposal and recovery facilities. However, the proposed permit provides that where the City believes that non-industrial facilities may be more significant sources of pollutants, the City may inspect such sources as an alternative to the industrial facilities which would have been inspected under the City's SWMP. These requirements will ensure that the City fully consider all major sources of pollutants to the MS4 and prioritize its program in accordance with the risks presented by the particular types of the facilities within its jurisdiction.

The Part 2 application indicates that the City has already developed a significant amount of information concerning industrial facilities in the City. This information concerning pollutant sources will assist the City in implementing the requirements of the storm water management program and reducing pollutants in accordance with the MEP standard.

0322

7. Identification of water quality improvement or degradation.

H. Compliance with Arizona Water Quality Standards

As noted earlier, current water quality standards for the State of Arizona (Arizona Administrative Code, Title 18, Chapter 11, Articles 1 and 2) provide up to 10 years (from February 18, 1992) for storm water discharges to come into compliance with applicable standards. The Arizona municipalities have expressed concern that numeric effluent limits based on water quality standards might be established during the term of the permit since the Arizona standards provide that compliance schedules to establish effluent limitations may be established which would require compliance prior to the full 10 years. However, Region 9 believes that the intent of the standards (and the compliance schedule which is provided) is to provide time for the City to gain experience with storm water quality management and determine the best means of achieving compliance with the standards. We expect that the full 5-year term of the permit is likely to be necessary to gain the necessary experience. Therefore, Part I.A.4 of the proposed permit provides that compliance schedules leading to effluent limitations based on Arizona water quality standards will not be established by Region 9 during the term of the permit.

to be revised to not preclude compliance schedules for WQS

I. Endangered Species Act Requirements

Region 9 reviewed the publications: Endangered and Threatened Species of Arizona, Summer, 1991, Ecological Services Field Office, U.S. Fish and Wildlife Service; and an updated list of "Federally Threatened and Endangered Species of Arizona", July, 1994, to determine whether the discharges authorized by this permit would affect any endangered or threatened species. The review showed that there are no aquatic endangered or threatened species downstream of the area in which the regulated discharges would occur. Since this permit will result in benefits to water quality, the permit should not adversely impact any endangered or threatened species.

A copy of the draft permit and fact sheet were forwarded to the U.S. Fish and Wildlife Service for comment. The U.S. Fish and Wildlife Service was also provided with a representative Part 1 and Part 2 permit application for Arizona (from the City of Tucson). This application provides detailed information which is representative of the activities which would be undertaken by all Arizona municipalities subject to the storm water program, including the City of Phoenix. In addition, the draft permit was placed on public notice for a period of 30 days.

VOL 22

00323

J. Requirements for State of Arizona 401 Certification

Additional permit requirements may be established by the State of Arizona to ensure compliance with all state laws and requirements. Section E of the permit has been reserved to include any such requirements.

K. Standard Conditions

NPDES regulations at 40 CFR 122.41 and 122.42 require the inclusion of certain standard conditions in all NPDES permits. Region 9 normally includes these conditions in all NPDES permits, and we also include certain other basic conditions which set forth additional requirements of the CWA.

However, the City has requested certain modifications or deletions to Region 9's list of standard conditions for clarity and in consideration of the unique nature of storm water discharges. In response to this request, Region 9 has made certain modifications to the standard conditions which we believe are responsive to this request, but do not significantly affect the intent of the standard conditions overall.

IV. EXPIRATION DATE OF PROPOSED PERMIT

The expiration date of the proposed permit is July 31, 2000.

IV. FOR ADDITIONAL INFORMATION

For additional information concerning the proposed permit, please contact either of the following:

NOTICE

TENTATIVE WASTE DISCHARGE REQUIREMENTS FOR SACRAMENTO COUNTY WATER AGENCY CITIES OF SACRAMENTO, FOLSOM, AND GALT AREA-WIDE STORM WATER DISCHARGES FROM MUNICIPAL SEPARATE STORM SEWER SYSTEMS SACRAMENTO COUNTY

TO ALL CONCERNED PERSONS AND AGENCIES:

Any comments or recommendations you may have concerning this tentative order should be submitted to this office by **18 August 1995** in order that consideration may be given them prior to the September meeting of the Regional Board.

Please note that Provisions D.5 and D.6 of this Tentative Order permit the discharge of storm water associated with industrial activities from industrial facilities owned and operated by the Dischargers that are currently regulated by the State of California General Permit for Storm Water Discharges Associated with Construction Activities, and the General Permit for Storm Water Discharges Associated with Industrial Activities. These discharges are not required by the Federal Regulations to be included in a municipal storm water NPDES permit, and are done so in an effort to reduce the number of NPDES permits issued to facilities owned and operated by the Dischargers. These provisions may be removed from the Tentative Order prior to bringing it before the Board for adoption.

If you have any questions, please call Pamela Barksdale at (916) 255-3024.

R0065563

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

ORDER NO. _____

NPDES NO. CA 0082597

WASTE DISCHARGE REQUIREMENTS
FOR

SACRAMENTO COUNTY WATER AGENCY
CITIES OF SACRAMENTO, FOLSOM, AND GALT
AREA-WIDE STORM WATER DISCHARGES
FROM MUNICIPAL SEPARATE STORM SEWER SYSTEMS
SACRAMENTO COUNTY

The California Regional Water Quality Control Board, Central Valley Region (hereafter Board) finds that:

1. The Sacramento County Water Agency, and the cities of Sacramento, Folsom, and Galt (hereafter collectively referred to as Dischargers) have submitted a completed permit application on 3 March 1995, for re-issuance of waste discharge requirements under the National Pollutant Discharge Elimination System (NPDES) to discharge storm water runoff from storm drains and watercourses within the Dischargers' jurisdictions.

2. The Dischargers are currently subject to NPDES area-wide municipal storm water permit, Order No. 90-158 (NPDES No. CA0082597) adopted on 22 June 1990.

3. The Sacramento County Water Agency (hereafter referred to as the County) and the City of Sacramento are defined as large municipalities (with populations greater than 250,000) in Appendices H and F, respectively, of Part 122 of Title 40 of the Federal Code of Regulations (40CFR). As such, the County and the City of Sacramento must obtain an NPDES municipal storm water permit for storm water discharges associated with urbanized areas in their respective jurisdictions.

4. The Cities of Galt and Folsom are urbanized areas with populations less than 100,000. Due to their proximity to the urbanized areas of the County, and the location of their storm sewer system discharges relative to discharges from the County's system, the Cities of Galt and Folsom are designated as part of the large municipal separate storm sewer system (40 CFR 122.26(b)(7)(iii)). Attachment A shows Sacramento County and illustrates the relationship of the co-permittees in Sacramento County.

5. As directed by Section 402(p)(4)(a) of the Federal Clean Water Act (CWA), the United States Environmental Protection Agency (hereafter referred to as U.S. EPA) promulgated regulations addressing NPDES permit application requirements for storm water discharges (hereafter referred to as the regulations) on November 16, 1990. The Dischargers' current NPDES permit for storm water

VOL 22

00329

R0065564

VOL 22

discharges was adopted prior to the promulgation of these regulations. The requirements of the Dischargers' current NPDES permit, and subsequent compliance with the permit requirements by the Dischargers, adequately addressed the regulations.

6. The regulations do not address renewal application requirements for storm water discharges from separate municipal storm sewer systems. Renewal application requirements were established by Board staff, in consultation with U.S.EPA, and the Dischargers, and consisted of the Dischargers submitting the following:

   a. USEPA General Information, Form 1, and the State of California Application for Facility Permit/Waste Discharge, Report of Waste Discharge, Form 200, submitted on 23 November 1994.
   b. Comprehensive Stormwater Management Program submitted on 21 June 1994, which provides a plan, with a schedule, for the development, implementation, and monitoring of best management practices, and other programs and activities required to reduce the discharge of pollutants in storm water discharges to the maximum extent practicable (MEP) during the life of this Order.
   c. Effectiveness Evaluation Report submitted on 3 March 1995, summarizing the effectiveness of the Dischargers' Storm Water Management Program under the current Permit requirements, and provided a plan on how the effectiveness of the storm water program for this Order will be evaluated.

7. The Dischargers have jurisdiction over, and/or maintenance responsibility for certain municipal separate storm drain systems, and/or watercourses in the County. Discharges consist of surface runoff generated from various land uses that discharge into the Sacramento and American Rivers through natural water courses or manmade conveyances. Based on monitoring data collected during the term of the current Order, the Dischargers have initially identified the pollutants of concern in runoff and receiving waters as certain heavy metals, petroleum hydrocarbons, and certain pesticides. The quality of the discharge, and resulting impact it may have on receiving waters, varies, and is affected by hydrology, geology, land use, season, and sequence and duration of rainfall events.

   Over the term of this Order, the Dischargers will continue to develop and refine the list of constituent of concerns through monitoring, or through special studies.

8. The permit application submitted by the Dischargers included a Comprehensive Stormwater Management Program (Program), which describes the framework for management of storm water discharges during the term of this Order. The title page and table of contents of the Program are included in Attachment B of this Order. The Program defines the priorities in development and implementation of best management practices (BMPs), and provides an implementation program which summarizes the major activities to be accomplished during the five-year term of this Order. Specific activities regarding implementation of the Program will be provided by the Dischargers on

0330

VOL 22

an annual basis through submittal of a work plan as part of the Annual Monitoring and Reporting Program.

The Implementation Chapter of the Program consists of the following elements:

a. Construction Site Management Program
b. New Development Management Program
c. Public Education and Awareness Program
d. Industrial Discharge Management Program
e. Illegal Discharge Program
f. Illicit Connection Program
g. Public Agency Program
h. Monitoring Program
i. Intra/Inter Agency Coordination
j. Legal Authority
k. Program Management

9) The Program emphasizes incorporating BMPs into established programs as much as possible in order to maximize the use of existing resources, to minimize the risk of creating redundant and overlapping regulatory programs, and to expedite the implementation of the Program.

10) The permit application included an Effectiveness Evaluation Report. This report summarized the Dischargers' evaluation of the effectiveness of the Program during the current Order, and provided methodologies the Dischargers intend to implement to determine BMP and overall Program effectiveness over the term of this Order. The proposed methodologies are detailed in the Effectiveness Evaluation Plan (EEP). The EEP is designed to gradually increase the level of sophistication used to judge the effectiveness of the Program, and consists of three principle components:

a. Identification and reduction of constituents of concerns (hereafter referred to as COC)
b. Program evaluation
c. Effectiveness evaluation process

Over the course of this Order, the primary methods for evaluation performance standards and estimating water quality improvements will be special studies for structural and non-structural BMPs, sub-watershed pilot studies for COC reduction programs, and statistical methods and water quality models for predicting the effectiveness of the Program.

The title sheet, table of contents and a summary of the EEP schedule are included in Attachment C of this Order.

0331

VOL 22

11. The Program and EEP, and modifications or revisions to the Program and EEP that are approved in accordance with Provision D.7 of this Order, and future year work plans to be submitted in accordance with Monitoring and Reporting Program No. ____ Provision B.3 of this Order, are integral and enforceable components of this Order. Program elements identified in Finding Nos. 8 and 10 that have been found to be deficient have been identified and are addressed as permit requirements provided in Provisions D.2 and D.3 of this Order.

12. Under the current Permit, the roles and responsibilities of the Dischargers are defined in a Memorandum of Understanding (MOU) that was effective through the term of the current permit, and expired on 1 June 1995. Provision D.2.b of this Order directs the Dischargers to complete and submit to the Board a MOU that specifically defines the roles and responsibilities of each co-permittee as they relate to compliance and participation with this Order.

13. Discharges from municipal separate storm sewer systems owned and operated by the Dischargers consist of storm water runoff, and non-storm water discharges which discharge directly, or indirectly, to lakes, water-supply reservoirs, ground waters, rivers, tributary streams and water courses and contiguous water bodies in Sacramento County.

14. The Regulations require NPDES permits for storm water discharges from separate municipal storm drain systems, storm water discharges associated with industrial activity (including construction activities), and designated storm water discharges which are significant contributors of pollutants to waters of the United States. Storm water discharges from separate municipal separate storm sewer systems are subject to MEP discharge standards. Discharges of non-storm water and storm water from industrial activities defined in the Federal Regulations are subject to Best Available Technology Economically Achievable (BAT) and Best Conventional Pollutant Control Technology (BCT) standards.

    This Order regulates both storm water and non-storm water discharges from municipal separate storm sewer systems, and storm water discharges associated with industrial activities (including construction) from industrial facilities, as identified by the Dischargers in accordance with Provisions D.5 and D.6 of this Order, that are owned or operated by the Dischargers.

15. Clean Water Act Section 402(p)(3)(B)(ii) requires that NPDES permits shall require the Dischargers to effectively prohibit non-storm water discharges into storm sewers. The Regulations recognize certain categories of non-storm water discharges that do not need to be prohibited if the discharges have been determined by the Dischargers to not be significant sources of pollutants.

    The State Water Resources Control Board is currently conducting a study of non-storm water discharges. In addition, the Dischargers may, over the term of this Order, conduct studies to determine the threat to water quality for various non-storm water discharges. These studies may

0332

VOL 22

result in additional de minimis categories of non-storm water discharges being identified. Provision D.4.d allows this Order to be amended to include additional de minimis categories of non-storm water discharges.

16. The State Water Resources Control Board (State Board) has issued NPDES General Permits for the regulation of storm water discharges associated with industrial and construction activities. To effectively implement the industrial, new development, and construction elements of the Program, the Dischargers may conduct regulatory activities at industrial or construction sites currently covered by one of the State NPDES General Permits. Under the CWA, the Dischargers cannot enforce the State's NPDES General Permit. However, Board staff intends to work cooperatively with the Dischargers to ensure the industries, businesses, and developers within the Dischargers jurisdiction are not subject to duplicate or overlapping storm water regulatory activities.

17. Federal, state, or regional entities within the Dischargers' boundaries, not currently named in this Order, operate storm drain facilities and/or discharge storm water to the storm drains and watercourses covered by this Order. The Dischargers may lack legal jurisdiction over these entities under the state and federal constitutions. Consequently, the Regional Board recognizes that the Dischargers should not be held responsible for such facilities and/or discharges. The California Department of Transportation (Caltrans) is a state agency that is currently, among others, such an entity. The Regional Board issued a separate storm water permit (Order No. 95-001, NPDES No. CA0083640), to Caltrans in 1995 January, and will consider issuing separate NPDES permits for storm water discharges to other federal, state, or regional entities within the Dischargers' boundaries.

As an alternative to a separate NPDES permit being issued to other federal, state, or regional entities, Provision D.8 allows the Dischargers to request that this Order be amended to allow these entities to be named as co-permittees to this Order.

18. On 6 June 1995, the Dischargers entered into a Memorandum of Understanding (MOU) with Caltrans. This MOU provided agreements and procedures regarding communication, coordination, cooperation, and collaboration between the Dischargers and Caltrans concerning individual or shared activities required to achieve compliance with their respective Board Orders. Attachment D provides a copy of the MOU.

As stated in Finding No. 17, there may be other federal, state or regional agencies, within the Dischargers' boundaries that may be issued separate municipal NPDES permits. Provision D.2.e directs the Dischargers to develop a plan on how they will develop and implement adequate communication, coordination, cooperation, and collaboration with other possible future municipal storm water permittees to ensure timely compliance with this Order.

0333

VOL 22

19. The Board adopted a Water Quality Control Plan, Third Edition, (Basin Plan) which contains water quality objectives for all waters in the Basin. This Order implements the Basin Plan.

20. The beneficial uses of the receiving waters, the Sacramento, American, Consumnes, and Mokelumne Rivers and the Delta are municipal and domestic, industrial, and agricultural supply; water contact and non-contact recreation; aesthetic enjoyment; navigation; ground water recharge; fresh water replenishment; and preservation and enhancement of fish, wildlife and other aquatic resources. Attachment E lists all of the Sacramento area surface waters that could be impacted by storm water discharges.

21. Urban storm water runoff discharges contain pollutants that may lower the quality of receiving waters and impact beneficial uses. Studies indicate there may be increases in pollutant levels and aquatic toxicity in receiving waters as a result of urban storm water discharges.

22. This Order requires evaluation of existing water quality impacts from urban storm water runoff discharges, and the implementation and evaluation of the Program to reduce the discharge of pollutants into storm water runoff to the maximum extent practicable (MEP) for discharges from municipal separate storm sewer systems, and BAT/BCT for discharges from industrial facilities, to improve water quality and protect beneficial uses. Implementation of the Program to reduce pollutant loads from industrial and construction sites, new developments and existing urbanized areas are required as part of this permit. Additionally, this Order requires that the effectiveness of the Program in reducing the discharge of pollutants, attaining water quality objectives and protecting beneficial uses, be evaluated.

23. The permitted discharge is consistent with the anti-degradation provisions of 40CFR 131.12 and the State Board Resolution 68-16.

24. This Order requires implementation of programs (i.e., BMPs) to reduce the level of pollutants in storm water discharges from municipal separate storm sewer systems. However, given the continuing development within the area, it is possible that future degradation in water quality could occur. Any such change in water quality will not unreasonably affect the present and anticipated beneficial use of water and will not result in water quality less than that prescribed in policies of the State Board. The programs required pursuant to this Order constitute the best practicable treatment or control of discharges necessary to assure that a pollution or nuisance will not occur and the highest quality consistent with maximum benefit to people of the State will be maintained.

25. It is not feasible at this time to establish numeric effluent limits for pollutants in storm water discharges from municipal storm sewer systems. Therefore, the effluent limitations in the Order are narrative, and include the requirement to reduce pollutants in storm water discharges to the MEP. This Order requires the implementation of BMPs, identified in the Program, to control and abate the

0334

VOL 22

discharge of pollutants in storm water discharges. Implementation of BMPs, in accordance with the Program and its schedule, the EEP, and any revisions, modifications, and amendments as approved by the Executive Officer or Board, constitutes compliance with MEP requirements, and with requirements to achieve water quality standards.

26. It is not feasible at this time to establish numeric effluent limits for pollutants in non-storm water and storm water discharges from industrial facilities, including construction sites, owned or operated by the Dischargers. Therefore, the effluent limitations in the Order are narrative, and include the requirement to reduce pollutants in storm water discharges through implementation of BAT/BCT technologies. Until such time numeric effluent limits are developed, implementation of BMPs, both structural and nonstructural, constitute compliance with BAT/BCT effluent limitation standards.

27. Section 402(p)(4)(B) of the Clean Water Act (CWA) requires that the dischargers shall be in full compliance with this permit as expeditiously as practicable, but in no event later than three (3) years after the date of issuance of this permit.

28. The Regulations require that the Plan be implemented during the entire duration of the Permit (40CFR 122.26(d)(2)(iv)), which is 5 years. Implementation of the Program, in accordance with its schedule, will result in substantial compliance being achieved within three (3) years.

The Dischargers shall demonstrate substantial compliance with the Program and Permit through the information and data supplied in the Annual Report.

29. The action to adopt an NPDES permit is exempt from the provisions of Chapter 3 of the California Environmental Quality Act (CEQA) (Public Resources Code Section 21100, et seq.), in accordance with Section 13389 of the California Water Code.

30. The Board has notified the Dischargers and interested agencies and persons of its intent to prescribe waste discharge requirements for this discharge and has provided them with an opportunity for a public hearing and an opportunity to submit their written views and recommendations.

31. The Board, in a public meeting, heard and considered all comments pertaining to the discharge.

32. This Order supersedes Order No. 90-158 which is hereby rescinded.

33. This Order shall serve as an NPDES permit pursuant to Section 402 of the CWA, and amendments thereto, and shall take effect upon the date of hearing, provided EPA has no objections.

0335

VOL 22

IT IS HEREBY ORDERED that Order No. 90-158 is rescinded, and that the Dischargers, their agents, successors and assigns, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Waste Act and regulations and guidelines adopted thereunder, shall comply with the following:

A. **Discharge Prohibitions:**

1. The Dischargers shall effectively prohibit discharge of non-storm water through their systems into waters of the United States. The following non-storm water discharges listed as 'a' through 'r' below, do not need to be prohibited provided such sources are identified and the appropriate control measures to minimize the impact of such sources are developed in the Program. However, dischargers of such non-storm water discharges *may* need to obtain NPDES permits:

   a. water line flushing;
   b. landscape irrigation;
   c. diverted stream flows;
   d. rising ground waters;
   e. uncontaminated ground water infiltration [as defined in 40CFR 35.2005(20)] to separate storm sewers;
   f. uncontaminated pumped ground water;
   g. discharges from potable water sources;
   h. foundation drains;
   i. air conditioning condensate;
   j. irrigation water;
   k. springs;
   l. water from crawl space pumps;
   m. footing drains;
   n. lawn watering;
   o. individual residential car washing;
   p. flows from riparian habitats and wetlands;
   q. dechlorinated swimming pool discharges;
   r. discharges or flows from emergency fire fighting activities.

2. NPDES permitted non-storm water discharges are exempt from this prohibition, unless the Dischargers establish legal prohibitions against such discharges into their separate storm sewer systems.

3. List 'a' through 'r' in Discharge Prohibition A.1 may be amended, as approved by the Executive Officer, over the term of this Order in accordance with Provision D.4.d of this Order, to incorporate other de minimis categories of non-storm waters determined as a result of studies conducted by the State and Regional Boards, or Dischargers.

0336

VOL 22

B. Effluent Limitations:

1. The Dischargers shall reduce the discharge of pollutants from municipal sewers to the MEP.

2. The Dischargers shall reduce or eliminate the discharge of pollutants in storm water runoff from industrial and construction activities, as defined in the Federal Code of Regulations, 40CFR Part 122.26(b)(14)(i) through (xi), being conducted at facilities that are owned or operated by the Discharger, through implementation of Best Available Technologies Economically Achievable for toxic and nonconventional pollutants, and Best Conventional Control Technologies for conventional pollutants.

3. The Dischargers shall reduce or eliminate, to the extent feasible, the discharge of pollutants in non-storm water discharges from facilities owned or operated by the Dischargers. Discharges of pollutants in non-storm water discharges that cannot be eliminated shall be reduced or eliminated through implementation of Best Available Technologies Economically Achievable for toxic and nonconventional pollutants, and Best Conventional Control Technologies for conventional pollutants.

C. Receiving Water Limitations:

Receiving Water Limitations are based upon water quality objectives contained in the Basin Plan. As such, they are a required part of this permit. However, a receiving water violation not in conformance with the limitation is not necessarily a violation of this Order. The Board may require an investigation to determine cause and culpability prior to asserting a violation has occurred.

1. Discharges shall not cause the following conditions to create a condition of nuisance or to adversely affect beneficial uses of waters of the State:

   a. Oils, greases, waxes, or other materials to form a visible film or coating on the water surface or on the stream bottom.
   b. Oils, greases, waxes, floating material (liquids, solids, foams, and suds) or suspended material to create a nuisance or adversely affect beneficial uses.
   c. Aesthetically undesirable discoloration.
   d. Fungi, slime, or other objectionable growths.
   e. Deposition of material that causes nuisance or adversely affects beneficial uses.
   f. Toxic pollutants to be present in the water column, sediments, or biota in concentrations that adversely affect beneficial uses; that produce detrimental response in human, plant, animal or aquatic life; or that bioaccumulate in aquatic resources at levels which are harmful to human health.

0337

VOL 22

g. Taste or odor-producing substances to impart undesirable tastes or odors to fish flesh or other edible products of aquatic origin or to cause nuisance or adversely affect beneficial uses.

2. The discharge shall not cause violations of any applicable water quality standard for receiving waters contained in the Basin Plan. If different applicable water quality objectives are adopted after the date of adoption of this Order, the Regional Board may revise and modify this Order, as appropriate.

3. The discharge shall not cause underlying ground water to be degraded.

D. Provisions

1. The Dischargers shall demonstrate compliance with this Order through timely implementation of the Program, EEP, and monitoring program submitted in their application, and any modifications, revisions, or amendments developed pursuant to this Order. Each permittee needs only to comply with all requirements of this Order for storm water discharges from municipal separate storm sewers for which they are operators or owners.

2. **Storm Water Management Plan**

a. The Dischargers shall begin implementing forthwith the Storm Water Management Program as submitted on 21 June 1994, and shall subsequently demonstrate its effectiveness and provide for necessary and appropriate revisions, modifications, and improvements to it as required by Provisions D.7, D.11 and D.12 of this Order. In addition, the Dischargers shall comply forthwith with the following:

i. *Construction Site Management Program (CSMP)*

The goal of the CSMP is to minimize water quality degradation through controlling runoff of sediment and other pollutants in storm water runoff from construction activities being conducted by private developers in the Dischargers' jurisdiction.

The CSMP includes five (5) BMPs (see Attachment F). The CSMP shall be amended or revised to address the following:

1) The Dischargers shall include a BMP for the control and enforcement of all construction activities, including the construction of structures, in addition to sediment and erosion control.

0338

2) The Dischargers shall include educating architects, engineers, contractors, and developers through holding workshops, and distribution of educational material regarding appropriate construction activities management. In particular, construction site inspectors, superintendents, and other appropriate field personnel responsible for implementing all control measures for the developers should be appropriately educated in construction site management measures.
3) The Dischargers shall submit to the Regional Board **quarterly**, a listing of approved development projects, and all developments that have been issued a grading or building permit.
4) The Dischargers shall include provisions for continued training and education of public agency staff to insure all new and continuing staff remain apprised of the storm water management program.

ii. *New Development Management Program (NDMP)*

The goal of the NDMP is to control the discharge of pollutants from new development into the waterways of Sacramento County.

The NDMP includes four (4) BMPs (see Attachment F).

1) The Dischargers shall submit copies of all draft and final documents developed in response to the NDMP for Board staff review and comment.

iii. *Public Education and Awareness Program (PEAP)*

The goal of the PEAP is to enhance the awareness, and educate the community and public agencies and officials in regards to the importance of storm water quality management, and foster community involvement in the storm water program.

The PEAP includes four (4) BMPs (see Attachment F).

1) The Dischargers are to notify Board staff sufficiently in advance of all anticipated public education events.

iv. *Industrial Discharge Management Program (IDMP)*

The goal of the IDMP is to control the discharge of pollutants associated with industrial activity into waterways of Sacramento County.

VOL 22

0339

R0065574

VOL 22

The IDMP includes three (3) BMPs (see Attachment F). The CMP shall be amended or revised to address the following:

1) The Dischargers shall develop clear legal authority to conduct control programs for industries in their respective jurisdictions that the Dischargers determine contribute, or threaten to contribute, significant pollutants to storm sewer systems owned, operated and maintained by the Dischargers. Dischargers shall implement controls over all industrial dischargers determined to be a major contributor, or threatened contributor, of pollutants to storm water runoff, regardless if the industry is regulated by permits issued by the Board, State Water Resources Control Board, or U.S. EPA. The legal authority developed by the Dischargers shall be written such that an industry that complies with the Dischargers' controls will be in compliance with all State or Federal requirements.
2) The Dischargers shall submit draft copies of proposed control programs to Board staff for their review and comment.
3) The Dischargers shall implement industrial control programs as soon as practicably possible, but no later than **January 1, 1997**.

v. *Illegal Discharge Program (IDP)*

The goal of the IDP is to identify and prevent illegal discharges to the storm sewer system, to educate the public and industry on the water quality impacts of illegal discharges, and to promote alternatives to illegal discharges to the storm sewer system.

There are four (4) BMPs included in the IDP (see Attachment F).

1) IDP-1 shall be revised or amended as appropriate to include follow-up reporting provisions for all departments or agencies not directly reporting to the storm water management program that respond to a report of an illegal discharge. Follow-up reporting will provide the storm water management program with a summary of all the activities conducted by the responding department or agency relating to the response, cleanup, enforcement, and other pertinent activities of the illegal discharge.

vi. *Public Agency Program (PAP)*

The goal of the PAP is to address a wide spectrum of activities being conducted by the Dischargers that are a source of pollutants to storm water runoff, or are activities being conducted by the Dischargers that could result in the reduction or elimination of pollutants in storm water discharges.

0340

VOL 22

The PAP includes four (4) BMPs (see Attachment F). The CMP shall be amended or revised to address the following:

i) The Dischargers shall amend the PAP to include appropriate BMPs, in addition to street sweeping, to address runoff from streets and major thoroughfares in their respective jurisdictions.

b. **Storm Water Program Management Activities**

i. The Dischargers shall complete and submit to the Board a Memorandum of Understanding (MOU) no later than **6 months** from the date of adoption of this Order. The MOU should specifically identify management, development, implementation, evaluating, monitoring, reporting, and other activities required to comply with the requirements of this Order. The MOU will specifically identify the roles and responsibilities of each Discharger named as a co-permittee to this Order for the activities identified. A draft of the MOU shall be submitted to Board staff for review and comment prior to its final adoption by the Dischargers.

Any changes, deletions or revisions made to the MOU subsequent to its adoption shall be reported as part of the Annual Report required by Monitoring and Reporting Program No. _____.

c. **Legal Authority**

i. Annually the Dischargers shall review and assess their legal authority to adequately implement the Program. If the Dischargers find their legal authority is not adequate they shall submit a plan, with a schedule, on how they propose to address and change their legal authorities to cause their authority to be adequate to implement the program. Reporting of the Dischargers findings, and plan, if needed, will be submitted as part of the Annual Report required by Monitoring and Reporting Program No. _____.

d. **Fiscal and Staffing Analysis**

i. Annually the Dischargers shall provide a fiscal and staffing analysis. The fiscal analysis will detail the capital, and operation and maintenance expenditures necessary to accomplish the activities of the Program. Such analysis shall include a description of the source(s) of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds. The staffing analysis will detail the equivalent staffing required to accomplish the activities of the Program. The fiscal and

0341

VOL 22

staffing analysis will be submitted as part of the Annual Report required to by the Monitoring and Reporting Program No. ____.

e. **Local Agencies**

i. **Within 6 months** from the adoption of this Order, the Dischargers shall submit a plan to the Regional Board, acceptable to the Executive Officer, that describes communication, coordination, cooperation, and collaboration of the Dischargers' Program, and other pertinent storm water quality activities, with other municipal storm water programs, with the exception of Caltrans', that are not named to this Order. The plan shall include the establishment of agreements or policies with municipalities, flood control department, or districts as necessary, or appropriate.

f. **Intra/Interagency Agreements**

i. The Program proposes to utilize agencies or departments in the jurisdiction of the Dischargers, that may not directly report, or receive direction from the storm water personnel or department, to implement some of the BMPs. Some Program BMPs address the need for intra/interagency agreements, while others do not. The Dischargers shall enter into intra/interagency agreements prior to implementation of all BMPs that would require the use of an agency or department other than that specifically named as the storm water program lead agency or department by each Discharger named to this Order. The agreements must be explicit and formal, and would specify the role and responsibilities of each department or agency in regards to the implementation and enforcement of the BMPs or Program.

3. **Effectiveness Evaluation Plan (EEP)**

a. The Dischargers shall begin implementing forthwith the EEP as submitted on 3 March 1995, and shall subsequently demonstrate its effectiveness and provide for necessary and appropriate revisions, modifications, and improvements to it as required by Provisions D.7, D.11, and D.12 of this Order. In addition, the Dischargers shall comply forthwith with the following:

i. The Dischargers shall conduct an annual audit to determine the applicability and adequacy of the EEP. Based on the audit findings, the Dischargers shall make all revisions, or amendments necessary to the EEP to insure continued applicability and adequacy. The Dischargers may report their audits findings as part of the Annual Report required by Monitoring and Reporting Program No. ____.

0342

VOL 22

ii. The primary emphasis in the Program is on source controls, i.e., education and training. Currently there is little information statewide regarding the effectiveness of source controls. In order to ensure the Dischargers can quantify the effectiveness of such control measures, the Dischargers shall conduct at least two (2) special studies, subject to the Executive Officer approval, over the term of this Order. The studies are to validate the Dischargers selection of source control measures in their Program.

iii. **Within 3 months** from the adoption of this Order, the Dischargers shall submit a detailed work plan, including a schedule, subject to Executive Officer approval, of the special studies that will be conducted by the Dischargers during the first year of this Order. Subsequent special study work plans will be submitted annually as part of the Annual Report required by Monitoring and Reporting Program No. _____.

4. **Non-Storm Water Discharges**

The Dischargers shall identify and describe the categories of non-storm water discharges of the non-prohibited types listed in Discharge Prohibition A of this Order which they wish to exempt from the prohibition. For each category, the Dischargers shall identify and describe as necessary and appropriate the category, and incorporate into the Program, control measures to minimize the adverse impacts of such sources, procedures for notifying the Regional Board of these discharges, and procedures for monitoring and record management.

a. Discharges of non-storm water from sources owned or operated by the Dischargers are authorized and permitted by this Order, if they are in accordance with the conditions of this provision and the Dischargers' Program.
b. The Regional Board may require the dischargers of non-storm water other than the Dischargers, to apply for and obtain coverage under an NPDES permit.
c. The Regional Board may prohibit, or establish additional monitoring and reporting requirements, for any non-storm water discharges identified as a non-prohibited discharge by the Dischargers.
d. The Dischargers may propose, as part of their Annual Report required by Monitoring and Reporting Program No. _____, additional categories of non-storm water discharges, subject to Executive Officer approval, to be included in the exemption to Discharge Prohibition A.

5. **Storm Water Discharges Associated with Construction Activity**

a. Discharges of storm water from construction sites owned or operated by the Dischargers involving the disturbance of five or more acres of total land area, or less if the site is part of a larger common plan of development (40 CFR 122.26 (b)(14)(x)), are currently regulated by the State of California General Permit for Storm Water Dischargers Associated with

0343

VOL 22

Construction Activities. In an effort to reduce the number of NPDES permits issued to the Dischargers, this Provision allows the Dischargers to request that storm water discharges from construction activities at facilities owned and operated by the Dischargers are permitted by this Order, if the following conditions are met:

i. The Dischargers shall establish procedures for notifying the Regional Board of construction activities being conducted by the Dischargers that are to be regulated by this Order.
ii. The Dischargers shall amend their Program which defines construction management BMPs to be implemented at construction sites owned and operated by the Dischargers that are regulated by this Order.
iii. The Dischargers shall develop site specific Storm Water Pollution Prevention Plans pursuant to, and in accordance with Appendix I of this Order, for all construction sites regulated by this Order.
iv. **Annually**, as part of their Annual Report required by Monitoring and Reporting Program No. _____, the Dischargers shall report the effectiveness of the Storm Water Pollution Prevention Plans for each site, and certify the construction sites are in compliance with the requirements of this Order.

b. Construction activities at facilities owned and operated by the Dischargers that the Dischargers do not specify to be covered by this Order, and that are required to be regulated by an NPDES for storm water discharges from construction activities defined in the Federal regulations, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction Activities.

6. **Storm Water Discharges Associated with Industrial Activity**

a. Discharges of storm water from industrial facilities defined in 40CFR 122.26(b)(14)(i) through (ix) and (xi), or as designated by the Regional Board, are currently regulated by the State of California General Permit for Storm Water Dischargers Associated with Industrial Activities. In an effort to reduce the number of NPDES permits issued to the Dischargers, this Provision allows the Dischargers to request that storm water discharges from industrial activities at facilities owned and operated by the Dischargers are permitted by this Order, if the following conditions are met:

i. The Dischargers shall establish procedures for notifying the Regional Board of industrial sites owned or operated by the Dischargers to be permitted by this Order.
ii. The Dischargers shall amend their Program which defines the industrial management BMPs to be implemented at industrial sites owned and operated by the Dischargers.

0344

VOL 22

iii. The Dischargers shall develop site specific Storm Water Pollution Prevention Plans pursuant to, and in accordance with Appendix 2 of this Order, for all industrial sites regulated by this Order.

iv. **Annually**, as part of their Annual Report required by Monitoring and Reporting Program No. _____, the Dischargers shall report the effectiveness of the Storm Water Pollution Prevention Plans for each site, and certify the construction sites are in compliance with the requirements of this Order.

b. Industrial activities at facilities owned and operated by the Dischargers that the Dischargers do not specify to be covered by this Order, and that are required to be regulated by an NPDES for storm water discharges from industrial activities defined in the Federal regulations, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Industrial Activities.

7. It is anticipated that the Program and EEP may be modified, revised or amended from time to time to respond to changed conditions and to incorporate more effective approaches to pollutant control. Requests for changes may be initiated by the Regional Board's Executive Officer or by the Dischargers. Major revisions to the program will be brought before the Regional Board as permit amendments. Minor changes may be made with the Executive Officers' approval, and will be brought to the Board as informational items. Such proposed changes shall be submitted to the Regional Board as technical reports as needed, and shall be reported as part of the Annual Report required by Monitoring and Reporting Program No. _____.

8. At the request of the Dischargers, this Order may be amended to name other municipalities, or federal, state, or regional entities that own or operate separate municipal separate storm sewer systems in Sacramento County, as co-permittees.

9. This Order may be modified, or alternatively, revoked or reissued, prior to the expiration date as follows:

a. to address changed conditions identified in the required technical reports, or other sources deemed significant by the Regional Board;

b. to incorporate applicable requirements of statewide water quality control plans adopted by the State Board or amendments to the Basin Plan; or

c. to comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this

0345

VOL 22

Order. The Order as modified or reissued under this paragraph shall also contain any other requirements of the CWA then applicable.

10. All applications, reports, or information submitted to the Board shall be signed and certified pursuant to signatory requirements specified in 40CFR Part 122.41(k).

11. The Dischargers shall comply with Monitoring and Reporting Program No. ____, which is part of this Order, and any revisions or modifications thereto as ordered by the Executive Officer.

It is anticipated that the monitoring and reporting Program will change as the Program develops and program priorities change. To accommodate such changes, the monitoring program will be subject to review and approval on an annual basis throughout the life of this Order. The Dischargers shall submit a proposed annual monitoring and reporting program for the following year's monitoring period to the Executive Officer for review and approval, such that the proposed monitoring program is approved by 1 April of each year, and implemented by 1 September of each year.

12. All revisions, modifications, and amendments made to the Program, EEP, and Monitoring and Reporting Program as approved by the Executive Officer are integral and enforceable parts of this Order.

13. The Dischargers shall comply with all applicable items of the "Standard Provisions and Reporting Requirements for Waste Discharge Requirements (NPDES)", dated 1 March 1991, which are part of this Order. This attachment and its individual paragraphs are referred to as "Standard Provisions".

14. This Order expires on _____. The Dischargers must file a Report of Waste Discharge in accordance with Title 23, California Code of Regulations, no later than 180 days in advance of such date in application for renewal of waste discharge requirements.

I, WILLIAM H. CROOKS, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Board, Central Valley Region, on _____.

A. **Monitoring Program**

1. The Dischargers shall develop a monitoring program on a fiscal year basis. The Dischargers shall develop and submit their proposed monitoring program no later than **15 February** of each year for review and comments by Board, and to ensure Executive Officer approval of the program by **1 April** of each year for implementation by **1 September** of each year. Each year's program shall be developed based on past monitoring results, program evaluation and effectiveness, program priorities and direction, and as directed by the Executive Officer. The program should be developed to ensure minor changes or revisions can be accomodated prior to implementation.

   It is recognized that the Dischargers are being directed to submit a proposed monitoring program prior to the submittal of the Annual Report on 1 September of each year, and prior to the Dischargers obtaining all analytical results of the current year monitoring program. Therefore, the Dischargers may request minor revisions to the approved monitoring program based on monitoring or special study results, if the request is made prior to its implementation each fiscal year, with Executive Officer approval.

   The Monitoring Program shall be developed such that it is an integral part in the evaluation of the Plan's effectiveness, provides quantitative information regarding program priorities and direction, demonstrates the reduction in pollutants in storm water runoff, and is designed to achieve the following objectives:

   a. Characterization of representative drainage areas and storm water discharges, including land use characteristics, pollutants concentrations, and mass loadings;

   b. Assessment of existing or potential adverse impacts on beneficial uses caused by pollutants of concern in storm water discharges, including an evaluation of representative receiving waters;

   c. Identification of potential sources of pollutants of concern found in storm water discharges; and

VOL 22

03471

VOL 22

d. Evaluation of effectiveness of representative storm water pollution prevention or control measures.

2. The Dischargers submitted a draft proposed fiscal year 1995-1996 monitoring program in April 1995, and have been working with Board staff to revise, and amend the program to ensure the program will be implemented by the anticipated first flush storm event. The Dischargers shall implement the 1995-1996 monitoring program forthwith upon adoption of this Order.

The Dischargers shall implement subsequent year monitoring programs by 1 **September** of each year.

3. **Annually** the Dischargers shall report the results of their monitoring program. The report shall be submitted such that it provides a summary of the analytical results, and provides a discussion on the findings, how the analytical results apply to the Dischargers studies towards discharge characterization, Program effectiveness, receiving water impacts, reductions in pollutants, and other pertinent areas or activities required by this Order. The monitoring report is to submitted as part of the Annual Report identified in B.2 of the below.

B. **Annual Report and Work Plans**

1. The Annual Report is an important element of the program and reporting procedures. The report is to be formatted such that it provides both the Dischargers and Regional Board staff an opportunity to adequately evaluate:

a. Implementation progress of the Plan;
b. Summary and evaluation of the monitoring program analytical results, and how these results relate to the Plan's priorities and directions;
c. Dischargers' fiscal and manpower resources, and legal authority to implement an effective Plan; and
d. The overall effectiveness of the Plan and its control measures both qualitatively and quantitatively.

The Annual Report is a tool for the Dischargers to establish that, through implementing their Program, they have reduced the discharge of pollutants to storm water to the MEP. As such the report format, and its contents may change as the Program develops, and Program, EEP, and monitoring program priorities and direction change.

2. The Dischargers shall submit **by 1 September** each year, an Annual Report documenting the status of all the general program and individual tasks contained in the Program and EEP, and monitoring program. The Annual Report will be a detailed report on the status of

0348

VOL 22

implementation of the Program and EEP and include an evaluation of the effectiveness of the control measures, management practices, and other actions and activities described in the Program and EEP. Measures of effectiveness include, but are not limited to, quantitative monitoring to assess the effectiveness of control measures, detailed accounting of program accomplishments, funds expended and staff hours utilized. This Annual Report shall provide an overall evaluation of the Program and set forth plans and schedule of implementation for the upcoming year. The Annual Report may also include proposed modifications or revisions to the Program and EEP.

In the report, the Dischargers shall propose pertinent updates, improvements, or revisions to the Program and EEP, which shall be deemed to be incorporated into this Order as provided in Provision D.12, unless disapproved by the Executive Officer.

3. By **1 April** of each year the Dischargers shall submit draft work plans for the following year which describe the proposed implementation of the Program and EEP for the next fiscal year. The work plans shall consider the status of implementation of current year activities and actions of the Dischargers, problems encountered, and proposed solutions, and shall address any comments received from the Executive Officer on their previous year Annual Report. The work plans shall include clearly defined tasks, responsibilities, and schedules for implementation of Program and Discharger actions for the next fiscal year. The work plans shall be deemed to be incorporated into the Program and EEP as provided in Provision D.12, and shall be implemented by **1 July** of each year except for those parts of the work plan determined to be unacceptable by the Executive Officer.

All parts, if any, found to unacceptable to the Executive Officer shall be revised or amended as appropriate by the Dischargers, and submitted as part of the Annual Report, at which time the work plans shall be deemed to be incorporated into the Program and EEP as provided in Provision D.12, unless disapproved by the Executive Officer.

a. It is recognized that the Dischargers will be submitting and implementing the work plan prior to the submittal of the Annual Report, and that the Dischargers may wish to revise their work plan as a result of their findings in the development of their Annual Report. Therefore, the Dischargers may submit proposed revisions to the work plan, subject to Executive Officer approval, with the Annual Report. All approved revisions to the work plan shall be deemed to be incorporated into the Program and EEP as provided in Provision D.12.

C. **Monitoring Program Alternatives**

1. It is recognized that costs associated with storm water monitoring, determination of program effectiveness, and other activities required for the Dischargers to evaluate compliance with this

0349

Order could be significant. It is also recognized that municipalities, and other agencies state and country wide are, or will be, permitted by municipal NPDES storm water permits similar to this Order, and will be conducting storm water monitoring, and conducting other special studies similar to the Dischargers'. As such, we recognize that the Dischargers may wish to reduce their costs associated with compliance evaluation by proposing alternative monitoring methods. Alternative methods may include, but not be limited to, special projects, financial participation in regional, state or national special projects or research, literature review, visual observations, use of indicator parameters, recognition and reliance on special studies conducted by others, etc.

a. The Dischargers may submit a written proposal of alternative monitoring methods, subject to the Executive Officer approval, as part of their work plan to be submitted in accordance with item B.3 above. Such proposal shall be detailed, and provide the Dischargers' justification for requesting the alternative method, and demonstrate how the data or information obtained is applicable and useful to the Dischargers. The proposal shall include a schedule, and define the roles and responsibilities of parties involved in the alternative monitoring proposal.

MEMORANDUM OF UNDERSTANDING
BETWEEN LOCAL AGENCIES AND
CALIFORNIA DEPARTMENT OF TRANSPORTATION

This is a Memorandum of Understanding entered into this 6th day of June, 1995, by and between the State of California, Department of Transportation (Caltrans), and the Local Agencies consisting of the County of Sacramento, the City of Sacramento, the City of Galt and the City of Folsom. The purpose of this MOU is to provide communication, coordination, cooperation, and collaboration between the State and Local Agencies concerning National Pollutant Discharge Elimination Systems (NPDES) stormwater requirements as directed by the California Regional Water Quality Control Board Central Valley Region. Each party in this MOU administers its own stormwater management program and is equally represented by this MOU.

This Memorandum of Understanding constitutes solely a guide to the respective intentions and policies of the parties involved. It is not intended to authorize funding or project effort nor is it a legally binding contract. Funding commitments providing for the deposit of funds for specific work phases or project effort committing either equipment or personnel time will be covered by one or more separate cooperative agreements as may be outlined herein.

AGREEMENTS AND PROCEDURES

Communication - Each individual agency has identified a specific contact person to resolve water quality issues pertaining to NPDES.

NPDES Coordinator - Caltrans - District 3	916-741-4585
Stormwater Program Manager - County of Sacramento	916-440-6851
Stormwater Program Manager - City of Sacramento	916-433-6634
Stormwater Program Manager - City of Galt	209-745-3077
Stormwater Program Manager - City of Folsom	916-355-7267

Coordination - The State and Local agencies will meet semi-annually, or more often if needed. The purpose of meeting is to coordinate on-going projects, share information to identify problem areas, discuss and resolve problem areas, and investigate possibilities of pilot programs and special studies.

Cooperation - State and Local Agencies agree to share information on approaches and conclusions on the different aspects of stormwater programs on an on-going basis. These programs would include, but are not limited to, construction activities, public information, stormwater monitoring, Best Management Practices (BMP) technology, and illicit connection programs.

Collaboration - The group of NPDES coordinators will identify and explore the available resources of the different agencies and determine a means, on a case by case basis, to jointly implement common activities of the individual stormwater programs.

VOL 22

AMENDMENT

This Memorandum of Understanding may be amended by written agreement of all parties.

TERMINATION

This Memorandum of Understanding may be terminated by any party upon sixty (60) days written notice.

District Director of Caltrans	Date 6/6/95
Agency Engineer, Sacramento County Water Agency	Date 5/20/95
Director of Utilities City of Sacramento	Date 6/2/95
Director of Public Works City of Galt	Date 5/31/95
Director of Public Works City of Folsom	Date 5/31/95

				Co	70.7	non-urban	N	E, Ag
Mokelumne River								
	Dry Creek			G, Co	64.9	predominately	C	Y, Ag

Footnotes:

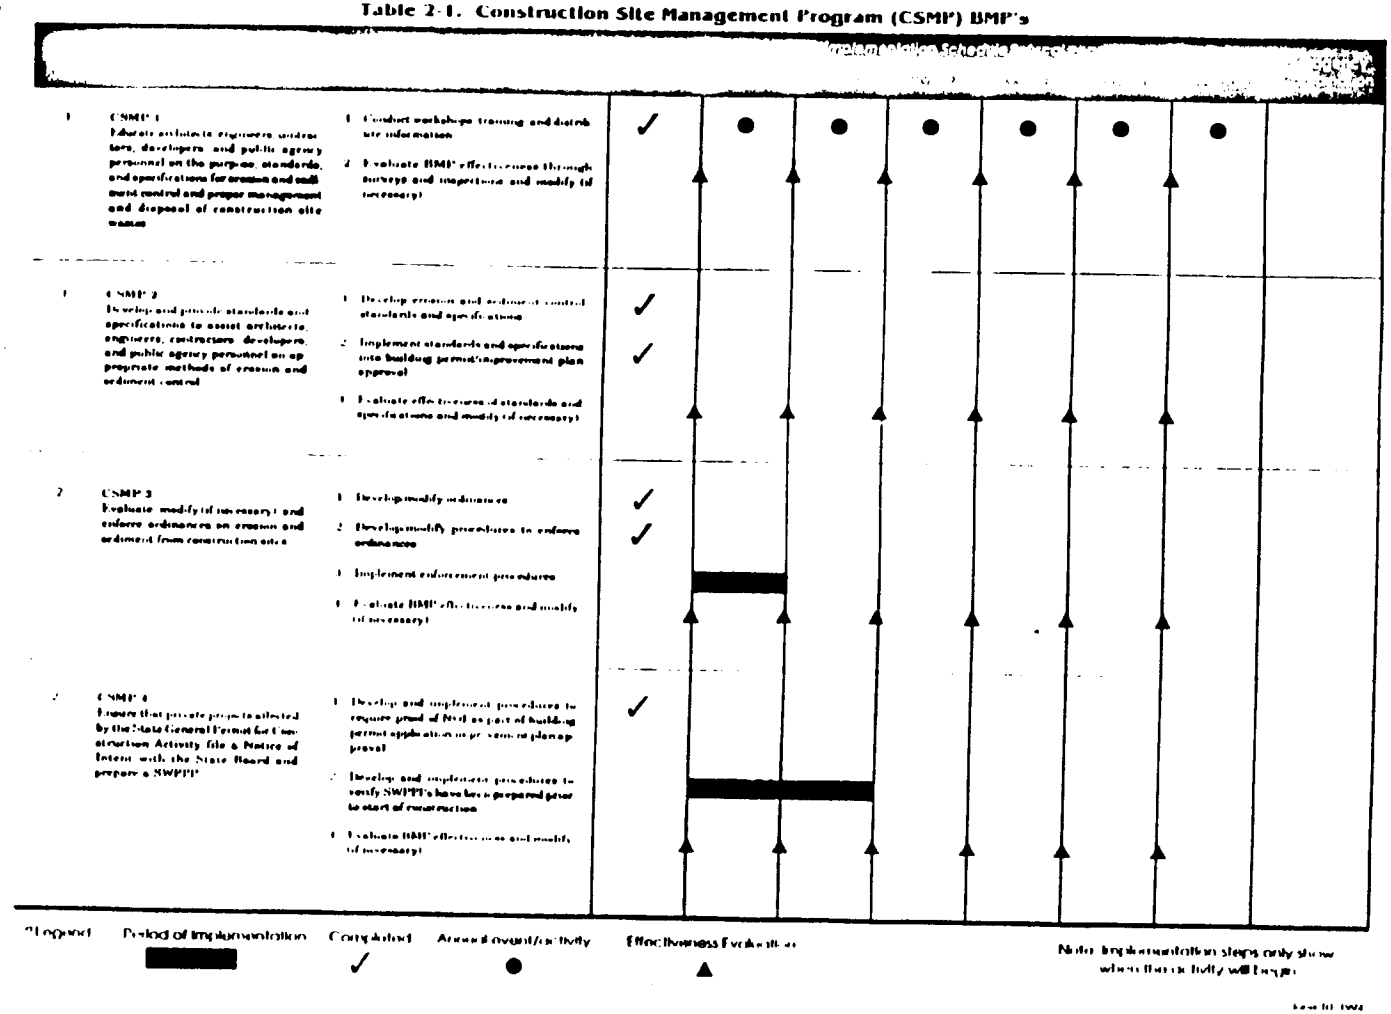
(a) Co = County of Sacramento
S = City of Sacramento
F = City of Folsom
G = City of Galt

(b) Non-urban = 0 to 30% urban
Partially urban = 30 to 70% urban
Predominantly urban = greater than 70% urban

(c) N = natural
M = man-made
C = combination of modified natural
L = levied

(d) E = ephemeral flow
Y = year round flow
YPre = year round flow prior to development of the watershed
YPost = year-round flow only after development of the watershed
NS = natural sources of flow (snow melt, springs, groundwater inflow)
NGO = contains water due to an gravity outfall
Ag = agricultural sources of flow

(e) These watersheds have been scheduled for master planning as described in the County of Sacramento's September 5, 1991 "Sacramento County Water Agency New Development Management Program" submitted to the Central Valley Regional Water Quality Control Board



(f) Watershed area extends beyond Sacramento County border. Only Sacramento County watershed area is shown

CONSTRUCTION PROJECT
STORM WATER POLLUTION PREVENTION PLAN PROVISIONS

1. **Objectives:** The Storm Water Pollution Prevention Plan (SWPPP) shall be developed and amended, when necessary, to meet the following objectives:

   a. To identify pollutant sources that may affect the quality of discharges of storm water associated with construction activity (storm water discharges) from the construction sites, and

   b. To identify, construct, and implement storm water pollution prevention measures (control practices) to reduce pollutants in storm water discharges to the extent practicable and reasonable from the construction site both during construction and after construction is completed.

2. **Availability.** The SWPPP shall be kept on site during construction activity and made available upon request of a representative of the Regional Water Board and/or local agency.

3. **Required Changes:**

   a. The discharger shall amend the SWPPP whenever there is a change in construction or operations which may affect the discharge of significant quantities of pollutants to surface waters, ground waters, or a municipal separate storm sewer system. The SWPPP should also be amended if it is in violation of any condition of this general permit or has not achieved the general objective of reducing pollutants in storm water discharges.

   b. The Regional Water Board may require the discharger to amend the SWPPP.

4. **Project Description:** The SWPPP shall provide a description of potential sources which are likely to add significant quantities of pollutants to storm water discharges or which may result in non-storm water discharges from the construction site. The SWPPP shall include, at a minimum, the following items:

   a. A map extending approximately one-quarter mile beyond the property boundaries of the construction site showing: the construction site, surface water bodies (including known springs and wetlands[1]), known wells, an outline of off-site drainage areas that discharge into the construction site, general topography, and the anticipated discharge location(s) where the construction site's storm water discharges to a municipal storm sewer system

---

[1] The determination of whether wetlands exist shall be made by the person who prepares the SWPPP and shall not be binding upon any other person.

VOL 22

0374

or other water body. The requirements of this paragraph may be included in the site map required under the following paragraph if appropriate.

b. A site map(s) showing:

i. Location of control practices used during construction:
ii. Areas used to store soils and wastes:
iii. Areas of cut and fill:
iv. Drainage patterns and slopes anticipated after major grading activities are completed:
v. Areas of soil disturbance:
vi. Surface water locations:
vii. Areas of potential soil erosion where control practices will be used during construction:
viii. Existing and planned paved areas and buildings:
ix. Locations of post-construction control practices;
x. An outline of the drainage area for each on-site storm water discharge point:
xi. Vehicle storage and service areas; and
xii. Areas of existing vegetation.

c. A narrative description of the following:

i. Toxic materials that are known to have been treated, stored, disposed, spilled, or leaked in significant quantities onto the construction site:

ii. Practices to minimize contact of construction materials, equipment, and vehicles with storm water:

iii. Construction material loading, unloading, and access areas:

iv. Preconstruction control practices (if any) to reduce sediment and other pollutants in storm water discharges:

v. Equipment storage, cleaning, and maintenance areas;

vi. Methods of on-site storage and disposal of construction materials; and

vii. The nature of fill material and existing data describing the soil on the construction site.

VOL 22

0375

R0065610

CONSTRUCTION PROJECT
STORM WATER POLLUTION PREVENTION PLAN PROVISIONS

d. A list of pollutants (other than sediment) that are likely to be present in storm water discharges in significant quantities. Describe the control practices (if different from Item b below) appropriate to reduce these pollutants in the storm water discharges.

e. An estimate of the size of the construction site (in acres or square feet), an estimate of the runoff coefficient of the construction site before and after construction, and an estimate of the percentage of the area of the construction site that is impervious (e.g., pavement, buildings, etc.) before and after construction.

5. **Erosion and Sediment Control:** The SWPPP shall include:

a. A description of soil stabilization practices. These practices shall be designed to preserve existing vegetation where feasible and to revegetate open areas as soon as feasible after grading or construction. In developing these practices, the discharger shall consider: temporary seeding, permanent seeding, mulching, sod stabilization, vegetative buffer strips, protection of trees, or other soil stabilization practices. At a minimum, the operator must implement these practices on all disturbed areas during the rainy season.

b. A description or illustration of control practices which, to the extent feasible, will prevent a net increase of sediment load in storm water discharge. In developing control practices, the discharger shall consider a full range of erosion and sediment controls such as detention basins, straw bale dikes, silt fences, earth dikes, brush barriers, velocity dissipation devices, drainage swales, check dams, subsurface drain, pipe slope drain, level spreaders, storm drain inlet protection, rock outlet protection, sediment traps, temporary sediment basins, or other controls. At a minimum, sandbag dikes, silt fences, straw bale dikes, or equivalent controls practices are required for all significant sideslope and downslope boundaries of the construction area. The discharger must consider site-specific and seasonal conditions when designing the control practices.

c. Control practices to reduce the tracking of sediment onto public or private roads. These public and private roads shall be inspected and cleaned as necessary.

d. Control practices to reduce wind erosion.

6. **Non-Storm Water Management** Non-storm water discharges are allowed only when necessary and where they do not cause or contribute to a violation of any water quality standard. Such discharges must be described in the SWPPP. Whenever feasible, alternatives which do not result in the discharger of non-storm water shall be implemented.

VOL 22

0376

R0065611

APPENDIX 1

CONSTRUCTION PROJECT
STORM WATER POLLUTION PREVENTION PLAN PROVISIONS

7. **Post-Construction Storm Water Management** The SWPPP shall describe the control practices to reduce pollutants in storm water discharges after all construction phases have been completed at the site. These must be consistent with all local post-construction storm water management requirements, policies, and guidelines. The discharger must consider site-specific and seasonal conditions when designing the control practices. Operation and maintenance of control practices after construction is completed shall be addressed, including short- and long-term funding sources and the responsible party.

8. **Waste Management and Disposal** All wastes (including equipment maintenance waste) disposed at the site or removed from the site for disposal shall be disposed of in compliance with Federal, State, and local laws, regulations, and ordinances.

9. **Maintenance, Inspection, and Repair**: The SWPPP shall include maintenance, inspections, and repair procedures to ensure that all grade surfaces, walls, dams and structures, vegetation, erosion and sediment control measures, and other protective devices identified in the site plan are maintained in good and effective condition and are promptly repaired or restored.

10. **Monitoring:** The SWPPP shall describe procedures for conducting inspections of the construction site prior to anticipated storm events and after actual storm events to identify areas contributing to a discharge associated with construction activity. These inspections shall evaluate whether control measures to reduce to pollutants in discharges are effective and properly implemented or whether additional control measures are needed. A record of the inspections must include the date of the inspection, the individual(s) who performed the inspection, inspection observations, and inspection evaluation. The record, and certification that the site is in compliance shall be submitted annual with the Annual Report.

    If certification of compliance is not possible, then the report shall identify the type(s) of non-compliance, describe actions necessary to achieve compliance, and include a time schedule, acceptable to the Executive Officer, for achieving compliance.

11. **Training:** The SWPPP shall include procedures to ensure that all inspections required in Section B.4 of the Monitoring Program and Reporting Requirements of this general permit and maintenance and repair required in Paragraph 10 of this Section are done by trained personnel.

12. **List of Contractors/Subcontractors:** The SWPPP shall include a list of all contractors (or subcontractors) responsible for implementing the SWPPP.

VOL 22

0377

CONSTRUCTION PROJECT
STORM WATER POLLUTION PREVENTION PLAN PROVISIONS

13. **Other Plans:** This SWPPP may incorporate, by reference, the appropriate elements of other plans required by local, State, or Federal agencies. A copy of any requirements incorporated by reference shall be kept at the construction site.

14. **Public Access:** The SWPPP is considered a report that shall be available to the public under Section 308(b) of the CWA. Upon request by members of the public, the discharger shall make available for review a copy of the SWPPP either to the Regional Water Board or directly to the requester.

15. **Preparer:** The SWPPP shall include the signature and title of the person responsible for preparation of the SWPPP and include the date of initial preparation and each amendment thereto.

VOL 22

APPENDIX 2

INDUSTRIAL FACILITY
(EXCLUDING CONSTRUCTION SITES)
STORM WATER POLLUTION PREVENTION PLAN PROVISIONS

1. **Objective:** A storm water pollution prevention plan (SWPPP) shall be developed and implemented, and amend when necessary, to meet the following objectives:

   a. to identify pollutant sources that may affect the quality of industrial storm water discharges; and

   b. to identify, assign, and implement control measures and management practices to reduce pollutants in industrial storm water discharges.

2. **Availability:** The SWPPP shall be kept at the facility and made available upon request o a representative of the Regional Board.

3. **Required changes.**

   a. The Dischargers shall amend the SWPPP whenever there is a change in design, construction, operation, or maintenance which may effect the discharge of significant quantities of pollutants to surface water, ground waters, or municipal separate storm sewer system. The SWPPP should also be amended if it is in violation of any conditions of this permit, or has not achieved the general objectives of reducing pollutants in storm water discharges.

   b. The Regional Board may require the Dischargers to amend the SWPPP.

4. **Source Identification:** The SWPPP shall provide a description of potential sources which may be expected to add significant quantities of pollutants to storm water discharges, or which may result in non-storm water discharges from the facility. The SWPPP shall include, at a minimum, the following items:

   a. A topography map extending approximately one-quarter mile beyond the property boundaries of the facility, showing: the facility, surface water bodies (including known springs and wells), and the discharge point where the facility's storm water discharges to a municipal storm drain system or other water body. The requirements of this paragraph may be included in the site map required under the following paragraph if appropriate.

   b. A site map showing:

      i. Storm water conveyance, drainage, and discharge structures;

      ii. An outline of the storm water drainage areas for each storm water discharge point;

      iii. Paved areas and buildings;

      iv. Areas of pollutant contact with storm water or release of storm water, actual or potential, including but not limited to outdoor storage, manufacturing, and process areas,

0379

INDUSTRIAL FACILITY
(EXCLUDING CONSTRUCTION SITES)
STORM WATER POLLUTION PREVENTION PLAN PROVISIONS

material loading, unloading, storage, and access areas, and waste treatment, storage, and disposal areas:

v. Location of existing storm water structural control measures (i.e., berms, coverings, etc.);

vi. Surface water locations, including springs and wetlands;

vii. Areas of existing and potential soil erosion; and

viii. Vehicle service areas.

ix. Location of each well where fluids from the facility are injected underground.

c. A narrative description of the following:

i. Significant materials that have been treated, stored, disposed, spilled, or leaked in significant quantities in storm water discharge after November 19, 1988;

ii. Materials, equipment, and vehicle management practices employed to minimize contact of significant materials with storm water discharge;

iii. Loading, unloading, and access areas;

iv. Existing structural and non-structural control measures (if any) to reduce pollutants in storm water discharge;

v. Industrial storm water discharge treatment facilities (if any);

vi. Methods of on-site storage and disposal of significant materials; and

vii. Outdoor storage, manufacturing, and processing activities including activities that generate significant quantities of dust or particulates.

d. A list of pollutants that have a reasonable potential to be present in storm water discharge in significant quantities, and an estimate of the annual quantities of these pollutants in storm water discharge.

e. An estimate of the size of the facility (in acres or square feet), and the percent of the facility that has impervious areas (i.e., pavement, buildings, etc.).

f. A list of significant spills or leaks of toxic or hazardous pollutants to storm water that have occurred after November 19, 1988. This shall include:

VOL 22 0380

INDUSTRIAL FACILITY
(EXCLUDING CONSTRUCTION SITES)
STORM WATER POLLUTION PREVENTION PLAN PROVISIONS

i. Toxic chemicals (listed in 40 CFR Part 372) that have been discharged to storm water as reported on USEPA Form R.

ii. Oil or hazardous substances in excess of reportable quantities (see 40 CFR Part 110, 117 or 302).

g. A summary of existing sampling data (if any) describing pollutants in storm water discharge.

5. **Storm Water Management Controls:** The SWPPP shall describe the storm water management controls appropriate for the facility and a time schedule for fully implementing such controls. The appropriateness and priorities of controls in the SWPPP shall reflect identified potential sources of pollutants. The description of the storm water management controls shall include, as appropriate:

a. Storm Water Pollution Prevention Personnel. Identify specific individuals (and job titles) who are responsible for developing, implementing, and revising the SWPPP.

b. Preventive Maintenance. Preventive maintenance involves inspection and maintenance of storm water conveyance system devices (i.e., oil/water separators, catch basins, etc.) and inspection and testing of plant equipment and systems that could fail and result in discharges of pollutants to storm water.

c. Good Housekeeping. Good housekeeping requires the maintenance of clean, orderly facility areas that discharge storm water. Material handling areas shall be inspected and cleaned to reduce the potential for pollutants to enter the storm water conveyance system.

d. Spill Prevention and Response. Identification of areas where significant materials can spill into or otherwise enter the storm water conveyance systems and their accompanying drainage points. Specific material handling procedures, storage requirements, and clean-up equipment and procedures should be identified, as appropriate. Internal reporting procedures for spills of significant materials shall be established.

e. Storm Water Management Practices. Storm water management practices are practices other than those which control the source of pollutants. They include treatment/conveyance structures such as drop inlets, channels, retention/detention basins, treatment vaults, infiltration galleries, filters, oil/water separators, etc. Based on assessment of the potential of various sources to contribute pollutants to storm water discharges in significant quantities, additional storm water management practices to remove pollutants from storm water discharge shall be implemented, and design criteria shall be described.

f. Source Control. Source controls, such as elimination or reduction of the use of toxic pollutants, covering of pollutant areas, sweeping of paved areas, containment of potential pollutants, labelling all storm drain inlets with "No Dumping" signs, isolation/separation of industrial from non-industrial pollutant sources so that runoff from these areas do not mix, etc.

VOL 22

0381

APPENDIX 2

INDUSTRIAL FACILITY
(EXCLUDING CONSTRUCTION SITES)
STORM WATER POLLUTION PREVENTION PLAN PROVISIONS

g. Erosion and Sediment Controls/ Prevention. Measures such as riprap, revegetation, slope stabilization, etc. to limit erosion and reduce sediment in storm water discharges shall be described and implemented.

h. Employee Training. Employee training programs shall inform all personnel responsible for implementing the SWPPP. Training should address spill response, good housekeeping, and material management practices. Periodic dates for training should be identified.

i. Inspections. All inspections, visual observations and sampling as required by Section B. shall be done by trained personnel. A tracking or follow-up procedure shall be used to ensure appropriate response has been taken in response to these activities.

j. Records. A tracking and follow up procedure shall be described to ensure that adequate response and corrective actions have been taken in response to inspections. Records of inspections shall be maintained. Establishment of internal record keeping and internal reporting procedures of inspections and spill incidents.

6. **Non-Storm Water Discharges**: Non-storm water discharges are allowed only when necessary and where they do not cause or contribute to a violation of any water quality standard. Such discharges must be described in the SWPPP. Whenever feasible, alternatives which do not result in the discharger of non-storm water shall be implemented.

7. **Annual Inspection:** An annual facility inspection shall be conducted to verify that all elements of the SWPPP (i.e., site map, potential pollutant sources, structural and non-structural controls to reduce pollutants in industrial storm water discharge, etc.) are accurate. A report of the annual inspection and observations that require a response (and appropriate response to the observations) shall be retained as part of the SWPPP, and submitted as part of the Annual Report.

8. **Other Plans:** The SWPPP may incorporate, by reference, the appropriate elements of other program requirements (i.e., Spill Prevention Control and Countermeasures (SPCC) plans under Section 311 of the CWA, Best Management Programs under 40 CFR 125.100, etc.).

9. **Public Access:** The SWPPP is considered a report that shall be available to the public under Section 308(b) of the CWA.

10. **Preparer:** The SWPPP shall include the signature and title of the person responsible for preparation of the SWPPP and include the date of initial preparation and each amendment, thereto.

VOL 22

R0065617

WASTE DISCHARGE REQUIREMENTS
AREA-WIDE STORM WATER DISCHARGES FROM
MUNICIPAL SEPARATE STORM SEWER SYSTEMS
SACRAMENTO COUNTY WATER AGENCY,
CITIES OF SACRAMENTO, FOLSOM, AND GALT

INFORMATION SHEET

The 1972 Amendments to the Federal Clean Water Act (CWA) prohibited the discharge of any pollutants from a point source into waters of the U.S. unless permitted under the National Pollutant Discharge Elimination System (NPDES). Storm water and urban runoff discharges that occur through discreet conveyance systems are considered point sources subject to NPDES requirements. The 1987 amendments to the CWA mandated the USEPA to publish regulations establishing permit requirements for storm water discharges associated with industrial activities, and large and medium municipal storm sewer systems that service an urbanized area with a population greater than 100,000. On 16 November 1990, USEPA published these Regulations which were codified in the Federal Code of Regulations (40CFR) within Part 122.

Appendices to Part 122 of the Regulations, provide a listing of the cities and counties throughout the United States that meet threshold urbanized population criteria that requires a municipality to obtain a NPDES storm water permit. Appendix H of the Regulations lists Sacramento County (County) as a county with an unincorporated urbanized area population greater than 250,000, and Appendix F lists the City of Sacramento with an incorporated urbanized population greater than 250,000. In listing the County, and the City of Sacramento, the Regulations have identified them as a large municipalities that are required to obtain a municipal NPDES storm water permit.

The Regulations allow the Board to designate owners or operators of municipal separate storm sewers, not meeting the population threshold established in the Regulations, and that are in the boundaries of a municipality that is required by the Regulations, as a medium or large municipal separate storm sewer system. This has resulted in many cities throughout California, with populations less than 100,000, or government entities, such as flood control districts or transportation districts, being required to obtain storm water permits.

There are four incorporated cities in the County of Sacramento, the Cities of Sacramento, Folsom, Galt, and Isleton. The Cities of Folsom, Galt, and Isleton have populations less than 100,000. The Cities of Folsom, and Galt are designated as urbanized areas that are subject to the storm water regulations. Designation is based on the location of each city's storm water discharges relative to storm water discharges for the County and City of Sacramento, and the nature of development and urbanization of the cities.

The City of Isleton has a population less than 1000, and is situated such that its developed area is not a continguous, intergral part of the uranized area of the County and its incorporated cities. Therefore, it is not required to obtain a storm water permit at this time.

VOL 22
0383
R0065618

WASTE DISCHARGE REQUIREMENTS
AREA-WIDE STORM WATER DISCHARGES FROM
MUNICIPAL SEPARATE STORM SEWER SYSTEMS
SACRAMENTO COUNTY WATER AGENCY,
CITIES OF SACRAMENTO, FOLSOM, AND GALT

The Regulations allow for the issuance of area-wide municipal NPDES storm water permits. Under the area-wide approach, various municipalities and entities can be named as permittees to one NPDES permit. The Regulations recognize the differences between the permittees in regards to its responsibilities for discharges from its municipal storm sewer system, and allows permittees to develop site-specific storm water programs.

The County, and the Cities of Sacramento, Folsom, and Galt together applied for an NPDES area-wide municipal storm water permit in February 1990. Order No. 90-158 (NPDES No. CA 0082597) was subsequently adopted by the Regional Board on 22 June 1990. Order No. 90-158 expired on 1 June 1995. However, due to no fault by the Dischargers, the Regional Board did not issue a new permit prior to that date resulting in the conditions of Order No. 90-158 continuing in full force until the new order is adopted.

On 3 March 1995, the Dischargers submitted the final segment of their renewal application. The application package included U.S. EPA General Information, Form 1, the State of California Form 200, a Comprehensive Stormwater Management Program (CSMP), and an Effectiveness Evaluation Report (EER). The CSMP and EER provide the Dischargers' management plan to evaluate and reduce the discharge of pollutants in storm water discharges from the urbanized areas covered by this Order.

The CSMP is a comprehensive document that describes the framework for management of storm water discharges during the term of this Order. It defines the priorities in development and implementation of best management practices (BMPs), and provides an implementation program which summarizes the major activities to be accomplished over and beyond the five-year term of this Order. Annually the Dischargers will submit a work plan, with a schedule, that provides the specific activities to be conducted by the Dischargers.

The EER reports the Dischargers' evaluation of the effectiveness of the CSMP during the current Order, and provides methodologies the Dischargers intend to implement to determine BMP, and overall CSMP effectiveness over the term of the new order. The proposed methodologies are detailed in the Effectiveness Evaluation Plan (EEP). The primary methods provided in the EEP for evaluation of program performance and estimated water quality improvements will be special studies for structural and non-structural BMPs, sub-watershed pilot studies for COC reduction programs, and statistical methods and water quality models for predicting the effectiveness of the CSMP.

This Order requires the permittees to implement various technologies to control the discharge of pollutants in storm water discharges from municipal separate storm sewer systems to the Maximum Extent Practicable (MEP), and to control the discharge of pollutants through implementation of Best Available Technologies Economically Achievable (BAT), and Best Conventional Control Technologies (BCT) for storm water discharges associated with industrial activities, as defined by the Federal Storm Water Regulations, and in non-storm water discharges from facilities that are owned and operated by the

VOL 22
0384
R0065619

Dischargers. In accordance with the storm water Regulations, implementation of structural and non-structural BMPs are acceptable control technologies to meet MEP, BAT, and BCT standards. Timely and adequate implementation of BMPs and other program elements outlined in the CSMP and EEP will constitute compliance with MEP, BAT, and BCT standards.

Annually, the Dischargers are required to submit an Annual Report. The Annual Report is a tool for the Dischargers to establish that, through implementing their CSMP, they have reduced the discharge of pollutants in storm water discharges from storm sewer systems, and non-storm water discharges from facilities owned and operated by the Dischargers, and have effectively prohibited the discharge of non-storm water discharges to storm sewer systems from various land uses under the jurisdiction of the Dischargers. The report is to be formatted such that it provides both the Dischargers and Regional Board staff an opportunity to adequately evaluate: 1) implementation progress of the CSMP; 2) monitoring program analytical results, and how these results relate to the CSMP's priorities and direction; 3) dischargers' fiscal and manpower resources, and legal authority to implement an effective CSMP; and, 4) evaluate overall effectiveness of the CSMP and its control measures both qualitatively and quantitatively.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION

TENTATIVE ORDER
NPDES PERMIT NO. CAS029718

REISSUING WASTE DISCHARGE REQUIREMENTS FOR:

SANTA CLARA VALLEY WATER DISTRICT, COUNTY OF SANTA CLARA, CITY OF CAMPBELL, CITY OF CUPERTINO, CITY OF LOS ALTOS, TOWN OF LOS ALTOS HILLS, TOWN OF LOS GATOS, CITY OF MILPITAS, CITY OF MONTE SERENO, CITY OF MOUNTAIN VIEW, CITY OF PALO ALTO, CITY OF SAN JOSE, CITY OF SANTA CLARA, CITY OF SARATOGA, AND CITY OF SUNNYVALE, which have joined together to form the SANTA CLARA VALLEY NONPOINT SOURCE POLLUTION CONTROL PROGRAM

The California Regional Water Quality Control Board, San Francisco Bay Region, (hereinafter referred to as the Regional Board) finds that:

1. The Santa Clara Valley Water District (hereinafter District), County of Santa Clara, City of Campbell, City of Cupertino, City of Los Altos, Town of Los Altos Hills, Town of Los Gatos, City of Milpitas, City of Monte Sereno, City of Mountain View, City of Palo Alto, City of San Jose, City of Santa Clara, City of Saratoga, and City of Sunnyvale (hereinafter referred to as the Dischargers) have joined together to form the Santa Clara Valley Nonpoint Source Pollution Control Program (hereinafter referred to as the Program) and have submitted a permit application (Report of Waste Discharge), dated December 20, 1994, for re-issuance of waste discharge requirements under the National Pollutant Discharge Elimination System (NPDES) to discharge storm water runoff from storm drains and watercourses within the Dischargers' jurisdictions.

2. The Dischargers are currently subject to NPDES Permit No.CA0029718 issued by Order No. 90-094 on June 20, 1990, and amended by Order No. 92-021 on February 19, 1992.

3. The Dischargers each have jurisdiction over and/or maintenance responsibility for certain municipal separate storm drain systems and/or watercourses in the Santa Clara Valley basin. (See attached location and political jurisdiction map.) The basin can be divided into eleven subbasins or watersheds including the Coyote Creek watershed on the east side of the valley, the Guadalupe River watershed which drains the south-central portion of the valley, and a series of small, relatively urbanized watersheds that drain the west side of the valley. (See attached basin watersheds map.) Discharge consists of the surface runoff generated from various land uses in all the hydrologic subbasins in the basin which discharge into watercourses which in turn flow into South San Francisco Bay. The quality and quantity of these discharges varies considerably and is affected by hydrologic, geologic, land use, season, and sequence and duration of hydrologic event. Pollutants of concern in these discharges are certain heavy metals, sediment from erosion due to anthropogenic activities, petroleum hydrocarbons from sources such as used motor oil, certain pesticides associated with in stream acute toxicity, and other pollutants which may cause aquatic toxicity in the receiving waters.

VOL 22

03871

4. The permit application submitted by the Dischargers includes the Program's Storm Water Management Plan, which describes a framework for management of stormwater discharges during the term of this permit. The title page and table of contents of the Storm Water Management Plan are included in Attachment C of this Order. The Storm Water Management Plan describes the Program's Goals and Objectives, Legal Authorities, Institutional Arrangements and Funding, the Annual Reporting and Program Evaluation Process, Monitoring Strategy, an Implementation Plan which summarizes major activities to be accomplished during the five-year term of this permit, and detailed Workplans of activities to be implemented by the Program and each of the Dischargers during Fiscal Year 1995-1996. Workplans for subsequent fiscal years will be prepared by the Program and each of the Dischargers and submitted to the Regional Board by the Program as part of the Annual Reporting and Program Evaluation Process.

   The Implementation Plan chapter of the Storm Water Management Plan consists of the following elements:

   - Program Management
   - Annual Reporting and Evaluation
   - Monitoring
   - Public Agency Activities
   - Public Information and Participation
   - Metals Control Measures
   - Watershed Management Measures
   - Illicit Connection / Illegal Dumping Elimination
   - Industrial and Commercial Discharges
   - New Development and Construction

5. The Storm Water Management Plan (Plan) and modifications or revisions to the Plan that are approved in accordance with Provision C.3 of this Order, and future fiscal year Workplans to be submitted in accordance with the Plan and Provision C.3 of this Order are incorporated into this Order by reference and are an integral and enforceable component of this Order.

6. The Program is organized, coordinated, and implemented based upon a Memorandum of Agreement signed by the Dischargers, which defines roles and responsibilities of the Dischargers. The roles and responsibilities of the Dischargers are, in part, as follows:

   a. The Management Committee, which includes representatives from all of the Dischargers, is the decision making body of the Program. It operates within the budget and policies established by the Dischargers' governing boards and councils to decide matters of budget and policy necessary to implement the Storm Water Management Plan, and provides direction to the Program Manager and staff. The Management Committee has established subcommittees to assist in planning and implementation of the Storm Water Management Plan, and may add, modify, or delete subcommittees as deemed necessary.

VOL 22
03888

b. The District's representative serves as the Chair of the Management Committee and is responsible for implementation of the Program's self-monitoring activities and preparation and submittal of Program components of the Annual Report and Workplans. In acting as the Program's NPDES Permit coordinator, the District does not assume responsibility for the obligations assigned to other Dischargers by this Order.

c. Each of the Dischargers is individually responsible for adoption and enforcement of ordinances, implementation of assigned control measures needed to prevent or reduce pollutants in stormwater, and providing funds for the capital, operation, and maintenance expenditures necessary to implement such control measures within their jurisdiction. The Regional Board in exercising its enforcement discretion will, wherever possible, take action only against the individual Discharger(s) responsible for specific violations of this Order.

7. Section 402(p) of the federal Clean Water Act (CWA), as amended by the Water Quality Act of 1987, requires NPDES permits for storm water discharges from separate municipal storm drain systems, storm water discharges associated with industrial activity (including construction activities), and designated storm water discharges which are considered significant contributors of pollutants to waters of the United States. On November 16, 1990, the United States Environmental Protection Agency (hereinafter US EPA) published regulations (40 CFR Part 122) which prescribe permit application requirements for municipal storm water discharges pursuant to Section 402(p) of the CWA. The application requirements include submittal of a proposed storm water management plan to reduce the discharge of pollutants in storm water to the maximum extent practicable and to effectively prohibit non-storm water discharges into municipal storm drain systems. The Program's Storm Water Management Plan fulfills these permit application requirements. The implementation of the Implementation Plan and related Workplans of the Storm Water Management Plan should achieve pollutant reduction and pollution prevention to the maximum extent practicable.

8. The Regional Board amended its Water Quality Control Plan (Basin Plan) for the San Francisco Bay Region on September 16, 1992. The State Water Resources Control Board (hereinafter the State Board) approved the Basin Plan on April 27, 1993. The provisions of this permit are consistent with the amended Basin Plan.

9. The beneficial uses of South San Francisco Bay, its tributary streams and contiguous water bodies, and other water bodies within the drainage basin are listed in the Basin Plan.

10. The Regional Board considers storm water discharges from the urban and developing areas in the San Francisco Bay Region, such as the Santa Clara Valley basin, to be significant sources of pollutants in waters of the Region that may be causing or threatening to cause or contribute to water quality impairment.

VOL 22
03899
R0065624

11. The San Francisco Estuary Project, established pursuant to CWA Section 320, culminated in June of 1993 with completion of its Comprehensive Conservation and Management Plan (CCMP) for the preservation, restoration, and enhancement of the San Francisco Bay-Delta Estuary. The CCMP includes recommended actions in the areas of aquatic resources, wildlife, wetlands, water use, pollution prevention and reduction, dredging and waterway modification, land use, public involvement and education, and research and monitoring. Recommended actions which may, in part, be addressed through implementation of the Dischargers' Storm Water Management Plan include, but are not limited to, the following:

    a. Action PO-2.1: Pursue a mass emissions strategy to reduce pollutant discharges into the Estuary from point and nonpoint sources and to address the accumulation of pollutants in estuarine organisms and sediments.

    b. Action PO-2.4: Improve the management and control of urban runoff from public and private sources.

    c. Action PO-2.5: Develop control measures to reduce pollutant loadings from energy and transportation systems.

    d. Action LU-1.1: Local General Plans should incorporate watershed protection plans to protect wetlands and stream environments and reduce pollutants in runoff.

    e. Action LU-3.1: Prepare and implement Watershed Management Plans that include the following complementary elements: 1) wetlands protection; 2) stream environment protection; and 3) reduction of pollutants in runoff.

    f. Action LU-3.2: Develop and implement guidelines for site planning and Best Management Practices.

12. The Regional Board reviewed reports submitted by the Dischargers between June of 1990 and September of 1993 and Regional Monitoring Program data and found that the Dischargers have made considerable progress in reducing the discharge of pollutants, including pollutants of concern, but that the South Bay remained impaired and applicable water quality objectives had not been achieved. Consequently, on December 15, 1993, the Regional Board adopted Cease and Desist Order No. 93-164 which required the Dischargers to submit a plan identifying measures for further control of certain pollutants of concern and assigning responsibilities and time schedules for implementation of such control measures. *(Status of CDO and 304(l) and this finding to be determined)*

13. The Regional Board considers the Program's Storm Water Management Plan (Plan) an essential component of an urban watershed management plan for the Santa Clara Valley basin and its eleven subbasins or watersheds. The Plan is intended to provide a framework for protection and restoration of the Santa Clara Valley watersheds and the South Bay in part through effective and efficient implementation of appropriate control

VOL 22

03900

R0065625

measures for the most important sources of pollutants within the watersheds.

14. The Regional Board has issued a NPDES general permit for the regulation of storm water discharges associated with industrial activities in the Santa Clara Valley basin, and the State Board has issued a NPDES general permit for the regulation of storm water discharges associated with construction activities throughout the entire state. To effectively implement the Industrial and Commercial Dischargers and New Development and Construction elements of the Plan, the Dischargers may conduct investigations and local regulatory activities at industries or construction sites covered by these general permits. However, under the CWA, the Regional Board cannot delegate to the Dischargers its own authority to enforce these general permits. Therefore, Regional Board staff intend to work cooperatively with the Dischargers to ensure that industries and construction sites within the Discharger's jurisdiction are in compliance with applicable general permit requirements but are not subject to uncoordinated storm water regulatory activities.

15. Federal, state, or regional entities within the Dischargers' boundaries, not currently named in this Order, operate storm drain facilities and/or discharge storm water to the storm drains and watercourses covered by this Order. The Dischargers may lack legal jurisdiction over these entities under the state and federal constitutions. Consequently, the Regional Board recognizes that the Dischargers should not be held responsible for such facilities and/or discharges. California Department of Transportation (Caltrans) is a state agency that is currently, among others, such an entity. The Regional Board issued a separate storm water permit (NPDES Permit No. CAS029998), to Caltrans in August of 1994, and will consider issuing separate NPDES permits for storm water discharges to other federal, state, or regional entities within the Dischargers' boundaries.

16. The action to adopt a NPDES permit is exempt from the provisions of the California Environmental Quality Act; Chapter 3 (commencing with Section 21100) of Division 13 of the Public Resources Code in accordance with Section 13389 of the California Water Code.

17. The Regional Board will notify interested agencies and interested persons of the availability of reports, plans, and schedules submitted in response to requirements of this Order and may provide them with an opportunity for a public hearing and an opportunity to submit their written views and recommendations. The Regional Board will consider all comments and may modify the reports, plans, or schedules or may modify this Order accordingly.

18. The Regional Board has notified the Dischargers and interested agencies and interested persons of its intent to prescribe waste discharge requirements and an NPDES permit for this discharge and has provided them with an opportunity for a public hearing and an opportunity to submit their written views and recommendations.

VOL 22

0391

19. The Regional Board, at a properly noticed public meeting, heard and considered all comments pertaining to the discharge.

20. This Order supercedes Order Nos. 90-094 and 92-021 which are hereby rescinded.

21. This Order serves as a NPDES permit, pursuant to CWA Section 402, or amendments thereto, and shall become effective ten days after the date of its adoption provided the Regional Administrator, US EPA, Region IX, has no objections.

IT IS HEREBY ORDERED that the Dischargers, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder and the provisions of the Clean Water Act as amended and regulations and guidelines adopted thereunder, shall comply with the following:

A. DISCHARGE PROHIBITION

The Dischargers shall, within their respective jurisdictions, effectively prohibit the discharge of non-storm water (materials other than storm water) through their systems into waters of the United States. NPDES permitted discharges are exempt from this prohibition.

The following non-storm water discharges need not be prohibited provided such sources are identified and appropriate control measures to minimize the adverse impacts of such sources are developed and implemented under the Storm Water Management Plan in accordance with Provision C.5 of this Order.

a. water line and hydrant flushing;
b. landscape irrigation;
c. diverted stream flows;
d. rising ground waters;
e. uncontaminated groundwater infiltration;
f. uncontaminated pumped groundwater;
g. discharges from potable water sources;
h. foundation drains;
i. air conditioning condensate;
j. irrigation water;
k. springs;
l. water from crawl space pumps;
m. footing drains;
n. lawn or garden watering;
o. individual residential car washing;
p. flows from riparian habitats or wetlands;
q. dechlorinated swimming pool discharges; and
r. discharges or flows from emergency fire fighting activities;

VOL 22

03992

B. RECEIVING WATER LIMITATIONS

1. The discharge shall not cause the following conditions to create a condition of nuisance or water quality impairment in waters of the State:
   a. Floating, suspended, or deposited macroscopic particulate matter, or foam;
   b. Bottom deposits or aquatic growths;
   c. Alteration of temperature, turbidity, or apparent color beyond present natural background levels;
   d. Visible, floating, suspended, or deposited oil or other products of petroleum origin; and/or
   e. Toxic or deleterious substances present in concentrations or quantities which will cause deleterious effects on aquatic biota, wildlife, or waterfowl, or which render any of these unfit for human consumption either at levels created in the receiving waters or as a result of biological concentration.

2. The discharge shall not cause a violation of any applicable water quality objective for receiving waters. If applicable water quality objectives are adopted and approved by the State Board after the date of the adoption of this Order, the Regional Board may revise and modify this Order as appropriate .

C. PROVISIONS

1. The Dischargers shall demonstrate compliance with Discharge Prohibition A, and Receiving Water Limitations B.1 and B.2 through the timely implementation of their Storm Water Management Plan and any of its modifications, revisions, or amendments developed pursuant to this Order.

2. **Storm Water Management Plan and Performance Standards**

   a. The Dischargers shall begin implementing forthwith the Program's Storm Water Management Plan (Plan) as submitted on December 20, 1994, and shall subsequently demonstrate its effectiveness and provide for necessary and appropriate revisions, modifications, and improvements to it as required by Provision C.3 of this Order.

   b. The Storm Water Management Plan shall be revised to adopt and incorporate Performance Standards developed by the Dischargers. Performance Standards shall be established for implementing control measures and best management practices contained in the Implementation Plan chapter of the Storm Water Management Plan. Performance Standards should include appropriate criteria for the applicability, economic feasibility, design, operation, and maintenance or otherwise implementation of a control measure or best management practice so as to achieve pollutant reduction or pollution prevention benefits to the maximum extent practicable. Performance Standards may be based upon special studies or other activities conducted by the Dischargers, literature review, or special studies conducted by other programs or dischargers. Following the addition of a Performance Standard to the Storm Water

VOL 22

03993

Management Plan, all Dischargers for which the Performance Standard is applicable shall adhere to its implementation.

i. The following Performance Standards shall be the highest priority and shall be developed during Fiscal Year 1995-1996:

a) Industrial/Commercial Discharger Inspection Program -

A Performance Standard for conducting the Industrial/Commercial Inspection Program shall be developed and submitted to the Executive Officer by September 1, 1995. The Performance Standard shall include the baseline activities and items of an inspection check list. The "handbook of procedures for storm water inspections of industrial and commercial sources" to be developed by Alameda County will be used by the Dischargers as a basis for guidance to their activities.

b) Municipal Separate Storm Drain System Operations and Maintenance -

A Performance Standard for conducting routine operations and maintenance of the Dischargers' municipal storm drain systems shall be developed and submitted to the Executive Officer by March 1, 1996.

c) Water Utility Operations and Maintenance -

A Performance Standard for discharges associated with water utility operations shall be developed and submitted to the Executive Officer by July 1996. The State Board is considering issuing a NPDES General Permit for Discharges from Water Suppliers and Utility Companies (General Permit). The Performance Standard shall consider the control measures and best management practices defined in the General Permit.

Discharges associated with water utility operations owned or operated by the Dischargers are authorized and permitted by this Order, if they are in in accordance with the conditions of this provision and Provision C.5 of this Order and the Dischargers' Storm Water Management Plan.

ii. Beginning in September of 1996, the Dischargers shall incorporate newly developed or updated Performance Standards in each annual revision to the Storm Water Management Plan. The draft Annual Workplan required in Provision C.3 shall identify those Performance Standards which will be developed for the upcoming fiscal year.

3. **Annual Reports and Work Plans**

a. The Dischargers shall submit an Annual Report, by September 1 of each year,

VOL 22

0394

R0065629

documenting the status of the Program's and the Dischargers' activities and tasks contained in the Storm Water Management Plan.

The Annual Report shall include a compilation of deliverables and milestones completed as described in the Storm Water Management Plan. As part of the Annual Report process, each of the Dischargers shall conduct an overall evaluation of the effectiveness of its applicable activities described in the Storm Water Management Plan. Measures of effectiveness may include, but are not limited to, conformance with established Performance Standards, quantitative monitoring to assess the effectiveness of control measures, detailed accounting of Program accomplishments, funds expended, or staff hours utilized. Methods to improve effectiveness in the implementation of tasks and activities including development of new, or modification of existing, Performance Standards, shall be identified where appropriate.

In each Annual Report, the Dischargers shall propose pertinent updates, improvements, or revisions to the Storm Water Management Plan, which shall be deemed to be incorporated into this Order unless disapproved of by the Executive Officer.

b. The Dischargers shall submit draft Workplans by March 1 of the following year which describes the proposed implementation of the Storm Water Management Plan for the next fiscal year.

The Workplans shall consider the status of implementation of current year activities and actions of the Dischargers, problems encountered, and proposed solutions, and shall address any comments received from the Executive Officer on their previous year Annual Report. The Workplans shall include clearly defined tasks, responsibilities, and schedules for implementation of Program and Discharger actions for the next fiscal year. The Workplans shall also include a proposal for development of new, or modification of existing, Performance Standards in accordance with Provision C.2.b and alternative monitoring activities as required in Provision C.4.

The Workplans shall be deemed to be incorporated into the Storm Water Management Plan and this Order as of July 1 unless determined to be unacceptable by the Executive Officer. The Dischargers shall address any comments received from the Executive Officer on their draft Workplans prior to the submission of their Annual Report on September 1, at which time the Workplans shall be deemed to be incorporated into the Storm Water Management Plan and this Order unless disapproved of by the Executive Officer.

4. **Monitoring Program**

The Dischargers shall submit by September 1 of each year, an Annual Monitoring Program Plan acceptable to the Executive Officer, that supports the development and implementation and demonstrates the effectiveness of the Storm Water Management Plan.

VOL 22

0395

The Monitoring Program Plan shall be designed to achieve the following objectives:

- Characterization of representative drainage areas and storm water discharges, including land use characteristics, pollutant concentrations, and mass loadings;
- Assessment of existing or potential adverse impacts on beneficial uses caused by pollutants of concern in storm water discharges, including an evaluation of representative receiving waters;
- Identification of potential sources of pollutants of concern found in storm water discharges; and
- Evaluation of effectiveness of representative storm water pollution prevention or control measures.

The Monitoring Program shall include the following:

a. Provisions for conducting and reporting the results of special studies conducted by the Program or Dischargers which are designed to determine effectiveness of best management practice or control measures, define a Performance Standard in accordance with Provision C.2, or assess the adverse impact of a pollutant or pollutants on beneficial uses.

b. Provisions for conducting watershed monitoring activities including; identification of major sources of pollutants of concern; and evaluation of the effectiveness of control measures and best management practices; and use of physical, chemical, and biological parameters and indicators as appropriate; and

c Identification and justification of representative sampling locations, frequencies and methods, suite of pollutants to be analyzed, analytical methods, and quality assurance procedures. Alternative monitoring methods in place of these (special projects, financial participation in regional, state, or national special projects or research, literature review, visual observations, use of indicator parameters, recognition and reliance on special studies conducted by other programs, etc.) may be proposed with justification. Such proposed alternative monitoring methods shall be included as a component of the Program draft Workplan as required in Provision C.3.

5. **Non-Storm Water Discharges**

The Dischargers shall identify and describe the categories of discharges of the non-prohibited types listed in Discharge Prohibition A. of this Order which they wish to exempt from the prohibition. For each such category, the Dischargers shall identify and describe as necessary and appropriate to the category, and incorporate into the Storm Water Management Plan, control measures to minimize the adverse impacts of such sources, procedures and Performance Standards for their implementation, procedures for

VOL 22
03996
R0065631

notifying the Regional Board of these discharges, and procedures for monitoring and record management.

a. Discharges of non-storm water from sources owned or operated by the Discharges are authorized and permitted by this Order, if they are in in accordance with the conditions of this provision and the Dischargers' Storm Water Management Plan.

b. The Regional Board may require dischargers of non-storm water other than the Discharges to apply for and obtain coverage under a NPDES permit.

c. The Dischargers may propose, as part of their annual updates to the Storm Water Management Plan under Provision C.3 of this Order, additional categories of non-storm water discharges to be included in the exemption to Discharge Prohibition A.

6. **Watershed Management Measures**

The Dischargers shall develop and implement Watershed Management Measures defined in the Storm Water Management Plan and Workplans. Watershed Management Measures embrace many of the programmatic areas of activity within the Storm Water Management Plan, such as Metals Control Measures and New Development and Construction, and are designed to coordinate and integrate the goals and tasks of these activities in a way that recognizes that there may be unique values, problems, goals, and strategies specific to individual watersheds. Watershed Management Measures also seek to develop and implement the most cost effective approaches to solving identified problems and to coordinate these activities with other related programs. Examples of related goals and programs include: (1) protection of the San Francisco Bay-Delta Estuary under Section 320 of the Clean Water Act (San Francisco Estuary Project), (2) protection of coastal waters from nonpoint source pollution under the Coastal Zone Management Act, and (3) source water protection under the Safe Drinking Water Act.

7. **Storm Water Discharges Associated With Construction Activity**

Pursuant to Provisions C.2 and C.3 of this Order, the Dischargers may submit to the Executive Officer, proposed amendments to the Storm Water Management Plan which define Performance Standards and Best Management Practices and procedures for notifying the Regional Board for Construction Activities conducted by the Dischargers. Following incorporation into the Storm Water Management Plan, the applicable Dischargers shall implement such Construction Performance Standards and Best Management Practices pursuant to site specific Storm Water Pollution Prevention Plans to be developed pursuant to and accordance with Appendix B of this Order for all construction sites involving the disturbance of five or more acres of total land area.

Discharges of storm water from construction sites owned or operated by the Dischargers are authorized and permitted by this Order, if they are in in accordance with the conditions of this provision and the Dischargers' Storm Water Management Plan.

VOL 22

039971

R0065632

8. It is anticipated that the Storm Water Management Plan may need to be modified, revised, or amended from time to time to respond to changed conditions and to incorporate more effective approaches to pollutant control. Requests for changes may be initiated by the Executive Officer or by the Dischargers. Minor changes may be made with the Executive Officer's approval and will be brought to the Regional Board as information items and the Dischargers and interested parties will be notified accordingly. If proposed changes imply a major revision in the overall scope of effort of the Program, the Executive Officer shall bring such changes before the Regional Board as permit amendments and notify the Dischargers and interested parties accordingly.

9. This Order may be modified, or alternatively, revoked or reissued, prior to the expiration date as follows:

   a. to address significant changed conditions identified in the technical reports required by the Regional Board which were unknown at the time of the issuance of this Order;

   b. to incorporate applicable requirements of statewide water quality control plans adopted by the State Board or amendments to the Basin Plan approved by the State Board; or

   c. to comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain any other requirements of the CWA then applicable.

10. Each of the Dischargers shall comply with all parts of the Standard Provisions contained in Appendix A of this Order.

11. This Order expires on June 21, 2000. The Dischargers must file a Report of Waste Discharge in accordance with Title 23, California Code of Regulations, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

I, Steven R. Ritchie, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, San Francisco Bay Region on June 21, 1995.

ATTACHMENTS

VOL 22
03988
R0065633

California Regional Water Quality Control Board
Santa Ana Region

PROPOSED BY RIVERSIDE COUNTY FLOOD

ORDER NO. 95-

NPDES NO. CA95

Waste Discharge Requirements
for the Riverside County Flood Control
and Water Conservation District,
the County of Riverside
and the Incorporated Cities of Riverside County
For Area-Wide Urban Stormwater Runoff
Within the Santa Ana Region of Riverside County

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter called Regional Board), finds that:

1. On January 3, 1995, the Riverside County Flood Control and Water Conservation District (RCFC&WCD) in cooperation with the County of Riverside and the Cities of Beaumont, Calimesa, Canyon Lake, Corona, Hemet, Lake Elsinore, Moreno Valley, Norco, Perris, Riverside and San Jacinto (hereinafter collectively referred to as the Permittees), submitted National Pollutant Discharge Elimination System (NPDES) Application No. CA 95_____ for an area-wide stormwater discharge permit under the NPDES.

2. The 1972 Clean Water Act (CWA) recognized the need to prohibit the discharge of pollutants to surface water bodies from point sources such as industrial facilities and municipal sewage treatment plants. The discharge of pollutants from point sources is regulated by the NPDES permit system, which requires technology-based controls for treatment of wastewater. Stormwater point source discharges were exempt from the NPDES permitting requirements unless these discharges were contaminated by industrial/commercial activity. The Regional Board recognized the water quality problems associated with stormwater from industrial facilities and has issued a number of stormwater permits for such facilities in accordance with the United States Environmental Protection Agency (USEPA) regulations.

3. In 1976, the USEPA issued new regulations establishing a comprehensive permitting program for all stormwater discharges except for rural runoff uncontaminated by industrial/commercial activity. Channelized stormwater runoff continued to be defined as non-point source unless designated otherwise by the permitting authority.

VOL 22

03999

R0065634

4. Since 1976, the USEPA has issued several revisions to the stormwater regulations. Section 405 of the Water Quality Act (WQA) of 1987 added Section 402(p) to the CWA. Pursuant to Section 402(p)(4) of the CWA, the USEPA was required to promulgate regulations for stormwater discharges associated with industrial activities and municipal separate storm drain systems serving a population of 100,000 or more, or area designated by the Director of the USEPA or permitting State agency.

5. On December 7, 1988, the USEPA published its proposed regulations for stormwater discharges in the Federal Register to solicit public comments. Final regulations were promulgated and published in the Federal Register on November 16, 1990.

6. The beneficial uses of a number of water bodies within Riverside County are threatened or impaired which may be in part due to urban stormwater runoff and non-stormwater flows from urbanized areas. These water bodies include the Santa Ana River, Reaches 3 and 4, Canyon Lake, Lake Elsinore, Lake Evans and Lake Mathews. A comprehensive stormwater and urban runoff management and regulatory program is essential for the protection of the water resources of the Region. The RCFC&WCD, the County of Riverside, the Cities in Riverside County, and the Regional Board have recognized this fact, and as a first step toward protecting water quality in the area, a comprehensive stormwater management program has been developed. This order outlines the existing programs and specifies additional requirements and/or modifications to achieve water quality objectives for the Riverside County drainage areas within the Santa Ana Region. The intent of this permit is to regulate pollutants associated with discharges of stormwater from municipal storm drain systems and improve water quality in the Region in a timely manner.

7. Within the Santa Ana Region, the RCFC&WCD serves a population of approximately 930,000, occupying an area of approximately 1,360 square miles. The RCFC&WCD's storm drain system includes an estimated 200 miles of opened and closed storm drains, and the systems operated by the remaining Permittees include an estimated 57 miles of opened and closed storm drains.

8. The discharges from the municipal storm drain system consists of surface runoff generated from various land uses in all the hydrologic drainage areas which discharge into water bodies in Riverside County. The quality of these discharges varies considerably and is affected by land use activities, basin hydrology and geology, season, the frequency and duration of storm events and point source discharges permitted by the Regional Board under NPDES. The constituents of concern and significance in these discharges are: total and fecal coliform, enterococcus, total suspended solids, biochemical oxygen demand (BOD), chemical oxygen demand (COD), total organic carbon (TOC), oil and grease,

VOL 22
0400
R0065635

heavy metals, nutrients, base/neutral and acid extractables, pesticides and herbicides, and petroleum hydrocarbon components.

9. There are several entities whose land/facilities drain into the Riverside County municipal storm drain systems operated by the Permittees. The RCFC&WCD operates approximately 85 percent of the storm drain systems within the Region, and has agreed to be the lead party in implementing the provisions of this order. The remaining storm drain systems are owned and operated by the County and Cities within the county and by the State Department of Transportation (Caltrans). The County of Riverside and the incorporated Cities within the county have agreed to cooperate with the RCFC&WCD in controlling and improving the quality of urban runoff from their respective areas. The RCFC&WCD has been named as the Principal Permittee and the County of Riverside and the incorporated Cities have been named as the Co-Permittees. Appendix B lists the incorporated Cities with their 1994 estimated populations. Of the eleven Cities, there are two Cities with an estimated 1994 population over 100,000. The Regional Board has issued a separate stormwater NPDES permit to Caltrans.

10. Due to the enormous variability in stormwater quality and the complexity of the urban runoff management program, this area-wide stormwater permit is categorized as a major NPDES permit. This area-wide stormwater permit requires all entities discharging stormwater/urban runoff into the storm drain systems or any surface water bodies to have appropriate controls for proper management of this runoff. The Regional Board has the discretion and authority to require non-cooperating entities to participate in this area-wide permit or obtain individual stormwater discharge permits, pursuant to 40 CFR 122.26(a). The entities listed in Appendix C are considered as potential permittees of stormwater to the Riverside County drainage areas. It is expected that these entities will also work cooperatively with RCFC&WCD, the County of Riverside and Cities to manage urban runoff.

11. The RCFC&WCD, as the Principal Permittee, will obtain (within its powers) the cooperation of all entities in implementing the provisions of this order. The Permittees have agreed upon the responsibilities as described in the November 19, 1991 Implementation Agreement. This agreement will be revised to reflect this order. In general, the RCFC&WCD, as the Principal Permittee, is responsible for the monitoring program, general overall education program, RCFC&WCD fiscal information, coordinating and submitting Permittee reports to the Regional Board and conducting inspections on RCFC&WCD's storm drain systems. The County of Riverside and the incorporated cities, as the Co-Permittees, will develop and implement site-specific compliance requirements, perform compliance monitoring and inspections, submit storm drain maps, fiscal and other information and compliance reports to the RCFC&WCD, exercise enforcement authority for achieving compliance with programs or BMPs, and review and implement

VOL 22 0401
R0065636

stormwater management programs. The Regional Board will regulate stormwater discharges from state and federal facilities and activities, public utilities, and special districts and other stormwater discharges not under the jurisdiction of the Permittees.

12. The RCFC&WCD obtains its authority to control stormwater discharges, to prohibit discharges or connections to their facilities and to require compliance and carry out inspections of the storm drain systems within the District's boundaries from the RCFC&WCD Act. Various County and city ordinances which address industrial wastes and waste discharges, and land use within the unincorporated areas of Riverside County and Cities can be used by the Permittees to implement compliance activities. The Permittees have various forms of legal authority in place, such as charters, State Code Provisions for General Law Cities, city ordinances, and applicable portions of municipal codes and the State Water Code, to regulate stormwater/urban runoff discharges.

13. The RCFC&WCD has an active surface water quality monitoring program as described in detail in Appendix D of this Order. Initiatives to coordinate stormwater quality monitoring are being discussed at the federal, state and regional levels. These initiatives contemplate potential revisions in local stormwater monitoring programs including participation in special studies, increased data sharing, and modification of baseline data collection activities. It is anticipated that one or more of these initiatives may be implemented as early as fiscal year 1995/96. The Monitoring Program may be modified to reflect the participation of the Permittees in the coordinated monitoring programs or to reflect the findings of special studies.

14. A Water Quality Control Plan was adopted by the Regional Board on May 13, 1983. The Plan contains water quality objectives and beneficial uses of waters in the Santa Ana Region. On July 14, 1989, the Regional Board adopted a Basin Plan amendment, incorporating revised beneficial use designations for the ground and surface waters of the Region.

15. The requirements contained in this order are necessary to implement the Water Quality Control Plan.

16. An attempt has been made to incorporate all of the essential elements of the federal stormwater regulations in this permit.

17. Stormwater discharges to the storm drain systems in Riverside County within the Santa Ana Region are tributary to various water bodies of the State. The identified water bodies are as follows (only a portion of some of the water bodies

VOL 22
0402
R0065637

(3)
VOL 22
04003

listed below is within Riverside County):

A. Inland Surface Streams

a. Santa Ana River
Santa Ana River, Reaches 3 and 4

b. Tributary to South Bank Santa Ana River
Tequesquite Arroyo (Sycamore Creek)
Temescal Creek, Reaches 1, 2, 3, 4, 5 and 6
Temescal Tributaries
Coldwater Canyon Creek
Bedford Canyon Creek
Other tributaries to these creeks

c. Tributary to North Bank Santa Ana River
Day Creek
Sevaine Creek

d. San Jacinto River Basin
San Jacinto River, Reaches 1, 2, 3, 4, 5, 6 and 7
Bautista Creek - Headwaters to Debris Dam
Strawberry Creek
San Jacinto River, North Fork
Fuller Mill Creek
Stone Creek
Salt Creek
Other tributaries: Indian, Hurkey, Poppet and Potrero Creeks

e. San Timoteo Creek Area Streams
San Timoteo Creek, Reach 4
Little San Gorgonio Creek
Other Tributaries to these Creeks - Valley Reaches
Other Tributaries to these Creeks - Mountain Reaches

f. Reche Canyon
Reche Canyon

B. Lake and Reservoirs

a. Lake Evans
b. Lee Lake
c. Lake Mathews
d. Mockingbird Reservoir

R0065638

e. Canyon Lake
f. Lake Elsinore
g. Lake Fulmor
h. Lake Hemet
i. Lake Perris

The beneficial uses of these water bodies include municipal and domestic supply (MUN), agricultural supply (AGR), industrial service supply (IND), industrial process supply (PROC), groundwater recharge (GWR), water contact recreation (REC-1), non-contact water recreation (REC-2), warm freshwater habitat (WARM), cold freshwater habitat (COLD), wildlife habitat (WILD), and preservation of rare and endangered species (RARE). The beneficial uses of individual water bodies are shown on Appendix E.

18. Stormwater discharged from the storm drain systems operated by the County of San Bernardino drain into various water bodies in the project/permit area. These water bodies include the Santa Ana River and San Timoteo Creek and various mountain creeks. The County of San Bernardino has been issued an area-wide stormwater permit (Order No. 90-) for effective control of the pollutants in the stormwater runoff discharged from its storm drain systems.

19. Numeric and narrative water quality standards exist (as found in the Basin Plan's Water Quality objectives) for the water bodies listed in Item No. 17 above. Currently, this Permit does not contain numeric limitations for any constituents because the impact of stormwater discharges on the water quality of the above named receiving waters has not been fully determined. Extensive water quality monitoring and analysis of the data are essential to make that determination. This order requires the Permittees to continue to monitor the stormwater discharges or begin monitoring as necessary, and to analyze the data. Additionally, since this order also requires development and implementation of BMPs by the Permittees, the pollutants in the stormwater runoff will be improved. The ultimate goal of the urban stormwater runoff management program is to attain water quality consistent with the water quality objectives for the receiving waters to protect the beneficial uses.

20. With respect to industrial activities, the Regional Board currently regulates discharges of point source process wastewater and non-process wastewater and stormwater discharges to storm drain systems through NPDES permits. Point source discharges other than stormwater will continue to be regulated by the Regional Board. Industrial stormwater dischargers are required to cooperate with the Permittees to control the discharge of pollutants in the stormwater runoff from individual facilities or to obtain individual industrial stormwater discharge or NPDES General Industrial or NPDES General Construction Permits from the Regional Board.

VOL 22
0404
R0065639

21. Recognizing the need for public involvement and participation in the development and implementation of an effective stormwater/urban runoff management program, the Regional Board will conduct at least one workshop each year during the term of this permit. The purposes of the workshops will be to solicit comments and to inform the public of the progress of the program. Written comments submitted will be forwarded to the State Board, the USEPA, and the RCFC&WCD for their review and comments.

22. In accordance with California Water Code Section 13389, the issuance of waste discharge requirements for this discharge is exempt from those provisions of the California Environmental Quality Act (CEQA) contained in Chapter 3 (commencing with Section 21100), Division 13 of the Public Resources Code.

23. The Regional Board has considered an antidegradation analysis, pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16, for this discharge. The Regional Board finds that the stormwater discharges are consistent with the Federal and State antidegradation requirements and a complete antidegradation analysis is not necessary.

24. The Regional Board has notified the Permittees and interested agencies and persons of its intent to issue waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

25. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

IT IS HEREBY ORDERED that the Permittees, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and regulations and guidelines adopted thereunder, shall comply with the following:

I. RESPONSIBILITIES OF PRINCIPAL PERMITTEE

The Principal Permittee shall be responsible to manage the program overall, including:

1. Conduct water quality and necessary hydrographic monitoring of the storm drain system as agreed to by the Executive Officer, as contained in the Consolidated Program for Water Quality Monitoring (Appendix D) and as noted in Section VI of this Order. Initiatives to coordinate stormwater quality monitoring are being discussed at the federal, state and regional levels. These initiatives contemplate potential revisions in local stormwater monitoring programs including participation in special studies, increased data sharing, and modification of baseline data collection activities. It is anticipated that one or more of these

VOL 22
0405
R0065640

initiatives may be implemented as early as fiscal year 1995/96. The Monitoring Program may be modified to reflect the participation of the Permittees in the coordinated monitoring programs or to reflect the findings of special studies.

2. Implement uniform methods and criteria for storm drain system inspections by all Permittees as agreed to by the Executive Officer, as contained in the Reconnaissance Survey Implementation Plan (Appendix F) and as noted in Section IV of this Order.

3. Conduct inspections/surveillance for illegal discharges to the storm drain facilities within its jurisdiction (ownership) as noted in Section IV of this Order.

4. Implement management programs, and implementation plans within its jurisdiction and powers as required by this Order.

5. Prepare and submit to the Regional Board all the reports, plans and programs as required by this Order.

6. Monitor the implementation of the plans and programs to determine their effectiveness in attaining water quality objectives to the MEP (maximum extent practicable).

7. Coordinate all the activities with the Regional Board.

8. Enact legislation and ordinances as necessary to establish legal authority within the scope and powers of the RCFC & WCD Act.

9. Obtain public input for any proposed management and implementation plans.

10. Pursue enforcement actions as necessary to ensure compliance with stormwater management programs and implementation plans within the scope and powers of the RCFC & WCD Act.

11. Respond to or arrange for a response to emergency situations such as accidental spills, leaks, illegal discharges, illicit connections etc. to prevent or reduce the discharge of pollutants to storm drain systems and waters of the United States.

II. RESPONSIBILITIES OF THE CO-PERMITTEES

The Co-Permittees shall be responsible to manage the program within their respective jurisdictions, including:

1. Conduct inspections/surveillance for illegal discharges to the storm drain facilities within their jurisdiction as noted in Section IV of this Order.

VOL 22
0406
R0065641

2. Conduct and coordinate with the Principal Permittee any surveys and characterizations needed to identify pollutant sources and drainage areas

3. Review, comment and approve management programs, monitoring programs (not stormwater sampling), implementation plans and other elements of the overall program.

4. Implement management programs, monitoring programs (not stormwater sampling) implementation plans and other elements of the overall program within each respective jurisdiction as required by this Order.

5. Submit storm drain facility system maps with periodic revisions as necessary to the Principal Permittee.

6. Prepare and submit all reports and other information to the Principal Permittee in a timely manner with sufficient time for the group report to be submitted, in accordance with Section IX, to the Executive Officer.

7. Adopt resolutions and ordinances as necessary to establish legal controls required for direction of staff or to enable enforcement action to prevent or prosecute stormwater pollution violations.

8. Pursue enforcement actions as necessary to ensure compliance with the stormwater management programs and the implementation plans.

9. Respond to or arrange for a response to emergency situation(s) such as accidental spills, illegal discharges, illicit connections, etc. to prevent or reduce the discharge of pollutants to the storm drain facilities and waters of the United States.

III. GENERAL REQUIREMENTS

1. The Permittees shall prohibit illegal discharges from entering into the municipal storm drain facilities. Discharges conditionally allowed to enter storm drain facilities are specified in Section IV.

2. The Permittees have developed and begun implementation of best management practices (BMPs) to control discharges of pollutants to the maximum extent practicable to the waters of the United States. The BMPs so developed, are found in the Santa Ana Drainage Area Management Plan (DAMP) (Appendix G). The DAMP shall be up-dated and revised, if necessary, in accordance with Section IX (REPORTING).

VOL 22
0407
R0065642

IV. ILLEGAL DISCHARGE CONTROL PROGRAM

1. The Permittees shall implement the Reconnaissance Survey Implementation Plan as developed by the Permittees, as the result of Order 90-104, and included in this Order as Appendix F. In addition or modification to said Plan the following shall apply:

   A. Storm drain systems not previously inspected must be inspected for illegal discharges and illicit connections during the first permit year. This applies to pipes 36 inches and larger built before June 1990 and channels with a bottom width larger than two feet or a depth greater than three feet.

   B. Underground storm drains previously inspected need not be inspected during this permit period.

   C. Channels will be inspected during the third year of the permit period for illegal discharges and illicit connections.

   D. All illicit connections identified shall be eliminated during this permit period.

   E. All illicit discharges identified shall be traced to their source and the source eliminated or permitted by the Regional Board.

   F. A yearly report shall be submitted to the Regional Board, by the month and day specified in Section IX (REPORTING), and shall include the following information:

      1. List of all drainage facilities inspected preformed during the year.

      2. List of all illegal and illicit connections and discharges found during the year and all previously found that have not been eliminated or permitted by the Regional Board.

      3. Information of all inspections, enforcement or other actions taken regarding illegal discharges, illicit connections, illegal disposal of wastes, etc. to public right of ways, public properties or receiving waters, that may or does cause water pollution.

      4. A description of how the Permittees preformed all the actions/duties listed above.

      5. A Reconnaissance Survey Implementation Plan updated from the

VOL 22

040088

R0065643

previous permit period shall be submitted in the first permit year. The up-date shall be complete with reporting forms and how the forms are processed, public personnel/inspector training information or process, who the internal enforcement agency or personnel are and the legal authority used (i.e. laws, ordinance, etc.) for enforcement. If an outside agency preforms the enforcement (i.e. a city has the County Environmental Health Department for enforcement) the agreement needs to be cited and the enforcement process described.

6. The up-dated Reconnaissance Survey Implementation Plan shall be submitted in accordance with Section IX REPORTING. Previous reconnaissance plans and reports have been submitted and are accepted by the Board; no retroactive revisions will be made other than those noted herein.

V. DRAINAGE AREA MANAGEMENT PLAN

Submittals made for the DAMP under order 90-104 have been accepted and no revisions are required unless stated in this Order.

1. The Permittees have developed and are implementing Santa Ana Regional DAMP which is included in this Order as Appendix G. This plan has been approved by the Executive Officer and will meet the requirements of this section if properly implemented. Appendixes H through L included with this Order and noted below are the result of development of different portions of the DAMP. These Appendixes H through L are hereby included in the DAMP as DAMP Supplements A through E ; as noted below.

Appendix H	New Development Conditions Supplement "A"
Appendix I	Education Program Outline Supplement "B"
Appendix J	Stormwater Ordinance Supplement "C"
Appendix K	Soil Erosion Control Ordinance Supplement "D"
Appendix L	NPDES Reporting Forms Supplement "E"

2. The DAMP shall be reviewed, evaluated and revised as needed by the Permittees and an updated DAMP shall be submitted in accordance with Section IX (REPORTING). The Permittees shall address all the best management practices (BMPs) in the DAMP and its Supplements as well as the following:

   A. Enforcement procedures/programs established by the cities and County for the enforcement of the Stormwater and the Soil Erosion Control ordinances.

VOL 22
0409
R0065644

B. BMPs or stormwater pollution prevention plans (SWPPPs) used by the Co-Permittees at their facilities, buildings and yards.

C. Hazardous/toxic waste collection programs.

D. Hazardous/toxic spill response

E. Cooperative action taken with or for the state in conjunction with the state's NPDES Construction General Permit.

F. Cooperative actions taken with or for the state in conjunction with the state's NPDES Industrial General Permit.

G. A listing of all of the Permittees' facilities or projects that are permitted with the NPDES Industrial or Construction General Permits.

3. The Permittees shall submit a DAMP progress report, except during the second permit year, assessing the progress of implementation of the DAMP and evaluating the effectiveness of the BMPs developed for the stormwater discharges. The yearly progress report will also address all of the items A through G listed in Section V.2 DRAINAGE AREA MANAGEMENT PLAN. The DAMP progress report will be submitted in accordance with the schedule in Section IX (REPORTING).

VI. WATER QUALITY MONITORING

1. The Principal Permittee shall implement the Consolidated Program for Water Quality Monitoring (CPWQM) included in this Order as Appendix D. The CPWQM was developed by the RCFC&WCD to address water quality monitoring in Regions 8 and 9 as a program for stormwater system monitoring, receiving water monitoring and data analysis of the monitoring. The CPWQM was written to also include monitoring in Region 7 once a permit is issued.

   The Board supports the concept of a consolidated monitoring program as long as the particular issues of concern of this Regional Board are addressed. In general, a study or pilot program in one Region will be acceptable by this Board as it is deemed to apply and need not be repeated in the Santa Ana River watershed.

2. In addition to implementing the CPWQM the Permittees shall include in their monitoring program the following:

   A. The CPWQM shall have the following purposes:

      1. To assess the quality of stormwater entering receiving waters.

VOL 22
0410
R0065645

2. To assess water quality status or changes in the receiving waters.

3. To provide a basis for mass loading estimates.

4. To provide support to the Illegal Discharge Control Program for the investigation and discovery of illegal discharges or sources of stormwater pollutants.

5. To characterize pollutants 'produced' by different land uses.

6. To support the selection, modification, or evaluation of BMPs implemented from the DAMP.

B. In general the CPWQM shall be supportive of the other programs and activities of the overall NPDES Stormwater Program.

3. Data Analysis Report

A. The results of the chemical analysis and quantitative data (such as flow, precipitation, and discharge data) shall be compiled according to the drainage area and storm events monitored. The mass loading rates for the pollutant of concern shall be calculated.

B. An evaluation shall be performed for the calculated mass loading rates from the stormwater and receiving water monitoring. Any impact of the discharges from the storm drainage systems on the receiving waters shall be discussed, starting with the most significantly impacted receiving water bodies. The evaluation shall be concluded with recommendations and the corrective actions proposed for any resulting discrepancies.

4. The RCFC&WCD shall continue the implementation the CPWQM and shall submit a CPWQM progress report and Data Analysis report on the dates specified in Section IX (REPORTING).

VII. FISCAL ANALYSIS

1. A Fiscal Analysis report shall be submitted to the Regional Board on the dates specified in Section IX (REPORTING). The report shall include information on or an analysis of the following:

A. Each Permittee's expenditures for the previous fiscal year.

B. Each Permittee's budget for the current fiscal year.

VOL 22

041 1 1

R0065646

C. A description of the source of funds for items 1 and 2

D. Contract services (relating to the NPDES Program) - describing the service provided and the amount charged for the service.

E. A list of staff, type of work, estimated time dedicated to the stormwater program and estimated cost.

VIII. PROGRAM ANALYSIS

1. Each year the Principal Permittee shall conduct an analysis of the effectiveness of the overall stormwater management program. If the water quality objectives of the receiving waters are violated as a result of urban stormwater runoff discharges, the Principal Permittee shall identify proposed action(s) which intend to result in the attainment of the water quality objectives. The Principal Permittee shall also propose a time schedule to implement the new action(s).

2. The Program Analysis Report shall provide information explaining or showing the institutional arrangements of the Permittees as a group and individually and the legal authority each has to implement or enforce the various programs of this Order as follows:

   A. a macro flow chart showing all the Permittees and their relationship with each other and other key agencies;

   B. a micro flow chart showing the internal relationships between each Permittee's departments and any external agencies;

   C. a chart of all the BMPs, programs, and actions and the responsible party; and

   D. a copy of all agreements for the implementation or performance of services related to the NPDES Stormwater Program. Once submitted, such agreements need not be submitted the following years.

3. An evaluation of each BMP from the DAMP and other program elements prescribed in this Order implemented by each individual Permittee shall be included with the Program Analysis Report. The Principal Permittee shall develop standard reporting forms and methods for the evaluation. The proposed evaluation forms shall be submitted to the Regional Board for review and approval six months prior to submittal of the Program Analysis Report.

4. Existing data and information pertinent to this program shall be updated annually

VOL 22
041
R0065647

and submitted as part of the Program Analysis Report; unless covered elsewhere in this Order. The existing information and data to be updated shall include but not be limited to:

A. Any changes or additions in storm drainage facilities, new outfalls, or any new major structural controls.

B. Identification of land uses in each drainage area that is sampled during the previous year. The map shall show the storm drain system, drainage boundaries, sampling location and the following groups of land uses: commercial; industrial (including hospitals); parks, schools, and churches; residential; undeveloped and rural (less than one house per two-acres); and agriculture.

C. Any additional industries subject to the State's General Industrial Activities Stormwater Permit identified during the last year.

IX. REPORTING

1. All reports shall be signed by the Principal Permittee or duly authorized representative of the Permittees and shall be submitted to the Regional Board under penalty of perjury.

2. The Permittees shall be responsible for the submittal of the needed information, forms, data, or other materials needed to meet the requirements of each and every submittal with or without request from the Principal Permittee or the Regional Board to the Principal Permittee. Said information, forms, data, or other material submitted for reporting to the Regional Board shall be signed by a duly authorized representative of that Permittee under penalty of perjury.

3. Reports or submittals required in the previous sections of this Order shall be submitted in accordance with the following schedule:

	Submittal/Report	Frequency	Date
A.	Water Quality Monitoring 1. Stormwater 2. Receiving Waters 3. Data Analysis	Yearly	August 31

VOL 22
0413
R0065648

B.	Progress Report 1. Fiscal Analysis 2. Program Analysis 3. Existing Data Update 4. DAMP Progress 5. Program Management	Yearly	September 30
C.	Illegal Discharge Control 1. Personnel Training/Reports 2. Facility/Channel Survey 3. Monitoring Investigations 4. Construction Controls 5. Illegal Reports & Actions 6. Enforcement Actions	Yearly	October 31
D.	DAMP Revision	Once	July 31, 1997
E.	Reconnaissance Survey Implementation Plan/ Illegal Discharge Control Program Revision	Once	June 30, 1996

X. EXPIRATION AND RENEWAL

1. This Order expires on July 1, 2000 and the Permittees must file a Permit Renewal Application in accordance with Title 23, Division 3, Chapter 9 of the California Code of Regulations as applicable not later than 180 days in advance of such expiration date as application for issuance of new waste discharge requirements. This Permit Renewal Application shall include, but not be limited to, the following:

   A. Summary of the results of the Monitoring Program.

   B. Summary of the DAMP BMPs implemented and evaluations of their effectiveness.

   C. Summary of the Illegal Discharge Control Program

   D. Evaluation of the need for additional BMPs, source control,and other control measures.

   E. Proposed plan of urban stormwater runoff quality management activities that will be undertaken during the term of the next Order.

VOL 22
0414
R0065649

F. Any significant changes to the storm drain systems, outfall, detention or retention basins or dams, and other controls.

XI. CERTIFICATION

This Order shall serve as a NPDES permit pursuant to Section 402(p) of the Clean Water Act, or amendments thereto, and shall become effective 10 days after date of its adoption, provided that the Regional Administrator of the Environmental Protection Agency has no objection. If the Regional Administrator objects to its issuance, the permit shall not become effective until such objection is withdrawn.

I, Gerard J. Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Control Board, Santa Ana Region, on June 29, 1995.

Gerard J. Thibeault
Executive Officer

VOL 22
0415
R0065650

DRAFT

I. GENERAL REQUIREMENTS

A. The following entities (permittees) are subject to the terms and conditions of this Order and shall cooperate in the development and implementation of a comprehensive county-wide storm water/urban runoff management program:

Cities	County	Other
Carlsbad	San Diego	San Diego Unified Port District
Chula Vista		
Coronado		
Del Mar		
El Cajon		
Encinitas		
Escondido		
Imperial Beach		
La Mesa		
Lemon Grove		
National City		
Oceanside		
Poway		
San Diego		
San Marcos		
Santee		
Solana Beach		
Vista		

B. The permittees shall approve and sign the Memorandum of Understanding submitted as part of the Permit Application. The Permittees will submit a copy of the signed legally binding Memorandum of Understanding to the Regional Board within 30 days of the adoption of this Order. Any revisions to the Memorandum of Understanding shall be forwarded to the Executive Officer within 30 days of approval by all the permittees.

C. The permittees shall prohibit illicit/illegal discharges from entering into storm water conveyance systems. Discharges conditionally allowed to enter storm water conveyance systems are specified in Item No. VIII below.

D. As specified in Item No. IX, the permittees shall implement best management practices (BMPs) developed during the previous permit period. In addition, the permittees shall develop and implement additional BMPs according to the schedule specified in Item No.IX. Other BMPs that the Executive Officer determines appropriate to control or reduce the discharge of pollutants to waters of the United States to the maximum extent practicable will be developed as

VOL 22

0416

necessary. In developing the BMP practices, the permittees shall consider the water quality objectives of all the receiving waters and emphasize pollution prevention.

E. The permittees shall ensure that BMPs are implemented by entities discharging to the storm water conveyance systems within their area of jurisdiction.

II. RESPONSIBILITIES OF PRINCIPAL PERMITTEE

The principal permittee, as a minimum, shall be responsible for the overall program management or coordination as specified in the proposed Memorandum of Understanding.

III. RESPONSIBILITIES OF COPERMITTEES

The copermittee, as a minimum, shall be responsible for management of storm water and urban runoff management programs within their jurisdictions as specified in the proposed Memorandum of Understanding.

IV. RESPONSIBILITIES OF THE MANAGEMENT COMMITTEE

The Management Committee, as a minimum, shall be responsible for the tasks specified in the proposed Memorandum of Understanding.

V. FISCAL ANALYSIS

A. By January 15 of each year, a fiscal analysis of the capital and operation and maintenance expenditures necessary to accomplish the activities of the proposed plans and programs shall be performed by each permittee and the results submitted to the principal permittee. The principal permittee will submit a collated report to the Regional Board by January 31 of each year.

B. By July 15 of each year a fiscal analysis of the previous fiscal years expenditures shall be performed by each permittee and the results submitted to the principal permittee. The principal permittee will submit a collated report to the Regional Board by July 31 of each year.

C. The report will follow a format so that the following information can be determined from it:

Total Budget
Source of Funding

Budget Specifics:

Program Element	Proposed	Previous

VOL 22

04171

	Expenditure	Year Expenditure
Program Management		
Illicit Connection/ Illegal Discharge Program		
Illicit Connections		
Field Screening		
Other (provide details as necessary)		
BMP Program		
Public Education		
Other BMPs (provide details as necessary)		
Monitoring		

D. At the time that the municipal budget is passed, the permittee must submit a copy of the portion showing the appropriations relevant to the storm water program. If the appropriation is significantly different than the proposed budget, the permittee must also submit a revised plan showing how the budget changes will be made.

VI. LEGAL AUTHORITY

A. Permittees who did not provide proof of adequate legal authority during the previous permit period will provide that proof within 30 days of the adoption of this order. For most permittees, adequate legal authority has taken the form of an ordinance passed by their governing body that follows the form of the model ordinance.

B. At any time that the legal counsel for the permittee finds that their legal authority is not sufficient to enforce the terms of the permit, they must seek additional authority.

C. At the time the Regional Board adopts a policy on Non-Storm Water Discharges, permittees will be required to obtain the legal authority to implement that policy.

VII. STORM WATER/RECEIVING WATER MONITORING PROGRAM

A. The permittees shall continue to implement the monitoring program currently in effect with the adjustments outlined in Attachment A. The permittees will review the monitoring program annually and suggest changes. Proposed changes to the monitoring program shall be subject to the approval of the Executive Officer.

VOL 22

0418

B. The Executive Officer of the Regional Board will review the monitoring program annually and make changes to it as necessary.

C. A report on the monitoring program will be submitted on July 31 of each year by the principal permittee, including recommendations for the following year.

VIII. ILLICIT CONNECTION/ILLEGAL DUMPING DETECTION PROGRAM

IX. BEST MANAGEMENT PRACTICES PROGRAM

A. The permittees will implement all of the following BMPs within 180 days of the adoption of this order:

1. Establish a public education program including the following elements:
   - A. Establish or improve an areawide catch basin stenciling program to discourage dumping, discarding, and/or discharge of pollutants or debris into storm water conveyance systems.
   - B. Develop programs to promote, publicize and facilitate public reporting of illegal discharges and/or dumping.
   - C. Develop/augment public education and outreach programs on the topic of catch basins and storm water conveyance systems and their intended purpose.
   - D. Encourage owners and occupants of homes or businesses to remove dirt, rubbish, and debris from their sidewalks and alleys which may contribute pollutants to urban runoff (i.e, sweep and discard in trash).
   - E. Encourage recycling of oil, antifreeze, glass, plastic, and other materials to prevent their improper disposal into the storm water conveyance system.
   - F. Encourage the proper disposal of household hazardous wastes to prevent the improper disposal of such materials to the storm water conveyance system.
   - G. Encourage the proper use and conservation of water to minimize runoff from landscaped areas, lawns, golf-courses, etc.
   - H. Educate all municipal departments and personnel on the requirements of the storm water program and on ways that the municipality can comply and encourage compliance with those requirements.
2. Provide catch basin and storm water channel cleaning when and where needed.

VOL 22
0419
R0065654

3. Increase cleaning frequency and number of roadside and beach trash receptacles in areas where needed.

4. Increase street sweeping in areas where needed.

5. Create or augment a program to eliminate the improper disposal of litter, lawn/garden clippings, and pet feces into the street or areas where runoff may carry these pollutants to the storm drainage system.

6. Participate in recycling and Household Hazardous Waste programs.

7. Incorporate storm water quality BMPs into the requirements for all construction projects within the municipal jurisdiction.

B. During the first year of the five year permit period (FY 1995-96), in addition to the implementation of the baseline BMPs, permittees will also develop a Municipal Source Control Program. This program will focus on control of pollutants from all city activities and city facilities such as corporation yards, and city maintenance facilities. Tasks will include:

Identification of all municipal activities which can lead to storm water pollution. These can include, but are not limited to vehicle maintenance, painting, landscape maintenance and weed control, water body maintenance including swimming pool maintenance, construction and maintenance of streets and roads, construction and maintenance of flood control system and drinking water system activities;

Identification of pollutants and potential paths of pollution associated with these activities;

Development of SWPPP for municipal facilities such as corporation yards and vehicle maintenance facilities;

Development of a program for inspection of municipal facilities including methodology and schedule.

Development of a BMP program, stressing pollution prevention for all municipal activities. This should include a focused education program for city employees;

Development of a schedule for implementing the BMP and inspection programs, including activities that can be implemented immediately, activities that can be implemented in the short term, and activities that can be implemented over the long term.

VOL 22

04220

C. By July 15, 1996 permittees will provide the principal permittee with a report on their BMP program. This will include a report on their baseline program activities and a report on all of the tasks listed above. In addition, they will provide a schedule for implementation of the Municipal Source Control. Tasks that are identified for immediate implementation, including education programs should be implemented immediately without waiting for Regional Board approval.

D. During the second year of the five year permit period (FY 1996-97), permittees will continue to implement the seven baseline BMPs, the Municipal Source Control program and will evaluate the need for additional BMPs.

Permittees will also evaluate their program under baseline BMP Number Seven, and develop a more comprehensive Construction Source Control program for managing runoff from new development and redevelopment both for projects that are covered by the State Construction General Permit and projects that are under five acres. Tasks will include:

Evaluation of the current grading ordinance and planning department requirements;

Evaluation of construction site management;

Evaluation of training and outreach efforts;

Evaluation of required control measures;

Development of an inspection program or a program for integrating storm water inspection requirements into current inspection programs.

Development of a BMP program for new construction and redevelopment that addresses the deficiencies uncovered by this evaluation;

Development of a schedule for implementing the BMP program, including activities that can be implemented immediately, activities that can be implemented in the short term, and activities that can be implemented over the long term.

E. By July 15, 1997 permittees will provide the principal permittee with a report on their BMP program. This will include a report on their baseline program activities, the program for municipal facilities and a report on all of the

VOL 22

0421

tasks listed above. In addition, they will provide a schedule for implementation of their Construction Source Control program. Tasks that are identified for immediate implementation, including education programs should be implemented immediately without waiting for Regional Board approval. Permittees will also report on the adequacy of their grading ordinance and provide a plan and schedule for obtaining adequate legal authority if the current ordinance is not adequate.

F. During the third year of the five year permit period, permittees will continue to implement the seven baseline BMPs and the Municipal Source Control Program, and will evaluate the need for additional BMPs.

Permittees will also develop a Commercial Source Control program. Tasks will include:

Evaluation of existing program;

Identification of all commercial sources;

Identification and categorization of pollutants associated with these sources;

Development of a BMP program for commercial facilities including an education program targeting specific types of facilities;

Development of a schedule for implementing the BMP program, including activities that can be implemented immediately, activities that can be implemented in the short term, and activities that can be implemented over the long term;

Development of procedures and a schedule for inspecting commercial facilities or a program for integrating storm water inspection requirements into current inspection programs.

G. By July 15, 1998 permittees will provide the principal permittee with a report on their BMP program. This will include a report on their baseline program activities, their Municipal Source Control Program, their Construction Source Control Program, and a report on all of the tasks listed above. In addition, they will provide a schedule for implementation of their Construction Source Control program, including the inspection schedule. Tasks that are identified for immediate implementation, including education programs should be implemented immediately without waiting

VOL 22

04222

for Regional Board approval.

H. During the fourth year of the permit period (FY 1998-99) permittees will continue to implement the seven baseline BMPs, the existing source control programs, evaluate the need for additional BMPs and begin implementation the Commercial Source Control program.

Permittees will also develop an Industrial Source Control program to complement the State industrial program. The Regional Board will cooperate with this effort by providing information wherever possible. Tasks will include:

Evaluation of existing program;

Identification of all industrial sources;

Identification of pollutants associated with these sources;

Development of a BMP program for industrial facilities including an education program targeting specific types of facilities;

Development of a schedule for implementing the BMP program, including activities that can be implemented immediately, activities that can be implemented in the short term, and activities that can be implemented over the long term;

Development of procedures and a schedule for inspecting industrial facilities in cooperation with the State program or a program for integrating storm water inspection requirements into current inspection programs.

I. By July 15, 1999 permittees will provide the principal permittee with a report on their BMP program. This will include a report on their baseline program activities, all of their Source Control Programs, and a report on all of the tasks listed above. In addition, they will provide a schedule for implementation of their Industrial Source Control Program. Tasks that are identified for immediate implementation, including education programs should be implemented immediately without waiting for Regional Board approval.

J. During the fifth year of the permit period permittees will continue to implement the seven baseline BMPs and will evaluate the need for additional BMPs. Permittees will continue to implement their previously identified Source Control Programs and will begin implementation

VOL 22

0423

of the program for control of Industrial sources. In addition, permittees will do an internal audit on all of their BMPs and evaluate what changes need to be made. The results of this audit will be used to prepare the permit application for the next permit.

K. By July 15, 1999 permittees will provide the principal permittee with a report on their BMP program. This will include a report on their baseline program activities and on the implementation of all of their source control programs.

X. PROGRAM ANALYSIS

The permittees shall conduct an annual analysis of the effectiveness of the overall storm water pollution control management program in their areas of jurisdiction.

XI. REPORTING AND SCHEDULE

A. A summary of tasks to be completed and reports submitted is as follows:

Within 30 days of the adoption of this order:

The Memorandum of Understanding must be signed and submitted to the Regional Board.

Permittees who had not obtained adequate legal authority through passage of an ordinance during the first permit period must submit evidence of adequate legal authority.

Within 180 days of the adoption of this order:

Permittees who had not developed an adequate BMP program during the first permit period, which addresses all of the seven baseline BMPs must submit evidence of an adequate program.

By January 31, 1996:

A proposed storm water management program for FY 1996-97 including:

A Fiscal Analysis of the proposed program;

An illicit discharge program including field screening;

A proposed monitoring program;

A proposed BMP program.

VOL 22 0424

By July 31, 1996:

An analysis of the FY 1995-96 storm water management program with an explanation on significant changes to the proposed program including:

A Fiscal Analysis of the actual expenditures;

A report on the results of the illicit discharge and field screening programs;

A report on the results of the monitoring program;

A report on the existing BMP program;

A report on the tasks identified under the municipal source control program; and

An analysis of the overall program and program effectiveness.

By January 31, 1997:

A proposed storm water management program for FY 1997-98 including:

A Fiscal Analysis of the proposed program;

An illicit discharge program including field screening;

A proposed monitoring program;

A proposed BMP program.

By July 31, 1997:

An analysis of the FY 1996-97 storm water management program with an explanation on significant changes to the proposed program including:

A Fiscal Analysis of the actual expenditures;

A report on the results of the illicit discharge and field screening programs;

A report on the results of the monitoring program;

A report on the existing BMP program;

VOL 22

0425

A report on the Construction Source Control program with an implementation schedule;

A report on the grading ordinance; and

An analysis of the overall program and program effectiveness.

By January 31, 1998:

A proposed storm water management program for FY 1998-99 including:

A Fiscal Analysis of the proposed program;

An illicit discharge program including field screening;

A proposed monitoring program;

A proposed BMP program.

By July 31, 1998:

An analysis of the FY 1997-98 storm water management program with an explanation on significant changes to the proposed program including:

A Fiscal Analysis of the actual expenditures;

A report on the results of the illicit discharge and field screening programs;

A report on the results of the monitoring program;

A report on the existing BMP program;

A report on the Commercial Source Control program with an implementation schedule;

And an analysis of the overall program and program effectiveness.

By January 31, 1999:

A proposed storm water management program for FY 1999-2000 including:

A Fiscal Analysis of the proposed program;

An illicit discharge program including field screening;

VOL 22

0426

A proposed monitoring program;

A proposed BMP program.

By July 31, 1999:

An analysis of the FY 1998-99 storm water management program with an explanation on significant changes to the proposed program including:

A Fiscal Analysis of the actual expenditures;

A report on the results of the illicit discharge and field screening programs;

A report on the results of the monitoring program;

A report on the existing BMP program;

A report on the Industrial Source Control program with an implementation schedule; and

An analysis of the overall program and program effectiveness.

By January 17, 2000:

A permit application for the NPDES storm water permit to be adopted in July, 2000.

By July 31, 2000:

An analysis of the FY 1999-2000 storm water management program with an explanation on significant changes to the proposed program including:

A Fiscal Analysis of the actual expenditures;

A report on the results of the illicit discharge and field screening programs;

A report on the results of the monitoring program;

A report on the existing BMP program; and

An analysis of the overall program and program effectiveness.

B. All reports and information required herein shall be submitted to the Executive Officer of the Regional

VOL 22

04271

DRAFT April 13, 1995 11:59 am

California Regional Water Quality Control Board
San Diego Region
ORDER NO. 95-??
NPDES NO. CA
Waste Discharge Requirements
for Storm Water/Urban Runoff
from the County of San Diego
the
Incorporated Cities of San Diego County
and the San Diego Unified Port District

The California Regional Water Quality Control Board, San Diego Region (hereinafter RWQCB), finds that:

1. Section 405 of the Water Quality Act of 1987 added § 402(p) to the Clean Water Act (33 U.S.C. § 1251 et seq. (1977)) (hereafter CWA) requiring permits for storm water discharges from municipal separate storm water conveyance systems and prohibits non-storm water discharges into these systems. On November 16, 1990, the United States Environmental Protection Agency (EPA) published regulations for storm water discharges pursuant to § 402(p) of the CWA. This Order was prepared to meet the RWQCB Water Quality Control Plan, San Diego Basin (9), (September 8, 1994) (hereafter Basin Plan) requirements and to satisfy EPA's regulations on applying for a National Pollutant Discharge Elimination System (NPDES) permit for storm water discharges from separate municipal storm water conveyance systems.

2. The following entities are currently permitted under Order No. 90-42 for storm water/urban runoff discharges. Order No. 90-42 expires July 16, 1995. The application for renewal of Order No. 90-42 was received on January 17, 1995.

3. Each watershed in the permitted area has specific characteristics and water quality problems. A **watershed** is defined as a drainage area or basin in which all land and water areas drain or flow toward a central collector such as a stream, river, or lake at a lower elevation. The tasks performed under this Order should include a consideration of all of the specific characteristics and problems of the watershed. Cities should work together to develop unified approaches in their shared watersheds.

4. Storm water/urban runoff from the County of San Diego, all cities in San Diego County and the area under the jurisdiction of the San Diego Unified Port District (SDUPD) contribute to violations of water quality standards and/or are significant contributors of pollutants to waters of the United States. Storm water as defined in 40 C.F.R. § 122.26(b)(13) means "storm water runoff, snow melt runoff, and surface runoff and drainage." **Table 1**, summarizes water quality standard violations to which storm water/urban runoff discharges from various entities in San Diego County contribute. Consequently, the County of San Diego, all the incorporated cities in the San Diego County, and SDUPD are named as Permittees in this Order.

5. Water quality studies have shown that urban runoff typically contains significant quantities of pollutants which adversely affect water quality in receiving waters. A comprehensive storm water/urban runoff management program is essential for the protection of the water resources of the region. To establish an effective county-wide storm water/urban runoff pollution control management program, it is necessary to name all incorporated cities in San Diego County, the SDUPD, and the County of San Diego as Permittees in this Order. In the County of San Diego, areas subject to the terms and conditions of this Order are those unincorporated areas within the County of San Diego's **Urban Limit Line** (define). The remaining areas subject to the terms and conditions of this Order are within the boundary lines of the incorporated cities, and the lands under the jurisdiction of the SDUPD.

VOL 22

0429

6. The discharges consist of surface runoff generated from various land uses and activities in hydrologic drainage areas which discharge into receiving waters in San Diego County. The quality and quantity of these discharges are affected by land use, basin hydrology and geology, season, the frequency and duration of storm events, the presence of illicit connections and illegal discharges, human activities, and waste management and disposal practices. The parameters and pollutants of potential concern and significance in these illegal discharges may include, but are not limited to pH, fecal coliform, total coliform, fecal streptococcus, enterococcus, volatile organic carbon (VOC), surfactants (MBAS), oil and grease, petroleum hydrocarbons, total suspended and settleable solids, total organic carbon, biochemical oxygen demand (BOD), chemical oxygen demand (COD), lead, copper, chromium, cadmium, silver, nickel, zinc, cyanides, phenols, nutrients (e.g., nitrogen, nitrate, phosphate, etc.), and biocides (e.g., pesticides). Since storm water contains "waste" as defined in California Water Code (CWC) § 13050, storm water discharges constitute discharges of waste. Consequently such discharges are subject to CWC § 13260 et seq., as well as CWA § 402 as amended.

7. This Order requires the Permittees to have legal authority to require the prevention and control of pollutants in storm water/urban runoff discharges, prohibit illegal discharges and control spills, and require compliance with storm water/urban runoff management programs and carry out inspections of the drainage facilities in their area of jurisdiction. Various forms of legal authority, such as charters, State Code provisions for General Law cities, city ordinances and applicable portions of Municipal Codes and the State Water Code may be used. Where an individual Permittee does not already have the legal authority to do so, the Permittee must establish the legal authority to control pollutants in storm water/urban runoff discharges to receiving waters of the United States.

8. This Order requires the Permittees to sign the Memorandum of Understanding (MOU) submitted with the permit application which defines the roles and responsibilities of each of the parties.

9. This Order requires the Permittees to develop a comprehensive county-wide storm water/urban runoff management program consisting of a management structure

VOL 22

0430

which allows implementation of all of the program elements; adequate legal authority; adequate fiscal resources; a program to find and eliminate illicit connection and illegal discharges to the storm water conveyance system; a program of Best Management Practices to eliminate pollutants from entering the storm water conveyance system that addresses Residential, Industrial, Commercial and Construction sources; and a monitoring and field screening program. Permittees will implement programs to ensure that entities discharging storm water into storm water conveyance systems take steps to prevent, control or reduce discharges of pollutants to waters of the United States. Storm water conveyance system as defined in 40 C.F.R. § 122.26(b)(8) means "a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):

> (i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;
>
> (ii) Designated or used for collecting or conveying storm water;
>
> (iii) Which is not a combined sewer; and
>
> (iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2."

The City of San Diego defines a SWCS as "those municipal and natural facilities within the City of San Diego by which storm water/urban runoff may be conveyed to waters of the United States, including any roads with drainage systems, municipal streets, catch basins, natural and artificial channels, aqueducts, canyons, stream beds, gullies, curbs, gutters, ditches, or storm drains."

The RWQCB has the discretion and authority to require non-cooperating entities to participate in this county-

VOL 22 0431

wide permit or obtain individual waste discharge requirements (WDRs).

10. The Basin Plan was adopted by the RWQCB on March 17, 1975 and subsequently approved by the State Water Resources Control Board (SWRCB). Subsequent revisions to the Basin Plan have also been adopted by the RWQCB and approved by the SWRCB, most recently December 8, 1994.

11. Storm water/urban runoff discharges in San Diego County are tributary to various receiving waters, including creeks, rivers, reservoirs, lakes, lagoons, estuaries, harbors, bays, and the Pacific Ocean. The receiving waters under the jurisdiction of the RWQCB are identified in the Basin Plan.

12. The Basin Plan identifies the following beneficial uses of state ocean waters to be protected:

a. Industrial service supply;
b. Navigation;
c. Contact water recreation;
d. Non-contact water recreation;
e. Commercial and sport fishing;
f. Preservation of biological habitats of special significance;
g. Rare, threatened, or endangered species;
h. Marine habitat;
i. Migration of aquatic organisms;
j. Aquaculture;
k. Spawning, reproduction, and/or early development;
l. Wildlife habitat; and
m. Shellfish harvesting.

The Basin Plan relies primarily on requirements of the Ocean Plan for protection of those beneficial uses. However, the Basin Plan establishes additional water quality objectives for dissolved oxygen and pH.

13. The SWRCB adopted a Water Quality Control Plan for Enclosed Bays and Estuaries of California (Bays and Estuaries Plan) on November 19, 1992. The Plan established water quality principles, guidelines, effluent quality requirements and prohibitions to govern the disposal of wastes in the enclosed bays and estuaries of California. The Bays and Estuaries Plan applies to the following receiving waters:

a. Tijuana River Estuary
b. San Diego Bay

VOL 22
0432
R0065667

c. Mission Bay
d. Los Peñasquitos Lagoon
e. San Dieguito Lagoon
f. San Elijo Lagoon
g. Batiquitos Lagoon
h. Agua Hedionda Lagoon
i. Buena Vista Lagoon
j. Oceanside Harbor/Del Mar Boat Basin
k. Santa Margarita Lagoon

14. The Bays and Estuaries Plan contains the following prohibition specific to land runoff:

> "The direct or indirect discharge of silt, sand, soil, clay, or other earthen materials from onshore operations including mining, construction, agriculture, and lumbering, in quantities which unreasonably affect or threaten to affect beneficial uses shall be prohibited."

15. The SWRCB adopted a Water Quality Control Plan for Inland Surface Waters (Inland Surface Waters Plan) of California on April 11, 1991. The Plan established water quality principles, guidelines, effluent quality requirements and prohibitions to govern the discharges of wastes in inland surface waters. The Inland Surface Waters Plan contains the following prohibition to discharges:

> "In no case shall discharges to inland surface waters result in a violation of objectives for downstream water bodies. The water quality objectives of this plan apply throughout a water body outside mixing zones, except that no acute toxicity shall occur within mixing zones. The Regional Boards shall determine where, at the confluence of water bodies with different water quality objectives, the differing objectives apply. This determination may be reviewed by the State Board."

Inland surface waters means all surface waters of the State which do not include the ocean, enclosed bays, or estuaries. Mixing zone means a designated volume of a receiving water where wastewaters and receiving waters mix. Allocation of a mixing zone provides limited dilution of a wastewater discharge before certain water quality objectives must be met. Acute toxicity means less than ninety percent survival, fifty percent of the time, and less than seventy percent survival, ten percent of the time, of standard test organisms in undiluted effluent in a 96-hour static or continuous-flow test.

VOL 22

0433

16. The SWRCB approved an amendment to the Water Quality Control Plan for Ocean Waters of California (Ocean Plan) on March 22, 1990. The Ocean Plan identifies the following beneficial uses of state ocean waters to be protected;

a. Industrial Water Supply;
b. Navigation;
c. Aesthetic Enjoyment;
d. Water Contact Recreation;
e. Non-contact Water Recreation;
f. Commercial and Sport Fishing;
g. Mariculture;
h. Preservation and enhancement of areas of special biological significance;
i. Preservation and enhancement of rare and endangered species;
j. Marine habitat;
k. Fish migration;
l. Fish spawning; and
m. Shellfish harvesting.

In order to protect the above beneficial uses, the Ocean Plan established water quality objectives (for bacteriological, physical, chemical, and biological characteristics, and for radioactivity), general requirements for management of waste discharged to the ocean, quality requirements for waste discharges, discharge prohibitions, and general provisions.

17. Although the Basin Plan relies primarily on the Ocean Plan for the protection of marine waters, the Basin Plan contains the following prohibitions, applicable to discharges, for waters subject to tidal action:

> "The dumping or deposition from shore or from vessels of oil, garbage, trash or other solid municipal, industrial or agricultural waste directly into waters subject to tidal action or adjacent to waters subject to tidal action in any manner which may permit it to be washed into the waters subject to tidal action is prohibited."
>
> "Discharge of industrial waste-waters exclusive of cooling water, clear brine or other waters which are essentially chemically unchanged, into waters subject to tidal action is prohibited."
>
> "The dumping or deposition of chemical wastes, chemical agents or explosives into waters subject to tidal action is prohibited."

VOL 22

0434

18. The Basin Plan identifies the following beneficial uses of inland surface waters in San Diego County:

a. Municipal and domestic supply;
b. Agricultural supply;
c. Industrial service supply;
d. Industrial process supply;
e. Ground water recharge;
f. Freshwater Replenishment;
g. Hydropower generation;
h. Contact water recreation;
i. Non-contact water recreation;
j. Preservation of biological habitats of special significance;
k. Warm freshwater habitat;
l. Cold freshwater habitat;
m. Rare, threatened, or endangered species; and
n. Wildlife habitat.

The Basin Plan also identifies groundwater recharge as a potential beneficial use for several surface waters within the region. Site-specific listings of beneficial uses are listed in the Basin Plan.

19. The Basin Plan contains the following prohibitions, applicable to discharges, for inland surface waters:

> "Discharge of treated or untreated sewage or industrial wastes to a natural watercourse upstream of surface storage or diversion facilities used for municipal supply is prohibited."
>
> "Discharge of treated or untreated sewage or industrial wastewater, exclusive of cooling water or other waters which are chemically unchanged, to watercourse, is prohibited except in cases where the quality of said discharges complies with the receiving body's water quality objectives."
>
> "The dumping or deposition of oil, garbage, trash, or other solid municipal, industrial, or agricultural waste directly into inland waters or watercourses or adjacent to the water courses in any manner which may permit its being washed into the watercourse is prohibited."
>
> "Land grading and similar operations causing soil disturbance which do not contain provisions to minimize soil erosion and limit suspended matter in area runoff are prohibited."

VOL 22
0435
R0065670

20. The requirements contained in this Order are necessary to implement the objectives of the Ocean Plan, Bays and Estuaries Plan, Inland Surface Waters Plan, and the Basin Plan for receiving waters within the region.

21. Numerical and narrative water quality standards exist for the receiving waters in the region. Due to the enormous variability in storm water/urban runoff quality and quantity and the complexity of urban runoff, this Order does not contain numerical limitations for any constituent. The impact of storm water/urban runoff discharges on water quality of receiving waters has not been fully determined. Extensive water quality monitoring and analysis are essential to make that determination. This Order requires the Permittees to monitor their discharges and to analyze the data obtained. This Order also requires the development and implementation of best management practices (BMPs). BMPs are defined as "schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States" (40 C.F.R. § 122.2). BMPs also include treatment requirements, operating procedures, and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage. For purposes of this Order, BMPs for the prevention and control of pollutants in storm water/urban runoff may include the use of non-structural (e.g., public education, regulatory powers, urban planning, etc.) and structural (e.g., detention basins, grass swales, runoff infiltration devices, etc.) controls which may be applied to a particular site or throughout a region (e.g., a city or throughout an area served by a storm water conveyance system). Pollution prevention is the best approach for a BMP program.

22. Pursuant to 40 C.F.R. § 131.12 and SWRCB Resolution No. 68-16, Statement of Policy with Respect to Maintaining High Quality of Waters in California (collectively "antidegradation policies"), the RWQCB shall ensure that any increase in pollutant loading to a receiving water meets the requirements stated in the foregoing policies. At a minimum, permitting actions shall be consistent with the following:

    a. Existing instream water uses and the level of water quality necessary to protect existing beneficial uses shall be maintained and protected;

    b. Where the quality of the waters exceed levels necessary to support propagation of fish, shellfish, and wildlife and recreation in and on the water, the quality shall be maintained and protected unless the State finds,

VOL 22 0436

after full satisfaction of the intergovernmental coordination and public participation provisions of the State's continuing planning process, that allowing lower water quality is necessary to accommodate important economic or social development in the area in which the waters are located;

c. Where high quality waters constitute an outstanding national resource, such as waters of National and State parks and wildlife refuges and waters of exceptional recreational or ecological significance, that water quality shall be maintained and protected; and

d. In those cases where potential water quality impairment associated with a thermal discharge is involved, the antidegradation policy and implementing method shall be consistent with CWA § 316.

23. The RWQCB, in establishing the requirements contained herein, has taken into consideration the requirements of the State and Federal antidegradation policies and has determined that:

a. The conditions and requirements established in this Order for discharges of storm water/urban runoff to waters of the United States ensure that the existing beneficial uses and quality of receiving Bay waters will be protected and improved through the implementation of BMPs for the prevention and control of pollutants in storm water/urban runoff;

b. Discharges of storm water/urban runoff to waters of the United States will continue regardless of the issuance of this Order. The issuance of this Order is necessary to ensure achievement and maintenance of the goals and objectives of the water quality control plans adopted by the State;

c. Thermal discharges potentially impairing water quality are not authorized under the terms and conditions of this Order, thus, CWA § 316 is not applicable.

24. Pursuant to CWA § 402, and amendments thereto, and pursuant to CWC § 13260 et seq., this Order shall serve as an NPDES permit and waste discharge requirements for the discharge of storm water/urban runoff to surface waters of San Diego County.

25. Pollution should be prevented or reduced at the source, whenever feasible; pollution that cannot be prevented should be recycled in an environmentally safe manner, whenever

VOL 22

0437

feasible; pollution that cannot be prevented or recycled should be treated in an environmentally safe manner, whenever feasible; and disposal or other releases into the environment should be employed only as a last resort and should be conducted in an environmentally safe manner.

Pollution prevention is the first step in reducing pollution in any pollution reduction program, including nonpoint source pollution prevention and control programs. Pollution prevention is the utilization of techniques, material substitutions and policies that eliminate or reduce the generation of pollutants, and is often the most cost effective option to reduce pollution because it may:

a. reduce material loss;

b. reduce the need for expensive "end of pipe" treatment and other pollution control technologies;

c. reduce on site and off site waste disposal costs;

d. reduce costs by conserving energy, water, chemicals, and other inputs;

e. reduce production costs through better management;

f. reduce costs associated with accidental releases;

g. reduce the potential long term liability associated with waste generation; and

h. avoid costs associated with cleanups.

i. reduce health risks associated with exposure to pollutants.

After pollution prevention, source control of the pollutants that are generated is the next step in reducing nonpoint source pollution. Examples of source control include:

a. Reducing or eliminating the introduction of pollutants to a land area (reduced nutrient and pesticide application).

b. Preventing pollutants from leaving the site during land-disturbing activities (erosion control measures on construction sites).

c. Preventing interaction between precipitation and introduced pollutants (cover materials stored outside).

VOL 22 0438

d. Protecting riparian habitat and other sensitive areas (shorelines and wetlands).

e. Protecting natural hydrology (maintenance of pervious surfaces in developing areas and water conservation).

26. The RWQCB, in establishing the requirements contained herein, considered factors including, but not limited to, the following:

a. Beneficial uses to be protected and the water quality objectives reasonably required for that purpose;

b. Other waste discharges;

c. The need to prevent nuisance;

d. Past, present, and probable future beneficial uses of the waters under consideration;

e. Environmental characteristics of the waters under consideration:

f. Water quality conditions that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area;

g. Economic considerations; and

h. The need for developing housing within the region.

27. The issuance of this Order for the discharge of storm water/urban runoff is exempt from the requirement for preparation of environmental documents under the California Environmental Quality Act (Pub. Resources Code, div. 13, ch. 3, § 21000 et seq.) in accordance with the CWC § 13389.

28. The RWQCB has considered all water resource related environmental factors associated with the discharge of storm water/urban runoff.

29. The RWQCB has notified all known interested parties of its intent to issue an NPDES permit for the discharge of storm water/urban runoff.

30. The RWQCB has, at a public meeting, heard and considered all comments pertaining to the discharge of storm water/urban runoff.

IT IS HEREBY ORDERED that the Permittees, in order to meet the provisions contained in Division 7 of the California Water Code

VOL 22

04399

and regulations adopted thereunder, and the provisions of the Clean Water Act as amended and regulations and guidelines adopted thereunder, shall comply with the following:

I. GENERAL REQUIREMENTS

A. The following entities (Permittees) are subject to the terms and conditions of this Order and shall cooperate in the development and implementation of a comprehensive county-wide storm water/urban runoff management program:

Cities	County	Other
Carlsbad	San Diego	San Diego Unified Port District
Chula Vista		
Coronado		
Del Mar		
El Cajon		
Encinitas		
Escondido		
Imperial Beach		
La Mesa		
Lemon Grove		
National City		
Oceanside		
Poway		
San Diego		
San Marcos		
Santee		
Solana Beach		
Vista		

The comprehensive county-wide storm water/urban runoff management program will consist of the following elements:

1. A management structure which allows implementation of all of the program elements;

2. Adequate legal authority;

3. Adequate fiscal resources;

4. A program to find and eliminate illicit connection and illegal discharges to the storm water conveyance system;

5. A program of Best Management Practices to eliminate pollutants from entering the storm water conveyance system that addresses

VOL 22

0440

Residential, Industrial, Commercial and Construction sources;

6. A monitoring and field screening program.

B. **Task I.B.** - The Permittees shall approve and sign the Memorandum of Understanding (MOU) submitted as part of the Permit Application. The Permittees will submit a copy of the signed, legally binding MOU to the RWQCB within 90 days of the adoption of this Order. Any revisions to the MOU shall be forwarded to the Executive Officer within 30 days of approval by all Permittees.

C. The Permittees shall prohibit illicit connections and illegal discharges from entering into storm water conveyance systems. Discharges conditionally allowed to enter storm water conveyance systems are specified Attachment B.

D. As specified in Item No. IX, the Permittees shall implement the best management practices developed under Order No. 90-42, as adopted on July 16, 1990. In addition, the Permittees shall develop and implement additional BMPs according to the schedule specified in Item No.IX. Other BMPs that the Executive Officer determines appropriate to prevent, control or reduce the discharge of pollutants to waters of the United States to the maximum extent practicable (MEP) will be developed as necessary. In developing BMPs, the Permittees shall consider the water quality objectives of all the receiving waters and emphasize pollution prevention. BMP programs should be watershed based. Watershed based water quality protection is defined by the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) Urban Technical Advisory Committee (UTAC) as the prevention/control of pollution and management of human activities in a geographically or other defined drainage area to protect, restore, and/or enhance the natural resources and beneficial uses within the watershed. Watershed may be defined on a variety of levels - such as different geographic scales relative to drainage areas and affected municipalities (CZARA UTAC report November, 1994, p.6).

E. The Permittees shall ensure that BMPs are implemented by entities discharging to the storm water conveyance systems within their jurisdiction.

II. RESPONSIBILITIES OF PRINCIPAL PERMITTEE

VOL 22

0441

The Principal Permittee, at a minimum, shall be responsible for the overall program management or coordination as specified in the proposed MOU and this Order.

III. RESPONSIBILITIES OF PERMITTEES

A. The Permittees, at a minimum, shall be responsible for management of storm water/urban runoff management programs within their jurisdictions as specified in the proposed MOU and this Order.

B. This Order is issued to each City, the County, and the Port District as a whole, not to a department within their jurisdiction. Each Permittee is responsible for ensuring that every department within its jurisdiction is aware of the requirements of this Order and comply with the requirements where it is appropriate.

C. **Interdepartmental responsibilities.**

IV. RESPONSIBILITIES OF THE MANAGEMENT COMMITTEE

The Management Committee, at a minimum, shall be responsible for the tasks specified in the proposed MOU.

V. FISCAL ANALYSIS

The purpose of the fiscal analysis is to provide the RWQCB with a clear delineation of all expenditures for activities that achieve the requirements of this Order. A complete fiscal analysis is required for programs and expenses directly related to the NPDES program. This should include all costs including personnel and non-personnel expenses, overhead, benefits, etc. Activities that are not carried out by the NPDES program, but that are related such as street sweeping, flood control and recycling, should be discussed. The discussion should include a chart showing the responsible department, as well as an analysis, not necessarily a fiscal analysis, that shows the level of program effort.

A. **Task V.A.** - By January 15 of each year, a fiscal analysis of all the expenditures (including the capital, operation, and maintenance costs) projected to be necessary to accomplish the activities of the proposed plans and programs shall be performed by each Permittee and the results submitted to the Principal Permittee. The Principal Permittee will submit a collated report to the RWQCB by January 31 of each year.

VOL 22
0442
R0065677

B. **Task V.B.** - By July 15 of each year an analysis of the previous fiscal year's expenditures shall be performed by each Permittee and the results submitted to the Principal Permittee. The Principal Permittee will submit a collated report to the RWQCB by July 31 of each year.

C. Both reports will follow a format which allows the following information to be determined from them:

Total NPDES Storm Water Program Budget

Source of Funding

Budget Specifics:

For **Task V.A.** show proposed expenditures for next fiscal year and previous year's proposed expenditures. For **Task V.B.** show proposed expenditures for previous fiscal year and actual expenditures for the fiscal year which ended June 30th.

PROGRAM ELEMENTS	PROPOSED EXPENDITURE	PREVIOUS YEAR EXPENDITURE	IF DIFFERENT, EXPLAIN
PROGRAM MANAGEMENT			
ILLICIT CONNECTION/ILLEGAL DISCHARGE PROGRAM Field Screening Other (provide details as necessary)			
BMP PROGRAM Public Education Other BMPs (provide details as necessary)			
MONITORING			

D. **Task V.D.** - At the time that the Permittee budget is adopted, the Permittee must submit a copy of the portion showing the appropriations relevant to the storm water/urban runoff program. If the appropriation is significantly different than the amount shown in the proposed budget, the Permittee must also submit a revised plan showing how the program will be changed to reflect the difference in the appropriation.

VI. LEGAL AUTHORITY

VOL 22

0443

A. **Task VI.A.** - Permittees who did not provide proof of adequate legal authority under Order No. 90-42, as adopted on July 16, 1990, will be subject to a RWQCB enforcement action. For most Permittees, adequate legal authority has taken the form of an ordinance passed by their governing body that follows the form of the model ordinance.

B. At any time that the legal counsel to the RWQCB or the Permittee finds that their legal authority is not sufficient to enforce the terms of the permit, the Permittee must adopt additional authority within 180 days of the finding.

C. At the time the RWQCB adopts a policy on Non-Storm Water Discharges, Permittees will be required to obtain the legal authority to implement that policy within one year of adoption.

VII. STORM WATER/URBAN RUNOFF-RECEIVING WATER MONITORING PROGRAM

A. **Task VII.A.** - The Permittees shall implement a cooperative wet weather monitoring program. The wet weather monitoring program for 1995-96 is outlined in Attachment A. A report on **Task VII.A.** (report of results of monitoring) will be submitted on July 31 of each year by the Principal Permittee.

B. **Task VII.B.** - The Permittees will submit a revised monitoring program by July 31 based on the results prepared under **Task VII.A.** for the wet season in the next fiscal year. Note that the proposed program will not be implemented for a year and a half. Any monitoring program proposed shall be subject to the approval of the Executive Officer.

C. The Executive Officer of the RWQCB will review the monitoring program annually and make changes to it as necessary.

VIII. ILLICIT CONNECTION/ILLEGAL DISCHARGE DETECTION PROGRAM

A. **Task VIII.A.** - Permittees will implement a program for detecting illicit connections and illegal discharges (IC/ID). The requirements for the IC/ID program are given in Attachment B. Permittees will report on **Task VIII.A.** (report of field screening and other IC/ID activities) by January 31 of each year.

B. **Task VIII.B.** - Within 60 days of the adoption of this Order, Permittees will submit evidence that they have

VOL 22

0444

developed the procedures necessary to implement **Task VIII.A.** The individual tasks include:

1. **Task VIII.B.1.** - Submit a report on Attachment B, Section I Storm Water Conveyance System Survey. If an adequate, up to date map was submitted under Order No. 90-42, Permittees can refer to that map and the date of submittal rather than submitting a new map.

2. **Task VIII.B.2.** - Submit a report detailing field procedures to be used in the dry weather field screening program.

3. **Task VIII.B.3.** - Submit a list of equipment to be used for the dry weather field screening program.

4. **Task VIII.B.4.** - Submit a report on the citizen complaint hot line required in Attachment B.

5. **Task VIII.B.5.** - Submit a report on the follow-up procedures to be used in the event of :
   Citizen Complaints
   Permittee staff detection of spills or IC/ID
   Field Screening detection of non-storm water discharges.

C. **Task VIII.C.** - The Permittees will analyze the field screening report submitted under **Task VIII.A.** by January 31 of each year and propose a monitoring program based on the results of that report for the dry season in the next fiscal year. Note that the proposed program will not be implemented for a year and a half. Any field screening program proposed shall be subject to the approval of the Executive Officer.

D. The Executive Officer of the RWQCB will review the field screening program annually and make changes to it as necessary.

IX. BEST MANAGEMENT PRACTICES PROGRAM

A. The Permittees will implement all of the following BMPs within 60 days of the adoption of this Order:

1. **Task IX.A.1.** - Establish a Public Education Program. Include the following elements:

   a. **Task IX.A.1.a.** - Establish or improve an areawide catch basin stenciling program to discourage dumping, discarding, and/or

VOL 22

0445

discharge of pollutants or debris into storm water conveyance systems.

b. **Task IX.A.1.b.** - Develop programs to promote, publicize and facilitate public reporting of illicit connections and illegal discharges.

c. **Task IX.A.1.c.** - Develop/augment public education and outreach programs (inter-departmental, construction, media, community, school, commercial, industrial, and decision makers/elected officials) on the topic of catch basins and storm water conveyance systems and their intended purpose.

d. **Task IX.A.1.d.** - Encourage all residents, owners, renters, managers of multi-family dwellings, and businesses to remove and properly dispose of dirt, rubbish, and debris from their sidewalks and alleys which may contribute pollutants to urban runoff (i.e, sweep and discard in trash).

e. **Task IX.A.1.e.** - Encourage recycling of oil, antifreeze, batteries, tires, glass, plastic, and other materials to prevent their improper disposal into the storm water conveyance system.

f. **Task IX.A.1.f.** - Encourage the proper disposal of household hazardous wastes to prevent the improper disposal of such materials to the storm water conveyance system.

g. **Task IX.A.1.g.** - Encourage the proper use and conservation of water to minimize runoff from landscaped areas, lawns, golf-courses, etc.

h. **Task IX.A.1.h.** - Educate all Permittee departments and personnel on the requirements of the storm water/urban runoff program and on ways that the departments and personnel can comply and encourage compliance with those requirements. Include compliance with the State Industrial and Construction General NPDES Storm Water Permits in the permitting requirements of the departments and personnel.

i. **Task IX.A.1.i.** - Provide input to SANDAG

VOL 22 0446

representatives to ensure that water quality considerations are included in Congestion Management activities.

2. **Task IX.A.2.** - Provide catch basin and storm water channel cleaning when and where needed.

3. **Task IX.A.3.** - Increase cleaning frequency and number of roadside and beach trash receptacles in areas where needed.

4. **Task IX.A.4.** - Perform street sweeping in a manner which improves the quality of urban runoff, and which is consistent with the current findings on methodology.

5. **Task IX.A.5.** - Create or augment a program to eliminate the improper disposal of solid waste, including but not limited to such things as litter, lawn/garden clippings, and pet feces into the street or areas where runoff may carry these pollutants to the storm water conveyance system.

6. **Task IX.A.6.** - Participate in recycling and Household Hazardous Waste programs.

7. **Task IX.A.7.** - Municipal Source Control Program: Focus on prevention and control of pollutants from all Permittee activities and Permittee facilities such as corporation yards, and Permittee maintenance facilities. This program must include:

   Task IX.A.7.a. - Storm Water Pollution Prevention Plans (SWPPP) for Permittee facilities such as corporation yards and vehicle maintenance facilities.

   Task IX.A.7.b. - A program for inspection of Permittee facilities.

   Task IX.A.7.c. - BMP program, stressing pollution prevention for all Permittee activities. This should include a focused education program for Permittee employees involved in outdoor operation or maintenance activities anywhere in a Permittee's jurisdiction. Specifically, Permittees must minimally develop a timeline and a program for the adoption and implementation of an Integrated Pest Management (IPM) program for

VOL 22 0447

all public parks, golf courses, landscaping around public schools, buildings and cemeteries. The IPM program is to be fully implemented within two years of the issuance of this Order.

Task IX.A.7.d. - A program for prevention of sewage spills into the storm water conveyance system to the extent practicable.

Task IX.A.7.e. - A program for prevention and control of pollutants from:

Storm water conveyance system operation and management,

Streets and roads,

Flood control activities,

Public facilities,

Maintenance of public facilities including but not limited to streets and roads, parking lots, public water bodies and municipal buildings.

B. **Task IX.B.** - Public Education Program - Establishment of a public education program will be an ongoing task over the life of the permit. Tasks for the 1995-96 permit year include:

Task IX.B.1. - Establish a Public Education Subcommittee which reports to the management committee made up of at least five Permittees and representatives of the larger community. The community should be represented by at least one representative from each of the eight outreach groups: interdepartmental, construction, media, community, school, commercial, industrial, and decision makers/elected officials. This subcommittee shall establish a public education program addressing municipal, residential, commercial, industrial and construction sources. Note that residential includes all residents, both owners and renters, as well as managers of multifamily dwellings and permanent and temporary residents of boats in marinas. The goal of the subcommittee is to develop cooperative watershed based public education programs aimed at pollution prevention. Those programs that cannot be done cooperatively should be developed to be

VOL 22
0448
R0065683

consistent county-wide. Public education programs should seek to address all members of the outreach group and be written in both English and Spanish.

Task IX.B.2 - Evaluate **Task IX.A.1.a-i**, and determine which areas need augmentation. Develop a list of products to be developed during the next fiscal year and a schedule for their development. This will be done each fiscal year. The development of products schedules and programs under **Task IX.B** will be reported under **Task IX.B.2.** The implementation of these products and programs will be reported under **Task IX.A.1.a-i.**

Task IX.B.3 - Develop Public Education Programs and products according to the schedule developed under **Task IX.B.2.**

C. **Task IX.C.** - Construction Source Control Program: Incorporate storm water quality BMPs into the requirements for all construction projects within the Permittee's jurisdiction. Within 60 days of the adoption of this Order report on the existing Construction Source Control Program.

A comprehensive Construction Source Control program will be developed during the first year of the permit period (1995-96) for managing runoff from new development and redevelopment both for projects that are covered by the State Construction General Permit and projects that are under five acres. Tasks will include:

Task IX.C.1. - Evaluation of the current grading ordinance and planning department requirements must be completed within one year from the issuance of this Order. If the grading ordinance is not adequate, develop a schedule for developing and adopting a new ordinance within one and a half years from the issuance of this Order;

Task IX.C.2. - Evaluation of construction site management requirements;

Task IX.C.3. - Evaluation of training and outreach efforts;

Task IX.C.4. - Evaluation of required control measures;

Task IX.C.5. - Development of an inspection program or a program for integrating storm water inspection

VOL 22 0449

requirements into current inspection programs.

Task IX.C.6. - Development of a BMP program for new construction and redevelopment that addresses the deficiencies uncovered by this evaluation. BMP programs that are appropriate for a variety of projects should be developed. Size of project as well as watershed and site specific considerations should be included;

Task IX.C.7. - Development of a schedule for implementing the BMP program, including activities that can be implemented immediately, activities that can be implemented in the short term (within years one and two), and activities that can be implemented over the long term (beginning year three and beyond).

D. By July 31, 1996 Permittees will report on **Tasks IX.A.1-7.**, **Task IX.B.**, and **Task IX.C.** Tasks that are identified for immediate implementation, including education programs, should be implemented immediately without waiting for RWQCB approval. Permittees will also report on the adequacy of their grading ordinance and provide a plan and schedule for obtaining adequate legal authority if the current ordinance is not adequate.

E. During the second year of the five year permit period (FY 1996-97), Permittees will continue to implement **Tasks IX.A.1-7 and IX.B.** and evaluate the need for additional BMPs in these areas. Permittees will begin implementation of their augmented Construction Source Control Program. This Construction Source Control Program will be reported as **Task IX.C.**

F. **Task IX.F.** - Commercial Source Control Program: Implement a program of Water Quality BMPs for Commercial Sources. Within 60 days of the adoption of this Order report on the existing Commercial Source Control Program.

A comprehensive Commercial Source Control program will be developed during the second year of the permit (1996-97). Permittees should develop an incentive program for businesses to encourage utilization of nonpoint source pollution prevention and control strategies. Tasks include:

Task IX.F.1. - Evaluation of existing program;

VOL 22

0450

Task IX.F.2. - Identification of all commercial sources by a list categorized by business type. Prioritize commercial sources based on potential threat to water quality;

Task IX.F.3. - Identification and categorization of pollutants associated with these sources;

Task IX.F.4. - Development of a BMP program for commercial facilities including an education program targeting specific types of facilities. Implementation of this program should be based on the priority of sources developed under Task IX.F.2;

Task IX.F.5. - Development of a schedule for implementing the BMP program, including activities that can be implemented immediately, activities that can be implemented in the short term, and activities that can be implemented over the long term;

Task IX.F.6. - Development of procedures and a schedule for inspecting commercial facilities or a program for integrating storm water/urban runoff inspection requirements into current inspection programs. This schedule should include consideration of the priorities developed under Task IX.F.2.

G. By July 15, 1997 Permittees will provide the Principal Permittee with a report on the previous year's implementation of **Tasks IX.A.1-7, IX.B., and IX.C.** and **Task IX.F.1-6.** In addition, they will provide a schedule for implementation of their Commercial Source Control program, including the inspection schedule. Tasks that are identified for immediate implementation, including education programs, should be implemented immediately without waiting for RWQCB approval.

H. During the third year of the five year permit period, (1997-98) Permittees will continue to implement **Tasks IX.A.1-7, IX.B., and IX.C.**, and will evaluate the need for additional BMPs in these areas. They will begin implementation of their augmented Commercial Source Control program which will be reported under **Task IX.F.**

I. **Task IX.I.** - Industrial Source Control Program: Implement a program of Water Quality BMPs for Industrial Sources. Within 60 days of the adoption of this Order report on the existing Industrial Source Control Program.

VOL 22

0451

A comprehensive Industrial Source Control program will be developed during the third year of the permit (1997-98). Permittees should develop an incentive program for businesses to encourage utilization of nonpoint source pollution prevention and control strategies. This program should complement the State Industrial program. The RWQCB will cooperate with this effort by providing information wherever possible. Tasks include:

Task IX.I.1. - Evaluation of existing program;

Task IX.I.2. - Identification of all industrial sources, categorized by industry type or Standard Industrial Classification (SIC) code; Prioritize industrial sources based on potential threat to water quality;

Task IX.I.3. - Identification of pollutants associated with these sources;

Task IX.I.4. - Development of a Permittee BMP program for Permittee control of industrial facilities including an education program targeting specific types of facilities. This program will include activities to be undertaken by the Permittee to control the introduction/flow of pollutants into the storm water conveyance system from industrial facilities. It can include incentive programs, outreach programs, and development of a schedule of minimum BMPs emphasizing pollution prevention that the Permittee wants facilities to implement;

Task IX.I.5. - Development of a schedule for implementing the BMP program, including activities that can be implemented immediately, activities that can be implemented in the short term, and activities that can be implemented over the long term. This schedule should include consideration of the priorities developed under Task IX.I.2.;

Task IX.I.6. - Development of procedures and a schedule for inspecting industrial facilities in cooperation with the State program or a program for integrating storm water/urban runoff inspection requirements into current inspection programs. This schedule should include consideration of the priorities developed under Task IX.I.2.

J. By July 15, 1998 Permittees will provide the Principal Permittee with a report on the previous

VOL 22

0452

year's implementation of **Tasks IX.A.1-7, IX.B., IX.C.,** and **IX.F.** and on **Task IX.I.1-6.** In addition, they will provide a schedule for implementation of their Industrial Source Control Program. Tasks that are identified for immediate implementation, including education programs should be implemented immediately without waiting for RWQCB approval.

K. During the fourth year of the permit period (FY 1998-99) Permittees will continue to implement **Tasks IX.A.1-7, IX.B., IX.C.,** and **IX.F.**, and evaluate the need for additional BMPs in these areas. They will begin implementation of their augmented Industrial Source Control program which will be reported under **Task IX.I.**

L. **Task IX.L.** - Permittees will do an internal audit on the effectiveness and adequacy of all of their BMPs and source control programs. The results of this audit will be used to prepare the permit application for the next permit.

L. By July 15, 1999 Permittees will provide the Principal Permittee with a report on the previous year's implementation of **Tasks IX.A.1-7, IX.B., IX.C., IX.F., and IX.I.** and **Task IX.K.**

M. During the fifth year of the permit period Permittees will continue to implement **Tasks IX.A.1-7, IX.B., IX.C., IX.F., and IX.I.** In addition, Permittees will examine the results of **Task IX.K.** and update each of the Task areas based on the results. These updated Tasks will be submitted as part of the application for the new permit.

N. By July 15, 2000 Permittees will provide the Principal Permittee with a report on the previous year's implementation of **Tasks IX.A.1-7, IX.B., IX.C., IX.F., and IX.I.**

X. PROGRAM ANALYSIS

Task X. - The Permittees shall conduct an annual analysis of the effectiveness of the overall storm water/urban runoff pollution control management program in their areas of jurisdiction.

XI. REPORTING AND SCHEDULE

A. A summary of tasks to be completed and reports

VOL 22
0453
R0065688

submitted is as follows:

Within 30 days of the adoption of this Order:

Task V.A. - Permittees who had not submitted a detailed budget for the first year permit period must submit a budget.

Task VI.A. - Permittees who had not obtained adequate legal authority through passage of an ordinance during the first permit period must submit evidence of adequate legal authority.

Within 60 days of the adoption of this order:

Task VIII.B.1-5. - Permittees will show that they have all of the elements of an Illicit Connection and Illegal Discharge Detection program.

Task IX.A.1-7 - Permittees must demonstrate that they have all of the elements of a Best Management Practices program.

Task IX.C. - Permittees will submit current Construction Source Control Program information.

Task IX.F. - Permittees will submit current Commercial Source Control Program information.

Task IX.I. - Permittees will submit current Industrial Source Control Program information.

Within 90 days of the adoption of this order:

Task I.B. - The MOU must be signed and submitted to the RWQCB.

By July 31, 1995:

Task VII.B. for the 1996-97 wet weather season.

By January 31, 1996:

A proposed comprehensive storm water/urban runoff management program for FY 1996-97 including:
Task V.A. Fiscal Analysis.

A proposed program and schedule for:
Task IX.A.1-7.
Task IX.B.
Task IX.E.1-6.

VOL 22

0454

Task VIII.A. for the 1995 dry weather season

Task VIII.B. for the 1997 dry weather season

By July 31, 1996:

An analysis of the FY 1995-96 Comprehensive storm water/urban runoff management program with an explanation on significant changes to the proposed program including:

Task V.B.
Task VII.A.
Task IX.A.1-7.
Task IX.B.1-7.
Task IX.C
Task X.

Task VII.A. for the 1995-96 wet weather season
Task VII.B. for the 1997-98 wet weather season

By January 31, 1997:

A proposed comprehensive storm water/urban runoff management program for FY 1997-98 including:

Task V.A.
A proposed program and schedule for:
Task IX.A.1-7.
Task IX.B.
Task IX.H.1-6.

Task VIII.A. for the 1996 season
Task VIII.C. for the 1998 season

By July 31, 1997:

An analysis of the FY 1996-97 comprehensive storm water/urban runoff management program with an explanation on significant changes to the proposed program including:

Task V.B.
Task VII.A.
Task IX.A.1-7.
Task IX.B.
Task IX.E.1-6
Task X.

Task VII.A. for the 1996-97 wet weather season
Task VII.B. for the 1998-99 wet weather season

VOL 22

0455

By January 31, 1998:

A proposed storm water/urban runoff management program for FY 1998-99 including:

Task V.A.
A proposed program for:
Task IX.A.1-7.
Task IX.K.

Task VIII.A. for the 1997 dry weather season
Task VIII.C. for the 1999 dry weather season

By July 31, 1998:

An analysis of the FY 1997-98 storm water/urban runoff management program with an explanation on significant changes to the proposed program including:

Task V.B.
Task VII.A.
Task IX.A.1-7.
Task IX.H.1-6.
Task X.

Task VII.A. for the 1997-98 wet weather season
Task VII.B. for the 1999-2000 wet weather season

By January 31, 1999:

A proposed storm water/urban runoff management program for FY 1999-2000 including:

Task V.A.
A proposed program for:
Task IX.A.1-7.
Task IX.B.

Task VIII.A. for the 1998 dry weather season
Task VIII.C. for the 2000 dry weather season

By July 31, 1999:

An analysis of the FY 1998-99 comprehensive storm water/urban runoff management program with an explanation on significant changes to the proposed program including:

Task V.B.
Task VII.A.

VOL 22
0456

Task IX.A.1-7.
Task IX.K.
Task X.

Task VII.A. for the 1998-99 wet weather season
Task VII.B. for the 2000-2001 wet weather season (to be done under the next permit period)

By January ??, 2000:

A permit application for the NPDES storm water permit to be adopted in July, 2000.

By January 31, 2000:

Task VIII.A. for the 1999 dry weather season
Task VIII.B. for the 2001 dry weather season

By July 31, 2000:

An analysis of the FY 1999-2000 storm water/urban runoff management program with an explanation on significant changes to the proposed program including:

Task V.B.
Task VII.A.
Task IX.A.1-7.
Task X.

Task VII.B. for the 2000-2001 wet weather season

B. All reports and information required herein shall be submitted to the Executive Officer of the RWQCB and the Regional Director of the Environmental Protection Agency, Region IX, at the following addresses:

Executive Officer
California Regional Water Quality Control Board
San Diego Region
9771 Clairemont Mesa Blvd. Suite B
San Diego, California 92124-1331

Environmental Protection Agency
Region IX
Permits and Compliance Branch
San Francisco, California

XIII. PROVISIONS

A. Neither the treatment nor the discharge of pollutants

VOL 22

0457

shall create a pollution, contamination, or nuisance as defined by California Water Code § 13050.

B. The Permittees must comply with all conditions of this Order. Any permit noncompliance constitutes a violation of the Clean Water Act and the California Water Code and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; the issuance of an individual permit; or for denial of a renewal application.

C. The Permittees shall take all reasonable steps to minimize or correct any adverse impact on the environment resulting from noncompliance with this Order, including such accelerated or additional monitoring as may be necessary to determine the nature and impact of the noncomplying discharge.

D. This Order may be modified, revoked and reissued, or terminated for cause including, but not limited to, the following:

1. Violation of any terms or conditions of this Order;

2. Obtaining this Order by misrepresentation or failure to disclose fully all relevant facts; or

3. A change in any condition that requires either a temporary or permanent reduction or elimination of the discharge.

The filing of a request by a Permittee for modification, revocation and reissuance, or termination of this Order or a notification of planned change in or anticipated noncompliance with this Order does not stay any condition of this Order.

E. In addition to any other grounds specified herein, this Order shall be modified or revoked at any time if, on the basis of any new data, the Executive Officer determines that continued discharges may cause unreasonable degradation of the aquatic environment.

F. This Order is not transferable to any person except after notice to the Executive Officer of this RWQCB. The RWQCB may require a new report of waste discharge to change the name of a Permittee and incorporate such other requirements as may be necessary under the California Water Code and the Clean Water Act. A Permittee shall submit notice of any transfer of this

VOL 22 0458

Order's responsibility and coverage to a new Permittee as described under Standard Reporting Requirement XIV.C.

G. This Order does not convey any property rights of any sort or any exclusive privileges. The requirements prescribed herein do not authorize the commission of any act causing injury to persons or property of another, including property damage caused as a result of the discharge, nor protect the Permittee from his liabilities under federal, state, or local laws, nor create a vested right for the Permittee to continue his discharge.

H. Permittees shall allow the RWQCB, or an authorized representative or any representative of the United States Environmental Protection Agency upon the presentation of credentials and other documents as may be required by law, to:

1. Enter upon the Permittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this Order:

VOL 22 0459

2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order;

3. Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices or operation regulated or required under this Order; and

4. Sample or monitor at reasonable times, for the purposes of assuring compliance with this Order or as otherwise authorized by the Clean Water Act or the California Water Code, any substances or parameters at any location.

5. This does not preclude unannounced and unscheduled entry/inspections/sampling.

I. Permittees shall, at all times, properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by a Permittee to achieve compliance with the conditions of this Order. Proper operation and maintenance includes effective performance, adequate funding, adequate operator staffing and training, and adequate laboratory and process controls including appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems only when necessary to achieve compliance with the conditions of this Order.

J. In an enforcement action, it shall not be a defense for a Permittee that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with this Order. Upon reduction, loss, or failure of the treatment facility, the Permittee shall, to the extent necessary to maintain compliance with this Order, control production or all discharges, or both, until the facility is restored or an alternative method of treatment is provided. This provision applies, for example, when the primary source of power of the treatment facility fails, is reduced or is lost.

K. The provisions of this Order are severable, and if any provision of this Order, or the application of any provision of this Order to any circumstances, is held invalid, the application of such provision to other circumstances, and the remainder of this Order, shall not be affected thereby.

XIV. STANDARD REPORTING REQUIREMENTS

VOL 22 0460

A. A new Report of Waste Discharge shall be filed with the RWQCB not less than 180 days prior to the following:

1. Significant change in disposal method (e.g., change in the method of treatment which would significantly alter the nature of the waste).

2. Significant change in disposal area (e.g., moving the discharge to a disposal area significantly removed from the original area, potentially causing different water quality or nuisance problems).

3. Other circumstances which result in a material change in character, amount, or location of the waste discharge.

B. A Permittee shall give advance notice to the Executive Officer of any planned changes in a permitted facility or activity which may result in noncompliance with the requirements of this Order.

C. A Permittee must notify the Executive Officer, in writing, at least 30 days in advance of any proposed transfer of this Order's responsibility and coverage to a new Permittee. The notice must include a written agreement between the existing and new Permittee containing a specific date for the transfer of this Order's responsibility and coverage between the current Permittee and the new Permittee. This agreement shall include an acknowledgement that the existing Permittee is liable for violations up to the transfer date and that the new Permittee is liable from the transfer date on.

D. The Permittees shall comply with any monitoring and reporting requirements contained in this Order and any additional monitoring requirements specified by the Executive Officer.

E. A Permittee shall report any noncompliance which may endanger health or the environment. Any information shall be provided orally to the Executive Officer within 24 hours from the time the Permittee becomes aware of the circumstances. A written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance.

VOL 22 0461

The Executive Officer, or an authorized representative may waive the written report on a case-by-case basis if the oral report has been received within 24 hours.

F. A Permittee shall notify the Executive Officer as soon as it is known or there is reason to believe:

1. That any activity has occurred or which will occur which would result in the discharge of any toxic pollutant which is not limited in this Order, if that discharge will exceed the highest of the following notification levels-:

   a. One hundred micrograms per liter (100 ug/L);

   b. Two hundred micrograms per liter (200 ug/L) for acrolein and acrylonitrile; five hundred micrograms per liter (500 ug/L) for 2.4-dinitrophenol and for 2-methyl-4, 6-dinitrophenol; and one milligram per liter (1 mg/L) for antimony.

G. A Permittee shall furnish to the Executive Officer, within a reasonable time, any information which the Executive Officer may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order or other requirements established by the Executive Officer. A Permittee shall also furnish to the Executive Officer, upon request, copies of records required to be kept by this Order.

H. A Permittee shall provide adequate notice to the Executive Officer of the following:

1. Any new introduction of pollutants to the discharge.

2. Any substantial change in the volume or character of pollutants being introduced into the discharge.

3. For the purpose of this provision, adequate notice shall include information on (a) the quality and quantity of waste introduced into the discharge, and (2) any anticipated impact of the change on the quantity or quality of runoff to be discharged to surface waters.

I. Where a Permittee becomes aware that he failed to submit any relevant facts in a Report of Waste Discharge, or submitted incorrect information in a

VOL 22 0462

Report of Waste Discharge, or in any report to the RWQCB, he shall promptly submit such facts or information.

J. This Order expires on July 16, 2000. The Permittees must jointly file a Report of Waste Discharge in accordance with Title 23, Chapter 3, Subchapter g of the California Code of Regulations not later than 180 days in advance of such expiration date as application for issuance of new waste discharge requirements. This report of waste discharge shall include as a minimum, the following:

1. Summary of the results of the monitoring program.

2. Summary of BMPs implemented and evaluations of their effectiveness.

3. Summary of procedures implemented to detect illicit connections and illegal discharges and an evaluation of their effectiveness.

4. Summary of measures implemented to control pollutants in surface runoff from construction sites and an evaluation of their effectiveness.

5. Evaluation of the need for additional BMPs, source control, and/or structural control measures.

6. Proposed plan of storm water/urban runoff quality management activities that will be undertaken during the term of the next permit.

L. All applications, reports, or information submitted to the Executive Officer of this RWQCB shall be signed and certified.

1. The Report of Waste Discharge shall be signed as follows:

   a. **For a corporation** - by a principal executive officer of at least the level of vice president.

   b. **For a partnership or sole proprietorship** - by a general partner or the proprietor, respectively.

   c. **For a municipality, state, federal or other public agency** - by either a principal executive officer or ranking elected

VOL 22 0463

official.

2. All other reports required by this Order and other information requested by the Executive Officer shall be signed by a person designated in paragraph (1) of this provision, or by a duly authorized representative of that person. An individual is a duly authorized representative only if:

a. The authorization is made in writing by a person described in paragraph (1) of this provision;

b. The authorization specified either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the portion of plant manager, operator of a well or well field, superintendent, or position of equivalent responsibility (a duly authorized representative may thus be either a named individual or any individual occupying a named position); and

c. The written authorization is submitted to the Executive Officer.

3. Any person signing a document under this Section shall make the following certification:

"I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."

M. Except for data determined to be confidential under 40 C.F.R. § 2, all reports prepared in accordance with the terms of this Order Shall be available for public inspection at the offices of the California Regional Water Quality Control Board, San Diego Region and the United States Environmental Protection Agency, Region IX. As required by the Clean Water Act, Reports of Waste Discharge, this Order, and effluent data shall not be considered confidential.

VOL 22
0464
R0065699

XV. NOTIFICATIONS

A. California Water Code § 13263(g) states:

> "No discharge of waste into the waters of the state, whether or not such discharge is made pursuant to waste discharge requirements, shall create a vested right to continue such discharge. All discharges of waste into waters of the state are privileges, not rights."

B. The Clean Water Act provides that any person who violates a condition of this Order implementing sections 301, 302, 306, 307, 308, 318 or 405 of the Clean Water Act is subject to a civil penalty not to exceed $10,000 per day of such violations. Any person who willfully or negligently violates conditions of this Order implementing section 301, 302, 306, 307 or 308 of the Clean Water Act is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than one year, or both.

C. The Clean Water Act provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this Order, including monitoring reports or reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than $10,000 per violation, or by imprisonment for not more than six months per violation, or by both.

D. Nothing in this Order shall be construed to relieve a Permittee from civil or criminal penalties for noncompliance.

E. Nothing in this Order shall be construed to preclude the institution of any legal action or relieve a Permittee from any responsibilities, liabilities, or penalties to which a Permittee is or may be subject to under Clean Water Act § 311.

F. Nothing in this Order shall be construed to preclude institution of any legal action or relieve a Permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable State law or regulation under authority preserved by Clean Water Act § 510.

G. This Order shall become effective ten days after the

VOL 22

04665

date of its adoption, provided the Regional Administrator or Director, United States Environmental Protection Agency, has no objection. If the Regional Administrator objects to its issuance, this Order shall not become effective until such objection is withdrawn.

Tasks will include:

Identification of all Permittee activities which can lead to storm water/urban runoff pollution. These can include, but are not limited to vehicle maintenance, painting, landscape maintenance and weed control, water body maintenance including swimming pool maintenance, construction and maintenance of streets and roads, construction and maintenance of flood control system and drinking water system activities;

Identification of pollutants and potential paths of pollution associated with these activities;

Development of SWPPP for Permittee facilities such as corporation yards and vehicle maintenance facilities;

Development of a program for inspection of Permittee facilities including methodology and schedule.

Development of a BMP program, stressing pollution prevention for all Permittee activities. This should include a focused education program for Permittee employees;

Development of a schedule for implementing the BMP and inspection programs, including activities that can be implemented immediately, activities that can be implemented in the short term, and activities that can be implemented over the long term.

I, Arthur L. Coe, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Diego Region, on July ??, 1995.

Dear San Diego Municipal Copermittee or Interested Party:
(Distribution list attached)

TENTATIVE ORDER NO. 95-76 (NPDES PERMIT NO. CA0108758), "WASTE DISCHARGE REQUIREMENTS FOR STORM WATER AND URBAN RUNOFF FROM THE COUNTY OF SAN DIEGO, THE INCORPORATED CITIES OF SAN DIEGO COUNTY, AND THE SAN DIEGO UNIFIED PORT DISTRICT."

Enclosed for your review is a copy of the subject Tentative Order. The California Regional Water Quality Control Board, San Diego Region (SDRWQCB), will conduct a hearing to consider adoption of Tentative Order No. 95-76 at its meeting on **August 10, 1995**. The August 10, 1995 SDRWQCB meeting is open to public participation and will be held at the following location beginning at 9:00 a.m.:

San Diego Wastewater Management
District Board Room
600 B Street, 3rd Floor
San Diego, CA

The enclosed version of Tentative Order No. 95-76 is the official 45 day draft of the renewal municipal storm water permit. The official 45 day public review and comment period will begin on Wednesday, **May 24, 1995** and close on Friday, **July 7, 1995**. Written comments or testimony should be submitted to the SDRWQCB as soon as possible, but no later than **July 7, 1995**. All written comments or testimony received by July 7, 1995, will be reviewed by the SDRWQCB members prior to the August 10 hearing. The SDRWQCB will consider oral statements at the August 10 hearing, but, for the accuracy of the record, all important comments or testimony should be submitted in writing by July 7, 1995.

If you have questions concerning Tentative Order No. 95-76, please call Frank Melbourn of my staff at (619) 467-2973.

Sincerely,

ARTHUR L. COE
Executive Officer

NOTICE OF PUBLIC HEARING

The California Regional Water Quality Water Board, San Diego Region (SDRWQCB), intends to hold a public hearing on **August 10, 1995**, to take testimony and comments regarding reissuance of National Pollutant Discharge Elimination System (NPDES) permits for the following discharges of pollutants from point sources to surface waters in the San Diego Region:

1. Waste Discharge Requirements for Storm Water and Urban Runoff from the County of San Diego, the Incorporated Cities of San Diego County, and the San Diego Unified Port District (Tentative Order No. 95-76) (NPDES Permit No. CA0108758).

2. Waste Discharge Requirements for Storm Water and Urban Runoff from the Riverside County Flood Control and Water Conservation District, the County of Riverside, and the Incorporated Cities of Riverside County Within the San Diego Region (Tentative Order No. 95-77) (NPDES Permit No. CA0108766).

3. Waste Discharge Requirements for Storm Water and Urban Runoff from the County of Orange, the Orange County Flood Control District, and the Incorporated Cities of Orange County Within the San Diego Region (Tentative Order No. 95-78) (NPDES Permit No. CA0108740).

TIME AND PLACE OF PUBLIC HEARING:

August 10, 1995, at 9:00 a.m.

San Diego Wastewater Management
District Board Room
600 B Street, 3rd Floor
San Diego, CA

Interested persons are invited to attend to express their views on issues relating to the waste discharges and the requirements and permit conditions needed to regulate the discharges under state and federal laws. Oral statements will be heard, but for the accuracy of the record, all important testimony should be in writing. Written testimony should be submitted to the SDRWQCB office as soon as possible and preferably no later than Friday, **July 7, 1995**. Presentations should be brief to allow all interested persons time to be heard.

SDRWQCB staff has prepared tentative orders containing waste discharge requirements that implement the federal regulations for NPDES permits for storm water discharges. The tentative orders, permit applications, fact sheets, comments received, and other

VOL 22

0472

information are on file and may be inspected in the office of the SDRWQCB at 9771 Clairemont Mesa Boulevard, Suite B, San Diego, phone (619) 467-2952, Monday through Friday between the hours of 8:00 a.m. and 5:00 p.m.. Copies of the tentative orders may be obtained from the SDRWQCB by contacting John Phillips at (619) 627-3928, Frank Melbourn at (619) 467-2973, or at the address shown above.

Please bring the foregoing to the attention of any persons known to you who would be interested in this matter.

Arthur L. Coe
Executive Officer

DRAFT

May 19, 1995

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN DIEGO REGION

ORDER NO. 95-76
NPDES NO. CA0108758

WASTE DISCHARGE REQUIREMENTS FOR STORM WATER AND URBAN RUNOFF FROM THE COUNTY OF SAN DIEGO, THE INCORPORATED CITIES OF SAN DIEGO COUNTY, AND THE SAN DIEGO UNIFIED PORT DISTRICT

The California Regional Water Quality Control Board, San Diego Region (hereinafter SDRWQCB), finds that:

1. On July 16, 1990, the SDRWQCB issued Order No. 90-42, NPDES NO. CA0108758, **WASTE DISCHARGE REQUIREMENTS FOR STORM WATER AND URBAN RUNOFF FROM THE COUNTY OF SAN DIEGO THE INCORPORATED CITIES OF SAN DIEGO COUNTY AND THE SAN DIEGO UNIFIED PORT DISTRICT**. Order No. 90-42 established waste discharge requirements for the discharge of storm water[1] and urban runoff to waters of the United States from storm water conveyance systems[2] owned and operated by the County of San Diego, the San Diego Unified Port District and the incorporated cities of San Diego County. Order No. 90-42 expires on July 16, 1995.

2. On January 17, 1995 the SDRWQCB received a joint National Pollutant Discharge Elimination System (NPDES) permit renewal application from the following entities:

   a. the County of San Diego;

   b. the incorporated cities of San Diego County:

Carlsbad	Escondido	Poway
Chula Vista	Imperial Beach	San Diego
Coronado	La Mesa	San Marcos
Del Mar	Lemon Grove	Santee
El Cajon	National City	Solana Beach
Encinitas	Oceanside	Vista; and

   c. the San Diego Unified Port District.

3. The above entities are hereinafter referred to in this Order as copermittees or dischargers. The City of San Diego is also referred to in this Order as principal copermittee. The terms and conditions of this Order are applicable to all lands within:

VOL 22

0474

a. the unincorporated urban areas of San Diego County within the boundaries of the San Diego Region;

b. the above incorporated cities of San Diego County; and

c. the jurisdiction of the San Diego Unified Port District.

4. Clean Water Act (CWA) Section 402(a)(l) provides that any person discharging, or proposing to discharge, pollutants from any point source to waters of the United States must apply for and obtain an NPDES Permit. Applicable United States Environmental Protection Agency (USEPA) regulations are contained in Title 40 Code of Federal Regulations (CFR) Part 122.

5. Storm water discharges are point source discharges of pollutants and as such they are also discharges of waste that could affect the quality of the waters of the state. California Water Code (CWC) Section 13376 provides that any person discharging or proposing to discharge pollutants to waters of the United States must apply for and obtain waste discharge requirements. (The term waste discharge requirements is equivalent to the term NPDES permits as used in the Clean Water Act). Furthermore, California Water Code Section 13260 provides that persons discharging waste that could affect the quality of waters of the state must file a report of waste discharge in application for waste discharge requirements. Applicable State of California regulations are contained in Title 23, Division 3, Chapter 9, Articles 3 and 9.

6. All storm water conveyance systems discharge into waters of the United States or tributaries thereto. Each copermittee owns and operates a storm water conveyance system which discharges into one or more surface water bodies in the San Diego Region including creeks, rivers, reservoirs, lakes, lagoons, estuaries, harbors, bays, the Pacific Ocean and tributaries thereto. These surface waters are waters of the United States as defined in 40 CFR 122.2.

7. Urban storm water runoff has two major components: (1) storm water (wet weather flows) and (2) non-storm water illicit discharges (dry weather flows).

8. Storm water (wet weather flows) consists of precipitation only and is defined in 40 CFR 122.26(b)(13) as storm water runoff, snow melt runoff, and surface runoff and drainage. During storm events in urban areas, rain water picks up and transports pollutants through storm water conveyance systems to waters of the United States.

9. Non-storm water (dry weather flows) is defined in 40 CFR 122.26(b)(2) as illicit discharges consisting of any discharge to a storm water conveyance system that is not composed entirely of storm water. The definition specifically excludes discharges pursuant to an NPDES permit and discharges resulting from fire fighting activities.

10. Pollutants occur in both storm water and non-storm water runoff. The sources of these pollutants occur primarily in commercial, industrial, and residential urban land use areas. The most important pollutant sources include motor vehicles; construction site runoff; industrial site runoff; sewage spills; illegal dumping; illicit connections or improper plumbing of sewage; commercial and industrial discharges; paved surfaces; animal waste; and home and garden care. The most important pollutant categories include metals (copper, lead and zinc), pathogens (bacteria and viruses), synthetic organics (petroleum products,

VOL 22

0475

pesticides, PCBs and PAHs), sediment; nutrients (nitrogen and phosphorus fertilizers), and oxygen demanding substances (decaying vegetation, animal waste, and other organic matter).

11. Clean Water Act Section 402(p) provides, in part, that the following categories of municipal storm water discharges are required to obtain an NPDES permit:

a. A discharge from a municipal separate storm water conveyance system serving a population of 250,000 or more (large system);

b. A discharge from a municipal separate storm water conveyance system serving a population of 100,000 or more but less than 250,000 (medium system); and

c. A discharge from a municipal storm water conveyance system which contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

Applicable USEPA regulations are contained in Title 40 Code of Federal Regulations Part 122.26.

12. The unincorporated areas of the County of San Diego, the Cities of Chula Vista, Escondido, Oceanside and San Diego each have a current population in excess of 100,000. These copermittees operate large or medium storm water conveyance systems as defined by 40 CFR 122.26(b)(4) and (7).

13. The Cities of Carlsbad, Coronado, Del Mar, El Cajon, Encinitas, Imperial Beach, La Mesa, Lemon Grove, National City, Poway, San Marcos, Santee, Solana Beach and Vista have populations of less than 100,000 and operate small storm water conveyance systems.

14. All copermittees with populations less than 100,000 (small systems) are part of large or medium separate storm water conveyance systems. This is because discharges from the small systems are "interrelated" to discharges from the large or medium systems as provided in 40 CFR 122.26(b)(4)(iii). The determination of "interrelation" is based on the following factors:

a. physical interconnections between the municipal storm water conveyance systems of some copermittees;

b. the nature of the pollutants discharged to waters of the United States as described in previous findings;

c. the nature of the receiving waters as described in findings 15 and 16 below; and

d. the location of discharges from the smaller municipal systems relative to discharges from the large or medium systems. The following copermittees jointly and cumulatively discharge storm water pollutants into the same water body:

VOL 22 0476

i. The County of San Diego; the Cities of San Diego, Coronado, National City, Chula Vista, Imperial Beach, La Mesa, Lemon Grove; and the San Diego Unified Port District jointly and cumulatively discharge storm water pollutants into San Diego Bay;

ii. The County of San Diego and the Cities of Oceanside, Vista, and Carlsbad jointly and cumulatively discharge storm water pollutants into Buena Vista Lagoon;

iii. The Cities of Carlsbad and San Marcos jointly and cumulatively discharge storm water pollutants into Agua Hedionda Lagoon;

iv. The County of San Diego; the Cities of Carlsbad, Encinitas, and San Marcos jointly and cumulatively discharge storm water pollutants into Batiquitos Lagoon;

v. The County of San Diego; the Cities of Encinitas, Escondido, and Solana Beach jointly and cumulatively discharge storm water pollutants into San Elijo Lagoon;

vi. The County of San Diego, the Cities of San Diego, Del Mar, Solana Beach, and Escondido jointly and cumulatively discharge storm water pollutants into Los Penasquitos Lagoon;

vii. The Cities of San Diego and Imperial Beach jointly and cumulatively discharge storm water pollutants into the Tijuana River Estuary;

viii. The County of San Diego; the Cities of San Diego, La Mesa, El Cajon, and Santee jointly and cumulatively discharge storm water pollutants into the San Diego River;

ix. The Cities of El Cajon and Santee jointly and cumulatively discharge storm water pollutants into Forester Creek; and

x. The Cities of San Diego, Escondido, and Poway jointly and cumulatively discharge storm water pollutants into Lake Hodges;

15. Certain water bodies receiving storm water discharges are designated by the State Water Resources Control Board (SWRCB) and USEPA as Clean Water Act Section 303(d) water bodies. A "Section 303(d) water body" is an impaired water body in which water quality does not meet applicable water quality standards and/or is not expected to meet water quality standards, even after the application of technology based pollution controls required by the Clean Water Act. The discharge of storm water pollutants by the copermittees are significant because these discharges contribute to violations of applicable water quality standards as summarized in Table 1 below:

VOL 22 0471

TABLE 1
COPERMITTEES DISCHARGING TO CWA SECTION 303(D) WATER BODIES

Clean Water Act Section 303(d) Impaired Water Body	Pollutants Causing Impairment	Copermittee Discharging Storm Water
San Diego Bay	Synthetic organics, metals	County of San Diego; Cities of San Diego, Coronado, National City, Chula Vista, Imperial Beach, La Mesa, Lemon Grove; and San Diego Unified Port District
Mission Bay	Metals, pathogens, nutrients	City of San Diego
Santa Margarita Lagoon	Nutrients	County of San Diego
Agua Hedionda Lagoon	Pathogens	Cities of Carlsbad and San Marcos
Batiquitos Lagoon	Nutrients, sediment	County of San Diego; Cities of Carlsbad, Encinitas, and San Marcos
San Elijo Lagoon	Nutrients	County of San Diego, Cities of Encinitas, Escondido, and Solana Beach
Los Penasquitos Lagoon	Nutrients, sediment	County of San Diego; Cities of San Diego, Del Mar and Poway
Tijuana River Estuary	Pathogens, synthetic organics, metals	Cities of San Diego and Imperial Beach
Tijuana River	Pathogens, nutrients, synthetic organics, metals	City of San Diego
Oceanside Harbor	Metals	City of Oceanside

16. Each of the copermittees are significant contributors of pollutants to waters of the United States in the San Diego Region based on the following considerations:

a. Limited wet weather monitoring data collected by the San Diego copermittees indicate that storm water discharges in San Diego County contain metals, pathogens, sediment, and nutrients in concentrations that could adversely affect receiving waters.

b. Because the semiarid San Diego Region has an extended dry season, pollutant loads during the first several storms of the wet season may be significantly higher than pollutant loads from storms later in the season.

c. In the semiarid San Diego Region, most receiving water streams are essentially ephemeral in nature. Non-storm water flows containing pollutants discharge into these streams during dry weather conditions. During the dry weather season these streams have no reliable dilution waters available to aid in protection of the public health and wildlife and to provide sufficient assimilative capacity to ensure that

VOL 22
0478
R0065713

discharges do not contribute to violations of receiving water quality objectives. Accordingly, non-storm water flows to these streams during dry weather periods can cause pollution and nuisance conditions.

d. All watercourses in the San Diego Region terminate in bays, estuaries, or lagoons, most of which have poor flushing characteristics and little assimilative capacity.

17. Based on the foregoing findings, as summarized below, each copermittee is required to obtain an NPDES Permit for the discharge of storm water runoff to waters of the United States.

a. Each copermittee owns and operates a storm water conveyance system which conveys storm water and non-storm water flows containing pollutants to waters of the United States.

b. Five copermittees (the County of San Diego; the Cities of Chula Vista, Escondido, Oceanside, and San Diego) have a current population exceeding 100,000.

c. Each small copermittee (having a population of less than 100,000), owns and operates a storm water conveyance system whose discharges are "interrelated" to discharges from large or medium size storm water conveyance systems within the meaning of 40 CFR 122.26(b)(iii). Accordingly, small storm water conveyance systems are part of large or medium size conveyance systems.

d. Each copermittee, except the Cities of El Cajon, Santee, and Vista, discharge storm water and non-storm water flows to a Clean Water Act Section 303(d) impaired water body and thus are contributing to a violation of a water quality standard.

e. Each copermittee is a significant contributor of pollutants to waters of the United States within the meaning of 40 CFR 122.26(a)(1)(v).

18. The copermittees have requested that the SDRWQCB regulate them under a single NPDES permit. The SDRWQCB believes that issuance of a single NPDES permit to the copermittees will:

a. provide for a unified regional approach to storm water management in contiguous urban areas and shared watersheds;

b. reduce copermittee costs and administrative burden associated with storm water NPDES permit fees, applications, monitoring and reporting, implementation of required best management practices plans, and other activities; and

c. reduce the Regional Board's administrative burden of issuing individual NPDES permits to each copermittee.

Therefore, each copermittee is named as a discharger in this Order.

19. The copermittees have entered into a memorandum of understanding (MOU) in order to establish the joint and separate responsibilities of the copermittees with respect to compliance with this Order. The MOU provides that certain programs (e.g., wet weather

VOL 22
0479
R0065714

monitoring and reporting, public education) required under this Order be conducted jointly by the copermittees. The conduct of a joint wet weather monitoring program will facilitate the collection and analysis of storm water samples in a uniform and cost effective manner.

20. USEPA regulations contained in 40 CFR 122.26(d)(2)(i)(A)-(F) provide that the copermittees must demonstrate adequate legal authority, through ordinance or other means, to control discharges of pollutants to their storm water conveyance system.

21. Order No. 90-42 required the copermittees to demonstrate adequate legal authority to control discharges of pollutants to their storm water conveyance system in conformance with 40 CFR 122.26(d)(2)(i)(A)-(F). As of August 10, 1995, all copermittees, except the Cities of Carlsbad, Oceanside, and Santee have adopted storm water ordinances.

22. Clean Water Act Section 402(p)(3)(B)(iii) requires that NPDES permits for discharges from municipal storm water conveyance systems ".....shall include a requirement to effectively prohibit non-storm water discharges into storm water conveyance systems." USEPA regulations implementing Section 402 recognize that certain classes of non-storm water discharges, on a case by case basis, may not be sources of pollutants to waters of the United States. These special classes of non-storm water discharges are listed in 40 CFR 122.26(d)(2)(iv)(B)(1).

23. Clean Water Act Section 402(p)(3)(B)(ii) requires that NPDES permits for discharges from municipal storm water conveyance systems ".....shall require controls to reduce the discharge of pollutants to the maximum extent practicable[3] (MEP) including management practices, control techniques and system, design and engineering methods....." Copermittees can reduce pollutants to the maximum extent practicable through the effective implementation of Best Management Practices[4] (BMPs).

24. Pursuant to 40 CFR 122.26(d)(2)(vi), the SDRWQCB may require each copermittee to prepare and submit a fiscal analysis demonstrating sufficient financial resources have been appropriated to implement the conditions of this Order.

25. Pollution prevention is defined as practices and processes which reduce or eliminate the generation of pollutants at their source. Under Section 6602(B) of the federal Pollution Prevention Act of 1990, Congress established a national policy that: ".....pollution should be prevented or reduced at the source, whenever feasible: pollution that cannot be prevented should be recycled in an environmentally safe manner, whenever feasible; pollution that cannot be prevented or recycled should be treated in an environmentally safe manner, whenever feasible; and disposal or other releases into the environment should be employed only as a last resort and should be conducted in an environmentally safe manner...." The SDRWQCB fully supports pollution prevention as a fundamental principle of the SDRWQCB's mission to protect the quality of the Region's ground and surface waters and encourages its maximum use by the copermittees.

26. The "Water Quality Control Plan, San Diego Basin (9)" (hereinafter Basin Plan) was adopted by the SDRWQCB on September 8, 1994 and subsequently approved by the SWRCB on December 13, 1994. Subsequent revisions to the Basin Plan have also been adopted by the SDRWQCB and approved by the SWRCB The Basin Plan designates beneficial uses, narrative and numeric water quality objectives, and includes prohibitions which are applicable to the storm water and urban runoff discharges regulated under this

VOL 22 04800

Order. The Basin Plan also incorporates by reference all SWRCB water quality control plans and policies including the 1990 Water Quality Control Plan for Ocean Waters of California (Ocean Plan) and the 1974 Water Quality Control Policy for Enclosed Bays and Estuaries of California (Enclosed Bays and Estuaries Policy). The discharges regulated by this Order must be in compliance with the prohibitions and water quality standards of the Basin Plan and all referenced SWRCB water quality control plans and policies.

27. The beneficial uses of inland surface waters in San Diego County designated in the Basin Plan are: Municipal and Domestic supply; Agricultural supply; Industrial process supply; Industrial service supply; Freshwater Replenishment; Hydropower generation; Contact water recreation; Non-contact water recreation; Warm freshwater habitat; Cold freshwater habitat; Wildlife habitat; Preservation of biological habitats of special significance; and Rare, threatened, or endangered species. Beneficial uses of inland surface waters vary. The beneficial uses for specific inland surface waters are described in the Basin Plan. Inland surface waters consist of all waters exclusive of the waters of the Pacific Ocean, enclosed bays and estuaries, coastal lagoons, and ground waters.

28. The beneficial uses of coastal waters in San Diego County designated in the Basin Plan are: Industrial service supply; Navigation; Contact water recreation; Non-contact water recreation; Commercial and sport fishing; Estuarine habitat; Wildlife habitat; Preservation of biological habitats of special significance; Rare, threatened, or endangered species; Marine habitat; Aquaculture; Migration of aquatic organisms; Spawning, reproduction, and/or early development; Warm freshwater habitat; and Shellfish harvesting. Beneficial uses of coastal waters vary. The beneficial uses for specific coastal waters are described in the Basin Plan. Coastal waters are defined as waters subject to tidal action and include ocean waters and enclosed bays and estuaries.

29. The Basin Plan contains the following general antidegradation water quality objective which applies to all waters of the State within the San Diego Region:

"Wherever the existing quality of water is better than the quality of water established herein as objectives, such existing quality shall be maintained unless otherwise provided by the provisions of the State Water Resources Control Board Resolution No. 68-16, "Statement of Policy with Respect to Maintaining of Waters in California", including any revisions thereto, or the federal antidegradation policy, 40 CFR 131.12 (for surface waters only)."

Discharges of storm water in compliance with the terms and conditions of this Order will not degrade surface water quality. Furthermore, the purpose of this Order is to reduce pollutants in storm water discharges to the maximum extent practicable in conformance with Clean Water Act Section 402(p)(3)(B)(ii). Therefore, the Regional Board finds that this Order is in conformance with SWRCB Resolution No. 68-16 and the federal antidegradation policy described in 40 CFR 131.12.

30. The SDRWQCB, in establishing the requirements contained in this Order, considered factors including, but not limited to, the following:

a. Beneficial uses to be protected and the water quality objectives reasonably required for that purpose;
b. Other waste discharges;
c. The need to prevent nuisance;

VOL 22 0481

d. Past, present, and probable future beneficial uses of the waters under consideration;
e. Environmental characteristics of the waters under consideration, including the quality of water available thereto;
f. Water quality conditions that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area;
g. Economic considerations;
h. The need for developing housing within the region; and
i. The need to develop and use recycled water.

31. This Order shall serve as an NPDES permit pursuant to Clean Water Act Section 402, and waste discharge requirements pursuant to California Water Code Section 13260 for the discharge of storm water and urban runoff to surface waters of San Diego County.

32. The issuance of this Order for the discharge of storm water and urban runoff is exempt from the requirement for preparation of environmental documents under the California Environmental Quality Act (Public Resources Code, Division. 13, Chapter 3, Section 21000 et seq.) in accordance with the California Water Code Section 13389.

33. The SDRWQCB has notified the copermittees and all known interested parties of its intent to renew an NPDES permit for the existing discharge of storm water and urban runoff.

34. The SDRWQCB has, at a public meeting on August 10, 1995, held, or provided an opportunity for, a public hearing, and heard and considered all comments pertaining to the terms and conditions of this Order.

IT IS HEREBY ORDERED that the copermittees, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act and regulations adopted thereunder, shall each comply with the following:

A. PROHIBITIONS

1. Any discharge to a storm water conveyance system that is not composed entirely of "storm water" is prohibited unless authorized by the SDRWQCB. The federal regulations, 40 CFR 122.26(b)(13), define storm water as runoff, snow melt runoff, and surface runoff and drainage. An illicit discharge is defined in 40 CFR 122.26 (b)(2) as any discharge to a storm water conveyance system that is not composed entirely of storm water except discharges pursuant to an NPDES permit and discharges resulting from fire fighting activities. [Section 122.26 amended at FR 56553, November 5, 1991; 57 FR 11412, April 2, 1992].

2. The discharge of storm water to waters of the United States containing pollutants which have not been reduced to the maximum extent practicable is prohibited.

3. The unauthorized discharge of treated or untreated sewage to waters of the state or to a storm water conveyance system is prohibited.

VOL 22 0482

VOL 22

4. The discharge of pollutants, or dredged or fill material, to waters of the United States, except as authorized by an NPDES permit or a dredged or fill material permit (subject to the exemption described in California Water Code §13376), is prohibited.

5. The discharge of waste to waters of the state in a manner causing, or threatening to cause, a condition of pollution, contamination, or nuisance as defined in California Water Code Section 13050, is prohibited.

6. The dumping, deposition, or discharge of waste (e.g., oil, rubbish, refuse) directly into waters of the state, or adjacent to such waters in any manner which may permit its being transported into the waters, is prohibited unless authorized by the SDRWQCB.

7. The discharge of treated or untreated waste to lakes or reservoirs used for municipal water supply, or to inland surface waters tributary thereto, is prohibited.

8. The discharge of waste to inland surface waters, except in cases where the quality of the discharge complies with applicable receiving water quality objectives, is prohibited.

9. The discharge of any radiological, chemical, or biological warfare agent into waters of the state is prohibited.

10. The discharge of sand, silt, clay, or other earthen materials from any activity, including land grading and construction, in quantities which cause deleterious bottom deposits, turbidity or discoloration in waters of the state or which unreasonably affect, or threaten to affect, beneficial uses of such waters, is prohibited.

0483

B. DISCHARGE SPECIFICATIONS -- NON-STORM WATER

1. Each copermittee shall forthwith effectively prohibit non-storm water discharges into its storm water conveyance systems unless such discharges are authorized by a separate NPDES permit.

2. Copermittees may, but need not, prohibit a non-storm water discharge that is currently authorized under a separate NPDES permit.

3. Copermittees may, but need not, prohibit the following classes of non-storm water discharges. If the copermitee proposes not to prohibit any of the following classes of non-storm water discharges, the copermitee must first comply with the requirements of section B.4. below to the satisfaction of the SDRWQCB Executive Officer.

   a. water line flushing;
   b. landscape irrigation;
   c. diverted stream flows;
   d. rising ground waters;

e. uncontaminated ground water infiltration [as defined at 40 CFR 35.2005(20)] to storm water conveyance systems;
f. uncontaminated pumped ground water;
g. discharges from potable water sources;
h. foundation drains;
i. air conditioning condensation;
j. irrigation water springs;
k. water from crawl space pumps;
l. footing drains;
m. lawn watering;
n. individual residential car washing;
o. flows from riparian habitats and wetlands;
p. dechlorinated swimming pool discharges; and
q. street wash water.

4. Each copermittee shall submit the following information to the SDRWQCB for each non-storm water discharge class in section B.3. above which the copermittee proposes not to prohibit:

   a. identification of the non-storm water discharge class listed in section B.3. above which the copermitee proposes not to prohibit;

   b. identification of the BMPs which the copermitee will require to prevent or reduce pollutant discharges from the proposed non-prohibited class of non-storm water discharges;

   c. a monitoring program to access the volume, concentration and types of pollutants discharged as a result of the proposed non-prohibited class of non-storm water discharge; and

   d. a program to document and track compliance with the BMPs required for the non-prohibited class of non-storm water discharges.

5. Each copermittee shall prohibit, on a case by case basis, any individual non-storm water discharge listed in section B.3. above (or any class of non-storm water discharges listed above) that is determined by the copermittee to be a source of pollutants to waters of the United States.

6. Discharges or flows from emergency fire fighting activities shall be prohibited only when such flows are determined by the copermittee to be significant sources of pollutants to waters of the United States.

C. DISCHARGE SPECIFICATIONS -- STORM WATER

1. Each copermittee shall forthwith reduce the discharge of pollutants to its storm water conveyance systems to the maximum extent practicable.

2. Copermittees shall reduce pollutants to the maximum extent practicable through implementation of the Comprehensive Storm Water and Urban Runoff Management Program described in section E.

VOL 22 0484

VOL 22

D. **RECEIVING WATER LIMITATIONS**

The discharge of storm water and non storm water (subject to the limitations described in section B. above) shall not cause or contribute to a violation of any applicable receiving water quality objective contained in the Basin Plan or any SWRCB water quality control plan or policy.

E. **COMPREHENSIVE STORM WATER AND URBAN RUNOFF MANAGEMENT PROGRAM**

1. Each copermittee shall effectively implement a Comprehensive Storm Water and Urban Runoff Management Program to achieve compliance with the Prohibitions (section A.), Discharge Specifications (sections B. and C.), and Receiving Water Limitations (section D.) of this Order.

2. The Comprehensive Storm Water and Urban Runoff Management Program shall contain the components listed below and described in sections F. through K. of this Order.

   a. Legal authority (section F.);
   b. Illicit Connection / Illegal Discharge Detection Program (section G.);
   c. Best Management Practices Program (section H.)
      (1) Existing Minimum Best Management Practices Program
      (2) Municipal Best Management Practices Program
      (3) Construction Best Management Practices Program
      (4) Commercial Best Management Practices Program
      (5) Industrial Best Management Practices Program;
   d. Wet Weather Monitoring and Reporting Program (section I.);
   e. Assessment of Management Program Effectiveness (section J.); and
   f. Fiscal Analysis (section K.).

3. Each copermittee shall fully implement each component of the Comprehensive Storm Water and Urban Runoff Management Program as expeditiously as possible, but in no event later than the deadline dates specified in sections F. through K. of this Order.

F. **LEGAL AUTHORITY**

1. Pursuant to 40 CFR 122.26(d)(2)(i)(A-F), each copermittee shall establish and maintain adequate legal authority through ordinance, statute, permit, contract or other means to control discharges to and from those portions of the storm water conveyance system over which it has jurisdiction. This authority must, at a minimum, authorize the copermittee to:

   a. Control the discharge of storm water from industrial (including construction) sites to the copermittee's storm water conveyance system;

   b. Prohibit illicit discharges into the copermittees storm water conveyance system in accordance with sections A., B., C., D., and E. of this Order;

0485

c. Control spills, dumping, and disposal of materials other than storm water into the copermittees storm water conveyance system;

d. Control through interagency agreements among copermittees the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;

e. Require compliance with conditions in ordinances, permits, contracts or orders; and

f. Carry out all inspection, surveillance and monitoring necessary to determine compliance and noncompliance with the applicable conditions of this Order, including the prohibition on illicit discharges in Discharge Specifications - Non-Storm Water (section B.) of this Order.

2. The Cities of Carlsbad, Oceanside, and Santee shall, by **September 10, 1995**, submit a report to the SDRWQCB indicating that legal authority has been obtained to implement and enforce each of the key regulatory requirements contained in 40 CFR 122.26(d)(2)(i)(A-F) and summarized in F.1. above.

3. Each copermittee shall, by **December 15, 1995**, provide to the SDRWQCB a statement certified by its chief legal counsel that the copermittee has adequate legal authority to implement and enforce each of the key regulatory requirements contained in 40 CFR 122.26(d)(2)(i)(A-F) and summarized in F.1. above. The copermittee shall develop and submit a matrix that compares, in a side by side format, the regulatory requirements in 40 CFR 122.26(d)(2)(i)(A-F) to the copermittee's legal authority. Furthermore, the matrix shall also illustrate where the authority to mandate compliance is vested. In order to support the assertion of adequate legal authority, the copermittee shall include the complete text of the applicable storm water, grading, or other ordinances. The copermittee shall also provide a specific explanation of why and how the language of the storm water and grading ordinance or other authority meets the requirements of 40 CFR 122.26(d)(2)(i)(A-F). The copermittee shall indicate to whom the ordinance applies and how it will operate to control, prevent or stop discharges that violate the terms and conditions of this Order.

G. ILLICIT CONNECTION AND ILLEGAL DISCHARGE DETECTION PROGRAM

The purpose of the Illicit Connection and Illegal Discharge (IC/ID) Detection Program is to detect and eliminate illicit connections and illegal discharges (IC/ID) to the storm water conveyance system. The IC/ID Detection Program consists of the following three major components/activities:

a. Detection of IC/IDs;
b. Followup investigation of each IC/ID; and
c. Elimination of each IC/ID.

1. Each copermittee shall forthwith, in conjunction with its local ordinance, implement the IC/ID Detection Program described below to comply with sections A., B., C., D., and E. of this Order.

VOL 22 0486

2. Each copermittee shall implement each component of the IC/ID Detection Program in accordance with sections G.3 - G.6. below.

3. **Detection of IC/IDS**

Each copermittee shall, at a minimum, detect Illicit connections and illegal discharges by way of (1) dry weather field screening; and the (2) public complaint and information hotline as described in Attachment A.

4. **Followup Investigation of IC/IDs**

Each copermittee shall conduct followup investigations of every IC/ID detected (regardless of means of detection) as follows:

a. Each copermittee shall, by **December 15, 1995**, submit to the SDRWQCB written followup procedures to investigate and confirm the source of each IC/ID. Followup procedures may include, but are not limited to, further field screening (observations and field analyses), collection and laboratory analysis of samples (upstream and downstream), smoke or dye tests, and video taping with a remote control camera.

b. Each copermittee shall, as expeditiously as possible, conduct followup investigations to identify the source of each IC/ID detected by any means.

c. Each copermittee shall, by **December 15, 1995**, submit to the SDRWQCB written procedures for documenting the findings of each investigation, for making recommendations, and setting projected time schedules to eliminate each IC/ID. The procedures should include notification to the complainant of the findings and subsequent planned actions.

5. **Elimination of IC/IDs**

Each copermittee shall eliminate each IC/ID using its legal authority as follows:

a. Each copermittee shall establish and submit to the SDRWQCB, by **December 15, 1995**, written procedures to eliminate IC/IDs by means of a gradually escalating level of enforcement (e.g., flyers, letters, notices of violation, monetary penalties, referral to County/City District Attorney). The failure of a responsible party to achieve compliance with an initial enforcement action should result in the prompt escalation to a higher level of enforcement; and

b. Each copermittee shall eliminate all IC/ID's as expeditiously as possible but in no event later than **August 10, 1998.**

H. BEST MANAGEMENT PRACTICES PROGRAMS

The purpose of each of the following five BMP Programs is to reduce pollutants in storm water discharges to the maximum extent practicable in compliance with the Prohibitions

VOL 22 0487

(section A.), Discharge Specifications (sections B. and C.), and Receiving Water Limitations (section D.) of this Order.

1. **Existing Minimum Best Management Practices Program**

   a. Each copermittee shall continue to effectively implement its existing BMP programs for municipal, construction, commercial, and industrial runoff sources. These existing programs must include, at a minimum, the BMPs described in Attachment B of this Order.

   b. Each copermittee shall, by **December 15, 1995**, submit a report to the SDRWQCB describing the implementation status of its current BMP programs for municipal, construction, commercial and industrial sources.

2. **Municipal Best Management Practices Program**

   The purpose of the Municipal Best Management Practices Program is to reduce pollutants in storm water runoff from municipal activities, facilities and land uses.

   The Municipal Best Management Practices Program shall consist of the following components and activities:

   (1) Land Use Planning, Management and Zoning;
   (2) Targeted Municipal Pollutant Sources;
   (3) BMPs Required For Municipal Land Uses;
   (4) Education of Municipal Departments and Employees;
   (5) Education of the Public;
   (6) Copermittee Implementation of Municipal Facility Storm Water Pollution Prevention Plan (SWPPPs);
   (7) Copermittee Inspections of Municipal Facilities; and
   (8) Copermittee Enforcement at Municipal Facilities.

   a. Each copermittee shall submit to the SDRWQCB by **August 10, 1996**, a Municipal Best Management Practices Program in accordance with sections H.2.c. - H.2.j. to achieve compliance with sections A., B., C., D., and E. of this Order.

   b. Each copermittee shall implement the Municipal Best Management Practices Program in accordance with sections H.2.c. - H.2.j. no later than **November 10, 1996**, unless otherwise directed by the SDRWQCB Executive Officer.

   c. Land Use Planning, Management And Zoning

      Land use planning, management, and zoning presents an important opportunity to reduce pollutants in storm water runoff by integrating water quality concerns into the development and redevelopment planning process. It is applicable to all types of land use. The objective is to guide decisions regarding existing and future uses of land to protect water quality. This component shall include measures to:

VOL 22 0488

(1) Direct heavy development away from environmentally sensitive areas where possible;
(2) Establish design criteria and performance standards for new development and redevelopment such as buffer zones, open space preservation, limits on impervious surfaces and erosion and sediment control;
(3) Adopt local codes and ordinances to protect storm water quality; and
(4) Approve storm water management plans for new development.

d. Targeted Municipal Pollutant Sources

Each copermittee shall, at a minimum, target the following municipal sources:

(1) New development and redevelopment areas;
(2) Commercial and residential land use areas;
(3) Public streets, roads and highways under its jurisdiction;
(4) Flood control management projects;
(5) Landfills and sewage treatment plants;
(6) Municipal Corporate Yards; and
(7) Pesticides, herbicides and fertilizers at public parks, golf courses, landscaping around public schools, cemeteries and other public right-of-ways.

e. Municipal BMPs Required For Land Uses

Each copermittee shall describe the BMPs that it will implement to reduce pollutants in runoff from the targeted municipal sources described in H.2.d. above. Each copermittee shall include pollution prevention, source control, and treatment control BMPs as appropriate. Pollution prevention shall always be emphasized. Examples of each BMP category are described below:

(1) Pollution Prevention (non-structural) measures reduce or eliminate the generation of pollutants, or waste. The most important municipal pollution prevention measure is land use planning.

(2) Source control BMPs (non-structural) control pollutants once they are generated. Examples include:

a. public education;
b. household hazardous waste collection;
c. used oil recycling;
d. vehicle use reduction (congestion management); material storage controls;
f. catch basin cleaning;
g. safer alternative products;
h. leaking sanitary sewer control;
i. prevention of sewage spills into storm drains

VOL 22

04889

j. roadway/bridge maintenance;
k. illicit connection detection and elimination;
l. illegal dumping detection and elimination;
m. storm channel maintenance;
n. detention/infiltration device maintenance;
o. leak and spill control;
p. street cleaning;
q. vegetation controls;
r. pesticide, herbicide and fertilizer use controls; and
s. good housekeeping practices.

(3) Treatment control measures (structural) remove pollutants from storm water runoff. Examples include constructed wetlands, detention basins, biofilters, infiltration, oil water separators and media filtration devices.

f. Education Of Municipal Departments And Employees

Each copermittee shall develop and implement an educational program for all municipal departments and employees. The objective of the education program is to inform municipal departments and employees about pollution prevention, pollution sources, pollution controls, and water quality impacts. This program shall describe and schedule educational products and activities such as brochures and workshops. Education outreach shall target high priority municipal sources such as sewage spills entering storm drains, disposal of street sweeping or other waste, and municipal corporate yards.

g. Education Of The Public

Each copermittee shall implement a public education program. The objective of the education program is to inform the public about pollution prevention, sources, controls, and water quality impacts from storm water and urban runoff. This program shall describe and schedule educational products and activities such as brochures and workshops. Education outreach shall target political leaders, the general public, commercial and industrial businesses, trade associations, developers, contractors and the media.

(1) The copermittees shall establish a Public Education Subcommittee which reports to the copermittee management committee (as described in the MOU) made up of at least five copermittees and a representative from each of the following eight groups: other municipal departments, construction, media, community, schools, commercial business, industrial business, and decision makers/elected officials.

(2) The Public Education Subcommittee shall establish a public education program addressing municipal, residential, commercial, industrial and construction sources of storm water pollutants.

VOL 22 0490

R0065725

VOL 22

(Residential includes all residents, both owners and renters, as well as managers of multifamily dwellings and permanent and temporary residents of boats in marinas.) The goal of the subcommittee is to develop cooperative watershed based public education programs emphasizing pollution prevention. Public education programs should be communicated in both English and Spanish.

h. Copermittee Implementation Of Municipal Facility SWPPPs.

Each copermittee shall implement a site specific Storm Water Pollution Prevention Plans (SWPPPs) at each industrial facility owned by the municipality, including all corporate yards.

i. Copermittee Inspections Of Municipal Facilities

Each copermittee shall inspect each industrial facility owned by the municipality, including all corporate yards. Each facility should be inspected for compliance with its SWPPP and the storm water ordinance. This component shall describe inspection priorities, frequency, procedures and documentation.

j. Copermittee Enforcement At Municipal Facilities

Each copermittee shall enforce its local storm water ordinance at all municipal facilities and activities. This component shall describe enforcement priorities, penalties and other remedies to deter infractions and correct violations.

0491

3. **CONSTRUCTION BEST MANAGEMENT PRACTICES PROGRAM**

The purpose of the Construction Best Management Practices Program is to (1) reduce pollutants in storm water runoff from construction sites and activities, and (2) maintain pre-construction hydrologic conditions. The Construction Best Management Practices Program shall consist of the following major components and activities:

(1) Site Planning;
(2) BMPs Required For Construction Sites;
(3) Education for Construction Site Owners and Operators;
(4) Copermittee Review of Construction Site SWPPPs;
(5) Copermittee Inspections of Construction Sites; and
(6) Copermittee Enforcement at Construction Sites.

a. Each copermittee shall submit to the SDRWQCB by **August 10, 1996**, a Construction Best Management Practices Program in accordance with sections H.3.c. - H.3.j. to achieve compliance with sections A., B., C., D, and E. of this Order.

b. Each copermittee shall implement the Construction Best Management Practices Program in accordance with sections G.3.c. - G.3.j. no later than

November 10, 1996, unless otherwise directed by the SDRWQCB Executive Officer.

c. Site Planning

The objective of site planning is for the copermittee and the construction site owner to address potential water quality problems early in the site design process. Each copermittee shall require the following:

(1) Phased grading and development to minimize exposure and to coincide with seasonal dry periods;
(2) Site stabilization and revegetation as early as possible; and
(3) Review and approval of engineering plans and issuance of local permits.

d. BMPS Required For Construction Sites

Each copermittee shall describe the BMPs that it will require construction site owner/operator to implement to reduce pollutants in runoff. Each copermittee shall include pollution prevention, source control, and treatment control best management practices as appropriate. Pollution prevention shall always be emphasized. Examples of each BMP category are described below:

(1) Pollution Prevention (non-structural) measures reduce or eliminate the generation of pollutants or waste. At construction sites, pollution prevention primarily means erosion prevention. Examples include revegetation, matting, mulching, or other soil stabilization processes.

(2) Source control BMPs (non-structural) control pollutants once they are generated. At construction sites, source controls are primarily sediment controls. Examples include sand bags, hay bales, check dams, riprap, storm drain inlet protection, and silt fences.

(3) Treatment control BMPs (structural) remove pollutants, such as sediment, from storm water runoff. Examples include retention ponds, sediment basins, and filtration devices.

e. Each copermittee shall require maintenance and replacement of all source and treatment control BMPs.

f. Each copermittee shall require appropriate post construction BMPs. Each copermittee shall require maintenance and replacement of all post construction BMPs.

g. Each copermittee is responsible for storm water runoff from all construction sites within its jurisdiction, including those which are currently regulated under the statewide NPDES General Construction Storm Water Permit and those which are not subject to the general permit at this time. This includes all construction sites, regardless of size (i.e., sites less than five acres).

VOL 22 0492

h. Education for Construction Site Owners and Operators

Each copermittee shall implement an educational program for construction site owners and operators. The objective of the education program is to inform construction site owners and operators about pollution prevention (i.e., erosion prevention), pollution sources, pollution controls, and water quality impacts. This program shall describe and schedule educational products and activities such as brochures and workshops. Education outreach shall target high priority construction sites.

i. Copermittee Review of Construction Site SWPPPS.

Each copermittee shall review construction site Storm Water Pollution Prevention Plans (SWPPPs) for compliance with its local grading and storm water ordinances.

j. Copermittee Inspections of Construction Sites

Each copermittee shall inspect construction sites for compliance with its grading ordinance and permits. This component should describe inspection priorities, frequency, procedures, and documentation. Each copermittee shall inspect all construction sites for proper maintenance and replacement of all source and treatment controls.

k. Copermittee Enforcement at Construction Sites

Each copermittee shall enforce its local storm water ordinance, grading ordinance and permits at construction sites. This component shall describe enforcement priorities, penalties and other remedies to deter infractions and correct violations.

4. **COMMERCIAL BEST MANAGEMENT PRACTICES PROGRAM**

The purpose of the Commercial Best Management Practices Program is to reduce pollutants in storm water runoff from commercial sites. The Commercial Best Management Practices Program shall consist of the following major components and activities:

(1) Prioritization of Commercial Categories;
(2) BMPs Required For Commercial Sites;
(3) Education for Commercial Site Owners and Operators;
(4) Copermittee Inspections of Commercial Sites; and
(5) Copermittee Enforcement at Commercial Sites.

a. Each copermittee shall submit to the SDRWQCB by **August 10, 1997**, a Commercial Best Management Practices Program in accordance with sections H.4.c. - H.4.g., to achieve compliance with sections A., B., C., D., and E. of this Order.

VOL 22

049933

b. Each copermittee shall implement the Commercial Best Management Practices Program in accordance with sections H.4.c. - H.4.g., no later than **November 10, 1997**, unless otherwise directed by the SDRWQCB Executive Officer.

c. Prioritization of Commercial Categories

Each copermittee shall identify all commercial categories and prioritize the categories based on their threat to water quality.

(1) In evaluating threat to water quality each copermittee shall consider (1) type of commercial activity; (2) materials used in the commercial activity and the likelihood that storm water discharges will be contaminated; (3) non-storm water discharges; (4) proximity to water bodies; and (5) sensitivity of water bodies.

(2) At a minimum the priority categories shall include gas stations, vehicle repair and maintenance shops, car dealerships, commercial car washes, dry cleaners, cement mixing businesses, concrete cutting businesses, and restaurants.

d. BMPs Required for Commercial Sites

Each copermittee shall describe the BMPs that it will require commercial sites to implement to reduce pollutants in runoff. Each copermittee shall include pollution prevention, source control, and treatment control BMPs as appropriate. Pollution prevention shall always be emphasized. Examples of each BMP category are described below:

(1) Pollution Prevention measures (non-structural) reduce or eliminate the generation of pollutants or waste. Examples include: substitution of nontoxic materials for toxic; improvements in operation and maintenance efficiency; recycling within production process; and replacement or upgrade of production equipment and technologies;

(2) Source control BMPs (non-structural) control pollutants once they are generated by preventing the contact of pollutants with storm water or preventing the discharge of pollutants. Examples include berms, covers, and good housekeeping practices such as prompt cleanup of spills; and

(3) Treatment control BMPs (structural) remove pollutants from storm runoff and include on-site pretreatment, filtration, and oil water separators.

e. Education for Commercial Site Owners and Operators

Each copermittee shall implement an educational program for commercial site owners and operators. The objective of the education component is to

VOL 22 0494

VOL 22

inform commercial site owners and operators, particularly those in high priority commercial categories, about pollution prevention, pollution sources, controls, and water quality impacts. This component shall describe and schedule educational products and activities such as brochures and workshops. Education outreach shall target high priority commercial sites and activities.

f. Copermittee Inspections of Commercial Sites

Each copermittee shall develop a program to inspect high priority categories of commercial sites for compliance with its storm water ordinance. This component shall describe inspection priorities, frequency, procedures, and documentation.

g. Copermittee Enforcement of Commercial Sites

Each copermittee shall enforce its storm water ordinance at commercial sites. This component shall describe enforcement priorities, penalties and other remedies to deter infractions and correct violations.

5. **INDUSTRIAL BEST MANAGEMENT PRACTICES PROGRAM**

The purpose of the Industrial Best Management Practices Program is to reduce pollutants in storm water runoff from industrial sites. The Industrial Best Management Practices Program shall consist of the following major components and activities:

(1) Prioritization of Industrial Categories;
(2) BMPs Required for Industrial Sites;
(3) Education for Industrial Site Owners and Operators;
(4) Copermittee Inspections of Industrial Sites; and
(5) Copermittee Enforcement at Industrial Sites.

a. Each copermittee shall submit to the SDRWQCB by **February 10, 1998**, a Industrial Best Management Practices Program in accordance with sections H.5.c. - H.5.h. to achieve compliance with sections A., B., C., D., and E. of this Order.

b. Each copermittee shall implement the Industrial Best Management Practices Program in accordance with sections H.5.c. - H.5.h. no later than **May 10, 1998**, unless otherwise directed by the SDRWQCB Executive Officer.

c. Prioritization of Industrial Categories

Each copermittee shall identify all industrial categories and prioritize the categories based on their threat to water quality.

(1) In evaluating threat to water quality each copermittee shall consider (1) type of industrial activity including SIC Code; (2) materials used in industrial processes and the potential for storm water

0495

contamination; (3) non-storm water discharges; (4) proximity to water bodies; and (5) sensitivity of water bodies.

(2) At a minimum, the priority categories shall include hazardous waste treatment, disposal or recovery facilities; industries subject to effluent limitations under 40 CFR Subchapter N; industries subject to SARA Title III; shipyards; heavy manufacturing facilities (e.g. aircraft); oil and gas/mining facilities; landfills; recycling facilities; electric power generating facilities; transportation facilities; light manufacturing facilities; industrial sewage treatment plants; and military bases.

(3) Each copermittee is responsible for storm water runoff from all industrial sites within its jurisdiction, including those which are currently regulated under the statewide NPDES General Industrial Storm Water Permit and those which are not subject to the general permit at this time.

d. BMPS Required for Industrial Sites

Each copermittee shall describe the BMPs that it will require industrial sites to implement to reduce pollutants in runoff. Each copermittee shall include pollution prevention, source control, and treatment control BMPs as appropriate. Pollution prevention shall be emphasized. Examples of each BMP category are described below:

(1) Pollution Prevention measures (non-structural) reduce or eliminate the generation of pollutants or waste. Examples include: substitution of nontoxic materials for toxic; improvements in operation and maintenance efficiency; recycling within production process; and replacement or upgrade of production equipment and technologies;

(2) Source control BMPs (non-structural) control pollutants once they are generated by preventing the contact of pollutants with storm water or preventing discharge of pollutants. Examples include: berms, covers, and good housekeeping practices such as prompt cleanup of spills; and

(3) Treatment control BMPs (structural) remove pollutants from storm water runoff and include on-site pretreatment, filtration and oil-water separators.

e. Education for Industrial Site Owners and Operators

Each copermittee shall implement an educational program for industrial site owners and operators. The objective of the education component is to inform industrial site owners and operators about pollution prevention, pollution sources, pollution controls, and water quality impacts. This component shall describe and schedule educational products and activities

VOL 22 0496

such as brochures and workshops. Education outreach shall target high priority industrial sites and activities.

f. Copermittee Review of Industrial SWPPPs

Each copermittee shall review industrial Storm Water Pollution Prevention Plans (SWPPPs) for compliance with its local storm water ordinance.

g. Copermittee Inspection of Industrial Sites

Each copermittee shall develop a program to inspect high priority categories of industrial sites for compliance with its local storm water ordinance. This component shall describe inspection priorities, frequency, procedures, and documentation.

h. Copermittee Enforcement at Industrial Sites

Each copermittee shall enforce its storm water ordinance at industrial sites. This component shall describe enforcement priorities, penalties and other remedies to deter infractions and correct violations.

I. WET WEATHER MONITORING AND REPORTING PROGRAM

The purpose of the Wet Weather Monitoring Program is to characterize storm water pollutant loading and concentrations, including long term trends, during the wet weather season. Each copermittee shall, beginning with the 1995-96 wet weather season, conduct wet weather monitoring and reporting in accordance with Attachment C of this Order.

J. ASSESSMENT OF MANAGEMENT PROGRAM EFFECTIVENESS

Each copermitee shall, by **January 31, 1996**, submit a report to the SDRWQCB describing estimated reductions in storm water pollutant loads expected as a result of the implementation of the Comprehensive Storm Water and Urban Runoff Management Program. Estimates of storm water pollutant load reductions shall be based on direct and indirect measurements of the effectiveness of the Comprehensive Storm Water and Urban Runoff Management Program. The report shall identify the direct and indirect measurements which will be used to track the long term effectiveness of the Comprehensive Storm Water and Urban Runoff Management Program.

1. Direct measurements of program effectiveness may include:

   a. Removal efficiencies of BMPs that control storm water quality;
   b. Reductions in the volume of storm water discharged;
   c. Reductions in the event mean concentrations; or
   d. Reductions in seasonal pollutant loadings.

2. Indirect measurements of program effectiveness may include changes in:

   a. Level of enforcement activity;
   b. Public awareness;

VOL 22 0497

c. Number of reports of illicit discharges or illegal dumping;
d. Gallons of used oil recycled;
e. Amount of household hazardous waste collected;
f. Number of spill cleanups;
g. Number of storm drains stenciled;
h. Acres of open space; and
i. Number of construction and erosion and sediment control plans submitted and approved.

K. FISCAL ANALYSIS

Each copermittee shall develop and submit to the SDRWQCB by **January 31, 1996** a fiscal analysis demonstrating that sufficient financial resources have been appropriated to implement the conditions of this Order. This Order will be effective on August 10, 1995 and expires on August 10, 2000. For each of the five fiscal years to be covered by this Order, the fiscal analysis must describe the necessary capital and operation and maintenance expenditures necessary to accomplish the activities required under this Order. The analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures including legal restrictions on the use of such funds. The fiscal analysis shall contain the following information:

1. Identification of the major tasks for each component required under this Order;
2. Development of a schedule outlining when each of the tasks for each component will be undertaken;
3. An estimate of the personnel and capital expenses necessary to accomplish each task for each component;
4. An estimate of other non-capital costs to implement the tasks for each component;
5. Identification of funding sources to cover total expenditures (e.g. general revenues, storm water utilities, plan review fees, permit fees, industrial/commercial user fees, special assessment district funds, special assessments on property tax bills and revenue bonds);
6. A comparison of the funding sources with the funding needs; and
7. Identification of alternative funding sources if adequate funding is not available.

L. PROVISIONS

1. Duty To Comply [40 CFR 122.26(a)(3)(vi)

   Each copermitees need only comply with conditions of this Order relating to (1) discharges from storm water conveyance systems for which they are operators; and (2) the Wet Weather Monitoring and Reporting Program described in Attachment C of this Order to be conducted jointly by all copermittees pursuant to the copermittees Memorandum of Understanding.

2. Duty To Comply [40 CFR 122.41(a)]

   The discharger must comply with all conditions of this Order. Any permit noncompliance constitutes a violation of the Clean Water Act and the California Water Code and is grounds for enforcement action; for permit termination,

VOL 22 0498

revocation and reissuance, or modification; or denial of a report of waste discharge submitted in application for permit modification or reissuance.

3. Duty To Comply [40 CFR 122.41(a)(1)]

The discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the Clean Water Ac for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the Clean Water Act within the time provided in the regulations that establish these standards or prohibitions or standards for sewage sludge use or disposal, even if this Order has not yet been modified to incorporate the requirement.

4. Need to Halt or Reduce Activity Not a Defense [40 CFR 122.41(c)]

It shall not be a defense for the discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order. Upon reduction, loss, or failure of a treatment facility, the discharger shall, to the extent necessary to maintain compliance with this Order, control production or all discharges, or both, until the facility is restored or an alternative method of treatment is provided. This provision applies, for example, when the primary source of power of a treatment facility fails, is reduced, or is lost.

5. Duty to Mitigate [40 CFR 122.41(d)]

The discharger shall take all reasonable steps to minimize or prevent any discharge or prevent any discharge or sludge use or disposal in violation of this Order which has a reasonable likelihood of adversely affecting human health or the environment.

6. Proper Operation and Maintenance [40 CFR 122.41(e)]

The discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems which are installed by the discharger only when the operation is necessary to achieve compliance with the conditions of this Order.

7. Permit Actions [40 CFR 122.41(f)] [California Water Code § 13381]

This Order may be modified, revoked and reissued, or terminated for cause including, but not limited to, the following:

a. Violation of any terms or conditions of this Order;

b. Obtaining this Order by misrepresentation or failure to disclose fully all relevant facts;

VOL 22 0499

c. A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge; or

d. A determination that the permitted activity endangers human health or the environment and can only be regulated to acceptable levels by permit modification or termination.

The filing of a request by the discharger for modification, revocation and reissuance, or termination of this Order, or a notification of planned changes or anticipated noncompliance does not stay any condition of this Order.

8. Property Rights [40 CFR 122.41(g)] [California Water Code §13263(g)]

This Order does not convey any property rights of any sort or any exclusive privilege. The requirements prescribed herein do not authorize the commission of any act causing injury to persons or property, nor protect the discharger from liabilities under federal, state, or local laws, nor create a vested right for the discharger to continue the waste discharge.

9. Inspection and Entry [40 CFR 122.41(i)] [California Water Code § 13267(c)]

The discharger shall allow the SDRWQCB, or an authorized SDRWQCB representative, or an authorized representative of the USEPA (including an authorized contractor acting as a representative of the SDRWQCB or USEPA), upon presentation of credentials and other documents as may be required by law, to:

a. Enter upon the discharger's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this Order;

b. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order;

c. Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; and

d. Sample or monitor at reasonable times, for the purposes of assuring compliance with this Order or as otherwise authorized by the Clean Water Act or California Water Code, any substances or parameters at any location.

10. Bypass of Treatment Facilities [40 CFR 122.41(m)]

a. Definitions

(1) "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility.

VOL 22

0500

(2) "Severe property damage" means substantial physical damage to property, damage to the treatment facilities which causes them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.

b. Bypass not Exceeding Limitations

The discharger may allow any bypass to occur which does not cause effluent limitations of this Order or the concentrations of pollutants set forth in Ocean Plan Table A or Table B to be exceeded, but only if it also is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions of paragraphs c. and d. of this provision.

c. Notice

(1) Anticipated bypass. If the discharger knows in advance of the need for a bypass, it shall submit prior notice, if possible, at least ten days before the date of the bypass.

(2) Unanticipated bypass. The discharger shall submit notice of an unanticipated bypass as required in Reporting Requirement N.9.

d. Prohibition of Bypass

(1) Bypass is prohibited, and the SDRWQCB may take enforcement action against the discharger for bypass, unless:Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage;

(2) There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgement to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance; and

(3) The discharger submitted notices as required under paragraph c. of this section.The SDRWQCB Executive Officer may approve an anticipated bypass, after considering its adverse effects, if the SDRWQCB Executive Officer determines that it will meet the three conditions listed above in paragraph d.(1) of this section.

VOL 22
0501

11. Upset [40 CFR 122.41(n)]

a. Definition

"Upset" means an exceptional incident in which there is unintentional and temporary noncompliance with technology based effluent limitations because of factors beyond the reasonable control of the discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.

b. Effect of an Upset

An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of paragraph c. of this section are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review.

c. Conditions Necessary for a Demonstration of Upset

A discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:

(1) An upset occurred and that the discharger can identify the cause(s) of the upset;

(2) The permitted facility was at the time being properly operated;

(3) The discharger submitted notice of the upset as required in Reporting Requirement N.9.(24 hour notice) of this Order; and

(4) The discharger complied with any remedial measures required under Provision L.5. of this Order.

d. Burden of Proof

In any enforcement proceeding the discharger seeking to establish the occurrence of an upset has the burden of proof.

12. Other Effluent Limitations and Standards [40 CFR 122.44(b)(1)]

If any toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under Section 307(a) of the Clean water Act for a toxic pollutant which is present in the discharge and that standard or prohibition is more stringent than any limitation on the pollutant in this Order, the SDRWQCB Executive Officer may institute proceedings under these regulations to modify or revoke and reissue the Order to conform to the toxic effluent standard or prohibition.

VOL 22 0502

13. The discharger shall take all reasonable steps to minimize or correct any adverse impact on the environment resulting from noncompliance with this Order, including such accelerated or additional monitoring as may be necessary to determine the nature and impact of the noncomplying discharge.

14. The provisions of this Order are severable, and if any provision of this Order, or the application of any provision of this Order to any circumstances, is held invalid, the application of such provision to other circumstances, and the remainder of this Order, shall not be affected thereby.

15. The discharger shall comply with any interim effluent limitations as established by addendum, enforcement action, or revised waste discharge requirements which have been, or may be, adopted by this SDRWQCB.

M. MONITORING REQUIREMENTS

1. Wet Weather Monitoring Annual Report

Pursuant to the Memorandum of Understanding, the copermitees shall jointly conduct the wet weather monitoring program described in Attachment C. of this Order. A single wet weather monitoring report shall be submitted by August 10 of each year.

2. Monitoring and Records [40 CFR 122.41(j)(1)]

Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

3. Monitoring and Records [40 CFR 122.41(j)(2)] [California Water Code § 13383(a)]

The discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least three years from the date of the sample, measurement, report or application. This period may be extended by request of the SDRWQCB Executive Officer at any time.

4. Monitoring and Records [40 CFR 122.21(j)(3)]

Records of monitoring information shall include the information requested in Attachments A. and C. and the following:

a. The date, exact place, and time of sampling or measurements;
b. The individual(s) who performed the sampling or measurements;
c. The date(s) analyses were performed;
d. The individual(s) who performed the analyses;
e. The analytical techniques or methods used; and
f. The results of such analyses.

VOL 22 0503

5. Monitoring and Records [40 CFR 122.21(j)(4)]

Monitoring results must be conducted according to test procedures approved under 40 CFR part 136 unless other test procedures have been specified in the permit.

6. Monitoring and Records [40 CFR 122.21(j)(5)]

The Clean Water Act provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than two years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by imprisonment of not more than four years, or both.

7. Monitoring and Records [40 CFR 122.41(k)(2)]

The Clean Water Act provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or non-compliance shall, upon conviction, be punished by a fine of not more than $10,000 per violation, or by imprisonment for not more than six months per violation, or by both.

8. Monitoring Reports [40 CFR 122.41(l)(4)

Monitoring results shall be reported at the intervals specified elsewhere in this Order.

9. Monitoring Reports [40 CFR 122.41(l)(4)(ii)]

If the discharger monitors any pollutant more frequently than required by the permit using test procedures approved under 40 CFR part 136, unless otherwise specified in the permit, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the reports requested by the SDRWQCB Executive Officer.

10. Monitoring Reports [40 CFR 122.41(l)(4)(iii)]

Calculations for all limitations which require averaging of measurements shall utilize an arithmetic mean unless otherwise specified by the SDRWQCB Executive Officer in the permit.

N REPORTING REQUIREMENTS

1. **Memorandum of Understanding**

Each copermittee shall submit a signed and executed copy of the Memorandum of Understanding (MOU) to the SDRWQCB no later than **August 10, 1995.**

VOL 22

0504

2. **Annual Report** [40 CFR 122.42(c)]

Each copermittee must submit an annual report to the SDRWQCB Executive Officer by **August 10** of each year. The report shall include a detailed discussion on the status of implementing the Comprehensive Storm Water and Urban Runoff Management Program described in section E. through K. of this Order: The discussion shall address the following:

a. Non-Prohibited Non-Storm Water Discharges (section B.)

Provide a status report on each non-prohibited class of non-storm water discharges described in section B.3. containing the following information:

(1) identification of the non-storm water discharge class(es) ;

(2) identification of the BMPs which have been implemented to prevent or reduce pollutant discharges from the non-prohibited class of non-storm water discharges;

(3) the data results of the monitoring program to access the volume, concentration and types of pollutants discharged as a result of the proposed non-prohibited class of non-storm water discharge; and

(4) A summary describing the number and nature of enforcement actions, inspections, and public education related to these non-storm water discharge classes.

b. Legal Authority (section F.)

Provide confirmation of continuing adequate legal authority as required in Section F. of this Order.

c. Illicit Connection / Illegal Discharge Detection Program (section G.);

(1) Provide a status report on all IC/ID detection activities including:

(a) number of IC/IDs detected by field screening;summary of field screening data including a frequency distribution of data to identify stations at which elevated levels of pollutants are consistently found. (Field screening data report is due every January 31).; and
(b) number of IC/IDs reported by public hotline .

(2) Provide a status report on all IC/ID elimination activities

(a) including:number of IC/IDs eliminated;
(b) number of enforcement actions taken

d. Best Management Practices Program (section H.)

Provide a status report on the implementation of each of the following five BMP programs:

VOL 22 0505

(1) Existing Minimum Best Management Practices Program;
(2) Municipal Best Management Practices Program;
(3) Construction Best Management Practices Program;
(4) Commercial Best Management Practices Program; and
(5) Industrial Best Management Practices Program.

e. Assessment of Management Program Effectiveness (section J.);

Using direct and indirect measures selected as long term indicators of management program effectiveness, provide an assessment of overall reductions in storm water pollutant loads, occurring during the past year, attributable to implementation of the Comprehensive Storm Water and Urban Runoff Management Program. Provide a summary describing the number and nature of enforcement actions, inspections, public education programs, and identification of water quality improvements or degradation.

f. Fiscal Analysis (section K.).

Update the projected five year fiscal analysis required in section K. of this Order, if necessary. At a minimum documentation should be submitted demonstrating that sufficient financial resources have been appropriated for the upcoming fiscal year to implement the conditions of this Order. Also include a description of the annual expenditures for the previous fiscal year.

3. Duty to Reapply [40 CFR 122.41(b)]

This Order expires on August 10, 2000. If the discharger wishes to continue any activity regulated by this Order after the expiration date of this Order, the discharger must apply for and obtain new waste discharge requirements. The discharger must file a Report of Waste Discharge in accordance with Title 23, California Code of Regulations not later than 180 days in advance of the expiration date of this Order as application for issuance of new waste discharge requirements.

4. Duty to Provide Information [40 CFR 122.41(h)]

The discharger shall furnish to the Executive Officer, SWRCB Executive Director, or USEPA, within a reasonable time, any information which the Executive Officer, SWRCB Executive Director, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order, or to determine compliance with this Order. The discharger shall also furnish to the SDRWQCB Executive Officer, SWRCB Executive Director, or USEPA, upon request, copies of records required to be kept by this Order.

5. Planned Changes [40 CFR 122.41(l)(1)]

The discharger shall give notice to the SDRWQCB Executive Officer as soon as possible of any planned physical alterations or additions to the permitted facility.

Notice is required only when:

a The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR Part 122.29(b);

VOL 22 0506

b. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which are subject neither to effluent limitations in this Order, nor to notification requirements under 40 CFR 122.42(a)(l); or

c. The alteration or addition results in a significant change in the discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of conditions in this Order that are different from or absent in the existing Order, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan.

6. Anticipated Non-Compliance [40 CFR 122.41(l)(2)]

The discharger shall give advance notice to the Executive Officer of any planned changes in the permitted facility or activity which may result in noncompliance with the requirements of this Order.

7. Transfers [40 CFR 122.41(l)(3)]

This Order is not transferable to any person except after notice to the SDRWQCB Executive Officer. The SDRWQCB Executive Officer may require modification or revocation and reissuance of this Order to change the name of the discharger and

incorporate such other requirements as may be necessary under the Clean Water Act or the California Water Code in accordance with the following:

a. Transfers by Modification [40 CFR 122.61(a)]

Except as provided in paragraph b. of this reporting requirement, this Order may be transferred by the discharger to a new owner or operator only if this Order has been modified or revoked and reissued, or a minor modification made to identify the new discharger and incorporate such other requirements as may be necessary under the Clean Water Act or California Water Code.

b. Automatic Transfers [40 CFR 122.61(b)]

As an alternative to transfers under paragraph a. of this reporting requirement, any NPDES permit may be automatically transferred to a new discharger if:

(1) The current discharger notifies the SDRWQCB Executive Officer at least 30 days in advance of the proposed transfer date in paragraph b.(2) of this reporting requirement;

(2) The notice includes a written agreement between the existing and new dischargers containing a specific date for transfer of permit responsibility, coverage, and liability between them; and

(3) The SDRWQCB Executive Officer does not notify the existing discharger and the proposed new discharger of his or her intent to modify or revoke and reissue the Order. A modification under this

VOL 22 0507

subparagraph may also be a minor modification under 40 CFR Part 122.63. If this notice is not received, the transfer is effective on the date specified in the agreement mentioned in paragraph b.(2) of this reporting requirement.

8. Compliance Schedules [40 CFR 122.41(l)(5)]

Written reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order shall be submitted to the SDRWQCB no later than 14 days following each schedule date.

9. Twenty-four Hour Reporting [40 CFR 122.41(l)(6)]

The discharger shall report any noncompliance which may endanger health or the environment. Any information shall be provided orally to the SDRWQCB Executive Officer within 24 hours from the time the discharger becomes aware of the circumstances. A written description of any noncompliance shall be submitted to the SDRWQCB Executive Officer within five days of such an occurrence and contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance. The following shall be included as information which must be reported within 24 hours under this reporting requirement:

a. Any unanticipated bypass which exceeds any effluent limitation in this Order;

b. Any discharge of treated or untreated wastewater resulting from pipeline breaks, obstruction, surcharge or any other circumstance;

c. Any upset which exceeds any effluent limitation in this Order; and

d. Any violation of the prohibitions of this Order.

10. Other Non-Compliance [40 CFR 122.41(l)(7)]

The discharger shall report all instances of noncompliance not reported under Monitoring Requirements M.7., M.8., and M.9., and Reporting Requirements N.8. and N.9. of this Order, at the time monitoring reports are submitted. The reports shall contain the information listed in Reporting Requirement N.9. of this Order.

11. Other Information [40 CFR 122.41(l)(8)]

Where the discharger becomes aware that it failed to submit any relevant facts in a Report of Waste Discharge, or submitted incorrect information in a Report of Waste Discharge, or in any report to the SDRWQCB, it shall promptly submit such facts or information.

VOL 22 0508

12. Signatory Requirements [40 CFR 122.41(k)(1) and 40 CFR 122.22]

All applications, reports, or information submitted to the SDRWQCB Executive Officer shall be signed and certified.

a. All Reports of Waste Discharge shall be signed as follows:

(1) **For a corporation**: by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (a) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation; or (b) the manager of one or more manufacturing, production, or operating facilities employing more than 250 persons or having gross annual sales or expenditures exceeding $25 million (in second-quarter 1980 dollars), if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures.

(2) **For a partnership or sole proprietorship**: by a general partner or the proprietor, respectively; or

(3) **For a municipality, State, Federal or other public agency:** by either a principal executive officer or ranking elected official. For purposes of this section, a principal executive officer of a Federal agency includes: (a) the chief executive officer of the agency; or (b) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of USEPA).

b. All reports required by this Order, and other information requested by the SDRWQCB Executive Officer shall be signed by a person described in paragraph a. of this reporting requirement, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

(1) The authorization is made in writing by a person described in paragraph a. of this reporting requirement;

(2) The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.); and,

(3) The written authorization is submitted to the SDRWQCB Executive Officer.

c. If an authorization under paragraph b. of this reporting requirement is no longer accurate because a different individual or position has responsibility

VOL 22 0509

for the overall operation of the facility, a new authorization satisfying the requirements of paragraph b. of this reporting requirement must be submitted to the SDRWQCB Executive Officer prior to or together with any reports, information, or applications to be signed by an authorized representative.

d. Any person signing a document under paragraph a. or b. of this reporting requirement shall make the following certification:

> "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

13. Except for data determined to be confidential under 40 CFR Part 2, all reports prepared in accordance with the terms of this Order shall be available for public inspection at the offices of the California Regional Water Quality Control Board, San Diego Region. As required by the Clean Water Act, Reports of Waste Discharge, this Order, and effluent data shall not be considered confidential.

14. The discharger shall submit reports and provide notifications as required by this Order to the following:

a. Storm Water Unit
California Regional Water Quality Control Board
San Diego Region
9771 Clairemont Mesa Blvd, Suite B
San Diego, California 92124-1331

Phone - (619) 467-2952 or
Fax - (619) 571-6972

b. U.S. Environmental Protection Agency
Region IX
Permits Issuance Section (W-5-1)
75 Hawthorne Street
San Francisco, California 94105

15. Unless otherwise directed, the discharger shall submit three copies of each report required under this Order to the SDRWQCB and one copy to USEPA.

VOL 22
0510

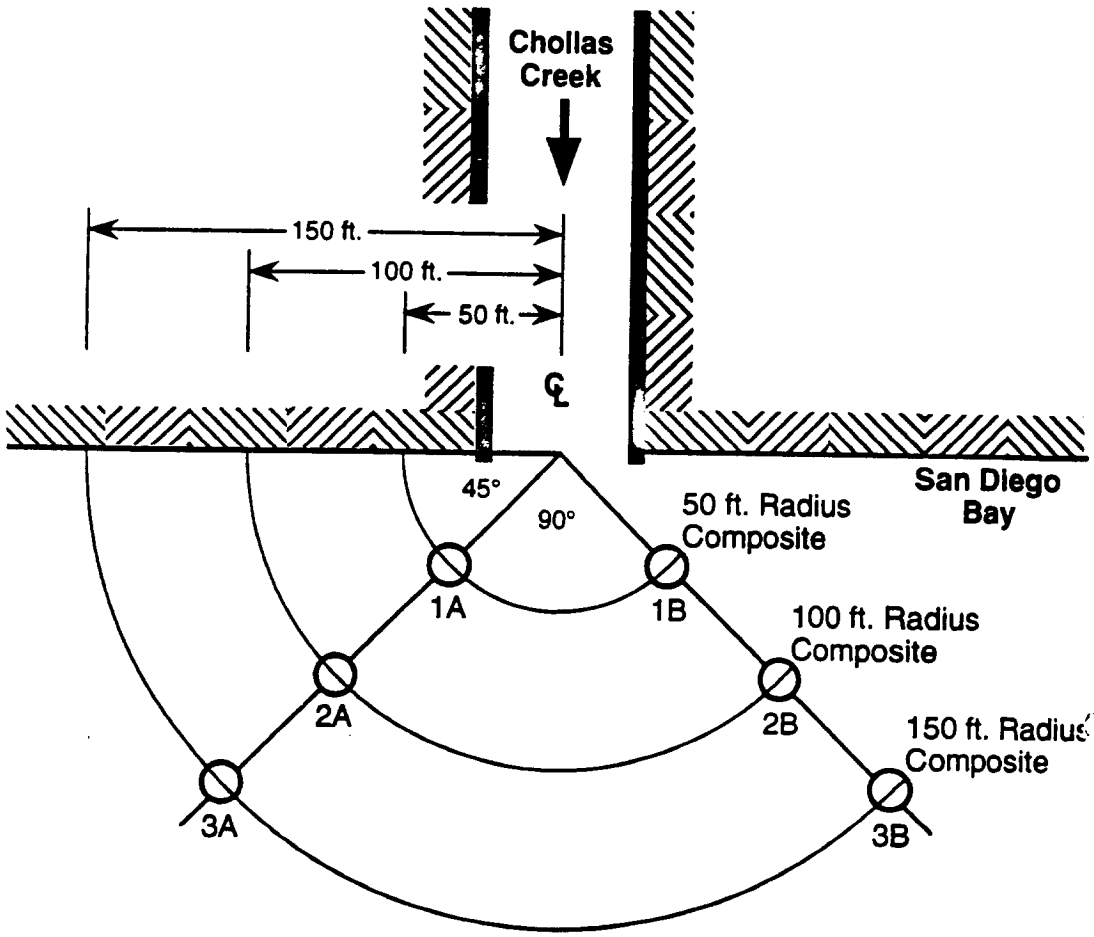
O. **NOTIFICATION**

1. California Water Code Section 13263(g) states:

   No discharge of waste into the waters of the state, whether or not such discharge is made pursuant to waste discharge requirements, shall create a vested right to continue such discharge. All discharges of waste into waters of the state are privileges, not rights.

2. Enforcement Provisions [40 CFR 122.41(a)(2)] [California Water Code Sections 13385 and 13387]

   The Clean Water Act provides that any person who violates section 301, 302, 306, 307, 308, 318 or 405 of the Act, or any condition or limitation of this Order, is subject to a civil penalty not to exceed $25,000 per day for each violation. The Clean Water Act provides that any person who negligently violates sections 301, 302, 306, 307, 308, 318, or 405 of the Act, or any condition or limitation of this Order, is subject to criminal penalties of $2,500 to $25,000 per day of violation, or imprisonment of not more than one year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than $50,000 per day of violation, or by imprisonment of not more than two years, or both. Any person who knowingly violates such sections, or such conditions or limitations is subject to criminal penalties of $5,000 to $50,000 per day of violation, or imprisonment for not more than three years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than $100,000 per day of violation, or imprisonment of not more than six years, or both. Any person who knowingly violates section 301, 302, 303, 306, 307, 308, 318 or 405 of the Act, or any condition or limitation of this Order, and who knows at that time that he or she thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of not more than $250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than $500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in section 309(c)(3)(B)(iii) of the Clean Water Act, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than $1,000,000 and can be fined up to $2,000,000 for second or subsequent convictions.



3. Except as provided in Provisions L.10. and L.11. nothing in this Order shall be construed to relieve the discharger from civil or criminal penalties for noncompliance.

4. Nothing in this Order shall be construed to preclude the institution of any legal action or relieve the discharger from any responsibilities, liabilities, or penalties to which the discharger is or may be subject to under Section 311 of the Clean Water Act.

5. Nothing in this Order shall be construed to preclude institution of any legal action or relieve the discharger from any responsibilities, liabilities, or penalties established pursuant to any applicable State law or regulation under authority preserved by Section 510 of the Clean Water Act.

dsjR1\attachmnt.c

except mercury. Preparation procedures for mercury are included in Method 7471 "Mercury in Solid or Semisolid Waste."

8. Total Petroleum Hydrocarbons, nC_{12} - nC_{32}

Using gas chromatography, analyze for the medium molecular weight hydrocarbons, boiling point range nC_{12} - nC_{32}. Using Method 3611, "Alumina Column Cleanup and Separation of Petroleum Wastes," separate the two resulting fractions, specifying the concentrations of (1) saturated aliphatic hydrocarbons; (2) unsaturated aromatic hydrocarbons; and their sum, the Total Petroleum Hydrocarbons. The concentrations of the remaining monitored contaminants, PCBs, and PAHs, can be determined by further analysis of these two fractions.

9. Extraction Procedures for Modified Method 8015, 8080, 8270

Conduct only the analysis portion of Modified Method 8015 "Nonhalogenated Volatile Organics," Method 8080 "Organochlorine Pesticides and PCBs," and Method 8270 "Gas Chromatography/Mass Spectrometry for Semivolatile Organics: Packed Column Technique." Do not conduct the extractions according to these methods. Instead, the extractions should be conducted according to Method 3540 "Soxhlet Extraction" or Method 3550 "Sonication Extraction."

10. Polynuclear Aromatic Hydrocarbons (PAHs)

The concentrations of the individual PAHs can be determined by further analysis of the unsaturated aromatic fraction. At a minimum, the concentrations of the following PAHs shall be reported: Acenaphthylene, Fluorene, Benz[a]anthracene, 1,2-Benzanthracene, 3,4-Benzofluoranthene, Benzo[b]fluoranthene, Benzo[k]fluoranthene, 1,12-Benzoperylene, Dibenzo[ah]anthracene, Fluoranthene, Indeno[1,2,3-cd]pyrene, Phenanthrene, 1-Methyl Phenanthrene, 2-Methyl Phenanthrene, Perylene, Benzo[e]pyrene, Benzo[a]pyrene, Benzo[ghi]perylene, Chrysene, Fluoranthene, Pyrene, and Anthracene.

6. Sample collection.
7. Use of field blanks to assess field contamination.
8. Use of field duplicate samples.
9. Transportation to the laboratory.
10. Training of field personnel.
11. Evaluation, and enhancement if needed of the QA/QC plan.

B. Develop and implement a QA/QC plan for laboratory operations, that covers at a minimum:

1. Quality assurance objectives.
2. Organization of laboratory personnel, their education, experience, and duties.
3. Sample procedures.
4. Sample custody.
5. Calibration procedures and frequency.
6. Analytical procedures.
7. Data reduction, validation, and reporting.
8. Internal quality control procedures.
9. Performance and system audits.
10. Preventive maintenance.
11. Assessment of accuracy and precision.
12. Corrective actions.
13. Quality assurance report.

IX. *DATA ANALYSIS AND REPORTING*

A. For each monitoring program component listed above (if applicable), provide the data/results, methods of evaluating the data, graphical summaries of the data, and an explanation/discussion of the data including conclusions, if any, which can be drawn.

B. Define the magnitude of each pollutant in terms of event mean concentration and mass loading. Describe and provide the models/calculations used to estimate the event mean concentrations and mass loadings.

C. In evaluating metals results, provide the concentration of each metal and the hardness of the water sample. Calculate the water quality objective for each metal at the corresponding hardness. Compare the measured concentration for each metal to the receiving water quality objective (adjusted for hardness) in Quality Criteria for 1986, "Gold Book," EPA 440/5-86-001.

0524

per year, before and after the wet season. Sediment samples shall be surficial meaning, collected from within the top one inch of bay sediment. The pre and post-wet season samples should be collected within the two (2) week period before October 1 and the two (2) week period after April 30 of the following year. Composite sediment from Station 1A and 1B. Conduct a bioassay on the Station 1 composite sample. Composite sediment from Station 3A and 3B. Conduct a sediment bioassay on the Station 3 composite sediment sample.

San Diego Bay

1. **Mouth of Chollas Creek.**

B. Conduct each bioassay in accordance with Standard Guide For Conducting 10-Day Static Sediment Toxicity Tests with Marine and Estuarine Amphipods, (American Society for Testing and Materials, Procedure E 1367-92) and Standard Guide for Collection, Storage, Characterization, and Manipulation of Sediments for Toxicological Testing, (American Society for Testing and Materials, Procedure E 1391-90).

C. Follow the protocol for use with the organism, *Eohaustorius estuarius*. Each bioassay should include at a minimum five (5) replicates of test sediment and the following three (3) types of controls: five (5) test chambers of negative sediment, five (5) test chambers of control reference sediment, and six to seven (6-7) test chambers of positive control.

VII. *MONITORING AND REPORTING PROGRAM OBJECTIVES*

A. Define the objectives of Wet Weather Monitoring and Reporting Program No. 95-76.

VIII. *QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)*

All field and laboratory handling must be conducted using "clean techniques." See citation under Section I.F. above.

A. Develop and implement a QA/QC plan for field operations, that covers at a minimum:

1. Quality assurance objectives.
2. Sample container preparation, labeling, and storage.
3. Chain-of-custody tracking.

VOL 22

0525

for the constituents shown in Table 4, SEDIMENT CHEMISTRY CONSTITUENTS, COMPOSITE SAMPLE.

V. *SAN DIEGO BAY/SEDIMENT CHEMISTRY*
(6 Stations) (1 Composite Sample/2 Stations) (2/Year)

A. Collect sediment samples from San Diego Bay at the mouth of Chollas Creek twice per year, before and after the wet season. The pre and post-wet season samples should be collected within the two (2) week period before October 1 and the two (2) week period after April 30 of the following year.

San Diego Bay

1. **Mouth of Chollas Creek.**

B. Collect one (1) sediment sample from each of six (6) stations at the Chollas Creek outfall as shown in Figure 2, SAN DIEGO BAY, MOUTH OF CHOLLAS CREEK STATION LOCATIONS. The station location pattern is designed to allow detection of a gradient, if present. The stations will be located along two (2) transects emanating from the centerline of the channel. Three (3) stations will be located along each transect. The first transect will extend from the channel centerline at a forty-five (45) degree angle. The second transect will extend from the channel centerline at a forty-five (45) degree angle in the opposite direction. Paired stations will be located at fifty (50), one hundred (100), and one hundred and fifty (150) feet from the centerline of the channel. Sediment samples shall be surficial meaning, collected from within the top one inch of bay sediment.

C. Composite the two (2) fifty (50) foot samples into one (1) composite sample. Composite the two (2) one hundred (100) foot samples into one (1) composite sample. Composite the two (2) one hundred and fifty (150) foot samples into one (1) composite sample. Analyze each of the three (3) composite sediment samples for the constituents shown in Table 4, SEDIMENT CHEMISTRY CONSTITUENTS, COMPOSITE SAMPLE.

VI. *SAN DIEGO BAY/SEDIMENT BIOASSAY*
(2 Stations) (1 Bioassay/Station) (2/Year)

A. For purposes of conducting sediment bioassays, collect sediment from Stations 1A, 1B, 3A, and 3B (see Figure 2) in San Diego Bay at the mouth of Chollas Creek twice

VOL 22
0526
R0065761

F. Chronic Toxicity, expressed as TU_c equals 100/NOEC. NOEC (No Observed Effect Concentration) is the maximum concentration of test water (in terms of percent test water) that causes no observed effect on a critical life stage of a test organism. The water quality objective for chronic toxicity is 1.0 TU_c as a daily average. If the chronic toxicity objective of 1.0 TU_c is exceeded, the copermittees shall analyze the corresponding archived water sample for dissolved metals. Dissolved metals, will be required in lieu of the requirement to conduct a toxicity reduction evaluation (TRE) and toxicity identification reduction (TIE).

IV. *MASS LOADING STATION/SEDIMENT CHEMISTRY* **(Chollas Creek 25 Stations) (1 Composite Sample/25 Stations) (2/year)**

A. Collect sediment samples twice per year, before and after the wet weather season, at the Chollas Creek mass loading station, SD8, (upstream of the tidal influence where the channel is natural and no longer concrete). The pre and post-wet season samples should be collected within the two (2) week period before October 1 and the two (2) week period after April 30 of the following year.

San Diego Bay

1. **Chollas Creek** -- SD8.

B. Collect one (1) sediment sample from each of twenty-five (25) stations in Chollas Creek [sediment from all twenty-five (25) stations will be composited into one (1) sample for analysis]. The twenty-five (25) stations will be located in accordance with Figure 1, CHOLLAS CREEK SEDIMENT STATION LOCATIONS. The stations will be located along five (5) bank to bank transects of the creek, each equally spaced across a two hundred (200) foot reach (length) of creek upstream from Chollas Creek mass loading station, SD8, where the channel is natural and no longer concrete. Each bank to bank transect will have five (5) equally spaced stations from which one (1) sample will be collected. Sediment samples shall be surficial meaning, collected from within the top one to two inches of creek sediment.

C. Composite the twenty-five (25) sediment samples into one (1) sample. Analyze the composite sediment sample

VOL 22

0527

the order of priority in which the analyses are to be conducted.

San Diego Bay

1. **Chollas Creek** -- SD8.

Mission Bay

2. **Tecolote Creek** -- SD5.

B. Archive a portion of all water samples taken from Chollas Creek and Tecolote Creek mass loading stations during each of three (3) storms. If toxicity of these samples is found to be significant, follow-up chemical analyses on the archived portions will be required.

C. The toxicity bioassays shall be conducted as specified in Short-Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms, (Second Edition, EPA 600 4-89/001, March 1989 or subsequent editions) and Supplement to Short-Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms (Revision 1, EPA 600 4-89/001a, September 1989).[2,3]

D. Specifically the following two (2) bioassays shall be conducted on samples from Chollas Creek and Tecolote Creek during three (3) storm events:

1. "Fathead Minnow, *Pimephales Promelas*, Larval Survival and Growth Test Method 1000.0"

2. "Cladoceran, *Ceriodaphnia Dubia*, Survival and Reproduction Test Method 1002.0"

E. Although these are both seven (7) day chronic toxicity bioassays, acute toxicity can also be calculated from these tests if daily observations on mortality are made. Rather than conducting separate tests for acute toxicity, record daily mortality during the above chronic tests and calculate acute toxicity.

---

[3]A single storm water sample will be split into sevenths (seven subsamples) to allow for daily replenishment of the test chambers. Every effort shall be made to meet the USEPA protocol for holding times. All holding times will be recorded and reported to the RWQCB.

VOL 22 0528

B. Sample each station during three (3) storm events. Sample the first two (2) storm events of the wet weather season which meet the USEPA's criteria. For the third storm event, sample the first event after February 1 which meets the USEPA's criteria.

C. Equip each mass loading station with an automatic refrigerated flow composite sampler by October 1.

D. At each station, during each storm event, collect one (1) grab sample and one (1) composite sample. Analyze all grab samples for the constituents shown in Table 1, WATER CHEMISTRY CONSTITUENTS, GRAB SAMPLE.[2] Analyze all composite samples for the constituents shown in Table 2, WATER CHEMISTRY CONSTITUENTS, COMPOSITE SAMPLE. In the event that sample volumes prove insufficient for analysis of all listed constituents, Table 3, CONSTITUENT PRIORITY FOR ANALYSIS, specifies the order of priority in which the analyses are to be conducted.

E. Monitoring must be conducted according to USEPA test procedures approved under Title 40, Code of Federal Regulations (CFR), Part 136, "Guidelines Establishing Test Procedures for Analysis of Pollutants Under the Clean Water Act" as amended, unless other test procedures have been specified by this Order or the Executive Officer.

F. All sampling and laboratory analyses must be conducted using "clean techniques" in accordance with the Interim Guidance On Determination and Use of Water-Effect Ratios for Metals, EPA-823-B-94-001. Specifically Appendix C, Guidance Concerning use of "Clean Technique" and QA/QC When Measuring Trace Metals.

III. *MASS LOADING STATIONS/AMBIENT WATER TOXICITY*
(2 Stations) (2 Bioassays/Station) (3 Storms)

A. To estimate the chronic toxicity of ambient water in Chollas and Tecolote Creeks during storm events, collect additional water samples (concurrent with sample collected for water chemistry) from these stations for toxicity bioassays. Conduct two (2) chronic toxicity bioassays from Chollas and Tecolote Creek mass loading stations during each of three (3) storms. In the event that sample volume proves insufficient for analysis of all listed constituents, Table 3, CONSTITUENT PRIORITY FOR ANALYSIS, specifies

VOL 22
0529

insufficient for analysis of all listed constituents, Table 3, CONSTITUENT PRIORITY FOR ANALYSIS, specifies the order of priority in which the analyses are to be conducted.

E. Monitoring must be conducted according to USEPA test procedures approved under 40 CFR § 136, "Guidelines Establishing Test Procedures for Analysis of Pollutants Under the Clean Water Act" as amended, unless other test procedures have been specified by this Monitoring and Reporting Program, or the Executive Officer.

F. All sampling and laboratory analyses must be conducted using "clean techniques" in accordance with the Interim Guidance On Determination and Use of Water-Effect Ratios for Metals, EPA-823-B-94-001. Specifically Appendix C, Guidance Concerning use of "Clean Technique" and QA/QC When Measuring Trace Metals.

G. Copermittees are no longer required to analyze grab samples from land use stations for volatile organic compounds. The Copermittees shall redirect fifty percent (50%) of the total resulting cost savings into their public education program. Evidence that each Copermittee's education budget has been augmented by fifty percent (50%) of the total cost savings (resulting from deletion of volatiles) shall be submitted to the RWQCB no later than July 31, 1996.

II. ***MASS LOADING STATIONS/WATER CHEMISTRY***
(3 Stations) (2 Samples/Station) (3 Storms)

A. Monitor the following three (3) existing mass loading stations sampled during the 1994/95 San Diego Copermittees Wet Weather Monitoring Program.

San Diego Bay

1. **Switzer Creek** -- SD7, located near the intersection of Imperial Avenue, National Avenue and 12th Avenue in the San Diego Trolley Yard.

2. **Chollas Creek** -- SD8, in the creek near the intersection of 33rd Street and Durant Street.

Mission Bay

3. **Tecolote Creek** -- SD5, located near the intersection of Tecolote Road and Morena Boulevard, in San Diego.

VOL 22

05300

VOL 22

Tributary to San Diego Bay

7. **Commercial** -- SD10, Bramson Place and Interstate 805.

8. **Industrial** -- SD11, 1342 Crosby Street.

9. **Residential** -- SD12, Landis Street, east of 40th Street.

B. Sample each station during three (3) storm events. Sample the first two (2) storm events of the wet weather season which meet the United States Environmental Protection Agency's (USEPA's) criteria as described in 40 CFR § 122.21(g)(7)[1]. For the third storm event, sample the first event after February 1 which meets the USEPA's criteria. The key components of USEPA's storm event criteria [40 CFR § 122.21(g)(7)] are summarized below.

   1. A rainfall of at least one-tenth (0.1) inch in the drainage area.

   2. No storm event in excess of one-tenth (0.1) inch in the drainage area for at least seventy-two (72) hours prior to the sampled storm event.

   3. A storm event within plus or minus fifty (50) percent of the average or median per storm volume and duration for the region.

C. Equip each land use station with an automatic refrigerated flow composite sampler by October 1.

D. At each station, during each storm event, collect one (1) grab sample and one (1) composite sample. Analyze all grab samples for the constituents shown in Table 1, WATER CHEMISTRY CONSTITUENTS, GRAB SAMPLE.[2] Analyze all composite samples for the constituents shown in Table 2, WATER CHEMISTRY CONSTITUENTS, COMPOSITE SAMPLE. In the event that sample volumes prove

0531

---

[1]For purposes of this Monitoring and Reporting Program the requirement that there be a one (1) month separation between storm event samples has been deleted.

[2]Total Chlorine Residual need not be analyzed in the field (as a water chemistry constituent) but will be analyzed and reported (estimated) during ambient water toxicity tests.

ATTACHMENT C (draft)

WET WEATHER MONITORING & REPORTING PROGRAM TO ORDER NO. 95-76

The purpose of the Wet Weather Monitoring and Reporting Program is to characterize storm water pollutant loading and concentrations, including long term trends, during the wet weather season. The wet weather season is defined as October 1 through April 30 of each year.

Pursuant to the copermittees' Memorandum of Understanding, the copermittees shall collectively conduct Wet Weather Monitoring and Reporting Program to Order No. 95-76 in accordance with the specifications below. This program shall be conducted on an ongoing basis beginning with the 1995-96 wet weather season (starting October 1, 1995).

I. ***LAND USE STATIONS/WATER CHEMISTRY***
(9 Stations) (2 Samples/Station) (3 Storms)

A. Monitor the existing nine (9) land use stations sampled during the 1994/95 San Diego Copermittees Wet Weather Monitoring Program.

El Cajon/Santee

1. **Residential** -- SC1, manhole in Jeremy Street south of the Braverman Drive intersection in Santee.

2. **Industrial** -- SC2, in Forrester Creek at the Vernon Way overpass in El Cajon.

3. **Commercial** -- SC3, Wal-Mart parking lot on Town Center Parkway in Santee.

Carlsbad/Oceanside

4. **Commercial** -- NC1, intersection of Yuma Avenue and Manzanita Drive in Oceanside.

5. **Residential** -- NC2, intersection of Park Drive and Adams Street in Carlsbad.

6. **Industrial** -- NC3, intersection of Yarrow Drive and Camino Vida Roble in Oceanside.

NPDES Storm Water Permits as a prerequisite condition to the issuance of a local permit; and

j. Provide input to SANDAG representatives to ensure that water quality considerations are included in Congestion Management activities.

2. Establish a periodic catch basin and storm water channel cleaning program.

3. Increase cleaning frequency of trash receptacles and the number of roadside and beach trash receptacles in areas where needed.

4. Conduct street sweeping in a manner which improves the quality of urban runoff and which is consistent with the current findings on optimum street sweeping methodologies and equipment.

5. Establish a program to eliminate the improper disposal of solid waste, including, but not limited to, litter lawn/garden clippings and animal waste, into the street or areas where runoff may carry these pollutants to the storm water conveyance system.

6. Participate in recycling and Household Hazardous Waste Programs.

7. Establish municipal source control including interdepartmental education and SWPPP for corporation yards. This program must also include:

a. Storm Water Pollution Prevention Plans (SWPPPs) for Copermittee facilities such as corporation yards and vehicle maintenance facilities;

b. A program for inspection of Copermittee facilities;

c. BMP program, stressing pollution prevention for all Copermittee activities. This should include a focused education program for Copermittee employees involved in outdoor operation or maintenance activities anywhere in a Copermittee's jurisdiction. Specifically, Copermittees must minimally develop a timeline and a program for the adoption and implementation of an Integrated Pest Management (IPM) program for all public parks, golf courses, landscaping around public schools, buildings and cemeteries. The IPM program is to be fully implemented within two years of the issuance of this order;

VOL 22 0534

ATTACHMENT B (DRAFT)

EXISTING MINIMUM BEST MANAGEMENT PRACTICES PROGRAM ORDER NO. 95-76

1. Establish a Public Education Program which includes, at a minimum, the following elements:

   a. Establish or improve an areawide catch basin stenciling program to discourage the dumping, spillage or discharge of pollutants or debris into storm water conveyance systems;

   b. Develop programs to promote, publicize and facilitate public reporting of illicit connections and illegal discharges;

   c. Develop public education and community outreach programs to increase public awareness of storm water conveyance systems and their intended purpose. Target specific audiences including decision makers/elected officials, municipal personnel, commercial, industrial and construction personnel, media, volunteers, citizens and students;

   d. Encourage all residents, owners, renters, managers of multi-family dwellings, and businesses to remove and properly dispose of dirt, rubbish and debris from their sidewalks and alleys which may contribute pollutants to urban runoff. (i.e., sweep and discard in trash, do not hose);

   e. Encourage recycling of oil, antifreeze, batteries, tires, glass, paper, plastic and other materials to prevent their improper disposal into the storm water conveyance system;

   f. Encourage the proper disposal of household hazardous wastes to prevent disposal of such materials to the storm water conveyance system;

   g. Encourage the proper use and conservation of water to minimize runoff from landscaped areas, lawns, golf-courses, etc.;

   h. Educate all departments and personnel of each copermittee on the requirements of the storm water/urban runoff management program and on ways to comply and encourage compliance with those requirements;

   i. Consider requiring verification of compliance with the statewide General Industrial and General Construction

VOL 22
0535

agencies include the SDRWQCB, Department of Public Health, Department of Fish and Game, etc.) The hotline shall also provide general information to the public.

Task 1. Develop and submit Public Complaint and Information Hotline procedures

Develop written procedures for receiving and documenting complaints from the public or governmental agencies (federal, state, or local, including in-house staff) of activities or incidents involving illicit connections or illegal discharges to the storm water conveyance system. The procedures shall also address the provision of information to the public on topics including, but not limited to, storm water pollution, pollution prevention, and proper disposal alternatives (including scheduled disposal events). Submit your written public hotline procedures to the SDRWQCB no later than **December 15, 1995.**

Task 2. Establish Public Complaint and Information Hotline

Establish a dedicated phone number to which the public can report incidents of illicit connections and illegal discharges no later than **January 31, 1996.** The phone line at a minimum should have voicemail capabilities (or telephone answering machine with a recorded message), must be in at least English and Spanish languages (copermittees can establish a model message), and advise callers to dial 911 in the case of an emergency.

Task 3. Publicize Public Complaint and Information Hotline

Include the following information in public education brochures and announcements:

a. Public complaint hotline telephone number;
b. Definition of an illicit connection;
c. Definition of an illegal discharge; and
d. Common disposal alternatives (and scheduled disposal events).

Publicize the hotline within 60 days of dedication. Send notice to the SDRWQCB that you have publicized the hotline no later than **March 31, 1997.**

VOL 22
0536
R0065771

NOTE:
Bacteriological analyses need only be conducted at those stations tributary to San Diego Bay.

c. If the station is dry (no flowing or ponded runoff), make and record all observations on USEPA's field screening data form.

Submit your written field screening procedures to the SDRWQCB no later than **December 15, 1995**. Also submit the name of the manufacturer of the test method along with the range and accuracy of the test. Alternative Dry Weather Field Screening Programs that are more comprehensive than described herein may be submitted with proper justification, in lieu of this program, for review by SDRWQCB staff.

Task 6. Conduct dry weather field screening

Conduct field screening in accordance with your storm water conveyance system map and field screening procedures as described in Tasks 1 and 5 above.

During field screening, confirm the accuracy of your storm water conveyance system map. If inaccuracies are found, conduct the followup investigation and elimination activities described in sections G.4. and G.5. of this Order. Also, correct your storm water conveyance system map and resubmit it to the SDRWQCB as part of the dry weather field screening data report due **January 31, 1997**.

Task 7. Summarize and report field screening results

Using Excel or compatible format (Lotus 1-2-3, Quatro Pro, and dBase II-IV), report the data in tabular and graphical presentations. Develop a frequency distribution of data to identify stations at which elevated levels are consistently found. Submit a summary data report in spreadsheet format and a frequency distribution to the SDRWQCB on **January 31, 1997** and each **January 31** thereafter.

PUBLIC COMPLAINT AND INFORMATION HOTLINE

Each copermittee shall, no later than **January 31, 1996**, establish a public hotline in accordance with the specifications below. A storm water public complaint hotline is required to receive complaints from the public or governmental agencies of activities or incidents involving illicit connections or illegal discharges to the storm water conveyance system. (Governmental

VOL 22 0537

Task 4. Complete and submit conveyance system map

Clearly identify each dry weather field screening station and the watershed drained through each station on your storm water conveyance system map. Ensure that all drainage areas within your jurisdiction are screened. Submit your map to the SDRWQCB no later than **December 15, 1995.**

Task 5. Develop and submit field screening procedures

Develop written procedures for dry weather field screening, including both field observations and analyses. The procedures must be based on the following minimum criteria:

a. Conduct field screening at each station once per month during the dry weather season.

b. If there is flowing or ponded runoff at the station and there has been at least seventy-two (72) hours of dry weather, make observations and collect two (2) grab samples during a twenty-four (24) hour period with a minimum period of four (4) hours between samples. Record observations and analyses on United States Environmental Protection Agency's (USEPA's) field screening data form[1]. Provide all information requested by the form, including General Information [time since last rain, and quantity of last rain], Field Site Description [conveyance type, and dominant watershed land uses], Flow Estimation [width of water surface, approximate depth of water, approximate flow velocity, and flow rate], and Visual Observations [odor, color, clarity, floatables, deposits/stains, vegetation condition, structural condition, and biological]. At a minimum, conduct field analyses for the following constituents:

Water Temperature (degrees Celsius)
pH
Total Phenol (mg/l)
Total Chlorine (mg/l)
Total Copper (mg/l)
Detergents (mg/l)
Total Coliform (San Diego Bay only)
Fecal Coliform (San Diego Bay only)

ATTACHMENT A (draft)

DRY WEATHER FIELD SCREENING AND PUBLIC HOTLINE SPECIFICATIONS TO ORDER NO. 95-76

DRY WEATHER FIELD SCREENING

Dry weather field screening consists of (1) field observations, and (2) field analysis at selected stations during the dry weather season for the purpose of detecting illicit connections and illegal discharges. The dry weather season is defined as May 1 through September 30 of each year.

Each copermittee shall continue to conduct its existing dry weather field screening program for the **1995** dry weather season. The 1995 dry weather season report shall be submitted by **January 31, 1996.**

Each copermittee shall, on an ongoing basis beginning **May 1, 1996**, conduct dry weather field screening in accordance with the specifications below. The **1996** dry weather field screening results shall be submitted on **January 31, 1997.**

Task 1. Develop storm water conveyance system map

Develop or obtain an up to date map showing your municipality's entire storm water conveyance system and all watersheds within your jurisdiction. Identify and label all watersheds and storm water conveyance systems. The accuracy of your storm water conveyance system map will be confirmed during field screening (See Task 6).

Task 2. Select field screening stations

Based upon hydrologic characteristics, select dry weather field screening stations which cover your entire municipality. Although there are no specific minimum number of stations or drainage size requirements, you must include enough stations to ensure that all watersheds, and all portions of each watershed, within your jurisdiction are drained through at least one station.

Task 3. Justify field screening stations

Provide written justification for your selection of each field screening station. Provide a detailed narrative description of each site and a photograph. Submit your justification/description to the SDRWQCB no later than **December 15, 1995.**

R0065776

END NOTES

1 **Storm water (wet weather flows)** consists of precipitation only and is defined in 40 CFR 122.26(b)(13) as storm water runoff, snow melt runoff, and surface runoff and drainage.

2 **Storm Water Conveyance System** - A discernable, confined, and discrete conveyance or system of conveyances, including but not limited to, natural channels, storm drains, gutters, ditches, pipes, tunnel, conduit, highways, and roads under the jurisdiction of a city, town, borough, county, parish, or other public body.

3 **Maximum extent practicable** - Maximum extent practicable is a performance standard for municipalities to reduce the discharge of pollutants from storm water conveyance systems as much as practicable. Under the MEP standard municipalities are required to employ the Best Management Practices that are technically and economically feasible. The selection of specific BMPs to achieve the MEP standard must be based upon the following factors:

a. The effectiveness of the BMP in reducing pollutants;
b. The degree of regulatory compliance with this Order and other federal, state and local laws and regulations;
c. The degree of public acceptance;
d. The cost of implementing the BMP in relationship to the pollution control benefit; and
e. The technical feasibility of the BMP.

4 **Best Management Practices** - Best Management Practices (BMPs) are defined in 40 CFR 122.2 as schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

VOL 22

0542

6. This Order shall become effective on August 10, 1995, provided the USEPA Regional Administrator has no objection. If the Regional Administrator objects to its issuance, this Order shall not become effective until such objection is withdrawn.

7. This Order supersedes Order No. 90-42 upon the effective date of this Order.

I, Arthur L. Coe, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Diego Region, on August 10, 1995.

ARTHUR L. COE
Executive Officer

California Regional Water Quality Control Board
Santa Ana Region
2010 Iowa Avenue, Suite 100
Riverside, CA 92507-2409

FACT SHEET

March 8, 1996

ITEM: 11

SUBJECT: Waste Discharge Requirements for the Riverside County Flood Control and Water Conservation District, the County of Riverside, and the Incorporated cities of Riverside County within the Santa Ana Region, Storm Water Run-off Management Program, Order No. 96-30 (NPDES No. CAS 618033)

PROJECT

The attached pages contain information concerning an application for renewal of waste discharge requirements and a National Pollutant Discharge Elimination System (NPDES) permit, Order No. 96-30, NPDES No. CAS 618033, which prescribes waste discharge requirements for urban storm water run-off from the cities and the unincorporated areas in Riverside County within the jurisdiction of the Santa Ana Regional Board. On January 3, 1995 the Riverside County Flood Control and Water Conservation District (RCFC&WCD), the County of Riverside, the Cities of Beaumont, Calimesa, Canyon Lake, Corona, Hemet, Lake Elsinore, Moreno Valley, Norco, Perris, Riverside, and San Jacinto (hereinafter collectively referred to as the Permittees), submitted NPDES Application No.CAS 618033 for an area-wide stormwater discharge permit under NPDES. The permit application was submitted in accordance with the previous NPDES permit (Order No. 90-104, NPDES No. CA 8000192) which expired on July 1, 1995. Additionally, the permit application follows guidance provided by staff of the State Water Resources Control Board (State Board) and the Regional Water Quality Control Boards (Regional Boards).

PROJECT AREA

The permitted area is delineated by the San Bernardino-Riverside County boundary line on the north and northwest, the Orange-Riverside County boundary line on the west, the Santa Ana-San Diego Regional Board boundary line on the south, and the Santa Ana-Colorado River Basin Regional Board boundary line on the east. Areas of the County not addressed or which are excluded by the stormwater regulations and areas not under the jurisdiction of the permittees are excluded from the area requested for coverage under this permit application. This includes the following areas and activities:

- Federal lands and state properties, including, but not limited to, military bases, national forests, hospitals, colleges and universities, and highways;

R0065779

- Native American tribal lands;
- Open space and rural (non-urbanized) areas;
- Agricultural lands; and
- Utilities and special districts.

As a partial illustration, federal and state lands in Riverside County within the jurisdiction of the Santa Ana Regional Board, for which coverage under a municipal stormwater NPDES permit is excluded, are shown in Appendix A (Western Riverside County NPDES Permit Area).

CLEAN WATER ACT REQUIREMENTS

The Federal Clean Water Act (CWA) allows the United States Environmental Protection Agency (USEPA) to delegate its NPDES permitting authority to states with an approved environmental regulatory program. The State of California is one of the delegated states. The Porter-Cologne Act (California Water Code) authorizes the State Board, through its Regional Boards, to regulate and control the discharge of pollutants into waters of the State and tributaries thereto. Section 405 of the Water Quality Act (WQA) of 1987 added Section 402(p) to the CWA. Pursuant to Section 402(p)(4) of the CWA, the USEPA promulgated regulations for stormwater permit applications for stormwater discharges associated with industrial activities and municipal separate storm drain systems serving a population of 100,000 or more. This permit governing municipal stormwater discharges meets both the statutory requirements of Section 402(p)(3)(B) and all requirements applicable to an NPDES permit issued under the issuing authority's discretionary authority in accordance with Section 401(a)(1)(B) of the CWA.

AREA-WIDE STORMWATER PERMIT

To regulate and control stormwater discharges from the Riverside County area to the municipal storm drain systems, an area-wide approach is essential. The entire storm drain system is not controlled by a single entity; the RCFC&WCD, the County, several Cities, the State Department of Transportation (Caltrans), and the U.S. Army Corps of Engineers, in addition to other smaller entities, manage the systems. In addition to the Cities, the County and the RCFC&WCD, there are a number of other significant contributors of urban stormwater runoff to these storm drain systems. These include: large institutions such as the State university system, schools, hospitals, etc.; federal facilities such as military sites, etc.; State agencies such as Caltrans; water and wastewater management agencies such as Eastern and Western Municipal Water District; the National Forest Service and State parks. The Regional Board has issued a separate NPDES permit to Caltrans. In addition, Caltrans, and the other contributors identified, are not under the jurisdiction of the Permittees. The management and control of the entire flood control system cannot be effectively carried out without the cooperation and efforts of all these entities. Also,

VOL 22
0545
R0065780

VOL 22

it would not be meaningful to issue a separate stormwater permit to each of the entities within the permitted area whose land/facilities drain into the storm drain systems operated by the Permittees. The Regional Board has concluded that the best management option for the Riverside County area is to issue an area-wide stormwater permit to the RCFC&WCD, Riverside County, and the cities in Riverside County. A separate stormwater NPDES permit has been issued to Caltrans. Stormwater discharges from other state, federal, utility, or special district facilities and state or federal lands will either be added to the Riverside County permit or permitted separately.

Some of the RCFC&WCD storm drain systems discharge into storm drain systems controlled by other entities, such as the Orange County Flood Control District, which is (or will be) regulated under the Regional Board's Order No. 96-30, NPDES No. CA 8000192. Some areas within Riverside County are within the Colorado River Basin and San Diego Regional Boards' jurisdiction. Permit requirements for stormwater runoff from the drainage areas of Riverside County within the jurisdiction of the San Diego and Colorado River Basin Regional Boards are addressed by these Regional Boards.

COORDINATION WITH OTHER REGIONAL AGENCIES

In developing best management practices and monitoring programs, consultation/coordination with other drainage management entities and other Regional Boards is essential. Regional Board staff will coordinate the program with other Regional Boards and other flood control entities/cities on an "as needed" basis. The permit/program process is at the same stage of development in both the Santa Ana and San Diego Regional Board areas of Riverside County. Common programs, reports, implementation schedules and efforts are desirable and will be utilized to the maximum extent practicable.

0546

EXISTING FACILITIES AND PROGRAMS

Within the Santa Ana Region, the RCFC&WCD serves a population of approximately 930,000, occupying an area of approximately 1,360 square miles. The RCFC&WCD's system includes an estimated 200 miles of open and closed storm drains. The storm drain systems operated by the remaining Permittees include an estimated 57 miles of open and closed storm drains. Approximately one-quarter (1/4) of Riverside County drains into water bodies within this Regional Board's jurisdiction. Stormwater discharges from urbanized areas consist mainly of surface runoff from residential, commercial, and industrial developments. In addition, there are stormwater discharges from agricultural land uses, including dairy operations. However, the WQA specifically excludes agricultural discharges from regulation under this program. The constituents of concern and significance in storm water discharges are: total suspended solids, biochemical oxygen demand (BOD), chemical oxygen demand (COD), oil and grease (O&G), heavy metals, nutrients and organic chemicals such as base/neutral and acid extractables, pesticides and herbicides, and petroleum hydrocarbon components

To protect the beneficial uses of waters of the State, the pollutants from all sources need to be controlled. Recognizing this, and the fact that stormwater discharges contain pollutants, the Permittees and the Regional Board have all agreed that an area-wide stormwater permit is the most effective way to develop and implement a comprehensive stormwater management program in a timely manner. This area-wide stormwater permit contains requirements with time schedules that will allow the Permittees to continue to address water quality problems caused by urban stormwater runoff through their management programs to reduce pollutants in stormwater discharges to the maximum extent practicable.

PERMIT REQUIREMENTS

In accordance with Section 402(p)(3), as part of a program to reduce the pollutants in stormwater discharges to the maximum extent practicable, the Permittees have been required to submit existing management plans and programs being implemented or developed in the previous municipal stormwater NPDES permit to reduce pollutants in stormwater discharges. In addition, the permittees will be required to report, review and/or revise the management programs and control measures in accordance with a time schedule approved by the Executive Officer of the Regional Board for this municipal permit.

If existing management programs are not effective in controlling pollutant loading and in achieving the water quality objectives of the receiving waters, additional programs shall be developed and implemented upon consultation and approval of the Executive Officer.

The permit also requires the development and implementation of management programs and/or best management practices (BMPs) during the life of the permit such that the quality of stormwater discharged can be improved and the water quality objectives of the receiving waters ultimately can be met. It is also expected that through implementation of these programs and/or BMPs the beneficial uses of the receiving waters will be protected.

BENEFICIAL USES

Stormwater flows which are discharged to municipal storm drain systems in Riverside County are tributary to various water bodies (inland surface streams and lake and reservoirs) of the state. The beneficial uses of these water bodies include municipal and domestic supply, agricultural supply, industrial service supply, industrial process supply, groundwater recharge, water contact recreation, non-contact water recreation, warm freshwater habitat, cold freshwater habitat, wildlife habitat, and preservation of rare and endangered species. The ultimate goal of this stormwater management program is to protect the beneficial uses of the receiving waters.

VOL 22
0547
R0065782

VOL 22 0548

ANTIDEGRADATION ANALYSIS

The Regional Board has considered whether a complete antidegradation analysis, pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16, is required for these stormwater discharges. The Regional Board finds that the pollutant loading rates to the receiving waters will be reduced with the implementation of the requirements in this order. As a result, the quality of stormwater discharges and receiving waters will be improved, thereby protecting the beneficial uses of waters of the United States. This is consistent with the federal and state antidegradation requirements and a complete antidegradation analysis is not necessary.

PUBLIC WORKSHOP

The Regional Board recognizes the significance of Riverside County's Storm Water/Cleanwater Protection Program and will conduct, participate, and/or assist with at least one workshop every year during the term of this permit to promote and discuss the progress of the stormwater management program. The details of the annual workshop will be published in local newspapers and mailed to interested parties. Persons wishing to be included in the mailing list for any of the items related to this permit may register their name, mailing address and phone number with the Regional Board office at the address given below.

PUBLIC HEARING

The Regional Board will hold a public hearing regarding the proposed waste discharge requirements. The public hearing is scheduled to be held on March 8, 1996, starting at 9:30 a.m. at the City Council Chambers, 3300 Newport Boulevard, Newport Beach, California. Further information regarding the conduct and nature of the public hearing concerning these waste discharge requirements may be obtained by writing or visiting the Santa Ana Regional Board office, 2010 Iowa Avenue, Suite 100, Riverside, CA 92507.

INFORMATION AND COPYING

Persons wishing further information may write to the above address or call Pavlova Vitale at 909/782-4920. Copies of the application, proposed waste discharge requirements, and other documents (other than those which the Executive Officer maintains as confidential) are available at the Regional Board office for inspection and copying by appointment scheduled between the hours of 10:00 a.m. and 4:00 p.m., Monday through Thursday (excluding holidays).

REGISTER OF INTERESTED PERSONS

Any person interested in a particular application or group for applications may leave his name, address and phone number as part of the file for an application. Copies of tentative waste discharge requirements will be mailed to all interested parties.

NPDES NO. CAS 618033
AND
WASTE DISCHARGE REQUIREMENTS
ORDER NO. 96-30
FOR
THE RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT, THE COUNTY OF RIVERSIDE, AND THE INCORPORATED CITIES OF RIVERSIDE COUNTY WITHIN THE SANTA ANA REGION
AREAWIDE URBAN STORM WATER RUN-OFF

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Board), finds that:

1. On January 3, 1995, the Riverside County Flood Control and Water Conservation District (RCFC&WCD), in cooperation with the County of Riverside, and the incorporated cities of Beaumont, Corona, Calimesa, Canyon Lake, Hemet, Lake Elsinore, Moreno Valley, Norco, Perris, Riverside, and San Jacinto (hereinafter collectively referred to as "permittees"), have jointly submitted a National Pollutant Discharge Elimination System (NPDES) Application No. CAS 618033 to renew their areawide NPDES permit for urban storm water run-off.

2. The 1987 amendments to the Clean Water Act required the United States Environmental Protection Agency (EPA) to develop permitting regulations for storm water discharges from municipal separate storm sewer systems serving a population of 100,000 or more and for storm water discharges associated with industrial activities, including construction sites. The EPA published proposed storm water regulations on December 7, 1988 and promulgated the final regulations on November 16, 1990. Prior to the EPA's promulgation of the final storm water regulations, the three counties (Orange, Riverside, and San Bernardino) and the incorporated cities within the jurisdiction of the Santa Ana Regional Board requested areawide NPDES permits for urban storm water run-off.

3. On July 13, 1990, the Regional Board adopted Order No. 90-104 for urban storm water run-off from urban areas in Riverside County within the Santa Ana Region. Order No. 90-104 expired on July 1, 1995. The Riverside County Flood Control and Water Conservation District was named as the principal permittee and Riverside County and the incorporated cities were named as the co-permittees. In order to more effectively carry out the requirements of this order, the permittees have agreed that the RCFC&WCD will continue as principal permittee and Riverside County and the incorporated cities will continue as co-permittees. However, the Regional Board, in exercising its enforcement discretion, will take action only against the individual permittee responsible for specific violations of this order, whenever possible.

R0065784

4. Order No. 90-104 required the permittees to develop and implement a drainage area management plan (DAMP); develop and implement storm water and receiving water monitoring plans; to eliminate illegal and illicit discharges to the storm drain systems; and, to enact the necessary legal authority to effectively prohibit illegal and illicit discharges. The overall goal of these requirements was to reduce pollutant loadings to surface waters from urban run-off to the maximum extent practicable (MEP)[1]. This Order regulates urban storm water run-off[2] from areas under the jurisdiction of the permittees.

5. The Report of Waste Discharge (the permit renewal application) included the following major components:

   a. A map of the drainage area and maps of existing storm drain facilities
   b. A summary of the storm water management program
   c. A Consolidated Program for Water Quality Monitoring
   d. A copy of a Proposed Storm Water/Urban Run-off Management and Discharge Control Ordinance
   e. A copy of the current Implementation Agreement
   f. A copy of the Interagency Agreement
   g. The Drainage Area Management Plan (DAMP)
   h. A copy of Proposed Riverside County Grading and Erosion Control Ordinance

6. Within the Santa Ana Region, the permittees serve a population of approximately 930,000, occupying an area of approximately 1,360 square miles. The permitted area is shown on Appendix 1. This order regulates storm water run-off from areas under the jurisdiction of the permittees. The term storm water as used in this order includes storm water run-off, snow melt run-off, and surface run-off and drainage. The average annual rainfall in the urbanized area of Riverside County ranges from 10 to 12 inches. The permittees have jurisdiction over and/or maintenance responsibility for storm water conveyance systems within Riverside County. The storm drain system includes an estimated 200 miles of open and closed storm drains owned and operated by RCFC&WCD and an estimated 57 miles of open and closed storm drains owned and operated by the remaining permittees. The permittees have identified major outfalls(with a pipe diameter of 36 inches or greater or drainage areas draining 50 acres or more) and have submitted maps of existing storm drain facilities.

7. Approximately one quarter (1/4) of the entire Riverside County area drains into water bodies within the Santa Ana Region. Most of the urbanized areas of Riverside County lie within this Regional Board's jurisdiction. Storm water run-off from other portions of

---

[1] Maximum Extent Practicable (MEP) means to the maximum extent possible, taking into account equitable considerations of synergistic, additive and competing factors, including but not limited to the gravity of the problem, fiscal feasibility, public health risks, societal concerns and social benefits.

[2] Urban storm water run-off discharges include those discharges from residential, commercial, industrial and construction areas within the permitted area and excludes discharges from feedlots, dairies and farms

VOL 22
0550
R0065785

Riverside County is regulated by the San Diego and Colorado River Basin Regional Boards. The discharges consist of run-off from rainfall, snow melt, and surfacing ground water from various land use areas which either discharge directly to the Santa Ana River or to watercourses tributary to the Santa Ana River. Other major rivers in the area include the San Jacinto River and Temescal Creek. The San Jacinto Mountain areas drain into the San Jacinto River, which discharges into Lake Elsinore. Any overflow from Lake Elsinore is tributary to Temescal Creek, which flows into Reach 3 of the Santa Ana River in the Prado Flood Control Basin.

8. The Santa Ana River Basin is the major watershed within this Region. This watershed is divided into the upper and lower Santa Ana watersheds. The lower Santa Ana River Basin (downstream from Prado Dam) includes the Orange County drainage areas and the Upper Santa Ana River Basin includes the San Bernardino County and the Riverside County drainage areas. The San Bernardino County drainage areas are generally upstream of the Riverside County drainage areas.

9. The three county areas within this Region are regulated under three areawide permits for urban storm water run-off. These areawide NPDES permits are:

   a. Orange County, NPDES No. CA 8000180, Order No. 90-71 (upon renewal NPDES No. CAS 618030, Order No. 96-31)

   b. Riverside County, NPDES No. CA 8000192, Order No. 90-104 (upon renewal NPDES No. CAS 618033, Order No. 96-30)

   c. San Bernardino County, NPDES No. CA 8000200, Order No. 90-136 (upon renewal NPDES No. CAS 618036, Order No. 96-32)

10. Run-off from the San Bernardino County drainage areas is generally conveyed to the Riverside County drainage areas through the Santa Ana River or other drainage channels tributary to the Santa Ana River. These flows are then discharged to Reach 2 of the Santa Ana River through Prado Dam (Reach 3 of the Santa Ana River). Most of the flow in Reach 2 is recharged in Orange County. During wet weather, some of the flow is discharged to the Pacific Ocean through Reach 1 of the Santa Ana River.

11. In addition to the Regional Board, a number of other stakeholders are involved in the management of the water resources of the Region. These include, but are not limited to, the incorporated cities in the Region, publicly owned treatment works, the three counties, and the Santa Ana Watershed Project Authority and its member agencies. The entities listed in Appendix 2 are considered as potential dischargers of storm water to the Riverside County drainage areas. It is expected that these entities will also work cooperatively with the permittees to manage urban run-off. The Regional Board has the discretion and authority to require non-cooperating entities to participate in this areawide permit or to issue individual storm water permits, pursuant to 40 CFR 122.26(a)

VOL 22

0551

Cooperation and coordination among all the stakeholders are critical to optimize the use of limited resources and insure economical management of the watershed. Recognizing this fact, this order focusses on watershed management and seeks to integrate the programs of all the stakeholders, especially the three municipal storm water permit holders, within this watershed.

12. The 1989, 1991, and 1994 Water Quality Assessments by the Regional Board identified impairment of a number of water bodies within the permitted area. The beneficial uses of these water bodies are threatened or impaired in part due to urban storm water run-off and non-storm water flows from urbanized areas. Preliminary results from urban storm water monitoring programs within the Region indicate that major pollutants of concern in urban run-off are certain heavy metals, sediment, coliform bacteria, pesticides, and nutrients. Municipal storm water run-off is a source of pollutants to waters of the Region that may be causing or contributing to water quality impairment. It is recognized that instream or end-of-channel treatment of storm water is difficult and expensive. Therefore, it is critical to identify the pollutant sources and to develop management practices necessary to reduce pollutant loading to storm water. The quality of these discharges varies considerably and is affected by land use activities, basin hydrology and geology, season, the frequency and duration of storm events and point source discharges permitted by the Regional Board under individual permits.

13. Studies conducted by the EPA, the states, flood control districts and other entities indicate the following major sources of urban storm water pollution nationwide:

    a. Industrial sites where appropriate pollution control and best management practices (BMPs) are not implemented,

    b. Construction sites where erosion and siltation controls and BMPs are not implemented, and

    c. Urban run-off where the drainage area is not properly managed.

14. To address the industrial and construction sites, the State Water Resources Control Board (State Board) issued two statewide general NPDES permits: one for storm water run-off from industrial sites (NPDES No. CAS000001, General Industrial Activities Storm Water Permit) and the second one for storm water run-off from construction sites (NPDES No. CAS000002, General Construction Activity Storm Water Permit). Most industrial activities (some light industrial activities are exempt) and construction activities on five acres or more are required to get individual NPDES permits for storm water discharges, or get coverage under these statewide general permits by completing and filing a Notice of Intent (NOI) with the State Board.

VOL 22
0552

15. In addition, the Regional Board adopted Order No. 94-005, NPDES NO. CA 8000279, for storm water run-off from facilities owned and/or operated by Caltrans, which includes freeways and highways, and Order No. 94-7, NPDES NO. CA 8000336, for concentrated animal feeding operations, including dairies (General Dairy Permit). The Regional Board has issued and continues to issue individual storm water permits for certain industrial facilities within the Region.

16. One of the major components of these statewide permits, the Caltrans permit, and the General Dairy Permit is the requirement for the development and implementation of a storm water pollution prevention plan (SWPPP).

17. The Regional Board is the enforcing authority for the two statewide general permits. However, in most cases, the industrial and construction sites discharge directly into storm drains and/or flood control facilities owned and operated by the permittees. These industrial and construction sites are also regulated under local laws and regulations. Therefore, a coordinated effort between the permittees and the Regional Board is critical to avoid duplicative storm water regulatory activities. A memorandum of understanding between the permittees and the Regional Board may be appropriate to efficiently implement the storm water regulations for industries and construction sites at the local level.

18. The permittees generally conduct inspections of industrial and commercial facilities and construction sites within their jurisdiction to determine compliance with local storm water ordinances and regulations as well as for other regulatory purposes. The permittees have established a subcommittee to develop an enforcement/compliance strategy for industrial and commercial facilities and construction sites. The permittees have agreed to notify Regional Board staff when conditions are observed during such inspections which result in a threat or potential threat to water quality. This also includes failure to obtain coverage under the general storm water permits.

19. The permittees have agreed not to issue grading and/or building permits without proof of compliance for projects subject to the State's General Construction Activity Storm Water Permit.

20. The permittees own/operate facilities where industrial or related activities take place that may have an impact on storm water quality. Some of the permittees also enter into contracts with outside parties to carry out activities that may also have an impact on storm water quality. These facilities and related activities include, but are not limited to, street sweeping, catch basin cleaning, maintenance yards, vehicle and equipment maintenance areas, waste transfer stations, corporation and storage yards, parks and recreational facilities, landscape and swimming pool maintenance activities, storm drain system

VOL 22
0553
R0065788

maintenance activities and the application of herbicides, algaecides and pesticides. As part of this order, the permittees will assess public agency activities and facilities for potential impact to storm water quality and develop and implement best management practices to reduce pollutant discharges from those activities/facilities found to be significant sources of pollutants. Non-storm water discharges from these facilities and/or activities also affect water quality. This order prohibits non-storm water discharges from public facilities unless the discharges are exempt under Section III., Discharge Limitations, 3 of this order or are permitted by the Regional Board under an individual NPDES permit.

21 The major focus of storm water pollution prevention is the development and implementation of an appropriate drainage area management plan (DAMP) including best management practices (BMPs). The ultimate goal of the urban storm water management program is to attain water quality consistent with the water quality objectives for the receiving waters in order to protect beneficial uses. The permittees developed and submitted a DAMP, which was approved on January 18, 1994.

22 The DAMP is a dynamic document and the permittees have implemented, or are in the process of implementing its various elements. The Regional Board also recognizes other drainage area management plans such as the Drainage Water Quality Plan for Lake Mathews (DWQPLM), which includes structural BMPs for pollution control. The RCFC & WCD and Riverside County are involved in the DWQPLM.

23. There is some contribution of pollutants in urban run-off from privately owned and operated facilities such as residences, businesses and commercial establishments and public and private institutions. Therefore, a successful storm water management plan should include the participation and cooperation of the public, businesses, and institutions. Therefore, the DAMP has a strong emphasis on public education.

24. The DAMP included 34 BMPs and a time schedule for implementation. These BMPs are organized into two components: BMPs for existing facilities and BMPs for new development. Both components include regulatory activities, public education programs and operations and maintenance activities.

25. In order to characterize storm water discharges, to identify problem areas, and to determine the effectiveness of the various BMPs, an effective monitoring program is critical. From 1990 through 1995, the principal permittee administered the monitoring program for the permittees which included storm water monitoring, receiving water monitoring, dry weather monitoring and sediment monitoring. The Report of Waste Discharge included a Consolidated Program for Water Quality Monitoring.

VOL 22

0554

26. In order to make the best use of limited resources of all the permittees (including other municipal permittees in San Bernardino and Orange Counties), and to derive maximum benefit from the storm water management programs, future programs should consider and explore approaches and program elements common to all three counties. An integrated management program may be developed with the cooperation of all the stakeholders, including the permittees in the three counties, and the Regional Board. The Regional Board will coordinate the activities within the watershed and seek participation of the permittees

27. The permittees have agreed to revise the implementation agreement that was developed in 1990 as required under Order No. 90-104 to coordinate the activities of the principal and co-permittees.

28. Illegal dumping and illicit/illegal connections and discharges to the storm drains are contributors to storm water and other surface water contamination. All the permittees have completed a reconnaissance survey of the municipal storm drain systems (open channels and underground storm drains). The permittees are required to detect, identify and eliminate illicit/illegal discharges. Additionally, the permittees are required to develop a program to prohibit illegal/illicit connections to their storm drains and flood control facilities.

29. This order requires the permittees to continue to implement the BMPs listed in the DAMP and to effectively prohibit illegal and illicit discharges to the storm drain system. One of the major elements of the DAMP, the Storm Water/Urban Run-off Management and Discharge Controls Ordinance, was adopted by Riverside County on May 9, 1995. The purpose of this ordinance is to reduce pollutant discharges in storm water, and to regulate illicit connections and non-storm water discharges to the storm drain system.

30. Early identification of potential storm water impacts and mitigation measures can significantly reduce storm water pollution problems. The permittees should consider these impacts and appropriate mitigation measures in planning procedures, in the California Environmental Quality Act (CEQA) review process for specific projects, Master Plans, etc.

31. Successful implementation of the provisions and limitations in this order will require the cooperation of all the public agency organizations within Riverside County having programs/activities that have an impact on storm water quality (e.g., Fire Department, Department of Environmental Health, Planning Department, Building and Safety, Code Enforcement, etc.) As such, these organizations are expected to actively participate in implementing this areawide storm water program.

VOL 22
0555
R0065790

32. The permittees may lack legal jurisdiction over storm water discharges into their systems from some of the State and federal facilities, agricultural land, utilities and special districts, and Native American tribal lands. The Regional Board recognizes that the permittees should not be held responsible for such facilities and/or discharges.

33. The permittees may petition the Regional Board to issue a NPDES permit to any discharger of non-storm water into storm drain systems that the permittees own or operate.

34. A revised Water Quality Control Plan (Basin Plan) was adopted by the Regional Board and became effective on January 24, 1995. The Basin Plan contains water quality objectives and beneficial uses for water bodies in the Santa Ana Region.

35. The requirements contained in this order are necessary to implement the Basin Plan.

36. In accordance with the Clean Water Act and its implementing regulations, this order requires the permittees to develop and implement programs and policies necessary to control the discharge of pollutants to waters of the United States to the maximum extent practicable.

37. The legislative history and the preamble to the federal storm water regulations indicate that Congress and the U.S. EPA were aware of the difficulties in regulating urban storm water run-off solely through traditional end-of-pipe treatment. However, the U.S. EPA and the State Water Resources Control Board have determined that the NPDES permits for urban storm water run-off must contain effluent limitations based on water quality standards (beneficial uses and water quality objectives). The development and implementation of best management practices (BMPs), which will achieve compliance with applicable standards, are generally considered to be acceptable as effluent limitations. In accordance with Section 402 (p) of the Clean Water Act, this order requires the permittees to develop controls to reduce the discharge of pollutants to the maximum extent practicable. If urban storm water discharges cause an exceedance of the water quality standards in the receiving waters, the BMPs must be reevaluated, revised and implemented as appropriate to address any exceedances of receiving water quality standards. Numeric and narrative water quality objectives are contained in the Basin Plan for the water bodies in this Region. This order does not contain numeric effluent limitations for any constituents because the impact of the storm water discharges on the water quality of the receiving waters has not yet been fully determined. Extensive water quality monitoring and analysis of the data are essential to make that determination. Due to the high cost associated with monitoring, and due to the variability that exists in the current storm water monitoring efforts being conducted by the permittees and other municipal permittees in Orange and San Bernardino Counties under their municipal storm

VOL 22
0556
R0065791

water permits, a tri-county monitoring program to develop and implement effective monitoring procedures and strategies will be considered.

38 It is the Regional Board's intent that this order shall attain and protect the beneficial uses of receiving waters. This order therefore, includes Receiving Water Limitations required to implement water quality objectives and to prevent nuisance and water quality impairment in receiving waters. This order requires implementation of control measures in accordance with the DAMP that will reduce pollutants in storm water discharges to the maximum extent practicable. The Receiving Water Limitations require the implementation of control measures that are technically and economically feasible as necessary to protect beneficial uses and water quality objectives of the receiving waters.

The Regional Board finds that the unique aspects of the regulation of storm water discharges through municipal storm sewer systems, including intermittent discharges, difficulties in monitoring and limited physical control over the discharge, will require adequate time to implement and evaluate the effectiveness of best management practices and to determine whether they will adequately protect receiving waters. Therefore, the permit includes a procedure for determining whether storm water discharges are causing continuing and recurring exceedances of receiving water limitations and for evaluating whether the DAMP must be revised. The permittee will be in compliance with the Receiving Water Limitations so long as the permittees comply with that procedure.

39. The storm water regulations require public participation in the storm water management program development and implementation. As such the permittees are required to solicit and consider all comments received from the public and submit copies of the comments to the Executive Officer of the Regional Board. In considering the public comments, the permittees may modify reports, plans, or schedules prior to submittal to the Regional Board.

40. In accordance with California Water Code Section 13389, the issuance of waste discharge requirements for this discharge is exempt from those provisions of the California Environmental Quality Act contained in Chapter 3 (commencing with Section 21100), Division 13 of the Public Resources Code.

41. The Regional Board has considered anti-degradation requirements, pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16, for this discharge. The Regional Board finds that the storm water discharges are consistent with the federal and state anti-degradation requirements and a complete anti-degradation analysis is not necessary.

VOL 22
0551
R0065792

42. The Regional Board has notified the permittees and interested parties of its intent to issue waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

43. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

IT IS HEREBY ORDERED that the permittees, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and the regulations and guidelines adopted thereunder, shall comply with the following:

I. RESPONSIBILITIES OF THE PRINCIPAL PERMITTEE:

The principal permittee shall be responsible for managing the overall storm water program and shall:

1. Conduct water quality and hydrographic monitoring of the municipal separate drain system outfalls as agreed upon by the Executive Officer of the Regional Board.

2. Develop criteria for inspections of the municipal storm drain systems.

3. Conduct inspections of the storm drain systems owned and operated by the RCFC&WCD.

4. Implement management programs, monitoring programs, and related plans as required by this order.

5. Enact and revise policies and ordinances necessary to establish and maintain adequate legal authority within the scope of the Riverside County Flood Control and Water Conservation District Act, as required by the Federal Storm Water Regulations, 40CFR, Part 122.26(d)(2)(i)(A-F).

6. Respond and/or arrange for responding to emergency situations such as accidental spills, leaks, illicit discharges/illegal connections, etc., to prevent or reduce the discharge of pollutants to the municipal separate storm drain systems and to waters of the United States.

7. Prepare and submit to the Executive Officer of the Regional Board, unified reports, plans, and programs necessary to comply with this order

VOL 22
0558
R0065793

The activities of the principal permittee should include, but not be limited to, the following:

8. Coordinate permit activities and participate in any committees/subcommittees formed to coordinate permit compliance activities.

9. Provide technical and administrative support and inform the co-permittees of the progress of other pertinent municipal programs, pilot projects, research studies, etc.

10. Coordinate the implementation of areawide storm water quality management activities such as monitoring programs, public education, other pollution prevention measures, household hazardous waste collection, etc.

11. Gather and disseminate information on the progress of statewide municipal storm water programs and evaluate the information for potential use in the execution of this order.

12. Monitor the implementation of the plans and programs required by this order and determine their effectiveness in reducing pollutant loadings to surface waters to the maximum extent practicable.

13. Coordinate activities pertaining to implementation of this order with the Regional Board.

14. Solicit and coordinate public input for any major proposed storm water management programs and implementation plans.

15. Develop and implement mechanisms, performance standards, etc., to promote consistent implementation of BMPs among the permittees.

16. In conjunction with the co-permittees, implement the BMPs listed in the approved DAMP.

II. RESPONSIBILITIES OF THE CO-PERMITTEES

Each co-permittee shall be responsible for managing the storm water program within its jurisdiction and shall:

1. Adopt the Grading and Erosion Control Ordinance or its equivalent, within 120 days of adoption of this order.

VOL 22
0559
R0065794

2. Conduct storm drain system inspections in accordance with the criteria developed by the principal permittee.

3. Enact and revise policies and ordinances necessary to establish and maintain adequate legal authority as required by the Federal Storm Water Regulations, 40CFR, Part 122.26(d)(2)(i)(A-F).

4. Implement management programs, monitoring programs, and related plans as required by this order.

The co-permittees' activities should include, but not be limited to, the following:

5. Administer the storm water and erosion control ordinances adopted pursuant to Item 1., above.

6. Conduct and coordinate with the principal permittee any surveys, monitoring and/or characterizations needed to identify the pollutant sources and drainage areas.

7. Review and comment on all plans, strategies, management programs, monitoring programs, as developed by the principal permittee or any subcommittee to comply with this order.

8. Cooperate in committees and/or subcommittees formed by the principal permittee to address compliance with this order.

9. In conjunction with the principal permittee, implement the BMPs listed in the approved DAMP.

10. Submit to the principal permittee any information necessary to develop unified report submittals to the Executive Officer of the Regional Board.

11. Prepare and submit any specific reports/information related to the permittees' storm water program as deemed necessary by the Executive Officer of the Regional Board.

VOL 22
0560
R0065795

VOL 22
0561

III. DISCHARGE LIMITATIONS

1. The permittees shall prohibit illicit discharges from entering into the municipal separate storm sewer systems (municipal storm drain systems) and require controls to reduce the discharge of pollutants to the maximum extent practicable.

2. This order authorizes storm water discharges to waters of the State from the permittees' existing municipal separate storm drain systems provided that the permittees implement the BMPs (structural and/or non-structural control measures) necessary to reduce the pollutants in the discharge to the maximum extent practicable. All other discharges are prohibited except those listed under Item 3., below, those for which the Regional Board has issued individual permits, and those discharges which are in accordance with Item 5., below.

3. The following discharges need not be prohibited by the permittees unless identified by the permittees as sources of pollutants to the waters of the United States.

   a. Discharges covered by an NPDES permit, or for which an approval has been issued by the Regional or State Board office;

   b. Discharges from potable water line flushing and other potable water sources;

   c. Discharges from fire fighting and fire hydrant testing and flushing;

   d. Discharges from landscape irrigation, lawn watering and other irrigation activities;

   e. Diverted stream flows:

   f. Rising ground waters and natural springs;

   g. Uncontaminated groundwater infiltration (as defined in 40 CFR 35.2005(20)) and uncontaminated pumped groundwater;

   h. Passive foundation drains;

   i. Air conditioning condensate;

   j. Water from crawl space pumps;

VOL 22

k. Passive footing drains;

l. Discharges from individual residential vehicle washing (not including discharges from mobile sources such as automobile/equipment detailing or washing);

m. Flows from riparian habitats and wetlands;

n. Dechlorinated swimming pool discharges;

o. Street wash water and run-off from fire fighting (program descriptions shall address discharges or flows from fire fighting only where such discharges are identified as significant sources of pollutants to waters of the United States),

p. Waters not otherwise containing wastes as defined in California Water Code Section 13050 (d); and

q. Other types of discharges identified and recommended by the permittees and approved by the Regional Board.

For purposes of this order, a discharge may include storm water and other types of discharges as indicated above.

4. The permittees shall take necessary steps as required under Item 1., above, to ensure that non-storm water discharges to the municipal storm drain system do not cause or contribute to violations of water quality objectives or discharge pollutants to waters of the United States.

5. Non-storm water discharges from permittees' activities into waters of the state are prohibited unless the non-storm water discharges are permitted by an NPDES permit or are included in Item 3., above. If permitting or immediate elimination of the non-storm water discharges is impractical, the permittees shall include in the storm water pollution prevention strategy, required under Section V., Provision 13., of this order, a proposed plan to address the non-storm water discharges.

6. The discharge shall not cause or contribute to degradation of groundwaters.

7. Pollutants in storm water discharges from the municipal separate storm sewer system shall be reduced to the maximum extent practicable.

0562

VOL 22
05563

IV. RECEIVING WATER LIMITATIONS

1. Receiving water limitations are based upon beneficial uses, water quality objectives and water quality standards contained in the Basin Plan, and amendments thereto, and on ambient water quality. The discharge of storm water, or non-storm water from a municipal storm sewer system for which the permittees are responsible under the terms of this order shall not cause or contribute to a continuing of recurring violation of any applicable receiving water limitations adopted by the Regional Board or the State Water Resources Control Board. The permittees will not be in violation of this provision so long as they are in compliance with the requirements set forth in 1.A.

   A. If the Executive Officer determines that a continuing or recurring exceedance of a receiving water limitation has been caused by discharges from the municipal storm sewer system, the following steps shall be taken:

      i. The Executive Officer will evaluate the adequacy of the permittees implementation of the DAMP based on the permittees submitted reports and other relevant information. The Executive Officer will determine if implementation of the DAMP has a reasonable likelihood of preventing future exceedances of receiving water limitations. If the Executive Officer makes this determination, the permittees are required to continue implementing the DAMP.

      ii. If the Executive Officer determines that the implementation of the DAMP will not have a reasonable likelihood of preventing future exceedances of receiving water limitations, the permittees shall, upon notice from the Executive Officer, do the following:

         a. The Executive Officer may require the permittees to submit a report that includes an evaluation of the relative contribution of the storm water discharges to the exceedance of the receiving water limitations. The report shall address the persistence and the causes of the exceedance, and the technical and economic feasibility of control actions by the permittees to reduce or eliminate the exceedance.

         b. The Executive Officer may require the permittees to submit a report reviewing the DAMP to determine whether it should be revised so that there will be a reasonable likelihood of preventing future exceedances of receiving water limitations, or whether revisions to achieve compliance with receiving water limitations are

technically or economically unfeasible. If the report recommends revision of the DAMP, the report shall include a work plan to revise the plan so that it will have a reasonable likelihood of preventing future exceedances of receiving water limitations. If the report concludes that no revisions are necessary to achieve compliance with receiving water limitations, the report shall explain how implementation of the DAMP will achieve compliance. If the report determines that revisions to achieve compliance with receiving water limitations are technically or economically infeasible, the permittees shall fully document this determination and shall include recommendations for actions to achieve compliance, including for example, commencement of a total maximum daily load report or revisions of the Basin Plan, and identification of funding sources for such actions.

c. The permittees shall implement the work plan and the revised DAMP as approved by the Executive Officer.

2. The Executive Officer shall review and approve or disapprove the reports required under Receiving Water Limitation 1. The reports may be submitted as part of the next Annual Report, or at some other time designated by the Executive Officer. So long as the permittees have complied with the procedures set forth in Receiving Water Limitation 1, they do not have to repeat the procedure for continuing exceedances of the same receiving water limitations. As appropriate, any determinations under this part or revisions to the DAMP may be considered by the Regional Board in a public meeting.

V. PROVISIONS

GENERAL

1. Permittees shall demonstrate compliance with all the requirements in this order and specifically with Section III., Discharge Limitations, and Section IV., Receiving Water Limitations, through timely implementation of their approved Drainage Area Management Plan and any approved modifications, revisions, or amendments thereto, which are developed pursuant to this order. The Drainage Area Management Plan and any amendments thereto are hereby made an enforceable part of this order.

2 Permittees shall implement all elements of the approved DAMP. Any proposed revisions to the DAMP shall be submitted to the Executive Officer of the Regional

VOL 22
0564
R0065799

Board for review and approval. All revisions to the DAMP approved by the Executive Officer shall be implemented in a timely manner.

3. The permittees shall comply with Monitoring and Reporting Program No. 96-30, which is hereby made a part of this order, and any revisions thereto. The Executive Officer is authorized to revise the Monitoring and Reporting Program and also to allow the permittees to participate in regional, statewide, national, or other monitoring programs in lieu of Monitoring and Reporting Program No. 96-30.

4. Upon approval by the Executive Officer of the Regional Board, all plans and reports required by this order, including any subsequent amendments, shall be implemented and shall become an enforceable part of this order.

5. The permittees shall report to the Executive Officer of the Regional Board:

   a. Any enforcement actions and known discharges of storm or wastewaters to facilities owned or operated by the permittees which may impair domestic water supply sources (e.g., discharges due to a levee break, illegal discharges to the street, etc.) or which may have an impact on human health or the environment; if the discharge is to Canyon Lake or any tributary to Canyon Lake, Elsinore Valley Municipal Water District shall also be notified immediately;

   b. Any industrial and/or construction facilities found not to be in compliance with the State's General Storm Water Permits or where the activities may be contributing pollutants to the waters of the U.S.; and

   c. Any suspected or reported activities on federal, state, or other entity's land or facilities, where the permittees do not have any jurisdiction, and where the suspected or reported activities may be contributing pollutants to waters of the United States.

6. The permittees shall not issue occupancy permits unless the applicant is informed of his obligation under the State's NPDES industrial general permit. The permittees shall not issue grading or building permits to developments that may result in land disturbance of five acres or more (or less than five acres, if it is part of a larger common plan of development or sale which is five acres or more) unless the applicant shows proof of coverage under the State's General Construction Activity Storm Water Permit. The proof of coverage may include a letter from the Regional Board office, a copy of the Notice of Intent, etc. The

VOL 22 0565

permittees shall coordinate the activities of the various departments/sections within each permittee's jurisdiction to insure consistent implementation of storm water regulations.

7. Permit application asn special NPDES program requirements contained in 40 CFR 122.21 and 122.41-42 are incorporated into this order by reference.

IMPLEMENTATION AGREEMENT

8. No later than June 4, 1996, the permittees shall submit to the Executive Officer of the Regional Board an updated copy of an implementation agreement with authorized signatures of each of the permittees. Any subsequent revisions to the implementation agreement shall be forwarded to the Executive Officer of the Regional Board within 30 days of approval by the permittees. At a minimum, the implementation agreement should include all the essential elements of the existing agreement, developed in accordance with Order No. 90-104.

LEGAL AUTHORITY

9. The permittees shall adopt the proposed Storm Water/Urban Run-off Management and Discharge Control Ordinance, or its equivalent. No later than April 26, 1996, each permittee shall certify to the Regional Board that it has adequate legal authority to control the discharges of pollutants into the municipal storm drain system and that it has, at a minimum, satisfied each of the key regulatory requirements contained in 40 CFR Section 122.26(d)(2)(i)(A-F).

ENFORCEMENT/COMPLIANCE STRATEGY

10 Permittees shall develop and implement an enforcement/compliance strategy to enforce storm water and erosion control ordinances. This enforcement/compliance strategy should include a mechanism to determine compliance of industrial facilities and construction sites, and notification to the Executive Officer of any finding of non-compliance and any proposed local enforcement action. The enforcement/compliance strategy shall be submitted to the Executive Officer of the Regional Board by August 27, 1996.

PUBLIC EDUCATION AND OUTREACH

11 The permittees shall continue to implement the public education efforts already underway and shall implement all of the proposed efforts identified in the Report of Waste Discharge.

VOL 22
0566
R0065801

12. When feasible, the permittees shall participate in joint outreach with other programs including, but not limited to, other municipal storm water programs to ensure that a consistent message on storm water pollution prevention is brought to the public.

13. The permittees shall develop public education materials to encourage the public to report illegal dumping from residential, industrial, construction and commercial sites into public streets, storm drains and other water bodies.

MUNICIPAL FACILITIES

14. The permittees shall develop a pollution prevention strategy to address their public agency facilities and activities which are determined by the permittees (with the approval of the Executive Officer of the Regional Board) to be activities of concern regarding storm water pollution. The pollution prevention strategy shall be developed to ensure that the public agency facilities and/or activities that are currently not required to obtain coverage under the State's general storm water permits are not sources of pollutants into the waters of the United States. The pollution prevention strategy shall be submitted to the Executive Officer of the Regional Board by October 9, 1996. In developing the pollution prevention strategy, the permittees shall consider the following:

a. Identification of public agency facilities and activities that are potential contributors of pollutants to waters of the United States.

b. Potential pollutants of concern that are associated with the facilities and/or activities;

c. Proposed BMPs and a schedule for their implementation to ensure that these facilities are not sources of pollutants into the waters of the United States;

d. A monitoring program to measure the effectiveness of the BMPs;

e. A schedule for training of public agency staff to ensure proper implementation of the BMPs; and

f. Identification of any non-storm water discharges from the public agency facilities/activities, frequency of the discharge, characterization of the discharge, volume, flow and duration of the discharge, short term source control BMPs to mitigate the impacts

VOL 22
0567
R0065802

from the discharge, and a schedule for elimination or permitting of the discharge.

MUNICIPAL CONSTRUCTION PROJECTS/ACTIVITIES

15. This Order authorizes the discharge of storm water run-off from construction projects that may result in land disturbance of 5 acres or more (or less than five acres, if it is part of a larger common plan of development or sale which is five acres or more) that are under ownership and/or direct responsibility of any of the permittees.

16. Prior to commencement of construction activities, the permittees shall notify the Executive Officer of the Regional Board of the proposed construction project. Upon completion of the project, the Executive Officer shall be notified of the completion of the project.

17. The permittees shall develop and implement a storm water pollution prevention plan and a monitoring program that is specific for the construction project prior to the commencement of any of the construction activities. The SWPPP and monitoring program shall be implemented throughout the duration of the construction project. The SWPPP shall be kept at the construction site and released to the public and/ or Regional Board staff upon request.

18. The SWPPP and the monitoring program for the construction projects shall be consistent with the requirements of the most recent version of the State's General Permit for Storm Water Discharges Associated with Construction Activities.

19. The permittees shall give advance notice to the Executive Officer of the Regional Board of any planned changes in the construction activity which may result in non-compliance with the current version of the State's General Permit for Storm P E TER

VOL 22
0568
R0065803

22. Within 120 days of the issuance of this order, th rmittees all review their General Plan update and CEQA document prepar. .on proces s to insure that storm water-related issues are properly considered. If necessar , these processes shall be revised to include requirements for evaluation of sto m water-related impacts and identification of appropriate mitigation measures.

23. The permittees shall establish a mechanism to insure proper maintenance and operation of all permanent flood control structures. For new developments, the parties responsible for the maintenance of the flood control structures and funding sources for maintenance and operation of the facilities shall be identified prior to issuance of grading permits.

FISCAL RESOURCES

24. The permittees shall prepare and submit a unified fiscal analysis report appropriate for implementation of the requirements of this order to the Executive Officer of the Regional Board. The fiscal analysis report shall be submitted no later than November 15, of each year and shall at a minimum include the following:

a. Each permittee's expenditures for the previous fiscal year;
b. Each permittee's budget for the current fiscal year;
c. A description of the source of funds;

PERMIT EXPIRATION AND RENEWAL

25. This order expires on March 1, 2001 and the permittees must file a Report of Waste Discharge (permit application) no later than 180 days in advance of such expiration date as application for issuance of new waste discharge requirements. The Report of Waste Discharge shall, at a minimum, include the following:

a. Any revisions to the Drainage Area Management Plan including, but not limited to, all the activities the permittees propose to undertake during the next permit term, goals and objectives of such activities, an evaluation of the need for additional source control and/or structural BMPs, any proposed pilot studies, etc.;

b Changes in land use and/or population including map updates; and

c Any significant changes to the storm drain systems, outfalls, detention or retention basins or dams, and other controls, including map updates of the storm drain systems.

VOL 22

0569

26. This order may be modified, revoked or reissued prior to its expiration date for the following reasons:

a. To address significant changes in conditions identified in the technical reports required by the Regional Board which were unknown at the time of the issuance of this order;

b. To incorporate applicable requirements of statewide water quality control plans and policies adopted by the State Water Resources Control Board or any amendments to the Basin Plan approved by the Regional Board, the State Board, and, if necessary, by the Office of Administrative Law; or

c. To comply with any applicable requirements, guidelines, or regulations issued or approved under the Clean Water Act, if the requirements, guidelines, or regulations contain different conditions or additional requirements than those included in this order.

d. To incorporate new or revised program elements and compliance schedule(s) necessary to comply with Section IV of this order.

27. This order shall serve as a National Pollutant Discharge Elimination System (NPDES) permit pursuant to Section 402 (p) of the Clean Water Act, or amendments thereto, and shall become effective ten days after the date of its adoption provided the Regional Administrator of the U. S. EPA has no objections. If the Regional Administrator objects to its issuance, the permit shall not become effective until such objection is withdrawn.

28. Order No. 90-104 is hereby rescinded.

I, Gerard Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on March 8, 1996.

Santa Ana Region

Monitoring and Reporting Program No. 96-30

NPDES NO. CAS 618033
for
RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT, THE COUNTY OF RIVERSIDE, AND THE INCORPORATED CITIES OF RIVERSIDE COUNTY WITHIN THE SANTA ANA REGION
AREAWIDE URBAN STORM WATER RUN-OFF

I. GENERAL

1. Revisions of the monitoring and reporting program may be necessary to ensure that the discharger is in compliance with requirements and provisions contained in this order. Revisions may be made by the Executive Officer at any time during the term of this order, and may include a reduction or increase in the number of parameters to be monitored, the frequency of monitoring, or the number and size of samples collected.

2. All sample collection, handling, storage, and analyses shall be in accordance with 40 CFR Part 136 or other methods approved by the Executive Officer.

3. The permittees are authorized to complement their monitoring data with data from other sources provided those sources are similar to sources in the Santa Ana Watershed.

4. The permittees shall implement the Consolidated Program for Water Quality Monitoring (submitted as part of the Report of Waste Discharge) until development and implementation of other acceptable monitoring programs.

II. OBJECTIVES

The overall goal of this monitoring program is to provide feedback in direction for and in support of an effective watershed management program. The following are the major objectives:

1. To define storm water quality status, trends, and pollutants of concern.

2. To characterize pollutants in storm water and to assess the influence of land use on storm water quality.

3. To identify significant water quality problems related to storm water discharges within the watershed.

0513

R0065808

VOL 22

4. To identify other sources of pollutants in storm water run-off to the extent possible (e.g., atmospheric deposition, contaminated sediments, other non-point sources, etc.).

5. To verify and to control illicit discharges.

6. To identify those waters which without additional action to control pollution from storm water discharges cannot reasonably be expected to attain or maintain applicable water quality objectives or the goals and requirements of the Basin Plan.

7. To evaluate the effectiveness of existing management programs, including an estimate of pollutant reductions achieved by the structural and nonstructural BMPs.

The Regional Board recognizes that these objectives may not be attainable during this permit period and authorizes the Executive Officer to evaluate and to determine adequate progress toward meeting each objective.

III. MONITORING PROGRAM REQUIREMENTS

The lead permittee shall develop and submit for the approval of the Executive Officer an integrated monitoring program to achieve the above stated objectives. In developing this program, the lead permittee is encouraged to seek cooperation with the permittees from San Bernardino and Orange counties. The Executive Officer or his/her designated representative(s) shall facilitate the coordination meetings or subcommittees formed to achieve this goal. The development and implementation of the monitoring program shall be in accordance with the time schedule prescribed by the Executive Officer. At a minimum, the program shall consider the following:

1. Uniform guidelines for quality control, quality assurance, data collection and data analyses.

2. A mechanism for the collection, analysis and interpretation of existing data from Orange, Riverside, and San Bernardino County monitoring programs. These and other data from local, regional or national sources should be utilized to characterize different storm water sources, to determine pollutant generation, transport and fate; to develop a relationship between land use, development size, storm size and the event mean concentration of pollutants, to determine spatial and temporal variances in storm water quality and seasonal and other bias in the collected data; and to identify any unique features of the Santa Ana Watershed. The permittees are encouraged to use data from similar studies, if available.

0574

3. A description of the monitoring program including:

   a. The number and location of monitoring stations;
   b. Environmental indicators (e. g., ecosystem, biological, habitat, chemical, sediment, stream health, etc.) chosen for monitoring;
   c. Parameters selected for field screening and for laboratory work; and
   d. Total number of samples to be collected from each station, receiving water and major outfall monitoring, frequency of sampling during dry weather and short or long duration storm events, type of samples (grab, 24-hour composite, etc.), and the type of sampling equipment.

4. A mechanism for analyzing the collected data and interpreting the results including an evaluation of the effectiveness of the management practices, and need for any refinement of the management practices.

5. A description of the responsibilities of all the participants in this program including estimated cost.

IV. REPORTING

1. All progress reports and proposed strategies and plans required by this order shall be signed by the principal permittee and copies shall be submitted to the Executive Officer of the Regional Board under penalty of perjury.

2. The permittees shall submit an **ANNUAL PROGRESS REPORT** to the Executive Officer of the Regional Board and to the Regional Administrator of U. S. EPA, Region 9, no later than November 15, of each year. This progress report may be submitted in a mutually agreed upon electronic format. At a minimum, the annual progress report shall include the following:

   a. A review of the status of program implementation and compliance (or non-compliance) with the schedules contained in this order.

   b. An assessment of the effectiveness of control measures established under the illicit discharge elimination program and the Drainage Area Management Plan. The effectiveness may be measured in terms of how successful the program has been in eliminating illicit/illegal discharges and in reducing pollutant loads in storm water discharges.

   c. An analysis of the feasibility and usefulness of using structural BMPs based on data collected from the Drainage Water Quality Plan for Lake Mathews and/or other similar programs..

VOL 22
0575
R0065810

d. An assessment of any storm water management program modifications made to comply with Clean Water Act requirements to reduce the discharge of pollutants to the maximum extent practicable.

3. Co-permittees shall be responsible for the submittal of all required information/materials needed to comply with this Monitoring and Reporting Program in a timely manner to the principal permittee. All such submittals shall be signed by a duly authorized representative of the co-permittee under penalty of perjury.

V. REPORTING SCHEDULE

All reports required by this order shall be submitted to the Executive Officer of the Regional Board in accordance with the following schedule:

ITEM	*DUE DATE*
Legal Authority Certification	April 26, 1996
Revised Implementation Agreement	June 4, 1996
Enforcement Strategy	August 27, 1996
Municipal Activities Pollution Prevention Strategy	October 9, 1996
Annual Report including the Fiscal Analyses Report	November 15 of each year (next report due in 1996)

RENEWAL OF WASTE DISCHARGE REQUIREMENTS FOR THE COUNTY OF ORANGE, ORANGE COUNTY FLOOD CONTROL DISTRICT AND INCORPORATED CITIES OF ORANGE COUNTY, ORDER 96-31, NPDES NO. CAS 618030 , AREAWIDE URBAN STORM WATER RUNOFF, ORANGE COUNTY

Dear Mr. Novello:

Enclosed is a copy of the revised tentative Order No. 96-31, NPDES No. CAS 618030, revising Order No. 90-71. The only significant change is in the findings and the requirements related to receiving water limitations. These changes are in Findings 35 and 36 and in Section IV. Also please note that a clarification has been added to Finding 10. This item is now scheduled for consideration by the Regional Board at the March 8, 1996 Board meeting. A copy of the Agenda for the Board meeting is also enclosed.

If you have any questions, please contact Laurie Taul at 909-782-4906.

Sincerely,

mjadackapara

RENEWAL OF WASTE DISCHARGE REQUIREMENTS FOR THE COUNTY OF ORANGE, ORANGE COUNTY FLOOD CONTROL DISTRICT AND INCORPORATED CITIES OF ORANGE COUNTY, ORDER 95-52, NPDES NO. CA 8000180, AREAWIDE URBAN STORM WATER RUNOFF, ORANGE COUNTY

Dear Mr. Wingard:

Enclosed is a copy of tentative Order No. 95-52, NPDES No. CA 8000180, revising Order No. 90-71. The tentative order renews the requirements for the discharge of urban storm water runoff from the areas of Orange County within the Santa Ana Region. This item is scheduled for consideration by the Regional Board at the September 1, 1995 Board meeting. Please provide your comments by August 11, 1995.

Four copies of a "Notice of Public Hearing" and two copies of a "Statement of Posting Notice are also enclosed. Two copies of the notice of public hearing are to be posted by August 1, 1995, within the permitted area (e.g. local post office, library, city hall or courthouse). The third copy of the notice of public hearing should be published in a local newspaper of general circulation for one day, no later than August 1, 1995. Please retain the fourth copy of the notice of public hearing for your records. The expense of publication is to be paid by you.

By August 11, 1995, you must file with this office proof of posting and publication. Proof of posting shall consist of a statement executed on the enclosed form and the proof of publication shall consist of an affidavit from the publisher or the foreman of the newspaper, with a copy of the notice as published, attached.

VOL 22

California Regional Water Quality Control Board
Santa Ana Region

ORDER NO. 96-31
NPDES No. CAS618030

Waste Discharge Requirements
for
the County of Orange, Orange County Flood Control District
and
The Incorporated Cities of Orange County Within the Santa Ana Region
Areawide Urban Storm Water Run-off
Orange County

TENTATIVE

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Board), finds that:

1. On December 30, 1994, the County of Orange and the Orange County Flood Control District (OCFCD), in cooperation with the cities of Anaheim, Brea, Buena Park, Costa Mesa, Cypress, Fountain Valley, Fullerton, Garden Grove, Huntington Beach, Irvine, La Habra, La Palma, Lake Forest, Los Alamitos, Newport Beach, Orange, Placentia, Santa Ana, Seal Beach, Stanton, Tustin, Villa Park, Westminster, and Yorba Linda (hereinafter collectively referred to as permittees), submitted National Pollutant Discharge Elimination System (NPDES) Application No. CA 8000180 and a Report of Waste Discharge for reissuance of their areawide storm water NPDES permit.

2. Section 402(p) of the Federal Clean Water Act (CWA), as amended by the Water Quality Act of 1987, requires NPDES permits for storm water discharges from separate municipal storm drain systems, storm water discharges associated with industrial activity (including construction activities), and designated storm water discharges which are considered significant contributors of pollutants to waters of the United States (U.S.). On November 16, 1990, the United States Environmental Protection Agency (hereinafter US EPA) published regulations (40 CFR Parts 122, 123 and 124) which describe permit application requirements for storm water discharges pursuant to Section 402(p) of the CWA. Prior to EPA's promulgation of the final storm water regulations, the three counties (Orange, Riverside, and San Bernardino) and the incorporated cities within the jurisdiction of the Santa Ana Region requested areawide NPDES permits for urban storm water run-off.

3. On July 13, 1990, the Regional Board adopted Order No. 90-71 for urban storm water run-off from urban areas in Orange County within the Santa Ana Region. The County of Orange was named as the principal permittee and the Orange County Flood Control District (OCFCD) and the incorporated cities were named as the co-permittees. In order to more effectively carry out the requirements of this order, the permittees have agreed that the County of Orange will continue as principal permittee and the OCFCD and the incorporated cities will continue as co-permittees. Order 90-71 expired on July 1, 1995.

05822

R0065817

4. Order No. 90-71 required the permittees to develop and implement a drainage area management plan (DAMP) and a storm water and receiving water monitoring plan, to eliminate illegal and illicit discharges to the storm drain systems and to enact the necessary legal authority to effectively prohibit such discharges. The overall goal of these requirements was to reduce pollutant loadings to surface waters from urban run-off to the maximum extent practicable (MEP)[1].

5. This order outlines the next step toward an effective program and specifies requirements to protect the beneficial uses of the waters of the U. S. The intent of this permit is to regulate pollutant discharges, identify and focus on those areas which threaten the beneficial uses and improve water quality in the Region in a timely manner. This order regulates urban storm water run-off[2] from areas under the jurisdiction of the permittees.

6. The Report of Waste Discharge (the permit renewal application) included the following major components:

   a. Summary of status of current Storm Water Management Program
   b. Proposed Plan of Storm Water Quality Management Activities for 1995-2000
   c. The Drainage Area Management Plan
   d. A Model Water Quality Ordinance
   e. An Enforcement Consistency Guide
   f. A Reconnaissance Survey Field Inspection and Documentation Manual

7. The permittees serve a population of approximately 2.6 million, occupying an area of approximately 511 square miles (including both unincorporated areas and the limits of 31 cities). The permittees have jurisdiction over and /or maintenance responsibility for storm water conveyance systems within Orange County. The County's systems include an estimated 400 miles of storm drain systems. A major portion of the urbanized areas of Orange County drains into water bodies within this Regional Board's jurisdiction. The project area is shown on Attachment A. The major storm drain systems and drainage areas in Orange County which are within this Region are shown on Attachment B. A portion of the Orange County drainage area is within the jurisdiction of the San Diego Regional Board and is currently regulated under an order issued by that Board.

---

[1] Maximum Extent Practicable (MEP) means to the maximum extent possible, taking into account equitable considerations of synergistic, additive, and competing factors, including but not limited to, gravity of the problem, fiscal feasibility, public health risks, societal concerns, and social benefits.

[2] Urban storm water run-off includes those discharges from residential, commercial, industrial and construction areas within the permitted area and excludes discharges from feedlots, dairies and farms.

VOL 22
0583
R0065818

VOL 22
0584

8. The permittees may lack legal jurisdiction over storm water discharges into their systems from some of the State and federal facilities, utilities and special districts, Native American tribal lands, waste water management agencies and other point and non-point source discharges otherwise permitted by the Regional Board. The Regional Board recognizes that the permittees should not be held responsible for such facilities and/or discharges.

9. Storm water discharges consist of surface run-off generated from various land uses in all the hydrologic drainage areas which discharge into the water bodies of the U. S. The quality of these discharges varies considerably and is affected by land use activities, basin hydrology and geology, season, the frequency and duration of storm events, and the presence of illegal disposal practices/illicit connections. Nationwide studies in urban areas have shown that urban run-off typically contains significant quantities of pollutants. Preliminary results from urban storm water monitoring programs within the permitted area indicate that the major pollutants of concern are certain heavy metals, sediment, chemical oxygen demand (COD), pesticides, herbicides, and nutrients.

   The 1989, 1991, and 1994 Water Quality Assessments by the Regional Board identified impairment of a number of water bodies within the permitted area. The beneficial uses of these water bodies have been found to be threatened or impaired due to point and non-point source discharges.

10. Certain activities that generate pollutants present in storm water runoff are beyond the ability of the permittees to eliminate. Examples of these include operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear and leaching of naturally-occurring minerals from local geography. Pollutants contributed by these activities, however, can be controlled by the permittees.

11. Storm water discharges to the storm drain systems in Orange County are tributary to various water bodies of the Region. The permitted area can be subdivided into five tributary watersheds: the San Gabriel River drainage area, the Huntington Harbor and Bolsa Bay drainage area, the Greenville-Banning Channel drainage area, the Santa Ana River drainage area, and the Newport Bay drainage area (see Attachment B). These watersheds are tributary to the Pacific Ocean. The surface water bodies in Orange County include:

   Inland Surface Streams

   a. Santa Ana River, Reaches 1 and 2,

   b. Silverado Creek (tributary to Santiago Creek),

   c. Santiago Creek, Reaches 1, 2, 3, and 4 (tributary to the Santa Ana River),

d. San Diego Creek, Reaches 1 and 2 (tributary to Newport Bay),

e. San Joaquin Freshwater Marsh (tributary to San Diego Creek),

f. All other tributaries to these Creeks: Bonita Creek, Serrano Creek, Peters Canyon Wash, Hicks Canyon Wash, Bee Canyon Wash, Borrego Canyon Wash, Agua Chinon Wash, Laguna Canyon Wash, Rattlesnake Canyon Wash, Sand Canyon Wash, Black Star Creek, Carbon Canyon Creek, Coyote Creek and other tributaries to these washes,

Bays, Estuaries, and Tidal Prisms

11. (cont'd)
The beneficial uses of these water bodies include: municipal and domestic supply, agricultural supply, industrial service supply, groundwater recharge, navigation, hydropower generation, water contact recreation, non-contact water recreation, commercial and sportfishing, warm freshwater habitat, cold freshwater habitat, preservation of biological habitats of special significance, wildlife habitat, preservation of rare, threatened or endangered species, marine habitat, shellfish harvesting, spawning, reproduction and development of aquatic habitats, and estuarine habitat . The ultimate goal of this storm water management program is to protect the beneficial uses of the receiving waters.

12. The Santa Ana River Basin is the major watershed within the jurisdiction of the Regional Board. The lower Santa Ana River Basin (downstream from Prado Basin) includes the Orange County drainage areas and the Upper Santa Ana River Basin includes the San Bernardino and the Riverside drainage areas. Within the Region, generally the San Bernardino County drainage areas drain to the Riverside County drainage areas, and Riverside County drainage areas discharge to Orange County.

13. Within the Region, run-off from the San Bernardino County areas is generally conveyed to the Riverside County areas through the Santa Ana River or other drainage channels tributary to the Santa Ana River. These flows are then discharged to Reach 2 of the Santa Ana River through Prado Basin (Reach 3 of the Santa Ana River). Most of the flow in Reach 2 is recharged in Orange County. During wet weather, some of the flow is discharged to the Pacific Ocean through Reach 1 of the Santa Ana River.

14. The three county areas within this Region are regulated under three areawide permits for urban storm water run-off. These areawide NPDES permits are:

    a. Orange County, NPDES No. CAS618030;
    b. Riverside County, NPDES No. CAS618033; and
    c. San Bernardino County, NPDES No. CAS618036.

15. Studies conducted by the EPA, the states, flood control districts and other entities indicate the following major sources for urban storm water pollution nationwide:

    a. Industrial sites where appropriate pollution control and best management practices (BMPs)[3] are not implemented;

    b. Construction sites where erosion and siltation controls and BMPs are not implemented; and

    c. Urban run-off where the drainage area is not properly managed.

[3] Best Management Practices (BMPs) are water quality management practices that are maximized in efficiency for the control of storm water run-off pollution.

16. To address the industrial and construction sites, the State Board issued two statewide general NPDES permits: one for storm water run-off from industrial sites (NPDES No. CAS000001, General Industrial Activities Storm Water Permit) and the second one for storm water run-off from construction sites (NPDES No. CAS000002, General Construction Activity Storm Water Permit). In addition, the Regional Board adopted Order No. 94-005, NPDES NO. CA 8000279, for storm water run-off from facilities owned and/or operated by Caltrans, which includes freeways and highways, and Order 94-7, NPDES No. CA 8000336 for concentrated animal feeding operations, including dairies. The Regional Board issued and continues to issue individual storm water permits for certain industrial facilities within the Region.

17. One of the major components of these statewide permits and the Caltrans permit is the development and implementation of a storm water pollution prevention plan (SWPPP).

18. Most industrial activities (some light industrial activities are exempt) and construction sites on five acres or more are required to get coverage under these statewide general permits.

19. The Regional Board administers compliance with the State's General Industrial Activities Storm Water Permit and the General Construction Activity Storm Water Permit. However, in most cases, the industries and construction sites discharge into storm drains and/or flood control facilities owned and operated by the permittees. These industries and developers are also regulated under local laws and regulations. Therefore, a coordinated effort of the permittees and the Regional Board staff is critical to avoid duplicative and overlapping storm water regulatory activities. A memorandum of understanding between the permittees and the Regional Board may be appropriate to efficiently implement the storm water regulations for industries and construction sites at the local level.

20. The permittees have agreed to continue to notify Regional Board staff when conditions are observed during their routine activities which result in a threat or potential threat to water quality. This also includes failure to obtain coverage under the general storm water permits.

21. The permittees have developed project conditions of approval for new developments to be implemented at the time of grading or building permit issuance for individual sites on five acres or more, with the intent to comply with the General Construction Activity Storm Water Permit.

22. The permittees own/operate facilities where industrial or related activities take place that may have an impact on storm water quality. Some of the permittees also enter into contracts with outside parties to carry out municipal related activities that may also have an impact on storm water quality. These facilities and related activities include, but are not limited to, street sweeping, catch basin cleaning, maintenance yards, vehicle and equipment maintenance areas, waste transfer stations, corporation and storage yards, parks and recreational facilities, landscape and swimming pool maintenance activities, storm

VOL 22 0587

VOL 22
05888

drain system maintenance activities and the application of herbicides, algaecides and pesticides. As part of this order, the permittees will prepare an environmental performance report for appropriate public facilities under their jurisdiction, and develop and implement best management practices for those activities found to require pollution prevention measures. Non-storm water discharges from these facilities and/or activities could also affect water quality. This order prohibits non-storm water discharges from public facilities unless the discharges are exempt under Section III, Discharge Limitations, 3 & 5 of this order or are permitted by the Regional Board under an individual NPDES permit.

23. Successful implementation of the provisions and limitations in this order will require the cooperation of all the public agency organizations within Orange County having programs/activities that have an impact on storm water quality. A list of these organizations is included in Attachment C. As such, these organizations are expected to actively participate in implementing the Orange County NPDES Storm Water Program. The Regional Board has the discretion and authority to require non-cooperating entities to participate in this areawide permit or obtain individual storm water discharge permits, pursuant to 40 CFR 122.26(a).

24. The major focus of storm water pollution prevention is the development and implementation of appropriate drainage area management plan (DAMP) including best management practices (BMPs). The ultimate goal of the urban storm water management program is to support attainment of water quality consistent with the water quality objectives for the receiving waters in order to protect beneficial uses through the implementation of the DAMP. The permittees developed and submitted a DAMP for approval, which was approved on May 3, 1994.

25. The DAMP is a dynamic document and the permittees have implemented, or are in the process of implementing, the various elements of the DAMP. This order requires the permittees to continue to implement the BMPs listed in the DAMP and to effectively prohibit illegal and illicit discharges to the storm drain system.

26. Urban run-off contains pollutants from privately owned and operated facilities such as residences, businesses, private and/or public institutions, and commercial establishments. Therefore, a successful storm water management plan should include the participation and cooperation of the public, businesses, the permittees and the regulators. The DAMP has a strong emphasis on public education.

27. The Orange County DAMP defined a management structure for the permittees' compliance effort, a formal agreement to underpin cooperation, and detailed municipal efforts to develop, implement, and evaluate various BMPs or control programs in the areas of public agency activities, public information, new-development and construction, public works construction, industrial discharger identification, and illicit discharger/connection identification and elimination. The DAMP also defined an extensive surface water quality and sediment monitoring program.

28. In order to characterize storm water discharges, to identify problem areas, to determine the impact of urban run-off on receiving waters, and to determine the effectiveness of the various BMPs, an effective monitoring program is critical. From 1990 through 1995, the principal permittee administered the monitoring program for the permittees which included storm water monitoring, receiving water monitoring, dry weather monitoring and sediment monitoring. The permit application included a summary of monitoring data collected during 1991-1994. The monitoring program did not identify any specific pollutant sources which could be targeted for special pollutant control programs. The monitoring data indicated spatial differences in water quality between Orange County's major watersheds. Some of the monitoring data collected to date may be used to develop baseline water quality data for future evaluation of program effectiveness.

29. The Strategic Plan and Initiatives (June 22, 1995) for the State Water Resources Control Board and the Regional Water Quality Control Boards recognizes the importance of an integrated watershed management approach. The Regional Board also recognizes that a watershed management program should integrate all related programs, including the storm water programs. Consistent with this approach, an integrated monitoring program could be developed with the cooperation of all the stakeholders, including the permittees in the three counties, and the Regional Board. The Regional Board will coordinate the activities within the watershed and seek participation of the permittees.

30. Any illegal dumping and illicit/illegal connections and discharges[4] to the storm drains could contribute to storm water and other surface water contamination. A reconnaissance survey of the municipal storm drain systems (open channels and underground storm drains) is being conducted by the permittees. The permittees are required to detect, identify and eliminate illicit/illegal discharges. Additionally, the permittees are also required to develop a program to prohibit illegal/illicit connections to their storm drains and flood control facilities.

31. The County of Orange obtains its authority to control pollutants in storm water discharges, to prohibit illegal discharges/illicit connections, to control spills, and to require compliance and carry out inspections of the storm drain systems in the County of Orange from the Orange County Flood Control Act, Orange County Water Pollution Ordinance, and various county ordinances which address industrial wastes and waste discharges within the unincorporated areas of Orange County and contract cities. The permittees have various forms of legal authority in place, such as charters, State Code provisions for General Law cities, city ordinances, and applicable portions of municipal codes and the State Water Code, to regulate storm water/urban run-off discharges.

---

[4] Illegal discharge means any discharge (or seepage) to the municipal separate storm sewer that is not composed entirely of storm water except for the authorized discharges listed in Section III of this permit. Illegal discharges include the improper disposal of wastes into the storm sewer system.

VOL 22
0589
R0065824

In order to insure countywide consistency and to provide a legal underpinning to the entire Orange County Storm Water Program, a model water quality ordinance was completed on August 15, 1994 and is available to the permittees for adoption.

32. Early identification of potential storm water impacts and mitigation measures can significantly reduce storm water pollution problems. The permittees should consider these impacts and appropriate mitigation measures in the planning procedures and in the California Environmental Quality Act (CEQA) review process for specific projects, Master Plans, etc. The County of Orange already requires a Water Quality Management Plan which addresses permanent post-construction BMPs, in addition to the SWPPP required by the statewide general permit for construction activity.

33. Successful implementation of the provisions and limitations in this order will require the cooperation of all the public agency organizations within Orange County having programs/activities that have an impact on storm water quality (e.g. Fire Department, Building and Safety, Code enforcement, etc.). As such, these organizations are expected to actively participate in implementing this areawide storm water program.

34. In accordance with the Clean Water Act and its implementing regulations, this order requires the permittees to develop and implement programs and policies necessary to control the discharge of pollutants in urban run-off to waters of the U. S. to the maximum extent practicable.

35. The legislative history and the preamble to the federal storm water regulations indicate that the Congress and the U.S. EPA were aware of the difficulties in regulating urban storm water run-off solely through traditional end-of-pipe treatment. However, it is the Regional Board's intent that this order shall attain and protect the beneficial uses of receiving waters. This order, therefore, includes Receiving Water Limitations required to implement water quality objectives and to prevent nuisance and water quality impairment in receiving waters. In accordance with Section 402 (p) of the Clean Water Act, this order requires the permittees to implement control measures in accordance with the DAMP that will reduce pollutants in storm water discharges to the maximum extent practicable. The Receiving Water Limitations require the implementation of control measures that are technically and economically feasible as necessary to protect beneficial uses and water quality objectives of the receiving waters.

36. The Regional Board finds that the unique aspects of the regulation of storm water discharges through municipal storm sewer systems, including intermittent discharges, difficulties in monitoring and limited physical control over the discharge, will require adequate time to implement and evaluate the effectiveness of best management practices and to determine whether they will adequately protect receiving waters. Therefore, the permit includes a procedure for determining whether storm water discharges are causing continuing and recurring exceedances of receiving water limitations and for evaluating

VOL 22
0590
R0065825

whether the DAMP must be revised. The permittees will be in compliance with the Receiving Water Limitations so long as it complies with that procedure.

37. A revised Water Quality Control Plan (Basin Plan) was adopted by the Regional Board and became effective on January 24, 1995. The Basin Plan contains water quality objectives and beneficial uses for water bodies in the Santa Ana Region. The Basin Plan also incorporates by reference all State Board water quality control plans and policies including the 1990 Water Quality Control Plan for Ocean Waters of California (Ocean Plan) and the 1974 Water Quality Control Policy for Enclosed Bays and Estuaries of California (Enclosed Bays and Estuaries Plan).

38. The requirements contained in this order are necessary to implement the plans and policies described in Finding 36, above. These plans and policies contain numeric and narrative water quality standards for the water bodies in this Region. This order does not contain numeric effluent limitations for any constituents because the impact of the storm water discharges on the water quality of the receiving waters has not yet been fully determined. Continuation of water quality/biota monitoring and analysis of the data are essential to make that determination.

39. The permittees may petition the Regional Board to issue a separate NPDES permit to any discharger of non-storm water into storm drain systems that they own or operate.

40. The permittees have developed a Storm Water Implementation Agreement between the County, its cities and the Orange County Flood Control District as required under Order No. 90-71.

41. The storm water regulations require public participation in the storm water management program development and implementation. As such the permittees are required to solicit and consider all comments received from the public and submit copies of the comments to the Executive Officer of the Regional Board. In considering the public comments, the permittees may modify reports, plans, or schedules prior to submittal to the Executive Officer.

42. In accordance with California Water Code Section 13389, the issuance of waste discharge requirements for this discharge is exempt from those provisions of the California Environmental Quality Act contained in Chapter 3 (commencing with Section 21100), Division 13 of the Public Resources Code.

43. The Regional Board has considered anti-degradation requirements, pursuant to 40 CFR 131.12 and State Board Resolution 68-16, for this discharge. The Regional Board finds that the storm water discharges are consistent with the federal and state anti-degradation requirements and a complete anti-degradation analysis is not necessary.

VOL 22
0591
R0065826

VOL 22

44. The Regional Board has notified the permittees and interested parties of its intent to issue waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

45. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

IT IS HEREBY ORDERED that the permittees, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and regulations and guidelines adopted thereunder, shall comply with the following:

I. RESPONSIBILITIES OF PRINCIPAL PERMITTEE

The principal permittee shall be responsible for the overall program management and shall:

1. Conduct chemical and biological water quality monitoring of the storm drain system outfalls as agreed upon by the Executive Officer of the Regional Board.

2. Develop criteria for inspections of the municipal separate storm drain systems.

3. Conduct inspections of the storm drain systems within its jurisdiction.

4. Implement management programs (within its jurisdiction), monitoring programs, and related plans as required by this order.

5. Enact and revise policies/ordinances necessary to establish legal authority as required by the Federal Storm Water Regulations.

6. Respond and/arrange for responding to emergency situations such as accidental spills, leaks, illegal discharges/illicit connections, etc. to prevent or reduce the discharge of pollutants to storm drain systems and waters of the U.S.

7. Prepare and submit to the Executive Officer of the Regional Board unified reports, plans, and programs as required by this order.

The activities of the principal permittee should include, but not be limited to, the following:

8. Coordinate permit activities and participate in any subcommittees formed as necessary, to coordinate compliance activities with this order.

0592

9. Provide technical and administrative support and inform the co-permittees of the progress of other pertinent municipal programs, pilot projects, research studies, etc.

10. Coordinate the implementation of areawide storm water quality management activities such as public education, pollution prevention, household hazardous waste collection, etc.

11. Develop and implement mechanisms, performance standards, etc., to promote uniform and consistent implementation of BMPs among the permittees.

12. Pursue enforcement actions as necessary within its jurisdiction to ensure compliance with storm water management programs, ordinances and implementation plans including physical elimination of undocumented connections and illicit discharges.

13. In conjunction with the other permittees, implement the BMPs listed in the approved DAMP.

14. Monitor the implementation of the plans and programs required by this order and determine their effectiveness in protecting beneficial uses.

15. Coordinate all the activities with the Regional Board including the submittal of all reports, plans, and programs as required under this order.

16. Obtain public input for any proposed management and implementation plans where applicable.

17. Cooperate in watershed management programs and regional and/or statewide monitoring programs.

II. RESPONSIBILITIES OF THE CO-PERMITTEES

The co-permittees shall be responsible for the management of storm drain systems within their jurisdictions and shall:

1. Implement management programs, monitoring programs, implementation plans and all BMPs outlined in the DAMP within each respective jurisdiction as required by Order No. 96-31.

2. Adopt the Orange County Water Quality Ordinance or the equivalent legislation necessary to establish and maintain adequate legal authority as required by the Federal Storm Water Regulations.

VOL 22
05993
R0065828

VOL 22

3. Conduct storm drain system inspections in accordance with the criteria developed by the principal permittee.

The co-permittees' activities should include , but not be limited to, the following:

4. Participate in committees or subcommittees formed by the principal permittee to address storm water related issues to comply with this order.

5. Review, approve, implement, and comment on all plans, strategies, management programs, monitoring programs, as developed by the principal permittee or any subcommittee to comply with this order.

6. Pursue enforcement actions as necessary to ensure compliance with the storm water management programs, ordinances and the implementation plans including physical elimination of undocumented connections and illicit discharges.

7. Conduct and coordinate with the principal permittee any surveys and characterizations needed to identify the pollutant sources and drainage areas.

8. Submit storm drain system maps with periodic revisions as necessary.

9. Respond to emergency situations such as accidental spills, leaks, illegal discharges/illicit connections, etc. to prevent or reduce the discharge of pollutants to storm drain systems and waters of the U.S.

10. Prepare and submit all reports to the principal permittee in a timely manner.

III. DISCHARGE LIMITATIONS

1. The permittees shall prohibit illicit/illegal discharges from entering into the municipal separate storm sewer systems (municipal storm drain systems) and require controls to reduce the discharge of pollutants to the maximum extent practicable.

2. The discharge of storm water from permittees' municipal storm drain systems to waters of the United States containing pollutants which have not been reduced to the maximum extent practicable is prohibited.

3. The following discharges need not be prohibited by the permittees unless identified by the permittees as a source of pollutants to the receiving waters.

   a. discharges composed entirely of storm water,

0594

b. covered by NPDES permits or written clearances issued by the Regional or State Board
c. from potable water line flushing and other potable water sources,
d. fire hydrant testing and flushing,
e. air conditioning condensation,
f. landscape irrigation, lawn garden watering and other irrigation waters,
g. passive foundation drains,
h. passive footing drains,
i. water from crawl space pumps,
j. dechlorinated swimming pool discharges,
k. non-commercial vehicle washing,
l. diverted stream flows,
m. rising ground waters and natural springs,
n. ground water infiltration as defined in 40 CFR 35.2005 (20) and uncontaminated pumped groundwater,
o. flows from riparian habitats and wetlands,
p. street wash water and run-off from fire fighting (program descriptions shall address discharges or flows from fire fighting only where such discharges are identified as significant sources of pollutants to waters of the United States),
q. waters not otherwise containing wastes as defined in California Water Code Section 13050 (d), and
r. other types of discharges identified and recommended by the permittees and approved by the Regional Board.

For purposes of this order, a discharge may include storm water and other types of discharges as indicated above.

4. If it is determined by the permittees that any of the preceding discharges cause or contribute to violations of water quality standards or are significant contributors of pollutants to waters of the U.S., the permittees shall prohibit these discharges from entering the storm drain system.

5. Non-storm water discharges from public agency activities into waters of the U.S. are prohibited unless the non-storm water discharges are permitted by an NPDES permit or are included in Item 3., above. If permitting or immediate elimination of the non-storm water discharges is impractical, the permittees shall include in the Environmental Performance Report, required under Section V., Provision 18., of this order, a proposed plan to eliminate the non-storm water discharges in a timely manner.

6. The permittees shall reduce the discharge of pollutants to the storm water conveyance systems to the maximum extent practicable.

VOL 22
05995
R0065830

VOL 22

IV. RECEIVING WATER LIMITATIONS

1. Receiving water limitations have been established based on beneficial uses, water quality objectives, and water quality standards contained in the Basin Plan, and amendments thereto, and on ambient water quality. The discharge of storm water, or non-storm water, from a municipal storm sewer system for which the permittees are responsible under the terms of this permit shall not cause or contribute to a continuing or recurring violation of any applicable receiving water limitations adopted the Regional Board or the State Water Resources Control Board. The permittees will not be in violation of this provision so long as they are in compliance with the requirements set forth in 1.a.

   a. If the Executive Officer determines that a continuing or recurring exceedance of a receiving water limitation has been caused by discharges from the municipal storm sewer system, the following steps shall be taken:

      i. The Executive Officer will evaluate the adequacy of the permittees' implementation of the DAMP based on the permittees' submitted reports and other relevant information. The Executive Officer will determine if implementation of the DAMP has a reasonable likelihood of preventing future exceedances of receiving water limitations. If the Executive Officer makes this determination, the permittees are required to continue implementing the DAMP.

      ii. If the Executive Officer determines that implementation of the DAMP will not have a reasonable likelihood of preventing future exceedances of receiving water limitations, the permittees shall, upon notice from the Executive Officer, do the following:

         A. The Executive Officer may require the permittees to submit a report that includes an evaluation of the relative contribution of the storm water discharges to the exceedance of the receiving water limitation. The report shall address the persistence and the causes of the exceedance, and the technical and economic feasibility of control actions by the permittees to reduce or eliminate the exceedance.

         B. The Executive Officer may require the permittees to submit a report reviewing the DAMP to determine whether it should be revised so that there will be a reasonable likelihood of preventing future exceedances of receiving water limitations, or whether revisions to achieve compliance with receiving water limitations are technically or economically infeasible. If the report recommends revision of the DAMP, the report shall include a work plan to

0596

revise the plan so that it will have a reasonable likelihood of preventing future exceedances of receiving water limitations. If the report concludes that no revisions are necessary to achieve compliance with receiving water limitations, the report shall explain how implementation of the DAMP will achieve compliance. If the report determines that revisions to achieve compliance with receiving water limitations are technically or economically infeasible, the permittees shall fully document this determination and shall include recommendations for actions to achieve compliance, including, for example, commencement of a total maximum daily load report or revision of the Basin Plan, and identification of funding sources for such actions.

C. The permittees shall implement the work plan and the revised DAMP as approved by the Executive Officer.

2. The Executive Officer shall review and approve or disapprove the reports required under Receiving Water Limitation 1. The reports may be submitted as part of the next Annual Report, or at some other time designated by the Executive Officer. So long as the permittees have complied with the procedures set forth in Receiving Water Limitation 1, they do not have to repeat the procedure for continuing exceedances of the same receiving water limitations. As appropriate, any determinations under this part or revisions to the DAMP may be considered by the Regional Board in a public meeting.

V. PROVISIONS

GENERAL

1. Permittees shall demonstrate compliance with all the requirements in this order and specifically with Section III. Discharge Limitations and Section IV. Receiving Water Limitations, through timely implementation of their approved Drainage Area Management Plan (DAMP) and any approved modifications, revisions, or amendments developed pursuant to this order. The approved DAMP, as included in the Report of Waste Discharge, including any approved amendments thereto, is hereby made an enforceable component of this order.

2. The permittees shall implement all elements of the approved DAMP. Where the dates are different than those of the order, the dates in the order shall prevail. Any proposed revisions to the DAMP shall be submitted with the Annual Report to the Executive Officer of the Regional Board for review and approval. All approved revisions to the DAMP shall be implemented in a timely manner.

VOL 22
0597

3. The permittees shall comply with Monitoring and Reporting Program No. 96-31 which is hereby made a part of this order and any revisions thereto. The Executive Officer is authorized to revise the Monitoring and Reporting Program and also to allow the permittees to participate in regional, statewide, national or other monitoring programs in lieu of Monitoring and Reporting Program No. 96-31.

4. Upon approval by the Executive Officer of the Regional Board, all plans, reports and subsequent amendments as required by this order shall be implemented and shall become an enforceable part of this order. Prior to approval by the Executive Officer, these plans, reports and amendments shall not be considered as an enforceable part of this order.

5. The permittees shall report to the Executive Officer of the Regional Board:

   a. Any enforcement actions and discharges of storm or wastewaters, known to the permittees, which may have an impact on human health or the environment,

   b. Any suspected or reported activities on federal, state, or other entity's land or facilities, where the permittees do not have any jurisdiction, and where the suspected or reported activities may be contributing pollutants to waters of the U.S.

6. The permittees shall not issue any grading permit for construction activities which will disturb five acres or more (or less than five acres, if it is part of a larger common plan of development or sale which is five acres or more) until proof of coverage with the State's General Construction Activity Storm Water Permit is verified. The proof of coverage may include a letter from the Regional Board office, a copy of the Notice of Intent, Waste Discharger Identification number, etc.

7. The permittees shall identify all illegal and or illicit connections by February 1, 1997 and submit a report of the findings by February 28, 1997 including a schedule for elimination of any identified illicit connection and for periodic inspections of the storm drain facilities.

8. Permit application and special NPDES program requirements contained in 40 CFR 122.21, 122.41 and 122.42 (c) are incorporated into this order by reference.

IMPLEMENTATION AGREEMENT

13. No later than May 31, 1996, the permittees shall submit to the Executive Officer of the Regional Board a copy of the existing Storm Water Program Implementation Agreement with authorized signatures of each of the permittees. Any further revisions to the implementation agreement shall be forwarded to the Executive Officer of the Regional Board within 30 days of approval by the permittees.

VOL 22
0598
R0065833

LEGAL AUTHORITY

14. The permittees shall adopt the proposed Water Quality Ordinance, or its equivalent. The permittees shall review their existing grading and erosion control ordinances and determine the need for any revision. Upon adoption of the ordinances, but no later than July 31, 1997 each permittee shall certify to the Regional Board that it has adequate legal authority to control the discharges of pollutants into the municipal storm drain system and that it has satisfied the requirements of 40 CFR Section 122.26(d)(2)(i)(A-F). The certification may be submitted jointly by all permittees.

ENFORCEMENT/COMPLIANCE STRATEGY

15. The Permittees shall implement the Enforcement Consistency Guide, dated 8/15/94, or an equivalent enforcement strategy, in order to enforce the Water Quality Ordinance. Upon implementation, but no later than July 31, 1997, each permittee shall certify to the Regional Board that the guide or similar policies are in place for their enforcement staff. Before implementation, this guide and its equivalent must include the following:

    a. A mechanism to determine compliance of industrial facilities, commercial facilities, and construction sites with storm water ordinances and concerns;

    b. A program to monitor and control the pollutants in storm water discharges to the municipal system from industrial facilities that the permittees determines are contributing to a substantial pollutant loading to the municipal storm drain system. The program shall identify priorities and procedures for inspections and establishing and implementing control measures.

16. The permittees shall develop a training program and offer it to the staff of existing industrial and construction inspection programs, to raise concerns with regard to storm water requirements.

17. The permittees will continue to provide notification to the Regional Board regarding storm water related information gathered during site inspections of industrial and construction sites regulated by the Statewide General Storm Water Permits.

PUBLIC EDUCATION AND OUTREACH

18. The permittees will continue to implement the public education efforts already underway and shall implement all of the proposed efforts contained in the permit application. Any proposed changes shall be reported in the Annual Report.

VOL 22
05999
R0065834

19. When feasible, the permittees shall participate in joint outreach with other programs including, but not limited to, other municipal storm water programs to ensure that a consistent message on storm water pollution prevention is brought to the public.

20. The permittees shall develop public education materials to encourage the public to report illegal dumping from residential, industrial, construction and commercial sites into public streets, storm drains and other water bodies.

21. The permittees shall develop BMP guidance for the control of those potentially polluting activities not otherwise regulated by any agency.

MUNICIPAL FACILITIES

22. The permittees shall prepare an Environmental Performance Report, as stated in the amended DAMP, to address public agency facilities and activities not currently required to obtain coverage under the State's general storm water permits. This report may include a pollution prevention strategy to ensure that the public agency facilities and/or activities that are currently not required to obtain coverage under the State's general storm water permits are not sources of pollutants into the waters of the U.S. A report shall be submitted to the Executive Officer of the Regional Board by July 31, 1997, identifying the extent of the investigation and all findings of the Environmental Performance Report as it pertains to storm water quality. Thereafter, the permittees shall include in the annual report for each year the actions taken by the permittees to eliminate discharges of pollutants to waters of the U.S., identified by the permittees, at public agency facilities.

MUNICIPAL CONSTRUCTION PROJECTS/ACTIVITIES

23. This order authorizes the discharge of storm water run-off from construction projects that may result in land disturbance of five (5) acres or more (or less than five acres, if it is part of a larger common plan of development or sale which is five acres or more) that are under ownership and/or direct responsibility of any of the permittees.

24. Prior to commencement of construction activities, the permittees shall notify the Executive Officer of the Regional Board of the proposed construction project. Upon completion of the construction project, the Executive Officer shall be notified of the completion of the project.

25. The permittees shall develop and implement a storm water pollution prevention plan (SWPPP) and a monitoring program that is specific for the construction project prior to the commencement of any of the construction activities. The SWPPP shall be kept at the construction site and released to the public and/or Regional Board staff upon request.

26. The SWPPP and the monitoring program for the construction projects shall be consistent with the requirements of the latest version of the State's General Construction Activity Storm Water Permit.

VOL 22
0600
R0065835

27. The permittees shall give advance notice to the Executive Officer of the Regional Board of any planned changes in the construction activity which may result in non-compliance with the latest version of the State's General Construction Activity Storm Water Permit.

28. All other terms and conditions of the latest version of the State's General Construction Activity Storm Water Permit shall be applicable.

NEW DEVELOPMENT (INCLUDING RE-DEVELOPMENT)

29. Within 90 days of the issuance of this order, the permittees shall begin implementation of the new development BMPs (DAMP, Appendix G, dated September 1993) and BMPs for public works construction (DAMP, Appendix H) that were developed under Order 90-71. Each permittee shall certify to the Regional Board by November 15, 1996, that these guidelines or the equivalent are being implemented and enforced.

30. Within 120 days of the issuance of this order, the permittees shall review their planning procedures and CEQA document preparation processes to insure that storm water-related issues are properly considered. If necessary, these processes shall be revised to include storm water requirements for evaluation of appropriate mitigation measures.

31. The permittees shall, through conditions of approval, insure proper maintenance and operation of any permanent flood control structures installed in new developments. The parties responsible for the maintenance and operation of the facilities shall be identified.

FISCAL RESOURCES

32. The permittees shall prepare and submit a unified fiscal analyses to the Executive Officer of the Regional Board. The fiscal analysis shall be submitted with the Annual Report document no later than November 15th of each year and shall, at a minimum, include the following:

    a. Each permittee's expenditures for the previous fiscal year,
    b. Each permittee's budget for the current fiscal year,
    c. A description of the source of funds, and
    d. Each permittee's estimated budget for the next fiscal year.

PERMIT EXPIRATION AND RENEWAL

33. This order expires on March 8, 2001 and the permittees must file a Report of Waste Discharge (permit application) no later than 180 days in advance of such expiration date as application for issuance of new waste discharge requirements. The Report of Waste Discharge shall, at a minimum, include the following:

    a. Any revisions to the Drainage Area Management Plan including, but not limited to, all the activities the permittees propose to undertake during the next permit

VOL 22
0601

term, goals and objectives of such activities, an evaluation of the need for additional source control and/or structural BMPs, any proposed pilot studies, etc.:

b. Changes in land use and/or population including map updates; and

c. Any significant changes to the storm drain systems, outfalls, detention or retention basins or dams, and other controls including map updates of the storm drain systems.

d. To incorporate new or revised program elements and compliance schedule(s) necessary to comply with Section IV of this order.

34. This Order may be modified, revoked or reissued prior to its expiration date for the following reasons:

a. To address significant changes in conditions identified in the technical reports required by the Regional Board which were unknown at the time of the issuance of this order;

b. To incorporate applicable requirements of statewide water quality control plans adopted by the State Water Resources Control Board or any amendments to the Basin Plan approved by the Regional Board, the State Board, and, if necessary, by the Office of Administrative Law; or

c. To comply with any applicable requirements, guidelines, or regulations issued or approved under the Clean Water Act, if the requirements, guidelines, or regulations contain different conditions or additional requirements than those included in this order.

35. This order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit pursuant to Section 402 (p) of the Clean Water Act, or amendments thereto, and shall become effective ten days after the date of its adoption provided the Regional Administrator of the U. S. EPA has no objections. If the Regional Administrator objects to its issuance, the permit shall not become effective until such objection is withdrawn.

36. Order No. 90-71 is hereby rescinded.

I, Gerard Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on March 8, 1996.

Gerard J. Thibeault

Monitoring and Reporting Program No. 96-31
NPDES No. CAS618030

for
the County of Orange, Orange County Flood Control District
and
Incorporated Cities of Orange County Within the Santa Ana Region
Areawide Urban Storm Water Runoff

I. GENERAL

1. Revisions of the monitoring and reporting program are appropriate to ensure that the permittees are in compliance with requirements and provisions contained in this order. Revisions may be made under the direction of the Executive Officer at any time during the term, and my include a reduction or increase in the number of parameters to be monitored, the frequency of monitoring, or the number and size of samples collected.

2. The Executive Officer is authorized to allow the permittees to participate in statewide, national, or other monitoring programs in lieu of this monitoring program.

3. All sample collection, handling, storage, and analysis shall be in accordance with 40 CFR Part 136 or other methods approved by the Executive Officer.

4. The permittees are authorized to complement their monitoring data with other monitoring sources provided the monitoring conditions and sources are similar to those in the Santa Ana Watershed.

5. The permittees shall implement the Orange County Water Quality Monitoring Program (submitted as part of the permit application) until development and implementation of other acceptable monitoring programs.

II. OBJECTIVES

The overall goal of this monitoring program is to develop and support an effective watershed management program. The following are the major objectives:

1. To develop and support an effective municipal non-point source control program.

2. To define water quality status, trends, and pollutants of concern associated with municipal storm water discharges.

3. To characterize pollutants associated with municipal storm water discharges and to assess the influence of urban land uses on water quality and the beneficial uses of receiving waters.

4. To identify significant water quality problems related to urban storm water discharges.

VOL 22
0608
R0065843

5. To identify other sources of pollutants in storm water run-off to the maximum extent possible (e.g., atmospheric deposition, contaminated sediments, other non-point sources, etc.).

6. To identify and prohibit illicit discharges.

7. To identify those waters, which without additional action to control pollution from urban storm water discharges cannot reasonably be expected to attain or maintain applicable water quality standards required to sustain the beneficial uses in the Basin Plan.

8. To evaluate the effectiveness of existing municipal storm water quality management programs, including an estimate of pollutant reductions achieved by the structural and nonstructural BMPs implemented by the permittees.

9. To evaluate costs and benefits of proposed municipal storm water quality control programs to the stakeholders including the public.

The Regional Board recognizes that these objectives may not be attainable during this permit period and authorizes the Executive Officer to evaluate and to determine adequate progress toward meeting each objective.

III. MONITORING PROGRAM REQUIREMENTS

The permittees shall develop and submit for approval of the Executive Officer an integrated watershed monitoring program geared towards achieving the above stated goals. This program may be developed in cooperation with the permittees from the San Bernardino and Riverside counties. The Executive Officer or his/her designated representative(s) shall facilitate the coordination meetings or subcommittees formed to achieve this goal. The development and implementation of the monitoring program shall be in accordance with the time schedules prescribed by the Executive Officer. At a minimum, the program shall include the following:

1. Uniform guidelines for quality control, quality assurance, data collection and data analysis.

2. A mechanism for the collection, analysis and interpretation of existing data from local, regional or national monitoring programs. These data sources may be utilized to characterize different storm water sources; to determine pollutant generation, transport and fate; to develop a relationship between land use, development size, storm size and the event mean concentration of pollutants; to determine spatial and temporal variances in storm water quality and seasonal and other bias in the collected data; and to identify any unique features of the Santa Ana Watershed. The permittees are encouraged to use data from similar studies, if available.

3. A description of the monitoring program including:

   a. The number of monitoring stations;

VOL 22
0609
R0065844

b. Monitoring locations within flood control channels, bays and estuaries, coastal areas, major outfalls, and other receiving waters;

c. Environmental indicators (e.g., ecosystem, biological, habitat, chemical, sediment, stream health, etc.) chosen for monitoring;

d. Parameters selected for field screening and for laboratory work; and

e. Total number of samples to be collected from each station, frequency of sampling during wet and dry weather, short duration or long duration storm events, type of samples (grab, 24-hour composite, etc.), and the type of sampling equipment.

4. A mechanism for analyzing the collected data and interpreting the results including an evaluation of the effectiveness of the management practices, and need for any refinement of the management practices.

5. A description of the responsibilities of all the participants in this program including cost sharing.

IV. REPORTING

1. All progress reports and proposed strategies and plans required by this order shall be signed by the principal permittee and copies shall be submitted to the Executive Officer of the Regional Board under penalty of perjury.

2. The permittees shall submit an **ANNUAL PROGRESS REPORT** to the Executive Officer of the Regional Board and to the Regional Administrator of the U.S. EPA, Region 9, no later than November 15th, of each year. This progress report may be submitted in a mutually agreeable electronic format. At a minimum, annual progress report shall include the following:

a. A review of the status of program implementation and compliance (or non-compliance) with the schedules contained in this order;

b. An assessment of the effectiveness of control measures established under the illicit discharge elimination program and the Drainage Area Management Plan. The effectiveness may be measured in terms of how successful the program has been in eliminating illicit/illegal discharges and reducing pollutant loads in storm water discharges;

c. An assessment of any storm water management program modifications made to comply with Clean Water Act requirements to reduce the discharge of pollutants to the maximum extent practicable;

d. A summary and analysis of monitoring results from the previous year and any changes to the monitoring program for the following year;

VOL 22
0610

e. A fiscal analysis progress report as described in Section V., Provision, 25., of this order;

f. A draft workplan which describes the proposed implementation of the DAMP for next fiscal year. The workplan shall include clearly defined tasks, responsibilities, and schedules for implementation of the storm water program and each permittee's actions for the next fiscal year; and

g. Major changes in any previously submitted plan/policies.

3. The permittees shall be responsible for the submittal of all required information/materials needed to comply with this order in a timely manner to the principal permittee. All such submittals shall be signed by a duly authorized representative of the permittee under penalty of perjury.

V. REPORTING SCHEDULE

All reports required by this order shall be submitted to the Executive Officer of the Regional Board in accordance with the following schedule:

ITEM	DUE DATE
Report on Illicit/Illegal Discharges & Storm Water Program Implementation Agreement	February 28, 1997
Legal Authority & Enforcement Strategy Certification	July 31, 1997
Environmental Performance Report	July 31, 1997
New Development BMP Certification	November 15, 1996
Proposed Monitoring Program	July 31, 1997
Annual Report/Fiscal Analysis	November 15th of each year

ORDER NO. 96-31
NPDES No. CAS618030

Waste Discharge Requirements
for
the County of Orange, Orange County Flood Control District
and
The Incorporated Cities of Orange County Within the Santa Ana Region
Areawide Urban Storm Water Run-off
Orange County

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Board), finds that:

1. On December 30, 1994, the County of Orange and the Orange County Flood Control District (OCFCD), in cooperation with the cities of Anaheim, Brea, Buena Park, Costa Mesa, Cypress, Fountain Valley, Fullerton, Garden Grove, Huntington Beach, Irvine, La Habra, La Palma, Lake Forest, Los Alamitos, Newport Beach, Orange, Placentia, Santa Ana, Seal Beach, Stanton, Tustin, Villa Park, Westminster, and Yorba Linda (hereinafter collectively referred to as permittees), submitted National Pollutant Discharge Elimination System (NPDES) Application No. CA 8000180 and a Report of Waste Discharge for reissuance of their areawide storm water NPDES permit.

2. Section 402(p) of the federal Clean Water Act (CWA), as amended by the Water Quality Act of 1987, requires NPDES permits for storm water discharges from separate municipal storm drain systems, storm water discharges associated with industrial activity (including construction activities), and designated storm water discharges which are considered significant contributors of pollutants to waters of the United States (U.S.). On November 16, 1990, the United States Environmental Protection Agency (hereinafter US EPA) published regulations (40 CFR Parts 122, 123 and 124) which describe permit application requirements for storm water discharges pursuant to Section 402(p) of the CWA. Prior to EPA's promulgation of the final storm water regulations, the three counties (Orange, Riverside, and San Bernardino) and the incorporated cities within the jurisdiction of the Santa Ana Region requested areawide NPDES permits for urban storm water run-off.

3. On July 13, 1990, the Regional Board adopted Order No. 90-71 for urban storm water run-off from urban areas in Orange County within the Santa Ana Region. The County of Orange was named as the principal permittee and the Orange County Flood Control District (OCFCD) and the incorporated cities were named as the co-permittees. In order to more effectively carry out the requirements of this order, the permittees have agreed that the County of Orange will continue as principal permittee and the OCFCD and the incorporated cities will continue as co-permittees. Order 90-71 expired on July 1, 1995.

FACT SHEET

March 8, 1996

ITEM: 12

SUBJECT: Waste Discharge Requirements for the County of Orange, Orange County Flood Control District, and the Incorporated Cities of Orange County within the Santa Ana Region, Storm Water Runoff Management Program, Orange County, Order No. 96-31 (NPDES No. CAS 618030)

PROJECT

The attached pages contain information concerning an application for renewal of waste discharge requirements and a National Pollutant Discharge Elimination System (NPDES) permit, which prescribes waste discharge requirements for urban storm water runoff from the cities and the unincorporated areas in Orange County within the jurisdiction of the Santa Ana Regional Board. On December 30, 1994, the County of Orange and the Orange County Flood Control District (OCFCD), in cooperation with the cities of Anaheim, Brea, Buena Park, Costa Mesa, Cypress, Fountain Valley, Fullerton, Garden Grove, Huntington Beach, Irvine, La Habra, La Palma, Lake Forest, Los Alamitos, Newport Beach, Orange, Placentia, Santa Ana, Seal Beach, Stanton, Tustin, Villa Park, Westminster, and Yorba Linda (hereinafter collectively referred to as permittees), submitted National Pollutant Discharge Elimination System (NPDES) Application No. CAS 618030 (Report of Waste Discharge) for reissuance of their areawide storm water NPDES permit. The permit application was submitted in accordance with the previous NPDES permit (Order No. 90-71, NPDES No. CA 8000180) which expired on July 1, 1995. Additionally, the permit application follows guidance provided by staff of the State Water Resources Control Board (State Board) and the Regional Water Quality Control Boards (Regional Boards).

CLEAN WATER ACT REQUIREMENTS

The 1987 amendments to the Clean Water act (CWA) required municipal separate storm drain systems and industrial facilities to obtain NPDES permits for storm water runoff from their facilities. On November 16, 1990, the United States Environmental Protection Agency (EPA) promulgated the final storm water regulations. Prior to EPA's promulgation of the final storm water regulations, the counties of Orange, Riverside and San Bernardino requested for areawide NPDES permits for storm water runoff. On July 13, 1990, the Regional Board issued Order No. 90-71 to the permittees. This areawide NPDES permit is being considered for renewal by the Regional Board in accordance with Section 402 (p) of the CWA and all requirements applicable to an NPDES permit issued under the issuing authority's discretionary authority. The storm water regulations are contained in 40 CFR Parts 122, 123 and 124.

0614

R0065849

VOL 22 0615

PROJECT AREA

The permitted area is delineated by the Los Angeles County-Orange County Boundary line on the northwest, the San Bernardino-Orange County boundary line on the north and northeast, the Riverside County-Orange County boundary line on the east, the Santa Ana Regional Board-San Diego Regional Board boundary line on the southeast, and the Pacific Ocean on the southwest (see Attachment A of the order). The permittees serve a population of approximately 2.6 million, occupying an area of approximately 511 square miles (including both unincorporated areas and the limits of 31 cities). The permittees have jurisdiction over and /or maintenance responsibility for storm water conveyance systems within Orange County. The County's systems include an estimated 400 miles of storm drain systems. A major portion of the urbanized areas of Orange County drains into water bodies within this Regional Board's jurisdiction. Storm water discharges from urbanized areas consist mainly of surface runoff from residential, commercial, and industrial developments. In addition, there are storm water discharges from agricultural land uses, including farming and animal operations. However, the CWA specifically excludes agricultural discharges from regulation under this program. Other areas of the County not addressed or which are excluded by the storm water regulations and areas not under the jurisdiction of the permittees are excluded from the area requested for coverage under this permit application. This includes the following areas and activities:

- Federal lands and state properties, including, but not limited to, military bases, national forests, hospitals, schools, colleges, universities, and highways;
- Native American tribal lands; and
- Utilities and special district properties.

WATERSHED MANAGEMENT

To efficiently manage the water resources of the Region, it is critical to have a holistic approach. The entire storm drain system in Orange County is not controlled by a single entity; the County of Orange, the OCFCD, several cities, Caltrans, U.S. Army Corps of Engineers and a number of other entities own, operate and/or manage the storm drain systems. In addition to the cities, the County and the OCFCD, there are a number of other significant contributors of storm water runoff to these storm drain systems. These include: large institutions such as the State University facilities, schools, hospitals, etc.; federal facilities such as Department of Defense facilities; State agencies such as Caltrans, water and wastewater management agencies such as Orange County Water District, Metropolitan Water District etc.; the National Forest Service; state parks; and entertainment centers such as Disneyland. The quality and quantity of storm water runoff into and out of Orange County also depends upon runoff from San Bernardino and Riverside County areas which are tributary to Orange County. Some of the runoff from Orange county enters systems controlled by other entities, such as the Los Angeles County Flood Control District, which is under the Los Angeles Regional Board's jurisdiction.

Some of these facilities such as U.S. Marine Corps, Tustin and El Toro Air Stations, Disneyland and Caltrans are already under individual permits for storm water runoff. The Los Angeles and San Diego Regional Boards have also issued areawide storm water permits for areas within their jurisdiction.

Cooperation and coordination among all the stakeholders are essential for efficient and economical management of the watershed. Regional Board staff will facilitate coordination of monitoring and management programs among the various stakeholders.

EXISTING PROGRAMS AND FUTURE DIRECTION

As required under Order No. 90-71, the permittees developed a Drainage Area Management Plan (DAMP) which was approved by the Executive Officer of the Regional Board on April 29, 1994. The DAMP includes a number of best management practices and a very extensive public education program. The monitoring program includes 89 monitoring stations within streams and flood control channels and 21 stations within the bays, estuaries and the ocean. The findings and conclusions from these monitoring stations and monitoring programs of other municipal permittees (Riverside and San Bernardino Counties) may be used to identify problem areas and to evaluate the effectiveness of the DAMPs. The future direction of some of these program elements will depend upon the results of the ongoing studies and holistic approach to watershed management.

Other elements of the storm water management program include identification and elimination of illegal/illicit discharges and establishment of adequate legal authority to control pollutants in storm water discharges. Most of the cities and the County of Orange have completed a survey of their storm drain systems to identify illegal/illicit connections and have adopted appropriate ordinances to establish legal authority. The remaining permittees are in the process of complying with these requirements.

It appears that coordination among the municipal permittees in Orange, Riverside and San Bernardino Counties and a watershed approach to managing storm water are the essential factors in mapping the future course of the storm water program.

BENEFICIAL USES

Storm water flows which are discharged to municipal storm drain systems in Orange County are tributary to various water bodies (inland surface streams, bays and tidal prisms, ocean waters, and lakes and reservoirs) of the state. The beneficial uses of these water bodies include municipal and domestic supply, agricultural supply, industrial service supply, groundwater recharge, navigation, hydropower generation, water contact recreation, non-contact water recreation, commercial and sportfishing, warm freshwater habitat, cold freshwater habitat, preservation of biological habitats of special significance, wildlife habitat, preservation of rare, threatened or endangered species, marine habitat, shellfish harvesting, spawning, reproduction and development of aquatic habitats, and estuarine habitat. The ultimate goal of this storm water management program is to protect the beneficial uses of the receiving waters.

VOL 22
0616
R0065851

VOL 22 0617

ANTIDEGRADATION ANALYSIS

The Regional Board has considered whether a complete antidegradation analysis, pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16, is required for these storm water discharges. The Regional Board finds that the pollutant loading rates to the receiving waters will be reduced with the implementation of the requirements in this order. As a result, the quality of storm water discharges and receiving waters will be improved, thereby protecting the beneficial uses of waters of the United States. This is consistent with the federal and state antidegradation requirements and a complete antidegradation analysis is not necessary.

PUBLIC WORKSHOP

The Regional Board recognizes the significance of Orange County's Storm Water/Urban Runoff Management Program and will conduct, participate, and/or assist with any workshop during the term of this permit to promote and discuss the progress of the storm water management program. The details of the workshop will be published in local newspapers and mailed to interested parties. Persons wishing to be included in the mailing list for any of the items related to this permit may register their name, mailing address and phone number with the Regional Board office at the address given below.

PUBLIC HEARING

The Regional Board will hold a public hearing regarding the proposed waste discharge requirements. The public hearing is scheduled to be held on Friday, March 8, 1996 at 9:30 a.m. at the Newport Beach City Council Chambers, 3300 Newport Boulevard, Newport Beach, CA. Further information regarding the conduct and nature of the public hearing concerning these waste discharge requirements may be obtained by writing or visiting the Santa Ana Regional Board office, 3737 Main Street, Suite 500, Riverside, CA 92501-3339.

INFORMATION AND COPYING

Persons wishing further information may write to the above address or call Laurie Taul at (909) 782-4906. Copies of the application, proposed waste discharge requirements, and other documents (other than those which the Executive Officer maintains as confidential) are available at the Regional Board office for inspection and copying by appointment scheduled between the hours of 10:00 a.m. and 4:00 p.m., Monday through Thursday (excluding holidays).

REGISTER OF INTERESTED PERSONS

Any person interested in a particular application or group for applications may leave his name, address and phone number as part of the file for an application. Copies of tentative waste discharge requirements will be mailed to all interested parties.

PERMIT NO. FLS000004
Major MS4

VOL 22

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IV

AUTHORIZATION TO DISCHARGE UNDER THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

In compliance with the provisions of the Clean Water Act, 33 U.S.C. 1251 et seq., as amended by the Water Quality Act of 1987, P.L. 100-4, the "Act",

Sarasota County - Municipal Separate Storm Sewer System Permittees:

Sarasota County
Engineering Department
Sarasota, Florida

Town of Longboat Key
Department of Public Works
Longboat Key, Florida

City of North Port
Roads and Drainage Department
North Port, Florida

City of Sarasota
Department of Public Works
Sarasota, Florida

City of Venice
Department of Public Works
Venice, Florida

Florida Department of Transportion
District One
Bartow, Florida

are authorized to discharge, in accordance with the approved Storm Water Management Program(s), effluent limitations, monitoring requirements, and other provisions as set forth in Parts I, II, III, IV, V, VI, VII, and VIII herein, from all portions of the

Municipal Separate Storm Sewer System owned or operated by any Permittee listed above,

to waters of the United States and all tributaries thereto.

This permit shall become effective on January 1, 1995.

This permit and the authorization to discharge under the National Pollutant Discharge Elimination System shall expire at midnight, on December 31, 1999.

Date Issued

VOL 22

PART I.

DISCHARGES AUTHORIZED UNDER THIS PERMIT

A. **Permit Area.** This permit covers all areas located within the political boundary of Sarasota County and the portion of the Town of Longboat Key within Manatee County served by municipal separate storm sewer systems owned or operated by the permittees identified in Part I.C.

B. **Authorized Discharges.** Except for discharges prohibited under Part I.D., this permit authorizes all existing or new storm water point source discharges to waters of the United States from those portions of the Municipal Separate Storm Sewer System (MS4) owned or operated by the permittees.

C. **Permittees.**

The following entities are permittees subject to the conditions of this permit:

- **Sarasota County**
- **Town of Longboat Key***
- **City of North Port**
- **City of Sarasota**
- **City of Venice**
- **Florida Department of Transportation, District One**

* *Permit coverage includes the entire Town of Longboat Key which is located in both Sarasota and Manatee Counties*

References to "permittee" in this permit includes each of the entities above.

1. Each permittee is individually responsible for:

   a. Compliance with permit conditions relating to discharges from portions of the MS4 where they are the operator;

   b. Storm water management program implementation on portions of the MS4 where they are the operator;

   c. Where permit conditions are established for specific portions of the MS4, the permittee need only comply with the permit conditions relating to those portions of the MS4 for which they are the operator; and

   d. A plan of action to assume responsibility for implementation of storm water management and monitoring programs on their portions of the MS4 should inter-jurisdictional agreements allocating responsibility between permittees be dissolved or in default. (See Part II.G.3., page 20 of this permit also.)

0624

R0065859

2. Each permittee is jointly responsible for:

   a. Submission of annual reporting requirements as specified in Part V.C. (ANNUAL REPORT), page 49;

   b. Collection of monitoring data as required by Part V.B., page 47, according to such agreements as may be established between permittees;

   c. Insuring implementation of system-wide management program elements, including any system-wide public education efforts.

3. Specific permittees are jointly liable for permit compliance on portions of the MS4:

   a. Where operational or storm water management program implementation authority over portions of the MS4 has been transferred from one permittee to another in accordance with legally binding interagency or inter-jurisdictional agreements, both the owner and operator are jointly responsible for permit compliance on those portions of the MS4, unless specific responsibility provisions have been otherwise outlined in said agreements.

D. Limitations on Coverage. Section 402(p)(3)(B)(ii) of the Clean Water Act specifically requires EPA to include within this permit an effective prohibition on non-storm water entering the MS4. The following discharges are not authorized by this permit:

1. *Non-storm Water:* discharges of non-storm water, except where such discharges are:

   a. in compliance with a separate NPDES permit (or the discharger has applied for such permit); or

   b. identified by and in compliance with Part II.A.7.a., page 9 of this permit.

2. *Spills*: discharges of material resulting from a spill, except where such discharges are:

   a. the result of an Act of God where reasonable and prudent measures have been taken to minimize the impact of the discharge; or

   b. an emergency discharge required to prevent imminent threat to human health or prevent severe property damage, provided reasonable and prudent measures have been taken to minimize the impact of the discharge.

VOL 22

0625

R0065860

G. **Storm Water Management Program Review and Modification.**

1. *Program Review:* Each permittee shall participate in an annual review of the current Storm Water Management Program (SWMP) in conjunction with preparation of the ANNUAL REPORT required under Part V.C. of the permit.

2. *Program Modification:* The permittee(s) may modify the SWMP during the life of the permit in accordance with the following procedures:

   a. Modifications adding (but not subtracting nor replacing) components, controls, or requirements to the approved SWMP may be made by the permittee(s) at any time. A description of the modification shall be included within the subsequent ANNUAL REPORT.

   b. Modifications replacing an ineffective or unfeasible BMP specifically identified in the SWMP with an alternate BMP may be made by the permittee(s) at any time. A description of the replacement BMP shall be included in the subsequent ANNUAL REPORT along with the following information:

      (1) an analysis of why the former BMP was ineffective or infeasible (including cost prohibitive);

      (2) expectati n the effectiveness of the replacement BMP; and

      (3) an analysis of why the replacement BMP is expected to achieve the goals of the BMP which was replaced.

   c. Modifications to adjust the schedule for maintenance activities or the frequency of inspections or monitoring identified in the SWMP may be made by the permittee(s) on an annual basis. The permittees must include in the subsequent ANNUAL REPORT a description of the schedule adjustment along with the following information:

      (1) an analysis of why the former schedule was ineffective or infeasible;

      (2) expectations on the effectiveness of the replacement schedule; and

      (3) an analysis, if applicable, of why the replacement schedule will ensure the optimization of equipment use.

VOL 22

0626

R0065861

d. Modifications subtracting components, controls, or requirements of the SWMP may not be made by the permittee(s) UNLESS it can be clearly demonstrated that with the elimination of this component, the SWMP will continue to achieve a reduction in pollutants to the MEP and shall not cause or contribute to violations of State water quality standards of the receiving stream. In the case where this type of modification is appropriate, the permittee(s) may make the required modification and shall include in the subsequent ANNUAL REPORT a description of the component which has been eliminated along with the following information:

(1) an analysis of why the component was ineffective or infeasible, and

(2) a detailed explanation of why, with the elimination of this component, the SWMP will continue to achieve a reduction in pollutants to the MEP and shall not cause or contribute to violations of State water quality standards of the receiving stream.

e. Modifications included within the ANNUAL REPORT shall be signed in accordance with Part VI.H. by all directly affected permittees, and shall include a certification that all affected permittees were given an opportunity to comment on proposed changes.

3. *Transfer of Ownership, Operational Authority, or Responsibility for Storm Water Management Program Implementation:* The permittee(s) shall implement the SWMP on all new areas added to their portion of the municipal separate storm sewer system (or for which they become responsible for implementation of storm water quality controls) as expeditiously as practicable. Implementation of the program in any new area shall consider the plans in the SWMP of the previous MS4 ownership.

Prior to land annexation, the permittee shall include a schedule for extending the SWMP to the annexed areas. At least 30 days prior to transfer of operational authority or responsibility for SWMP implementation, all parties shall prepare a schedule for transfer of responsibility for SWMP implementation on the affected portions of the MS4. This schedule shall be included in the ANNUAL REPORT.

VOL 22 0627

R0065862

PART C SCHEDULES FOR IMPLEMENTATION AND COMPLIANCE

The permittee(s) shall comply with the following schedules for Storm Water Management Program implementation and augmentation, and for permit compliance.

A. IMPLEMENTATION AND AUGMENTATION OF STORM WATER MANAGEMENT PROGRAMS

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
1. *Operation and Maintenance of Structural Controls and Storm Water Collection System*	Sarasota County City of Sarasota City of Venice City of North Port FDOT	Perform inspections and maintenance of structural controls. Maintain an internal record keeping system to track inspections and maintenance activities performed during the permit. Conduct an annual assessment of the effectiveness of inspection & maintenance schedule and provide a summary of the assessment in each ANNUAL REPORT.	Annual Requirement
	ALL	Identify and inventory each privately-owned and maintained storm water management facility which discharges into the MS4.	Within 12 Months of the Effective Date of the Permit
		Develop a revolving inspection program for privately-owned and maintained storm water treatment systems which discharge into the MS4 to determine compliance with local permit conditions and/or local ordinances. Program developed shall include a description of the enforcement provisions for non-compliance. Following development, include a summary of the inspection program & schedule in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 12 Months of the Effective Date of the Permit
		Implement revolving inspection program for privately-owned and maintained storm water treatment systems which discharge into the MS4.	Within 24 Months of the Effective Date of the Permit.

R0065863

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
1. *Operation and Maintenance of Structural Controls and Storm Water Collection System* (continued)	Sarasota County	Complete Florida Water & Pollution Control Operators Association (FW&PCOA) course or equivalent.	5 employees / year
	ALL OTHERS **except for** FDOT		1 employee / permit

RECEIVED
22 NOV

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
2. *Control of Discharges from Areas of New Development and Significant Redevelopment*	ALL **except for** City of North Port and FDOT	Adopt as local ordinances storm water quality treatment criteria consistent, but not necessarily similar to the State of Florida Storm Water Treatment Regulations (F.A.C. 40D-4, 40D-40, 62-25).	Prior to the end of the Permit Term
	FDOT	Employ new FDOT Drainage Connection Permit requirements which include a "certification of water quality" to be provided by the connecting entity.	Effective Date of Permit
	ALL **except for** FDOT	Continue on the current schedule to perform master basin studies on the major watersheds identified in Table 1 on page 4A-34 of Appendix A. Develop a course of action for each as they are completed. Include in each ANNUAL REPORT a brief summary of each basin study completed during the permit year and the resulting course of action.	Effective Date of the Permit
	ALL **except for** City of North Port and FDOT	Evaluate land development practices to reduce the amount of impervious surfaces in future development. After completing the evaluation, include a summary of the resulting course of action in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 36 Months of the Effective Date of Permit
		Implement appropriate land development practices & incentives for the reduction of impervious surfaces.	As Determined by the Evaluation - Prior to the end of the Permit Term

R0065865

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
3. *Operation and Maintenance of Public Streets, Roads, and Highways*	Sarasota County City of Sarasota City of Venice	Provide a description of the municipally-operated Litter Control Program(s) for highways and streets within jurisdictional area for incorporation into the permit.	Provide in First ANNUAL REPORT
	ALL **except for** City of North Port and FDOT	Implement Litter Control Program(s) for highways and streets within jurisdictional area and properly dispose of collected material.	Effective Date of the Permit
	FDOT	Implement Litter Control Program for highways and streets within jurisdictional area and properly dispose of collected material. Report in each ANNUAL REPORT the approximate frequency of litter collection services performed under contractual agreements during the permit year.	Effective Date of the Permit
	ALL **except for** North Port WCD City of North Port & FDOT	Implement street sweeping program within jurisdictional area and properly dispose of collected material.	Effective Date of the Permit
	FDOT	Implement street sweeping program within jurisdictional area and properly dispose of collected material. Report in each ANNUAL REPORT the approximate frequency of street sweeping services performed under contractual agreements during the permit year.	
	Sarasota County	Provide the maintenance schedule for storm water structures (i.e., catch basins) and roadside ditches.	Provide in First ANNUAL REPORT

R0065866

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
3. *Operation and Maintenance of Public Streets, Roads, and Highways* (continued)	ALL	Perform scheduled maintenance on catch basins, grates, and other storm water structures and roadside ditches and properly dispose of accumulated sediments. Maintain an internal log documenting maintenance activities.	Effective Date of the Permit
	ALL **except for** City of North Port	As described in Part II.3.a. on page 7 of the permit, develop practices to reduce to the MEP and shall not cause or contribute to violations of State water quality standards of the receiving stream regarding the pollutants from road repair and from all municipal equipment yards & maintenance shops. After development, include a summary of the practices in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 12 months of the Effective Date of the Permit
		Implement developed practices to reduce to the MEP pollutants from road repair and municipal yards.	Within 24 months of the Effective Date of the Permit
	FDOT	Coordinate the "Adopt A Highway" program for local organizations to be identified with specific highway cleanup and beautification projects.	Within 24 months of the Effective Date of the Permit
		Conduct annual routine inspections of each FDOT maintenance facility to ensure that BMPs are operational. The FDOT NPDES Coordinator or his/her representative shall perform this activity.	

R0065867

RECEIVED
22 NOV

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
4. *Ensure Flood Control Projects Comply With State Storm Water Quality Requirements*	ALL **except for** FDOT	Develop a priority list and construction schedule for the retrofit projects recommended by the master basin studies completed to date.	Within 12 Months of the Effective Date of the Permit
		Include a copy of the prioritized project list and construction schedule in the ANNUAL REPORT for incorporation into the permit. Provide updates to this list in future ANNUAL REPORTS as additional master basin studies are completed.	
	FDOT	Present a retrofitting program to the local Metropolitan Planning Organizations (MPO) for consideration which focuses on water quality improvement.	Within 12 Months of the Effective Date of the Permit
		Submit within the ANNUAL REPORT the list of approved retrofit projects in the MPO's work program for District One. Also provide the construction schedule for these approved projects. Provide updates to this list in future ANNUAL REPORTS as additional projects are approved.	Within 24 Months of the Effective Date of the Permit
		Begin retrofit priority projects as per the construction schedule in the approved work program for District One.	

R0065868

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
5. *Identification, Monitoring, and Control of Discharges from Municipal Waste Treatment, Storage, or Disposal Facilities not covered by an NPDES Storm Water Permit*	Sarasota County City of Sarasota City of North Port	Develop program to evaluate, through inspections and monitoring, the municipally-operated solid waste transfer station(s), maintenance and storage yards for waste transportation fleets, POTWs, and sludge application and/or disposal sites. The goals of the evaluation program shall be to identify these facilities, determine the necessary control measures & procedures to be employed at each, and administer an appropriate implementation schedule. After developing the evaluation program, submit a program summary in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 30 Months of the Effective Date of the Permit
		Implement developed program to reduce pollutants in storm water discharges to the MEP and shall not cause or contribute to violations of State water quality standards of the receiving stream from these facilities.	Within 36 Months of the Effective Date of the Permit

R0065869

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
6. *Control of Pollutants Related to Application of Pesticides, Herbicides, and Fertilizers*	ALL	Provide the details, for incorporation into the permit, of the specific public education program(s) designed to encourage the public to reduce their use of pesticides, herbicides and fertilizers.	Provide in First ANNUAL REPORT
		Implement public education program(s).	Effective Date of the Permit
	ALL **except for** FDOT	Evaluate current training requirements & certification procedures for employees who handle pesticides, herbicides and fertilizers. After completing the evaluation, include a summary of the results in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
		Implement any revised procedures for the training & certification of these employees.	As Necessary - Within 36 Months of the Effective Date of the Permit
	ALL	Require evidence of proper certification and licensing for all applicators contracted to apply pesticides, herbicides, and fertilizers on municipal and FDOT property.	Effective Date of the Permit

R0065870

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
6. *Control of Pollutants Related to Application of Pesticides, Herbicides, and Fertilizers* (continued)	ALL **except for** FDOT	Develop a program with procedures to minimize the use of pesticides, herbicides, and fertilizers and to properly store and mix these products. The program developed should also consider including components such as providing xeriscape planning assistance and promoting voluntary use of native Florida plantings and slow-release fertilizers. After development, include a summary of the procedures in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
	ALL **except for** FDOT	Employ program procedures to minimize the use of pesticides, herbicides, and fertilizers and to properly store and mix these products.	Within 36 Months of the Effective Date of the Permit
	FDOT		Effective Date of the Permit

R0065871

07 NOV 22

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
7. *Illicit Discharges and Improper Disposal*			
a.) *Inspections, ordinances, and enforcement measures*	ALL **except for** City of North Port and FDOT	Complete the assessment of non-storm water discharges allowed to be discharged to the MS4 as detailed on page 9 of the permit. After completing the assessment, include a summary of the results in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 18 Months of the Effective Date of the Permit
	ALL **except for** City of North Port and FDOT	Develop an inspection program to enforce ordinances which prohibit illicit connections and illegal dumping into the MS4. After development, include a summary of the inspection program in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 30 Months of the Effective Date of the Permit
	Sarasota County	Implement inspection program to enforce ordinances which prohibit illicit connections and illegal dumping into the MS4. Maintain an internal log documenting inspections and enforcement actions performed and provide a summary of these reports in each ANNUAL REPORT.	Within 36 Months of the Effective Date of the Permit
	ALL OTHERS **except for** City of North Port and FDOT		Within 36 Months of the Effective Date of the Permit

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
7. *Illicit Discharges and Improper Disposal*			
a.) *Inspections, ordinances, and enforcement measures* (continued)	FDOT	Develop a program to inspect drainage connections after project completion to ensure continued compliance with drainage connection permit requirements and to ensure that no illicit or non-permitted connections have been made. In cases where another regulatory agency requires a periodic certification of compliance, the program developed may allow FDOT to accept this certification of compliance in lieu of further inspections by FDOT. After development, include a summary of the inspection program in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 21 Months of the Effective Date of the Permit
		Implement developed program to inspect drainage connections after project completion. Maintain an internal log documenting inspections and enforcement actions performed and provide a summary of these records in each ANNUAL REPORT.	Within 30 Months of the Effective Date of the Permit
	Sarasota County Longboat Key City of Sarasota	Provide photocopies of signed adopted storm water ordinances as identified in Table II.A.7.a.(3) on page 10 of the permit.	Provide in First ANNUAL REPORT
	City of North Port City of Sarasota City of Venice	Amend ordinances as identified in Table II.A.7.a.(4) on page 11 of the permit to reflect correct citation for *"industrial activity"* {40 CFR 122.26(b)(14)} Include a copy of the amended ordinances in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 12 Months of the Effective Date of the Permit

R0065873

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
7. *Illicit Discharges and Improper Disposal* (continued)			
b.) Field Screening	ALL	Conduct field screening of the MS4 for illicit discharges and improper disposal as shown in Table II.A.7.b. on page 12 of this permit. Collect inventory information on outfalls and on portions of MS4 not mapped and update database system on an ongoing basis. Maintain an internal log documenting the results of all field screening performed.	At least ⅓ of Grid Areas Screened in Permit Years Three, Four and Five with Entire MS4 Screened Once / 5 years
c.) Investigation of Suspected Illicits and/or Improper Disposal	**ALL except for FDOT**	Develop standard investigative procedures to identify and terminate the source(s) of illicit connections or discharges to the MS4. After development, include a summary of the investigative procedures in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
		Implement standard investigative procedures to identify and terminate the source(s) of illicit connections or discharges to the MS4.	Within 30 Months of the Effective Date of the Permit

R0065874

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
7. *Illicit Discharges and Improper Disposal* (continued)			
c.) *Investigation of Suspected Illicits and/or Improper Disposal* (continued)	FDOT	Develop standard investigative procedures to identify and report the source(s) of illicit connections or discharges. These procedures shall include notification to FDEP and EPA of illicit connections. After development, include a summary of the investigative procedures in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
		Implement standard investigative procedures to identify the sources(s) of illicit connections or discharges to the MS4.	Within 30 Months of the Effective Date of the Permit
d.) *Spill Prevention and Response*	Sarasota County FDOT	Provide a copy of the applicable portions of Sarasota County's *Hazardous Materials Emergency Plan* and FDOT's *Emergency Operations Procedures* which effectively mitigate potential pollutant discharges to surface waters.	Provide in First Annual Report
	ALL **except for** Sarasota County and FDOT	Adopt Sarasota County's *Hazardous Materials Emergency Plan*, FDOT's *Emergency Operations Procedures*, or a comparable plan and procedures which effectively mitigate potential pollutant discharges to surface waters.	Within 12 Months of the Effective Date of the Permit

R0065875

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
7. *Illicit Discharges and Improper Disposal* (continued)			
e.) Public Notification	ALL	Develop a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges and improper disposal of materials into the MS4. After development, include a summary of the public program in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 30 Months of the Effective Date of the Permit
		Implement public reporting program.	Within 36 Months of the Effective Date of the Permit
		Maintain a citizen complaint log documenting all reports of illicit discharges and what actions were taken to investigate and resolve the problem. Include a summary of this log in each ANNUAL REPORT.	Within 36 Months of the Effective Date of the Permit
	FDOT	Establish a direct dial local telephone number at the District Office to be used for the reporting of illicit connections, accidental spills, illegal dumping, or other water quality violations and action as needed. This requirement may be satisfied through cooperative efforts with other permittees.	Within 36 Months of the Effective Date of the Permit

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
7. *Illicit Discharges and Improper Disposal* (continued)			
f.) Oils, Toxics, and Household Hazardous Waste Control	ALL **except for** FDOT	Support and promote on a regular basis the six (6) oil recycling site locations within Sarasota County and the two (2) permanent collection centers for household hazardous waste materials. Continue Amnesty Days program. Document the total annual amount of household hazardous waste materials collected.	Effective date of Permit
		Actively promote and support a voluntary stenciling program for all storm sewer inlets which discharge directly or indirectly into surface waters.	Within 12 Months of the Effective Date of the Permit
	FDOT	With each FDOT Drainage Connection Permit, include information on used oil recycling, proper hazardous waste disposal, storm water regulations, and spill reporting.	Within 12 Months of the Effective Date of the Permit

R0065877

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
7. *Illicit Discharges and Improper Disposal* (continued)			
g.) *Limitation of Sanitary Sewer Seepage*	ALL **except for** City of North Port and FDOT	Develop procedures to limit the infiltration of sanitary seepage into the MS4, in areas where wastewater infiltration is suspected. After development, include a summary of the procedures in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 30 Months of the Effective Date of the Permit
		Implement developed procedures to limit the infiltration of sanitary seepage into the MS4.	Within 36 Months of the Effective Date of the Permit
	ALL	Advise appropriate utility owner of violation if constituents common to wastewater contamination are discovered in the MS4 during dry weather field screening.	Effective Date of the Permit
		Identify areas served by septic tanks. Advise appropriate State Agency of violation if constituents common to wastewater contamination due to malfunctioning septic tank systems are discovered in the MS4 during dry weather field screening.	Within 12 Months of the Effective Date of the Permit

R0065878

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
8. *Industrial and High Risk Runoff*			
a.) *Identification of Priorities and Procedures for Inspections*	ALL	Develop an inventory of all existing high risk facilities discharging into the MS4. This inventory shall identify the outfall and surface waterbody into which each high risk facility drains.	Within 24 Months of the Effective Date of the Permit
		Based upon historical information and available monitoring & screening data, prioritize the identified high risk facilities.	Within 24 Months of the Effective Date of the Permit
	ALL **except for** FDOT	Develop procedures for inspecting high risk facilities and establish an inspection schedule. After development, include a summary of the procedures & inspection schedule in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
	FDOT	Develop procedures for the inspection of high risk facilities which hold FDOT drainage connection permits to ensure compliance with permit requirements. In cases where another regulatory agency requires a periodic certification of compliance, the program developed may allow FDOT to accept this certification of compliance in lieu of further inspections by FDOT. After development, include a summary of the procedures & inspection schedule in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
	ALL	Begin inspections of identified high risk facilities. Maintain an internal log documenting the results of the inspections performed.	Within 36 Months of the Effective Date of the Permit

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
8. *Industrial and High Risk Runoff* (continued)			
a.) *Identification of Priorities and Procedures for Inspections* (continued)	ALL	Maintain a list of all industrial storm water sources discharging to MS4 & update in ANNUAL REPORTS.	Effective Date of the Permit
b.) ***Monitoring for High Risk Industries***	ALL **except for** FDOT	Develop a monitoring (or self monitoring) program for high risk industrial facilities. Include a description of the specific enforcement steps to be taken to require compliance with local storm water ordinances if violations are identified. After development, include a summary of the monitoring program in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
	FDOT	Develop a monitoring (or self monitoring) program for high risk industrial facilities which hold FDOT drainage connection permits. Include a description of the specific enforcement steps to be taken to require compliance with permit conditions if violations are identified. After development, include a summary of the monitoring program in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
	ALL	Implement the monitoring program for high risk industrial facilities.	Within 36 Months of the Effective Date of the Permit

R0065880

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
9. *Construction Site Runoff*			
a.) Site Planning & Structural and Non-structural Controls	ALL **except for** City of North Port and FDOT	Review erosion and sediment control requirements to determine modifications necessary to correlate with SWFWMD's requirements and EPA's NPDES Construction Activity General Permit. Summarize the necessary modifications in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 12 Months of the Effective Date of the Permit
		Incorporate necessary modifications to the erosion and sediment control requirements.	Within 36 Months of the Effective Date of the Permit
		In land development regulations, incorporate guidelines and recommendations for reducing the amount of sediment leaving construction sites.	Within 36 Months of the Effective Date of the Permit
		Track construction projects required to install erosion and sediment controls. Document the installation, maintenance, and effectiveness of the controls. Integrate these records with the education program for training the site contractors.	Within 18 Months of the Effective Date of the Permit
	FDOT	Employ new FDOT Drainage Connection Permit requirements which direct connecting entities subject to the NPDES storm water regulations to submit a copy of their NPDES Storm Water Pollution Prevention Plan to FDOT.	Effective Date of the Permit

R0065881

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
9. *Construction Site Runoff* (continued)			
b.) *Inspection and Enforcement*	ALL **except for** City of North Port and FDOT	Review existing inspection policies and code enforcement programs to first identify all agencies conducting site inspections and then to determine which agency is responsible for issuing enforcement actions for which code violations. Summarize results and include in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
		Train inspectors (regardless of specialty) who are likely to be on-site during earth moving activities in erosion control techniques.	1 Inspector / Year
		Implement the use of an erosion & sediment control checklist for all inspectors. Include verification that construction sites subject to the NPDES Storm Water Regulations have NPDES permit coverage and a Storm Water Pollution Prevention Plan on site. Include developed checklist in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
	ALL **except for** City of North Port	Develop a program to inspect construction projects for compliance with local storm water ordinances and/or local permits.	Within 24 Months of the Effective Date of the Permit
	ALL **except for** City of North Port and FDOT	Implement program developed to inspect construction projects for compliance with local storm water ordinances and/or local permits.	Within 36 Months of the Effective Date of the Permit

R0065882

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
9. *Construction Site Runoff* (continued)			
b.) Inspection and Enforcement (continued)	FDOT	Implement program developed to inspect construction projects that propose to directly discharge storm water to the FDOT MS4 and have been granted an FDOT drainage connection permit for compliance with FDOT permit conditions. Require connection entities, who are found or suspected of discharging storm water of unacceptable quality during or following construction, to sample and test the discharge to prove compliance with FDOT permit conditions.	Within 36 Months of the Effective Date of the Permit
c.) Site Operator Training	ALL **except for** City of North Port and FDOT	Implement an annual NPDES workshop for design professionals, land developers, inspectors and contractors, including earth moving contractors. Topics to include are measures to reduce pollutants from sites, awareness of the NPDES program requirements for construction activities, and solutions to erosion and sediment problems commonly found by the inspectors during construction.	Within 24 Months of the Effective Date of the Permit
		Evaluate the feasibility of an erosion & sediment control certification program for construction site operators (contractors and developers), plan reviewers, and inspectors that work on sites that discharge to the MS4. Upon conclusion of the evaluation, include a summary of the findings in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 30 Months of the Effective Date of the Permit
		If certification program is deemed feasible, implement program for construction site operators, plan reviewers, and inspectors.	If Deemed Feasible - Within 36 Months of the Effective Date of the Permit

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
c.) *Site Operator Training* (continued)	ALL **except for** City of North Port and FDOT	Develop a procedure to notify building permit applicants in developments which, because of the amount of land area disturbed, are subject to the NPDES storm water regulations of their application responsibilities under the NPDES permitting program for construction site runoff. After development, include a summary of procedures in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
		Implement developed procedures to notify building permit applicants in developments which, because of amount of land area disturbed, are subject to the NPDES storm water regulations of their application responsibilities under the NPDES permitting program for construction site runoff.	Within 30 Months of the Effective Date of the Permit
		Conduct presentations to local professional organizations which are associated with the construction industry to discuss proper construction site management for water quality.	Ongoing

PART V. MONITORING AND REPORTING REQUIREMENTS

A. <u>Seasonal Loadings and Event Mean Concentrations.</u>

1. As per 40 CFR 122.26(d)(2)(iii)(C), the permittees shall provide estimates of the seasonal pollutant load and of the event mean concentration of a representative storm for the parameters listed in Table V.A.1. for each "major outfall" within the MS4. These constituents were detected in the sampling data reported in the Part 2 application. The location of all known major outfalls shall be inventoried in the ANNUAL REPORT for Year One of the permit, with updates describing any additionally identified major outfalls in each sequent ANNUAL REPORT. The seasonal pollutant load and event mean concentration for each major outfall may be estimated from the representative monitoring locations, from regional NURP or State data, or from pooling results from other nearby Florida MS4 monitoring activities and shall take into consideration land uses and drainage areas for the outfall. The estimates of seasonal loadings and event mean concentrations shall be included in the ANNUAL REPORT for Year Four of the permit. For the purposes of this permit, a "major outfall"is defined as follows:

   - a pipe (or closed conveyance) system with a cross-sectional area equal to or greater than 7.07 square feet (e.g., if a single circular pipe system, an inside diameter of 36 inches or greater);
   - a single conveyance other than a pipe, such as an open channel ditch, which is associated with a drainage area of more than 50 acres;
   - a pipe (or closed conveyance) system, draining *"industrial land use,"* with a cross-sectional area equal to or greater than 0.79 square feet (e.g., if a single circular pipe system, an inside diameter of 12 inches or greater); or
   - a single conveyance other than a pipe, such as an open channel ditch, which is associated with a *"industrial land use"* drainage area of more than 2 acres;

TABLE V.A.1.	
PARAMETERS	
Biochemical Oxygen Demand (BOD_5) (mg/l)	Oil & Grease (mg/l)
Chemical Oxygen Demand (COD) (mg/l)	Total Recoverable Cadmium (mg/l)
Total Suspended Solids (TSS) (mg/l)	Total Recoverable Chromium (mg/l)
Total Dissolved Solids (TDS) (mg/l)	Total Recoverable Copper (mg/l)
Total Kjeldahl Nitrogen (as N) (mg/l)	Total Recoverable Lead (mg/l)
Nitrate plus Nitrite (as N) (mg/l)	Total Recoverable Zinc (mg/l)
Total Phosphorus (mg/l)	Dissolved Phosphorus (mg/l)

2. The permittees listed in Table V.A.2. below shall conduct an investigation of the identified drainage basins to determine the sources of the following organic pollutants detected in the Part 2 application sampling data. A report summarizing the conclusions of this investigation shall be included in the ANNUAL REPORT for Year Three of the permit.

TABLE V.A.2.		
PARAMETERS	BASIN	PERMITTEE(S)
Benezo(a)anthracene	Indian Ave. - Site #5	City of Venice
Benezo(k)fluoranthene	Indian Ave. - Site #5	City of Venice
3,4-Benzofluoranthene	East Ave. - Site #2	City of Sarasota
	Indian Ave. - Site #5	City of Venice

R0065888

B. **Monitoring Data Collection.** According to the agreements established between permittees, the following monitoring program shall be developed and implemented:

1. *Monitoring:* Establish local monitoring stations in conjunction with the State of Florida's *Surface Water Ambient Monitoring Program*. (See definition of the *Surface Water Ambient Monitoring Program* in Part VIII for description of program goals and monitoring strategies.) The selection of the monitoring stations shall be the result of a cooperative effort between the permittees, EPA, and the Bureau of Surface Water Management, Florida Department of Environmental Protection (FDEP). Acceptance of the monitoring program components proposed by the permittees in the July 23, 1993, Part 2 application submittal shall be explored before any alternative monitoring programs are introduced. The number of monitoring stations as well as the type of sampling performed shall be established in accordance with the following:

   a.) The costs associated with the monitoring program developed shall not exceed the projected costs for the monitoring program proposed by the permittees in the July 23, 1993, Part 2 application submittal.

   b.) The monitoring program developed shall assist in determining the impact of storm water discharges on receiving waters located in the geographical area covered by this permit.

   c.) The monitoring program developed shall assist in determining the effectiveness of the storm water management programs being implemented under this permit and shall assist in identifying and prioritizing portions of the MS4 requiring additional controls.

   d.) The monitoring program developed shall be designed to help identify local sources and impacts of specific pollutants considered a problem in the geographic area covered by this permit. Once the source and the impacts are identified, these pollutants may be more effectively reduced or eliminated.

   e.) The selection of the monitoring stations and sampling program schedule shall be agreed upon by the permittees and the Bureau of Surface Water Management, FDEP and EPA. The monitoring program developed shall be implemented by the permittees within 24 months of the effective date of this permit or within 12 months of the date of program development, whichever is later. The details of the monitoring program shall be submitted to EPA in the subsequent ANNUAL REPORT; status reports shall be given in any Annual Reports prior to this one.

VOL 22 0654

R0065889

It is the intent of EPA to use the monitoring information collected to evaluate any trends in the reduction in pollutant loads discharged to waters of the U.S during the term of the permit. The pollutant loading trends will be used to evaluate the effectiveness of the permittees' Storm Water Management Program to reduce the discharge of pollutants to the MEP and to shall not cause or contribute to violations of State water quality standards of the receiving stream.

2. *Monitoring Data:* For Part V.B.1., records shall be maintained of all analytical results. Additionally, for the monitoring program developed under Part V.B.1. which involves storm event sampling, the records maintained shall include: the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches or centimeters) of the storm event which generated the sampled runoff; the duration (in hours) between the storm event sampled and the end of the previous measurable (greater than 0.1 inch or 0.25 centimeter rainfall) storm event; and an estimate of the total volume (in gallons or liters) of the discharge sampled.

3. *Sample Analysis:* All samples collected for Part V.B.1. shall be analyzed in accordance with the methods specified at 40 CFR Part 136.

4. *Sampling Waiver.* When a discharger is unable to collect samples required by Part V.B.1. due to adverse climatic conditions, the discharger must submit in lieu of sampling data, a description of why samples could not be collected, including available documentation of the event. Adverse climatic conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, etc.).

VOL 22

0655

C. **Annual Report.** Each permittee shall contribute to the preparation of an annual system-wide report to be submitted by no later than six months following the period covered by the report. The ANNUAL REPORT shall cover the 12 month period beginning on the effective date of this permit and annually thereafter.

The preparation and submittal of a system-wide ANNUAL REPORT shall be coordinated by a *"committee."* The *"committee"* shall include a member or designated representative from each municipal entity covered by this permit. Each permittee shall be individually responsible for providing information on the portions of the MS4 for which they are the operator and for providing information for the system-wide report in a timely manner. Joint responsibility for the ANNUAL REPORT submission shall be limited to the following: (1) participation in preparation of the overview for the entire system; and (2) inclusion of the identity of any permittee who failed to provide input to the report. Each permittee shall sign and certify the ANNUAL REPORT in accordance with Part VI.H. & VI.I. of this permit, and shall include a statement or resolution that the permittee's governing body or agency (or delegated representative) has reviewed or has been appraised of the content of the ANNUAL REPORT.

The ANNUAL REPORT shall include the following sections:

- Contacts List
- SWMP Evaluation
- Summary Table
- Narrative Report
- Monitoring Section
- Summary of SWMP and Monitoring Modifications
- Fiscal Analysis
- FDOT District Report
- Appendices

The following items describe in more detail the specific requirements for the ANNUAL REPORT.

1. Provide a list of contacts and responsible parties (e.g.: agency, name, phone number) who had input to and are responsible for the preparation of the ANNUAL REPORT.

2. Provide an overall evaluation of the Storm Water Management Program including: Objective of Program; Major Findings (e.g.: water quality improvements or degradation); Major Accomplishments; Overall Program Strengths / Weaknesses; and Future Direction of Program.

VOL 22 0656

R0065891

3. Provide a Summary Table of Storm Water Management Program Elements.

a. A Summary Table of appropriate SWMP annual activities for each permittee shall be provided. The purpose of the Summary Table is to document in a concise form the program activities and permittees' compliance status with quantifiable permit requirements. Program elements that are administrative (e.g.: planning procedures, program development and pilot studies) are inappropriate for the summary table and shall be discussed in the narrative section of the ANNUAL REPORT. The following are examples of SWMP activities to be included in the Summary Table:

(1) Structural Controls - maintenance and/or inspection activities of existing structural controls

(2) Roadway Maintenance - street sweeping, litter control activities, and maintenance on storm water structures & roadside ditches

(3) Municipal Waste TSD Facilities - inspections, monitoring, and implementation of control measures

(4) Pesticide, Herbicide, and Fertilizer Application - certification training and public education

(5) Illicits - facility inspections, investigations, enforcement actions, illicit (dry weather) screening, illicit public reporting, oil/household hazardous waste collection, and storm sewer inlet stencilling

(6) High Risk Industrial Facilities - inspection activities and monitoring

(7) Construction - training of inspectors, certification of construction site operators, inspections, and enforcement actions

(8) Storm Water Treatment Projects - description of municipal storm water treatment projects that have been completed, including a brief description of the affected drainage basin

VOL 22

0651

b. The Summary Table shall indicate each permittee's SWMP activities and accomplishments. The format for this information shall adhere to the example shown in Table V.C.1. on page 55. Items to be reported include:

(1) Activity description;

(2) Number of activities (with frequency) that were scheduled for implementation and/or accomplishment in program element discussion (i.e., once/6 months, 100%/5 years, 6 sites monitored once/year, all sites inspected/permit term). Enter "Not Applicable" (N/A) if no specific schedule was specified;

(3) Status of schedule for year ("yes" for schedule was adhered to, or "no" for schedule was not adhered to);

(4) Number of activities which were accomplished; and

(5) The availability of documentation (i.e., inspection reports) for those activities which were accomplished and comments describing the reason(s) for any non-compliance.

4. The ANNUAL REPORT shall contain a Narrative Report to succinctly discuss the SWMP Elements which were not included within the SWMP Summary Table. Those SWMP Elements required to be developed under Parts II and III of the permit shall be discussed within this section of the ANNUAL REPORT following development.

a. The permittees shall include a brief discussion of the following applicable SWMP Elements:

(1) Structural Controls Maintenance
(2) Development Planning Procedures
(3) Roadway Maintenance
(4) Flood Management
(5) Municipal Facilities
(6) Pesticides, Herbicides, and Fertilizers
(7) Illicits Inspection/Investigation/Enforcement
(8) Field Screening
(9) Spill Response

VOL 22

0658

R0065893

(10) Public Reporting of Illicit Discharges
(11) Oil and Household Hazardous Waste
(12) Sanitary Sewer Seepage
(13) High Risk Industrial Facility Inspection
(14) Construction Planing Procedures
(15) Construction Inspections
(14) Education Activities
(15) Monitoring Activities
(16) Any additional elements of Storm Water Management Program

b. The format for the Narrative Report section of the ANNUAL REPORT shall be a brief discussion of the SWMP Element. The aspects of each permittee's activities concerning a SWMP Element shall be succinctly discussed in the section of the Narrative Report dedicated to that Element. The discussion shall include the following:

(1) Objective of SWMP Element,

(2) SWMP Element activities completed and those in progress,

(3) General discussion of Element. Explanation of all Element activity deficiencies (e.g.: activities described in the program that have not been fully implemented or completed). Results of activities shall be summarized and discussed (e.g.: maintenance caused by inspection, pollutants detected by monitoring, investigations as a result of dry and wet weather screening, number and nature of enforcement items, education activities participation),

(4) Status of SWMP Element with compliance, implementation, and augmentation schedules in Part III of the permit,

(5) SWMP Element strengths and weaknesses,

(6) Assessment of controls, and

(7) Discussion of Element revisions that are summarized elsewhere in the ANNUAL REPORT.

VOL 22

0659

R0065894

5. The ANNUAL REPORT shall contain a Monitoring Section which discusses the progress and results of the monitoring programs required under Part V of the permit.

   a. The Monitoring Section of the ANNUAL REPORT shall include a summary of the monitoring program developed and implemented under Part V.B.1. of the permit. The details to be discussed include:

      (1) Brief summary statement of the objective of each monitoring project included under the program,

      (2) Summary chart of the data from the monitoring completed,

      (3) Discussion of any results or conclusions derived from the monitoring completed,

      (4) Status of monitoring with respect to the compliance schedule in Part V.B.1. of the permit, and

      (5) Discussion of monitoring program revisions that are summarized elsewhere in the ANNUAL REPORT.

   b. The Monitoring Section of the ANNUAL REPORT shall include the following information as required in Part V.A. of the permit:

      (1) The ANNUAL REPORT for Year One of the permit shall contain an inventory of all known major outfalls, with updates describing additionally identified major outfall in each sequent ANNUAL REPORT.

      (2) The ANNUAL REPORT for Year Three of the permit shall include the investigation of the sources of the organic pollutants detected in the Part 2 application sampling data as required in Part V.A.2. of the permit.

      (3) The ANNUAL REPORT for Year Four of the permit shall include estimates of seasonal pollutant loadings and event mean concentrations (EMC) for each major outfall required by Part V.A.1.

6. Provide a summary of SWMP and Monitoring Modifications made during the permit year.

VOL 22

0660

R0065895

7. Provide a complete fiscal analysis for each permittee's program implementation, both for the past calendar year and the next. The analysis shall indicate budgets and funding sources.

8. FDOT shall report on the status of the FDOT statewide Storm Water Management Program elements as shown in Table V.C.8.a. on page 56 and shall indicate whether the resulting program modifications have been implemented at the District Office. In addition, FDOT shall also indicate the number of District employees included in the training courses described in Table V.C.8.b. on page 57.

9. The following information shall be included as Appendices within the ANNUAL REPORT for Year Five of the permit:

   a. Analytical data collected from the monitoring program.

   b. Results of illicit connections screening or dry weather screening.

   c. Any other data specifically requested by EPA to substantiate statements and conclusions reached in the ANNUAL REPORTS.

Table V.C.1. - EXAMPLE Summary Table for Storm Water Management Program Element Status/Compliance (EXAMPLE ONLY)

PROGRAM ELEMENT	PERMITTEE	REQUIREMENT	ACTIVITY SCHEDULE			COMMENTS
			Activities Required by SWMP	Complied with	Activities Accomplished during calendar year	
Structural Controls	Permittee 1	Major Channels Inspected	15 Channels, once/6 mos.	YES	15 Channels, once/6 mos	Copies of Inspection Report Forms - Available Upon Request
		Major Channels Maintained	As needed	N/A	7 Channels maintained	
		Grate Inlets Inspected	1500 Inlets, once/year	NO	1000 Inlets	Ambitious projection. Reducing to 1000 next year due to resources.
	Permittee 2	Detention Ponds Maintained	1 Pond, once/month	YES	1 Pond once/month	Sediment removed after spring rains.
		Storm Drain Inlets Inspected	35 Inlets, once/6 mos.	YES	35 Inlets once/6 mos.	Copies of Inspection Report Forms - Available Upon Request
Monitoring	Permittee 1	Municipal - Landfills	2 Facilities, once/6 mos.	YES	2 Facilities once/6 mos.	Copies of Monitoring Data - Available Upon Request
		POTW	3 Facilities, once/year	NO	2 Facilities	Copies of Monitoring Data - Available Upon Request
		Industrial - Hazardous	5 Facilities, once/6 mos.	YES	5 Facilities, once/6 mos.	Copies of Monitoring Data - Available Upon Request
		Title III	3 Facilities, once/6 mos.	YES	3 Facilities, once/6 mos.	Copies of Monitoring Data - Available Upon Request
		Others	2 Facilities, once/year	YES	2 Facilities	Copies of Monitoring Data - Available Upon Request
		Dry Weather Screening	100% system, once/5 yrs.	YES	20% system	Copies of Screening Field Reports - Appendix B.
		Floatable Assessment	100 sections surveyed/yr.	YES	140 sections surveyed	Copies of Field Survey - Available Upon Request

R0065897

Table V.C.8.a. - Table for FDOT Statewide Storm Water Management Program Element Status

FDOT STATEWIDE STORM WATER MANAGEMENT PROGRAM ELEMENT (To Be Conducted at State Office)	ACTIVITY ACCOMPLISHED DURING THE PERMIT YEAR?	DESCRIPTION OF RESULTING PROGRAM MODIFICATIONS	PROGRAM POLICY INCORPORATED AT DISTRICT OFFICE?
Evaluate the feasibility of the FDOT drainage connection permit becoming an operating permit requiring long-term storm water facility management by the connecting entity.	YES / NO (If no, list anticipated completion date)		YES / NO (If no, list reason and/or anticipated implementation date.)
Add information specific to storm water runoff protection and reduction of chemical usage to the FDOT's *Turf Management Manual* and *Chemical Weed and Grass Control Manual*.	YES / NO (If no, list anticipated completion date)		YES / NO (If no, list reason and/or anticipated implementation date.)
Evaluate, on an ongoing basis, innovative structural and non-structural BMPs and new technologies as they evolve to determine their efficiency and cost effectiveness in the field. Comment on those which are found suitable & adopted for use in FDOT projects in the District.	ONGOING ACTIVITY		Describe new BMPs adopted for use in the District.
Identify those of the non-storm water discharges listed under Part II.A.7.a. on page 9 of the permit, as well as any other non-storm water discharges, which will be allowed to be discharged into the FDOT MS4.	YES / NO (If no, list anticipated completion date)		YES / NO (If no, list reason and/or anticipated implementation date.)

Table V.C.8.b. - Table for FDOT Statewide Storm Water Management Program Training Status

FDOT STATEWIDE STORM WATER MANAGEMENT PROGRAM TRAINING (Conducted through State Office)	TRAINING CONDUCTED DURING THE PERMIT YEAR?	DESCRIPTION OF TRAINING COURSE	NO. OF DISTRICT EMPLOYEES COMPLETING TRAINING COURSE?
Conduct training for FDOT maintenance and construction inspectors in the identification and detection of potential storm water related problems, signs of illegal dumping and illicit connections, proper containment methods, and reporting procedures.	YES / NO (If no, give anticipated schedule.)		
Conduct training for the FDOT Emergency Coordinator assigned to each FDOT maintenance facility. Training shall not only educate the FDOT Emergency Coordinator in the proper containment of spills and spill reporting procedures, but shall include storm water remediation activities, storm water regulations, and storm water retrofitting necessary to eliminate polluted storm water discharges from FDOT maintenance facilities.	YES / NO (If no, give anticipated schedule.)		
Conduct training for all FDOT personnel involved in the chemical weed and grass control program to ensure a safe and effective program. Incorporate into the training of these applicators an emphasis on storm water implications of the use of pesticides, herbicides, and fertilizers.	YES / NO (If no, give anticipated schedule.)		
Conduct training for all FDOT personnel involved in hazardous waste handling. Incorporate into the training a segment on the identification, detection, and reporting of illicit storm water connections and potential storm water related problems such as visible water quality degradation and signs of illegal dumping.	YES / NO (If no, give anticipated schedule.)		

R0065899

D. **Certification and Signature of Reports.**

All reports required by the permit and other information requested by the Director shall be signed and certified in accordance with Parts VI.H. & VI.I. of the permit.

E. **Reporting: Where and When to Submit.**

1. As required by Part V.C., monitoring results obtained during the reporting period running from the 12 month term beginning on the effective date of this permit and annually thereafter shall be submitted on Discharge Monitoring Report Form(s) in the ANNUAL REPORT for Year Five of the permit. A separate Discharge Monitoring Report Form is required for each event monitored.

2. Signed copies of the ANNUAL REPORT required by Part V.C. and all other reports required herein, shall be submitted to:

U.S. EPA, Region IV
Water Management Division
Water Permits and Enforcement Branch (WPEB-7)
345 Courtland Street, N.E.
Atlanta, Georgia 30365

F. **Additional Notification.**

In addition, the permittees shall provide a copy of each ANNUAL REPORT to:

Florida Department of Environmental Protection
Bureau of Surface Water Management
Storm Water Section
Twin Towers Office Building
2600 Blair Stone Road
Tallahassee, Florida 32399-2400

G. **Retention of Records.**

The permittees shall retain the latest version of the Storm Water Management Program developed in accordance with Part II of this permit for at least three years after the expiration date of this permit. The permittees shall retain all records of all monitoring information, copies of all reports required by this permit, and records of all other data required by or used to demonstrate compliance with this permit, until at least three
years after the expiration date of this permit. This period may be explicitly modified by alternative provisions of this permit or extended by request of the Director at any time.

VOL 22 0665

R0065900

VOL 22

0666

PART VI. STANDARD PERMIT CONDITIONS

A. Duty to Comply. The permittees must comply with all conditions of this permit insofar as those conditions are applicable to each permittee, either individually or jointly. Any permit noncompliance by a permittee constitutes a violation of the CWA and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification, or for denial of a permit renewal application for the non-complying permittee.

B. Penalties for Violations of Permit Conditions.

1. Criminal

a. Negligent Violations The CWA provides that any person who negligently violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than 1 year, or both.

b. Knowing Violations The CWA provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

c. Knowing Endangerment The CWA provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than $250,000, or by imprisonment for not more than 15 year, or both.

d. False Statement The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than 2 years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or by both. (See Section 309(c)(4) of the Clean Water Act).

VOL 22

0667

2. Civil Penalties - The CWA provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed $25,000 per day for each violation.

3. Administrative Penalties - The CWA provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to an administrative penalty, as follows:

   a. Class I penalty Not to exceed $10,000 per violation nor shall the maximum amount exceed $25,000.

   b. Class II penalty Not to exceed $10,000 per day for each day during which the violation continues nor shall the maximum amount exceed $125,000.

C. **Duty to Reapply**. If a permittee(s) wishes to continue an activity regulated by this permit after the permit expiration date, the permittee(s) must apply for and obtain a new permit. The application shall be submitted at least 180 days prior to expiration of this permit. The Director may grant permission to submit an application less than 180 days in advance but no later than the permit expiration date. Continuation of expiring permits shall be governed by regulations promulgated at 40 CFR 122.6 and any subsequent amendments.

D. **Need to Halt or Reduce Activity Not a Defense**. It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

E. **Duty to Mitigate**. Each permittee shall take all reasonable steps to minimize or prevent any discharge in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.

F. **Duty to Provide Information**. Each permittee shall furnish to the Director, within a time specified by the Director, any information which the Director may request to determine compliance with this permit. The permittees shall also furnish to the Director upon request copies of records required to be kept by this permit.

G. **Other Information**. When a permittee becomes aware that he or she failed to submit any relevant facts or submitted incorrect information in any report to the Director, he or she shall promptly submit such facts or information.

VOL 22

0668

R0065903

H. Signatory Requirements. All Discharge Monitoring Reports, storm water management programs, reports, certifications or information either submitted to the Director or that this permit requires be maintained by the permittees, shall be signed by:

1. Either a principal executive officer or ranking elected official; or

2. A duly authorized representative of that person. A person is a duly authorized representative only if:

   a. The authorization is made in writing by a person described above and submitted to the Director, and

   b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of manager, operator, superintendent, or position of equivalent responsibility or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.)

   If an authorization is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new written authorization satisfying the requirements of this paragraph must be submitted to the Director prior to or together with any reports, information, or applications to be signed by an authorized representative.

I. Certification. Any person signing documents under this section shall make the following certification:

   "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

VOL 22 0669

R0065904

J. **Penalties for Falsification of Reports.** Section 309(c)(4) of the Clean Water Act provides that any person who knowingly makes any false material statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than 2 years, or by both.

K. **Penalties for Falsification of Monitoring Systems.** The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by fines and imprisonment described in Section 309 of the CWA.

L. **Oil and Hazardous Substance Liability.** Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittees from any responsibilities, liabilities, or penalties to which the permittee is or may be subject under section 311 of the CWA or section 106 of CERCLA.

M. **Property Rights.** The issuance of this permit does not convey any property rights of any sort, nor any exclusive privileges, nor does it authorize any injury to private property nor any invasion of personal rights, nor any infringement of Federal, State or local laws or regulations.

N. **Severability.** The provisions of this permit are severable, and if any provision of this permit, or the application of any provision of this permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this permit shall not be affected thereby.

O. **Requiring an Individual Permit.**

1. The Director may require any permittee authorized by this permit to obtain an individual NPDES permit. Any interested person may petition the Director to take action under this paragraph. The Director may require any owner or operator authorized to discharge under this permit to apply for an individual NPDES permit only if the owner or operator has been notified in writing that a permit application is required. This notice shall include a brief statement of the reasons for this decision, an application form (as necessary), a statement setting a deadline for the owner or operator to file the application, and a statement that on the effective date of the individual NPDES permit, coverage under this permit shall automatically terminate. Individual permit applications shall be submitted to the address of the appropriate Regional Office shown in Part V.E.2. of this permit. The Director may grant additional time to submit the application upon request of the applicant. If an owner or operator fails to submit in a timely manner an individual NPDES permit application as required by the Director, then the applicability of this permit to the individual NPDES permittee is automatically terminated at the end of the day specified for application submittal.

VOL 22

0670

2. Any owner or operator authorized by this permit may request to be excluded from the coverage of this permit by applying for an individual permit. The owner or operator shall submit an individual application as specified by 40 CFR 122.26(d) with reasons supporting the request to the Director. Individual permit applications shall be submitted to the address of the appropriate Regional Office shown in Part V.E.2. of this permit. The request may be granted by the issuance of a individual permit if the reasons cited by the owner or operator are adequate to support the request.

P. **State/Environmental Laws.**

1. Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable State law or regulation under authority preserved by Section 510 of the Act.

2. No condition of this permit shall release the permittee from any responsibility or requirements under other environmental statutes or regulations.

Q. **Proper Operation and Maintenance**. Each permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit and with the requirements of storm water management programs. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance requires the operation of backup or auxiliary facilities or similar systems, installed by a permittee only when necessary to achieve compliance with the conditions of the permit.

R. **Monitoring and Records.**

1. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

2. The permittees shall retain records of all monitoring information including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of the reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least 3 years from the date of the sample, measurement, report or application. This period may be extended by request of the Director at any time.

VOL 22 0671

R0065906

3. Records of monitoring information shall include:

   a. The date, exact place, and time of sampling or measurements;

   b. The initials or name(s) of the individual(s) who performed the sampling or measurements;

   c. The date(s) analyses were performed;

   d. The time(s) analyses were initiated;

   e. The initials or name(s) of the individual(s) who performed the analyses;

   f. References and written procedures, when available, for the analytical techniques or methods used; and

   g. The results of such analyses, including the bench sheets, instrument readouts, computer disks or tapes, etc., used to determine these results.

S. Monitoring Methods. Monitoring must be conducted according to test procedures approved under 40 CFR Part 136, unless other test procedures have been specified in this permit.

T. Inspection and Entry. The permittee shall allow the Director or an authorized representative of EPA, or the State, upon the presentation of credentials and other documents as may be required by law, to:

   1. Enter the permittee's premises where a regulated facility or activity is located or conducted or where records must be kept under the conditions of this permit;

   2. Have access to and copy at reasonable times, any records that must be kept under the conditions of this permit; and

   3. Inspect at reasonable times any facilities or equipment (including monitoring and control equipment).

U. Permit Actions. This permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

V. Additional Monitoring by the Permittee(s). If the permittees monitor more frequently than required by this permit, using test procedures approved under 40 CFR Part 136 or as specified in this permit, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the Discharge Monitoring Report (DMR). Such increased monitoring frequency shall also be indicated on the DMR.

VOL 22

0672

R0065907

PART VII. PERMIT MODIFICATION

A. **Modification of the Permit:** The permit may be reopened and modified during the life of the permit to:

1. Incorporate into the permit the finalized pollutant load reduction goals agreed to by the permittees and the National Estuary Program (NEP) in the National Estuary Program Comprehensive Conservation and Management Plan for the geographical area covered by this NPDES permit;

2. Address impacts on receiving water quality caused, or contributed to, by discharges from the MS4;

3. Address changes in State or Federal statutory or regulatory requirements;

4 Include the addition of a new permittee who is the owner or operator of a portion of the Municipal Separate Storm Sewer System; or

5. Include other modifications deemed necessary by the Director to comply with the goals and requirements of the Clean Water Act.

All modification to the permit will be made in accordance with 40 CFR 122.62, 122.63, and 124.5.

B. **Termination of Coverage for a Single Permittee**

Permit coverage may be terminated, in accordance with the provisions of 40 CFR 122.64 and 124.5, for a single permittee without terminating coverage for other permittees.

C. **Modification of Storm Water Management Program(s)**

Only those portions of the Storm Water Management Programs specifically required as permit conditions shall be subject to the modification requirements of 40 CFR 124.5. Replacement of an ineffective or infeasible BMP implementing a required component of the Storm Water Management Program with an alternate BMP expected to achieve the goals of the ineffective or infeasible BMP shall be considered minor modifications to the Storm Water Management Program and not modifications to the permit. (See also Part II.G.)

VOL 22 0673

R0065908

D. **Changes in Monitored Outfalls**

This permit is issued on a system-wide basis in accordance with CWA §402(p)(3)(i) and authorizes discharges from all portions of the Municipal Separate Storm Sewer System. Since all outfalls are authorized, changes in monitoring outfalls, other than those with specific numeric effluent limitations, if any, shall be considered minor modifications to the monitoring program and not modifications to the permit. (See also Part V.B.1. and V.C.6.) Changes in monitoring outfalls with specific numeric effluent limitations shall be considered modifications to the permit and will be made in accordance with the procedures at 40 CFR 122.62.

VOL 22

0674

R0065909

PART VIII. DEFINITIONS

All definitions contained in Section 502 of the CWA shall apply to this permit and are incorporated herein by reference. Unless otherwise specified in this permit, additional definitions of words or phrases used in this permit are as follows:

A. "Best Management Practices" ("BMPs") means schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures, and practices to control facility site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

B. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility, which is not a designed or established operating mode for the facility.

C. "CWA" means Clean Water Act, also referred to as "the Act" (formerly referred to as the Federal Water Pollution Control Act or Federal Water Pollution Control Act Amendments of 1972) Pub.L. 92-500, as amended Pub. L. 95-217, Pub. L. 95-576, Pub. L. 6-483 and Pub. L. 97-117, 33 U.S.C. 1251 et.seq., as amended by the WQA of 1987, P.L. 100-4, the "Act."

D. "Director" means the EPA Regional Administrator or an authorized representative.

E. "Discharge" for the purpose of this permit, unless indicated otherwise, refers to discharges from the Municipal Separate Storm Sewer System (MS4).

F. "Flow-weighted composite sample" means a composite sample consisting of a mixture of aliquots collected at a constant time interval, where the volume of each aliquot is proportional to the flow rate of the discharge at the time of sampling.

G. "Illicit connection" means any man-made conveyance connecting a non-storm water discharge directly to a municipal separate storm sewer system.

H. "Illicit discharge" means any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and other discharges listed in Part II. A.7.a. of this permit.

I. "Industrial Land Use" means land utilized in connection with manufacturing, processing, or raw materials storage at facilities identified under 40 CFR 122.26(b)(14).

J. "Landfill" means an area of land or an excavation in which wastes are placed for permanent disposal, and which is not a land application unit, surface impoundment, injection well, or waste pile.

VOL 22 0675

R0065910

K. "Large Municipal Separate Storm Sewer System" means all municipal separate storm sewers that are either:

(i) located in an incorporated place (city) with a population of 250,000 or more as determined by the latest Decennial Census by the Bureau of Census (these cities are listed in Appendices F and G of 40 CFR Part 122); or

(ii) located in the counties with unincorporated urbanized populations of 250,000 or more, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties (these counties are listed in Appendices H and I of 40 CFR Part 122); or

(iii) owned or operated by a municipality other than those described in paragraph (i) or (ii) and that are designated by the Director as part of the large municipal separate storm sewer system.

L. "Medium Municipal Separate Storm Sewer System" means all municipal separate storm sewers that are either:

(i) located in an incorporated place (city) with a population of 100,000 or more as determined by the latest Decennial Census by the Bureau of Census (these cities are listed in Appendices F and G of 40 CFR Part 122); or

(ii) located in the counties with unincorporated urbanized populations of 100,000 or more, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties (these counties are listed in Appendices H and I of 40 CFR Part 122); or

(iii) owned or operated by a municipality other than those described in paragraph (i) or (ii) and that are designated by the Director as part of the medium municipal separate storm sewer system.

M. "MEP" is an acronym for "Maximum Extent Practicable," the technology-based discharge standard for Municipal Separate Storm Sewer Systems established by CWA §402(p).

N. "MS4" is an acronym for "municipal separate storm sewer system" and is used to refer to either a Large or Medium Municipal Separate Storm Sewer System (e.g. "the Atlanta MS4").

VOL 22
0676

R0065911

O. "Municipal Separate Storm Sewer" means a conveyance, or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, and storm drains):

(i) owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State Law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State Law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian Tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

(ii) designed or used for collecting or conveying storm water;

(iii) which is not a combined sewer; and

(iv) which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

P. "Permittee" means each individual co-applicant for an NPDES permit who is only responsible for permit conditions relating to the discharge that they own or operate. (Also, See 40 CFR 122.2)

Q. "Point Source" means any discernible, confined, and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

R. "Severe property damage" means substantial physical damage to property, damage to the treatment facility which causes them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.

S. "State Storm Water Quality Standards", is defined at Section 403.0891 of the Florida Statutes, and State Water Policy, Chapter 62-40, Florida Administrative Code.

T. "Storm Sewer", unless otherwise indicated, refers to a municipal separate storm sewer.

U. "Storm Water" means storm water runoff, snow melt runoff, surface runoff and drainage.

V. "Storm Water Discharge Associated with Industrial Activity" is defined at 40 CFR 122.26(b)(14). (Also, See Fact Sheet for this Permit.)

VOL 22

0671

R0065912

W. "Storm Water Management Program" refers to a comprehensive program to manage the quality of storm water discharged from the municipal separate storm sewer system. For the purposes of this permit, the Storm Water Management Program is considered a single document, but may actually consist of separate programs (e.g. "chapters") for each permittee.

X. "Surface Water Ambient Monitoring Program" refers to a comprehensive program implemented by the Florida Department of Environmental Protection, Bureau of Surface Water Management, which is designed to accomplish the following goals:

1. Identify and document the existing condition of the surface waters of the State,

2. Document potential problem areas,

3. Establish stream ecoregion reference sites for comparison purposes,

4. Collect biological data at ecoregion reference sites to establish preliminary biological integrity measurements techniques, and

5. Establish a Statewide ambient monitoring network which will eliminate duplication, share data, increase efficiency, and improve assessment and management capabilities.

To date, the monitoring strategies included within the State of Florida's Surface Water Ambient Monitoring Program have been based on:

- Ecoregion Subregionalization and the associated stream Community Bioassessment Protocols (CBA) developed for the nonpoint source program,

- Chemistry Trend Network to fulfill the need to evaluate the State's water quality over time,

- Chemistry Status Network with emphasis on water bodies with fair or poor water quality or areas which have not been recently sampled, and

- Lake Ecoregion and Community Bioassessment Projects.

Y. "SWMP" is an acronym for "Storm Water Management Program."

Z. "Time-weighted composite" means a composite sample consisting of a mixture of equal volume aliquots collected at a constant time interval.

AA. "Waters of the United States" is defined at 40 CFR 122.2.

Re: NPDES Permit No. AKS052426
Port of Anchorage NPDES Municipal Storm Water Permit

Dear Ms. Adair:

A National Pollutant Discharge Elimination System (NPDES) permit has been issued to the referenced facility. Enclosed is a copy of the transmittal letter, permit, and list of changes made from the draft to the final permit.

There were no significant comments received during the public notice period. The permit will be effective 30 days after the issuance unless a request for evidentiary hearing is received.

Sincerely,

Charles E. Findley
Director, Water Division

Anchorage, Alaska 99501

Re: NPDES Permit No. AKS052426
Port of Anchorage NPDES Municipal Storm Water Permit

Dear Mr. Dietz:

We are issuing the above referenced National Pollutant Discharge Elimination System (NPDES) permit. The enclosed document is your official copy of the permit and demonstrates that the referenced facility is authorized to discharge to waters of the United States subject to certain specified requirements. Stipulations of the state's water quality certification and Coastal Management Program consistency determination have been incorporated into the permit. More specifically, the stipulations revising the monitoring conditions are in Part IV of the permit.

There were no significant comments received during the public notice period. This permit will become effective 30 days after the issuance date unless a request for an evidentiary hearing which meets the requirements of 40 CFR 124.74 is received. A copy of these requirements is enclosed for your information.

Sincerely,

Charles E. Findley
Director, Water Division

CHANGES TO DRAFT PERMIT

The following changes to the draft permit have been made for this final permit:

1) The Port of Anchorage commented that the outfall previously labelled 001, Transit Area A, was discovered by its consulting engineers to no longer exist, and asked that it be deleted from the application.

   EPA has deleted this outfall and re-numbered the remaining three outfalls as 001, 002, and 003 (see Table V.A.1.b).

2) Special requirements stipulated as part of the State of Alaska water quality certification are contained in Part IV of the permit. These special requirements include changes in monitoring, analytical test methods, and reporting requirements. Specifically:

   - The monitoring parameter "Total Aqueous Hydrocarbons" has been substituted for the parameter "Oil and Grease" found in Part II.B.9.b.

   - The analytical test methods EPA 602 and EPA 610 will be used to determine the presence of "Total Aqueous Hydrocarbons".

   - Copies of all documents, reports, and requests, required in the permit will be sent to the state offices as stipulated.

   In addition, the following changes to the permit have been made pursuant to the water quality stipulations and comments from the State:

   - Part II.A.1 has been expanded to include a statement on emphasizing source reduction techniques as a means to reduce the discharge of pollutants.

   - In Part II.B.4 the permittee is now directed to operate and maintain parking and cargo storage/staging areas in a manner to reduce, to the Maximum Extent Practicable, discharge of pollutants.

   - In Part II.B.11 the following was added as paragraph (d): a program to promote, publicize and facilitate implementation of technologies and techniques to prevent pollution through source reduction and recycling.

   - In Part II.B.7.b the items numbered 8, 12, and 13 now specify that the water be uncontaminated as found in #6.

   - The term "co-permittees" in Part II.C has been deleted.

VOL 22 0681

- In Part II.C.1 the term "port vehicles" has been clarified to mean those vehicles owned or operated by The Port.

- The citation in Part H.1 has been changed to correctly read Part II.I.

- The phrase "at the permittees option" in Part V.A.4.b has been deleted.

- The reference in Part V.B.1 has been changed to correctly read Part III.A.

AUTHORIZATION TO DISCHARGE UNDER THE

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

In compliance with the provisions of the Clean Water Act, 33 U.S.C. §1251 et seq., as amended by the Water Quality Act of 1987, P.L. 100-4, the "Act",

Port of Anchorage

is authorized to discharge from a Municipal Separate Storm Sewer System located at Port of Anchorage, 2000 Anchorage Port Road, Anchorage, Alaska,

to receiving waters named Cook Inlet,

in accordance with discharge point(s), an approved storm water management plan, monitoring requirements, and other conditions set forth herein.

This permit shall become effective March 3, 1995.

This permit and the authorization to discharge shall expire at midnight, March 3, 2000.

Signed this 1st day of February, 1995.

R0065919

PART I. DISCHARGES AUTHORIZED UNDER THIS PERMIT

A. **Permit Area**
This permit covers all areas within the jurisdictional boundary of the Port of Anchorage within the Municipality of Anchorage, Alaska, served by, or otherwise contributing to discharges from, municipal separate storm sewers (MS4s) owned or operated by the permittee listed in Part I.C.

B. **Authorized Discharges**
This permit authorizes all existing or new storm water point source discharges to waters of the United States from the MS4. This permit also authorizes the discharge of storm water commingled with flows contributed by process wastewater, non-process wastewater, or storm water associated with industrial activity provided such discharges are authorized under separate NPDES permits. This permit will consider any and all activities conducted by lessees of the Port of Anchorage while within the jurisdictional boundaries of the Port, and which activity leads to a discharge either to or from the MS4s for which this permit is written, to be the activity of the Port and subject to the conditions of this permit.

C. **Limitations on Coverage**
The following discharges are not authorized by this permit:

1. *Non-storm Water:* storm water discharges that are mixed with non-storm water or storm water associated with industrial activity except where such discharges are:

   a. in compliance with a separate NPDES permit; or

   b. identified by and in compliance with Part II.B.7 of this permit.

2. *Endangered Species Protection:* storm water discharges whose direct, indirect, interrelated, interconnected, or interdependent impacts would jeopardize a listed endangered or threatened species or adversely modify designated critical habitat.

3. *Historic Preservation:* storm water discharges, or the permittee construction activities or implementation of storm water management controls, which adversely effect properties listed or eligible for listing in the National Register of Historic Places, unless the permittee is in compliance with requirements of the National Historic Preservation Act and has coordinated any necessary activities to avoid or minimize impacts with the appropriate State Historic Preservation Officer; and

4. *Coastal Zone Management:* storm water discharges not in compliance with any applicable requirements of a State's Coastal Zone Management Plan.

VOL 22 0685

R0065920

PART II. STORM WATER POLLUTION PREVENTION & MANAGEMENT PROGRAMS

The permittee is required to develop and implement a storm water pollution prevention and management program designed to limit, to the maximum extent practicable, the discharge of pollutants from the MS4. Either collectively, or separately, the permittee's storm water pollution prevention and management program shall satisfy the requirements of paragraphs A through I, below for all portions of the MS4 authorized to discharge under this permit.

A. **POLLUTION PREVENTION REQUIREMENTS**
The permittee shall develop and implement the following pollution prevention measures:

1. The permittee shall include requirements to consider water quality impacts of new and significant re-development in its comprehensive master planning process. The goal of such requirements shall be limiting, to the maximum extent practicable, the discharge of pollutants to pre-development levels.

2. The permittee shall ensure the establishment or availability of a program to collect used motor vehicle fluids (including oil and antifreeze) and batteries for recycle or reuse. Such program shall be readily available to all lessees. This program shall be publicized and promoted on a regular basis, but at least anually.

3. The permittee shall ensure the establishment or availability of a program to collect commonly-used hazardous materials (including paint, pesticides, herbicides, cleaners, solvents, and similar hazardous materials) for recycle, reuse, or safe disposal. The program shall be readily available to all lessees and include information on locations accepting such materials on a continuous basis. This program shall be publicized and promoted on a regular basis, but at least anually.

4. The permittee shall ensure the establishment of a program, including structural controls where necessary, to reduce the discharge of floatables (including solid wastes) to the maximum extent practicable.

B. **SWMP SYSTEM-WIDE REQUIREMENTS**
The permittee shall operate a Storm Water Management Program (SWMP) in accordance with Section 402(p)(3)(B) of the Clean Water Act, the storm water regulations (40 CFR Part 122.26) and the approved SWMP plan to be submitted to EPA by the permittee. SWMP controls and activities identified in the SWMP plan shall clearly identify areas of applicability on a system-wide basis, jurisdiction-wide basis, or specific-area basis. The SWMP, and all approved updates, are hereby incorporated into this permit by reference and shall be implemented in a manner consistent with the following requirements:

VOL 22 0686

R0065921

1. *Statutory Requirements:* SWMPs shall include controls necessary to reduce the discharge of pollutants from the MS4 to the Maximum Extent Practicable (MEP). Controls may consist of a combination of best management practices, control techniques, system design and engineering methods, and such other provisions as the permittee, Administrator or the State determines appropriate. The various components of the SWMP, taken as a whole (rather than individually), shall be sufficient to meet the statutory MEP standard. The SWMP shall be updated as necessary to ensure conformance with the statutory requirements of Clean Water Act §402(p)(3)(B)(ii) and (iii).

2. *Structural Controls:* The permittee shall operate and maintain any storm water structural controls over which it has jurisdiction, in a manner so as to reduce the discharge of pollutants (including floatables) to the MEP.

3. *Areas of New Development:* The Port of Anchorage shall utilize a comprehensive master planning process to develop, implement, and enforce controls to reduce, to the MEP, the discharge of pollutants from areas of new development and significant redevelopment after construction is completed.

4. *Roadways:* The permittee shall operate and maintain public streets, roads, highways, parking areas, and cargo storage/staging areas under its jurisdiction in a manner so as to reduce, to the MEP, discharge of pollutants (including those related to deicing or sanding activities).

5. *Flood Control Projects:* The permittee shall ensure any flood control project it undertakes assesses and minimize to the MEP the impacts on water quality of the receiving waters. The permittee shall also evaluate the feasibility of retro-fitting existing structural flood control devices to provide additional pollutant removal from storm water. If retro-fitting is found to be feasible, the permittee shall implement the retro-fitting of existing structural devices within 3 years of such determination of feasibility.

6. *Pesticide, Herbicide, and Fertilizer Application:* The permittee shall implement controls to reduce, to the MEP, the discharge of pollutants related to application of pesticides, herbicides, and fertilizers applied by Port employees, contractors, or lessees to public right of ways, parks, and all port lands and facilities.

7. *Illicit Discharges and Improper Disposal:* The permittee shall implement an ongoing program to detect and eliminate illicit discharges and improper disposal into the storm sewer. The permittee may chose to require the discharger to the MS4 to eliminate the illicit discharges or obtain a separate NPDES permit for such discharges.

VOL 22

0687

R0065922

a. The permittee shall effectively prohibit non-storm water discharges to the MS4.

b. Unless identified by either the permittee, the Administrator, or the State as significant sources of pollutants to waters of the United States, the following non-storm water discharges need not be prohibited from entering the MS4, provided the necessity of such discharge(s) and appropriate control measures (if needed) to minimize the impacts of such sources, are developed under the SWMP:

(1) water line flushing;
(2) landscape irrigation;
(3) diverted stream flows;
(4) rising ground waters;
(5) uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)) to separate storm sewers;
(6) uncontaminated pumped ground water;
(7) discharges from potable water sources;
(8) uncontaminated foundation drains;
(9) air conditioning condensate;
(10) irrigation water;
(11) springs;
(12) uncontaminated water from crawl space pumps;
(13) uncontaminated footing drains;
(14) lawn watering;
(15) individual residential car washing;
(16) flows from riparian habitats and wetlands;
(17) dechlorinated swimming pool discharges;
(18) street wash waters;
(19) NPDES permitted non-contact cooling waters and remediated ground waters, provided appropriate management practices are implemented and the discharges are in accordance with the Municipality's storm water management program; and,
(20) discharges or flows from emergency fire fighting activities.

c. The permittee shall prevent discharges of dry and wet weather overflows from sanitary sewers into the MS4. The permittee shall limit, to the maximum extent practicable, the infiltration of seepage from sanitary sewers into the MS4.

d. The permittee shall prohibit the discharge or disposal of all motor vehicle fluids and chemical wastes into separate storm sewers.

e. The permittee shall require the elimination of illicit connections as expeditiously as possible and the immediate cessation of improper disposal practices upon identification of responsible parties. Where elimination of an illicit connection within seven (7) days is not possible, the Port of Anchorage shall require an expeditious

VOL 22 0688

R0065923

schedule for elimination of the discharge. In the interim, the Port of Anchorage shall require the operator of the illicit connection to take all reasonable and prudent measures to minimize the discharge of pollutants to the MS4. Elimination schedules should not exceed ninety (90) days, except for capital intensive projects which shall not exceed 455 days (one year ninety days).

8. *Spill Prevention and Response:* The permittee shall implement a program to prevent, contain, and respond to spills that may discharge into the MS4. The spill response program may include a combination of spill response actions by the permittee and its lessees.

9. *Industrial & High Risk Runoff:* The permittee shall implement a program to identify, monitor, and control pollutants in storm water discharges to the MS4 from: hazardous waste treatment, storage and disposal facilities that are subject to EPCRA Title III, Section 313; bulk storage facilities; and, any other industrial or commercial discharges the permittee determines are contributing a substantial pollutant loading to the MS4. The program shall include:

   a. priorities and procedures for inspections and establishing and implementing control measures for such discharges;

   b. a monitoring (or self-monitoring) program for facilities identified under this section, including the collection of quantitative data on the following constituents:

      (1) any pollutants limited in an existing NPDES permit for an identified facility;
      (2) oil and grease;
      (3) chemical oxygen demand (COD);
      (4) pH;
      (5) biochemical oxygen demand, five-day (BOD_5);
      (6) total suspended solids (TSS);
      (7) total phosphorous;
      (8) total Kjeldahl nitrogen (TKN);
      (9) nitrate plus nitrite nitrogen; and
      (10) any of the metals cadmium, copper, lead, and zinc which can be reasonably expected in storm water runoff from such industrial site; and,
      (11) any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).

10. *Construction Site Runoff:* The permittee shall implement a program to reduce, to the MEP, the discharge of pollutants from constructions sites, including:

   a. requirements for the use and maintenance of appropriate structural and nonstructural best management practices to reduce pollutants

VOL 22 0689

R0065924

discharged to the MS4 upon commencement of, and during, the construction activities;

b. procedures for site planning which incorporate considerations for potential short and long term water quality impacts and minimizes, to the MEP, these impacts;

c. prioritized inspection of construction sites and enforcement of SWMP-required control measures;

d. appropriate education and training measures for construction site operators; and,

e. notification of all construction permit applicants of their potential responsibilities under the NPDES permitting program for construction site runoff.

11. *Public Education:* The permittee shall implement a public education program including:

a. a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or improper disposal of materials into the MS4;

b. a program to promote, publicize, and facilitate the proper management and disposal of used oil and commonly-used hazardous materials.

c. a program to promote, publicize, and facilitate the proper use, application, and disposal of pesticides, herbicides, and fertilizers by commercial and private applicators and distributors conducting such business within the Port of Anchorage jusrisdictional area.

C. **AREA-SPECIFIC STORM WATER MANAGEMENT PROGRAM REQUIREMENTS**
The following SWMP requirements apply only to the areas or discharges specified below. Management practices must also be developed in the SWMP for the following:

1. The Port of Anchorage (The Port) will provide an area for the washing of Port vehicles (that is, vehicles owned or operated by The Port) that will not result in the discharge of wash waters. The Port will encourage the use of detergent-free methods of vehicle washing and will require regular maintenance of the area to ensure wash waters, and resulting contaminants, will not be transported by storm water to waters of the U.S. This area is not required to be within Port jurisdictional boundaries, and does not have to be operated by the Port or Port personnel.

2. The Port may provide this area to its tenants solely for the purpose of vehicle washing. In such case, The Port accepts the responsibilty of proper operation and

VOL 22
0690
R0065925

maintenance of this area, and will ensure proper management practices are adhered to at all times.

3. All vehicle and equipment maintenance areas will be managed so as to control discharges from these areas to the maximum extent practicable. All hydrocarbon compounds used in these areas will be handled in a manner that will eliminate or minimize potential discharges to waters of the U.S.

D. **DEADLINES FOR PROGRAM COMPLIANCE**

1. Except as provided in PART III, compliance with the storm water management program shall be required within 120 days of the effective date of this permit.

2. Proposed modifications and updates to the SWMP, along with proposed schedules for implementation, shall be submitted with the Annual Report required under Part II.G. to EPA.

E. **ROLES AND RESPONSIBILITIES OF PERMITTEE AND LESSEES**

The SWMP plan shall clearly identify the roles and responsibilities of the permittee. Activities required of the lessees by the permittee must also be clearly identified.

F. **LEGAL AUTHORITY**

The permittee shall ensure legal authority exists to control discharges to and from those portions of the MS4 over which it has jurisdiction. This legal authority may be a combination of statute, ordinance, permit, contract, order or inter-jurisdictional agreements with entities having existing legal authority to:

1. Control the contribution of pollutants to the MS4 by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity;

2. Prohibit illicit discharges to the municipal separate storm sewer;

3. Control the discharge of spills and the dumping or disposal of materials other than storm water into the MS4;

4. Control through interagency agreements among co-permittees the contribution of pollutants from one portion of the MS4 to another;

5. Require compliance with conditions in ordinances, permits, contracts or orders; and,

6. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance with permit conditions.

VOL 22

0691

R0065926

G. **SWMP RESOURCES**

The permittee shall provide adequate finances, staff, equipment, and support capabilities to fully implement the storm water management program.

H. **SWMP REVIEW AND MODIFICATION**

1. *Program Review:* The permittee shall conduct an annual review of the current SWMP in conjunction with preparation of the annual system-wide report required under Part II.I. This annual review shall include:

   a. A review of the status of program implementation and compliance (or non-compliance) with all schedules of compliance contained in this permit;

   b. An assessment of the effectiveness of controls established by the SWMP;

   c. A review of monitoring data and any trends in estimated cumulative annual pollutant loadings; and,

   d. An assessment of any SWMP modifications needed to comply with the CWA §402(p)(3)(B)(iii) requirement to reduce the discharge of pollutants to the MEP.

2. *Program Modification:* The approved SWMP, and its plan, shall not be modified by the permittee without the prior approval of the EPA, unless in accordance with items a. through c. below:

   a. Modifications adding (but not subtracting or replacing) components, controls, or requirements to the approved SWMP may be made by the permittee at any time upon written notification to the permitting authority.

   b. Modifications replacing a failing Best Management Practice (BMP) identified in the SWMP with an alternate BMP may be requested in conjunction with the annual system-wide report required by Part II.I. below. Such requests must: 1) be made in writing; 2) provide an analysis of why the BMP is failing or ineffective (including cost prohibitive); 3) discuss the expectations of the effectiveness of the replacement BMP; and, 4) explain why the replacement BMP is expected to provide at least the same level of performance as originally expected of the BMP to be replaced.

   c. Modifications made under this paragraph shall not become enforceable permit conditions until such time as the modifications are approved by EPA.

   Modification requests and/or notifications shall be signed in accordance with Part VI.H.

VOL 22 0692

R0065927

3. *Modifications Required by the Permitting Authority:* The EPA may require the permittee to modify the SWMP as needed to:

   a. Address contributions by the MS4 discharges to impacts on receiving water quality;

   b. Include more stringent requirements necessary to comply with new State or Federal statutory or regulatory requirements; or,

   c. Include such other conditions deemed necessary by the Administrator to comply with the goals and requirements of the Clean Water Act.

   Modifications requested by the Administrator shall be made in writing, set forth the time schedule for the permittee to develop the modification(s), and offer the permittee the opportunity to propose alternative program modifications to meet the objective of the requested modification.

I. **SYSTEM-WIDE REPORT**

The permittee shall prepare and submit a system-wide report no later than one year after the anniversary of the effective date of this permit (March 3, 1995), and continue to submit an updated system-wide report every year thereafter. The report shall include the following separate sections and an overview for the entire MS4:

1. The status of implementing the components of the SWMPs that are established as permit conditions (status of compliance with any schedules established under this permit shall be included in this section);

2. Proposed changes to the SWMPs that are established as permit conditions, including an update on areas added to the MS4 due to annexation or other legal means;

3. Revisions, if necessary, to the assessments of controls and management practices;

4. A summary of the data, including monitoring data, that is accumulated throughout the last reporting year;

5. Annual expenditures for the reporting period (i.e., the last year), and projected budget for the one year period comprising the next system-wide report;

6. A summary describing the number and nature of compliance actions, inspections, and public education programs; and,

7. Identification of water quality improvements or degradation, with a discussion of those management practices implemented or proposed for implementation to address identified water quality degradation.

VOL 22

0693

R0065928

PART III. SCHEDULES FOR COMPLIANCE

A. IMPLEMENTATION OF POLLUTION PREVENTION MEASURES

POLLUTION PREVENTION MEASURE	ACTIVITY DESCRIPTION	DATE DUE
Part II.A.1 - New Development & Re-Development	Implement construction-phase storm water runoff control program.	March 4, 1996
	Modify land use planning process within Port to require controls for storm water quality.	March 3, 1998
	Implement requirements for post-construction storm water quality controls for new and significant re-development.	July 30, 1998
Part II.A.2 - Vehicle Fluids	Implement public education program.	July 30, 1995
	Develop collection/recycling/safe disposal program.	March 4, 1996
	Implement collection/recycling/safe disposal program.	March 3, 1997
Part II.A.3 - Common Hazardous Waste	Implement public education program.	July 30, 1995
	Develop collection/recycling/safe disposal program.	March 4, 1996
	Implement collection/recycling/safe disposal program.	March 3, 1997
Part II.A.4 - Floatables	Implement public education program.	July 30, 1995
	Implement litter control program.	July 30, 1995
	Install floatables monitoring location (See Part V.A.2)	July 30, 1995
	Complete study for targeting of structural controls.	July 30, 1996
	Complete installation of structural controls on 100% of targeted storm sewer.	July 30, 1997

VOL 22 0694

R0065929

B. IMPLEMENTATION OF STORM WATER MANAGEMENT PLANS

SWMP ACTIVITY	ACTIVITY DESCRIPTION	DATE DUE
PART II.B - Storm Water Management Program (SWMP) plan development	Complete development of SWMP plan	June 5, 1995
Part II.B.7 - Illicit Discharges and Improper Disposal	Implement public education program.	July 30, 1995
	Complete screening of the MS4.	July 30, 1996
	Complete follow up investigations based on screening results.	July 30, 1999
Part II.I - System-wide Report	Episodic system and implementation status report	Annually: March 3

VOL 22

0695

R0065930

PART IV. SPECIAL PERMIT REQUIREMENTS

The following requirements are included in this permit as stipulations of water quality certification from the Alaska Department of Environmental Conservation (ADEC).

A. **MONITORING**

1. In Part II.B.9.b the parameter "Total Aqueous Hydrocarbons" will be substituted for the parameter "Oil and Grease" on the list of parameters to be monitored.

   The parameter "Total Aqueous Hydrocarbons" (TAqH) means those collective dissolved and water-accomodated monoaromatic and polynuclear aromatic petroleum hydrocarbons that are persistent in the water column; TAqH does not include floating surface oils and greases. TAqH is calculated by summing the values of the parameters Total Aromatic Hydrocarbons (TAH) and Total Polynuclear Hydrocarbons (PAH). The parameters TAqH, TAH, and PAH are all defined in the Adopted Draft Water Quality Standards, 18 AAC 70.020(b) Note #8, dated 9/13/94. The test methods to be used to determine the presence of these parameters are the EPA 602 method for TAH and the EPA 610 method for PAH. Equivalent methods may be substituted for EPA 610 that meet the performance standards, Minimum Detection Limits (MDLs), precision, and standard recoveries specified in method 610. The applicable criteria are contained in Note #8 (cited above).

2. Table V.A.1.a (Monitoring Frequency) shall be modified as follows:

   a) The monitoring frequency and the parameters listed for monitoring in years 2 and 3 shall be identical to that listed for year 4, such that the full list of parameters will be sampled in years 2, 3, and 4 at the frequency listed under YEAR 4.

   b) The parameter "Total Aqueous Hydrocarbons" will be substituted in the table for the parameter "Oil and Grease" (as discussed above).

   c) Delete "Other Water Quality Parameters" from the table.

VOL 22 0696

R0065931

B. **MISCELLANEOUS**

1. Copies of all reports required in the permit will be sent to the following ADEC offices:

Alaska Department of Environmental Conservation
Southcentral Regional Office
3601 C Street, Suite 1334
Anchorage, AK 99503
(907) 563-6529

Alaska Department of Environmental Conservation
Anchorage Western District Office
800 E. Dimond Blvd. #3-470
Anchorage, Alaska 99515
(907) 349-7755

2. In Part II.A.1., add the following statement: The permittee shall emphasize source reduction techniques as a means to reduce the discharge of pollutants. The permittee shall inform the lessees of the availability, through ADEC, of pollution prevention resources, technical assistance programs and other non-regulatory initiatives that will support the overall objective of eliminating the discharge of pollutants.

3. In Part II.B.11., add the following as paragraph (d): a program to promote, publicize and facilitate implementation of technologies and techniques to prevent pollution through source reduction and recycling.

VOL 22

0697

R0065932

PART V. MONITORING AND REPORTING REQUIREMENTS

A. **Storm Event Monitoring**

The permittee shall implement a wet-weather monitoring program for the MS4 to provide data necessary to: 1) assess the effectiveness and adequacy of control measures implemented under the SWMP; 2) estimate annual cumulative pollutant loadings from the MS4; 3) estimate event mean concentrations and seasonal pollutants in discharges from major outfalls; 4) identify and prioritize portions of the MS4 requiring additional controls; and, 5) identify water quality improvements or degradation.

1. *Representative Monitoring:*
The permittee shall monitor representative outfalls and/or instream monitoring locations to characterize the quality of storm water discharges from the MS4.

   a. Monitoring Requirements: (See Table V.A.1.a).

   b. Outfall Descriptions: (See Table V.A.1.b)

2. *Wet Weather Screening Program:*
The permittee shall implement a program to screen all areas contibuting storm water to the MS4 for the presence of excessive pollutants in discharges from the MS4. The wet weather screening program:

   a. Shall screen the entire MS4 at least once during the permit term.

   b. Shall specify the sampling and non-sampling techniques, parameters, collection techniques, and analytical methods to be used for initial screening purposes. For screening samples only, sample collection and analysis need not conform to the requirements of 40 CFR Part 136 and are not subject to the requirements of Paragraphs 3, 4, and 5 below.

VOL 22

0698

R0065933

Table V.A.1.a. - Monitoring Requirements for Outfalls 001, 002, and 003[1]

PARAMETER	MONITORING FREQUENCY				
	YEAR 1	YEAR 2	YEAR 3	YEAR 4	YEAR 5
Biochemical Oxygen Demand (BOD_5) (mg/l)	Once/year	Once/year	Once/year	Once/year	Once/year
Chemical Oxygen Demand (COD) (mg/l)	Once/year	Once/year	Once/year	Once/year	Once/year
Total Suspended Solids (TSS) (mg/l)	Once/year	Once/year	Once/year	Once/year	Once/year
Total Dissolved Solids (TDS) (mg/l)	Once/year	Once/year	Once/year	Once/year	Once/year
Total Nitrogen (mg/l)	Once/year	Once/year	Once/year	Once/year	Once/year
Total Kjeldahl Nitrogen (TKN) (mg/l)	Once/year	Once/year	Once/year	Once/year	Once/year
Total Phosphorus (mg/l)	---------	---------	---------	Once/year	---------
Dissolved Phosphorus (mg/l)	---------	---------	---------	Once/year	---------
Oil & Grease (mg/l)	Twice/year	Twice/year	Twice/year	Twice/year	Twice/year
Total Cadmium (ug/l)	---------	---------	---------	Once/year	---------
Total Copper (ug/l)	---------	Once/year	---------	Once/year	---------
Total Lead (ug/l)	---------	---------	---------	Once/year	---------
Total Zinc (ug/l)	---------	Once/year	---------	Once/year	---------
Ph (S.U.)	Twice/year	Twice/year	Twice/year	Twice/year	Twice/year
Hardness (as $CaCO_3$) (mg/l)	---------	---------	---------	Once/year	---------
Temperature (°C)	Twice/year	Twice/year	Twice/year	Twice/year	Twice/year

[1] This table represents the baseline monitoring requirements for the discharges and outfalls described in this permit. Some specific parameters and monitoring frequencies have have been modified pursuant to the special requirements as discussed in Part IV of this permit.

R0065934

Table V.A.1.b - Representative Monitoring Outfall Descriptions

OUTFALL	LOCATION	DESCRIPTION
001	Transit Area B	Storm water drain for Transit Area B. This area is 52.0 total acres with 16.2 acres of impervious surface.
002	Transit Area D and Transit Area A	Storm water drain for Transit Area D and a portion of Transit Area A. Transit Area D is 43.4 total acres and has 7.8 acres of impervious surface. This portion of Transit Area A has 55 total acres with 15 acres covered by impervious surface. The total acreage of impervious surface draining to outfall 002 is 22.8 acres.
003	Transit Area 12-B	Storm water drain for Transit Area 12-B. Area 12-B is 36.7 total acres with 16.8 acres of impervious surface.

VOL 22

07000

R0065935

c. Shall establish three monitoring locations for removal of floatable material in discharges from the MS4. The amount of material collected shall be estimated in cubic yards. Floatable material shall be measured periodically as necessary for maintenance of the removal device.

d. Shall submit, along with the system-wide report required by Part II.I, the following information:

(1) An estimate of the amount of floatable material collected (cubic yards);

(2) A summary of results and actions taken or proposed based on the results of the wet weather screening program.

e. Any monitoring location that collects an annual average of less than 3 cubic yards of floatables over any consecutive 3 calendar-year period during the permit term will no longer be considered a mandatory monitoring location. The Port must maintain at least one monitoring location for floatables regardless of the amount of floatables collected.

3. *Storm Event Data:*
Quantitative data shall be collected to estimate pollutant loadings and event mean concentrations for each parameter sampled. In addition to the parameters listed above, The Port shall maintain records on site of the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

4. *Sample Type, Collection, and Analysis:*
a. For discharges from storm water holding ponds or other storm water impoundments with a retention period greater than 24 hours, (estimated by dividing the volume of the detention pond by the estimated volume of water discharged during the 24 hours previous to the time that the sample is collected) a minimum of one grab sample may be taken.

b. Grab samples taken during the first two hours of discharge shall be used for the analysis (if required) of pH, temperature, cyanide, oil & grease, fecal coliform, fecal streptococcus, total phenols, residual chlorine, and volatile organics. For all other parameters, data shall be reported

VOL 22

0701

R0065936

for flow weighted composite samples of the entire event or, at a minimum, the first three hours of discharge.

c. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Composite samples may be taken with a continuous sampler or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire discharge or for the first three hours of the discharge, with each aliquot being separated by a minimum period of fifteen minutes.

d. Analysis and collection of samples shall be done in accordance the methods specified at 40 CFR Part 136. Where an approved Part 136 method does not exist, any available method may be used.

5. *Sampling Waiver:*
When a discharger is unable to collect samples due to adverse climatic conditions, the discharger must submit in lieu of sampling data a description of why samples could not be collected, including available documentation of the event. Adverse climatic conditions which may prohibit the collection of samples includes weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.). Dischargers are precluded from exercising this waiver more than once during a two year period.

B. <u>Dry Weather Monitoring</u>

1. *Dry Weather Screening Program:*
The permittee shall continue ongoing efforts to detect the presence of illicit connections and improper discharges to the MS4. All portions (but not necessarily all outfalls) of the MS4 must be screened at least once during the permit term, in accordance with the schedule set forth in PART III.A.

2. *Screening Procedures:*
Screening methodology may be developed and/or modified based on experience gained during actual field screening activities and need not conform to the protocol at 40 CFR 122.26(d)(1)(iv)(D).

3. *Follow-up on Dry Weather Screening Results:*
The permittee shall implement a program to locate and

VOL 22 0702

R0065937

eliminate suspected sources of illicit connections and improper disposal identified during dry weather screening activities. Follow-up activities may be prioritized on the basis of:

a. magnitude and nature of the suspected discharge;

b. sensitivity of the receiving water; and

c. other relevant factors.

C. **Certification and Signature of Reports**

1. All reports required by the permit and other information requested by the Director shall be signed and certified in accordance with Parts VII.H. & VII.I. of the permit.

D. **Reporting: Where to Submit**

1. Monitoring results obtained during each anual reporting period shall be submitted on Discharge Monitoring Report Form(s) and included with the annual system-wide reprt. A separate Discharge Monitoring Report Form is required for each event monitored. The first report may include less than twelve months of information.

2. Signed copies of discharge monitoring reports required under Part V., the System-Wide Report required by Part II.G., SWMP modifications and modification requests, requests for changes in monitoring outfalls and all other reports required herein, shall be submitted to:

U.S. EPA, Region 10
Wastewater Management and Enforcement Branch
Municipal Storm Water Permits (WD-135)
1200 Sixth Avenue
Seattle, Washington 98101

E. **Additional Notification**

1. Copies of the discharge monitoring reports required under Part V., the System-Wide Report required by Part II.G., and other reports requested by the State shall be submitted to:

Alaska Department of Environmental Conservation
Southcentral Regional Office
3601 C Street, Suite 1334
Anchorage, AK 99503
(907) 563-6529

VOL 22 0703

R0065938

Alaska Department of Environmental Conservation
Anchorage Western District Office
800 E. Dimond Blvd. #3-470
Anchorage, Alaska 99515
(907) 349-7755

F. **Retention of Records**

1. The permittee shall retain at The Port the latest approved version of the storm water management program developed in accordance with Part II of this permit until at least three years after coverage under this permit terminates. The permittee shall retain at The Port all records of all monitoring information, copies of all reports required by this permit, and records of all other data required by or used to demonstrate compliance with this permit, until at least three years after coverage under this permit terminates. This period may be explicitly modified by alternative provisions of this permit or extended by request of the Director at any time.

VOL 22

0704

R0065939

PART VI. STANDARD PERMIT CONDITIONS

A. Duty to Comply

1. The permittee must comply with all conditions of this permit insofar as those conditions are applicable to each permittee, either individually or jointly. Any permit noncompliance constitutes a violation of CWA and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or for denial of a permit renewal application.

B. Penalties for Violations of Permit Conditions

1. Criminal

a. Negligent Violations The CWA provides that any person who negligently violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than 1 year, or both.

b. Knowing Violations The CWA provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

c. Knowing Endangerment The CWA provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than $250,000, or by imprisonment for not more than 15 year, or both.

d. False Statement The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than 2 years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4

VOL 22 0705

R0065940

years, or by both. (See Section 309(c)(4) of the Clean Water Act).

2. Civil Penalties - The CWA provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed $25,000 per day for each violation.

3. Administrative Penalties - The CWA provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to an administrative penalty, as follows:

   a. Class I penalty Not to exceed $10,000 per violation nor shall the maximum amount exceed $25,000.

   b. Class II penalty Not to exceed $10,000 per day for each day during which the violation continues nor shall the maximum amount exceed $125,000.

C. **Duty to Reapply**

If the permittee wishes to continue an activity regulated by this permit after the permit expiration date, the permittee(s) must apply for and obtain a new permit. The application shall be submitted at least 180 days prior to expiration of this permit. The Administrator may grant permission to submit an application less than 180 days in advance but no later than the permit expiration date. Continuation of expiring permits shall be governed by regulations promulgated at 40 CFR 122.6 and any subsequent amendments.

D. **Need to halt or reduce activity not a defense**

It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

E. **Duty to Mitigate**

The permittee shall take all reasonable steps to minimize or prevent any discharge in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.

F. **Duty to Provide Information**

The permittee shall furnish to the Administrator, within a time specified by the Director, any information which the

VOL 22 0706

R0065941

Administrator may request to determine compliance with this permit. The permittee shall also furnish to the Administrator upon request copies of records required to be kept by this permit.

G. **Other Information**
When the permittee becomes aware that he or she failed to submit any relevant facts or submitted incorrect information in any report to the Director, he or she shall promptly submit such facts or information.

H. **Signatory Requirements**
All Discharge Monitoring Reports, storm water pollution prevention plans, reports, certifications or information either submitted to the Administrator or that this permit requires be maintained by the permittee, shall be signed by:

1. either a principal executive officer or ranking elected official.

2. a duly authorized representative of that person. A person is a duly authorized representative only if:

   a. The authorization is made in writing by a person described above and submitted to the Director.

   b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of manager, operator, superintendent, or position of equivalent responsibility or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position).

   c. If an authorization is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new notice of intent satisfying the requirements of this paragraph must be submitted to the Director prior to or together with any reports, information, or applications to be signed by an authorized representative.

I. **Certification**
Any person signing documents under this section shall make the following certification:

VOL 22

0707

R0065942

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

J. **Penalties for Falsification of Reports**
Section 309(c)(4) of the Clean Water Act provides that any person who knowingly makes any false material statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than 2 years, or by both.

K. **Penalties for Falsification of Monitoring Systems**
The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by fines and imprisonment described in Section 309 of the CWA.

L. **Oil and Hazardous Substance Liability**
Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties to which the permittee is or may be subject under section 311 of the CWA or section 106 of CERCLA.

M. **Property Rights**
The issuance of this permit does not convey any property rights of any sort, nor any exclusive privileges, nor does it authorize any injury to private property nor any invasion of personal rights, nor any infringement of Federal, State or local laws or regulations.

N. **Severability**
The provisions of this permit are severable, and if any provision of this permit, or the application of any provision

VOL 22 0708

R0065943

of this permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this permit shall not be affected thereby.

O. Requiring an individual permit

1. The Administrator may require the permittee authorized by this permit to obtain an individual NPDES permit. Any interested person may petition the Administrator to take action under this paragraph. The Director may require any owner or operator authorized to discharge under this permit to apply for an individual NPDES permit only if the owner or operator has been notified in writing that a permit application is required. This notice shall include a brief statement of the reasons for this decision, an application form (as necessary), a statement setting a deadline for the owner or operator to file the application, and a statement that on the effective date of the individual NPDES permit, coverage under this permit shall automatically terminate. Individual permit applications shall be submitted to the address of the appropriate Regional Office shown in Part V.D. of this permit. The Administrator may grant additional time to submit the application upon request of the applicant. If an owner or operator fails to submit in a timely manner an individual NPDES permit application as required by the Administrator, then the applicability of this permit to the individual NPDES permittee is automatically terminated at the end of the day specified for application submittal.

2. Any owner or operator authorized by this permit may request to be excluded from the coverage of this permit by applying for an individual permit. The owner or operator shall submit an individual application as specified by 40 CFR 122.26(d) with reasons supporting the request to the Administrator. Individual permit applications shall be submitted to the address of the appropriate Regional Office shown in Part V.D. of this permit. The request may be granted by the issuance of a individual permit if the reasons cited by the owner or operator are adequate to support the request.

P. State/Environmental Laws

1. Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable State law or regulation under authority preserved by section 510 of the Act.

VOL 22 0709

R0065944

2. No condition of this permit shall release the permittee from any responsibility or requirements under other environmental statutes or regulations.

Q. Proper Operation and Maintenance

The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit and with the requirements of storm water pollution prevention plans. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance requires the operation of backup or auxiliary facilities or similar systems, installed by a permittee only when necessary to achieve compliance with the conditions of the permit.

R. Monitoring and records

1. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

2. The permittee shall retain records of all monitoring information including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of the reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least 3 years from the date of the sample, measurement, report or application. This period may be extended by request of the Administrator at any time.

3. Records of monitoring information shall include:

   a. The date, exact place, and time of sampling or measurements;

   b. The initials or name(s) of the individual(s) who performed the sampling or measurements;

   c. The date(s) analyses were performed;

   d. The time(s) analyses were initiated;

   e. The initials or name(s) of the individual(s) who performed the analyses;

   f. References and written procedures, when available, for the analytical techniques or methods used; and

VOL 22 0710

R0065945

g. The results of such analyses, including the bench sheets, instrument readouts, computer disks or tapes, etc., used to determine these results.

S. **Monitoring Methods**
Monitoring must be conducted according to test procedures approved under 40 CFR Part 136, unless other test procedures have been specified in this permit.

T. **Inspection and Entry**
The permittee shall allow the Administrator or an authorized representative of EPA, or the State, upon the presentation of credentials and other documents as may be required by law, to:

1. Enter upon the permittee's premises where a regulated facility or activity is located or conducted or where records must be kept under the conditions of this permit;

2. Have access to and copy at reasonable times, any records that must be kept under the conditions of this permit; and,

3. Inspect at reasonable times any facilities or equipment (including monitoring and control equipment).

U. **Permit Actions**
This permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

VOL 22

0711

R0065946

PART VII. PERMIT MODIFICATION

A. **Modification of the Permit**
The permit may be reopened and modified during the life of the permit to address:

1. changes in the State's Water Quality Management Plan, including Water Quality Standards;

2. changes in State or Federal statutes or regulations;

3. add a co-permittee who is the owner or operator of a portion of the MS4;

4. changes in portions of the storm water management program that are considered permit conditions; or

5. other modifications deemed necessary by the Administrator to meet the requirements of the Clean Water Act.

All modification to the permit will be made in accordance with 40 CFR 122.62, 122.63, and 124.5.

B. **Termination of Coverage for a Single Co-permittee**
Permit coverage may be terminated, in accordance with the provisions of 40 CFR 122.64 and 124.5, for a single co-permittee without terminating coverage for other co-permittees.

C. **Modification of Storm Water Management Program(s)**
Only those portions of the SWMPs specifically required as permit conditions shall be subject to the modification requirements of 40 CFR 124.5. Replacement of a failing BMP implementing a required component of the SWMP with an alternate BMP expected to provide at least the same level of performance initially expected of the failing BMP, shall be considered minor modifications to the permit and will be made in accordance with the procedures at 40 CFR 122.63.

D. **Changes in Monitoring Outfalls**
This permit is issued on a system-wide basis in accordance with CWA § 402(p)(3)(i) and authorizes discharges from all portions of the MS4. Since all outfalls are authorized, changes in monitoring outfalls, other than those with specific numeric effluent limitations, shall be considered minor modifications to the permit and will be made in accordance with the procedures at 40 CFR 122.63.

VOL 22
0712
R0065947

PART VIII. DEFINITIONS

"Administrator" means the Regional Administrator.

"Best Management Practices" ("BMPs") means schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures, and practices to control facility site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

"CWA" means Clean Water Act (formerly referred to as the Federal Water Pollution Control Act or Federal Water Pollution Control Act Amendments of 1972) Pub.L. 92-500, as amended Pub. L. 95-217, Pub. L. 95-576, Pub. L. (6-483 and Pub. L. 97-117, 33 U.S.C. 1251 et.seq.

"Co-permittee" means a permittee to a NPDES permit that is only responsible for permit conditions relating to the discharge for which it is operator.

"Director" means the Regional Administrator or an authorized representative.

"Discharge" for the purpose of this permit, unless indicated otherwise, refers to discharges from the Municipal Separate Storm Sewer System (MS4).

"Flow-weighted composite sample" means a composite sample consisting of a mixture of aliquots collected at a constant time interval, where the volume of each aliquot is proportional to the flow rate of the discharge.

"Illicit connection" means any man-made conveyance connecting an illicit discharge directly to a municipal separate storm sewer.

"Illicit discharge" means any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges resulting from fire fighting activities.

"Landfill" means an area of land or an excavation in which wastes are placed for permanent disposal, and which is not a land application unit, surface impoundment, injection well, or waste pile.

"Land application unit" means an area where wastes are applied onto or incorporated into the soil surface (excluding manure spreading operations) for treatment or disposal.

VOL 22

0713

R0065948

"MS4" is an acronym for "municipal separate storm sewer system" and is used to refer to either a Large or Medium Municipal Separate Storm Sewer System.

"Large or Medium municipal separate storm sewer system" means all municipal separate storm sewers that are either:

(i) located in an incorporated place (city) with a population of 100,000 or more as determined by the latest Decennial Census by the Bureau of Census (these cities are listed in Appendices F and G of 40 CFR Part 122); or

(ii) located in the counties with unincorporated urbanized populations of 100,000 or more, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties (these counties are listed in Appendices H and I of 40 CFR Part 122); or

(iii) owned or operated by a municipality other than those described in paragraph (i) or (ii) and that are designated by the Director as part of the large or medium municipal separate storm sewer system.

"Municipal Separate Storm Sewer" means a conveyance, or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains): (i) owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State Law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State Law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian Tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States; (ii) designed or used for collecting or conveying storm water; (iii) which is not a combined sewer; and (iv) which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

"Point Source" means any discernible, confined, and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharges. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

"Storm sewer", unless otherwise indicated, refers to a municipal separate storm sewer.

"Storm Water" means storm water runoff, snow melt runoff, and surface runoff and drainage.

"SWMP" is an acronym for "Storm Water Management Program."

VOL 22 0714

R0065949

"Time-weighted composite" means a composite sample consisting of a mixture of equal volume aliquots collected at a constant time interval.

"Waste pile" means any noncontainerized accumulation of solid, nonflowing waste that is used for treatment or storage.

"Waters of the United States" means:

(a) All waters which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
(b) All interstate waters, including interstate "wetlands";
(c) All other waters such as interstate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:
(1) Which are or could be used by interstate or foreign travelers for recreational or other purposes;
(2) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
(3) Which are used or could be used for industrial purposes by industries in interstate commerce;
(d) All impoundments of waters otherwise defined as waters of the United States under this definition;
(e) Tributaries of waters identified in paragraphs (a) through (d) of this definition;
(f) The territorial sea; and
(g) Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition.

Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA are not waters of the United States. This exclusion applies only to manmade bodies of water which neither were originally created in waters of the United States (such as disposal areas in wetlands) nor resulted from the impoundment of waters of the United States.

I. PUBLIC INVOLVEMENT OPPORTUNITIES

The Department of Ecology (Ecology) has scheduled the following public workshop and public hearing for the proposed permits:

Public Workshop		Public Hearing	
Date:	April 20, 1995	Date:	April 27, 1995
Time:	7 p.m.	Time:	7 p.m.
Location:	Ecology Northwest Regional Office 3190 160th Ave. S.E. Bellevue, WA	Location:	Ecology Northwest Regional Office 3190 160th Ave. S.E. Bellevue, WA

The workshop will explain the need for and requirements of the permits. The workshop participants will have the opportunity to ask questions of and converse with Ecology staff members concerning the proposed permits. This is an informal process.

At the public hearing, Ecology staff will once again explain the need for and requirements of the permits. Then an opportunity for formal public comment will commence. Ecology staff will not be able to respond to comments or questions during the public hearing. Comments will be recorded and transcribed into an official public record. Written comments will be accepted through May 5, 1995. All oral comments made during the hearing, and written comments provided by the May 5, 1995 deadline, will be considered by Ecology. A written record of all comments and Ecology's response will be prepared and distributed to those who commented and others indicating interest.

Ecology anticipates issuing the permits in June. After issuance of the permits, Ecology will conduct workshops, a public hearing, and provide an opportunity for public comment prior to making a decision on approval or disapproval of each permittee's stormwater management program. The hearings on the proposed programs are not scheduled to occur until early 1996 for the King Co. and Seattle programs, and in mid-1996 for the Snohomish Co., Pierce Co., Tacoma, and Washington State Department of Transportation programs. An opportunity for public comment will also be provided prior to making a decision on any significant modifications to an approved stormwater management program.

II. PURPOSE OF THE PERMIT

These permits authorize the discharge of stormwater from municipal separate storm sewers owned or operated by the permittees, to surface and ground waters of the State of Washington. As required by §402(p)(3) of the Clean Water Act, discharges covered under these permits must effectively prohibit non-stormwater discharges into storm sewers, and must apply controls to reduce the discharge of pollutants to Waters of the U.S. to the maximum extent practicable. As authorized by RCW 90.48.030 and .162, Ecology is also

VOL 22
0718
R0065953

rainfall and snowmelt). There are a wide range of pollutants in stormwater, and concentrations vary depending on storm events. Further difficulty in controlling municipal stormwater discharges comes from the large number of outfalls where stormwater is being discharged (hundreds or even thousands of outfalls within a city are typical). These features of stormwater runoff make conventional end-of-pipe treatment options that are applied to traditional wastewater discharges difficult, and often they are not cost-effective to apply to stormwater.

Two basic control options exist for stormwater. One is to prevent pollutants from coming into contact with stormwater in the first place by using source control best management practices (BMPs). The second option is treatment BMPs. Source control BMPs include activities as diverse as changing vehicle and equipment maintenance activities to prevent the leaking of oil or other fluids; landscape design, installation, and maintenance to minimize stormwater runoff; product replacement or substitution (e.g., replace roofs that are sources of copper contamination with roofs that have no copper in them); land use zoning to reduce the intensity of urbanization in sensitive watersheds; covering up materials that are stored outside and exposed to rainfall and runoff; and prohibiting or restricting the use of certain chemicals that are causing a pollution problem (e.g., pesticides, or phosphorus in watersheds that drain to lakes). Where source control BMPs are feasible, they can be very effective in preventing stormwater contamination.

Treatment BMPs include detention or retention ponds, filtration, and infiltration devices that are designed to capture runoff and treat it using physical, biological, and/or chemical processes. The effectiveness and feasibility of treatment BMPs is variable, subject to some debate, and much remains to be learned. Treatment BMPs can be very costly to design, build, maintain, and operate.

In summary, the complexity inherent in stormwater discharges, and the difficulty of controlling such discharges means that it will take many years to fully implement a program which adequately mitigates or prevents their adverse environmental impacts.

Clean Water Act Amendments of 1987 and Subsequent Rulemaking by U.S. EPA

Amendments to the Clean Water Act in 1987 established new statutory requirements to control industrial and municipal stormwater discharges to waters of the United States. Waters of the United States include most surface water bodies and ground waters that are hydrologically connected to surface waters. Municipalities with separate storm sewers serving populations of 100,000 or greater are required to have a National Pollutant Discharge Elimination System (NPDES) permit to discharge stormwater. Municipalities with populations of 250,000 or more are defined as "large" while those with populations between 100,000 and 250,000 are defined as "medium" municipalities. The U.S. EPA proceeded to implement 402(p) of the Clean Water Act through a rulemaking process which culminated in finalization of the stormwater rule in November 1990. The rule went into effect on

VOL 22 0719

R0065954

December 17, 1990.

U.S. EPA implementing regulations define the term "municipality" to mean incorporated cities and unincorporated counties that have sufficient population in a Census Bureau designated urbanized area to meet the population thresholds. In addition, other public entities (excluding incorporated cities) that own and operate storm sewer systems located within the municipalities that meet the population thresholds are also required to be covered under the permit program. The basis for the permit requirement is being located within the municipalities with large populations. Examples of other publicly-owned storm sewer systems include state highway systems, drainage districts, and flood control districts located within named municipalities. Permit application requirements are identical for medium and large municipalities with the exception that the permitting process started six months earlier for large municipalities.

Recognizing the complexity of controlling stormwater, Congress and the U.S. EPA have established a regulatory framework for municipal stormwater discharges that is very different from traditional NPDES permit programs. Some of the key provisions of the stormwater rule that reflect these differences are:

- Permits are to require the implementation of stormwater management programs rather than establishing numeric effluent standards for stormwater discharges (40 CFR 122.26(d)(2)(iv)).
- Permits are to cover a large geographic area rather than individual "facilities." Within a permit coverage area there will be hundreds or even thousands of individual outfalls discharging stormwater (40 CFR 122.26(a)(3)).
- Flexibility that allows permittees to first focus their resources on the highest priority problems (40 CFR 122.26(d)(2)(iv)).
- A watershed approach is allowed, even encouraged, to comprehensively manage stormwater (40 CFR 122.26(a)(3) & (d)(2)(iv)).
- Pollution prevention is emphasized with some provisions requiring eliminating or controlling pollutants at their source and by requiring permittees to assess potential future impacts due to population growth and other factors (40 CFR 122.26(d)(2)(iv)(B) & (d)(1)(iii)).

Chapter 90.48 RCW - The Water Pollution Control Act

Along with requirements in federal law, there are state law requirements for the control of pollution. RCW 90.48.080 states that it is unlawful for any person to discharge anything which causes pollution of waters of the state. Ecology is granted authority to control pollution and protect all waters of the state in RCW 90.48.030. In addition, RCW 90.48.162 states that municipalities are to obtain permits from Ecology for discharges of pollutants or waste materials to waters of the state. The Waste Discharge General Permit Program regulation, Chapter 173-226 WAC, establishes a permit program applicable to the discharge

VOL 22
0720
R0065955

of pollutants, wastes, and other materials to waters of the state. Prior to issuance of these permits the state has not regulated municipal stormwater as a point source discharge under the state waste discharge permit program. The federal government decision to control municipal stormwater through NPDES permits created incentive for application of Ecology's authority under RCW 90.48.162 to municipal stormwater.

RCW 90.48.035 grants Ecology authority to adopt standards for the quality of waters of the state. Ecology has adopted the following standards: Ch. 173-200 WAC Ground Water Quality Standards; Ch. 173-201A WAC Water Quality Standards for Surface Waters; and Ch. 173-204 WAC Sediment Management Standards. These standards generally require that permits that are issued by Ecology are to ensure that standards are not violated or a compliance schedule is put in place to bring discharges into compliance.

Description of the Municipal Stormwater Permit Application Requirements and Procedures

The following is a summary of the permit application requirements and procedures from the federal rule, 40 CFR 122.26.

The issuance of a municipal stormwater NPDES permit is a multi-step procedure that occurs over a lengthy time period (typically three years) and is composed of a two-part application (Part 1 and Part 2) that forms the basis for the permit conditions. The following is a summary of the procedure:

1. Ecology or EPA notifies an applicant to submit a Part 1 application. At least one year is allowed for preparation of the Part 1 application.
2. Applicant submits a Part 1 application to Ecology. Part 1 applications for large municipalities were due November 18, 1991, medium municipalities on May 18, 1992.
3. Applicant submits a Part 2 application one year after submitting the Part 1 application. Part 2 applications for large municipalities were due November 16, 1992, medium municipalities on May 17, 1993.
4. Ecology reviews the Part 2 application and issues a draft permit within one year of receiving a complete Part 2 application.
5. Upon completion of a formal public review process the permit is issued.

The permittees named in Special Condition S3.A. of this permit submitted timely applications in accordance with the federal deadlines listed above.

The Part 1 application requires an assessment of the applicant's current stormwater management program and legal authority. It requires the applicant to submit the results of a field screening program intended to detect illicit (non-stormwater) discharges to municipal separate storm sewers. Mapping of outfalls from the municipal separate storm sewer system and sources of contamination to the system is required. In addition, a sampling program

VOL 22

0721

R0065956

must be proposed that will be used to characterize the quality of stormwater discharges for a limited number of outfalls. Ecology has 90 days to approve or deny the proposed discharge characterization program.

In the Part 2 application, the applicant is required to submit a proposed stormwater management program, demonstrate adequate legal authority to support the management program and other regulatory requirements, conduct an assessment of controls, provide a fiscal analysis for the term of the permit (typically five years), and submit the characterization data. The stormwater management program required under these permits is based upon the program description required in the Part 2 application. A description of the differences between the application requirements and the program required under this permit is found in the discussion of special condition S7, below.

The Part 1 and Part 2 applications are complementary and form the basis for the permit conditions, especially the requirement to propose a stormwater management program, or SWMP.

IV. NPDES AND STATE WASTE DISCHARGE PERMITS

Under agreement with U.S. EPA - Region X, Ecology has the authority to authorize discharges to waters of the U.S. by issuing NPDES permits for those discharges. Ecology also has authority under state law to issue State Waste Discharge permits for discharges to state surface waters and ground waters. These permits are issued under both authorities.

This allows Ecology to not only regulate discharges to surface waters under the permits, but also to regulate discharges to the ground. Discharges to ground are covered under the permit because portions of the areas regulated under these permits may include discharges of stormwater to the ground from municipal separate storm sewers. It is appropriate that the stormwater management programs that are required under these permits should apply area-wide, regardless of where water is discharged, and that measures are taken to reduce the discharge of pollutants to ground as well as surface waters.

Along with discharges to surface water, the implementation of controls for discharges to ground will be subject to a set of identified priorities for the stormwater management program of each permittee. Where stormwater discharges to ground are not identified as a priority concern, it is likely that controls will be minimal in the initial stormwater management programs. However, actions to minimize the potential for ground water quality impacts resulting from stormwater discharges should be part of a long-term stormwater management program.

VOL 22 0722

R0065957

V. ECOLOGY'S WATERSHED-BASED PERMITTING STRATEGY

Ecology has chosen to issue three watershed-based municipal stormwater NPDES general permits. A general permit is being used as the mechanism to cover a category of dischargers (and, therefore, multiple permittees) under a single permit for a discrete geographic area as allowed under WAC 173-226-050. The permit coverage area generally follows the boundaries of a single water quality management area, however, exceptions have been made to allow efficient coverage of the entire municipal separate storm sewer system. (See maps in appendices B and C)

These permits are being issued to cover entire watersheds, but they do not cover discharges from all the municipalities in the named watersheds. This initial municipal stormwater permitting action applies only to municipalities named under the U.S. EPA stormwater regulations. As the need for coverage of more municipal stormwater discharges is identified through future U.S. EPA regulations or the Clean Water Act reauthorization, additional permittees will be added either during this five-year permit cycle or when the permits are reissued. However, federal laws give Ecology the option, should we chose to use it, of requiring more municipalities to apply for coverage because of the interrelationship between the municipal separate storm sewers, or where it is found that the discharge contributes to a violation of a water quality standard, or is a significant contributor of pollutants to waters of the U.S. In addition, an outside party may petition Ecology to designate a municipality located within a watershed that includes a named permittee. (ref. 40 CFR 122.26(b)(4) and (7)). Ecology does not intend to use these additional options in the foreseeable future.

There are two major reasons for issuing permits on a watershed basis. The first is that Ecology believes a watershed approach to stormwater management will, in the future, result in better water quality for waters of the state. The second is to integrate stormwater management into Ecology's watershed approach to water quality permitting, and more efficiently use state resources allocated to this program.

To control stormwater impacts on water bodies it will be necessary to eventually address activities in an entire watershed. Restricting permits to jurisdictional boundaries would not allow this to occur. Coordinating management activities throughout the watershed, and addressing the cumulative impact of municipal stormwater discharges from several jurisdictions to a large, downstream waterbody is a necessary part of reducing the discharge of pollutants.

Ecology recognizes that a truly regional program is not possible without including all jurisdictions in these watersheds under the permit. Therefore, these permits represent the initial stage of watershed-wide coordination and are limited to activities that a subset of jurisdictions in the watershed can do. As more permittees are added in the future, coordination will become a more important part of the permits.

In addition to issuing watershed-based municipal stormwater permits, the Water Quality

VOL 22 0723

R0065958

Program at the Department of Ecology has adopted a watershed approach to all water quality permit activities. Twenty three water quality management areas have been delineated to cover the entire state. A water quality management area is a large watershed or grouping of watersheds identified as a management unit. Each water quality management area is put onto a five-year cycle that starts with information, monitoring, modeling and analysis, and culminates with issuing permits for all dischargers in the watershed. After permit issuance, the cycle begins again.

With this approach, permits will reflect a broader understanding of water quality problems in the entire watershed. As knowledge about the watershed increases, over several permit cycles, changes in permit requirements can be made to ensure water quality goals are met. In addition, synchronizing the steps in the five-year cycle for a relatively large area will make more efficient use of state resources. Integrating municipal stormwater permitting into this "watershed approach" will improve the information base for the watershed by using the information collected under the stormwater permits, and allow Ecology to make decisions about water quality needs that take into account process wastewater and other discharges, as well as stormwater. Ecology will, in the future, integrate the municipal stormwater permits into the five-year cycle of the overall watershed approach.

VI. ECOLOGY'S APPROACH TO ISSUING MUNICIPAL STORMWATER NPDES PERMITS

The federal stormwater rules envisioned a process where municipal stormwater management programs are reviewed and approved by the permitting agency before permits are issued. Ecology has chosen to issue permits before approving stormwater management programs and provide a public involvement process during approval of the stormwater management programs. Ecology has chosen this approach to issue permits in as timely a manner as possible.

Section 402(p)(4)(B) of the federal Clean Water Act required the issuance or denial of NPDES permits for large municipalities by February 1991, and for medium-sized municipal separate storm sewer systems not later than February 1993. We have missed those deadlines. Federal rules extended the deadlines, stating that permits were to be issued within one year of receipt of a complete Part 2 application. The Part 2 deadline for large municipalities was November 16, 1992; for medium municipalities, it was May 17,1993. Due to limited resources and the fact that program requirements are in the developmental stage for this new initiative, review and approval of programs prior to issuance of the permits would further delay compliance with these deadlines.

The conditions of the permits establish a definition of a stormwater management program, and set deadlines and compliance schedules for stormwater management program approvals during the term of the permits. Ecology has taken this approach to comply with the statutory requirements in the Clean Water Act to issue permits.

VOL 22
0124
R0065959

The deadlines for Ecology's approval of the permittees' stormwater management programs are set for approximately one year after permit issuance for large municipalities, and 18 months after permit issuance for medium municipalities. These deadlines were intended to prevent the program approval process from extending too long during the term of the permits. Ecology's intention is to address program review and approval as quickly as possible. In addition, the program approval process will include an opportunity for public comment on each of the permittee's proposed stormwater management program. Prior to making a final decision on a proposed stormwater management program, Ecology will hold workshops, a public hearing, and advertise a public comment period. Ecology's decision to approve or disapprove a stormwater management program is appealable under the provisions of RCW 43.21B.110.

As required under 40 CFR 122.26, other publicly-owned storm sewers located in the municipalities named as permittees must also obtain an NPDES permit to discharge stormwater. In addition to state highways, this requirement applies to special districts such as drainage districts and flood control districts that own or operate conveyances discharging into waters of the state. Ecology recognizes that there may be special districts which need a permit but did not submit application materials, or participate with another permittee as a co-applicant (see permit definitions). It will be necessary for these entities to obtain a permit. Ecology intends to work with these entities to identify those that require a permit and to assist with the application process.

VII. DISCUSSION OF PERMIT CONDITIONS

Summary

These municipal stormwater NPDES permits require the development and implementation of stormwater management programs for municipal separate storm sewers owned or operated by the permittees. The stormwater management programs must be approved by Ecology. The permittees are to identify participation in watershed-wide coordination activities to the extent appropriate at this early stage of watershed permit implementation. Implementation of approved stormwater management programs constitutes reduction of pollutants to the maximum extent practicable (MEP) during the life of the permit, as required in section 402(p)(3)(B) of the federal Clean Water Act.

The conditions defining the stormwater management program requirements are based on U.S. EPA regulations for the municipal stormwater permit program (CFR title 40, §122.26), on the stormwater elements of the Puget Sound Water Quality Management Plan, and on the State Water Pollution Control Act, Chapter 90.48 RCW. The stormwater management program must include: program priorities that reflect an appropriate balance between prevention and correction; program components to control pollutants in accordance with approved priorities; adequate legal authority and fiscal resources; a monitoring program; and an implementation schedule.

VOL 22
0725
R0065960

S1 - Permit Coverage Area - **for Cedar/Green permit**

As authorized by Section 402 (p) of the federal Clean Water Act, this permit is being proposed on a system basis. Ecology has chosen to issue the permit to cover a water quality management area as defined under Ecology's watershed approach to water quality management (see discussion of Ecology's watershed based permitting strategy above). Within this water quality management area, during this first round of municipal stormwater permits, the permit applies only to municipalities named under the U.S. EPA stormwater regulations. Therefore, the permit initially applies only to those areas served by or contributing to municipal separate storm sewers owned or operated by the permittees listed in Special Condition S3.

Application of permit requirements to discharges from municipal separate storm sewers owned by the Washington State Department of Transportation (WSDOT) is limited to those storm sewers located within the regulated area of the other named permittees. This is a result of the federal stormwater regulations requiring coverage of other publicly owned storm sewers where they are located in municipalities over 100,000 population.

A permit is required for discharges from all the municipal separate storm sewers owned or operated by the Cities and Counties named as permittees. For efficient coverage of all of King County, Vashon Island is included under this permit even though it is not in this water quality management area. This area is part of the Kitsap water quality management area, and the majority of the Kitsap peninsula is not required to have coverage under the municipal stormwater NPDES permit program. Other portions of unincorporated King County and Snohomish County that are not covered under this permit will be covered by another watershed-based municipal stormwater permit.

S1 - Permit Coverage Area - **for Island/Snohomish permit**

As authorized by Section 402 (p) of the federal Clean Water Act, this permit is being proposed on a system basis. Ecology has chosen to issue the permit to cover a water quality management area as defined under Ecology's watershed approach to water quality management (see discussion of Ecology's watershed based permitting strategy above). Within this watershed, during this first round of municipal stormwater permits, the permit applies only to municipalities named under the U.S. EPA stormwater regulations. Therefore, the permit initially applies only to those areas served by or contributing to municipal separate storm sewers owned or operated by the permittees listed in Special Condition S3.

Application of permit requirements to discharges from municipal separate storm sewers owned by WSDOT is limited to those storm sewers located within the regulated area of the other named permittees. This is a result of the federal stormwater regulations requiring coverage of other publicly owned storm sewers where they are located in municipalities over 100,000 population.

VOL 22 0726

R0065961

Named permittees - South Puget Sound general permit:

The permittees listed in Special Condition S3.A. are the municipalities and public entities that are required to obtain a permit in accordance with 40 CFR 122.26(b)(4) and (b)(7). The named permittees for the South Puget Sound general permit are Tacoma, Pierce County, King County, and WSDOT.

Other permittees - all permits:

In addition to the permittees named in Special Condition S3.A., there are other potential permittees which may be required by Ecology or U.S. EPA to obtain coverage under this permit. These are addressed in special condition S3.B. There are three circumstances under which owners or operators of municipal separate storm sewers may be required to obtain coverage:

1. Ecology has authority under 40 CFR 122.26 (b)(4) and (b)(7) to designate other municipalities under the permit program because of interconnections, location in relation to the named permittees, the quality and nature of pollutants discharged, or the nature of the receiving waters. At this time, Ecology has not identified any other municipalities that should be designated for these reasons.

2. Permit coverage is required for discharges from all municipal separate storm sewers located in the municipalities that meet the population threshold for the permit requirement. Municipal separate storm sewers are defined at 40 CFR 122.26(b)(8) to include conveyances owned or operated by a public body having jurisdiction over disposal of stormwater. It is this definition that brings WSDOT and METRO into the permit program. There may be other owners or operators of municipal separate storm sewers located in the area covered by the permit that must be brought into the permit program in the future. As necessary, Ecology will notify and require application information from these public entities.

3. U.S. EPA is scheduled to issue additional stormwater regulations. These regulations are to address stormwater discharges not covered under the current regulations, including discharges from smaller municipalities. If new federal regulations require additional municipalities within any of the water quality management areas to have NPDES permits, those municipalities can obtain coverage under this permit.

Special Condition S3.C. allows any other owners or operators of municipal separate storm sewers (within this watershed) who desire coverage under this permit, to apply to become permittees.

Ecology received a petition requesting that all smaller cities located in the Counties covered under the three watershed permitting areas be designated for inclusion in the permit program. Ecology denied this petition for the following reasons:

VOL 22
0727
R0065962

1) U.S. EPA currently requires that only municipalities of population > 100,000 be covered under permit;
2) Ecology has chosen not to pursue coverage of municipalities beyond existing federal requirements;
3) Due to Ecology and local government resource limits, this addition of new municipalities at this time would seriously delay our current efforts and be counterproductive.

Though the smaller local governments are not included in this permit, they are subject to the stormwater program requirements of the Puget Sound Water Quality Management Plan. Many of the requirements of that plan are the same as those required under the permit. We are optimistic that many smaller cities will implement stormwater management programs without being required to do so by an NPDES permit.

S4 - How to Obtain Coverage

To comply with the requirements of Ch. 173-226 WAC, the General Permit Rule, it is necessary for entities to submit an application that contains the information specified in WAC 173-226-200. The Notice of Intent (NOI) is the official permit application document required to request coverage under these general permits and is included in the permits. In addition, entities named in federal stormwater rules, 40 CFR 122.26, must submit permit applications in accordance with those rules. All permittees initially named in this permit have submitted the federal application materials in compliance with the deadlines specified in 40 CFR 122.26. Submitting the NOI and federal application requirements also constitutes application for the state waste discharge permit.

Since these are general permits, it is necessary to provide procedures for other permittees to obtain coverage. These procedures are described in S4.B and C.

As discussed in the section on Special Condition S3 - Permittees, and other public entities may be required by Ecology or U.S. EPA to obtain permit coverage. Where federal rules do not specify application requirements for any entity required to obtain stormwater permit coverage, Ecology will identify those requirements as stated in S4.B.1.b. Some public entities may choose to pursue co-permittee status with one of the named permittees. Entities may elect to become a co-permittee to be able to jointly manage stormwater with others in the basin, or because the entity does not have adequate legal authority to control discharges into their storm sewers. Co-permittees must supplement the application information of the existing permittee.

Entities which are not required to obtain a stormwater permit, but which desire coverage under one of these general permits, are only required to submit an NOI. If granted coverage under the permit, these permit volunteers will be given a compliance schedule to develop a stormwater management program.

VOL 22 0128

R0065963

S5 - Responsibilities of Permittees

Since there are multiple permittees, this section is included to explain the responsibilities of each permittee. Co-permittees, in particular, are responsible only for discharges from municipal separate storm sewers which they own or operate, and together with the municipality they are located in, must be able to achieve full compliance with the requirements of the permit. Co-permittees are also required to have an agreement with the municipality they are located in, clarifying the responsibilities of each party for compliance with the terms of the permit.

S6 - Compliance with Standards

The municipal stormwater NPDES permit program involves the regulation of a large number of discharges under a single area-wide permit. This approach is different from any other NPDES permits previously issued and presents many challenges for state and local governments. The inherent difficulties in controlling stormwater discharges, as described earlier in the background section, means that it will take many years to fully implement a municipal stormwater permit program which achieves all the objectives of the U.S. EPA stormwater regulations, the federal Clean Water Act, and state law. Though some local governments and the state have had programs to reduce stormwater impacts, particularly in the Puget Sound Basin, this permit represents a commitment, and a significant step towards achieving these objectives.

To achieve the objectives of the Clean Water Act, Congress decided that discharges from municipal separate storm sewers must meet all applicable provisions of sections 402(p) and 301(b)(1)(c) of the Act. These provisions require a prohibition on non-stormwater discharges in municipal storm sewers, controls to reduce the discharge of pollutants to the maximum extent practicable (MEP), and any more stringent limitations necessary to meet water quality standards. Neither Congress nor EPA have defined what is meant by "maximum extent practicable" (MEP). Therefore, it is left for Ecology to determine what is expected of permittees to comply with these standards.

A. State law requires all dischargers, including stormwater dischargers, to apply all known, available, and reasonable (methods) of treatment (AKART) to prevent and control the pollution of waters of the state (RCW 90.48.010).

   "MEP" (the federal requirement) and "AKART" (the state requirement) are technology-based statutory requirements. Traditionally, Ecology determines, or uses a U.S. EPA determined, specific effluent quality which it considers as achieving such technology-based statutory requirements.

   Given the large number of municipal storm sewers covered by this permit, the wide

VOL 22
0129
R0065964

variation in quantity and quality of these discharges, the lack of adequate data on stormwater quality, the impacts of stormwater from all these discharges, and the uncertainty and variability of the pollutant removal effectiveness of currently accepted BMPs, it is not feasible at this time to establish specific numeric effluent quality limitations for municipal stormwater discharges. Therefore, the permit requires the development and implementation of stormwater management programs which include the implementation of BMPs and other program components. Ecology will consider compliance with these requirements as meeting the technology-based requirements of MEP and AKART.

MEP is likely to be defined differently in future permits as our ability to control stormwater discharges improves, or if a federal definition of MEP is adopted.

As required by the Puget Sound Water Quality Management Plan, Ecology has adopted a manual which defines appropriate BMPs for addressing stormwater erosion and sediment control, runoff control, and control of pollution from urban land uses. Under the Puget Sound Water Quality Management Plan, local governments in the Puget Sound Basin are required, subject to the availability of local funding, to adopt this manual, or an equivalent manual for control of stormwater from new development, redevelopment, and construction sites. To date, Ecology has approved, or conditionally approved, four local government manuals as equivalent to Ecology's manual. Five other manuals, including manuals from Tacoma, Pierce County, Seattle, and King County are currently under review. The adoption and implementation of BMPs in these manuals by these entities is considered justification that the requirement is known, available, and reasonable.

B. Attaining compliance with water quality standards presents an even greater challenge than compliance with technology-based requirements. State law requires application of any more stringent limitations necessary to meet all applicable water quality standards, including surface water, ground water, and sediment management standards. In this state, U.S. EPA sanctioned water quality standards include surface water and sediment management standards. Compliance with ground water standards is a state requirement and not a federal requirement. The implementation of the existing, known, available and reasonable BMPs and other strategies will not likely be sufficient to attain compliance with the present surface and ground water quality and sediment quality standards at many discharge locations. Ecology's permitting strategy to achieve compliance with standards is:

- To require permittees to adopt stormwater management programs consisting of priorities and an implementation schedule to address all components of special condition S7 selected for implementation during the first permit cycle.

- To assess the success of those programs through monitoring and other evaluation efforts.

VOL 22 0730

R0065965

- To require in subsequent programs, re-evaluations of the priorities of the stormwater management program and the level of effort in some program components in light of monitoring and evaluation results.

- To require in subsequent programs, implementation of more effective BMPs as they are developed.

- To evolve towards compliance with standards through successive permit cycles and program updates.

This strategy is to be implemented through this and subsequent permits. Regulations implementing the standards allow compliance schedules to meet them.

Finally, it is fair to note that achieving compliance with standards for some pollutants may require source control strategies which extend beyond the authority of the permittees. Possible examples of this include pollutants generated by internal combustion engine exhaust, tire wear, and brake wear.

C. This condition delineates that the permittees' stormwater discharges to surface water are regulated by federal and state statutes and regulations. Compliance with ground water standards is regulated only by state authority. However, it is U.S. EPA policy that where hydraulic connectivity exists between surface water and ground water, discharges to ground water can be regulated under federal Clean Water Act authority to meet surface water quality and sediment management standards.

S7 - Stormwater Management Program

A. The federal stormwater rules require a description of a stormwater management program to cover the duration of these permits. This section requires each permittee to develop and implement a stormwater management program. The stormwater management program forms the core requirement of these permits. As part of the approval process for each stormwater management program, Ecology and each permittee will hold a public hearing as an opportunity for public comment on the content of the proposed program. Ecology follows the procedures for public hearings in the Administrative Procedures Act, Ch. 34.05 RCW.

B. This section defines a stormwater management program as a plan for the term of the permit, and spells out the components of a stormwater management program. Each permittee is to propose a plan which describes how and when it will implement priority program components. The planning period is the term of the permit, approximately from 1996 to 2000.

VOL 22
0731
R0065966

Conditions S7.B.1 through 7 describe program components which are necessary administrative, legal, or evaluation measures. All of these components must be included in a stormwater management program. Special Conditions S7.B.8 a.-i. describe program components which should directly effect pollutant reductions. The level of effort for these stormwater control components should be determined with regard to program priorities and in light of budget limitations.

The permittees named in Special Condition S3.A. have existing stormwater programs. It is likely that they will have to modify their programs to meet some of these permit requirements. It is unrealistic to expect permittees to immediately have stormwater management programs that satisfy each of the required components.

Ecology anticipates that permittees will phase-in program implementation. As further explained later in this fact sheet, permittees will have 12 to 18 months after permit issuance to gain Ecology approval for their stormwater management program. The program should describe the permittee's proposed method for implementing program components which have been identified as priorities based on local water quality needs. The program should also identify steps necessary to phase in implementation, and a schedule for those steps. Depending on identified needs and budget restrictions (see explanation under S7.B.5., below), the plan may not include efforts in all the program components listed in this condition.

Ecology and permittees have discussed what is expected for stormwater management program submittals for the first permit. A document has been written to provide clarification in interpreting permit conditions and reviewing stormwater management programs that will be submitted by permittees. The document contains recognized problems and constraints affecting stormwater program development, long-term outcomes for the components of the program, and short-term expectations for the stormwater management program for the first permit. The permittees and Ecology recognize that the permits and stormwater management programs will be subject to public review. In addition, the permittees and Ecology may modify the expectations document as a result of comments received from the public or experience gained during the course of permit implementation. A copy of this document is available from Ann Wessel at the Department of Ecology (360) 407-6457.

In addition to the expectations document developed among all permittees, a more specific Memorandum of Understanding is being prepared with the Washington State Department of Transportation. The purpose of the MOU is the same as the expectations document, with additional specificity for WSDOT. The Department of Transportation is unique among the permittees since they are included under all permits being issued, and have only one primary type of land use. A copy of the draft MOU will be available, upon request, when it is completed. Contact Ann Wessel at the above number to arrange to receive a copy.

VOL 22
0732
R0065967

Stormwater management program components S7.B.3, 8b, 8d, 8e, and 8f are drawn directly from federal regulations (40 CFR 122.26) or the Puget Sound Water Quality Management Plan. Explanation of the reasons for including these components in a stormwater management program is found in the preamble to the U.S. EPA stormwater regulations published in the Federal Register on November 16, 1990, and in the Puget Sound Water Quality Management Plan. The remaining program components are either a modification of a federal rule, or Puget Sound Plan provision, or drafted specifically for this permit. These warrant further explanation, and are discussed below.

S7.B.1. - Comprehensive Planning Process

The federal stormwater rules call for a description of the comprehensive planning process used to develop the stormwater management program. Ecology has included this requirement as part of the stormwater management program, and added a request for additional information about the relationship to other planning processes. Given the interconnection of stormwater issues with decisions regarding land use and transportation, it is reasonable to expect that other planning processes, including the Growth Management Act, will play a part in development of the local stormwater management program.

S7.B.2. - Stormwater Management Needs and Priorities

This condition requires permittees to assess their stormwater needs, to prioritize those needs, and to develop an implementation plan and schedule based on those prioritized needs. The needs analysis, priority system, and the resultant implementation plan and schedule are subject to Ecology review.

Though the permits establish a list of program components as requirements for stormwater management programs, local governments are given the flexibility to set priorities for their program. Program priorities should be based on what is known about water quality threats and impairments and sources of pollution to discharges from the permittees' municipal separate storm sewers. Program priorities can determine the level of effort and the implementation schedule for different parts of the stormwater management program requirements. They should help establish the basis for monitoring to evaluate the effectiveness of the local programs. To make progress toward achieving state and federal water quality objectives, stormwater management programs must include problem prevention and problem correction aspects.

The Department of Transportation has responsibility for stormwater runoff from highway systems throughout the state. WSDOT has prioritized stormwater quality projects state-wide and not all projects are located in watersheds covered by permits. Ecology has agreed that state-wide priorities are acceptable, and that may mean having higher priority projects outside of the area under permit.

VOL 22

0733

R0065968

The federal stormwater rules require an implementation schedule for the program to reduce pollutants from commercial and residential areas. However, the rules do not call for an implementation schedule for all components of the stormwater management program. Since the stormwater management program is the core requirement for these permits, Ecology considers it reasonable to require an implementation schedule for the proposed program for the term of the permit.

S7.B.4. - Monitoring

The federal stormwater rules require municipalities to propose a stormwater monitoring program for the term of the permit (40 CFR Part 122.26(d)(2)(iii)(D)). However, few specific requirements of such programs are listed. In the preamble to the federal rule (See pages 48049 - 48052 of the Federal Register, Volume 55, No. 222, November 16, 1990) U.S. EPA indicates that they favor ... " a permit scheme where the collection of representative data is primarily a task that will be accomplished through monitoring programs during the term of the permit." In the same text, they indicate that "an estimate of annual pollutant loading associated with discharges from municipal stormwater sewer systems is necessary to evaluate the magnitude and severity of the environmental impacts of such discharges and to evaluate the effectiveness of controls which are imposed at a later time."

Ecology concurs with these statements and has written this condition to establish broad monitoring objectives. Specifics concerning monitoring strategies for each discharger will be established in their respective stormwater management programs. This is appropriate because monitoring needs may vary among the permittees, and because the science of monitoring stormwater discharges and their impacts is new and still developing.

The development of cost-effective and meaningful strategies for monitoring is the subject of much nationwide debate. Ecology wants permittees to make maximum use of evolving information and strategies in establishing their monitoring programs. The U.S. EPA rules imply, and U.S. EPA guidance assumes that some monitoring for chemical constituents in stormwater is necessary. Ecology concurs with this view. However, there also may be cost-effective and useful biological and visual monitoring methods that can be employed by the permittees. Also, there may be opportunities to complement and coordinate with Ecology ambient monitoring efforts.

Because Washington has adopted sediment management standards for marine waters, and is developing similar standards for fresh waters, the scope of monitoring programs must include assessing sediment impacts. Also, because this permit covers stormwater discharges to ground, the scope of monitoring programs should include impacts to ground water. A monitoring program to adequately cover all these needs in this permit cycle would be overwhelming. Ecology expects that in this first permit, permittees will establish monitoring programs which are focused on their identified

VOL 22 0734

R0065969

priorities.

All the monitoring objectives listed in these permits remain applicable in the long run, regardless of those identified priorities. Knowledge of pollutant loads and of average event mean concentrations from representative areas drained by the municipal storm sewer system are necessary to gauge whether the stormwater management program is making progress towards the goal of reducing the amount of pollutants discharged. On a smaller scale, we also need to determine the effectiveness of specific BMPs in reducing pollutant discharges and receiving water impacts. The third objective, identification of significant pollution sources, is already a Puget Sound Water Quality Management Plan requirement.

Finally, there is a need to evaluate the effect of stormwater on receiving waters, and assess progress toward the ultimate goals of protecting the receiving waters, aquatic habitat, aquatic resources, and their beneficial uses. Receiving water monitoring can include surveys of streambed physical characteristics, chemical analyses of water and sediment quality, and various types of biological monitoring (e.g., bioassays and stream surveys). Modeling efforts may help predict likely impacts and aid development of strategies to avoid impacts. Results of monitoring will be used by the permittee to reassess stormwater management program priorities, and to evaluate and modify the stormwater management program.

The expenditure of large amounts of money on stormwater management programs makes it imperative that we allocate a reasonable amount of resources to determine program effectiveness. Although the scope of each permittee's monitoring program is yet to be established, Ecology anticipates that the sampling and analysis costs could be at least in the tens of thousands of dollars per year. Permittees may be able to realize some cost savings through cooperative monitoring agreements with other permittees and Ecology. Ecology sees potential cost savings in avoiding duplicative monitoring for BMP effectiveness (subparagraph b) and for impacts on shared waterbodies (subparagraph d). Also, permittees are encouraged to share field and laboratory staff expertise, time, and material resources. Coordination with Ecology monitoring efforts may also help with cost savings.

S7.B.5. - Fiscal Analysis

The federal stormwater regulations, at 40 CFR 122.26(d)(2)(vi), require that permittees provide a fiscal analysis, including yearly cost estimates, for the capital and operation and maintenance expenditures necessary to accomplish the activities of the program. A fiscal analysis is needed to evaluate the municipalities' ability to prepare and implement management programs, and is an appropriate measure to justify a proposed stormwater management program. Where adequate funds are not available to implement all aspects of a program to reduce the discharge of pollutants to the maximum extent practicable, it will be necessary for permittees to propose a strategy

VOL 22
0135
R0065970

and a schedule for seeking additional funding, and to reschedule program activities accordingly.

In addition, at 40 CFR 122.26(d)(2)(iv), the federal stormwater regulations require a description of staff and equipment available to implement the stormwater management program. Ecology has chosen to combine this requirement with the fiscal analysis since they are logically linked, and added a request for information on support capability.

S7.B.6. - Adequate Information

This condition is a modification of, and a logical follow-up to a requirement of the federal rules regarding municipal stormwater permit applications. The permit application requirements in 40 CFR 122.26 specify a two-part application process. "The purpose of the two-part application process is to develop information, in a reasonable timeframe, that would build successful municipal stormwater management programs and allow the permit writer to make informed decisions with regard to developing permit conditions."[1] The Part 1 application information, together with the results of the discharge characterization, is used to prepare the proposed stormwater management program that is submitted in Part 2 of the permit application.

Maintenance of data bases regarding the physical characteristics and location of the separate storm sewer system and the areas it serves are necessary for proper management of the system. In addition, it is necessary to maintain an adequate information base concerning stormwater discharges and receiving waters to evaluate program effectiveness. This information base should include any available, pertinent information (including information not required to be collected by the permit) which may be used by the permittees in planning and evaluating their stormwater management programs. As conditions change, an accessible data base is necessary to display those changes. Managers can then make changes to the stormwater management program to maintain or increase its effectiveness.

S7.B.7. - Watershed-wide Coordination

This permit condition is intended to establish an initial framework for watershed-wide management of stormwater quality. For this permit the watershed-wide requirements are very basic. This section will be expanded in future permits.

Permittees are to identify intergovernmental coordination mechanisms. The type of coordination mechanisms are not specified and may be determined by the permittees. Acceptable mechanisms could include a management committee process, interlocal agreements, a regional stormwater management entity, or similar agreements among

[1]Federal Register, Vol. 55, No. 222, November 16, 1990. p. 48044.

VOL 22
0736
R0065971

permittees.

Through intergovernmental coordination the permittees are to address shared waterbodies by developing coordinated stormwater management priorities. What is intended here is that permittees priorities not be in conflict with respect to shared waterbodies. It is not necessary to have identical priorities for shared waterbodies. Permittees are also to coordinate data management, mapping, monitoring, and modeling.

One of the objectives of issuing permits on a watershed basis is to ensure protection of waterbodies that are beyond the control of an individual permittee. While this cannot be accomplished without including all municipalities in the watershed under the permit program, efforts can be made by the current group of permittees to ensure compatibility among stormwater management programs. In addition, the comprehensive stormwater program (element SW-2) of the Puget Sound Water Quality Management Plan requires interlocal coordination among all jurisdictions in shared watersheds. Therefore, permittees are directed to develop coordinated stormwater management priorities for shared waterbodies.

To allow a broader look at stormwater quality issues, permittees are to address coordinated data management and mapping efforts. To allow comparisons of data, permittees are directed to coordinate stormwater monitoring and modeling efforts.

In the next round of permits, permittees will be expected to begin implementing best management practices and other measures to control stormwater impacts from cumulative discharges to shared waterbodies.

S7.B.8.a. - New Development and Redevelopment

The federal stormwater rules require applicants to have programs "to reduce the discharge of pollutants ... from areas of new development and significant redevelopment." (40 CFR Part 122.26(d)(2)(iv)(A)(2)). The rules also require a program "to reduce pollutants in storm water runoff from construction sites." (40 CFR Part 122.26(d)(2)(iv)(D)). The Puget Sound Water Quality Management Plan has similar requirements for municipalities within the Puget Sound Basin.

As required by the Puget Sound Water Quality Management Plan, Ecology has developed a Technical Manual which establishes stormwater control requirements for new development, redevelopment, and construction sites. As required also by that plan, Ecology has included these requirements as permit conditions. Subject to available funding, the Puget Sound Water Quality Management Plan requires local governments to either adopt Ecology's manual or a local version that contains equivalent standards. Therefore, the substantial requirements of this special condition are already required of the permittees.

VOL 22
0737
R0065972

To these pre-established requirements, Ecology has made one addition. We are attempting to utilize existing local government permitting procedures to notify as many people as possible of a federal requirement for some construction sites and industries to obtain an NPDES permit. NPDES stormwater rules require that construction sites of five acres or more (including sites less than five acres which are part of a larger common plan of development, or sale of five or more acres) obtain an NPDES permit if stormwater runoff discharges to a surface water. Where those construction projects involve establishing a new industrial facility, that facility may also need an NPDES permit to discharge stormwater. In Washington, such construction sites and industries must obtain coverage under Ecology's "Baseline General Permit for the Discharge of Stormwater from Industrial Activities." Coverage is obtained by completing the Notice of Intent forms referenced in this special condition.

This condition does not make the municipality responsible for determining which sites need such coverage, nor does it give them responsibility to assure that these sites obtain coverage under the Baseline General Permit. However, Ecology does consider it reasonable to expect the permittees to assist with informing dischargers within their geographic boundaries of this permit requirement.

S7.B.8.c. - Operation and Maintenance Programs

The requirements for an operation and maintenance program and an ordinance for operation and maintenance of facilities owned by entities other than the permittees, which discharge to municipal separate storm sewers, are drawn from the federal stormwater rules and the Puget Sound Water Quality Management Plan.

Ecology has added a requirement for a strategy to address the disposal of street waste decant. Current maintenance practices for catch basins and other similar stormwater facilities involve using a vactor truck to collect accumulated sediments. This process uses water to free-up the sediments and frequently this water is decanted from the truck back into stormwater conveyances to allow more solids to be put in the vactor truck. Vactor truck decant water often contains high levels of suspended sediments, metals, and petroleum hydrocarbons, and can contain other unpredictable contaminants.

It is not appropriate to continue to reintroduce these pollutants into storm drains. However, adequate alternatives to this practice have not been identified. Therefore, Ecology is requiring the permittees to cooperate in identifying solutions to this problem and to develop strategies consistent with those solutions.

The requirement for a strategy to address street waste decant is consistent with state policy prohibiting the reintroduction of pollutants into the waste stream. This policy has been applied by Ecology to traditional wastewater treatment systems and supported by the Pollution Control Hearings Board and the courts. This policy is expressed in

VOL 22
0738
R0065973

General Condition G10 in this permit, which is based on a standard condition that is applied to all NPDES permits. This condition states that, except for decant from street waste vehicles, the permittee shall not allow removed substances to be resuspended or reintroduced to the storm sewer system. Decant from street waste vehicles may be reintroduced only when other practical means are not available and only to catch basins remote from the discharge point. The exception for decant will end as municipalities implement the solutions identified in response to Special Condition S.7.B.8.c.

S7.B.8.g. - Illicit Discharges

The requirement for a program to control illicit discharges and improper disposal is drawn from the U.S. EPA stormwater regulations in 40 CFR 122.26(d)(2). The U.S. EPA requirements are based on the provision in the Clean Water Act that municipal stormwater NPDES permits include a requirement to effectively prohibit non-stormwater discharges into the storm sewers.

In acknowledgement of the diverse contributions to storm drains, U.S. EPA included a list of discharges to storm sewers that must be addressed where they are identified by the permittees as sources of pollution to waters of the United States. This list is referenced in Special Condition S7.B.8.g., consists of the following: water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated ground water infiltration, uncontaminated pumped ground water, discharges from potable water sources, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl spaced pumps, footing drains, lawn watering, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, street wash water, and flows from fire fighting. Because this permit also covers stormwater discharges to all waters of the state, Ecology expects these sources to be addressed where they are sources of pollution to ground water.

In special Condition S7.B.8.g., Ecology has allowed the use of alternative field screening methods for detecting illicit discharges. Use of alternative methods requires Ecology approval. During the permit application process several of the permittees reported problems with the colorimetric field test kits that were specified by U.S. EPA for this purpose. Some permittees have developed effective ways of detecting illicit discharges that include visual inspections of storm drains using television cameras and site inspections. Ecology agrees that there should be flexibility on field screening methods.

In addition, the permits specify that urbanized areas should be the focus of the field screening program. This is intended to provide some clarification for county governments that are under the permit program, where rural areas are not as likely to have illicit connections to storm sewers.

VOL 22
0739
R0065974

S7.B.8.h. - Industrial Facilities

The federal stormwater regulations envision that Ecology and the municipal permittees will cooperate to develop programs to monitor and control pollutants in stormwater discharges to municipal storm sewers from industrial facilities. A wide range of industrial facilities listed at 40 CFR 122.26(b)(14) must obtain an NPDES permit from Ecology if they discharge to surface waters or to municipal separate storm sewers which drain to surface waters. Under 40 CFR 122.26(d)(2)(iv)(C), municipal permittees are to establish a program to monitor and control discharges from industrial facilities that the permittees determine are contributing a substantial pollutant loading to municipal separate storm sewers. In the preamble to the federal stormwater regulations U.S. EPA makes their position on the dual responsibility for controlling stormwater discharges associated with industrial activity very clear:

> "Although today's rule will require industrial discharges through municipal separate storm sewers to be covered by separate permit, EPA still believes that municipal operators of large and medium municipal systems have an important role in source identification, and the development of pollution controls for industries that discharge storm water through municipal separate storm sewer systems is appropriate. Under the CWA *(Clean Water Act)*, large and medium municipalities are responsible for reducing pollutants in discharges from municipal separate storm sewers to the maximum extent practicable. Because stormwater from industrial facilities may be a major contributor of pollutants to municipal separate storm sewer systems, municipalities are obligated to develop controls for stormwater discharges associated with industrial activity through their system in their stormwater management program."[2]

The Puget Sound Water Quality Management Plan goes a step further than the federal requirements. It requires municipalities in all urbanized areas of the Puget Sound Basin to develop a "comprehensive urban stormwater program" (Element SW-2). Such programs are to "seek to control the quality and quantity of runoff from public facilities and industrial, commercial, and residential areas including streets and roads, consistent with manuals and guidance provided by Ecology ..." (Element SW-2.4). Those programs are to include inspection, compliance and enforcement measures (SW-2.4.i.). Clearly, the Puget Sound Water Quality Management Plan requires local governments to develop programs to control stormwater flowing into their systems from industrial facilities.

This component includes requirements from federal rules and the Puget Sound Water Quality Management Plan. The permittees must have a program to reduce pollutants from industrial stormwater. Subsection i requires that each permittee identify industries tributary to their storm sewer system. It does not require municipalities to

[2] U.S. EPA, Federal Register, Vol.55, No. 222; November 16, 1990; p. 48090.

VOL 22 0740

R0065975

identify, within a specific time frame, all industrial discharges to their system. But eventual identification of all industrial discharges to municipal storm sewers is the goal to be achieved. Subsection ii is drawn from the Puget Sound Water Quality Management Plan. Subsection iii is derived from the federal rules. In subsection iii, we added the last statement concerning coordination of monitoring and controlling pollutants from certain industries, because those same industries may have monitoring and control requirements mandated under their NPDES permit from Ecology. It can be argued that industrial facilities which require NPDES permits, though they drain through the municipal storm sewer system, should be regulated solely by Ecology and not by the municipality. Ecology does not concur with this view. Municipalities are ultimately responsible for discharges from their storm sewer system. Therefore, they need to have a role in controlling what goes into that system.

Ecology acknowledges that the federal stormwater rules establish overlapping responsibilities for the control of industrial stormwater. Ecology and the local governments need to negotiate agreements that make the most efficient use of limited regulatory resources. Ecology expects to play the lead role in gaining compliance from industries covered under NPDES permits for their stormwater discharges. Municipalities are not expected to enforce the requirements of NPDES permits issued to industries. However, nothing in the federal regulations would prohibit the municipalities from requiring additional stormwater controls beyond those required in an industry's NPDES permit from Ecology. Municipalities may consider such actions necessary in order to meet their own NPDES permit obligations. Where such additional controls are required by a municipality, the municipality is responsible, and required by this permit, for gaining compliance with those controls.

S7.B.8.i. - Public Education

The public education program described in special condition S7.B.8.i is derived from the U.S. EPA stormwater regulations and the Puget Sound Water Quality Management Plan. Ecology has broadened the public education program to include permittees' staff whose job functions may impact stormwater quality. We feel it is appropriate to also direct education efforts internally.

As a means of reducing overall costs to the public, the education program requirement has been modified to allow permittees to develop education programs on a regional basis. For example, permittees in the Puget Sound Basin could develop an education campaign for the entire region. In addition, Ecology provides guidance materials and conducts workshops to provide training on BMP selection and the use of Ecology's Stormwater Management Manual for the Puget Sound Basin (the technical manual). There may be some overlap between Ecology's and the permittees' education efforts. However, Ecology's focus has been to educate local government staff (not just staff of NPDES permittees), to enable local governments to transfer information to the public.

VOL 22
0741
R0065976

S8 - Total Maximum Daily Load Allocations

Under some circumstances, when the water quality of a waterbody is impaired, the federal Clean Water Act requires states to set limits on the amount of pollutants that the waterbody receives from all sources. States may also set limits on pollutant loads when waterbodies are threatened. These limits are known as Total Maximum Daily Loads (TMDLs). TMDLs differ from commonly used technology-based or water quality-based numeric limits for discharges. A TMDL is developed through a defined process. Through this process, the maximum amount of a pollutant that may be discharged from all sources to a waterbody without causing violations of water quality standards is identified. Then pollutant control strategies are developed to keep the pollutant loading below that level. The strategies may be numerical wasteload allocations to NPDES permitted dischargers or management strategies to control the loads from nonpoint sources.

When controls for stormwater discharges are necessary to implement a TMDL, stormwater management programs must be modified appropriately. Ecology considers a four-month timeframe reasonable for making these modifications. The condition also requires permittees to consider existing TMDLs when submitting their initial stormwater management program as required by S11.

S9 - Program Modification

This section is included in the permit because Ecology recognizes the need for permittees to modify their stormwater management programs in response to changing conditions and unplanned occurrences. However, Ecology also recognizes that it is the state's responsibility to make sure programs are not modified to the extent they undermine compliance with the terms of the permit. Therefore, we have identified certain types of modifications that must have prior approval from Ecology, and an opportunity for public comment.

The list of modifications requiring prior approval addresses several potential concerns:

A change in the level of effort of program implementation (i.e., a greater than 20 percent reallocation or reduction in resources).

A change in implementation of program components, as defined in special condition S7, that could negatively influence the effectiveness of the approved stormwater management program (i.e., significantly delaying, completely changing, or eliminating program components).

Changing the geographic area of coverage by adding a co-permittee or accepting permit responsibility for another entity.

VOL 22

0742

R0065977

Changes necessary to implement a TMDL.

All other program modifications are to be described in the annual report required in Special Condition S10.

If, based on information in the annual report, Ecology finds that the basis for the stormwater management program priorities have significantly changed, parts of the program are proving to be ineffective, or there are other problems with program implementation, Ecology may require permittees to make program modifications.

S10 - Reporting Requirements

A. The federal stormwater rules at 40 CFR 122.42 require municipal stormwater permittees to submit an annual report. Ecology included the annual reporting requirement in these permits, and modifications were made to clarify what is requested from permittees and to make the reporting requirements consistent with other provisions in the permits.

To reduce the administrative burden for Ecology and permittees, brief status reports are requested at the end of years one, two, three, and five. Ecology does not want the annual reporting requirement to unnecessarily take resources away from program implementation. Also, Ecology does not have staff resources to respond to voluminous annual reports. However, it is necessary to have more detailed information to prepare the next permit. Therefore, the report scheduled for the end of year four (one year before the expiration of this permit), together with a Notice of Intent shall constitute permit reapplication.

The year four report shall include a detailed evaluation of the effectiveness of the stormwater management program, all of the annual reporting information, a summary and analysis of cumulative monitoring data, and a proposed stormwater management program for the term of the next permit. If U.S. EPA establishes application requirements for the next permit before the end of year four, this permit will be modified, if necessary.

B. The items for inclusion in the annual report have been modified from the federal requirements for the following reasons:

- Additional clarification is provided on what is to be included in the portion of the report on the status of implementing the components of the stormwater management program. Compliance with the approved implementation schedule is to be addressed. Also, program modifications that were made during the reporting year are to be described.

VOL 22 0743

R0065978

- The federal requirement to describe proposed changes to the stormwater management program has been deleted since this requirement is addressed by special condition S9 - Program Modifications.

- The portion of the report on annexations and incorporation has been added by Ecology. Major annexations and incorporation could have a negative impact on stormwater management program implementation if large areas are taken out of the municipal stormwater permit program. Ecology believes it is reasonable to be notified of these types of changes in the permit coverage area so that decisions can be made about designating new or newly enlarged municipalities under the permit program.

- Ecology has provided clarification on what kind of information is required in the portion of the report on annual expenditures. Ecology needs to assess differences between planned and actual expenditures for components of the stormwater management program to evaluate the level of effort each permittee is expending on their program. We recognize that permittees do not currently have budget tracking systems that reflect the stormwater management program required under this permit, and that it is difficult to create these systems. Therefore, we have clarified our expectations on this requirement, narrative descriptions are acceptable, but over the term of the permit, reports shall evolve to show numeric expenditures.

- The federal requirement for information on revisions to the assessment of controls has been deleted from the annual report. The purpose of the federal requirement is to estimate the effectiveness of Stormwater Management Plans in reducing pollutants discharged. Except for qualitative observations, it would not be possible to estimate pollutant reductions annually without extensive monitoring of discharges. Ecology prefers the broader monitoring program outlined in S.7.B.4. for assessing success. These objectives include monitoring for overall program effectiveness. However, with multiple objectives for these programs, Ecology does not want to mandate a monitoring program which exclusively accomplishes one objective at the exclusion of the others.

  In addition, changes in program effectiveness will probably not be measurable on an annual basis. A longer time period in which trends may become observable seems more appropriate.

- Ecology has eliminated the requirement to provide a summary of monitoring data in each annual report, and replaced it with a requirement for a summary and analysis of cumulative data for the year four report. We did not feel it was necessary to look at the data annually, but do want to be able to judge trends, and make decisions about requirements for the next permit. In addition, Ecology has requested a description of any other stormwater

VOL 22
0744
R0065979

monitoring programs to be provided in the annual reports. We need this information to stay aware of all available information about stormwater in the watershed.

- The requirements for a summary of enforcement actions and identification of water quality improvements or degradation are drawn from the federal rules.

- Ecology has added a requirement for a report on the status of watershed-wide coordination activities. Information that will be used to develop the next permit is required at the end of year four.

S11 - Schedules for Compliance with Permit Conditions

This section sets schedules for stormwater management program approval. The decision to approve or disapprove a stormwater management program is identified as a modification of the permit which gives a right of appeal before the Pollution Control Hearings Board.

Ecology has set an approximately one year deadline for stormwater management program approval for large municipalities and 18 months for medium municipalities. The intention is to prevent stormwater program development from dragging on too long during the term of the permit. Permittees have already spent several years developing proposed programs and submitting applications. Ecology is anxious to expedite formal program implementation. We have set staggered program approval deadlines for large and medium municipalities because large municipalities had a statutory deadline for filing applications that was six months ahead of medium municipalities and they are generally ahead of the medium municipalities in developing their stormwater management programs.

WSDOT is a permittee that cannot be categorized as a large or medium municipality on the basis of population. Therefore, we have assigned WSDOT to the medium municipality category for the purpose of assigning a schedule for compliance.

Deadlines for program approval are contingent on Ecology meeting deadlines for review of proposed programs. It is unfair to have permittees in violation of permit requirements because Ecology was not able to provide a timely review. Therefore, the deadline for program approval is extended by the number of days by which Ecology exceeds its deadlines for program review. S11.D.3 also provides for schedule extensions for other actions beyond the permittee's control or caused by Ecology.

S11.D.2. and D.3. allow for compliance schedule extensions to accommodate comments on the SWMP and for good cause as requested in writing. Ecology shall establish compliance schedule extensions through administrative order.

VOL 22 0745

R0065980

General Conditions

The General Conditions of this permit are requirements based on federal or state laws which must be included in all NPDES general permits, either expressly or by reference. Ecology has decided to expressly incorporate the requirements of federal and state law that can be applied to municipal stormwater discharges. Where necessary, the requirements have been modified to make sense when applied to municipal stormwater discharges. The significant modifications are summarized below.

As previously explained in the discussion of Special Condition S7.B.8.c., G10, Removed Substances, is changed to allow for the reintroduction of street waste vehicle decant water until a more appropriate strategy can be developed and implemented.

G4, Bypass Prohibited, is changed to allow for bypasses of stormwater treatment facilities when the design capacity is exceeded. Ecology has set a minimum technology-based requirement that stormwater treatment BMPs in the Puget Sound Basin should be designed to treat the six-month, 24-hour storm event. Roughly, this should provided capacity for treatment of 90 percent of the annual stormwater runoff. However, higher flows generated by larger storm events are allowed to bypass. The incremental costs and the space needed to provide additional capacity to treat flows generated by larger storms becomes prohibitive quickly beyond the six-month, 24-hour storm event.
