ATTACHMENT U-2

APPENDIX 4

SWRCB Minimum Levels in ppb (µg/L)

The Minimum Levels (MLs) in this appendix are for use in reporting and compliance determination purposes in accordance with section 2.4 of this Policy. These MLs were derived from data for priority pollutants provided by State certified analytical laboratories in 1997 and 1998. These MLs shall be used until new values are adopted by the SWRCB and become effective. The following tables (Tables 2a - 2d) present MLs for four major chemical groupings: volatile substances, semi-volatile substances, inorganics, and pesticides & PCBs.

Table 2a - VOLATILE SUBSTANCES*	GC	GCMS
1,1 Dichloroethane	0.5	1
1,1 Dichloroethene	0.5	2
1,1,1 Trichloroethane	0.5	2
1,1,2 Trichloroethane	0.5	2
1,1,2,2 Tetrachloroethane	0.5	1
1,2 Dichlorobenzene (volatile)	0.5	2
1,2 Dichloroethane	0.5	2
1,2 Dichloropropane	0.5	1
1,3 Dichlorobenzene (volatile)	0.5	2
1,3 Dichloropropene (volatile)	0.5	2
1,4 Dichlorobenzene (volatile)	0.5	2
Acrolein	2.0	5
Acrylonitrile	2.0	2
Benzene	0.5	2
Bromoform	0.5	2
Bromomethane	1.0	2
Carbon Tetrachloride	0.5	2
Chlorobenzene	0.5	2
Chlorodibromo-methane	0.5	2
Chloroethane	0.5	2
Chloroform	0.5	2
Chloromethane	0.5	2
Dichlorobromo-methane	0.5	2
Dichloromethane	0.5	2
Ethylbenzene	0.5	2
Tetrachloroethene	0.5	2
Toluene	0.5	2
trans-1,2 Dichloroethylene	0.5	1
Trichloroethene	0.5	2
Vinyl Chloride	0.5	2

*The normal method-specific factor for these substances is 1, therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance.

Table 2b - SEMI-VOLATILE SUBSTANCES*	GC	GCMS	LC	COLOR
1,2 Benzanthracene	10	5		
1,2 Dichlorobenzene (semivolatile)	2	2		
1,2 Diphenylhydrazine		1		
1,2,4 Trichlorobenzene	1	5		
1,3 Dichlorobenzene (semivolatile)	2	1		
1,4 Dichlorobenzene (semivolatile)	2	1		
2 Chlorophenol	2	5		
2,4 Dichlorophenol	1	5		
2,4 Dimethylphenol	1	2		
2,4 Dinitrophenol	5	5		
2,4 Dinitrotoluene	10	5		
2,4,6 Trichlorophenol	10	10		
2,6 Dinitrotoluene		5		
2- Nitrophenol		10		
2-Chloroethyl vinyl ether	1	1		
2-Chloronaphthalene		10		
3,3' Dichlorobenzidine		5		
3,4 Benzofluoranthene		10	10	
4 Chloro-3-methylphenol	5	1		
4,6 Dinitro-2-methylphenol	10	5		
4- Nitrophenol	5	10		
4-Bromophenyl phenyl ether	10	5		
4-Chlorophenyl phenyl ether		5		
Acenaphthene	1	1	0.5	
Acenaphthylene		10	0.2	
Anthracene		10	2	
Benzidine		5		
Benzo(a) pyrene(3,4 Benzopyrene)		10	2	
Benzo(g,h,i)perylene		5	0.1	
Benzo(k)fluoranthene		10	2	
bis 2-(1-Chloroethoxyl) methane		5		
bis(2-chloroethyl) ether	10	1		
bis(2-Chloroisopropyl) ether	10	2		
bis(2-Ethylhexyl) phthalate	10	5		
Butyl benzyl phthalate	10	10		
Chrysene		10	5	
di-n-Butyl phthalate		10		
di-n-Octyl phthalate		10		
Dibenzo(a,h)-anthracene		10	0.1	
Diethyl phthalate	10	2		
Dimethyl phthalate	10	2		
Fluoranthene	10	1	0.05	
Fluorene		10	0.1	
Hexachloro-cyclopentadiene	5	5		

Table 2b - SEMI-VOLATILE SUBSTANCES*	GC	GCMS	LC	COLOR
Hexachlorobenzene	5	1		
Hexachlorobutadiene	5	1		
Hexachloroethane	5	1		
Indeno(1,2,3,cd)-pyrene		10	0.05	
Isophorone	10	1		
N-Nitroso diphenyl amine	10	1		
N-Nitroso-dimethyl amine	10	5		
N-Nitroso -di n-propyl amine	10	5		
Naphthalene	10	1	0.2	
Nitrobenzene	10	1		
Pentachlorophenol	1	5		
Phenanthrene		5	0.05	
Phenol **	1	1		50
Pyrene		10	0.05	

* With the exception of phenol by colorimetric technique, the normal method-specific factor for these substances is 1000, therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance multiplied by 1000.

** Phenol by colorimetric technique has a factor of 1.

Table 2c – INORGANICS*	FAA	GFAA	ICP	ICPMS	SPGFAA	HYDRIDE	CVAA	COLOR	DCP
Antimony	10	5	50	0.5	5	0.5			1000
Arsenic		2	10	2	2	1		20	1000
Beryllium	20	0.5	2	0.5	1				1000
Cadmium	10	0.5	10	0.25	0.5				1000
Chromium (total)	50	2	10	0.5	1				1000
Chromium VI	5							10	
Copper	25	5	10	0.5	2				1000
Cyanide								5	
Lead	20	5	5	0.5	2				10,000
Mercury				0.5			0.2		
Nickel	50	5	20	1	5				1000
Selenium		5	10	2	5	1			1000
Silver	10	1	10	0.25	2				1000
Thallium	10	2	10	1	5				1000
Zinc	20		20	1	10				1000

* The normal method-specific factor for these substances is 1, therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance.

Table 2d - PESTICIDES – PCBs*	GC
4,4'-DDD	0.05
4,4'-DDE	0.05
4,4'-DDT	0.01
a-Endosulfan	0.02
a-Hexachloro-cyclohexane	0.01
Aldrin	0.005
b-Endosulfan	0.01
b-Hexachloro-cyclohexane	0.005
Chlordane	0.1
d-Hexachloro-cyclohexane	0.005
Dieldrin	0.01
Endosulfan Sulfate	0.05
Endrin	0.01
Endrin Aldehyde	0.01
Heptachlor	0.01
Heptachlor Epoxide	0.01
Lindane(g-Hexachloro-cyclohexane)	0.02
PCB 1016	0.5
PCB 1221	0.5
PCB 1232	0.5
PCB 1242	0.5
PCB 1248	0.5
PCB 1254	0.5
PCB 1260	0.5
Toxaphene	0.5

* The normal method-specific factor for these substances is 100, therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance multiplied by 100.

Techniques:

GC - Gas Chromatography
GCMS - Gas Chromatography/Mass Spectrometry
HRGCMS - High Resolution Gas Chromatography/Mass Spectrometry (i.e., EPA 1613, 1624, or 1625)
LC - High Pressure Liquid Chromatography
FAA - Flame Atomic Absorption
GFAA - Graphite Furnace Atomic Absorption
HYDRIDE - Gaseous Hydride Atomic Absorption
CVAA - Cold Vapor Atomic Absorption
ICP - Inductively Coupled Plasma
ICPMS - Inductively Coupled Plasma/Mass Spectrometry
SPGFAA - Stabilized Platform Graphite Furnace Atomic Absorption (i.e., EPA 200.9)
DCP - Direct Current Plasma
COLOR - Colorimetric

Santa Clara River	Historic Pesticides, Chloride, Coliform, Nitrogen, Eutrophication, Trash
Los Cerritos Channel	Metals, Ammonia, Coliform

Los Angeles County Municipal Storm Water Permit (Order 01-XXX)
Individual Annual Report Form

This form summarizes the requirements in Order No. 01-XXX. Each Permittee must complete this form in its entirety, except for those requirements applicable only to the Principal Permittee. Only report activities that were performed during the previous fiscal year. Upon completion, this form shall be submitted to the Principal Permittee, by the date specified by the Principal Permittee, for inclusion in the unified Annual Storm Water Program Report. Attachments should be included where necessary to provide sufficient information on program implementation.

The goals of this Report are to: 1) concisely document implementation of the Storm Water Quality Management Plan (SQMP) during the past fiscal year; 2) evaluate program results for continuous improvement; 3) to determine compliance with order 01-XXX; and 4) to share this information with other Permittees, municipal decision makers, and the public.

!	YOU MUST FILL OUT ALL THE INFORMATION REQUESTED *Do not leave any of the sections blank.*
N/A	If the question does not apply to your municipality, please indicate N/A in the space provided and provide a brief explanation
U	If the information requested is currently unavailable, please indicate U in the space provided and give a brief explanation.

Reporting Year 200__- 200__

I. Program Management

A. Permittee Name: _____

B. Permittee Program Supervisor: _____
Title: _____
Address: _____
City: _____ Zip Code: _____
Phone: _____ Fax: _____

C. In the space below, briefly describe how the storm water program is coordinated within your agency's departments and divisions. Include a description of any problems with coordination between departments. To facilitate this, complete the Table 1.

TABLE 1

Storm Water Management Activity	Division/Department	# of Individuals Responsible for Implementing
1. Outreach & Education		
2. Industrial/Commercial Inspections		
3. Construction Permits/Inspections		
4. IC/ID Inspections		
5. Street sweeping		
6. Catch Basin Cleaning		
7. Spill Response		
8. Development Planning (project/SUSMP review and approval)		
9. Trash Collection		

D. Staff and Training

Attach a summary of staff training over the last fiscal year. This shall include the staff name, department, type of training, and date of training.

E. Budget Summary (Part 3.E.5)

1. Does your municipality have a storm water utility? Yes ☐ No ☐

If no, describe the funding source(s) used to implement the requirements of Order No. 01-XXX.

2. Are the existing financial resources sufficient to accomplish all required activities? Yes ☐ No ☐
3. Complete Table 2, and report any supplemental dedicated budgets for the same categories on the lines below the table.
4. List any additional state/federally funded projects related to storm water.

Los Angeles County Municipal Storm Water Permit (Order 01-XXX)
Individual Annual Report Form

TABLE 2

Program Element	Expenditures in Previous Fiscal Year	Estimated Amount Needed to implement Order 01-XXX
1. Program management a. Administrative costs b. Capital costs		
2. Public Information and Participation a. Public Outreach/Education b. Employee Training c. Corporate Outreach d. Business Assistance		
3. Industrial/Commercial inspection/ site visit activities		
4. Development Planning		
5. Development Construction a. Construction inspections		
6. Public Agency Activities a. Maintenance of structural and treatment control BMPs b. Municipal street sweeping c. Catch basin cleaning d. Trash collection/recycling e. Capital costs f. Other		
7. IC/ID Program a. Operations and Maintenance b. Capitol Costs		
8. Monitoring		
9. Other		
10. TOTAL		

List any supplemental dedicated budgets for the above categories:

List any activities that have been contracted out to consultants/other agencies:

F. Receiving Water Limitations (Part 2)

1. Are you aware, or have you been notified, of any discharges from your MS4 that cause or contribute to a condition of nuisance or to the violation of any applicable water quality standards? Yes ☐ No ☐
2. Has the Regional Board notified you that discharges from your MS4 are causing or contributing to an exceedance of water quality standards? Yes ☐ No ☐
3. If you answered Yes to either of the above questions, you must attach a Receiving Water Limitations (RWL) Compliance Report. The Report must include the following:
   a) A description of the pollutants that are in exceedance and an analysis of possible sources;
   b) A plan to comply with the RWL (Order 01-XXX, Part 2);
   c) Changes to the SQMP to eliminate water quality exceedances;
   d) Enhanced monitoring to demonstrate compliance; and
   e) Results of implementation.

G. Storm Water Quality Management Plan (SQMP) Implementation (Part 3)

1. Have you developed a SQMP specific to your city that incorporates the countywide SQMP, and identifies additional provisions intended to reduce the discharges of pollutants in storm water to the maximum extent practicable? Yes ☐ No ☐
2. Describe the status of SQMP implementation.

3. List the BMPs that your city has implemented to reduce pollutants in storm water to the maximum extent practicable.

4. Watershed Management Committees (WMCs)
   a) Which WMC are you in?
   b) Who is your designated representative to the WMC?
   c) How many WMC meetings did you participate in last year?
   d) Describe specific improvements to your storm water management program as a result of WMC meetings.

e) Attach any comments or suggestions regarding your WMC.

5. Storm Water Ordinance

a) Have you adopted a Permittee-specific storm water and urban runoff ordinance to enforce all requirements of Order 01-XXX? Yes ☐ No ☐
If not, describe the status of adopting such an ordinance.

b) If yes, have you already submitted a copy of the ordinance to the Regional Board? Yes ☐ No ☐
If not, please attach a copy to this Report.

c) Were any amendments made to your storm water ordinance during the last fiscal year? Yes ☐ No ☐
If yes, submit a copy of amendments to the Regional Board.

6. Discharge Prohibitions

a) List any non-storm water discharges you feel should be further regulated:

b) List any non-storm water discharges you feel should be exempt, and provide an explanation for each:

II. Special Provisions (Part 4)

A. Public Information and Participation (Part 4.B)

In addition to answering the following questions, attach a summary of all storm water education activities that your agency conducted or participated in last year.

1. No Dumping Message (Part 4.B.1.a.)

a) How many storm drain inlets does your agency own?

b) How many storm drain inlets were marked with a no dumping message in the last fiscal year?

c) What is the total number of storm drain inlets that are legibly marked with a no dumping message?

If this number is less than the number in question 1, describe why all inlets have not been marked, the process used to implement this requirement, and the expected completion date.

d) How many public access points to creeks, channels, and other water bodies within your jurisdiction have been posted with no dumping signage in the past year?

Describe your agency's status of implementing this requirement by November 29, 2003.

2. Reporting Hotline

b) Has your agency established its own hotline for reporting and for general storm water management information? Yes ☐ No ☐

b) If so, what is the number?

c) Is this information listed in the government pages of the telephone book? Yes ☐ No ☐

d) If no, is your agency coordinated with the countywide hotline? Yes ☐ No ☐

e) How many calls were received in the last fiscal year?

f) Do you keep record of the number of calls received and how they were responded to? Yes ☐ No ☐

g) Describe the process used to respond to hotline calls.

h) Have you provided the Principal Permittee with your current reporting contact information? Yes ☐ No ☐

i) Have you compiled a list of the general public reporting contacts for all Permittees and posted it on the www.888CleanLA.com web site (*Principal Permittee only)?* Yes ☐ No ☐

If not, when is this scheduled to occur?

3. Outreach and Education

a) Describe the strategy developed to provide outreach and bilingual materials to target ethnic communities. Include an explanation of why each community was chosen as a target, how program effectiveness will be determined, and status of implementation. *(Principal Permittee only)*

b) Did the Principal Permittee organize quarterly Public Outreach Strategy meetings that you were aware of? Yes ☐ No ☐

How many Public Outreach Strategy meetings did your agency participate in last year?

Explain why your agency did not attend any or all of the organized meetings.

Identify specific improvements to your storm water management program as a result of these meetings:

List suggestions to increase the usefulness of quarterly meetings:

If quarterly Public Outreach Strategy meetings were not organized, explain why not and when this requirement will be implemented *(Principal Permittee only).*

c) Approximately how many impressions were made last year on the general public about storm water quality via print, local TV, local radio, or other media?

d) Describe efforts your agency made to educate local schools on storm water pollution.

e) Did you, in cooperation with other Permittees, provide all schools within each school district in Los Angeles County with materials necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution *(Principal Permittee only)*? Yes ☐ No ☐

If not, explain why.

f) Describe the strategy developed to measure the effectiveness of in-school educational programs, including assessing students' knowledge of storm water pollution problems and solutions before and after educational efforts *(Principal Permittee only).*

For Permit Years 2-5, attach an assessment of the effectiveness of in-school storm water education programs.

g) What is the behavioral change target that was developed based on sociological data and other studies *(Principal Permittee only)?*

If no target has been developed, explain why and describe the status of developing a target.

What is the status of meeting the target by the end of Year 5?

4. Pollutant-Specific Outreach

a) Attach a description of each watershed-specific outreach programs that your agency developed *(Principal Permittee only).* All pollutants listed in Table 1 (Section B.1.d.) must be included.

b) Did your agency cooperate with the Principal Permittee to develop specific outreach programs to target pollutants in your area? Yes ☐ No ☐

c) Describe, or attach, the pollutant-specific material that was distributed.

d) Describe how your agency has made outreach materiai available to the general public, schools, community groups, contractors and developers, etc...

5. Businesses Program

a) Briefly describe the Corporate Outreach Program that has been developed to target gas stations and restaurant chains *(Principal Permittee only)*.

b) How many corporate managers did your agency reach last year?

c) What is the total number of corporations to be reached through this program?

d) Is your agency meeting the requirement of reaching all gas station and restaurant corporations once every two years? Yes ☐ No ☐

If not, describe measures that will be taken to fully implement this requirement.

e) Has your agency developed and/or implemented a Business Assistance Program? Yes ☐ No ☐

If so, briefly describe your agency's program, including the number of businesses assisted, the type of assistance, and an assessment of the program's effectiveness.

6. Did you encourage local radio stations and newspapers to use public service announcements? Yes ☐ No ☐

How many media outlets were contacted?

Which newspapers or radio stations ran them?

Who was the audience?

7. Did you supplement the County's media purchase by funding additional media buys? Yes ☐ No ☐
   Estimated dollar value/in-kind contribution:
   Type of media purchased:
   Frequency of the buys:
   Did another agency help with the purchase? Yes ☐ No ☐
8. Did you work with local business, the County, or other Permittees to place non-traditional advertising? Yes ☐ No ☐
   If so, describe the type of advertising.

9. Did you establish local community partnerships to distribute educational storm water pollution prevention material? Yes ☐ No ☐
   Describe the materials that were distributed:

   Who were the key partners?
   Who was the audience (businesses, schools, etc.)?

10. Did you participate in or publicize workshops or community events to discuss storm water pollution? Yes ☐ No ☐
    How many events did you attend?
11. Does your agency have a website that provides storm water pollution prevention information? Yes ☐ No ☐
    If so, what is the address?
12. Has awareness increased in your community regarding storm water pollution? Yes ☐ No ☐
    Do you feel that behaviors have changed? Yes ☐ No ☐
    Explain the basis for your answers. Include a description of any evaluation methods that are used to determine the effectiveness of your agency's outreach.

13. How would you modify the storm water public education program to improve it on the City or County level?

B. Industrial/Commercial Facilities Program

Did you (individually or jointly) update the Database for Critical Sources Identification? Yes ☐ No ☐

Comments/Explanation/Conclusion:

Inspection and Site Visit Program

Provide the reporting data as suggested in the following tables.

Initial Number of Facilities at the start of cycle proposed for inspection by categories (after the initial year, the updated number based on the new data)	Number of facilities inspected in the current reporting year	% Completed at the time of this report for present cycle (from the initial value, and from the updated value after first cycle)	Total number since permit adoption

R0006967

Los Angeles County Municipal Storm Water Permit (Order 01-XXX)

Individual Annual Report Form

Initial Number of Facilities at the start of cycle proposed for site visit by categories (after the initial year, the updated number based on the new data)	Number of facilities site visited in the current reporting year	% Completed at the time of this report for this cycle (from the initial value, and from the updated value after first cycle)	Total number since permit adoption

Comments/Explanation/Conclusion:

BMPs Implementation

Provide the reporting data as suggested in the following table.

Number of facilities inspected/ site visited by category in this reporting year	Number of facilities identified as adequately implementing BMPs as specified in this reporting year	% adequately implementing out of total in this reporting year	Number of facilities required to implement or upgrade in this reporting year	Number of facilities inspected/ site visited by category in this reporting cycle	Number of facilities identified as adequately implementing BMPs as specified in this reporting cycle	% adequately implementing out of total in this reporting cycle	Number of facilities required to implement or upgrade in this reporting cycle	Total Number during this permit adequately implementing	Total Number during this permit required to implement or upgrade

B-146

R0006968

Comments/Explanation/Conclusion:

Enforcement Activities

Provide the reporting data as suggested in the following tables.

Enforcement Actions by categories (e.g. Warning letter, NOV, referral to D.A., etc.)	Number of facilities issued enforcement actions in the current reporting year	Number of facilities issued enforcement actions in the current reporting cycle	Number of facilities (re)inspected due to enforcement actions in current reporting year	Number of facilities (re)inspected due to enforcement actions in current reporting cycle	Number of facilities brought into compliance in the current reporting year	Number of facilities brought into compliance in current reporting cycle	Total number since permit adoption

Facilities by category	Number of enforcement actions by type (Warning letter)	Number of NOVs	Number of Referral	Number of Other

Program Implementation Effectiveness Assessment

Please give a brief assessment of the implementation of the program in removing pollutants from the storm water discharges. Please provide an explanation. Suggested improvements or adjustments based on the

knowledge gained through this reporting period activities must be reflected in a change in the SQMP, if warranted.

Highly Effective ☐ Somewhat Effective ☐ Non-effective ☐

Comments/Explanation/Conclusion:

You must also submit a quarterly electronic submittal of your Industrial/Commercial Facilities Program activities.

B-148
R0006970

C. Development Planning Program (Part 4.D)

1. Does your agency have a process to minimize impacts from storm water and urban runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA, Section 404 of the CWA, local ordinances, and other legal authorities? Yes ☐ No ☐
   Attach a copy of your CEQA checklist, and any other examples showing how storm water quality impacts were addressed in environmental documents for projects over the past year.
2. Does your agency have procedures to include the following requirements in all priority development and redevelopment projects:
   a) Maximize the percentage of permeable surfaces to allow more percolation of storm water into the ground? Yes ☐ No ☐
   b) Minimize the quantity of storm water directed to impermeable surfaces and the MS4? Yes ☐ No ☐
   c) Minimize pollution emanating from parking lots through the use of appropriate treatment control BMPs and good housekeeping practices? Yes ☐ No ☐
   d) Provide for appropriate permanent measures to reduce storm water pollutant loads from the development site? Yes ☐ No ☐

   Briefly describe each procedure and attach examples of how each was required in a priority development or redevelopment project.

3. Describe the status of the development or implementation of peak flow controls in natural drainage systems.

4. Describe the process your agency uses to include SUSMP design standards in new development and redevelopment project approvals.

5. How many of each of the following projects did your agency review and condition to meet SUSMP requirements last year?
   a) Residential

b) Commercial
c) Industrial
d) Automotive service facilities
e) Retail gasoline outlets
f) Restaurants
g) Parking lots
h) Projects located in or directly adjacent to or discharging directly to an environmentally sensitive area
i) Total number of permits issued to priority projects

6. What is the percentage of total development projects that were conditioned to meet SUSMP requirements? %

7. How has your agency prepared to reduce the SUSMP threshold for industrial/commercial facilities to 1 acre from 100,000 square feet in 2003?

After 2003, how many additional projects per year will require/did require implementation of SUSMP requirements as a result of the lower threshold?

8. Does your agency participate in an approved regional or sub-regional storm water mitigation program to substitute in part or wholly SUSMP requirements for new development? Yes ☐ No ☐

9. Has your agency modified its planning procedures for preparing and reviewing CEQA documents to consider potential storm water quality impacts and provide for appropriate mitigation? Yes ☐ No ☐
If yes, attach a copy of your CEQA checklist.
If no, provide an explanation and an expected date of completion.

10. Did your agency update any of the following General Plan elements in the past year?
a) Land Use Yes ☐ No ☐
b) Housing Yes ☐ No ☐
c) Conservation Yes ☐ No ☐
d) Open Space Yes ☐ No ☐

If yes, please describe how watershed and storm water quality and quantity management considerations were included. Attach a copy of the amendment, if you have not already provided the Regional Board with a copy.

11. How many targeted staff were trained last year?
    How many targeted staff are trained annually?
    What percentage of total staff (listed on page 2) are trained annually? %
12. Has your agency developed and made available development planning guidelines? Yes ☐ No ☐
    If no, what is the expected date that guidelines will be developed and available to developers?
13. What is the status of completion of the technical manual for siting and design of BMPs for the development community?

D. Development Construction Program

1. Describe your agency's program to control runoff from construction activity at all construction sites within its jurisdiction.

2. Does your agency require the preparation, submittal, and implementation of a Local Storm Water Pollution Prevention Plan (Local SWPPP) prior to the issuance of a grading permit for all sites that meet one or all of the following criteria?
   a) Will result in soil disturbance of one acre or greater Yes ☐ No ☐
   b) Is within, directly adjacent to, or is discharging directly to an environmentally sensitive area Yes ☐ No ☐
   c) Is located in a hillside area Yes ☐ No ☐

   Attach one example of a local SWPPP

3. Describe the process your agency uses to require proof of filing a Notice of Intent for coverage under the State General Construction Activity Storm Water permit and a certification that a SWPPP has been prepared prior to issuing a grading permit?

4. How many building/grading permits were issued to sites requiring Local SWPPPs last year?
5. How many building/grading permits were issued to sites requiring coverage under the General Construction Activities Storm Water Permit last year?
6. How many building/grading permits were issued to construction site less than one acre in size last year?
7. How many construction sites were inspected during the last wet season?

8. Complete the following table.

Type of Violation	# of Violations	% of Total Inspections	# of Follow-up Inspections	# of Enforcement Actions
Off-site discharge of sediment				

Off-site discharge of other pollutants				
No or inadequate SWPPP				
Inadequate BMP/SWPPP implementation				

9. Describe the process for taking enforcement actions against construction site violations, including the types of actions that are taken.

10. Describe the system that your agency uses to track the issuance of grading permits.

E. Public Agency Activities (Part 4.F)

1. Trash Receptacles
   a) Did your agency place trash receptacles at all transit stops within its jurisdiction and maintain the receptacles? Yes ☐ No ☐
   b) How many trash receptacles within your jurisdiction are near transit stops or commercial areas?

2. Sewage System Maintenance, Overflow, and Spill Prevention (*only applicable to agencies that own and/or operate a sanitary sewer system*)
   a) Did your jurisdiction submit its Sewage System Response Plan to the Regional Board? Yes ☐ No ☐
   b) How many sanitary sewer overflows occurred within your jurisdiction?
      How many did your agency respond to?
   c) Did your agency investigate all complaints received? Yes ☐ No ☐
   d) How many complaints were received?
   e) Upon notification, did your agency immediately respond to overflows by containment? Yes ☐ No ☐
   f) Did your agency notify appropriate sewer and public health agencies when a sewer overflowed to the MS4? Yes ☐ No ☐
   g) Did your agency implement a program to prevent sewage spills or leaks from sewage facilities from entering the MS4? Yes ☐ No ☐
      If so, describe the program:

   h) Did your agency implement a program to identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers to the MS4? Yes ☐ No ☐
      If so, describe the program:

3. Public Construction Activities Management

a) What percentage of public construction sites 5 acres or greater in size did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit ? Yes ☐ No ☐

Give an explanation for any sites greater than 5 acres that were not covered:

b) What is the total number of active public construction sites?

How many were 5 acres or greater in size?

c) (In March, 2003) Did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit coverage for public construction sites for sites one acre or greater? Yes ☐ No ☐

4. Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management

a) Did your agency implement pollution prevention plans for each public vehicle maintenance facility, material storage facility, and corporation yard? Yes ☐ No ☐

b) Have you submitted a list to the Regional Board that includes contact person, location and telephone number for each public vehicle maintenance facility, material storage facility, and corporation yard? Yes ☐ No ☐

If not, explain why:

c) Briefly describe how your agency implements the following, and any additional, BMPs to minimize pollutant discharges in storm water:

1) Good housekeeping practices
2) Material storage control
3) Vehicle leaks and spill control
4) Illicit discharge control

d) Are all Permittee owned and/or operated vehicle/equipment wash areas self-contained, covered, equipped with a clarifier, and properly connected to the sanitary sewer? Yes ☐ No ☐

If not, what is the status of implementing this requirement?

e) How many Permittee owned and/or operated vehicle/equipment wash areas are scheduled to be redeveloped to include the BMPs listed above? Yes ☐ No ☐

5. Landscape and Recreational Facilities Management

a) Has your agency developed a standardized protocol for the routine and non-routine application of pesticides, herbicides (including pre-emergents), and fertilizers? Yes ☐ No ☐

Briefly describe this protocol:

b) How does your agency ensure that there is no application of pesticides or fertilizers immediately before, during, or immediately after a rain event or when water is flowing off the area to be applied?

c) Are any banned pesticides, herbicides, fungicides, or rodenticides stored or applied in your agency's jurisdiction that you know of? Yes ☐ No ☐

If so, list them:

d) What percentage of your agency's staff that apply pesticides are certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator?

e) Describe procedures your agency has implemented to encourage retention and planting of native vegetation and to reduce water, fertilizer, and pesticide needs:

f) How often are storage areas for fertilizers and pesticides inspected?

What BMPs are commonly implemented in storage areas?

6. Storm Drain Operation and Management

a) Did your agency designate catch basin inlets within its jurisdiction as Priority A; Priority B; and Priority C? Yes ☐ No ☐

How many of each designation exist in your jurisdiction?

Priority A:
Priority B:
Priority C:

b) How many times were all Priority A basins cleaned last year?

c) How many times were all Priority B basins cleaned last year?

d) How many times were all Priority C basins cleaned last year?

e) How much total waste was collected in tons from catch basin clean-outs last year?

f) Attach a record of all catch basins in your jurisdiction. This shall identify each basin as City or County owned, and Priority A, B, or C. For all basins that are owned and operated by your agency, include dates that each was cleaned out over the past year.

g) Did your agency place special conditions for events that generated substantial quantities of trash and litter including provisions that:

1) Provide for the proper management of trash and litter generated from the event? Yes ☐ No ☐

2) Arrange for temporary screens to be placed on catch basins? Yes ☐ No ☐

3) Or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain? Yes ☐ No ☐

h) Has your Agency conducted an assessment of measures that can be implemented to reduce and/or prevent trash from entering the MS4 system? Yes ☐ No ☐

If yes, has this assessment been submitted to the Regional Board? Yes ☐ No ☐

If no, what is the status of conducting this assessment?

i) Did your agency inspect the legibility of the catch basin stencil or labels? Yes ☐ No ☐

What percentage of stencils were legible?

j) Were illegible stencils recorded and re-stenciled or re-labeled within 180 days of inspection? Yes ☐ No ☐

k) Did your agency visually monitor Permittee-owned open channel storm drains and other drainage structures for debris at least annually and identify and prioritize problem areas of illicit discharge for regular inspection? Yes ☐ No ☐

Is the prioritization attached? Yes ☐ No ☐

l) Did your agency review its maintenance activities to assure that appropriate storm water BMPs are being utilized to protect water quality? Yes ☐ No ☐

What changes have been made?

m) Did your agency remove trash and debris from open channel storm drains a minimum of once per year before the storm season? Yes ☐ No ☐

n) How did your agency minimize the discharge of contaminants during MS4 maintenance and clean outs?

o) How much total waste was collected (in tons) by stream or channel segment from Permittee-owned open channels or other drainage structures?

p) Where was the removed material disposed of?

7. Streets and Roads Maintenance

a) Did your agency designate streets and/or street segments within its jurisdiction as one of the following:

Priority A – streets and/or street segments that are designated as consistently generating the highest volumes of trash and/or litter? Yes ☐ No ☐

Priority B - streets and/or street segments that are designated as consistently generating moderate volumes of trash and/or litter? Yes ☐ No ☐

Priority C – streets and/or street segments that are designated as generating low volumes of trash and/or litter? Yes ☐ No ☐

b) Did your agency perform all street sweeping in compliance with the permit and according to the following schedule:

Priority A – These streets and/or street segments shall be swept at least two times per month? Yes ☐ No ☐

Priority B - Each Permittee shall ensure that each streets and/or street segments is cleaned at least once per month? Yes ☐ No ☐

Priority C – These streets and/or street segments shall be cleaned as necessary but in no case less than once per year? Yes ☐ No ☐

c) Did your agency require that saw cutting wastes be recovered and disposed of properly and that in no case shall waste be left on a roadway or allowed to enter the storm drain? Yes ☐ No ☐

d) Did your agency require that concrete and other street and road maintenance materials and wastes be managed to prevent pollutant discharges? Yes ☐ No ☐

e) Did your agency require that the washout of concrete trucks and chutes only occur in designated areas and never into storm drains, open ditches, streets, or catch basins leading to the storm drain system? Yes ☐ No ☐

f) Did your agency train its employees in targeted positions (whose interactions, jobs, and activities affect storm water quality) regarding the requirements of the storm water management program to:

1) Promote a clear understanding of the potential for maintenance activities to pollute storm water? and Yes ☐ No ☐

2) Identify and select appropriate BMPs? Yes ☐ No ☐

8. Parking Facilities Management

a) Did your agency ensure that Permittee-owned parking lots be kept clear of debris and excessive oil buildup and cleaned no less than 2 times per month and/or inspected no less than 2 times per month to determine if cleaning is necessary. Yes ☐ No ☐

b) Were any Permittee-owned parking lots cleaned less than once a month? Yes ☐ No ☐

How many?

9. Public Industrial Activities Management

a) Did your agency, for all municipal activity considered an industrial activity under USEPA Phase I storm water regulations, obtain separate coverage under the State of California General Industrial Activities Storm Water Discharge Permit no later than December 31, 2001? Yes ☐ No ☐

b) Does your agency serve a population of less than 100,000 people? Yes ☐ No ☐

10. Emergency Procedures

a) In case of real emergencies, did your agency repair essential public services and infrastructure in a manner to minimize environmental damage? Yes ☐ No ☐

b) Were BMPs implemented to the extent that measures did not compromise public health and safety? Yes ☐ No ☐

11. Feasibility Study

a) Did your agency cooperate with the County Sanitation Districts of Los Angeles County to prepare a study which investigates the possible diversion of dry weather flows or the use of alternative treatment control BMPs? Yes ☐ No ☐

b) Did your agency review its individual prioritized list and create a watershed based priority list of drains for potential diversion and submit a listing of priority diversions to the Regional Board Executive Officer? Yes ☐ No ☐

F. Illicit Connections and Illicit Discharges (IC/ID) Elimination Program (Part 4.G)

1. Attach a copy of your agency's IC/ID Elimination Implementation Program (Part 4.G.1.a.).
2. Attach a map of your storm drain system showing all permitted connections, and the locations of all illicit connections and discharges that occurred last year (Part 4.G.1.b). If your agency has not completed this requirement, describe the status of the development of a baseline map, including an expected completion date.

3. Describe your enforcement procedures for eliminating illicit discharges and terminating illicit connections.

4. Describe your record keeping system to document all illicit connections and discharges.

5. What is the total length of open channel that your agency owns and operates?

   What length was screened last year for illicit connections?
6. What is the total length of closed storm drain that your agency owns and operates?

What length was screened last year for illicit connections?

7. Describe the method used to screen your storm drains.

8. Attach a copy of your agency's plan for proactive storm drain screening of priority areas (Part 4.G.2.b). If a plan has not been developed, describe the status of development.

9. Provide the reporting data for illicit connections as suggested in the following table (you may submit a spreadsheet from your database that contains the information).

Year	Total # reported/ identified	Total # investigated	# that conveyed exempt discharges or NPDES permitted	# that conveyed illicit discharges that were terminated	# that were removed	# that resulted in enforcement action	# not identified
01/02							
02/03							
03/04							
04/05							
05/06							

10. What is the average time it takes your agency to initiate an illicit connection investigation after it is reported?

a) Were all identified connections terminated within 180 days? Yes ☐ No ☐

b) If not, explain why.

11. Provide the reporting data for illicit discharges as suggested in the following table (you may submit a spreadsheet from you database that contains this information).

Year	Total # reported	Total # that were discontinued/ cleaned up voluntarily through enforcement and the source was identified	# that were cleaned up but the source could not be identified	# that resulted in no evidence of discharge	# that were determined to be conditionally exempt	# that were exempt or in compliance and the source identified	# that resulted in enforcement action
01/02							
02/03							
03/04							
04/05							
05/06							

12. What is the average response time after an illicit discharge is reported?
    a) Did any response times exceed 72 hours? Yes ☐ No ☐
    b) If yes, explain why.

13. Describe the your agency's spill response procedures.

14. What would you do differently to improve your agency's IC/ID Elimination Program?

15. Attach a list of all permitted connections to your storm sewer system.

III. Monitoring

Briefly describe any storm water monitoring activities that are not required by Order No. 01-XXX that your municipality conducted, participated in, or received funding to conduct in the past fiscal year. These activities should correspond with the dollar amount you listed in Table 3.

IV. Assessment of Program Effectiveness

F. Attach a summary of the effectiveness of your storm water management program. This summary should include, at a minimum, the following:

1. An assessment of your agency's compliance with permit requirements, based on your responses to the questions in this form;
2. Descriptions of any evaluation methods that your agency uses to determine the effectiveness of your storm water management program;
3. A summary of the strengths and weaknesses of your agency's storm water management program;
4. A list of specific program highlights and accomplishments;
5. A description of water quality improvements or degradation in your watershed over the past fiscal year;
6. Interagency coordination between cities to improve the storm water management program;
7. Future plans to improve your agency's storm water management program; and
8. Suggestions to improve the effectiveness of your program or the County model programs.

G. On a scale of 1 to 10, rate your municipality's level of compliance with Order No. 01-XXX.

Certification Statement

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility, of a fine and imprisonment for knowing violations.

Tentative Draft – FACT SHEET/STAFF REPORT

State of California
California Regional Water Quality Control Board Los Angeles Region
National Pollutant Discharge Elimination System (NPDES)
Permit No. CAS004001, CI 6948
Regional Board Order No. 01-XXX

I. PURPOSE

The purpose of this Fact Sheet/Staff Report is to give the Permittees and interested parties an overview of the proposed permit as well as to provide the technical basis for the permit requirements. Sections I through IV describe water quality problems from storm water and urban runoff, and permit conditions to address these problems. Sections V and VI discuss each major element of the Permittees' Storm Water Quality Management Plan (SQMP), and is meant to be used as a reference document during review of the permit.

II. INTRODUCTION - THE NEED TO REGULATE STORM WATER DISCHARGES

A. Impacts

The quality of storm water and urban runoff are fundamentally important to the health of the environment and the quality of life in Southern California. Polluted storm water runoff is a leading cause of water quality impairment in the Los Angeles Region. Storm water and urban runoff (during dry and wet weather) are often contaminated with pesticides, fertilizers, animal droppings, trash, food wastes, automotive byproducts, and many other toxic substances generated by our urban environment. Water that flows over streets, parking lots, construction sites, and industrial, commercial, residential, and municipal areas carries these untreated pollutants through the storm drain networks directly into the receiving waters of the Region. The water quality impacts and increased public health risks from Municipal Separate Storm Sewer System (MS4) discharges that affect receiving waters nationwide and Los Angeles County and its coastline are well documented.

The **National Urban Runoff Program** (NURP) Study (USEPA 1983) showed that MS4 discharges draining from residential, commercial, and light industrial areas contain significant loadings of total suspended solids. Although the NURP Study did not cover industrial sites, the study suggested that runoff from industrial sites may have significantly higher contaminant levels than runoff from other urban land use sites. Several studies tend to support this observation, for e.g., the City of Fresno, California, a NURP project site, industrial areas there had the poorest storm water quality of the four land-uses evaluated. The study found that pollutant levels from illicit discharges were high enough to significantly degrade receiving water quality, and threaten aquatic life, wildlife, and human health.

The 1992, 1994, and 1996 National Water Quality Inventory Reports to Congress prepared by USEPA showed a trend of impairment in the Nation's waters from

contaminated storm water and urban runoff. The recent 1998 National Water Quality Inventory (305(b) Report)[1] showed that urban runoff/storm water discharges affect 11% of rivers, 12% of lakes, and 28% of estuaries. The report states that ocean shoreline impairment due to urban runoff/storm sewers increased from 55% in 1996 to 63% in 1998. The report notes that urban runoff and storm water discharges are the leading source of pollution and the main factor in the degradation of surface water quality[2] in California's coastal waters, rivers and streams.

The Natural Resources Defense Council (NRDC) 1999 Report, **"Stormwater Strategies, Community Responses to Runoff Pollution"**[3] identifies two main causes of the storm water pollution problem in urban areas. Both causes are directly related to development in urban and urbanizing areas:

1. Increased volume and velocity of surface runoff. There are three types of human-made impervious covers that increase the volume and velocity of runoff: (i) rooftop, (ii) transportation imperviousness, and (iii) non-porous (impervious) surfaces. As these impervious surfaces increase, infiltration will decrease, forcing more water to run off the surface, picking up speed and pollutants.

2. The concentration of pollutants in the runoff. Certain activities, such as those from industrial sites, are large contributors of pollutant concentrations to the storm water system.

The report also identified several activities causing storm water pollution from urban areas, practices of homeowners, businesses, and government agencies.

More recent studies conducted by **United States Geological Survey** (USGS)[4] confirms the link between urbanization and water quality impairments in urban watersheds due to contaminated storm water runoff.

Furthermore, the water quality impacts of urbanization and urban storm water discharges have been summarized by several other recent USEPA reports.[5] Urbanization causes changes in hydrology and increases pollutant loads which adversely impact water quality and impairs the beneficial uses of receiving waters. Increases in population density and imperviousness result in changes to stream hydrology including:

a) increased peak discharges compared to predevelopment levels;

b) increased volume of storm water runoff with each storm compared to pre-development levels;

c) decreased travel time to reach receiving water; increased frequency and severity of floods;

d) reduced stream flow during prolonged periods of dry weather due to reduced levels of infiltration;

e) increased runoff velocity during storms due to a combination of effects of higher discharge peaks, rapid time of concentration, and smoother hydraulic surfaces from channelization, and

f) decreased infiltration and diminished groundwater recharge.

The LA County MS4 program conducts monitoring to:

1. quantify mass emissions for pollutants;
2. identify critical sources for pollutants of concern in storm water;
3. evaluate BMP effectiveness; and
4. evaluate receiving water impacts.

The monitoring indicates that instream concentrations of pathogen indicators (fecal coliform and streptococcus), heavy metals (such as Pb, Cu, Zn,) and pesticides (such as diazinon) exceed state and federal water quality criteria.[6] The mass emissions of pollutants to the ocean are significant from the urban WMAs such as the Los Angeles River WMA, Ballona Creek WMA, and Coyote Creek WMA, with the Los Angeles River WMA providing more than seventy percent of the loadings. Critical source data for facilities (such as auto-salvage yards, primary metal facilities, and automotive repair shops) show that total and dissolved heavy metals (Pb, Cu, Zn, and Cd), and total suspended solids (TSS) exceeded state and federal water quality criteria by as much as 2 orders of magnitude. The results are consistent with a limited term study conducted by the Regional Board to characterize storm water runoff in the Los Angeles region before the issuance of MS4 permits.[7] Storm water runoff data from predominant land uses in LA County showed similar patterns. Light-industrial, commercial and transportation land uses showed the highest range of exceedances. A pesticide (diazinon) was detected in higher concentrations from residential land use. The data for polycyclic aromatic hydrocarbons (PAHs), a known pollutant of concern in urban storm water runoff, is inconclusive but improved analytical methods may yield more definitive results next year. Receiving water impacts studies found that storm water discharges from urban watersheds exhibit toxicity that are attributable to heavy metals. Biosurveys of the benthic communities showed bioaccumulation of toxicants. Sediment analysis showed higher concentrations of pollutants, such as Pb and PAHs, in urban watersheds than in rural watersheds (2 to 4 times higher). In addition, toxicity of dry weather flows was

[6] *Los Angeles County 1998-1999 Storm water Monitoring Report*, Los Angeles County Department of Public Works (1999). Data summarizes results of storm water monitoring for the most recent year and the past five years.
[7] *Storm Water Runoff in Los Angeles and Ventura Counties, Final Report* (1988), California Regional Water Quality Control Board, Los Angeles, SCCWRP Contribution C292. This study found the highest mean concentrations of pollutants of concern such as heavy metals in the urban watershed rivers and that they contributed significant loads to the ocean.

observed with the cause of toxicity undetermined.[8] Other studies have found chemical concentration of pollutants that exceed state and federal water quality criteria in storm drains flowing to the ocean during dry weather,[9] and that there are adverse health impacts from swimming near them.[10]

B. Benefits of Permit Program Implementation

Implementation of the MS4 permit requirements will significantly reduce pollutants in urban storm water in a cost-effective manner. Implementation of Best Management Practices (BMPs) should also reduce pollutant discharges, and improve surface water quality. The expected benefits of implementing the provisions of the Los Angeles County MS4 NPDES permit include:

- **Enhanced Aesthetic Value**: Storm water affects the appearance and quality of a water body, and the desirability of working, living, traveling, or owning property near that water body. Reducing storm water pollution will increase benefits as these water bodies recover and become more desirable.
- **Enhanced Opportunities for Boating**: reducing sediment and other pollutants, and increasing water clarity, which enhances the boating experience for users, offer additional benefits.
- **Enhanced Commercial Fishing**: Important because commercial fisheries are a significant part of the nation's economy, and 28% of the estuaries in the 305(b) Report were impacted by storm water/urban runoff.
- **Enhanced Recreational and Subsistence Fishing**: Pollutants in storm water can eliminate or decrease the numbers, or size, of sport fish and shell fish in receiving waters.
- **Reduced Flood Damage**: Storm water runoff controls may mitigate flood damage by addressing problems due to the diversion of runoff, insufficient storage capacity, and reduced channel capacity from sedimentation.
- **Reduced Illness from Consuming Contaminated Seafood**: Storm water controls may reduce the presence of pathogens in seafood caught by commercial or recreational anglers.
- **Reduced Illness from Swimming in Contaminated Water**: Epidemiological studies indicate that swimmers in water contaminated by storm water runoff are more likely to experience illness than those who swim farther away from a storm water outfall.
- **Enhanced Opportunities for Non-contact Recreation**: Storm water controls reduce turbidity, odors, floating trash, and other pollutants, which then allow waters to be used as focal point for recreation, and enhance the experience of the users.
- **Drinking Water Benefits**: Pollutants from storm water runoff, such as solids, toxic pollutants, and bacteria may pose additional costs for treatment, or render the water unusable for drinking.

[8] *Toxicity of Dry Weather Flow from the Santa Monica Bay Watershed*, Bay, S. et al (1996), Bull. Southern California Acad. Sci. 5(1), pp. 33-45. The paper describes preliminary results on dry weather toxicity which have been confirmed by the MS4 monitoring program.

[9] *Chemical Contaminant Release into Santa Monica Bay, Final Report*, American Oceans Campaign , Santa Monica (1993)

[10] *The Health Effects of Swimming in Ocean Water Contaminated by Storm Drain Runoff*, Haile, R.W. et al. (1999), Epidemiology 10: 355-363). The study found higher risks of respiratory and gastrointestinal symptoms from swimmers.

- **Water Storage Benefits:** Storm water is a major source of impairment for reservoirs. The heavy load of solids deposited by storm water runoff can lead to rapid sedimentation of reservoirs and the loss of needed water storage capacity.[11]

III. STATUTORY AND REGULATORY HISTORY OF THE STORM WATER PROGRAM

Over the past 29 years, water pollution control efforts have focused primarily on certain process wastewater discharges from facilities such as factories and sewage treatment plants, with less emphasis on diffuse sources. The 1972 amendments to the Federal Clean Water Act (CWA) prohibit the discharge of any pollutant to waters from a point source, unless a NPDES permit authorizes the discharge. Because the focus on reducing pollutants was centered on industrial and sewage treatment discharges, the U.S. Congress amended the CWA in 1987, requiring the USEPA to create phased NPDES requirements for storm water discharges.

In response to the 1987 Amendments to the CWA, the USEPA developed Phase I of the NPDES Storm Water Program in 1990. Phase I requires NPDES permits for storm water discharges from: (i) "medium" and "large" MS4s generally serving, or located in incorporated places or counties with, populations of 100,000 or more people; and (ii) eleven categories of industrial activity (including construction activity that disturbs five acres or greater of land).

Phase II, adopted in December 2000 and scheduled to take effect in March 2003, requires operators of small MS4s and small construction sites (construction activity disturbing between 1 and 5 acres of land) in urban areas to control storm water runoff discharges. Phase II establishes a cost-effective approach for reducing environmental harm caused by storm water discharges from previously unregulated diffuse sources.

A. Basis for Permit Conditions

1. **Statutory basis for permit conditions.** The conditions established by this permit are based on Section 402(p)(3)(B) of the CWA which mandates that a permit for discharges from MS4s must: effectively prohibit the discharges of non-storm water to the MS4; and require controls to reduce pollutants in discharges from MS4 to the maximum extent practicable (MEP) including best management practices, control techniques, and system, design and engineering methods, and such other provisions determined to be appropriate. MS4s are not exempted from compliance with Water Quality Standards. Section 301(b)(1)(C) of the CWA requiring that NPDES permits include limitations, including those necessary to meet water quality standards, applies. The intent of the permit conditions is to meet the statutory mandate of the CWA.

   The permit requires the implementation of a comprehensive Storm Water Quality Management Program (SQMP) through a selection of Best Management Practices (BMPs) (40 CFR 122.44(k)) as the mechanism to

[11] *Report to Congress on Phase II Storm Water Regulations.* USEPA, Office of Water. EPA-833-R-99-001, Oct. 1999.

achieving the reduction of pollutants in storm water to the maximum extent practicable (MEP) (CWA. § 402(p)(3)(B)(iii)).

2. **Regulatory basis for permit conditions.** As a result of the statutory requirements of the CWA the USEPA promulgated the MS4 Permit application regulations, 40 CFR 122.26(d). These regulations described in detail the permit application requirements for MS4s operators. The information in the Report of Waste Discharge (ROWD) was utilized to develop the permit conditions and determine permittees status in relationship to these conditions.

3. **Discharge limitations.** No numeric effluent limitations are proposed at this time. In accordance with 40 CFR 122.44(k), the USEPA has required a series of increasingly more effective BMPs[12], in the form of a comprehensive SQMP, performance standards, in lieu of numeric limitations.[13]

B. Public Review and Participation Process

Los Angeles County Flood Control District submitted the ROWD for on January 31, 2001. Since that time Regional Board staff has dedicated significant time and effort to providing the opportunities for public participation and comment. More than 30 meetings, 2 workshops, and numerous outreach efforts have been conducted to ensure that the public, the Permittees, and other interested parties had ample opportunity to participate in the development and comment on draft permit requirements and language prior to consideration by the Regional Board for adoption.

To invite public comment at the beginning of the renewal process, a preliminary draft, dated March 16, 2001, was issued to a working group of interested parties. This draft was used as a starting point for discussion. The workgroup had approximately 30 days to review it prior to the issuance of the first draft, on April 13, 2001. The first draft was sent to all Permittees, storm water consultants, environmental organizations, and other interested parties. It was also made available on the Regional Board Storm Water web page at www.swrcb.ca.gov/rwqcb4/html/programs/Stormwater/renewal.html. More than 30 days were provided for the submittal of written comments. After considering comments submitted, Regional Board staff issued the second draft permit on June 29, 2001. Comments on the second draft (due by August 6, 2001) were considered and incorporated as appropriate in the tentative draft issued on October 11, 2001. Permittees and interested parties have an additional thirty days to submit written comments and a forty-five day period for review prior to Regional Board consideration. The tentative permit is scheduled for consideration on November 29, 200,a Regional Board meeting. A public notice was published in the Los Angeles Times on October 3, 2001, more than 45 days prior to the date of the Board meeting.

Furthermore, Regional Board staff conducted separate meetings to particular special provisions with Permittees and interested parties as necessary. In addition to these

[12] *Interpretative Policy Memorandum on Reapplication Requirements* of MS4s issued by USEPA (61 Fed. Reg. 41697)
[13] *Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits* (61 Fed. Reg. 43761)

meetings, Regional Board staff held two workshops to review the permit and listen to comments, including one formal workshop with the Board members. Regional Board staff has also participated in the monthly Executive Advisory Committee meetings to answer questions and discuss permit issues. Staff has also been available for public outreach via telephone. The following table outlines some of the opportunities for permittee and public input provided by Regional Board staff.

Date	Public Involvement Activity
January 31, 2001	Application for permit renewal (ROWD)
February 27, 2001	Inspections Working Group Meeting
February 28, 2001	Illicit Connection/Discharge Working Group Meeting

November 29, 2001	Proposed Permit Adoption at Board Meeting

IV. BACKGROUND - LOS ANGELES COUNTY MS4

A. Los Angeles County MS4 Permit History

In 1990, the Los Angeles Regional Board (Regional Board) adopted Order No. 90-079, the Los Angeles County MS4 Permit. That permit required the Los Angeles County Flood Control District, the County of Los Angeles and the incorporated cities in Los Angeles County to implement storm water pollution controls including amending ordinances, optimizing existing pollutant controls such as street sweeping, construction site controls, and others. The Regional Board required all Permittees to implement a minimum list of 13 BMPs for consistency across the County. The 1990 permit was issued on a system wide basis due to the highly interconnected storm drain system serving a population well in excess of 100,000 inhabitants. An NPDES permit is valid for a five-year period after the date is issued[14].

On July 15, 1996, the Regional Board adopted Order No. 96-054 that revised the 1990 permit. The 1996 LA County MS4 permit required model programs be developed and implemented by the Permittees for Public Information and Public Participation, Industrial/Commercial Activities, Development Construction, Illicit Connections and Illicit Discharges, Public Agency Activities, and Development Planning. These model programs were intended to be dynamic and expected to change with time, as more information on storm water impacts became available.

Following the adoption of Order 96-054, the City of Long Beach submitted a ROWD as an application for its own MS4 permit. The City of Long Beach Municipal Storm Water Permit (Order No. 99-060) was adopted on June 30, 1999. This Order superseded the countywide permit requirements for the City of Long Beach, and the City now operates under its separate waste discharge requirements.

On January 31, 2001, the Los Angeles County Department of Public Works submitted an application for renewal of their MS4 permit in the form of an ROWD for Los Angeles County and the incorporated cities, except for the City of Long Beach. This application started the process for reissuance of the permit, which enters into its third permit term now.

[14] 40 CFR §122.46 (a)

B. Los Angeles County Storm Drain System

The MS4 covered by this proposed permit for the County of Los Angeles and 83 incorporated cities drains the coastal slopes of the Transverse Mountain Ranges, and flows into the Santa Monica Bay and the Los Angeles/Long Beach Harbor. The storm drain structure consists of thousands of catch basins, thousands of miles of underground storm drains, as well as open channels, all owned and operated separately by Permittees. The length of the system, and the locations of all storm drain connections, are not known exactly, as a comprehensive map for the storm drain system does not exist. Rough estimates, based on information from large municipalities (population > 100,000), indicate that the length exceeds 4,300 miles, as shown below.

Permittee	Area (Square Miles)	Catch Basins	Storm Drain Length	Open Channel Length
LA County		73,000	2,650 miles	450 miles
City of LA	469	30,000	1,600 miles	31 miles
El Monte	10	316	11 miles	0.4 mile
Glendale	30.6	1,100	Unknown	Unknown
Inglewood	9	1,157	12 miles	Unknown
Pasadena	26	1,050	30	Unknown
Santa Monica	8.3	850	Unknown	Unknown
Torrance	20	2,000	20 miles	3 miles
TOTAL		**109,473**	**4,323**	**484.4**

C. Summary of Problems in the Los Angeles County Watersheds

Watersheds are geographic areas draining into a river system, ocean or other bodies of water through a single outlet. There are six Watershed Management Areas (WMAs) that represent the six major watersheds covered by the Los Angeles County MS4 NPDES permit. The following is a summary of some significant issues in each watershed.[15]

Dominguez Channel/Los Angeles-Long Beach Harbor Watershed

[15] *Watershed Management Initiative Chapter.* California Regional Water Quality Control Board – Los Angeles Region. Dec. 2000.

Permitted discharges

- 415 dischargers covered under an industrial storm water permit
- 69 dischargers covered under a construction storm water permit

Potential sources of pollution

- Historical deposits of DDT and PCBs in sediment
- Spills from ships and industrial facilities
- Leakages contaminating groundwater
- **Urban and storm water runoff**
- Impairments: metals, PCBs, PAHs, historic pesticides, coliform, trash, and nitrogen

Los Angeles River Watershed

Permitted discharges

- 1,327 dischargers covered under an industrial storm water permit
- 147 dischargers covered under a construction storm water permit

Potential sources of pollution

- Nitrogen and coliform contributions from septic systems
- Other nonpoint sources (horse stables, golf courses)
- Leakage of MTBE from underground storage tanks
- **Urban and storm water runoff**
- Impairments: nitrogen, trash, selenium, other metals, coliform, PCBs, historic pesticides, chlorpyrifos

San Gabriel River Watershed[16]

Permitted discharges

- 549 dischargers covered under an industrial storm water permit
- 175 dischargers covered under a construction storm water permit

Potential sources of pollution

- Excessive trash in recreational areas of upper watershed
- Nonpoint source loadings from nurseries and horse stables
- **Urban and storm water runoff**
- Impairments: nitrogen and effects, trash, metals, historic pesticides, coliform, chlorides, and PCBs

[16] *San Gabriel Watershed State of The Watershed* - RWQCB - LA Region - June 2000

Santa Monica Bay Watershed

- 147 dischargers covered under an industrial storm water permit
- 107 dischargers covered under a construction storm water permit

Potential sources of pollution

- Discharges from Ballona and Malibu Creeks contribute to impairments in the Santa Monica Bay and its beaches.
- Impairments: mercury, selenium, other metals, historical pesticides, PAHs, PCBs, nitrogen, coliform, trash, TBT, habitat alteration, exotic vegetation, and salts

Coastline

- **Acute health risk associated with swimming in runoff contaminated surfzone waters**
- Chronic risk associated with consuming seafood from areas impacted by DDT and PCB contamination
- Historic deposits of DDT and PCBs in sediment

Ballona Creek Watershed

- Trash loading from creek
- Sediment contamination by heavy metals form creek to Marina del Rey Harbor and offshore
- **Toxicity of both dry weather and storm water runoff in creek**
- High bacterial indicators at mouth of creek

Malibu Creek Watershed

- Excessive freshwater, nutrients, and coliform in lagoon; contribution from POTW and other sources
- **Urban runoff from upper watersheds**
- Septic tanks in lower watershed

Santa Clara River

Permitted discharges

- 4 POTWs
- 98 dischargers covered under an industrial storm water permit
- 190 dischargers covered under a construction storm water permit

Potential sources of pollution

- Agriculture
- Increasing loads of nitrogen and salts in supplies of ground water
- POTW discharges
- Increasing development and channelization that results in increased runoff volumes and velocities, erosion, and loss of habitat
- Septic tanks

- Impairments: chloride, nutrients (nitrogen), coliform, trash (in parts of watershed)

D. Enforcement Provision

During the renewal process for the existing permit (i.e. in 1995 and 1996), the permittees proposed and the Regional Board agreed to addition of a "Notice to Meet and Confer" provision (Part 2, section G of the existing permit). This was envisioned as an administrative review process for resolving permit disputes before the Regional Board would take formal enforcement action. It has been actually used only once (in 2000), when the Regional Board issued Notice to Meet and Confer letters to permittees in the Los Angeles River and Ballona Creek watersheds. The purpose of this process was to determine the effectiveness of municipalities' efforts to reduce trash in waters that are impaired by trash.

Subsequent to renewal of the existing permit, the State developed an enforcement policy (State Board Resolution 96-030) and guidance, which sets forth a progressive strategy that has the goal of ensuring consistent, predicable, and fair enforcement of regulations. This is now a well-established and widely implemented policy throughout the State, including in the Los Angeles Region. Therefore, with this policy of progressive enforcement in place the Notice to Meet and Confer provision is not needed; accordingly, the proposed permit does not contain this provision.

E. Total Maximum Daily Loads (TMDLs)

Part 3, Section C. of the proposed permit specifies that the Permittees shall amend the SQMPto comply with load allocations approved pursuant to adoption and approval of Total Maximum Daily Loads (TMDLs). The addition of this provision represents a significant difference from the existing permit, which does not contain a provision for implementation of TMDLs. In addition, the Special Provisions for the Permittees' Program for Public Agencies (Part 4, Sections F.7. and F.8.) specifies performance measures for watersheds subject to a trash TMDL.

TMDLs are one of the Regional Board's highest priorities. In view of the Region's highly urbanized environment, it is likely that pollutants in storm water will be allocated significant load reductions. While specific load reductions can't be forecast at this time, the Board's does envision that storm water permits will be an important mechanism for implementing load reductions. An early example of the relationship between TMDLs and storm water permits is the trash TMDL adopted for the Los Angeles River and Ballona Creek in September 13, 2001, which directs municipalities to monitor for baseline trash levels for 2-4 years, and then to start implementing trash prevention and/or control measures to reduce trash to zero by the year 2013. This proposed 5-year permit incorporates the monitoring requirements of the TMDL and, based on the results of the monitoring requirements, specified load reductions of 60% by 2006. Permits that

are adopted subsequent to this proposed MS4 permit are expected to incorporate the remaining load allocation reductions to achieve zero trash in the Los Angeles River and Ballona Creek by 2013.

Public review of the Regional Board's TMDLs, will occur during the TMDL adoption process (and there will not be an additional public process for TMDL implementation and Basin Plan amendment). Upon approval of a TMDL, the load allocations (specified in that TMDL) effective and enforceable under this permit. This TMDL requirement is consistent with TMDL provisions in the Long Beach and Ventura County MS4 permits.

F. Revision of the Permittees' Storm Water Quality Management Program

In general, MS4 permits such as the Los Angeles County MS4 Permit do not have numeric effluent limits for storm water discharges. Rather, the Regional Board relies on a BMP approach implemented by the Permittees to reduce the discharge of pollutants in storm water to the MEP. Therefore the development and implementation of the special provisions (i.e. the model programs) become of paramount importance.

The Special Provisions in the next section are - for the most part - based on the Permitees' existing model programs, which they've been implementing since at least 1999. The changes Regional Board staff has made provide to the current permit include greater specificity, and better measures to determine. Some of the Permittees are already meeting these performance measures. Many of the performance measures Regional Board staff is proposing will clarify the MEP compliance expectations, and set a consistent bar for all Permittees.

V. DISCUSSION OF SPECIAL PROVISIONS

A. Public Information and Participation Program (PIPP)

Legal Authority:

CWA § 402(p)(3)(B)(ii-iii), CWC section 13377, and NPDES regulations at 40 CFR 122.26(d)(2)(I)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(6) provides that the proposed management program include "A description of a program to reduce to the maximum extent practicable, pollutants in discharges from MS4s associated with the application of pesticides, herbicides, and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications, and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities."

NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(6) provides that the proposed management program include " A description of education activities, public

information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials."

To satisfy the Public Education and Outreach minimum control measure, the Permittees need to: (i) implement a public education program to distribute educational materials to the community, or conduct equivalent outreach activities about the impacts of storm water discharges on local waterbodies and the steps that can be taken to reduce storm water pollution; and (ii) determine the appropriate BMPs and measurable goals for this minimum control measure.

Background:

Implementation of a PIPP is a critical BMP and a necessary component of a storm water management program. The State Board Technical Advisory Committee "recognizes that education with an emphasis on pollution prevention is the fundamental basis for solving nonpoint source pollution problems." The USEPA Phase II Fact Sheet 2.3 (Fact Sheet 2.3) finds that "An informed and knowledgeable community is critical to the success of a storm water management program since it helps insure the following: (i) greater support for the program as the public gains a greater understanding of the reasons why it is necessary and important, and (ii) greater compliance with the program as the public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters."[17]

Furthermore, the public can provide valuable input and assistance to a municipal storm water management program and, therefore, should play an active role in the development and implementation of the program. An active and involved community is essential to the success of a storm water management program because it allows for:

- Broader public support since residents who participate in the development and decision making process are partially responsible for the program and, therefore, are more likely to take an active role in its implementation;
- Shorter implementation schedules due to fewer obstacles in the form of public and legal challenges and increased sources in the form of residents volunteers;
- A broader base of expertise and economic benefits since the community can be a valuable, and free, intellectual resource; and
- A conduit to other programs as residents involved in the storm water program development process make important cross-connections and relationships with other community and government programs. This benefit is particularly valuable when trying to implement a storm water program on a watershed basis, which is encouraged by the USEPA.

Discussion of New Requirements:

[17] *Storm Water Phase II Final Rule - Public Education and Outreach Minimum Control Measure.* USEPA Fact Sheet 2.3, January 2000.

Based on the background information, Los Angeles County should continue its comprehensive educational storm water and urban runoff outreach program, which is designed to measurably increase public knowledge and change behavior regarding storm water pollution. The first five-year public education plan was successful at studying segments of Los Angeles County residents to identify those who pose the greatest threat to storm water quality and those who represent the greatest opportunity to respond to a public education program, as well as providing a baseline measurement of residents' storm water-related practices and habits. This information was used to target the residents who are most likely to change their behaviors to improve storm water quality. Using various communication tactics and activities, the program successfully reached 83% of County residents with pollution prevention messages through the Storm Water/Urban Runoff Public Education Program Five-Year Storm Water Public Education Strategic Analysis (Five-Year Strategy).[18]

Although the Program has been successful at certain goals, it must be augmented to continue increasing public awareness of specific storm water issues. According to the USEPA, materials and activities should be relevant to local situations and issues, and incorporate a variety of strategies to ensure maximum coverage.[19] To help address local situations and sources of specific pollutants, section B.1.d. of the PIPP requires the development of watershed and pollutant-specific education programs.

A need also exists to target ethnic groups that may not be reached by or understand existing storm water educational materials. In an effort to reach these groups, section B.1.c.2. requires the development of a strategy to provide outreach and bilingual materials to target ethnic communities.

Also, the USEPA encourages partnerships and cooperation.[20] Quarterly meetings will provide the opportunity for Permittees to coordinate their outreach efforts and efficiently build on the County's existing program with local, watershed-specific efforts. Since the Program's inception, Permittees have been required to conduct educational activities within their own jurisdictions. The lack of guidance and coordination has led to duplicate efforts and confusion about developing appropriate programs that are consistent with, and enhance the Principal Permittee's regional education program. This requirement will ensure that all Permittees are coordinated for the most efficient and effective Program. It will also help identify Permittees with insufficient Programs.

It is generally more cost-effective to have numerous operators coordinate to use an existing program than all developing their own local programs. Therefore, Permittees should build on the regional program with additional information specific to local needs.

Furthermore, directing materials or outreach programs toward specific groups of commercial, industrial, and institutional entities likely to have significant storm

[18] Storm Water/Urban Runoff Public Education Program Five-Year Storm Water Public Education Strategic Analysis, Los Angeles County of Public Works, July 31, 2000.
[19] Phase II Fact Sheet 2.3
[20] *Id.*

water impacts is recommended.[21] Pursuant to Order 96-054, the Principal Permittee conducted educational site visits to Phase I industrial facilities, auto repair shops, retail gasoline outlets, and restaurants over the last 5 years. The next step in this targeted outreach program is education at the corporate level to facilitate employee compliance.[22] Therefore, the Principal Permittee is required to implement a corporate outreach program to educate corporate management at gas stations and restaurant chains about storm water regulations.[23] Also, a non-regulatory business assistance program would encourage small businesses that lack access to the expertise necessary to comply with storm water regulations and to implement pollution prevention measures. The business assistance program is not a requirement, however, its implementation is encouraged.

Program Performance Measures:

The current public information program does not include a protocol to measure the effectiveness of the different public education efforts. The draft permit includes requirements to measure the outcome of outreach efforts and demonstrate that they are effective at increasing knowledge and changing the behavior of the public in regards to storm water pollution. The proposed permit includes requirements for the Principal Permittee to develop a strategy for measuring the effectiveness of different educational programs and to develop a behavioral change target that will become a performance measure that must be reported on in Annual Reports.

To augment the effort to assess the public information and education programs, the following new requirement has been included in the draft:

> "The Principal Permittee shall convene a panel to annually review the PIPP and the effectiveness of each of its components. Panel members shall possess the expertise to assess public information and outreach programs, strategies, and materials. Comments and recommendations on the PIPP shall be submitted to the Regional Board Executive Officer no later than December 31, 2001 annually."

In addition to the assessment requirements mentioned above, the Principal Permittee is also required to: (a) ensure that a minimum of 35 million impressions per year are made on the general public about storm water via print, local TV access, local radio, or other appropriate media; and (b) provide all School Districts within its jurisdiction with materials, including videos, live presentations, brochures, and other media necessary to educate a minimum of fifty percent of all school children (K-12) every 2 years on storm water pollution. These performance measure are justified based on their consistency with requirements in the City of Long Beach and Ventura County MS4 permits, and on the Principal Permittee's previous performance of PIPP requirements.

[21] Phase II Fact Sheet 2.3
[22] *Storm Water/Urban Runoff Public Education Program Five-Year Storm Water Public Education Strategic Analysis*, Los Angeles County Public Works, July 31, 2000. Part P.5.
[23] Permit, Part 4, section B.2.a.

According to the Principal Permittee's Year Four (1999-2000) Highlights, approximately 85 million impressions were made through advertising, media relations, customized coffee jackets, corporate partnerships, special events, and business outreach. Hits on the www.888CleanLA.com web site have been consistently increasing, indicating a growing public interest, as well as greater awareness. It can be anticipated that mass media coverage will become more efficient after the Five Year PIPP Program Assessment study is completed in the Fall of 2001. Also, increased media attention and public interest in current issues, such as trash TMDLs, is expected. Los Angeles County has committed to making a minimum of 35 million impressions per year.

Furthermore, the requirement is consistent with the number of impressions (3 - 3.5 per resident) required in the Long Beach MS4 Permit and the Ventura County MS4 Permit. The City of Long Beach is required to make a minimum of 1.5 million impressions per year. With a total population of approximately 426, 000 people, this amounts to 3.5 impressions per resident per year. Ventura County is required to achieve 3 impressions per resident per year. Los Angeles County's population is 9.5 million people.[24]

According to data provided by Los Angeles County, the School Environmental Education Program has been reaching approximately 50 percent of elementary and secondary schools in the County every 2 years. It is also expected that the required coordination among Permittees will increase the effectiveness and range of this Program.

B. Industrial/Commercial Facilities Program

Legal Authority:

The Phase I regulations require, in part, that the applicant (i) develop adequate legal authority, (ii) perform a source identification, and (iv) develop a management program to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system design and engineering methods, and such other provisions which are appropriate.[25] Specifically, with regards to industrial controls, the management plan shall include the following.

40 CFR 122.26(d)(2)(iv)(C), A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program shall:

(1) Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges;
(2) Describe a monitoring program for storm water discharges associated with industrial facilities [...]

[24] 2000 U.S. Census Bureau
[25] 40 CFR 122.26(d)(2)

Background:

The municipality is ultimately responsible for discharges from the MS4. Because industrial awareness of the program may not be complete, there may be facilities within the MS4 area that should be permitted but are not (non-filers). In addition, the Phase I regulations that require industries to obtain permit coverage for storm water discharges is largely based on SIC Code. This has been shown to be incomplete in identifying industries that may be significant sources of storm water pollution (*by industries we also mean commercial businesses. The word "industries" is used in a broad sense*). Another concern is that the permitting authority may not have adequate resources to provide the necessary oversight of permitted facilities. Therefore, it is in the municipality's best interest to assess the specific situation and implement an industrial/commercial inspection/site visit and enforcement program to control the contribution of pollutants to the MS4 from all high risk sources.

In the preamble to the 1990 regulations, the USEPA clearly states the intended strategy for discharges of storm water associated with industrial activity:

"...Municipal operators of large and medium municipal separate storm sewer systems are responsible for obtaining system-wide or area permits for their system's discharges. These permits are expected to require that controls be placed on storm water discharges associated with industrial activity which discharge through the municipal system." The USEPA also notes in the preamble that *"... municipalities will be required to meet the terms of their permits related to industrial dischargers."*

Similarly, in the USEPA's Guidance Manual[1] (Chapter 3.0), it is specified that MS4 applicants must demonstrate that they possess adequate legal authority to:

- Control construction site and other industrial discharges to MS4s;
- Prohibit illicit discharges and control spills and dumping;
- Carry out inspection, surveillance, and monitoring procedures.[26]

The document goes on to explain that *"control"*, in this context means not only to require disclosure of information, but also to *limit, discourage, or terminate* a storm water discharge to the MS4. Further, to satisfy its permit conditions, a municipality may need to impose additional requirements on discharges from permitted industrial facilities, as well as discharges from industrial facilities and construction sites *not* required to obtain permits.

In the same Guidance Manual[27] (Chapter 6.3.3), it is stated that the municipality is ultimately responsible for discharges from their MS4. Consequently, the MS4 applicant must describe how the municipality will help the USEPA and authorized NPDES States to:

[26] *Guidance Manual For the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems* - USEPA -November 1992
[27] *Id.*

- Identify priority industries discharging to their systems;
- Review and evaluate storm water pollution prevention plans (SWPPPs) and other procedures that industrial facilities must develop under general or individual permits;
- Establish and implement BMPs to reduce pollutants from these industrial facilities (or require industry to implement them); and
- Inspect and monitor industrial facilities discharging storm water to the municipal systems to ensure these facilities are in compliance with their NPDES storm water permit, if required.

Discussion:

Recognizing that the municipality is ultimately responsible for the quality of storm water discharges in the MS4, the municipalities must evaluate the industrial/commercial facilities and determine their compliance with the permit requirements, as well as their contribution to the MS4 and potential impacts to the receiving waters. The following areas must be addressed in order to implement a meaningful industrial/commercial inspection/site visit and enforcement program.

- **Source Identification**
  - Identification of industrial/commercial sites discharging to the MS4 (by SIC codes and narrative if needed)
  - Characterization of activities, materials used, and potential for contributing pollutants along with the type of pollutants

- **Pollution Prevention**
  - Key concepts are many times overlooked: Prevent, before it happens, and be Pro-active rather than Reactive. It is more difficult to treat after the pollutant is released or mixed with storm water. BMPs and other site-specific controls are often most appropriate for reducing pollutants in storm water discharges from industrial and commercial facilities.

- **Threat to Water Quality Prioritization**
  - Identify impaired water bodies by pollutants and link with activities and industrial/commercial sites that may contribute those particular pollutants (or potentially contribute to) the water quality impairment

- **Through existing ordinance, order, or similar means, the ability to**
  - enter premises;
  - conduct inspections;
  - review and evaluate SWPPPs and monitoring results review;
  - require control methods (BMPs) implementation; and,
  - take appropriate enforcement actions, if necessary.

It may be necessary to update existing ordinances if they do not provide sufficient legal authority to implement the above mentioned components as required by the regulations.

Integration of NPDES Program for MS4 with NPDES Program for Industrial Activities

Recognizing the dual coverage envisioned by the USEPA regulations[28], and suggested partnership between local and State authorities, municipalities shall coordinate with State activities for the implementation of the General Industrial Activities Storm Water Permit (GIASP). The goal is to control industrial sources and other sources not specifically covered under Phase I storm water regulations but identified as significant contributors of pollutants by the municipalities through their identification and prioritization studies. The net result should be a better and improved coordinated program with greater impact on limiting and eliminating (as a final goal) the contribution of pollutants to the receiving water while maintaining and/or restore the capacity of the receiving water to sustain the beneficial uses without impairments.

The *Critical Source Selection and Monitoring Report*[29] identified seven highest ranked pollution potential activities to be, in order of ranking: (i) wholesale trade (scrap, auto dismantling), (ii) *automotive repair/parking*, (iii) fabricated metal products, (iv) motor freight (including trucking), (v) chemical and allied products, (vi) automotive dealers/gas stations, (vi) primary metals products. The report also outlined a complete study plan to be implemented by the Permittees during the permit term. It is significant to note that five out of seven categories of activities are subject to Phase I industrial storm water regulations. Although *automotive repair/parking* and automotive dealers/gas stations categories were not the focus of the Phase I storm water regulations, the study identified these commercial categories as significant potential pollutant contributors based on the criteria developed in the critical source criteria study.

Rank (pollution potential)[30]	Industrial Category	SIC Code	No. Facilities (estimated)
1	Wholesale trade (scrap, auto dismantling)	50	587
2	*Automotive repair/parking*	*75*	*6,067*
3	Fabricated metal products	34	3,283
4	Motor freight (including trucking)	42	872
5	Chemical and allied products	28	1,069
6	*Automotive Dealers/Gas Stations*	*55*	*2,744*
7	Primary Metals Products	33	703

It is also important to note that heavy metals are significant pollutants transported with storm water discharges and a cause of impairment to receiving waters in the Los Angeles Region. The above table identifies at least two industrial categories that have the highest potential to contribute those pollutants: fabricated metal products and primary metal products. During the previous permit term, the County conducted a Critical Source Study (1998-2000). The aim of the study was to monitor for two years the previously identified five

[28] Federal Register Vol. 55, No 222, pag. 48000; USEPA Storm Water Phase II Compliance Assistance Guide, 2000, pag. 4-32 and 5-11, where it clarifies the dual responsibility
[29] Critical Source Selection and Monitoring Report, Woodward-Clyde, 1997
[30] *Critical Source Selection and Monitoring Report (Table 1-3)* - Woodward-Clyde 1996

priority industrial and/or commercial critical source categories. The results of the study confirmed that the critical source industries are high risk. Storm water discharges exceeded water quality standards for almost all toxic pollutants in all categories.

Based on the dual coverage and partnership approach between the permitting authority and municipalities that the USEPA called for in the storm water regulations (see letters from Alexis Strauss, USEPA Water Division Director)[31,32], and in order to best use limited resources at the State and local level, Regional the draft permit requires the following improvements.

Recognizing that this permit represents a *third term* permit, and building upon the experience and tools developed under the previous permits, the Industrial/Commercial program has been elevated to an Inspection/Site visits implementation and enforcement program. The municipalities are required to (i) control the storm water discharges associated with industrial activities and other commercial facilities identified as significant contributors of pollutants, and (ii) assist the Regional Board in implementing the general permit for industrial activities. This approach is consistent with the nationwide approach used by the USEPA in issuing *second term* MS4 permits[33]. Also, this approach is consistent with other MS4 permits issued in California: San Diego, Santa Clara permits. The education and outreach should be continued under the auspices of the Public Education program.

The strategy as outlined in the draft permit builds on the State/municipalities partnership by focusing their limited resources on the following activities:

- The Permittees will take a lead role in inspecting restaurants, automotive service facilities, retail gasoline outlets, industrial facilities mandated specifically by the regulations, top five highest ranking industrial categories identified by the Permittees through their critical sources identification and monitoring studies and site visits at the remaining industrial categories identified through their critical sources identification study while
- The Regional Board will be the lead agency for inspections of facilities covered or in need of coverage under GIASP;
- The Permittees will assist Regional Board in its activities to fully enforce the GIASP through spot check inspections, referrals, data information research, joint inspections;
- The Regional Board and Permittees will coordinate their information systems and task scheduling to avoid duplication and strengthen harmonization of activities;
- The Regional Board may based on available funding enter into agreement with Permittees to contract some of the inspection activities required by the GIASP to be done by the Permittees.

C. Construction Sites Program

Legal Authority:

USEPA storm water regulations at 40 CFR 122.26(d)(2)(iv)(D) provide that a proposed management program must include "a description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system".

The draft permit provides consistency with the Long Beach MS$ permit and the Ventura County MS4 permit.

Background:

There are different environmental impacts of construction activity.

As stated in the *California Storm Water Best Management Practice Handbook for Construction Activity* (BMP Handbook), "Construction usually increases the amount of impervious area causing more of the rainfall to runoff, and increasing the speed at which runoff occurs. Unless properly managed, this increased runoff will erode natural and/or unprotected watercourses causing the watercourse to widen...Sedimentation can also contribute to accelerated filling of reservoirs, harbors, and drainage systems.[34]

Discussion:

The prevention of erosion is a key objective of the draft permit modifications to the construction program. The Permittees currently oversee construction sites within their respective jurisdiction. The oversight of smaller construction sites (those sites under five acres) is inconsistent among Permittees. Some Permittees have incorrectly assumed that responsibility begins only after a discharge of pollutants, sediments for example, has left the site. USEPA storm water regulations do not support such interpretations. Regional Board staff have clarified this in the draft to require that the municipalities better coordinate oversight of construction activity within their jurisdiction. The Permittees are ultimately responsible for what enters and exits the MS4 that they own and/or operate. It is in the best interest of the Permittees to control what enters their storm drain system.

Specific significant changes in the draft permit and justifications:

NEW REQUIREMENT: The draft permit requires that Permittees promote the use of effective erosion and sediment controls at construction sites regardless of size.

[34] *California Storm Water Best Management Practice Handbook for Construction Activity.* 1993.

NEW REQUIREMENT: Wet weather inspections are required of all construction sites one acre or greater. The Permittees need to conduct wet weather inspections to ensure compliance with local ordinances.

JUSTIFICATION: If all sites are inspected, this allows the Permittees to ascertain compliance and focus educational and enforcement efforts on those that most need it. Additionally, Regional Board staff can assist the Permittees in compliance oversight by conducting joint inspections.

D. Illicit Connections and Illicit Discharges Elimination Program

Legal Authority:

A proposed management program "shall be based on a description of a program, including a schedule, to detect and remove (or require the discharger to the municipal storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer," per federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B). A Copermittee must include in its proposed management program "a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal storm sewer system," per subsection (1) of the above regulation.

Background:

During dry weather, much of the discharge to storm drain systems consists of wastes and wastewater from non-storm water sources. A significant amount of such discharges may be from illicit discharges or connections, or both. Illicit discharges may occur either through direct connections, such as deliberate or mistaken piping, or through indirect connections, such as dumping, spillage, subsurface infiltration, and washdowns.

The objective of a municipality's illicit connection/illicit discharge (IC/ID) elimination program should be to detect illicit connections and illicit discharges to the storm drain system, and to promptly eliminate such discharges and connections. Municipalities typically employ the approaches listed below to achieve this objective:

JUSTIFICATION: The need for proper erosion and sediment controls is very apparent during, and immediately after, the rains that we experience in Southern California. The environmental effects of erosion are well documented. Erosion can be prevented or reduced with the proper planning and implementation of appropriate BMPs.

NEW REQUIREMENT: Requirements for source control and treatment control BMPs for controlling runoff at construction sites.

JUSTIFICATION: Erosion occurs when land is exposed and the sediments are mobilized. With adequately engineered and implemented structural or non-structural BMPs, the detrimental environmental effects can be eliminated or minimized. Currently, there are many manuals and guidance handbooks available to lead a developer. The municipalities, in general, are aware of these BMPs, and working with Regional Board staff facilitates the requirements being quickly implemented.

NEW REQUIREMENT: Each Permittee shall require the preparation, submittal, and implementation of a Local SWPPP prior to issuance of a grading permit for construction projects that meet one or more of the following criteria: will result in soil disturbance of one acre or more in size.

JUSTIFICATION: This is to ensure that a site that is being graded, but is less than the required size threshold for a General Construction Activities Storm Water Permit (GCASP) has oversight by the Permittee. Currently, there are inconsistent requirements for grading. USEPA Phase II storm water regulations require that sites one acre or more in size are subject to permitting.

NEW REQUIREMENT: The Permittees shall implement a process to review, approve, and enforce any erosion control plan submitted to the Permittee for implementation at construction sites, regardless of size and GCASP coverage of the sites. Local SWPPPs shall be required for projects of one acre or more in size.

JUSTIFICATION: The Permittees need to enforce local storm water ordinances at construction sites to prevent erosion. The should not wait for a discharge to react with an enforcement action.

REQUIREMENT: For sites that require a construction storm water permit, Permittees are required to ensure that a Notice of Intent (NOI) has been filed with the State Board prior to issuing a grading permit. This requirement also applies to land transfers between developers on common plans of sale or development.

JUSTIFICATION: This is currently a requirement in Board Order No. 96-054, but not all Permittees have consistently implemented this provision. Regional Board staff inspect construction sites covered by a GCASP. Some Permittees have issued a grading permit where a GCASP was not obtained. State/municipal coordination will ensure that all construction sites have obtained the required permits.

1. Permitting connections to the municipal storm drain.

2. Mapping the storm drain system, locations of catch basins, outfalls, permitted connections, and the names and locations of all waters of the U.S. that receive discharges from the outfalls.

3. Adopting a storm water/ urban runoff ordinance to prohibit unauthorized non-storm water discharges into the MS4, and implementing appropriate enforcement procedures and actions.

4. Implementing a program to detect and eliminate non-storm water discharges to the MS4, including illegal dumping.

5. Educating public employees, businesses, and the general public about the dangers associated with illegal discharges and improper disposal.

6. Establishing a public reporting hotline or other mechanism to report illicit discharges and illegal dumping.

7. Establishing measurable goals to evaluate successful program implementation.

Discussion:

Existing IC/ID Elimination Program

The Regional Board approved a model IC/ID elimination program for the Permittees' SQMP on March 23, 1999. However, only vague performance standards are specified in this model program.

By July 1999, all Permittees reported that they implemented an IC/ID elimination program. For the most part, however, this was a passive program, and relied upon IC/ID detection during regularly scheduled maintenance. Most Permittees cannot estimate the extent of their storm drain they have screened during regularly scheduled maintenance.

Results of the Permittees' efforts to eliminate illicit connections are summarized in Tables 1 through 5. Their estimates of fiscal resources required to implement these activities for 1999/00 range widely, with two cities – Culver City and Hermosa Beach – estimating budgets of $4.2 million and $2.8 million, respectively. At the other end, four cities estimated $0 expenditures, namely La Habra Heights, Lawndale, Maywood (which does not operate a storm drain system), and West Covina. Based on the Permittees' estimates of expenditures, the Permittees budgeted an average of $113,900 in 1999/00. Removing the anomalous estimates for Culver City and Hermosa Beach, the high ranges up to $564,809, as estimated by the City of Los Angeles, and averaged $32,500. These activities, as summarized in the tables, do not appear to bear a relationship with IC/ID expenditures by each Permittee.

Illicit Connections: As designed in the model program, Permittees with storm drain systems under their management rely upon field screening, during regularly scheduled maintenance of the storm drain system, to locate illicit

connections. However, most Permittees cannot estimate the length of the storm drain system that was field-screened; nor did the Regional Board require reporting such information.

For the 1999/00 annual reporting period, very few Permittees reported illicit connections. The attached tables show that the numbers of illicit connections varied widely among Permittees, with about half reporting no illicit connections, and with the County reporting 877 suspected illicit connections. Part of the reason for this range is that the County is responsible for maintaining over half[35] of the storm drain system. Also, several Permittees believe that few – if any – illicit connections have been identified in many cities because: (a) many cities are primarily residential, and illicit connections are unlikely to occur from residential land use; and (b) cities in the County of Los Angeles are relatively new vis a vis their eastern counterparts, and adequate controls were in place at the time storm drain connections were installed.

Illicit Discharges: As designed in the model program, Permittees eliminate illicit discharges by preventing spills and, for those that do occur, by responding promptly. To prevent spills, Permittees enacted ordinances prohibiting non-storm water runoff, and are following spill prevention guidance. To respond to discharges, Permittees implement containment and cleanup procedures, coordinate with other agencies, investigate the cause of the discharge and – when the source and responsible party is know – take enforcement action. Additionally, employee training is provided on all of the above.

As with illicit connections, the numbers of illicit discharges varies widely for the annual reporting period 1999/00. The County reported a total of 788 suspected illicit discharges. Among the Cities, results at the high end include 1,876 in the City of Los Angeles, 700 in the City of Beverly Hills, and 450 in Santa Monica. At the other end of the range, many cities reported no incidents of suspected illicit

discharges. Based on information provided to date, staff cannot account for this wide range. Audits of the Permittees' programs should help clarify this.

Reporting: As designed in the model program, Permittees have implemented procedures to receive reports of illicit discharge and disposal incidents, and to promptly respond and report such incidents. Most rely upon the countywide hotline system, which is maintained by the County. For hazardous substances, Permittees implement additional reporting procedures.

Proposed IC/ID Elimination Program

The Special Provisions Section of the proposed permit requires the Permittees to revise their IC/ID Elimination Program in the SQMP to meet the following proposed requirements in the draft permit:

- General requirements, among which include a development (if necessary) and updating of a list of permitted connections to the storm drain system, a tracking system for illicit connections and discharges, and compilation, coordination of this information by the Principal Permittee, as well as identification of priority areas for proactive screening.

- Illicit connection requirements: Proactive screening of the storm drain system over a 5-year period, including:

  - Filed screening of open channels and underground pipes (with a diameter of 36 inches or greater);[39] and

  - Permit screening, to ensure that all connections are effectively implementing the prohibition on non-storm water discharges.

  - Requirements to investigate and terminate illicit connections, including response times.

- Illicit discharge requirements, specifying response times for abatement and cleanup (within one business day), and investigation (as soon as practicable).

As Permittees have pointed out, and as staff acknowledges, residential land uses are less likely to have illicit connections. However, staff remains concerned that adequate controls have been in place at all times for proper connections to the storm drain system. Staff's concern is based upon the wide range of illicit connections reported by Permittees with no apparent relation to land use, the poor water quality of dry weather flows in inland receiving waters, and also incidents of illicit connections reported separately to the Regional Board.

[39] As set forth on page 3-3 and in Appendix I of the Permittees' model program, screening tools for the proactive program will include dye tests, smoke tests, and TV inspections.

E. Public Agency Activities Program

Legal Authority:

USEPA storm water regulations 40 CFR 122.26(d)(2)(iv)(A)(1;3,4,5,and 6). Each Permittee must develop a program to reduce the discharge of pollutants to and from the MS4 to the maximum extent practicable for all urban land uses and activities, including municipal areas and activities.

Background:

Many Permittees provide services that ultimately result in the enhancement of the lives of the residents. Some of these services include but are not limited to: sewage system operations; public construction activities; vehicle maintenance; material storage; street and road maintenance; landscaping; recreational facility management; parking facility management; public industrial activities; and many other activities.

Specific significant changes in the draft permit and justifications:

NEW REQUIREMENT: In sewage system operations, the proposed change is that each Permittee will be required to implement a response plan in case of an overflow of the sewage system to the storm drain system.

JUSTIFICATION: The response plan will have different requirements dependent upon whether the Permittee owns or operates the sewer system.

NEW REQUIREMENT: In public construction activity management, the proposed changes include generally, that the requirements in the construction section of the draft permit also apply to the Permittees public construction sites.

JUSTIFICATION: This is proposed to reduce the possibility of a public construction site from becoming a source of pollutants. A public construction site should be a model of what to do efficiently and effectively (preceding a discharge).

NEW REQUIREMENT: Each Permittee with a construction site that meets the size requirements for a GCASP shall obtain a permit from the State for the construction activity. Currently the size threshold is 5 acres but will change to 1 acre on March 10, 2003. However, a municipality of less than 100,000 people need not apply for the state permit for a construction activity until March 10, 2003.

JUSTIFICATION: This change is consistent with USEPA Phase II storm water regulations, and will assist in the tracking of construction sites operated by Permittees.

NEW REQUIREMENT: Each Permittee will be required to ensure that public facilities are designed and constructed using construction and post-construction BMPs consistent with the Standard Urban Storm Water Mitigation Plans (SUSMPs) required under the Construction Planning section of the draft permit.

JUSTIFICATION: This requirement ensures consistency with the planning, design, and construction requirements for public projects.

NEW REQUIREMENT: For Permittee owned or operated vehicle maintenance, material storage areas, and corporation yards the Permittees will implement site specific SWPPPs to minimize pollutant discharges in storm water discharges. Vehicle and equipment wash areas will be required to be self contained or covered, equipped with a clarifier, or other pretreatment device, and or properly connected to the sanitary sewer. This requirement will take effect when a new facility is constructed or when an existing site is remodeled or reconstructed.

JUSTIFICATION: This provision ensures that the planning of public projects is treated the same as that of private projects.

NEW REQUIREMENT: For storm drain operation and maintenance the changes proposed are the inspection and clean out of catch basin inlets during the wet season and the classification of priority catch basins.

JUSTIFICATION: This provision ensures consistency with the Ventura County MS4 Permit.

NEW REQUIREMENT: For storm drain maintenance each Permittee must visually monitor their open channels for debris and identify and prioritize areas of illicit discharge for regular inspection and at least annually remove trash and debris from the channels. Permittees will review existing maintenance activities. After clean out, the material will be properly disposed of.

NEW REQUIREMENT: For street and road maintenance each Permittee will conduct street sweeping on curbed public streets in their permitted area at a monthly average, not less than four times per month, in areas generating high volumes of trash, and at a monthly average not less than two times per month in areas generating moderate volumes of trash on traffic collector streets and residential areas (except that for any Permittee within an area subject to a trash TMDL, the Permittee may implement a program which maximizes trash removal by using an effective combination of street sweeping, catch basin clean outs, installation of treatment devices, and/or implementation of any other BMPs that achieve waste load allocations).

F. New Development And Significant Redevelopment Program

Impacts from New Development:

Treatment control BMP requirements on new development and redevelopment offer the most cost effective strategy to reduce pollutant loads to surface waters. Retrofit of existing development will be expensive and may be considered on a targeted basis. Studies on the economic impacts of watershed protection

indicate that storm water quality management has a positive or at least neutral economic effect while greatly improving the quality of surface waters.[40]

USEPA storm water regulations at 40 CFR 122.26 require that pollutants in storm water be reduced to MEP. The USEPA's definition is intentionally broad to provide maximum flexibility in MS4 permitting and to give municipalities the opportunity to optimize pollutant reductions on a program-to-program basis.[41] The definition of MEP has generally been applied to mean implementation of economically achievable management practices. Because storm water runoff rates can vary from storm to storm, the statistical probabilities of rainfall or runoff events become economically significant and are central to the control of pollutants through cost effective BMPs. Further, it is recommended that storm water BMPs be designed to manage both flows and water quality for best performance. [42] It is equally important that treatment BMPs once implemented be routinely maintained.

Financing the MS4 program offers a considerable challenge for municipalities. A proven successful financing mechanism is the establishment of a storm water utility.[43] Utility fees, which are assessed on the property owner based on some estimate of storm water runoff generated for the site, are a predictable and dedicated source of funds. Utility fees can also provide a mechanism to provide incentives to commercial and industrial property owners to reduce impervious surface areas. Such incentives offer flexibility to property owners to choose the better economic option – paying more fees or making improvements to reduce runoff from the site.

Review of Design Standards:

The American Society of Civil Engineers (ASCE) and the Water Environment Federation (WEF) have recommended a numerical BMP design standard for storm water that is derived from a mathematical equation to maximize treatment of runoff volume for water quality based on rainfall/ runoff statistics and which is economically sound.[44] The maximized treatment volume is cut-off at the point of diminishing returns for rainfall/ runoff frequency. On the basis of this equation the maximized runoff volume for eighty-five percent treatment of annual runoff volumes in California can range from 0.08 to 0.86 inches depending on the imperviousness of the watershed area and the mean rainfall.[45]

Other methods of establishing numerical BMP design standards include: (i) Percent treatment of the annual runoff; (ii) Full treatment of runoff from rainfall

[45] *Sizing and Design Criteria for Storm Water Treatment Controls, Presentation to California Storm Water Quality Task Force,* November 13, 1998, Sacramento, CA. L.A. Roesner, Camp Dresser McKee.

event equal to or less than a predetermined size; (iii) Percent reduction in runoff based on a rainfall event of standard size.[46] These numerical design standards have been applied to Development Planning in Puget Sound, WA; Alexandria, VA; Montgomery County, MD; Denver, CO; Orlando, FL; Portland, OR; and Austin, TX.

The City of Seattle requires that where new development coverage is 750 square feet or more, storm water detention be provided based on a 25 year storm return frequency, and a peak discharge rate not to exceed 0.2 cubic feet per second.[47] Additionally, for projects that add more than 9,000 square feet in developmental coverage, the peak drainage water discharge rate is limited to 0.15 cubic feet per second per acre for a two-year storm. The City of Denver requires new residential, commercial, and industrial developments to capture and treat the 80th percentile runoff event. This capture and proper treatment is estimated to remove 80 to 90 percent of the annual TSS load which is a surrogate measure for heavy metal and petroleum hydrocarbon pollutants.[48]

Some States have established numerical standards for sizing storm water post-construction BMPs for new development and significant redevelopment. The State of Maryland has established storm water numerical criteria for water quality of 0.9 to 1 inch, and BMP design standards in a unified approach combining water quality, stream erosion potential reduction, groundwater recharge, and flood control objectives.[49] The State of Florida has used numerical criteria to require treatment of storm water from new development since 1982, including BMPs sized for 80 percent reduction (95 percent for impaired waters) in annual TSS loads derived from the 90 percent (or greater for impaired waters) annual runoff treatment volume method for water quality.[50] The State of Washington has proposed at least six different approaches of establishing storm water numerical mitigation criteria for new development, which add 10,000 square feet of impervious surface or more for residential development, and 5,000 square feet of impervious surface or more for other types of development[51]. Other mitigation criteria options include the 90th percentile 24-hour rainfall event (used by the State of Maryland) and the six month 24 hour rainfall event (used by the State of Washington).

On a national level, the USEPA is planning to standardize minimum BMP design and performance criteria for post-construction BMPs, and will likely build from the experience of effective state and local programs to establish national criteria.[52]

The volumes 1,3 and 5 are most relevant to new development standards and cover Hydrologic and Flow Control Designs, Minimum Technical Requirements and Treatment BMPs. The volumes will be adopted as statewide standards in early 2000 after completion of public hearings according to the agency.

[52] *Storm Water Phase II Final Rule* – 64 Fed. Reg. 68759. See USEPA's discussion on construction and post-construction BMP requirements for Phase II.

The USEPA, based on the NURP, supports the first half-inch of rainfall as generating first flush runoff.[53] First flush runoff is associated with the highest pollutant concentrations, and not pollutant load. The USEPA considers the first flush treatment method, the rainfall volume method, and the runoff capture volume method as common approaches for sizing of water quality BMPs.

Background:

On April 22, 1999, the Regional Board approved a List of BMPs for MS4 Permittees to select from and required implementation of the most effective BMPs in their Development Planning and Development Construction programs.[54]

The Final SUSMP was issued on March 8, 2000. It established new development and significant redevelopment conditions for all projects in the following categories:

10 or more home subdivision;
100,000+ square-foot commercial development;
automotive repair facilities;
retail gasoline outlets;
restaurants;
parking lots more than 5,000 square feet or more than 25 parking spaces
hillside located single-family dwelling,
construction projects adjacent to, in, or discharging directly to environmentally sensitive areas

The SUSMP included numerical design criteria for structural and treatment control BMPs. These criteria are:

Mitigate (infiltrate or treat) storm water runoff from either:

a) the 85th percentile 24-hour runoff event, determined as the maximized capture storm water volume for the area from the formula recommended by the WEF and ASCE study[55];

b) the annual runoff volume, based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in the BMP Handbook[56];

[53] *A Watershed Approach to Urban Runoff: Handbook for Decisionmakers*, Terene Institute and USEPA Region 5 (1996). See discussion on sizing rules for water quality purposes, p 36.
[54] (Board Resolution No. 99-03).

[55] *In Urban Runoff Quality Management, WEF Manual of Practice No. 23, ASCE Manual and Report on Engineering Practice No. 87.* WEF, Alexandria, VA; ASCE, Reston, VA. (1998).
[56] *California Storm water Best Management Practices Handbook – Industrial/ Commercial.* (1993)

c) the volume of runoff produced from each and every storm event up to and including 0.75 inch of rainfall, prior to its discharge to a storm water conveyance system; or

d) the volume of runoff produced from each and every storm event up to and including a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event; and/or

e) the flow of runoff produced from a rain event equal to at least 0.2 inches per hour intensity; or

f) the flow of runoff produced from a rain event equal to at least two times the 85th percentile hourly rainfall intensity for Los Angeles County; or

g) the flow of runoff produced from a rain event that will result in treatment of the same portion of runoff as treated using volumetric standards above.

The State Board issued a precedential decision[57] on the matter in Order WQ 2000-11, largely sustaining the SUSMP as approved by the Regional Board. The State Board amended the SUSMP to limit its application to discretionary projects as defined by CEQA, eliminated the category for projects in environmentally sensitive areas, and set aside the requirement for retail gasoline outlets to treat storm water until a threshold is developed in the future. In addition the State Board articulated its support for regional solutions and the mitigation banking.

The draft permit amends the SUSMP requirements to clarify implementation, make it consistent with recent Regional Board actions, and where appropriate correct procedural and other deficiencies identified by the State Board in its SUSMP ruling. The proposed changes include:

- SUSMPs for hillside developments that are 1 acre or more. Hillside residential homes below the threshold would be required to incorporate BMPs to facilitate drainage and pollutant removal but would not be subject to the numerical mitigation criteria. Currently, all hillside developments regardless of size are subject to the numerical mitigation criteria. This change normalizes post-construction controls for home developments irrespective of location.

- Numerical design criteria retail gasoline stations, where they meet thresholds such as: (i) projected average daily traffic of 100 cars or more; and (ii) 5,000 square feet or more of surface area.

[57] *State Water Board Order WQ 2000-11*: SUSMP; Memorandum from Chief Counsel to Regional Board Executive Officers, (December 26, 2000) discusses statewide policy implications of the decision.

- Clarify that the 100,000 square feet commercial development includes heavy industrial development. The category is designated 'industrial/commercial'.

- Lower the industrial/commercial category threshold from 100,000 square feet to 1-acre (43,560 square feet) beginning March 9, 2003, to be consistent with the USEPA Phase 2 storm water regulations for small construction projects.

- SUSMP requirements apply to all developments, both ministerial and discretionary. As presently implemented the SUSMP requirements apply to only discretionary projects as defined under CEQA.

- SUSMP requirements apply to projects situated in, adjacent to, or discharging directly to environmentally sensitive areas where the development (a) creates 2,500 square feet or more of impervious area, and (b) discharge storm water and urban runoff that is likely to impact a sensitive biological species or habitat.

- Redevelopment clarification.

The attached technical papers provide more detail.

VI. MONITORING PROGRAM

Background:

Using data collected from a monitoring program, storm water management efforts can be prioritized, helping limited resources be most effective in improving receiving water quality. For example, a monitoring program can provide data that can allow for specific receiving waters and watersheds to be targeted for urban runoff management and education efforts based on their need. Particular pollutants and their sources can also be identified and targeted using monitoring data. In addition, monitoring data can be useful in assessing the effectiveness of an urban runoff management program. Successful efforts that have resulted in receiving water quality improvements can be analyzed for use elsewhere, while areas that need follow-up efforts can also be identified. In general, a comprehensive monitoring program can supply a wealth of data that can be used in a wide range of applications for improving water quality.

Storm Water Monitoring History:

In the 1994-95 storm season, the Los Angeles County Department of Public Works began monitoring storm water quality in Los Angeles County. The first two years of monitoring were conducted pursuant to the 1990 permit. Over the past five years, the Los Angeles County storm water monitoring program consisted of four main components: mass emission monitoring, land use monitoring, critical source monitoring, and a Santa Monica Bay receiving water study. The results of each objective are summarized below.

- **Mass Emission Monitoring**

Mass emissions were monitored for four major watersheds: Ballona Creek, Malibu Creek, Los Angeles River, and San Gabriel River. The County also monitored mass emissions from Coyote Creek, although it was not a requirement of Order 96-045. The mass emission monitoring identified the Los Angeles River as consistently contributing the most zinc, copper, and suspended solids[58]. Sixteen chemical constituents of concern were identified from the comparison of mass emission annual concentrations to the objectives of the Ocean Plan, Basin Plan, and the CTR (several other constituents of concern were identified through research)[1]. The mass emission monitoring was also successful at identifying toxic levels of zinc and copper from Ballona Creek discharge, toxicity in the Los Angeles and San Gabriel Rivers, and the extent of severity of bacterial indicators in both dry and wet weather.

- **Land Use Monitoring**

  The County selected eight land use types to be monitored to identify sources of pollutants in storm water monitoring. These land uses include retail/commercial, vacant, high-density single family residential, transportation, light industrial, education, multifamily residential, and mixed residential. The land use monitoring identified light industrial, transportation, and retail/commercial land uses as producing the highest median concentrations for total and dissolved zinc[1]. Light industrial and transportation displayed the highest median concentrations for total and dissolved copper, and light industrial produced the highest concentrations of suspended solids. The majority of the Land Use monitoring requirement was completed, however, Event Mean Concentrations (EMCs) for several constituents (many due to the lowering of method detection limits) were not achieved. Pesticide, nutrient, and PAHs are among the constituents that do not have EMCs for most land uses.

- **Critical Source Monitoring**

  Five critical sources, including industrial and commercial facilities, were monitored to evaluate the effectiveness of voluntary good housekeeping and preventative BMPs. The critical sources included in the study were motor freight, auto dealers, chemical manufacturing, machinery manufacturing, and rubber/plastics. The critical source monitoring program identified fabricated metal businesses as producing the highest median concentrations for zinc, copper, and suspended solids[59]. The inability to require or control the implementation of BMPs made this study somewhat ineffective at evaluating BMP effectiveness. In most cases, there was no significant difference in pollutant levels from critical sources with and without BMPs. However, levels of total and dissolved copper at the fabricated metal industry were significantly reduced with the implementation of BMPs[1].

- **Receiving Water Study**

  A three-year study was conducted to assess the impacts of urban storm water runoff, specifically ecosystem health, on the receiving waters of the Santa Monica Bay. The study examined plume characteristics, water column and seafloor biology.

[58] Los Angeles County 1994-2000 Integrated Receiving Water impacts Report, Los Angeles County Department of Public Works

[59] Integrated Report

Ballona and Malibu Creek were compared to evaluate the effects of different watershed types. The study discerned the presence of well-developed plumes containing toxic materials, identified zinc and copper as contaminants in Ballona Creek, and concluded that sediments offshore of Ballona Creek generally had higher concentrations of urban contaminants. These findings demonstrate the need for further studies and for the identification of sources of toxic pollutants.

Proposed Storm Water Monitoring Program:

The objectives of this program include, but are not limited to: 1) assessing compliance with the MS4 permit; 2) measuring and improving the effectiveness of the SQMP; 3) assessing the chemical, physical, and biological impacts of receiving waters resulting from urban runoff; 4) characterization of storm water discharges; 5) identifying sources of pollutants; and 6) assessing the overall health and evaluating long-term trends in receiving water quality.

Mass Emissions Monitoring

Seven mass emissions stations will be monitored. Monitoring at the five existing stations will continue, and new stations were required in Dominguez Channel, and the Santa Clara River.

The Dominguez Channel watershed contains the highest percentage of impervious area. Studies reveal that the level of imperviousness in an area strongly correlates with the quality of the nearby receiving waters.[60] Also, the Dominguez Channel Watershed is a highly industrialized area and the storm water runoff needs to be characterized to determine its contribution of pollutants in the San Pedro Bay.

A new mass emission station in the Santa Clara watershed is also required. The purpose of this station is to characterize mass emissions from Los Angeles County and to monitor the impacts from new development. Therefore, the station should be located as close to the Ventura County line as practicable. The Santa Clara is currently the most natural and least impacted watershed in the County. However, it is rapidly urbanizing and contains a significant amount of proposed development. Several factors, including the natural state of the river and the lack of accessibility, have made it difficult to select a location for a sampling station.

Method Detection Limits

The Minimum Levels (MLs) listed in Appendix 4 of the State Board Policy for Implementation of Toxics Standards for Inland Surface Water, Enclosed bays, and Estuaries of California, 2000 (SIP) represent the lowest quantifiable concentration in a sample based on the proper application of all method-based analytical procedures and the absence of any matrix interferences.[61] These MLs must be incorporated into all water quality monitoring programs to detect priority toxic pollutants. The MLs are the only established criteria that take into consideration recent improvements in chemical analytical methods. If they are not used in the storm water program, concentrations of concern of priority toxic pollutants may not be detected, which has occurred throughout

[60] 64 Fed. Reg. 68725
[61] SIP

the history of the Los Angeles County storm water monitoring program. Detection and control of toxic pollutants in surface waters is necessary to achieve the CWA's goals and objectives.[62] Numeric criteria for toxic pollutants is necessary to evaluate the adequacy of existing and potential control measures to protect aquatic ecosystems and human health.[63] Also, using MLs will provide quantifiable data that is necessary to better assess water quality and to develop Waste Load Allocations and Load Allocations for TMDLs. Furthermore, non-detects cannot be used to accurately determine mass loadings. The criteria established in the CTR are legally applicable in the State of California for inland surface waters, enclosed bays and estuaries for all purposes and programs under the CWA.[64] Section 402(p)(3)(B)(iii) gives USEPA and states the authority to incorporate appropriate water quality-based effluent limitations in NPDES permits for discharges from MS4s.[65]

TSS Monitoring

Every storm greater than .25 inch shall be sampled and analyzed for TSS. The purpose of this requirement is to consider the high variability of storm water discharges and determine more accurate average mass emission values. The high variability of storm water makes it unlikely to characterize a storm season based on a few mass emission samples. Studies show that the median event mean concentration for storm water programs that do not sample every storm is consistently biased low, relative to the annual flow-weighted mean[66]. To adequately characterize a storm and capture central tendencies, many storms would need to be sampled. However, this is cost-prohibitive. Therefore, the correlation between TSS and trace metals should be used. Studies have indicated that runoff contaminants tend to be highly correlated with suspended solids in large rivers and creeks throughout southern California[67]. TSS measurements are one-tenth the cost of trace metal analyses. However, TSS concentrations accounted for up to 95% of the variability in some trace metal concentrations in a study of the Santa Ana River (urbanized watershed in Orange County) conducted by the Southern California Coastal Water Research Project (SCCWRP)[2].

Water Column Toxicity Monitoring

Storm water samples were found to be toxic in the Los Angeles River, the San Gabriel River, Ballona Creek, and the Santa Monica Bay, demonstrating the need for this toxicity monitoring requirement.

Toxicity testing is used to assess the impact of storm water pollutants on the overall quality of aquatic systems[68]. It can be a very useful tool for storm water managers. The Center for Watershed Protection rated toxicity testing as a "very useful" indicator for assessing municipal storm water programs. Toxicity testing can also be used to evaluate the effectiveness of storm water BMPs and other storm water pollution reduction measures[69]. Managers can use the results of toxicity testing to identify areas

[62] 65 Fed. Reg. 31683

[68] Center for Watershed Protection, Environmental Indicators to Assess Stormwater Control Programs and Practices (1996).
[69] Ibid.

of high concern and to establish priority locations for BMPs. Furthermore, Toxicity Identification Evaluations (TIEs) can be used to identify specific pollutants and their sources so that management actions can be more specifically prioritized.

Previous toxicity testing was only conducted using the *Stronglyocentrotus purpuratus* (sea urchin) fertilization test, a marine species. Toxicity testing using multiple species is needed to provide a more complete assessment of the causes of toxicity in storm water[70]. The identification of zinc and copper as contaminants of concern in previous studies in the County were based primarily on studies with the sea urchin. Reliance on single species tests may not provide an accurate assessment of toxicity[71]. Because different species vary in their sensitivity to contaminants, tests with multiple species are needed to determine if other contaminants are present at toxic concentrations[72]. Specifically, an organism that is sensitive to pesticides, which have been found to be important factors in the toxicity of storm water from other watersheds, should be used[73]. USEPA recommends the use of the *Ceriodaphnia dubia* (water flea) reproduction and survival test for the measurement of receiving water toxicity. The water flea is one of the most sensitive aquatic species to diazinon, whereas the sea urchin fertilization test is insensitive to organophosphorus pesticides[74]. By contrast, sea urchin sperm are approximately 10 times more sensitive to trace metals than are water fleas.

Furthermore, the toxicity component of the Monitoring Program should include toxicity identification procedures so that potential constituents of concern can be confirmed and others can be discounted. TIEs are needed to prioritize management actions.

Two wet weather and two dry weather samples will be analyzed for toxicity from each mass emission station every year. When a sample is substantially toxic to either test species, a Phase I TIE will begin immediately. Substantial toxicity means the amount of toxicity necessary to successfully conduct a Phase I TIE. For example, Ceriodaphnia TIEs require at least 50% mortality in undiluted sample at any time during the 7-day duration of the initial chronic bioassay.[75] If enough toxicity is not present at the beginning of a TIE, it cannot be successfully completed. The City of Long Beach Storm Water Monitoring Program is being modified to include similar TIE procedures.

Based on the results from the Long Beach Monitoring Report, the Regional Board determined that using consecutive hits of toxicity in storm water as a trigger for a TIE does not yield adequate results. For example, every single storm event sampled at the Long Beach mass emission stations was toxic to some extent to at least one of the three species tested, but only one TIE was conducted on one species.[76] Also, due to the high variability of storm water, there is no guarantee that substantial toxicity will be present after the two consecutive hits. To increase the chances of a successful TIE and to better identify all causes of toxicity in storm water, TIEs should begin immediately when substantial toxicity is detected in a sample.

Furthermore, after a toxic pollutant is identified, Toxicity Reduction Evaluations (TRE) will be conducted. The purpose of this requirement is to evaluate the extent and causes of toxicity in inland and coastal receiving waters, and to eliminate or reduce the sources of toxicity in storm water. TRE development and implementation is directly tied to the SQMP, to ensure that management actions are taken when problems are identified. The Principal Permittee expressed concern to Regional Board staff that the TRE requirement could potentially be too involved and costly to be completed with the available funds and resources during the course of the Order. To address this concern, the Regional Board clarified the TRE language. It was decided that a third party should be involved in the source analysis and BMP recommendations, and that each Permittee shall be responsible for the implementation of BMPs in their areas of jurisdiction that are causing or contributing to toxicity. The Principal Permittee is responsible for retaining a neutral third party to evaluate possible sources of toxicity and recommend appropriate BMPs, based on available information. Regional Board staff agreed with the Principal Permittee's proposed funding limit for TRE development, to ensure that the majority of the monitoring budget is not used.

Overall, the toxicity monitoring program will assess the impact of storm water on the overall quality of aquatic systems and implement measures to ensure that those impacts are eliminated or reduced. Chemical monitoring does not necessarily reveal the impacts of storm water on aquatic life or beneficial uses of water bodies. Therefore, toxicity monitoring is a necessary component of a storm water monitoring program.

Tributary/Source Identification Monitoring

Based on the results of previous storm water quality monitoring and toxicity testing, there is a need to monitor subwatersheds to determine pollutant sources and prioritize management actions. Exceedances of various pollutants, including toxic levels of zinc and copper in the Ballona Watershed, have been occurring at the mass emission stations for many years, but there has not yet been an effort to monitor tributaries to determine where the pollutants are actually coming from.[77] Regional Board staff worked with Los Angeles County staff, and other interested stakeholders, to design a tributary monitoring program.

Shoreline Monitoring

The City of Los Angeles has conducted shoreline and nearshore water quality monitoring off the Santa Monica Bay since the 1950s under the monitoring program for the Hyperion Waste Water Treatment Plant (NPDES No. CA0109991). The monitoring results indicate that effluent from Hyperion's 5-Mile Outfall does not impinge the shoreline, and that elevated bacterial counts are associated with runoff from storm drains and discharges from piers. In 1994, the Regional Board approved the relocation of Hyperion's shoreline stations to implement a bay-wide, regional shoreline monitoring program associated with storm drain outfalls in the Santa Monica Bay. The City of Los Angeles requested that the shoreline monitoring requirement be incorporated in this Order. Regional Board staff and the County of Los Angeles determined that the shoreline monitoring is an appropriate requirement for the storm water monitoring program, per the conditions listed in Section D of the draft Monitoring Program.

[77] Los Angeles County 1994-2000 Integrated Receiving Water Impacts Report, July 31, 2000. LA County DPW, SCCWRP, Woodward Clyde.

Trash Monitoring

Trash is a pollutant that impacts storm water runoff, and a monitoring program should be developed. The language in the draft reflects the monitoring language in the trash TMDL for the Los Angeles River watershed[78]. The same trash monitoring program will be required through a CWC § 13267 Request for Trash Monitoring, related to the TMDL. The Regional Board does not intend to require two separate monitoring programs through the MS4 permit and the TMDL.

Regional Monitoring

Regional Monitoring efforts address public health concerns, monitor trends in natural resources and nearshore habitats, and assess regional impacts from all pollutant sources. Los Angeles County is a major discharger in this region and should participate in regional programs. Also, participation in Regional Monitoring, such as the SCCWRP Bight-wide study in 2003, can accomplish several goals of the Monitoring Program.

Estuary Sampling

The main goal of the estuary sampling is to determine the spatial extent of sediment fate from storm water, and the magnitude of its effects. Previous studies indicate that contaminated sediments can be linked to suspended solids in storm water[79]. Form this information, a map of each estuary that depicts the impacted areas will be produced. Such a map will be used to direct future monitoring efforts. Once the impacted areas are identified, regular monitoring can be conducted to determine trends and accumulation of sediment from storm water. The specific sampling requirements are consistent with the Hyperion Waste Water Treatment Plant NPDES permit. This sampling program is also consistent with the objectives of the SCCWRP Bight-wide 2003 study. The results will be incorporated into a larger study of the entire coast of Southern California, from Santa Barbara to the boarder of Mexico. This will provide a comparison of the storm water impacts from Los Angeles County to other larger MS4s, as well as individual dischargers.

Bioassessment

Bioassessment data can be an important indicator of stream health and storm water impacts. It can detect impacts that chemical and physical monitoring cannot. In the Interpretive Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems, EPA encourages permitting authorities to consider requiring biological monitoring methods to fully characterize the nature and extent of storm water problems. Therefore, this Regional Board and other Regional Boards commonly require bioassessment monitoring in storm water and point source NPDES permits.

However, the fact that a biological index does not yet exist for this region is an issue that Regional Board staff took into consideration for this requirement. Without a biological index, including reference conditions and knowledge of background variability, data cannot be fully analyzed to accurately indicate stream health or impacts. However, it can be used to determine trends in the biological community, and it is necessary for

[78] Trash Total Maximum Daily Loads for the Los Angeles River Watershed, June 18, 2001, Regional Board
[79] Los Angeles County 1994-2000 integrated Receiving Water Impacts Report, Los Angeles County Department of Public Works, Contaminated Sediments and Total Suspended Solids (Section 4.2.4)

index development. Also, bioassessment data can be analyzed in the future, after an index is developed.

Considering the importance of bioassessment and the need for an index, the Principal Permittee is required to develop a bioassessment program as part of a regional effort (Southern California Stormwater Research/Monitoring Program) and to coordinate with the Surface Water Ambient Monitoring Program (SWAMP), organized by the Regional Board. This is to ensure that the most useful data is collected for the purposes of detecting biological trends in receiving waters and for developing a biological index.

New Development Impact Study in the Santa Clara Watershed

The Santa Clara River is the largest river system in southern California that remains in a relatively natural state. For much of its length, it is a high quality natural resource[80]. There is also a great amount of current and future development in the watershed. Therefore, it is important to monitor this watershed to detect water quality impacts from new development and implement measures to prevent degradation from occurring. To accomplish this, a special study is appropriate.

The special study will consist of monitoring tributaries in the Santa Clara watershed to accomplish two goals. The first is to determine impacts from new development. The second is to assess the effectiveness of SUSMPs by comparing storm water quality between subwatersheds with and without post-construction storm water BMPs. Two tributary stations will be selected and monitored for this study. One will be chosen that is representative of a subwatershed in which the majority of development has occurred without SUSMP implementation. The second station will be representative of a subwatershed in which the majority of development has/will include SUSMP implementation.

Due to the similarities in sites to be monitored, it may be appropriate to combine this study with the Peak Discharge Impact Study.

The City of Santa Clarita will cooperate with the County to conduct the New Development Impact Study (as well as the Peak Discharge Study, if they are combined). The City has proposed to contribute a maximum of $100,000 over the course of the New Development Impact Study. The City also has 2 field staff that may be available for sampling and other field measurements during normal working hours. The City is also interested in participating in site selection and study design.

Peak Discharge Impact Study

The Development Planning section (Part 4.C.2) of the draft permit requires that the Principal Permittee determine numeric criteria to prevent or minimize erosion of natural stream channels and banks caused by urbanization. The purpose of the Peak Discharge Impact Study is to help meet that requirement. The Ventura County MS4 permit contains a similar requirement. The Ventura County Flood Control District has designed a study that can be extended to a watershed in Los Angeles County.

BMP Effectiveness Study

[80] Watershed Management Initiative Chapter, January 2000. California Regional Water Quality Control Board, Los Angeles Region

The BMP Effectiveness Study is an integral part of the storm water monitoring program. It is necessary to document the effectiveness of treatment control BMPs so that the storm water management agency can make informed decisions on the use of BMPs.

Introduction

On March 8, 2000, the California Regional Water Quality Control Board, Los Angeles Region (LA Regional Board) issued requirements for new development and significant redevelopment consolidated in a Standard Urban Storm Water Mitigation Plan (SUSMP). The SUSMP included requirements for retail gasoline outlets (RGOs), commonly referred to as "gas stations", among several other development categories. Several municipalities, the Building Industry of Southern California (BIA), and the Western States Petroleum Association (WSPA) appealed the action of the LA Regional Board to the State Water Resources Control Board (State Board) for review. The State Board issued its decision *In Re City of Bellflower et al.* (SUSMP Decision) in large part upholding the action of the LA Regional Board.

In its Order, the State Board set aside the numerical mitigation requirement for RGOs explaining that the decision did not preclude future inclusion of numerical mitigation standards for RGOs with proper justification.

On February 21, 2001, the California Regional Water Quality Control Board, San Diego Region (SD Regional Board) issued an MS4 permit for San Diego County and Cities which includes requirements for new development and significant redevelopment. The MS4 permit requires Permittees to develop a model SUSMP no later than February 21, 2002, that will establish new development controls for project categories including RGOs. The SD Regional Board did not propose a threshold for RGOs to apply numerical design standards, giving the MS4 permittees the first option to develop the threshold criterion for RGOs and the justification. On March 22, WSPA filed an appeal of the SD Regional Board action for review before the State Board contending that RGOs were being improperly subject to numerical design standards in the MS4 permit for San Diego County and cities.

R0007042

Urbanization and Storm Water Quality

Urbanization alters the natural infiltration capability of the land and generates a host of pollutants that are entrained in storm water and urban runoff. These pollutants such as heavy metals and petroleum hydrocarbons result from the activities of dense human populations. The overall impact is an increase in storm water runoff volumes and pollutant loading in storm water discharged to receiving water-bodies.[1]

Urban development increases the amount of impervious surface in a watershed as farmland, forests, and meadowlands with natural infiltration characteristics are converted into buildings with rooftops, driveways, sidewalks, roads, and parking lots with virtually no ability to absorb storm water. Storm water and snow-melt runoff wash over these impervious areas, picking up pollutants along the way while gaining speed and volume because of their inability to disperse and filter into the ground. What results are storm water flows that are higher in volume, pollutants, and temperature than the flows in less impervious areas, which have more natural vegetation and soil to filter the runoff.[2] In addition to impervious areas increase, urban development brings with it proportionately high levels of car emissions, car maintenance waste, pet waste, litter, pesticides, and household hazardous wastes, which may be washed into receiving waters by storm water or dumped directly into storm drains designed to discharge to receiving waters.

Most organic compounds found in storm water are associated with various human-related activities, especially automobile use, or are associated with plastics.[3] Heavy metals found in storm water also mostly originate from automobile use activities, including gasoline combustion, brake lining, fluids, undercoatings, and tire wear.[4]

More recently, studies reveal a connection between urban development and contamination of local waterbodies. Studies found the highest levels of organic contaminants, known as polycyclic aromatic hydrocarbons (PAHs) (products of combustion including fossil fuels combustion), in the reservoirs of urbanized watersheds.[5] Studies also established a clear

relationship between the adverse impact of urbanization and impairment of aquatic communities in receiving waterbodies.[6]

Federal Storm Water Regulations

Federal regulations require that MS4 permittees implement a program to control storm water pollution from new developments during and post-construction. Because there is no express national standard for the control of storm water pollutants from new developments, the permitting authority must defer to statements of policy and intent made by the U.S.EPA.

The U.S.EPA under Phase I regulations did not fully describe the expectations for MS4 Permittees in controlling post construction storm water discharges from new development and significant redevelopment except that "a comprehensive master plan" was required [55 *Fed Reg.* 48054]. For a better understanding of the regulatory expectation, we look to the Final Rule for Phase II storm water regulations. Therein, the U.S.EPA notes that "prior planning and designing for the minimization of pollutants in storm water is the most cost-effective approach to storm water quality management" [64 *Fed Reg.* 68759], and identifies four essential elements to control storm water from new development and redevelopment. These are, (i) to develop and implement strategies that include a combination of structural and non-structural BMPs; (ii) adopt an ordinance to address post construction runoff; (iii) ensure long term operation and maintenance of the BMPs; and (iv) ensure that controls are in place that will *minimize* water quality impacts. [Emphasis added] EPA goes on to say:

> "The requirements .....[are] consistent with the permit application requirements for large MS4s for post-construction controls for new development and redevelopment."

The permitting authority in order to comply with federal regulations must thus require the implementation of an MS4 program that will achieve all four enumerated objectives for new development and redevelopment. In order for the program to be enforceable, the program for new development and significant redevelopment must include objective criteria such as water quality design standards for treatment-control BMPs, for significant categories of development such as RGOs.

Further, the Federal Court of Appeals has unequivocally stated that Congress intended for "the Administrator or a State to design [substantive] controls" for storm water discharges from MS4s but did not mandate a particular approach [*NRDC v. USEPA*, 966 F.2d 1292 (9th Cir. 1992)]. The court held that it is appropriate to defer to U.S.EPA [and the State] where the agency supplied a "reasoned explanation".

Also, the USEPA is currently in the process of developing effluent guidelines for the construction and development industry, which will include controls for new development and significant redevelopment.[7]

Retail Gasoline Outlets

RGOs can range in size from about 3,000 square feet to more than 200,000 square feet. The median size of new RGOs in Los Angeles County is about 13,000 square feet.[8] There are about 2,133 RGOs in Los Angeles County servicing a population of 9.5 million, and nearly six million registered motor vehicles.[9] In San Diego County there are about 700 RGOs serving a population of 2.8 million, and nearly 2 million registered vehicles.

RGOs are points of confluence for motor vehicles for automotive related services such as repair, refueling, and ancillary services such as tire air inflation and radiator fillup. The vehicular traffic patterns at RGOs are similar to those on parking lots and on highways. Researchers have identified RGOs as toxic pollutant hotspots.[10]

Storm Water Quality

RGOs are a well identified source of urban storm water pollutants that impair receiving waters. WSPA has acknowledged that storm water discharges from even "normally operated and maintained" RGOs are no worse than discharges from commercial parking lots and diffuse urban runoff.[11] The reason that "normally operated and maintained" RGOs do not demonstrate any improvement in storm water discharge quality is because existing BMPs do not address pollutants generated by motor-vehicle traffic.[12] Heavy metals, significant concentrations of which occur in storm water discharges from RGOs, have been demonstrated to be the main cause of toxicity in Santa Monica Bay during wet weather.[13] Oil and grease in the storm water discharges from RGOs are also of concern.[14]

In a study conducted in Maryland, RGOs were identified to generate significantly higher concentrations of hydrocarbon and heavy metals than parking lots, convenience store lots, and streets.[15] A study conducted in Sacramento County, California, identified heavy metals such

[14] Rouge River National Wet Weather Demonstration Project, MI, - Evaluation of On-line Media Filters in the Rouge River Watershed, Report No. RPO-NPS-TPM59.00 (1999), 36 pp.

[15] *Hydrocarbon Hotspots in the Urban Landscape, Shueler T., and Shepp, D., (1995), pp. 259-264, National Conference on Urban Runoff Management: Enhancing Urban Watershed Management at the Local, County and State Levels, Chicago, IL,* Report No. EPA/625/R-95/003. A survey of oil and grit separators in suburban Maryland indicated that RGOs and convenience stores had much higher levels of hydrocarbons and metals both in the water column and the sediments.

as lead, copper, and zinc, as significant in storm water from RGOs.[16] Volatile organic compounds (VOCs) such as benzene, toluene, ethylbenzene, and xylene are rarely detected in storm water because of their volatility. In contrast, gasoline and other solvents, because of their physical and chemical characteristics, may present a significant risk for groundwater contamination, if underground and aboveground storage tanks leak.

The sources of storm water pollutants at RGO are from tail-pipe exhaust particles, fluid losses, drips, spills, and mechanical, brakepad and tire wear products, which build up on impervious surfaces at RGOs.[17] The pollutants of most concern in storm water are heavy metals such as Pb, Cu, and Zn and petroleum hydrocarbons such as PAHs.[18] The concentration and loads of these pollutants in storm water runoff from RGOs depends on the surface deposition and removal rates, and permanent storage. The permanent storage on surfaces is a function of surface area texture and condition and is literally trapped in the texture or cracks of the surface area. Pollutants are deposited any where vehicles travel, park, or are serviced, including RGOs.[19]

Review of New Development Design Standards

WSPA represents petroleum industry members in the States of Arizona, Hawaii, Nevada, Oregon, in addition to California. WSPA in its Petitions before the State Board has contended that new development standards that include numerical design standards for BMPs are impracticable and unnecessary at RGOs, and so we focussed the review on development standards that new RGOs are subject to in Western U.S. States. We are aware that new RGO developments in other States such as Maryland, Virginia, Florida, Alabama, Tennessee, Georgia, Oklahoma and Texas, are also subject to numerical mitigation requirements for storm water pollutants, but we did not review their programs for this technical report.

In Washington, RGOs in the western region that create impervious surfaces of 5,000 square feet or more are required to mitigate the 6 month 24 hour storm (about 1.2 inches of rainfall). In addition to the standard treatment menu based on a water quality design storm, RGOs that are expected to generate ADT of 100 vehicles or more per 1,000 square feet of gross building area are required separately to treat to remove oil.[20] The City of Portland in Oregon under its MS4 program requires RGOs to mitigate storm water runoff from impervious areas equal to or greater than 500 square feet using any one of three different design

[20] Such sites are considered "high use sites" because they typically generate high concentrations of oil from traffic turnover. See Stormwater Management Manual for Western Washington, Vol. V, Runoff Treatment BMPs, (2000), Washington Department of Ecology, p 145.

approaches.[21] One of the choices is the 24-hour rainfall event standard (0.83 inch of rainfall). In addition, RGOs that are expected to generate 100 vehicles or more ADT per 1000 square feet of gross building area are subject to separate treatment controls for oil using a water quality design standard of a two year 24 hour storm.[22] In both Washington and Oregon, storm water treatment is required in addition to the source control BMPs identified by WSPA for implementation at its facilities in California.[23]

Treatment Control BMPs

The U.S. EPA funded a demonstration project to evaluate the effectiveness of on-line media filter media to treat pollutants from storm discharges at RGOs.[24] Four on-line media filter systems were tested and the study concluded that the treatment systems had sufficient ability to remove pollutants without risk of flooding, were easy to operate and maintain, and reasonable in capital cost.

We also reviewed storm water quality data results evaluating the pollutant removal effectiveness of a proprietary on-line filter media device located at a large RGO in Washington.[25] The device was installed underground and thus occupied no surface area. The treatment device was effective in removing between 50 and 90 percent of pollutants of concern in storm water discharges from RGOs. We note with interest that in perusing the treatment devices installation list of this proprietary manufacturer between 1997 and 2001 in the Western U.S., California had not a single installation at an RGO but Oregon and Washington had a combined total of 13 RGO sites where the treatment devices were installed. Considering that RGOs in the State of Washington and Oregon have ADT that is much less than in California, the aberration can only be explained by the lack of rigorous storm water regulatory controls in California to control the discharge of pollutants in storm water discharges from RGOs.[26]

Our review indicates that effective treatment devices for RGOs include on-line media filter systems with a combination of media placed in series to remove the pollutants of concern. Sand filters are another option. There may be other treatment control BMPs that may be equally if not more effective.[27]

[27] For a list of potential treatment options see, Storm Water Manual for Western Washington Vol. V, - Runoff Treatment BMPs, Washington Dept. Ecology (2000).

Economic Considerations

A review of costs of storm water treatment controls for RGOs indicates that the cost of storm water treatment is reasonable.[28] In addition, a demonstration project sponsored by the USEPA to evaluate the effectiveness and costs of on-line media filters placed the first year capital cost between $250 and $900 and an operations and maintenance cost of $240 annually.[29]

Justification

The State Board in its SUSMP Decision temporarily excluded RGOs from the numerical mitigation standard until Regional Boards provided proper justification and established appropriate thresholds. Issues to be considered included presumptions that RGOs were, (i) already heavily regulated; (ii) limited in their ability to construct infiltration BMPs; (iii) generally small in size; and (iv) storm water treatment may not be feasible or safe.

Over-regulation:[30] Under State law, the State Board and Regional Boards are the primary authorities for implementation of the federal Clean Water Act, and for matters related to water quality within the State.[31] There is no basis in federal or State statute that permits the State Board or Regional Boards to abdicate their water quality authority because discharges from facilities that impact water quality are already regulated for other purposes. Attainment and maintenance of receiving water objectives and the protection of beneficial uses are the paramount considerations.

Limitations of space or ability: Our review indicates that RGOs appear not to be limited by space or ability to treat storm water. The surface area of RGO developments is generally greater than 5000 square feet. The fabricated storm water treatment systems we reviewed generally do not exceed 128 square feet in surface area when installed and do not impede traffic flow because they are situated sub-surface. While opportunities for infiltration practices may be limited, it is but one type of option for mitigation of pollutants in storm water. The SUSMP does not mandate infiltration BMPs. Other treatment options exist such as fabricated treatment control BMPs to remove storm water runoff pollutants using physical, biological, or chemical processes. Also treatment control BMPs can be installed sub-surface without interfering with surface use. RGOs situated in other Western U.S. States, which have lower impervious surface area and higher water quality treatment volume criteria thresholds already implement storm water treatment controls at new facilities.

---

[28] See "Cost and Benefits of Storm Water BMPs", Preliminary Data Summary of Urban Storm Water Best Management Practices, USEPA, (1999) Report No. EPA-821-R-99-0012, pp. 6-1 – 6-44.

[29] Rouge River National Wet Weather Demonstration Project, MI, - Evaluation of On-line Media Filters in the Rouge River Watershed, Report No. RPO-NPS-TPM59.00 (1999), at p 15-18.

[30] The Regional Board's review of regulations that affect RGOs identified, (i) business license for business operation, (ii) Fire Department for tank/ piping integrity and gasoline storage; (iii) County Public Works for underground storage of hazardous chemicals; (iv) Air Quality Management District for VOC emissions; (v) Sanitation District for any sanitary sewer discharges; (vi) County Weights and Measures for sale of gasoline; (vi) Department of Toxics Substance Control for waste motor oil disposal; (vii) County Health for food and beverage sale; and (viii) Regional Board for regulation of leaking tanks to protect groundwater.

[31] Cal. Wat. Code § 13160 states that, "the State Board is designated as the state water pollution control authority for all purposes.... in federal act." Cal. Pub. Res. Code § 30412 states that, "other State agencies shall not modify, adopt conditions, or take any action in conflict with any determination by the State Board in matters relating to water quality".

Feasibility of storm water treatment: Our review of implementation of storm water treatment control requirements in other Western U.S. States indicates that storm water treatment at RGOs is both feasible and safe. In California, sub-surface fabricated treatment systems have been commonly used at RGOs to separate waste-oil before discharge to the sanitary sewer system. Safety or feasibility has not been an issue when sanitation districts required RGOs to install treatment systems in order to obtain connection permits to the sanitary sewer system. As previously mentioned storm water treatment controls are installed as a matter of practice by RGOs in other Western U.S. States. There is no reason to suppose that storm water treatment in California introduces new and different safety and feasibility considerations, as when compared to wastewater treatment systems which RGOs have readily installed in California and storm water treatment systems installed in other Western U.S. States.

Suggested criteria

Storm water pollution at RGOs is primarily a function of the number of motor vehicles that are refueled or serviced. Ancillary services such as auto repair may additionally contribute significant pollutant loads. A WSPA study concluded that the storm water runoff quality from well-maintained RGOs is comparable in pollutant concentrations to runoff from commercial parking lots.[32]

The State Board recommended that the Regional Boards undertake further consideration of a threshold relative to size of RGOs for application of the numerical design standard for storm water. Our analysis indicated the following criteria for thresholds may be appropriate.

Land area: 5,000 square feet or more of impervious area. RGOs in Portland, Oregon and Western Washington that meet this land area threshold are currently subject to storm water treatment requirements based on the water quality design storm.[33]

Projected Average Daily Traffic (ADT): 100 or more vehicles fueled per day. The projection for the number of vehicle trips a RGO can expect may be estimated using information published by the Institute of Transportation Engineers. The vehicular traffic at an RGO is a good determinant for the quantity of storm water pollutants generated at the site. RGOs in Oregon and Washington are subject to two tiers of threshold for treatment of storm water, the first based on the impervious area threshold, and an additional tier storm water treatment requirement for sites that expect 100 vehicles or more ADT per 1,000 square feet of gross building area. [34]

Projected volume of gasoline sale: 25,000 gallons or more of gasoline sale per month. [35] The projected volume of gasoline sales is directly correlated with vehicular trips. 25,000 gallons of gasoline sale per month is equivalent to an average daily traffic of about 100 vehicles.[36]

---

[32] See 'Results of a Retail Gasoline Outlet and Commercial Parking Lot Storm Water Runoff Study (1994)', Western States Petroleum Association, and American Petroleum Institute, 49 p. Commercial parking lots 5,000 square feet or more are presently subject to the SUSMP numerical mitigation standard.

[33] WSPA represents companies that explore, produce, refine, transport and market petroleum in six western states including Oregon, Washington, and California. See www.wspa.org

[34] See, Storm Water Management Manual (August 2000), City of Portland, Oregon, (p 9-10) additional thresholds for fuel dispensing facilities. Also, Storm Water Management Manual for Western Washington, Vol. V, Runoff Treatment BMPs, Washington Department of Ecology, p 9-10, additional requirement thresholds for high-use sites.

[35] The average volume of gasoline sales at a RGO in California is approximately 100,000 gallons per month. Gasoline stations with outputs of 200,000 or more gallons a month are considered high output facilities by the industry.

Although other criteria such as the number of fueling dispensers ("nozzles"-4 or more) and the number of dispenser meters (12 or more assuming one meter per octane grade), were considered for thresholds, the relationship of such criteria to predict the potential for pollutant generation at RGOs is less direct.

It is recommended that numerical mitigation standards be made applicable, if the RGO development meets the following thresholds, (i) creates 5,000 square feet or more of impervious surface; and (ii) has a projected trip generation of 100 or more motor vehicles ADT.

Conclusion

RGOs have been well documented in the scientific literature as significant sources of storm water pollutants. These pollutants such as heavy metals and PAHs have been know to cause the impairment of beneficial uses in receiving waters. As a source of pollutants, storm water from RGOs is similar to runoff from driveways, roads, highways and parking lots.

In order to reduce the discharge of pollutants in storm water to the MS4, it is technically appropriate to require that new RGOs and significantly redeveloped RGOs be subject to the SUSMP numerical mitigation criteria. RGOs in other Western U.S. States already comply with higher numerical mitigation standards than those established by the LA Regional Board and the SD Regional Board. The treatment of storm water for RGOs is technically feasible, safe, and of reasonable cost.

[36] A typical "full" tank gas refueling is around 8 gallons delivered at a pump. Many RGOs use this benchmark for discount offerings or other type of incentives associated with refueling. 100 cars x 8 gallons per car x 30 days = 24,000 gallons of gasoline per month.

STORM WATER MITIGATION REQUIREMENTS FOR PRIORITY PLANNING PROJECTS FOR THE PROTECTION OF WATER QUALITY

Technical Report

October 2001

Megan Fisher and

Xavier Swamikannu

CalEPA
California Water Quality Control Board, Los Angeles Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Problem Statement

The municipalities covered by the Los Angeles County Municipal Separate Storm Sewer (MS4) permit and the Building Industry Association of Southern California (BIA-SC) argue that the implementation of the development planning provisions required by the MS4 permit should be limited to the definition of "discretionary projects", as understood in the California Environmental Quality Act (CEQA). Such an interpretation limits the application of storm water management programs and is not supported by the federal Clean Water Act (CWA), U.S. EPA storm water regulations, the California Water Code (CWC), or the California Public Resources Code (Cal. Pub. Res. Code).

Introduction

On July 15, 1996, the California Water Quality Control Board, Los Angeles Region (LA Regional Board) issued a revised MS4 permit (Order No. 96-054) for the County of Los Angeles and all incorporated cities. The permit contains provisions for the regulation of discharges from development planning and construction. The development planning section requires Permittees to develop a checklist for determining priority and exempt projects[1]. In the Order, priority projects are described as development and redevelopment projects requiring discretionary approval which may have a potential significant effect on storm water quality.[2] Although the permit refers to the term "discretionary" projects in a few places, the term was not defined in the permit, and there is no evidence of a "meeting of minds" or discussion about its meaning when the permit was adopted.[3]

---

[1] Permit, Part 2, III.A.1.a.

[2] *Ibid.*

[3] Regional Board Comment on Proposed SUSMP Order, September 26, 2000

Under CEQA, a "discretionary project" is one which requires the exercise of judgment or deliberation when the public agency or body decides to approve or disapprove a particular project, as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations.[4] This limitation was never contemplated in the Order and was never adopted by the LA Regional Board.[5] However, the use of the term "discretionary" resulted in unintentional and inappropriate limitations on the development planning requirements in this Order as understood by Permittees and interpreted by the State Board. Controversy regarding this issue arose during the development of Standard Urban Storm Water Mitigation Plans (SUSMPs), pursuant to the development planning provisions in the permit.[6]

The SUSMPs are plans that designate best management practices (BMPs) that must be used for specified categories of development projects. After LA County submitted the SUSMPs, the LA Regional Board made several revisions and issued the revised SUSMPs on March 8, 2000. The State Board received petitions for review of the SUSMP action from a coalition of municipalities and the BIA-SC. The Petitioners contended that the SUSMPs should only apply to projects that are considered "discretionary" within the meaning of CEQA. They argued that the inclusion of non-discretionary, or ministerial, projects is inconsistent with the terms of the permit.[7]

The State Board issued Order (WQ 2000-11) deciding the petition. The SUSMP decision included the State Board's determinations on the petitioners' issues and made certain revisions to the SUSMPs. Although the State Board realized that the limitation of SUSMPs to discretionary projects might not be sufficiently broad for an effective storm water control program, it found that it was inappropriate to include non-discretionary projects in the SUSMPs at that time because of a procedural defect.[8] The State Board upheld the 'CEQA discretionary' limitation only because the term was undefined in the permit and its intended meaning was unclear in the SUSMP...not because it was sufficiently protective of water quality standards.[9] The State Board authorized the LA Regional Board to consider expanding the new development planning controls beyond the CEQA definition when the LA County MS4 permit is reissued. On its part, the LA Regional Board has always held that the limiting interpretation of the term "discretionary" opened an "unintended loophole" in the development planning requirements.[10]

Presently, the LA Regional Board has removed all references to the term "discretionary" from the proposed permit. The proposed permit requires the application of new development requirements to all planning priority development and redevelopment projects, regardless of whether they are considered ministerial or

[8] *Ibid.*

[9] The State Board's SUSMP decision states, "the provisions of the permit appear to link the development requirements for SUSMPs to developments that receive discretionary approval by local governments, as defined in CEQA."

[10] Regional Board Comment on Proposed Order, September 26, 2000

discretionary under CEQA. This approach is consistent with the development planning provisions in the Ventura County permit, issued on July 27, 2000. The LA County MS4 permittees contend that existing CEQA procedures must be used to implement the development planning provisions, and that reviewing all projects is inconsistent with their current procedures and is not feasible. However, local governments have several options for implementing the proposed requirements. These options are described later in this report in the section, "Options for Municipalities".

Urbanization and Storm Water Quality

Urbanization alters the natural infiltration capability of the land and generates a host of pollutants that are entrained in storm water and urban runoff. These pollutants such as heavy metals and petroleum hydrocarbons result from the activities of dense human populations. The overall impact is an increase in storm water runoff volumes and pollutant loading in storm water discharged to receiving water-bodies.[11]

Urban development increases the amount of impervious surface in a watershed as farmland, forests, and meadowlands with natural infiltration characteristics are converted into buildings with rooftops, driveways, sidewalks, roads, and parking lots with virtually no ability to absorb storm water. Storm water and snow-melt runoff wash over these impervious areas, picking up pollutants along the way while gaining speed and volume because of their inability to disperse and filter into the ground. What results are storm water flows that are higher in volume, pollutants, and temperature than the flows in less impervious areas, which have more natural vegetation and soil to filter the runoff.[12] In addition to impervious areas increase, urban development brings with it proportionately high levels of car emissions, car maintenance waste, pet waste, litter, pesticides, and household hazardous wastes, which may be washed into receiving waters by storm water or dumped directly into storm drains designed to discharge to receiving waters.

Most organic compounds found in storm water are associated with various human-related activities, especially automobile use, or are associated with plastics.[13] Heavy metals found in storm water also mostly originate from automobile use activities, including gasoline combustion, brake lining, fluids, undercoatings, and tire wear.[14]

(1980). *The Influence of Urbanization on the Transport of Heavy Metals in New Jersey Streams*. Water Resources Research Institute. Rutgers University. New Brunswick, NJ.

More recently, studies reveal a connection between urban development and contamination of local waterbodies. Studies found the highest levels of organic contaminants, known as polycyclic aromatic hydrocarbons (PAHs) (products of combustion including fossil fuels combustion), in the reservoirs of urbanized watersheds.[15] Studies also established a clear relationship between the adverse impact of urbanization and impairment of aquatic communities in receiving waterbodies.[16]

Federal Storm Water Regulations

Federal regulations require at a minimum that MS4 permittees develop, implement, and enforce storm water management programs designed to reduce the discharge of pollutants from the MS4 to the maximum extent practicable (MEP), to protect water quality, and to satisfy the appropriate water quality requirements of the Clean Water Act.[17] The regulations state that storm water management programs must include certain minimum control measures to meet the compliance standard of reducing pollutants to the "MEP". These minimum control measures include the development, implementation, and enforcement of a program to address storm water runoff from new development and redevelopment projects that disturb one or more acres of land, including projects less than one acre that are part of a larger common plan of development.[18] MS4 programs must include requirements to address storm water during and after construction. Because there is no express national standard for the control of storm water pollutants from new developments, the permitting authority must defer to statements of policy and intent made by the U.S.EPA.

The U.S.EPA under Phase I regulations did not fully describe the expectations for MS4 Permittees in controlling post construction storm water discharges from new development and significant redevelopment except that "a comprehensive master plan" was required [55 *Fed Reg.* 48054]. For a better understanding of the regulatory expectation, we look to the Final Rule for Phase II storm water regulations. Therein, the U.S.EPA notes that "prior planning and designing for the minimization of pollutants in storm water is the most cost-effective approach to storm water quality management" [64 *Fed Reg.* 68759]. It goes on to state, "If potential adverse water quality impacts are considered from the beginning stages of a project, new development and redevelopment provides more opportunities for water quality protection". The Final Rule identifies four essential elements to control storm water from new development and redevelopment. These are, (i) to develop and implement strategies that include a combination of structural and non-structural BMPs; (ii) adopt an ordinance to address post construction runoff; (iii) ensure long term operation and maintenance of the BMPs; and (iv) ensure that controls are in place that will *minimize* water quality impacts. [Emphasis added] EPA goes on to say:

[17] 40 CFR Part 122.23(a)

[18] *Ibid.*

"The requirements .....[are] consistent with the permit application requirements for large MS4s for post-construction controls for new development and redevelopment."

The permitting authority in order to comply with federal regulations must thus require the implementation of an MS4 program that will achieve all four enumerated objectives for new development and redevelopment. To aid in the implementation of an adequate program, EPA recommends that MS4 operators adopt a planning process that identifies the municipality's program goals, implementation strategies, operation and maintenance policies and procedures, and enforcement procedures.[19] EPA also encourages MS4 operators to assess existing ordinances, policies, and programs while developing a post-construction storm water management program.[20]

Further, the U.S. Court of Appeals has unequivocally stated that Congress intended for "the Administrator or a State to design [substantive] controls" for storm water discharges from MS4s but did not mandate a particular approach [*NRDC v. U.S.EPA*, 966 F.2d 1292 (9th Cir. 1992)]. The court held that it is appropriate to defer to U.S.EPA [and the State] where the agency supplied a "reasoned explanation".

It should also be noted that the U.S.EPA is currently in the process of developing effluent guidelines for the construction and development industry, which will include controls for new development and significant redevelopment.[21]

Scope of California Environmental Quality Act

The California Environmental Quality Act, (Cal. Pub. Res. Code § 21000 *et seq.*) was enacted in 1970 as a system of checks and balances for land-use development and management decisions in California. CEQA establishes a duty for public agencies to avoid or minimize environmental damage where feasible, and applies to projects that involve the exercise of discretionary powers by a public agency, which will result in a direct or reasonably foreseeable indirect physical change in the environment.[22]

"Discretionary project" means a project which requires the exercise of judgment or deliberation when the public agency or body decides to approve or disapprove a particular activity, as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations.[23] A project is called "ministerial" if the law requires an agency to act on it a set way without allowing the agency to use its own judgment. Ministerial projects involve no special discretion or judgment in reaching a decision and are not subject to CEQA. Each public agency should, in its implementing regulations or

[19] 40 CFR Part122.23(b)(5)(iii)

[20] *Ibid.*

[21] See, Fact Sheet: Effluent Guidelines for the Construction and Development Industry, U.S.EPA, 1999, 3 pp.

[22] CEQA Guidelines Section 15060

[23] CEQA Guidelines Section 15357

ordinance, provide a list of its projects and actions, which are deemed ministerial under the applicable laws and ordinances.[24] Projects that possess both ministerial and discretionary attributes are treated as discretionary.[25]

Whether an agency has discretionary or ministerial control over a project depends on the authority granted by the law providing the controls over the activity[26] (the law or ordinance authorizing the particular permit). CEQA is intended to be used in conjunction with discretionary powers granted to public agencies by other laws, it does not grant an agency new powers independent of the powers granted by other laws.[27] Because ordinances vary, similar projects may be subject to discretionary controls in one city or county and only ministerial controls in another. [28]

No presumptions regarding decision-making discretion exist in CEQA, "unless the public entity retains *no* discretion whatsoever in approving an application for a permit".[29] Therefore, no project or type of project is assumed to be ministerial unless related local ordinances limit public officials' review to determining whether (a) the zoning allows the structure to be built in the requested location, (b) the structure would meet the strength requirements of the Uniform Building Code, and (c) the applicant has paid his fee.[30]

Furthermore, CEQA includes many exemptions. Even if a public agency has discretionary control over a project, that project may still be exempt from CEQA. A project is exempt from CEQA if it meets one of the following conditions:[31]

1. The project is exempt by statute;
2. The project is exempt pursuant to a categorical exemption;
3. It can be seen with certainty that there is no possibility that the activity in question may have a significant effect on the environment;
4. The project will be rejected or disapproved by a public agency (each agency should include a list of such projects in its implementation procedures).

Statutory exemptions are created by the Legislature. CEQA Guidelines §15282 summarizes existing statutory exemptions, but there is no exhaustive list. Some of these projects and activities are listed in the statute itself and some are included in many different sections of the Cal. Pub. Res. Code, while others are not even codified.[32] A few notable statutory exemptions include:

[29] Guide to CEQA, Part IV

[30] CEQA Guidelines Section 15369

[31] CEQA Guidelines Section 15061

[32] Guide to CEQA Part IV

1. Ministerial projects;
2. Any residential development project, including any subdivision, that is undertaken consistent with an existing plan for which an EIR has been certified after January 1, 1980;
3. Any development project consisting of the construction, conversion, or use of residential housing for agricultural employees;
4. Any development project consisting of the construction, conversion, or use of residential housing of not more than 100 units in an urbanized area that is affordable to lower income households;
5. The construction of housing or neighborhood facilities in an urbanized area pursuant to certain provisions.[33]

Categorical exemptions are classes of projects which the Secretary of Resources Agency has determined not to have a significant effect on the environment and which are exempt from CEQA. If an agency determines that a project is subject to a categorical exemption, then no further environmental evaluation is required.[34] There are 32 classes of categorical exemptions, which are described in the CEQA Guidelines. A few examples are listed below.

1. Class 1 consists of the operation, repair, maintenance, permitting, leasing, licensing, or minor alterations of existing structures. This includes additions to existing structures that will not result in an increase of more then 50 percent of the floor area, or 2,500 square feet, or 10,000 square feet if the project meets certain conditions.[35]
2. Class 2 consists of replacement or reconstruction of existing structures where the new structure will be located on the same site and will have substantially the same purpose and capacity as the structure replaced.[36]
3. Class 11 consists of construction, or placement of minor structures accessory to existing commercial, industrial, or institutional facilities, including but not limited to small parking lots.[37]
4. Class 32 consists of projects characterized as in-fill development up to five acres that are consistent with all applicable zoning regulations, occur within city limits, and are substantially surrounded by urban uses.[38]

In cases where CEQA applies, a public agency must then determine whether the project may have a significant effect on the environment. In making this determination, an agency must use careful judgement based to the extent possible on scientific and factual data.[39] If an agency determines that a significant effect on the environment may occur, an Environmental Impact Report (EIR) must be prepared. The EIR records the

[33] CEQA Guidelines Section 15282

[34] *Ibid.*

[35] CEQA Guidelines Section 15301

[38] CEQA Guidelines Section 15332

[39] CEQA Guidelines Section 15064

scope of the applicant's proposal and analyzes all its known environmental effects. The CEQA Guidelines define "a significant effect on the environment" as a substantial adverse change in the physical conditions, which exist in the area, affected by the proposed project.[40]

CEQA encourages each public agency to develop and publish thresholds of significance that the agency uses in determining the significance of environmental effects. A threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect.[41] Thresholds of significance for use as part of an agency's environmental review process must be adopted by ordinance, resolution, rule, or regulation, and supported by substantial evidence.[42]

The CEQA Guidelines state that a public agency should not approve a project as proposed if there are feasible alternatives or mitigation measures available that would substantially lessen any significant effects that the project would have on the environment[43]. However, the Guidelines go on to say that "in determining whether and how a project should be approved, a public agency has an obligation to balance a variety of public objectives, including economic, environmental, and social factors and in particular the goal of providing a decent home and satisfying living environment for every Californian".[44] CEQA gives public agencies the flexibility to approve a project that will cause one or more significant effects on the environment, if they determine that other competing public objectives outweigh protection of the environment, or if there is no feasible way to lessen or avoid the significant effect.

"Feasible" means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors.[45]

Each public agency shall adopt objectives, criteria, and specific procedures consistent with CEQA and the CEQA Guidelines for administering its responsibilities under CEQA.[46] Agencies have flexibility in adopting procedures to implement CEQA. An agency may adopt a complete set of procedures in one document, or it may adopt specific procedures and tailor them to the specific operations of the agency. "Local agencies must integrate the CEQA review process into the other planning and environmental review procedures they are legally or otherwise obligated to conduct."[47]

[47] Guide to CEQA, Chapter II, 1999

Review of Applicability of CEQA to MS4 Permit Objectives

As described in the sections above, many fundamental differences exist between the scope and intent of CEQA and the intent of state and federal storm water regulations.

The first fundamental difference lies in the main objectives of each regulation. The purpose of CEQA is to avoid or minimize environmental damage where feasible. Prior to requiring mitigation or changes to a project, an agency must determine whether a significant effect on the environment may result from a particular project. The CEQA Guidelines define a "significant effect" as a substantial adverse change in the physical conditions, which exist in the area affected by the proposed project. The goal of controlling pollutants and other impacts from storm water runoff is not specifically mentioned in the CEQA Guidelines.

On the other hand, the purpose of the MS4 permit is to effectively prohibit non-storm water discharges to the MS4 and to require the implementation of controls to reduce the discharge of pollutants in storm water to the MEP and to meet water quality standards.[48] The ultimate goal of the CWA is to restore and maintain the physical, chemical, and biological integrity of the Nation's waters. Wherever attainable, water quality control should provide for the protection and propagation of fish, shellfish, and wildlife, and for recreation in and on the water (i.e., fishable, swimmable). The criteria used to measure these goals are often chemical and biological in nature. Also, under the CWA, compliance with and effectiveness of MS4 permits are unequivocally based on meeting chemical and biological standards. In fact, exceedances of chemical water quality criteria and/or impacts to aquatic life and many other beneficial uses would not constitute a substantial change in the physical conditions under which exist in a project area. Under CEQA, causing or contributing to pollutants discharged in storm water would not meet the definition of "significant effect. It is a fair inference that CEQA was never intended to remedy impacts to surface water quality, but only that impacts be considered in public-decision making. For example, Cal. Pub. Res. Code § 21001 states that the policy of the State is to:

> "Ensure that the long-term protection of the environment, consistent with the provision of a decent home and suitable living environment for every Californian, shall be the guiding criteria in public decisions."

Justification that Review Must Not be Limited to "Discretionary" Projects

Another major discrepancy under CEQA is the project categories covered. Clearly the projects subject to CEQA and the CEQA review process do not encompass all development categories covered by the LA County MS4 permit. There is no question under U.S.EPA storm water regulations that minimum development planning control measures must be implemented for all projects one acre or greater in size. The CWA makes no distinction between projects that may be considered ministerial or discretionary under the local government project planning approval process.

[48] Clean Water Act, Section 402(p)

Consequently, there is no justifiable reason to limit storm water management requirements to "discretionary" projects when mitigating storm water impacts. The difference between a ministerial and a discretionary project varies between agencies, and it is based on their own specific ordinances that may not be related to the protection of water quality in any way. As discussed in the introduction, the LA Regional board never intended for the term "discretionary" to be defined as it is under CEQA. The examples described below are evidence that limiting the requirements in the permit to "discretionary" projects would allow many projects to escape storm water mitigation requirements, which are necessary to comply with federal regulations. Cities classify projects as discretionary based on other ordinances that are totally unrelated to water quality.

For example, the City of Santa Monica classifies proposals for restaurants as ministerial projects, so long as they do not serve alcohol. Therefore, all new restaurants not serving alcohol, which includes the majority of fast food chains, are only required to comply with zoning requirements and pay permit fees to begin construction. When the LA Regional Board issued the Final SUSMP, on March 8, 2000, restaurants were one of the categories that were made subject to development and significant redevelopment conditions in order to reduce pollutants in storm water runoff to the MEP. If a proposed restaurant in the City of Santa Monica plans to serve alcohol, it is considered "discretionary". The City can choose to deny these proposals, or approve them with conditions, such as storm water mitigation conditions. Whether or not a restaurant serves alcohol has no affect on the type or amount of pollutants generated at the site that may come in contact with storm water. The City's basis for classifying a proposed restaurant as discretionary or ministerial is clearly not related to the protection of water quality. A limiting interpretation based on alcohol sale would lead to noncompliance with the CWA and federal storm water regulations.[49]

As another example, a retail gasoline outlet (RGO) that is proposed to be located in a commercial zone is considered ministerial.[50] Whereas an RGO proposed in a non-commercial zone requires discretionary approvals. RGOs have been determined to be a significant category subject to storm water mitigation requirements. They are a well-identified source of urban storm water pollutants that impair receiving waters.[51] Yet under CEQA, municipalities may treat RGOs differently because of local government zoning criteria. Regardless of existing zoning practices, RGOs generate significant concentrations of hydrocarbons and heavy metals. This fact is further evidence that the municipal distinction between ministerial and discretionary is not related to water quality.

Municipal zoning plays a very significant role under CEQA as to the extent of environmental review that a development project undergoes. For example, if a commercial project, regardless of its size, is proposed for an area that is already zoned for commercial use, it does not require discretionary approval. Thus, if SUSMP requirements were only applied to the discretionary approval process as determined by CEQA, the result would be that large commercial developments that meet or exceed the thresholds in the SUSMP would not be required to implement storm water mitigation

[49] City of Santa Monica CEQA review procedures

[50] *Ibid.*

[51] RGO Technical Report, Radulescu *et al.* (June 2000)

measures because they were built in zones considered conforming use. For example, just between January 1, 2000 and December 31, 2000, the City of Los Angeles issued building permits to 133 commercial developments greater than 100,000 square feet that would be considered ministerial under this criterion.[52]

Similarly, the numerous statutory and categorical exemptions provided under CEQA clearly are not consistent with the statutory standard of reducing pollutants in storm water to the MEP. Many of the exemptions appear to have the intention of providing a decent home to Californians without considering possible impacts to water quality from storm water runoff. For example, all development projects consisting of the construction, conversion, or use of residential housing of not more than 100 units in an urbanized area that is affordable to lower income households are exempt by statute. Storm water monitoring and studies have documented that urban areas contribute significant pollutants to storm water, such as metals, hydrocarbons, and pesticides, irrespective of the affordability of the homes. The affordability of housing does not affect the generation of these pollutants from urban residential developments.

Furthermore, the Class 2 categorical exemption also allows for the replacement or reconstruction of existing structures where the new structure will be located on the same site and will have substantially the same purpose and capacity as the structure replaced. This exemption would negate the inclusion of many "redevelopment" projects in the development planning provisions of the permit. For the purposes of water quality protection, storm water mitigation requirements must be applied to all planning priority projects that undergo significant redevelopment in their respective categories.[53] As defined in the permit, significant redevelopment means land-disturbing activity that results in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site, or an increase of more than fifty percent of impervious surfaces of a previously existing development.[54] The U.S.EPA affirms this requirement in its Phase II Final Rule, where it states that considering potential adverse water quality impacts from redevelopment projects provides more opportunities for water quality protection.[55]

Options for Municipalities

The municipalities argue that their development planning programs and review procedures cannot be modified to include the review of ministerial projects. This statement is incorrect. The following options exist for municipalities to include all planning priority development and redevelopment projects in their environmental review processes.

The first option is for cities to make all planning priority project categories discretionary beyond statewide categories by adopting local ordinance provisions that

[52] City of Los Angeles, Department of Building and Safety, New Commercial Building Permits Issued Between 1/1/2000 and 12/31/2000.

[53] Permit, Part 4.D.8

[54] *Ibid.*

[55] 64 Fed. Reg. 68759

create decision-making discretion. CEQA gives an agency a blanket authority to conduct environmental reviews of projects when other laws allow them any type of decision-making powers. "CEQA is intended to be used in conjunction with discretionary powers granted to public agencies by other laws, it does not grant an agency new powers independent of the powers granted by other laws." Certainly, the MS4 permit can be viewed as one of these "other laws", which requires cities to modify their local ordinances to protect water quality and implement control measures consistent with federal storm water regulations. The SUSMP requires that cities amend their codes and promulgate ordinances to give legal effect to the SUSMP requirements.[56] These requirements then become the part of each local ordinance that gives the city discretionary powers over priority development projects, deeming them "discretionary projects".

The second option is for municipalities to administratively establish standards and objective criteria for storm water mitigation for ministerial projects and for planning priority development categories that are otherwise exempt from CEQA review. The City of Los Angeles currently uses this process and, in a letter dated July 25, 2001, did not oppose the LA Regional Board staff recommendation to retain the requirement to include all projects in the development planning program.[57] The County of Los Angeles utilizes a similar administrative process to ensure that priority-planning projects considered ministerial incorporate SUSMP requirements.[58] In the City of Santa Monica, all projects undergo urban runoff procedures regardless of whether they are discretionary or ministerial.[59]

Conclusion

There is no technical or legal basis to limit the application of new development and redevelopment requirements to projects defined for environmental review by the limitations of CEQA. Restricting the application of storm water mitigation requirements to CEQA discretionary projects is not consistent with federal storm water regulations for the protection of water quality. The determinative consideration for the application of development planning provisions should be whether a particular category of development has been determined to cause or contribute to significant pollution of storm water. A procedural classification defined by CEQA should not matter, let alone be determinative.

MITIGATION OF STORM WATER IMPACTS FROM NEW DEVELOPMENT IN ENVIRONMENTALLY SENSITIVE AREAS

Technical Report

October 2001

Matt Yeager and

Xavier Swamikannu

CalEPA
California Regional Water Quality Control Board, Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, CA 90013

INTRODUCTION

The California Regional Water Quality Control Board, Los Angeles Region (LA Regional Board) issued the final version of the Standard Urban Storm Water Mitigation Plan (SUSMP) for the County of Los Angeles and Cities in Los Angeles County on March 8, 2000. As adopted, the SUSMP included locations within or directly discharging to an environmentally sensitive area (EnvSA) as a development category to be subject to SUSMP requirements. The Building Industry Association, Western States Petroleum Association, and 32 cities filed an amended petition to the State Water Resources Control Board (State Board) to appeal certain aspects of the SUSMP. On October 5, 2000, the State Board issued its decision, *In Re: Bellflower et al.* ("SUSMP Decision").[1]

Although the SUSMP decision upheld much of the Regional Board's action, it removed EnvSAs as a development category from the SUSMP. The State Board surmised that EnvSAs were not a developmental category, but rather a locational designation. Further, the State Board expressed some concern that no threshold size had been specified that would trigger SUSMP requirements[2], and that development in EnvSAs may already be extensively regulated. Although the LA Regional Board had proposed a threshold for development within, adjacent to or directly discharging to an EnvSA in its response, the State Board determined that adequate opportunity for discussion of the threshold by interested parties had not been provided.[3] In setting aside the EnvSAs, the State Board explained the types of evidence and findings that

Regional Boards must make for future inclusion of the category.[4] The action to set aside EnvSAs was not to be interpreted as precedent setting.

The LA Regional Board intends to insure consistency among the requirements of the different municipal storm water permits it adopts. On July 27, 2000, the LA Regional Board adopted a renewed municipal storm water permit for Ventura County (Ventura County MS4 Permit) (Board Order No. 00-108). The Ventura County MS4 Permit included the Ventura Countywide Stormwater Quality Urban Impact Mitigation Plan (SQUIMP), which is analogous to the SUSMP for Los Angeles County. The Ventura County MS4 Permit requires that that new development controls be implemented for several development categories, including projects sited within, adjacent to or directly discharging to an EnvSA. Like the SUSMP, the SQUIMP requires a suite of water quality-related best management practices (BMPs) intended to minimize impacts from development.

Following issuance of the SUSMP decision, the Ventura County Co-permittees requested to have the language of the Ventura Permit and SQUIMP revised to conform to the changes made to the Los Angeles County SUSMP. In response, the LA Regional Board Executive Officer issued a letter, which changed portions of the Ventura County MS4 Permit language. However these changes did not modify the Ventura County MS4 Permit with respect to the EnvSA language or SQUIMP requirements. Three Ventura County MS4 Permittees petitioned the State Board against the actions of the LA Regional Board Executive Officer in making these changes to the Ventura County MS4 Permit. The State Board and LA Regional Board have held the appeals in abeyance pending the resolution of related issues during the renewal of the LA County MS4 Permit. Until these appeals are resolved, the Ventura County MS4 Permit remains in effect as adopted, including the requirements for projects in EnvSAs.

The California Regional Water Quality Control Board, San Diego Region (SD Regional Board) adopted a Municipal Storm Water Permit for San Diego County and Cities (SD County MS4 Permit) on February 28, 2001. The SD County MS4 Permit designated EnvSAs as a development category to be subject to SUSMPs, and included threshold development size and/or alteration criteria that will trigger the requirements. The threshold criteria were either the creation of 2,500 square feet of impervious surface or increasing the imperviousness of a proposed project site by ten percent above its natural condition.[5]

URBAN STORM WATER RUNOFF AND WATER QUALITY IMPACTS

Urban storm water contains pollutants that degrade water quality and adversely impact aquatic habitat. Pollutants found in storm water include suspended solids, heavy metals and a broad suite of organic compounds including pesticides, nutrients, petroleum compounds, pathogen indicators and other by-products of urban activities.[6] [7] Urban storm water has also been shown to alter water quality parameters such as pH, oxygen demand, specific

conductance, temperature and turbidity.[8] Finally, urbanization modifies the hydrologic properties of a site, generally leading to increased volumes of runoff from a given amount of precipitation, and a more rapidly developing runoff peak.[9]

These pollutants and hydromodifications can directly result in negative impacts to biota and degrade ecosystems. Metals, organic compounds and other pollutants can have acute and/or chronic toxic effects to aquatic flora and fauna[10], and flow modifications can directly degrade the physical conditions of a habitat through erosion and deposition of sediments.[11] [12] A growing body of research links urban storm water runoff to water quality impairments and habitat degradation.[13] [14] Rivers and tributary streams, lakes, wetlands, estuaries and near shore ocean waters are susceptible to storm water impacts.

Adjacent habitats may be indirectly impacted by the degradation of aquatic areas. Fauna in riparian habitats may be negatively impacted by water quality degradation through reduced aquatic food sources, alteration of reproductive environments and habitat alteration that fosters proliferation of non-native species.

FEDERAL STORM WATER REGULATIONS

Federal storm water regulations require MS4 permittees to control storm water pollution from new developments during and after construction. U.S.EPA guidance advocates preventative measures including development design, implementation and maintenance of structural and non-structural best management practices (BMPs), and adoption of post-construction runoff ordinances.[15]

In February 2001, the U.S.EPA issued a Memorandum of Agreement (MOA) between the U.S.EPA, U.S. Fish and Wildlife Service (USFW) and the National Marine Fisheries Service (NMFS). The MOA is designed to enhance coordination of protection of endangered and threatened species pursuant to the Endangered Species Act (ESA) and the Clean Water Act (CWA). EPA believes that a coordinated national approach will insure greater protection for listed species, enhance regulatory predictability, and increase the efficiency of ESA

consultations.[16]

Under the CWA, the Regional Board is responsible for "restoring and maintaining the chemical, physical and biological integrity of the Nation's waters". Clearly, the MOA contemplates cooperation and coordination of the Regional Board's regulatory programs to enhance the relationship between the CWA and the ESA.

In issuing MS4 Permits, the Regional Boards are expected to ensure that all federal requirements are met. New developments that occur in EnvSAs should be required to incorporate into development design and long-term maintenance planning, storm water pollution prevention methods and appropriate BMPs.

ENVIRONMENTALLY SENSITIVE AREAS

California Public Resources Code defines EnvSAs as follows:

> "Environmentally sensitive area means any area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which could be easily disturbed or degraded by human activities and Development."[17]

In the proposed LA County MS4 Permit these include:

(i) Significant Ecological Areas (SEAs), designated by the County of Los Angeles;
(ii) Significant Natural Areas (SNAs) designated by the California Department of Fish and Game (CDFG);
(iii) Rare, Threatened, or Endangered Species (RARE) beneficial use areas listed in the Regional Board Basin Plan, designated by the LA Regional Board; and

For the Ventura County MS4 Permit, the SEA category is substituted with the following because the Ventura County Planning Agency has not performed an equivalent designation,

(iv) Other Areas identified by the Permittees as environmentally sensitive for water quality purposes.

EnvSAs in the LA County MS4 Permit have been designated through a public process by their designating agencies. SEAs provide a habitat for rare, endangered, or threatened plant and animal species; biotic communities, vegetative associations, and species that are either one of a kind, or are restricted in distribution. These habitats often serve as concentrated breeding, feeding, or resting, or migrating grounds, and is limited in availability. They contain biotic resources that are of scientific interest. Some of these areas are important as game species habitat or fisheries; provide for the preservation of examples of relatively undisturbed natural biotic communities; and areas that are special for other reasons.[18] SNAs are areas that may

[18] Los Angeles County Department of Regional Planning, 2000. Los Angeles County Significant Ecological Area update study 2000, Background Report. Prepared for Los Angeles County by PCR Services, Frank Hovore & Associates, and FORMA Systems.

support extremely rare species or habitats, support associations or concentrations of rare species or habitats, or exhibit the best examples of rare species and habitats in California.[19] The RARE beneficial use designation is assigned to "uses of water that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state of federal law as rare, threatened, or endangered.

Since most of the selection criteria for EnvSAs involve rare, endangered or threatened species and associated habitat, any negative impact to such areas acquires a higher degree of severity. In these areas, recovery from impacts is inhibited by inherently smaller populations, restricted habitat boundaries, habitat fragmentation, and boundary effects. So, for a given negative stimulus, EnvSAs will experience a potentially greater and less reversible negative response than areas with more abundant and less sensitive species or biotic assemblages. Due to this sensitivity these areas are more easily degraded, therefore they merit a higher standard of protection.

RELATED ENVIRONMENTAL PROTECTION

Selected areas in California already merit a higher standard of protection from development impacts because of location. The California Ocean Plan prohibits the discharge of "waste" to Areas of Special Biological Significance (ASBS), and requires discharges to be located far enough away to allow maintenance of natural water quality conditions in ASBS.[20] The State Board recently issued a decision regarding storm water discharges where it determined that discharges to ASBS are prohibited.[21]

In the late 1980s the Sierra Club brought a petition against the County of Los Angeles alleging a failure to conduct an environmental review of a proposed project in a protected habitat area prior to granting project approval, as specified by the Malibu Local Coastal Plan (LCP). The trial court ruling in this case resulted in the creation of an environmental review board (ERB) to regulate development in sensitive environmental resource areas.[22] The function of the ERB is to advise decision-makers of the County of Los Angeles to insure that development within sensitive environmental resource areas is consistent with the environmental protection policies of the Malibu LCP. The ERB evaluates proposed projects, makes recommendations, and suggests mitigation measures or conditions to minimize adverse environmental impacts[23]. Projects found not to be consistent with the Malibu LCP could presumably be denied a permit.

Relevant policies in the Malibu LCP include:

Policy 86:

[23] Los Angeles County Board of Supervisors, 1986. Malibu Local Coastal Program Land Use Plan.

"A drainage control system, including on-site retention or detention where appropriate, shall be incorporated into the site design of new developments to minimize the effects of runoff and erosion. Runoff control systems shall be designed to prevent any increase in site runoff over pre-existing peak flows. Impacts on downstream sensitive riparian habitats must be mitigated."

Policy 96:

"Degradation of the water quality of groundwater basins, nearby streams, or wetlands shall not result from development of the site. Pollutants, such as chemicals, fuels, lubricants, raw sewage, and other harmful waste shall not be discharged into or alongside coastal streams or wetlands."

The California Coastal Act contains provisions for an increased level of protection for resources defined as Environmentally Sensitive Habitat Areas (ESHAs). Cal. Pub. Res. Code § 30240.a states that:

"Environmentally sensitive habitat areas shall be protected against any significant disruption of habitat values, and only uses dependent on those resources shall be allowed within those areas."

On September 28, 2000, the California Coastal Commission (CCC) sent a letter to the State Board supporting the LA Regional Board's action in extending SUSMP requirements to EnvSAs.[24] Recently in commenting on a draft of the LA County MS4 permit, the CCC reiterated its support for inclusion of EnvSAs.[25] The CCC explained that the inclusion of EnvSAs is an important action that would greatly assist the State's efforts to protect the ecological integrity of land and coastal environments.

THRESHOLDS/EXEMPTIONS

The State Board in the SUSMP decision explained that Regional Boards might extend new development requirements to EnvSAs in the future if thresholds are established after full public discussion.

From a review of exemption criteria for developments in the literature, we note that CEQA uses the criterion of 2,500 square feet of impervious surface area for projects in EnvSAs as the threshold below which there is no environmental review. CEQA categorically exempts from environmental review: single-family residences or second dwelling unit in a residential zone; up to three single-family residences in an urbanized area; a duplex or similar structure in a residential area; apartments or similar structures designed for not more than six dwelling units in an urbanized area; stores, motels, offices or similar structures not using significant amounts of hazardous materials, and not exceeding 2,500 square feet in floor area.[26] The CEQA categorical exemption for up to four commercial buildings not exceeding 10,000 square feet of floor area, and not using significant amounts of hazardous materials, applies only if the

[24] California Coastal Commission, 2000. Letter dated September 28, 2000, to Craig Wilson, Chief Counsel, SWRCB, from Jaime Kooser, Deputy Director, Energy, Ocean Resources, and Water Quality.

[25] See Comment Letter from Jamie Kooser, Deputy Director, California Coastal Commission to Dennis Dickerson, Executive Officer, LA Regional Board dated July25, 2001.

[26] Title 14. California Code of Regulations, Chapter 3. Guidelines for Implementation of the California Environmental Quality Act; Article 19. Categorical Exemptions.

surrounding area is not environmentally sensitive. Commercial facilities less than 10,000 square feet and surrounded by an area that is environmentally sensitive therefore are not exempt from CEQA requirements. The CCC exempts single family residences (subject to conditions for access, water supply, etc.) from requirements for a coastal development permit. [27] The SD Regional Board excludes the applicability of new development requirements for development in EnvSAs where the change in impervious surface area is less than ten percent from the natural condition.[28] States such as Maryland, Washington, Florida, and Virginia use a threshold of 4,000 square feet or 5,000 square feet of disturbed land area for new development requirements to apply, but do not have a separate threshold for projects in EnvSAs although they require a stricter performance standard.

Although, we were unable to find an express basis in the legislative record for the CEQA threshold of 2,500 square feet of impervious area, it is reasonable to assume that the threshold derives from the typical impervious surface footprint of a single-family residential home (less than 2,500 square feet). Similarly, the typical single family lot size (less than 5,000 square feet) may be the basis of the threshold for the application of new development controls in other States. The SD Regional Board's alternative criteria of ten percent change from the natural condition appears to be based on scientific studies in the Mid-West and Pacific-Northwest which demonstrated that a more than ten percent change in impervious cover of watershed resulted in visible change to the ecological health of streams. Highly urbanized watersheds such as those in Los Angeles County usually have more than 50 percent impervious cover.

From our review of the scientific and regulatory literature, it is clear that environmental law and policy on development controls have been often framed to avoid imposing regulatory obligations on the individual homebuilder and/ or homeowner. A threshold for development in EnvSAs based on a similar objective appears to be reasonable.

DESIGN STANDARDS

The SUSMP requires the implementation of a suite of BMPs for developments, to mitigate adverse environmental impacts due to storm water and urban runoff. The suggested BMPs are designed to reduce the pollutant load in runoff and impacts from increased runoff volume and flow rates. Examples of BMPs include design elements such as clustering development, preserving existing vegetated areas, covering exposed pollutant sources and minimizing impervious surfaces, and treatment devices including detention or retention basins, oil/water separators, and filter systems.

The SUSMP does not prescribe specific BMPs, but does provide flow-based and volume-based criteria for runoff treatment. The choice of BMP or combination of BMPs is left to local control as long as the Maximum Extent Practicable (MEP) standard is met.

[27] California Public Resources Code, 30610.1. (a) Prior to certification of the applicable local coastal program, no coastal development permit shall be required for the construction of a single-family residence on any vacant lot meeting the criteria set forth in subdivision (c) and located in a specified area designated by the commission pursuant to subdivision (b).

[28] SD County MS4 Permit (Board Order No. 2001-01) at p. 16

ECONOMIC CONSIDERATION

BMPs required as part of the implementation of the SUSMP and SQUIMP will have economic impacts. Some BMPs would be implemented in most developments even if they were not explicitly required by regulation, including protection of slopes and channels and covered and contained trash and material storage areas. Other BMPs will be implemented only because they are required, and therefore potentially have a greater economic impact.

Economic impact will be case-specific and will depend on many factors. Studies about storm water BMP cost show that the size, type of development, existing environment, geology, and climate can affect the choice of BMP and its cost.[29] For example, an infiltration basin may be appropriate if the substrate is permeable, and groundwater contamination is not likely, whereas a biofiltration system that releases to the surface may be appropriate is the substrate is impermeable, or if sensitive groundwater resources are close to the surface. However, by imposing water quality requirements on the development at the design stage, cost savings can be maximized.

Clustered housing may save money on infrastructure, while minimizing the addition of impervious surface. Cost savings from alternative residential development designs have been estimated to be from 39–63% over conventional designs.[30] Commercial developments may demand certain parking space requirements, but water quality requirements can be met by pervious pavement, vegetative treatment swales, or water quality basins. Construction costs for storm water treatment BMPs for a five-acre commercial development have been estimated to range from $5,000 to $60,000 depending on the selected BMP. If water quality requirements are factored into the initial planning and design phase, total cost can be minimized and water quality benefits maximized.

JUSTIFICATION

The State Board excluded developments sited within, adjacent to, or directly discharging to EnvSAs from SUSMP requirements primarily because, it may have been mis-categorized as developmental rather than "locational", the absence of a threshold, the lack of adequate consideration by interested parties, and concerns of extensive regulation.

The LA Regional Board at this time, after nearly 12 months of public review for comment on three drafts, has provided ample opportunity for all interested parties to comment on the proposed criteria and its basis. By the nature of the designation of EnvSAs as a category to provide enhanced protection for, the basis is locational and identified as such under the Cal. Pub. Res. Code. § 30107.5. We propose a threshold of 2,500 square feet of impervious surface area or more as a threshold to trigger SUSMP requirements for projects in EnvSAs. On the issue of extensive regulation, we submit that most of the existing regulations regarding EnvSAs, are intended to exclude development entirely or limit allowed activities within the area but seldom for water quality protection. For developments that will be allowed, it is the responsibility of the State Board and Regional Boards to require effective mitigation of impacts from storm water and urban runoff and ensure at the same time that their actions do not harm

[29] Center for Watershed Protection, 1998. Cost and Benefits of Storm Water BMPs, Final Report 9/14/98, Prepared for Parsons Engineering Science, EPA Contract 68-C6-0001.

[30] *Ibid.*

the natural resources of California.

We recommend a threshold of 2,500 square feet or more to trigger the SUSMP requirements for developments in EnvSAs. Developments that create less than 2,500 square feet of impervious area will not require a SUSMP, developments that create 2,500 square feet of impervious surface or more will require a SUSMP. Staff also proposes that the redevelopment (i.e. creation, addition, and replacement) of single-family structures (including those in EnvSAs) be excluded from SUSMP requirements.[31] Permittees may consider the threshold of altering the imperviousness cover to ten or more percent over the natural condition as an alternative approach when they submit a watershed or a regional plan for consideration by the Regional Board as a substitute for site-by-site SUSMP requirements.

CONCLUSION

EnvSAs are inherently sensitive habitats containing unique, rare, threatened or endangered species and/or assemblages of species. Their unique and sensitive nature merits a higher standard of environmental protection than more common areas with common and abundant species. Storm water and urban runoff are known to contain a wide range of pollutants and have demonstrated toxicity to plants and animals. Therefore it is necessary to mitigate impacts from storm water and urban runoff to the MEP for developments within or directly discharging to EnvSAs. Applying SUSMP requirements to these developments is feasible and can be accomplished by a range of BMPs that can be tailored to the size and type of a particular development. The recommended threshold of 2,500 square feet of impervious area for application of SUSMP requirements in EnvSAs is reasonable and consistent with current principles of environmental law and policy. The most effective and economic way to accomplish the mitigation of storm water pollution from new development is to identify and implement water quality control techniques at the planning and design stage rather than require post-construction retrofits.

Response to Comments

California Regional Water Quality Control Board, Los Angeles Region
Los Angeles County Municipal Storm Water Discharge Permit
Summary of Comments and Regional Board Staff Response
Second Draft [June 29, 2001]

Commentors	Comment	Staff Response
Burke Williams and Sorenson (BWS), [R Tahir, Baldwin Park, Carson, Claremont, Compton, Duarte, Lakewood, Montebello, San Gabriel, San Marino, Whittier (RT)], Coalition for Practical Regulation (CPR), Executive Advisory Committee (EAC)	1. Unfunded Mandate Support clean water but the permit requirements cost money to implement. It constitutes an unfunded mandate.	Compliance with the Clean Water Act (CWA) is not predicated on the availability of funding. The requirements of the LA County MS4 permit are the same as that which would be expected under the CWA. There are no additional requirements that would constitute a supplementary requirement imposed separately and solely under the authority of the California Water Code (CWC). Thus the permit provisions are not subject to the California Constitutional bar on unfunded mandates. Proven successful financing programs nationwide include storm water utility fees and sewer fees. For more information on financing information please see, http://stormwaterfinance.urbancenter.iupui.edu/
Natural Resources Defense Council (NRDC), Santa Monica Bay Keeper (SMBK)	2. Completeness of Permit Application Permittees have not submitted necessary information to the Regional Board for permit issuance. Such information is important for the successful development and implementation of programs. The Regional Board cannot lawfully issue the permit if the necessary information has not been submitted	The first term LA County MS4 permit was issued in 1990 prior to the promulgation of USEPA Phase I storm water regulations. Some of the application requirements under 40 CFR 122.26 may not have been strictly met at that time. Prior to the permit being reissued in 1996, Regional Board staff reviewed the reapplication and determined that it was consistent with USEPA's Reapplication Policy (61 *Fed. Reg.* 41697) which was in draft form then. This Policy essentially states that the MS4 reapplication for reissuance for a subsequent five-year permit term should contain certain basic information, information for proposed changes, and proposed improvements to the storm water management program and monitoring program. Regional Board staff concur that information necessary for the successful development and implementation of programs should be obtained. However, such information can be developed during the permit term as well, without holding up permit reissuance (See, In Re: City of Irving, Texas, NPDES Appeal No. 00-18, at 23 (EAB, July 16, 2001). Regional Board staff opine that the draft permit incorporates necessary provisions to obtain any information that is lacking for the implementation of a successful program.

Diamond Bar (DB), RT, [Arcadia, Culver City, Hawthorne, (AR)], Charles Abbott and Assoc. (CAA), Rutan and Tucker (R&T), CPR, Richards Watson and Gershon (RWG), BWS, Building Industry Assoc and Construction Industry Coalition on Water Quality (BIA)	3. Enforcement Retain the Notice to Meet and Confer provision that requires the Regional Board Executive Officer to meet with a Permittee prior to initiating a formal enforcement action.	The Regional Board is required to adhere to the State Board Enforcement Policy (Resolution No. 96-030) which established a progressive enforcement approach to ensure consistent, predictable, and fair enforcement of regulations. The Policy does not have a 'Notice to Meet and Confer' provision. The first level of enforcement is the issuance of a Notice of Violation (NOV). The NOV provides the Permittee the opportunity to demonstrate compliance, before the enforcement action is escalated to a penalty phase. The Regional Board Executive Officer has always been open to meeting with Permittees and interested parties to discuss permit issues irrespective of any other provision in the permit.
Heal the Bay (HtB), NRDC, SMBK	4. Comparison with the Ventura County and City of Long Beach MS4 Permits The draft permit appears weaker in several permit provisions than either the City of Long Beach MS4 permit or the Ventura County MS4 permit. These permits should set the baseline and no section of the proposed permit for LA County should be weaker The specific areas are. (i) TDML Language; (ii) Criteria for applying SUSMPs to ESAs; (iii) Single Family Hillside Homes; (iv) monitoring reduction for non-detected pollutants; (v) toxicity testing requirements.	Corrected where true. The TMDL language has been revised to be identical to that in the Ventura County and LB MS4 permits. In the case of SUSMP criteria for ESAs, Regional Board staff has proposed thresholds to be responsive to the State Board decision in Order No. WQ 2000-11. In that decision, the State Board set forth types of evidence and criteria necessary for inclusion of ESAs in subsequent permits, including thresholds (See memorandum from Office of Chief Counsel to Regional Board Executive Officers dated December 26, 2000). The Ventura County MS4 permit precedes the State Board decision, as does the LB MS4 permit. A petition by several Ventura County MS4 Permittees on the ESA matter is being held in abeyance by the State Board, pending Regional Board consideration of the issue during reissuance of the LA County MS4 permit. For a complete discussion of the ESA matter see, Fact Sheet/ Staff Report – Attachment, Technical Report: 'Mitigation of Storm Water Impacts from New Development in Environmentally Sensitive Areas'. The draft permit incorporates narrative SUSMP requirements for single family hillside homes and applies the numerical mitigation standard to single family hillside developments of one or

Commentors	Comment	Staff Response
		more acres of surface area. It is correct that the State Board decision in Order No. WQ 2000-11 approved the hillside category without a threshold and that neither the Ventura County MS4 permit nor LB Ms4 permit contain one. However, Regional Board staff is persuaded that there is no technical basis to support different post-construction requirements for hillside development as compared to developments on flat land. The primary differences occur during construction and not post construction. Hillsides are more susceptible to erosion and sediment loss from exposed land than is flatland. This difference in potential risk is addressed through BMPs under the Development Construction provision. The proposed threshold will normalize the numerical mitigation standard for hillside development with general housing development. The monitoring reduction for non-detected parameters has been revised to be similar to that in the Ventura County MS4 permit. The toxicity-testing requirement has been revised to be similar to that in the LB MS4 permit.
Burbank (Brb), Calabasas (Cal). DB, AR, RT. R&T, RWG. BWS. BIA	5. Receiving Water Limits Language The statutory requirement for municipal storm water discharges is to reduce the discharge of pollutants to the maximum extent practicable (MEP standard). [CWA § 402(p)(3)(B)(iii)] The proposed language in the draft requires also that storm water discharges achieve water quality standards, thus nullifying the MEP standard Which criteria will the Board use when determining compliance? CWC § 13263(a) requires the Regional Board to consider reasonableness and economics when prescribing waste discharge requirements. As written it invites third party lawsuits because Permittees will be out of compliance as soon as the permit is adopted. The language in the current permit, 'timely	The draft permit incorporates the RWL adopted by the State Board in its precedential decision in State Board Order No. WQ 99-05. The State Board Office of Chief Counsel has clarified that the U.S. Appellate Court decision in *Defenders of Wildlife v. Browner* 191 F.3d 1159 (9th Cir., 1999), did not contradict the RWL and that the State Board Order stands (Memorandum dated October 14, 1999, from Senior Counsel Elizabeth Jennings to Executive Director, Walt Petit). Also, the USEPA in prior comments to the State Board on the RWL in MS4 permits cites NPDES regulations at 40 CFR 122.44(d)(1)(i) as requiring effluent limitations where discharges, 'will cause, have the reasonable potential to cause, or contribute to an excursion above any State water quality standard.....' and that the CWA § 301(b)(1)(C)does not provide the "not in violation" exception to compliance with water quality standards when exceedences occur (Letter of March 17, 1998 from Alexis Strauss, Water Division Director, USEPA Region IX, to Walt Petit, Executive Director, State Board). The State Board's interpretation of RWL can best be inferred from the Caltrans MS4 permit it issued in 2000 (Board Order No. DWQ), which includes language very similar to the RWL in this draft permit. The RWL provision in the draft permit requires Permittees to implement programs to reduce the discharge of pollutants in storm water to the maximum extent practicable (MEP). For those pollutants in storm water discharges that cause or contribute to the exceedences of water quality standards, Permittees will be required to implement additional controls to eliminate these exceedences. So long as Permittees continue to implement more and better controls to eliminate the exceedences, a citizen lawsuit brought under CWA (33 U.S.C. §1365) is unlikely

B-256

R0007078

Commentors	Comment	Staff Response
	and complete implementation of model programs....shall satisfy the requirements of this section' should be reinstated in the draft. Further, the language is inconsistent with State Board Order No. 99-05, which states that Permittees will not be in violation of water quality standards so long as they follow an implementation schedule. State Board Order No. 98-01 excised the 'cause or contribute' text from the compliance language. The U.S. Appellate Court decision in *Defenders of Wildlife v. Browner* 191 F.3d 1159 (9th Cir., 1999) defeats the interpretation in State Board Order No 99-05. There is no justification for Permittees to have not upgraded the Storm Water Quality Management Plan to address water quality exceedences, especially in a third permit term. Water quality objectives in Table B of the California Ocean Plan apply to all discharges to the Ocean including non-point source and storm water.	to go forward. The Regional Board retains its discretionary authority to bring an enforcement action for exceedences of a water quality standard (*Sierra Club v. Whitman*, Case No. 00-16895, 9th Cir. (2001))
HtB	5 a. Numeric Effluent Limits The absence of numeric effluent limits for storm water in the permit may be reasons for the extensive impairment of receiving waters from municipal storm water discharges. The ambiguous MEP standard and the iterative approach to augmenting BMPs when water quality objectives	The draft permit incorporates SWMP requirements that serve as effluent limitations consistent with the State Board precedential decisions in Order No. WQ 91-03; Order No. WQ 91-04; and Order No. WQ. No numerical effluent limitations are included at this time. However, the draft permit contains language that makes any numerical allocation or effluent limitations for pollutants in MS4 discharges that are approved through the TDML process, immediately implementable and enforceable under this permit. In addition the RWL authorizes the Regional Board to make a determination, based on receiving water monitoring data, that water quality standards are being exceeded and then require Permittees to submit an implementation plan to eliminate exceedences.

B-257

R0007079

Commentors	Comment	Staff Response
	are exceeded are not enough based on the experience with implementation during the two past terms of the permit.	
EAC, NRDC, CPR, RT	6. Recognition of the EAC Eliminate the requirement that EAC Meetings be subject to the Brown Act (Cal. Gov. Code § 54950 *et seq*) because the EAC is not a political decision making body Eliminate any formal recognition of the EAC because such recognition would also require that other interested parties and coalitions be recognized similarly.	Reference to the EAC has now been deleted in the draft permit. Agree that the EAC is not a political decision making body but rather an informal executive group of permittee representatives. It would not be proper to recognize the EAC in the permit when it is does not subscribe to government rules for open meetings.
AR, RT, EAC, CPR	7. Open-ended Authority for Modification The draft permit grants the Regional Board Executive Officer unfettered authority to make modifications to certain requirements without public comment.	Incorrect. Modifications to the permit are governed by the 'Standard Provision: Reopener and Modifications' 40 CFR 122.41(f), which ensures that non-minor modifications to the permit are undertaken after public comment. Any party aggrieved by the action or inaction of the Regional Board Executive Officer may petition the full Regional Board for review (CWC). Similarly, any authority that the Regional Board delegates to the Regional Board Executive Officer under this permit, is reversible at the discretion of the Regional Board on petition (See State Board Order No. WQ 2000-11).
Covina (COV), LA County Fire, LA County (LAC), LA City (LA), [City of Los Angeles Department of Water and Power, California Water Service Company, Central Basin Water	8. Non-Storm Water Discharges Authorize potable water releases, which are intermittent and generally of short duration, conditionally as is the current practice. Authorize wash-down of trauma scene wastes to the storm drain system.	The draft permit now includes potable water releases from drinking water distribution systems under authorized non-storm water discharges provided the release is done in accordance with American Water Works Association guidelines for dechlorination/ debromination and suspended solids removal. The discharge of trauma waste wash-down to the MS4 is not authorized. The Medical Waste Management Act requires that trauma scene waste be transported to a permitted medical waste transfer station or treatment facility (Cal. Health and Safety Code § 117600 *et seq*). This Act preempts the Regional Board from authorizing the discharge of trauma scene waste to the MS4. Several municipalities already implement trauma waste management programs, which avoid

B-258

R0007080

Commentors	Comment	Staff Response
Association, Southern California Water Company, South Montebello Irrigation District (Water)]		discharge to the storm drain system.
HtB, NRDC	9. Public Information and Participation Program The education program should be expanded to include measures and assessment of behavioral changes resulting from educational outreach.	The draft permit now includes provisions to evaluate change in behavior resulting from implementation of the public education program to determine effectiveness and help focus or redirect resources.
Brb, DB, AR, RT. R&T, RWG, BWS, LAC, LA, CPR. EAC	10. Industrial/ Commercial Inspections The municipality should not be held responsible for the compliance of industrial/ commercial facilities with storm water regulations The site-education program alone should be sufficient The municipality may carry out drive-by observations and report problem facilities to the Regional Board for follow-up. The industrial inspection program must require that municipalities inspect industrial facilities to verify compliance with local storm water ordinances. Municipalities must compel the implementation of additional controls at facilities when they are needed to assure compliance with local ordinances	The MS4 Permittee has a responsibility to make sure that industrial sites comply with local government storm water and urban runoff ordinances. The Regional Board has the responsibility to make sure that facilities 'discharging storm water associated with industrial activity' comply with the state's GIASP. USEPA storm water regulations require the MS4 permittee to obtain legal authority to monitor and controls pollutant discharges to the MS4 from industrial sites (40 CFR 122.26(d)(2)(iv)(C)) The legal authority includes the ability to carry out inspection, surveillance and monitoring procedures (Guidance Manual for the Preparation of Part 2 of the NPDES Applications for Discharges from Municipal Separate Storm Sewer Systems (USEPA1992)). Further, USEPA guidance states that MS4 Permittees shall, (i) identify priority industries discharging to the MS4; (ii) review and evaluate SWPPPs; (iii) require that industrial sites implement BMPs to reduce the discharge of pollutants in storm water; (iv) inspect and monitor compliance at industrial facilities discharging storm water. The USEPA clearly contemplates a dual and a cooperative oversight of facilities 'discharging storm water associated with industrial activity', between the permitting authority and the MS4 permittee (55 *Fed. Reg.* 222, 48000; and Storm Water Phase II Compliance Assistance Guide (USEPA 2000), p 4-32 and 5-11). Further, LA County has conducted a prioritization of critical industrial/ commercial facilities that discharge storm water (Critical Source Selection and Monitoring Report, (LACDPW 1996). It has also conducted monitoring to document that the highest risk sites are indeed significant sources of storm water pollution, and that the implementation of source control BMPs (voluntary good housekeeping measures) at high risk critical source sites are not enough to

B-259

R0007081

Commentors	Comment	Staff Response
		reduce the discharge of pollutants in storm water (Los Angeles County 1999-2000 Storm Water Monitoring Report (LACDPW 2000)). Given the information that is known, educational site visits and drive-by observations by themselves will not be enough to meet the statutory standard of MEP. At a minimum a MS4 Permittee must implement an inspection program for high-risk industrial/ commercial facilities to verify implementation of controls to reduce the discharge of pollutants. A review of USEPA issued MS4 permits nationwide indicates that an inspection program is incorporated as a basic requirement (Palm Beach County, FL; Tulsa, OK; Denver, CO). Similarly, Regional Board issued MS4 permits in California include an inspection expectation (San Diego County; Santa Clara County; Alameda County; Sacramento County)
Brb, DB, AR, RT, R&T, RWG, BWS, CPR, EAC, Upper LA Water Master	11. Development Planning SUSMP provisions seek to regulate local land-use authority and local government decision making. CEQA preempts such development planning provisions.	Incorrect. The draft permit recognizes that MS4 Permittees are obligated to consider potential storm water impacts when making planning decisions and approving development projects or building permits. The SUSMP provisions are not intended to restrict or control local land-use decision-making, only that the potential discharge of storm water pollutants be mitigated. On the other hand MS4 Permittees have to demonstrate that their programs for development planning meet the MEP standard. Failure to use the full authority granted to them on land-use planning matters under State law does not meet the MEP standard. CEQA is a procedural statute enacted to ensure that public agencies consider environmental impacts in development decisions they make. For water quality purposes, CWA and CWC are controlling, not CEQA. For a complete discussion of the CEQA matter see, Fact Sheet/ Staff Report – Attachment, Technical Report. Storm Water Mitigation Requirements for Priority Planning Projects for the Protection of Water Quality
Brb, Htb, SMBK, DB. AR, RT, R&T, RWG, BWS, CPR, EAC, LA, Cal	11a Peak Flow Control There appears to be no authority in the CWA for the permitting authority to regulate flow. Develop consensus language on peak flow control. Provide the flexibility to conduct an assessment under the monitoring program and consider alternate solution to avoid accelerated downstream erosion and protect stream habitat.	Clearly the CWA authorizes the control of activities, discharges, and pollutants when beneficial uses are adversely impacted (*Jefferson County: PUD No. 1 v. Washington Dept. of Ecology*, 511 U.S. 700 (1994)). USEPA Phase II storm water regulations state that for post-development, "[the] consideration of the increased flow rate, velocity, and energy of storm water discharges must be taken into consideration in order to reduce the discharge of pollutants, to meet water quality standards, and to prevent the degradation of receiving streams" 64 *Fed. Reg.* 68761). Several studies have demonstrated a definite nexus between pollutant discharges and increased flow from increases in impervious surface area (*Impervious Cover as An Urban Stream Indicator and a Watershed Management Tool*; Schueler, T. and R. Claytor, *Effects of Water Development and Management on Aquatic Ecosystems (1995), ASCE, New York; Leopold, L. B., 1973, River channel change with time: an example, Geological Society of America Bulletin*, v. 84. p. 1845-1860; Hammer, T. R., 1972. *Stream channel enlargement due to urbanization: Water Resources Research*, v. 8. p. 1530-1540: Booth, D. B., 1991. *Urbanization and the natural drainage system--impacts, solutions and prognoses: The Northwest Environmental*

Commentors	Comment	Staff Response
		Journal, v. 7, p. 93-118; Klein, R. D., 1979, *Urbanization and stream quality impairment: Water Resources Bulletin*, v. 15, p. 948-963; May, C. W., Horner, R. R., Karr, J. R., Mar, B. W., and Welch, E. B., 1997, *Effects of urbanization on small streams in the Puget Sound Lowland ecoregion: Watershed Protection Techniques*, v. 2, p. 483-494; Morisawa, M. and LaFlure, E. *Hydraulic geometry, stream equilibrium and urbanization*; Rhodes, Dallas P. and Williams, Garnet P. *Adjustments to the fluvial system.* 333-350. 1979; Dubuque, Iowa, Kendall/Hunt. *Tenth Annual Geomorphology Symposia Series*; and Schueler, Tom, 1994. *The importance of imperviousness. Watershed Protection Techniques*, 1(3). The Peak Flow Control provision in response to comments has been amended to include a time period for development of criteria after the completion of a Peak Discharge Impact Study. It has been clarified that the criteria apply to natural drainage systems, a term which is defined. In addition, the flexibility to develop a watershed strategy to control peak flow rather than through the use of site-by-site criteria is included.
Western States Petroleum Association (WSPA), Brb. Htb. SMBK, DB, AR. RT. R&T, RWG. BWS. CPR, EAC. BIA	<u>11.b SUSMP Applicability</u> The draft permit extends numerical design criteria for all projects, (not just discretionary), to projects in ESAs, and to retail gasoline outlets. The State Board in its 'SUSMP' decision rejected these categories. Retain applicability of the numerical design criteria to just CEQA discretionary approvals. Revise the residential development category to projects with 100,000 square feet or more of directly connected impervious area (that is not low or moderate-income housing). Object to the change in thresholds for numerical mitigation criteria to apply from 10,000 square feet single-family hillside developments to one acre and ten or more of housing developments to 1 acre. The 1-acre threshold, which is obtained from USEPA Phase II	Incorrect. The State Board decision in Order No. WQ 2000-11 was precedential in upholding the requirement for new development and significant redevelopment to mitigate post-construction storm water based on a numerical design criteria for treatment control BMPs. The decision also set forth types of evidence and criteria necessary for extension of SUSMP requirements in future MS4 permits to all projects (not just discretionary), the application of the numerical mitigation criteria to retail gasoline outlets, and inclusion of ESAs, (See memorandum from Office of Chief Counsel to Regional Board Executive Officers dated December 26, 2000). For a complete discussion of the evidence for extension of the SUSMP requirements to these categories, see, Fact Sheet/ Staff Report – Attachment, (i) Technical Report: Storm Water Mitigation Requirements for Priority Planning Projects for the Protection of Water Quality; (ii) Technical Report: 'Mitigation of Storm Water Impacts from New Development in Environmentally Sensitive Areas'; and (iii) Technical Report: Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts. The State Board SUSMP decision upheld the application of SUSMP requirements to 10 or more unit home developments (about one acre) and not 100,000 square feet residential development (about 2.5 acres). To be consistent with USEPA Phase II storm water regulations the draft permit lowers the threshold for industrial/ commercial development from 100,000 square feet of impervious surface area to one acre of surface area (43,560 sq. ft) beginning 2003. This provision ensures that the SUSMP thresholds for industrial/ commercial development and residential development converge in 2003.

B-261

R0007083

Commentors	Comment	Staff Response
	regulations, does not apply to Permittees because they are in Phase 1. The City supports the extension of SUSMP requirements to all projects (including those receiving administrative review). Support the extension of numerical mitigation criteria to retail gasoline outlets and developments in environmentally sensitive areas.	The basis of the threshold for hillside residential developments has been previously discussed (See, Response in 'Comparison with the LA County and City of Long Beach MS4 Permits'). The 10,000 square feet threshold was a staff proposal considered in the first draft but has no precedent in the LB MS4 and Ventura County MS4 permits. The LA County MS4 Permittees are subject to USEPA Phase I storm water regulations for MS4 discharges. Additionally, Phase I storm water regulation included regulatory requirements for construction projects 5 acres or greater and facilities discharging storm water associated with industrial activity. USEPA Phase II requirements cover small MS4s and small construction projects (1-5 acres). The 1 acre threshold for construction projects is obtained from USEPA Phase II storm water regulations. It is incorrect to state that the one-acre is an inappropriate threshold for SUSMP requirements because LA County MS4 Permittees are in Phase I.
California Coastal Commission (CCC), Brb, DB, AR, RT, R&T, RWG, BWS, CPR, EAC, BIA	11c. ESAs There is no reason to include ESAs under SUSMP requirements since they are heavily regulated by other agencies and are subject to many other environmental regulations. Support the extension of numerical mitigation criteria to ESAs. There is no justification to condition the applicability of SUSMP requirements to projects in ESAs, such as '2,500 square feet of impervious surface area' and 'likely to affect sensitive biological species or habitat'.	Regional Board staff has proposed thresholds for ESAs to be responsive to the State Board decision in Order No. WQ 2000-11. In that decision, the State Board set forth types of evidence and criteria necessary for inclusion of ESAs in subsequent permits, including thresholds (See memorandum from Office of Chief Counsel to Regional Board Executive Officers dated December 26, 2000). For a complete discussion of the ESA matter see, Fact Sheet/ Staff Report - Attachment, Technical Report: 'Mitigation of Storm Water Impacts from New Development in Environmentally Sensitive Areas'.
Brb, DB, AR, RT, R&T, RWG, BWS, CPR, EAC, BIA, WSPA	11d. Definition of Redevelopment The State Board's SUSMP decision did not include the word. "replacement", in the definition of redevelopment.	Correct. The addition of the word 'replacement' constitutes a clarification. The State Board's SUSMP decision did not clarify this issue. The USEPA describes Redevelopment as "alterations to a property that change the footprint of a site or a building...." (Storm Water Phase II Compliance Assistance Guide, (USEPA 2000) p 4-34. USEPA's description encompasses replacement of an existing impervious surface in addition to creation and addition of impervious cover. The intent of the Regional Board in adopting SUSMP requirements was expressly to ensure that when highly developed communities, such as those in Los Angeles County, replace themselves through generations, the opportunity to mitigate the adverse impacts

Commentors	Comment	Staff Response
		of storm water pollution from urbanization is not lost (See Meeting Transcript, comment by Dennis Dickerson, Regional Board Executive Officer, at Regional Board Meeting on January 26, 2000). The redevelopment provision in the draft permit specifically excludes routine maintenance activity and single-family structures in response to comments submitted by Permittees.
Brb, DB, AR, RT, R&T, RWG, BWS, CPR, EAC	11e. CEQA Guidelines Update The requirement is redundant because LA County already has similar guidelines. Compliance expectation is unclear because both construction and post-construction activities are included.	LA County MS4 Permittees include 85 entities and not all of them use LA County's CEQA guidelines. CEQA is a procedural statute enacted to ensure that public agencies consider environmental impacts in development decisions they make. The guidelines are intended to ensure that local government officials consider both the adverse environmental impacts of development during construction and post-construction during decision-making. The CEQA guideline provision is intended for LA County MS4 Permittees to demonstrate that they meet the MEP statutory standard under their development review and building approval powers.
Brb, DB, AR, RT, R&T, RWG, BWS, CPR, EAC	11f. General Plan Update The Regional Board does not have a right to review or approve proposed updates or amendments to General Plans. State law requires that storm water quality be addressed only in the conservation element.	Under State Law, General Plan amendments and update are the privilege of the local government elected officials. The Regional Board has the right to provide comment on updates and amendments (Govt. Code § 65350 *et seq.*) and is requiring adequate notice to comment. The opportunity to make policy that promotes the consideration of adverse impacts of storm water discharges from new development and redevelopment exists in several other General Plan elements (not just Conservation). Failure to use the full authority granted to MS4 Permittees under State law to express policy direction through updates or amendments to the General Plan does not meet the MEP standard. Further, this provision is very similar to that in the current LA County MS4 permit but without the notification requirement.
BIA	12. Development Construction Adoption of the draft permit will effectively nullify coverage of construction projects under the GCASP (State Board Order No. 99-05-DWQ).	Incorrect. The GCASP regulates directly construction projects subject to USEPA Phase I storm water regulations. The LA County MS4 permit regulates directly municipal Permittees (not land developers or owners) and requires MS4 Permittees to implement a program to control storm water discharges associated with new development and redevelopment. Nullification of coverage under the GCASP for a construction project occurs only when the Regional Board adopts a separate general or individual permit for construction projects within the Regional Board jurisdiction and not when it adopts an MS4 permit.
Brb, DB, AR, RT, R&T, RWG, BWS, CPR, EAC, BIA	12a. Construction Site Inspections The municipality should not be held responsible for the compliance of construction sites also regulated under the statewide construction storm water permit.	The MS4 Permittee has a responsibility to implement an inspection program to make sure that construction sites irrespective of size comply with local government storm water and urban runoff ordinances (40 CFR 122.26(d)(2)(iv)(D)). The draft permit requires construction sites one acre or greater to demonstrate compliance through the implementation of a local SWPPP approved by the municipality. The Regional Board has the responsibility to make sure that construction sites five acres or greater comply with the state's GCASP. The local SWPPP may substitute for the State SWPPP if the local SWPPP is at least as stringent, but the compliance

Commentors	Comment	Staff Response
		obligation is dual and not mutually exclusive. The USEPA clearly contemplates a dual and a cooperative oversight of construction projects subject to state permitting between the permitting authority and the MS4 Permittee. (See comment on Industrial/commercial inspections)
Brb, DB, AR, RT, R&T, RWG, BWS, CPR, EAC, BIA	12b. Small Construction Projects The municipality should not be required to obtain state permit coverage for construction projects between 1 and five acres beginning 2003 because the requirement does not currently exist. The State has not completed its rule making.	Incorrect. USEPA Phase II regulations are final (64 *Fed. Reg.* 68722). The regulations require the state permitting authority to implement a permitting scheme to cover small construction projects (1-5 acres). The draft permit consistent with the regulations requires coverage for small construction projects beginning 2003.
Brb, DB, AR, RT, R&T, RWG, BWS, CPR, EAC	13. Illicit Discharge/ Illicit Connection Elimination Make the requirement to map illicit connections and incidents of illicit discharges for priority action an optional task. Illicit discharges are best identified by drive-by ("off-site") inspections. The requirement to map is too costly because it would require a GIS.	The provision has been modified to require the listing of all illicit connections and illicit discharges (in lieu of mapping). MS4 Permittees are required to conduct field screening of open channels and underground pipes according to a schedule. This change makes the program consistent with the LB MS4 Permit.
Cal	14. Standard Provision Delete the standard provision, 'Bypass' because it may result in an automatic violation during heavy storms if treatment control BMPs are installed	The USEPA requires that this Standard Provision be included in MS4 permits because it has been deemed applicable. The purpose of the provision is to provide clarification as to under what circumstances a " Bypass" can occur without it being a violation of the MS4 permit. A treatment control BMP that is designed for water quality purposes and to bypass non-water quality events would not be considered to violate this provision when a "Bypass" occurs under design conditions.
NRDC, R&T, Cal	15. Definition of Pollutant The definition of the term pollutant includes language that inverts the burden of proof to demonstrate that a discharge of pollutant did not occur. Delete phrases in the definition that do not comport with the definition in the CWA	Extraneous phrases have been deleted and the definition is now referenced to the CWA
LAC, HtB	16. Monitoring	The draft permit has been amended to require tributary monitoring to determine if water quality

Commentors	Comment	Staff Response
	Require use of State Board 'Policy for Implementation of Inland Waters and Bays and Estuary Plan Minimum Levels (MLs) for toxic pollutant parameters. Require tributary monitoring to verify land-use model. Require annual sediment toxicity testing and benthic community analysis in estuaries.	standards are being exceeded in inland surface waters. The existing steady state land-use model will require significant data collection and modification to improve its predictive ability on tributary loads. Regional Board staff consider that the effort would not be worthwhile because the Regional Board intends to rely on the predictive ability of a dynamic model currently being developed in partnership with the Southern California Coastal Research Project in order to establish TMDLs. The draft permit has been revised to ensure that monitoring protocols achieve Minimum Levels (MLs). This change is to ensure that the most current analytical methods are used to measure pollutants in storm water. Sediment testing, bioassesssment and benthic analysis in estuaries are best conducted as part of a regional study. The draft permit requires LA County to participate in the next Southern California Bight-wide Study in partnership with SCCWRP to generate this information.

STATE OF CALIFORNIA
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

320 W. 4TH Street, Suite 200
Los Angeles, California 90013
Tel. No.: (213) 576-6600; Fax No.: (213) 576-6660

Public Notice No. 01-066

NPDES No. CAS004001

NOTICE OF PUBLIC HEARING

CONSIDERATION OF A STORM WATER MANAGEMENT/URBAN RUNOFF PERMIT

FOR

THE COUNTY OF LOS ANGELES AND THE INCORPORATED CITIES THEREIN,

EXCEPT FOR THE CITY OF LONG BEACH

The Los Angeles Regional Water Quality Control Board will conduct a public hearing to consider the adoption of a municipal storm water permit for Los Angeles County (the renewal of an existing five-year permit). Regional Board staff will provide background and a brief overview of the proposed draft permit. The public will have the opportunity to testify regarding the proposed permit.

NOTE CHANGE IN HEARING LOCATION:

DATE: Thursday, November 29, 2001
TIME: 9:00am (However, this item will not be heard before 1:30pm)
PLACE: Metropolitan Water District, Board Meeting Room
700 North Alameda Street (Next to Union Station)
Los Angeles, CA

AVAILABILITY OF DOCUMENTS

You may contact Weindy Abarquez, at (213) 576-6802, to request a copy of the tentative draft permit and staff report. After October 15, you may also download the tentative draft permit and other related documents from the Regional Board Storm Water web page at: www.swrcb.ca.gov/rwqcb4/html/programs/Stormwater/renewal.html.

BACKGROUND

On January 31, 2001, the Los Angeles County Department of Public works submitted an application for renewal of the five-year Municipal Storm Water Management/Urban Runoff Discharges Requirements for the County of Los Angeles, and the incorporated cities, except for the City of Long Beach (Board Order No. 96-045). Regional Board staff conducted a public workshop on April 24 and a formal workshop with the Regional Board on July 26 to give background on the permit and allow for public comment. Regional Board staff have considered comments in the issuance of each of the three draft permits.

Under the requirements of the permit, the County will implement the Storm Water Quality Management Plan which includes the following provisions: (a) Program Management; (b) Public Information and Participation Program; (c) Programs for industrial/commercial facilities; (d) Public Agency Activities; (e) Programs to eliminate illicit connections and discharges; (f) Programs for development planning; and (g) Programs for construction sites. These programs collectively are expected to reduce pollutants in storm water discharges to the Maximum Extent Practicable.

In addition the County will conduct a storm water monitoring program to assess permit compliance, assess the chemical, physical and biological impacts on receiving waters from storm water runoff, characterize storm water discharges, and identify sources of water quality exceedances and toxic pollutants.

HEARING PROCEDURE

The hearing will start at 9:00 am. However, this item will not be heard before 1:30pm. Regional board staff will present an overview of the proposed permit. Interested persons are invited to attend and to testify in front of the Regional Board. For the accuracy of the record, comments should also be submitted in writing. The Regional Board may ask questions of staff and persons who testify prior to making a decision on the adoption of the proposed permit.

Date: November 1, 2001

FROM: Xavier Swamikannu, D. Env.,
Acting Storm Water Section Chief

DATE: November 6, 2001

SUBJECT: CHANGE OF LOCATION OF THE PUBLIC HEARING FOR THE TENTATIVE DRAFT COUNTY OF LOS ANGELES MUNICIPAL STORM WATER NPDES PERMIT

The Regional Water Quality Control Board (Regional Board) will conduct a public hearing to consider adoption of the attached tentative permit during a public meeting on:

NOTE CHANGE IN HEARING LOCATION:

DATE: **Thursday, November 29, 2001**
TIME: **9:00am (However, this item will not be heard before 10:00am)**
PLACE: **Metropolitan Water District, Board Meeting Room**
700 North Alameda Street (Next to Union Station)
Los Angeles, CA

An agenda and public comment protocol for this Board Meeting will be posted on our web site by November 19, 2001, at: www.swrcb.ca.gov/rwqcb4/html/programs/Stormwater/renewal.html

The public will have an opportunity to provide oral testimony before the Regional Board on November 29, 2001. Written comments should either be hand delivered or mailed to our office with sufficient time to be received no later than the close of business on November 13, 2001. In order to consider and include the conclusions of the SWRCB in the San Diego MS4 Permit Petition scheduled to be issued on November 15, 2001, Regional Board will issue a response to comments no later than November 20, 2001.

Any comments received after November 13, 2001, will be provided to the Regional Board members ex agenda, and may not receive full consideration. Following the consideration of written comments and oral testimony, the Board may take action to adopt tentative Order No. 01-XXX during a public meeting on November 29, 2001. At its discretion, however, the Board may direct further investigation.

Please call Dr. Xavier Swamikannu at (213) 576-6654 should you have any questions. Thank you for your interest in and comments on this proposed regulatory action for the County of Los Angeles and the Cities of Los Angeles County.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

ORDER NO. 01-xxx
NPDES PERMIT NO. CAS004001
WASTE DISCHARGE REQUIREMENTS
FOR
MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES, AND THE INCORPORATED CITIES THEREIN, EXCEPT THE CITY OF LONG BEACH

The California Regional Water Quality Control Board, Los Angeles Region (hereinafter referred to as the Regional Board) finds:

A. **Existing Permit**

The Los Angeles County Flood Control District, the County of Los Angeles, and 84 incorporated cities within the Los Angeles County Flood Control District (see Attachment A, List of Permittees), hereinafter referred to separately as Permittees and jointly as the Discharger, discharge or contribute to discharges of storm water and urban runoff from municipal separate storm sewer systems (MS4s), also called storm drain systems. The discharges flow to water courses within the Los Angeles County Flood Control District and into receiving waters of the Los Angeles Region. These discharges are covered under countywide waste discharge requirements contained in Order No. 96-054 adopted by this Regional Board on July 15, 1996, which replaced Order No. 90-079 adopted by this Regional Board on June 18, 1990. Order No. 96-054 also serves as a National Pollutant Discharge Elimination System (NPDES) permit for the discharge of municipal storm water.

B. **Nature of Discharges and Sources of Pollutant**

1. Storm water discharges consist of surface runoff generated from various land uses in all the hydrologic drainage basins that discharge into water bodies of the State. The quality of these discharges varies considerably and is affected by the hydrology, geology, land use, season, and sequence and duration of hydrologic events. The primary constituents of concern currently identified by the Los Angeles County Flood Control District 1994-2000 Integrated Receiving Water Impacts Report are cyanide, indicator bacteria, total dissolved solids, turbidity, total suspended solids, nutrients, total aluminum, dissolved cadmium, copper, lead, total mercury, nickel, zinc, bis(2-ethylhexyl)phthalate, polycyclic aromatic hydrocarbons (PAHs), diazinon, and chlorpyrifos.

2. Certain pollutants present in storm water and/or urban runoff may be derived from extraneous sources that Permittees have no or limited jurisdiction over. Examples of such pollutants and their respective sources are: PAHs which are products of internal combustion engine

operation, nitrates, bis (2-ethylhexyl) phthalate and mercury from atmospheric deposition, lead from fuels, copper from brake pad wear, zinc from tire wear, dioxins as products of combustion, and natural-occurring minerals from local geology. However, the implementation of the measures set forth in this Order is intended to reduce the entry of these pollutants into storm water and their discharge to receiving waters.

3. Water quality assessments conducted by the Regional Board identified impairment, or threatened impairment, of beneficial uses of water bodies in the Los Angeles Region. The causes of impairments include pollutants of concern identified in municipal storm water discharges by the County of Los Angeles in the Integrated Receiving Water Impacts Report (1994-2000). Pollutants in storm water can have damaging effects on both human health and aquatic ecosystems.

4. The Los Angeles County Grand Jury, September 2000, completed an investigation into the health risks of swimming near beaches in Los Angeles County and made several recommendations to reduce public health risks (Final Report, Grand Jury, Los Angeles County, 1999-2000). The Grand Jury recommended that the Regional Board consider among other actions, (i) a focus on setting contaminant limits rather than programmatic evaluations, (iii) audit of MS4 Permittee programs; and (iiiiv) clarifying enforcement responsibilities between the State and local governments.

5. Studies and research conducted by other Regional agencies, academic institutions, and universities have also identified storm water and urban runoff as significant sources of pollutants to surface waters in Southern California. See, e.g., [*Surface Runoff to the Southern California Bight*, Southern California Coastal Water Research Project, (1992); *Impacts of Urban Runoff on Santa Monica Bay and Surrounding Ocean Waters* (Gersberg, R.M., 1995); *State of the Bay 1998*, Santa Monica Bay Restoration Project; *Storm Water Impact*, In, Southern California Environmental Report Card 1999, Institute of the Environment, University of California, Los Angeles (Stenstrom, M.S., 1999); *Distribution of Anthropogenic and Natural Debris on the Mainland Shelf of Southern California Bight*, Shelly L. Moore and M. James Allen (1999); *The Health Effects of Swimming in Ocean Water Contaminated by Storm Drain Runoff*, Haile, R.W. et al. (1999); *Huntington Beach Closure Investigation: Technical Review* (University of Southern California, 2000); *A Regional Survey of the Microbiological Water Quality Along the Shoreline of the Southern California Bight*, Rachel T. Noble et al. (2001); *Integrated Receiving Water Impacts Report (1994-2000)*, County of Los Angeles (2001)].

6. Development and urbanization increase pollutant load, volume, and discharge velocity. First, natural vegetated pervious ground cover is converted to impervious surfaces such as paved highways, streets, rooftops and parking lots. Natural vegetated soil can both absorb rainwater and remove pollutants providing an effective natural purification process. In contrast, pavement and concrete can neither absorb water nor remove pollutants, and thus the natural purification characteristics are

lost. Second, urban development creates new pollution sources as the increased density of human population brings proportionately higher levels of vehicle emissions, vehicle maintenance wastes, municipal sewage waste, pesticides, household hazardous wastes, pet wastes, trash, and other anthropogenic pollutants. Development and urbanization especially threaten environmentally sensitive areas. Such areas have a much lower capacity to withstand pollutant shocks than might be acceptable in the general circumstance. In essence, development that is ordinarily insignificant in its impact on the environment may in a particular sensitive environment become significant. These environmentally sensitive areas designated by the State and/or the County of Los Angeles include Areas of Special Biological Significance (ASBS), water bodies designated as supporting a RARE beneficial use, Significant Natural Areas (SNAs), and Significant Ecological Areas (SEAs).

7. The increased volume, increased velocity, and discharge duration of storm water runoff from developed areas has the potential to greatly accelerate downstream erosion and impair stream habitat in natural drainages. Studies have demonstrated a direct correlation between the degree of imperviousness of an area and the degradation of its receiving waters. Significant declines in the biological integrity and physical habitat of streams and other receiving waters have been found to occur with as little as 10 percent conversion from natural to impervious surfaces. Percentage impervious cover is a reliable indicator and predictor of potential water quality degradation expected from new development. (*Impervious Cover as An Urban Stream Indicator and a Watershed Management Tool*, Schueler, T. and R. Claytor, In, Effects of Water Development and Management on Aquatic Ecosystems (1995), ASCE, New York; Leopold, L. B., 1973, *River channel change with time: an example*, Geological Society of America Bulletin, v. 84, p. 1845-1860; Hammer, T. R., 1972, *Stream channel enlargement due to urbanization: Water Resources Research*, v. 8, p. 1530-1540; Booth, D. B., 1991, *Urbanization and the natural drainage system--impacts, solutions and prognoses*: The Northwest Environmental Journal, v. 7, p. 93-118; Klein, R. D., 1979, *Urbanization and stream quality impairment*: Water Resources Bulletin, v. 15, p. 948-963; May, C. W., Horner, R. R., Karr, J. R., Mar, B. W., and Welch, E. B., 1997, *Effects of urbanization on small streams in the Puget Sound Lowland ecoregion*: Watershed Protection Techniques, v. 2, p. 483-494; Morisawa, M. and LaFlure, E. *Hydraulic geometry, stream equilibrium and urbanization*; Rhodes, Dallas P. and Williams, Garnet P. *Adjustments to the fluvial system.* 333-350. 1979; Dubuque, Iowa, Kendall/Hunt. Tenth Annual Geomorphology Symposia Series; and Schueler, Tom, 1994. *The importance of imperviousness.* Watershed Protection Techniques, 1(3).)

8. The County of Los Angeles has identified as the seven highest –priority industrial and commercial critical source types, (i) wholesale trade (scrap recycling, auto dismantling); (ii) automotive repair/parking; (iii) fabricated metal products; (iv) motor freight; (v) chemical and allied products; (vi) automotive dealers/gas stations; (vii) primary metal products (*Critical Source Selection and Monitoring Report*, Los Angeles County

R0007104

Department of Public Works -Sept 1996). Monitoring conducted by Los Angeles County and the Regional Board demonstrates that the priority industrial sectors and auto repair facilities (one of the commercial sectors) on the list, contribute significant concentrations of heavy metals to storm water (*Los Angeles County 1999-2000 Storm Water Monitoring Report*, Los Angeles County Department of Public Works -July 2000; *Compliance Assessment of the Auto Dismantling Industry; Evaluation of the California General Industrial Storm Water Permit*, H. Chang, (2001), 70 pp., California Regional Water Quality Control Board).

9. The discharge of washwaters and contaminated storm water from businesses is an environmental threat and also can adversely impact public health and safety. A review of industrial waste/ pretreatment records performed in 1995 in the County of Los Angeles on illicit discharges indicates that automotive service facilities and food service facilities sometimes discharge polluted washwaters to the MS4. The pollutants of concern in such washwaters include food waste, oil and grease, and toxic chemicals. Other storm water/industrial waste programs in California have reported similar observations. Illicit discharges from automotive service facilities and food service facilities have been identified elsewhere as a major cause of widespread contamination and water quality problems (Washtenaw County Statutory Drainage Board - 1987 Huron River Pollution Abatement Program).

10. Studies indicate that facilities with paved surfaces subject to frequent motor vehicular traffic (such as parking lots and fast food restaurants), or facilities that perform vehicle repair, maintenance, or fueling (automotive service facilities) are potential sources of pollutants of concern in storm water. [References: Pitt *et al.*, *Urban Storm Water Toxic Pollutants: Assessment, Sources, and Treatability*, Water Environment Res., 67, 260 (1995); *Results of Retail Gas Outlet and Commercial Parking Lot Storm Water Runoff Study*, Western States Petroleum Association and American Petroleum Institute, (1994); *Action Plan Demonstration Project, Demonstration of Gasoline Fueling Station Best Management Practices*, Final Report, County of Sacramento (1993); *Source Characterization*, R. Pitt, In Innovative Urban Wet-Weather Flow Management Systems (2000) Technomic Press, Field, R *et al.* editors; *Characteristics of Parking Lot Runoff Produced by Simulated Rainfall*, , L.L. Tiefenthaler *et al.* Technical Report 343, Southern California Coastal Water Research Project (2001).]

11. Retail gasoline outlets are points of convergence for vehicular traffic and are similar to parking lots and urban roads. Studies indicate that storm water discharges from retail gasoline outlets have high concentrations of hydrocarbons and heavy metals. [*Schueler and Shepp* (1992): *Concentrations of Selected Constituents in Runoff from Impervious Surfaces in Four Urban Catchments of Different Landuse*, Ranabal, F.I., and T.J. Gizzard (1995), In Proceedings of the Fourth Biennial Stormwater Research Conference, Florida, pp-42-52]. Pilot studies indicate that treatment control best management practices installed at retail gasoline stations are effective in removing pollutants, reasonable in capital

R0007105

cost, easy to operate, and do not present safety risks [*Rouge River National Wet Weather Demonstration Project, Task Product Memorandum – Evaluation of On-line Media Filters RPO-NPS-TPM59.00*, Wayne County, MI, March 1999]. The LA Regional Board and the San Diego Regional Board have jointly prepared a Technical Report on the applicability of new development BMP design criteria for retail gasoline outlets, (*Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts*, (June 2001)). Retail Gasoline Outlets in Western U.S. States (such as Washington and Oregon) are already subject to numerical BMP design criteria, as well in other U.S. States.

C. Permit Background

1. The essential components of the Storm Water Management Program, as established by federal regulations [40 CFR 122.26(d)] are: (i) adequate legal authority, (ii) fiscal resources, (iii) Storm Water Quality Management Program (SQMP) - (Public Information and Participation Program, Industrial/Commercial Facilities Program, Development Planning Program, Development Construction Program, Public Agency Activities Program, Illicit Connection and Illicit Discharges Elimination Program), and (iv) monitoring and reporting program.

2. The Permittees have filed a Report of Waste Discharge (ROWD), dated February 1, 2001, and applied for renewal of their waste discharge requirements that serves as an NPDES permit to discharge wastes to surface waters. The ROWD includes a proposed SQMP and a Monitoring Program. The proposed SQMP contains programs previously approved under Board Order No. 96-054 in the following areas:

   Public Information and Participation
   Development Planning
   Development Construction
   Public Agency Activities
   Illicit Connection/Illicit Discharge Elimination Program

   These programs are revised pursuant to the provisions of this Order after adoption.

3. The County of Los Angeles has previously conducted source identification and pollutant characterization consistent with 40 CFR 122.26(d)(1)(ii) and (iii) under its storm water monitoring program. The Monitoring Program submitted with the ROWD proposes to advance the assessment of receiving water impacts, identification of sources of pollution, evaluation of Best Management Practices (BMPs), and measurement of long term trends in mass emissions.

4. The Regional Board has reviewed the ROWD and has determined it to be complete under the reapplication policy of MS4s issued by the U.S. Environmental Protection Agency (USEPA) (61 *Fed. Reg.* 41697). The Regional Board finds that the Permittees' proposed SQMP, incorporating

the additional and/or revised provisions contained in this Order would meet the minimum requirements of federal regulations.

~~7.~~5. The City of Los Angeles has conducted shoreline and nearshore water quality monitoring off the Santa Monica Bay since the 1950s under the monitoring program for the Hyperion Waste Water Treatment Plant (NPDES No. CA0109991). The monitoring results indicate that effluent from Hyperion's 5-Mile Outfall does not impinge the shoreline, and that elevated bacterial counts are associated with runoff from storm drains and discharges from piers. In 1994, the Regional Board approved the relocation of Hyperion's shoreline stations to implement a bay-wide, regional shoreline-monitoring program associated with storm drain outfalls in the Santa Monica Bay. The City of Los Angeles requested that the shoreline-monitoring requirement be incorporated in this Order. The shoreline pathogen monitoring requirements are outlined in the Monitoring Program for this Order.

D. Permit Coverage

1. The requirements in this Order cover all areas within the boundaries of the Permittee municipalities (see Attachment A) over which they have regulatory jurisdiction as well as unincorporated areas in Los Angeles County Flood Control District within the jurisdiction of the Regional Board. The Permittees serve a population of about 9.5 million [Reference: *2000 Census of Population and Housing*, Bureau of the Census, U.S. Department of Commerce (2001)] in an area of approximately 3,100 square miles. ~~Attachment B shows the map of the permitted area in Los Angeles County Flood Control District.~~

2. Federal, state, regional or local entities within the Permittees' boundaries or in jurisdictions outside the Los Angeles County Flood Control District, and not currently named in this Order, may operate storm drain facilities and/or discharge storm water to storm drains and watercourses covered by this Order. The Permittees may lack legal jurisdiction over these entities under state and federal constitutions. The Regional Board will coordinate with these entities to implement programs that are consistent with the requirements of this Order. The Regional Board will consider such facilities for coverage in 2003 under its NPDES permitting scheme pursuant to USEPA Phase II storm water regulations.

3. Sources of discharges into receiving waters in the County of Los Angeles but in jurisdictions outside its boundary include the following:

   About 34 square miles of unincorporated area in Ventura County, which drain into Malibu Creek and then to Santa Monica Bay,

   About 9 square miles of the City of Thousand Oaks, which also drain into Malibu Creek and then to Santa Monica Bay, and

About 86 square miles of area in Orange County, which drain into Coyote Creek and then into the San Gabriel River.

The Regional Board will ensure that storm water management programs for the areas in Ventura County and the City of Thousand Oaks that drain into Santa Monica Bay are consistent with the requirements of this Order. The Regional Board will coordinate with the Santa Ana Regional Board so that storm water management programs for the areas in Orange County that drain into Coyote Creek are consistent with the requirements of this Order.

4. This permit is intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water to the maximum extent practicable (MEP) from the permitted areas in the County of Los Angeles to the waters of the U~~nited~~ S~~tates~~ subject to the Permittees' jurisdiction.

5. Permittees have expressed their intention to work cooperatively to control the contribution of pollutants from one portion of the MS4 to another portion of the system. Permittees may control the contribution of pollutants to the MS4 from non-permittee dischargers such as Caltrans, the U.S. Department of Defense, and other state and federal facilities, through interagency agreements.

E. Federal, State, and Regional Regulations

1. The Water Quality Act of 1987 added Section 402(p) to the federal Clean Water Act (CWA) (33 U.S.C Section 1251-1387). This section requires the USEPA to establish regulations setting forth NPDES requirements for storm water discharges in two phases.

   - The USEPA Phase I storm water regulations were directed at MS4s serving a population of 100,000 or more, including interconnected systems and storm water discharges associated with industrial activities, including construction activities. The Phase I Final Rule was published on November 16, 1990 (55 *Fed Reg.* 47990).

   - The USEPA Phase II storm water regulations are directed at storm water discharges not covered in Phase I, including small MS4s (serving a population of less than 100,000), small construction projects (one to five acres), municipal facilities with delayed coverage under the Intermodal Surface Transportation Efficiency Act of 1991, and other discharges for which the USEPA Administrator or the State determines that the storm water discharge contributes to a violation of a water quality standard, or is a significant contributor of pollutants to waters of the United States. The Phase II Final Rule was published on December 8, 1999 (64 *Fed Reg.* 68722).

2. The USEPA published an 'Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits' on August 26, 1996 (61 *Fed. Reg.* 43761). This policy discusses the appropriate kinds of

water quality-based effluent limitations to be included in NPDES storm water permits to provide for the attainment of water quality standards.

3. The USEPA published an 'Interpretative Policy Memorandum on Reapplication Requirements' for MS4 permits on August 9, 1996 (61 *Fed. Reg.* 41697). This policy requires that MS4 reapplication for reissuance for a subsequent five-year permit term contains certain basic information and information for proposed changes and improvements to the storm water management program and monitoring program.

4. The USEPA has entered into a Memorandum of Agreement (MOA) with the U.S. Fish and Wildlife Service and the National Marine Fisheries Service for enhancing coordination regarding the protection of endangered and threatened species under Section 7 of the Endangered Species Act (ESA) and the CWA's Water Quality Standards and NPDES programs. Among other actions, the MOA establishes a framework for coordination of actions by the USEPA, the Services, and CWA delegated States on CWA permit issuance under Section 402 of the CWA [66 *Fed. Reg.* 11202 – 11217].

5. USEPA regulations at 40 CFR 122.26(d)(2)(iv)(A) and 40 CFR 122.26(d)(2)(iv)(C) require that MS4 permittees implement a program to monitor and control pollutants in discharges to the municipal system from industrial and commercial facilities that contribute a substantial pollutant load to the MS4. The regulations require that permittees establish priorities and procedures for inspection of industrial facilities and priority commercial establishments. This permit, consistent with the USEPA policy, incorporates a cooperative partnership, including the specifications of minimum expectations, between the Regional Board and the Permittees for the inspection of industrial facilities and priority commercial establishments to control pollutants in storm water discharges (58 *Fed. Reg.* 61157).

6. Section 402 (p) of the CWA (33 U.S.C. Section 1342(p) provides that MS4 permits must "require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design engineering method and such other provisions as the [EPA] Administrator or the State determines appropriate for the control of such pollutants." The State Water Resources Control Board's (State Board) Office of Chief Counsel (OCC) has issued a memorandum interpreting the meaning of MEP to include technical feasibility, cost, and benefit derived with the burden being on the municipality to demonstrate compliance with MEP by showing that a BMP is not technically feasible in the locality or that BMPs costs would exceed any benefit to be derived (dated February 11, 1993).

7. The CWA authorizes the USEPA to permit a state to serve as the NPDES permitting authority in lieu of the USEPA. The State of California has in-lieu authority for an NPDES program. The Porter-Cologne Water Quality Control Act authorizes the State Board, through the Regional Boards, to regulate and control the discharge of pollutants into waters of the State. The State Board entered into a MOA with the USEPA, on

September 22, 1989, to administer the NPDES Program governing discharges to waters of the United States.

8. Section 303(d) of the CWA requires that the State identify a list of impaired water-bodies and develop and implement Total Maximum Daily Loads (TMDLs) for these waterbodies (33 U.S.C. §1313(d)(1)). A TMDL specifies the maximum amount of a pollutant that a water-body can receive, still meet applicable water quality standards and protect beneficial uses. The USEPA entered into a consent decree with the Natural Resources Defense Council (NRDC), Heal the Bay, and the Santa Monica BayKeeper on March 22, 1999, under which the Regional Board must adopt all TMDLs for the Los Angeles Region within 13 years from that date. This permit incorporates a provision to implement and enforce approved load allocations for municipal storm water discharges and require amending the SQMP after pollutants loads have been allocated and approved.

9. Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point pollution impacting or threatening coastal water quality. CZARA (16 U.S.C. Sections 1451-1465) amends the Coastal Zone Management Act of 1972, to address five sources of non-point pollution: agriculture, silviculture, urban, marinas, and hydromodification. This NPDES permit addresses the management measures required for the urban category, with the exception of septic systems. The Regional Board addresses septic systems through the administration of other programs.

10. On May 18, 2000, the USEPA established numeric criteria for priority toxic pollutants for the State of California (California Toxics Rule) 65 *Fed. Reg.* 31682 (40 C.F.R. § 131.38), for the protection of human health and aquatic life. These apply as ambient water quality criteria for inland surface waters, enclosed bays, and estuaries. The State Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (SIP) – 2000,* on March 2, 2000, for implementation of the California Toxics Rule (State Board Resolution No. 2000-15 as amended by Board Resolution No. 2000-030). This policy requires that discharges comply with TMDL-derived load allocations as soon as possible but no later than 20 years from the effective date of the policy.

11. The State Board adopted a revised Water Quality Control Plan for Ocean Waters of California (Ocean Plan) on July 23, 1997. The Ocean Plan contains water quality objectives which apply to all discharges to the coastal waters of California.

12. The State Board *In Re*: California Department of Transportation (State Board Order WQ 2001-08), determined that the discharge of storm water to Areas of Special Biological Significance (ASBS) is subject to the prohibition in the Ocean Plan against the discharge of wastes to an ASBS.

R0007110

13. The Regional Board adopted an updated Water Quality Control Plan (Basin Plan) for the Los Angeles Region on June 13, 1994, *'Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties*, (1994).' The Basin Plan designates beneficial uses of receiving waters and specifies both narrative and numerical water quality objectives for the receiving waters in Los Angeles County.

14. The Regional Board on September 19, 2001, adopted amendments to the Basin Plan, to incorporate TMDLs for trash in the Los Angeles River (Resolution No. 01-013) and Ballona Creek (Resolution No. 01-014). After approval by the State Board, the Office of Administrative Law, and the USEPA, the TMDLs for trash will be effective and enforceable.

15. The Regional Board on April 13, 1998, approved BMPs for sidewalk rinsing to minimize the discharge of wash waters to the storm drain system (Resolution No. 98-08). By the same resolution, the Regional Board prohibited the discharge of municipal street wash waters to the storm drain system.

16. The Regional Board on April 13, 1998, approved recommended BMPs for industrial/commercial facilities (Resolution No. 98-08).

17. The Regional Board on April 22, 1999, approved a list of BMPs for use in development planning and development construction (Resolution No. 99-03)

18. The Regional Board adopted and approved requirements for new development and significant redevelopment projects in Los Angeles County to control the discharge of storm water pollutants in post-construction storm water, on January 26, 2000, in Board Resolution No. R-00-02. The Regional Board Executive Officer issued the approved Standard Urban Storm Water Mitigation Plans (SUSMPs) on March 8, 2000. The State Board in large part affirmed the Regional Board action and SUSMPs in State Board Order No. WQ 2000-11 issued on October 5, 2000.

    - The State Board's Chief Counsel has issued a statewide policy memorandum (dated December 26, 2000), which interprets the Order to provide broad discretion to Regional Boards and identifies potential future areas for inclusion in SUSMPs and the types of evidence and findings necessary. Such areas include ministerial projects, projects in environmentally sensitive areas, and water-quality design criteria for retail gasoline outlets.

    - The State Board's Chief Counsel interprets the Order to encourage regional solutions and endorses a mitigation fund or "bank" that may be funded by developers who obtain waivers from the numerical design standards for new development and significant redevelopment.

~~19. The Regional Board has determined that the creation of structural or treatment control BMPs for storm water mitigation in waters of the U.S.~~

~~is not permissible.~~ 40 CFR Part 131.10(a) prohibits states from designating waste transport or waste assimilation as a use for any water of the U.S. Authorizing the construction of a storm water/ urban runoff treatment facility in a jurisdictional water body would be tantamount to accepting waste assimilation as an appropriate use for that water body. Furthermore, the construction and operation of a pollution control facility in a water body can impact the physical, chemical, and biological integrity as well as the beneficial uses of the water body. Therefore, storm water treatment and/or mitigation in accordance with SUSMPs and any other requirements of this Order must occur prior to the discharge of storm water into a water of the U.S.

~~19.~~20. The Regional Board supports a Watershed Management Approach to address water quality protection in the region. The objective of the Watershed Management Approach should be to provide a comprehensive and integrated strategy towards water resource protection, enhancement, and restoration while balancing economic and environmental impacts within a hydrologically defined drainage basin or watershed. It emphasizes cooperative relationships between regulatory agencies, the regulated community, environmental groups, and other stakeholders in the watershed to achieve the greatest environmental improvements with available resources.

~~20.~~21. To promote a watershed management approach, the County of Los Angeles is divided into six Watershed Management Areas (WMAs) as follows:

Malibu Creek and Rural Santa Monica Bay WMA
Ballona Creek and Urban Santa Monica Bay WMA
Los Angeles River WMA
San Gabriel River WMA
Dominguez Channel/Los Angeles Harbor WMA, and
Santa Clara River WMA

Attachment A shows the list of Permittees under each WMA and some Permittees have expressed an intent to form sub-watershed groups within the WMA to promote regional solutions for the mitigation of storm water discharge pollution.

~~21.~~22. To facilitate compliance with federal regulations, the State Board has issued two statewide general NPDES permits for storm water discharges: one for storm water from industrial sites [NPDES No. CAS000001, General Industrial Activity Storm Water Permit (GIASP)] and the other for storm water from construction sites [NPDES No. CAS000002, General Construction Activity Storm Water Permit (GCASP)]. The GCASP was reissued on August 19, 1999. The GIASP was reissued on April 17, 1997. Facilities discharging storm water associated with industrial activities and construction projects with a disturbed area of five acres or more are required to obtain individual NPDES permits for storm water discharges, or to be covered by a statewide general permit by completing and filing a Notice of Intent (NOI)

with the State Board. The USEPA guidance anticipates coordination of the state-administered programs for industrial and construction activities with the local agency program to reduce pollutants in storm water discharges to the MS4.

~~22.~~The Regional Board is the enforcement authority in the Los Angeles Region for the two statewide general permits regulating discharges from industrial facilities and construction sites, and all NPDES storm water and non-storm water permits issued by the Regional Board. These industrial and construction sites and discharges are also regulated under local laws and regulations.

23. The State Board, on October 28, 1968, adopted Resolution No. 68-16, which established an anti-degradation policy for the State and Regional Boards. This policy restricts the degradation of surface waters and protects waterbodies where existing water quality is higher than is necessary for the protection of beneficial uses.

24. The State Board, on June 17, 1999, adopted Order No. WQ 99-05, which, in a precedential decision, identifies acceptable receiving water limitations language to be included in municipal storm water permits issued by the State and Regional Boards. The receiving water limitations included herein are consistent with the State Board Order, USEPA Policy, and the U.S. Appellate court decision in, *Defenders of Wildlife v. Browner* (9th. Cir, 1999). The State Board OCC has determined that the federal court decision did not conflict with State Board Order No. WQ 99-05 (memorandum dated October 14, 1999)

25. California Water Code (CWC) Section 13263(a) requires that waste discharge requirements issued by the Regional Board shall implement any relevant water quality control plans that have been adopted; shall take into consideration the beneficial uses to be protected and the water quality objectives reasonably required for that purpose; other waste discharges; the need to prevent nuisance; and provisions of CWC Section 13241. The Regional Board has considered the requirements of sections 13263 and 13241, and applicable plans, policies, rules, and regulations in developing these waste discharge requirements.

26. CWC Section 13370 *et seq.* requires that waste discharge requirements issued by the Regional Boards be consistent with provisions of the Federal Clean Water Act and its amendments.

27. On March 12, 2001, the U.S. Court of Appeals ruled that it is necessary to obtain a NPDES permit for application of aquatic pesticides to waterways. (*Headwaters, Inc. vs. Talent Irrigation District*, 243 F3d. 526 (9th Cir., 2001)) This decision is controlling in California for nonagricultural applications of pesticides to waterways. The State Board adopted a general NPDES permit (Order No. 2001-12-DWQ) on July 19, 2001, for public entities that discharge pollutants to waters of the U.S. associated with the application of aquatic pesticides for resource or pest management. Public entities that conduct such activities must seek coverage under the general permit.

R0007113

F. Implementation

1. The California Environmental Quality Act (CEQA) (Cal Pub Resources Code Section 21000 *et seq.*) requires that public agencies consider the environmental impacts of the projects they approve for development. CEQA applies to projects that are considered discretionary and does not apply to ministerial projects, which involve the use of established standards or objective measurements. A ministerial project may be made discretionary by adopting local ordinance provisions or imposing conditions to create decision-making discretion in approving the project. In the alternative, Permittees may establish standards and objective criteria administratively for storm water mitigation for ministerial projects. For water quality purposes, the Regional Board considers that all new development and significant redevelopment activity in specified categories, that receive approval or permits from a municipality, are subject to storm water mitigation requirements.

~~3.~~2. The objective of this Order is to protect the beneficial uses of receiving waters in Los Angeles County. To meet this objective, this Order requires that the SQMP specify BMPs that will be implemented to reduce the discharge of pollutants in storm water to the maximum extent practicable. Further, Permittees are to assure that storm water discharges from the MS4 shall neither cause nor contribute to the exceedance of water quality standards and objectives nor create conditions of nuisance in the receiving waters, and that the discharge of non-storm water to the MS4 has been effectively prohibited.

~~4.~~3. The SQMP required in this Order builds upon the programs established in Order Nos. 90-079, and 96-054, consists of the components recommended in the USEPA guidance manual, and was developed with the cooperation of representatives from the regulated community and environmental groups. The SQMP includes provisions that promote customized initiatives, both on a countywide and watershed basis, in developing and implementing cost-effective measures to minimize discharge of pollutants to the receiving water. The various components of the SQMP, taken as a whole rather than individually, are expected to reduce pollutants in storm water and urban runoff to the maximum extent practicable. Provisions of the SQMP are fully enforceable under provisions of this Order.

~~5.~~4. The emphasis of the SQMP is pollution prevention through education, public outreach, planning, and implementation as source control BMPs first and then structural and treatment control BMPs next. Successful implementation of the provisions of the SQMP will require cooperation and coordination of all public agencies in each Permittee's organization, among Permittees, and with the regulated community.

~~6.~~5. The implementation of a Public Information and Participation Program is a critical component of a storm water management program. An informed and knowledgeable community is critical to the success of a storm water management program since it helps insure the following: (i) greater support for the program as the public gains a greater

R0007114

understanding of the reasons why it is necessary and important, and (ii) greater compliance with the program as the public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters.

~~7.~~6. This Order includes a Monitoring Program that incorporates Minimum Levels (MLs) established under the SIP The SIP's MLs represent the lowest quantifiable concentration for priority toxic pollutants that is measurable with the use of proper method-based analytical procedures and factoring out matrix interferences. The SIP's MLs therefore represent the best available science for determining MLs and are appropriate for a storm water monitoring program. The use of MLs allows the detection of toxic priority pollutants at concentrations of concern using recent advances in chemical analytical methods.

~~8.~~7. This Order provides flexibility for Permittees to petition the Regional Board Executive Officer to substitute a BMP ~~or requirement~~ under the SQMP with an alternative BMP, if they can provide information and documentation on the effectiveness of the alternative, equal to or greater than the prescribed BMP in meeting the objectives of this Order.

~~9.~~8. This Order contemplates that the Permittees are responsible for considering potential storm water impacts when making planning decisions in order to fulfill the Permittees' CWA requirement to reduce the discharge of pollutants in municipal storm water to the maximum extent practicable from new development and redevelopment activities. However, the Permittees retain authority to make the final land-use decisions and retain full statutory authority for deciding what land uses are appropriate at specific locations within each Permittee's jurisdiction. This Order and its requirements are not intended to restrict or control local land use decision-making authority.

~~10.~~9. This Order is not intended to prohibit the inspection for or abatement of vectors by the State Department of Health Services or local vector agencies in accordance with Cal. Health and Safety Code § 2270 *et seq.* and §116110 *et seq.* Certain treatment control BMPs if not properly designed, operated or maintained may create habitats for vectors (e.g. mosquito and rodents). This Order contemplates that the Permittees will closely cooperate and collaborate with local vector control agencies and the State Department of Health Services for the implementation, operation, and maintenance of treatment control BMPs in order to minimize the risk to public health from vector borne diseases.

G. Public Process

1. The Regional Board has notified the Permittees and interested agencies and persons of its intent to issue waste discharge requirements for this discharge, and has provided them with an opportunity to submit their written view and recommendations.

R0007115

2. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

3. The Regional Board has conducted public workshops to discuss drafts of the permit. On April 24, 2001, Regional Board staff conducted a workshop outlining the reasoning behind the changes proposed for the new permit and received input from the Permittees and the public regarding those proposed changes. On July 26, 2001, a second public workshop was held at a special Regional Board meeting. The Permittees and the public had another opportunity to express their opinions regarding the proposed changes to the permit in front of the Regional Board members. A significant number of working meetings with the Permittees and other interested parties have occurred throughout the period from the submittal of the ROWD and completion of the tentative draft, in an attempt to incorporate and address all the comments presented.

4. The Los Angeles County Flood Control District, the County of Los Angeles and the other municipalities are co-permittees as defined in 40 CFR 122.26 (b)(1). Los Angeles County Flood Control District will coordinate with the other municipalities and facilitate program implementation. Each Permittee is responsible only for a discharge for which it is the operator.

5. This Order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit, pursuant to Section 402 of the CWA, or amendments thereto, and shall take effect 50 days from Order adoption provided the Regional Administrator of the USEPA has no objections.

6. The action to adopt an NPDES permit is exempt from the provisions of Chapter 3 of CEQA (Cal Pub. Resources Code Section 21100 *et seq.*), in accordance with CWC § 13389.

7. Pursuant to CWC §13320, any aggrieved party may seek review of this Order by filing a petition with the State Board. A petition must be sent to the State Water Resources Control Board, P.O. Box 100, Sacramento, California, 95812, within 30 days of adoption of the Order by the Regional Board.

8. This Order may be modified or alternatively revoked or reissued prior to its expiration date, in accordance with the procedural requirements of the NPDES program, and the CWC for the issuance of waste discharge requirements.

IT IS HEREBY ORDERED that the Los Angeles County Flood Control District, Los Angeles County, and the Cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Cañada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk,

Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier, in order to meet the provisions contained in Division 7 of the CWC and regulations adopted thereunder, and the provisions of the CWA, as amended, and regulations and guidelines adopted thereunder, shall comply with the following:

Part 1. DISCHARGE PROHIBITIONS

The Permittees shall effectively prohibit non-storm water discharges into the MS4 and watercourses, except where such discharges ~~are~~:

1. Are covered by a separate individual or general NPDES permit for non-storm water discharges; or

2. Ffall within one of the categories below, and meet all conditions when specified by the Regional Board Executive Officer:

   a) Category A - Natural flow:

      (1) Natural springs and rising ground water;

      (2) Flows from riparian habitats or wetlands;

      (3) Stream diversions, permitted by the State Board; and

      (4) Uncontaminated ground water infiltration [as defined by 40 CFR 35.2005(20)].

   b) Category B - Flows from emergency fire fighting activity.

   c) Category C - Flows incidental to urban activities:

      (1) Reclaimed and potable landscape irrigation runoff;

      (2) Potable drinking water supply and distribution system releases (consistent with American Water Works Association guidelines for dechlorination/~~debromination~~ and suspended solids reduction practices);

      (3) Drains for foundations, footings, and crawl spaces;

      (4) Air conditioning condensate;

      (5) Dechlorinated/debrominated swimming pool discharges;

      (6) Dewatering of lakes and decorative fountains;

      (7) Non-commercial car washing by residents or by non-profit organizations; and

      (8) Sidewalk rinsing.

The Regional Board Executive Officer may add or remove categories of non-storm water discharges above. Furthermore, in the event that any of the above categories of non-storm water discharges are determined to be a source of pollutants by the Regional Board Executive Officer, the discharge will no longer be exempt from this prohibition unless the Permittee implements conditions approved by the Regional Board Executive Officer to ensure that the discharge is not a source of pollutants. Notwithstanding the above, the Regional Board Executive Officer may impose additional prohibitions of non-storm water discharges in consideration of anti-degradation policies and TMDLs.

Part 2. RECEIVING WATER LIMITATIONS

1. Discharges from the MS4 that cause or contribute to the violation of water quality standards or water quality objectives are prohibited.

2. Discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible for, shall not cause or contribute to a condition of nuisance.

3. The Permittees shall comply with Part 2.1. and 2.2. through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the SQMP and its components and other requirements of this Order including any modifications. The SQMP and its components shall be designed to achieve compliance with receiving water limitations. If exceedances of water quality objectives or water quality standards (collectively, water quality standards) persist, notwithstanding implementation of the SQMP and its components and other requirements of this permit, the Permittee shall assure compliance with discharge prohibitions and receiving water limitations by complying with the following procedure:

   a) Upon a determination by either the Permittee or the Regional Board that discharges are causing or contributing to an exceedance of an applicable water quality standard, the Permittee shall promptly notify and thereafter submit a Receiving Water Limitations (RWL) Compliance Report (as described in the Program Reporting Requirements, Section I of the Monitoring and Reporting Program)~~report~~ to the Regional Board that describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedances of water quality standards. This RWL Compliance Report~~report~~ may be incorporated in the annual Storm Water Report and Assessment unless the Regional Board directs an earlier submittal. The RWL Compliance Report~~report~~ shall include an implementation schedule. The Regional Board may require modifications to the RWL Compliance Report.

   b) Submit any modifications to the RWL Compliance Report~~report~~ required by the Regional Board within 30 days of notification.

R0007118

c) Within 30 days following the approval of the RWL Compliance Report~~report~~, the Permittee shall revise the SQMP and its components and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, an implementation schedule, and any additional monitoring required.

d) Implement the revised SQMP and its components and monitoring program according to the approved schedule.

4. So long as the Permittee has complied with the procedures set forth above and is implementing the revised SQMP and its components, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Board to develop additional BMPs.

Part 3. STORM WATER QUALITY MANAGEMENT PROGRAM (SQMP) IMPLEMENTATION

A. General Requirements

1. Each Permittee shall, at a minimum, implement the SQMP. The SQMP is an enforceable element of this Order. The SQMP shall be implemented immediately following (the permit effective date), unless a later date has been specified for a particular provision in this Order.

2. The SQMP shall, at a minimum, comply with the applicable storm water program requirements of 40 CFR 122.26(d)(2). The SQMP and its components shall be implemented so as to reduce the discharges of pollutants in storm water to the maximum extent practicable.

3. Each Permittee shall implement additional controls, where necessary, to reduce the discharges of pollutants in storm water to the maximum extent practicable.

4. Permittees that modify the countywide SQMP (i.e., need additional controls, implement different controls than described in the countywide SQMP, or determine that certain BMPs in the countywide SQMP are not applicable in the area under its jurisdiction), shall develop a local SQMP, no later than (6 months from the permit effective date). The local SQMP shall be customized to reflect the conditions in the area under the Permittee's jurisdiction and shall specify activities being implemented under the appropriate elements described in the countywide SQMP.

B. Best Management Practice Implementation

The Permittees shall implement or require the implementation of the most effective combination of BMPs for storm water/urban runoff pollution controls. When implemented, BMPs are intended to result in the reduction of pollutants in storm water to the maximum extent practicable.

R0007119

C. Revision of the Storm Water Quality Management Program

The Permittees shall revise the SQMP, at the direction of the Regional Board Executive Officer, to incorporate program implementation amendments so as to comply with. ~~Such amendments may include~~ regional, watershed specific requirements, and/or waste load allocations developed and approved pursuant to the process for the designation and implementation of Total Maximum Daily Loads (TMDLs) for impaired water bodies.

D. Designation and Responsibilities of the Principal Permittee

The Los Angeles County Flood Control District is hereby designated as the Principal Permittee. As such, ~~t~~The Principal Permittee shall:

1. Coordinate and facilitate activities necessary to comply with the requirements of this Order, but is not responsible for ensuring compliance of any individual Permittee;

2. Coordinate permit activities among Permittees and act as liaison between Permittees and the Regional Board on permitting issues;

3. Provide personnel and fiscal resources for the necessary updates of the SQMP and its components;

4. Provide technical and administrative support for committees that will be organized to implement the SQMP and its components;

5. Convene the Watershed Management Committees (WMCs) constituted pursuant to Part F, below, upon designation of representatives;

6. Implement the Countywide Monitoring Program required under this Order and evaluate, assess and synthesize the results of the monitoring program;

7. Provide personnel and fiscal resources for the collection, processing and submittal to the Regional Board of annual reports and summaries of other reports required under the SQMP; and

8. Comply with the "Responsibilities of the Permittees" in Part 3.E., below.

E. Responsibilities of the Permittees

Each Permittee is required to comply with the requirements of this Order applicable to discharges within its boundaries (see Findings B.2. and D.2.) and not for the implementation of the provisions applicable to the Principal Permittee or other Permittees. Each Permittee shall, within its geographic jurisdiction:

1. Comply with the requirements of the SQMP and any modifications thereto;

2. Coordinate among its internal departments and agencies, as appropriate, to facilitate the implementation of the requirements of the SQMP applicable to such Permittee in an efficient and cost-effective manner;

3. Designate a technically knowledgeable representative to the appropriate WMC; and

4. Participate in intra-agency coordination (e.g. Fire Department, Building and Safety, Code Enforcement, Public Health, etc.) necessary to successfully implement the provisions of this Order and the SQMP.

5. Prepare an annual summary of expenditures applied to the storm water management program. This summary of budget expenditures shall identify the storm water budget for the following year, using estimated percentages and written explanations where necessary, for the specific categories noted below:

   a) Program management
      - Administrative costs

   b) Program Implementation

      Where information is available, provide an estimated percent breakdown of expenditures for the categories below:

      ~~β)~~• Illicit connection/illicit discharge
      ~~χ)~~• Development planning
      ~~δ)~~• Development construction
      - Construction inspection activities
      ~~ε)~~• Industrial/Commercial inspection/site visit activities
      ~~φ)~~• Public Agency Activities
         ~~(1)~~• Maintenance of structural BMPs and treatment control BMPs
         ~~(2)~~• Municipal Street Sweeping
         ~~(3)~~• Catch basin clean-up
         ~~(4)~~• Trash collection
         ~~(5)~~• Capital costs

   ~~g)~~c) Public Information and Participation

   ~~h)~~d) Monitoring Program

   ~~i)~~e) Miscellaneous Expenditures

6. Each Permittee, in addition to the budget summary, shall report any supplemental dedicated budgets for the same categories.

F. Watershed Management Committees (WMCs)

1. Each WMC shall be comprised of a voting representative from each Permittee in the Watershed Management Area (WMA).

2. The WMC's chair and secretary shall be chosen by the WMC upon Order adoption and on an annual basis, thereafter. In the absence of volunteer Permittee(s) for the positions, the Principal Permittee shall assume those roles until the WMC chooses members of the committee for the positions.

3. Each WMC shall:

a) Facilitate cooperation and exchange of information among Permittees;

b) Establish additional goals and objectives and associated deadlines for the WMA, as the program implementation progresses;

c) Prioritize pollution control efforts based on beneficial use impairment(s), watershed characteristics and analysis of results from studies and the monitoring program;

d) Develop and/or update and monitor the adequate implementation, on an annual basis, of the tasks identified for the WMA;

e) Assess the effectiveness of, prepare revisions for, and recommend appropriate changes to the SQMP and its components;

f) Continue to prioritize the Industrial/Commercial critical sources for investigation, outreach and follow-up; and

g) Meet~~Conduct joint WMC meetings~~ four times per year and, as necessary.

G. Legal Authority

1. Permittees shall possess the necessary legal authority to prohibit non-storm water discharges~~,~~ to the storm drain system, including, but not limited to:

   a) ~~Prohibit i~~Illicit discharges and illicit connections and require removal of illicit connections;

   b) ~~Prohibit t~~The discharge of wash waters to the MS4 from the cleaning of gas stations, auto repair garages, or other types of automotive service facilities;

   c) ~~Prohibit t~~The discharge of runoff to the MS4 from mobile auto washing, steam cleaning, mobile carpet cleaning, and other such mobile commercial and industrial operations;

   d) ~~Prohibit t~~The discharge of runoff to the MS4 from areas where repair of machinery and equipment which are visibly leaking oil, fluid or antifreeze, is undertaken;

   e) ~~Prohibit t~~The discharge of runoff to the MS4 from storage areas of materials containing grease, oil, or other hazardous substances, and uncovered receptacles containing hazardous materials;

   f) ~~Prohibit t~~The discharge of chlorinated/ brominated swimming pool water and filter backwash to the MS4;

   g) ~~Prohibit t~~The discharge of runoff from the washing of toxic materials from paved or unpaved areas to the MS4;

R0007122

h) ~~Prohibit w~~Washing impervious surfaces in industrial/commercial areas that results in a discharge of runoff to the MS4;

i) ~~Prohibit t~~The discharge of concrete or cement~~concrete~~ laden wash water from concrete trucks, pumps, tools, and equipment to the MS4;~~.~~

j) ~~Prohibit, d~~Dumping, or disposal of materials into the MS4, other than storm water, such as:

(1) Litter, landscape debris and construction debris;

(2) Any state or federally banned or unregistered pesticides;

(3) Food and food processing wastes; and

(4) Fuel and chemical wastes, animal wastes, garbage, batteries, and other materials that have potential adverse impacts on water quality.

2. The Permittees shall possess adequate legal authority to:

a) Require persons within their jurisdiction to comply with conditions in Permittees' ordinances, permits, contracts, model programs, or orders (i.e. hold dischargers to its MS4 accountable for their contributions of pollutants and flows);

b) Utilize enforcement mechanisms to require compliance with Permittees ordinances, permits, contracts, or orders;

c) Control pollutants, including potential contribution, in discharges of storm water runoff associated with industrial activities (including construction activities) to its MS4 and control the quality of storm water runoff from industrial sites (including construction sites). This requirement applies to source control, and treatment control, BMPs;

d) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and non-compliance with permit conditions, including the prohibition of illicit discharges to the MS4. Permittees must possess authority to enter, sample, inspect, review and copy records, and require regular reports from industrial facilities (including construction sites) discharging polluted or with the potential to discharge polluted storm water runoff into its MS4.

e) Require the use of best management practices (BMPs) to prevent or reduce the discharge of pollutants to MS4s to the maximum extent practicable.

R0007123

f) Require that treatment control BMPs be properly operated and maintained to prevent the breeding of vectors.

3. Each Permittee shall, no later than [9 months from permit effective date] amend and adopt, (if necessary), a Permittee-specific storm water and urban runoff ordinance to enforce all requirements of this permit.

4. Each Permittee shall submit no later than [10 months from permit effective date], a new or updated statement by its legal counsel that the Permittee has obtained all necessary legal authority to comply with this Order through adoption of ordinances and/or municipal code modifications.

Part 4. SPECIAL PROVISIONS

Maximum Extent Practicable Standard

This permit, and the provisions herein, are intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water to the MEP from the permitted areas in the County of Los Angeles to the waters of the State.

A. General Requirements

1. Best Management Practice Substitution

The Regional Board Executive Officer may approve any site-specific ~~Best Management Practice (~~BMP~~)~~ substitution upon petition by a Permittee(s), if the Permittee can document that:

a) The proposed alternative BMP or program will meet or exceed the objective of the original BMP or program in the reduction of storm water pollutants; or

b) The fiscal burden of the original BMP or program is substantially greater than the proposed alternative and does not achieve a substantially greater improvement in storm water quality; and,

c) The proposed alternative BMP or program will be implemented within a similar period of time.

~~2.Customized SQMP~~

~~Each Permittee shall have available a local SQMP, which:~~

R0007124

~~a)Is customized and reflects the conditions in the area under its jurisdiction; and~~

~~b)Specifies activities being implemented under the appropriate elements described in the countywide SQMP.~~

B. Public Information and Participation Program (PIPP)

The Principal Permittee shall implement a Public Information and Participation Program (PIPP) that includes, but is not limited to, the requirements listed in this section. The Principal Permittee shall be responsible for developing and implementing the Public Education Program, as described in the SQMP, and shall coordinate with Permittees to implement specific requirements.

The objectives of the PIPP are as follows:

a) To measurably increase the knowledge of the target audiences regarding the MS4, the impacts of storm water pollution on receiving waters, and potential solutions to mitigate the problems caused;

b) To measurably change the waste disposal and runoff pollution generation behavior of target audiences by encouraging implementation of appropriate solutions;

c) To involve and engage ~~all~~ socio-economic groups and ethnic communities in Los Angeles County to participate in mitigating the impacts of storm water pollution ~~(such as African American, Latino, East Asian, South Asian, and Middle Eastern)~~.

T~~T~~he Principal Permittee shall convene an advisory committee to provide input and assistance in meeting the goals and objectives of the public education campaign. The advisory committee shall be consulted during the process of developing the campaign, and shall provide comments and advice during the process of preparing a request for Proposals for a storm water public education contractor. The committee may participate as a part of a working group that evaluates contractor proposals, and other tasks as appropriate. The committee shall be comprised of representatives of the environmental community, Permittee cities, Regional Board staff, and experts in the fields of public education and marketing. The Principal Permittee shall ensure that the committee meets at least once a year. ~~a panel to review the PIPP and the effectiveness of each of its components. Panel members shall possess the expertise to assess public information and outreach programs, strategies, and materials. Comments and recommendations on the PIPP shall be submitted to the Regional Board Executive Officer for consideration no later than December 31, annually. The PIPP will become effective upon approval.~~

PIPP - Residential Program **R0007125**

~~a)~~d) "No Dumping" Message

Each Permittee shall mark all storm drain inlets that they own with a legible "no dumping" message. In addition, signs with prohibitive language discouraging illegal dumping must be posted at designated public access points to creeks, other relevant water

bodies, and channels no later than (2 years after the effective date of this Order). Signage and storm drain messages shall be legible and maintained as necessary during the term of the permit.

~~b)~~e) Countywide Hotline

The 888-CLEAN-LA hotline will serve as the general public reporting contact for reporting clogged catch basin inlets and illicit discharges/dumping, faded or lack of catch basin stencils, and general storm water management information. Each Permittee may establish its own hotline if preferred. Permittees shall include this information, updated when necessary, in public information, and the government pages of the telephone book, as they are developed/published. The Principal Permittee shall compile a list of the general public reporting contacts from all Permittees and make this information available on the web site (888CleanLA.com) and upon request. Permittees shall provide the Principal Permittee with their reporting contacts within 30 days of the date this order becomes effective. Permittees are responsible for providing current, updated information to the Principal Permittee.

~~c)~~f) Outreach and Education

(1) The Principal Permittee shall continue to implement the following activities that were components of the first five-year Public Education Program:

(i) Advertising;

(ii) Media relations;

(iii) Public service announcements;

(iv) "How To" instructional material distributed in a targeted and activity-related manner;

(v) Corporate, community association, environmental organization and entertainment industry tie-ins;

(vi) Events targeted to specific activities and population subgroups.

(2) The Principal Permittee shall develop a strategy to educate ethnic communities and businesses through culturally effective methods. Details of this strategy should be incorporated into the Public Education Program, and implemented, no later than (365 days from the effective date of this Order).

(3) The Principal Permittee shall enhance the existing outreach efforts to residents and businesses related to the proper disposal of cigarette buttsimplement an outreach program to educate on proper disposal of cigarette butts.

R0007126

(4) Each Permittee shall conduct educational activities within its jurisdiction and participate in countywide events.

(5) The Principal Permittee shall organize Public Outreach Strategy meetings for Permittees on a quarterly basis, beginning (within 3 months of the effective date of this Order). The Principal Permittee shall provide guidance for Permittees to augment the countywide outreach and education program. Permittees shall coordinate regional and local outreach and education to reduce duplication of efforts. Permittees are encouraged to include other interested parties in the outreach strategy to strengthen and coordinate educational efforts.

(6) The Principal Permittee shall ensure that a minimum of 35 million impressions per year are made on the general public about storm water quality via print, local TV access, local radio, or other appropriate media.

(7) The Principal Permittee, in cooperation with the Permittees, shall provide schools within each School District in the County with materials, including, but not limited to, videos, live presentations, and other information necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution.

(8) ~~The~~ Permittees shall provide the contact information for their appropriate ~~storm water~~ staff responsible for storm water public education activities to the Principal Permittee no later than (60 days from the effective date of this Order), and changes to contact information no later than 30 days after a change occurs. ~~Cooperative efforts with other agencies may also be used to accomplish this requirement.~~

(9) The Principal Permittee shall develop a strategy to measure the effectiveness of in-school educational programs. The protocol shall include assessment of students' knowledge of storm water pollution problems and solutions before and after educational efforts are conducted. The protocol shall be developed and submitted to the Regional Board Executive Officer for approval no later than (90 days from the effective date of this Order). It shall be implemented on approval.

(10) In order to ensure that the PIPP is demonstrably effective in changing the behavior of the public, the Principal Permittee shall develop a behavioral change assessment strategy no later than (90 days from the effective date of this Order). The strategy shall be developed based on sociological data and studies (such as the County

Segmentation Study). The Principal Permittee shall submit the assessment strategy to the Regional Board Executive Office for approval. It shall be implemented on approval.

~~d)~~g) Pollutant-Specific Outreach

The Principal Permittee, in cooperation with Permittees, shall coordinate to develop outreach programs that focus on the watershed-specific pollutants listed in Table 1 no later than (365 days from the effective date of this Order). Metals may be appropriately addressed through the Industrial/Commercial Facilities Program (e.g. distribute education materials on appropriate BMPs for metal waste management to facilities that have been identified as a potential source, such as metal fabricating facilities). Region-wide pollutants may be included in the Principal Permittee's mass media outreach efforts.

Table 1.	
Watershed	***Target Pollutants for Outreach***
Ballona Creek	Trash, Indicator Bacteria, Metals, PAHs
Malibu Creek	Trash, Nutrients (Nitrogen), Indicator Bacteria, Sediments
Los Angeles River	Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals, Pesticides, PAHs
San Gabriel River	Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals
Santa Clara River	Nutrients (Nitrogen), Coliform
Dominguez Channel	Trash, Indicator Bacteria, PAHs

Each Permittee shall make outreach materials available to the general public and target audiences, such as schools, community groups, contractors and developers, and at appropriate public counters and events. Outreach material shall include information on pollutants, sources of concern, and source abatement measures.

~~3.~~2. Businesses Program

a) Corporate Outreach

The Principal Permittee shall develop and implement a Corporate Outreach program to educate and inform corporate managers about storm water regulations. The program shall target retail gasoline outlets and restaurant chains. At a minimum, this program shall include:

(1) Conferring with corporate management to explain storm water regulations;

R0007128

(2) Distribution and discussion of educational material regarding storm water pollution and BMPs, and provide managers with suggestions to facilitate employee compliance with storm water regulations.

Corporate Outreach for all retail gasoline outlet and restaurant chain corporations shall be conducted not less than twice during the permit term, with the first outreach contact to begin no later than (365 days from effective date of this Order).

b) Business Assistance Program

(1) The Principal Permittee and Permittees may implement a Business Assistance Program to provide technical resource assistance to small businesses to advise them on BMPs implementation to reduce the discharge of pollutants in storm water runoff. Programs may include:

(2) On-site technical assistance or consultation via telephone to identify and implement storm water pollution prevention methods and best management practices; and

(3) Making available, distributing, and discussing of applicable BMP and educational materials.

SPACE LEFT INTENTIONALLY BLANK

C. Industrial/Commercial Facilities Program [VERSION B]

Each Permittee shall implement an Industrial and Commercial Facilities Program. The objective is to reduce pollutants in storm water runoff to the maximum extent practicable by requiring the implementation of pollutant reduction and control measures at industrial and commercial facilities. At a minimum, the Program shall include the following requirements.

1. Inventory of Facilities

a) Database for Critical Sources Identification

Each Permittee, within its jurisdiction, shall update annually (individually or in partnership) a watershed-based inventory of all facilities identified as priority through the Permittees critical sources identification program. The database inventory of facilities may be augmented or reduced as new data becomes available. The update of the database may be accomplished through the collection of new information obtained through field activities or through other readily available intra-agency informational databases (e.g. business licenses, pretreatment permits, sanitary sewer hook-up permits). The inventory shall include the following minimum fields of information for each industrial and commercial facility:

(1) Name of facility and name of owner/operator;

(2) address;

(3) coverage under the GIASP or other individual or general NPDES permits; and

(4) a narrative description including SIC codes that best reflects the principal products or activities performed by each facility.

The use of an automated database system, such as Geographical Information System (GIS) or Internet-based system is highly recommended, but not required. The Permittees may add other fields of information, as necessary (e.g. to point out discrepancies between SIC Code designation and type of activities actually performed on-site, exposure of activities and/or materials to storm water, etc:) Facilities determined at no risk of exposure will be so identified in the inventory database. At a minimum, the type of facilities considered for the inventory, will include:

b) High Priority Categories

(1) Municipal Landfills

(2) Hazardous Waste Treatment, Disposal and Recovery Facilities

R0007130

(3) Facilities Subject to SARA Title III (also known as EPCRA)

(4) Restaurants

(5) Wholesale trade (scrap, auto dismantling)

(6) Automotive service facilities

(7) Fabricated metal products

(8) Motor freight

(9) Chemical/allied products

(10) Automotive Dealers/Gas Stations

(11) Primary Metals Products

c) Lower Priority Categories

Facilities which are listed in Attachment B of the permit.

2. **Municipal Landfills, Hazardous Waste Treatment, Disposal and Recovery Facilities, Facilities Subject to SARA Title III (also known as EPCRA)**

a) The Permittees shall inspect

(1) Municipal landfills;

(2) Hazardous waste treatment, disposal and recovery facilities; and,

(3) Facilities subject to SARA Title III

once every 24 months.

b) Level of inspection: The Permittees shall confirm that

(1) BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP; and,

(2) Each owner/operator has a current Waste Discharge Identification (WDID) number, and that a Storm Water Pollution Prevention Plan is available on-site.

3. **Restaurants**

The Permittees, in cooperation with their appropriate departments (such as health, public works, etc.), or using an equivalent approach, shall

inspect all restaurants to determine that storm water BMPs are being implemented effectively.

a) Frequency: The Permittees shall inspect each restaurant once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) Restaurants shall be inspected to verify that:

(1) Oil and Grease residue is not poured onto a parking lot, street or adjacent catch basin;

(2) The trash bin area is clean, trash bin lid closed, not filled with liquid or washed out;

(3) Parking lot, alley, sidewalk and street areas (in the immediate vicinity of the establishment), floormats, filters and garbage containers are not washed and that no washwater is poured in those areas;

(4) Removal of food waste, rubbish or other materials from the parking lot area is not performed in an unsanitary manner or creating a nuisance through hosing down the area.

d) Inspectors shall distribute educational materials to facility operator on storm water pollution prevention practices.

4. Retail Gasoline Outlets

The Permittees shall communicate appropriate BMPs to each RGO (in accordance with the SQMP and Regional Board Resolution 98-08, and the Stormwater Quality Task Force Best Management Practice Guide for RGOs.)

a) Frequency: The Permittees shall inspect each RGO and Automotive Service facility once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) RGOs shall be inspected to verify that:

(1) Fuel-dispensing areas are routinely swept for removal of litter and debris, and that rags and absorbents are ready for use in case of leaks and spills;

(2) Operator is aware that wash down of RGO area to the storm drain is prohibited;

(3) Employees are trained in management of waste materials;

(4) Drains and flow patterns are labeled at the facility;

(5) Inspection and cleans up of storm drain inlets and catch basins within the facility's boundaries are performed before October 1 each year;

(6) Posting signs are close to the fuel dispenser that warn vehicle owners/operators against "topping off" of vehicle fuel tanks and installation of automatic shutoff fuel dispensing nozzles;

(7) Outdoor waste receptacle and air/water supply area is routinely cleaned-up of leaks and drips, that only watertight waste receptacles are used and lids are closed. Check if grading is done in such a way to prevent run-on of storm water, segregation of flow, and if a roof cover or a low containment berm was built; and,

(8) Employees are trained to implement storm water pollution prevention practices.

d) A follow-up inspection shall be performed within one business day when a complaint related to non-storm water or contaminated storm water discharge is made against a previously inspected RGO.

5. **Wholesale Trade (scrap, auto dismantling), Fabricated Metal Products, Motor Freight, Chemical/Allied Products, Primary Metal Products Facilities**

a) The Permittees shall inspect

(1) Wholesale trade (scrap, auto dismantling);

(2) Fabricated metal products;

(3) Motor freight;

(4) Chemical/Allied products; and

(5) Primary metal products

facilities once every 24 months.

b) Level of inspection: The Permittees shall confirm that

(1) BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP; and,

(2) Each owner/operator has a current Waste Discharge Identification (WDID) number, and that a Storm Water Pollution Prevention Plan is available on-site.

6. **Automotive Service Facilities**

R0007133

The Permittees shall communicate appropriate BMPs to each Automotive Service facility (in accordance with the SQMP and Regional Board Resolution 98-08.)

a) Frequency: The Permittees shall inspect each Automotive Service facility once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) Automotive Service facilities shall be inspected to verify that:

(1) The facility area is clean and dry without evident stains;

(2) Measures are implemented to prevent spills and leaks;

(3) The facility operator properly manages wastewaters;

(4) The facility operator is aware of the prohibition on discharge of non-storm water to the storm drain;

(5) The facility operator properly manages raw and waste materials including proper disposal of hazardous waste;

(6) Outdoor work and storage areas are protected to prevent potential pollution;

(7) Storm drain inlets situated on the property are labeled, inspected and routinely cleaned out; and,

(8) Employees are trained to implement storm water pollution prevention practices.

7. Site Visits to Lower Priority Categories

a) Based on the inventory developed under paragraph 1. above, each Permittee shall visit facilities identified as lower priority as specified below.

(1) Frequency: Each Permittee shall visit all industrial/commercial facilities (except those subject to the inspection program) no later than (24 months from the permit effective date).

(2) Level of visit: Each Permittee shall confirm that each owner/operator:

(i) has a current Waste Discharge Identification (WDID) number (for facilities discharging storm water associated with industrial activity), and that a Storm Water Pollution Prevention Plan is available on-site, and

R0007134

(ii) is implementing BMPs consistent with model programs for industrial and commercial facilities, and local storm water/urban runoff ordinances.

(3) Enforcement Referral: For any facility not complying with requirements for facilities discharging storm water associated with industrial activity (i.e. a non-filer), Permittees shall advise the owner/operator of such facility of its obligation to obtain coverage under the GIASP, and shall document this action. On a quarterly basis, Permittees shall provide the Regional Board an updated electronic record of non-filers identified during site visits.

b) Each Permittee shall develop and implement a program to conduct spot checks of lower priority facilities subject to site visits (excluding those previously determined to pose no risk of exposure). After the completion of the first site visit cycle (i.e., first 24 months) twenty percent of the total number of facilities will be visited per year. Spot check visits will be performed as described in paragraph a.2. and a.3. of section 7.

8. BMPs Implementation

In the event that particular minimum BMPs are infeasible at any site, Permittees shall require implementation of other BMPs that will achieve the equivalent reduction of pollutants in the storm water discharges. Furthermore, Permittees may require additional site-specific controls (BMPs) as necessary to comply with this Order, including BMPs that are more stringent than those required under the statewide GIASP.

a) For industrial and specified commercial facilities, identified as critical sources, tributary to CWA § 303(d) impaired water bodies, Permittees shall consider requiring operators to implement additional controls as necessary.

b) For industrial and specified commercial facilities, identified as critical sources, within or directly adjacent to or discharging directly to ESAs, Permittees shall consider requiring operators to implement additional controls as necessary.

9. Complaint Response

In response to any complaint related to storm water or unauthorized non-storm water discharges or a specific request by the Regional Board Executive Officer, a Permittee shall visit any facility, to determine if the facility is effectively complying with the SQMP and municipal storm water/urban runoff ordinances.

10. Interagency Coordination **R0007135**

The Permittees shall provide compliance assistance to the Regional Board through supporting activities, including but not limited to: referrals

of complaints, assisting in identification of current owners, operators, and leasees in conjunction with activities performed at any facility within municipal jurisdiction, appearing as witnesses in Regional Board enforcement hearings, and participating in joint inspections when requested by Regional Board staff.

Copies of the inspection/site visit report and any follow-up documentation shall be provided to the Regional Board Executive Officer upon request.

11. Regional Board Inspected Facilities

To the extent that the Regional Board has conducted an inspection of a facility during a particular year, or the inspection has been performed through an authorized agent on behalf of the Regional Board, the Permittee need not inspect the facility during the same 24 month inspection period.

12. Facilities Not Addressed

The Permittees need not inspect State or Federal facilities that are not under their jurisdiction.

SPACE LEFT INTENTIONALLY BLANK

R0007136

C. Industrial/Commercial Facilities Program [VERSION A]

Each Permittee shall implement an Industrial and Commercial Facilities Program. The objective is to reduce pollutants in storm water runoff to the maximum extent practicable by requiring the implementation of pollutant reduction and control measures at industrial and commercial facilities. At a minimum, the Program shall include the following requirements.

1. Inventory of Facilities

a) Database for Critical Sources Identification

Each Permittee, within its jurisdiction, shall update annually (individually or in partnership) a watershed-based inventory of all facilities identified as priority through the Permittees critical sources identification program. The database inventory of facilities may be augmented or reduced as new data becomes available. The update of the database may be accomplished through the collection of new information obtained through field activities or through other readily available intra-agency informational databases (e.g. business licenses, pretreatment permits, sanitary sewer hook-up permits). The inventory shall include the following minimum fields of information for each industrial and commercial facility:

(1) Name of facility and name of owner/operator;

(2) address;

(3) coverage under the GIASP or other individual or general NPDES permits; and

(4) a narrative description including SIC codes that best reflects the principal products or activities performed by each facility.

The use of an automated database system, such as Geographical Information System (GIS) or Internet-based system is highly recommended, but not required. The Permittees may add other fields of information, as necessary (e.g. to point out discrepancies between SIC Code designation and type of activities actually performed on-site, exposure of activities and/or materials to storm water, etc.) Facilities determined at no risk of exposure will be so identified in the inventory database. At a minimum, the type of facilities considered for the inventory, will include:

b) High Priority Categories

(1) Municipal Landfills

(2) Hazardous Waste Treatment, Disposal and Recovery Facilities

(3) Facilities Subject to SARA Title III (also known as EPCRA)

(4) Restaurants

(5) Wholesale trade (scrap, auto dismantling)

(6) Automotive service facilities

(7) Fabricated metal products

(8) Motor freight

(9) Chemical/allied products

(10) Automotive Dealers/Gas Stations

(11) Primary Metals Products

c) Lower Priority Categories

Facilities which are listed in Attachment B of the permit.

2. **Municipal Landfills, Hazardous Waste Treatment, Disposal and Recovery Facilities, Facilities Subject to SARA Title III (also known as EPCRA)**

a) The Permittees shall inspect

(1) Municipal landfills;

(2) Hazardous waste treatment, disposal and recovery facilities; and,

(3) Facilities subject to SARA Title III

once every 24 months.

b) Level of inspection: The Permittees shall confirm that

(1) BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP; and,

(2) Each owner/operator has a current Waste Discharge Identification (WDID) number, and that a Storm Water Pollution Prevention Plan is available on-site.

R0007138

3. **Restaurants**

The Permittees, in cooperation with their appropriate departments (such as health, public works, etc.), or using an equivalent approach, shall inspect all restaurants to determine that storm water BMPs are being implemented effectively.

a) Frequency: The Permittees shall inspect each restaurant once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) Restaurants shall be inspected to verify that:

(1) Oil and Grease residue is not poured onto a parking lot, street or adjacent catch basin;

(2) The trash bin area is clean, trash bin lid closed, not filled with liquid or washed out;

(3) Parking lot, alley, sidewalk and street areas (in the immediate vicinity of the establishment), floormats, filters and garbage containers are not washed and that no washwater is poured in those areas;

(4) Removal of food waste, rubbish or other materials from the parking lot area is not performed in an unsanitary manner or creating a nuisance through hosing down the area.

d) Inspectors shall distribute educational materials to facility operator on storm water pollution prevention practices.

4. **Retail Gasoline Outlets**

The Permittees shall communicate appropriate BMPs to each RGO (in accordance with the SQMP and Regional Board Resolution 98-08, and the Stormwater Quality Task Force Best Management Practice Guide for RGOs.)

a) Frequency: The Permittees shall inspect each RGO and Automotive Service facility once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) RGOs shall be inspected to verify that:

(1) Fuel-dispensing areas are routinely swept for removal of litter and debris, and that rags and absorbents are ready for use in case of leaks and spills;

R0007139

(2) Operator is aware that wash down of RGO area to the storm drain is prohibited;

(3) Employees are trained in management of waste materials;

(4) Drains and flow patterns are labeled at the facility;

(5) Inspection and cleans up of storm drain inlets and catch basins within the facility's boundaries are performed before October 1 each year;

(6) Posting signs are close to the fuel dispenser that warn vehicle owners/operators against "topping off" of vehicle fuel tanks and installation of automatic shutoff fuel dispensing nozzles;

(7) Outdoor waste receptacle and air/water supply area is routinely cleaned-up of leaks and drips, that only watertight waste receptacles are used and lids are closed. Check if grading is done in such a way to prevent run-on of storm water, segregation of flow, and if a roof cover or a low containment berm was built; and,

(8) Employees are trained to implement storm water pollution prevention practices.

d) A follow-up inspection shall be performed within one business day when a complaint related to non-storm water or contaminated storm water discharge is made against a previously inspected RGO.

5. **Automotive Service Facilities**

The Permittees shall communicate appropriate BMPs to each Automotive Service facility (in accordance with the SQMP and Regional Board Resolution 98-08.)

a) Frequency: The Permittees shall inspect each Automotive Service facility once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) Automotive Service facilities shall be inspected to verify that:

(1) The facility area is clean and dry without evident stains;

(2) Measures are implemented to prevent spills and leaks;

(3) The facility operator properly manages wastewaters;

(4) The facility operator is aware of the prohibition on discharge of non-storm water to the storm drain;

R0007140

(5) The facility operator properly manages raw and waste materials including proper disposal of hazardous waste;

(6) Outdoor work and storage areas are protected to prevent potential pollution;

(7) Storm drain inlets situated on the property are labeled, inspected and routinely cleaned out; and,

(8) Employees are trained to implement storm water pollution prevention practices.

6. Site Visits to Lower Priority Categories

a) Based on the inventory developed under paragraph 1. above, each Permittee shall visit facilities identified as lower priority as specified below.

(1) Frequency: Each Permittee shall visit all industrial/commercial facilities (except those subject to the inspection program) no later than (24 months from the permit effective date).

(2) Level of visit: Each Permittee shall confirm that each owner/operator:

(i) has a current Waste Discharge Identification (WDID) number (for facilities discharging storm water associated with industrial activity), and that a Storm Water Pollution Prevention Plan is available on-site, and

(ii) is implementing BMPs consistent with model programs for industrial and commercial facilities, and local storm water/urban runoff ordinances.

(3) Enforcement Referral: For any facility not complying with requirements for facilities discharging storm water associated with industrial activity (i.e. a non-filer), Permittees shall advise the owner/operator of such facility of its obligation to obtain coverage under the GIASP, and shall document this action. On a quarterly basis, Permittees shall provide the Regional Board an updated electronic record of non-filers identified during site visits.

b) Each Permittee shall develop and implement a program to conduct spot checks of lower priority facilities subject to site visits (excluding those previously determined to pose no risk of exposure). After the completion of the first site visit cycle (i.e., first 24 months) twenty percent of the total number of facilities will be visited per year. Spot check visits will be performed as described in paragraph a.2. and a.3. of section 6.

7. **BMPs Implementation**

In the event that particular minimum BMPs are infeasible at any site, Permittees shall require implementation of other BMPs that will achieve the equivalent reduction of pollutants in the storm water discharges. Furthermore, Permittees may require additional site-specific controls (BMPs) as necessary to comply with this Order, including BMPs that are more stringent than those required under the statewide GIASP.

a) For industrial and specified commercial facilities, identified as critical sources, tributary to CWA § 303(d) impaired water bodies, Permittees shall consider requiring operators to implement additional controls as necessary.

b) For industrial and specified commercial facilities, identified as critical sources, within or directly adjacent to or discharging directly to ESAs, Permittees shall consider requiring operators to implement additional controls as necessary.

8. **Complaint Response**

In response to any complaint related to storm water or unauthorized non-storm water discharges or a specific request by the Regional Board Executive Officer, a Permittee shall visit any facility, to determine if the facility is effectively complying with the SQMP and municipal storm water/urban runoff ordinances.

9. **Interagency Coordination**

The Permittees shall provide compliance assistance to the Regional Board through supporting activities, including but not limited to: referrals of complaints, assisting in identification of current owners, operators, and leasees in conjunction with activities performed at any facility within municipal jurisdiction, appearing as witnesses in Regional Board enforcement hearings, and participating in joint inspections when requested by Regional Board staff.

Copies of the inspection/site visit report and any follow-up documentation shall be provided to the Regional Board Executive Officer upon request.

10. **Regional Board Inspected Facilities**

To the extent that the Regional Board has conducted an inspection of a facility during a particular year, or the inspection has been performed through an authorized agent on behalf of the Regional Board, the Permittee need not inspect the facility during the same 24 month inspection period.

11. Facilities Not Addressed

The Permittees need not inspect State or Federal facilities that are not under their jurisdiction.

C. Industrial/Commercial Educational Program [VERSION C]

Each Permittee shall implement an industrial/commercial site visit program. The purpose of such site visits will be solely educational and to provide industrial/commercial facilities with information regarding the Permittee's storm water program, and to provide advice when requested in understanding and complying with the Permittee's storm water regulations. To minimize cost, each Permittee is encouraged to coordinate its site visit program with existing fire, health, industrial wastes and/or other inspection type programs so that the Permittee need not institute new and separate site visit programs. The program shall contain the following components:

1. Identification of Sources

   a. The Principal Permittee in consultation with the Permittees shall maintain and update a database for listing industrial/commercial facilities by four digit SIC Industry Numbers. This database will serve as a reference resource for the public, business, industry, local government, the Regional Board, and other public agencies on storm water program participation. The initial accuracy of the database will be dependent on the accuracy of electronic and information sources used to establish the database, but the accuracy is expected to improve after Permittees begin to implement the industrial/commercial site visit program. No legal import is to be attributed to the database developed by the Permittees. The database format shall include at a minimum:

      i. Facility name;
      ii. Site address;
      iii. Watershed Management Area;
      iv. Applicable SIC code(s); and
      v. NPDES storm water permit coverage status, if applicable.

   b. Each Permittee shall collect information based on the format developed by the Principal Permittee to identify industrial/commercial facilities within its jurisdiction and submit to the Principal Permittee not later than one month after the Principal Permittee provides the database format to the Permittees or for "iii" below not later than one year after designation of groups by the WMC. The list of facilities shall include, at a minimum:

      i. All industrial groups regulated under Phase I of the Federal storm water program (40 CFR 122.26; Phase I Facilities);

      ii. Motor vehicle repair shops, motor vehicle body shops, motor vehicle parts and accessories facilities, gas stations, and restaurants; and

R0007144

iii. Additional SIC industrial/commercial groups identified as priorities by each WMC pursuant to this Order.

c. The Principal Permittee shall maintain and update the information submitted by each Permittee into a database of industrial/commercial facilities. This database shall include:

i. For each four-digit SIC Industry Number, primary activities that might impact runoff discharges (from national or commercial database sources); and

ii. For each four-digit SIC Industry Number, primary materials that might impact runoff discharges (from national or commercial database).

2. Source Control Measures

The Permittees, shall require the implementation of specific storm water BMPs for each industrial/commercial SIC group of facilities requiring educational site. The BMPs shall:

a. Address multiple pollutants;

b. Initially focus on pollutant source minimization, education, good housekeeping, and site design alternatives; and

c. Target source areas and activities with the highest potential to generate substantial pollutant loads.

The Principal Permittees shall distribute the BMP lists to the Permittees to be incorporated in each Permittee's outreach measures conducted during industrial/commercial site visits.

3. Educational Site Visits

a. Each Permittee shall implement an industrial/commercial educational site visit program according to the following schedule in Table 7:

Table 7
Schedule of Educational Site Visits

FACILITIES	SITE VISIT FREQUENCY (No. of Contacts / Time period)
i) Phase I*, [i]-[ix] and [xi] with waste discharge or pretreatment permit	1 / 24 months **
ii) Phase I, [i]-[ix] and [xi] with no waste discharge or pretreatment permit but with GIASP	1 / 24 months**
iii) Phase I, [i]- [ix] with no waste discharge or pretreatment permit, and no GIASP	1 / 24 months**
iv) Phase I [xi] with no GIASP	1 / 5 years***

R0007145

v) Vehicle repair shops, vehicle body shops, vehicle parts and accessories facilities	1 / 24 months**
vi) Gas stations	1 / 24 months* *
vii) Restaurants	1 / 24 months* *
viii) Facilities selected by WMCs	1 / 36 months

* See Glossary of Terms for definition
** Once in 24 months with a minimum of two site visits during the five-year term of this Order
*** See exception in text below

i. Phase 1 facilities in categories [i] through [ix] and [xi] which have an industrial waste discharge permit or a pretreatment permit, once every twenty-four months;

ii. Phase 1 facilities in categories [i] through [ix] and [xi], which do not have an industrial waste discharge permit or a pretreatment permit but have obtained coverage under the GIASP, once every twenty-four months;

iii. Phase 1 facilities in categories [i] through [ix], which do not have an industrial waste discharge permit, a pretreatment permit or GIASP coverage, once every twenty-four months;

iv. Phase 1 facilities in category [xi] without an industrial waste discharge permit, a pretreatment permit, or GIASP coverage. In lieu of a site visit, contact by phone, mail-out of questionnaire and educational materials, or other similar method to inform the facilities of notice of intent (NOI) requirements and encourage good storm water quality control measures (non-responders to be identified in annual report), once in five years;

v. Vehicle repair shops, vehicle body shops, vehicle parts and accessories (SIC Industry Major Group 75); once every twenty-four months;

vi. Gasoline stations (SIC Industry Number 5541); once every twenty-four months;

vii. Restaurants (SIC Industry Number 5812), once every twenty-four months; and,

viii. Additional SIC industrial/commercial groups identified by the WMC for the watershed in which the Permittee is located, once in thirty-six months, with a maximum limit of 3,000 additional site visits per Permittee during the term of this Order.

b. During the educational site visit, the Permittee shall:

i. Consult with a representative of the facility to explain applicable storm water regulations;

R0007146

ii. Distribute and discuss applicable BMP and educational materials, including information regarding the codes, regulations, ordinances, and permits applicable to the category of the facility. In the case of Phase I facilities, notify the facility of specific requirements under the GIASP including that such facilities must file an NOI with the State Water Resources Control Board and that SWPPP must be available on the site; and

iii. Follow-up with facilities, as deemed necessary and appropriate by the Permittee, to provide advice in complying with the Permittee's storm water ordinances, prohibitions, and other legal instruments.

c. Each Permittee shall submit to the Principal Permittee, on a quarterly basis, the lists of visited facilities identified by category. The Principal Permittee shall compile the submitted lists and submit them to the Executive Officer on a quarterly basis.

4. Alternative Programs

A Permittee may petition the Executive Officer to substitute the industrial/commercial educational program with an alternative industrial/commercial educational program that will achieve greater or substantially similar educational goals and which will be implemented within a similar period of time.

R0007147

C. Industrial/Commercial Facilities Control Program [VERSION A/C]

Each Permittee shall require implementation of pollutant reduction and control measures at industrial and commercial facilities, with the objective of reducing pollutants in storm water runoff. Except as specified in other sections of this Order, pollutant reduction and control measures can be used alone or in combination, and can include nonstructural, structural controls, and operation and maintenance procedures, which can be applied before, during, and/or after pollution producing activities. At a minimum, the Control Program shall include requirements to: (1) track, (2) inspect, and (3) ensure compliance at industrial and commercial facilities that are critical sources of pollutants in storm water.

1. Track Critical Sources

a) Each Permittee shall maintain a watershed-based inventory or database of all facilities within its jurisdiction that are critical sources of storm water pollution. Critical sources to be tracked are summarized below, and also specified in Attachment B:

(1) Commercial Facilities

- restaurants;
- automotive service facilities; and
- gas stations and automotive dealers.

(2) US EPA Phase 1 Facilities (Tier 1 and 2)

(3) Other Federally-mandated Facilities [as specified in 40 CFR 122.26(d)(2)(iv)(C)]

- municipal landfills;
- hazardous waste treatment, disposal, and recovery facilities; and
- facilities subject to SARA Title III (also known as EPCRA).

b) Each Permittee shall include the following minimum fields of information for each industrial and commercial facility:

- name of facility and name of owner/operator;
- address;
- coverage under the GIASP or other individual or general NPDES permits; and
- a narrative description including SIC codes that best reflects the industrial activities at and principal products of each facility.

The Regional Board encourages Permittees to add other fields of information, such as material usage and/or industrial output, and discrepancies between SIC Code designations (as reported by

facility operators) and the actual type of industrial activity has the potential to pollute storm water. In addition, the Regional Board recommends use of an automated database system, such as a Geographical Information System (GIS) or Internet-based system; however, this is not required.

c) Each Permittee shall update its inventory of critical sources at least annually. The update may be accomplished through collection of new information obtained through field activities or through other readily available intra-agency informational databases (e.g. business licenses, pretreatment permits, sanitary sewer hook-up permits).

2. Inspect Critical Sources

Each Permittee shall inspect all facilities in the categories and at a level and frequency as specified in the following subsections.

a) Commercial Facilities

(1) Restaurants

Frequency of Inspections: Twice during the 5-year term of the Order, provided that the first inspection occurs no later than 30 months from the effective date of this Order, and that there is a minimum interval of one year in between the first compliance inspection and the second compliance inspection.

Level of inspections: Each Permittee, in cooperation with its appropriate department (such as health or public works), shall inspect all restaurants within its jurisdiction to confirm that storm water BMPs are effectively implemented in compliance with County and municipal ordinances, Regional Board Resolution 98-08, and the SQMP. At each restaurant, inspectors shall verify that the restaurant operator:

- has received educational materials on storm water pollution prevention practices;
- does not pour oil and grease or oil and grease residue onto a parking lot, street or adjacent catch basin;
- keeps the trash bin area clean and trash bin lids closed, and does not fill trash bins with washout water or any other liquid;
- does not allow illicit discharges, such as discharge of washwater from floormats, floors, porches, parking lots, alleys, sidewalks and street areas (in the immediate vicinity of the establishment), filters or garbage/trash containers;

- removes food waste, rubbish or other materials from parking lot areas in a sanitary manner that does not create a nuisance or discharge to the storm drain.

(2) Automotive Service Facilities

Frequency of Inspections: Twice during the 5-year term of the Order, provided that the first inspection occurs no later than 30 months from the effective date of this Order, and that there is a minimum interval of one year in between the first compliance inspection and the second compliance inspection.

Level of inspections: Each Permittee shall inspect all automotive service facilities within its jurisdiction to confirm that storm water BMPs are effectively implemented in compliance with County and municipal ordinances, Regional Board Resolution 98-08, and the SQMP. At each automotive service facility, inspectors shall verify that each operator:

- maintains the facility area so that it is clean and dry and without evidence of excessive staining;
- implements housekeeping BMPs to prevent spills and leaks;
- properly discharges wastewaters to a sanitary sewer and/or contains wastewaters for transfer to a legal point of disposal;
- is aware of the prohibition on discharge of non-storm water to the storm drain;
- properly manages raw and waste materials including proper disposal of hazardous waste;
- protects outdoor work and storage areas to prevent contact of pollutants with rainfall and runoff;
- labels, inspects, and routinely cleans storm drain inlets that are located on the facility's property; and
- trains employees to implement storm water pollution prevention practices.

(3) Retail Gasoline Outlets and Automotive Dealers

Frequency of Inspection: Twice during the 5-year term of the Order, provided that the first inspection occurs no later than 30 months from the effective date of this Order, and that there is a minimum interval of one year in between the first compliance inspection and the second compliance inspection.

R0007150

Level of Inspection: Each Permittee shall confirm that BMPs are effectively implemented at each RGO and automotive dealer within its jurisdiction, in compliance with the SQMP, Regional Board Resolution 98-08, and the Stormwater Quality Task Force Best Management Practice Guide for RGOs. At each RGOs and automotive dealer, inspectors shall verify that each operator:

- routinely sweeps fuel-dispensing areas for removal of litter and debris, and keeps rags and absorbents ready for use in case of leaks and spills;
- is aware that washdown of facility area to the storm drain is prohibited;
- is aware of design flaws (such as grading that doesn't prevent run-on, or inadequate roof covers and berms), and that equivalent BMPs are implemented;
- inspects and cleans storm drain inlets and catch basins within each facility's boundaries before October 1st of each year;
- posts signs close to fuel dispensers, which warn vehicle owners/operators against "topping off" of vehicle fuel tanks and installation of automatic shutoff fuel dispensing nozzles;
- routinely checks outdoor waste receptacle and air/water supply areas, cleans leaks and drips, and ensures that only watertight waste receptacles are used and that lids are closed; and
- trains employees to properly manage hazardous materials and wastes as well as to implement other storm water pollution prevention practices.

b) Phase 1 Facilities: Permittees need not inspect facilities that have been inspected by the Regional Board within the past 24 months. For the remaining Phase 1 facilities that the Regional Board has not inspected, each Permittee shall conduct compliance inspections as specified below.

Frequency of Inspection

Facilities in Tier 1 Categories: Twice during the 5-year term of the Order, provided that the first inspection occurs no later than 30 months from the effective date of this Order, and that there is a minimum interval of one year in between the first compliance inspection and the second compliance inspection.

Facilities in Tier 2 Categories: Twice during the 5-year term of the permit, provided that the first inspection occurs no later than 30 months from the effective date of this Order. Permittees need not perform additional inspections at those facilities determined to

have no risk of exposure of industrial activity to storm water. For those facilities that do have exposure of industrial activities to storm water, a Permittee may reduce the frequency of additional compliance inspections to once every 5 years, provided that the Permittee inspects at least 20% of the facilities in Tier 2 each year.

Level of Inspection: Each Permittee shall confirm that each operator:

- has a current Waste Discharge Identification (WDID) number for facilities discharging storm water associated with industrial activity, and that a Storm Water Pollution Prevention Plan is available on-site, and
- is effectively implementing BMPs in compliance with County and municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) Other Federally-mandated Facilities

Frequency of Inspection: Twice during the 5-year term of the Order, provided that the first inspection occurs no later than 30 months from the effective date of this Order, and that there is a minimum interval of one year in between the first compliance inspection and the second compliance inspection.

Level of Inspection: Each Permittee shall confirm that each operator:

- has a current Waste Discharge Identification (WDID) number for facilities discharging storm water associated with industrial activity, and that a Storm Water Pollution Prevention Plan is available on-site, and
- is effectively implementing BMPs in compliance with County and municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

3. Ensure Compliance of Critical Sources

a) **BMP Implementation:** In the event that a Permittee determines that a BMP specified by the SQMP or Regional Board Resolution 98-08 is infeasible at any site, that Permittee shall require implementation of other BMPs that will achieve the equivalent reduction of pollutants in the storm water discharges. Likewise, for those BMPs that are not adequate to achieve water quality objectives, Permittees may require additional site-specific controls, such as treatment.

b) **Environmentally Sensitive Areas and Impaired Waters:** For critical sources that are in environmentally sensitive areas or that are tributary to CWA § 303(d) impaired water bodies, Permittees shall consider requiring operators to implement additional controls to reduce pollutants in storm water runoff that are causing the exceedences of water quality objectives.

c) **Progressive Enforcement:** Each Permittee shall implement a progressive enforcement policy to ensure that facilities are brought into compliance with all storm water requirements within a reasonable time period as specified below.

(1) In the event that a Permittee determines, based on an inspection conducted above, that an operator has failed to adequately implement all necessary BMPs, that Permittee shall take progressive enforcement action which, at a minimum, shall include a follow-up inspection within 4 weeks from the date of the initial inspection.

(2) In the event that a Permittee determines that an operator has failed to adequately implement BMPs after a follow-up inspection, that Permittee shall take further enforcement action as established through authority in its municipal code and ordinances or through the judicial system.

(3) Each Permittee shall maintain records, including inspection reports, warning letters, notices of violations, and other enforcement records, demonstrating a good faith effort to bring facilities into compliance.

d) Interagency Coordination

(1) **Referral of Violations of the SQMP, Regional Board Resolution 98-08, and Municipal Storm Water Ordinances:** A Permittee may refer a violation(s) to the Regional Board provided that that Permittee has made a good faith effort of progressive enforcement. At a minimum, a Permittee's good faith effort must include documentation of:

- Two follow-up inspections,
- Two warning letters or notices of violation.

(2) **Referral of Violations of the GIASP, including Requirements to File a Notice of Intent:** For those facilities in violation of the GIASP, Permittees may escalate referral of such violations to the Regional Board after one inspection and one written notice to the operator regarding the violation. In making such referrals, Permittees shall include, at a minimum, the following documentation:

R0007153

- Name of the facility;
- Operator of the facility;
- Owner of the faciltiy;
- Industrial activity being conducted at the facility that is subject to the GIASP; and
- Records of communication with the facility operator regarding the violation, which shall include at least an inspection report and one written notice of the violation.

Permittees shall, at a minimum, make such referrals on a quarterly basis.

(3) **Investigation of Complaints Regarding Facilities – Transmitted by the Regional Board Staff:** Each Permittee shall initiate, within one business day, investigation of complaints (other than non-storm water discharges) regarding facilities within its jurisdiction. The initial investigation shall include, at a minimum, a limited inspection of the facility to confirm the complaint to determine if the facility is effectively complying with the SQMP and municipal storm water/urban runoff ordinances, and to oversee corrective action.

(4) **Support of Regional Board Enforcement Actions:** As directed by the Executive Officer, Permittees shall support Regional Board enforcement actions by: assisting in identification of current owners, operators, and lessees of facilities; providing staff, when available, for joint inspections with Regional Board inspectors; appearing as witnesses in Regional Board enforcement hearings; and providing copies of inspection reports and other progressive enforcement documentation.

(5) **Participation in a Task Force:** The Permittees, Regional Board, and other stakeholders may form a Storm Water Task Force, the purpose of which is to communicate concerns regarding special cases of storm water violations by industrial and commercial facilities and to develop a coordinated approach to enforcement action.

D. Development Planning Program

1. The Permittees shall implement a development-planning program that will require all Pplanning Ppriority development and Rredevelopment projects to:

   a) Minimize impacts from storm water and urban runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA (Cal. Pub. Resources Code § 21100), CWC § 13369, CWA § 319, CWA § 402(p), CWA § 404, CZARA § 6217(g), ESA § 7, and local government ordinances ;

   b) Maximize the percentage of perviouspermeable surfaces to allow percolation of storm water into the ground;

   c) Minimize the quantity of storm water directed to imperviousimpermeable surfaces and the MS4;

   d) Minimize pollution emanating from parking lots through the use of appropriate treatment control BMPs and good housekeeping practices;

   e) Ensure that treatment control BMPs are pProperly designed and maintained treatment control BMPs in a manner that does not promote the breeding of vectors; and

   f) Provide for appropriate permanent measures to reduce storm water pollutant loads in storm water from the development site.

2. Peak Flow Control

   The Permittees shall control post-development peak storm water runoff discharge rates, velocities, and duration (peak flow control) in natural drainage systems (i.e., mimic pre-development hydrology) to prevent accelerated stream erosion and to protect stream habitat. Natural drainage systems are located in the following areas:

   a) Malibu Creek

   b) Topanga Canyon Creek

   c) Upper Los Angeles River

   d) Upper San Gabriel River

   e) Santa Clara River

   f) Los Angeles County Coastal streams (see Basin Plan Table 2-1)

   The Principal Permittee in consultation with Permittees shall develop numerical criteria for peak flow control, based on the results of the Peak Discharge Impact Study (see Monitoring Program Section II.I).

R0007155

Each Permittee shall no later than (3 years~~540 days~~ from the permit effective date) implement numerical criteria for peak flow control.

A Permittee or group of Permittees may substitute for the countywide peak flow control criteria with a Hydromodification Control Plan (HCP), on approval by the Regional Board, in the following circumstances:

(1) Stream or watershed-specific conditions indicate the need for a different peak flow control criteria, and the alternative numerical criteria is developed through the application of hydrologic modeling and supporting field observations; or

(2) A ~~W~~watershed~~-~~-wide plan has been developed for implementation of control measures to reduce erosion and stabilize drainage systems on a watershed basis.

3. Standard Urban Storm Water Mitigation Plans (SUSMPs)

a) Each Permittee shall amend codes and ordinances not later than [6 months from permit effective date] to give legal effect to SUSMP changes contained in this Order. Changes to SUSMP requirements shall take effect not later than [7 months from permit effective date].

~~a)~~b) Each Permittee shall require that a single-family hillside home~~ development~~:

(1) Conserve natural areas

(2) Protect slopes and channels

(3) Provide storm drain system stenciling and signage

(4) Divert roof runoff to vegetated areas before discharge unless the diversion would result in slope instability

(5) Direct surface flow to vegetated areas before discharge unless the diversion would result in slope instability

~~b)~~c) Each Permittee shall require that a SUSMP~~Standard Urban Storm Water Mitigation Plan~~ as approved by the Regional Board in Board Resolution No. R 00-02 be implemented for the following categories of developments:

(1) Ten or more unit homes (includes single family homes, multifamily homes, condominiums, and apartments)

(2) A 100,000 or more square feet of impervious surface area industrial/ commercial development

(3) Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534, and 7536-7539)

(4) Retail gasoline outlets

R0007156

(5) Restaurants (SIC 5812)

(6) Parking lots 5,000 square feet or more of surface area or with 25 or more parking spaces

(7) Redevelopment projects in subject categories that meet Rredevelopment thresholds

~~c~~d) Each Permittee shall submit an Environmentally Sensitive Area (ESA) Delineation Map for its jurisdictional boundary, based on the Regional Board's ESA Definition, no later than (120 days from permit effective date) for approval by the Regional Board Executive Officer in consultation with the California Department of Fish and Game, and the California Coastal Commission.

~~d~~e) Each Permittee shall require the implementation of SUSMP provisions no later than (7 months ~~180 days~~ from permit effective date), for all projects located in or directly adjacent to or discharging directly to an ESA, where~~,~~ the development will:

(1) discharge storm water and urban runoff that is likely to impact a sensitive biological species or habitat; and

(2) create 2,500 square feet or more of impervious surface area.

4. Numerical Design Criteria

The Permittees shall require that post-construction treatment control BMPs incorporate, at a minimum, either a volumetric or flow based treatment control design standard, or both, as identified below -to mitigate (infiltrate, filter or treat) storm water runoff:

a) Volumetric Treatment Control BMP

(1) the 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*, or

(2) the volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial,* (1993), or

(3) the volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or

R0007157

(4) the volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event.

b) Flow Based Treatment Control BMP

(1) the flow of runoff produced from a rain event equal to at least 0.2 inches per hour intensity, or

(2) the flow of runoff produced from a rain event equal to at least two times the 85th percentile hourly rainfall intensity for Los Angeles County, or

(3) the flow of runoff produced from a rain event that will result in treatment of the same portion of runoff as treated using volumetric standards above.

5. Applicability of Numerical Design Criteria

The Permittees shall require the following categories of Pplanning Ppriority Pprojects to design and implement post-construction treatment controls to mitigate storm water pollution:

a) Single-family hillside residential developments of one acre or more of surface area.

b) Housing developments (includes single family homes, multifamily homes, condominiums, and apartments) of ten units -or more.

c) A 100,000 square feet or more impervious surface area industrial/ commercial development.

d) Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534 and 7536-7539) [5,000 square feet or more of surface area].

e) Retail gasoline outlets [5,000 square feet or more of impervious surface area and with projected Average Daily Traffic (ADT) of 100 or more vehicles]. Subsurface Treatment Control BMPs which may endanger public safety (i.e., create an explosive environment) are considered not appropriate.

f) Restaurants (SIC 5812) [5,000 square feet or more of surface area].

g) Parking lots 5,000 square feet or more of surface area or with 25 or more parking spaces.

R0007158

h) Projects located in, adjacent to or discharging directly to an ESA that meet threshold conditions identified above in 3.c.

i) Redevelopment projects in subject categories that meet Rredevelopment thresholds.

6. Not later than March 9, 2003, each Permittee shall require the implementation of SUSMP and post-construction control requirements for the industrial/commercial category to projects that disturb one acre or more of surface area.

7. Site Specific Mitigation

Each Permittee shall no later than (180 days from permit effective date) require the implementation of a site-specific plan to mitigate post-development storm water for new development and Rredevelopment not requiring a SUSMP but which may potentially have adverse impacts on post-development storm water quality, where one or more of the following project characteristics exist:

a) Vehicle or equipment fueling areas

b) Vehicle or equipment maintenance areas, including washing and repair

c) Commercial or industrial waste handling or storage

d) Outdoor handling or storage of hazardous materials

e) Outdoor manufacturing areas

f) Outdoor food handling or processing

g) Outdoor animal care, confinement, or slaughter

h) Outdoor horticulture activities

8. Redevelopment Projects

The Permittees shall apply the SUSMP, or site specific requirements including post-construction storm water mitigation to all planning priority projects that undergo significant Rredevelopment in their respective categories.

a) Significant Rredevelopment means land-disturbing activity that results in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site.

Where Rredevelopment results in an alteration to more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, the entire project must be mitigated. Where Rredevelopment results

in an alteration to less than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, only the change must be mitigated, and not the entire development.

b) Redevelopment does not include activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency Rredevelopment activity required to protect public health and safety.

c) Existing Single Family Structures are exempt from the Rredevelopment requirements.

9. Maintenance Agreement and Transfer

Each Permittee shall require that all developments subject to SUSMP and site specific plan requirements provide verification of maintenance provisions for structural and treatment control BMPs, including but not limited to legal agreements, covenants, CEQA mitigation requirements, and or conditional use permits. Verification at a minimum shall include:

a) The developer's signed statement accepting responsibility for maintenance until the responsibility is legally transferred, and either

b) A signed statement from the public entity assuming responsibility for structural or treatment control BMP maintenance and that it meets all local agency design standards, or

c) Written conditions in the sales or lease agreement, which requires the recipient to assume responsibility for maintenance and conduct a maintenance inspection at least once a year, or

d) Written text in project conditions, covenants and restrictions (CCRs) for residential properties assigning maintenance responsibilities to the Home Owners Association for maintenance of the structural and treatment control BMPs; or

e) Any other legally enforceable agreement that assigns responsibility for the maintenance of post-construction structural or treatment control BMPs

10. Regional Storm Water Mitigation Program

A Permittee or Permittee group may apply to the Regional Board for approval of a regional or sub-regional storm water mitigation program to substitute in part or wholly SUSMP requirements . Upon review and a determination by the Regional Board Executive Officer that the proposal is technically valid and appropriate, the Regional Board may consider for approval such a program if its implementation will:

a) result in equivalent or improved storm water quality;

b) protect stream habitat;

R0007160

c) promote cooperative problem-solving by diverse interests;

d) be fiscally sustainable and has secure funding; and

e) be completed in five years including the construction and start-up of treatment facilities.

Nothing in this provision shall be construed as to delay the implementation of SUSMP requirements, as approved in this Order.

11. Mitigation Funding

The Permittees may propose a management framework, for endorsement by the Regional Board Executive Officer, to support regional or sub-regional solutions to storm water pollution, where any of the following situations occur:

a) A waiver for impracticability is granted

b) Legislative funds become available

c) Off-site mitigation is required because of loss of environmental habitat

d) An approved watershed management plan or a regional storm water mitigation plan exists that incorporates an equivalent or improved strategy for storm water mitigation

12. California Environmental Quality Act (CEQA) Document Update

Each Permittee shall incorporate into its CEQA process, with immediate effect, procedures for considering potential storm water quality impacts and providing for appropriate mitigation when preparing and reviewing CEQA documents. The procedures shall require consideration of the following:

a) Potential Impact of project construction on storm water runoff

b) Potential Impact of projects post-construction activity on storm water runoff.

c) Potential for discharge of storm water from areas from material storage, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas or loading docks, or other outdoor work areas.

d) Potential for discharge of storm water to impair the beneficial uses of the receiving waters or areas that provide water quality benefit

e) Potential for the discharge of storm water to cause significant harm on the biological integrity of the waterways and water bodies

f) Potential for significant changes in the flow velocity or volume of storm water runoff that can cause environmental harm

g) Potential for significant increases in erosion of the project site or surrounding areas

13. General Plan Update

a) Each Permittee shall amend, revise or update its General Plans to include watershed and storm water quality and quantity management considerations and policies when the following General Plans elements are updated or amended: (i) Land Use, (ii) Housing, (iii) Conservation, (iv) Open Space.

b) Each Permittee shall provide the Regional Board with the draft amendment or revision when a listed General Plan element or the General Plan is noticed for comment in accordance with Cal. Govt. Code § 65350 et seq.

14. Targeted Employee Training

Each Permittee shall train its employees in targeted positions (whose jobs or activities are engaged in development planning) regarding the ~~requirements of the~~ development planning requirements on an annual basis beginning no later than (six months from the effective date of this Order), and more frequently if necessary. For Permittees with a population of 250,000 or more (2000 Census), training shall be completed no later than (one year from the effective date of this Order).

15. Developer Technical Guidance and Information

a) Each Permittee shall develop and make available to the developer community SUSMP (development planning) guidelines immediately.

b) The Principal Permittee in partnership with Permittees shall issue no later than (two years~~ten months~~ from the effective date of this Order), a technical manual for the siting and design of BMPs for the development community in Los Angeles County. The technical manual may be adapted from the revised California Storm Water Quality Task Force Best Management Practices Handbooks scheduled for publication in September 2002. The technical manual shall at a minimum include:

(1) treatment control BMPs based on flow-based and volumetric water quality design criteria for the purposes of countywide consistency;

(2) Peak Flow Control criteria to control peak discharge rates, velocities and duration;

(3) expected pollutant removal performance ranges obtained from national databases, technical reports and the scientific literature;

(4) maintenance considerations; and

R0007162

(5) cost considerations.

E. Development Construction Program

1. Each Permittee shall implement a program to control runoff from construction activity at all construction sites within its jurisdiction. The program shall ensure the following minimum requirements are effectively implemented at all construction sites:

   a) Sediments generated on the project site shall be retained using adequate treatment control or structural controls;

   b) Construction-related materials, wastes, spills, or residues shall be retained at the project site to avoid discharge to streets, drainage facilities, receiving waters, or adjacent properties by wind or runoff;

   c) Non-storm water runoff from equipment and vehicle washing and any other activity shall be contained at the project site; and

   d) Erosion from slopes and channels shall be controlled by implementing an effective combination of BMPs (as approved in Regional Board Resolution No. 99-03), such as the limiting of grading scheduled during the wet season; inspecting graded areas during rain events; planting and maintenance of vegetation on slopes; and covering erosion susceptible slopes.

2. For construction sites one acre and greater, each Permittee shall comply with all conditions in section E.1. above and shall:

   a) Require the preparation and submittal of a Local Storm Water Pollution Prevention Plan (Local SWPPP), for approval prior to issuance of a grading permit for construction projects.

   The Local SWPPP shall include appropriate construction site BMPs and maintenance schedules. (A Local SWPPP may substitute for the State SWPPP if the Local SWPPP is at least as inclusive in controls and BMPs as the State SWPPP). The Local SWPPP must include the rationale used for selecting or rejecting BMPs. The project architect, or engineer of record, or authorized qualified designee, must sign a statement on the Local SWPPP to the effect:

   "As the architect/engineer of record, I have selected appropriate BMPs to effectively minimize the negative impacts of this project's construction activities on storm water quality. The project owner and contractor are aware that the selected BMPs must be installed, monitored, and maintained to ensure their effectiveness. The BMPs not selected for implementation are redundant or deemed not applicable to the proposed construction activity."

   The landowner or the landowner's agent shall sign a statement to the effect:

R0007163

"I certify that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is true, accurate, and complete. I am aware that submitting false and/or inaccurate information, failing to update the Local SWPPP to reflect current conditions, or failing to properly and/or adequately implement the Local SWPPP may result in revocation of grading and/or other permits or other sanctions provided by law."

The Local SWPPP certification shall be signed by the landowner as follows, for a corporation: by a responsible corporate officer which means (a) a president, secretary, treasurer, or vice president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or (b) the manager of the construction activity if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures; for a partnership or sole proprietorship: by a general partner or the proprietor; or for a municipality or other public agency: by an elected official, a ranking management official (e.g., County Administrative Officer, City Manager, Director of Public Works, City Engineer, District Manager), or the manager of the construction activity if authority to sign Local SWPPPs has been assigned or delegated to the manager in accordance with established agency policy.

b) Inspect all construction sites for storm water quality requirements during routine inspections a minimum of once during the wet season. The Local SWPPP shall be reviewed for compliance with local codes, ordinances, and permits. For inspected sites that have not adequately implemented their Local SWPPP, a follow-up inspection to ensure compliance will take place within 2 weeks. If compliance has not been attained, the Permittee will take additional actions to achieve compliance (as specified in municipal codes). If compliance has not been achieved, and the site is also covered under a statewide general construction storm water permit, each Permittee shall enforce their local ordinance requirements, and if non-compliance continues the Regional Board shall be notified for further joint enforcement actions.

c) Require, commencing March 10, 2003, prior to issuing a grading permit for all projects less than five acres requiring coverage under a statewide general construction storm water permit, proof of a Waste Discharger Identification (WDID) Number for filing a Notice of Intent (NOI) for permit coverage and a certification that a SWPPP has been prepared by the project developer. A Local

SWPPP may substitute for the State SWPPP if the Local SWPPP is at least as inclusive in controls and BMPs as the State SWPPP.

3. For sites five acres and greater, each Permittee shall comply with all conditions in Sections E.1. and E.2.and shall:

a) Require, prior to issuing a grading permit for all projects requiring coverage under the state general permit, proof of a Waste Discharger Identification (WDID) Number for filing a Notice of Intent (NOI) for coverage under the GCASP and a certification that a SWPPP has been prepared by the project developer. A Local SWPPP may substitute for the State SWPPP if the Local SWPPP is at least as inclusive in controls and BMPs as the State SWPPP.

b) Require proof of an NOI and a copy of the SWPPP at any time a transfer of ownership takes place for the entire development or portions of the common plan of development where construction activities are still on-going.

c) Use an effective system to track grading permits issued by each Permittee. To satisfy this requirement, the use of a database or GIS system is encouraged, but not required.

4. GCASP Violation Referrals

a) Referral of Violations of the SQMP, Regional Board Resolution 98-08, and municipal storm water ordinances:

A Permittee may refer a violation(s) to the Regional Board provided that the Permittee has made a good faith effort of progressive enforcement. At a minimum, a Permittee's good faith effort must include documentation of:

- Two follow-up inspections within 3 months, and
- Two warning letters or notices of violation.

b) Referral of Violations of GCASP Filing Requirements:

For those projects subject to the GCASP, Permittees shall refer non-filers (i.e., those projects which cannot demonstrate that they have a WDID number) to the Regional Board, within 15 days of making a determination. In making such referrals, Permittees shall include, at a minimum, the following documentation:

- Project location,
- Developer,
- Estimated project size, and
- Records of communication with the developer regarding filing requirements.

4.5. Each Permittee shall train employees in targeted positions (whose jobs or activities are engaged in construction activities including construction inspection staff) regarding the requirements of the storm water management program no later than (six months from the effective date of this Order), and annually thereafter. For Permittees with a

population of 250,000 or more, initial training shall be completed no later than (one year from the effective date of this Order). Each Permittee shall maintain a list of trained employees.

F. Public Agency Activities Program

Each Permittee shall implement a Public Agency program to minimize storm water pollution impacts from public agency activities. Public Agency requirements consist of:

- Sewage Systems Maintenance, Overflow, and Spill Prevention
- Public Construction Activities Management
- Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management
- Landscape and Recreational Facilities Management
- Storm Drain Operation and Management
- Streets and Roads Maintenance
- Parking Facilities Management
- Public Industrial Activities Management
- Emergency Procedures
- Treatment Feasibility Study

1. Sewage System Maintenance, Overflow, and Spill Prevention

a) Each Permittee shall implement a response plan for overflows of the sanitary sewer system within their respective jurisdiction, which shall consist at a minimum of the following:

(1) Investigation of any complaints received;

(2) Upon notification, immediate response to overflows for containment; and

(3) Notification to appropriate sewer and public health agencies when a sewer overflows to the MS4.

b) In addition to 1.a.1, 1.a.2, and 1.a.3 above, for those Permittees, which own and/or operate a sanitary sewer system, the Permittee shall also implement the following requirements:

(1) Procedures to prevent sewage spills or leaks from sewage facilities from entering the MS4; and

(2) Identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers to the MS4.

2. Public Construction Activities Management

a) Each Permittee shall implement the Development Planning Program requirements (Permit Section D) at public construction projects.

b) Each Permittee shall implement the Development Construction Program requirements (Permit Section E) at Permittee owned construction sites.

c) Each Permittee shall obtain coverage under the GCASP for public construction sites 5 acres or greater (or part of a larger area of development) except that a municipality under 100,000 in population need not obtain coverage under a separate permit until March 10, 2003.

d) Each Permittee, no later than March 9, 2003, shall obtain coverage under a statewide general construction storm water permit for public construction sites for projects between one and five acres.

3. Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management

a) Each Permittee, consistent with the SQMP, shall implement pollution prevention plans for public vehicle maintenance facilities, material storage facilities, and corporation yards which have the potential to discharge pollutants into storm water.

b) Each Permittee shall implement BMPs to minimize pollutant discharges in storm water including but not be limited to:

(1) Good housekeeping practices;

(2) Material storage control;

(3) Vehicle leaks and spill control; and

(4) Illicit discharge control.

c) Each Permittee shall implement~~require~~ the following measures to prevent the discharge of pollutants to the MS4:

(1) For existing facilities, that are not already plumbed to the sanitary sewer, all vehicle and equipment wash areas (except for fire stations) shall be:~~that all vehicle/equipment wash areas are self-contained or covered, or equipped with a clarifier, or other pretreatment device.~~

(i) Self-contained; or

(ii) Equipped with a clarifier; or

R0007167

(iii) Equipped with an alternative pre-treatment device; or

(iv) Plumbed to the sanitary sewer.

(2) For new facilities, or during redevelopment of existing facilities (including fire stations), all vehicle and equipment wash areas shall be plumbed to the sanitary sewer and be equipped with a pre-treatment device in accordance with requirements of the sewer agency. ~~sites to be equipped with a clarifier, or other pretreatment device, and properly connected to the sanitary sewer to prevent the discharge of pollutants to the MS4.~~

~~This provision does not apply to fire fighting vehicles.~~

4. Landscape and Recreational Facilities Management

Each Permittee shall implement the following requirements:

a) A standardized protocol for the routine and non-routine application of pesticides, herbicides (including pre-emergents), and fertilizers;

b) Consistency with State Board's guidelines and monitoring requirements for application of aquatic pesticides to surface waters (WQ Order No. 2001-12 DWQ).

c) Ensure no application of pesticides or fertilizers immediately before, during, or immediately after a rain event or when water is flowing off the area to be applied;

d) Ensure that no banned or unregistered pesticides are stored or applied;

e) Ensure that staff applying pesticides are certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator;

f) Implement procedures to encourage retention and planting of native vegetation and to reduce water, fertilizer, and pesticide needs;

g) Store fertilizers and pesticides indoors or under cover on paved surfaces or use secondary containment;

h) Reduce the use, storage, and handling of hazardous materials to reduce the potential for spills; and

i) Regularly inspect storage areas.

5. Storm Drain Operation and Management

~~Each Permittee shall:~~

a) Each Permittee shall ~~D~~designate catch basin inlets within its jurisdiction as one of the following:

Priority A: ~~—c~~Catch basins that are designated as consistently generating the highest volumes of trash and/or debris~~litter~~.

Priority B: ~~—c~~Catch basins that are designated as consistently generating moderate volumes of trash and/or debris.~~litter~~

Priority C: ~~—c~~Catch basins that are designated as generating low volumes of trash and/or debris~~litter~~.

b) Permittees subject to a trash TMDL (Los Angeles River and Ballona Creek WMAs) shall continue to implement the requirements listed below until trash TMDL implementation measures are adopted. Thereafter, the subject Permittees shall implement programs in conformance with the TMDL implementation schedule, which shall include an effective combination of measures such as street sweeping, catch basin cleaning, installation of treatment devices and trash receptacles, or other BMPs. Default requirements include:

(1) Inspection and cleaning of catch basins between May 1 and September 30 of each year;

(2) Additional cleaning of any catch basin that is at least 40% full of trash and/or debris;

(3) Record keeping of catch basins cleaned; and

(4) Recording of the overall quantity of catch basin waste collected.

~~b)~~c) Permittees not subject to a trash TMDL shall:

(1) C~~c~~lean catch basins according to the following schedule:

Priority A: A minimum of three times during the wet season and once during the dry season every year. ~~—At least once during the dry season and once per month during the wet season.~~

Priority B: A minimum of once during the wet season and once during the dry season every year. ~~—At least 2 times per year and once during the wet season. Between the effective date of this Order and July 1, 2003, each Permittee shall ensure that each catch basin is cleaned whenever the catch basin reaches 40% full during the wet~~

~~season. From July 1, 2003 to the date this Order is renewed, each Permittee shall ensure that each catch basin is cleaned whenever the catch basin reaches 25% full during the wet season.~~

Priority C: A minimum of once per year. ~~as necessary but at least once per year.~~

In addition to the schedule above, between (permit effective date) and July 1, 2003, Permittees shall ensure that any catch basin that is at least 40% full of trash and/or debris shall be cleaned out. After July 1, 2003, Permittees shall ensure that any catch basin that is at least 25% full of trash and debris shall be cleaned out.

~~c)~~(2) For any special event that can be reasonably expected to generate substantial quantities of trash and litter, include provisions that require for the proper management of trash and litter generated, as a condition of the special use permit issued for that event. At a minimum, the municipality who issues the permit for the special event ~~Permittee~~ shall arrange for either temporary screens to be placed on catch basins or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain event.

~~d)~~(3) Place trash receptacles at all transit stops within its jurisdiction that have shelters no later than (6 months from the permit effective date), and at all other transit stops within its jurisdiction no later than (1 year from the permit effective date). ~~and maintain them.~~ All trash receptacles shall be maintained as necessary.

~~e)The Permittees shall implement a program which achieves the waste load allocations in conformance with a TMDL schedule of implementation by using an effective combination of BMPs which may include a combination of street sweeping, catch basin clean outs, installation of treatment devices, or other BMPs.~~

~~f)~~d) Each Permittee shall inspect the legibility of the catch basin stencil or label nearest the inlet. Catch basins with illegible stencils shall be recorded and re-stenciled or re-labeled within 180 days of inspection.

~~g)~~e) Each Permittee shall implement BMPs for Storm Drain Maintenance that include:

(1) A program to visually monitor Permittee-owned open channel storm drains and other drainage structures for debris at least annually and identify and prioritize problem areas of illicit discharge for regular inspection;

R0007170

(2) A review of current maintenance activities to assure that appropriate storm water BMPs are being utilized to protect water quality;

(3) Removal of trash and debris from open channel storm drains shall occur a minimum of once per year before the storm season;

(4) Minimize the discharge of contaminants during MS4 maintenance and clean outs; and

(5) Proper disposal of material removed.

6. Streets and Roads Maintenance

a) Each Permittee shall designate streets and/or street segments within its jurisdiction as one of the following:

Priority A: —Sstreets and/or street segments that are designated as consistently generating the highest volumes- of trash and/or debrislitter.

Priority B: —sStreets and/or street segments that are designated as consistently generating moderate volumes -of trash and/or debrislitter.

Priority C: —sStreets and/or street segments that are designated as generating low volumes of trash and/or debrislitter.

b) Each Permittee shall perform street sweeping of curbed streets according to the following schedule:

Priority A: —These streets and/or street segments shall be swept at least two times per month.

Priority B: —Each Permittee shall ensure that each street and/or street segments is swept at least once per month.

Priority C: —These streets and/or street segments shall be swept as necessary but in no case less than once per year.

c) Each Permittee shall require that:

(1) Sawcutting wastes be recovered and disposed of properly and that in no case shall waste be left on a roadway or allowed to enter the storm drain.

(2) Concrete and other street and road maintenance materials and wastes shall be managed to prevent discharge to the MS4; and

R0007171

(3) The washout of concrete trucks and chutes shall only occur in designated areas and never discharged to storm drains, open ditches, streets, or catch basins.

d) Each Permittee shall, no later than (six months from effective date of this Order), train their employees in targeted positions (whose interactions, jobs, and activities affect storm water quality) regarding the requirements of the storm water management program to:

(1) Promote a clear understanding of the potential for maintenance activities to pollute storm water; and

(2) Identify and select appropriate BMPs.

For Permittees with a population of 250,000 or more training shall be completed no later than (one year from the effective date of this Order.)

7. Parking Facilities Management

Permittee-owned parking lots exposed to storm water shall be kept clear of debris and excessive oil buildup and cleaned no less than 2 times per month and/or inspected no less than 2 times per month to determine if cleaning is necessary. In no case shall a Permittee-owned parking lot be cleaned less than once a month.

8. Public Industrial Activities Management

Each Permittee shall, for any municipal activity considered a discharge of storm water associated with industrial activity , obtain separate coverage under the GIASP except that a municipality under 100,000 in (1990 Census) population need not file the Notice Of Intent to be covered by said permit until March 10, 2003 (with the exception of power plants, airports, and uncontrolled sanitary landfills).

9. Emergency Procedures

Each Permittee shall repair essential public services and infrastructure in a manner to minimize environmental damage in emergency situations such as: earthquakes; fires; floods; landslides; or windstorms. BMPs shall be implemented to the extent that measures do not compromise public health and safety. After initial emergency response or emergency repair activities have been completed, each Permittee shall implement BMPs and programs as required under this Order.

10. Treatment Feasibility Study

R0007172

The Permittees in cooperation with the County Sanitation Districts of Los Angeles County shall conduct a study to investigate the -possible diversion of dry weather discharges or the use of alternative treatment control BMPs to treat flows from their jurisdiction- which may impact public health and safety and/or the environment. The Permittees shall collectively review their individual prioritized lists and create a watershed based priority list of -drains for potential diversion or treatment -and submit the priority listing to the Regional Board Executive Officer, no later than July 1, 20032.

G. Illicit Connections and Illicit Discharges Elimination Program

Permittees shall eliminate all illicit connections and illicit discharges to the storm drain system, and shall document, track, and report all such cases in accordance with the elements and performance measures specified in the following subsections.

1. General

   a) Implementation: Each Permittee must develop an Implementation Program which specifies how each Permittee is implementing revisions to the IC/ID Program of the SQMP. This Implementation Program must be documented, and available for review and approval by the Regional Board Executive Officer, upon request.

   b) Tracking: All Permittees shall, no later than [365 days from the effective date of this Order] develop and maintain a listing of all permitted connections to their storm drain system. All Permittees shall map at a scale and in a format specified by the Principal Permittee all illicit connections and discharges on their baseline maps, and shall transmit this information to the Principal Permittee. No later than [365 days from the effective date of this Order] the Principal Permittee shall use this information as well as results of baseline and priority screening for illicit connections (as set forth in subsection 2 below) to start an annual evaluation of patterns and trends of illicit connections and illicit discharges, with the objectives of identifying priority areas for elimination of illicit connections and illicit discharges.

   c) Training: All Permittees shall train all targeted employees who are responsible for identification, investigation, termination, cleanup, and reporting of illicit connections and discharges. For Permittees with a population of less than 250,000, training shall be completed no later than [six months from the effective date of this Order]. For Permittees with a population of 250,000 or more, training shall be completed no later than [365 days from the effective date of this Order]. Furthermore, all Permittees shall conduct refresher training on an annual basis thereafter.

2. Illicit Connections

a) Screening for Illicit Connections

(1) Field Screening: All Permittees shall field sScreen the storm drain system for illicit connections in accordance with the following schedule:

(i) Open channels: [365 days from the effective date of this Order];

(ii) Underground pipes in priority areas: [three years from the effective date of this Order]; and

(iii) Underground pipes with a diameter of 36 inches or greater: [five years from the effective date of this Order].

Permittees shall report, to the Principal Permittee, on the location and length of open channels or underground pipes that have been sScreened vis a vis the entire storm drain network, and on the status of suspected, confirmed, and terminated illicit connections. Permittees shall maintain a list containing all permitted connections and the status of connections under investigation for possible illicit connection.

(2) Permit Screening: [five years from the effective date of this Order], Permittees shall complete a review of all permitted connections to the storm drain system, to confirm compliance with Part 1 (Discharge Prohibition).

b) Response to Illicit Connections

(1) Investigation: Upon discovery or upon receiving a report of a suspected illicit connection, Permittees shall initiate an investigation within 21 days, to determine the source of the connection, the nature and volume of discharge through the connection, and the responsible party for the connection.

(2) Termination: Upon confirmation of the illicit nature of a storm drain connection, Permittees shall ensure termination of the connection within 180 days, using enforcement authority as needed.

3. Illicit Discharges

a) Abatement and Cleanup: Permittees shall respond, within one business day of discovery or a report of a suspected illicit discharge, with activities to abate, contain, and clean up all illicit discharges, including hazardous substances.

R0007174

~~b~~)Investigation: Permittees shall investigate illicit discharges as soon as practicable (during or immediately following containment and cleanup activities), and shall take enforcement action as appropriate.

Part 5. DEFINITIONS

The following are definitions for terms applicable to this Order:

"Adverse Impact" means a detrimental effect upon water quality or beneficial uses caused by a discharge or loading of a pollutant or pollutants.

"Anti-degradation policies" means the *Statement of Policy with Respect to Maintaining High Quality Water in California* (State Board Resolution No. 68-16) which protects surface and ground waters from degradation. In particular, this policy protects waterbodies where existing quality is higher than that necessary for the protection of beneficial uses including the protection of fish and wildlife propagation and recreation on and in the water.

"Applicable Standards and Limitations" means all State, interstate, and federal standards and limitations to which a "discharge" or a related activity is subject under the CWA, including "effluent limitations, "water quality standards, standards of performance, toxic effluent standards or prohibitions, "best management practices," and pretreatment standards under sections 301, 302, 303, 304, 306, 307, 308, 403 and 404 of CWA.

"**Areas of Special Biological Significance (ASBS)**" means all those areas of this state as ASBS, listed specifically within the California Ocean Plan or so designated by the State Board which, among other areas, includes the area from Mugu Lagoon to Latigo Point: Oceanwater within a line originating from Laguna Point at 34° 5' 40" north, 119° 6'30" west, thence southeasterly following the mean high tideline to a point at Latigo Point defined by the intersection of the meanhigh tide line and a line extending due south of Benchmark 24; thence due south to a distance of 1000 feet offshore or to the 100 foot isobath, whichever distance is greater; thence northwesterly following the 100 foot isobath or maintaining a 1,000-foot distance from shore, whichever maintains the greater distance from shore, to a point lying due south of Laguna Point, thence due north to Laguna Point.

"Authorized Discharge" means any discharge that is authorized pursuant to an NPDES permit or meets the conditions set forth in this Order.

"Automotive Service Facilities" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 5511, 7532-7534, or 7536-7539. For inspection purposes, Permittees need not inspect facilities with SIC codes 5013, 5014, 5541, 5511, provided that these facilities have no outside activities or materials that may be exposed to storm water.

"Basin Plan" means the Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties, adopted by the Regional Board on June 13, 1994 and subsequent amendments.

R0007175

"Beneficial Uses" means the existing or potential uses of receiving waters in the permit area as designated by the Regional Board in the Basin Plan.

"Best Management Practices (BMPs)" means methods, measures, or practices designed and selected to reduce or eliminate the discharge of pollutants to surface waters from point and nonpoint source discharges including storm water. BMPs include structural and nonstructural controls, and operation and maintenance procedures, which can be applied before, during, and/or after pollution producing activities.

"Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

"Construction" means constructing, clearing, grading, or excavation that results in soil disturbance. Construction includes structure teardown. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility~~, nor does it include~~; emergency construction activities required to immediately protect public health and safety; interior remodeling with no outside exposure of construction material or construction waste to storm water; mechanical permit work; or sign permit work.

"Control" means to minimize, reduce, eliminate, or prohibit by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

"Dechlorinated/Debrominated Swimming Pool Discharge" means swimming pool discharges which have no measurable chlorine or bromine and do not contain any detergents, wastes, or additional chemicals not typically found in swimming pool water. The term does not include swimming pool filter backwash.

"Development" means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"Directly Adjacent" means situated within 200 feet of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area.

"Director" means the Director of a municipality and Person(s) designated by and under the Director's instruction and supervision.

"Discharge" means when used without qualification the "discharge of a pollutant."

"Discharging Directly" means outflow from a drainage conveyance system that is composed entirely or predominantly of flows from the subject, property, development, subdivision, or industrial facility, and not commingled with the flows from adjacent lands.

R0007176

"Discharge of a Pollutant" means: Any addition of any "pollutant" or combination of pollutants to "waters of the United States" from any "point source" or, any addition of any pollutant or combination of pollutants to the waters of the "contiguous zone" or the ocean from any point source other than a vessel or other floating craft which is being used as a means of transportation. The term discharge includes additions of pollutants into waters of the United States from: surface runoff which is collected or channeled by man; discharges through pipes, sewers, or other conveyances owned by a State, municipality, or other person which do not lead to a treatment works; and discharges through pipes, sewers, or other conveyances, leading into privately owned treatment works.

"Disturbed Area" means an area that is altered as a result of clearing, grading, and/or excavation.

"Environmentally Sensitive Areas (ESAs)" means an area "in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which would be easily disturbed or degraded by human activities and developments" (California Public Resources Code § 30107.5). Areas subject to storm water mitigation requirements are: areas designated as Significant Ecological Areas by the County of Los Angeles (*Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976)* and amendments); an area designated as a Significant Natural Area by the California Department of Fish and Game's Significant Natural Areas Program; an area listed in the Basin Plan as supporting the "Rare, Threatened, or Endangered Species (RARE)" beneficial use; or an area identified by a Permittee as environmentally sensitive.

~~**"Full Capture Device"** means any device or system that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow resulting from a one-year, one-hour, storm.~~

"General Construction Activities Storm Water Permit (GCASP)" means the general NPDES permit adopted by the State Board which authorizes the discharge of storm water from construction activities under certain conditions.

"General Industrial Activities Storm Water Permit (GIASP)" means the general NPDES permit adopted by the State Board which authorizes the discharge of storm water from certain industrial activities under certain conditions.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is 25% or greater and where grading contemplates cut or fill slopes.

"Illicit Connection" means any man-made conveyance that is connected to the storm drain system without a permit, excluding roof drains and other similar type connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

"Illicit Discharge" means any discharge to the storm drain system that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term illicit discharge includes all non storm-water discharges except discharges pursuant to an NPDES permit, discharges that are

identified in Part 1, "Discharge Prohibitions" of this order, and discharges authorized by the Regional Board Executive Officer.

"Illicit Disposal" means any disposal, either intentionally or unintentionally, of material(s) or waste(s) that can pollute storm water.

"Industrial/Commercial Facility" means any facility involved and/or used in the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by the Standard Industrial Classifications (SIC). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

"Infiltration" means the downward entry of water into the surface of the soil.

"Inspection" means entry and the conduct of an on-site review of a facility and its operations, at reasonable times, to determine compliance with specific municipal or other legal requirements. The steps involved in performing an inspection, include, but are not limited to:

1. ~~1.~~ Pre-inspection documentation research.;
2. ~~2.~~ Request for entry;
3. ~~3.~~ Interview of facility personnel;
4. ~~4.~~ Facility walk-through.
5. ~~5.~~ Visual observation of the condition of facility premises;
6. ~~6.~~ Examination and copying of records as required;
7. ~~7.~~ Sample collection (if necessary or required);
8. ~~7.~~ Exit conference (to discuss preliminary evaluation); and,
9. ~~8.~~ Report preparation, and if appropriate, recommendations for coming into compliance.

In the case of restaurants, a Permittee may conduct an inspection from the curbside, provided that such "curbside" inspection provides the Permittee with adequate information to determine an operator's compliance with BMPs that must be implemented per requirements of this Order, Regional Board Resolution 98-08, County and municipal ordinances, and the SQMP.

"Large Municipal Separate Storm Sewer System (MS4)" means all MS4s that serve a population greater than 250,000 (1990 Census) as defined in 40 CFR § 122.26 (b)(4). The Regional Board designated Los Angeles County as a large MS4 in 1990, based on: (i) the U.S. Census Bureau 1990 population estimate of 8.9 million, and (ii) the interconnectivity of the MS4s in the incorporated and unincorporated areas within the County.

"Local SWPPP" means the Storm Water Pollution Prevention Plan required by the local agency for a project that disturbs one or more acres of land.

"Maximum Extent Practicable (MEP)" means the standard for implementation of storm water management programs to reduce pollutants in storm water. CWA's § 402(p)(3)(B)(iii) requires that municipal permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State

determines appropriate for the control of such pollutants. Specifically, municipalities must choose effective BMPs, and reject applicable BMPs only where other effective BMPs will serve the same purpose. See the legal memorandum (Feb 11, 1993) from State Board Office of Chief Counsel (OCC) to the Division of Water Quality (DWQ).

"Method Detection Limit (MDL)" means the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in 40 CFR 136, Appendix B.

"Minimum Level (ML)" means the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

"Municipal Separate Storm Sewer System (MS4)" means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, alleys, catch basins, curbs, gutters, ditches, manmade channels, or storm drains) owned by a State, city, county, town or other public body, that is designed or used for collecting or conveying storm water, which is not a combined sewer, and which is not part of a publicly owned treatment works, and which discharges to Waters of the United States.

"National Pollutant Discharge Elimination System (NPDES)" means the national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under CWA §307, 402, 318, and 405. The term includes an "approved program."

"Natural Drainage Systems" means unlined or unimproved (not engineered) creeks, streams, rivers or similar waterways.

"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

"Non-Storm Water Discharge" means any discharge to a storm drain that is not composed entirely of storm water.

"Nuisance" means anything that meets all of the following requirements: (1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; (2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal.; (3) occurs during, or as a result of, the treatment or disposal of wastes.

"Parking Lot" means land area or facility for the parking or storage of motor vehicles used for businesses, commerce, industry, or personal use, ~~personally, for businesses or for commerce~~ with a lot size of 5,000 square feet or more of surface area, or with 25 or more parking spaces.

"Permittee(s)" means Co-Permittees and any agency named in this Order as being responsible for permit conditions within its jurisdiction. Permittees to this Order include the Los

Angeles County Flood Control District, Los Angeles County, and the cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Canada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier.

"Planning Priority Projects" means those projects that are required to incorporate appropriate storm water mitigation measures into the design plan for their respective project. These types of projects include:

~~(1)~~1. Ten or more unit homes (includes single family homes, multifamily homes, condominiums, and apartments)

~~(2)~~2. A 100,000 or more square feet of impervious surface area industrial/ commercial development

~~(3)~~3. Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534, and 7536-7539)

~~(4)~~4. Retail gasoline outlets

~~(5)~~5. Restaurants (SIC 5812)

~~(6)~~6. Parking lots 5,000 square feet or more of surface area or with 25 or more parking spaces

~~(7)~~7. Redevelopment projects in subject categories that meet R~~r~~edevelopment thresholds

8. ~~Additionally, for all p~~Projects located in or directly adjacent to or discharging directly to an ESA, which meet thresholds; and

~~(8)~~9. Those projects that require the implementation of a site-specific plan to mitigate post-development storm water for new development not requiring a SUSMP but which may potentially have adverse impacts on post-development storm water quality, where the following project characteristics exist:

~~(9)~~a) Vehicle or equipment fueling areas;

~~(10)~~b) Vehicle or equipment maintenance areas, including washing and repair;

~~(11)~~c) Commercial or industrial waste handling or storage;

~~(12)~~d) Outdoor handling or storage of hazardous materials;

~~(13)~~e) Outdoor manufacturing areas;

~~(14)~~f) Outdoor food handling or processing;

~~(15)~~g) Outdoor animal care, confinement, or slaughter; or

~~(16)~~h) Outdoor horticulture activities.

"Pollutants" means those "pollutants" defined in CWA §502(6) (33.U.S.C.§1362(6)), and incorporated by reference into California Water Code §13373.

"Potable Water Distribution Systems Releases" means sources of flows from drinking water storage, supply and distribution systems including flows from system failures, pressure releases, system maintenance, ~~well development,~~ distribution line testing~~pump testing~~, fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults, ~~and wells~~and minor non-invasive well maintenance activities not involving chemical addition(s). It does not include wastewater discharges from activities that occur at wellheads, such as well construction, well development (i.e., aquifer pumping tests, well purging, etc.), or major well maintenance.

"Project" means all development, redevelopment, and land disturbing activities. The term is not limited to "Project" as defined under CEQA (Pub. Resources Code §21065).

"Rain Event" means any rain event greater than 0.1 inch in 24 hours except where specifically stated otherwise.

"Rare, Threatened, or Endangered Species (RARE)" means a beneficial use for waterbodies in the Los Angeles Region, as designated in the Basin Plan (Table 2-1), that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered.

"Receiving Waters" means all surface water bodies in the Los Angeles Region that are identified in the Basin Plan.

"Redevelopment" means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; ; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and

grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"Regional Administrator" means the Regional Administrator of the Regional Office of the USEPA or the authorized representative of the Regional Administrator.

"Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC Code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils.

"Runoff" means any runoff including storm water and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of base flow either contaminated with pollutants or uncontaminated, and nuisance flows.

"Screening" means using proactive methods to identify illicit connections through a continuously narrowing process. The methods may include: performing baseline monitoring of open channels, conducting special investigations using a prioritization approach, analyzing maintenance records for catch basin and storm drain cleaning and operation, and verifying all permitted connections into the storm drains. Special investigation techniques may include: dye testing, visual inspection, smoke testing, flow monitoring, infrared, aerial and thermal photography, and remote control camera operation.

"Sidewalk Rinsing" means pressure washing of paved pedestrian walkways with average water usage of 0.006 gallons per square foot, with no cleaning agents, and properly disposing of all debris collected, as authorized under Regional Board Resolution No. 98-08.

"Significant Ecological Area (SEA)" means an area that is determined to possess an example of biotic resources that cumulatively represent biological diversity, for the purposes of protecting biotic diversity, as part of the Los Angeles County General Plan.[1]
Areas are designated as SEAs, if they possess one or more of the following criteria:

1. The habitat of rare, endangered, and threatened plant and animal species.
2. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind, or are restricted in distribution on a regional basis.
3. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind or are restricted in distribution in Los Angeles County.
4. Habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, migrating grounds and is limited in availability either regionally or within Los Angeles County.

[1] The 61 existing SEAs represent the findings of a study that was completed in 1976 by England and Nelson, Environmental Consultants, as amended through the adoption of a revised Los Angeles County General Plan in 1980. The results of an update study to evaluate existing SEAs within unincorporated Los Angeles County is currently being proposed to the Los Angeles County Planning Commission (*Los Angeles County Significant Ecological Area Update Study 2000, Background Report*, PCR Services Corporation). The *Update Study 2000*, which contains existing and proposed SEA boundaries, can be downloaded from the Los Angeles County Department of Planning website at http://planning.co.la.ca.us/drp_revw.html#SEA

5. Biotic resources that are of scientific interest because they are either an extreme in physical/geographical limitations, or represent an unusual variation in a population or community.
6. Areas important as game species habitat or as fisheries.
7. Areas that would provide for the preservation of relatively undisturbed examples of natural biotic communities in Los Angeles County.
8. Special areas.[2]

"Significant Natural Area (SNA)" means an area defined by the California Department of Fish and Game (DFG), Significant Natural Areas Program, as an area that contains an important example of California's biological diversity. The most current SNA maps, reports, and descriptions can be downloaded from the DFG website at ftp://maphost.dfg.ca.gov/outgoing/whdab/sna/. These areas are identified using the following biological criteria only, irrespective of any administrative or jurisdictional considerations:

1. Areas supporting extremely rare species or habitats.
2. Areas supporting associations or concentrations of rare species or habitats.
3. Areas exhibiting the best examples of rare species and habitats in the state.

"Site" means the land or water area where any "facility or activity" is physically located or conducted, including adjacent land used in connection with the facility or activity.

"Source Control BMP" means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

"SQMP" means the Los Angeles Countywide Stormwater Quality Management Program.

"State Storm Water Pollution Prevention Plan (State SWPPP)" means a plan, as required by a State General Permit, identifying potential pollutant sources and describing the design, placement and implementation of BMPs, to effectively prevent non-stormwater Discharges and reduce Pollutants in Stormwater Discharges during activities covered by the General Permit.

"Storm Water" means storm water runoff, snow melt runoff, and surface runoff and drainage.

"Storm Water Discharge Associated with Industrial Activity" means industrial discharge as defined in 40 CFR 122.26(b)(14)

"Stormwater Quality Management Program" means the Los Angeles Countywide Stormwater Quality Management Program, which includes descriptions of programs, collectively developed by the Permittees in accordance with provisions of the NPDES Permit, to comply with applicable federal and state law, as the same is amended from time to time.

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both treatment control BMPs and source control BMPs.

[2] These criteria from the 1976 study have been modified in the *Update Study 2000.*

R0007183

"SUSMP" means the Los Angeles Countywide Standard Urban Stormwater Mitigation Plan. The SUSMP shall address conditions and requirements of new development.

"Total Maximum Daily Load (TMDL)" means the sum of the individual waste load allocations for point sources and load allocations for nonpoint sources and natural background.

"Toxicity Identification Evaluation (TIE)" means a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

"Toxicity Reduction Evaluation (TRE)" means a study conducted in a step-wise process to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity.

"Treatment" means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media absorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment Control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

"USEPA Phase I Facilities" means facilities in specified industrial categories that are required to obtain an NPDES permit for storm water discharges, as required by 40 CFR 122.26(c). These categories include:

i. facilities subject to storm water effluent limitation guidelines, new source performance standards, or toxic pollutant effluent standards (40 CFR N)
ii. manufacturing facilities
iii. oil and gas/mining facilities
iv. hazardous waste treatment, storage, or disposal facilities
v. landfills, land application sites, and open dumps
vi. recycling facilities
vii. steam electric power generating facilities
viii. transportation facilities
ix. sewage of wastewater treatment works
x. light manufacturing facilities

"Vehicle Maintenance/Material Storage Facilities/Corporation Yards" means any Permittee owned or operated facility or portion thereof that:

i. Conducts industrial activity, operates equipment, handles materials, and provides services similar to Federal Phase I facilities;
ii. Performs fleet vehicle service/maintenance on ten or more vehicles per day including repair, maintenance, washing, and fueling;
iii. Performs maintenance and/or repair of heavy industrial machinery/equipment ; and
iv. Stores chemicals, raw materials, or waste materials in quantities that require a hazardous materials business plan or a Spill Prevention, Control , and Counter-measures (SPCC) plan.

R0007184

~~**"Water Column Toxicity"** means a 70 percent survival rate for a single test or an average of 90 percent survival for three consecutive tests.~~

"Water Quality Standards and Water Quality Objectives" means water quality criteria contained in the Basin Plan, the California Ocean Plan, the National Toxics Rule, the California Toxics Rule, Title 22 of the California Water Code, and other state or federally approved surface water quality plans. Such plans are used by the Regional Board to regulate all discharges, including storm water discharges.

"Waters of the State" means any surface water or groundwater, including saline waters, within boundaries of the state.

"Waters of the United States" or "Waters of the U.S." means:

a. All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
b. All interstate waters, including interstate "wetlands";
c. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:
    1. Which are or could be used by interstate or foreign travelers for recreational or other purposes;
    2. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
    3. Which are used or could be used for industrial purposes by industries in interstate commerce;
a. All impoundments of waters otherwise defined as waters of the United States under this definition;
b. Tributaries of waters identified in paragraphs (a) through (d) of this definition;
c. The territorial sea; and
d. "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraph (a) through (f) of this definition.

Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.22(m), which also meet the criteria of this definition) are not waters of the United States. This exclusion applies only to man-made bodies of water, which neither were originally created in waters of the United States (such as disposal area in wetlands) nor resulted from the impoundment of waters of the United States. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the CWA, the final authority regarding CWA jurisdiction remains with US EPA.

"Wet Season" means the calendar period beginning October 1 through April 15.

Part 6. STANDARD PROVISIONS

A. Standard Requirements

1. Each Permittee shall comply with all provisions and requirements of this permit.

2. Should a Permittee discover a failure to submit any relevant facts or that it submitted incorrect information in a report, it shall promptly submit the missing or correct information.

3. Each Permittee shall report all instances of non-compliance not otherwise reported at the time monitoring reports are submitted.

4. This Order includes the attached Monitoring and Reporting Program, and SUSMP(Regional Board Resolution No. R00-02), which are a part of the permit and must be complied with in the same manner as with the rest of the requirements in the permit.

B. Regional Board Review

Any formal determination or approval made by the Regional Board Executive Officer pursuant to the provisions of this Order may be reviewed by the Regional Board. A Permittee(s) or a member of the public may request such review upon petition within 30 days of the effective date of the notification of such decision to the Permittee(s) and interested parties on file at the Regional Board.

C. Public Review

1. All documents submitted to the Regional Board in compliance with the terms and conditions of this Order shall be made available to members of the public pursuant to the Freedom of Information Act (5 U.S.C. § 552 (as amended) and the Public Records Act (Cal Government Code Section 6250 *et seq.*).

2. All documents submitted to the Regional Board Executive Officer for approval shall be made available to the public for a 30-day period to allow for public comment.

D. Duty to Comply

1. Each Permittee must comply with all of the terms, requirements, and conditions of this Order. Any violation of this order constitutes a violation of the Clean Water Act, its regulations and the California Water Code, and is grounds for enforcement action, Order termination, Order revocation and reissuance, denial of an application for reissuance; or a combination thereof [40 CFR 122.41(a), CWC Section 13261, 13263, 13265, 13268, 13300, 13301, 13304, 13340, 13350].

2. A copy of these waste discharge specifications shall be maintained by each Permittee so as to be available during normal business hours to Permittee employees and members of the public.

R0007186

3. Any discharge of wastes at any point(s) other than specifically described in this Order is prohibited, and constitutes a violation of the Order.

E. Duty to Mitigate [40 CFR 122.41 (d)]

Each Permittee shall take all reasonable steps to minimize or prevent any discharge that has a reasonable likelihood of adversely affecting human health or the environment.

F. Inspection and Entry [40 CFR 122.41(i), CWC Section 13267]

The Regional Board, USEPA, and other authorized representatives shall be allowed:

1. Entry upon premises where a regulated facility is located or conducted, or where records are kept under conditions of this Order;
2. Access to copy any records, at reasonable times, that are kept under the conditions of this Order;
3. To inspect at reasonable times any facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; and,
4. To photograph, sample, and monitor at reasonable times for the purpose of assuring compliance with this Order, or as otherwise authorized by the Clean Water Act and the California Water Code.

G. Proper Operation and Maintenance [40 CFR 122.41 (e), CWC Section 13263(f)]

The Permittees shall at all times properly operate and maintain all facilities and systems of treatment (and related appurtenances) that are installed or used by the Permittees to achieve compliance with this Order. Proper operation and maintenance includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar system that are installed by a Permittee only when necessary to achieve compliance with the conditions of this Order.

H. Signatory Requirements [40 CFR 122.41(k) & 122.22]

Except as otherwise provided in this Order, all applications, reports, or information submitted to the Regional Board shall be signed by the Director of Public Works, City Engineer, or authorized designee and certified as set forth in 40 CFR 122.22.

I. Reopener and Modification [40 CFR 122.41(f) & 122.62]

1. This Order may only be modified, revoked, or reissued, prior to the expiration date, by the Regional Board, in accordance with the procedural

requirements of the Water Code and Title 23 of the California Code of Regulations for the issuance of waste discharge requirements, 40 CFR 122.62, and upon prior notice and hearing, to:

a) Address changed conditions identified in the required reports or other sources deemed significant by the Regional Board;

b) Incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;

c) Comply with any applicable requirements, guidelines, and/or regulations issued or approved pursuant to CWA Section 402(p); and/or,

d) Consider any other federal, or state laws or regulations that became effective after adoption of this Order.

2. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:

a) Violation of any term or condition contained in this Order;

b) Obtaining this Order by misrepresentation, or failure to disclose all relevant facts; or,

c) A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.

~~3.This Order may be modified, revoked and reissued, or terminated for cause.~~

~~4.~~3. The filing of a request by the Principal Permittee or Permittees for a modification, revocation and re-issuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any condition of this Order.

~~5.~~4. This Order may be modified to make corrections or allowances for changes in the permitted activity listed in this section, following the procedures at 40 CFR Part 122.63, if processed as a minor modification. Minor modifications may only:

a) Correct typographical errors, or

b) Require more frequent monitoring or reporting by the Permittee.

J. Severability

The provisions of this permit are severable; and if any provision of this permit or the application of any provision of this permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this permit shall not be affected.

K. Duty to Provide Information [40 CFR 122.41(h)] R0007188

The Permittees shall furnish, within a reasonable time, any information the Regional Board or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order. The Permittees shall also furnish to the Regional Board, upon request, copies of records required to be kept by this Order.

L. Twenty-four Hour Reporting [40 CFR 122.41(l)(6)][3]

1. The Permittees shall report to the Regional Board any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time any Permittee becomes aware of the circumstances. A written submission shall also be provided within five days of the time the Permittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times and, if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

2. The Regional Board may waive the required written report on a case-by-case basis.

M. Bypass [40 CFR 122.41(m)][4]

Bypass (the intentional diversion of waste streams from any portion of a treatment facility) is prohibited. The Regional Board may take enforcement action against Permittees for bypass unless:

1. Bypass was unavoidable to prevent loss of life, personal injury or severe property damage. (Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.);

2. There were no feasible alternatives to bypass, such as the use of auxiliary treatment facilities, retention of untreated waste, or maintenance during normal periods of equipment down time. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that could occur during normal periods of equipment downtime or preventive maintenance;

3. The Permittee submitted a notice at least ten days in advance of the need for a bypass to the Regional Board; or,

[3] This provision applies to incidents where effluent limitations (numerical or narrative) as provided in this Order or in the Los Angeles County SQMP are exceeded, and which endanger public health or the environment.

[4] This provision applies to the operation and maintenance of storm water controls and BMPs as provided in this Order or in the SQMP.

4. Permittees may allow a bypass to occur that does not cause effluent limitations to be exceeded, but only if it is for essential maintenance to assure efficient operation. In such a case, the above bypass conditions are not applicable. The Permittee shall submit notice of an unanticipated bypass as required.

N. Upset [40 CFR 122.41(n)][5]

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.

1. A Permittee that wishes to establish the affirmative defense of an upset in an action brought for non compliance shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:

   a) An upset occurred and that the Permittee can identify the cause(s) of the upset;

   b) The permitted facility was being properly operated by the time of the upset;

   c) The Permittee submitted notice of the upset as required; and,

   d) The Permittee complied with any remedial measures required.

2. No determination made before an action for noncompliance, such as during administrative review of claims that non-compliance was caused by an upset, is final administrative action subject to judicial review.

3. In any enforcement proceeding, the Permittee seeking to establish the occurrence of an upset has the burden of proof.

O. Property Rights [40 CFR 122.41(g)]

This Order does not convey any property rights of any sort, or any exclusive privilege.

P. Enforcement

1. Violation of any of the provisions of the NPDES permit or any of the provisions of this Order may subject the violator to any of the penalties described herein, or any combination thereof, at the discretion of the prosecuting authority; except that only one kind of penalties may be

[5] *Supra*. See footnote number 2.

applied for each kind of violation. The Clean Water Act provides the following:

a) Criminal Penalties for:

(1) Negligent Violations:

The CWA provides that any person who negligently violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $2,500 nor more than $25,000 per day for each violation, or by imprisonment for not more than 1 year, or both.

(2) Knowing Violations:

The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

(3) Knowing Endangerment:

The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than $250,000, or by imprisonment for not more than 15 years, or both.

(4) False Statement:

The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than two years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than four years, or by both. (See section 309(c)(4) of the Clean Water Act.)

b) Civil Penalties

The CWA provides that any person who violates a permit condition implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed $27,500 per day for each violation.

2. The CWC provides that any person who violates a waste discharge requirement provision of the CWC is subject to civil penalties of up to $5,000 per day, $10,000 per day, or $25,000 per day of violation; or when the violation involves the discharge of pollutants, is subject to civil penalties of up to $10 per gallon per day or $25 per gallon per day of violation; or some combination thereof, depending on the violation or combination of violations.

Q. Need to Halt or Reduce Activity not a Defense [40 CFR 122.41(c)]

It shall not be a defense for a Permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order.

R. Rescission

Regional Board Order No. 96-054 is hereby rescinded.

S. Expiration

This Order expires on December 13~~November 29~~, 2006. The ~~Principal~~ Permittees must submit a Report of Waste Discharges and a proposed Storm Water Quality Management Program in accordance with Title 23, California Code of Regulations, ~~not later than 180 days in advance of such date~~ as application for reissuance of waste discharge requirements no later than June 13, 2006.

I, Dennis A. Dickerson, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on November 29, 2001.

Dennis A. Dickerson

MONITORING AND REPORTING PROGRAM - CI 6948

FOR

MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES, AND THE INCORPORATED CITIES, EXCEPT THE CITY OF LONG BEACH

(NPDES PERMIT NO. CAS004001)

I. Program Reporting Requirements

The Principal Permittee shall submit, no later than October 15 of each year beginning in the year 2002, a unified Annual Storm Water Report (~~u~~Unified Annual Report) documenting the progress of Permittees' implementation of the SQMP and the requirements of this Order. The ~~u~~Unified Annual Report shall contain a section covering common activities conducted collectively by the Permittees, and an integrated summary of the Monitoring Program results. Each Permittee shall submit an individual Annual Report to the Principal Permittee, by the date determined by the Principal Permittee, to be included in the ~~u~~Unified Annual Report. The ~~u~~Unified Annual Reports shall cover each fiscal year from July 1 through June 30. The first ~~u~~Unified Annual Report, to be submitted on October 15, 2002, shall include the period from July 1, 2001 through June 30, 2002. Specific requirements that must be addressed in the Annual Reports are listed below.

A. Unified Annual Report

The Principal Permittee shall include the following in the ~~u~~Unified Annual Report:

1. A compilation of Permittee Individual Annual Reports.

2. Proposed changes to the SQMP, as recommended by the WMCs.

3. An assessment of the effectiveness of SQMP requirements to reduce storm water pollution. This assessment shall be comprised of a compilation of watershedwide assessments conducted by each WMC. ~~This a~~Assessments ~~will~~shall be based upon the specific record-keeping information requirement in each ~~major~~ section of the permit, monitoring data, summaries of program effectiveness from each Permittee, and any other information related to program effectiveness. The program assessment shall include summaries of the following:

   a) Summary of common activities conducted by all Permittees;

   b) Watershed Management Area~~County-wide~~ BMP implementation;

   c) Identification of management measures proven to be effective and/or ineffective at reducing urban runoff pollutants and flow;

   d) Permittee level of effort, as indicated in their individual Annual Report self evaluations (Attachment U-4, section VI); and

e) Integrated summary of Monitoring Program results, including the identification of water quality improvements or degradation, and recommendations for improvements to the SQMP (including proposed BMPs) based on the results from the ~~m~~Monitoring ~~p~~Program. ~~When exceedances of applicable water quality standards have been identified, a discussion of how Permittees will comply with the requirements in Part 2 of this Order (Receiving Water Limitations) shall be included.~~

4. Pursuant to Part 2 of this Order, after a determination by either the Permittee or the Regional Board that discharges are causing or contributing to an exceedance of an applicable Water Quality Standard, a~~A~~ Receiving Water Limitations (RWL) Compliance Report shall be attached to the subsequent unified Annual Report. A status RWL Compliance Report shall be submitted every alternate year following the submittal of the first Report~~, beginning in 2003~~. The RWL Compliance Report shall include the following:

   a) A plan to comply with the RWL (~~Order 01-XXX,~~ Part 2 of this Order);

   b) Changes to the SQMP to eliminate water quality exceedances;

   c) Enhanced monitoring to demonstrate compliance; and

   d) Results of implementation.

   If all water quality exceedances have been abated, a RWL Compliance Report is not required.

B. Individual Annual Reports

Each iIndividual Annual Report shall document and describe all activities conducted by a Permittee to meet all requirements of this Order, during the completed~~past~~ annual reporting period. Individual Annual Reports shall use the attached form (Attachment U-~~4~~5), or create another reporting format that includes all items on the attached form. Each Permittee shall complete the form in its entirety, except for those requirements applicable only to the Principal Permittee, as indicated on the form. Status of compliance with permit requirements including implementation dates for all time-specific deadlines should be included for each program area. If permit deadlines are not met, Permittees shall report the reasons why the requirement was not met and how the requirements will be met in the future, including projected implementation dates. A comparison of program implementation results to performance standards established in this Order and in the SQMP shall be included for each program area.

C. Monitoring Program Management

The Principal Permittee shall submit a Storm Water Monitoring Report (Monitoring Report) on August 15, 2002, and annually on August 15, thereafter. The Monitoring Report to be submitted on August 15, 2002 shall include the results of monitoring from July 1, 2001 through June 30, 2002. Each Monitoring Report shall include:

R0007197

1. Status of implementation of the monitoring program.

2. Data, results, methods of evaluating the data, graphical summaries of the data, and an explanation/discussion of the data for each component of the monitoring program, including any specific reporting requirements included in Section II. Monitoring Program. ~~All data shall be compared to applicable water quality standards in the Ocean Plan, the Basin Plan, the California Toxics Rule (CTR), and California Title 22 (Title 22).~~

3. An analysis of the findings of each monitoring program component. The analysis shall identify and prioritize water quality problems. Based on the identification and prioritization of water quality problems, the analysis shall identify potential sources of the problems, and recommend future monitoring and BMP implementation measures for identifying and addressing the sources. The analysis shall also include an evaluation of the effectiveness of existing control measures.

4. Identification and analysis of any long-term trends in storm water or receiving water quality.

5. An estimation of total pollutant loads due to storm water/urban runoff for each mass emission station.

6. A comparison to the~~An assessment of compliance with~~ applicable water quality standards for each component of the monitoring program. The lowest applicable standard from the Basin Plan, the Ocean Plan, ~~the~~ CTR, or Title 22 of the CWC shall be used for~~as a~~ comparison. Constituents that exceed applicable water quality standards shall be highlighted. When data indicate that discharges are causing or contributing to exceedances of applicable water quality standards, a discussion of possible pollutant sources shall be included in the Monitoring Report and a RWL Compliance Report (Section I.A.4) shall be submitted with the subsequent Unified Annual Report.~~how Permittees plan to comply with the requirements of Part 2 of this Order (RWL) shall be included.~~

~~7. Recommendations for improvements to the SQMP and to the monitoring program to address water quality exceedances and potential pollutant sources.~~

~~8.~~7. For each monitoring component, maps of all monitoring station locations and descriptions of each location.

~~9.~~8. All monitoring reports shall be submitted in both electronic and paper formats.

D. The Principal Permittee shall, not later than December 15, 2005, prepare and submit an Integrated Receiving Water Impacts Report. The report shall include, but not be limited to, a comprehensive analysis of the results of the data from each component of the monitoring program, and other pertinent studies available, and feasible environmental indicators. It should also include a budget summary for each monitoring requirement and recommendations on future monitoring requirements. This report will be an integral part of the ROWD.

E. All applications, reports, or information submitted to the Regional Board shall be signed and certified pursuant to US EPA regulations at 40 CFR 122.41 (k). Each report shall contain the following completed declaration:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility, of a fine and imprisonment for knowing violations.

Executed on the ___ day of _____ , 20_,

at _____.

(Signature)_____(Title)_____";

Permittee submittals to the Principal Permittee shall also be signed and certified pursuant to EPA regulations 40 CFR 122.41 (k).

The Principal Permittee shall mail the original of each annual report to:

INFORMATION TECHNOLOGY
CALIFORNIA REGIONAL WATER QUALITY
CONTROL BOARD - LOS ANGELES REGION
320 W. 4TH STREET, SUITE 200
LOS ANGELES, CA 90013

A copy of the annual report shall also be mailed to:

REGIONAL ADMINISTRATOR
ENVIRONMENTAL PROTECTION AGENCY
REGION 9
75 Hawthorne Street
San Francisco, CA 94105

R0007199

II. Monitoring Program

The primary objectives of the Monitoring Program include, but are not limited to: 1) assessing compliance with this Order; 2) measuring and improving the effectiveness of the SQMPs; 3) assessing the chemical, physical, and biological impacts of receiving waters resulting from urban runoff; 4) characterization of storm water discharges; 5) identifying sources of pollutants; and 6) assessing the overall health and evaluating long-term trends in receiving water quality. Ultimately, the results of the monitoring requirements outlined below should be used to refine the SQMP for the reduction of pollutant loadings and the protection and enhancement of the beneficial uses of the receiving waters in Los Angeles County.

The Principal Permittee and Permittees shall implement the Monitoring Program as follows:

CORE MONITORING

A. Mass Emissions

The Principal Permittee shall monitor mass emissions to accomplish the following objectives: 1) estimate the mass emissions from the MS4; 2) assess trends in the mass emissions over time; and 3) determine if the MS4 is contributing to exceedances of water quality standards~~objectives~~ by comparing results to applicable standards ~~objectives~~ in the Basin Plan, the Ocean Plan, the CTR, Title 22, and with emissions from other dischargers.

1. The Principal Permittee shall monitor mass emissions from the following seven mass emission stations: Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, Coyote Creek, Dominguez Channel, and the Santa Clara River[1]. The Principal Permittee shall monitor the first storm event and a minimum of 2 additional storm events for each season. A minimum of two dry weather samples per year at each mass emission station shall also be analyzed. Sampling at all stations shall begin no later than (the effective date of this Order), except for sampling in the Santa Clara River, which will begin no later than (the following wet season).

2. All storms events, in addition to those required above, that result in at least 0.25 inches of rainfall shall be sampled and analyzed for TSS. Results shall be used to assess the variability of storm water constituents and provide a more accurate estimate of mass emissions (pollutant correlation with TSS). This requirement does not apply to manual sampling stations.

3. Samples for mass emission monitoring may be taken with the same type of automatic sampler used under Order 96-054. Grab samples shall be taken for pathogen indicators and oil and grease. The samplers shall be set to monitor storms that produce 0.25 inches or greater of rainfall. Samples taken at mass emission stations during the first storm event of the wet season shall be analyzed for all constituents listed in Attachment U-1.

[1] Regional Board staff will work with the Principal Permittee to determine an appropriate location for the Santa Clara River station.

4. Manual samples shall be collected from mass emission stations where it is not feasible to install an automatic sampler (Santa Clara River). Manual samples shall be flow-weighted composites, collected during the first 3 hours, or for the duration of the storm if it is less than 3 hours. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge[2], unless the Regional Board Executive Officer approves an alternate protocol.

5. Samples from mass emission stations shall be analyzed for all constituents listed in Attachment U-1. If a constituent is not detected at the method detection limit for its respective test method listed in Attachment U-1 in more than 75 percent of the first 48 sampling events, it need not be further analyzed unless the observed occurrences show concentrations greater than state water quality standards. The Principal Permittee will also conduct annual confirmation sampling for non-detected constituents during the first storm of the wet season every year at each station.

6. The Principal Permittee shall perform an annual analysis, to be included in the Monitoring Report, of the correlation between pollutants of concern (including but not limited to metals and PAHs) and TSS loadings for the sampling events that are analyzed for the full suite of constituents.

B. Water Column Toxicity Monitoring

The Principal Permittee shall analyze mass emission samples for toxicity to evaluate the extent and causes of toxicity in receiving waters and to modify and utilize the SQMP to implement practices that eliminate or reduce sources of toxicity in storm water.

1. The Principal Permittee shall analyze samples from two storm events (including the first storm of each year) and two dry weather events from each mass emission station for toxicity every year. A minimum of one freshwater and one marine species shall be used for toxicity testing for each station event. Specifically, *Ceriodaphnia dubia* (water flea) 7-da, survival/reproduction and *Strongylocentrotus purpuratus* (sea urchin) fertilization tests shall be used. These tests should include a dilution series (0.5x steps) that ranges from the undiluted sample (or the highest concentration that can be tested within the limitations of the test methods or sample type) to≤ 6% sample.

2. Toxicity Identification Evaluations (TIE)

The Principal Permittee shall begin a Phase I TIE immediately on all samples that are substantially toxic (≥1 Toxic Unit) to either test species.[3] If a sample is substantially toxic to both species, a TIE shall be performed for both species. ~~Substantial toxicity means the amount of toxicity~~

[2] Required in 40 CFR 122.21(g)(7)(ii), and described in NPDES Storm Water Sampling Guidance Document EPA 833-B-92-001. Time-weighted samples may be appropriate if flow is measured during sampling.

[3] Substantial toxicity means the amount of toxicity necessary to successfully conduct a Phase I TIE. Toxic Units are calculated by dividing 100 by the calculated median test response value (e.g., LC50 or EC50). For example, a LC50 of 50% sample equals 2 Toxic Units. Ceriodaphnia TIEs require at least 50% mortality in undiluted sample (1 Toxic Unit) at any time during the 7-day duration of the initial chronic bioassay (SCCWRP).

~~necessary to successfully conduct a Phase I TIE. For example, *Ceriodaphnia* TIEs require at least 50% mortality in undiluted sample at any time during the 7-day duration of the initial chronic bioassay.~~[4] The Phase I TIE shall include the following treatments and corresponding blanks:

a) Baseline toxicity;

b) Particle removal by centrifugation;

c) Solid phase extraction of the centrifuged sample using C18 media;

d) Complexation of metals using ethylenediaminetetraacetic acid (EDTA) addition to the raw sample;

e) Neutralization of oxidants/metals using sodium thiosulfate addition to the raw sample; and

f) Inhibition of organo-phosphate (OP) pesticide activation using piperonyl butoxide addition to the raw sample (crustacean toxicity tests only).

3. Toxicity Reduction Evaluations (TRE)

a) When the same pollutant or class of pollutants is identified through the TIE process as causing at least 50% of the toxic responses in at least 3 samples at a sampling location, a TRE shall be performed for that identified toxic pollutant.~~If a discharge from the MS4 is identified to cause or contribute to toxicity in a receiving water body, a TRE shall be performed.~~ TRE development shall be performed by a neutral third party (retained by the Principal Permittee), with input from Permittees and Regional Board staff. The TRE shall include all reasonable steps to identify the source(s) of toxicity and discuss appropriate BMPs to eliminate the causes of toxicity. Once the source of toxicity and appropriate BMPs are identified, the Principal Permittee shall submit the TRE to the Regional Board Executive Officer for approval. At a minimum, it shall include a discussion of the following items:

(1) The potential sources of pollutant(s) causing toxicity;

(2) A list of municipalities that may have jurisdiction over sources of pollutant(s) causing toxicity;

(3) Recommended BMPs to reduce the pollutant(s) causing toxicity;

(4) Proposed changes to the SQMP to reduce the pollutant(s) causing toxicity; and

(5) Suggested follow-up monitoring to demonstrate that toxicity has been removed.

~~[4] SCGRWP~~

b) Since the Phase I TIEs may only identify a broad category of toxicants (e.g., nonpolar organics), additional TIE analyses may be required in order to identify or confirm the identity of the pollutants causing toxicity before the TRE can be completed.

~~b)~~c) If TRE implementation for a specific pollutant coincides with TMDL implementation for that pollutant, the efforts may be coordinated.

~~c)~~d) Upon approval by the Regional Board Executive Officer, the Permittee(s) having jurisdiction over sources causing or contributing to toxicity shall implement the recommended BMPs and take all reasonable steps necessary to eliminate toxicity.

~~d)~~e) The Principal Permittee shall be responsible for the development of a maximum of two TREs per year. If applicable, the Principal Permittee may use the same TRE for the same toxic pollutant or pollutant class in different watersheds. The TRE process shall be coordinated with TMDL development and implementation (ie. If a TMDL for zinc is being implemented when a TRE for zinc is required, the efforts shall be coordinated to avoid overlap).

~~e)~~f) The Principal Permittee shall report on the development, implementation, and results for each TRE in the annual Monitoring Reports, beginning the year following the identification of each pollutant or pollutant class causing toxicity.

C. Tributary Monitoring

The Principal Permittee shall monitor tributaries to identify sub-watersheds where storm water discharges are causing or contributing to exceedances of water quality standards, and to prioritize drainage and sub-drainage areas that need management actions.

1. The Principal Permittee shall develop and implement a watershed-based tributary monitoring program, in which a minimum of six tributaries per year~~WMA~~ will be monitored, based on the schedule described below:

   a) Monitoring station locations will be rotated so that a minimum total of six tributaries will be monitored per year. Each tributary shall be monitored for a minimum period of one year. If no exceedances of applicable water quality standards occur during one year of monitoring at a single tributary station, the Principal Permittee may move that monitoring station to another tributary, subject to the approval of the Regional Board Executive Officer. When an applicable water quality standard is exceeded in three out of four sampling events in a given monitoring year, the Permittees shall initiate a focused effort to identify sources of pollutants within that subwatershed.

   b) Tributary monitoring shall begin in the Los Angeles River WMA, and shall be rotated to locations in other watersheds as monitoring

R0007203

at each station is complete, as approved by the Regional Board Executive Officer. The Principal Permittee shall include a description and explanation of each proposed station location and a summary of the prior year's results of the tributary monitoring program in the annual Monitoring Report.

c) Monitoring shall begin at the following tributaries:

(1) Aliso Creek
(2) Bull Creek
(3) Arroyo Seco Channel~~Compton Creek~~
(4) Rio Hondo Channel
(5) Burbank West
(6) Verdugo Wash

2. Tributary monitoring shall begin in October 2002~~(no later than the effective date of this Order)~~.

3. The Principal Permittee shall monitor the first storm event and at least 3 additional storm events during each storm season. At least one dry weather event per year will also be sampled at each station.

4. Samples shall be flow-weighted composites, collected during the first 3 hours or for the duration of the storm if it is less than 3 hours. Samples may be collected manually or automatically. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge[5], unless the Regional Board Executive Officer approves an alternate protocol. Samples shall be taken just upstream of the tributary's confluence with the mainstem. Constituents to be analyzed for each location shall include the following:

a) pH, dissolved oxygen, temperature, conductivity, and total suspended solids;

b) Indicator bacteria;

c) All priority pollutants (Attachment U-1) for the first storm of the year;

d) All constituents for which the water body is impaired downstream of the monitoring station[6];

e) All constituents that caused toxicity or exceeded any applicable water quality criteria at the associated mass emission station the previous year. These constituents shall be listed in each Monitoring Report.

f) Flow (flow may be estimated using EPA methods[7] at sites where flow measurement devices are not in place).

[5] Required in 40 CFR 122.21(g)(7)(ii), and described in NPDES Storm Water Sampling Guidance Document EPA 833-B-92-001. Time-weighted samples may be appropriate if flow is measured during sampling.

[6] The 1998 California 303(d) List and TMDL Priority Schedule lists pollutants for which each water body is impaired, www.swrcb.ca.gov/tmdl/docs/303d98.pdf#reg4

D. Shoreline Monitoring

The City of Los Angeles shall monitor shoreline stations to evaluate the impacts to coastal receiving waters and the loss of recreational beneficial uses resulting from storm water/urban runoff. This component shall be integrated and coordinated with similar monitoring programs in the region.

1. The City of Los Angeles shall monitor eighteen water quality sampling stations along the shoreline of the Pacific Ocean within the Santa Monica Bay to determine compliance with the California's bathing water standards for public beaches and ocean water-contact sport areas[8], and the related impacts of discharges from storm drains and piers. The shoreline monitoring program shall be implemented as follows:

   a) The eighteen established shoreline water quality stations listed in Attachment U-~~2~~3 shall be monitored. Station locations may be modified based on recommendations from the Santa Monica Bay Restoration Project (SMBRP) and approval from the Regional Board Executive Officer;

   b) Three indicator groups shall be tested for using either membrane filtration, multiple tube fermentation, or chromogenic substrate test kits. Monitoring shall include the following types and frequencies of sampling:

Parameter	Units	Sample Frequency
Total coliforms	CFU or MPN/100 ml	6/week (Mon-Sat)[9]
Fecal coliform[10]	CFU or MPN/100 ml	6/week (Mon-Sat)[5]
Enterococcus	CFU or MPN/100 ml	6/week (Mon-Sat)[5]

   c) Shoreline monitoring shall occur during daylight hours. Samples may be omitted in the event of hazardous weather;

   d) Shoreline monitoring frequencies at certain stations may be modified based on the use of the adjacent beaches and their proximity to storm drains, as recommended by the SMBRP's Technical Advisory Committee and the Los Angeles County Department of Health Services (LA County DHS).

   e) Data collected shall be transmitted daily to the LA County DHS. The City of Los Angeles will annually assess the data and submit it to the Principal Permittee for inclusion in the Monitoring Report;

   f) When exceedances of public health standards for bacteria occur, the LA County DHS shall take the appropriate action, as described

[7] NPDES Storm Water Sampling Guidance Document, EPA 833-B-92-001, July 1992
[8] California Department of Health Services, Health and Safety Code §115880 (Assembly Bill 411, Statutes of 1997, Chapter 765
[9] Samples will be collected on Sundays preceding Monday holidays
[10] *Escherichia Coli (E. Coli)* may be substituted for Fecal Coliform if chromogenic substrate test kits are used

in the Regulations for Public Beaches and Ocean Water-Contact Sports Areas[11].

g) The City of Los Angeles will continue to conduct all monitoring, testing, and data transferring actions as part of the SMBRP regional program for the Santa Monica Bay.

E. Trash Monitoring

To assess the quantities of trash in receiving waters after storm events and to identify areas impaired for trash, the Principal Permittee shall conduct visual observations of trash and take a minimum of one photograph at each mass emission station after the first storm event and 3 additional storm events per year.

The Principal Permittee and Permittees in the Los Angeles River and Ballona Creek WMAs (listed in Permit Attachment A) shall ~~conduct trash monitoring to assess likely sources and to identify areas impaired for trash. The Principal Permittee and the Permittees in the Los Angeles River and Ballona Creek WMAs (listed in Attachment A) shall~~ develop and implement a trash monitoring program for the Los Angeles River and Ballona Creek watersheds no later than October 15, 2002. The monitoring program and schedule shall be consistent with and pursuant to ~~the~~ CWC §13267 "Request for Trash Monitoring", issued by the Regional Board on [date letter issued]. ~~All other Permittees shall begin implementation of the trash monitoring program in watersheds that are not presently listed on the CWA §303(d) list for impairment for trash no later than October 15, 2003.~~

1. For the first two years of monitoring, ~~E~~either of the following formats for monitoring plans may be used:

a) For each watershed, the group of Permittees in that watershed will capture and quantify trash from an area no less than 10% of the total land area over which they have jurisdiction. The monitoring areas shall represent 10% of every land use the group of Permittees has jurisdiction over. If storm drain configuration versus land use make the representation of 10% of a land use infeasible, the Permittees can choose areas that represent their land uses as accurately as possible, as long as the extent of the surface being monitored represents 10%. This monitoring shall use full capture devices. During wet weather, all sampling devices will be emptied within 72 hours of every rain event of 0.25 inch or greater. During dry weather, sampling devices will be emptied and analyzed every three months in the absence of precipitation.

b) For each watershed, the group of Permittees in that watershed will sample a minimum of ten representative sites for each land use monitored. For each sampling site, a minimum of five catch basins will be fitted with inserts, for a total of not less than 50 catch basin inserts per land use monitored. The existing littler removal practices that the cities implement will remain in place, so that monitoring will evaluate how much

[11] Regulations for Public Beaches and Ocean Water-Contact Sports Areas, Title 17 CCR Group 10, developed in response to Health and Safety Code §115880

trash is washed into the system under current practices. A structural, full capture device shall be installed downstream of at least one sampling site for each land use monitored. For this sampling site, all of the catch basins that are upstream of the full capture-monitoring device must be fitted with inserts. This configuration will provide information on the relative effectiveness of the catch basin inserts as opposed to the full capture systems in varying land uses and under varying weather conditions. During wet weather, all sampling devices will be emptied within 72 hours of every rain event of 0.25 inch or greater. During dry weather, sampling devices will be emptied and analyzed every three months in the absence of precipitation.

2. Permittees shall report data in a single unit of measure that is reproducible and measures the amount of trash, irrespective of water content (e.g. compacted volume based on a standardized compaction rate, or dry weight). Permittees may select the unit, but all Permittees must use the same unit of measure.

3. Following the first two years of data collection, Permittees shall conduct compliance monitoring, which involves calculateing trash loading as a running three-year average (estimated total load discharged from 2003-2006, divided by three).

4. All trash collected shall be disposed of in compliance with all applicable regulations.

REGIONAL MONITORING

The Principal Permittee shall participate on regional monitoring committees to help establish on-going regional programs that address public health concerns, monitor trends in natural resources and nearshore habitats, and assess regional impacts from all pollutant sources. Regional Monitoring participation shall include, but not necessarily be limited to, the efforts described below.

F. Estuary Sampling

The Southern California Coastal Waters Research Project (SCCWRP), in conjunction with the USEPA, the State Board, three Regional Boards, and participating dischargers, has organized an effort to implement a regional monitoring program for the southern California bight. Previous studies (in 1994 and 1998) included microbiology, water quality, sediment chemistry, sediment toxicity testing, benthic infauna, demersal fish, and bioaccumulation. A similar bight-wide monitoring effort is planned to be conducted in 2003. The Principal Permittee shall participate on the Steering Committee for this bight-wide monitoring project, and should complete the estuary sampling requirement described below in parallel with this effort.

In addition to participation in the Bight-wide study, the goal of this requirement is to sample estuaries for sediment chemistry, sediment toxicity, and benthic macroinvertibrate community to determine the spatial extent of sediment fate from storm water, and the magnitude of its effects. A map of each estuary which depicts the impacted areas shall be produced. The maps shall provide the

information necessary to conduct effective sediment monitoring to determine trends and accumulation, as a future permit requirement.

1. The Principal Permittee shall sample a maximum of 25 sites in each estuary/mouth (Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, and Dominguez Channel) once during the permit cycle. Sediment samples shall be taken at each station by means of a $0.1m^2$ ($1.1 ft^2$) modified Van Veen sediment grab sampler.

2. The Principal Permittee shall also sample a total of 25 sites outside of the direct outfalls to assess cumulative effects.

3. All samples shall be analyzed for the following:
   a) Sediment Chemistry (priority pollutants)
   b) Total Organic Carbon (TOC)
   c) Grain size
   d) Sediment Toxicity
      (1) Amphipod survival bioassays shall be conducted on each sediment sample. Toxicity shall be indicated by an amphipod survival rate of 70% or less in a single test.
      (2) Phase I TIEs of interstitial water, using the amphipod test species~~Ceriodaphnia dubia and Strongylocentrotus purpuratus (sea urchin) fertilization~~, shall be conducted for samples from stations identified to be toxic in a single amphipod survival bioassay.
   e) Benthic Macroinvertibrates
      (1) All sediment samples shall be passed through a 1.0mm (0.039 in) screen to retrieve the benthic organisms. Benthic epifauna and infauna shall be analyzed to determine the structure of the benthic community.
      (2) The Principal Permittee shall identify all organisms to lowest possible taxon.
      (3) The Principal Permittee shall determine the Total Biomass of:
         (i) Mollusks
         (ii) Echinoderms
         (iii) Annelids/polychaetes
         (iv) Crustaceans
         (v) All other macroinvertebrates
      (4) The Principal Permittee shall determine the community structure analysis, including wet weight of each taxonomic group (listed above), number of species, number of individuals per species, total numerical abundance, species abundance per grab, species richness, species

diversity, species evenness and dominance, similarity analysis, cluster analyses, or other appropriate multivariate statistical techniques approved by the Regional Board Executive Officer, and the Infaunal Index[12].

4. The Principal Permittee shall create a map of each estuary depicting degraded areas and the spatial distribution of sediment from storm water. In the Integrated Monitoring Report, the Principal Permittee shall suggest appropriate locations for regular sediment monitoring, based on the results of this study.

G. Bioassessment

The Principal Permittee shall continue participation on the Stormwater Monitoring Coalition (SMC), as well as coordinate with the Surface Water Ambient Monitoring Program (SWAMP) being developed by the State Board to complete this requirement. The Regional Board anticipates that the SMC will organize an effort to evaluate the biological index approach for southern California and to design a research project for developing an Index of Biological Integrity (IBI) for this region. The SWAMP has begun work on a statewide effort to determine how to identify reference sites with the goal of IBI development.

The purpose of this requirement is to detect biological trends in receiving waters and to collect data for the development of an IBI for southern California. The ultimate goals of bioassessment are to assess the biological integrity of receiving waters, to detect biological responses to pollution, and to identify probable causes of impairment not detected by chemical and physical water quality analysis.

1. The Principal Permittee shall coordinate with the SMC and SWAMP to identify the most appropriate locations for bioassessment stations within Los Angeles County.

2. Station selection shall be complete within one year from the date this Order is adopted, and sampling shall begin no later than October of 2003.

3. The Principal Permittee shall monitor a minimum of 20 bioassessment stations in October of each year, beginning in 2003. A minimum of three replicate samples shall be collected at each station during each sampling event.

4. A professional environmental laboratory shall perform all laboratory, quality assurance, and analytical procedures. The Principal Permittee may collect samples when properly trained in CSBP methods. The Principal Permittee shall develop Standard Operation Procedures (SOPs) for the Bioassessment Monitoring Program that describes all procedures and responsible parties. The SOPs must contain step-by-step field, laboratory and data entry procedures, as well as, related QA/QC procedures. There must also be specific information about the bioassessment program including: assessment program description, its organization and the responsibilities of all its personnel; assessment

[12] Benthic Response Index for Assessing Infaunal Communities on the Mainland Shelf of Southern California, the SCCWRP

project description and objectives; qualifications of all personnel; and the type of training each member has received. A copy of the SOPs shall be available to the Regional Board Executive Officer upon request.

5. Field sampling must conform to the SOP established for the California Stream Bioassessment Procedure (CSBP) when appropriate. For sampling of aquatic environments where the CSBP is not appropriate (i.e., an estuary or unwadable stream), California Department of Fish and Game and the Regional Board Executive Officer shall be consulted in order to determine the most appropriate protocol to be implemented. Field crews shall be trained on aspects of the protocol and appropriate safety issues. All field data and sample Chain of Custody (COC) forms must be examined for completion and gross errors by the field crews, the receiving laboratory, and the Principal Permittee. These forms shall be available to California Department of Fish and Game or the Regional Board Executive Officer upon request. Field inspections should be planned with random visits and should be performed by the Principal Permittee, if properly trained in CSBP methods, or an independent auditor. These visits should report on all aspects of the field procedure with corrective action occurring immediately.

6. Taxonomic identification laboratories process the biological samples that usually consist of subsampling organisms, enumerating and identifying taxonomic groups and entering the information into an electronic format. There should be intra-laboratory QA/QC results for subsampling, taxonomic validation and corrective actions. Biological laboratories should also maintain reference collections, vouchered specimens (the Principal Permittee can request return of their sample voucher collections) and remnant collections. Biological laboratories shall participate in an inter-laboratory (external) taxonomic validation program at a recommended level of 20% for the first two years of the program. If there are no substantial QA/QC problems, the level of external validation may be decreased to 10% in year three upon approval from the Regional Board. External QA/QC should be arranged through the California Department of Fish and Game's Aquatic Bioassessment Laboratory in Rancho Cordova.

7. Sampling, laboratory, quality assurance, and analysis procedures shall follow the standardized "Non-point Source Bioassessment Sampling Procedures" for professional bioassessment as set forth in the California Department of Fish and Game California Stream Bioassessment Procedure (CSBP)[13]. The following results and information shall be included in the annual Monitoring Report:

[13] California Stream Bioassessment Procedure (Protocol Brief for Biological and Physical/Habitat Assessment in Wadeable Streams), California Department of Fish and Game - Aquatic Bioassessment Laboratory, May 1999. Located at www.dfg.ca.gov/cabw/protocols.html.

a) All physical, chemical and biological data collected in the assessment;

b) Photographs and GPS locations of all stations;

c) Documentation of quality assurance and control procedures;

d) Analysis that shall include calculation of the metrics used in the CSBP;

e) Comparison of mean biological and habitat assessment metric values between stations and year-to-year trends;

f) Electronic data formatted to the California Department of Fish and Game Aquatic Bioassessment Laboratory for inclusion in the Statewide Access Bioassessment Database; and

g) Copies of all QA/AC documents from laboratories.

SPECIAL STUDIES

H. New Development Impacts Study in the Santa Clara Watershed

The Principal Permittee, with support from the City of Santa Clarita, shall monitor tributaries in the Santa Clara watershed to determine impacts from new development and to compare storm water quality between subwatersheds with and without SUSMPs.

1. The Principal Permittee, in cooperation with the City of Santa Clarita, shall select one station that is representative of a subwatershed in which the majority of development has occurred without SUSMP implementation, and one station (SUSMP station) in a subwatershed in which the majority of the development has/will include SUSMP implementation. Other inputs to runoff, such as septic systems, in the two subwatersheds should be similar.

2. The Principal Permittee shall coordinate with the City of Santa Clarita and the Regional Board to develop a proposed study design, including a description of the drainage areas to be monitored and sampling locations, no later than 180 days from the date this Order is adopted. If appropriate, this study may be conducted in conjunction with the Peak Discharge Impact Study, described below.

3. The Principal Permittee shall monitor the first storm event and at least 2 additional storm events during each storm season. At least one dry weather event per year will also be sampled at each station.

4. Samples shall be flow-weighted composites, collected during the first 3 hours, or for the duration of the storm if it is less than 3 hours. Samples may be collected manually or automatically. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge[14], unless the Regional Board Executive Officer approves alternate protocol. Constituents to be analyzed for each location shall include the following:

a) pH, dissolved oxygen, temperature, conductivity, chloride, nitrogen, and TSS

b) Metals: aluminum, arsenic, beryllium, cadmium, chromium, copper, iron, lead, mercury, nickel, selenium, silver, and zinc.

c) Pathogen Indicators (Coliform)

d) PAHs

e) Flow (flow may be estimated using EPA methods at sites where flow measurement devices are not in place)

5. The Principal Permittee shall submit an analysis of the data, including a description of each subwatershed, year-to-year changes compared to the amount of development that occurred in each, comparisons between stations, and an analysis of SUSMP effectiveness, with the fourth year Monitoring Report.

I. Peak Discharge Impact Study

The Principal Permittee shall conduct a study to evaluate peak flow control and to determine numeric criteria to prevent or minimize erosion of natural stream channels and banks caused by urbanization.[15] The Principal Permittee may partner with the Ventura County Flood Control District to expand the stream erosion study to the Santa Clara River watershed. The study shall begin no later than (180 days from the effective date this Order).

J. BMP Effectiveness Study

The Principal Permittee shall conduct or participate in studies to evaluate the effectiveness of structural and treatment control BMPs. The objective of this study shall include the following:

R0007212

[14] Required in 40 CFR 122.21(g)(7)(ii), and described in NPDES Storm Water Sampling Guidance Document EPA 833-B-92-001. Time-weighted samples may be appropriate if flow is measured during sampling.

[15] Permit, Part 4.D.2 (Development Planning Program) requires the development of numerical criteria for peak flow control in natural drainage systems.

1. Monitor the reduction of pollutants of concern in storm water (including, but not limited to: trash, suspended sediment, pathogen indicators, nutrients, heavy metals, and oil and grease) from five or more different types of BMPs that have been properly installed within the year preceding monitoring. Monitoring shall be continued until the effectiveness of the BMP can be determined.

2. Evaluate the requirements, feasibility and cost of maintenance for each BMP.

3. Develop recommendations for appropriate BMPs for the reduction of pollutants of concern in storm water in Los Angeles County.

The Principal Permittee may participate in the SMBRP's, "Performance Evaluation of Structural BMPs for Storm Water Pollution Control in the Santa Monica Bay Watershed" study to meet this requirement. Participation includes collaboration and fund contribution to cover the scope of the proposed study.

K. Standard Monitoring Provisions

All monitoring activities shall meet the following requirements:

1. Monitoring and Records [40 CFR 122.41(j)(1)]

   Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

2. Monitoring and Records [40 CFR 122.41(j)(2)] [California Water Code §13383(a)]

   The Principal Permittee and Permittees shall retain records of all monitoring information, including all calibration and maintenance of monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the Report of Waste Discharge and application for this Order, for a period of at least five (5) years from the date of the sample, measurement, report, or application. This period may be extended by request of the Regional Board or EPA at any time and shall be extended during the course of any unresolved litigation regarding this discharge.

3. Monitoring and Records [40 CFR 122.21(j)(3)]

   Records of monitoring information shall include:

   a) The date, exact place, and time of sampling or measurements;

   b) The individual(s) who performed the sampling or measurements;

   c) The date(s) analyses were performed;

   d) The individual(s) who performed the analyses;

   e) The analytical techniques or methods used; and,

   f) The results of such analyses.

R0007213

4. Monitoring and Records [40 CFR 122.21(j)(4)]

   All sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this Order.

5. Monitoring and Records [40 CFR 122.21(j)(5)]

   The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this Order shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than two years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by imprisonment of not more than four years, or both.

6. All chemical, bacteriological, and toxicity analyses shall be conducted at a laboratory certified for such analyses by an appropriate governmental regulatory agency.

7. For priority toxic pollutants that are identified in the CTR (65 *Fed. Reg.* 31682), the MLs published in Appendix 4 of the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California - 2000* (SIP) shall be used for all analyses, unless otherwise specified. The MLs from the SIP are incorporated into the Constituent List (Attachment U-1). ~~Appendix 4 of the SIP is included as Attachment U-2. For pollutants not contained in Appendix 4 of the SIP, the test method and method detection limit (MDL) listed in Appendix U-1 shall be used for all analyses, and the ML for these parameters shall be lower than or equal to the lowest applicable water quality criteria from the Basin Plan and/or the Ocean Plan.~~

8. The Monitoring Report shall specify the analytical method used, the MDL and the ML for each pollutant. For the purpose of reporting compliance with numerical limitations, performance goals, and receiving water limitations, analytical data shall be reported with one of the following methods, as appropriate:

   a) An actual numerical value for sample results greater than or equal to the ML;

   b) "Not-detected (ND)" for sample results less than the laboratory's MDL with the MDL indicated for the analytical method used; or

   c) "Detected, but Not Quantified (DNQ)" if results are greater than or equal to the laboratory's MDL but less than the ML. The estimated chemical concentration of the sample shall also be reported. This is the concentration that results from the confirmed detection of the substance by the analytical method below the ML value.

9. For priority toxic pollutants, if the Principal Permittee or Permittee can demonstrate that a particular ML is not attainable, in accordance with procedures set forth in 40 CFR 136, the lowest quantifiable concentration

of the lowest calibration standard analyzed by a specific analytical procedure (assuming that all the method specified sample weights, volumes, and processing steps have been followed) may be used instead of the ML listed in Appendix 4 of the SIP. The Principal Permittee must submit documentation from the laboratory to the Regional Board Executive Officer for approval prior to raising the ML for any constituent.

10. Monitoring Reports [40 CFR 122.41(l)(4)(ii)]
    If the Principal Permittee monitors any pollutant more frequently than required by the permit using test procedures approved under 40 CFR part 136, unless otherwise specified in the Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the annual Monitoring Reports.

11. Monitoring Reports [40 CFR 122.41(l)(4)(iii)]
    Calculations for all limitations which require averaging of measurements shall utilize an arithmetic mean unless otherwise specified in this Order.

12. If no flow occurred during the reporting period, the Monitoring Report shall so state.

13. The Regional Board Executive Officer or the Regional Board, consistent with 40 CFR 122.41, may approve changes to the Monitoring Program, after providing the opportunity for public comment, either:

    a) By petition of the Principal Permittee or by petition of interested parties after the submittal of the annual Monitoring Report. Such petition shall be filed not later than 60 days after the Monitoring Report submittal date, or

    b) As deemed necessary by the Regional Board Executive Officer following notice to the Principal Permittee.

Ordered by:

Dennis A. Dickerson
Executive Officer

Los Angeles County Municipal Storm Water Permit (Order 01-XXX)
Individual Annual Report Form

This form summarizes the requirements in Order No. 01-XXX. Each Permittee must complete this form in its entirety, except for those requirements applicable only to the Principal Permittee. Only report activities that were performed during the previous fiscal year. Upon completion, this form shall be submitted to the Principal Permittee, by the date specified by the Principal Permittee, for inclusion in the unified Annual Storm Water Program Report. Attachments should be included where necessary to provide sufficient information on program implementation.

The goals of this Report are to: 1) concisely document implementation of the Storm Water Quality Management Program (SQMP) during the past fiscal year; 2) evaluate program results for continuous improvement; 3) to determine compliance with Order 01-XXX; and 4) to share this information with other Permittees, municipal decision makers, and the public.

!	YOU MUST FILL OUT ALL THE INFORMATION REQUESTED *Do not leave any of the sections blank.*
N/A	If the question does not apply to your municipality, please indicate N/A in the space provided and provide a brief explanation
U	If the information requested is currently unavailable, please indicate U in the space provided and give a brief explanation.

This Report Form consists of the following sections:

SECTION	PAGE
I. Program Management	2-4
II. Receiving Water Limitations	5
III. SQMP Implementation	5-7
IV. Special Provisions	8
IV.A. Public Information and Participation Program	8-14
IV.B. Industrial/Commercial Facilities Program	15-18
IV.C. Development Planning Program	19-22
IV.D. Development Construction Program	23-24
IV.E. Public Agency Activities Program	25-34
IV.F. IC/ID Elimination Program	35-38
V. Monitoring	39
VI. Assessment of Program Effectiveness	39
VII. Certification	40

Los Angeles County Municipal Storm Water Permit (Order 01-XXX)
Individual Annual Report Form
Reporting Year 200__- 200__

I. Program Management

A. Permittee Name: _____

B. Permittee Program Supervisor: _____
Title:
Address:
City: Zip Code:
Phone: Fax:

C. In the space below, briefly describe how the storm water program is coordinated within your agency's departments and divisions. Include a description of any problems with coordination between departments. To facilitate this, complete the Table 1.

TABLE 1 - Program Management

Storm Water Management Activity	Division/Department	# of Individuals Responsible for Implementing
1. Outreach & Education		
2. Industrial/Commercial Inspections		
3. Construction Permits/Inspections		
4. IC/ID Inspections		
5. Street sweeping		
6. Catch Basin Cleaning		
7. Spill Response		
8. Development Planning (project/SUSMP review and approval)		
9. Trash Collection		

D. Staff and Training

Attach a summary of staff training over the last fiscal year. This shall include the staff name, department, type of training, and date of training.

E. Budget Summary

1. Does your municipality have a storm water utility? Yes ☐ No ☐

If no, describe the funding source(s) used to implement the requirements of Order No. 01-XXX.

2. Are the existing financial resources sufficient to accomplish all required activities? Yes ☐ No ☐
3. Complete Table 2 to the extent that accurate information is available (indicate U in the spaces where the information is unavailable), and report any supplemental dedicated budgets for the same categories on the lines below the table.
4. List any additional state/federally funded projects related to storm water.

Los Angeles County Municipal Storm Water Permit (Order 01-XXX)
Individual Annual Report Form

TABLE 2

Program Element	Expenditures in Previous Fiscal Year	Estimated Amount Needed to implement Order 01-XXX
1. Program management a. Administrative costs b. Capital costs		
2. Public Information and Participation a. Public Outreach/Education b. Employee Training c. Corporate Outreach d. Business Assistance		
3. Industrial/Commercial inspection/ site visit activities		
4. Development Planning		
5. Development Construction a. Construction inspections		
6. Public Agency Activities a. Maintenance of structural and treatment control BMPs b. Municipal street sweeping c. Catch basin cleaning d. Trash collection/recycling e. Capital costs f. Other		
7. IC/ID Program a. Operations and Maintenance b. Capitol Costs		
8. Monitoring		
9. Other		
10. TOTAL		

List any supplemental dedicated budgets for the above categories:

List any activities that have been contracted out to consultants/other agencies:

II. Receiving Water Limitations (Part 2)

A. Are you aware, or have you been notified, of any discharges from your MS4 that cause or contribute to a condition of nuisance or to the violation of any applicable water quality standards? Yes ☐ No ☐

B. Has the Regional Board notified you that discharges from your MS4 are causing or contributing to an exceedance of water quality standards? Yes ☐ No ☐

C. If you answered Yes to either of the above questions, you must attach a Receiving Water Limitations (RWL) Compliance Report. The Report must include the following:

1. A description of the pollutants that are in exceedance and an analysis of possible sources;
2. A plan to comply with the RWL (Permit; Part 2);
3. Changes to the SQMP to eliminate water quality exceedances;
4. Enhanced monitoring to demonstrate compliance; and
5. Results of implementation.

III. SQMP Implementation (Part 3)

A. Has your agency implemented the SQMP and any additional controls necessary to reduce the discharges of pollutants in storm water to the maximum extent practicable? Yes ☐ No ☐

B. If your agency has implemented additional or different controls than described in the countywide SQMP, has your agency developed a local SQMP that reflects the conditions in its jurisdiction and specifies activities being implemented under the appropriate elements described in the countywide SQMP? Yes ☐ No ☐

C. Describe the status of developing a local SQMP in the box below.

D. If applicable, describe an additional BMP, in addition to those in the countywide SQMP, that your city has implemented to reduce pollutants in storm water to the maximum extent practicable.

E. Watershed Management Committees (WMCs)

1. Which WMC are you in?
2. Who is your designated representative to the WMC?
3. How many WMC meetings did you participate in last year?
4. Describe specific improvements to your storm water management program as a result of WMC meetings.
5. Attach any comments or suggestions regarding your WMC.

F. Storm Water Ordinance

1. Have you adopted a storm water and urban runoff ordinance to enforce all requirements of Order 01-XXX? Yes ☐ No ☐
   If not, describe the status of adopting such an ordinance.
2. If yes, have you already submitted a copy of the ordinance to the Regional Board? Yes ☐ No ☐
   If not, please attach a copy to this Report.

3. Were any amendments made to your storm water ordinance during the last fiscal year? Yes ☐ No ☐
   If yes, attach a copy of amendments to this Report.

G. Discharge Prohibitions

1. List any non-storm water discharges you feel should be further regulated:

2. List any non-storm water discharges you feel should be exempt, and provide an explanation for each:

IV. Special Provisions (Part 4)

A. Public Information and Participation (Part 4.B)

In addition to answering the following questions, attach a summary of all storm water education activities that your agency conducted or participated in last year.

1. No Dumping Message

a) How many storm drain inlets does your agency own?

b) How many storm drain inlets were marked with a no dumping message in the last fiscal year?

c) What is the total number of storm drain inlets that are legibly marked with a no dumping message?

If this number is less than the number in question 1.b, describe why all inlets have not been marked, the process used to implement this requirement, and the expected completion date.

d) How many public access points to creeks, channels, and other water bodies within your jurisdiction have been posted with no dumping signage in the past year?

Describe your agency's status of implementing this requirement by November 29, 2003.

2. Reporting Hotline

a) Has your agency established its own hotline for reporting and for general storm water management information? Yes ☐ No ☐

b) If so, what is the number?

c) Is this information listed in the government pages of the telephone book? Yes ☐ No ☐

d) If no, is your agency coordinated with the countywide hotline? Yes ☐ No ☐

e) Do you keep record of the number of calls received and how they were responded to? Yes ☐ No ☐

f) How many calls were received in the last fiscal year?

g) Describe the process used to respond to hotline calls.

h) Have you provided the Principal Permittee with your current reporting contact information? Yes ☐ No ☐

i) Have you compiled a list of the general public reporting contacts for all Permittees and posted it on the www.888CleanLA.com web site *(Principal Permittee only)?* Yes ☐ No ☐

If not, when is this scheduled to occur?

3. Outreach and Education

a) Describe the strategy developed to provide outreach and bilingual materials to target ethnic communities. Include an explanation of why each community was chosen as a target, how program effectiveness will be determined, and status of implementation. *(Principal Permittee only)*

b) Did the Principal Permittee organize quarterly Public Outreach Strategy meetings that you were aware of? Yes ☐ No ☐

How many Public Outreach Strategy meetings did your agency participate in last year?

Explain why your agency did not attend any or all of the organized meetings.

Identify specific improvements to your storm water education program as a result of these meetings:

List suggestions to increase the usefulness of quarterly meetings:

If quarterly Public Outreach Strategy meetings were not organized, explain why not and when this requirement will be implemented *(Principal Permittee only)*.

c) Approximately how many impressions were made last year on the general public about storm water quality via print, local TV, local radio, or other media?

d) Describe efforts your agency made to educate local schools on storm water pollution.

e) Did you provide all schools within each school district in Los Angeles County with materials necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution *(Principal Permittee only)*? Yes ☐ No ☐

If not, explain why.

f) Describe the strategy developed to measure the effectiveness of in-school educational programs, including assessing students' knowledge of storm water pollution problems and solutions before and after educational efforts *(Principal Permittee only).*

For Permit Years 2-5, attach an assessment of the effectiveness of in-school storm water education programs.

g) What is the behavioral change target that was developed based on sociological data and other studies *(Principal Permittee only)?*

If no target has been developed, explain why and describe the status of developing a target.

What is the status of meeting the target by the end of Year 5?

4. Pollutant-Specific Outreach

   a) Attach a description of each watershed-specific outreach program that your agency developed *(Principal Permittee only)*. All pollutants listed in Table 1 (Section B.1.d.) must be included.

   b) Did your agency cooperate with the Principal Permittee to develop specific outreach programs to target pollutants in your area? Yes ☐ No ☐

   c) Did your agency help distribute pollutant-specific materials in your city? Yes ☐ No ☐

   d) Describe how your agency has made outreach material available to the general public, schools, community groups, contractors and developers, etc...

5. Businesses Program

   a) Briefly describe the Corporate Outreach Program that has been developed to target gas stations and restaurant chains *(Principal Permittee only)*.

   b) How many corporate managers did your agency *(Principal Permittee only)* reach last year?

   c) What is the total number of corporations to be reached through this program *(Principal Permittee only)*?

   d) Is your agency meeting the requirement of reaching all gas station and restaurant corporations once every two years *(Principal Permittee only)*? Yes ☐ No ☐

   If not, describe measures that will be taken to fully implement this requirement.

e) Has your agency developed and/or implemented a Business Assistance Program? Yes ☐ No ☐

If so, briefly describe your agency's program, including the number of businesses assisted, the type of assistance, and an assessment of the program's effectiveness.

6. Did you encourage local radio stations and newspapers to use public service announcements? Yes ☐ No ☐

How many media outlets were contacted?

Which newspapers or radio stations ran them?

Who was the audience?

7. Did you supplement the County's media purchase by funding additional media buys? Yes ☐ No ☐

Estimated dollar value/in-kind contribution:

Type of media purchased:

Frequency of the buys:

Did another agency help with the purchase? Yes ☐ No ☐

8. Did you work with local business, the County, or other Permittees to place non-traditional advertising? Yes ☐ No ☐

If so, describe the type of advertising.

9. Did you establish local community partnerships to distribute educational storm water pollution prevention material? Yes ☐ No ☐

Describe the materials that were distributed:

Who were the key partners?
Who was the audience (businesses, schools, etc.)?

10. Did you participate in or publicize workshops or community events to discuss storm water pollution? Yes ☐ No ☐
    How many events did you attend?

11. Does your agency have a website that provides storm water pollution prevention information? Yes ☐ No ☐
    If so, what is the address?

12. Has awareness increased in your community regarding storm water pollution? Yes ☐ No ☐
    Do you feel that behaviors have changed? Yes ☐ No ☐
    Explain the basis for your answers. Include a description of any evaluation methods that are used to determine the effectiveness of your agency's outreach.

13. How would you modify the storm water public education program to improve it on the City or County level?

B. Industrial/Commercial Facilities Program

1. Critical Source Identification Database

Did you (individually or jointly) update the Database for Critical Sources Identification? Yes ☐ No ☐

Comments/Explanation/Conclusion:

2. Inspection and Site Visit Program

Provide the reporting data as suggested in the following tables.

Initial Number of Facilities at the start of cycle proposed for inspection by categories (after the initial year, the updated number based on the new data)	Number of facilities inspected in the current reporting year	% Completed at the time of this report for present cycle (from the initial value, and from the updated value after first cycle)	Total number since permit adoption

B-412 R0007236

Los Angeles County Municipal Storm Water Permit (Order 01-XXX)

Individual Annual Report Form

Initial Number of Facilities at the start of cycle proposed for site visit by categories (after the initial year, the updated number based on the new data)	Number of facilities site visited in the current reporting year	% Completed at the time of this report for this cycle (from the initial value, and from the updated value after first cycle)	Total number since permit adoption

Comments/Explanation/Conclusion:

3. BMPs Implementation

Provide the reporting data as suggested in the following table.

Number of facilities inspected/ site visited by category in this reporting year	Number of facilities identified as adequately implementing BMPs as specified in this reporting year	% adequately implementing out of total in this reporting year	Number of facilities required to implement or upgrade in this reporting year	Number of facilities inspected/ site visited by category in this reporting cycle	Number of facilities identified as adequately implementing BMPs as specified in this reporting cycle	% adequately implementing out of total in this reporting cycle	Number of facilities required to implement or upgrade in this reporting cycle	Total Number during this permit adequately implementing	Total Number during this permit required to implement or upgrade

B-413

R0007237

Comments/Explanation/Conclusion:

4. Enforcement Activities

Provide the reporting data as suggested in the following tables.

Enforcement Actions by categories (e.g. Warning letter, NOV, referral to D.A., etc.)	Number of facilities issued enforcement actions in the current reporting year	Number of facilities issued enforcement actions in the current reporting cycle	Number of facilities (re)inspected due to enforcement actions in current reporting year	Number of facilities (re)inspected due to enforcement actions in current reporting cycle	Number of facilities brought into compliance in the current reporting year	Number of facilities brought into compliance in current reporting cycle	Total number since permit adoption

Facilities by category	Number of enforcement actions by type (Warning letter)	Number of NOVs	Number of Referral	Number of Other

5. Program Implementation Effectiveness Assessment

Please give a brief assessment of the implementation of the program in removing pollutants from the storm water discharges. Please provide an explanation. Suggested improvements or adjustments based on the

knowledge gained through this reporting period activities must be reflected in a change in the SQMP, if warranted.

Highly Effective ☐ Somewhat Effective ☐ Non-effective ☐

Comments/Explanation/Conclusion:

6. You must also submit a quarterly electronic submittal of your Industrial/Commercial Facilities Program activities.

B-415
R0007239

C. Development Planning Program (Part 4.D)

1. Does your agency have a process to minimize impacts from storm water and urban runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA, Section 404 of the CWA, local ordinances, and other legal authorities? Yes ☐ No ☐
   Attach examples showing how storm water quality impacts were addressed in environmental documents for projects over the past year.

2. Does your agency have procedures to include the following requirements in all priority development and redevelopment projects:

   a) Maximize the percentage of permeable surfaces to allow more percolation of storm water into the ground? Yes ☐ No ☐

   b) Minimize the quantity of storm water directed to impermeable surfaces and the MS4? Yes ☐ No ☐

   c) Minimize pollution emanating from parking lots through the use of appropriate treatment control BMPs and good housekeeping practices? Yes ☐ No ☐

   d) Provide for appropriate permanent measures to reduce storm water pollutant loads from the development site? Yes ☐ No ☐

3. List the types and numbers of BMPs that your agency required for priority projects to meet the requirements described above.

4. Describe the status of the development or implementation of peak flow controls in natural drainage systems.

5. Has your agency amended codes and/or ordinances to give legal effect to the SUSMP changes required in the Permit? Yes ☐ No ☐

6. Describe the process your agency uses to include SUSMP design standards in new development and redevelopment project approvals.

7. How many of each of the following projects did your agency review and condition to meet SUSMP requirements last year?

   a) Residential

   b) Commercial

   c) Industrial

   d) Automotive service facilities

   e) Retail gasoline outlets

   f) Restaurants

   g) Parking lots

   h) Projects located in or directly adjacent to or discharging directly to an environmentally sensitive area

   i) Total number of permits issued to priority projects

8. What is the percentage of total development projects that were conditioned to meet SUSMP requirements? %

9. How has your agency prepared to reduce the SUSMP threshold for industrial/commercial facilities to 1 acre from 100,000 square feet in 2003?

10. After 2003, how many additional projects per year will require/did require implementation of SUSMP requirements as a result of the lower threshold?

11. Does your agency participate in an approved regional or sub-regional storm water mitigation program to substitute in part or wholly SUSMP requirements for new development? Yes ☐ No ☐

12. Has your agency modified its planning procedures for preparing and reviewing CEQA documents to consider potential storm water quality impacts and provide for appropriate mitigation? Yes ☐ No ☐

If no, provide an explanation and an expected date of completion.

13. Did your agency update any of the following General Plan elements in the past year?

a) Land Use Yes ☐ No ☐

b) Housing Yes ☐ No ☐

c) Conservation Yes ☐ No ☐

d) Open Space Yes ☐ No ☐

If yes, please describe how watershed and storm water quality and quantity management considerations were included.

14. How many targeted staff were trained last year?

15. How many targeted staff are trained annually?

16. What percentage of total staff are trained annually? %

17. Has your agency developed and made available development planning guidelines? Yes ☐ No ☐

18. If no, what is the expected date that guidelines will be developed and available to developers?

19. What is the status of completion of the technical manual for siting and design of BMPs for the development community?

D. Development Construction Program

1. Describe your agency's program to control runoff from construction activity at all construction sites within its jurisdiction.

2. Does your agency require the preparation, submittal, and implementation of a Local Storm Water Pollution Prevention Plan (Local SWPPP) prior to the issuance of a grading permit for all sites that meet one or all of the following criteria?

   a) Will result in soil disturbance of one acre or greater — Yes ☐ No ☐

   b) Is within, directly adjacent to, or is discharging directly to an environmentally sensitive area — Yes ☐ No ☐

   c) Is located in a hillside area — Yes ☐ No ☐

3. Attach one example of a local SWPPP

4. Describe the process your agency uses to require proof of filing a Notice of Intent for coverage under the State General Construction Activity Storm Water permit and a certification that a SWPPP has been prepared prior to issuing a grading permit?

5. How many building/grading permits were issued to sites requiring Local SWPPPs last year?

6. How many building/grading permits were issued to sites requiring coverage under the General Construction Activities Storm Water Permit last year?

7. How many building/grading permits were issued to construction site less than one acre in size last year?

8. How many construction sites were inspected during the last wet season?

9. Complete the table below.

Type of Violation	# of Violations	% of Total Inspections	# of Follow-up Inspections	# of Enforcement Actions
Off-site discharge of sediment				
Off-site discharge of other pollutants				
No or inadequate SWPPP				
Inadequate BMP/SWPPP implementation				

10. Describe the process for taking enforcement actions against construction site violations, including the types of actions that are taken.

11. Describe the system that your agency uses to track the issuance of grading permits.

E. Public Agency Activities (Part 4.F)

1. Sewage System Maintenance, Overflow, and Spill Prevention (only applicable to agencies that own and/or operate a sanitary sewer system)

a) Has your agency developed and implemented a response plan for sanitary sewer overflows that includes the requirements in Order 01-XXX? Yes ☐ No ☐

b) How many sanitary sewer overflows occurred within your jurisdiction?

c) How many did your agency respond to?

d) Did your agency investigate all complaints received? Yes ☐ No ☐

e) How many complaints were received?

f) Upon notification, did your agency immediately respond to overflows by containment? Yes ☐ No ☐

g) Did your agency notify appropriate sewer and public health agencies when a sewer overflowed to the MS4? Yes ☐ No ☐

h) Did your agency implement a program to prevent sewage spills or leaks from sewage facilities from entering the MS4? Yes ☐ No ☐

If so, describe the program:

i) Did your agency implement a program to identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers to the MS4? Yes ☐ No ☐

If so, describe the program:

2. Public Construction Activities Management

   a) What percentage of public construction sites 5 acres or greater in size did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit ? ☐ %

   b) Give an explanation for any sites greater than 5 acres that were not covered:

   c) What is the total number of active public construction sites?

   How many were 5 acres or greater in size?

   d) (After March, 2003) Did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit coverage for public construction sites for sites one acre or greater? Yes ☐ No ☐

3. Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management

   a) Did your agency implement pollution prevention plans for each public vehicle maintenance facility, material storage facility, and corporation yard? Yes ☐ No ☐

b) Briefly describe how your agency implements the following, and any additional, BMPs to minimize pollutant discharges in storm water:

(1) Good housekeeping practices

(2) Material storage control

(3) Vehicle leaks and spill control

(4) Illicit discharge control

c) Are all Permittee owned and/or operated vehicle/equipment wash areas self-contained, covered, equipped with a clarifier, and properly connected to the sanitary sewer? Yes ☐ No ☐

If not, what is the status of implementing this requirement?

d) How many Permittee owned and/or operated vehicle/equipment wash areas are scheduled to be redeveloped to include the BMPs listed above?

4. Landscape and Recreational Facilities Management

a) Has your agency developed a standardized protocol for the routine and non-routine application of pesticides, herbicides (including pre-emergents), and fertilizers? Yes ☐ No ☐

Briefly describe this protocol:

b) How does your agency ensure that there is no application of pesticides or fertilizers immediately before, during, or immediately after a rain event or when water is flowing off the area to be applied?

c) Are any banned pesticides, herbicides, fungicides, or rodenticides stored or applied in your agency's jurisdiction that you know of? Yes ☐ No ☐

If so, list them:

d) What percentage of your agency's staff that apply pesticides are certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator?

e) Describe procedures your agency has implemented to encourage retention and planting of native vegetation and to reduce water, fertilizer, and pesticide needs:

5. Storm Drain Operation and Management

a) Did your agency designate catch basin inlets within its jurisdiction as Priority A; Priority B; and Priority C? Yes ☐ No ☐

b) How many of each designation exist in your jurisdiction?

Priority A:
Priority B:
Priority C:

c) Is your city subject to a trash TMDL? Yes ☐ No ☐

d) If yes, describe the activities and/or implementation measures that your agency conducted pursuant to the TMDL and any other trash reduction efforts that occurred.

e) How many times were all Priority A basins cleaned last year?

f) How many times were all Priority B basins cleaned last year?

g) How many times were all Priority C basins cleaned last year?

h) How much total waste was collected in tons from catch basin clean-outs last year?

i) Attach a record of all catch basins in your jurisdiction. This shall identify each basin as City or County owned, and Priority A, B, or C. For all basins that are owned and operated by your agency, include dates that each was cleaned out over the past year.

j) Did your agency place and maintain trash receptacles at all transit stops within its jurisdiction. Yes ☐ No ☐

k) How many new trash receptacles were installed last year?

l) Did your agency place special conditions for events that generated substantial quantities of trash and litter including provisions that:

(1) Provide for the proper management of trash and litter generated from the event? Yes ☐ No ☐

(2) Arrange for temporary screens to be placed on catch basins? Yes ☐ No ☐

(3) Or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain? Yes ☐ No ☐

m) Did your agency inspect the legibility of the catch basin stencil or labels? Yes ☐ No ☐

What percentage of stencils were legible?

n) Were illegible stencils recorded and re-stenciled or re-labeled within 180 days of inspection? Yes ☐ No ☐

o) Did your agency visually monitor Permittee-owned open channel storm drains and other drainage structures for debris at least annually and identify and prioritize problem areas of illicit discharge for regular inspection? Yes ☐ No ☐
Is the prioritization attached? Yes ☐ No ☐

p) Did your agency review its maintenance activities to assure that appropriate storm water BMPs are being utilized to protect water quality? Yes ☐ No ☐
What changes have been made?

q) Did your agency remove trash and debris from open channel storm drains a minimum of once per year before the storm season? Yes ☐ No ☐

r) How did your agency minimize the discharge of contaminants during MS4 maintenance and clean outs?

s) Where is removed material disposed of?

6. Streets and Roads Maintenance

a) Did your agency designate streets and/or street segments within its jurisdiction as one of the following:

(1) Priority A – streets and/or street segments that are designated as consistently generating the highest volumes of trash and/or litter? Yes ☐ No ☐

(2) Priority B - streets and/or street segments that are designated as consistently generating moderate volumes of trash and/or litter? Yes ☐ No ☐

(3) Priority C – streets and/or street segments that are designated as generating low volumes of trash and/or litter? Yes ☐ No ☐

b) Did your agency perform all street sweeping in compliance with the permit and according to the following schedule:

(1) Priority A – These streets and/or street segments shall be swept at least two times per month? Yes ☐ No ☐

(2) Priority B - Each Permittee shall ensure that each streets and/or street segments is cleaned at least once per month? Yes ☐ No ☐

(3) Priority C – These streets and/or street segments shall be cleaned as necessary but in no case less than once per year? Yes ☐ No ☐

c) Did your agency require that saw cutting wastes be recovered and disposed of properly and that in no case shall waste be left on a roadway or allowed to enter the storm drain? Yes ☐ No ☐

d) Did your agency require that concrete and other street and road maintenance materials and wastes be managed to prevent pollutant discharges? Yes ☐ No ☐

e) Did your agency require that the washout of concrete trucks and chutes only occur in designated areas and never into storm drains, open ditches, streets, or catch basins leading to the storm drain system? Yes ☐ No ☐

f) Did your agency train its employees in targeted positions (whose interactions, jobs, and activities affect storm water quality) regarding the requirements of the storm water management program to:

(1) Promote a clear understanding of the potential for maintenance activities to pollute storm water? and Yes ☐ No ☐

(2) Identify and select appropriate BMPs? Yes ☐ No ☐

7. Parking Facilities Management

a) Did your agency ensure that Permittee-owned parking lots be kept clear of debris and excessive oil buildup and cleaned no less than 2 times per month and/or inspected no less than 2 times per month to determine if cleaning is necessary. Yes ☐ No ☐

b) Were any Permittee-owned parking lots cleaned less than once a month? Yes ☐ No ☐

How many?

8. Public Industrial Activities Management

   a) Did your agency, for all municipal activity considered an industrial activity under USEPA Phase I storm water regulations, obtain separate coverage under the State of California General Industrial Activities Storm Water Discharge Permit no later than December 31, 2001? Yes ☐ No ☐

   b) Does your agency serve a population of less than 100,000 people? Yes ☐ No ☐

9. Emergency Procedures

   a) In case of real emergencies, did your agency repair essential public services and infrastructure in a manner to minimize environmental damage? Yes ☐ No ☐

   b) Were BMPs implemented to the extent that measures did not compromise public health and safety? Yes ☐ No ☐

10. Feasibility Study

   a) Did your agency cooperate with the County Sanitation Districts of Los Angeles County to prepare a study which investigates the possible diversion of dry weather flows or the use of alternative treatment control BMPs? Yes ☐ No ☐

   b) Did your agency review its individual prioritized list and create a watershed based priority list of drains for potential diversion and submit a listing of priority diversions to the Regional Board Executive Officer? Yes ☐ No ☐

F. Illicit Connections and Illicit Discharges (IC/ID) Elimination Program (Part 4.G)

1. Attach a copy of your agency's IC/ID Elimination Implementation Program (Part 4.G.1.a.).

2. Attach a map of your storm drain system showing all permitted connections (if available), and the locations of all illicit connections and discharges that occurred last year (Part 4.G.1.b). If your agency has not completed this requirement, describe the status of the development of a baseline map, including an expected completion date.

3. Describe your enforcement procedures for eliminating illicit discharges and terminating illicit connections.

4. Describe your record keeping system to document all illicit connections and discharges.

5. What is the total length of open channel that your agency owns and operates?

6. What length was screened last year for illicit connections?

7. What is the total length of closed storm drain that your agency owns and operates?

8. What length was screened last year for illicit connections?

9. Describe the method used to screen your storm drains.

10. Provide the reporting data for illicit connections as suggested in the following table (you may submit a spreadsheet from your database that contains the information).

Year	Total # reported/ identified	Total # investigated	# that conveyed exempt discharges or NPDES permitted	# that conveyed illicit discharges that were terminated	# that were removed	# that resulted in enforcement action	# that resulted in *other* actions
01/02							
02/03							
03/04							
04/05							
05/06							

11. Explain any *other* actions that occurred in the last year.

12. What is the average time it takes your agency to initiate an illicit connection investigation after it is reported?

    a) Were all identified connections terminated within 180 days? Yes ☐ No ☐

    b) If not, explain why.

13. Provide the reporting data for illicit discharges as suggested in the following table (you may submit a spreadsheet from you database that contains this information).

Year	Total # reported	Total # that were discontinued/ cleaned up voluntarily through enforcement and the source was identified	# that were cleaned up but the source could not be identified	# that resulted in no evidence of discharge	# that were determined to be conditionally exempt	# that were exempt or in compliance and the source identified	# that resulted in enforcement action
01/02							
02/03							
03/04							
04/05							
05/06							

14. What is the average response time after an illicit discharge is reported?

    a) Did any response times exceed 72 hours? Yes ☐ No ☐

    b) If yes, explain why.

15. Describe the your agency's spill response procedures.

16. What would you do differently to improve your agency's IC/ID Elimination Program?

17. Attach a list of all permitted connections to your storm sewer system.

V. Monitoring

Briefly describe any storm water monitoring activities that are not required by Order No. 01-XXX that your municipality conducted, participated in, or received funding to conduct in the past fiscal year. These activities should correspond with the dollar amount you listed in Table 3.

VI. Assessment of Program Effectiveness

A. Attach a summary of the effectiveness of your storm water management program. This summary should include, at a minimum, the following:

1. An assessment of your agency's compliance with permit requirements, based on your responses to the questions in this form;
2. Descriptions of any evaluation methods that your agency uses to determine the effectiveness of your storm water management program;
3. A summary of the strengths and weaknesses of your agency's storm water management program;
4. A list of specific program highlights and accomplishments;
5. A description of water quality improvements or degradation in your watershed over the past fiscal year;
6. Interagency coordination between cities to improve the storm water management program;
7. Future plans to improve your agency's storm water management program; and
8. Suggestions to improve the effectiveness of your program or the County model programs.

B. On a scale of 1 to 10 (10 being full implementation of requirements by their deadlines), rate your municipality's level of compliance with Order No. 01-XXX.

C. List any suggestions your agency has for improving program reporting and assessment.

VII. Certification Statement

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility, of a fine and imprisonment for knowing violations.

Change Sheet

Draft (12/04/01)

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

COUNTY OF LOS ANGELES
MUNICIPAL STORM WATER NPDES PERMIT
(NPDES PERMIT No. CAS004001)

DRAFT CHANGE SHEET

SUMMARY

This draft Change Sheet lists proposed changes to the Final Tentative - County of Los Angeles Municipal Storm Water NPDES Permit (October 11, 2001). In general, the proposed changes respond to commenters' suggestions on improving clarity, format, and implementability of the Permit. Additional changes may be proposed prior to the proposed permit adoption.

In the Change Sheet, cross-references to pages and sections are for the 'Clean Version' and the 'Strike-Out Version', of the tentative draft, dated October 11, 2001. New text added to a sentence is indicated by underline, and deleted text is indicated by strikethrough.

PROPOSED CHANGES

1. Table of Contents
   Changed the following items to be consistent with their corresponding sections:
   Findings A, Part 3, Part 3.C, Part 6.H, Part 6.I, Part 6.R, and Part 6.T

Findings

2. Finding B.4
   Strike-Out Version: Page 2
   Clean Version: Page 2
   Correct number sequence in second sentence. Sentence changed to read:
   "The Grand Jury recommended that the Regional Board consider among other actions, (i) a focus on setting contaminant limits rather than programmatic evaluations, ~~(iii)~~ (ii) audit of MS4 permit programs; and ~~(iv)~~ (iii) clarifying enforcement responsibilities between the State and local governments."

3. Finding B.5
   Strike-Out Version: Page 2
   Clean Version: Page 2
   Insert "]" at end of last sentence.

4. Finding B.7
   Strike-Out Version: Page 3
   Clean Version: Page 3
   Add the following references to the last sentence of Finding B.7:
   "(*Impervious Cover as An Urban Stream Indicator and a Watershed Management Tool*, Schueler, T. and R. Claytor, In, Effects of Water Development and Management on Aquatic Ecosystems (1995), ASCE, New York; Leopold, L. B., 1973, River channel change with time: an example, Geological Society of America Bulletin, v. 84, p. 1845-1860; Hammer, T. R., 1972, Stream channel enlargement due to urbanization: Water Resources Research, v. 8, p. 1530-1540; Booth, D. B., 1991, Urbanization and the natural drainage system--impacts, solutions and prognoses: The Northwest Environmental Journal, v. 7, p. 93-118; Klein, R. D., 1979, Urbanization and stream quality impairment: Water Resources Bulletin, v. 15, p. 948-963; May, C. W., Horner, R. R., Karr, J. R., Mar, B. W., and Welch, E. B., 1997, Effects of

urbanization on small streams in the Puget Sound Lowland ecoregion: Watershed Protection Techniques, v. 2, p. 483-494; Morisawa, M. and LaFlure, E. Hydraulic geometry, stream equilibrium and urbanization; Rhodes, Dallas P. and Willlams, Garnet P. Adjustments to the fluvial system. 333-350. 1979; Dubuque, Iowa, Kendall/Hunt. Tenth Annual Geomorphology Symposia Series; and Schueler, Tom, 1994. The importance of imperviousness. Watershed Protection Techniques, 1(3))."

5. Finding B.8
   Strike-Out Version: Page 3
   Clean Version: Page 3
   Add reference to Regional Board monitoring to the second sentence. Sentence changed to read:
   "Monitoring conducted by Los Angeles County and the Regional Board demonstrates that the priority industrial sectors and auto repair facilities (one of the commercial sectors) on the list, contribute significant concentrations of heavy metals to storm water (*Los Angeles County 1999-2000 Storm Water Monitoring Report*, Los Angeles County Department of Public Works - July 2000; *Compliance Assessment of the Auto Dismantling Industry; Evaluation of the California General Industrial Storm Water Permit*, H. Chang, (2001), 70 pp., California Regional Water Quality Control Board)."

6. Finding B.9
   Strike-Out Version: Page 4
   Clean Version: Page 3
   Insert the following sentence at the beginning of Finding B.9:
   "The discharge of washwaters and contaminated storm water from businesses has the potential to adversely impact public health and safety."

7. Finding C.4
   Strike-Out Version: Page 5
   Clean Version: Page 4
   Change the second sentence of finding to read:
   "The Regional Board finds that the Permittees' proposed SQMP, incorporating the additional and/or revised provisions contained in this Order, would meet the minimum requirements of federal regulations."

8. Finding C.5
   Strike-Out Version: Page 5
   Clean Version: Page 4
   Move Finding C.5 to Finding B.10. No language change.

9. Finding C.6
   Strike-Out Version: Page 5
   Clean Version: Page 5
   Move Finding C.6 to Finding B.11. Insert addition to reference after the second sentence. Sentence changed to read:
   "Studies indicate that storm water discharges from retail gasoline outlets have high concentrations of hydrocarbons and heavy metals [Schueler and Shepp (1992): *Concentrations of Selected Constituents in Runoff from Impervious Surfaces in Four Urban Catchments of Different Landuse*, Ranabal, F.I., and T.J. Gizzard (1995), In Proceedings of the Fourth Biennial Stormwater Research Conference, Florida, pp 42-52.]"

10. Finding D.1
    Strike-Out Version: Page 6
    Clean Version: Page 5
    Delete the last sentence of finding:

~~"Attachment B shows the map of the permitted area in Los Angeles County Flood Control District."~~

11. Finding D.4
    Strike-Out Version: Page 7
    Clean Version: Page 6
    Change finding to read:
    "This permit is intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water to the maximum extent practicable (MEP) from the permitted areas in the County of Los Angeles to the waters of the United States subject to the Permittees' jurisdiction."

12. Finding E.14
    Strike-Out Version: Page 10
    Clean Version: Page 9
    Insert comma in second sentence. Sentence changed to read:
    "After approval by the State Board, the Office of Administrative Law, and the USEPA, the TMDLs for trash will be effective and enforceable."

13. Finding E.19
    Strike-Out Version: Page 11
    Clean Version: Page 10
    Delete the first sentence. Finding changed to read:
    "~~The Regional Board has determined that the creation of structural or treatment control BMPs for storm water mitigation in waters of the U.S. is not permissible~~. 40 CFR Part 131.10(a) prohibits states from designating waste transport or waste assimilation as a use for any water of the U.S. Authorizing the construction of a storm water/urban runoff treatment facility in a jurisdictional water body would be tantamount to accepting waste assimilation as an appropriate use for that water body. Furthermore, the construction and operation of a pollution control facility in a water body can impact the physical, chemical, and biological integrity as well as the beneficial uses of the water body. Therefore, storm water treatment and/or mitigation in accordance with SUSMPs and any other requirements of the Order must occur prior to the discharge of storm water into a water of the U.S."

14. Finding F.2
    Strike-Out Version: Page 13
    Clean Version: Page 12
    Move Finding F.2 to Finding E.27. No language change.

Part 1. Discharge Prohibitions

15. Part 1.1 and 2
    Strike-Out Version: Page 17
    Clean Version: Page 15
    Move the word "are" to the beginning of section 1 as follows:
    "The Permittees shall effectively prohibit non-storm water discharges into the MS4 and watercourses, except where such discharges ~~are~~:
    1. are covered by a separate individual or general NPDES permit for non-storm water discharges; or"

16. Part 1.2.c.2
    Strike-Out Version: Page 17
    Clean Version: Page 16
    Delete the word "debromination". Sentence changed to read:

"Potable drinking water supply and distribution system releases (consistent with American Water Works Association guidelines for dechlorination/~~debromination~~ and suspended solids reduction practices);"

17. Part 1.2.c.5
    Strike-Out Version: Page 17
    Clean Version: Page 16
    Change section to read:
    "Dechlorinated/debrominated swimming pool discharges;"

Part 2. Receiving Water Limitations

18. Part 2.3
    Strike-Out Version: Page 18
    Clean Version: Page 17
    Change all references to the "report" to "Receiving Water Limitations (RWL) Compliance Report" and "RWL Compliance Report" and insert reference to the Program Reporting Requirements. Section changed to read:

    a) "Upon a determination by either the Permittee or the Regional Board that discharges are causing or contributing to an exceedance of an applicable water quality standard, the Permittee shall promptly notify and thereafter submit a ~~report~~ Receiving Water Limitations (RWL) Compliance Report (as described in the Program Reporting Requirements, Section I of the Monitoring and Reporting Program) to the Regional Board that describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedances of water quality standards. This ~~report~~ RWL Compliance Report may be incorporated in the annual Storm Water Report and Assessment unless the Regional Board directs an earlier submittal. The ~~report~~ RWL Compliance Report shall include an implementation schedule. The Regional Board may require modifications to the ~~Report~~ RWL Compliance Report.

    b) Submit any modifications to the ~~report~~ RWL Compliance Report required by the Regional Board within 30 days of notification.

    c) Within 30 days following the approval of the ~~report~~ RWL Compliance Report, the Permittee shall revise the SQMP and its components and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, an implementation schedule, and any additional monitoring required."

Part 3. SQMP Implementation

19. General Requirements, Part 3.A.1
    Strike-Out Version: Page 20
    Clean Version: Page 17
    Change sentence to read:
    "Each Permittee shall, at a minimum, implement the SQMP. The SQMP is an enforceable element of this Order. The SQMP shall be implemented immediately following [the permit effective date]."

20. General Requirements, Part 3.A.4
    Strike-Out Version: Page 20
    Clean Version: Page 18
    Below Part 3.A.3, insert the following section ("Customized SQMP" moved from Part 4.A.2) as Part 3.A.4:
    "Permittees that deviate from the countywide SQMP (i.e., need additional controls, implement different controls than described in the countywide SQMP, or determine that certain BMPs in

the countywide SQMP are not applicable in the area under its jurisdiction), shall develop a local SQMP, no later than [6 months from the permit effective date]. The local SQMP shall be customized to reflect the conditions in the area under the Permittee's jurisdiction and shall specify activities being implemented under the appropriate elements described in the countywide SQMP."

21. Revision of the Storm Water Quality Management Program, Part 3.C
Strike-Out Version: Page 20
Clean Version: Page 18
Change section to read:
The Permittees shall revise the SQMP, at the direction of the Regional Board Executive Officer, to incorporate program implementation amendments. ~~Such amendments may include~~ so as to comply with regional, watershed-specific requirements, and/or waste load allocations developed and approved pursuant to the process for the designation and implementation of Total Maximum Daily loads (TMDLs) for impaired water bodies."

22. Designation and Responsibilities of the Principal Permittee, Part 3.D
Strike-Out Version: Page 20
Clean Version: Page 18
Change second sentence to read:
"As such, ~~T~~the Principal Permittee shall:"

23. Responsibilities of the Permittees, Part 3.E.4
Strike-Out Version: Page 21
Clean Version: Page 19
Insert the word "the" in section 4. Section changed to read:
"Participate in intra-agency coordination (e.g. Fire Department, Building and Safety, Code Enforcement, Public Health, etc.) necessary to successfully implement the provisions of this Order and the SQMP."

24. Watershed Management Committees (WMCs), Part 3.F.3.g
Strike-Out Version: Page 23
Clean Version: Page 20
Change section to read:
"~~Conduct joint WMC meetings~~ Meet four times per year and, as necessary."

25. Legal Authority, Part 3.G.1
Strike-Out Version: Page 24
Clean Version: Page 20
Underline the word "prohibit" in the first sentence, and delete the comma after discharges. Also, delete the word "Prohibit" from the beginning of sections a-j.. For example:
"1. Permittees shall possess the necessary legal authority to prohibit non-storm water discharges~~,~~ to the storm drain system, including, but not limited to:
a) ~~Prohibit~~ Illicit discharges and illicit connections and require removal of illicit connections;"

26. Legal Authority, Part 3.G.i
Strike-Out Version: Page 24
Clean Version: Page 21
Change section to read:
"~~Prohibit t~~The discharge of concrete or ~~concrete~~ cement laden wash water from concrete trucks, pumps, tools, and equipment to the MS4;"

27. Legal Authority, Part 3.G.2.a
Strike-Out Version: Page 25
Clean Version: Page 21

Change section to read:
"Require persons within their jurisdiction to comply with conditions in Permittees' ordinances, permits, contracts, model programs, or orders (i.e. hold dischargers to its MS4 accountable for their contributions of pollutants and flows);"

Part 4. Special Provisions

28. General Requirements, Part 4.A.2
Strike-Out Version: Page 27
Clean Version: Page 23
Move section 2 "Customized SQMP" to Part 3.E "SQMP Implementation, Responsibilities of the Permittees".

29. Public Information and Participation Program, Part 4.B.c
Strike-Out Version: Page 28
Clean Version: Page 23
Delete the phrase in parentheses at the end of sentence. Sentence changed to read:
"To involve and engage all socio-economic groups and ethnic communities in Los Angeles County to participate in mitigating the impacts of storm water pollution ~~(such as African American, Latino, East Asian, South Asian, and Middle Eastern)~~.

30. Public Information and Participation Program, Part 4.B.1.b
Strike-Out Version: Page 29
Clean Version: Page 24
Add the following sentence to the end of the section: "Permittees are responsible for providing current, updated information to the Principal Permittee."

31. Public Information and Participation Program, Part 4.B.1.c.3
Strike-Out Version: Page 29
Clean Version: Page 24
Change sentence to read:
"The Principal Permittee shall enhance existing outreach efforts to residents and businesses related to the proper disposal of cigarette butts. ~~implement an outreach program to educate on proper disposal of cigarette butts.~~

32. Public Information and Participation Program, Part 4.B.1.8
Strike-Out Version: Page 30
Clean Version: Page 25
Change section to read:
"~~The~~ Permittees shall provide the contact information for their appropriate ~~storm water~~ staff responsible for storm water public education activities to the Principal Permittee no later than (60 days from the effective date of this Order). ~~Cooperative efforts with other agencies may also be used to accomplish this requirement.~~"

33. Development Planning Program, Part 4.D.1.b
Strike-Out Version: Page 40
Clean Version: Page 34
Change the word "permeable" to "pervious". Sentence changed to read:
"Maximize the percentage of pervious surfaces to allow percolation of storm water into the ground;"

34. Development Planning Program, Part 4.D.1.c
Strike-Out Version: Page 40
Clean Version: Page 34
Change the word "impermeable" to "impervious". Sentence changed to read:
"Minimize the quantity of storm water directed impervious surfaces and the MS4;"

35. Development Planning Program, Part 4.D.1.e
Strike-Out Version: Page 40
Clean Version: Page 34
Change section to read:
"~~Ensure that treatment control BMPs are~~ pProperly designed and maintained treatment control BMPs in a manner that does not promote the breeding of vectors; and"

36. Development Planning Program, Part 4.D.2
Strike-Out Version: Page 41
Clean Version: Page 34
Change the comma to a period at the end of the second paragraph. Clarify the section name. Sentence changed to read:
"The Principal Permittee in consultation with Permittees shall develop numerical criteria for peak flow control, based on the results of the Peak Discharge Impact Study (see Monitoring Program Section II.I)~~,~~."

37. Development Planning Program, Part 4.D.2
Strike-Out Version: Page 41
Clean Version: Page 34
In the third paragraph, change "540 days" to "3 years". Sentence changed to read:
"Each Permittee shall no later than (3 years ~~540 days~~ from the permit effective date) implement numerical criteria for peak flow control."

38. Development Planning Program, Part 4.D.3.a
Strike-Out Version: Page 41
Clean Version: Page 35
Change section to read:
"Each Permittee shall require that a single-family hillside home ~~development~~:"

39. Development Planning Program, Part 4.D.3.c
Strike-Out Version: Page 42
Clean Version: Page 36
Change "180 days" to "240 days". Section changed to read:
"Each Permittee shall require the implementation of SUSMP provisions no later than (~~180~~ 240 days from permit effective date), for all projects located in or directly adjacent to or discharging directly to an ESA, where~~,~~ the development will:"

40. Development Planning Program, Part 4.D.5.e
Strike-Out Version: Page 43
Clean Version: Page 37
Add "of impervious surface area". Sentence changed to read:
"Retail gasoline outlets [5,000 square feet or more of impervious surface area and with projected Average Daily Traffic (ADT) of 100 or more vehicles]"

41. Development Planning Program, Part 4.D.9.a
Strike-Out Version: Page 45
Clean Version: Page 39
Add an apostrophe in "developers". Sentence changed to read:
"The developer's signed statement accepting responsibility for maintenance until the responsibility is legally transferred, and either".

42. Development Planning Program, Part 4.D.11
Strike-Out Version: Page 46
Clean Version: Page 39
Add the words "any of" in the first sentence. Sentence changed to read:

"The Permittees may propose a management framework, for endorsement by the Regional Board Executive Officer, to support regional or sub-regional solutions to storm water pollution, where any of the following situations occur:"

43. Development Planning Program, Part 4.D.14
Strike-Out Version: Page 47
Clean Version: Page 41
Change the first sentence of the section to read:
"Each Permittee shall train its employees in targeted positions (whose jobs or activities are engaged in development planning) regarding the ~~requirements of the~~ development planning requirements on an annual basis beginning no later than (six months from the effective date of this Order), and more frequently if necessary."

44. Public Agency Activities program, Part 4.F.2.d
Strike-Out Version: Page 54
Clean Version: Page 45
Change "March 9, 2003" to "March 10, 2003".

45. Public Agency Activities Program, Part 4.F.3.c
Strike-Out Version: Page 54
Clean Version: Page 46
Sentence changed to read:

c) "Each Permittee shall require the following to prevent the discharge of pollutants to the MS4:

1. For existing facilities that are not already plumbed to the sanitary sewer, all vehicle and equipment wash areas (except for fire stations) shall be: ~~that all vehicle/equipment wash areas are self-contained or covered, or equipped with a clarifier, or other pretreatment device.~~

a) self-contained; or
b) equipped with a clarifier; or
c) equipped with an alternative pre-treatment device; or
d) plumbed to the sanitary sewer.

2. For new facilities, or during redevelopment of existing facilities, all vehicle and equipment wash areas shall be plumbed to the sanitary sewer and be equipped with a pre-treatment device in accordance with requirements of the sewer agency. ~~sites to be equipped with a clarifier, or other pretreatment device, and properly connected to the sanitary sewer to prevent the discharge of pollutants to the MS4.~~"

46. Public Agency Activities Program, Part 4.F.5.a and b
Strike-Out Version: Page 55
Clean Version: Page 47
Sections changed to read:

a) Designate catch basin inlets within its jurisdiction as one of the following:

Priority A: Catch basins that are designated as consistently generating the highest volumes of trash and/or debris ~~litter~~.

Priority B: Catch basins that are designated as consistently generating moderate volumes of trash and/or debris ~~litter~~.

Priority C: Catch basins that are designated as generating low volumes of trash and/or debris ~~litter~~.

In addition to the schedule below, between (permit effective date) and July 1, 2003, Permittees shall ensure that any catch basin that is at least 40% full of trash and/or debris shall be cleaned out. After July 1, 2003, Permittees shall ensure that any catch basin that is at least 25% full of trash and/or debris shall be cleaned out.

b) Clean catch basins according to the following schedule:

Priority A: A minimum of three times during the wet season and once during the dry season every year. ~~At least once during the dry season and once per month during the wet season.~~

Priority B: A minimum of once during the wet season and once during the dry season every year. ~~At least 2 times per year and once during the wet season. Between the effective date of this Order and July 1, 2003, each Permittee shall ensure that each catch basin is cleaned whenever that catch basin reaches 40% full during the wet season. From July 1, 2003 to the date this Order is renewed, each Permittee shall ensure that each catch basin is cleaned whenever the catch basin reaches 25% full during the wet season.~~

Priority C: A minimum of once per year. ~~As necessary but at least once per year.~~

47. Public Agency Activities Program, Part 4.F.5.c
Strike-Out Version: Page 56
Clean Version: Page 47
Change second sentence to read:
"At a minimum, the Permittee(s) hosting the special event shall arrange for either temporary screens to be placed on catch basins or for catch basins in that area to be cleaned out subsequent to the event prior to any rain."

48. Public Agency Activities Program, Part 4.F.5.d
Strike-Out Version: Page 56
Clean Version: Page 47
Change section to read:
"Place trash receptacles at all transit stops within its jurisdiction that have shelters no later than (6 months from the permit effective date), and at all other transit stops within its jurisdiction no later than (1 year from the permit effective date) ~~and maintain them~~. All trash receptacles shall be maintained as necessary.

49. Public Agency Activities Program, Part 4.F.6.c.3
Strike-Out Version: Page 58
Clean Version: Page 48
Insert the word "basins" at the end of sentence. Sentence changed to read:
"The washout of concrete trucks and chutes shall only occur in designated areas and never discharged to storm drains, open ditches, streets, or catch basins."

50. Public Agency Activities Program, Part 4.F.10
Strike-Out Version: Page 59
Clean Version: Page 50
Change the last sentence to read:
"The Permittees shall collectively review their individual prioritized lists and create a watershed based priority list of drains for potential diversion or treatment and submit the priority listing to the Regional Board Executive Officer, no later than July 1, ~~2002~~ 2003."

Part 5. Definitions

51. All defined terms throughout permit text have been capitalized.

52. "Automotive Service Facilities"
Strike-Out Version: Page 63
Clean Version: Page 52
Change definition to read:
"'**Automotive Service Facilities**' means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 5511, 7532-7534, or 7536-7539. For inspection purposes, Permittees need not inspect facilities with industrial activities falling under SIC codes 5013, 5014, 5541, 5511, provided that these facilities have no outside activities or materials that may be exposed to storm water."

53. "Construction"
Strike-Out Version: Page 64
Clean Version: Page 53
Change definition to read"
"'**Construction**' means constructing, clearing, grading, or excavation that results in soil disturbance. Construction includes structure teardown. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility~~, nor does it include~~; emergency construction activities required to immediately protect public health and safety; interior remodeling with no outside exposure of construction material or construction waste to storm water; mechanical permit work; or sign permit work."

54. "Development"
Strike-Out Version: Page 64
Clean Version: Page 53
Add the following sentence to the end of the definition:
"It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety."

55. "Environmentally Sensitive Areas"
Strike-Out Version: Page 65
Clean Version: Page 54
Insert "(ESAs)" in the definition name as follows: **"Environmentally Sensitive Areas (ESAs)".**

56. "Full Capture Device"
Strike-Out Version: Page 65
Clean Version: Page 54
Remove the definition.
~~"'Full Capture Device' means any device or system that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow resulting from a one-year, one-hour, storm."~~

57. "Inspection"
Strike-Out Version: Page 66
Clean Version: Page 55
Change definition to read:
"'**Inspection**' means entry and the conduct of an on-site review of a facility and its operations, at reasonable times, to determine compliance with specific municipal or other legal requirements. The steps involved in performing an inspection, include, but are not limited to:

1. Pre-inspection documentation research;
2. Request for entry;
3. Interview of facility personnel;
4. Facility walk-through; .
5. Visual observation of the condition of facility premises;
6. Examination and copying of records as required;
7. Sample collection (if necessary or required);
8. Exit conference (to discuss preliminary evaluation); and
9. Report preparation, and if appropriate, recommendations for coming into compliance.

In the case of restaurants, a Permittee may conduct an inspection from the curbside, provided that such a "curbside" inspection provides the Permittee with adequate information to determine an operator's compliance with BMPs that must be implemented per requirements of this Order, Regional Board Resolution 98-08, County and municipal ordinances, and the SQMP."

58. "Parking Lot"
Strike-Out Version: Page 67
Clean Version: Page 56
Change definition to read:
"'**Parking Lot**' means land area or facility for the parking or storage of motor vehicles used ~~personally, for businesses or for commerce~~ for businesses, commerce, industry, or personal use, with a lot size of 5,000 square feet or more of surface area, or with 25 or more parking spaces."

59. "Planning Priority Projects"
Strike-Out Version: Page 68
Clean Version: Page 57
Change section viii of the definition to read:
"viii. ~~Additionally, for all~~ pProjects located in or directly adjacent to or discharging directly to an ESA, which meet thresholds; and"

60. "Potable Water Distribution Systems"
Strike-Out Version: Page 69
Clean Version: Page 57
Change definition to read:
"'**Potable Water Distribution Systems Releases**' means sources of flows from drinking water storage, supply and distribution systems including flows from system failures, pressure releases, system maintenance, ~~well development,~~ distribution line testing ~~pump test~~, fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults, ~~and wells~~ and minor non-invasive well maintenance activities not involving chemical addition(s). It does not include wastewater discharges from activities that occur at wellheads, such as well construction, well development (i.e. aquifer pumping tests, well purging etc.), and major well maintenance."

61. "Redevelopment"
Strike-Out Version: Page 70
Clean Version: Page 58
Add the following sentence to the end of definition:
"It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety."

62. "Vehicle Maintenance/Material Storage Facilities/Corporation Yards"
Strike-Out Version: Page 73

Clean Version: Page 61
Insert "service/maintenance" in section ii. Section ii. changed to read:
"Performs fleet vehicle service/maintenance on ten or more vehicles per day including repair, maintenance, washing, and fueling;".

63. "Water Column Toxicity"
Strike-Out Version: Page 73
Clean Version: Page 61
Delete definition. Defined in Monitoring Program.

Part 6. Standard Provisions

64. Reopener and Modification, Part 6.I.3
Strike-Out Version: Page 77
Clean Version: Page 64
Delete section 3:
~~"This Order may be modified, revoked and reissued, or terminated for cause."~~

65. Enforcement, Part 6.P.2
Strike-Out Version: Page 81
Clean Version: Page 68
Insert the word "of". Section changed to read:
"The CWC provides that any person who violates a waste discharge requirement provision of the CWC is subject to civil penalties of up to $5,000 per day, $10,000 per day, or $25,000 per day of violation; or when the violation involves the discharge of pollutants, is subject to civil penalties of up to $10 per gallon per day or $25 per gallon per day of violation; or some combination thereof, depending on the violation or combination of violations."

Monitoring and Reporting Program

66. Reporting Program, Section I.A.3.d
Both Versions: Page T-1
Change to read:
"Permittee level of effort, as indicated in the individual Annual Report self-evaluations;"

67. Reporting Program, Section I.A.3.e
Both Versions: Page T-2
Delete the last sentence. Section changed to read:
"Integrated summary of Monitoring Program results, including the identification of water quality improvements or degradation, and recommendations for improvements to the SQMP (including proposed BMPs) based on the results from the monitoring program. ~~When exceedances of applicable water quality standards have been identified, a discussion of how Permittees will comply with the requirements in Part 2 of this Order (Receiving Water Limitations) shall be included."~~

68. Reporting Program, Section I.B
Both Versions: Page T-2
Change the reference to "Attachment U-5" to "Attachment U-4" in the second sentence.

69. Reporting Program, Section I.C.2
Both Versions: Page T-2
Delete second sentence (redundant to Section I.C.6). Section changed to read:
"Data, results, methods of evaluating the data, graphical summaries of the data, and an explanation/discussion of the data for each component of the monitoring program, including any specific reporting requirements included in Section II. Monitoring Program. ~~All data shall~~

~~be compared to applicable water quality standards in the Ocean Plan, the Basin Plan, the California Toxics Rule (CTR), and California Title 22 (Title 22).~~

70. Reporting Program, Section I.C.6
Both Versions: Page T-3
Section changed to read:
"A comparison to the ~~An assessment of compliance with~~ applicable water quality standards for each component of the monitoring program. The lowest applicable standard from the Basin Plan, the Ocean Plan, the CTR, and Title 22 of the California Water Code shall be used as a comparison. Constituents that exceed applicable standards shall be identified. When data indicate that discharges are causing or contributing to exceedances of applicable water quality standards, a discussion of ~~how Permittees plan to comply with the requirements of Part 2 of this Order (RWL) shall be submitted~~ possible pollutant sources shall be included in the Monitoring Report and a RWL Compliance Report (Section I.A.4) shall be submitted with the subsequent unified Annual Report."

71. Reporting Program, Section I.C.7
Both Versions: Page T-3
Delete section (redundant to Section I.A.3.e):
"~~Recommendations for improvements to the SQMP and to the monitoring program to address water quality exceedances and potential pollutant sources~~."

72. Mass Emissions Monitoring, Section II.A
Both Versions: Page T-4
Change the word "objectives" to "standards". Add the word "applicable". Section changed to read:
"The Principal Permittee shall monitor mass emissions to accomplish the following objectives: 1) estimate the mass emissions from the MS4; 2) assess trends in the mass emissions over time; and 3) determine if the MS4 is contributing to exceedances of water quality ~~objectives~~ standards by comparing results to applicable ~~objectives~~ standards in the Basin Plan, the Ocean Plan, the CTR, Title 22, and with emissions from other dischargers."

73. Water Column Toxicity Monitoring, Section II.B
Both Versions: Page T-6
Change sections 1, 2 and 3 to read as follows:

1. The Principal Permittee shall analyze samples from two storm events (including the first storm of each year) and two dry weather events from each mass emission station for toxicity every year. A minimum of one freshwater and one marine species shall be used for toxicity testing for each station event. Specifically, the *Ceriodaphnia dubia* (water flea) 7-day survival/reproduction and *Strongylocentrotus purpuratus* (sea urchin) fertilization tests shall be used. These tests should include a dilution series (0.5x steps) that ranges from the undiluted sample (or the highest concentration that can be tested within the limitations of the test method or sample type) to 6% sample.

2. Toxicity Identification Evaluations (TIE)

   The Principal Permittee shall begin a Phase I TIE immediately on all samples that are substantially toxic (1 Toxic Unit) to either test species.[1] If a sample is substantially toxic to both species, a TIE shall be performed for both species. ~~Substantial toxicity means the amount of toxicity necessary to successfully conduct a Phase I TIE. For example, Ceriodaphnia TIEs require at least 50% mortality in undiluted sample at any~~

13-100 13-200 3-300

[1] Substantial toxicity means the amount of toxicity necessary to successfully conduct a Phase I TIE. Toxic Units are calculated by dividing 100 by the calculated median test response value (e.g., LC50 or EC50). For example, a LC50 of 50% sample equals 2 Toxic Units. *Ceriodaphnia* TIEs require at least 50% mortality in undiluted sample (1 Toxic Unit) at any time during the 7-day duration of the initial chronic bioassay (SCCWRP).

~~time during the 7-day duration of the initial chronic bioassay.~~[2] The Phase I TIE shall include the following treatments and corresponding blanks:

a) Baseline toxicity;

b) Particle removal by centrifugation;

c) Solid phase extraction of the centirfuged sample using C18 media;

d) Complexation of metals using EDTA addition to the raw sample;

e) Neutralization of oxidants/metals using sodium thiosulfate addition to the raw sample; and

f) Inhibition of OP pesticide activation using piperonyl butoxide addition to the raw sample (crustacean toxicity tests only).

3. Toxicity Reduction Evaluations (TRE)

a) When the same pollutant or class of pollutants is identified through the TIE process as causing at least 50% of the toxic responses in at least 3 samples at a sampling location, a TRE shall be performed for that identified toxic pollutant. ~~If a discharge from the MS4 is identified to cause or contribute to toxicity in a receiving water body, a TRE shall be performed.~~ TRE development shall be performed by a neutral third party (retained by the Principal Permittee), with input from Permittees and Regional Board staff. The TRE shall include all reasonable steps to identify the source(s) of toxicity and discuss appropriate BMPs to eliminate the causes of toxicity. Once the source of toxicity and appropriate BMPs are identified, the Principal Permittee shall submit the TRE to the Regional Board Executive Officer for approval. At a minimum, it shall include a discussion of the following items:

(1) The potential sources of pollutant(s) causing toxicity;
(2) A list of municipalities that may have jurisdiction over sources of pollutant(s) causing toxicity;
(3) Recommended BMPs to reduce the pollutant(s) causing toxicity;
(4) Proposed changes to the SQMP to reduce the pollutant(s) causing toxicity; and
(5) Suggested follow-up monitoring to demonstrate that toxicity has been removed.

b) Since the Phase I TIEs may only identify a broad category of toxicants (e.g., nonpolar organics), additional TIE analysis may be required in order to identify or confirm the identity of the pollutants causing toxicity before the TRE can be completed.

~~b)~~c) If TRE implementation for a specific pollutant coincides with TMDL implementation for that pollutant, the efforts may be coordinated.

~~c)~~d) Upon approval by the Regional Board Executive Officer, the Permittee(s) having jurisdiction over sources causing or contributing to toxicity shall implement the recommended BMPs and take all reasonable steps necessary to eliminate toxicity.

~~d)~~e) The Principal Permittee shall be responsible for the development of a maximum of two TREs per year. If applicable, the Principal Permittee may use the same TRE for the same toxic pollutant or pollutant class in different watersheds. The TRE process shall be coordinated with TMDL development and implementation (i.e. If a TMDL for zinc is being implemented when a TRE for zinc is required, the efforts shall be coordinated to avoid overlap).

[2] ~~SCCRWP~~

e)f) The Principal Permittee shall report on the development, implementation, and results for each TRE in the annual Monitoring Reports, beginning the year following the identification of each pollutant or pollutant class causing toxicity.

74. Tributary Monitoring, Section II.C.1
Both Versions: Page T-7
Change "WMA" to "year". Section changed to read:
"The Principal Permittee shall develop and implement a watershed-based tributary monitoring program, in which a minimum of six tributaries per year ~~WMA~~ will be monitored, based on the schedule described below:"

75. Tributary Monitoring, Section II.C.1.c.6
Both Versions: Page T-8
Change "Verdigo Wash" to "Verdugo Wash".

76. Tributary Monitoring, Section II.C.2
Both Versions: Page T-8
Change "no later than the effective date of this Order" to "in October 2002". Sentence changed to read:
"Tributary monitoring shall begin in October 2002, or the first subsequent storm event. ~~(no later than the effective date of this Order).~~"

77. Trash Monitoring, Section II.E
Both Versions: Page T-10
Modify the first section to read:
" To assess the quantities of trash in receiving waters after storm events and to identify areas impaired for trash, the Principal Permittee shall conduct visual observations of trash and take a minimum of one photograph at each mass emission station after the first storm event and 3 additional storm events per year.

The Principal Permittee and Permittees in the Los Angeles River and Ballona Creek WMAs (listed in Attachment A) shall develop and implement a ~~conduct~~ trash monitoring program in the Los Angeles River and Ballona Creek watersheds to assess likely sources and amounts of trash no later than October 15, 2002~~to identify areas impaired for trash. The Principal Permittee and the Permittees in the Los Angeles River and Ballona Creek WMAs (listed in Attachment A) shall develop and implement a trash monitoring program for the Los Angeles River and Ballona Creek watersheds no later than October 15, 2002.~~ The monitoring program and schedule shall be consistent with and pursuant to the CWC §13267 Request for Trash Monitoring, issued by the Regional Board on [date letter issued]. ~~All other Permittees shall begin implementation of the trash monitoring program in watersheds that are not presently listed on the CWA §303(d) list for impairment for trash no later than October 15, 2003~~."

78. Trash Monitoring, Section II.E.1
Both Versions: Page T-10
Section changed to read:
"For the first two years of monitoring, either of the following formats for monitoring plans may be used:"

79. Trash Monitoring, Section II.E.3
Both Versions: Page T-11
Section changed to read:
"Following the first two years of data collection, Permittees shall conduct compliance monitoring, which involves calculating ~~calculate~~ trash loading as a running three-year average (estimated total load discharged from 2003-2006, divided by three)."

80. Estuary Sampling, Section II.F.3.d.2
Both Versions: Page T-12
Change sentence to read:
"Phase I TIEs of interstitial water, using the amphipod test species ~~Ceriodaphnia dubia and Strongylocentotus purperatus (sea urchin) fertilization~~, shall be conducted for samples from stations identified to be toxic in a single amphipod survival bioassay."

81. Bioassessment, Section II.G
Both Versions: Page T-13
Insert the word "by" in the first sentence:
"The Principal Permittee shall continue participation on the Stormwater Monitoring Coalition (SMC), as well as coordinate with the Surface Water Ambient Monitoring Program (SWAMP) being developed by the State Board to complete this requirement."

82. Bioassessment, Section II.G.4
Both Versions: Page T-13
In the last sentence, change "Boar" to "Board".

83. Standard Monitoring Provisions, Section II.K.5.
Both Versions: Page T-17
Last sentence changed to read:
"If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by imprisonment of not more than four years, or ~~by~~ both."

84. Standard Monitoring Provisions, Section II.K.7
Both Versions: Page T-17
Section changed to read:
"For priority toxic pollutants that are identified in the CTR (65 *Fed. Reg.* 31682), the MLs published in Appendix 4 of the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* - 2000 (SIP) shall be used for analyses, unless otherwise specified. The MLs from the SIP are incorporated into the Constituent List (Attachment U-1). ~~Appendix 4 of the SIP is included as Attachment U-2. For pollutants not contained in Appendix 4 of the SIP, the test method and method detection limit (MDL) listed in Appendix U-1 shall be used for all analyses, and the ML for these parameters shall be lower than or equal to the lowest applicable water quality criteria from the Basin Plan and/or the Ocean Plan.~~

85. Attachment U-1, *List of Constituents for the Storm Water Monitoring Program and Associated Minimum Levels (MLs)*
The following changes have been made to the Constituent List:
a. Semi-volatile organic compounds that are not federal priority pollutants and that have consistently not been detected in Los Angeles County storm water analyses have been removed.
b. For each priority pollutant, the lowest corresponding ML from Appendix 4 of the SIP (Attachment U-2) has been incorporated. Therefore, Attachment U-2 will be eliminated.
c. Streptococcus has been changed to Enteroccus for salt water and E. coli for fresh water.
d. Title changed to read as written above.

86. Attachment U-2, *Appendix 4 of SIP*
Remove entire attachment.

87. Attachment U-4, *Total Maximum Daily Loads Scheduled for Implementation in Los Angeles County Watershed Within 10 Years*
a. Delete the word "Watershed" from the title. Title changed to read:

"*Total Maximum Daily Loads Scheduled for Implementation in Los Angeles County within 10 Years*".

b. Change the first column title from "Waterbody" to "Watershed".
c. Change from "Attachment U-4" to "Attachment U-3"

88. Attachment U-5, Individual Annual Report Form
    a. Page 1: Change from "Attachment U-5" to "Attachment U-4".
    b. Add Table of Contents to Page 1
    c. Modify several questions to better correspond to permit sections and requirements.
    d. Page 18, Section C.2: Change the last sentence of the section to read as follows: "~~Briefly describe each procedure and attach examples of how each was required in a priority development or redevelopment project.~~ List the types and numbers of BMPs that your agency required for priority projects to meet the requirements listed above."
    e. Page 31, Section F.2: Change the first senterice to read:
    "Attach a map of your storm drain system showing all permitted connections (if available), and the locations of all illicit connections and discharges that occurred last year (Part 4.G.1.b)."
    f. Page 32, Item 9: Change last column label from "# not identified" to "# that resulted in *other* actions". Under the table, insert the sentence: "Explain any *other* actions that occurred in the last year."

Change Sheet Additions

(12/10/01)

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

COUNTY OF LOS ANGELES
MUNICIPAL STORM WATER NPDES PERMIT
(NPDES PERMIT No. CAS004001)

ADDITIONS TO DRAFT CHANGE SHEET

SUMMARY

This additional Change Sheet lists proposed changes to the Final Tentative - County of Los Angeles Municipal Storm Water NPDES Permit (October 11, 2001), in addition to those included in the draft Change Sheet issued on December 4, 2001. Cross-references to pages and sections are for the 'Clean Version' and the 'Strike-Out Version', of the tentative draft, dated October 11, 2001. New text added to a sentence is indicated by underline, and deleted text is indicated by strikethrough.

PROPOSED CHANGES

1. Finding B.9
   Strike-Out Version: Page 4
   Clean Version: Page 3
   Insert the following sentence at the beginning of finding:
   "The discharge of washwaters and contaminated storm water from businesses is an environmental threat and also can adversely impact public health and safety."

2. Finding C.6
   Strike-Out Version: Page 5
   Clean Version: Page 5
   Change last sentence of finding to read:
   "Retail Gasoline Outlets in Western U.S. States (such as Washington and Oregon) are already subject to numerical BMP design criteria~~under the MS4 program~~, as well as in other U.S. States."

3. Finding F.8
   Strike-Out Version: Page 15
   Clean Version: Page 13
   Change finding to read:
   "This Order provides flexibility for Permittees to petition the Regional Board Executive Officer to substitute a BMP ~~or requirement~~ under the SQMP with an alternative BMP, if they can provide information and documentation on the effectiveness of the alternative, equal to or greater than the prescribed BMP in meeting the objectives of this Order."

4. SQMP Implementation, Part 3.A.1
   Strike-Out Version: Page 20
   Clean Version: Page 17
   Change last sentence to read:
   "The SQMP shall be implemented immediately following (the permit effective date), unless a later date has been specified for particular provisions in this Order."

5. SQMP Implementation, Part 3.A.4
   Strike-Out Version: Page 20
   Clean Version: Page 18
   Change first sentence to read:

R0007281

"Permittees that modify ~~deviate from~~ the countywide SQMP (i.e., need additional controls, implement different controls than described in the countywide SQMP, or determine that certain BMPs in the countywide SQMP are not applicable to the area under its jurisdiction), shall develop a local SQMP, no later than (6 months from the permit effective date)."

6. SQMP Implementation, Part 3.E.5
   Strike-Out Version: Page 21
   Clean Version: Page 19
   Change the requirement for a summary of budget expenditures to read:
   "Prepare an annual summary of expenditures applied to the storm water management program. This summary of budget expenditures shall identify the storm water budget for the following year, using estimated percentages and written explanations where necessary, for the specific categories noted below:
   a) Program management
      - Administrative costs
   b) Program implementation
      Where information is available, provide an estimated percent breakdown of expenditures for the categories below:
      - Illicit connection/illicit discharge
      - Development planning
      - Development construction
        - Construction inspection activities
      - Industrial/Commercial inspection/site visit activities
      - Public Agency Activities
        - Maintenance of structural BMPs and treatment control BMPs
        - Municipal street sweeping
        - Catch basin clean-up
        - Trash collection
        - Capital costs
   c) Public Information and Participation
   d) Monitoring Program
   e) Miscellaneous Expenditures

7. Public Information and Participation Program, Part 4.B
   Strike-Out Version: Page 28
   Clean Version: Page 23
   Change the last paragraph of Part 4.B to read:
   "The Principal Permittee shall convene an advisory committee to provide input and assistance in meeting the goals and objectives of the public education campaign. The advisory committee shall be consulted during the process of developing the campaign, and shall provide comments and advice during the process of preparing a Request For Proposals for a storm water public education contractor. The committee may participate as a part of a working group that evaluates contractor proposals, and other tasks as appropriate. The committee shall be comprised of representatives of the environmental community, Permittee cities, Regional Board staff, and experts in the fields of public education and marketing. The Principal Permittee shall ensure that the committee meets at least once a year. ~~a panel to review the PIPP and the effectiveness of each of its components. Panel members shall possess the expertise to assess public information and outreach programs, strategies, and materials. Comments and recommendations on the PIPP shall be submitted to the Regional Board Executive Officer for consideration no later than December 31, annually. The PIPP will become effective upon approval.~~"

8. Public Information and Participation, Part 4.B.8
   Strike-Out Version: Page 30
   Clean Version: Page 25

R0007282

Change section to read:
"~~The~~ Permittees shall provide the contact information for their appropriate ~~storm water~~ staff responsible for storm water public education activities to the Principal Permittee no later than (60 days from the effective date of this Order), and changes to contact information no later than 30 days after a change occurs. ~~Cooperative efforts with other agencies may also be used to accomplish this requirement.~~

9. Development Planning Program, Part 4.D.2
Strike-Out Version: Page 41
Clean Version: Page 34
Change the fourth paragraph to read:
"A Permittee of group of Permittees may substitute ~~for~~ the countywide peak flow control criteria with a Hydromodification Control Plan (HCP), on approval by the Regional Board, in the following circumstances:"

10. Development Planning Program, Part 4.D.3
Strike-Out Version: Page 41
Clean Version: Page 35
Insert the following paragraph at the beginning of the SUSMP section:
"Each Permittee shall amend codes and ordinances not later than [6 months from permit effective date] to give legal effect to SUSMP changes contained in this Order. Changes to SUSMP requirements shall take effect not later than [7 months from permit effective date]."

11. Development Planning Program, Part 4.D. 3.c
Strike-Out Version: Page 42
Clean Version: Page 36
Change section to read:
"Each Permittee shall require the implementation of SUSMP provisions no later than (7 months ~~240 180 days~~ from the permit effective date), for all projects located in or directly adjacent to or discharging directly to an ESA, where the development will:"

12. Development Planning Program, Part 4.D.5.e
Strike-Out Version: Page 43

Strike-Out Version: Page 48
Clean Version: Page 41
Change the date to read:
"The Principal Permittee in partnership with Permittees shall issue no later than (two years ~~ten months~~ from the effective date of this Order), a technical manual for the siting and design of BMPs for the development community in Los Angeles County."

15. Development Construction Program, Part 4.E.4

Strike-Out Version: Page 51
Clean Version: Page 44
Insert the following section between sections 3 and 4:
4. GCASP Violation Referrals

a) Referral of Violations of the SQMP, Regional Board Resolution 98-08, and municipal storm water ordinances:

A Permittee may refer a violation(s) to the Regional Board provided that the Permittee has made a good faith effort of progressive enforcement. At a minimum, a Permittee's good faith effort must include documentation of:

- Two follow-up inspections within 3 months, and
- Two warning letters or notices of violation.

b) Referral of Violations of GCASP Filing Requirements:

For those projects subject to the GCASP, Permittees shall refer non-filers (i.e., those projects which cannot demonstrate that they have a WDID number) to the Regional Board, within 15 days of making a determination. In making such referrals, Permittees shall include, at a minimum, the following documentation:

- Project location,
- Developer,
- Estimated project size, and
- Records of communication with the developer regarding filing requirements.

16. Public Agency Activities Program, Part 4.F.3.c
Strike-Out Version: Page 54
Clean Version: Page 46
Change section to read:

c) Each Permittee shall implement ~~require~~ the following measures to prevent the discharge of pollutants to the MS4:

~~1.~~ For existing facilities, that are not already plumbed to the sanitary sewer, all vehicle and equipment wash areas (except for fire stations) shall be: ~~that all vehicle/equipment wash areas are self-contained or covered, or equipped with a clarifier, or other pretreatment device.~~

a) Self-contained; or

b) Equipped with a clarifier; or

c) Equipped with an alternative pre-treatment device; or

d) Plumbed to the sanitary sewer.

2. For new facilities, or during redevelopment of existing facilities (including fire stations), all vehicle and equipment wash areas shall be plumbed to the sanitary sewer and be equipped with a pre-treatment device in accordance with requirements of the sewer agency. ~~sites to be equipped with a clarifier, or other pretreatment device, and properly connected to the sanitary sewer to prevent the discharge of pollutants to the MS4.~~

~~This provision does not apply to fire fighting vehicles.~~

17. Public Agency Activities Program, Part 4.F.5
Strike-Out Version: Page 55
Clean Version: Page 46
Modify the Storm Drain Operation and Maintenance section to read:

a) Each Permittee shall designate catch basin inlets within its jurisdiction as one of the following:

Priority A: Catch basins that are designated as consistently generating the highest volumes of trash and/or debris~~litter~~.

Priority B: Catch basins that are designated as consistently generating moderate volumes of trash and/or debris~~litter~~.

Priority C: Catch basins that are designated as generating low volumes of trash and/or debris~~litter~~.

b) Permittees subject to a trash TMDL (Los Angeles River and Ballona Creek WMAs) shall continue to implement the requirements listed below until trash TMDL implementation measures are adopted. Thereafter, the subject Permittees shall implement programs in conformance with the TMDL implementation schedule, which shall include an effective combination of measures such as street sweeping, catch basin cleaning, installation of treatment devices and trash receptacles, or other BMPs. Default requirements include:

(1) Inspection and cleaning of catch basins between May 1 and September 30 of each year;

(2) Additional cleaning of any catch basin that is at least 40% full of trash and/or debris;

(3) Record keeping of catch basins cleaned; and

(4) Recording of the overall quantity of catch basin waste collected.

c) Permittees not subject to a trash TMDL shall:

(1) Clean catch basins according to the following schedule:

Priority A: A minimum of three times during the wet season and once during the dry season every year.

Priority B: A minimum of once during the wet season and once during the dry season every year.

Priority C: A minimum of once per year.

In addition to the schedule above, between (permit effective date) and July 1, 2003, Permittees shall ensure that any catch basin that is at least 40% full of trash and/or debris shall be cleaned out. After July 1, 2003, Permittees shall ensure that any catch basin that is at least 25% full of trash and debris shall be cleaned out.

(2) For any special event that can be reasonably expected to generate substantial quantities of trash and litter, include provisions that require for the proper management of trash and litter generated, as a condition of the special use permit issued for that event. At a minimum, the municipality who issues the permit for the special event shall arrange for either temporary screens to be placed on catch basins or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain event.

(3) Place trash receptacles at all transit stops within its jurisdiction that have shelters no later than (6 months from the permit effective date), and at all other transit

stops within its jurisdiction no later than (1 year from the permit effective date). All trash receptacles shall be maintained as necessary.

e) ~~The Permittees shall implement a program which achieves the waste load allocations in conformance with a TMDL schedule of implementation by using an effective combination of BMPs which may include a combination of street sweeping, catch basin clean outs, installation of treatment devices, or other BMPs.~~

18. Public Agency Activities Program, Part 4.F.6.b

Change "Automotive Service Facilities" definition to read:
"'**Automotive Service Facilities**' means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 5511, 7532-7534, or 7536-7539. For inspection purposes, Permittees need not inspect facilities with SIC codes 5013, 5014, 5541, 5511, provided these facilities have no outside activities or materials that may be exposed to storm water."

20. Definitions, Part 5
Strike-Out Version: Page 70
Clean Version: Page 58
Insert the following definition of "Screening" after the "Runoff" definition:
"'**Screening**' means using proactive methods to identify illicit connections through a continuously narrowing process. The methods may include: performing baseline monitoring of open channels, conducting special investigations using a prioritization approach, analyzing maintenance records for catch basin and storm drain cleaning and operation, and verifying all permitted connections into the storm drains. Special investigation techniques may include: dye testing, visual inspection, smoke testing, flow monitoring, infrared, aerial and thermal photography, and remote control camera operation."

21. Definitions, Part 5
Strike-Out Version: Page 73
Clean Version: Page 61
Change the "Water Quality Standards and Water Quality Objectives" definition to read:
"'**Water Quality Standards and Water Quality Objectives**' means water quality criteria contained in the Basin Plan, the California Ocean Plan, the National Toxics Rule, the California Toxics Rule, Title 22 of the California Water Code, and other state and federally approved surface water quality plans. Such plans are used by the Regional Board to regulate all discharges, including storm water discharges."

22. Standard Provisions, Part 6.S
Strike-Out Version: Page 81
Clean Version: Page 68
Change section to read:
"This Order expires on December 13 ~~November 29~~, 2006. The ~~Principal~~ Permittees must submit a Report of Waste Discharges and a proposed Storm Water Quality Management Program in accordance with Title 23, California Code of Regulations~~, not later than 180 days~~

~~in advance of such date~~ as application for reissuance of waste discharge requirements, not later than June 13, 2006.

23. Program Reporting Requirements, Section I.A.3
Both Versions: Page T-1
Change section to read:
An assessment of the effectiveness of SQMP requirements to reduce storm water pollution. This assessment shall be comprised of a compilation of watershedwide assessments conducted by each WMC. ~~This a~~Assessments ~~will~~shall be based upon the specific record-keeping information requirement in each ~~major~~ section of the permit, monitoring data, summaries of program effectiveness from each Permittee, and any other information related to program effectiveness. The program assessment shall include summaries of the following:
    a) Summary of common activities conducted by all Permittees;
    b) Watershed Management Area ~~Countywide~~ BMP implementation;
    c) Identification of management measures proven to be effective and/or ineffective at reducing urban runoff pollutants and flow;
    d) Permittee level of effort, as indicated in their Individual Annual Report self evaluations (Attachment U-4, section VI); and
    ~~e)~~ Integrated summary of Monitoring Program results, including the identification of water quality improvements or degradation, and recommendations for improvements to the SQMP (including proposed BMPs) based on the results from the Monitoring Program. ~~When exceedances of applicable water quality standards have been identified, a discussion of how Permittees will comply with the requirements in Part 2 of this Order (RWL) shall be included.~~

24. Program Reporting Requirements, Section I.A.4.
Both Versions: Page T-2
Change section to read:
"Pursuant to Part 2 of this Order, after a determination by either the Permittee or the Regional Board that discharges are causing or contributing to an exceedance of an applicable water quality standard, a ~~A~~Receiving Water Limitations (RWL) Compliance Report shall be submitted with the ~~attached to the~~ subsequent Unified Annual report. A status RWL Compliance Report shall be submitted every alternate year following the submittal of the first Report~~, beginning in 2003~~. The RWL Compliance Report shall include the following:"

25. Program Reporting Requirements, Section I.C.6
Both Versions: Page T-3
Change section to read:
"A comparison to the ~~An Assessment of compliance with~~ applicable Water Quality Standards for each component of the Monitoring Program. The lowest applicable standards from the Basin Plan, the Ocean Plan, the CTR, or Title 22 of the CWC shall be used for ~~as a~~ comparison. Constituents that exceed applicable Water Quality Standards shall be highlighted. When data indicate that discharges are causing or contributing to exceedances of applicable Water Quality Standards, a discussion of possible pollutant sources shall be included in the Monitoring Report and a RWL Compliance Report (Section I.A.4) shall be submitted with the subsequent Unified Annual Report. ~~how Permittees plan to comply with the requirements of Part 2 of this Order (RWL) shall be included.~~"

26. Tributary Monitoring, Section II.C.2
Both Versions: Page T-8
Change section to read:
"Tributary monitoring shall begin in October 2002~~, or the first subsequent storm event(no later than the effective date of this Order)~~.

STATE OF CALIFORNIA

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

ORDER NO. 01-xxx
NPDES PERMIT NO. CAS004001
WASTE DISCHARGE REQUIREMENTS
FOR
MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES, AND THE INCORPORATED CITIES THEREIN, EXCEPT THE CITY OF LONG BEACH

The California Regional Water Quality Control Board, Los Angeles Region (hereinafter referred to as the Regional Board) finds:

A. Existing Permit Existing Permit and Report of Waste Discharge

The Los Angeles County Flood Control District, the County of Los Angeles, and 84 incorporated cities within the Los Angeles County Flood Control District (see Attachment A, List of Permittees), hereinafter referred to separately as Permittees and jointly as the Discharger, discharge or contribute to discharges of storm water and urban runoff from municipal separate storm sewer systems (MS4s), also called storm drain systems. The discharges flow to water courses within the Los Angeles County Flood Control District and into receiving waters of the Los Angeles Region. These discharges are covered under countywide waste discharge requirements contained in Order No. 96-054 adopted by this Regional Board on July 15, 1996, which replaced Order No. 90-079 adopted by this Regional Board on June 18, 1990. Order No. 96-054 also serves as a National Pollutant Discharge Elimination System (NPDES) permit for the discharge of municipal storm water.

B. Nature of Discharges and Sources of Pollutant

1. Storm water discharges consist of surface runoff generated from various land uses in all the hydrologic drainage basins that discharge into water bodies of the State. The quality of these discharges varies considerably and is affected by the hydrology, geology, land use, season, and sequence and duration of hydrologic events. The primary constituents of concern currently identified by the Los Angeles County Flood Control District 1994-2000 Integrated Receiving Water Impacts Report are cyanide, indicator bacteria, total dissolved solids, turbidity, total suspended solids, nutrients, total aluminum, dissolved cadmium, copper, lead, total mercury, nickel, zinc, bis(2-ethylhexyl)phthalate, polycyclic aromatic hydrocarbons (PAHs), diazinon, and chlorpyrifos.

2. Certain pollutants present in storm water and/or urban runoff may be derived from extraneous sources that Permittees have no or limited jurisdiction over. Examples of such pollutants and their respective sources are: PAHs which are products of internal combustion engine

R0007291

operation, nitrates, bis (2-ethylhexyl) phthalate and mercury from atmospheric deposition, lead from fuels, copper from brake pad wear, zinc from tire wear, dioxins as products of combustion, and natural-occurring minerals from local geology. However, the implementation of the measures set forth in this Order is intended to reduce the entry of these pollutants into storm water and their discharge to receiving waters.

3. Water quality assessments conducted by the Regional Board identified impairment, or threatened impairment, of beneficial uses of water bodies in the Los Angeles Region. The causes of impairments include pollutants of concern identified in municipal storm water discharges by the County of Los Angeles in the Integrated Receiving Water Impacts Report (1994-2000). Pollutants in storm water can have damaging effects on both human health and aquatic ecosystems.

4. The Los Angeles County Grand Jury, September 2000, completed an investigation into the health risks of swimming near beaches in Los Angeles County and made several recommendations to reduce public health risks (Final Report, Grand Jury, Los Angeles County, 1999-2000). The Grand Jury recommended that the Regional Board consider among other actions, (i) a focus on setting contaminant limits rather than programmatic evaluations, (iii) audit of MS4 Permittee programs; and (iv) clarifying enforcement responsibilities between the State and local governments.

5. Studies and research conducted by other Regional agencies, academic institutions, and universities have also identified storm water and urban runoff as significant sources of pollutants to surface waters in Southern California. See, e.g., [*Surface Runoff to the Southern California Bight*, Southern California Coastal Water Research Project, (1992); *Impacts of Urban Runoff on Santa Monica Bay and Surrounding Ocean Waters* (Gersberg, R.M., 1995); *State of the Bay 1998*, Santa Monica Bay Restoration Project; *Storm Water Impact*, In, Southern California Environmental Report Card 1999, Institute of the Environment, University of California, Los Angeles (Stenstrom, M.S., 1999); *Distribution of Anthropogenic and Natural Debris on the Mainland Shelf of Southern California Bight,* Shelly L. Moore and M. James Allen (1999); *The Health Effects of Swimming in Ocean Water Contaminated by Storm Drain Runoff*, Haile, R.W. et al. (1999); *Huntington Beach Closure Investigation: Technical Review* (University of Southern California, 2000); *A Regional Survey of the Microbiological Water Quality Along the Shoreline of the Southern California Bight*, Rachel T. Noble et al. (2001); *Integrated Receiving Water Impacts Report (1994-2000)*, County of Los Angeles (2001).

6. Development and urbanization increase pollutant load, volume, and discharge velocity. First, natural vegetated pervious ground cover is converted to impervious surfaces such as paved highways, streets, rooftops and parking lots. Natural vegetated soil can both absorb rainwater and remove pollutants providing an effective natural purification process. In contrast, pavement and concrete can neither absorb water nor remove pollutants, and thus the natural purification characteristics are

lost. Second, urban development creates new pollution sources as the increased density of human population brings proportionately higher levels of vehicle emissions, vehicle maintenance wastes, municipal sewage waste, pesticides, household hazardous wastes, pet wastes, trash, and other anthropogenic pollutants. Development and urbanization especially threaten environmentally sensitive areas. Such areas have a much lower capacity to withstand pollutant shocks than might be acceptable in the general circumstance. In essence, development that is ordinarily insignificant in its impact on the environment may in a particular sensitive environment become significant. These environmentally sensitive areas designated by the State and/or the County of Los Angeles include Areas of Special Biological Significance (ASBS), water bodies designated as supporting a RARE beneficial use, Significant Natural Areas (SNAs), and Significant Ecological Areas (SEAs).

7. The increased volume, increased velocity, and discharge duration of storm water runoff from developed areas has the potential to greatly accelerate downstream erosion and impair stream habitat in natural drainages. Studies have demonstrated a direct correlation between the degree of imperviousness of an area and the degradation of its receiving waters. Significant declines in the biological integrity and physical habitat of streams and other receiving waters have been found to occur with as little as 10 percent conversion from natural to impervious surfaces. Percentage impervious cover is a reliable indicator and predictor of potential water quality degradation expected from new development. (*Impervious Cover as An Urban Stream Indicator and a Watershed Management Tool*, Schueler, T. and R. Claytor, In, Effects of Water Development and Management on Aquatic Ecosystems (1995), ASCE, New York.)

8. The County of Los Angeles has identified as the seven highest priority industrial and commercial critical source types, (i) wholesale trade (scrap recycling, auto dismantling); (ii) automotive repair/parking; (iii) fabricated metal products; (iv) motor freight; (v) chemical and allied products; (vi) automotive dealers/gas stations; (vii) primary metal products (*Critical Source Selection and Monitoring Report*, Los Angeles County Department of Public Works -Sept 1996). Monitoring conducted by Los Angeles County demonstrates that the priority industrial sectors and auto repair facilities (one of the commercial sectors) on the list, contribute significant concentrations of heavy metals to storm water (*Los Angeles County 1999-2000 Storm Water Monitoring Report*, Los Angeles County Department of Public Works -July 2000).

9. A review of industrial waste/ pretreatment records performed in 1995 in the County of Los Angeles on illicit discharges indicates that automotive service facilities and food service facilities sometimes discharge polluted washwaters to the MS4. The pollutants of concern in such washwaters include food waste, oil and grease, and toxic chemicals. Other storm water/industrial waste programs in California have reported similar observations. Illicit discharges from automotive service facilities and food service facilities have been identified elsewhere as a major cause of

widespread contamination and water quality problems (Washtenaw County Statutory Drainage Board - 1987 Huron River Pollution Abatement Program).

C. Permit Background

1. The essential components of the Storm Water Management Program, as established by federal regulations [40 CFR 122.26(d)] are: (i) adequate legal authority, (ii) fiscal resources, (iii) Storm Water Quality Management Program (SQMP) - (Public Information and Participation Program, Industrial/Commercial Facilities Program, Development Planning Program, Development Construction Program, Public Agency Activities Program, Illicit Connection and Illicit Discharges Elimination Program), and (iv) monitoring and reporting program.

2. The Permittees have filed a Report of Waste Discharge (ROWD), dated February 1, 2001, and applied for renewal of their waste discharge requirements that serves as an NPDES permit to discharge wastes to surface waters. The ROWD includes a proposed SQMP and a Monitoring Program. The proposed SQMP contains programs previously approved under Board Order No. 96-054 in the following areas:

   Public Information and Participation
   Development Planning
   Development Construction
   Public Agency Activities
   Illicit Connection/Illicit Discharge Elimination Program

   These programs are revised pursuant to the provisions of this Order after adoption.

3. The County of Los Angeles has previously conducted source identification and pollutant characterization consistent with 40 CFR 122.26(d)(1)(ii) and (iii) under its storm water monitoring program. The Monitoring Program submitted with the ROWD proposes to advance the assessment of receiving water impacts, identification of sources of pollution, evaluation of Best Management Practices (BMPs), and measurement of long term trends in mass emissions.

4. The Regional Board has reviewed the ROWD and has determined it to be complete under the reapplication policy of MS4s issued by the U.S. Environmental Protection Agency (USEPA) (61 *Fed. Reg.* 41697). Tne Regional Board finds that the Permittees' proposed SQMP, incorporating the additional provisions contained in this Order would meet the minimum requirements of federal regulations.

5. Studies indicate that facilities with paved surfaces subject to frequent motor vehicular traffic (such as parking lots and fast food restaurants), or facilities that perform vehicle repair, maintenance, or fueling (automotive service facilities) are potential sources of pollutants of concern in storm water. [References: Pitt *et al.*, *Urban Storm Water Toxic Pollutants: Assessment, Sources, and Treatability*, Water Environment Res., 67, 260

(1995); *Results of Retail Gas Outlet and Commercial Parking Lot Storm Water Runoff Study*, Western States Petroleum Association and American Petroleum Institute, (1994); *Action Plan Demonstration Project, Demonstration of Gasoline Fueling Station Best Management Practices*, Final Report, County of Sacramento (1993); *Source Characterization*, R. Pitt, In Innovative Urban Wet-Weather Flow Management Systems (2000) Technomic Press, Field, R *et al.* editors; *Characteristics of Parking Lot Runoff Produced by Simulated Rainfall*, , L.L. Tiefenthaler *et al.* Technical Report 343, Southern California Coastal Water Research Project (2001).]

6. Retail gasoline outlets are points of convergence for vehicular traffic and are similar to parking lots and urban roads. Studies indicate that storm water discharges from retail gasoline outlets have high concentrations of hydrocarbons and heavy metals. [*Schueler and Shepp* (1992)]. Pilot studies indicate that treatment control best management practices installed at retail gasoline stations are effective in removing pollutants, reasonable in capital cost, easy to operate, and do not present safety risks [*Rouge River National Wet Weather Demonstration Project, Task Product Memorandum – Evaluation of On-line Media Filters RPO-NPS-TPM59.00*, Wayne County, MI, March 1999]. The LA Regional Board and the San Diego Regional Board have jointly prepared a Technical Report on the applicability of new development BMP design criteria for retail gasoline outlets, (*Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts*, (June 2001)). Retail Gasoline Outlets in Western U.S. States (such as Washington and Oregon) are already subject to numerical BMP design criteria under the MS4 program, as well in other U.S. States.

7. The City of Los Angeles has conducted shoreline and nearshore water quality monitoring off the Santa Monica Bay since the 1950s under the monitoring program for the Hyperion Waste Water Treatment Plant (NPDES No. CA0109991). The monitoring results indicate that effluent from Hyperion's 5-Mile Outfall does not impinge the shoreline, and that elevated bacterial counts are associated with runoff from storm drains and discharges from piers. In 1994, the Regional Board approved the relocation of Hyperion's shoreline stations to implement a bay-wide, regional shoreline-monitoring program associated with storm drain outfalls in the Santa Monica Bay. The City of Los Angeles requested that the shoreline-monitoring requirement be incorporated in this Order. The shoreline pathogen monitoring requirements are outlined in the Monitoring Program for this Order.

D. Permit Coverage

1. The requirements in this Order cover all areas within the boundaries of the Permittee municipalities (see Attachment A) over which they have regulatory jurisdiction as well as unincorporated areas in Los Angeles County Flood Control District within the jurisdiction of the Regional Board. The Permittees serve a population of about 9.5 million [Reference: *2000 Census of Population and Housing,* Bureau of the Census, U.S.

R0007295

Department of Commerce (2001)] in an area of approximately 3,100 square miles. Attachment B shows the map of the permitted area in Los Angeles County Flood Control District.

2. Federal, state, regional or local entities within the Permittees' boundaries or in jurisdictions outside the Los Angeles County Flood Control District, and not currently named in this Order, may operate storm drain facilities and/or discharge storm water to storm drains and watercourses covered by this Order. The Permittees may lack legal jurisdiction over these entities under state and federal constitutions. The Regional Board will coordinate with these entities to implement programs that are consistent with the requirements of this Order. The Regional Board will consider such facilities for coverage in 2003 under its NPDES permitting scheme pursuant to USEPA Phase II storm water regulations.

3. Sources of discharges into receiving waters in the County of Los Angeles but in jurisdictions outside its boundary include the following:

   About 34 square miles of unincorporated area in Ventura County, which drain into Malibu Creek and then to Santa Monica Bay,

   About 9 square miles of the City of Thousand Oaks, which also drain into Malibu Creek and then to Santa Monica Bay, and

   About 86 square miles of area in Orange County, which drain into Coyote Creek and then into the San Gabriel River.

   The Regional Board will ensure that storm water management programs for the areas in Ventura County and the City of Thousand Oaks that drain into Santa Monica Bay are consistent with the requirements of this Order. The Regional Board will coordinate with the Santa Ana Regional Board so that storm water management programs for the areas in Orange County that drain into Coyote Creek are consistent with the requirements of this Order.

4. This permit is intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water to the maximum extent practicable (MEP) from the permitted areas in the County of Los Angeles to the waters of the United States.

5. Permittees have expressed their intention to work cooperatively to control the contribution of pollutants from one portion of the MS4 to another portion of the system. Permittees may control the contribution of pollutants to the MS4 from non-permittee dischargers such as Caltrans, the U.S. Department of Defense, and other state and federal facilities, through interagency agreements.

E. Federal, State, and Regional Regulations

1. The Water Quality Act of 1987 added Section 402(p) to the federal Clean Water Act (CWA) (33 U.S.C Section 1251-1387). This section requires

R0007296

the USEPA to establish regulations setting forth NPDES requirements for storm water discharges in two phases.

- The USEPA Phase I storm water regulations were directed at MS4s serving a population of 100,000 or more, including interconnected systems and storm water discharges associated with industrial activities, including construction activities. The Phase I Final Rule was published on November 16, 1990 (55 *Fed Reg.* 47990).

- The USEPA Phase II storm water regulations are directed at storm water discharges not covered in Phase I, including small MS4s (serving a population of less than 100,000), small construction projects (one to five acres), municipal facilities with delayed coverage under the Intermodal Surface Transportation Efficiency Act of 1991, and other discharges for which the USEPA Administrator or the State determines that the storm water discharge contributes to a violation of a water quality standard, or is a significant contributor of pollutants to waters of the United States. The Phase II Final Rule was published on December 8, 1999 (64 *Fed Reg.* 68722).

2. The USEPA published an 'Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits' on August 26, 1996 (61 *Fed. Reg.* 43761). This policy discusses the appropriate kinds of water quality-based effluent limitations to be included in NPDES storm water permits to provide for the attainment of water quality standards.

3. The USEPA published an 'Interpretative Policy Memorandum on Reapplication Requirements' for MS4 permits on August 9, 1996 (61 *Fed. Reg.* 41697). This policy requires that MS4 reapplication for reissuance for a subsequent five-year permit term contains certain basic information and information for proposed changes and improvements to the storm water management program and monitoring program.

4. The USEPA has entered into a Memorandum of Agreement (MOA) with the U.S. Fish and Wildlife Service and the National Marine Fisheries Service for enhancing coordination regarding the protection of endangered and threatened species under Section 7 of the Endangered Species Act (ESA) and the CWA's Water Quality Standards and NPDES programs. Among other actions, the MOA establishes a framework for coordination of actions by the USEPA, the Services, and CWA delegated States on CWA permit issuance under Section 402 of the CWA [66 *Fed. Reg.* 11202 – 11217].

5. USEPA regulations at 40 CFR 122.26(d)(2)(iv)(A) and 40 CFR 122.26(d)(2)(iv)(C) require that MS4 permittees implement a program to monitor and control pollutants in discharges to the municipal system from industrial and commercial facilities that contribute a substantial pollutant load to the MS4. The regulations require that permittees establish priorities and procedures for inspection of industrial facilities and priority commercial establishments. This permit, consistent with the USEPA policy, incorporates a cooperative partnership, including the specifications of minimum expectations, between the Regional Board and the

Permittees for the inspection of industrial facilities and priority commercial establishments to control pollutants in storm water discharges (58 *Fed. Reg.* 61157).

6. Section 402 (p) of the CWA (33 U.S.C. Section 1342(p) provides that MS4 permits must "require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design engineering method and such other provisions as the [EPA] Administrator or the State determines appropriate for the control of such pollutants." The State Water Resources Control Board's (State Board) Office of Chief Counsel (OCC) has issued a memorandum interpreting the meaning of MEP to include technical feasibility, cost, and benefit derived with the burden being on the municipality to demonstrate compliance with MEP by showing that a BMP is not technically feasible in the locality or that BMPs costs would exceed any benefit to be derived (dated February 11, 1993).

7. The CWA authorizes the USEPA to permit a state to serve as the NPDES permitting authority in lieu of the USEPA. The State of California has in-lieu authority for an NPDES program. The Porter-Cologne Water Quality Control Act authorizes the State Board, through the Regional Boards, to regulate and control the discharge of pollutants into waters of the State. The State Board entered into a MOA with the USEPA, on September 22, 1989, to administer the NPDES Program governing discharges to waters of the United States.

8. Section 303(d) of the CWA requires that the State identify a list of impaired water-bodies and develop and implement Total Maximum Daily Loads (TMDLs) for these waterbodies (33 U.S.C. §1313(d)(1)). A TMDL specifies the maximum amount of a pollutant that a water-body can receive, still meet applicable water quality standards and protect beneficial uses. The USEPA entered into a consent decree with the Natural Resources Defense Council (NRDC), Heal the Bay, and the Santa Monica BayKeeper on March 22, 1999, under which the Regional Board must adopt all TMDLs for the Los Angeles Region within 13 years from that date. This permit incorporates a provision to implement and enforce approved load allocations for municipal storm water discharges and require amending the SQMP after pollutants loads have been allocated and approved.

9. Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point pollution impacting or threatening coastal water quality. CZARA (16 U.S.C. Sections 1451-1465) amends the Coastal Zone Management Act of 1972, to address five sources of non-point pollution: agriculture, silviculture, urban, marinas, and hydromodification. This NPDES permit addresses the management measures required for the urban category, with the exception of septic systems. The Regional Board addresses septic systems through the administration of other programs.

10. On May 18, 2000, the USEPA established numeric criteria for priority toxic pollutants for the State of California (California Toxics Rule) 65 *Fed. Reg.* 31682 (40 C.F.R. § 131.38), for the protection of human health and aquatic life. These apply as ambient water quality criteria for inland surface waters, enclosed bays, and estuaries. The State Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (SIP) – 2000,* on March 2, 2000, for implementation of the California Toxics Rule (State Board Resolution No. 2000-15 as amended by Board Resolution No. 2000-030). This policy requires that discharges comply with TMDL-derived load allocations as soon as possible but no later than 20 years from the effective date of the policy.

11. The State Board adopted a revised Water Quality Control Plan for Ocean Waters of California (Ocean Plan) on July 23, 1997. The Ocean Plan contains water quality objectives which apply to all discharges to the coastal waters of California.

12. The State Board *In Re*: California Department of Transportation (State Board Order WQ 2001-08), determined that the discharge of storm water to Areas of Special Biological Significance (ASBS) is subject to the prohibition in the Ocean Plan against the discharge of wastes to an ASBS.

13. The Regional Board adopted an updated Water Quality Control Plan (Basin Plan) for the Los Angeles Region on June 13, 1994, *'Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties*, (1994).' The Basin Plan designates beneficial uses of receiving waters and specifies both narrative and numerical water quality objectives for the receiving waters in Los Angeles County.

14. The Regional Board on September 19, 2001, adopted amendments to the Basin Plan, to incorporate TMDLs for trash in the Los Angeles River (Resolution No. 01-013) and Ballona Creek (Resolution No. 01-014). After approval by the State Board, the Office of Administrative Law, and the USEPA the TMDLs for trash will be effective and enforceable.

15. The Regional Board on April 13, 1998, approved BMPs for sidewalk rinsing to minimize the discharge of wash waters to the storm drain system (Resolution No. 98-08). By the same resolution, the Regional Board prohibited the discharge of municipal street wash waters to the storm drain system.

16. The Regional Board on April 13, 1998, approved recommended BMPs for industrial/commercial facilities (Resolution No. 98-08).

17. The Regional Board on April 22, 1999, approved a list of BMPs for use in development planning and development construction (Resolution No. 99-03)

18. The Regional Board adopted and approved requirements for new development and significant redevelopment projects in Los Angeles County

R0007299

to control the discharge of storm water pollutants in post-construction storm water, on January 26, 2000, in Board Resolution No. R-00-02. The Regional Board Executive Officer issued the approved Standard Urban Storm Water Mitigation Plans (SUSMPs) on March 8, 2000. The State Board in large part affirmed the Regional Board action and SUSMPs in State Board Order No. WQ 2000-11 issued on October 5, 2000.

- The State Board's Chief Counsel has issued a statewide policy memorandum (dated December 26, 2000), which interprets the Order to provide broad discretion to Regional Boards and identifies potential future areas for inclusion in SUSMPs and the types of evidence and findings necessary. Such areas include ministerial projects, projects in environmentally sensitive areas, and water quality design criteria for retail gasoline outlets.

- The State Board's Chief Counsel interprets the Order to encourage regional solutions and endorses a mitigation fund or "bank" that may be funded by developers who obtain waivers from the numerical design standards for new development and significant redevelopment.

- The Regional Board has determined that the creation of structural or treatment control BMPs for storm water mitigation in waters of the U.S. is not permissible. 40 CFR Part 131.10(a) prohibits states from designating waste transport or waste assimilation as a use for any water of the U.S. Authorizing the construction of a storm water/ urban runoff treatment facility in a jurisdictional water body would be tantamount to accepting waste assimilation as an appropriate use for that water body. Furthermore, the construction and operation of a pollution control facility in a water body can impact the physical, chemical, and biological integrity as well as the beneficial uses of the water body. Therefore, storm water treatment and/or mitigation in accordance with SUSMPs and any other requirements of this Order must occur prior to the discharge of storm water into a water of the U.S.

19. The Regional Board supports a Watershed Management Approach to address water quality protection in the region. The objective of the Watershed Management Approach should be to provide a comprehensive and integrated strategy towards water resource protection, enhancement, and restoration while balancing economic and environmental impacts within a hydrologically defined drainage basin or watershed. It emphasizes cooperative relationships between regulatory agencies, the regulated community, environmental groups, and other stakeholders in the watershed to achieve the greatest environmental improvements with available resources.

20. To promote a watershed management approach, the County of Los Angeles is divided into six Watershed Management Areas (WMAs) as follows:

Malibu Creek and Rural Santa Monica Bay WMA
Ballona Creek and Urban Santa Monica Bay WMA
Los Angeles River WMA
San Gabriel River WMA
Dominguez Channel/Los Angeles Harbor WMA, and
Santa Clara River WMA

Attachment A shows the list of Permittees under each WMA and some Permittees have expressed an intent to form sub-watershed groups within the WMA to promote regional solutions for the mitigation of storm water discharge pollution.

21. To facilitate compliance with federal regulation, the State Board has issued two statewide general NPDES permits for storm water discharges: one for storm water from industrial sites [NPDES No. CAS000001, General Industrial Activity Storm Water Permit (GIASP)] and the other for storm water from construction sites [NPDES No. CAS000002, General Construction Activity Storm Water Permit (GCASP)]. The GCASP was reissued on August 19, 1999. The GIASP was reissued on April 17, 1997. Facilities discharging storm water associated with industrial activities and construction projects with a disturbed area of five acres or more are required to obtain individual NPDES permits for storm water discharges, or to be covered by a statewide general permit by completing and filing a Notice of Intent (NOI) with the State Board. The USEPA guidance anticipates coordination of the state-administered programs for industrial and construction activities with the local agency program to reduce pollutants in storm water discharges to the MS4.

22. The Regional Board is the enforcement authority in the Los Angeles Region for the two statewide general permits regulating discharges from industrial facilities and construction sites, and all NPDES storm water and non-storm water permits issued by the Regional Board. These industrial and construction sites and discharges are also regulated under local laws and regulations.

23. The State Board, on October 28, 1968, adopted Resolution No. 68-16, which established an anti-degradation policy for the State and Regional Boards. This policy restricts the degradation of surface waters and protects waterbodies where existing water quality is higher than is necessary for the protection of beneficial uses.

24. The State Board, on June 17, 1999, adopted Order No. WQ 99-05, which, in a precedential decision, identifies acceptable receiving water limitations language to be included in municipal storm water permits issued by the State and Regional Boards. The receiving water limitations included herein are consistent with the State Board Order, USEPA Policy, and the U.S. Appellate court decision in, *Defenders of Wildlife v. Browner* (9th. Cir, 1999). The State Board OCC has determined that the federal court decision did not conflict with State Board Order No. WQ 99-05 (memorandum dated October 14, 1999)

25. California Water Code (CWC) Section 13263(a) requires that waste discharge requirements issued by the Regional Board shall implement any relevant water quality control plans that have been adopted; shall take into consideration the beneficial uses to be protected and the water quality objectives reasonably required for that purpose; other waste discharges; the need to prevent nuisance; and provisions of CWC Section 13241. The Regional Board has considered the requirements of sections 13263 and 13241, and applicable plans, policies, rules, and regulations in developing these waste discharge requirements.

26. CWC Section 13370 *et seq.* requires that waste discharge requirements issued by the Regional Boards be consistent with provisions of the Federal Clean Water Act and its amendments.

F. Implementation

1. The California Environmental Quality Act (CEQA) (Cal Pub Resources Code Section 21000 *et seq.*) requires that public agencies consider the environmental impacts of the projects they approve for development. CEQA applies to projects that are considered discretionary and does not apply to ministerial projects, which involve the use of established standards or objective measurements. A ministerial project may be made discretionary by adopting local ordinance provisions or imposing conditions to create decision-making discretion in approving the project. In the alternative, Permittees may establish standards and objective criteria administratively for storm water mitigation for ministerial projects. For water quality purposes, the Regional Board considers that all new development and significant redevelopment activity in specified categories, that receive approval or permits from a municipality, are subject to storm water mitigation requirements.

2. On March 12, 2001, the United States Court of Appeals ruled that it is necessary to obtain a NPDES permit for application of aquatic pesticides to waterways. (*Headwaters, Inc. vs. Talent Irrigation District*, 243 F3d. 526 (9th Cir., 2001)) This decision is controlling in California for nonagricultural applications of pesticides to waterways. The State Board adopted a general NPDES permit (Order No. 2001-12-DWQ) on July 19, 2001, for public entities that discharge pollutants to waters of the U.S. associated with the application of aquatic pesticides for resource or pest management. Public entities that conduct such activities must seek coverage under the general permit.

3. The objective of this Order is to protect the beneficial uses of receiving waters in Los Angeles County. To meet this objective, this Order requires that the SQMP specify BMPs that will be implemented to reduce the discharge of pollutants in storm water to the maximum extent practicable. Further, Permittees are to assure that storm water discharges from the MS4 shall neither cause nor contribute to the exceedance of water quality standards and objectives nor create conditions of nuisance in the receiving waters, and that the discharge of non-storm water to the MS4 has been effectively prohibited.

4. The SQMP required in this Order builds upon the programs established in Order Nos. 90-079, and 96-054, consists of the components recommended in the USEPA guidance manual, and was developed with the cooperation of representatives from the regulated community and environmental groups. The SQMP includes provisions that promote customized initiatives, both on a countywide and watershed basis, in developing and implementing cost-effective measures to minimize discharge of pollutants to the receiving water. The various components of the SQMP, taken as a whole rather than individually, are expected to reduce pollutants in storm water and urban runoff to the maximum extent practicable. Provisions of the SQMP are fully enforceable under provisions of this Order.

5. The emphasis of the SQMP is pollution prevention through education, public outreach, planning, and implementation as source control BMPs first and then structural and treatment control BMPs next. Successful implementation of the provisions of the SQMP will require cooperation and coordination of all public agencies in each Permittee's organization, among Permittees, and with the regulated community.

6. The implementation of a Public Information and Participation Program is a critical component of a storm water management program. An informed and knowledgeable community is critical to the success of a storm water management program since it helps insure the following: (i) greater support for the program as the public gains a greater understanding of the reasons why it is necessary and important, and (ii) greater compliance with the program as the public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters.

7. This Order includes a Monitoring Program that incorporates Minimum Levels (MLs) established under the SIP The SIP's MLs represent the lowest quantifiable concentration for priority toxic pollutants that is measurable with the use of proper method-based analytical procedures and factoring out matrix interferences. The SIP's MLs therefore represent the best available science for determining MLs and are appropriate for a storm water monitoring program. The use of MLs allows the detection of toxic priority pollutants at concentrations of concern using recent advances in chemical analytical methods.

8. This Order provides flexibility for Permittees to petition the Regional Board Executive Officer to substitute a BMP or requirement under the SQMP with an alternative BMP, if they can provide information and documentation on the effectiveness of the alternative, equal to or greater than the prescribed BMP in meeting the objectives of this Order.

9. This Order contemplates that the Permittees are responsible for considering potential storm water impacts when making planning decisions in order to fulfill the Permittees' CWA requirement to reduce the discharge of pollutants in municipal storm water to the maximum extent practicable from new development and redevelopment activities.

R0007303

However, the Permittees retain authority to make the final land-use decisions and retain full statutory authority for deciding what land uses are appropriate at specific locations within each Permittee's jurisdiction. This Order and its requirements are not intended to restrict or control local land use decision-making authority.

10. This Order is not intended to prohibit the inspection for or abatement of vectors by the State Department of Health Services or local vector agencies in accordance with Cal. Health and Safety Code § 2270 *et seq.* and §116110 *et seq.* Certain treatment control BMPs if not properly designed, operated or maintained may create habitats for vectors (e.g. mosquito and rodents). This Order contemplates that the Permittees will closely cooperate and collaborate with local vector control agencies and the State Department of Health Services for the implementation, operation, and maintenance of treatment control BMPs in order to minimize the risk to public health from vector borne diseases.

G. Public Process

1. The Regional Board has notified the Permittees and interested agencies and persons of its intent to issue waste discharge requirements for this discharge, and has provided them with an opportunity to submit their written view and recommendations.

2. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

3. The Regional Board has conducted public workshops to discuss drafts of the permit. On April 24, 2001, Regional Board staff conducted a workshop outlining the reasoning behind the changes proposed for the new permit and received input from the Permittees and the public regarding those proposed changes. On July 26, 2001, a second public workshop was held at a special Regional Board meeting. The Permittees and the public had another opportunity to express their opinions regarding the proposed changes to the permit in front of the Regional Board members. A significant number of working meetings with the Permittees and other interested parties have occurred throughout the period from the submittal of the ROWD and completion of the tentative draft, in an attempt to incorporate and address all the comments presented.

4. The Los Angeles County Flood Control District, the County of Los Angeles and the other municipalities are co-permittees as defined in 40 CFR 122.26 (b)(1). Los Angeles County Flood Control District will coordinate with the other municipalities and facilitate program implementation. Each Permittee is responsible only for a discharge for which it is the operator.

5. This Order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit, pursuant to Section 402 of the CWA, or amendments thereto, and shall take effect 50 days from Order adoption provided the Regional Administrator of the USEPA has no objections.

6. The action to adopt an NPDES permit is exempt from the provisions of Chapter 3 of CEQA (Cal Pub. Resources Code Section 21100 *et seq.*), in accordance with CWC § 13389.

7. Pursuant to CWC §13320, any aggrieved party may seek review of this Order by filing a petition with the State Board. A petition must be sent to the State Water Resources Control Board, P.O. Box 100, Sacramento, California, 95812, within 30 days of adoption of the Order by the Regional Board.

8. This Order may be modified or alternatively revoked or reissued prior to its expiration date, in accordance with the procedural requirements of the NPDES program, and the CWC for the issuance of waste discharge requirements.

IT IS HEREBY ORDERED that the Los Angeles County Flood Control District, Los Angeles County, and the Cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Cañada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier, in order to meet the provisions contained in Division 7 of the CWC and regulations adopted thereunder, and the provisions of the CWA, as amended, and regulations and guidelines adopted thereunder, shall comply with the following:

Part 1. DISCHARGE PROHIBITIONS

The Permittees shall effectively prohibit non-storm water discharges into the MS4 and watercourses, except where such discharges are:

1. covered by a separate individual or general NPDES permit for non-storm water discharges; or

2. fall within one of the categories below, and meet all conditions when specified by the Regional Board Executive Officer:

   a) Category A - Natural flow:

      (1) Natural springs and rising ground water;

      (2) Flows from riparian habitats or wetlands;

      (3) Stream diversions, permitted by the State Board; and

      (4) Uncontaminated ground water infiltration [as defined by 40 CFR 35.2005(20)].

b) Category B - Flows from emergency fire fighting activity.

c) Category C - Flows incidental to urban activities:

(1) Reclaimed and potable landscape irrigation runoff;

(2) Potable drinking water supply and distribution system releases (consistent with American Water Works Association guidelines for dechlorination/debromination and suspended solids reduction practices);

(3) Drains for foundations, footings, and crawl spaces;

(4) Air conditioning condensate;

(5) Dechlorinated swimming pool discharges;

(6) Dewatering of lakes and decorative fountains;

(7) Non-commercial car washing by residents or by non-profit organizations; and

(8) Sidewalk rinsing.

The Regional Board Executive Officer may add or remove categories of non-storm water discharges above. Furthermore, in the event that any of the above categories of non-storm water discharges are determined to be a source of pollutants by the Regional Board Executive Officer, the discharge will no longer be exempt from this prohibition unless the Permittee implements conditions approved by the Regional Board Executive Officer to ensure that the discharge is not a source of pollutants. Notwithstanding the above, the Regional Board Executive Officer may impose additional prohibitions of non-storm water discharges in consideration of anti-degradation policies and TMDLs.

Part 2. RECEIVING WATER LIMITATIONS

1. Discharges from the MS4 that cause or contribute to the violation of water quality standards or water quality objectives are prohibited.

2. Discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible for, shall not cause or contribute to a condition of nuisance.

3. The Permittees shall comply with Part 2.1. and 2.2. through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the SQMP and its components and other requirements of this Order including any modifications. The SQMP and its components shall be designed to achieve compliance with receiving water limitations. If exceedances of water quality objectives or water quality standards (collectively, water quality standards) persist, notwithstanding implementation of the SQMP and its components and other requirements of this permit, the Permittee

shall assure compliance with discharge prohibitions and receiving water limitations by complying with the following procedure:

a) Upon a determination by either the Permittee or the Regional Board that discharges are causing or contributing to an exceedance of an applicable water quality standard, the Permittee shall promptly notify and thereafter submit a report to the Regional Board that describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedances of water quality standards. This report may be incorporated in the annual Storm Water Report and Assessment unless the Regional Board directs an earlier submittal. The report shall include an implementation schedule. The Regional Board may require modifications to the Report.

b) Submit any modifications to the report required by the Regional Board within 30 days of notification.

c) Within 30 days following the approval of the report, the Permittee shall revise the SQMP and its components and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, implementation schedule, and any additional monitoring required.

d) Implement the revised SQMP and its components and monitoring program according to the approved schedule.

4. So long as the Permittee has complied with the procedures set forth above and is implementing the revised SQMP and its components, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Board to develop additional BMPs.

Part 3. STORM WATER QUALITY MANAGEMENT PROGRAM (SQMP) IMPLEMENTATION

A. General Requirements

1. Each Permittee shall, at a minimum, implement the SQMP. The SQMP is an enforceable element of this Order.

2. The SQMP shall, at a minimum, comply with the applicable storm water program requirements of 40 CFR 122.26(d)(2). The SQMP and its components shall be implemented so as to reduce the discharges of pollutants in storm water to the maximum extent practicable.

R0007307

3. Each Permittee shall implement additional controls, where necessary, to reduce the discharges of pollutants in storm water to the maximum extent practicable.

B. Best Management Practice Implementation

The Permittees shall implement or require the implementation of the most effective combination of BMPs for storm water/urban runoff pollution controls. When implemented, BMPs are intended to result in the reduction of pollutants in storm water to the maximum extent practicable.

C. Revision of the Storm Water Quality Management Program

The Permittees shall revise the SQMP, at the direction of the Regional Board Executive Officer, to incorporate program implementation amendments. Such amendments may include regional, watershed specific requirements, and/or waste load allocations developed and approved pursuant to the process for the designation and implementation of Total Maximum Daily Loads (TMDLs) for impaired water bodies.

D. Designation and Responsibilities of the Principal Permittee

The Los Angeles County Flood Control District is hereby designated as the Principal Permittee. As such, The Principal Permittee shall:

1. Coordinate and facilitate activities necessary to comply with the requirements of this Order, but is not responsible for ensuring compliance of any individual Permittee;

2. Coordinate permit activities among Permittees and act as liaison between Permittees and the Regional Board on permitting issues;

3. Provide personnel and fiscal resources for the necessary updates of the SQMP and its components;

4. Provide technical and administrative support for committees that will be organized to implement the SQMP and its components;

5. Convene the Watershed Management Committees (WMCs) constituted pursuant to Part F, below, upon designation of representatives;

6. Implement the Countywide Monitoring Program required under this Order and evaluate, assess and synthesize the results of the monitoring program;

7. Provide personnel and fiscal resources for the collection, processing and submittal to the Regional Board of annual reports and summaries of other reports required under the SQMP; and

8. Comply with the "Responsibilities of the Permittees" in Part 3.E., below.

E. Responsibilities of the Permittees

Each Permittee is required to comply with the requirements of this Order applicable to discharges within its boundaries (see Findings B.2. and D.2.) and not for the implementation of the provisions applicable to the Principal Permittee or other Permittees. Each Permittee shall, within its geographic jurisdiction:

1. Comply with the requirements of the SQMP and any modifications thereto;

2. Coordinate among its internal departments and agencies, as appropriate, to facilitate the implementation of the requirements of the SQMP applicable to such Permittee in an efficient and cost-effective manner;

3. Designate a technically knowledgeable representative to the appropriate WMC; and

4. Participate in intra-agency coordination (e.g. Fire Department, Building and Safety, Code Enforcement, Public Health, etc.) necessary to successfully implement the provisions of this Order and SQMP.

5. Prepare an annual summary of expenditures applied to the storm water management program. This summary of budget expenditures shall identify the storm water budget for the following year, using estimated percentages and written explanations where necessary, for the specific categories noted below:

   a) Program management
      - Administrative costs

   b) Illicit connection/illicit discharge

   c) Development planning

   d) Development construction
      - Construction inspection activities

   e) Industrial/Commercial inspection/site visit activities

   f) Public Agency Activities

      (1) Maintenance of structural BMPs and treatment control BMPs

      (2) Municipal Street Sweeping

      (3) Catch basin clean-up

      (4) Trash collection

      (5) Capital costs

   g) Public Information and Participation

   h) Monitoring Program

i) Miscellaneous Expenditures

6. Each Permittee, in addition to the budget summary, shall report any supplemental dedicated budgets for the same categories.

F. Watershed Management Committees (WMCs)

1. Each WMC shall be comprised of a voting representative from each Permittee in the Watershed Management Area (WMA).

2. The WMC's chair and secretary shall be chosen by the WMC upon Order adoption and on an annual basis, thereafter. In the absence of volunteer Permittee(s) for the positions, the Principal Permittee shall assume those roles until the WMC chooses members of the committee for the positions.

3. Each WMC shall:

a) Facilitate cooperation and exchange of information among Permittees;

b) Establish additional goals and objectives and associated deadlines for the WMA, as the program implementation progresses;

c) Prioritize pollution control efforts based on beneficial use impairment(s), watershed characteristics and analysis of results from studies and the monitoring program;

d) Develop and/or update and monitor the adequate implementation, on an annual basis, of the tasks identified for the WMA;

e) Assess the effectiveness of, prepare revisions for, and recommend appropriate changes to the SQMP and its components;

f) Continue to prioritize the Industrial/Commercial critical sources for investigation, outreach and follow-up; and

g) Conduct joint WMC meetings four times per year and, as necessary.

G. Legal Authority

1. Permittees shall possess the necessary legal authority to prohibit non-storm water discharges, to the storm drain system, including, but not limited to:

a) Prohibit illicit discharges and illicit connections and require removal of illicit connections;

b) Prohibit the discharge of wash waters to the MS4 from the cleaning of gas stations, auto repair garages, or other types of automotive service facilities;

c) Prohibit the discharge of runoff to the MS4 from mobile auto washing, steam cleaning, mobile carpet cleaning, and other such mobile commercial and industrial operations;

d) Prohibit the discharge of runoff to the MS4 from areas where repair of machinery and equipment which are visibly leaking oil, fluid or antifreeze, is undertaken;

e) Prohibit the discharge of runoff to the MS4 from storage areas of materials containing grease, oil, or other hazardous substances, and uncovered receptacles containing hazardous materials;

f) Prohibit the discharge of chlorinated/ brominated swimming pool water and filter backwash to the MS4;

g) Prohibit the discharge of runoff from the washing of toxic materials from paved or unpaved areas to the MS4;

h) Prohibit washing impervious surfaces in industrial/commercial areas that results in a discharge of runoff to the MS4;

i) Prohibit the discharge of concrete or concrete laden wash water from concrete trucks, pumps, tools, and equipment to the MS4.

j) Prohibit, dumping, or disposal of materials into the MS4, other than storm water, such as:

(1) Litter, landscape debris and construction debris;

(2) Any state or federally banned or unregistered pesticides;

(3) Food and food processing wastes; and

(4) Fuel and chemical wastes, animal wastes, garbage, batteries, and other materials that have potential adverse impacts on water quality.

2. The Permittees shall possess adequate legal authority to:

a) Require persons within their jurisdiction comply with conditions in Permittees ordinances, permits, contracts, model programs, or orders (i.e. hold dischargers to its MS4 accountable for their contributions of pollutants and flows);

b) Utilize enforcement mechanisms to require compliance with Permittees ordinances, permits, contracts, or orders;

c) Control pollutants, including potential contribution, in discharges of storm water runoff associated with industrial activities (including construction activities) to its MS4 and control the quality of storm water runoff from industrial sites (including construction sites). This requirement applies to source control, and treatment control, BMPs;

d) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and non-compliance with permit conditions, including the prohibition of illicit discharges to the MS4. Permittees must possess authority to enter, sample, inspect, review and copy records, and require regular reports from industrial facilities (including construction sites) discharging polluted or with the potential to discharge polluted storm water runoff into its MS4.

e) Require the use of best management practices (BMPs) to prevent or reduce the discharge of pollutants to MS4s to the maximum extent practicable.

f) Require that treatment control BMPs be properly operated and maintained to prevent the breeding of vectors.

3. Each Permittee shall, no later than [9 months from permit effective date] amend and adopt, (if necessary), a Permittee-specific storm water and urban runoff ordinance to enforce all requirements of this permit.

4. Each Permittee shall submit no later than [10 months from permit effective date], a new or updated statement by its legal counsel that the Permittee has obtained all necessary legal authority to comply with this Order through adoption of ordinances and/or municipal code modifications.

Part 4. SPECIAL PROVISIONS

Maximum Extent Practicable Standard

This permit, and the provisions herein, are intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water to the MEP from the permitted areas in the County of Los Angeles to the waters of the State.

A. General Requirements

1. Best Management Practice Substitution

The Regional Board Executive Officer may approve any site-specific Best Management Practice (BMP) substitution upon petition by a Permittee(s), if the Permittee can document that:

a) The proposed alternative BMP or program will meet or exceed the objective of the original BMP or program in the reduction of storm water pollutants; or

b) The fiscal burden of the original BMP or program is substantially greater than the proposed alternative and does not achieve a substantially greater improvement in storm water quality; and,

R0007312

c) The proposed alternative BMP or program will be implemented within a similar period of time.

2. Customized SQMP

Each Permittee shall have available a local SQMP, which:

a) Is customized and reflects the conditions in the area under its jurisdiction; and

b) Specifies activities being implemented under the appropriate elements described in the countywide SQMP.

B. Public Information and Participation Program (PIPP)

The Principal Permittee shall implement a Public Information and Participation Program (PIPP) that includes, but is not limited to, the requirements listed in this section. The Principal Permittee shall be responsible for developing and implementing the Public Education Program, as described in the SQMP, and shall coordinate with Permittees to implement specific requirements.

The objectives of the PIPP are as follows:

a) To measurably increase the knowledge of the target audiences regarding the MS4, the impacts of storm water pollution on receiving waters, and potential solutions to mitigate the problems caused;

b) To measurably change the waste disposal and runoff pollution generation behavior of target audiences by encouraging implementation of appropriate solutions;

c) To involve and engage all socio-economic groups and ethnic communities in Los Angeles County to participate in mitigating the impacts of storm water pollution (such as African American, Latino, East Asian, South Asian, and Middle Eastern).

The Principal Permittee shall convene a panel to review the PIPP and the effectiveness of each of its components. Panel members shall possess the expertise to assess public information and outreach programs, strategies, and materials. Comments and recommendations on the PIPP shall be submitted to the Regional Board Executive Officer for consideration no later than December 31, annually. The PIPP will become effective upon approval.

2. PIPP - Residential Program

a) "No Dumping" Message

Each Permittee shall mark all storm drain inlets that they own with a legible "no dumping" message. In addition, signs with prohibitive language discouraging illegal dumping must be posted at designated public access points to creeks, other relevant water bodies, and channels no later than (2 years after the effective date of this Order). Signage and storm drain messages shall be legible and maintained as necessary during the term of the permit.

b) Countywide Hotline

The 888-CLEAN-LA hotline will serve as the general public reporting contact for reporting clogged catch basin inlets and illicit discharges/dumping, faded or lack of catch basin stencils, and general storm water management information. Each Permittee may establish its own hotline if preferred. Permittees shall include this information, updated when necessary, in public information, and the government pages of the telephone book, as they are developed/published. The Principal Permittee shall compile a list of the general public reporting contacts from all Permittees and make this information available on the web site (888CleanLA.com) and upon request. Permittees shall provide the Principal Permittee with their reporting contacts within 30 days of the date this order becomes effective.

c) Outreach and Education

(1) The Principal Permittee shall continue to implement the following activities that were components of the first five-year Public Education Program:

(i) Advertising;

(ii) Media relations;

(iii) Public service announcements;

(iv) "How To" instructional material distributed in a targeted and activity-related manner;

(v) Corporate, community association, environmental organization and entertainment industry tie-ins;

(vi) Events targeted to specific activities and population subgroups.

(2) The Principal Permittee shall develop a strategy to educate ethnic communities and businesses through culturally effective methods. Details of this strategy should be incorporated into the Public Education Program, and implemented, no later than (365 days from the effective date of this Order).

(3) The Principal Permittee shall implement an outreach program to educate on proper disposal of cigarette butts.

(4) Each Permittee shall conduct educational activities within its jurisdiction and participate in countywide events.

(5) The Principal Permittee shall organize Public Outreach Strategy meetings for Permittees on a quarterly basis, beginning (within 3 months of the effective date of this Order). The Principal Permittee shall provide guidance for

Permittees to augment the countywide outreach and education program. Permittees shall coordinate regional and local outreach and education to reduce duplication of efforts. Permittees are encouraged to include other interested parties in the outreach strategy to strengthen and coordinate educational efforts.

(6) The Principal Permittee shall ensure that a minimum of 35 million impressions per year are made on the general public about storm water quality via print, local TV access, local radio, or other appropriate media.

(7) The Principal Permittee, in cooperation with the Permittees, shall provide schools within each School District in the County with materials, including, but not limited to, videos, live presentations, and other information necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution.

(8) The Permittees shall provide the contact information for their appropriate storm water staff to the Principal Permittee no later than (60 days from the effective date of this Order). Cooperative efforts with other agencies may also be used to accomplish this requirement.

(9) The Principal Permittee shall develop a strategy to measure the effectiveness of in-school educational programs. The protocol shall include assessment of students' knowledge of storm water pollution problems and solutions before and after educational efforts are conducted. The protocol shall be developed and submitted to the Regional Board Executive Officer for approval no later than (90 days from the effective date of this Order). It shall be implemented on approval.

(10) In order to ensure that the PIPP is demonstrably effective in changing the behavior of the public, the Principal Permittee shall develop a behavioral change assessment strategy no later than (90 days from the effective date of this Order). The strategy shall be developed based on sociological data and studies (such as the County Segmentation Study). The Principal Permittee shall submit the assessment strategy to the Regional Board Executive Office for approval. It shall be implemented on approval.

d) Pollutant-Specific Outreach

The Principal Permittee, in cooperation with Permittees, shall coordinate to develop outreach programs that focus on the watershed-specific pollutants listed in Table 1 no later than (365

days from the effective date of this Order). Metals may be appropriately addressed through the Industrial/Commercial Facilities Program (e.g. distribute education materials on appropriate BMPs for metal waste management to facilities that have been identified as a potential source, such as metal fabricating facilities). Region-wide pollutants may be included in the Principal Permittee's mass media outreach efforts. .

Table 1.	
Watershed	***Target Pollutants for Outreach***
Ballona Creek	Trash, Indicator Bacteria, Metals, PAHs
Malibu Creek	Trash, Nutrients (Nitrogen), Indicator Bacteria, Sediments
Los Angeles River	Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals, Pesticides, PAHs
San Gabriel River	Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals
Santa Clara River	Nutrients (Nitrogen), Coliform
Dominguez Channel	Trash, Indicator Bacteria, PAHs

Each Permittee shall make outreach materials available to the general public and target audiences, such as schools, community groups, contractors and developers, and at appropriate public counters and events. Outreach material shall include information on pollutants, sources of concern, and source abatement measures.

3. Businesses Program

a) Corporate Outreach

The Principal Permittee shall develop and implement a Corporate Outreach program to educate and inform corporate managers about storm water regulations. The program shall target retail gasoline outlets and restaurant chains. At a minimum, this program shall include:

(1) Conferring with corporate management to explain storm water regulations;

(2) Distribution and discussion of educational material regarding storm water pollution and BMPs, and provide managers with suggestions to facilitate employee compliance with storm water regulations.

Corporate Outreach for all retail gasoline outlet and restaurant chain corporations shall be conducted not less than twice during the permit term, with the first outreach contact to begin no later than (365 days from effective date of this Order).

b) Business Assistance Program

(1) The Principal Permittee and Permittees may implement a Business Assistance Program to provide technical resource assistance to small businesses to advise them on BMPs implementation to reduce the discharge of pollutants in storm water runoff. Programs may include:

(2) On-site technical assistance or consultation via telephone to identify and implement storm water pollution prevention methods and best management practices; and

(3) Making available, distributing, and discussing of applicable BMP and educational materials.

C. Industrial/Commercial Facilities Program

Each Permittee shall implement an Industrial and Commercial Facilities Program. The objective is to reduce pollutants in storm water runoff to the maximum extent practicable by requiring the implementation of pollutant reduction and control measures at industrial and commercial facilities. At a minimum, the Program shall include the following requirements.

1. Inventory of Facilities

a) Database for Critical Sources Identification

Each Permittee, within its jurisdiction, shall update annually (individually or in partnership) a watershed-based inventory of all facilities identified as priority through the Permittees critical sources identification program. The database inventory of facilities may be augmented or reduced as new data becomes available. The update of the database may be accomplished through the collection of new information obtained through field activities or through other readily available intra-agency informational databases (e.g. business licenses, pretreatment permits, sanitary sewer hook-up permits). The inventory shall include the following minimum fields of information for each industrial and commercial facility:

(1) Name of facility and name of owner/operator;

(2) address;

(3) coverage under the GIASP or other individual or general NPDES permits; and

(4) a narrative description including SIC codes that best reflects the principal products or activities performed by each facility.

The use of an automated database system, such as Geographical Information System (GIS) or Internet-based system is highly

recommended, but not required. The Permittees may add other fields of information, as necessary (e.g. to point out discrepancies between SIC Code designation and type of activities actually performed on-site, exposure of activities and/or materials to storm water, etc.) Facilities determined at no risk of exposure will be so identified in the inventory database. At a minimum, the type of facilities considered for the inventory, will include:

b) High Priority Categories

(1) Municipal Landfills

(2) Hazardous Waste Treatment, Disposal and Recovery Facilities

(3) Facilities Subject to SARA Title III (also known as EPCRA)

(4) Restaurants

(5) Wholesale trade (scrap, auto dismantling)

(6) Automotive service facilities

(7) Fabricated metal products

(8) Motor freight

(9) Chemical/allied products

(10) Automotive Dealers/Gas Stations

(11) Primary Metals Products

c) Lower Priority Categories

Facilities which are listed in Attachment B of the permit.

2. Municipal Landfills, Hazardous Waste Treatment, Disposal and Recovery Facilities, Facilities Subject to SARA Title III (also known as EPCRA)

a) The Permittees shall inspect

(1) Municipal landfills;

(2) Hazardous waste treatment, disposal and recovery facilities; and,

(3) Facilities subject to SARA Title III

once every 24 months.

b) Level of inspection: The Permittees shall confirm that

(1) BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP; and,

(2) Each owner/operator has a current Waste Discharge Identification (WDID) number, and that a Storm Water Pollution Prevention Plan is available on-site.

3. Restaurants

The Permittees, in cooperation with their appropriate departments (such as health, public works, etc.), or using an equivalent approach, shall inspect all restaurants to determine that storm water BMPs are being implemented effectively.

a) Frequency: The Permittees shall inspect each restaurant once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) Restaurants shall be inspected to verify that:

(1) Oil and Grease residue is not poured onto a parking lot, street or adjacent catch basin;

(2) The trash bin area is clean, trash bin lid closed, not filled with liquid or washed out;

(3) Parking lot, alley, sidewalk and street areas (in the immediate vicinity of the establishment), floormats, filters and garbage containers are not washed and that no washwater is poured in those areas;

(4) Removal of food waste, rubbish or other materials from the parking lot area is not performed in an unsanitary manner or creating a nuisance through hosing down the area.

d) Inspectors shall distribute educational materials to facility operator on storm water pollution prevention practices.

4. Retail Gasoline Outlets

The Permittees shall communicate appropriate BMPs to each RGO (in accordance with the SQMP and Regional Board Resolution 98-08, and the Stormwater Quality Task Force Best Management Practice Guide for RGOs.)

a) Frequency: The Permittees shall inspect each RGO and Automotive Service facility once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) RGOs shall be inspected to verify that:

(1) Fuel-dispensing areas are routinely swept for removal of litter and debris, and that rags and absorbents are ready for use in case of leaks and spills;

(2) Operator is aware that wash down of RGO area to the storm drain is prohibited;

(3) Employees are trained in management of waste materials;

(4) Drains and flow patterns are labeled at the facility;

(5) Inspection and cleans up of storm drain inlets and catch basins within the facility's boundaries are performed before October 1 each year;

(6) Posting signs are close to the fuel dispenser that warn vehicle owners/operators against "topping off" of vehicle fuel tanks and installation of automatic shutoff fuel dispensing nozzles;

(7) Outdoor waste receptacle and air/water supply area is routinely cleaned-up of leaks and drips, that only watertight waste receptacles are used and lids are closed. Check if grading is done in such a way to prevent run-on of storm water, segregation of flow, and if a roof cover or a low containment berm was built; and,

(8) Employees are trained to implement storm water pollution prevention practices.

d) A follow-up inspection shall be performed within one business day when a complaint related to non-storm water or contaminated storm water discharge is made against a previously inspected RGO.

5. Wholesale Trade (scrap, auto dismantling), Fabricated Metal Products, Motor Freight, Chemical/Allied Products, Primary Metal Products Facilities

a) The Permittees shall inspect

(1) Wholesale trade (scrap, auto dismantling);

(2) Fabricated metal products;

(3) Motor freight;

(4) Chemical/Allied products; and

(5) Primary metal products

facilities once every 24 months.

b) Level of inspection: The Permittees shall confirm that

(1) BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP; and,

(2) Each owner/operator has a current Waste Discharge Identification (WDID) number, and that a Storm Water Pollution Prevention Plan is available on-site.

6. Automotive Service Facilities

The Permittees shall communicate appropriate BMPs to each Automotive Service facility (in accordance with the SQMP and Regional Board Resolution 98-08.)

a) Frequency: The Permittees shall inspect each Automotive Service facility once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) Automotive Service facilities shall be inspected to verify that:

(1) The facility area is clean and dry without evident stains;

(2) Measures are implemented to prevent spills and leaks;

(3) The facility operator properly manages wastewaters;

(4) The facility operator is aware of the prohibition on discharge of non-storm water to the storm drain;

(5) The facility operator properly manages raw and waste materials including proper disposal of hazardous waste;

(6) Outdoor work and storage areas are protected to prevent potential pollution;

(7) Storm drain inlets situated on the property are labeled, inspected and routinely cleaned out; and,

(8) Employees are trained to implement storm water pollution prevention practices.

7. Site Visits to Lower Priority Categories

a) Based on the inventory developed under paragraph 1. above, each Permittee shall visit facilities identified as lower priority as specified below.

(1) Frequency: Each Permittee shall visit all industrial/commercial facilities (except those subject to the inspection program) no later than (24 months from the permit effective date).

(2) Level of visit: Each Permittee shall confirm that each owner/operator:

(i) has a current Waste Discharge Identification (WDID) number (for facilities discharging storm water associated with industrial activity), and that a Storm Water Pollution Prevention Plan is available on-site, and

(ii) is implementing BMPs consistent with model programs for industrial and commercial facilities, and local storm water/urban runoff ordinances.

(3) Enforcement Referral: For any facility not complying with requirements for facilities discharging storm water associated with industrial activity (i.e. a non-filer), Permittees shall advise the owner/operator of such facility of its obligation to obtain coverage under the GIASP, and shall document this action. On a quarterly basis, Permittees shall provide the Regional Board an updated electronic record of non-filers identified during site visits

b) Each Permittee shall develop and implement a program to conduct spot checks of lower priority facilities subject to site visits (excluding those previously determined to pose no risk of exposure). After the completion of the first site visit cycle (i.e.. first 24 months) twenty percent of the total number of facilities will be visited per year. Spot check visits will be performed as described in paragraph a.2. and a.3. of section 7.

8. BMPs Implementation

In the event that particular minimum BMPs are infeasible at any site, Permittees shall require implementation of other BMPs that will achieve the equivalent reduction of pollutants in the storm water discharges. Furthermore, Permittees may require additional site-specific controls (BMPs) as necessary to comply with this Order, including BMPs that are more stringent than those required under the statewide GIASP.

a) For industrial and specified commercial facilities, identified as critical sources, tributary to CWA § 303(d) impaired water bodies,

Permittees shall consider requiring operators to implement additional controls as necessary.

b) For industrial and specified commercial facilities, identified as critical sources, within or directly adjacent to or discharging directly to ESAs, Permittees shall consider requiring operators to implement additional controls as necessary.

9. Complaint Response

In response to any complaint related to storm water or unauthorized non-storm water discharges or a specific request by the Regional Board Executive Officer, a Permittee shall visit any facility, to determine if the facility is effectively complying with the SQMP and municipal storm water/urban runoff ordinances.

10. Interagency Coordination

The Permittees shall provide compliance assistance to the Regional Board through supporting activities, including but not limited to: referrals of complaints, assisting in identification of current owners, operators, and leasees in conjunction with activities performed at any facility within municipal jurisdiction, appearing as witnesses in Regional Board enforcement hearings, and participating in joint inspections when requested by Regional Board staff.

Copies of the inspection/site visit report and any follow-up documentation shall be provided to the Regional Board Executive Officer upon request.

11. Regional Board Inspected Facilities

To the extent that the Regional Board has conducted an inspection of a facility during a particular year, or the inspection has been performed through an authorized agent on behalf of the Regional Board, the Permittee need not inspect the facility during the same 24 month inspection period.

12. Facilities Not Addressed

The Permittees need not inspect State or Federal facilities that are not under their jurisdiction.

D. Development Planning Program

1. The Permittees shall implement a development-planning program that will require all planning priority development and redevelopment projects to:

   a) Minimize impacts from storm water and urban runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA (Cal. Pub.

Resources Code § 21100), CWC § 13369, CWA § 319, CWA § 402(p), CWA § 404, CZARA § 6217(g), ESA § 7, and local government ordinances ;

b) Maximize the percentage of permeable surfaces to allow percolation of storm water into the ground;

c) Minimize the quantity of storm water directed to impermeable surfaces and the MS4;

d) Minimize pollution emanating from parking lots through the use of appropriate treatment control BMPs and good housekeeping practices;

e) Ensure that treatment control BMPs are properly designed and maintained in a manner that does not promote the breeding of vectors; and

f) Provide for appropriate permanent measures to reduce storm water pollutant loads in storm water from the development site.

2. Peak Flow Control

The Permittees shall control post-development peak storm water runoff discharge rates, velocities, and duration (peak flow control) in natural drainage systems (i.e., mimic pre-development hydrology) to prevent accelerated stream erosion and to protect stream habitat. Natural drainage systems are located in the following areas:

a) Malibu Creek

b) Topanga Canyon Creek

c) Upper Los Angeles River

d) Upper San Gabriel River

e) Santa Clara River

f) Los Angeles County Coastal streams (see Basin Plan Table 2-1)

The Principal Permittee in consultation with Permittees shall develop numerical criteria for peak flow control, based on the results of the Peak Discharge Impact Study (see Monitoring Program Section I),

Each Permittee shall no later than (540 days from the permit effective date) implement numerical criteria for peak flow control.

A Permittee or group of Permittees may substitute for the peak flow control criteria with a Hydromodification Control Plan, on approval by the Regional Board, in the following circumstances:

(1) Stream or watershed-specific conditions indicate the need for a different peak flow control criteria, and the alternative numerical criteria is developed through the application of hydrologic.modeling and supporting field observations; or

(2) Watershed wide plan has been developed for implementation of control measures to reduce erosion and stabilize drainage systems on a watershed basis.

3. Standard Urban Storm Water Mitigation Plans

a) Each Permittee shall require that a single-family hillside home development:

(1) Conserve natural areas

(2) Protect slopes and channels

(3) Provide storm drain system stenciling and signage

(4) Divert roof runoff to vegetated areas before discharge unless the diversion would result in slope instability

(5) Direct surface flow to vegetated areas before discharge unless the diversion would result in slope instability

b) Each Permittee shall require that a Standard Urban Storm Water Mitigation Plan as approved by the Regional Board in Board Resolution No. R 00-02 be implemented for the following categories of developments:

(1) Ten or more unit homes (includes single family homes, multifamily homes, condominiums, and apartments)

(2) A 100,000 or more square feet of impervious surface area industrial/ commercial development

(3) Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534, and 7536-7539)

(4) Retail gasoline outlets

(5) Restaurants (SIC 5812)

(6) Parking lots 5,000 square feet or more of surface area or with 25 or more parking spaces

(7) Redevelopment projects in subject categories that meet redevelopment thresholds

c) Each Permittee shall submit an Environmentally Sensitive Area (ESA) Delineation Map for its jurisdictional boundary, based on the Regional Board's ESA Definition, no later than (120 days from permit effective date) for approval by the Regional Board

Executive Officer in consultation with the California Department of Fish and Game, and the California Coastal Commission.

d) Each Permittee shall require the implementation of SUSMP provisions no later than (180 days from permit effective date), for all projects located in or directly adjacent to or discharging directly to an ESA, where, the development will:

(1) discharge storm water and urban runoff that is likely to impact a sensitive biological species or habitat; and

(2) create 2,500 square feet or more of impervious surface area.

4. Numerical Design Criteria

The Permittees shall require that post-construction treatment control BMPs incorporate, at a minimum, either a volumetric or flow based treatment control design standard, or both, as identified below to mitigate (infiltrate, filter or treat) storm water runoff:

a) Volumetric Treatment Control BMP

(1) the 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*, or

(2) the volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial,* (1993), or

(3) the volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or

(4) the volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event.

b) Flow Based Treatment Control BMP

(1) the flow of runoff produced from a rain event equal to at least 0.2 inches per hour intensity, or

(2) the flow of runoff produced from a rain event equal to at least two times the 85th percentile hourly rainfall intensity for Los Angeles County, or

(3) the flow of runoff produced from a rain event that will result in treatment of the same portion of runoff as treated using volumetric standards above.

5. Applicability of Numerical Design Criteria

The Permittees shall require the following categories of planning priority projects to design and implement post-construction treatment controls to mitigate storm water pollution:

a) Single-family hillside residential developments of one acre or more of surface area

b) Housing developments (includes single family homes, multifamily homes, condominiums, and apartments) of ten units or more

c) A 100,000 square feet or more impervious surface area industrial/ commercial development

d) Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534 and 7536-7539) [5,000 square feet or more of surface area]

e) Retail gasoline outlets [5,000 square feet or more and with projected Average Daily Traffic (ADT) of 100 or more vehicles]

f) Restaurants (SIC 5812) [5,000 square feet or more of surface area]

g) Parking lots 5,000 square feet or more of surface area or with 25 or more parking spaces

h) Projects located in, adjacent to or discharging directly to an ESA that meet threshold conditions identified above in 3.c.

i) Redevelopment projects in subject categories that meet redevelopment thresholds

6. Not later than March 9, 2003, each Permittee shall require the implementation of SUSMP and post-construction control requirements for the industrial/commercial category to projects that disturb one acre or more of surface area.

7. Site Specific Mitigation

Each Permittee shall no later than (180 days from permit effective date) require the implementation of a site-specific plan to mitigate post-development storm water for new development and redevelopment not requiring a SUSMP but which may potentially have adverse impacts on post-development storm water quality, where one or more of the following project characteristics exist:

a) Vehicle or equipment fueling areas

b) Vehicle or equipment maintenance areas, including washing and repair

c) Commercial or industrial waste handling or storage

d) Outdoor handling or storage of hazardous materials

e) Outdoor manufacturing areas

f) Outdoor food handling or processing

g) Outdoor animal care, confinement, or slaughter

h) Outdoor horticulture activities

8. Redevelopment Projects

The Permittees shall apply the SUSMP, or site specific requirements including post-construction storm water mitigation to all planning priority projects that undergo significant redevelopment in their respective categories.

a) Significant redevelopment means land-disturbing activity that results in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site.

Where redevelopment results in an alteration to more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, the entire project must be mitigated. Where redevelopment results in an alteration to less than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, only the change must be mitigated, and not the entire development.

b) Redevelopment does not include activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety.

c) Existing Single Family Structures are exempt from the redevelopment requirements.

9. Maintenance Agreement and Transfer

Each Permittee shall require that all developments subject to SUSMP and site specific plan requirements provide verification of maintenance provisions for structural and treatment control BMPs, including but not limited to legal agreements, covenants, CEQA mitigation requirements, and or conditional use permits. Verification at a minimum shall include:

a) The developers signed statement accepting responsibility for maintenance until the responsibility is legally transferred, and either

b) A signed statement from the public entity assuming responsibility for structural or treatment control BMP maintenance and that it meets all local agency design standards, or

c) Written conditions in the sales or lease agreement, which requires the recipient to assume responsibility for maintenance and conduct a maintenance inspection at least once a year, or

d) Written text in project conditions, covenants and restrictions (CCRs) for residential properties assigning maintenance responsibilities to the Home Owners Association for maintenance of the structural and treatment control BMPs; or

e) Any other legally enforceable agreement that assigns responsibility for the maintenance of post-construction structural or treatment control BMPs

10. Regional Storm Water Mitigation Program

A Permittee or Permittee group may apply to the Regional Board for approval of a regional or sub-regional storm water mitigation program to substitute in part or wholly SUSMP requirements . Upon review and a determination by the Regional Board Executive Officer that the proposal is technically valid and appropriate, the Regional Board may consider for approval such a program if its implementation will

a) result in equivalent or improved storm water quality;

b) protect stream habitat;

c) promote cooperative problem solving by diverse interests;

d) be fiscally sustainable and has secure funding; and

e) be completed in five years including the construction and start-up of treatment facilities.

Nothing in this provision shall be construed as to delay the implementation of SUSMP requirements, as approved in this Order.

11. Mitigation Funding

The Permittees may propose a management framework, for endorsement by the Regional Board Executive Officer, to support regional or sub-regional solutions to storm water pollution, where the following situations occur:

R0007329

a) A waiver for impracticability is granted

b) Legislative funds become available

c) Off-site mitigation is required because of loss of environmental habitat

d) An approved watershed management plan or a regional storm water mitigation plan exists that incorporates an equivalent or improved strategy for storm water mitigation

12. California Environmental Quality Act (CEQA) Document Update

Each Permittee shall incorporate into its CEQA process, with immediate effect, procedures for considering potential storm water quality impacts and providing for appropriate mitigation when preparing and reviewing CEQA documents. The procedures shall require consideration of the following:

a) Potential Impact of project construction on storm water runoff

b) Potential Impact of projects post-construction activity on storm water runoff.

c) Potential for discharge of storm water from areas from material storage, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas or loading docks, or other outdoor work areas.

d) Potential for discharge of storm water to impair the beneficial uses of the receiving waters or areas that provide water quality benefit

e) Potential for the discharge of storm water to cause significant harm on the biological integrity of the waterways and water bodies

f) Potential for significant changes in the flow velocity or volume of storm water runoff that can cause environmental harm

g) Potential for significant increases in erosion of the project site or surrounding areas

13. General Plan Update

a) Each Permittee shall amend, revise or update its General Plans to include watershed and storm water quality and quantity management considerations and policies when the following General Plans elements are updated or amended: (i) Land Use, (ii) Housing, (iii) Conservation, (iv) Open Space.

b) Each Permittee shall provide the Regional Board with the draft amendment or revision when a listed General Plan element or the General Plan is noticed for comment in accordance with Cal. Govt. Code § 65350 et seq.

14. Targeted Employee Training

Each Permittee shall train its employees in targeted positions (whose jobs or activities are engaged in development planning) regarding the requirements of the development planning on an annual basis beginning no later than (six months from the effective date of this Order), and more frequently if necessary. For Permittees with a population of 250,000 or more, training shall be completed no later than (one year from the effective date of this Order).

15. Developer Technical Guidance and Information

a) Each Permittee shall develop and make available to the developer community SUSMP (development planning) guidelines immediately.

b) The Principal Permittee in partnership with Permittees shall issue no later than (ten months from the effective date of this Order), a technical manual for the siting and design of BMPs for the development community in Los Angeles County. The technical manual may be adapted from the revised California Storm Water Quality Task Force Best Management Practices Handbooks scheduled for publication in September 2002. The technical manual shall at a minimum include:

(1) treatment control BMPs based on flow-based and volumetric water quality design criteria for the purposes of countywide consistency;

(2) Peak Flow Control criteria to control peak discharge rates, velocities and duration;

(3) expected pollutant removal performance ranges obtained from national databases, technical reports and the scientific literature;

(4) maintenance considerations; and

(5) cost considerations.

E. Development Construction Program

1. Each Permittee shall implement a program to control runoff from construction activity at all construction sites within its jurisdiction. The program shall ensure the following minimum requirements are effectively implemented at all construction sites:

a) Sediments generated on the project site shall be retained using adequate treatment control or structural controls;

b) Construction-related materials, wastes, spills, or residues shall be retained at the project site to avoid discharge to streets, drainage

facilities, receiving waters, or adjacent properties by wind or runoff;

c) Non-storm water runoff from equipment and vehicle washing and any other activity shall be contained at the project site; and

d) Erosion from slopes and channels shall be controlled by implementing an effective combination of BMPs (as approved in Regional Board Resolution No. 99-03), such as the limiting of grading scheduled during the wet season; inspecting graded areas during rain events; planting and maintenance of vegetation on slopes; and covering erosion susceptible slopes.

2. For construction sites one acre and greater, each Permittee shall comply with all conditions in section E.1. above and shall:

a) Require the preparation and submittal of a Local Storm Water Pollution Prevention Plan (Local SWPPP), for approval prior to issuance of a grading permit for construction projects.

The Local SWPPP shall include appropriate construction site BMPs and maintenance schedules. (A Local SWPPP may substitute for the State SWPPP if the Local SWPPP is at least as inclusive in controls and BMPs as the State SWPPP). The Local SWPPP must include the rationale used for selecting or rejecting BMPs. The project architect, or engineer of record, or authorized qualified designee, must sign a statement on the Local SWPPP to the effect:

"As the architect/engineer of record, I have selected appropriate BMPs to effectively minimize the negative impacts of this project's construction activities on storm water quality. The project owner and contractor are aware that the selected BMPs must be installed, monitored, and maintained to ensure their effectiveness. The BMPs not selected for implementation are redundant or deemed not applicable to the proposed construction activity."

The landowner or the landowner's agent shall sign a statement to the effect:

"I certify that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is true, accurate, and complete. I am aware that submitting false and/or inaccurate information, failing to update the Local SWPPP to reflect current conditions, or failing to properly and/or adequately implement the Local SWPPP may result in revocation of grading and/or other permits or other sanctions provided by law."

The Local SWPPP certification shall be signed by the landowner as follows, for a corporation: by a responsible corporate officer which means (a) a president, secretary, treasurer, or vice president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or (b) the manager of the construction activity if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures; for a partnership or sole proprietorship: by a general partner or the proprietor; or for a municipality or other public agency: by an elected official, a ranking management official (e.g., County Administrative Officer, City Manager, Director of Public Works, City Engineer, District Manager), or the manager of the construction activity if authority to sign Local SWPPPs has been assigned or delegated to the manager in accordance with established agency policy.

b) Inspect all construction sites for storm water quality requirements during routine inspections a minimum of once during the wet season. The Local SWPPP shall be reviewed for compliance with local codes, ordinances, and permits. For inspected sites that have not adequately implemented their Local SWPPP, a follow-up inspection to ensure compliance will take place within 2 weeks. If compliance has not been attained, the Permittee will take additional actions to achieve compliance (as specified in municipal codes). If compliance has not been achieved, and the site is also covered under a statewide general construction storm water permit, each Permittee shall enforce their local ordinance requirements, and if non-compliance continues the Regional Board shall be notified for further joint enforcement actions.

c) Require, commencing March 10, 2003, prior to issuing a grading permit for all projects less than five acres requiring coverage under a statewide general construction storm water permit, proof of a Waste Discharger Identification (WDID) Number for filing a Notice of Intent (NOI) for permit coverage and a certification that a SWPPP has been prepared by the project developer. A Local SWPPP may substitute for the State SWPPP if the Local SWPPP is at least as inclusive in controls and BMPs as the State SWPPP.

3. For sites five acres and greater, each Permittee shall comply with all conditions in Sections E.1. and E.2.and shall:

a) Require, prior to issuing a grading permit for all projects requiring coverage under the state general permit, proof of a Waste Discharger Identification (WDID) Number for filing a Notice of Intent (NOI) for coverage under the GCASP and a certification that a SWPPP has been prepared by the project developer. A Local SWPPP may substitute for the State SWPPP if the Local SWPPP is at least as inclusive in controls and BMPs as the State SWPPP.

R0007333

b) Require proof of an NOI and a copy of the SWPPP at any time a transfer of ownership takes place for the entire development or portions of the common plan of development where construction activities are still on-going.

c) Use an effective system to track grading permits issued by each Permittee. To satisfy this requirement, the use of a database or GIS system is encouraged, but not required.

4. Each Permittee shall train employees in targeted positions (whose jobs or activities are engaged in construction activities including construction inspection staff) regarding the requirements of the storm water management program no later than (six months from the effective date of this Order), and annually thereafter. For Permittees with a population of 250,000 or more, initial training shall be completed no later than (one year from the effective date of this Order). Each Permittee shall maintain a list of trained employees.

F. Public Agency Activities Program

Each Permittee shall implement a Public Agency program to minimize storm water pollution impacts from public agency activities. Public Agency requirements consist of:

- Sewage Systems Maintenance, Overflow, and Spill Prevention
- Public Construction Activities Management
- Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management
- Landscape and Recreational Facilities Management
- Storm Drain Operation and Management
- Streets and Roads Maintenance
- Parking Facilities Management
- Public Industrial Activities Management
- Emergency Procedures
- Treatment Feasibility Study

1. Sewage System Maintenance, Overflow, and Spill Prevention

a) Each Permittee shall implement a response plan for overflows of the sanitary sewer system within their respective jurisdiction, which shall consist at a minimum of the following:

(1) Investigation of any complaints received;

(2) Upon notification, immediate response to overflows for containment; and

(3) Notification to appropriate sewer and public health agencies when a sewer overflows to the MS4.

b) In addition to 1.a.1, 1.a.2, and 1.a.3 above, for those Permittees, which own and/or operate a sanitary sewer system, the Permittee shall also implement the following requirements:

(1) Procedures to prevent sewage spills or leaks from sewage facilities from entering the MS4; and

(2) Identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers to the MS4.

2. Public Construction Activities Management

a) Each Permittee shall implement the Development Planning Program requirements (Permit Section D) at public construction projects.

b) Each Permittee shall implement the Development Construction Program requirements (Permit Section E) at Permittee owned construction sites.

c) Each Permittee shall obtain coverage under the GCASP for public construction sites 5 acres or greater (or part of a larger area of development) except that a municipality under 100,000 in population need not obtain coverage under a separate permit until March 10, 2003.

d) Each Permittee, no later than March 9, 2003, shall obtain coverage under a statewide general construction storm water permit for public construction sites for projects between one and five acres.

3. Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management

a) Each Permittee, consistent with the SQMP, shall implement pollution prevention plans for public vehicle maintenance facilities, material storage facilities, and corporation yards which have the potential to discharge pollutants into storm water.

b) Each Permittee shall implement BMPs to minimize pollutant discharges in storm water including but not be limited to:

(1) Good housekeeping practices;

(2) Material storage control;

(3) Vehicle leaks and spill control; and

(4) Illicit discharge control.

c) Each Permittee shall require:

(1) For existing facilities, that all vehicle/equipment wash areas are self-contained or covered, or equipped with a clarifier, or other pretreatment device.

(2) For new facilities or during redevelopment of existing sites to be equipped with a clarifier, or other pretreatment device, and properly connected to the sanitary sewer to prevent the discharge of pollutants to the MS4.

This provision does not apply to fire fighting vehicles.

4. Landscape and Recreational Facilities Management

Each Permittee shall implement the following requirements:

a) A standardized protocol for the routine and non-routine application of pesticides, herbicides (including pre-emergents), and fertilizers;

b) Consistency with State Board's guidelines and monitoring requirements for application of aquatic pesticides to surface waters (WQ Order No. 2001-12 DWQ).

c) Ensure no application of pesticides or fertilizers immediately before, during, or immediately after a rain event or when water is flowing off the area to be applied;

d) Ensure that no banned or unregistered pesticides are stored or applied;

e) Ensure that staff applying pesticides are certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator;

f) Implement procedures to encourage retention and planting of native vegetation and to reduce water, fertilizer, and pesticide needs;

g) Store fertilizers and pesticides indoors or under cover on paved surfaces or use secondary containment;

h) Reduce the use, storage, and handling of hazardous materials to reduce the potential for spills; and

i) Regularly inspect storage areas.

5. Storm Drain Operation and Management

Each Permittee shall:

a) Designate catch basin inlets within its jurisdiction as one of the following:

Priority A – catch basins that are designated as consistently generating the highest volumes of trash and/or litter.

Priority B - catch basins that are designated as consistently generating moderate volumes of trash and/or litter

Priority C – catch basins that are designated as generating low volumes of trash and/or litter.

b) Clean catch basins according to the following schedule:

Priority A –At least once during the dry season and once per month during the wet season.

Priority B – At least 2 times per year and once during the wet season. Between the effective date of this Order and July 1, 2003, each Permittee shall ensure that each catch basin is cleaned whenever the catch basin reaches 40% full during the wet season. From July 1, 2003 to the date this Order is renewed, each Permittee shall ensure that each catch basin is cleaned whenever the catch basin reaches 25% full during the wet season.

Priority C – as necessary but at least once per year.

c) For any special event that can be reasonably expected to generate substantial quantities of trash and litter, include provisions that require for the proper management of trash and litter generated, as a condition of the special use permit issued for that event. At a minimum, the Permittee shall arrange for either temporary screens to be placed on catch basins or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain.

d) Place trash receptacles at all transit stops within its jurisdiction and maintain them.

e) The Permittees shall implement a program which achieves the waste load allocations in conformance with a TMDL schedule of implementation by using an effective combination of BMPs which may include a combination of street sweeping, catch basin clean outs, installation of treatment devices, or other BMPs.

f) Each Permittee shall inspect the legibility of the catch basin stencil or label nearest the inlet. Catch basins with illegible stencils shall be recorded and re-stenciled or re-labeled within 180 days of inspection.

g) Each Permittee shall implement BMPs for Storm Drain Maintenance that include:

(1) A program to visually monitor Permittee-owned open channel storm drains and other drainage structures for

debris at least annually and identify and prioritize problem areas of illicit discharge for regular inspection;

(2) A review of current maintenance activities to assure that appropriate storm water BMPs are being utilized to protect water quality;

(3) Removal of trash and debris from open channel storm drains shall occur a minimum of once per year before the storm season;

(4) Minimize the discharge of contaminants during MS4 maintenance and clean outs; and

(5) Proper disposal of material removed.

6. Streets and Roads Maintenance

a) Each Permittee shall designate streets and/or street segments within its jurisdiction as one of the following:

Priority A – streets and/or street segments that are designated as consistently generating the highest volumes of trash and/or litter.

Priority B - streets and/or street segments that are designated as consistently generating moderate volumes of trash and/or litter.

Priority C – streets and/or street segments that are designated as generating low volumes of trash and/or litter.

b) Each Permittee shall perform street sweeping according to the following schedule:

Priority A – These streets and/or street segments shall be swept at least two times per month.

Priority B - Each Permittee shall ensure that each street and/or street segments is swept at least once per month.

Priority C – These streets and/or street segments shall be swept as necessary but in no case less than once per year.

c) Each Permittee shall require that:

(1) Sawcutting wastes be recovered and disposed of properly and that in no case shall waste be left on a roadway or allowed to enter the storm drain.

(2) Concrete and other street and road maintenance materials and wastes shall be managed to prevent discharge to the MS4; and

(3) The washout of concrete trucks and chutes shall only occur in designated areas and never discharged to storm drains, open ditches, streets, or catch.

d) Each Permittee shall, no later than (six months from effective date of this Order), train their employees in targeted positions (whose interactions, jobs, and activities affect storm water quality) regarding the requirements of the storm water management program to:

(1) Promote a clear understanding of the potential for maintenance activities to pollute storm water; and

(2) Identify and select appropriate BMPs.

For Permittees with a population of 250,000 or more training shall be completed no later than (one year from the effective date of this Order.)

7. Parking Facilities Management

Permittee-owned parking lots exposed to storm water shall be kept clear of debris and excessive oil buildup and cleaned no less than 2 times per month and/or inspected no less than 2 times per month to determine if cleaning is necessary. In no case shall a Permittee-owned parking lot be cleaned less than once a month.

8. Public Industrial Activities Management

Each Permittee shall, for any municipal activity considered a discharge of storm water associated with industrial activity , obtain separate coverage under the GIASP except that a municipality under 100,000 in (1990 Census) population need not file the Notice Of Intent to be covered by said permit until March 10, 2003 (with the exception of power plants, airports, and uncontrolled sanitary landfills).

9. Emergency Procedures

Each Permittee shall repair essential public services and infrastructure in a manner to minimize environmental damage in emergency situations such as: earthquakes; fires; floods; landslides; or windstorms. BMPs shall be implemented to the extent that measures do not compromise public health and safety. After initial emergency response or emergency repair activities have been completed, each Permittee shall implement BMPs and programs as required under this Order.

10. Treatment Feasibility Study

The Permittees in cooperation with the County Sanitation Districts of Los Angeles County shall conduct a study to investigate the possible diversion of dry weather discharges or the use of alternative treatment control BMPs to treat flows from their jurisdiction which may impact

public health and safety and/or the environment. The Permittees shall collectively review their individual prioritized lists and create a watershed based priority list of drains for potential diversion or treatment and submit the priority listing to the Regional Board Executive Officer, no later than July 1,2002.

G. Illicit Connections and Illicit Discharges Elimination Program

Permittees shall eliminate all illicit connections and illicit discharges to the storm drain system, and shall document, track, and report all such cases in accordance with the elements and performance measures specified in the following subsections.

1. General

a) Implementation: Each Permittee must develop an Implementation Program which specifies how each Permittee is implementing revisions to the IC/ID Program of the SQMP. This Implementation Program must be documented, and available for review and approval by the Regional Board Executive Officer, upon request.

b) Tracking: All Permittees shall, no later than [365 days from the effective date of this Order] develop and maintain a listing of all permitted connections to their storm drain system. All Permittees shall map at a scale and in a format specified by the Principal Permittee all illicit connections and discharges on their baseline maps, and shall transmit this information to the Principal Permittee. No later than [365 days from the effective date of this Order] the Principal Permittee shall use this information as well as results of baseline and priority screening for illicit connections (as set forth in subsection 2 below) to start an annual evaluation of patterns and trends of illicit connections and illicit discharges, with the objectives of identifying priority areas for elimination of illicit connections and illicit discharges.

c) Training: All Permittees shall train all targeted employees who are responsible for identification, investigation, termination, cleanup, and reporting of illicit connections and discharges. For Permittees with a population of less than 250,000, training shall be completed no later than [six months from the effective date of this Order]. For Permittees with a population of 250,000 or more, training shall be completed no later than [365 days from the effective date of this Order]. Furthermore, all Permittees shall conduct refresher training on an annual basis thereafter.

R0007340

2. Illicit Connections

a) Screening for Illicit Connections

(1) Field Screening: All Permittees shall field screen the storm drain system for illicit connections in accordance with the following schedule:

(i) Open channels: [365 days from the effective date of this Order];

(ii) Underground pipes in priority areas: [three years from the effective date of this Order]; and

(iii) Underground pipes with a diameter of 36 inches or greater: [five years from the effective date of this Order].

Permittees shall report, to the Principal Permittee, on the location and length of open channels or underground pipes that have been screened vis a vis the entire storm drain network, and on the status of suspected, confirmed, and terminated illicit connections. Permittees shall maintain a list containing all permitted connections and the status of connections under investigation for possible illicit connection.

(2) Permit Screening: [five years from the effective date of this Order], Permittees shall complete a review of all permitted connections to the storm drain system, to confirm compliance with Part 1 (Discharge Prohibition).

b) Response to Illicit Connections

(1) Investigation: Upon discovery or upon receiving a report of a suspected illicit connection, Permittees shall initiate an investigation within 21 days, to determine the source of the connection, the nature and volume of discharge through the connection, and the responsible party for the connection.

(2) Termination: Upon confirmation of the illicit nature of a storm drain connection, Permittees shall ensure termination of the connection within 180 days, using enforcement authority as needed.

3. Illicit Discharges

a) Abatement and Cleanup: Permittees shall respond, within one business day of discovery or a report of a suspected illicit discharge, with activities to abate, contain, and clean up all illicit discharges, including hazardous substances.

b) Investigation: Permittees shall investigate illicit discharges as soon as practicable (during or immediately following containment and cleanup activities), and shall take enforcement action as appropriate.

Part 5. DEFINITIONS

The following are definitions for terms applicable to this Order:

"Adverse Impact" means a detrimental effect upon water quality or beneficial uses caused by a discharge or loading of a pollutant or pollutants.

"Anti-degradation policies" means the *Statement of Policy with Respect to Maintaining High Quality Water in California* (State Board Resolution No. 68-16) which protects surface and ground waters from degradation. In particular, this policy protects waterbodies where existing quality is higher than that necessary for the protection of beneficial uses including the protection of fish and wildlife propagation and recreation on and in the water.

"Applicable Standards and Limitations" means all State, interstate, and federal standards and limitations to which a "discharge" or a related activity is subject under the CWA, including "effluent limitations, "water quality standards, standards of performance, toxic effluent standards or prohibitions, "best management practices," and pretreatment standards under sections 301, 302, 303, 304, 306, 307, 308, 403 and 404 of CWA.

"**Areas of Special Biological Significance (ASBS)**" means all those areas of this state as ASBS, listed specifically within the California Ocean Plan or so designated by the State Board which, among other areas, includes the area from Mugu Lagoon to Latigo Point: Oceanwater within a line originating from Laguna Point at 34° 5' 40" north, 119° 6'30" west, thence southeasterly following the mean high tideline to a point at Latigo Point defined by the intersection of the meanhigh tide line and a line extending due south of Benchmark 24; thence due south to a distance of 1000 feet offshore or to the 100 foot isobath, whichever distance is greater; thence northwesterly following the 100 foot isobath or maintaining a 1,000-foot distance from shore, whichever maintains the greater distance from shore, to a point lying due south of Laguna Point, thence due north to Laguna Point.

"Authorized Discharge" means any discharge that is authorized pursuant to an NPDES permit or meets the conditions set forth in this Order.

"Automotive Service Facilities" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 5511, 7532-7534, or 7536-7539.

"Basin Plan" means the Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties, adopted by the Regional Board on June 13, 1994 and subsequent amendments.

"Beneficial Uses" means the existing or potential uses of receiving waters in the permit area as designated by the Regional Board in the Basin Plan.

"Best Management Practices (BMPs)" means methods, measures, or practices designed and selected to reduce or eliminate the discharge of pollutants to surface waters from point and nonpoint source discharges including storm water. BMPs include structural and nonstructural controls, and operation and maintenance procedures, which can be applied before, during, and/or after pollution producing activities.

"Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

"Construction" means constructing, clearing, grading, or excavation that results in soil disturbance. Construction includes structure teardown. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"Control" means to minimize, reduce, eliminate, or prohibit by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

"Dechlorinated/Debrominated Swimming Pool Discharge" means swimming pool discharges which have no measurable chlorine or bromine and do not contain any detergents, wastes, or additional chemicals not typically found in swimming pool water. The term does not include swimming pool filter backwash.

"Development" means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction.

"Directly Adjacent" means situated within 200 feet of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area.

"Director" means the Director of a municipality and Person(s) designated by and under the Director's instruction and supervision.

"Discharge" means when used without qualification the "discharge of a pollutant."

"Discharging Directly" means outflow from a drainage conveyance system that is composed entirely or predominantly of flows from the subject, property, development, subdivision, or industrial facility, and not commingled with the flows from adjacent lands.

"Discharge of a Pollutant" means: Any addition of any "pollutant" or combination of pollutants to "waters of the United States" from any "point source" or, any addition of any pollutant or combination of pollutants to the waters of the "contiguous zone" or the ocean from any point source other than a vessel or other floating craft which is being used as a means of

transportation. The term discharge includes additions of pollutants into waters of the United States from: surface runoff which is collected or channeled by man; discharges through pipes, sewers, or other conveyances owned by a State, municipality, or other person which do not lead to a treatment works; and discharges through pipes, sewers, or other conveyances, leading into privately owned treatment works.

"Disturbed Area" means an area that is altered as a result of clearing, grading, and/or excavation.

"Environmentally Sensitive Areas" means an area "in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which would be easily disturbed or degraded by human activities and developments" (California Public Resources Code § 30107.5). Areas subject to storm water mitigation requirements are: areas designated as Significant Ecological Areas by the County of Los Angeles (*Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976)* and amendments); an area designated as a Significant Natural Area by the California Department of Fish and Game's Significant Natural Areas Program; an area listed in the Basin Plan as supporting the "Rare, Threatened, or Endangered Species (RARE)" beneficial use; or an area identified by a Permittee as environmentally sensitive.

"Full Capture Device" means any device or system that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow resulting from a one-year, one-hour, storm.

"General Construction Activities Storm Water Permit (GCASP)" means the general NPDES permit adopted by the State Board which authorizes the discharge of storm water from construction activities under certain conditions.

"General Industrial Activities Storm Water Permit (GIASP)" means the general NPDES permit adopted by the State Board which authorizes the discharge of storm water from certain industrial activities under certain conditions.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is 25% or greater and where grading contemplates cut or fill slopes.

"Illicit Connection" means any man-made conveyance that is connected to the storm drain system without a permit, excluding roof drains and other similar type connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

"Illicit Discharge" means any discharge to the storm drain system that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term illicit discharge includes all non storm-water discharges except discharges pursuant to an NPDES permit, discharges that are identified in Part 1, "Discharge Prohibitions" of this order, and discharges authorized by the Regional Board Executive Officer.

"Illicit Disposal" means any disposal, either intentionally or unintentionally, of material(s) or waste(s) that can pollute storm water.

"Industrial/Commercial Facility" means any facility involved and/or used in the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by the Standard Industrial Classifications (SIC). Facility ownership (federal, state, municipal; private) and profit motive of the facility are not factors in this definition.

"Infiltration" means the downward entry of water into the surface of the soil.

"Inspection" means entry and the conduct of an on-site review of a facility and its operations, at reasonable times, to determine compliance with specific municipal or other legal requirements. The steps involved in performing an inspection, include, but are not limited to: 1. Pre-inspection documentation research.; 2. Request for entry; 3. Interview of facility personnel; 4. Facility walk-through. 5. Visual observation of the condition of facility premises; 6. Examination and copying of records as required; 7. Sample collection (if necessary or required); 7. Exit conference (to discuss preliminary evaluation); and, 8. Report preparation, and if appropriate, recommendations for coming into compliance.

"Large Municipal Separate Storm Sewer System (MS4)" means all MS4s that serve a population greater than 250,000 (1990 Census) as defined in 40 CFR § 122.26 (b)(4). The Regional Board designated Los Angeles County as a large MS4 in 1990, based on: (i) the U.S. Census Bureau 1990 population estimate of 8.9 million, and (ii) the interconnectivity of the MS4s in the incorporated and unincorporated areas within the County.

"Local SWPPP" means the Storm Water Pollution Prevention Plan required by the local agency for a project that disturbs one or more acres of land.

"Maximum Extent Practicable (MEP)" means the standard for implementation of storm water management programs to reduce pollutants in storm water CWA's § 402(p)(3)(B)(iii) requires that municipal permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. Specifically, municipalities must choose effective BMPs, and reject applicable BMPs only where other effective BMPs will serve the same purpose. See the legal memorandum (Feb 11, 1993) from State Board OCC to DWQ.

"Method Detection Limit (MDL)" means the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in 40 CFR 136, Appendix B.

"Minimum Level (ML)" means the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

"Municipal Separate Storm Sewer System (MS4)" means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, alleys, catch basins, curbs, gutters, ditches, manmade channels, or storm drains) owned by a State, city, county, town or other public body, that is designed or used for collecting or conveying storm water,

R0007345

which is not a combined sewer, and which is not part of a publicly owned treatment works, and which discharges to Waters of the United States.

"National Pollutant Discharge Elimination System (NPDES)" means the national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under CWA §307, 402, 318, and 405. The term includes an "approved program."

"Natural Drainage Systems" means unlined or unimproved (not engineered) creeks, streams, rivers or similar waterways.

"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

"Non-Storm Water Discharge" means any discharge to a storm drain that is not composed entirely of storm water.

"Nuisance" means anything that meets all of the following requirements: (1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; (2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal.; (3) occurs during, or as a result of, the treatment or disposal of wastes.

"Parking Lot" means land area or facility for the parking or storage of motor vehicles used personally, for businesses or for commerce with a lot size of 5,000 square feet or more of surface area, or with 25 or more parking spaces.

"Permittee(s)" means Co-Permittees and any agency named in this Order as being responsible for permit conditions within its jurisdiction. Permittees to this Order include the Los Angeles County Flood Control District, Los Angeles County, and the cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Canada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier.

"Planning Priority Projects" means those projects that are required to incorporate appropriate storm water mitigation measures into the design plan for their respective project. These types of projects include:

(1) Ten or more unit homes (includes single family homes, multifamily homes, condominiums, and apartments)

(2) A 100,000 or more square feet of impervious surface area industrial/ commercial development

(3) Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534, and 7536-7539)

(4) Retail gasoline outlets

(5) Restaurants (SIC 5812)

(6) Parking lots 5,000 square feet or more of surface area or with 25 or more parking spaces

(7) Redevelopment projects in subject categories that meet redevelopment thresholds

Additionally, for all projects located in or directly adjacent to or discharging directly to an ESA, which meet thresholds; and

(8) Those projects that require the implementation of a site-specific plan to mitigate post-development storm water for new development not requiring a SUSMP but which may potentially have adverse impacts on post-development storm water quality, where the following project characteristics exist:

(9) Vehicle or equipment fueling areas;

(10) Vehicle or equipment maintenance areas, including washing and repair;

(11) Commercial or industrial waste handling or storage;

(12) Outdoor handling or storage of hazardous materials;

(13) Outdoor manufacturing areas;

(14) Outdoor food handling or processing;

(15) Outdoor animal care, confinement, or slaughter; or

(16) Outdoor horticulture activities.

"Pollutants" means those "pollutants" defined in CWA §502(6) (33.U.S.C.§1362(6)), and incorporated by reference into California Water Code §13373.

"Potable Water Distribution Systems" means sources of flows from drinking water storage, supply and distribution systems including flows from system failures, pressure releases, system maintenance, well development, pump testing fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults, and wells.

"Project" means all development, redevelopment, and land disturbing activities. The term is not limited to "Project" as defined under CEQA (Pub. Resources Code §21065).

R0007347

"Rain Event" means any rain event greater than 0.1 inch in 24 hours except where specifically stated otherwise.

"Rare, Threatened, or Endangered Species (RARE)" means a beneficial use for waterbodies in the Los Angeles Region, as designated in the Basin Plan (Table 2-1), that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered.

"Receiving Waters" means all surface water bodies in the Los Angeles Region that are identified in the Basin Plan.

"Redevelopment" means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; ; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces.

"Regional Administrator" means the Regional Administrator of the Regional Office of the USEPA or the authorized representative of the Regional Administrator.

"Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC Code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils.

"Runoff" means any runoff including storm water and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of base flow either contaminated with pollutants or uncontaminated, and nuisance flows.

"Sidewalk Rinsing" means pressure washing of paved pedestrian walkways with average water usage of 0.006 gallons per square foot, with no cleaning agents, and properly disposing of all debris collected, as authorized under Regional Board Resolution No. 98-08.

"Significant Ecological Area (SEA)" means an area that is determined to possess an example of biotic resources that cumulatively represent biological diversity, for the purposes of protecting biotic diversity, as part of the Los Angeles County General Plan.[1]
Areas are designated as SEAs, if they possess one or more of the following criteria:

1. The habitat of rare, endangered, and threatened plant and animal species.
2. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind, or are restricted in distribution on a regional basis.

[1] The 61 existing SEAs represent the findings of a study that was completed in 1976 by England and Nelson, Environmental Consultants, as amended through the adoption of a revised Los Angeles County General Plan in 1980. The results of an update study to evaluate existing SEAs within unincorporated Los Angeles County is currently being proposed to the Los Angeles County Planning Commission (*Los Angeles County Significant Ecological Area Update Study 2000, Background Report*, PCR Services Corporation). The *Update Study 2000*, which contains existing and proposed SEA boundaries, can be downloaded from the Los Angeles County Department of Planning website at http://planning.co.la.ca.us/drp_revw.html#SEA

R0007348

3. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind or are restricted in distribution in Los Angeles County.
4. Habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, migrating grounds and is limited in availability either regionally or within Los Angeles County.
5. Biotic resources that are of scientific interest because they are either an extreme in physical/geographical limitations, or represent an unusual variation in a population or community.
6. Areas important as game species habitat or as fisheries.
7. Areas that would provide for the preservation of relatively undisturbed examples of natural biotic communities in Los Angeles County.
8. Special areas.[2]

"Significant Natural Area (SNA)" means an area defined by the California Department of Fish and Game (DFG), Significant Natural Areas Program, as an area that contains an important example of California's biological diversity. The most current SNA maps, reports, and descriptions can be downloaded from the DFG website at ftp://maphost.dfg.ca.gov/outgoing/whdab/sna/. These areas are identified using the following biological criteria only, irrespective of any administrative or jurisdictional considerations:

1. Areas supporting extremely rare species or habitats.
2. Areas supporting associations or concentrations of rare species or habitats.
3. Areas exhibiting the best examples of rare species and habitats in the state.

"Site" means the land or water area where any "facility or activity" is physically located or conducted, including adjacent land used in connection with the facility or activity.

"Source Control BMP" means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

"SQMP" means the Los Angeles Countywide Stormwater Quality Management Program.

"State Storm Water Pollution Prevention Plan (State SWPPP)" means a plan, as required by a State General Permit, identifying potential pollutant sources and describing the design, placement and implementation of BMPs, to effectively prevent non-stormwater Discharges and reduce Pollutants in Stormwater Discharges during activities covered by the General Permit.

"Storm Water" means storm water runoff, snow melt runoff, and surface runoff and drainage.

"Storm Water Discharge Associated with Industrial Activity" means industrial discharge as defined in 40 CFR 122.26(b)(14)

"Stormwater Quality Management Program" means the Los Angeles Countywide Stormwater Quality Management Program, which includes descriptions of programs, collectively developed by the Permittees in accordance with provisions of the NPDES Permit, to comply with applicable federal and state law, as the same is amended from time to time.

[2] These criteria from the 1976 study have been modified in the *Update Study 2000.*

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both treatment control BMPs and source control BMPs.

"SUSMP" means the Los Angeles Countywide Standard Urban Stormwater Mitigation Plan. The SUSMP shall address conditions and requirements of new development.

"Total Maximum Daily Load (TMDL)" means the sum of the individual waste load allocations for point sources and load allocations for nonpoint sources and natural background.

"Toxicity Identification Evaluation" means a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

"Toxicity Reduction Evaluation" means a study conducted in a step-wise process to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity.

"Treatment" means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media absorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment Control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

"USEPA Phase I Facilities" means facilities in specified industrial categories that are required to obtain an NPDES permit for storm water discharges, as required by 40 CFR 122.26(c). These categories include:

i. facilities subject to storm water effluent limitation guidelines, new source performance standards, or toxic pollutant effluent standards (40 CFR N)
ii. manufacturing facilities
iii. oil and gas/mining facilities
iv. hazardous waste treatment, storage, or disposal facilities
v. landfills, land application sites, and open dumps
vi. recycling facilities
vii. steam electric power generating facilities
viii. transportation facilities
ix. sewage of wastewater treatment works
x. light manufacturing facilities

"Vehicle Maintenance/Material Storage Facilities/Corporation Yards" means any Permittee owned or operated facility or portion thereof that:

i. Conducts industrial activity, operates equipment, handles materials, and provides services similar to Federal Phase I facilities;

ii. Performs fleet vehicle on ten or more vehicles per day including repair, maintenance, washing, and fueling;
iii. Performs maintenance and/or repair of heavy industrial machinery/equipment ; and
iv. Stores chemicals, raw materials, or waste materials in quantities that require a hazardous materials business plan or a Spill Prevention, Control , and Counter-measures (SPCC) plan.

"Water Column Toxicity" means a 70 percent survival rate for a single test or an average of 90 percent survival for three consecutive tests.

"Water Quality Standards and Water Quality Objectives" means water quality criteria contained in the Basin Plan, the California Ocean Plan, the National Toxics Rule, the California Toxics Rule, and other state or federally approved surface water quality plans. Such plans are used by the Regional Board to regulate all discharges, including storm water discharges.

"Waters of the State" means any surface water or groundwater, including saline waters, within boundaries of the state.

"Waters of the United States" or "Waters of the U.S." means:

a. All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
b. All interstate waters, including interstate "wetlands";
c. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:
    1. Which are or could be used by interstate or foreign travelers for recreational or other purposes;
    2. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
    3. Which are used or could be used for industrial purposes by industries in interstate commerce;
a. All impoundments of waters otherwise defined as waters of the United States under this definition;
b. Tributaries of waters identified in paragraphs (a) through (d) of this definition;
c. The territorial sea; and
d. "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraph (a) through (f) of this definition.

Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.22(m), which also meet the criteria of this definition) are not waters of the United States. This exclusion applies only to man-made bodies of water, which neither were originally created in waters of the United States (such as disposal area in wetlands) nor resulted from the impoundment of waters of the United States. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's

status as prior converted cropland by any other federal agency, for the purposes of the CWA, the final authority regarding CWA jurisdiction remains with US EPA.

"Wet Season" means the calendar period beginning October 1 through April 15.

Part 6. STANDARD PROVISIONS

A. Standard Requirements

1. Each Permittee shall comply with all provisions and requirements of this permit.

2. Should a Permittee discover a failure to submit any relevant facts or that it submitted incorrect information in a report, it shall promptly submit the missing or correct information.

3. Each Permittee shall report all instances of non-compliance not otherwise reported at the time monitoring reports are submitted.

4. This Order includes the attached Monitoring and Reporting Program, and SUSMP(Regional Board Resolution No. R00-02), which are a part of the permit and must be complied with in the same manner as with the rest of the requirements in the permit.

B. Regional Board Review

Any formal determination or approval made by the Regional Board Executive Officer pursuant to the provisions of this Order may be reviewed by the Regional Board. A Permittee(s) or a member of the public may request such review upon petition within 30 days of the effective date of the notification of such decision to the Permittee(s) and interested parties on file at the Regional Board.

C. Public Review

1. All documents submitted to the Regional Board in compliance with the terms and conditions of this Order shall be made available to members of the public pursuant to the Freedom of Information Act (5 U.S.C. § 552 (as amended) and the Public Records Act (Cal Government Code Section 6250 *et seq.*).

2. All documents submitted to the Regional Board Executive Officer for approval shall be made available to the public for a 30-day period to allow for public comment.

D. Duty to Comply

1. Each Permittee must comply with all of the terms, requirements, and conditions of this Order. Any violation of this order constitutes a violation of the Clean Water Act, its regulations and the California Water Code, and is grounds for enforcement action, Order termination, Order revocation and reissuance, denial of an application for reissuance; or a

R0007352

combination thereof [40 CFR 122.41(a), CWC Section 13261, 13263, 13265, 13268, 13300, 13301, 13304, 13340, 13350].

2. A copy of these waste discharge specifications shall be maintained by each Permittee so as to be available during normal business hours to Permittee employees and members of the public.

3. Any discharge of wastes at any point(s) other than specifically described in this Order is prohibited, and constitutes a violation of the Order.

E. Duty to Mitigate [40 CFR 122.41 (d)]

Each Permittee shall take all reasonable steps to minimize or prevent any discharge that has a reasonable likelihood of adversely affecting human health or the environment.

F. Inspection and Entry [40 CFR 122.41(i), CWC Section 13267]

The Regional Board, USEPA, and other authorized representatives shall be allowed:

1. Entry upon premises where a regulated facility is located or conducted, or where records are kept under conditions of this Order;

2. Access to copy any records, at reasonable times, that are kept under the conditions of this Order;

3. To inspect at reasonable times any facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; and,

4. To photograph, sample, and monitor at reasonable times for the purpose of assuring compliance with this Order, or as otherwise authorized by the Clean Water Act and the California Water Code.

G. Proper Operation and Maintenance [40 CFR 122.41 (e), CWC Section 13263(f)]

The Permittees shall at all times properly operate and maintain all facilities and systems of treatment (and related appurtenances) that are installed or used by the Permittees to achieve compliance with this Order. Proper operation and maintenance includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar system that are installed by a Permittee only when necessary to achieve compliance with the conditions of this Order.

H. Signatory Requirements [40 CFR 122.41(k) & 122.22]

Except as otherwise provided in this Order, all applications, reports, or information submitted to the Regional Board shall be signed by the Director of

Public Works, City Engineer, or authorized designee and certified as set forth in 40 CFR 122.22.

I. **Reopener and Modification [40 CFR 122.41(f) & 122.62]**

1. This Order may only be modified, revoked, or reissued, prior to the expiration date, by the Regional Board, in accordance with the procedural requirements of the Water Code and Title 23 of the California Code of Regulations for the issuance of waste discharge requirements, 40 CFR 122.62, and upon prior notice and hearing, to:

   a) Address changed conditions identified in the required reports or other sources deemed significant by the Regional Board;

   b) Incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;

   c) Comply with any applicable requirements, guidelines, and/or regulations issued or approved pursuant to CWA Section 402(p); and/or,

   d) Consider any other federal, or state laws or regulations that became effective after adoption of this Order.

2. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:

   a) Violation of any term or condition contained in this Order;

   b) Obtaining this Order by misrepresentation, or failure to disclose all relevant facts; or,

   c) A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.

3. This Order may be modified, revoked and reissued, or terminated for cause.

4. The filing of a request by the Principal Permittee or Permittees for a modification, revocation and re-issuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any condition of this Order.

5. This Order may be modified to make corrections or allowances for changes in the permitted activity listed in this section, following the procedures at 40 CFR Part 122.63, if processed as a minor modification. Minor modifications may only:

   a) Correct typographical errors, or

   b) Require more frequent monitoring or reporting by the Permittee.

J. Severability

The provisions of this permit are severable; and if any provision of this permit or the application of any provision of this permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this permit shall not be affected.

K. Duty to Provide Information [40 CFR 122.41(h)]

The Permittees shall furnish, within a reasonable time, any information the Regional Board or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order. The Permittees shall also furnish to the Regional Board, upon request, copies of records required to be kept by this Order.

L. Twenty-four Hour Reporting [40 CFR 122.41(l)(6)][3]

1. The Permittees shall report to the Regional Board any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time any Permittee becomes aware of the circumstances. A written submission shall also be provided within five days of the time the Permittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times and, if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

2. The Regional Board may waive the required written report on a case-by-case basis.

M. Bypass [40 CFR 122.41(m)][4]

Bypass (the intentional diversion of waste streams from any portion of a treatment facility) is prohibited. The Regional Board may take enforcement action against Permittees for bypass unless:

1. Bypass was unavoidable to prevent loss of life, personal injury or severe property damage. (Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.);

[3] This provision applies to incidents where effluent limitations (numerical or narrative) as provided in this Order or in the Los Angeles County SQMP are exceeded, and which endanger public health or the environment.

[4] This provision applies to the operation and maintenance of storm water controls and BMPs as provided in this Order or in the SQMP.

2. There were no feasible alternatives to bypass, such as the use of auxiliary treatment facilities, retention of untreated waste, or maintenance during normal periods of equipment down time. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that could occur during normal periods of equipment downtime or preventive maintenance;

3. The Permittee submitted a notice at least ten days in advance of the need for a bypass to the Regional Board; or,

4. Permittees may allow a bypass to occur that does not cause effluent limitations to be exceeded, but only if it is for essential maintenance to assure efficient operation. In such a case, the above bypass conditions are not applicable. The Permittee shall submit notice of an unanticipated bypass as required.

N. Upset [40 CFR 122.41(n)][5]

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.

1. A Permittee that wishes to establish the affirmative defense of an upset in an action brought for non compliance shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:

   a) An upset occurred and that the Permittee can identify the cause(s) of the upset;

   b) The permitted facility was being properly operated by the time of the upset;

   c) The Permittee submitted notice of the upset as required; and,

   d) The Permittee complied with any remedial measures required.

2. No determination made before an action for noncompliance, such as during administrative review of claims that non-compliance was caused by an upset, is final administrative action subject to judicial review.

3. In any enforcement proceeding, the Permittee seeking to establish the occurrence of an upset has the burden of proof.

O. Property Rights [40 CFR 122.41(g)]

This Order does not convey any property rights of any sort, or any exclusive privilege.

[5] *Supra*. See footnote number 2.

P. Enforcement

1. Violation of any of the provisions of the NPDES permit or any of the provisions of this Order may subject the violator to any of the penalties described herein, or any combination thereof, at the discretion of the prosecuting authority; except that only one kind of penalties may be applied for each kind of violation. The Clean Water Act provides the following:

   a) Criminal Penalties for:

      (1) Negligent Violations:

      The CWA provides that any person who negligently violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $2,500 nor more than $25,000 per day for each violation, or by imprisonment for not more than 1 year, or both.

      (2) Knowing Violations:

      The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

      (3) Knowing Endangerment:

      The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than $250,000, or by imprisonment for not more than 15 years, or both.

      (4) False Statement:

      The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than two years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more

than four years, or by both. (See section 309(c)(4) of the Clean Water Act.)

b) Civil Penalties

The CWA provides that any person who violates a permit condition implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed $27,500 per day for each violation.

2. The CWC provides that any person who violates a waste discharge requirement provision of the CWC is subject to civil penalties of up to $5,000 per day, $10,000 per day, or $25,000 per day of violation; or when the violation involves the discharge of pollutants, is subject to civil penalties of up to $10 per gallon per day or $25 per gallon per day of violation; or some combination thereof, depending on the violation or combination violations.

Q. Need to Halt or Reduce Activity not a Defense [40 CFR 122.41(c)]

It shall not be a defense for a Permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order.

R. Rescission

Regional Board Order No. 96-054 is hereby rescinded.

S. Expiration

This Order expires on November 29, 2006. The Principal Permittee must submit a Report of Waste Discharges and a proposed Storm Water Quality Management Program in accordance with Title 23, California Code of Regulation, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

I, Dennis A. Dickerson, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on November 29, 2001.

SUBJECT: LEGAL ISSUES CONCERNING RENEWAL OF ORDER NO. 96-054, AS REFLECTED IN TENTATIVE WASTE DISCHARGE REQUIREMENTS DATED OCTOBER 11, 2001

INTRODUCTION

This memorandum addresses some of the more notable legal issues raised by commenters during the development of a revised municipal separate storm sewer system (MS4) permit for Los Angeles County. The memorandum broadly follows an outline of legal issues raised by Rutan & Tucker in a May 15, 2001, letter to Dr. Xavier Swamikannu, with additional legal issues raised by other commenters. As the permit has evolved through multiple drafts, certain legal issues have been resolved. Except as noted, resolved issues are not the subject of this memorandum.

DISCUSSION

The Regional Board staff has followed applicable law and precedent in developing the October 11, 2001 tentative draft MS4 (draft MS4 permit). Many of the legal issues raised by commenters have been the subject of prior challenges to the State Water Resources Control Board (State Board) and have been resolved in a manner consistent with the draft MS4 permit's approach. To the extent the draft MS4 permit expands upon prior permit conditions and State Board precedential orders, the permit does so based on solid findings and in conformance with the iterative approach underlying storm water permitting.

A. *THE DRAFT MS4 PERMIT'S REQUIREMENTS FOR INSPECTION, ENFORCEMENT, MONITORING, AND REPORTING FOR CERTAIN INDUSTRIAL/COMMERCIAL FACILITIES ARE CONSISTENT WITH THE CLEAN WATER ACT AND AUTHORIZED BY LAW.*

The Clean Water Act and implementing MS4 regulations afford the Regional Board adequate legal authority to establish a permit condition, in the Regional Board's judgment, that requires inspections of facilities contributing pollutants to the MS4. The Clean Water Act vests the Regional Board with substantial authority in developing MS4 permit requirements. Section 402(p)(3)(B) states that permits for MS4 discharges:

> (i) may be issued on a system- or jurisdiction-wide basis;
> (ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and
> (iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.

(33 U.S.C. § 1342(p)(3)(B)(i)-(iii).) Congress created the "maximum extent practicable" (MEP) standard and the requirement to "effectively prohibit non-stormwater discharges" into the MS4 in an effort to allow permit writers the flexibility necessary to tailor permits to the site-specific nature of MS4 discharges. (132 Cong.Rec. S16,424 (Oct. 16, 1986), *reprinted in* 2 Environment and Natural Resources Policy Division, Library of Congress, *A Legislative History of the Water Quality Act of 1987* 646 (1988); House Committee on Public Works and Transportation, Section-by-Section Analysis (100th Sess. 1987), *reprinted in* 1987 U.S.C.C.A.N. (101 Stat. 7) 5, 38-39; *see also* 55 Fed.Reg. 47990, 48,038 (Nov. 16, 1990).) The flexibility includes the ability direct permit requirements at the sources of pollution, and not simply the MS4 discharge points. (55 Fed.Reg. at 48,038 (Nov. 16, 1990).)

In developing regulations to implement the MS4 requirements, the United States Environmental Protection Agency (USEPA) identified specific program elements that a municipal discharger had to identify as part of the MS4 permit application. (40 C.F.R. § 122.26(d).) Again, these were application requirements that in many instances identified the minimal authority that the municipal discharger must demonstrate as part of an application. (See, e.g., 40 C.F.R. § 122.26(d)(2)(iv).) Nothing in the regulations erodes the Regional Board's authority to establish provisions it deems "appropriate for the control of [] pollutants" in the MS4. (33 U.S.C. § 1342(p)(3)(B)(iii); see also *Defenders of Wildlife v. Browner* (9th Cir. 1999) 191 F.3d 1159, 1166-1167 (discussing permitting authorities' authority to establish appropriate requirements in storm water permitting approach).) In fact, the USEPA contended during the rulemaking that:

> Proposed management programs will then be evaluated in the development of permit conditions. * * * EPA anticipates that storm water management programs will evolve and mature over time. The permits for discharges from municipal separate storm sewer systems will be written to reflect changing conditions that result from program development and implementation and corresponding improvements in water quality.

(55 Fed.Reg. 47990, 48052 (Nov. 16, 1990).)

As part of the MS4 application, the permittee needs to develop a proposed management program that encompasses commercial and residential areas, illicit discharges, and discharges of storm water associated with industrial activities. (40 C.F.R. § 122.26(d)(2)(iv).) For commercial and residential areas, the application must describe "structural and source control measures to reduce pollutants." (40 C.F.R. § 122.26(d)(2)(iv)(A).) For illicit discharges and discharges associated with industrial activities, the program description must include a program of inspections. (40 C.F.R. § 122.26(d)(2)(iv)(B),(C).)

As part of work under its existing permit, the permittees identified certain commercial facilities that contributed substantial pollutants to the MS4. In particular, Retail Gasoline Outlets (RGOs) and restaurants contribute significant pollutants. (Findings B.8-9 and C.5-6.) At restaurants, pretreatment records indicated that grease traps often backed up from the sanitary sewer system into the MS4. In addition, there was a prevalence of illicit discharges into the MS4 from improper washdown operations. At RGOs, the significant volumes of pollutants had the ability to introduce pollutants via non-storm water discharges to the MS4. The permittee and the Regional Board have evaluated this evidence, and Regional Board staff has determined that more in-depth inspection is appropriate at these facilities.

The draft MS4 permit's requirement for inspections is appropriate within the meaning of section 402(p)(3)(B). First, the discharger has identified the subject facilities as significant contributors to the MS4 system. To have any meaning, the reduction of pollutants to the maximum extent practicable must include responding to pollutant concerns identified as part of the permit program. The current permit regime appears to be inadequate, so additional enforcement (through inspections to identify problems) is an appropriate response. Second, the pollutants are reaching the MS4 apparently as the result of illicit discharges and/or illicit connections to the MS4 and the inadequate implementation of storm water controls. To this extent, the USEPA's Part 2 MS4 application regulation explicitly requires the permittee to identify inspection authority. Following through with an actual inspection program is necessary to effect the regulatory provisions and reduce pollutants to the maximum extent practicable. The inspection requirement is a reasonable and appropriate application of the Regional Board's permitting authority.

B. THE DEVELOPMENT PLANNING (SUSMP) REQUIREMENTS IN THE DRAFT MS4 PERMIT ARE CONSISTENT WITH APPLICABLE LAW AND LAWFULLY EXPAND BEYOND THE STATE BOARD'S ORDER WQ NO. 2000-11 (SUSMP ORDER).

1. The .75-inch standard is appropriate.

A comment argues that the .75-inch standard is not based on "quantitative data," source identification," and "source characterization, " as assertedly required by the Federal storm water regulations. The Regional Board's existing SUSMP order contains the same .75-inch standard as a measure of performance. The party submitting this comment represented petitioners in a petition to the State Board challenging the Regional Board's SUSMP order. Following two days of hearing by the State Board and extensive analysis, the State Board issued its SUSMP Order. There, the State Board upheld the .75-inch standard. This argument has no merit. The proposed action merely incorporates the already-approved standard into the proposed permit.

2. Staff gave appropriate consideration to Water Code Section 13263 and 13241.

In large part, the proposed permit would incorporate into the permit renewal provisions that have already been found to be lawful and appropriate by the State Board. The comment asserts that re-adoption of the .75-inch standard fails to address "economic considerations" and "the need for developing housing within the Region." The draft MS4 permit includes a Fact Sheet that discusses economic and housing considerations. The staff has prepared two technical reports, which address these issues. (See "Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts," Radulescu, Swamikannu, and Hammer, 2001, and "Storm Water Mitigation Requirements for Priority Planning Projects for the Protection of Water Quality," Fisher and Swamikannu, 2001.) The Regional Board staff has adequately considered factors required under Water Code section 13263, subdivision (a), and these factors will again be considered by the Regional Board in adopting the permit.

3. The Regional Board may regulate Environmentally Sensitive Areas.

Citing the State Board's observation in the SUSMP Order that Environmentally Sensitive Areas (ESAs) are already subject to extensive regulation under other regulatory programs, a comment asserts that it is inappropriate for the Regional Board to include regulation of ESAs within the proposed permit.[1] The State Board's Order does not, as the comment suggests, foreclose inclusion of ESAs as a development category. The State Board stated:

[1] Letter from Richard Montevideo (Rutan & Tucker) to Dr. Xavier Swamikannu (May 15, 2001) (Montevideo Letter), p. 7. The comment erroneously states that the State Board "invalidated the prior SUSMP." Actually, the State Board did not invalidate the entire SUSMP, but rather, determined that the record failed to support ESAs as a properly- included category within the SUSMP.

> While it may be appropriate to include more stringent controls for developments in ESAs, we also note that such developments are already subject to extensive regulation under other regulatory programs. Moreover, in light of the permit language limiting the SUSMPs to development categories, ESAs are not an appropriate category within the SUSMPs. The Regional Water Board may choose to consider the issue further when it reissues the permit.

(SUSMP Order, p. 25.)

As is clear from the foregoing passage, the State Board left the issue open for the Regional Board to develop further. The Fact Sheet for the draft MS4 permit includes a technical report prepared by staff entitled, "Mitigation of Storm Water Impacts from New Development in Environmentally Sensitive Areas," Yeager and Swamikannu, 2001, which supports inclusion of ESAs within the development categories covered by the permit. The report demonstrates the need to afford ESAs additional protection from urban runoff through the extension of SUSMPs to projects in ESAs.

4. *The term "Redevelopment" has been revised to limit its application.*

A comment suggests that the term will make SUSMP requirements applicable to unintended projects, such as replacement of existing structures, rather than expansion or installation of a new structure. The comment has been considered by staff and revised definitions of "new development" and "redevelopment" have been incorporated into the tentative permit and the glossary. The revised definitions adequately address the concerns presented by the comment.

5. *The SUSMP permissibly covers nondiscretionary projects.*

The Regional Board staff has prepared a detailed report that provides the justification for extending the SUSMP requirements to nondiscretionary projects in order to improve the quality of storm water discharges. One comment suggests that the extension of SUSMPs to nondiscretionary projects is in violation of the SUSMP Order.[2] The comment grossly distorts the State Board's SUSMP Order.

---

[2] Montevideo Letter, p. 9. The comment also implies that, through a finding concerning nondiscretionary projects, the Regional Board is somehow attempting "to modify the regulations to CEQA." (*Ibid.*) The finding language does not attempt to alter CEQA, but simply reflects a correct statement of law: if local ordinances impose conditions to create decision-making discretion in approving a project, then the subsequent project action may be discretionary within the meaning of CEQA. The finding does not require the permittees to undertake any particular course of action. However, the finding does continue by observing that the Regional Board considers all new development and specified redevelopment to be subject to the SUSMP requirements.

In the SUSMP Order, the State Board was addressing the narrow issue of whether the existing MS4 permit, for which SUSMPs were being developed, could be construed to cover nondiscretionary projects. The State Board was analyzing, in pertinent part, whether "the inclusion of non-discretionary, or ministerial, projects is inconsistent with the terms of the permit." (SUSMP Order, p. 25.) In answering this question, the State Board concluded that existing permit provisions appeared "to link the development requirements for SUSMPs to developments that receive discretionary approval." (*Id.*, p. 26.) Because the SUSMPs were an implementation tool for the existing MS4 permit, the State Board concluded that the SUSMPs "must be consistent with the permit." (*Ibid.*)

Simply put, the State Board's decision in no way limited the Regional Board's authority to include nondiscretionary projects in the revised MS4 permit. After concluding that applying SUSMPs to nondiscretionary projects exceeded the scope of the existing permit, the State Board observed that "the limitation of the SUSMPs to discretionary projects may not be sufficiently broad for an effective storm water control program." (*Ibid.*) The State Board further stated that "The Regional Water Board may consider expanding the development controls beyond [California Environmental Quality Act (CEQA)] discretionary projects when it reissues the permit." (*Ibid.*)

Staff has revisited the issue of nondiscretionary projects, and has found adequate justification to expand the SUSMP provisions to nondiscretionary projects. The draft MS4 permit is accompanied by a lengthy report identifying the need for SUSMPs to cover nondiscretionary projects. (See Storm Water Mitigation Requirements for Priority Planning Projects for the Protection of Water Quality," Fisher and Swamikannu, 2001.) The draft MS4 permit removes the "discretionary" limitation that appeared in the prior permit, and if approved by the Regional Board will extend SUSMP requirements to nondiscretionary projects.

6. *The waiver fund is now an optional component.*

A comment suggests that the proposed order fails to include information that the State Board specifically indicated was required in order to make the "waiver fund" supportable. Although finding the proposed waiver fund unworkable, the State Board specifically endorsed the potential benefits and flexibility that arise from a waiver fund or mitigation bank. (SUSMP Order, p. 27.) The mandatory fund provisions have been removed from the October 11, 2001 tentative permit, but the permittees still have the option of implementing their own mitigation banks.

7. Regional solutions have not been considered because the permittees have not proposed a regional solution in lieu of the SUSMP approach.

A comment asserts that the Regional Board has failed to adequately consider "regional solutions." To the extent the comment maintains that State Board's SUSMP Order encouraged regional solutions, the Regional Board staff concurs. Specifically, the State Board encouraged the permittees to develop such projects. However, there is no requirement that the Regional Board itself develop regional solutions. Nor is there any requirement that the Regional Board adopt proposed regional solutions, in place of SUSMP requirements. Rather, it is the burden of the permittees to develop and present workable, acceptable programs that meet or exceed the requirements of the draft MS4 permit. At this time, the permittees have not submitted any specific proposals for regional solutions or programs. The Regional Board itself maintains broad discretion to consider proposed programs in the future.

8. The draft MS4 permit lawfully covers retail gasoline outlets (RGOs) and establishes threshold criteria for the numeric design standards.

The SUSMP Order recognizes the Regional Board's authority to include RGOs in the SUSMP categories, provided there are adequate findings supporting RGOs as a category. (SUSMP Order, pp. 22-23.) Since the SUSMP Order, the Regional Board staff has extensively studied the issue of storm water from RGOs. (See "Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts," Radulescu, Swamikannu, and Hammer, 2001 (RGO Report).) The RGO Report documents the significant pollutant contribution from RGOs. (*Id.*, p. 4-5, 10-11.) In light of this substantial evidence, the draft MS4 permit includes provisions to extend SUSMP provisions to RGOs.

In extending SUSMPs to RGOs, staff analyzed and the draft MS4 permit establishes threshold criteria that trigger numeric design standards. (See RGO Report, pp. 8-9.) Staff considered the impervious surface area, the projected average daily traffic, and the projected volume of gasoline sales as criteria. (*Ibid.*) In analyzing the likelihood of the criteria to predict storm water pollutant loading, staff proposed a two-part threshold. First, the RGO must create 5,000 square feet of impervious surface. Second, the RGO must have a projected trip generation of 100 or more motor vehicles average daily traffic. (RGO Report, p. 9.) A RGO that meets both criteria would be subject to SUSMP numeric design standards. The criteria ensure that SUSMP design criteria are targeted at those RGOs that have the greatest potential to contribute pollutants to the MS4.

C. *APPLICABLE LAWS DO NOT REQUIRE THE REGIONAL BOARD TO DEVELOP A COST-BENEFIT ANALYSIS IN DEVELOPING THE PERMIT.*

The Regional Board staff considered economic considerations in developing elements of the draft MS4, but the Regional Board is not required to conduct a cost-benefit analysis. Comments concerning economic issues closely parallel arguments presented to the State Board as part of the petition that resulted in the SUSMP Order. The State Board rejected any contention that a Regional Board is required to conduct a cost-benefit analysis as part of developing an MS4 permit: "It is clear that cost should be considered in determining MEP; this does not mean that the Regional Water Board must demonstrate that the water quality benefits outweigh the economic costs." (SUSMP Order, pp. 19-20.)

The commenter has also asserted that various provisions of the Porter-Cologne Water Quality Control Act (Porter-Cologne Act) similarly require a cost-benefit analysis. Although the commenter references several provisions purportedly requiring economic consideration, the commenter relies on Water Code section 13225, subdivision (c) for the proposition that a cost-benefit analysis is required.[3] Section 13225 does not govern the issuance of this permit. Section 13225 appears in Article 2 (General Provisions Relating to Powers and Duties of Regional Board) of Chapter 4 (Regional Water Quality Control) of the Porter-Cologne Act. Section 13225 empowers the Regional Board to require local agencies to report on "technical factors involved in water quality control." (Wat. Code, § 13225.) This authority is a general authority that the Regional Board can use outside the context of a specific investigation (Wat. Code, § 13267) or waste discharge requirements (Wat. Code, § 13263) as part of the Regional Board's responsibilities to assess water quality and to develop water quality control strategies for the region. The general authority does not trump the more specific authority the Regional Board has in the context of issuing waste discharge requirements. (Wat. Code, § 13263(a).) At most, the Regional Board is required to consider economic issues.

The State Board's SUSMP Order discussion was framed in the context of the Clean Water Act and Federal regulations governing the MEP standard. As a result, the SUSMP Order provides the relevant standard for the reissuance of the Los Angeles County MS4 permit. The Regional Board staff has invited comments on cost and other economic factors and the Regional Board has received ample testimony on economic factors. Some of the cost issues are in the administrative record supporting the development of SUSMPs. As the State Board noted, the Regional Board has already considered: "the costs of pilot mitigation projects, studies from similar programs in other states, and research studies[;]" and "the Regional Water Board found that the cost to include [best management practices (BMPs)] that will meet the mitigation criteria will be one to two percent of the total development cost." (SUSMP Order, p. 21.) Costs and other economic factors have been, are, and will be a component of the Regional Board's consideration of the

[3] The commenter also cites Water Code section 13165, which is not applicable because by its own terms section 13165 only applies to the State Board.

MS4 permit; however, there is no requirement in State or Federal law to demonstrate that the water quality benefits outweigh the economic costs.

D. THE PROPOSED PERMIT DOES NOT IMPOSE UNFUNDED MANDATES UPON THE MUNICIPALITIES IN VIOLATION OF THE CALIFORNIA CONSTITUTION.

The unfunded mandate argument has been made repeatedly and uniformly rejected by the State Board. The argument first appeared in the petition and lawsuit filed by the City of Long Beach contesting the validity of the Regional Board's adoption of Order No. 96-054, the existing MS4 permit for Los Angeles County. Next, the Regional Board saw the argument raised in connection with the SUSMP order adopted by the Regional Board pursuant to the existing MS4 permit. The argument now appears in connection with this tentative permit. The commenter argues that the draft order shifts responsibility for carrying out governmental functions to local entities. One commenter, in particular, asserts that the proposed order would shift to the municipalities the burden of carrying out "a state mandate."[4]

First, and most importantly, the draft MS4 permit does not purport to implement state law, but rather implements Federal law as provided in the Clean Water Act and the MS4 regulations promulgated thereunder.[5] Second, the State Board has already addressed the issue in its decision regarding this Region's SUSMP Order. In the SUSMP Order, the State Board indicated that its earlier decisions held that the constitutional provisions cited by the commenter have no application to the adoption of national pollutant discharge elimination system (NPDES) permits. The State Board cited its decision *In re San Diego Unified Port District*, State Board Order No. 90-3, for the proposition that the constitutional state mandate requirements do not apply to NPDES permits issued by Regional Board in that the NPDES permit program is a federally mandated program, rather than state-mandated. (*Id.*, p. 14.) The Regional Board's issuance of the MS4 permit does not violate the California constitutional prohibition on unfunded mandates because the MS4 permit implements Federal law.

E. THE DRAFT MS4 PERMIT DOES NOT IMPROPERLY TRANSFER THE BURDEN OF PROOF ON TO THE PERMITTEES IN ENFORCEMENT ACTIONS.

The definition of "pollutant" in early drafts of the permit improperly characterized a permittee's responsibility for demonstrating compliance with pollutant reductions to the maximum extent practicable. Staff has removed the provision at issue.

[4] Montevideo Letter, p. 13.
[5] 40 C.F.R. § 122.26.

F. THE DRAFT MS4 PERMIT DOES NOT IMPERMISSIBLY MANDATE CONTRACTUAL PROVISIONS IN PRIVATE PARTY AGREEMENTS GOVERNING BMP MAINTENANCE.

The draft MS4 permit identifies several options for permittees to use in ensuring that structural and treatment control BMPs are properly maintained. One comment contends that the draft MS4 permit, without legal support, imposes a requirement for permittees to verify written conditions in private sale and lease agreements. First, the Regional Board has established a maintenance requirement to ensure that structural and treatment control BMPs are functioning and can carry out there intended function. There can be no argument that proper, continuing maintenance of certain BMPs is required to ensure the BMPs' effectiveness. As a result, the draft MS4 permit includes a mechanism to ensure that such maintenance occurs.

Second, the Regional Board staff concluded that effective maintenance of certain BMPs required that there be a person with clear responsibility for maintaining the structural and treatment control BMPs. In attacking this provision, the comment mischaracterizes the draft MS4 permit's approach to this issue.

The draft MS4 permit provides four distinct options for the permittees to verify there is a person with maintenance authority. The commenter solely challenges Part 4.D.9.c which allows verification, by reviewing leases or sales agreements, that someone is responsible for BMP maintenance. However, a permittee may also accept responsibility itself (Part 4.D.9.b), establish a requirement that home owners associations assume responsibility (Part 4.D.9.d), or review "[a]ny other legally enforceable agreement that assigns responsibility for the maintenance of post-construction structural or treatment control BMPs" (Part 4.D.9.e). The draft MS4 permit affords the permittees flexibility in ensuring that there is some entity with the legal responsibility for maintaining structural and treatment control BMPs. The requirement is reasonable and necessary to effect the permit requirements.

G. THE ADMINISTRATIVE PROCEDURE ACT DOES NOT CONTROL THE ISSUANCE OF THE DRAFT MS4 PERMIT.

A comment asserts that the issuance of the MS4 permit constitutes a "regulation" and is subject to the processes set forth in the Administrative Procedure Act (Govt. Code, § 11340, et seq.). This is not the case. In adopting the Administrative Procedure Act (APA), the Legislature specifically exempted the adoption of permits by the State Board and regional boards. Government Code section 11352 states very plainly: "The following actions are not subject to this chapter: *** (b) issuance, denial, or revocation of waste discharge requirements and permits pursuant to sections 13263 and 13377 of the Water Code. . . ." The adoption of the proposed NPDES permit is an action pursuant to Water Code section 13377.

The Legislature recognized that the adoption of permits is an action that applies solely to the named dischargers who are subject to the individual permit, and that the process that the boards follow to adopt a permit complies with notice, comment, and response requirements necessary under the Regional Board's permitting authority. Moreover, the State Board has previously dispensed with this same comment in its SUSMP Order.

The Regional Board tailored the permit requirements to the needs of the Los Angeles County MS4. Only the named permittees are governed by the permit, and they as well as any other interested persons have had ample opportunity to comment on the permit. The Regional Board's permitting of the MS4 is exempt from the APA.

H. THE DRAFT MS4 PERMIT'S RECEIVING WATER LIMITATIONS IS APPROPRIATE AND COMPORTS WITH APPLICABLE STATE BOARD PRECEDENTS.

The Regional Board has the authority to issue MS4 permits with receiving water limitations. While it is true that waste discharge requirements and an MS4 permit allow the discharge of storm water,[6] the discharge requirements must nonetheless meet specific requirements. The Porter-Cologne Act requires waste discharge requirements to "implement relevant water quality control plans . . . ." (Wat. Code, § 13263, subd (a).) The water quality control plan identifies the beneficial uses to be protected and specifies the "water quality objectives reasonably required" to protect those uses, along with "the need to prevent nuisance . . . ." (*Ibid.* and *id.*, § 13241.[7])

The various permit conditions and requirements to implement BMPs provide the minimum conditions for the discharge of waste in conformance with the permit. The conditions reflect the best professional judgment of Regional Board staff in reducing the Clean Water Act and the Porter-Cologne Act into effective permit conditions to protect beneficial uses. Ultimately, however, the MS4 permittee is responsible for the discharges from the MS4. Those discharges are required to conform to the permit, but are subject to the underlying restrictions of the Porter-Cologne Act. Namely, the discharges from the MS4 may not violate the water quality objectives in the water quality control plan or contribute to a condition of nuisance.

Rather than being an "open ended" standard, the receiving water and nuisance permit language is a catchall provision ensuring that the underlying restrictions of the Porter-Cologne Act remain in force. The catchall standard is driven by water quality objectives and is, therefore, not an arbitrary or unknowable standard. The limitation simply reflects standards identified in the water quality control plan. Further, the limitation acknowledges the exigencies of permitting. The Regional Board may authorize the discharge of waste meeting certain requirements, but cannot provide blanket license for discharges of waste exceeding water quality objectives or creating a

[6] Montevideo Letter, p. 17.

[7] Compare Montevideo Letter, p. 17 (seemingly limiting waste discharge requirements to those "reasonably required" without regard to the beneficial uses protected or the need to prevent nuisance).

nuisance, and the permittee is not out of compliance so long as it timely implements the appropriate control measures.

The draft MS4 permit addresses many of the concerns raised by the commenter's letter by expressly demonstrating the nexus between timely implementation of measures in the SQMP and compliance with the receiving water limitations. To this extent, the revision affords the dischargers some measure of certainty that the timely implementation of controls consistent with the permit will satisfy the permit terms. In addition, the revision continues to uphold the underlying requirements of the Clean Water Act and the Porter-Cologne Act to implement the relevant water quality objectives and to protect against nuisance.

The authority for the Regional Board to incorporate receiving water limitations in an MS4 permit is discussed at length in State Board Order WQ 98-01 (as modified by State Board Order WQ 99-05). To the extent the commenter argues that the specific receiving water limitations and discharge prohibition for nuisance do not appear in State Board Order WQ 99-05, the argument is misplaced. The language in Order WQ 99-05 demonstrates the manner for compliance with the receiving water limitation and the discharge prohibition. The language in Order WQ 99-05 makes no sense absent underlying prohibitions and receiving water limitations: requirements emanating explicitly from the Porter-Cologne Act.

Further, the State Board issued Order WQ 99-05 as a precedential decision, which is explicitly authorized by the California Administrative Procedure Act. (Govt. Code, § 11425.60.) The order and its predecessor interpret the Federal Clean Water, the Porter-Cologne Act, and decisions by the USEPA, to identify a significant legal interpretation—namely, suitable language for compliance with the applicable MS4 permit requirements. Similarly, the State Board is poised to uphold similar receiving water language for the San Diego County storm water permit. (*In re Building Industry Association of San Diego County, et al.*, Draft Order WQ 2001-__ (November 2, 2001) at fn. 8, p. 3.) As such, the Regional Board may lawfully follow the State Board's precedential orders.

I. THE DRAFT MS4 PERMIT DOES NOT ATTEMPT TO AMEND STATUTORY AND REGULATORY REQUIREMENTS UNDER CEQA AND STATE GENERAL PLAN REQUIREMENTS.

The draft MS4 permit addresses many of the concerns voiced by commenters concerning CEQA and planning reviewing. As currently proposed, Part 4.D.12 makes clear that the permittees are not to revise the CEQA Guidelines. The current draft reflects staff's intent, all along, which is to include permit requirements that ensure the permittees consider storm water issues when reviewing CEQA documents.

Similarly, Part 4.D.13 has been modified so it does not require updating of the specified general plan elements until the elements are next updated by the permittees. The intent of the CEQA and planning procedure requirements is to ensure that permittees consider storm water issues during general planning and project planning, when opportunities to mitigate storm water impacts can best be devised. Neither provision conflicts with the statutory and regulatory requirements under CEQA or general planning law.

J. *THE REGIONAL BOARD HAS AUTHORITY TO ISSUE NPDES PERMITS IN ACCORDANCE WITH THE CLEAN WATER ACT AND A MEMORANDUM OF UNDERSTANDING WITH USEPA.*

The Regional Board has the authority to issue permits consistent with the Clean Water Act, the Porter-Cologne Act, and the USEPA's program approval. "On May 14, 1973, California became the first State to be approved by USEPA to administer the NPDES permit program." (54 Fed.Reg. 40,664 (Oct. 23, 1989).) The Porter-Cologne Act at the time of program approval authorized the regional boards to issue waste discharge requirements that would serve as Federal NPDES permits. (Wat. Code, §§ 13263 (regional water boards shall issue waste discharge requirements) and 13374 (waste discharge requirements equivalent to Federal permits under the Clean Water Act).) The regional boards' authority continues. Since 1973, California's approval to implement various Clean Water Act programs has expanded, and memoranda of agreement between the State Board and USEPA Region IX have authorized the issuance of NPDES permits by the regional boards. (See, 54 Fed.Reg. 40,664-40,665 (renewing and expanding California permitting authority under the Clean Water Act in 1989); see also, NPDES Memorandum of Agreement between the U.S. Environmental Protection Agency and the California State Water Resources Control Board [hereafter USEPA/California MOA], Sep. 22, 1989, pp. 6-7.)

The Porter-Cologne Act and the USEPA/California MOA recognize the State Board as the state water pollution control agency for purposes of the Clean Water Act. The Legislature confirmed the State Board's role in the Porter-Cologne Act. (Wat. Code, § 13160). In carrying out the State Board's role, the State Board entered into the USEPA/California MOA which serves as a basis for California NPDES program approval. (USEPA/California MOA, pp. cover, 1, and 49; see also, 54 Fed.Reg. 40,664.) The USEPA/California MOA makes clear that the State Board administers California's NPDES program as meant by the Federal regulations. (See, e.g., *id.*, pp. 1 ("State Board has been authorized . . . to administer the National Pollutant Discharge Elimination System [] program in California"), 5 (state board to act "on its own as necessary to assure that the program is administered in conformance with Federal and State legislation, regulations, policy, this MOA, and the State annual 106 Workplan"), and 7 (USEPA to meet with regional board in coordination with State Board and only after notifying State Board).) In contrast, the regional boards do not administer the NPDES program, but do implement portions of the NPDES program through the issuance of permits as authorized by USEPA. (See, e.g., *id.*, p. 6 (regional board responsibility to "regulat[e] discharges subject to the NPDES and

pretreatment programs . . . in conformance with Federal and State law, regulations, and policy". and to "maintain[] an adequate public file at the appropriate Regional Board Office for each permittee").)

The Federal regulations do not divest the Regional Board of authority to issue NPDES permits. The foundation for the commenter's argument is based on false premise: that the Regional Board must be the statewide agency that administers the NPDES program. The regulations merely require a statewide agency to *administer* California's NPDES program. (40 C.F.R. § 123.22.) In California, only the State Board administers the NPDES program under the terms of the Porter-Cologne Act and the USEPA/California MOA. However, this does not deprive the regional boards of the authority to issue permits and to carry out elements of the NPDES program.[8] The USEPA/California MOA acknowledges this reality and explicitly recognizes the State Board's authority to administer the program by modifying NPDES permits initially issued by regional boards. The Regional Board has lawful authority to issue NPDES permits, including the draft MS4 permit.

K. THE REGIONAL BOARD HAS APPROPRIATELY CONSIDERED THE CONDITIONS IN THE RECEIVING WATERS OR THE TYPES OF AND SOURCES OF POLLUTANTS IN DEVELOPING THE DRAFT MS4 PERMIT.

One comment suggests that the draft MS4 permit has not taken account of the receiving water conditions and the sources of pollutants. This contention is without merit. The draft order identifies the impairing characteristics of urban runoff discharged from the MS4, and for Los Angeles County's receiving waters particularly. (Findings B.1-9.) Moreover, the permit does not impose a one-size-fits-all approach to BMPs and storm water mitigation. Instead, the permit identifies specific sources that are high priority for control and targets enhanced storm water management requirements for such facilities. (See, e.g., Findings B.8-9, and Parts 4.C, 4.D (especially Parts 4.D.3.b, 4.D.5, and 4.D.6), and 4.E.) The Regional Board staff clearly considered the receiving waters and the sources in developing the draft MS4 permit.

[8] To the extent the commenter relies on section 123.2(g)(1) of the regulations to indicate that each regional board must submit its own approval application, that reliance is misplaced. First, section 123.2(g)(1) continues by saying that "each agency must make a submission meeting the requirements of section 123.21 before EPA will begin formal review." Here, USEPA has already accepted the State Board's application, begun formal review, completed formal review, and approved California's NPDES program. Second, the regulation did not exist at the time California's approval was granted and it is unclear what effect, if any, the regulation would have on California's NPDES program. Clearly, the USEPA believes there is no effect as it has authorized literally thousands of NPDES permits issued by regional boards and entered into an updated memorandum of agreement in 1989.

L. THE DRAFT MS4 PERMIT PROVIDES A NARROWLY TAILORED REQUIREMENT FOR PUBLIC AGENCIES TO CONTROL THEIR APPLICATION OF PESTICIDES, HERBICIDES, AND FERTILIZERS THAT MAY DISCHARGE FROM THE MS4.

The limited provisions of the draft MS4 permit in respect to pesticides, herbicides, and fertilizers (collectively pesticides) are not pre-empted by other laws. First, the draft MS4 permit does not impose or require the permittees to impose any restrictions on the use of these compounds by the general public. Instead, the permit requires the permittees to comply with applicable pesticide laws and to conform the permittees' use and storage of pesticides to practices that reduce the contribution of pesticides to the MS4. (Part 5.F.4.) These storm water-protection requirements do not conflict with applicable pesticide laws.

Moreover, the Ninth Circuit has recently recognized that Clean Water Act permitting requirements, which are specific to the point of use, are not pre-empted by the Federal Insecticide, Fungicide, and Rodenticide Act. (*Headwaters, Inc. v. Talent Irrigation District* (9th Cir. 2001) 243 F.3d 526.) The MS4 permit does not frustrate the relevant pesticide laws, but instead provides specific elements for the permittees to develop and to follow when it comes to using pesticides. These elements are tailored to the permittees' manner of use and storage that will minimize pesticides reaching the MS4. As with the *Talent Irrigation District* case, the Clean Water Act requirements carried out through the MS4 permit are distinct from the pesticide laws, not in conflict with the pesticide laws, and will perform a function intended by Congress under the Clean Water Act.

M. THE ISSUANCE OF THE MS4 PERMIT IS EXEMPT FROM THE DOCUMENTARY REQUIREMENTS OF CEQA.

The Porter-Cologne Act exempts, in relevant part, the Regional Board's issuance of the MS4 permit from compliance with CEQA. Water Code section 13389 provides that regional boards shall not "be required to comply with the provisions of Chapter 3 (commencing with Section 21100) of Division 13 of the Public Resources Code prior to the adoption of any waste discharge requirements, except requirements for new sources as defined in the Federal Water Pollution Control Act. . . ." Under the Clean Water Act, "new sources" has a specialized and limited meaning. Specifically "new source" means any source, the construction of which is commenced *after the publication of proposed regulations prescribing a standard of performance* under [section 306] which will be applicable to such source, if such standard is thereafter promulgated in accordance with [section 306]." (33 U.S.C. § 1316(a)(2) (emphasis added); see also, 40 C.F.R. § 122.2.)

Clean Water Act section 306 governs the development of national standards of performance for certain categories of sources. (33 U.S.C. § 1316.) As such, Congress tailored section 306 to certain narrows sectors. The national standards of performance appear as effluent guidelines in Code of Federal Regulations, title 40, chapter 1, subchapter N (commencing with part 400). The

national performance standards must be applied to "new sources" that are to be issued an NPDES permit. (33 U.S.C § 1316(b)(1)(B).)

In crafting the CEQA exemption, the Legislature explicitly incorporated the Federal new source scheme. (Wat. Code, § 13389.) The CEQA exemption exists so long as regional board is not establishing waste discharge requirements for "new sources"—i.e., in relevant part, those new sources commenced after Federal regulations establishing a national performance standard for the type of source.

Here, the Regional Board is establishing waste discharge requirements for the MS4. The Los Angeles MS4 is not a "new source" for two reasons. First, there is no national performance standard for MS4s. Second, the Los Angeles MS4 is not new in any ordinary or legal sense. The permitting for the Los Angeles MS4 falls squarely within the exemption of Water Code section 13389. There is no "new source" with a national performance standard under section 306 of the Clean Water Act that unravels the CEQA exemption. The Regional Board does not need to comply with the documentary requirements of CEQA for the issuance of the Los Angeles County MS4 permit.

N. THE DRAFT MS4 PERMIT DOES NOT VIOLATE THE PROHIBITION SET FORTH UNDER CALIFORNIA WATER CODE SECTION 13360.

The draft MS4 permit does not violate the restriction in Water Code section 13360 on the Regional Board identifying the "design" or "particular manner" in which a permittee shall comply with a permit. Water Code section 13360 restricts the Regional Board from specifying the manner of compliance with a permit. Specifically, the Regional Board may not specify the "design" or "particular manner in which compliance may be had." (Wat. Code, § 13360.) At the same time, Water Code Section 13377 provides that, notwithstanding section 13360, the Regional Board shall issue waste discharge requirements "which apply and ensure compliance with all applicable provisions of the [Clean Water Act]."

The commenters challenge the draft MS4 on two distinct levels. First, a commenter contends that the 0.75-inch volumetric standard is a design standard. In support of this contention, the commenter indicates that Water Code section 13360 precludes the Regional Board from "dictating the cure."[9] However, the 0.75-inch volumetric standard does not dictate the cure, it identifies the minimum level of protection that will prevent the harm, while affording the discharger a full range of options to meet the 0.75-inch standard. The *Tahoe Sierra* court explicitly permitted such an approach.

[9] Montevideo Letter, p. 22 (citing *Tahoe Sierra Preservation Council v. State Water Resources Control Board* (1989) 210 Cal.App.3d 1421, 1438).

In *Tahoe Sierra*, the Third Appellate District upheld a water quality control plan for the Lake Tahoe basin that placed impervious surface coverage limitations on land surrounding the lake. The plaintiffs challenged the plan on numerous grounds, including that the coverage standard created an impermissible design restriction under Water Code section 13360. The court quickly dispensed with the argument by noting that "The Plan sets a discharge prohibition – no greater discharge than would occur if the coverage standard were met." (*Tahoe Sierra, supra*, 210 Cal.App.3d at 1438.) The Court further observed that "Section 13360 is a shield against unwarranted interference with the ingenuity of the party subject to a waste discharge requirement; it is not a sword precluding regulation of discharges of pollutants." (*Ibid.*). Like the coverage standard in *Tahoe Sierra*, the 0.75-inch standard leaves to the dischargers the ingenuity in determining the design and best way to meet the standard.

The second challenge under Water Code section 13360 is an open-ended statement to the effect that any provision of the draft MS4 permit requiring the permittee to do specific things (e.g., amend ordinances, adopt or approve certain business assistance programs, or incorporate certain lease language) impermissibly specifies a "particular manner."[10] First, this contention fails for the same reason as the commenter's design argument. The permittee is left to its own ingenuity in terms of how it remedies the identified problem or carries out the activity.

Second, inasmuch as the permit seeks to implement Clean Water Act requirements, it does not violate Section 13360 with respect to specified programs that must be implemented by the municipalities to carry out Clean Water Act MS4 requirements. Many of the elements evolved out of iterative BMP identification and evaluation and recommendations identified by the permittee in its efforts to reduce pollutants to the maximum extent practicable. Reliance on BMPs requires specification of those practices that are relied upon to reduce pollution. It would be illogical to not allow the Regional Board to incorporate those recommendations into subsequent permit revisions, especially if the permittee retains final control in how the objective is achieved and the particular manner of carrying out the requirement. The program elements do not impermissibly identify a particular manner of compliance with a Regional Board order.

O. THE PERMIT DOES NOT REQUIRE A FINDING OF CONSISTENCY WITH THE AREA-WIDE WASTE TREATMENT MANAGEMENT PLAN.

Section 208 of the Federal Clean Water Act does not limit or otherwise affect the issuance of this NPDES permit. The Section 208 planning process, which has largely been subsumed by other planning processes in the development of the Basin Plan, is primarily directed at plans to identify, coordinate, and improve the needs and facilities for publicly owned treatment works and nonpoint sources. (33 U.S.C. § 1288(b); see also Rodgers, Environmental Law: Air and Water (1986) §§ 4.9, 4.21 ("EPA administered the Section 303(e) [statewide planning] provisions with gusto, effectively using them to replace Section 208 areawide planning"),

[10] Montevideo Letter, p. 22.

pp. 129, 313-314.) In addition, to the extent they are approved, the Section 208 plans are incorporated into statewide planning provisions under Section 303. (2 Rodgers, *supra*, §§ 4.9, 4.21, pp. 129, 314 (noting that a common problem is that the regional planning agencies have never generated Section 208 plans or all the elements thereof).)

To the extent the Section 208 planning process may have a residual effect on this NPDES permit, the effect would only be if the draft MS4 permit was somehow in conflict with an approved Section 208 plan. The Regional Board staff is not aware of any such conflict and the discharger has not identified how the NPDES permit could be in conflict with an approved Section 208 plan, let alone indicated how it conflicts. The Regional Board staff developed the tentative permit by implementing the previously adopted state and Federal laws and regulations designed to protect water quality. There is no need for a specific finding on consistency with a Section 208 plan.

P. THE MS4 PERMIT CONSTITUTES IMPERMISSIBLE LAND USE PLANNING BY A STATE AGENCY.

The draft MS4 permit does not impermissibly infringe on the permittees' ability to carry out their land use planning authority and responsibilities. The Regional Board staff concedes that both the Clean Water Act and California law anticipate that local land use planning and zoning will be carried out on the municipal level. (See 33 U.S.C. § 1251(b) (preserving state's primary responsibilities and rights to plan development and use of land resources).) However, the Regional Board staff strongly disagrees that the draft MS4 permit amounts to land use planning. Like the ability of USEPA to approve total maximum daily loads (TMDLs) and to establish the regulatory framework in which subsequent land use decisions will be made, the draft MS4 is an appropriate regulatory function. (See, e.g., *Pronsolino v. Marcus* (N.D. Cal. 2000) 91 F.Supp.2d 1337, 1355-1356.)

The draft MS4 places no constraints on what land uses a municipality may authorize within its jurisdiction. Further, the draft MS4 permit does not dictate how a municipality may zone its jurisdiction. Simply put, there is no land use planning or zoning done by the Regional Board through the draft MS4 permit. At most, the draft MS4 permit could be construed to place certain conditions on various types of land uses (e.g., the provision that municipalities require residential developments exceeding ten units to undertake certain mitigation measures or require developments on hillsides to undertake certain mitigation measures (Draft MS4 permit Part 4.D.5)). These conditions were developed by the Regional Board and permittees to reduce pollutants from the MS4 to the maximum extent practicable. These provisions do not invade the fundamental, municipal choice to make land use decisions and zone accordingly. As with many other Federal or State permitting and regulatory functions, the draft MS4 simply provides contours around which the municipalities must carry out their land use and zoning responsibility.

Q. THE REGIONAL BOARD MAY IMPOSE PERMIT CONDITIONS TO LIMIT PEAK FLOWS.

The Clean Water Act and the Porter-Cologne Act allow the Regional Board to include peak flow limitations for storm water entering natural channels. Contrary to a commenter's arguments, Clean Water Act case law has not uniformly "found the definition of 'pollutant' to not include the release of water which causes downstream erosion."[11] First, the commenter's citation to *National Wildlife Fed'n v. Gorsuch* (D.C. Cir. 1982) 693 F.2d 156 is inapposite. *Gorsuch* involved the issue of whether USEPA's decision not to require an NPDES permit for all dams was reasonable. The D.C. Circuit upheld USEPA's determination because it found that there was no addition of pollutants by the point source, and hence, no need for an NPDES permit. The *Gorsuch* decision simply does not apply in the MS4 context for which an NPDES permit is clearly required under the Clean Water Act. (See 33 U.S.C. § 1342(p).)

Unlike dams, which simply confine water in its natural course and then release it, an MS4 collects storm water, which contains pollutants, from throughout a jurisdiction and discharges the storm water from point sources into waters of the United States. Often the storm water discharged from the MS4 is discharged to a location that is not the natural drainage point for urban runoff. In this respect, the MS4 is distinguishable from *Gorsuch* and its progeny and is more akin to the analysis adopted by the Second Circuit in *Catskill Mountains Chapter of Trout Unlimited v. City of New York* (2d Cir. Oct. 23, 2001) ___ F.3d ___, 2001 WL 1267391, *9 (finding the addition of pollutants requiring an NPDES permit occurs when a tunnel conveys water and sediments from one water source to another). In conjunction with the express permitting requirements in the act, it is clear the NPDES permit is required and that there is an addition of pollutants from the MS4 that requires heightened regulation.

Moreover, the State Board has dismissed any contention that it is unlawful to establish peak flow controls designed to minimize erosion. Erosion limitations underlie many of the SUSMP provisions upheld by the State Board in 2000. (See SUSMP Order, p. 4.) Further, in a draft order on the San Diego County MS4, the State Board soundly rejects the argument that erosion cannot be the subject of an MS4 permit. The State Board states "It is absurd to contend that the [San Diego County MS4] permit should have ignored [the erosion] impact from urban runoff." (*In re Building Industry Association of San Diego County, et al.*, Draft Order WQ 2001-__ (November 2, 2001) at fn. 8, p. 3.)

The fundamental point that undermines the comment is that, while erosion may not trigger an NPDES requirement in certain circumstances, once an NPDES permit is required the NPDES permit provisions and California waste discharge requirements must protect beneficial uses. (33 U.S.C. § 1342(a); Wat. Code, § 13263, subd. (a).) The preamble to the USEPA Phase II storm water regulations states that for post-development, "[the] consideration of the increased flow

[11] Letter from Rufus Young (Burke, Williams & Sorensen) to Dennis Dickerson (Jul. 19, 2001), p. 14.

rate, velocity, and energy of storm water discharges must be taken into consideration in order to reduce the discharge of pollutants, to meet water quality standards, and to prevent the degradation of receiving streams." (64 Fed.Reg. 68722, 68761 (Dec. 8, 1999).) Further, the Regional Board staff has identified several studies that demonstrate the nexus between pollutant discharges and increased flow from increases in impervious surface area. The draft MS4 permit has been crafted to reduce these increased flows in natural channels to protect aquatic ecosystems and other beneficial uses within the receiving waters. Peak flow limitations are an appropriate and lawful requirement of the MS4 permit.

R. *THE REGIONAL BOARD CAN REISSUE THE NPDES PERMIT EVEN IF THE ORIGINAL PERMIT APPLICATION DID NOT CONTAIN ALL THE ELEMENTS REQUIRED IN SUBSEQUENTLY PROMULGATED APPLICATION REQUIREMENTS.*

The Regional Board may reissue the MS4 permit even if the permittees have not fulfilled a Part 1 application requirement that arose subsequent to the issuance of the permittees' initial permit. The Regional Board issued its first MS4 permit to Los Angeles County in the summer of 1990. The Phase I storm water regulations identifying Part 1 application requirements for MS4s did not become effective until December 17, 1990. (55 Fed.Reg. 47990 (Nov. 16, 1990).) As a result, the application materials that resulted in the 1990 permit issuance may not have strictly conformed with the subsequently promulgated application requirements of Code of Regulations, title 40, section 122.26(d)(1). Further, there was no requirement for the permittees to resubmit a permit application upon promulgation of the regulation because the Regional Board had already issued a permit for the subject MS4 discharges. (40 C.F.R. § 122.26(e) ("[a]ny operator of a point source required to obtain a permit under [section 122.26] that *does not have an effective* NPDES permit authorizing discharges from its storm water outfalls shall submit an application in accordance with the following deadlines . . . .")

Before the Regional Board reissued the MS4 permit in 1996, Regional Board staff reviewed the reapplication and determined that it was consistent with USEPA's Reapplication Policy, which was then in draft form. The published Reapplication Policy (61 Fed.Reg. 41698 (Aug. 9, 1996)) indicates that the MS4 reapplication for a subsequent five-year permit term should contain certain basic information, information for proposed changes, and proposed improvements to the storm water management program and monitoring program. (*Id.* at 41698-41699.) The crux of the reapplication policy is on (1) developing information that will result in an improved storm water management program, and (2) obtaining information for the permitting authority that will assist it in determining what program elements need to be revised in light of changes that have occurred since initial permit development. (*Id.* at 41698.)

The draft MS4 permit includes requirements for additional information development. The Part 1 application requirements are a component of the additional information development, but the

post-permit promulgation of application requirements does not bar the reissuance of an updated NPDES permit for the Los Angeles County MS4.

CONCLUSION

The Regional Board staff has crafted a draft MS4 permit that is grounded in applicable laws, regulations, and State Board precedents. Where appropriate, the staff has revised the draft MS4 permit to incorporate the legally necessary changes proposed by the commenters. In other respects, the staff has demonstrated a need for the permit requirements, and the Regional Board has the requisite legal authority to require the permit conditions.

WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES

Findings

The California Regional Water Quality Control Board, Los Angeles Region (hereinafter referred to as the Regional Board), finds:

Existing Permit and Report of Waste Discharge

1. The County of Los Angeles and 85 incorporated cities within the County of Los Angeles (see Attachment A, List of Permittees), hereinafter referred to as Permittees, discharge or contribute to discharges of storm water and urban runoff from municipal separate storm sewer systems (MS4s), also called storm drain systems, and water courses within the County of Los Angeles into receiving waters of the Los Angeles Basin under countywide waste discharge requirements contained in Order No. 90-079 adopted by this Regional Board on June 18, 1990. That Order also serves as a National Pollutant Discharge Elimination System (NPDES) permit (CA0061654).

2. On December 21, 1994, the Permittees submitted a Report of Waste Discharge (ROWD) as an application for re-issuance of waste discharge requirements and an NPDES permit.

Nature of Discharges and Sources of Pollutants

3. The discharges consist of surface runoff (non-storm water and storm water) from various land uses in all the hydrologic drainage basins that discharge into water bodies in Los Angeles County. The quality and quantity of these discharges vary considerably and are affected by the hydrology, geology, and land use characteristics of the watersheds; seasonal weather patterns; and frequency and duration of storm events.

4. Studies have shown that storm water runoff from urban and industrial areas typically contains the same general types of pollutants that are often found in wastewater in industrial discharges. Pollutants commonly found in storm water runoff include heavy metals, pesticides, herbicides, and synthetic organic compounds such as fuels, waste oils, solvents, lubricants, and grease. [References: *'Surface Runoff to the Southern California Bight'* and, *'Characteristics of Effluents from Large Municipal Wastewater Treatment Facilities in 1990*

and 1991,' SCCWRP Annual Report 1990-1991 and 1991-1992 (1993); Pitt and Field, *Hazardous and Toxic Wastes Associated with Urban Storm Water Runoff*, In Proceedings of the Sixteenth Annual RREL Hazardous Waste Reduction Symposium, Document No. EPA 600-9-90-037 (1990); *Storm Runoff in Los Angeles and Ventura Counties, Final Report*, California Regional Water Quality Control Board, Los Angeles Region (1988).]

These compounds can have damaging effects on both human health and aquatic ecosystems. In addition to pollutants, the high volumes of storm water discharged from MS4s in areas of rapid urbanization have had significant impacts on aquatic ecosystems due to physical modifications such as bank erosion and widening of channels. [References: *Fundamentals of Urban Storm Water Management*, Terrene Institute and USEPA, (1994); *Guidance Manual for the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems*, USEPA, Document No. EPA 833-B-92-002 (1992).]

5. Water Quality Assessments conducted by the Regional Board identified impairment of a number of water bodies in Los Angeles County. [Reference: *Water Quality Assessment 1996*, Regional Water Quality Control Board, Los Angeles Region (1996).] The beneficial uses of certain water bodies specifically identified in these assessments are either impaired or threatened to be impaired. Pollutants found causing impairment include: heavy metals, coliform, enteric viruses, pesticides, nutrients, polycyclic aromatic hydrocarbons, polychlorinated biphenyls, organic solvents, sediments, trash, debris, algae, scum, and odor.

6. An epidemiological study conducted during the summer of 1995 for the Santa Monica Bay Restoration Project (SMBRP) demonstrated that there is an increased risk of acute illnesses caused by swimming near flowing storm drain outlets in Santa Monica Bay. [Reference: *An Epidemiological Study of Possible Adverse Health Effects of Swimming in Santa Monica Bay*, SMBRP (1996).]

   Previous investigations conducted for the SMBRP showed pathogens were detected in summer runoff at four storm drain locations. [References: *Pathogens and Indicators in Storm Drains within the Santa Monica Bay Watershed*, SMBRP (1992); *Storm Drains as a Source of Surf Zone Bacterial Indicators and Human Enteric Viruses to Santa Monica Bay*, SMBRP (1991), *An Assessment of Inputs of Fecal Indicator Organisms and Human Enteric Viruses from Two Santa Monica Storm Drains*, SMBRP (1990).]

   Possible sources of pathogen contamination include pet and livestock feces, illicit sewer connections to the storm drains, leaking sewer lines, malfunctioning septic systems, and improper waste disposal by recreational vehicles, campers or transients. Additional potential sources of human pathogens in nearshore waters include sewage overflows into storm drains, small boats waste discharges, and bathers themselves.

7. The Regional Board therefore considers storm water/urban runoff discharges to be significant sources of pollutants that may be causing, threatening to cause, or contributing

to the impairment of the water quality and beneficial uses of the receiving water bodies in Los Angeles County, and, as such, need to be regulated.

Coverage and Exemptions

8. The requirements in this Order cover all areas within the boundaries of the cities as well as unincorporated areas in Los Angeles County within the jurisdiction of the Los Angeles Regional Board except the City of Avalon. The Permittees serve a population of about 11.4 million [Reference: *1990 Census of Population and Housing,* Bureau of the Census, U.S. Department of Commerce (1992)] in an area of approximately 3,100 square miles. Attachment B shows the map of the permitted area in Los Angeles County.

9. Federal, state, regional or local entities within the Permittees' boundaries or in jurisdictions outside the County of Los Angeles, and not currently named in this Order, may operate storm drain facilities and/or discharge storm water to storm drains and watercourses covered by this Order. The Permittees may lack legal jurisdiction over these entities under state and federal constitutions. Consequently, the Regional Board recognizes that the Permittees will not be held responsible for such facilities and/or discharges.

   For those entities within the Permittees' boundaries, the Regional Board may consider designating them as Permittees under this Order or issuing separate NPDES permits consistent with this Order. The California Department of Transportation (Caltrans), currently a Co-Permittee to Order No. 90-079, submitted an ROWD on July 3, 1995, for separate waste discharge requirements for its discharges in the County of Los Angeles and the County of Ventura. The waste discharge requirements to be issued to Caltrans will be consistent with this Order.

10. Sources of discharges into receiving waters in the County of Los Angeles but in jurisdictions outside its boundary include the following:

    a. About 34 square miles of unincorporated area in Ventura County drain into Malibu Creek, thence to Santa Monica Bay,

    b. About 9 square miles of the City of Thousand Oaks also drain into Malibu Creek, thence to Santa Monica Bay, and

    c. About 86 square miles of area in Orange County drain into Coyote Creek, thence into the San Gabriel River Watershed in the County of Los Angeles.

    The Regional Board will insure that storm water management programs for the areas in Ventura County and the City of Thousand Oaks that drain into Santa Monica Bay are consistent with the requirements of this Order. The Regional Board will coordinate with the Santa Ana Regional Board so that storm water management programs for the areas in Orange County that drain into Coyote Creek are consistent with the requirements of this

Order.

11. The City of Santa Clarita and some unincorporated areas of Los Angeles County drain into the Santa Clara River Watershed, a portion of which is located in Ventura County. Discharges of municipal storm water in Ventura County are regulated under NPDES permit CAS063339 (Order No. 94-082). Successful management of the entire watershed needs coordination among the City of Santa Clarita, the County of Los Angeles, and Ventura County in developing and implementing the storm water management plan for the watershed.

12. Certain pollutants present in storm water and/or urban runoff may be contributed by activities which the Permittees cannot control. Examples of such pollutants and their respective sources are: polycyclic aromatic hydrocarbons which are products of internal combustion engine operation, nitrates from atmospheric deposition, lead from fuels, copper from brake pad wear, zinc from tire wear, and natural-occurring minerals from local geology. However, Permittees can implement measures to minimize entry of these pollutants into storm water.

Bases of Waste Discharge Requirements

Federal Statutes and Regulations

13. Section 402(p) of the federal Clean Water Act (CWA), as amended by the Water Quality Act of 1987, requires NPDES permits for storm water discharges from MS4s to waters of the United States. Section 402(p)(3)(B) requires that permits for MS4s: ..... "(i) may be issued on a system- or jurisdiction-wide basis; (ii) shall include a requirement to effectively prohibit non-storm water discharges into the storm sewers; and (iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."

14. On November 16, 1990, pursuant to Section 402(p) of the CWA, the USEPA promulgated 40 Code of Federal Regulations (CFR) Part 122.26 which established requirements for storm water discharges under the NPDES program. The regulations recognize that certain categories of non-storm water discharges may not be prohibited if they have been determined not to be significant sources of pollutants.

15. Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point pollution impacting or threatening coastal water quality. As required by CZARA, USEPA issued *Guidance Specifying Management Measures For Sources of Non-point Pollution In Coastal Waters*, Document No. EPA-840-B-92-002 (1993). The guidance focuses on five major categories of non-point sources that impair or threaten coastal waters

nationally: (a) agricultural runoff; (b) silvicultural runoff; (c) urban runoff (including developing and developed areas); (d) marinas and recreational boating; and (e) hydromodification. This Order includes management measures for pollution from urban runoff. Thus, it provides the functional equivalence for compliance with CZARA in this area.

State Statutes and Permits

16. To facilitate compliance with federal regulations, in 1992 the State Water Resources Control Board (State Board) issued two statewide general NPDES permits: one for storm water from industrial sites [NPDES No. CAS000001, General Industrial Activities Storm Water Permit (GIASP)] and the other for storm water from construction sites [NPDES No. CAS000002, General Construction Activity Storm Water Permit (GCASP)]. "Industrial Activities," as defined in 40 CFR § 122.26(b)(14)(i) through (xi), and construction activities with a disturbed area of five acres or more are required to obtain individual NPDES permits for storm water discharges, or be covered by these statewide general permits by completing and filing a Notice of Intent with the State Board.

17. California Water Code (CWC) Section 13263(a) requires that waste discharge requirements issued by Regional Boards shall implement any relevant water quality control plans that have been adopted; shall take into consideration the beneficial uses to be protected and the water quality objectives reasonably required for that purpose; other waste discharges; and, the need to prevent nuisance.

Regional Board Water Quality Control Plans and Policies

18. The Regional Board adopted an updated Water Quality Control Plan (Basin Plan) for the Los Angeles Region on June 13, 1994, *'Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties*, (1994). 'The Basin Plan, which is incorporated in this Order by reference, specifies the beneficial uses of receiving waters and contains both narrative and numerical water quality objectives for the receiving waters in the County of Los Angeles.

19. This Regional Board has implemented a Watershed Management Approach to address water quality protection in the region. The objective of the Watershed Management Approach is to provide a comprehensive and integrated strategy towards water resource protection, enhancement, and restoration while balancing economic and environmental impacts within a hydrologically defined drainage basin or watershed. It emphasizes cooperative relationships between regulatory agencies, the regulated community, environmental groups, and other stakeholders in the watershed to achieve the greatest environmental improvements with the resources available.

20. To implement the Watershed Management Approach, as well as facilitate compliance with this Order, the County of Los Angeles is divided into six Watershed Management Areas (WMAs) as follows:

a. Malibu Creek and Rural Santa Monica Bay WMA
b. Ballona Creek and Urban Santa Monica Bay WMA
c. Los Angeles River WMA
d. San Gabriel River WMA
e. Dominguez Channel/Los Angeles Harbor WMA
f. Santa Clara River WMA

Attachment A, shows the list of Permittees under each Watershed Management Area.

Other Bases

21. The SMBRP developed a Bay Restoration Plan to serve as a blueprint for Santa Monica Bay's recovery, *'The Santa Monica Bay Restoration Plan*, SMBRP (1994).' The Plan recommends actions that the Regional Board should integrate into the storm water permit and provides guidance to the Regional Board for the development of a strong, environmentally sound storm water program.

22. The Regional Board is the enforcing authority in the Los Angeles region for the two statewide general permits, described in Finding 16, which regulate discharges from industrial facilities and construction sites, and all NPDES storm water and non-storm water permits issued by the Regional Board. These industrial and construction sites are also regulated under local laws and regulations.

23. The ROWD submitted by the Permittees includes:

a. Summary of Best Management Practices (BMP) implemented;
b. Storm water management plans for the six WMAs;
c. Countywide evaluation of existing storm water quality data; and
d. Monitoring Program.

The ROWD served as partial basis for the development of the Storm Water Management Program (SWMP) requirements of this Order.

24. A USEPA review of activities conducted by the automotive service sector indicates that automotive service facilities present a significant potential for the discharge of pollutants into storm water. [Reference: *Storm Water Discharges Potentially Addressed by Phase II of the NPDES, Report to Congress*, USEPA (1995).]

25. Studies indicate that facilities with paved surfaces subject to frequent motor vehicular traffic (such as parking lots and retail gasoline stations), or facilities which perform vehicle repair, maintenance, or fueling (such as retail gasoline outlets with service bays) are potential sources of pollutants of concern in storm water. [References: Pitt *et al.*, *Urban Storm Water Toxic Pollutants: Assessment, Sources, and Treatability*, Water Environment Res., 67, 260 (1995); *Results of Retail Gas Outlet and Commercial Parking Lot Storm Water*

Runoff Study, Western States Petroleum Association and American Petroleum Institute, (1994); Action Plan Demonstration Project, Demonstration of Gasoline Fueling Station Best Management Practices, Final Report, County of Sacramento (1993).]

Studies also suggest that the implementation of best management practices can reduce storm water pollutants from these types of facilities. [References: *Storm Water Best Management Practices for Retail Gasoline Outlets*, Western States Petroleum Association, (1996); and *Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters*, Document No. EPA 840-B-92-002 (1992).]

26. A review of industrial waste/pretreatment records in Los Angeles County on illicit discharges indicate that automotive service facilities and food service facilities sometimes discharge polluted washwaters to the MS4. The pollutants of concern in such washwaters include food waste, oil and grease, and toxic chemicals. Other storm water/industrial waste programs in California have reported similar observations.

Objectives and Requirements of this Order

27. The objective of this Order is to protect the beneficial uses of receiving waters in Los Angeles County. To meet this objective, this Order requires implementation of BMPs intended to reduce pollutants in storm water and urban runoff such that ultimately their discharge will neither cause violations of water quality objectives nor create conditions of nuisance in receiving waters.

28. The Regional Board recognizes the challenges unique to regulating storm water discharges through municipal storm sewer systems, including intermittent and variable nature of discharges, difficulties in monitoring, and limited physical control over the discharge, and that it will require adequate time to implement and evaluate the effectiveness of best management practices required in this Order and to determine whether they will adequately protect the receiving water.

29. This Order designates the County of Los Angeles as the Principal Permittee. The Principal Permittee will coordinate and facilitate activities necessary to comply with the requirements of this Order, but is not responsible for insuring compliance of any individual permittee.

30. Each Permittee is only responsible for the implementation of the appropriate storm water management program developed pursuant to the requirements of this Order, and not for the implementation of the provisions applicable to the Principal Permittee or other Permittees. A Permittee is required to comply only with the requirements of this Order applicable to discharges which originate from places within its boundaries over which it has authority to enforce the requirements of this Order.

31. In the ROWD, the Permittees proposed the formation of a countywide Executive Advisory Committee (EAC), and a Watershed Management Committee (WMC) for each of the WMAs.

The EAC and the six WMCs are now functional.

The EAC's main role is to facilitate programs within each watershed and to enhance consistency among all of the programs. Similar to the Principal Permittee, the EAC is not responsible for insuring compliance of any individual permittee with the requirements of this Order.

The WMCs, as required in this Order, will provide the leadership framework to facilitate development of the Watershed Management Area Plans and foster cooperation among Permittees.

32. The USEPA issued a guidance manual for submittal of a Part II application for MS4s. [Reference: *Guidance Manual for the Preparation of Part of the NPDES Applications for Discharges from Municipal Separate Storm Sewer Systems*, EPA Document No. 833-B-92-002 (1992).] The manual describes the components of a municipal storm water program that will meet the requirements of 40 CFR Part 122.26.

33. The SWMP required in this Order builds upon the foundation established in Order No. 90-079, consists of the components recommended in the USEPA guidance manual, and was developed with the cooperation of representatives from the regulated community and environmental groups. The SWMP includes requirements with compliance dates to provide specificity and certainty of expectations. It also includes provisions that promote customized initiatives, both on a countywide and watershed basis, in developing and implementing cost-effective measures to minimize discharge of pollutants to the receiving water. The various components of the SWMP, taken as a whole rather than individually, are expected to reduce pollutants in storm water and urban runoff to the maximum extent practicable.

34. The main focus of the SWMP is pollution prevention through education, public outreach, planning, and implementation of BMPs. Successful implementation of the provisions of the SWMP will require cooperation and coordination of all public agencies in each Permittees' organization, among Permittees, and the regulated community. To minimize cost, the Permittees are encouraged to utilize their existing organizational framework to implement the various activities required in this Order.

35. As required in Order No. 90-079 and pursuant to 40 CFR Part 122.26(d)(2)(i), this Order requires Permittees to demonstrate that they possess the legal authority to implement and enforce the storm water programs within their respective jurisdictions. If Permittees decide that the legal authority will be through ordinances, Permittees are encouraged to develop a model ordinance to minimize cost and promote countywide consistency.

The Permittees are encouraged to enter into interagency or interjurisdictional agreements or other means to control the discharge of pollutants from one portion of the MS4 to another portion of the MS4.

36. Order 90-079 required the development and implementation of BMPs to minimize pollutants in storm water. In 1993, the Regional Board approved 13 baseline BMPs to facilitate the implementation of countywide minimum requirements, encourage countywide consistency, and provide a minimum measure of progress. These BMPs were selected from Permittees' MS4 programs. Twelve of these 13 BMPs have been incorporated into this Order: a) catch basin labeling; b) public illicit discharges reporting; c) construction storm water ordinance; d) public education and outreach; e) catch basin cleanout; f) roadside trash receptacles; g) street sweeping; h) proper disposal of litter, lawn clippings, pet feces; i) removal of dirt, rubbish and debris at homes and businesses; j) oil, glass, and plastics recycling; k) proper disposal of household hazardous wastes; and l) proper water use and conservation. The thirteenth BMP (inspections of vehicle repair shops, vehicle body shops, vehicle parts and accessories, gasoline stations, and restaurants) has been changed to educational site visits.

37. Each Permittee owns and operates facilities within its jurisdiction that may impact storm water quality. Each Permittee, under this Order is required to implement BMPs to reduce pollutant discharges from these activities and/or facilities.

38. This Order provides the flexibility for the Permittees to petition the Regional Board Executive Officer to substitute a BMP or requirement under the SWMP with an alternative BMP, if they can provide information and documentation on the effectiveness of the alternative, equal to or greater than the prescribed BMP in meeting the objectives of this Order.

39. This order contemplates that the Permittees are responsible for considering potential stormwater impacts when making planning decisions. However, neither this order nor any of its requirements are intended to restrict or control local land use decision-making authority.

Others

40. The Regional Board will provide the Principal Permittee with an updated list of NPDES permits on a quarterly basis through the Regional Board's electronic bulletin board which may be accessed at (213) 266-7663, or other available methods, for use by each Permittee to identify permitted sources of active non-storm water discharges into the MS4.

41. This action to adopt and issue waste discharge requirements and a NPDES permit is exempt from the provisions of the California Environmental Quality Act; Chapter 3 (commencing with Section 21100) of Division 13 of the Public Resources Code in accordance with Section 13389 of the California Water Code.

Public Process

42. The Regional Board will notify interested agencies and interested persons of the availability of reports, plans, and/or schedules of implementation submitted pursuant to the requirements of this Order. The Regional Board will consider comments prior to taking any

action on the submitted documents as provided for in this Order.

43. This Order may be modified or alternatively revoked or reissued prior to its expiration date, in accordance with the procedural requirements of the federal NPDES program, and the California Water Code and Title 23 of the California Code of Regulations for the issuance of waste discharge requirements.

44. The Regional Board staff solicited comments on early drafts of this Order from Permittees, interested agencies, and interested persons. In addition, Regional Board staff met with representatives from Permittees, business associations, environmental groups, and other interested persons to discuss permit requirements and attempt to resolve critical issues. Regional Board staff also solicited feedback from the SMBRP Oversight Committee on early drafts of the Order, attended Permittee watershed meetings, made presentations to government officials, and conducted and/or participated in public workshops to hear concerns.

The Regional Board has notified Permittees, interested agencies, and interested persons of its intent to prescribe waste discharge requirements and an MS4 NPDES permit for storm water discharges, and has provided them with an opportunity for a public hearing and an opportunity to submit their written views and recommendations.

The Board, in a public hearing, heard and considered all comments pertaining to the tentative waste discharge requirements. This order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit pursuant to Section 402 of the federal Clean Water Act, or amendments thereto, and shall take effect at the end of 15 days from the date of its adoption, provided the Regional Administrator of the U.S. Environmental Protection Agency, Region IX, has no objections.

Requirements

IT IS HEREBY ORDERED that the County of Los Angeles and the Cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Cañada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Long Beach, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and regulations and guidelines adopted thereunder, shall comply with the following for the areas within their boundaries and subject to their regulatory jurisdiction, in the County of Los Angeles.

Part 1. DISCHARGE PROHIBITIONS AND RECEIVING WATER LIMITATIONS

I. Discharge Prohibition

Each Permittee shall, within its jurisdiction, effectively prohibit non-storm water discharges into the municipal separate storm sewer system (MS4) and watercourses, except where such discharges are:

A. In compliance with a separate individual or general NPDES permit; or

B. Identified and in compliance with Part 2.II.C (Non-storm Water Discharges), of this Order; or

C. Discharges originating from federal, state or other facilities which the Permittee is pre-empted from regulating.

Compliance with this Order through timely development and implementation of programs described herein shall constitute compliance with this prohibition.

II. Receiving Water Limitations

The water quality objectives and water quality standards applicable to receiving waters in Los Angeles County contained in the Basin Plan, '*Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties*, California Regional Water Quality Control Board, Los Angeles Region, Monterey Park (1994),' and amendments thereto, shall serve as receiving water limitations for discharges covered under this Order. It is the purpose of this Order that the discharge of storm water, or non-storm water, from a municipal separate storm sewer system (MS4) for which a Permittee is responsible not cause nuisance, continuing or recurring impairment of beneficial uses, or exceedances of water quality objectives in the receiving waters.

Timely and complete implementation by a Permittee of the storm water management programs prescribed in this Order shall satisfy the requirements of this section and constitute compliance with receiving water limitations. However, if the Integrated Receiving Waters Impact Report required in this Order (Part 2.VII.D.) and/or other available information show that discharges authorized under this Order still cause or contribute to the impairment of the beneficial uses or exceedances of water quality objectives, Permittees, as part of their Report of Waste Discharge for the renewal of this Order, shall submit revised storm water management programs that are watershed-specific and will increase the likelihood of preventing future exceedances of water quality objectives.

Part 2. STORM WATER MANAGEMENT PROGRAM REQUIREMENTS

The objective of the Storm Water Management Program requirements prescribed in this Order is to reduce pollutants in discharges to the maximum extent practicable in order to attain the water quality objective and protect the beneficial uses of receiving waters in Los Angeles County. Each Permittee shall implement within its jurisdiction the Storm Water Management Program requirements of this Order and those of the Countywide Storm Water Management Plan (CSWMP) or Watershed Management Area Plan (WMAP) that will be developed pursuant to this Order.

The CSWMP is the unified plan consisting of programs developed under the Storm Water Management Program Requirements of this Order.

The WMAP is the comprehensive implementation plan for a specific Watershed

Management Area (WMA) based on the requirements of this Order, the CSWMP, and any other applicable actions that address pollutants of concern and other water quality issues unique to that WMA toward the objective of reducing pollutants in discharges to the maximum extent practicable. Upon approval by the Executive Officer, the WMAP will supersede the CSWMP.

If there is any conflict or discrepancy between information in the tables and the narrative provisions of this Order, the narrative provisions prevail.

I. Program Management

Table 1 shows the summary of program management requirements and their corresponding compliance dates.

Table 1
Program Management Requirements and Compliance Dates

Requirement	Permit Section	Principal Permittee	Permittees	Months from Effective Date of Order (Compliance Date)	For Approval By
Submit completed CSWMP	I.A.8	✓		Upon completion of development of all programs but not later than July 30, 1999.	Executive Officer
Develop a WMAP for the WMA	I.C.3.d	✓	(through WMCs)	Within 180 days prior to expiration of Order (February 1, 2001) (pending the approval of the CSWMP by Executive Officer)	Executive Officer
Identify additional SIC groups	I.C.3.g		(through WMCs)	Established through WMCs	N/A
Prepare budget summary format	I.D.1	✓		3 (October 30, 1996)	Executive Officer
Submit annual budget summary to Principal Permittee	I.D.2		✓	60 days after budget adoption	Executive Officer
Demonstrate legal authority	I.E.2		✓	120 days (November 28, 1996)	Executive Officer

A. Responsibilities of the Principal Permittee

The County of Los Angeles is hereby designated as the Principal Permittee, and as such shall:

1. Coordinate permit activities among permittees and act as liaison between Permittees and the Regional Board on general permit issues;

2. Provide personnel and fiscal resources for the development and update of the CSWMP and WMAPs and their components;

3. Convene the Watershed Management Committees (WMCs) constituted pursuant to Part 2.I.C upon designation of representatives;

4. Provide technical and administrative support for committees that will be organized to implement this Order;

5. Implement the Countywide Monitoring Program required in this Order;

6. Provide personnel and fiscal resources for the preparation and submittal to the Regional Board of annual reports, and summaries of other reports required under this Order;

7. Comply with the "Responsibilities of the Permittees" in Part 2.I.B; and

8. Submit to the Regional Board the CSWMP upon completion of the development of all programs under the SWMP requirements.

B. Responsibilities of the Permittees

Each Permittee shall, within its geographic jurisdiction:

1. Comply with the requirements of SWMP and CSWMP and their amendments;

2. Coordinate among its internal departments and agencies, as appropriate, to facilitate the implementation of the requirements of this Order applicable to such Permittee in an efficient and cost-effective manner;

3. Participate in the development and, if necessary, the update of the CSWMP;

4. Submit in a timely manner to the Principal Permittee an annual report on its implementation of the SWMP and CSWMP;

5. Appoint a technically knowledgeable representative to the appropriate WMC;

6. Participate in the development of the WMAP for its respective watershed management area through its WMC, and shall implement said WMAP upon approval by the Executive Officer; and

7. Work with other agencies, to the extent necessary, and submit a report to the Executive Officer on recommendations to resolve any conflicts identified between the provisions of this Order and the requirements of

other regulatory agencies, if the Permittee considers it necessary.

C. Watershed Management Committees (WMCs)

1. Each WMC shall be comprised of a voting representative from each Permittee in the WMA.

2. The WMC's chair and secretary shall be chosen by the WMC. In the absence of volunteer Permittee(s) for the positions, the Principal Permittee shall assume those roles until the WMC chooses members of the committee for the positions.

3. Each WMC shall:

a. Facilitate cooperation and exchange among Permittees;

b. Establish goals and objectives for the WMA;

c. Prioritize pollution control efforts considering beneficial use impairment as a basis;

d. Participate in the development of the WMAP for its respective WMA after the CSWMP is completed;

e. Assess the effectiveness of, prepare revisions for, and recommend appropriate changes to the CSWMP and the WMAP;

f. Coordinate and facilitate the submittal of completed reporting forms to the Principal Permittee for report integration, and assist in the preparation of Annual Reports by the Principal Permittee on storm water management activities within the WMA for submittal to the Executive Officer;

g. Identify, as part of the industrial/commercial Source Identification program, additional SIC industrial/commercial groups selected as priority to be included in the database described in Part 2.V.B.1.a. The following criteria shall be considered in the identification process:

i. Extent of exposure of the industrial/commercial activity to storm water;

ii. Types and quality of non-storm water discharges;

iii. Similarity of industrial/commercial activity to industrial activity

regulated under the USEPA Phase 1 facilities;

iv. Types of chemicals and wastes generated that can contaminate storm water;

v. Existence of duplicate regulatory programs with other agencies that emphasize waste management and minimize exposure of the industrial/commercial activity to storm water;

vi. Number of facilities in the WMA;

vii. Professional understanding of the industrial/commercial sector's waste management practices;

viii. Experience of local agency industrial waste inspection programs; and

ix. Any other information that indicates a significant potential for contamination of storm water.

D. Fiscal Resources

1. The Principal Permittee, in consultation with the Permittees, shall prepare a budget summary format not later than October 30, 1996, for use by each Permittee to report resources available to implement the SWMP.

2. Each Permittee shall submit to the Principal Permittee a summary of resources dedicated for storm water program implementation, not later than 60 days after budget adoption by the Permittee's elected local governing body. A Permittee may provide all necessary data in an alternate format which includes the same information unless directed otherwise by the Executive Officer.

E. Legal Authority

1. Pursuant to the time frame established in E.2, each Permittee shall demonstrate that it possesses the legal authority necessary to control discharges to and from those portions of the Municipal Separate Storm Sewer System (MS4) over which it has jurisdiction so as to comply with this Order. This legal authority may be demonstrated by either a single ordinance or a single guidance document containing all the applicable statutes, ordinances, permits, contracts, orders or agreements which govern a Permittee's storm water management activities, as required by 40 CFR 122.26(d)(2)(i).

Each Permittee shall either individually or collectively possess the legal authority to:

a. Control the contribution of pollutants to the MS4 by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity, unless permitted under a separate NPDES permit, through the following prohibitions and requirements:

i. Prohibit the discharge of untreated wash waters to the MS4 when gas stations, auto repair garages, or other types of automotive service facilities are cleaned;

ii. Prohibit the discharge of untreated wastewater to the MS4 from mobile auto washing, steam cleaning, mobile carpet cleaning, and other such mobile commercial and industrial operations;

iii. Prohibit to the maximum extent practicable, discharges to the MS4 from areas where repair of machinery and equipment, including motor vehicles, which are visibly leaking oil, fluid or antifreeze is undertaken;

iv. Prohibit the discharges of untreated runoff to the MS4 from storage areas of materials containing grease, oil, or other hazardous substances, and uncovered receptacles containing hazardous materials;

v. Prohibit the discharge of commercial/municipal swimming pool filter backwash to the MS4;

vi. Prohibit the discharge of untreated runoff from the washing of toxic materials from paved or unpaved areas to the MS4;

vii. Prohibit or control to the maximum extent practicable washing impervious surfaces in industrial/commercial areas which results in a discharge of untreated runoff to the MS4, unless specifically required by State or local health and safety codes;

viii. Prohibit the discharge from washing out of concrete trucks to the MS4;

ix. Require regular sweeping or other equally effective measures to remove debris from industrial/commercial motor vehicle parking lots with more than twenty-five parking spaces that are

located in areas potentially exposed to storm water; and,

x. Require the use of BMPs or placement of machinery/ equipment that is to be repaired or maintained such that leaks, spills and other maintenance-related pollutants are not discharged to the MS4;

b. Prohibit illicit discharges and illicit connections to the MS4 and require removal of illicit connections.

c. Control spills, dumping, or disposal of materials, including the following, to the MS4 through the following prohibitions and requirements:

i. Prohibit littering;

ii. Prohibit the disposal of leaves, dirt, or other landscape debris into a storm drain;

iii. Prohibit the discharge to the MS4 of any pesticide, fungicide, or herbicide banned by the USEPA or the California Department of Pesticide Regulation;

iv. Require proper disposal of food wastes;

v. Prohibit the disposal of hazardous wastes into trash containers used for municipal trash disposal so as not to cause a discharge to the MS4; and

vi. Require, in areas exposed to storm water, the use of BMPs and/or removal and lawful disposal of all fuels, chemicals, fuel and chemical wastes, animal wastes, garbage, batteries, and other materials which have potential adverse impacts on water quality.

The above requirements (Part 2.I.E.1.) do not require inspection of private property. Legal authority is necessary, however, so that if the Permittee becomes aware of situations associated with private property that cause obvious discharges of prohibited materials to the MS4 or pose the potential for such discharges, the Permittee has the legal authority to abate such discharges.

2. Each Permittee shall:

Provide to the Principal Permittee for submittal to the Executive Officer, not later than November 28, 1996, copies of ordinances, regulations, and other legal documents establishing legal authority, or in the alternative:

a. A statement by its legal counsel that the Permittee has obtained all necessary legal authority to comply with this Order, referencing that legal authority with specificity; and/or

b. If Part 2.I.E.2.a. is only partially fulfilled, a timely schedule for obtaining adequate legal authority to comply with this Order, enumerating, with specificity, the legal authority that remains to be obtained.

F. Best Management Practice (BMP) or Program Substitution or Elimination

A Permittee may petition the Executive Officer to:

1. Substitute any BMP or program identified in this Order, the CSWMP, or the WMAP, if the Permittee can document that:

   a. The proposed alternative BMP or program will meet or exceed the objective of the original BMP or program in the reduction of storm water pollutants; or

   b. The fiscal burden of the original BMP or program is substantially greater than the proposed alternative, but does not achieve a substantially greater improvement in storm water quality; and,

   c. The proposed alternative BMP or program will be implemented within a similar period of time.

2. Eliminate any BMP or program identified in this Order, the CSWMP, and/or the WMAP, if the Permittee can document that:

   a. The BMP or program is not technically feasible and no substitute is available; or

   b. The cost of implementation outweighs the pollution control benefits; or

   c. The BMP or program is not applicable in the Permittee's jurisdiction.

The Executive Officer may approve or disapprove the petition in accordance with

Part 2.I.G and 2.I.H.

G. Administrative Review

The administrative review process formalizes the procedure for review and acceptance of reports and documents submitted to the Regional Board under this Order. In addition, it provides a method to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement action.

1. Storm water program documents, including progress reports, guidelines checklists, BMPs, databases, program summaries, and implementation and compliance schedules, developed by the Principal Permittee or a Permittee under the provisions of this Order, shall be submitted to the Executive Officer or the Regional Board, where required for approval. The process is as follows:

   a. For documents that require Executive Officer's approval, the Executive Officer will notify the Principal Permittee and/or Permittee of the results of the review and approval or disapproval within 120 days. If the Executive Officer has not responded within 120 days following submittal, the Permittee shall notify the Regional Board of its intent to implement the program components as submitted. If after 10 days the Executive Officer has not responded, the Permittee will implement the submitted program and the Executive Officer may not make modifications; and,

   b. Documents that require formal Regional Board approval will undergo public review and comment before Board consideration at a public meeting.

2. If the Executive Officer determines that a Permittee's storm water program is insufficient to meet the provisions of this Order, the Executive Officer shall send a "Notice of Intent to Meet and Confer (NIMC)" to the Permittee, with specific information in support of the determination. The NIMC shall include a time frame by which the Permittee must meet with Regional Board staff. The processes are as follows:

   a. The Permittee, upon receipt of a NIMC, shall meet and confer with Regional Board staff to demonstrate that the Permittee's program is sufficient to meet the requirements of this Order; and, if not, seek clarification on the steps to be taken to completely meet the provisions of this Order. The meet and confer period will conclude with either a notice of program sufficiency to the Permittee, or the

submittal to and acceptance by the Executive Officer of a written "Storm Water Program Compliance Amendment (SPCA)" which shall include implementation deadlines. The Executive Officer may terminate the meet and confer period after a reasonable period due to a lack of progress on issues and may order submittal of the SPCA by a specified date. Failure to submit an acceptable SPCA by the specified date shall constitute a violation of this Order;

b. The Executive Officer will approve or reject the submitted SPCA or an amended SPCA within 120 days. Rejection of an SPCA by the Executive Officer shall state the reasons for the failure to approve the SPCA. A Permittee that receives a rejection of an SPCA shall have sixty (60) days to remedy the specified deficiency and resubmit the SPCA. If the Executive Officer has not responded within 120 days following submittal of an SPCA, the Permittee shall notify tne Executive Officer of its intent to implement the SPCA as submitted. If after 10 days the Executive Officer has not responded, the Permittee will implement the submitted SPCA and the Executive Officer may not make modifications;

c. The Permittee shall comply with the terms of the SPCA. The Permittee shall submit reports to the Executive Officer on progress made under the SPCA. The frequency of progress report submittal shall be quarterly unless otherwise prescribed by the Executive Officer. Failure to comply with the terms and conditions of the SPCA shall constitute a violation of this Order and shall be cause for enforcement action by the Regional Board; and,

d. The Executive Officer shall not take enforcement action against a Permittee until the Executive Officer has notified the Permittee in writing that the Administrative Review Process has been exhausted and that the Executive Officer has determined that a violation exists warranting enforcement.

H. Public Review

1. The Principal Permittee shall maintain a current mailing list of interested parties, organized by WMAs, for distribution of documents that require the Executive Officer's approval. The Executive Officer will provide the Principal Permittee with the initial list of interested parties.

2. The Principal Permittee shall distribute for public comment the initial CSWMP, WMAPs, and other storm water program requirements that are submitted to the Executive Officer or the Regional Board for approval.

Interested parties wishing to have their comments considered prior to Regional Board action on these documents must submit their comments in writing to the Regional Board not later than 45 days after the Principal Permittee has made the document available to the public. The date of public release is also the date of submittal to the Regional Board. This 45-day comment period is part of the 120 day review period for documents submitted for Executive Officer's approval.

II. Illicit Connections and Illicit Discharges

Table 2 on the following page shows the summary of requirements under this section and corresponding compliance dates.

This space is left intentionally blank.

Table 2
Illicit Connections and Discharges Requirements and Compliance Dates

Requirement	Permit Section	Principal Permittee	Permittees	Months from Effective Date of Order (Compliance Date)	For Approval By
Develop model illicit connection elimination program	II.A.1	✓		8 months (March 31, 1997)	Executive Officer
Implement illicit connection elimination program	II.A.2		✓	≤ 36 months (July 30, 1999)	N/A
Develop model illicit discharge elimination program	II.B.1	✓		8 months (March 31, 1997)	Executive Officer
Implement illicit discharge elimination program	II.B.2		✓	≤ 36 months (July 30, 1999)	N/A
Conduct a study of municipal street and municipal sidewalk washing	II.C.3		✓ City of Los Angeles	Within 12 months from Executive Officer date of determination	Executive Officer
Submit BMPs and schedule for implementation	II.C.3		✓ City of Los Angeles	Within 12 months from Executive Officer date of determination	Regional Board
Implement non-storm water management program BMPs	II.C.3		✓	In accordance with RB approved schedule ≤ 36 months (July 30, 1999)	N/A
Develop standard program for public reporting of illicit discharges and illicit disposal practices	II.D.1	✓		8 months (March 31, 1997)	Executive Officer
Implement standard program to facilitate public reporting of illicit discharges and illicit disposal practices	II.D.2		✓	≤ 36 months (July 30, 1999)	N/A
Develop standard program for reporting hazardous substances	II.D.3	✓		8 months (March 31, 1997)	Executive Officer
Implement standard program for reporting hazardous substances	II.D.4		✓	≤ 36 months	N/A

A. Illicit Connections

1. The Principal Permittee, in consultation with the Permittees, shall develop a countywide model program for elimination of illicit connections to the MS4 not later than March 30, 1997. The program shall include, at a minimum:

   a. Standardized storm drain inspection procedures, and illicit connection identification and elimination procedures;

   b. Methods to prioritize potential problem areas, including, but not limited to old commercial/industrial areas, and areas with heavy industry listed under subchapter N of 40 CFR Parts 405 - 471;

   c. Methods to utilize results of field screening activities, and other appropriate information;

   d. Standardized record keeping to document illicit connections; and

   e. Enforcement procedures to terminate illicit connections.

2. Each Permittee, based on the countywide model program, shall develop and implement as appropriate a program to identify and eliminate illicit connections to the maximum extent practicable not later than four (4) months after the commencement of its next fiscal year following approval of the model program by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999.

B. Illicit Discharges

The primary responsibility for cleanup and removal of illicit discharges of pollutants to the MS4 shall be with the owner/operator of the discharging facility or site. Nothing in this Order shall be interpreted to limit or in any way prevent action by a Permittee against the party responsible for the illicit discharge.

1. The Principal Permittee, in consultation with the Permittees, shall develop a countywide model illicit discharges elimination program not later than March 31, 1997. The program shall include, at a minimum:

   a. Standardized enforcement procedures, including administrative and judicial, to eliminate illicit discharges;

b. Standardized procedures for investigation, containment and cleanup of spills, which include a procedure to ensure that sewage treated with disinfection agents will not be discharged into the storm drain system to the extent practicable;

c. Methods to prioritize problem areas of illicit disposal where inspection, cleanup, and enforcement are necessary to prevent the discharge of contaminants;

d. Standardized procedures to educate inspectors, maintenance workers, and other field staff to notice illicit discharges during the course of their daily activities, and report such occurrences;

e. Standardized record keeping system to document illicit discharges; and,

f. Industrial/commercial education and outreach materials to inform businesses about the problem of illicit discharges/dumping and proper discharge/disposal practices.

2. Each Permittee shall, based on the countywide model program, develop and implement, as appropriate, a program to identify and eliminate illicit discharges not later than four (4) months after commencement of its next fiscal year following approval of the model program by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval, but in no event shall implementation be later than July 30, 1999.

C. Non-Storm Water Discharges

Non-storm water discharges in compliance with a separate NPDES permit/Waste Discharge Requirements (WDR) or granted a discharge exemption by the Regional Board, the Executive Officer, or the State Water Resources Control Board are not prohibited under this Order.

1. Exempted Discharges

The following non-storm water discharges need not be prohibited:

a. Flows from riparian habitats or wetlands;
b. Diverted stream flows;

c. Springs;
d. Rising ground waters;
e. Uncontaminated groundwater infiltration; and
f. Discharges or flows from emergency fire fighting activities.

The Executive Officer, upon presentation of evidence in accordance with Part 2.II.C.4., may include other categories of non-storm water discharges under this subsection.

2. Conditionally Exempted Discharges

The following non-storm water discharges need not be prohibited. However, if they are identified by either a Permittee or the Executive Officer as being significant sources of pollutants to receiving waters, then appropriate BMPs to minimize the adverse impacts of these sources shall be developed and implemented under the CSWMP or the WMAPs:

a. Landscape irrigation;
b. Water line flushing;
c. Potable water sources provided the discharges are managed in accordance with an approved Industry-wide Standard Pollution Prevention Practices developed by the American Water Works Association, California-Nevada Section, or equivalent document; and in compliance with any requirements established by the Permittee(s);
d. Foundation drains;
e. Footing Drains;
f. Air conditioning condensate;
g. Irrigation water;
h. Lawn watering;
i. Water from crawl space pumps;
j. Dechlorinated swimming pool discharges;
k. Individual residential car washing; and,
l. Street washing (including sidewalk washing).

The Executive Officer, upon presentation of evidence in accordance with Part 2.II.C.4., may include other categories of non-storm water discharges under this subsection.

3. Designated Discharges

Municipal street washing and municipal sidewalk washing discharges have been determined by the Executive Officer to be potential sources of pollutants of concern. The City of Los Angeles will conduct a study to characterize municipal street washing and sidewalk washing, assess the

impacts of such activities, and recommend appropriate BMPs to control any adverse impact. The City of Los Angeles will submit its recommendations to the Executive Officer not later than one year from adoption of this Order. A BMP implementation schedule shall be included where appropriate.

The Regional Board will determine within four (4) months of the City of Los Angeles' submittal which BMPs, if any, the Permittees shall implement, and approve any necessary schedule of implementation, provided the implementation date is not later than July 30, 1999.

The Executive Officer, upon presentation of evidence, may include other categories of non-storm water discharges under this subsection.

4. Procedures for Exemption

A Permittee may identify and describe additional categories of non-storm water discharges to be considered by the Executive Officer for exemption from the Discharge Prohibitions. The criteria to be considered for a request for exemption include one or more of the following:

a. Documentation that the discharge is not a significant source of pollutants to receiving waters or does not cause impairment of beneficial uses of receiving waters;

b. Special circumstances that have been defined in which the discharge has been found not to be a significant sources of pollutants to, or does not cause impairment of beneficial uses of receiving waters;

c. Specific BMPs, where determined feasible, that have been identified to reduce pollutants in the discharge to the maximum extent practicable and minimize adverse impacts of such source, with an implementation schedule; or

d. Established procedures to ensure BMP implementation, including an implementation schedule, performance standards, monitoring and record keeping.

The exemption request for additional non-storm water discharges may be submitted, beginning with the first Annual Report. The exemption becomes effective upon approval by the Executive Officer.

D. Public Reporting

1. The Principal Permittee, in consultation with the Permittees, shall develop

a countywide standard program to promote, publicize, and facilitate public reporting of illicit discharges and illicit disposal practices not later than March 31, 1997. The program may include, but not be limited to:

a. A system to receive incoming complaints;

b. A communication network to link Permittees so that action can be coordinated and complaints can be investigated promptly; and

c. A system to notify the complainant of any action taken, if appropriate.

2. Each Permittee shall implement the countywide illicit discharges and illicit disposal reporting program not later than four months after commencement of its next fiscal year following approval of the program by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999.

3. The Principal Permittee, in consultation with the Permittees, shall develop a countywide program not later than March 31, 1997, for reporting incidents of "reportable quantity" of hazardous substances entering the MS4. The incidents shall be reported to the State of California Office of Emergency Services (OES) [current number, (800) 852-7550] and the Federal Hazardous Response Center [current number, (800) 424-8802].

4. Each Permittee shall implement the countywide program for reporting hazardous substances entering the MS4, not later than four months after commencement of its next fiscal year following approval of the program by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999.

III. Development Planning and Construction

A. Development Planning

Table 3 on the following page shows the summary of requirements under this section and corresponding compliance dates.

This space is left intentionally blank.

Table 3
Development Planning Requirements and Compliance Dates

Requirement	Permit Section	Principal Permittee	Permittees	Months from Effective Date of Order (Compliance Date)	For Approval By
Develop a model system for prioritization of development projects	III.A 1.a	✓		18 (January 30, 1998)	Executive Officer
Implement a system for prioritization of development projects	III.A.1.a		✓	≤ 36 months (July 30, 1999)	N/A
Develop list of recommended BMPs for development projects (countywide guidelines)	III.A.1.b	✓		18 (January 30, 1998)	Regional Board
Develop Standard Urban Storm Water Mitigation [illegible] (SUSMP)	III.A.1.c	✓		6 months after Regional Board approval of countywide guidelines	Executive Officer
Develop and submit a schedule of implementation for a program for planning measures consistent with the Standard Urban Storm Water Mitigation Plan (SUSMP) for priority projects	III.A.2		✓	≤ 36 months (July 30, 1999)	N/A
Develop guidelines for preparing/reviewing CEQA documents	III.A.3.a	✓		18 (January 30, 1998)	Executive Officer
Incorporate CEQA guidelines into internal procedures	III.A.3.a		✓	≤ 36 months (July 30, 1999)	N/A
Include watershed and storm water management consideration into General Plan revisions	III.A.4 3.b		✓	During General Plan revisions	N/A
Develop model program for developers	III.A.4	✓		18 (January 30, 1998)	Executive Officer
Implement developer [illegible]ation program	III.A.4		✓	≤ 36 months (July 30, 1999)	N/A

1. Countywide Development Planning Guidance

The Principal Permittee, in consultation with the Permittees, shall develop the following development planning guidance materials for use during planning and permitting of all development projects requiring discretionary approval:

a. A model documented system, such as a checklist, for determining priority projects as well as a list of specifically exempt projects not later that January 30, 1998. Priority and exempt projects are defined as follows:

i. Priority Projects are development and redevelopment projects requiring discretionary approval which the Building Official (or equivalent municipal authority) determines may have a potential significant effect on storm water quality.

ii. Exempt Projects are development and redevelopment projects which the Building Official (or equivalent municipal authority) determines will not have a potential significant impact on storm water quality.

The documented system shall consider location of the project with respect to designated environmentally sensitive areas and the slope and erosion potential of the site and surrounding areas.

Each Permittee shall incorporate a substantially similar system into its procedures not later than six months after commencement of its next fiscal year following approval of the of the documented system by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999.

b. A list of recommended BMPs not later than January 30, 1998. The list of BMPs shall include:

i. Site planning practices;
ii. Post-construction best management practices; and
iii. Redevelopment and infill practices.

Consideration shall be given to the type of development and the potential for storm water pollution when determining the applicability of BMPs. Cost effectiveness, ease of maintenance, and consistency with other environmental mandates may also be considered.

For developments where increased storm water discharge rates will result in an increase in downstream erosion potential, the list of recommended BMPs shall include those BMPs which can be used to maintain peak runoff rates at pre-development levels to the maximum extent feasible.

The list of recommended BMPs shall be submitted to the Regional Board for approval.

c. Standard Urban Storm Water Mitigation Plans (SUSMPs) and guidelines for their preparation not later than six months after Regional Board approval of the BMPs in Part 2.III.A.1.b. The SUSMPs shall incorporate the appropriate elements of the recommended BMPs list. At the minimum, SUSMPs and guidelines shall be prepared for the following development categories:

i. a 100+ home subdivision;
ii. a 10-home subdivision;
iii. a 100,000+ square-foot commercial development;
iv. an automotive repair shop;
v. a retail gasoline outlet;
vi. a restaurant; and
vii. a hillside-located single-family dwelling.

2. Planning Control Measures

Each Permittee shall develop a program on planning control measures for priority projects (Part 2.III.A.1.a) consistent with the programs developed under Part 2.III.A.1.b. & c.. Each Permittee shall initiate implementation of its program not later than six months after commencement of its next fiscal year following approval of the model Standard Urban Storm Water Mitigation Plans by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be initiated later than July 30, 1999. Each Permittee shall require that the project applicant submit an Urban Storm Water

Mitigation Plan appropriate and applicable to the project, and that the Permittee approve the Plan prior to the issuance of any grading or building permit. The Urban Storm Water Mitigation Plan shall incorporate by detail or reference appropriate post-construction BMPs to:

a. Implement, to the maximum extent practicable, requirements established by appropriate governmental agencies under CEQA, Section 404 of the Clean Water Act, local ordinances and other legal authorities intended to minimize impacts from storm water runoff on the biological integrity of natural drainage systems and water bodies;

b. Maximize, to the maximum extent practicable, the percentage of permeable surfaces to allow more percolation of storm water into the ground;

c. Minimize, to the maximum extent practicable, the amount of storm water directed to impermeable areas and to the MS4;

d. Minimize, to the maximum extent practicable, parking lot pollution through the use of appropriate BMPs such as retention, infiltration, and good housekeeping;

e. Establish reasonable limits on the clearing of vegetation from the project site including, but not limited to, regulation of the length of time during which soil may be exposed and, in certain sensitive cases, the prohibition of bare soil; and

f. Provide for appropriate permanent controls to reduce storm water pollutant load produced by the development site to the maximum extent practicable.

The Permittee may refer applicants to the *'California Storm Water Best Management Practice Handbooks,* California Storm Water Quality Task Force, Sacramento, CA (1992)' and its revisions; the Countywide Storm Water Management Plan; *'USEPA Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters, Issued under the Authority of Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990,* Document No. EPA 840 B 92-002 (1993),'; and similar manuals for specific guidance on selecting post-construction BMPs for reducing pollutants in storm water discharges.

3. Planning Process

In order to integrate storm water management considerations into

discretionary development projects at the time that they are first proposed to jurisdictions, and to support other provisions of this Order:

a. The Principal Permittee, in consultation with the Permittees, shall develop storm water management guidelines for use in preparing/reviewing CEQA documents, and in linking storm water quality mitigation conditions to local discretionary project approvals not later than January 30, 1998.

The guidelines shall address the preservation of areas that provide water quality benefits such as riparian corridors and wetlands and shall promote protection of the biological integrity of drainage systems and water bodies.

Each Permittee shall review the guidelines for the purpose of making appropriate modifications in their internal procedures not later than six months after commencement of its next fiscal year following approval of the program by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999.

b. Each Permittee shall include watershed and storm water management considerations in the appropriate elements of the Permittee's General Plan, whenever said elements are significantly rewritten. Appropriate elements may include the following:

i. Conservation; and/or
ii. Open space; and/or
iii. Land-use; and/or
iv. Public utilities; and/or
v. Infrastructure; and/or
vi. Other appropriate elements.

4. Developer Information Program

The Principal Permittee, in consultation with the Permittees, shall develop a model program not later than January 30, 1998, to inform developers seeking discretionary approvals about:

a. Development and construction storm water management;

b. Maximization of pervious areas and storm water infiltration (where geology and topography permit); and

c. Cost effective storm water pollution control measures.

The program shall provide specific guidance on selecting BMPs to reduce pollutants in storm water discharges from urbanized areas, and include appropriate BMPs, educational materials, and handbooks and guidelines described in Part 2. III.A.3.

Each Permittee shall implement a developer information program consistent with the model program not later than six months after commencement of its next fiscal year following approval of the model by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999. Each Permittee's program shall include information about its legal authorities. Permittees are encouraged to engage in joint efforts in implementing the program.

B. Development Construction

Table 4 on the following page shows the summary of requirements and corresponding compliance dates under this section.

This space is left intentionally blank.

Table 4
Development Construction Requirements and Compliance Dates

Requirement	Permit Section	Principal Permittee	Permittees	Months from Effective Date of Order (Compliance Date)	For Approval By
Develop minimum requirements, recommended BMPs, and design checklists for construction	III.B.1	✓		14 (September 30, 1998)	Regional Board
Develop and implement a program for construction control measures	III.B.2.a		✓	≤ 36 months (July 30, 1999)	N/A
Require applicants to demonstrate coverage under State Construction General Permit prior to issuance of grading permits	III.B.2.b		✓	6 (January 31, 1997)	N/A
Develop a model construction inspection program	III.B.3.a	✓		14 (September 30, 1997)	Executive Officer
Implement a construction inspection program	III.B.3.b		✓	≤ 36 months (July 30, 1999)	N/A

1. Countywide Development Construction Guidance

The Principal Permittee, in consultation with the Permittees and appropriate stakeholder organizations, shall develop not later than September 30, 1998, the following development construction guidance materials for all development project construction activities: minimum recommended requirements, BMPs appropriate for various activities, and checklists for use in design and inspection. The Countywide minimum requirements and recommended BMPs shall:

a. Include erosion and sediment control practices;

b. Address multiple construction activity-related pollutants;

c. Focus on BMPs such as source minimization, education, good housekeeping, good waste management, and good site planning;

d. Target construction areas and activities with the potential to generate significant pollutant loads;

e. Require retention on the site, to the maximum extent practicable, of sediment, construction waste, and other pollutants from construction activity;

f. Require, to the maximum extent practicable, management of excavated soil on site to minimize the amount of sediment that escapes to streets, drainage facilities, or adjoining properties;

g. Require, to the maximum extent practicable, use of structural drainage controls to minimize the escape of sediment and other pollutants from the site.

h. Require, to the maximum extent practicable, containment of runoff from equipment and vehicle washing at construction sites, unless treated to remove sediments and pollutants.

The lists of BMPs shall be submitted to the Regional Board for approval.

2. Construction Control Measures

a. Each Permittee shall develop a regulatory program for construction activities as defined in Part 2.III.A.1.a. consistent with the Countywide Development Construction Guidance not later than six months after commencement of its next fiscal year following approval of the minimum recommended requirements and BMPs in Part 2.III.B.1. by the Regional Board , provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999.

The Program shall require, prior to the issuance of any building or grading permit, preparation of appropriate wet weather erosion control and storm water pollution prevention plans which include, by detail or reference, all appropriate construction BMPs developed under Part 2.III.B.1.

Priority Project plans must include a narrative discussion of the reasons used for selecting or rejecting BMPs. In lieu of a narrative, the project architect or engineer of record may sign a statement on the plan to the effect: "As the architect/engineer of record, I have selected appropriate BMPs to effectively minimize the negative impacts of this project's construction activities on storm water quality. The project owner and contractor are aware that the selected BMPs must be installed, monitored, and maintained to ensure their effectiveness. The BMPs not selected for implementation are redundant or deemed not applicable to the proposed construction activities."

b. Each Permittee shall implement a procedure not later than January 31, 1997, whereby the Permittee shall not issue a grading permit for developments with disturbed areas of five acres or greater unless the applicant can show that (i) a Notice of Intent (NOI) to comply with the State Construction Activity Storm Water Permit has been filed and (ii) a Storm Water Pollution Prevention Plan (SWPPP) has been prepared.

3. Site Inspection

a. The Principal Permittee, in consultation with the Permittees, shall develop a model construction activity inspection program, which includes checklists, not later than September 30, 1997. The model program shall include but not be limited to:

i. Procedures for construction site inspections;

ii. Procedures to require corrective action be undertaken by contractors at noncomplying sites;

iii. Procedures for enforcement action against noncomplying construction activity; and

iv. Appropriate training for program staff.

b. Each Permittee shall implement a construction activities inspection program based on the model program not later than six months after commencement of its next fiscal year following approval of the model program by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such

program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999. The program may be integrated with the Permittees regular program of construction inspection for maximum efficiency.

This space is left intentionally blank.

IV. Public Agency Activities

Table 5 shows the summary of requirements under this section and their corresponding compliance dates.

Table 5
Public Agency Activities Requirements and Compliance Dates

Requirement	Permit Section	Principal Permittee	Permittees	Months from Effective Date of Order (Compliance Date)	For Approval By
Evaluate existing public agency activities and develop a model program to reduce storm water impacts	IV.A	✓		16 (December 1, 1997)	Executive Officer
Develop a program to reduce storm water impacts from public agency activities with a schedule for implementation	IV.B		✓	4 months after Executive Officer approval of model ≤ 36 months (July 30, 1999)	N/A

A. Public Agency Model Program

The Principal Permittee, in consultation with the Permittees, shall develop a model program to reduce the impact of public agency activities on storm water quality not later than December 1, 1997. The model program shall include a discussion of the on-going investigation of the feasibility of dry weather flow diversion from the MS4 to municipal waste water treatment plants, where appropriate. The model shall be submitted to the Regional Board for approval.

To minimize costs and avoid duplication of effort, it is encouraged to incorporate and recognize in the model program existing regulations, requirements and plans, such as waste minimization plans, spill prevention control and countermeasures, and business plans.

B. Permittee Public Agency Programs

Each Permittee shall develop and implement a Public Agency Program based on the model program developed by the Principal Permittee not later than four

months after commencement of its next fiscal year following approval of the model program by the Executive Officer, provided; however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999.

C. Program Requirements

Both the model program and the Permittee programs shall at a minimum include, where applicable:

1. Sewage Systems Operations

   a. Procedures to keep sewage spills or leaks from facilities operated by a Permittee from entering the MS4 to the maximum extent practicable;

   b. Procedures to identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers operated by a Permittee to the MS4;

   c. Procedures to respond to overflows and investigate complaints;

   d. Procedures to insure that the Permittee is able to investigate any suspected connections or cross connections from the sanitary sewer systems to the MS4; and

   e. Procedures to notify public health agencies with discretionary decision authority on beach closures when there is a threat to public health.

2. Public Construction Activities Management

   a. Storm water management requirements for the design and construction of public facilities consistent with the requirements and time lines specified for private development in Part 2.III.A and III.B. ;

   b. Procedures to seek coverage, as an option, under this Order for construction activity with a disturbed area of five acres or more (Phase 1, 40 CFR 122.26) which is under taken by or on behalf of the Permittee, if the Permittee develops:

i. A process for notifying the Executive Officer of Permittee's construction activity;

ii. A checklist of construction activity BMPs using BAT/BCT criteria for public construction activity;

iii. A procedure to verify implementation of construction activity BMPs;

iv. A requirement to prepare and retain site-specific SWPPPs;

v. A procedure to report annually on the effectiveness of SWPPPs at public construction activity sites, and certify compliance with the requirements in this Order.

3. Vehicle Maintenance/Material Storage Facilities Management

a. Model pollution prevention plan for public vehicle maintenance/material storage facilities which have the potential to discharge pollutants into storm water. A public vehicle maintenance/material storage facility is any Permittee-owned or operated facility or portion thereof that:

i. Conducts industrial activity, operates equipment, handles materials, and provides services similar to Federal Phase 1 facilities;

ii. Performs fleet vehicle maintenance on ten or more vehicles per day including repair, maintenance, washing, and fueling;

iii. Performs maintenance and/or repair of heavy industrial machinery/equipment; and

iv. Stores chemicals, raw materials, or waste materials in quantities that require a hazardous materials business plan or a Spill Prevention, Control, and Counter-measures (SPCC) plan.

b. BMPs to improve site specific pollutant control including but not be limited to:

i. Good housekeeping practices;

ii. Material storage control;

iii. Vehicle leaks and spill control;

iv. Illicit discharge control;

v. Training for employees on proper outdoor loading/unloading of materials;

vi. Vehicle and equipment washing area control;

vii. Regular maintenance of treatment structures such as sumps, oil/water separators, or equivalent; and

viii. Proper waste handling disposal.

4. Landscape and Recreational Facilities Management

a. Procedures for application of pesticides, herbicides, and fertilizers that will include:

i. List of approved pesticides and selective and environmentally responsible uses;

ii. Product and application information;

iii. Application equipment use and maintenance; and

iv. Record keeping.

b. Procedures to minimize storm water pollution by pesticides and fertilizers used for landscape maintenance, including the utilization of Integrated Pest Management (IPM) techniques to the maximum extent practicable;

c. Procedures to prevent the disposal of landscape waste into the MS4;

d. Procedures to encourage retention and planting of native vegetation to reduce water, fertilizer, and pesticide needs;

e. BMPs to reduce exposure of fertilizers and pesticides to storm water during storage, to include as applicable, the following:

i. Storage indoors or under cover on paved surfaces;

ii. Secondary containment;

iii. Reduction in storage and handling of hazardous materials;

iv. Regular inspection of storage areas;

f. Guidelines to schedule irrigation and fertilization to minimize:

i. Chemical application during wet season and to terminate chemical application during storm events; and

ii. Over-watering and nutrients/pesticides entrainment.

g. Procedures to manage discharges of municipal swimming pool water into the MS4, including dechlorination practices, proper disposal of clean-out waters, and piping of filter backwash to the sanitary sewer;

h. BMPs to minimize trash, debris, and other pollutants from entering Permittee-owned recreational water bodies, to include:

i. Routine trash collection along, on, and/or in, water bodies, where feasible; and

ii. Public outreach to educate the public about impacts of illicit disposal.

5. Storm Drain Operation and Management

a. BMPs for Inlet Maintenance to be implemented to the maximum extent practicable, including but not be limited to:

i. Inspection and cleaning of catch basins between May 1 and September 30 of each year;

ii. Additional cleaning of catch basins, as necessary, between October 1 and April 30;

iii. Record keeping of catch basins cleaned; and

iv. Recording of the overall quantity of catch basin waste collected.

b. BMPs for Storm Drain Maintenance to be implemented to the maximum extent practicable, including but not be limited to:

i. Proper disposal of material removed;

ii. Removal of trash and debris from open channel storm drains at least annually between May 1 and September 30 of each year;

iii. Surveillance for debris buildup in open channels during the rainy season.

c. Waste Management program to include:

i. Procedures to identify problem areas of illicit discharge for regular inspection;

ii. Procedures to minimize to the maximum extent practicable the discharge of contaminants during MS4 cleanup to maintain optimum channel capacity; and

iii. A review of current maintenance activities to assure that appropriate storm water BMPs are being utilized.

6. Streets and Roads Maintenance

a. Program to sweep curbed streets at a targeted frequency of:

i. At least monthly; and,

ii. Where feasible, more frequently in areas generating significant refuse.

b. Streets and roads maintenance program including:

i. BMPs for existing saw-cut management and paving practices to include but not be limited to:

aa. Avoidance during wet weather to the extent feasible; and

bb. Material storage away from drainage areas to prevent storm water pollution or other equally effective BMPs.

ii. Good housekeeping practices to insure proper management of any wastes that are generated;

iii. Collection, transport, and disposal of maintenance waste at appropriate disposal facilities in accordance with applicable federal, state, and local laws and regulations;

iv. Management of concrete materials and wastes including but not limited to:

aa. Washout of concrete trucks off- or on-site in designated areas and not into storm drains, open ditches, streets, or catch basins;

bb. Material storage under cover, away from drainage areas or other equally effective BMPs; and

cc. Avoidance of excess mixing of concrete or cement on-site.

v. Employee training to:

aa. Promote a clear understanding of the potential for maintenance activities to pollute storm water; and

bb. Identify and select appropriate BMPs.

7. Parking Facilities Management

Parking Facilities Management Plan to include sweeping or other equally effective measures to remove debris from Permittee-owned parking lots with more than twenty-five parking spaces that are located in areas potentially exposed to storm water.

8. Public Industrial Activities

a. Procedures to seek coverage, as an option, under this Order for Phase I industrial facilities which are owned or operated by a Permittee, if the Permittee develops:

i. A process for notifying the Executive Officer of public industrial facilities owned or operated by the Permittee;

ii. A checklist of BMPs using BAT/BCT criteria for public industrial facilities;

iii. A procedure to verify implementation of industrial facility BMPs;

iv. A requirement to prepare and retain site specific SWPPPs; and

v. A procedure to report annually on the effectiveness of SWPPPs and the results of the facility monitoring programs at public

Phase 1 industrial facilities, and certify compliance with the requirements of this Order.

9. Emergency Procedures

Procedures for addressing emergency repairs of essential public services and infrastructure and responding to natural disasters.

This space is left intentionally blank.

V. Public Information and Participation

To reach as many Los Angeles County residents as possible, a comprehensive educational outreach approach shall be undertaken under this Order. In recognition of the importance of public education to effective storm water management solutions, this Order calls for immediate Permittee public outreach efforts at a specified minimum level as well as a longer term effort to develop an integrated, comprehensive outreach program. As part of the immediate effort, each Permittee is expected to choose an appropriate combination of outreach tools and activities to raise public awareness of storm water issues and improve water quality in its own individual jurisdiction, with efforts at a prescribed minimum level as described below. As part of the longer term effort, each Permittee is expected to work collaboratively to develop a comprehensive outreach/education program countywide and within its watershed management area.

The objectives of the public education program are: (i) to measurably increase the knowledge of the target audiences regarding the MS4, the impacts of storm water pollution on receiving waters, and potential solutions for the target audiences to implement BMPs to reduce the problems caused; and (ii) to measurably change the behavior of target audiences by encouraging those audiences to implement appropriate solutions.

Table 6 on the following page shows the summary of requirements and corresponding compliance dates under this section.

This space is left intentionally blank.

Table 6
Public Information and Education Requirements and Compliance Dates

Requirement	Permit Section	Principal Permittee	Permittees	Months from Effective Date of Order (Compliance Date)	For Approval By
Have outreach materials available for distribution	V.A.1		✓	8 (March 31, 1997)	N/A
Demonstrate outreach materials are being distributed	V.A.2.a		✓	12 (July 30, 1997)	N/A
Demonstrate appropriate Permittee employees are being trained	V.A.2.b		✓	12 (July 30, 1997)	N/A
Develop industrial/commercial facility database format	V.B.1.a	✓		6 (January 31, 1997)	N/A
Collect information based on database format	V.B.1.b		✓	12 months from WMC designation	N/A
Compile information from Permittees into industrial/commercial site visits	V.B.1.c	✓		22 (June 1, 1998)	N/A
Develop a checklist of BMPs for industrial/commercial site visits	V.B.2	✓		10 (May 30, 1997)	Regional Board
Implement an Industrial/Commercial facility site visit program	V.B.3.a		✓	Upon Regional Board approval of BMP checklist and in accordance with Table 7	N/A
Provide list of facilities visited	V.B.3.c		✓	Quarterly	N/A
Begin use of BMP checklists	V.B.3.b		✓	Upon Regional Board approval	N/A
Develop a 5 year public education strategy	V.C.1	✓		12 (July 30, 1997)	Executive Officer
Implement the strategy	V.C.2		✓	Based upon implementation schedule to be included in the strategy	

A. Immediate Outreach

1. Each Permittee shall, at a minimum, have available for distribution or reference as appropriate, not later than March 31, 1997, the following:

a. Written Material

i. Written materials (minimum of three types) to convey pertinent information to meet program objectives. Examples of written materials include flyers, brochures, door-hangers, newspaper articles, mail-inserts, and newsletters;

ii. Documentation that a reasonable effort was made to list pertinent city phone numbers under the government pages of phone directories. This should be updated as necessary and should include telephone numbers for reporting clogged catch basin inlets and/or illicit discharges/dumping, and a general number for storm water management program information. These phone numbers may be city-specific or countywide;

iii. Training materials for educating appropriate Permittee employees regarding compliance with applicable storm water permits;

iv. An up-to-date listing of contractor and developer storm water management training programs available in the area. This list should be updated annually;

v. An up-to-date checklist and a brochure explaining contractor and developer needs as they relate to Development Planning and Construction (Part 2.III) of this Order for use at a Permittee's planning/permitting counter. They should be updated annually; and

vi. Education materials (a minimum of three types) for targeted business sector audiences for use in site visits as per provisions in Part 2.V.B.2 of this Order.

b. Audio Material

Documentation that a reasonable effort was made by the Principal Permittee or on behalf of the Permittees as a whole to obtain radio broadcast public service announcements to convey information regarding storm water management.

c. Visual Material

A catch basin labeling program, including label installation and maintenance schedules, to educate the public on the ultimate destination of storm drain flows.

2. Each Permittee shall demonstrate by July 30, 1997, that it has undertaken the following activities:

a. Distribution of outreach materials to the general public, or targeted audiences such as schools, community groups, contractors and developers at the appropriate public counters and public events; and,

b. Training of the appropriate Permittee employees (those whose jobs or activities directly affect storm water quality, or those who respond to questions from the public) regarding the requirements of the storm water management program.

B. Industrial/Commercial Educational Program

Each Permittee shall develop an industrial/commercial site visit program. The purpose of such site visits will be solely educational and to provide industrial/commercial facilities with information regarding the Permittee's storm water program, and to provide advice when requested in understanding and complying with the Permittee's storm water regulations. To minimize cost, each Permittee is encouraged to coordinate its site visit program with existing fire, health, industrial wastes and/or other inspection type programs so that the Permittee need not institute new and separate site visit programs. The program shall contain the following components:

1. Identification of Sources

a. The Principal Permittee in consultation with the Permittees shall develop a database format for listing industrial/commercial facilities by four digit SIC Industry Numbers not later than January 31, 1997. This database will serve as a reference resource for the public, business, industry, local government, the Regional Board, and other public agencies on storm water program participation. The initial accuracy of the database will be dependent on the accuracy of electronic and information sources used to establish the database, but the accuracy is expected to improve after Permittees begin to implement the industrial/commercial site visit program. No legal import is to be attributed to the database developed by the Permittees. The database format shall include at a minimum:

i. Facility name;
ii. Site address;
iii. Watershed Management Area;
iv. Applicable SIC code(s); and
v. NPDES storm water permit coverage status, if applicable.

b. Each Permittee shall collect information based on the format developed by the Principal Permittee to identify industrial/commercial facilities within its jurisdiction and submit to the Principal Permittee not later than one year after the Principal Permittee provides the database format to the Permittees or for "iii" below not later than one year after designation of groups by the WMC. The list of facilities shall include, at a minimum:

i. All industrial groups regulated under Phase I of the Federal storm water program (40 CFR 122.26; Phase I Facilities);

ii. Motor vehicle repair shops, motor vehicle body shops, motor vehicle parts and accessories facilities, gas stations, and restaurants; and

iii. Additional SIC industrial/commercial groups identified as priorities by each WMC pursuant to this Order.

c. The Principal Permittee shall compile the information submitted by each Permittee into a database of industrial/commercial facilities not later than June 1, 1998. This database shall include:

i. For each four-digit SIC Industry Number, primary activities that might impact runoff discharges (from national or commercial database sources); and

ii. For each four-digit SIC Industry Number, primary materials that might impact runoff discharges (from national or commercial database).

2. Source Control Measures

The Principal Permittee, in consultation with the Permittees, shall develop a list of specific storm water BMPs for each industrial/commercial SIC group of facilities requiring educational site visits under Part 2.V.B.3. not later than May 30, 1997. The BMPs shall:

a. Address multiple pollutants;

b. Initially focus on pollutant source minimization, education, good housekeeping, and site design alternatives; and

c. Target source areas and activities with the highest potential to generate substantial pollutant loads.

The BMP lists shall be submitted to the Regional Board for approval, after which the Principal Permittees shall distribute them to the Permittees to be incorporated in each Permittee's outreach measures conducted during industrial/commercial site visits.

3. Educational Site Visits

a. Each Permittee shall implement an industrial/commercial educational site visit program according to the following schedule in Table 7, upon Regional Board approval of BMP checklists:

Table 7
Schedule of Educational Site Visits

FACILITIES	SITE VISIT FREQUENCY (No. of Contacts / Time period)
i) Phase I*, [i]-[ix] and [xi] with waste discharge or pretreatment permit	1 / 24 months **
ii) Phase I, [i]-[ix] and [xi] with no waste discharge or pretreatment permit but with GIASP	1 / 24 months**
iii) Phase I, [i]- [ix] with no waste discharge or pretreatment permit, and no GIASP	1 / 24 months**
iv) Phase I [xi] with no GIASP	1 / 5 years***
v) Vehicle repair shops, vehicle body shops, vehicle parts and accessories facilities	1 / 24 months**
vi) Gas stations	1 / 24 months**
vii) Restaurants	1 / 24 months**
viii) Facilities selected by WMCs	1 / 36 months

* See Glossary of Terms for definition
** Once in 24 months with a minimum of two site visits during the five-year term of this Order
*** See exception in text below

i. Phase 1 facilities in categories [i] through [ix] and [xi] which have an industrial waste discharge permit or a pretreatment permit, once every twenty-four months;

ii. Phase 1 facilities in categories [i] through [ix] and [xi], which do not have an industrial waste discharge permit or a pretreatment permit but have obtained coverage under the GIASP, once every twenty-four months;

iii. Phase 1 facilities in categories [i] through [ix], which do not have an industrial waste discharge permit, a pretreatment permit or GIASP coverage, once every twenty-four months;

iv. Phase 1 facilities in category [xi] without an industrial waste discharge permit, a pretreatment permit, or GIASP coverage. In lieu of a site visit, contact by phone, mail-out of questionnaire and educational materials, or other similar method to inform the facilities of notice of intent (NOI) requirements and encourage good storm water quality control measures (non-responders to be identified in annual report), once in five years;

v. Vehicle repair shops, vehicle body shops, vehicle parts and accessories (SIC Industry Major Group 75); once every twenty-four months;

vi. Gasoline stations (SIC Industry Number 5541); once every twenty-four months;

vii. Restaurants (SIC Industry Number 5812), once every twenty-four months; and,

viii. Additional SIC industrial/commercial groups identified by the WMC for the watershed in which the Permittee is located, once in thirty-six months, with a maximum limit of 3,000 additional site visits per Permittee during the term of this Order.

b. During the educational site visit, the Permittee shall:

i. Consult with a representative of the facility to explain applicable storm water regulations;

ii. Distribute and discuss applicable BMP and educational materials, including information regarding the codes, regulations, ordinances, and permits applicable to the category of the facility. In the case of

Phase I facilities, notify the facility of specific requirements under the Statewide Industrial General Permit including that such facilities must file an Notice of Intent (NOI) with the State Water Resources Control Board and that a Storm Water Pollution Prevention Plan (SWPPP) must be available on the site; and

iii. Follow-up with facilities, as deemed necessary and appropriate by the Permittee, to provide advice in complying with the Permittee's storm water ordinances, prohibitions, and other legal instruments.

c. Each Permittee shall submit to the Principal Permittee, on a quarterly basis, the lists of visited facilities identified by category. The Principal Permittee shall compile the submitted lists and submit them to the Executive Officer on a quarterly basis.

4. Alternative Programs

A Permittee may petition the Executive Officer to substitute the industrial/commercial educational program with an alternative industrial/commercial educational program that will achieve greater or substantially similar educational goals and which will be implemented within a similar period of time.

C. Five-Year Storm Water Public Education Strategy

A Five-Year Storm Water Public Education Strategy, which elaborates steps for implementing public education programs, shall be developed by the Principal Permittee. The strategy shall: communicate key educational information; develop educational programs for target audiences; utilize various innovative educational tools and incentives for participation; employ effective outreach to the region's multi-ethnic communities; and conduct opinion surveys to assist in evaluating public awareness both before and after implementation of the public education programs.

The Permittees shall endeavor to coordinate public outreach efforts among themselves, with environmental groups, and pertinent public and private agencies.

1. The Principal Permittee, in consultation with Permittees, shall develop not later than July 30, 1997, a Five-Year Countywide Storm Water Education Strategy which addresses education/outreach issues countywide as well as by watershed, including a schedule for implementation. The strategy shall include a full range of outreach tools, from simple brochures to sophisticated media. The strategy shall identify the Permittee's responsibilities for implementation, including specific objectives for changing knowledge and behavior.

The Principal Permittee shall submit the strategy to the Executive Officer for approval. Each Permittee shall implement the strategy not later than four months after commencement of its next fiscal year following approval of the strategy by the Executive Officer, provided, however, that such approval is issued not later than 90 days prior to the commencement of the Permittee's fiscal year. If such approval is given within 90 days of the commencement of a Permittee's fiscal year, such program shall be implemented in the second fiscal year following approval but in no event shall implementation be later than July 30, 1999.

At a minimum, the Five-Year Storm Water Education Strategy shall include actions for:

a. Identification of land uses and activities that have a higher potential for storm water pollution and will include and/or accomplish the following:

   i. Pollutants: The reduction of targeted pollutants of concern in a particular watershed; and

   ii. Activity-specific: Activity-specific outreach programs shall be developed and implemented using written, audio, or visual outreach tools.

   The strategy shall include activity-specific outreach programs that inform residents about the problem of illicit discharges and dumping and shall promote, publicize, and facilitate public reporting of these activities. The program shall also include continuing operation, maintenance, and promotion of the countywide reporting hotline.

b. Emphasis on the importance of pollution prevention for a variety of audiences, including local residents, school-aged children, businesses, and public employees whose job functions and daily lives may impact storm water quality. Efforts will include and/or accomplish the following:

   i. For Residents

      aa. Educate residents on recycling and household hazardous waste disposal options. The program shall provide information on collection services, including locations and schedule; provide outreach materials on source reduction and proper use, storage, and disposal methods for household hazardous wastes; and continue to encourage residents to recycle, e.g., oil, antifreeze, glass, plastics, and batteries.

      bb. Encourage residents to participate in specific storm water outreach programs. Residents shall be informed of and provided with the opportunity to share ideas and comments about the programs. Each Permittee shall demonstrate that a good faith effort has been made

to outreach to different communities within the watershed management area or region and to receive feedback from the communities while measuring success of the program.

cc. Educate do-it-yourselfers regarding pollution prevention strategies. Each Permittee shall demonstrate that a good faith effort has been made to outreach to different communities within the watershed management area or region.

dd. Promote public participation through cooperative programs to foster awareness and identification of storm water pollution issues among residents in a watershed. Catch basin labeling and other established sign programs are examples of this type of cooperative effort. Another example for cooperative outreach is an "Adopt-A-" program. Residents can "adopt" highways, storm drains, catch basins, or streams to monitor, restore, and protect them.

ee. Residents shall be encouraged to mow vegetation surrounding their residence rather than disk.

ii. For School Children

School programs shall be developed and implemented wherever possible to include information on MS4s, the difference between sanitary sewers and storm drains, the importance of preventing storm water pollution, and provide illicit discharges/disposal and reporting procedures, source minimization, and general pollution prevention. Acquisition and/or development of classroom materials and their distribution to teachers are encouraged.

iii. For Businesses

aa. An education and outreach program shall be developed and implemented for business activities identified as having greater potential of discharging pollutants into the MS4. This includes sidewalk washing by individual merchants. The program shall encourage employee training on the effectiveness of storm water pollution prevention practices. In addition to written, audio, and visual materials, other possible means of focused outreach may include: conducting workshops, mass mailings, and submitting informational articles to trade/industry magazines. Each Permittee shall provide outreach materials through business license renewal counters and/or make efforts to outreach through professional and business associations or industrial/commercial site visits.

bb. Construction

An education program shall be developed and implemented for construction contractors, owners, builders, and do-it-yourselfers on proper BMP implementation and maintenance, and pollution prevention.

iv. Appropriate Permittee Employees

Permittee employees involved in storm water related activities shall be trained on storm water management and pollution prevention practices. Cooperative efforts among enforcement agencies should be encouraged.

Training programs shall include, but not be limited to, articles in city newsletters, training classes, checklists for field personnel, and interdepartmental forums or committees to the extent the Permittee utilizes any of the foregoing. Materials developed for other audiences may also be used in Permittee employee training programs. Appropriate public agency employees shall be trained in:

aa. Emergency spill cleanup procedures and hotline phone numbers;

bb. Environmentally sensitive alternative products;

cc. Good housekeeping practices; and,

dd. Municipal NPDES and other permitting requirements.

This space is left intentionally blank.

VI. Monitoring Program

A. Objectives

The overall goal of this monitoring program is to develop and support effective watershed storm water quality management programs towards reduction of pollutants to the maximum extent practicable.

The major specific objectives of program are as follows:

1. To track water quality status, pollutant trends and pollutant loads, and identify pollutants of concern;
2. To monitor and assess pollutant loads from specific land uses and watershed areas;
3. To identify, monitor, and assess significant water quality problems related to storm water discharges within the watershed;
4. To identify sources of pollutants in storm water runoff;
5. To identify and eliminate illicit discharges;
6. To evaluate the effectiveness of management programs, including pollutant reductions achieved by implementation of BMPs; and,
7. To assess the impacts of storm water runoff on receiving waters.

B. Monitoring Program Requirements

The Principal Permittee shall implement the monitoring program described in Attachment C, Monitoring Program Requirements. The summary of the monitoring program requirements and compliance dates are given in Table 8 on the following page.

This space is left intentionally blank.

Table 8
Monitoring Requirements And Compliance Dates

Requirement	Permit Attachment	Principal Permittee	Permittees	Months from Order Adoption Compliance Date)
Begin re-evaluation of land use monitoring station locations	C.1.a	✓		
Complete re-evaluation of land use monitoring station locations	C.1.a	✓		Upon EO* approval- Sept 1, 1996
Monitor land use stations at prescribed storm event frequency	C.1.c	✓		0
Implement a pilot study monitoring program from one sampler at a land use station to sample storm greater than .1 inches of rainfall	C.1.d	✓		0
Monitor at mass emission stations	C.2.a	✓		0
Submit a report for characterizing critical sources and BMPs	C.3.b	✓		Sept 1, 1996
Conduct a program for characterizing critical sources and BMPs	C.3.b	✓		Upon EO* approval
Install and evaluate BMPs appropriate to the critical sources	C.3.d	✓		Second full rainy season
Re-evaluate progress made by other entities within the state to evaluate critical sources and BMPs	C.3.e	✓		Third full rainy season
Submit a workplan for Loads Assessment model	C.4	✓		18 (January 30, 1998)
Fund a receiving waters study	C.5	✓		
Prepare, retain, and revise a Monitoring Plan	VI.C.1	✓		Submit to the EO* when so requested

* Executive Officer

VII. Program Reporting and Evaluation

Table 9 shows the summary of requirements under this section with corresponding compliance dates.

Table 9
Program Evaluation and Reporting Requirements and Compliance Dates

Requirement	Permit Section	Principal Permittee	Permittees	Months from Effective Date of Order (Compliance Date)	For Approval By
Develop standard Annual Reporting format, including reporting forms	VII.A.1	✓		6	Executive Officer
Submit Annual Report to Regional Board	VII.A.2	✓		Every October 15	N/A
Submit an Annual Monitoring Report	VII.B	✓		Every July 15	N/A
Submit a Program Evaluation Report of 5-Year Strategy	VII.C.1	✓		48 (July 31, 2000)	N/A
Submit Assessment of Effectiveness of CSWMP Components	VII.C.2	✓		48 (July 31, 2000)	N/A
Submit Recommendations for Development of Performance Standards for selected CSWMP Components	VII.C.3	✓		54 (February 1, 2001)	N/A
Submit a Receiving Water Impacts Report	VII.D	✓		48 (July 31, 2000)	N/A
Submit WMAPs	Part 3.VI		✓	To be included with ROWD. (February 1, 2001)	Executive Officer

A. Annual Program Report

1. The Principal Permittee shall, not later than January 31, 1997, develop a standard annual program reporting format for use by Permittees, including reporting forms.

2. The Principal Permittee, in coordination with the Permittees, shall submit an Annual Program Report to the Executive Officer on or before October 15 of each year. The first Annual Report is due October 15, 1997. The Annual Program Report shall comply with 40 CFR §122.42(c) and include, at a minimum:

   a. The implementation status of program tasks contained in this Order, CSWMP, and/or WMAP, as applicable to each Permittee;

   b. The status of, or statement of completion of all components and milestones described in this Order, CSWMP, and/or WMAP, as applicable to each Permittee;

   c. Results of program tasks contained in this Order, CSWMP, and/or WMAP, as applicable to each Permittee;

   d. Program accomplishments and self-assessment of strategy effectiveness (including how the Permittee arrived at new program elements, if any) by each Permittee, organized by Watershed Management Areas, in the areas of (i) Program Management; (ii) Illicit Connections/Discharges; (iii) Development Planning/Construction; (iv) Public Agency Activities; (v) Public Education/Public Participation;

   e. A summary of BMP implementation, Permittee level of effort, and other such measures of achieving storm water program objectives, utilizing uniform information and data collection methodology to support area-to-area, and year-to-year comparisons;

   f. The names, titles, and telephone numbers of personnel responsible for supervising implementation of the program tasks contained in this Order, CSWMP, and/or WMAP, as applicable to each Permittee.

   g. Recommended changes and/or modifications to the programs identified in this Order, CSWMP, and/or WMAP.

B. Annual Monitoring Report

The Principal Permittee shall submit a separate Annual Monitoring Report by July 15 of each year. The first Annual Monitoring Report is due on July 15, 1997. The report shall include status of implementation of the monitoring program, results of the monitoring program and interpretation thereof, and suggested modifications or amendments to the Monitoring Program with relevant justifications.

C. Program Evaluation Report

1. The Principal Permittee, shall, not later than July 31, 2000, complete an analysis of the general success of the Five-Year Storm Water Public Education Strategy and identify its accomplishments. This report shall serve as the basis for the next Five-year Storm Water Public Education Strategy that will be part of the ROWD.

2. The Principal Permittee shall, not later than July 31, 2000, and in consultation with the Permittees, prepare and submit a report on the assessment of the effectiveness of the CSWMP components (except that identified in C.1.).

3. The Principal Permittee shall, not later than February 1, 2001, submit a report on the identification of CSWMP components for which performance standards will be developed and implemented during the next term of the permit. The report shall include a schedule of development of performance standards. The performance standards will indicate the level of implementation necessary to demonstrate that efforts are being made to reduce the discharge of pollutants in storm water to the maximum extent practicable. This report will be an integral part of the ROWD.

D. Integrated Receiving Water Impacts Report

The Principal Permittee shall not later than July 31, 2000, prepare and submit an Integrated Receiving Water Impacts Report. The report shall include, but not be limited to a comprehensive analysis of the results of the different monitoring data (land use, mass emissions, critical source, load assessment, receiving waters, and other pertinent studies available), and feasible environmental indicators. It should also include recommendations on future monitoring requirements, e.g., integration of storm water receiving water monitoring with regional receiving water monitoring, if applicable. This report will be an integral part of the ROWD.

Part 3. STANDARD PROVISIONS

I. The initial storm water management program, as delineated in the CSWMP or WMAPs may need to be modified, revised, or amended periodically to respond to changed conditions and to incorporate more effective approaches to pollutant controls. Minor changes may be made at the direction of the Executive Officer. Minor changes requested by the Permittees shall become effective upon written approval of the Executive Officer. If proposed changes involved a major revision in the overall scope of the program, such changes must be approved by the Regional Board as amendments to this Order.

II. Except as otherwise provided in this Order, all reports or submittals made directly to the Executive Officer or through the Principal Permittee shall be signed under penalty of perjury by the principal executive officer or the ranking elected official of the Permittee or a duly authorized representative if:

A. The authorization is made in writing by a person described above;

B. The authorization specifies either an individual or a position having responsibility for the overall operation of the Permittee's storm water management program, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the Permittee. A duly authorized representative may thus be either a named individual or any individual occupying a named position; and

C. The written authorization is submitted to the Executive Officer.

III. This Order may only be modified, revoked, or reissued, prior to the expiration date, by the Regional Board, in accordance with the procedural requirements of the Water Code and Title 23 of the California Code Regulations for the issuance of waste discharge requirements, and upon prior notice and hearing, to:

A. Address changed conditions identified in the required reports or other sources deemed significant by the Regional Board;

B. Incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;

C. Comply with any applicable requirements, guidelines, and/or regulations issued or approved pursuant to CWA Section 402(p); and/or

D. Consider any other federal, or state laws or regulations that became effective after adoption of this Order.

IV. The Permittees shall continue to implement the BMPs and/or programs that were required pursuant to Order No. 90-079 until such time that replacement BMPs/programs are implemented under this Order. Except for the foregoing, enforcement purposes, and applicability to the State of California Department of Transportation (Caltrans), Order No. 90-079 (NPDES Permit No. CA0061654) is hereby superseded and replaced by this Order.

V. The issuance of this Order is not intended to, and does not, absolve any Permittee of liability for conduct which may have constituted a violation of Order 90-079 (CA0061654, CI 6948) adopted by this Regional Board on June 18, 1990, nor is it intended to impose any liability on any Permittee or person for any conduct prior to the effective date of this Order.

VI. This Order expires on July 30, 2001. The Principal Permittee and Permittees must submit complete Reports of Waste Discharge (ROWD) in accordance with Title 23, California Code of Regulations, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements. The ROWD shall include watershed-specific WMAPs.

I, Robert P. Ghirelli, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on July 15, 1996.

MONITORING PROGRAM REQUIREMENTS

A. MONITORING PLAN

The Principal Permittee shall prepare, maintain, and update, if necessary, a monitoring plan which shall include at a minimum, the following:

1. Quality control, quality assurance, data collection, storage and analyses, and detection limits;

2. All sample collection, handling, storage, and analyses in accordance with 40 CFR 136;

3. Location of monitoring stations, constituents, and sampling frequency;

4. Targeted monitoring indicators (e. g., ecosystem, biological diversity, in stream toxicity, habitat, chemical, sediment, stream health) chosen for monitoring;

5. Statistical methods used to design studies, conduct sampling, and interpret data;

6. A description of the role and responsibilities of all the participants in monitoring studies;

7. A description of computer software and modelling programs that will be utilized to assess data, interpret information; and

8. A general description of how data are intended to be utilized for feedback into the storm water management program.

An up-to-date Monitoring Plan shall be submitted to the Executive Officer, when so requested.

B. MONITORING PROGRAM

The following monitoring program is designed to meet the objectives stated under Part 2.VI of this Order:

1. Land Use Station Monitoring

   a. The Principal Permittee shall reevaluate the location of existing monitoring stations (established under Order No. 90-079) reflecting specific land uses ("land use stations") consistent with the cost-benefit methodology described in Attachment C-1. Upon completion of Step 6 of the reevaluation process, but not later than

September 1, 1996, the Principal Permittee shall submit a report to the Executive Officer outlining the steps taken in the reevaluation process; and recommend land use categories to be monitored. Based on results of the reevaluation process, existing land use stations established pursuant to Order 90-079, may be moved to monitor recommended land use categories for monitoring. Existing land use stations under Order 90-079 which do not reflect land use categories recommended for monitoring under the cost-benefit analysis or which are duplicative of other stations will be decommissioned.

b. Upon approval of the report by the Executive Officer, the Principal Permittee shall complete Steps 7-8 of the reevaluation process in Attachment C-1.

c. The Principal Permittee shall monitor land use stations according to the following schedule provided there are sufficient storm events during the season:

Storm Season	Number of Station Events/Storm Season
1996-97	100
1997-98, and thereafter	200

A station event is defined as one sampling event per station.

The land use stations shall be monitored during the term of this Order or until such time that event mean concentrations (EMC) are derived, at the 25% error rate, for the following constituents of concern:

PAHs (total)	Chlordane	Cadmium
Copper	Nickel	Lead
Chromium	Silver	Zinc
Selenium	Mercury	Total Nitrogen
Total Phosphorus	Total Suspended Solids	Diazinon
Chlorpyrifos	Malathion	Simazine
Total DDT	Total PCBs	

The Executive Officer may add or delete constituents of concern. However, for constituents added after the commencement of the second rainy season under the Order, the Principal Permittee need not derive an EMC at an error rate of 25% prior to closing a land use station.

d. All samples for land use station monitoring may be taken with the same type of automatic sampler used under Order 90-079. The samplers shall be set to monitor storms totalling 0.25 inches or greater of rainfall. The constituents to be analyzed are listed in Attachment C-3. The Principal Permittee, for land use sites,

may exclude constituents from the list that require grab sampling.

In addition, the Principal Permittee shall, as a pilot study, set one land use sampler to monitor storms from 0.1 inch of rainfall. Based upon an assessment of the following, a decision will be made as to whether to set some or all of the remaining land use samplers to monitor storms totalling 0.1 inches of rainfall or greater: 1) the operational effectiveness of the sampler; 2) the feasibility and effectiveness of sample retrieval and transport; and 3) the ability to reprogram and maintain this setting at other samplers.

e. If a constituent is not detected at the method detection limit (MDL) for its respective test method listed in Attachment C-3 in more than 25 percent of the first ten sampling events or on a rolling basis using ten consecutive sampling events, it will not be further analyzed unless the observed occurrences show high concentrations and are cause for concern. The Principal Permittee will also conduct annual confirmation sampling for non-detected constituents at each station for as long as the station is monitored.

2. Mass Emission Station Monitoring

a. The Principal Permittee shall monitor a total of four mass emission stations. During the 1995-96 storm season, monitoring shall be conducted only at the Ballona Creek and Malibu Creek monitoring stations established under Order 90-079. During the 1996-97 storm season, monitoring shall begin at the San Gabriel River and Los Angeles River (downstream of Wardlow Road) stations. The Principal Permittee shall monitor at the Ballona Creek and Malibu Creek monitoring stations during the 1995-1996 storm season up to ten station events per year including dry weather sampling. Thereafter, monitoring shall be reduced at all stations to a maximum of five events per year. Mass emission station monitoring frequency will be evaluated after the 1998-1999 storm season. However, regardless of the results, monitoring shall not exceed five storm events per station for the 1999-2000 storm season.

b. Samples for mass emission station monitoring shall be taken with the same type of automatic sampler used under Order 90-079, as well as through grab sampling. The samplers shall be set to monitor storms totalling 0.25 inches or greater of rainfall. The constituents to be analyzed for samples taken at mass emission stations are listed in Attachment C-3. The Principal Permittee may elect not to sample Volatile Organic Compounds from the list of constituents for mass emission stations.

c. If a constituent is not detected at the method detection limit for its respective test method listed in Attachment C-3 in more than 25 percent of the first ten sampling events or on a rolling basis using ten consecutive sampling events, it will not be

further analyzed unless the observed occurrences show high concentrations and are cause for concern.

d. With the exception of the stations noted in (2)(a) above, monitoring at other mass emission stations installed under Order 90-079 shall be discontinued and the stations decommissioned.

3. Critical Source/Best Management Practice Monitoring

The Principal Permittee shall conduct a program for monitoring critical sources to characterize sources of storm water pollutants and assess effectiveness of BMPs. The program shall be consistent with the following:

a. Selection of Critical Sources: The Principal Permittee will select critical sources for monitoring based on the methodology described in Attachment C-4 (Critical Source/BMP Monitoring). A total of five (5) critical sources will be monitored over six rainy seasons commencing with the 1996-97 rainy season, subject to the provisions of (3)(d) below.

b. Not later than September 1, 1996, the Principal Permittee shall submit a report to the Executive Officer for approval on the critical source selection process and recommend critical sources for evaluation. Upon approval of the report, the Principal Permittee shall proceed to conduct the activities set forth in (3)(c-f).

c. Characterization of Critical Sources: Commencing with the 1996-97 rainy season, the Principal Permittee shall commence the characterization of critical sources. A total of six (6) representative sites of each critical source will be characterized through analysis of runoff. Fewer representative sites may be selected due to distance considerations and/or the unavailability of sufficient source locations willing to participate in the program. A total of at least five (5) storms will be used to characterize the critical source runoff. Samples will be analyzed for those pollutants anticipated to be found in the critical source storm runoff and such analytes will be partitioned, as appropriate, to determine the soluble and suspended fractions.

d. Evaluation of BMPs: In the year after a critical source has been characterized, a BMP or BMPs appropriate to the critical source will be selected and installed at up to half of the critical source examples (the "test sites"). Flow from the remaining source representative sites (the "control sites") will continue to be analyzed. A total of ten (10) targeted storm events will be monitored to assess the effectiveness of the BMPs. If there are insufficient storm events during the year, the evaluation may be continued during the next storm season. The Principal Permittee's monitoring of critical sources and evaluation of BMPs will be concluded by the end of the sixth full rainy season after the adoption of this Order, provided that sufficient number of storms have occurred.

e. Additional Evaluation: After the third full rainy season following the adoption of the Order, the Principal Permittee will reevaluate, the progress made by other public entities in the State to evaluate critical sources and BMPs. If after the evaluation, the Principal Permittee determines that there are either additional critical sources, or BMPs associated with identified significant critical sources which have not been monitored and/or evaluated, the Principal Permittee, subject to the approval of the Executive Officer, will undertake "Additional Monitoring". The Additional Monitoring will consist of monitoring up to three (3) additional critical sources, or evaluate up to an additional three (3) BMP sets, or some combination thereof totalling three. The extent of Additional Monitoring will be dependent on the Principal Permittee's ability to complete the monitoring/evaluation described in(3)(c-d) above; if more time is needed to complete such monitoring, the extent of the Additional Monitoring shall be accordingly reduced.

4. Loads Assessment Model

The Principal Permittee shall, not later than January 15, 1998, submit to the Executive Officer for approval a workplan for performing a loads assessment analysis for each of the six WMAs to determine pollutant loads entering the ocean from receiving waters in the county. The assessment shall be conducted following the third full rainy season after adoption of this Order using the collected monitoring data from the land use and mass emission stations (including data collected from stations monitored under Order No. 90-079) and employing the USEPA simplified model.

5. Receiving Waters Study

The Principal Permittee, in conjunction with other participants that it may choose, will fund a study of receiving waters impacted by storm water described in Attachment C-5, subject to revisions as set forth below in (5)(d). The purpose of the study will be to study the impacts, if any, of storm water/non-storm water discharges on the beneficial uses of Santa Monica Bay and to assist the Permittees in developing storm water management programs. The obligation of the Principal Permittee under this Order with respect to the receiving waters study shall consist of the following:

a. Plume Study: The Principal Permittee will support a plume study to evaluate the dispersion, fate, and transport of storm water pollutants in Ballona Creek and Malibu Creek, through a contribution of up to a maximum of $145,000.

b. Benthic Study: The Principal Permittee will support a study to assess impacts of storm water on the marine benthic community near the mouths of Ballona Creek and Malibu Creek, through a contribution of up to a maximum of $205,000. If it is the consensus of project scientists that a third year of benthic study is advisable to meet the goals of the receiving waters study, the Principal Permittee will contribute up to a maximum of an additional $80,000 for the third year of study.

c. Toxicity Study: The Principal Permittee will support a study to evaluate sediment and water column toxicity in Ballona Creek and Malibu Creek through a contribution of up to a maximum of $118,500. If it is the consensus of the project scientists that a third year of toxicity studies is advisable to meet the goals of the receiving waters study, the Principal Permittee will contribute up to a maximum of $80,500 to fund a third year of study.

d. River Study: The Principal Permittee will take a total of three (two storm weather and one dry weather) water samples at each of the Los Angeles and San Gabriel River mass emission stations during the 1997-98 and 1998-99 seasons. The samples will be subjected to sea urchin fertilization bioassays to evaluate water column toxicity, with the Principal Permittee's out-of-pocket expenses for the study not to exceed $3,600.

e. Project Design: The receiving waters study shall initially contain the elements established in Attachment C-5. However, the scientists conducting the receiving waters study may alter the parameters of the second and (if necessary) the third year of the receiving waters study so as to meet the objectives of the study. Such alterations may include changing of sampling locations, use of different sampling techniques, or other pertinent redirection of resources. The Principal Permittee shall notify the Executive Officer of any revisions to the second and (if necessary) third years of the receiving waters study for review and approval.

f. Study Reports: The Principal Permittee shall require the project scientists conducting the study to prepare an annual report covering study activities of the previous year, and any interim/final assessments. Such reports shall be submitted by the Principal Permittee to the Executive Officer with the Annual Monitoring Report.

g. Principal Permittee Responsibilities: The commitments of the Principal Permittee toward performance of a receiving waters study are: providing funding, and submittal of progress and final reports.

ATTACHMENT C-1

LAND USE SITE SELECTION PROCESS OUTLINE

Step 1

The Principal Permittee will take the Southern California Association of Governments ("SCAG") categories listed below as an initial list of land use categories. The Principal Permittee will use its best efforts to obtain overlays (or similar information) for use in the land use selection process. However, these overlays or information must be usable County-wide in the SCAG database and the Principal Permittee shall not be required to look for or use overlays or information which cannot be so used. The Principal Permittee also shall not be required to create overlays. Some of these categories may not be important (very small area represented in study area, and/or known very low EMC or runoff mass). The initial number of categories will be reduced at this step.

For each remaining category, the Principal Permittee will identify eight (8) representative locations. The eight (8) locations in each category would be relatively small areas, such as a square block for residential areas, a single school or church, a few blocks of strip commercial, etc. These sites would be selected, where possible, over a wide geographical area of the study area to include a range of topographical characteristics such as distance from ocean, etc.

Step 2

In this step, the Principal Permittee should perform a site survey of ground conditions. For each of the eight (8) locations identified for each category, the Principal Permittee will collect information, to the extent such information is available, including: type of roof connections, type of drainage, age of development, housing density, type of landscaping, condition of pavement, soils, and existing storm water control practices.

These are simple field surveys that can be completed by a team of two people at the rate of about 5-6 (maximum) locations a day, depending on navigation problems, traffic delays, and the proximity of the sites. Several photographs should be made of each site and archived with the field sheets for future reference.

Step 3

In this step, currently available and usable aerial photographs taken in the past five years are used to measure the percent impervious area associated with rooftops, streets, driveways, sidewalks, parking areas, storage areas, decks and sheds, swimming pools, alleyways, and other paved areas. Photographic prints for each of the homogeneous neighborhoods examined on the ground in step 2 are needed. The actual measurements require about an hour per site.

Step 4

In this step, the Principal Permittee will compile the information collected in the previous steps and use it to determine which land use categories should be monitored. This refinement step will result in a final list of categories to be examined, based on the actual measured values.

Some of the sites selected for field measurement may actually belong in another category and would be reassigned to that category before the data were evaluated. In addition, development characteristics and areas of important elements may indicate greater variability within an initial category than between other categories in the same land use. If there is no other reason to suspect differences that would affect drainage quality or quantity, these areas could be combined to reduce the total number of individual land use categories used in subsequent evaluations.

On the basis of Step 2 and Step 3, the Principal Permittee will measure the percent of directly connected impervious area for each of the eight neighborhoods surveyed. The Principal Permittee will then compare the percent of impervious area using simple non-parametric statistics to see how differences within a single land use category compare with differences between land use categories. Based on this analysis, the Principal Permittee will aggregate or subdivide land use categories as appropriate. Subdivisions of land use categories shall correspond to those in the SCAG database.

Step 5

Next, the Principal Permittee will rank the selected land use categories according to their predominance and pollutant generation. As part of its analysis, the Principal Permittee will perform a marginal cost/benefit analysis as to which land use categories should be monitored.

For each land use category the following will be estimated based on existing data: drainage area, runoff quantity and an EMC value for each of four indicator pollutants (preliminarily, copper, pyrene, total suspended solids and diazinon). The product of runoff quantity and EMC is the estimated total annual pollutant loading associated with each land use category and indicator pollutant. These sums are then ranked, from the largest to the lowest, and an accumulated percentage contribution is then produced for each pollutant. These accumulated percentage values are plotted against the number of land use categories. The graph will be relatively steep initially and then level off as it approaches 100%. A marginal cost-benefit analysis can then be used to select the number of land uses that should be monitored, which will take into account all four of the indicator pollutants.

The list of County-wide land use categories to be evaluated in Step 5 will be reviewed for each of the six watersheds in the Permit area. If there is a land use category in an individual watershed which may be feasibly monitored and is in the top five land uses in terms of total area in the watershed and is otherwise an important contributor of constituents of concern, but which would not be monitored based on the County-wide marginal cost-benefit analysis, up to two such land uses shall be monitored after the first year of the monitoring program, subject to the station event cap.

Step 6

The Principal Permittee will take the top ranked land uses and if the total number of categories exceed ten, select ten monitoring sites for monitoring the first year. All of the remaining top-ranked land uses will need

to be monitored in future years, subject to the station event cap. In selecting those sites for initial monitoring, the Principal Permittee should look for homogeneous areas that are self-contained in a drainage area. In addition, monitoring locations will need to be selected along storm drains that are able to accommodate the sampling equipment, have sampling access, no safety problems, etc.

Step 7

Next, the monitoring stations are installed. The monitoring equipment will include automatic water samplers and, if surcharging flow problems are anticipated, flow sensors measuring velocity and depth of flow. The samples collected at the automatic samplers should all be flow-weighted composites, requiring only one sample to be analyzed per event at each monitoring station. Each sampler site will need to be visited periodically to ensure that everything is ready to sample.

Step 8

The Principal Permittee will continue down the list of priority land use categories and install additional monitoring stations in subsequent years. At some point, the marginal benefit from monitoring an additional land use category will not be sufficient to justify the cost, as determined from the marginal cost-benefit analysis in step 5, and no additional sites will need to be installed. The land use sampling program will end when sufficient storms have been sampled to obtain the desired error level in the EMC values for the constituents of concern.

ATTACHMENT C-4

CRITICAL SOURCE/ BMP MONITORING

Selection of Initial Critical Sources to be Studied: The selection of initial critical sources will be made using the following steps:

Step 1: The Principal Permittee first will develop an initial list of candidate critical sources, including industrial and commercial sources that are regulated under the state's General Permit and those which are not.

Step 2: The Principal Permittee next will develop a list of criteria for prioritizing the candidate critical sources developed pursuant to Step 1, including the following: number and/or total area associated with each critical source; runoff pollutants associated with each source; the impact of non stormwater discharges associated with each source; whether or not the source is regulated under the General Permit; and, ease of implementation of monitoring and BMPs.

Step 3: The Principal Permittee next will prioritize the candidate critical sources based on the selection criteria develop under Step 2.

Step 4: The Principal Permittee next will conduct a literature review and contact other state municipal stormwater programs to identify what critical sources have been (or are planned in the next five years) to be studied elsewhere. Where studies have been conducted or are planned to be conducted elsewhere, such studies will be reviewed to assess whether the hydrologic conditions in the study area are representative of those in Los Angeles County, the quality of the study, and any conclusions from studies already conducted. This evaluation will be coordinated with the State Stormwater Quality Task Force.

Step 5: The Principal Permittee next will take the list developed in Step 3 and refine and finalize it based upon the review conducted pursuant to Step 4.

Selection of Additional Critical Sources/BMPs: The selection of additional critical sources or BMPs for monitoring following the third rainy season from the adoption of this Order will follow the steps noted above, except that BMPs be evaluated in addition to critical sources.

ATTACHMENT C-5

RECEIVING WATERS STUDY

A receiving waters study will be a joint effort among the University of Southern California, the University of California at Santa Barbara and the Southern California Coastal Water Research Project ("SCCWRP"). In addition, the study will be done in cooperation with an ongoing toxicity study by investigators at UCLA. Co-funding, either direct or in terms of vessel support, will be provided by the federal government through the Sea Grant program, and by the City of Los Angeles through SCCWRP. It must be noted that while the Principal Permittee is committed to funding a receiving waters study, the scope of that study will be affected by the availability of non-Principal Permittee funding sources, as discussed below. The Principal Permittee's commitment is limited to the provision of funds.

A. Outline of Study: The receiving waters study includes a plume study to determine the dispersion of stormwater runoff and associated sediment, a study of the benthic environment near two principal storm drains, Malibu and Ballona Creeks, and an assessment of the toxicity of storm drain waters and affected sediments near Malibu and Ballona Creeks. The plume study will be carried out by the USC Sea Grant program. The benthic and toxicity studies will be carried out by SCCWRP. All of these studies will be carried out over two storm seasons, with the third year used for analysis of the data obtained in the previous years. If it is the consensus of the project scientists that a third year of research is appropriate for the benthic and toxicity studies, such study shall be carried out. Each element of these studies is outlined below.

1. Plume Study: The plume study will be conducted over two storm seasons to, at a minimum, accomplish the following:

   - Map the spatial and temporal structure of the runoff plumes from Ballona and Malibu Creeks as they flow into Santa Monica Bay following strong winter storms.
   - Examine the interaction between the runoff plume and ocean processes as they affect the advection, dispersion, and mixing of the plume.
   - Evaluate the impact of storm runoff plumes on beneficial uses of the coastal ocean.
   - Characterize the optical properties of the suspended particulate material ("SPM") and dissolved organic material ("DOM") associated with runoff sources.
   - Examine the effects of DOM and SPM on the water column optics and the distribution of nutrient concentrations, as the same may affect phytoplankton productivity.
   - Assist in establishing appropriate locations for benthic study stations.

2. Benthic Study: The benthic study will measure the following parameters:

   - Water quality (dissolved oxygen, salinity, density, temperature, light transmissivity and pH).
   - Sediment grain size, sediment organic concentrations and sediment contaminant concentrations.
   - The structure of the benthic invertebrate community.

   The benthic study will employ the same methods used in studies of dry weather impacts in river discharge areas carried out by SCCWRP in 1994 and 1995 in the entire Southern California Bight.

3. Toxicity Study: The toxicity study will involve the following proposed annual elements:
   Water Column Toxicity

   - 30 sea urchin fertilization bioassays taken during two storm and one dry weather event off each of Ballona and Malibu Creeks (including reference sites).
   - 3 Phase I TIE tests on up to 3 samples showing toxicity in the sea urchin fertilization bioassays

   Sediment Toxicity

   - Amphipod survival bioassays of sediment samples from 10 stations (including reference sites) will be taken 2 times (1 storm and 1 dry weather period) in Year 1.
   - Amphipod survival bioassays of sediment samples from 10 stations (including reference sites) will be taken 2 times (1 storm and 1 dry weather period) in Year 2.
   - Sea urchin growth bioassays will be conducted for chronic toxicity in sediment samples from 6 stations, plus 1 reference site, with the locations to be determined by project scientists based on existing data and best scientific judgment. Biological effects only (survival, growth, sediment avoidance) will be measured for all sites in Year 2.
   - Chemical analysis of sea urchin growth test tissue samples (gonad) will be conducted for organics and metals. Duplicate samples from 4 stations (including one reference) will be analyzed in Year 2.
   - Phase I TIE tests using sea urchin fertilization of interstitial water from up to 4 stations identified to be toxic in amphipod survival bioassays (4 samples total) will be conducted in Year 2.
   - Additional interstitial water testing intended to coordinate with the UCLA study

noted below may also be carried out.

B. Project Flexibility: The exact parameters of Year 2 (and Year 3, if necessary) testing will be determined through a review by the project scientists of the results of Year 1 and Year 2 testing. Thus, the steps outlined above may be modified following the reviews.

C. Coordination with UCLA Toxicity Study: UCLA researchers are involved in an ongoing Santa Monica Bay Restoration Project study of the toxicity of stormwater runoff in Ballona and Malibu Creeks. The receiving waters study shall be coordinated, to the extent possible, with the UCLA study to maximize the utility of information obtained by both studies.

D. Los Angeles and San Gabriel River Study: In addition, the Principal Permittee will take a total of three (two storm weather and one dry weather) water samples taken at each of the Los Angeles and San Gabriel River mass emission stations during each of the first two years that those stations are monitored. The samples will be analyzed using the sea urchin fertilization bioassay, with the bioassay costs not to exceed $3,600.

ATTACHMENT D

GLOSSARY OF TERMS

40 CFR: Title 40 of the Code of Federal Regulations, which is the codification of the general and permanent rules published in the Federal Register by the executive departments and agencies of the federal government.

Adverse Impact: A detrimental effect upon water quality or beneficial uses caused by a discharge or loading of a pollutant or pollutants. See also "Impact".

Authorized Discharge: Any discharge that is authorized pursuant to an NPDES permit or meets the conditions set forth in this Order.

Basin Plan: Refers to the Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties, adopted by the Regional Board on June 13, 1994 and subsequent amendments.

Beneficial Uses: Existing or potential uses of receiving waters in the permit area as designated by the Regional Board in the Basin Plan.

BAT/BCT Criteria: Treatment-based standards for reducing the discharge of pollutants, as defined in 40 CFR subchapter N, for specific categories of industrial facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards. Effluent limitations have been defined in 40 CFR for the reduction of toxic pollutants using Best Available Technology Economically Achievable (BAT) and for the reduction of conventional pollutants using Best Conventional Pollutant Control Technology (BCT).

BMP: See Best Management Practice

Best Management Practice (BMP): Activities, practices, facilities, and/or procedures that when implemented to their maximum efficiency will prevent or reduce pollutants in discharges. Examples of BMPs may include public education and outreach, proper planning of development projects, proper clean out of catch basin inlets, and proper sludge or waste handling and disposal, among others.

Bioaccumulate: The build up of a substance in the tissues of an organism to a higher concentration than in the surrounding environment, generally as a result of the organism's ingestion and internal storage of the substance over time.

Biostimulatory: An agent, action, or condition that arouses, elicits or accelerates physiological or organic activity. For example, the introduction of excessive nutrients to an aquatic system has a biostimulatory effect which manifests itself as excessive growth of algae in the aquatic systems. As the algae decomposes, dissolved oxygen in the water column is depleted, potentially leading to excessively low dissolved oxygen levels which can lead to suffocation of aquatic life, i.e., fish kills.

CFR: See Code of Federal Regulations.

CRWQCB: The California Regional Water Quality Control Board, Los Angeles Region. See also Regional Board.

CSWMP: See Countywide Storm Water Management Plan

California Storm Water Best Management Practice Handbooks: The technical manuals prepared under direction of the Storm Water Quality Task Force, representing California members of the American Public Works Association (APWA). Comprising three volumes—Municipal, Industrial, and Construction—they provide guidance for selecting BMPs to reduce pollutants in storm water discharges. These manuals are currently available from Blue Print Service, 1700 Jefferson Street, Oakland, CA 94612, (510) 444-6771 or Fax (510) 444-1262.

Clean Water Act (CWA): The Federal Water Pollution Control Act enacted in 1972 by Public Law 92-500 and amended by the Water Quality Act of 1987. The Clean Water Act prohibits the discharge of pollutants to Waters of the United States unless said discharge is in accordance with an NPDES permit. The 1987 amendments include guidelines for regulating municipal, industrial, and construction storm water discharges under the NPDES program.

Code of Federal Regulations: A codification of the general and permanent rules published in the Federal Register by the Executive departments and agencies of the Federal Government.

Construction Activity: Clearing, grading, or excavation that results in soil disturbance. Construction activity does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility, nor does it include emergency construction activities required to immediately protect public health and safety.

Control: To minimize, reduce or eliminate by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

Countywide Storm Water Management Plan (CSWMP): A single comprehensive plan for implementation of the requirements of this Order that are applicable to all Permittees and all Watershed Management Areas. The CSWMP is a storm water management implementation plan for the entire drainage area within the jurisdiction of the Permittees under this Order. The Countywide Storm Water Management Plan will be developed as a single document by the Principal Permittee, with assistance and participation from the Permittees, according to the schedule prescribed in the permit. The CSWMP shall be used as a tool to develop a watershed specific Watershed Management Area Plan (WMAP).

Dechlorinated Swimming Pool Discharges: Means swimming pool discharges which have no measurable chlorine and do not contain any detergents, wastes, or additional chemicals not typically found in swimming pool water. The term swimming pool discharges does not include swimming pool filter backwash.

Discharge: Any release, spill, leak, pump, flow, escape, dumping, or disposal of any liquid, semi-solid or solid substance.

Disposal: Affirmative act in the placement of wastes or other materials to be thrown out or thrown away.

Disturbed Area: Means that area altered as a result of clearing, grading, and/or excavation of earth.

Do-it-yourselfers: Means any person or persons who repair or maintain their own vehicle(s) and/or home(s).

Effectively Prohibit: Means prohibit through legal authority or control through requirements, conditions, or other limitation. Control may include best management practices.

Effectiveness: A direct or indirect measure or indicator of how well a program, plan, or best management practice achieves its intended purpose. Measures or indicators of effectiveness include, but are not limited to, detailed accounting of program accomplishments, funds expended, staff hours utilized, field surveys, amount of pollutants reduced, biosurveys, and quantitative data from water quality and sediment sampling.

Erosion: The wearing away of land surface primarily by wind or water. Erosion occurs naturally as a result of weather or runoff but can be intensified by clearing, grading, or excavation of the land surface.

Executive Advisory Committee (EAC): A committee composed of representatives of the County of Los Angeles, the City of Los Angeles, and the six Watershed Management Areas.

Executive Officer: The Executive Officer of the California Regional Water Quality Control Board, Los Angeles Region, or an authorized representative.

Food Distribution Industry: Establishments primarily engaged in the warehousing and storage of perishable goods under refrigeration described by SIC 4222, and establishments primarily engaged in retail selling of food for home preparation and consumption described by SIC Major Group 54.

Food Service Industry: Establishments primarily engaged in the retail sale of prepared food and drinks for on-premise consumption or immediate consumption described by SIC 5812

GCASP: See General Construction Activity Storm Water Discharge Permit.

GIASP: See General Industrial Activity Storm Water Discharge Permit.

General Construction Activity Storm Water Discharge Permit (GCASP). The NPDES permit adopted by the State Water Resources Control Board which authorizes the discharge of storm water under certain conditions.

General Industrial Activity Storm Water Discharge Permit (GIASP). The NPDES permit adopted by the State Water Resources Control Board which authorizes the discharge of storm water under certain conditions.

Good Housekeeping Practice: A common practice related to the storage, use, or cleanup of materials, performed in a manner that minimizes the discharge of pollutants. Examples include purchasing only the quantity of materials to be used at a given time, use of alternative and less harmful products, cleaning up spills and leaks, and storing materials in a manner that will contain any leaks or spills.

Hazardous Material: Any material defined as hazardous by Chapter 6.95 of the California Health and Safety Code.

Hazardous Substance: Any substance designated pursuant to 40 CFR 302. This also includes unlisted

hazardous substances which is a solid waste, as defined in 40 CFR 261.2, which is not excluded from regulation as a hazardous waste under 40 CFR 261.4(b), is a hazardous substance under section 101(14) of the CWA if it exhibits any of the characteristics identified in 40 CFR 261.20 through 261.24. Examples of hazardous substances include any substance or chemical product for which one or more of the following applies:

- A material safety data sheet (MSDS) is required
- The substance is listed as radioactive by the Nuclear Regulatory Commission
- The substance is listed as hazardous by the U.S. Department of Transportation
- The material is listed in Labor Code §6382(b).

Hazardous Waste: Means a 'Hazardous Substance' or 'Hazardous Material' which is to be discharged, discarded, recycled, or processed.

IPM: See Integrated Pest Management.

Illicit Connection: Any human-made conveyance that is connected to the storm drain system without a permit, excluding roof-drains and other similar type connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

Illicit Discharge: Any discharge to the storm drain system that is prohibited under local, state or federal statutes, ordinances, codes or regulations. This includes all non-storm water discharges except discharges pursuant to an NPDES permit and discharges that are exempted or conditionally exempted in accordance with Section II of this Order.

Illicit Disposal: Any disposal, either intentionally or unintentionally, of material(s) or waste(s) that can pollute storm water or urban runoff.

Impact: Any actual or potential effect caused either directly or indirectly by the discharge of pollutants.

Impervious Surface: Surface that prevents or significantly reduces the entry of water into the underlying soil, resulting in runoff from the surface in greater quantities and/or at an increased rate when compared to natural conditions prior to development. Examples of places that commonly exhibit impervious surfaces include parking lots, driveways, roadways, storage areas, and rooftops. The imperviousness of these areas commonly results from paving, compacted gravel, compacted earth, and oiled earth.

In Consultation With: Means that the Principal Permittee and Permittees work cooperatively towards the development of programs.

Industrial Activity: The term "industrial activity" is defined in 40 CFR 122.26(b)(14) and refers to 11 categories of activities required to obtain a National Pollutant Discharge Elimination System (NPDES) permit for storm water discharges associated with "industrial activity" as required by 40 CFR 122.26(c). See Phase I Facilities.

Industrial/Commercial Facility: Any facility involved and/or used in either the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facility includes, but is not limited to, any facility defined by the Standard Industrial Classifications (SIC). Facility ownership

(federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

Integrated Pest Management (IPM): Pest management practice that considers the whole ecosystem when determining potential pest control strategies. IPM emphasizes use of a hierarchy of controls, with a preference for mechanical controls (e.g., mowing) and biological controls (e.g., beneficial insects, pheromones) before chemical controls (e.g., pesticides).

Jurisdiction: Means the geographic area within the Permittee's boundaries that are required under this Order to be under the Permittee's regulatory control. The term is not intended to include facilities which the Permittee is preempted or otherwise precluded from regulating, such as federal and state facilities, school districts, and similar governmental (non-municipally owned or operated) entities.

Legal Authority: The ability of a Permittee to impose and enforce statutes, ordinances, and regulations to require control of pollutant sources and regulate the discharge of pollutants to the storm drain system, and to enter into interagency agreements, contracts, and memorandums of understanding. These powers are granted to the Permittees by the Constitution of the State of California and the General Laws of the State (for General Law Cities/Counties) or individual constitutions (for Charter Cities/Counties). These powers are promulgated by the Permittee through their municipal codes, ordinances, and statutes duly adopted by their governing body.

MS4: See Municipal Separate Storm Sewer System

Maximum Extent Practicable (MEP): The standard for implementation of storm water management programs to reduce pollutants in storm water. MEP refers to storm water management programs taken as a whole. It is the maximum extent possible taking into account equitable consideration and competing facts, including, but not limited to: the gravity of the problem, public health risk, societal concern, environmental benefits, pollutant removal effectiveness, regulatory compliance, public acceptance, implementability, cost and technical feasibility. Section 402(p)(3)(B)(iii) of the Clean Water Act requires that municipal permits "...shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.

Municipal Separate Storm Sewer System (MS4): See Storm Drain System.

NPDES: See National Pollutant Discharge Elimination System

National Pollutant Discharge Elimination System: A permit issued by the USEPA, SWRCB, or CRWQCB pursuant to the Clean Water Act that authorizes discharges to waters of the United States and requires the reduction of pollutants in the discharge.

Non-Storm Water Discharge: Any discharge to a municipal storm drain system that is not composed entirely of storm water.

Notice of Intent to Meet and Confer (NIMC): A letter sent to a Permittee or Permittees by the Regional Board Executive Officer as an invitation to discuss the implementation of requirements under this Order and is made when it is suspected that a Permittee or Permittees has/have an insufficient program based upon performance and submittals made under this Order. The NIMC is a part of the Administrative Review section of this Order and provides an opportunity for the Permittee(s) to meet with Regional Board staff to

clarify any potential misunderstandings prior to, or in lieu of the Regional Board taking enforcement action for "non-compliance".

Nuisance: Anything which meets all of the following requirements: (1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; (2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal; (3) occurs during, or as a result of, the treatment or disposal of wastes.

Permittee(s): Any agency named in the NPDES storm water permit as being responsible for permit conditions within its jurisdiction. Permittees to the NPDES storm water permit presently include the County of Los Angeles and the cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Canada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Long Beach, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier.

Pervious: Natural or man-made surfaces that allow the entry of water into the underlying soil, resulting in less runoff from the surface when compared to impervious surfaces. Examples of pervious surfaces include vegetated areas, most undeveloped areas, uncompacted earth surfaces, and lattice type modular pavements.

Phase I Facilities: This term refers to categories of facilities which are required to obtain a National Pollutant Discharge Elimination System (NPDES) permit for storm water discharges associated with "industrial activity" as required by 40 CFR 122.26(c). The term "industrial activity" is defined in 40 CFR 122.26(b)(14) and in general refers to 11 categories of activities. These categories include:

i. FACILITIES SUBJECT TO STORM WATER EFFLUENT LIMITATIONS GUIDELINES, NEW SOURCE PERFORMANCE STANDARDS, OR TOXIC POLLUTANT EFFLUENT STANDARDS (40 CFR SUBCHAPTER N). Currently, categories of facilities subject to storm water effluent limitations guideline are Cement Manufacturing (40 CFR Part 411), Feedlots (40 CFR Part 412), Fertilizer Manufacturing (40 CFR Part 418), Petroleum Refining (40 CFR Part 419), Phosphate Manufacturing (40 CFR Part 422), Steam Electric (40 CFR Part 423), Coal Mining (40 CFR Part 434), Mineral Mining and Processing (40 CFR Part 436), Ore Mining and Dressing (40 CFR Part 440), and Asphalt Emulsion (40 CFR Part 442). The fact sheet accompanying this general permit contains additional information pertaining to facilities subject to new source performance standards or toxic pollutant effluent standards.

ii. MANUFACTURING FACILITIES: Standard Industrial Classifications (SICs) 24 (except 2411 and 2434), 26 (except 265 and 267), 28 (except 283 and 285) 29, 311, 32 (except 323), 33, 3441, and 373.

iii. OIL AND GAS/MINING FACILITIES: SICs 10 through 14 including active or inactive mining operations (except for areas of coal mining operations meeting the definition of a reclamation area under 40 CFR 434.11(1) because of performance bond issued to the facility by the appropriate Surface Mining Control and Reclamation Act (SMCRA) authority has been released, or except for area of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990) and oil and gas exploration, production, processing, or treatment

operations, or transmission facilities that discharge stormwater contaminated by contact with or that has come into contact with any overburden, raw material, intermediate products, finished products, by products, or waste products located on the site of such operations. Inactive mining operations are mined sites that are not being actively mined, but which have an identifiable owner/operator. Inactive mining sites do not include sites where mining claims are being maintained prior to disturbances associated with the extraction, beneficiation, or processing of mined material, or sites where minimal activities are undertaken for the sole purpose of maintaining a mining claim.

iv. HAZARDOUS WASTE TREATMENT, STORAGE, OR DISPOSAL FACILITIES: Includes those operating under interim status or a general permit under Subtitle C of the Federal Resource Conservation and Recovery Act (RCRA).

v. LANDFILLS, LAND APPLICATION SITES, AND OPEN DUMPS: Sites that receive or have received industrial waste from any of the facilities covered by this general permit, sites subject to regulation under Subtitle D of RCRA, and sites that have accepted waste from construction activities (construction activities include any clearing, grading, or excavation that results in disturbance of five acres or more).

vi. RECYCLING FACILITIES: SICs 5015 and 5093. These codes include metal scrap yards, battery reclaimers, salvage yards, motor vehicle dismantlers and wreckers, and recycling facilities that are engaged in assembling, breaking up, sorting, and wholesale distribution of scrap and waste material such as bottles, wastepaper, textile wastes, oil waste, etc.

vii. STEAM ELECTRIC POWER GENERATING FACILITIES: Includes any facility that generates steam for electric power through the combustion of coal, oil, wood, etc.

viii. TRANSPORTATION FACILITIES: SICs 40, 41, 42 (except 4221-25), 43, 44, 45, and 5171 which have vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication) or other operations identified herein that are associated with industrial activity.

ix. SEWAGE OR WASTEWATER TREATMENT WORKS: Facilities used in the storage, treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that are located within the confines of the facility, with a design flow of one million gallons per day or more, or required to have an approved pretreatment program under 40 CFR Part 403. Not included are farm lands, domestic gardens, or lands used for sludge management where sludge is beneficially reused and which are not physically located in the confines of the facility, or areas that are in compliance with Section 405 of the CWA.

xi. MANUFACTURING FACILITIES WHERE MATERIALS ARE EXPOSED TO STORM WATER: SICs 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 3441), 35, 36, 37 (except 373), 38, 39, and 4221-4225.

Note: Category x, Construction activity, is covered by a separate general permit.

Pollutant: Those "pollutants" defined in Section 502(6) of the federal Clean Water Act (33 U.S.C.§1362(6)), or incorporated into California Water Code §13373. Examples of pollutants include, but are not limited to the following:

- Commercial and industrial waste (such as fuels, solvents, detergents, plastic pellets, hazardous substances, fertilizers, pesticides, slag, ash, and sludge);

- Metals such as cadmium, lead, zinc, copper, silver, nickel, chromium, and non-metals such as phosphorus and arsenic;

- Petroleum hydrocarbons (such as fuels, lubricants, surfactants, waste oils, solvents, coolants, and grease);

- Excessive eroded soils, sediment, and particulate materials in amounts which may adversely affect the beneficial use of the receiving waters, flora or fauna of the State;

▪Animal wastes (such as discharge from confinement facilities, kennels, pens, recreational facilities, stables, and show facilities);

▪Substances having characteristics such as pH less than 6 or greater than 9, or unusual coloration or turbidity, or excessive levels of fecal coliform, or fecal streptococcus, or enterococcus;

The term "Pollutant" shall not include uncontaminated storm water, potable water or reclaimed water generated by a lawfully permitted water treatment facility.

The term "Pollutant" also shall not include any substance identified in this definition, if through compliance with the best management practices available, the discharge of such substance has been eliminated to the maximum extent practicable. In an enforcement action, the burden shall be on the person who is the subject of such action to establish the elimination of the discharge to the maximum extent practicable through compliance with the best management practices available.

Pollutant Loading: The quantity of a pollutant found in storm water and/or non-storm water expressed in mass per unit of time. Pollutant loadings are commonly expressed in units of tons/year or pounds/year.

Pollutants of Concern: Pollutants that exhibit one or more of the following characteristics:

▪Current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water,

▪Elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein, or

▪The detectable inputs of the pollutant are at a level high enough to be considered potentially toxic to humans and/or flora and fauna.

Pollutants of concern may be different for each receiving water.

For example, Pollutants of concern for the Santa Monica Bay Watershed Management Area include, DDT, PCBs, PAHs, Chlordane, TBT, cadmium, chromium, copper, lead, nickel, silver, zinc, pathogens, TSS (sediment), nutrients, trash and debris, chlorine, oxygen demanding substances, and oil and grease.

Pollution Prevention: Includes any planning, schedules of activities, prohibitions of practices, implementation maintenance procedures, and other management practices, to prevent or reduce pollutants in storm water / urban runoff discharges.

Potable Water Sources: Means flows from drinking water storage, supply and distribution systems including flows from system failures, pressure releases, system maintenance, well development, pump testing, fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults, and wells.

Principal Permittee: The agency named in the NPDES storm water permit to serve as permit coordinator, responsible for general administration of the permit, and coordinating cooperation by other Permittees, including but not limited to the implementation of local self-monitoring programs and BMPs, and preparation and submittal of reports required by the permit. The Principal Permittee under this Order is the County of Los Angeles.

Proper Disposal: The act of disposing of material(s) in a lawful manner and which ensures the protection of water quality and beneficial uses of receiving waters.

Public Agency Vehicle Maintenance/Material Storage Facility: Any Permittee-owned and/or operated facility that is: used for vehicle or equipment maintenance, repair, washing, or fueling; and/or is required to prepare a hazardous materials business plan.

Regional Board: The Governing Board of the California Regional Water Quality Control Board State agency with primary responsibility for the coordination and control of water quality. This means the California Regional Water Quality Control Board, Los Angeles Region. The Los Angeles Region, is comprised of all basins draining into the Pacific Ocean between the southeasterly boundary, located in the westerly part of Ventura County, of the watershed of Rincon Creek and a line which coincides with the southeasterly boundary of Los Angeles County from the ocean to San Antonio Peak and follows thence the divide between San Gabriel River and Lytle Creek drainage to the divide between Sheep Creek and San Gabriel River drainage.

Reportable Quantity: Means that quantity of a hazardous substance, as set forth in 40 CFR 302, which requires notification pursuant to 40 CFR 302 in event of that quantity release.

Receiving Waters: All surface water bodies within the permit area that are identified in the Basin Plan.

Runoff: Means any runoff including storm water and dry-weather flows from a drainage area that reaches a receiving water body or sub-surface. During dry weather it is typically comprised of many base flow components either contaminated with pollutants or uncontaminated.

SIC: See Standard Industrial Classification.

SPCA: See Storm Water Program Compliance Amendment

SWRCB: State Water Resources Control Board

Secondary Containment: Structures, usually dikes or berms, surrounding tanks or other storage containers to catch spilled or leaked materials to prevent their discharge to the MS4.

Sediment: Organic or inorganic material that is carried by or suspended in water and settles to form deposits in the storm drain system or receiving waters.

Source Minimization: Planning or operational practices that reduce the amount of materials stored at a site.

Standard Industrial Classification (SIC): The statistical classification standard, organized by industry, underlying all establishment-based federal economic statistics. The SIC of a particular industry is determined using the latest Standard Industrial Classification Manual as prepared by the Executive Office of the President, Office of Management and Budget.

Storm Drain System: Streets, gutters, conduits, natural or artificial drains, channels and watercourses, or other facilities that are owned, operated, maintained or controlled by any Permittee and used for the purpose of collecting, storing, transporting, or disposing of storm water.

Storm Water: Water which originates from atmospheric moisture (rainfall or snowmelt) and that falls onto land, water, or other surfaces.

Storm Water Management Program: This is the sum of all requirements of this Order. This is not be confused with the CSWMP.

Storm Water Pollution Prevention Plan (SWPPP): A plan required by and for which contents are specified in the State of California General Permit for Storm Water Discharges Associated with Industrial Activities, and the General Permit for Storm Water Discharges Associated with Construction Activities. The purpose of the plan is to help identify the sources of pollution that affect the quality of storm water discharges from a site and to describe and ensure the implementation of practices to reduce pollutants in storm water discharges.

Storm Water Program Compliance Amendment (SPCA): The SPCA is a report prepared by a Permittee if directed to by the Regional Board Executive Officer for insufficient submittals made under this Order. The SPCA is a part of the Administrative Review section of this Order and will include additions and enhancements to the jurisdiction's storm water program with enforceable implementation deadlines.

Storm Water Runoff: That part of precipitation (rainfall or snowmelt) which travels via flow across a surface to the storm drain system or receiving waters. Examples of this phenomenon include: the water that flows from a building's roof when it rains (runoff from an impervious surface); the water that flows into streams when snow on the ground begins to melt (runoff from a semi-pervious surface); and the water that flows from a vegetated surface when rainfall is in excess of the rate at which it can infiltrate into the underlying soil (runoff from a pervious surface). When all other factors are equal, runoff increases as the perviousness of a surface decreases.

Storm Water Runoff Mitigation Plan: A plan, to be submitted prior to the submittal of an application for the first planning or building approval for a new development project, that sets forth storm water pollution controls to be incorporated into development projects. The plan shall:

- be designed to reduce the runoff volume from the site and the pollutant load contributed by the site through incorporation of design elements and practices that address each of the following goals:

- maximize, to the extent practicable, the percentage of permeable surfaces in order to allow more percolation,

- minimize, to the extent practicable, the amount of runoff directed to impermeable areas to the storm drain system,

- maximize, to the extent practicable, storm water filtration and storage for reuse through the use of sediment traps, cisterns or other means,

- minimize, to the extent practicable, parking lot pollution through the use of porous materials to allow percolation of storm water, through the installation of appropriate treatment controls, or through other means.

Street Washing: The practice of washing of streets and sidewalks using water or other cleaning fluids.

Toxic Materials: For the purposes of this Order, toxic materials means any material(s) or combination of materials which directly or indirectly cause(s) either acute or chronic toxicity in the water column.

Toxic Pollutant: Those "pollutants", or combinations of pollutants, defined in Section 502(13) or 307(a)(1) of the federal Clean Water Act (33 U.S.C.§1362(13)).

Undesirable Coloration: See "Color" in the Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties (page 3-9) June 13, 1994.

USEPA: United States Environmental Protection Agency

Waste Minimization: Operational practices that reduce the amount of waste materials generated. Practices may include recycling and reuse.

Watershed Management Area (WMA): Any one of the six general watershed areas covered by this NPDES storm water permit consisting of the: Malibu Creek and other rural areas discharging to Santa Monica Bay, Santa Clara River, Dominguez Channel/Los Angeles Harbor, San Gabriel River, Los Angeles River, and Ballona Creek and other urban areas discharging to the Santa Monica Bay watersheds.

Watershed Management Area Plan (WMAP): A plan for implementation of permit requirements that is based on the Countywide Storm Water Management Plan (CSWMP) but further addresses specific issues, pollutants of concern, and BMPs that are unique to the specific Watershed Management Area.

Watershed Management Committee (WMC): A committee composed of representatives from each Permittee in a Watershed Management Area. Duties include establishing goals and objectives for the Watershed; prioritizing pollution control efforts; developing a specific Watershed Management Plan; coordinating and facilitating annual reports for the watershed; and facilitating compliance by Permittees in the watershed.

ITEM 10F
(1) LA
SUSMP

Section F (1)

County of Los Angeles Standard Urban Storm Water Mitigation Plans (SUSMPs)

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD

ORDER: WQ 2000 - 11

In the Matter of the Petitions of
THE CITIES OF BELLFLOWER, ET AL., THE CITY OF ARCADIA, AND WESTERN STATES PETROLEUM ASSOCIATION
Review of January 26, 2000 Action of the Regional Board
and
Actions and Failures to Act
by both the
California Regional Water Quality Control Board,
Los Angeles Region and Its Executive Officer
Pursuant to Order No. 96-054,
Permit for Municipal Storm Water and Urban Run-Off Discharges Within
Los Angeles County
[NPDES NO. CAS614001]

SWRCB/OCC FILES A-1280, A-1280(a) and A-1280(b)

BY THE BOARD:

On July 15, 1996, the Los Angeles Regional Water Quality Control Board (Regional Water Board) issued a revised national pollutant discharge elimination system (NPDES) permit in Order No. 96-054 (permit) to the 85 incorporated cities and the county within Los Angeles County (the County).[1] The permit covers storm water discharges from municipal separate storm sewer systems throughout the County.[2]

---

[1] This was the second storm water permit adopted for Los Angeles County and its cities. The first permit was the subject of an earlier Order. (In the Matter of Natural Resources Defense Council, Inc., Order WQ 91-04). In this permit, the County is designated as the Principal Permittee, and each city is designated as a permittee. The County is required to submit various documents on behalf of all of the permittees.

[2] The Regional Water Board has since issued a separate permit for one city, Long Beach. The relevant provisions of the Long Beach permit are similar to those in Order No. 96-054.

The permit contains provisions for the regulation of storm water discharges from development planning and construction.[3] Pursuant to these provisions, the County was required to submit Standard Urban Storm Water Mitigation Plans (SUSMPs).[4] The SUSMPs are plans that designate best management practices (BMPs) that must be used in specified categories of development projects. The County submitted SUSMPs, but the Regional Water Board approved the SUSMPs only after making revisions. The Executive Officer issued the revised SUSMPs on March 8, 2000.[5]

On February 25, 2000, the State Water Resources Control Board (State Water Board or Board) received a petition for review of the actions and failures to act regarding the SUSMPs from a number of cities, the Building Industry Association of Southern California and the Building Industry Legal Defense Foundation (jointly referred to as Cities). A second petition was received from the City of Arcadia. And a third petition was received from the Western States Petroleum Association (WSPA). On April 7, 2000, the petitioners filed amendments to their petitions, concerning the March 8, 2000 issuance of the SUSMPs. The Cities' amendment also revised the list of cities included in the petition. The Cities' petition now includes 32 cities. The petitions are legally and factually related, and have therefore been consolidated for purposes of review.[6] The petitioners also requested a stay of the SUSMPs. This request was denied by letter, dated May 11, 2000.

[3] Permit, Part 2.III. These provisions focus more on post-construction impacts of development than on discharges from construction activities.
[4] Permit, Part 2.III.A.1.c.
[5] These are referred to herein as the Final SUSMPs. The Final SUSMPs also apply to Long Beach, even though it is subject to a separate permit.
[6] Cal. Code of Regs., tit. 23, section 2054.

On June 7 and 8, 2000, the Board held a hearing in Torrance. Several entities, including the petitioners, the Regional Water Board, and several environmental groups[7], were designated parties. The evidence from that hearing has been included in the record before the Board. The record for comments on the petition was kept open until the end of the hearing. The parties were allowed to submit post-hearing briefs.[8]

I. BACKGROUND

In prior Orders[9] this Board has explained the need for the municipal storm water programs and the emphasis on BMPs in lieu of numeric effluent limitations. The emphasis for preventing pollution from storm water discharges is still on the development and implementation of effective BMPs, but with the expectation that the level of effort will increase over time. In its Interim Permitting Approach[10], the United States Environmental Protection Agency (U.S. EPA) stated that first-round permits should include BMPs, and expanded or better-tailored BMPs in subsequent permits where necessary to attain water quality standards. Dischargers, consultants, and academic institutions in California and nationwide have conducted numerous studies on the effectiveness of BMPs and appropriate design standards. While many questions are still

[7] The environmental groups are Natural Resources Defense Council, Inc., Santa Monica BayKeeper, and Heal the Bay.

[8] There are several documents that were not timely received and, therefore, are not made a part of the record before the Board. The hearing notice specified that all evidence from parties must be received by May 31, 2000. The Regional Water Board submitted documents on June 6, 2000. The hearing notice specified that policy statements were due by the close of the hearing. Several comment letters were received June 12, 13, and 19, 2000. None of these submittals are a part of the record. The post-hearing briefs were subject to a 10-page limit. The environmental groups submitted objections to the post-hearing brief submitted by the Cities. First, the environmental groups challenge the length of the brief. All briefs were subject to a 10-page limit. The Cities submitted a 10-page brief, with a 22-page attachment showing extensive proposed revisions to the SUSMPs. This submittal violates the page limit, and only the brief is considered part of the record. Second, the environmental groups claim that an e-mail message referred to by the petitioners is subject to attorney-client privilege and should not have been used in this hearing. This e-mail message, from the Regional Water Board's counsel to one of its engineers, was placed in the Regional Water Board's administrative record and submitted to the State Water Board. Any privilege that may have attached to the message has been waived and no longer exists. Finally, the post-hearing brief from the City of Arcadia was received late and will not be considered. Documents submitted late for interim deadlines (such as the deadline for submitting responses to the petitions), have been included in the record.

[9] See, especially Orders WQ 91-03 (In the Matter of Citizens for a Better Environment et al.) and WQ 91-04.

outstanding, more is expected of municipal dischargers, and many are implementing more effective programs.

While storm water management plans are improving, our knowledge of the impacts is also growing. Urban runoff has been determined to be a significant contributor of impairment to waters throughout the state. In Los Angeles specifically, beach closures are sometimes associated with urban runoff. In adopting the SUSMPs, the Regional Water Board took note of the urgent need for preventing further pollution from urban runoff and storm water discharges.

It is important to emphasize the role of the SUSMPs within the totality of regulating storm water discharges, and the purpose of these particular control measures. The requirement to prepare SUSMPS was part of the development controls in the permit. In addition to development controls, the permit requires education, public outreach, programs to restrict illicit connections and discharges, and controls on public facilities. In the context of the entire effort required by the permit, the development controls can be seen as preventing the existing situation from becoming worse.

The Final SUSMPs include a list of mandatory BMPs for nine categories of development. There are provisions that are applicable to all categories and lists of BMPs for individual categories. Requirements applicable to all categories include provisions to limit erosion from new development and redevelopment, requirements to conserve natural areas, protection of slopes and channels, and storm drain stenciling. Examples of BMPs specific to categories of discharge include design of loading docks for commercial projects and design of fueling areas for retail gasoline outlets. In most respects, the Final SUSMPs were similar to those proposed by the County. The significant departures were the inclusion of a numeric design standard for

[10] Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits. (61 Federal Register 57425.)

structural or treatment control BMPs, and the inclusion of certain types of projects that were not covered in the County's proposal. The design standard creates objective and measurable criteria for the amount of runoff that must be treated or infiltrated by BMPs.

The record indicates that the purpose of the development controls, including the SUSMPs, is not simply to prevent pollution associated with construction runoff. As the petitioners point out, construction discharges are already subject to this Board's Statewide Construction Permit. The development controls in the SUSMPs, on the other hand, focus on post-construction runoff. They are aimed at limiting not just the pollutants in runoff from the new development, but also the volume of runoff that enters the municipal storm sewer system. By limiting runoff from new development, the SUSMPs prevent increased impacts from urban runoff generally. There is adequate technical information in the record to show that by controlling the volume of runoff from new development, BMPs can be effective in reducing the discharge of pollutants in storm water runoff.

The Procedure for Adopting the SUSMPs

The permit requires a program for controls on Development Planning and Construction. It involved a number of submissions by the County in consultation with the Cities. The first step was submission of a checklist for determining priority projects and exempt projects. The checklist was due on January 30, 1998. A list of recommended BMPs for development projects was also due on that date. The SUSMPs were due within six months of approval of the BMP list, and were to incorporate BMPs for certain categories of development. Following approval of the SUSMPs, the cities and County were to implement development programs for priority projects, consistent with the BMP list and the SUSMPs.

The BMP list was not approved until April 22, 1999. Thereafter, the County submitted proposed SUSMPs on July 22, 1999. The Regional Water Board held a public workshop on August 10, 1999. Following the workshop, the County submitted revisions to the SUSMPs on August 12, 1999. On August 16, 1999, the Regional water Board gave notice that it would discuss the SUSMPs in a public meeting on September 16, 1999. There was significant discussion at that meeting regarding the intent of the Executive Officer to approve the SUSMPs, but with revisions including a numeric design standard. At the conclusion of the meeting, the Regional Water Board members asked the Executive Officer to revise the SUSMPs and bring them back to another meeting. On December 7, 1999, the Executive Officer circulated revised SUSMPs for public review. This document incorporated a numeric design standard and made other revisions to the permittees' proposal. The Regional Water Board held a hearing on the SUSMPs on January 26, 2000. At that meeting, the Regional Water Board endorsed the SUSMPs revised by the Executive Officer, but directed him to make further changes. The Executive Officer issued the Final SUSMPs on March 8, 2000.

The Contents of the Final SUSMPs

The permit provides that the SUSMPs must incorporate the appropriate elements of the BMP list and, at a minimum, apply to seven development categories: 100-plus home subdivisions; 10-plus home subdivisions; 100,000-plus square foot commercial developments; automotive repair shops; retail gasoline outlets; restaurants; and hillside single-family dwellings.

The SUSMPs proposed by the County applied to these seven categories. Various BMPs applied to the different categories, and the SUSMPs contained narrative mitigation requirements for source control and treatment. The July proposals stated:

> "The development must be designed so as to mitigate (infiltrate and/or treat) the site runoff generated from impervious directly connected areas that may contribute pollutants of concern to the storm water conveyance system."

There were no numeric design criteria for mitigation. According to various participants, earlier County drafts had included design standards to mitigate flows from 0.6-inch storm events. But any numeric criteria had been removed from the version that was submitted.

In its revised SUSMPs, submitted on August 12, the County explained in its cover letter that the mitigation language did not mean that all runoff must be mitigated. Rather, the County's intent was to omit a numerical standard from the SUSMPs. The revised SUSMPs no longer referred to mitigation at all. Instead, the following language replaced the mitigation requirement:

> "The development must be designed so as to minimize, to the maximum extent practicable (MEP), the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas (DCIA), to the storm water conveyance system as approved by the building official."

The Final SUSMPs, as approved by the Executive Officer and the Regional Water Board, included several revisions from the County's submittal. The revision that is of greatest concern to the petitioners is the addition of Design Standards for Structural or Treatment Control BMPs.[11] The design standards require that developments subject to the SUSMPs shall be designed to mitigate storm water runoff (by treatment or infiltration) from one of the following:

> "1. The 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area..., or
> 2. The volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment..., or
> 3. The volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or
> 4. The volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles

[11] The Final SUSMPs also include the narrative language quoted from the County's August 22, 1999 proposal.

County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event."

The Final SUSMPs also applied to two additional categories of development: parking lots over 5,000 square feet or with 25 or more spaces and exposed to storm water, and to developments in environmentally-sensitive areas. Other revisions included application to all projects in the categories instead of discretionary projects only and the definition of redevelopment.

II. CONTENTIONS AND FINDINGS[12]

Contention: The petitioners contend that the Regional Water Board erred in not complying with the Administrative Review Process within the permit, and acted arbitrarily and capriciously and in violation of the Clean Water Act and state law.

Finding: The permit required the County, in consultation with the cities subject to the permit, to submit SUSMPs. The permit includes some general minimum requirements for the SUSMPs.[13] The Executive Officer is granted authority to approve the SUSMPs.[14]

The permit also contains an administrative review process.[15] The permit states that the administrative review process "formalizes the procedure for review and acceptance of reports and documents" and "provides a method to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement action."[16] Following this introductory statement, the permit includes two procedures. The first is for review and

[12] This Order does not address all of the issues raised by the petitioners. The Board finds that the issues that are not addressed are insubstantial and not appropriate for State Water Board review. (See *People v. Barry* (1987) 194 Cal.App.3d 158, [239 Cal.Rptr. 349], Cal. Code Regs., tit. 3, § 052.)
[13] Permit, Part 2, III.A.1.c.
[14] Permit, Part 2, III.A.2.
[15] Permit, Part 2, I.G.
[16] *Id.*

approval or disapproval of reports and documents. The second is the dispute resolution section that must be followed prior to enforcement action.

The process for review of documents that are subject to the Executive Officer's approval is that the Executive Officer will notify the permittees of the results of the review and approval or disapproval within 120 days. If the Executive Officer does not do so, the permittees must notify the Regional Water Board of their intent to implement the documents without approval. The Executive Officer then has 10 days to respond, or the permittees may implement the program and the Executive Officer may not make modifications.

The dispute resolution procedure is to be used when the Executive Officer determines that a permittee's storm water program is insufficient to meet the permit's provisions. The Executive Officer must send a "Notice of Intent to Meet and Confer" with the permittee. A meet and confer period then ensues, resulting in a written "Storm Water Program Compliance Amendment (SWPCA)." The permittee is provided time to comply with the SWPCA. The Executive Officer is not allowed to take enforcement action against a permittee until the Executive Officer notifies the permittee in writing that the administrative review process has been exhausted and that a violation exists warranting enforcement.

The petitioners contend that the Executive Officer failed to notify the permittees that their SUSMPs were inadequate within 120 days of its submittal. The petitioners also argue that, by revising the SUSMPs without pursuing the dispute resolution process, the Regional Water Board "violated" the terms of the permit.

The provision for review of documents, which clearly includes the SUSMPs, requires that the Executive Officer notify the permittees of the results of the review and approval or disapproval within 120 days. The County submitted the revised SUSMPs on August 12, 1999.

Within 120 days, the Regional Water Board held a workshop where staff expressed their concerns with the SUSMPs. Also within 120 days the Regional Water Board itself held a public meeting where there was extensive discussion and concern by board members that the SUSMPs did not include a numeric standard. And, prior to any notification by the permittees that they would proceed with implementing their SUSMPs, the Regional Water Board held a hearing January 26, 2000, where it directed the Executive Officer to issue the SUSMPs with revisions. The Executive Officer did so on March 8, 2000.

It is clear from the record that the Executive Officer, and the Regional Water Board itself, did inform the permittees that the SUSMPs were inadequate. There was no requirement for a specific form for expressing disapproval of documents. The extensive discussion and meetings on the need for revisions to the SUSMPs, and the Executive Officer's approval of revised SUSMPs, plainly refutes the allegation that the Regional Water Board never notified the permittees of its disapproval of the County's proposed SUSMPs.

The permittees also claim that the Regional Water Board "violated" the permit by failing to institute the meet and confer process.[17] The dispute resolution process, which includes meet and confer, did not apply to the decision to disapprove the proposed SUSMPs. That process is only required when the Regional Water Board ultimately takes an enforcement action against a permittee. It is separate from the process for review and approval or disapproval of documents, and does not even appear to relate to possible enforcement actions for submission of inadequate documents. This is illustrated by the fact that the provision regarding documents refers to submittals from both the Principal Permittee and the individual permittees, while the dispute resolution provision refers only to the permittees. This distinction is relevant because the County

[17] We note that permits are issued to permittees to allow discharges to waters of the state. It is only permittees, and not Regional Water Boards, who can be charged with violating permits.

is charged with submitting the documents, while the individual permittees are responsible for compliance. A fair reading of the entire section on the administrative review process is that the review and approval or disapproval of documents applies to submission of documents by the County on behalf of the cities, while the dispute resolution process applies to enforcement actions against any permittees for failing to implement adequate programs.

Contention: The petitioners contend that the Regional Water Board was not authorized to revise the SUSMPs to add more stringent requirements.

Finding: The petitioners contend that the mitigation standards in the SUSMPs are more stringent than the requirement in the permit to reduce pollutants in storm water runoff to the maximum extent practicable (MEP)[18]. The issue of what level of protection constitutes MEP will be discussed *Infra*, in the discussion of the reasonableness of the numeric standards. But the petitioners also make certain procedural claims on this point. They argue that in approving the BMP list, the Regional Water Board determined that those BMPs constituted MEP and that the Board could not add additional BMPs in the SUSMPs. They also contend the Regional Water Board itself had no authority to "usurp" the Executive Officer's role in reviewing the SUSMPs.[19] Finally, the petitioners contend that the Regional Water Board was not authorized to mandate a program for the permittees without amending the permit.

The permit requires the County to submit a list of BMPs for approval. The Regional Water Board approved this list. Following approval of the list, the County was required to submit the SUSMPs, which must "incorporate the appropriate elements of the recommended

[18] The technology-based standard for controls under municipal storm water permits is MEP. For a fuller discussion of this standard, see Order WQ 91-03.

[19] It is undisputed that, at its January 26, 2000 meeting, the Board directed the Executive Officer to make additional revisions to the SUSMPs.

BMPs list."[20] The petitioners contend that by approving the list, the Regional Water Board determined that those BMPs constituted MEP, and that under the terms of the permit the Regional Water Board could not require additional BMPs.

In addressing this contention, we face what appears to be a fundamental misunderstanding of the numeric design standards on the part of the petitioners. The design standards are objective criteria that developers must achieve in designing their BMPs. The design standards are not separate BMPs. The standards tell what magnitude of storm event the BMPs must be designed to treat or infiltrate. They do not specify the BMPs that must be employed.

The SUSMPs as submitted by the County specify BMPs for various categories of development. Many of these BMPs are designed to minimize the pollutants in storm water runoff, by reducing flow through infiltration or by treatment. Examples of BMPs proposed by the County include infiltration basins and trenches, oil/water separators, and media filtration. The County's proposed SUSMPs also included language requiring minimizing the introduction of pollutants to the storm water conveyance system. That language remains unchanged in the Final SUSMPs. The only significant difference between the two versions of the SUSMPs was that the Regional Water Board established numeric criteria for designing the BMPs.

In adopting the Final SUSMPs, the Regional Water Board based its decision on the MEP standard.[21] The Regional Water Board did not significantly revise the BMP list or specify further the actions that developers must take to comply with the SUSMPs. Thus, we find that the Regional Water Board did not inappropriately revise its determination of what constituted MEP.

[20] Permit, Part 2, III.A.1.c.
[21] Resolution R-00-02.

The Regional Water Board is the political body responsible for water quality control in the Los Angeles region.[22] While the Regional Water Board may delegate specified powers and duties to its Executive Officer,[23] it can at any time act on its own behalf. The fact that the Board authorized its Executive Officer to approve the SUSMPs in the permit did not mean that the Board thereby denied itself the opportunity to provide direction to the Executive Officer in his approval. Such an interpretation of its delegation authority would result in an improper failure of the Board to assume responsibility for water quality in the region.

We also find that the Regional Water Board was authorized to revise the SUSMPs to achieve compliance with the permit's requirements. The SUSMPs are a part of implementation of the permit. Because the permit regulates storm water discharges throughout the entire Los Angeles region and it is implemented by 85 cities and the County, it is obvious that the permit could not spell out every detail of the program for the five-year term of the permit. Instead, the implementation is through the submission, review and approval, and implementation of various programs, including the SUSMPs.[24] Where it receives a submission that it finds is not consistent with the requirements of the permit, it is reasonable for the Regional Water Board to be able to require revisions. The Regional Water Board is not required to amend the permit each time it approves a submittal or approves a submittal with revisions. On the other hand, if the Regional Water Board's action in requiring revisions is inconsistent with the terms of the permit, then the Board should not act without first amending the permit. While the Regional Water Board could have required the County to make the revisions rather than making them itself, we see no harm in the Regional Water Board's approach.

---

[22] Water Code sections 13200 and 13225.
[23] Water Code section 13223.
[24] A fuller discussion of the use of storm water management plans to incorporate a developing program is found in Order No. WQ 91-03.

As will be discussed below, in most respects the Final SUSMPs are consistent with the permit. But there are some portions of the SUSMPs that are not consistent, and in those cases the SUSMPs provisions are further revised in this Order.

Contention: The petitioners make various procedural claims, including that they were denied due process, and that the Regional Water Board violated the Administrative Procedure Act, the California Environmental Quality Act (CEQA), and the California Constitution, Article XIII B, section 6 (regarding state mandates).

Finding: The petitioners point out that at the January 26, 2000 Regional Water Board hearing, there was some confusion over late changes to the SUSMPs and they contend they were not provided adequate opportunity to comment. There was significant discussion of the SUSMPs over several months. We do not agree with the petitioners that a program of this magnitude must necessarily take years to develop. But we are concerned that at the January 26, 2000 hearing, interested persons and permittees were not given adequate time to review late revisions or to comment on them. Given the intense interest in this issue, the Regional Water Board should have diverged from its strict rule limiting individual speakers to three minutes and conducted a more formal process. Such a process should provide adequate time for comment, including continuances where appropriate.[25] But to the extent the Regional Water Board's process caused any harm, this Board cured those harms. We held a two-day hearing in Los Angeles County, where all parties were allowed significant time to present their positions and testimony. In addition, we allowed the introduction of new evidence that had not been presented to the Regional Water Board. At this point, all parties have been afforded a full

[25] For future adjudicative proceedings that are highly controversial or involve complex factual or legal issues, we encourage regional water boards to follow the procedures for formal hearings set forth in Cal. Code of Regs., tit. 23, section 648 et seq.

opportunity to review the Final SUSMPs, to present their positions and evidence, and to engage in cross-examination. The petitioners' due process rights have been protected.

The Board has already addressed the contentions regarding compliance with other laws in prior decisions. The Administrative Procedure Act exempts the adoption of permits from its requirements.[26] While the SUSMPs are not a permit, they are implementing documents for a permit, and are therefore subject to the exemption. Moreover, they are relevant only to this permit, and are not a general rule of application. The constitutional provisions regarding state mandates also do not apply to NPDES permits.[27] As will be explained below, the SUSMPs as revised herein, are consistent with MEP and therefore are federally mandated. The provisions of CEQA requiring adoption of environmental documents also do not apply to NPDES permits.[28] Again, as an implementing document for the permit, there is no requirement for a separate CEQA analysis.[29]

Contention: The petitioners contend that the SUSMPs do not properly apply the maximum extent practicable standard.

Finding: The permit, consistent with Clean Water Act section 402(p)(3)(B)(iii), requires controls to reduce the discharge of pollutants to the maximum extent practicable, or MEP.[30] In approving the Final SUSMPs, the Regional Water Board acknowledged that one of the primary objectives of the municipal storm water program is the requirement to reduce the discharge of pollutants from storm water conveyance systems to the MEP.[31] While all parties appear to agree

[26] Government Code section 11352; See, Order No. 95-4 (In the Matter of the City and County of San Francisco).
[27] See, Order No. WQ 90-3 (In the Matter of San Diego Unified Port District).
[28] Water Code section 13389.
[29] We do note with interest the environmental groups' comment that if the permittees believed it was necessary to comply with the APA and CEQA prior to adoption of the SUSMPs, then they themselves would have violated those acts in their submissions of the proposed SUSMPs.
[30] Permit, Finding 13.
[31] Final SUSMPs, at page 2; Resolution No. R-00-02, at page 3.

that the standard for the SUSMPs is MEP, they disagree about what level of effort is necessary to comply with that standard.

The petitioners approach this issue from two angles. First, they contend that the SUSMPs will not provide water quality benefits that reflect MEP. Second, they contend that there could be adverse impacts on groundwater quality that have not been adequately evaluated.

Storm Water Design Standards as MEP

In adopting the Final SUSMPs, the Regional Water Board found that many rivers and streams in Los Angeles County are impaired for pollutants found in storm water and urban runoff, and that storm water runoff carries pollutants from nearly all types of developed properties.[32] Pollutant loading from the aggregate of development in the basin results in impairments from sediments, metals, complex organic compounds, oil and grease, nutrients, and pesticides.[33] The Final SUSMPs reflect two goals: to reduce the amounts of these pollutants in runoff and to reduce the ability of runoff to act as a conveyance system to deliver more pollutants to receiving waters. The Final SUSMPs, which include lists of BMPs and design standards requiring treatment or infiltration, address these two goals.

Clean Water Act section 402(p)(3)(B)(iii), which sets forth the requirements for establishing MEP in municipal storm water permits, provides that such permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." The United States Environmental Protection Agency (U.S. EPA), in a guidance document, explains that BMPs should be used in first-round storm water permits, and "expanded

[32] Resolution No. R-00-02.
[33] *Id.*

or better-tailored BMPs in subsequent permits, where necessary, to provide for the attainment of water quality standards."[34] The Clean Water Act, as interpreted by U.S. EPA, does require that, in a second-round permit,[35] expanded BMPs may be appropriate. In light of the number of water bodies impaired by runoff in Los Angeles County, it was appropriate to expand the scope of BMPs during the permit term.

The regulations implementing section 402(p) specifically require municipalities to have controls to reduce the discharge of pollutants from their storm sewer systems that "receive discharges from areas of new development and significant redevelopment," including post-construction discharges.[36] Clearly, it was appropriate for the Regional Water Board to require BMPs for new development and significant redevelopment. The permittees, who submitted their own version of SUSMPs with listed BMPs for categories of development, appear to have no real quarrel with this general mandate.

This Board has already endorsed requirements to limit the flow of the "first flush" of storm water, which may contain more significant pollutants.[37] The permittees' own version of the SUSMPs required mitigation of storm water runoff by treatment or infiltration, thus conceding the propriety of these two approaches to lessening the impact of storm water discharges. The crux of the disagreement is that the Regional Water Board added numeric design standards to establish the amount of runoff that must be treated or infiltrated, and required the mandatory application of these standards to categories of development.

The addition of measurable standards for designing the BMPs provides additional guidance to developers and establishes a clear target for the development of the BMPs. The U.S.

[34] Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, 61 Federal Register 57425 (1996).
[35] The original permit was issued in 1990. The 1996 permit is a second-round permit.
[36] 40 CFR section 122.26(d)(2)(iv)(A)(2).

EPA guidance manual suggests the use of design criteria and performance standards for post-construction BMPs.[38] The numeric criteria the Regional Water Board adopted essentially requires that 85 percent of the runoff from the development be infiltrated or treated.[39] In adopting these standards, the Regional Water Board based its decision on a research review of standards in other states and a statistical analysis of the rainfall in the area. The standard was set to gain the maximum benefit in mitigation while imposing the least burden on developers.[40] In light of the evidence of the use of this or more stringent standards in other states, the expert testimony supporting this standard, the endorsement by U.S. EPA in its comments, and the cost-effectiveness of its implementation (discussed below), the Regional Water Board acted appropriately in determining that the standards reflect MEP.[41]

We also find that the Regional Water Board appropriately applied these standards to seven of the categories listed in the SUSMPs: single-family hillside residences, 100,000 square foot commercial developments, automotive repair shops, restaurants, home subdivisions with 10 to 99 housing units, home subdivisions with 100 or more housing units, and parking lots with 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff.[42] These categories, except for parking lots, were already targeted for special treatment in the permit. The evidence shows that each listed category can be a significant source

---

[37] In the Matter of National Steel and Shipbuilding Company, et al., Order WQ 98-07, at slip opinion 7.

[38] Guidance Manual for the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Strom Sewer Systems, at page 6-4 (November 1992).

[39] Four different methods of calculation are permitted, so the percentage of capture may vary slightly.

[40] At the hearing in this matter, Regional Water Board staff explained that the standard was set at the bottom of the "knee" of the curve where the benefits of the mitigation requirements decrease and the cost increases. Other states have set the standard higher along this curve, requiring 90 to 95 percent mitigation.

[41] This conclusion in no way departs from our acceptance of BMPs in lieu of numeric effluent limitations in storm water permits. (See, e.g., Order WQ 91-03 and Order WQ 91-04.) The numeric standard is a design standard for BMPs. It does not quantify or limit the pollutants in the effluent. It also does not specify which of the listed BMPs must be employed.

[42] As discussed below, this Board is revising the SUSMPs to delete the application of the design standards to retail gasoline outlets and to locations within or directly adjacent to or discharging directly to environmentally-sensitive areas.

of pollutants and/or runoff following development. It is appropriate that the design standards apply so that BMPs for these categories of development result in the infiltration or treatment of a significant about of the runoff.

Potential Impacts on Ground Water

The petitioners contend that infiltration of runoff may lead to ground water pollution, and that the Regional Water Board did not properly consider such potential impacts. The mitigation standards provide for a waiver where there is a risk of ground water contamination because a known unconfined aquifer lies beneath the land surface or an existing or potential underground source of drinking water is less than ten feet from the soil surface.[43] The Final SUSMPs also include a discussion on how to use infiltration so that the risk of contamination of groundwater is reduced, and where infiltration is not appropriate.[44]

The Regional Water Board did consider the potential impacts to groundwater from infiltration, and included appropriate limitations and guidance on its use as a BMP. These provisions will ensure adequate protection of groundwater from any adverse impacts due to infiltration.

Contention: The petitioners contend the Regional Water Board failed to show that the SUSMPs as adopted are cost-effective and that the benefits to be obtained outweigh the costs.

Finding: The petitioners refer to the Preamble to the Phase II storm water regulations[45] as the basis for their economic argument. The quoted language, however, does not wholly support the petitioners' contention. The Preamble states that President Clinton's Clean Water Initiative clarifies "that the maximum extent practicable standard should be applied in a site-

[43] Final SUSMP, page 14.
[44] *Id.*, at page 15.
[45] 64 Federal Register 68722 and following. These regulations do not apply to the permit, but the general language on MEP is relevant to EPA's interpretation of the standard.

specific, flexible manner, taking into account cost considerations as well as water quality effects."[46] It is clear that cost should be considered in determining MEP; this does not mean that the Regional Water Board must demonstrate that the water quality benefits outweigh the economic costs.

While the standard of MEP is not defined in the storm water regulations or the Clean Water Act, the term has been defined in other federal rules. Probably the most comparable law that uses the term is the Superfund legislation, or CERCLA, at section 121(b). The legislative history of CERCLA indicates that the relevant factors, to determine whether MEP is met in choosing solutions and treatment technologies, include technical feasibility, cost, and state and public acceptance.[47] Another example of a definition of MEP is found in a regulation adopted by the Department of Transportation for onshore oil pipelines. MEP is defined as to "the limits of available technology and the practical and technical limits on a pipeline operator . . . ."[48]

These definitions focus mostly on technical feasibility, but cost is also a relevant factor. There must be a serious attempt to comply, and practical solutions may not be lightly rejected. If, from the list of BMPs, a permittee chooses only a few of the least expensive methods, it is likely that MEP has not been met. On the other hand, if a permittee employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost would exceed any benefit to be derived, it would have met the standard. MEP requires permittees to choose effective BMPs, and to reject applicable BMPs only where other effective BMPs will serve the same purpose, the BMPs would not be technically feasible, or the cost would be prohibitive. Thus while cost is a factor, the Regional Water Board is not required to perform a cost-benefit analysis.

[46] 64 Federal Register 68722, 68732 (December 8, 1999).
[47] 132 Cong. Rec. H 9561 (Oct. 8, 1986).

In reviewing the record, it is apparent that the Regional Water Board did evaluate the cost of the SUSMPs. While the petitioners claim there is no evidence in the record to show the SUSMPs are necessary and cost effective, the opposite is true. The record is replete with documentation of costs of pilot mitigation projects, studies from similar programs in other states, and research studies. The Regional Water Board complied with the requirement to consider cost.

The Regional Water Board found that the cost to include BMPs that will meet the mitigation criteria will be one to two percent of the total development cost. This amount appears reasonable, especially in light of the amount of impervious surface already in Los Angeles County and the impacts on impaired water bodies. In considering the cost of compliance, it is also important to consider the costs of impairment. The beach closures in the Los Angeles region, well documented in the evidence, have reached critical proportions. These beach closures clearly have a financial impact on the area, and should be positively affected by the SUSMPs.

We do note that there could be further cost savings for developers if the permittees develop a regional solution for the problem. We recommend that the cities and the County, along with other interested agencies, work to develop regional solutions so that individual dischargers are not forced to create numerous small-scale projects. While the SUSMPs are an appropriate means of requiring mitigation of storm water discharges, we also encourage innovative regional approaches.[49]

Contention: The petitioners have raised contentions regarding details of the SUSMPs, including the amount of time allowed for inclusion of SUSMPs in local ordinances, and their application to both "discretionary" and "non-discretionary" projects. In addition, during the

---

[48] 49 CFR section 194.5.

hearing certain ambiguities in the wording of the Final SUSMPs became apparent, including the provisions regarding redevelopment and environmentally-sensitive areas. In this portion of the Order we address these issues and also the application of the design standards to retail gasoline outlets (RGOs) and the waiver funding requirements.

Finding: The testimony at the hearing in this matter revealed that there are specific provisions of the SUSMPs that create confusion as to the types of development projects subject to the mitigation design standards. The petitioners also contend that application of the standards to specific types of development either is unreasonable or is inconsistent with the terms of the permit. The specific requirements are discussed below.

Retail Gasoline Outlets

Petitioner WSPA contends that RGOs should be excluded from the SUSMPs. Its petition raised the same general contentions as the other petitioners, but at the hearing WSPA presented evidence specific to RGOs. In particular, WSPA raised questions about the propriety of applying the design standards for BMPs to RGOs. In considering this issue, we conclude that construction of RGOs is already heavily regulated and that owners may be limited in their ability to construct infiltration facilities. Moreover, in light of the small size of many RGOs and the proximity to underground tanks, treatment may not always be feasible, or safe. The mandatory BMPs that are included in the SUSMPs may be adequate to achieve MEP at RGOs, but the Regional Water Board should add additional mandatory BMPs, such as use of dry cleanup methods (e.g. sweeping) for removal of litter and debris, use of rags and absorbents for leaks and spills, restricting the practice of washing down hard surfaces unless the wash water is collected and disposed of properly, annual training of employees on proper spill cleanup and waste disposal

[49] We note that the SUSMPs as written do not in any way preclude the development of regional solutions approved by the Regional Water Board as a means to comply with the BMP and design standard requirements.

methods, and the inclusion of BMPs to address trash receptacle areas and air/water supply areas.[50] We conclude that because RGOs are already heavily regulated and may be limited in their ability to construct infiltration facilities or to perform treatment, they should not be subject to the BMP design standards at this time, and recommend that the Regional Water Board undertake further consideration of a threshold relative to size of the RGO, number of fueling nozzles, or some other relevant factor. This Order should not be construed to preclude inclusion of RGOs in the SUSMP design standards, with proper justification, when the permit is reissued.

Redevelopment Projects

The SUSMPs were written to apply to new development and to some types of redevelopment in nine categories of projects. The definition of "redevelopment" reflected the intent of the Regional Water Board to define the scope of redevelopment projects subject to the requirements. That definition[51], however, was somewhat confusing, and it was apparent from testimony at the hearing that the parties had different understandings of the scope of redevelopment subject to the SUSMPs. In their post-hearing briefs, the various parties appeared to agree on the actual intent of the Regional Water Board in including redevelopment in the SUSMPs. This intent was to include redevelopment that adds or creates at least 5,000 square feet of impervious surface to the original development and, where the addition constitutes less

[50] These BMPs are from a list of BMPs in a publication of the California Storm Water Quality Task Force. (Best Management Practice Guide – Retail Gasoline Outlets. March 1997.) This publication includes BMPs in addition to those listed in the SUSMPs. All BMPs recommended in this publication should be mandated.

[51] The SUSMPs state: "Redevelopment" means, on an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces or the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces.

than 50 percent of the original development, to limit the application of the BMP design standards to the addition.

While some parties requested further requirements for development, it appears that the Regional Water Board's original intent was relatively simple to apply and results in a fair and appropriate application of the SUSMPs' requirements to redevelopment. Therefore, we will revise the definition in the SUSMPs accordingly.

Environmentally-Sensitive Areas

The permit required that the SUSMPs address at least seven development categories.[52] The final SUSMPs added two more categories: parking lots of 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff; and location within or directly adjacent to an environmentally-sensitive area (ESA). The petitioners contend that the addition of ESAs was inappropriate because the permit refers only to "development categories"[53] and ESA is a location category.

Whether or not the Regional Water Board went beyond the permit's terms in including this category, we find a fundamental problem with the language of the SUSMPs regarding ESAs. All of the other categories are relatively simple to apply because they describe the types of development that fall within the category. For instance, the threshold for a commercial development is 100,000 square feet. If the development is smaller, it is not subject to the SUSMPs. But for developments within ESAs, the SUSMPs contain no threshold. This absence led to speculation by the petitioners that something as small as a new patio on a home in an ESA would make the SUSMPs applicable. The Regional Water Board, at the hearing and in its post-

[52] The categories listed in the permit are: single-family hill residences, 100,000 square-foot commercial developments, automotive repair shops, retail gasoline outlets, restaurants, home subdivisions with 10 to 99 housing units, and home subdivisions with 100 or more housing units. Permit, Part 2, III.A.1.c.
[53] *Id.*

hearing brief, conceded that there should be some threshold. While the Regional Water Board did recommend a specific threshold, we believe that it is inappropriate for this Board to add a threshold that has not been fully discussed by all interested persons.

While it may be appropriate to include more stringent controls for developments in ESAs, we also note that such developments are already subject to extensive regulation under other regulatory programs. Moreover, in light of the permit language limiting the SUSMPs to development categories, ESAs are not an appropriate category within the SUSMPs. The Regional Water Board may choose to consider the issue further when it reissues the permit.

Discretionary and Non-Discretionary, or Ministerial, Projects

The petitioners contend that the SUSMPs should apply only to projects that are considered "discretionary" within the meaning of California Environmental Quality Act (CEQA).[54] They argue that the inclusion of non-discretionary, or ministerial, projects is inconsistent with the terms of the permit.

The permit provisions on development projects do refer to "discretionary" projects in several places. The permittees are directed to develop a checklist for determining priority and exempt projects.[55] Priority projects are defined as development and redevelopment projects requiring discretionary approval, which may have a potential significant effect on storm water quality.[56] The permittees are also required to develop a BMP list.[57] In developing the SUSMPs, the permittees are required to incorporate appropriate elements of the BMP list.[58] Next, the permittees must develop a program on planning control measures for priority projects (which are limited to projects requiring discretionary approval), consistent with the list of BMPs and the

[54] Public Resources Code section 21000 *et seq.*
[55] Permit, Part 2, III.A.1.a.
[56] *Id.*
[57] Permit, Part 2, III.A.1.b.

SUSMPs.[59] The permit further states that, in order to assure compliance with these requirements, the permittees must develop guidelines on preparing CEQA documents that link mitigation conditions to "local discretionary project approvals."[60]

Taken as a whole, the provisions of the permit appear to link the development requirements for SUSMPs to developments that receive discretionary approval by local governments, as defined in CEQA. The SUSMPs are an implementation tool for the permit and must be consistent with the permit. While the limitation of the SUSMPs to discretionary projects may not be sufficiently broad for an effective storm water control program, the Regional Water Board acted inappropriately in expanding the SUSMPs to include non-discretionary projects. The Regional Water Board may consider expanding the development controls beyond CEQA discretionary projects when it reissues the permit. But at this time, the SUSMPs must be revised so that they are limited to development projects requiring discretionary approval within the meaning of CEQA.[61]

Waiver Funding Requirement

Where a waiver is granted from the design standard requirements, the Final SUSMPs provide that the permittee must require the project proponent to transfer the cost savings to a storm water mitigation fund. The fund is to be operated by a public agency or a non-profit entity, to promote regional or alternative solutions for storm water pollution in the same storm watershed. The petitioners contend that the funding requirement will create an additional administrative burden.

---

[58] Permit, Part 2, III.A.1.c.
[59] Permit, Part 2, III.a.2.
[60] Permit, Part 2, III.a.3.b.
[61] We note that the Final SUSMPs already include a definition of "discretionary project" consistent with the definition in the CEQA guidelines. Final SUSMPs at page 4 of 25; Title 14, California Code of Regulations, section 15357. Apparently this definition was inadvertently retained after the Regional Water Board decided to expand the SUSMPs beyond discretionary projects.

The concept of a mitigation fund or "bank" is a positive idea for obtaining regional solutions to storm water runoff. As a long-term strategy, municipal storm water dischargers should work to establish regional mitigation facilities, which may be more cost-effective and more technically effective than mitigation structures at individual developments. But at this point there are not sufficient resources in place to require all permittees to establish such funds or to find appropriate non-profit organizations. Before mandating funding, preliminary questions should be answered, including who will manage the fund, what types of projects it will be used for, what entities can legally operate such funds, and how permittees will determine the amount of the assessments. It would be appropriate for the County to consider developing a program with the appropriate flood control agency, or as a model for the separate cities to develop. There may be suitable agencies to administer such funds, but the development of programs may take some time. The Regional Water Board should consider adopting such a program when it reissues the permit, after consultation with the appropriate local agencies.

III. CONCLUSIONS

Based on the discussion above, the Board concludes that:

1. The Regional Water Board complied with the procedural requirements of the permit, including the Administrative Review Process, in approving the Final SUSMPs.
2. The Regional Water Board was authorized to revise the SUSMPs by including more stringent requirements than the permittees had proposed.
3. The Regional Water Board complied with did not violate the Administrative Procedure Act, CEQA, or the Constitutional provisions on state mandates. The petitioners' due process rights have been protected
4. The Regional Water Board considered the costs of the SUSMPs, and acted reasonably in requiring these controls in light of the expected benefits to water quality.

5. The Final SUSMPs reflect a reasonable interpretation of development controls that achieve reduction of pollutants in storm water discharges to the maximum extent practicable.
6. The SUSMPs include adequate protections of groundwater quality from any impacts from infiltration.
7. The SUSMPs will be revised to clarify the intent of the Regional Water Board and to make them consistent with the permit. Specifically, retail gasoline outlets should not be subject to the BMP design standards because they are already heavily regulated and may be limited in their ability to construct infiltration facilities or to perform treatment. Redevelopment projects should be subject to the SUSMPs only if they result in creation or addition of 5,000 square feet of impervious surfaces. Environmentally-sensitive areas should not be listed as a category in the SUSMPs. The SUSMPs should only apply to discretionary projects. The requirement for funding by project proponents who receive waivers should be deleted. The SUSMPs will be amended as shown in the attachment to this Order.
8. In light of the revisions of the SUSMPs made by this Order, and to allow the permittees adequate time to adopt implementing ordinances, the deadline for adopting ordinances will be revised to January 15, 2001, and the effective date of the Final SUSMPs will be revised to February 15, 2001.

IV. ORDER

IT IS HEREBY ORDERED that the Standard Urban Storm Water Mitigation Plans for Los Angeles County and Cities in Los Angeles County is revised consistent with the amendments attached hereto. In all other respects the petitions are dismissed.

CERTIFICATION

The undersigned, Administrative Assistant to the Board, does hereby certify that the foregoing is a full, true, and correct copy of an order duly and regularly adopted at a meeting of the State Water Resources Control Board held on October 5, 2000.

AYE: Arthur G. Baggett, Jr.

AMENDMENTS TO SUSMPS

[These amendments are to the Final SUSMP, as published March 8, 2000]

Page 3 of 25

First full paragraph:

All **discretionary development and redevelopment** projects that fall into one of ~~seven~~ **the following** categories are ~~identified in the Los Angeles County MS4 Permit as requiring~~ **subject to these** SUSMPs. These categories are:

- Single-family Hillside Residences
- 100,000 Square Foot Commercial Developments
- Automotive Repair Shops
- Retail Gasoline Outlets
- Restaurants
- Home Subdivisions with 10 to 99 housing units
- Home Subdivisions with 100 or more housing units
- **Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff**

Second full paragraph:

~~The Regional Board Executive Officer has designated two additional categories subject to SUSMP requirements for the Los Angeles County MS4 Permit. These categories are:~~

- ~~Location within or directly adjacent to or discharging directly to an environmentally sensitive area, and~~
- ~~Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff~~

Fourth full paragraph:

Permittees shall amend codes, if necessary, not later than ~~September 8, 2000~~ **January 15, 2001,** to give legal effect to the SUSMP requirements. The SUSMP requirements for projects identified herein shall take effect not later than ~~October 8, 2000~~ **February 15, 2001.**

Page 4 of 25

Delete definition of "Environmentally Sensitive Area"

Revise Definition of "Redevelopment":

"Redevelopment" means, on an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces ~~or the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure~~. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface that is not part of a routing maintenance activity; and land disturbing activities related with structural or impervious surfaces. **Where redevelopment results in an increase of less than fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to these SUSMPs, the Design Standards apply only to the addition, and not to the entire development.**

ANNOUNCEMENT

NPDES–DEVELOPMENT PLANNING FOR STORMWATER MANAGEMENT

On July 15, 1996, the Regional Water Quality Control Board (RWQCB), Los Angeles Region, adopted Order No. 96-054 ("Permit"). Under the Permit, the County of Los Angeles is designated as the Principal Permittee and the 85 incorporated cities as co-Permittees. In February 2000, the RWQCB adopted a Resolution that established Standard Urban Stormwater Mitigation Plan (SUSMP) criteria for priority projects for the Permittees described in Part A and Part B of the attached table.

The primary objectives are to:

- Effectively prohibit non-stormwater discharges, and
- Reduce the discharge of pollutants from stormwater conveyance systems to the maximum extent practicable

The Los Angeles County Department of Public Works (DPW) is responsible for the implementation of SUSMP requirements in the County unincorporated areas (excluding the Antelope Valley area) and all County-owned facilities. Development and redevelopment projects falling into either Parts A or B of the attached table will be required to obtain SUSMP approvals. Details of facilities and measures that mitigate impacts to water quality must be shown on improvement plans and reviewed as part of those plans.

Information regarding the preparation of SUSMP is available on our website (*link to* SUSMP Plan on www.888CleanLA.com).

SUSMP pertaining to new subdivisions will be reviewed by DPW's Land Development Division. Please call Steve Burger at (626) 458-4943 with any questions (Monday through Thursday).

SUSMP for single-lot developments will be reviewed by DPW's Building and Safety Division. Please contact Mitch Miller at (626) 458-6390 with any questions pertaining to these developments (Monday through Thursday).

In addition, SUSMP for non-residential projects will be reviewed by DPW's Environmental Programs Division. Related questions should be directed to the Industrial Waste Unit of Environmental Programs Division at (626) 458-3517 (Monday through Thursday).

Attachment: SUSMP Project Types, Characteristics and Activities, Parts A and B.

SUSMP Project Types, Characteristics, and Activities
Part A. Type of Proposed Project:
A 10+ home subdivision
A 100,000+ square-foot commercial development[1, 2]
An automotive repair shop (SIC codes 5013, 5014, 5541, 7532-7534, and 7536-7539)[3]
A retail gasoline outlet
A restaurant (SIC code 5812)[4]
A hillside-located single-family dewelling[5]
Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to stormwater runoff
Location within or directly adjacent to or discharging directly to an environmentally sensitive area

Part B. Project Characteristics or Activities:
Automotive or Equipment Repair and/or Maintenance
Automotive or Equipment Washing or Cleaning Area(s)
Gas Station or Fuel Dispensing
Outdoor Material or Waste Handling or Storage
Chemical handling and/or storage of petroleum products, paints, solvents, concrete, or hazardous waste?
Outdoor Equipment or Product Fabrication including welding; cutting; sawing; metal fabrication; assembly; application of paints, coatings, or finishes; pre-cast concrete fabrication, etc.
Outdoor Areas for Equipment or Machinery Repair and/or Maintenance
Dry Cleaning Factory
Food Service
Food Processing Plant
Animal Slaughtering
Animal Confinement, Pet Care Facilities, Stables, Kennels, etc.
10 or More Dwelling Units
Hillside Location[5]

[1] "100,000 Square Foot Commercial Development" means any commercial development that creates at least 100,000 square feet of impermeable area, including parking areas.

[2] "Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, multi-apartment buildings, car was facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, and public warehouses and other light industrial complexes.

[3] "Automotive Repair Shop" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

[4] "Restaurant" means a stand-alone facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812).

[5] "Hillside" means property located in an area with known erosivesoil conditions, where the development contemplates grading on any natural slope that is 25 percent or greater

County of San Diego Standard Urban Storm Water Mitigation Plans Draft (SUSMPs)

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD

ORDER WQ 2001-15

In the Matter of the Petitions of

BUILDING INDUSTRY ASSOCIATION OF SAN DIEGO COUNTY
AND
WESTERN STATES PETROLEUM ASSOCIATION

For Review Of Waste Discharge Requirements Order No. 2001-01
for Urban Runoff from San Diego County
[NPDES No. CAS0108758]
Issued by the
California Water Quality Control Board,
San Diego Region

SWRCB/OCC FILES A-1362, A-1362(a)

BY THE BOARD:

On February 21, 2001, the San Diego Regional Water Quality Control Board (Regional Water Board) issued a revised national pollutant discharge elimination system (NPDES) permit in Order No. 2001-01 (permit) to the County of San Diego (County), the 18 incorporated cities within the County, and the San Diego Unified Port District. The permit covers storm water discharges from municipal separate storm sewer systems (MS4) throughout the County. The permit is the second MS4 permit issued for the County, although the first permit was issued more than ten years earlier.[1]

[1] NPDES permits generally expire after five years, but can be extended administratively where the Regional Water Board is unable to issue a new permit prior to the expiration date. As the record in this matter amply demonstrates, the Regional Water Board engaged in an extensive process of issuing draft permits, accepting comments, and holding workshops and hearings since at least 1995.

The permit includes various programmatic and planning requirements for the permittees, including construction and development controls, controls on municipal activities, controls on runoff from industrial, commercial, and residential sources, and public education. The types of controls and requirements included in the permit are similar to those in other MS4 permits, but also reflect the expansion of the storm water program since the first MS4 permit was adopted for San Diego County 11 years ago.[2]

On March 23, 2001, the State Water Resources Control Board (State Water Board or Board) received petitions for review of the permit from the Building Industry Association of San Diego County (BIA) and from the Western States Petroleum Association (WSPA).[3] The petitions are legally and factually related, and have therefore been consolidated for purposes of review.[4] None of the municipal dischargers subject to the permit filed a petition, nor did they file responses to the petitions.

I. BACKGROUND

MS4 permits are adopted pursuant to Clean Water Act section 402(p). This federal law sets forth specific requirements for permits for discharges from municipal storm sewers. One of the requirements is that permits "shall require controls to reduce the discharge of pollutants to the maximum

[2] For a discussion of the evolution of the storm water program, consistent with guidance from the United States Environmental Protection Agency (U.S. EPA), see Board Order WQ 2000-11.

[3] On March 23, the State Water Board also received brief letters from the Ramona Chamber of Commerce, the North San Diego County Association of Realtors, the San Diego County Apartment Association, the National Association of Industrial and Office Properties, and the California Building Industry Association. All of these letters state that they are "joining in" the petition filed by BIA. None of the letters contain any of the required information for petitions, which is listed at Cal. Code of Regs., tit. 23, section 2050. These letters will be treated as comments on the BIA petition. To the extent the authors intended the letters be considered petitions, they are dismissed.

[4] Cal. Code of Regs., tit. 23, section 2054.

extent practicable [MEP]." States establish appropriate requirements for the control of pollutants in the permits.

This Board very recently reviewed the need for controls on urban runoff in MS4 permits, the emphasis on best management practices (BMPs) in lieu of numeric effluent limitations, and the expectation that the level of effort to control urban runoff will increase over time.[5] We pointed out that urban runoff is a significant contributor of impairment to waters throughout the state, and that additional controls are needed. Specifically, in Board Order WQ 2000-11 (hereinafter, LA SUSMP order), we concluded that the Los Angeles Regional Water Board acted appropriately in determining that numeric standards for the design of BMPs to control runoff from new construction and redevelopment constituted controls to the MEP.[6]

The San Diego permit incorporates numeric design standards for runoff from new construction and redevelopment similar to those considered in the LA SUSMP order.[7] In addition, the permit addresses programmatic requirements in other areas. The LA SUSMP order was a precedential decision,[8] and we will not reiterate our findings and conclusions from that decision.[9]

---

[5] Board Order WQ 2000-11.

[6] As explained in that Order, numeric design standards are not the same as numeric effluent limitations. While BIA contends that the permit under review includes numeric effluent limitations, it does not. A numeric design standard only tells the dischargers how much runoff must be treated or infiltrated; it does not establish numeric effluent limitations proscribing the quality of effluent that can be discharged following infiltration or treatment.

[7] The San Diego permit also includes provisions that are different from those approved in the LA SUSMP Order, but which were not the subject of either petition. Such provisions include the inclusion of non-discretionary projects. We do not make any ruling in this Order on matters that were not addressed in either petition.

[8] Government Code section 11425.60; State Board Order WR 96-1 (Lagunitas Creek), at footnote 11.

[9] BIA restates some of the issues this Board considered in the LA SUSMP order. For instance, BIA contends that it is inappropriate for the permit to regulate erosion control. While this argument was not specifically addressed in our prior Order, it is obvious that the most serious concern with runoff from construction is the potential for increased erosion. It is absurd to contend that the permit should have ignored this impact from urban runoff.

The petitioners make numerous contentions, mostly concerning requirements that they claim the dischargers will not be able to, or should not be required to, comply with. We note that none of the dischargers has joined in these contentions. We further note that BIA raises contentions that were already addressed in the LA SUSMP order. In this Order, we have attempted to glean from the petition issues that are not already fully addressed in Board Order Board Order WQ 2000-11, and which may have some impact on BIA and its members. WSPA restated the contentions it made in the petition it filed challenging the LA SUSMP order. We will not address those contentions again.[10] But we will address whether the Regional Water Board followed the precedent established there as it relates to retail gasoline outlets.[11]

[10] On November 8, 2001, following the October 31 workshop meeting that was held to discuss the draft order, BIA submitted a "supplemental brief" that includes many new contentions raised for the first time. (Interested persons who were not petitioners filed comments on the draft order asking the State Water Board to address some of these.) The State Water Board will not address these contentions, as they were not timely raised. (Wat. Code § 13320; Cal. Code of Regs., tit. 23, § 2050(a).) Specific contentions that are not properly subject to review under Water Code section 13320 are objections to findings 16, 17, and 38 of the permit, the contention that permit provisions constitute illegal unfunded mandates, challenges to the permit's inspection and enforcement provisions, objections to permit provisions regarding construction sites, the contention that post-construction requirements should be limited to "discretionary" approvals, the challenge to the provisions regarding local government compliance with the California Environmental Quality Act, and contentions regarding the term "discharge" in the permit. BIA did not meet the legal requirements for seeking review of these portions of the permit.

[11] On November 8, 2001, the State Water Board received eight boxes of documents from BIA, along with a "Request for Entry of Documents into the Administrative Record." BIA failed to comply with Cal. Code of Regs., tit. 23, section 2066(b), which requires such requests be made "prior to or during the workshop meeting." The workshop meeting was held on October 31, 2001. The request will therefore not be considered. BIA also objected in this submittal that the Regional Water Board did not include these documents in its record. The Regional Water Board's record was created at the time the permit was adopted, and was submitted to the State Water Board on June 11, 2001. BIA's objection is not timely.

II. CONTENTIONS AND FINDINGS[12]

Contention: BIA contends that the discharge prohibitions contained in the permit are "absolute" and "inflexible," are not consistent with the standard of "maximum extent practicable" (MEP), and financially cannot be met.

Finding: The gist of BIA's contention concerns Discharge Prohibition A.2, concerning exceedance of water quality objectives for receiving waters: "Discharges from MS4s which cause or contribute to exceedances of receiving water quality objectives for surface water or groundwater are prohibited." BIA generally contends that this prohibition amounts to an inflexible "zero contribution" requirement.

BIA advances numerous arguments regarding the alleged inability of the dischargers to comply with this prohibition and the impropriety of requiring compliance with water quality standards in municipal storm water permits. These arguments mirror arguments made in earlier petitions that required compliance with water quality objectives by municipal storm water permittees. (See, e.g., Board Orders WQ 91-03, WQ 98-01, and WQ 99-05.) This Board has already considered and upheld the requirement that municipal storm water discharges must not cause or contribute to exceedances of water quality objectives in the receiving water. We adopted an iterative procedure for complying with this requirement, wherein municipalities must report instances where they cause or contribute to exceedances, and then must review and improve BMPs so as to protect the receiving

[12] This Order does not address all of the issues raised by the petitioners. The Board finds that the issues that are not addressed are insubstantial and not appropriate for State Water Board review. (See *People v. Barry* (1987) 194 Cal.App.3d 158 [239 Cal.Rptr. 349]; Cal. Code Regs., tit. 23, § 2052.) We make no determination as to whether we will address the same or similar issues when raised in future petitions.

waters. The language in the permit in Receiving Water Limitation C.1 and 2 is consistent with the language required in Board Order WQ 99-05, our most recent direction on this issue.[13]

While the issue of the propriety of requiring compliance with water quality objectives has been addressed before in several orders, BIA does raise one new issue that was not addressed previously. In 1999, the Ninth Circuit Court of Appeals issued an opinion addressing whether municipal storm water permits must require "strict compliance" with water quality standards.[14] (*Defenders of Wildlife v. Browner* (9th Cir. 1999) 191 F.3d 1159.) The court in *Browner* held that the Clean Water Act provisions regarding storm water permits do not require that municipal storm-sewer discharge permits ensure strict compliance with water quality standards, unlike other permits.[15] The court determined that: "Instead, [the provision for municipal storm water permits] *replaces* the requirements of [section 301] with the requirement that municipal storm-sewer dischargers 'reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator . . . determines appropriate for the control of such pollutants'." (191 F.3d at 1165.) The court further held that the Clean Water Act does grant the permitting agency discretion to determine what pollution controls are appropriate for municipal storm water discharges. (*Id.* at 1166.) Specifically, the court stated that U.S.

---

[13] In addition to Discharge Prohibition A.2, quoted above, the permit includes Receiving Water Limitation C.1, with almost identical language: "Discharges from MS4s that cause or contribute to the violation of water quality standards (designated beneficial uses and water quality objectives developed to protect beneficial uses) are prohibited." Receiving Water Limitation C.2 sets forth the iterative process for compliance with C.1, as required by Board Order WQ 99-05.

[14] "Water quality objectives" generally refers to criteria adopted by the state, while "water quality standards" generally refers to criteria adopted or approved for the state by the U.S. EPA. Those terms are used interchangeably for purposes of this Order.

[15] Clean Water Act § 301(b)(1)(C) requires that most NPDES permits require strict compliance with quality standards.

EPA had the authority either to require "strict compliance" with water quality standards through the imposition of numeric effluent limitations, or to employ an iterative approach toward compliance with water quality standards, by requiring improved BMPs over time. (*Id.*) The court in *Browner* upheld the EPA permit language, which included an iterative, BMP-based approach comparable to the language endorsed by this Board in Order WQ 99-05.

In reviewing the language in this permit, and that in Board Order WQ 99-05, we point out that our language, similar to U.S. EPA's permit language discussed in the *Browner* case, does not require strict compliance with water quality standards. Our language requires that storm water management plans be designed to achieve compliance with water quality standards. Compliance is to be achieved over time, through an iterative approach requiring improved BMPs. As pointed out by the *Browner* court, there is nothing inconsistent between this approach and the determination that the Clean Water Act does not mandate strict compliance with water quality standards. Instead, the iterative approach is consistent with U.S. EPA's general approach to storm water regulation, which relies on BMPs instead of numeric effluent limitations.

It is true that the holding in *Browner* allows the issuance of municipal storm water permits that limit their provisions to BMPs that control pollutants to the maximum extent practicable (MEP), and which do not require compliance with water quality standards. For the reasons discussed below, we decline to adopt that approach. The evidence in the record before us is consistent with records in previous municipal permits we have considered, and with the data we have in our records, including data supporting our list prepared pursuant to Clean Water Act section 303(d). Urban runoff is causing and contributing to impacts on receiving waters throughout the state and impairing their

beneficial uses. In order to protect beneficial uses and to achieve compliance with water quality objectives in our streams, rivers, lakes, and the ocean, we must look to controls on urban runoff. It is not enough simply to apply the technology-based standards of controlling discharges of pollutants to the MEP; where urban runoff is causing or contributing to exceedances of water quality standards, it is appropriate to require improvements to BMPs that address those exceedances.

While we will continue to address water quality standards in municipal storm water permits, we also continue to believe that the iterative approach, which focuses on timely improvement of BMPs, is appropriate. We will generally not require "strict compliance" with water quality standards through numeric effluent limitations and we will continue to follow an iterative approach, which seeks compliance over time.[16] The iterative approach is protective of water quality, but at the same time considers the difficulties of achieving full compliance through BMPs that must be enforced throughout large and medium municipal storm sewer systems.[17]

We have reviewed the language in the permit, and compared it to the model language in Board Order WQ 99-05. The language in the Receiving Water Limitations is virtually identical to the language in Board Order WQ 99-05. It sets a limitation on discharges that cause or contribute to violation of water quality standards, and then it establishes an iterative approach to complying with the limitation. We are concerned, however, with the language in Discharge Prohibition A.2, which is

---

[16] Exceptions to this general rule are appropriate where site-specific conditions warrant. For example, the Basin Plan for the Lake Tahoe basin, which protects an outstanding national resource water, includes numeric effluent limitations for storm water discharges.

[17] While BIA argues that the permit requires "zero contribution" of pollutants in runoff, and "in effect" contains numeric effluent limitations, this is simply not true. The permit is clearly BMP-based, and there are no numeric effluent limitations. BIA also claims that the permit will require the construction of treatment plants for storm water similar to the publicly-owned treatment works for sanitary sewage. There is no basis for this contention; there is no requirement in the permit to treat all storm water. The emphasis is on BMPs.

challenged by BIA. This discharge prohibition is similar to the Receiving Water Limitation, prohibiting discharges that cause or contribute to exceedance of water quality objectives. The difficulty with this language, however, is that it is not modified by the iterative process. To clarify that this prohibition also must be complied with through the iterative process, Receiving Water Limitation C.2 must state that it is also applicable to Discharge Prohibition A.2. The permit, in Discharge Prohibition A.5, also incorporates a list of Basin Plan prohibitions, one of which also prohibits discharges that are not in compliance with water quality objectives. (See, Attachment A, prohibition 5.) Language clarifying that the iterative approach applies to that prohibition is also necessary.[18]

BIA also objects to Discharge Prohibition A.3, which appears to require that treatment and control of discharges must always occur prior to entry into the MS4: "Discharges into and from MS4s containing pollutants which have not been reduced to the [MEP] are prohibited."[19] An NPDES permit is properly issued for "discharge of a pollutant" to waters of the United States.[20] (Clean Water Act § 402(a).) The Clean Water Act defines "discharge of a pollutant" as an "addition" of a pollutant to waters of the United States from a point source. (Clean Water Act section 502(12).) Section 402(p)(3)(B) authorizes the issuance of permits for discharges "from municipal storm sewers."

---

[18] The iterative approach is not necessary for all Discharge Prohibitions. For example, a prohibition against pollution, contamination or nuisance should generally be complied with at all times. (See, Discharge Prohibition A.1.) Also, there may be discharge prohibitions for particularly sensitive water bodies, such as the prohibition in the Ocean Plan applicable to Areas of Special Biological Significance.

[19] Discharge Prohibition A.1 also refers to discharges into the MS4, but it only prohibits pollution, contamination, or nuisance that occurs "in waters of the state." Therefore, it is interpreted to apply only to discharges to receiving waters.

[20] Since NPDES permits are adopted as waste discharge requirements in California, they can more broadly protect "waters of the state," rather than being limited to "waters of the United States." In general, the inclusion of "waters of the state" allows the protection of groundwater, which is generally not considered to be "waters of the United States."

We find that the permit language is overly broad because it applies the MEP standard not only to discharges "from" MS4s, but also to discharges "into" MS4s. It is certainly true that in most instances it is more practical and effective to prevent and control pollution at its source. We also agree with the Regional Water Board's concern, stated in its response, that there may be instances where MS4s use "waters of the United States" as part of their sewer system, and that the Board is charged with protecting all such waters. Nonetheless, the specific language in this prohibition too broadly restricts all discharges "into" an MS4, and does not

allow flexibility to use regional solutions, where they could be applied in a manner that fully protects receiving waters.[21] It is important to emphasize that dischargers into MS4s continue to be required to implement a full range of BMPs, including source control. In particular, dischargers subject to industrial and construction permits must comply with all conditions in those permits prior to discharging storm water into MS4s.

Contention: State law requires the adoption of wet weather water quality standards, and the permit improperly enforces water quality standards that were not specifically adopted for wet weather discharges.

Finding: This contention is clearly without merit. There is no provision in state or federal law that mandates adoption of separate water quality standards for wet weather conditions. In arguing that the permit violates state law, BIA states that because the permit applies the water quality

[21] There are other provisions in the permit that refer to restrictions "into" the MS4. (See, e.g., Legal Authority D.1.) Those provisions are appropriate because they do not apply the MEP standard to the permittees, but instead require the permittees to demand appropriate controls for discharges into their system. For example, the federal regulations require that MS4s have a program "to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system . . . ." (40 C.F.R. § 122.26(d)(2)(iv)(D).)

objectives that were adopted in its Basin Plan, and those objectives were not specifically adopted for wet weather conditions only, the Regional Water Board violated Water Code section 13241. These allegations appear to challenge water quality objectives that were adopted years ago. Such a challenge is clearly inappropriate as both untimely, and because Basin Plan provisions cannot be challenged through the water quality petition process. (See Wat. Code § 13320.) Moreover, there is nothing in section 13241 that supports the claim that Regional Water Boards must adopt separate wet weather water quality objectives. Instead, the Regional Water Board's response indicates that the water quality objectives were based on all water conditions in the area. There is nothing in the record to support the claim that the Regional Water Board did not in fact consider wet weather conditions when it adopted its Basin Plan. Finally, Water Code section 13263 mandates the Regional Water Board to implement its Basin Plan when adopting waste discharge requirements. The Regional Water Board acted properly in doing so.

BIA points to certain federal policy documents that authorize states to promulgate water quality standards specific to wet-weather conditions.[22] Each Regional Water Board considers revisions to its Basin Plan in a triennial review. That would be the appropriate forum for BIA to make these comments.

Contention: BIA contends that the permit improperly classifies urban runoff as "waste" within the meaning of the Water Code.

[22] These documents do not support the claim that U.S. EPA and the Clinton Administration indicated that the absence of such regulations "is a major problem that needs to be addressed," as claimed in BIA's Points and Authorities, at page 18.

Finding: BIA challenges Finding 2, which states that urban runoff is a waste, as defined in the Water Code, and that it is a "discharge of pollutants from a point source" under the federal Clean Water Act. BIA contends that the legislative history of section 13050(d) supports its position that "waste" should be interpreted to exclude urban runoff. The Final Report of the Study Panel to the California State Water Resources Control Board (March, 1969) is the definitive document describing the legislative intent of the Porter-Cologne Water Quality Control Act. In discussing the definition of "waste," this document discusses its broad application to "current drainage, flow, or seepage into waters of the state of harmful concentrations" of materials, including eroded earth and garbage.

As we stated in Board Order WQ 95-2, the requirement to adopt permits for urban runoff is undisputed, and Regional Water Boards are not required to obtain any information on the impacts of runoff prior to issuing a permit. (At page 3.) It is also undisputed that urban runoff contains "waste" within the meaning of Water Code section 13050(d), and that the federal regulations define "discharge of a pollutant" to include "additions of pollutants into waters of the United States from: surface runoff which is collected or channeled by man." (40 C.F.R. § 122.2.) But it is the waste or pollutants in the runoff that meet these definitions of "waste" and "pollutant," and not the runoff itself.[23] The finding does create some confusion, since there are discharge prohibitions that have been incorporated into the permit that broadly prohibit the discharge of "waste" in certain circumstances.

[23] The Regional Water Board is appropriately concerned not only with pollutants in runoff but also the volume of runoff, since the volume of runoff can affect the discharge of pollutants in the runoff. (See Board Order WQ 2000-11, at page 5.)

(See Attachment A to the permit.) The finding will therefore be amended to state that urban runoff contains waste and pollutants.

Contention: BIA contends that the Regional Water Board violated California Environmental Quality Act (CEQA).

Finding: As we have stated in several prior orders, the provisions of CEQA requiring adoption of environmental documents do not apply to NPDES permits.[24] BIA contends that the exemption from CEQA contained in section 13389 applies only to the extent that the specific provisions of the permit are required by the federal Clean Water Act. This contention is easily rejected without addressing whether federal law mandated all of the permit provisions. The plain language of section 13389 broadly exempts the Regional Water Board from the requirements of CEQA to prepare environmental documents when adopting "any waste discharge requirement" pursuant to Chapter 5.5 (§§ 13370 et seq., which applies to NPDES permits).[25] BIA cites the decision in *Committee for a Progressive Gilroy v. State Water Resources Control Board* (1987) 192 Cal.App.3d 847. That case upheld the State Water Board's view that section 13389 applies only to NPDES permits, and not to waste discharge requirements that are adopted pursuant only to state law. The case did not concern an NPDES permit, and does not support BIA's argument.

Contention: WSPA contends that the Regional Water Board did not follow this Board's precedent for retail gasoline outlets (RGOs) established in the LA SUSMP order.

---

[24] Water Code section 13389; see, e.g., Board Order WQ 2000-11.

[25] The exemption does have an exception for permits for "new sources" as defined in the Clean Water Act, which is not applicable here.

Finding: In the LA SUSMP order, this Board concluded that construction of RGOs is already heavily regulated and that owners may be limited in their ability to construct infiltration facilities. We also noted that, in light of the small size of many RGOs and the proximity to underground tanks, it might not always be feasible or safe to employ treatment methodologies. We directed the Los Angeles Regional Water Board to mandate that RGOs employ the BMPs listed in a publication of the California Storm Water Quality Task Force. (*Best Management Practice Guide – Retail Gasoline Outlets* (March 1997).) We also concluded that RGOs should not be subject to the BMP design standards at this time. Instead, we recommended that the Regional Water Board undertake further consideration of a threshold relative to size of the RGO, number of fueling nozzles, or some other relevant factor. The LA SUSMP order did not preclude inclusion of RGOs in the SUSMP design standards, with proper justification, when the permit is reissued.

The permit adopted by the Regional Water Board did not comply with the directions we set forth in the LA SUSMP order for the regulation of RGOs. The permit contains no findings specific to the issues discussed in our prior order regarding RGOs, and includes no threshold for inclusion of RGOs in SUSMPs. Instead, the permit requires the dischargers to develop and implement SUSMPs within one year that include requirements for "Priority Development Project Categories," including "retail gasoline outlets." While other priority categories have thresholds for their inclusion in SUSMPs, the permit states: "Retail Gasoline Outlet is defined as any facility engaged in selling gasoline."[26]

[26] Permit at F.1.b(2)(a)(x).

The Regional Water Board responded that it did follow the directions in the LA SUSMP order. First, it points to findings that vehicles and pollutants they generate impact receiving water quality. But the only finding that even mentions RGOs is finding 4, which simply lists RGOs among the other priority development project categories as land uses that generate more pollutants. The Regional Water Board staff also did state some justifications for the inclusion of RGOs in two documents. The Draft Fact Sheet explains that RGOs contribute pollutants to runoff, and opines that there are appropriate BMPs for RGOs. The staff also prepared another document after the public hearing, which was distributed to Board Members prior to their vote on the permit, and which includes similar justifications and references to studies.[27] The LA SUSMP order called for some type of threshold for inclusion of RGOs in SUSMPs. The permit does not do so. Also, justifications for permit provisions should be stated in the permit findings or the final fact sheet, and should be subject to public review and debate.[28] The discussion in the document submitted after the hearing did not meet these criteria. There was some justification in the "Draft Fact Sheet," but the fact sheet has not been finalized.[29] In light of our concerns over whether SUSMP sizing criteria should apply to RGOs, it was incumbent on the Regional Water Board to justify the inclusion of RGOs in the permit findings or in a final fact sheet, and to consider an appropriate threshold, addressing the concerns we stated. The Regional Water Board also responded that when the dischargers develop the SUSMPs, the dischargers

[27] See "Comparison Between Tentative Order No. 2001-01 SUSMP Requirements and LARWQCB SUSMP Requirements (as Supported by SWRCB Order WQ 2000-11)."

[28] See 40 C.F.R. sections 124.6(e) and 124.8.

[29] U.S. EPA regulations require that there be a fact sheet accompanying the permit. (40 C.F.R. § 124.8.) The record contains only a draft fact sheet, which was never published or distributed in final form. The Regional Water Board should finalize the fact sheet, accounting for any revisions made in the final permit, and publish it on its web site as a final document.

might add specific BMPs and a threshold as directed in the LA SUSMP order. But the order specifically directed that any threshold, and the justification therefore, should be included in the permit. The Regional Water Board did not comply with these directions.

III. CONCLUSIONS

Based on the discussion above, the Board concludes that:

1. The Regional Water Board appropriately required compliance with water quality standards and included requirements to achieve reduction of pollutants to the maximum extent practicable. The permit must be clarified so that the reference to the iterative process for achieving compliance applies not only to the receiving water limitation, but also to the discharge prohibitions that require compliance with water quality standards. The permit should also be revised so that it requires that MEP be achieved for discharges "from" the municipal sewer system, and for discharges "to" waters of the United States, but not for discharges "into" the sewer system.

2. The Regional Water Board was not required to adopt wet-weather specific water quality objectives.

3. The Regional Water Board inappropriately defined urban runoff as "waste."

4. The Regional Water Board did not violate the California Environmental Quality Act.

5. The permit will be revised to delete retail gasoline outlets from the Priority Development Project Categories for Standard Urban Storm Water Mitigation Plans. The Regional Water Board may consider adding retail gasoline outlets, upon inclusion of appropriate findings and a threshold describing which outlets are included in the requirements.

IV. ORDER

IT IS HEREBY ORDERED that the Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems in San Diego County (Order No. 2001-01) are revised as follows:

1. Part A.3: The words "into and" are deleted.

2. Part C.2: Throughout the first paragraph, the words ", Part A.2, and Part A.5 as it applies to Prohibition 5 in Attachment A" shall be inserted following "Part C.1."

3. Finding 2: Revise the finding to read: **URBAN RUNOFF CONTAINS "WASTE" AND "POLLUTANTS"**: Urban runoff contains waste, as defined in the California Water Code, and pollutants, as defined in the federal Clean Water Act, and adversely affects the quality of the waters of the State.

4. Part F.1.b(2)(a): Delete section "x."

In all other respects the petitions are dismissed.

CERTIFICATION

The undersigned, Clerk to the Board, does hereby certify that the foregoing is a full, true, and correct copy of a resolution duly and regularly adopted at a meeting of the State Water Resources Control Board held on November 15, 2001.

Los Angeles, CA 90013

Introduction

The California Regional Water Quality Control Boards, Los Angeles Region (LA Regional Board) and the San Diego Region (SD Regional Board) issued a technical document (RB technical report) on new development standards for Retail Gasoline Outlets (RGOs) in June 2001. The RB technical report provided justification that RGOs should be subject to numerical design criteria for treatment control Best Management Practices (BMPs). On August 6, 2001, the Western States Petroleum Association (WSPA), a trade group for the petroleum industry in Western U.S., released a technical document that challenges the recommendations and the conclusions of the RB technical report. Among other claims, WSPA asserts that the California Storm Water Quality Task Force BMP Guide (Guide), a default collection of soft source control BMPs (Task Force BMPs) are sufficient and treatment control BMPs are not necessary at new and redeveloped RGOs.

The Storm Water Quality Task Force (Task Force) is primarily comprised of municipalities, private organizations and individuals responsible for and/or interested in the implementation of municipal separate storm sewer system (MS4) programs in California. Its Executive Committee is comprised of 17 members, including 11 municipal representatives, 2 industrial representatives, and 4 at-large members. The Executive Committee approves work products generated by the work groups, sets Task Force priorities, identifies issues of concern, appoints committees and work groups, updates the State Water Resources Control Board (State Board) on key issues, and establishes the agendas for bi-monthly meetings. Some Regional Board and State Board staff attend the Task Force meetings.

The following constitutes LA Regional Board staff review and comment on the Task Force BMPs and Guide.

Review of the Task Force BMPs and the Guide

The Task Force BMPs, mostly a collection of source control BMPs, are a "default" set of BMPs recommended for implementation at RGOs in 1997. The Task Force BMPs listed in the Guide carry over BMPs suggested by the USEPA in 1992 in a guidance document.[1]

The Guide recommends that BMPs be included in the construction and design of new and substantially remodeled RGO facilities. These Task Force BMPs are:

(i) Fueling area design and construction - Portland cement concrete with a 2% to 4% slope around fuel dispensing areas to prevent ponding, and minimum separation by a grade break to prevents run-on of storm water; fuel dispensing area is defined as extending 6.5 feet from the corner of each fuel dispenser or the length at which the hose and nozzle assembly may be operated plus 1 foot, whichever is less. The paving around the fuel dispensing area may exceed the minimum dimensions of the "fuel dispensing area" stated above. In addition, the fuel dispensing area must be covered, and the cover's minimum dimensions must be equal to or greater than the area within the grade break or the fuel dispensing area, as defined above. The cover must not drain onto the fuel dispensing area.

(ii) Fuel-dispensing areas maintenance - routinely swept for removal of litter and debris, and use of rags and absorbents for leaks and spills. It is also suggested that wash down of fueling areas should never be performed (but avoids the use of word: "prohibited") unless the wash water is collected and disposed of properly.[2]

(iii) Employee training - training in management of waste materials, labeling drains and flow patterns at the facility (seldom observed in practice), inspection and cleans up of storm drain inlets and catch basins within the facility's boundaries (also not performed routinely).

(iv) Fuel dispenser signage - posting signs close to the fuel dispenser that warn vehicle owners/operators against "topping off" of vehicle fuel tanks and installation of automatic shutoff fuel dispensing nozzles.[3]

(v) Outdoor waste receptacle and air/water supply area design and maintenance - clean-up of leaks and drips, grading the site in such a way to prevent run-on of storm water, segregation of flow, and the installation of a roof cover or a low containment berm.

---

[1] *Storm Water Management for Industrial Activities – Developing Pollution Prevention Plans and Best Management Practices*, EPA 832-R-92-006, pg. 3-2 to 3-4

[2] One might infer from this statement that the quality of the wash water cleaning the fueling areas is not appropriate for disposal, due to contamination from spills, stains and deposits from vehicular traffic. That raises the question of whether the practice of sweeping for removal of debris or the use of rags and absorbents for leaks and spills, at RGOs is adequate in itself. Numerous studies have shown that there is pollutant build-up and entrapment in the base pavement that can not be removed even after multiple episodes of pressure washing.

[3] Although the signs are a very good educational BMP, both the heavy automobile traffic at RGOs and accidental spills invariably contribute to pollutant build-up.

The language in the Guide is overly broad, voluntary, non-specific, and vague from a regulatory perspective. It is not known if the BMPs are mandatory throughout the petroleum retailing industry and are routinely implemented.[4]

No evidence has been provided to date to demonstrate that the sole implementation of source controls BMPs is sufficient to achieve the goal of reducing the discharge of pollutants in storm water from RGOs. Rather, more recent data shows that the opposite is true. Source control BMPs while essential to pollution reduction efforts, and presumptively cost effective, do not obviate the need for treatment control BMPs to remove pollutants of concern in storm water from RGOs. Essentially, these BMPs are the pre-treatment step in the treatment train to reduce the discharge of storm water pollutants.

The Guide has not been updated, although much research on the effectiveness of treatment control BMPs has been done and well documented in the literature since 1997. Some of these studies have determined that the implementation of source control BMPs alone is not sufficient to adequately address storm water pollution[5]. There is a tremendous body of evidence and numerous studies have been conducted in recent years since the Guide was first issued.

Summary of Research to Date

The US General Accounting Office (GAO) Report to Congress[6] mentions the relationship between automobile traffic (such as at RGOs) and sources of pollutants in storm water runoff, including toxic pollutants such as heavy metals and petroleum hydrocarbons. The GAO Report discusses (i) the evidentiary direct correlation between vehicular traffic and Polycyclic Aromatic Hydrocarbon (PAH) concentrations in lake-bottom sediment and, (ii) the occurrence of toxicity from heavy metal concentrations in receiving waters in urban and suburban communities in the U.S. Both PAH and heavy metal concentrations have increased with the increase of vehicular traffic in these areas.

Studies analyzing the effectiveness of source control BMPs reveal that there is scant evidence to demonstrate that source control BMPs are by themselves adequate to prevent pollutants from entering storm water discharges. The effectiveness of most storm water treatment control practices is dependent on their ability to remove pollutant particles from the water, or possibly from intermediate accumulating locations and not through source reduction.[7] To the contrary, some of the more recent studies show that some source control BMPs (such as sweeping) are ineffective in removing pollutants.[8] Other studies, performed at RGOs specifically demonstrate that some potent treatment control BMPs (mobile high pressure water cleaning) are still not effective in removing

pollutants due to the high pollutant deposition rates, heavy pollutant buildup and entrapment in the base pavement and also that soft source control BMPs are not likely to have a significant impact on the sources of pollution.[9] Furthermore, studies performed in the Los Angeles region at automotive service facilities and monitoring data collected through those studies show no improvement in storm water discharge quality after the implementation of source control BMPs, similar to those suggested by the Task Force.[4] Other studies indicate that while the data to recommend outright acceptance of a number of treatment control BMPs at this time may be limited, some of these treatment control BMPs are conditionally acceptable.[10,11,12]

Conclusion

The Guide is a basic document that has become obsolete. BMPs in the Guide are not substantive. They cannot be considered as being adequate to ensure that storm water discharges from RGOs meet the standard of Maximum Extent Practicable (MEP standard) under CWA § 402(p) and do not cause or contribute to the exceedance off water quality standards in receiving waters under CWA § 301. Rather, the Guide is a "default" list of source control BMPs identified as pollution prevention measures by the Task Force to be implemented as a first step. The Task Force, unlike WSPA, has never claimed that the Task Force BMPs constitute the MEP standard for MS4 permittees for controlling the discharge of pollutants from RGOs to the MS4. The Task Force BMPs and Guide were a recommendation of a minimal "default" set of source control BMPs agreed to by a representative workgroup in 1997, nothing more. WSPA's absolute reliance on the Guide appears misplaced, considering that nearly a decade ago, USEPA identified the need to implement treatment control BMPs at RGOs to address and control storm water pollution.[13]

In light of numerous recent studies, which demonstrate the need for aggressive treatment control BMPs at RGOs in addition to pollution prevention measures, the Guide is obsolete. The source control BMPs in the Guide are insufficient to control the sources of pollutants in storm water discharges at RGOs, where such discharges cause or contribute to an exceedance of water quality standards for toxic constituents such as heavy metals and petroleum hydrocarbons.

Regional Board staff stands behind the conclusions of the previously released *Technical Report – Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts – June 2001*. The justification in the RB technical report is valid and is supported by numerous studies and monitoring data. The recommendations in

Pag. 111: "Certain commercial and industrial sites can be responsible for disproportionate contributions of some pollutants (e.g., grit, oils, grease, and toxic materials) to the drainage system. Typical sources of potential concern include gasoline stations, railroad yards, freight loading areas, and parking lots. In specific cases where significant pollutant loadings to the system are contributed by well-defined locations of limited area, pretreatment of the runoff from these areas could be a practical and effective control measure. Pretreatment measures can be required as part of a community's regulations. Examples of pretreatment measures include oil/water separators for gasoline stations, or the use of modified catch basin designs to enhance the retention of oil and grease or solids

the document are sound, balanced, and responsive to areas of concern raised by the State Board in the SUSMP decision.

The overarching objective of new development and redevelopment requirements for RGOs is to protect an important natural resource: the quality of waters of the State. Implementation of the source control BMPs in the Guide alone will not and cannot achieve that objective. The implementation of treatment control BMPs adequately designed for water quality volume and water quality flow for pollutants of concern in storm water discharges from new and redeveloped RGOs is necessary.

Review of Retail Gasoline Outlets: New Development Design Standards For Mitigation of Storm Water Impacts

This report summarizes comments prepared by Geomatrix Consultants Inc. (Geomatrix) based upon a review of the "Retail Gasoline Outlets: New Development Design Standards For Mitigation of Storm Water Impacts" ("Technical Report"), June 2001 prepared by the Los Angeles and San Diego Regional Water Quality Control Boards.

As discussed in the following sections, the Technical Report attempts to establish proper justification that numerical mitigation standards are appropriate for RGOs based primarily on conclusions made by the RWQCBs regarding the quality of storm water runoff from RGOs and assertions regarding the ease and effectiveness of storm water treatment systems for RGOs.

RGO Storm Water Quality

The RWQCB's Technical Report states that RGOs are "toxic pollutant hotspots" and that RGOs have been identified as generators of significantly higher concentrations of hydrocarbon and heavy metals than parking lots, convenience store lots, and streets. These statements are based upon an unpublished study and subsequent article both prepared by Schueler and Shepp[1] and Shepp[2] that evaluated and contrasted analytical results from samples of pool water and trapped sediments collected from oil/grit separators installed to treat storm water runoff from gas stations, convenience stores, all-day parking lots, streets, and residential parking areas in suburban Maryland. Because the study was not based on analysis of actual storm water runoff samples, the results should not be construed to characterize storm water quality from these various sites. The intent of the study was to evaluate the "dismal" performance of oil/grit separators as storm water treatment BMPs. One finding of the study was that of the 100 separators inspected, not a single separator had ever been maintained. For this reason it is not

[1] Schueler, T. and D. Shepp, 1993, The Quality of Trapped Sediments and Pool Water Within Oil Grit Separators in Suburban MD. Metro Washington COG. 48 pp.

[2] Schueler, T. 2000, Hydrocarbon Hotspots in the Urban Landscape: Can They Be controlled? The Practice of Water Shed Protection by Thomas R Schueler and Heather K, Holland.

surprising that the separators would act as sumps and accumulate materials handled at the facility, which in the case of an RGO would be hydrocarbons and related materials.

The study confirms the difficulties associated with relying on structural treatment to improve storm water quality. These difficulties were also considered by the Storm Water Quality Task Force Work Group during development of the "Best Management Practice Guide for Retail Gasoline Outlets" ("Task Force BMP Guide"). At that time the Work Group, comprised of representatives from the State Water Resources Control Board, Regional Water Quality Control Boards, municipalities, and industry, considered structural treatment devices to augment the source control BMPs recommended in the Task Force BMP Guide and concluded:

> "the evidence reviewed by the Work Group indicated that the effectiveness and efficiency of these and other BMPs not listed was insufficient for them to pass peer review and therefore these BMPs can not be generally recommended for use statewide. There may be situations in which these BMPs would be effective and efficient (as evidenced by research), and therefore appropriate, but these situations should be the exception, not the rule."

In fact, the source control approach taken in the Task Force BMP Guide is consistent with the following conclusion presented in the same Schuler and Shepp article referenced in the RWQCB's Technical Report:

> "*Source control* may hold the greatest promise to reduce the delivery of pollutants from hotspots. This pollution prevention approach stresses the importance of eliminating the spills, leaks, and emissions that create hotspots in the first place. A series of better handling, recycling, storage, and disposal practices can reduce the chance that automotive fluids and cleaning solvents come into contact with rainwater and run off the site. The Santa Clara Valley Nonpoint Source Program has published an excellent summary of pollution prevention practices for gas stations."

Dr.L. Donald Duke, a U.C.L.A. researcher expanded on the Santa Clara Valley's prevention approach.

> "The intend of the pollution prevention approach is to control pollutants so well that stormwater need not be treated in a hydraulic detention facility or a pollutant removal device. The approach is highly practical from a business standpoint because it focuses on industrial operations and low-cost pollution control practices rather than expensive constructed solutions like new industrial structures or new storm water detention or treatment facilities. This approach is especially preferable in the kind of highly seasonal semi-arid rainfall regimes that are found in much of California and most of the western U.S."[3] (emphasis added)

The Santa Clara Valley Nonpoint Source Control Program BMP Guide for Automotive-Related Industries referenced by Schuler and Shepp was used as a reference by the work group during development of the Task Force BMP Guide and many of the pollution prevention practices in the Santa Clara document are incorporated into the Task Force guide.

The RWQCB's Technical Report also references the findings of a Rouge River National Wet Weather Demonstration Project as evidence that oil and grease from RGOs are a concern.[4] As with the Schuler and Shepp reference, the Rouge River study is not based upon storm water quality sampling but rather on analysis of filter media from catch basin inserts installed over an approximate one year period at two RGOs in Michigan. According to the principal investigator of the Rouge River study, neither of the RGOs monitored during the study performed any source control measures and for this reason, the presence of oil and grease in filter media is not surprising. In fact, the RGO operators were instructed not to implement source control measures and it is inappropriate to imply

[3] Santa Clara Valley Nonpoint Source Pollution Control Program. 1992. Duke, L.D. and Shannon, J.A. Best Management Practices for Industrial Storm Water Pollution Control.

[4] Rouge River National Wet Weather Demonstration Project, MI, Evaluation of On-Line Media Filters in the Rouge River Watershed, Report No. RPO-NPS-TPM59.00 (1999), 36 pp.

that the results of the Rouge River study are indicative of actual storm water quality from a RGO practicing BMPs such as those presented in the Task Force BMP Guide. A more accurate assessment of storm water quality from RGOs would be based upon actual water quality information. The results of three such studies are summarized in Table 1. The studies include a WPSA/API study published in 1994, another study published by Shepp in 1995, and Sacramento County's Action Plan Demonstration Project published in 1994. Collectively, these studies provide runoff characterization information for ten RGOs, 21 storm events, and 12 simulated storm events. Additionally, the mean concentrations for residential and commercial land uses from the National Urban Runoff Program (NURP) are summarized in Table 1. NURP was a comprehensive study conducted from 1978 through 1983 with funding and guidance provided by EPA. The results of NURP provide insight on what can be considered background levels for urban runoff.

As summarized in Table 1, the mean concentrations of total suspended solids, lead, copper and zinc in runoff from RGOs are below the background concentrations established by NURP. Additionally, in most cases, the mean concentrations of oil and grease, total suspended solids, and chemical oxygen demand are below the limitations established for a number of NPDES permits, including storm water discharge limitations established for transportation-related industrial facilities located in Alabama, Oregon, Louisiana, and North Carolina. On this basis, it appears that the mean concentrations of chemical constituents in runoff from the RGOs studies are below background and are generally below levels that require additional controls or treatment, as established by the effluent limitations developed for storm water discharges from sites where vehicle fueling, maintenance, and repair occur.

The preceding conclusions are based upon the mean concentrations in runoff samples collected from ten RGOs. Of course the analytical results for individual RGOs and storm events are variable, as would be expected based upon typical variability in RGO age, construction, throughput, and management practices. Notwithstanding this consideration, the results of this data compilation suggest that the RWQCB's characterization of RGOs

as "toxic pollutant hotspots" is inaccurate and misleading. Furthermore, the fact that the chemical composition in runoff from RGOs is consistent with urban background supports an approach of protecting the runoff water quality from RGOs through the pollution prevention measures documented in the Task Force BMP guide. The RWQCBs have failed to accurately demonstrate the need for measures beyond the pollution prevention measures presented in the Task Force BMP guide.

Another potentially misleading statement presented in the Technical Report is a reference to the *Study of the Impact of Storm Water Discharge on Santa Monica Bay*[5] and the statement "heavy metals, significant concentrations of which occur in storm water discharges from RGOs, have been demonstrated to be the main cause of toxicity in Santa Monica Bay during wet weather." While the study does report that a high percentage of samples collected offshore of Ballona and Malibu Creeks were toxic during dry and wet weather conditions and that dissolved metals contributed to the toxicity, the study does not speculate on the specific source of the metals. In fact, there is no mention of RGOs or RGO runoff quality in the RWQCB's reference. Interestingly, the Santa Monica Bay study points out that "dry weather toxicity results suggest that factors other than stormwater discharge have a major influence on surface water quality in Santa Monica Bay." This finding provides additional evidence that the RWQCB's attempt to attribute toxicity in Santa Monica Bay to RGOs is inaccurate and misleading.

Treatment Control BMPs

In the Technical Report, the RWQCBs indicate that the various studies cited by WSPA showing that the quality of RGO runoff is no worse than commercial parking lots and diffuse runoff is evidence that "existing BMPs do not address pollutants generated by motor-vehicle traffic." This statement is unfounded particularly because the studies cited by WSPA were performed prior to development of the Task Force BMPs and no data are presented to suggest that the Task Force BMPs are not effective. It is apparent that the RWQCBs have condemned the balanced pollution prevention approach provided by the

[5] "Study of the Impact of Storm Water Discharge on Santa Monica Bay – Executive Summary", Los Angeles County Department of Public Works (1999).

Task Force BMPs without adequate technical justification and instead are pushing dischargers towards treatment BMPs.

Furthermore, with respect to the effectiveness of the Task Force BMPs, the Technical Report indicates that heavy metals and oil and grease are of concern for RGOs. It is well understood and documented that the presence of heavy metals is correlated with sediment.[6] On this basis, BMPs that are effective in reducing the concentrations of sediment in storm water, such as regular sweeping, will also be effective in reducing the concentrations of total and dissolved heavy metals in storm water. Additionally, there are numerous BMPs that are effective for reducing exposure of oil and grease to storm water. These include but are not limited to grading to prevent runon across fuel islands, canopies for fueling areas, and spot cleaning of leaks and drips using appropriate materials and procedures.

In the Technical Report, the RWQCBs indicate that online media filter systems can be effective treatment devices for RGOs. In the Technical Report, the RWQCBs have recommended use of online media filters based upon their review of water quality data results for a proprietary on-line filter media device located at a large RGO in Washington. The Technical Report states that "the treatment device was effective in removing between 50 and 90 percent of pollutants of concern in storm water discharges from RGOs." The average removal results as reported in the referenced document are summarized in Table 2. The actual reported average removal rates for composite samples for total suspended solids, total zinc, and dissolved zinc are 43, 42.5, and 57.8 percent, respectively. More important than the RWQCBs' overstatement regarding filter performance is the failure of the RWQCBs to report all of the results from the study, including results for oil and grease and total phosphorous which actually increased by 84.3 and 95 percent, respectively as a result of filtering storm water through the media filter. Perhaps this selective use of data is an oversight but one must question the environmental benefit of requiring RGOs to install treatment systems that result in a net

[6] See "A Water Quality Characterization for Runoff from Discrete Land Use Types in the Washington Metropolitan Area" (Shepp, 1995); and Storm Water NPDES Monitoring in Santa Clara Valley (Cooke et. Al, 1994) where correlations between TSS, hydrocarbons, and heavy metals are established.

export of oil and grease and nutrients, particularly when many of California receiving waters are impaired by nutrients.

The only other treatment approach suggested by the RWQCBs based upon their review of performance data are storm drain filters inserts. The study cited in the Technical Report was the same Rouge River National Wet Weather Demonstration Project used by the RWQCBs as evidence that "oil and grease from RGOs are a concern." The conclusions in that study regarding filter performance were not based upon storm water quality sampling but on analysis of accumulated debris and filter media installed in the catch basins. As previously discussed in this comment letter, neither of the RGOs monitored during the study performed any source control measures and in fact, the RGO operators were instructed not to implement BMPs. On this basis, the quality of storm water entering the filters is not representative of RGOs implementing appropriate source control BMPs. Furthermore, analysis of the accumulated debris and filter media is not an accurate measure of storm water quality improvement or filter performance and is inconsistent with the BMP monitoring effectiveness approaches established by EPA and the American Society of Civil Engineers in the Urban Storm Water Best Management Practices Study. [7]

One study that did evaluate the effectiveness of drain inlet filters based upon extensive inflow and outflow monitoring was recently completed by Caltrans.[8] The study included monitoring two different types of drain inlet filter at six Caltrans maintenance stations in Los Angeles County. One of the drain inlet filters studied by Caltrans was also studied in the Rouge River study referenced in the Technical Report. The reported removal efficiencies for the drain inlet filters studied by Caltrans were very low, with average

[7] ASCE/EPA, 1999, Determining Urban Stormwater Best Management Practice (BMP) Removal Efficiencies, May 14. See also Strecker, E.W., Constituents and Methods for Assessing BMPs.

[8] Othermer Jr., E.F et al. 2001, Performance Evaluation of Structural BMPs: Drain Inlet Inserts (Fossil Filter™ and StreamGuard™ and Oil/Water Separator: American Society of .Civil Engineer's Environmental and Water Resources Institute's (EWRI's) World Water & Environmental Resource Congress, Orlando, Florida, May 20 to 24.

efficiencies of 10 percent for hydrocarbons, 14.5 percent for total suspended solids, and 5.8, 17.8, and 6 percent, respectively, for total copper, lead, and zinc. In addition to overestimating the performance of the drain inlet filters, the RWQCBs greatly underestimated the costs associated with this BMP. The Technical Report states that first year capital costs range between $250 and $900 per year and annual operations and maintenance costs are $240. These relatively low costs are in stark contrast to the findings of the Caltrans study, which report the annual operations and maintenance of the drain inlet filters to be $15,000 per year or 1250 percent of the initial purchase and installation cost.[9] The significant costs reported by Caltrans were the result of extensive cleanout and repair of the filters required throughout the study period. Additionally, the RWQCBs also have failed to consider the costs associated with constructing drainage systems at RGOs that would allow for installation of drain inlet filters or other treatment systems. Currently, storm water runoff from most RGOs is via sheet flow and installation of treatment systems would require installation of catch basins and subsurface piping. In many cases, extensive site grading or pump stations would be required to allow for proper site drainage.

In the Technical Report, the RWQCBs state that "storm water treatment at RGOs is both feasible and safe." While it may be feasible to install the storm water treatment systems recommended by the RWQCBs, the Technical Report fails to prove that the treatment systems are effective and whether treatment is necessary at all for RGOs implementing the Task Force BMPs. With respect to safety, the Technical Report states that "sub-surface fabricated treatment systems have been commonly used at RGOs to separate waste-oil before discharge to the sanitary sewer system" and that "there is no reason to suppose that storm water treatment in California introduces new and different safety and feasibility considerations, as when compared to waste water treatment systems which RGOs have readily installed in California." In fact there are significant differences in safety considerations between oil/water separators installed for discharge of oily waste to the sanitary sewer and subsurface storm water treatment systems at RGOs. Oil/water

[9] Smith, T., and Lantin, A., 2001 RBF Consulting,: Caltrans BMP Retrofit Pilot Program; A Real World Experience: from: Water Quality Elements in Development Today APWA Seminar, San Diego, CA., June 19.

separators are typically required when vehicle maintenance shop drains are connected to the sanitary sewer. The drain inlets are typically located inside a shop or in locations where they are isolated from the pump islands and consequently, there is little potential for the separator to accumulate spilled gasoline in significant quantities. However, in the case of a subsurface storm water treatment system installed to handle runoff from a fueling area, because the spill would flow into the RGO drainage/treatment system, there is a greater potential for a gasoline spill to occur undetected by the RGO operator and for the gasoline to accumulate in the enclosed underground structure resulting in a potential exposure hazard. In the absence of a subsurface treatment system, there is a greater likelihood that the spill would be noticed by the RGO operator so that appropriate spill control and countermeasure procedures could be implemented.

One additional consideration in regards to subsurface storm water treatment systems for RGOs is that from a practical perspective, any subsurface "treatment box" installed to receive runoff would act as a sump during dry weather accumulating debris, dirt and hydrocarbons. This concern is consistent with the results of the Rouge River Study where sediment and hydrocarbons were found to accumulate in the drain inlets. The presence of such a sump impedes the ability for the RGO operator to effectively clean the RGO using standard good housekeeping procedures and to perform the necessary inspections to determine when sweeping and other housekeeping activities are necessary. Cleaning a sump can be difficult and can result in significant safety issues including but not limited to confined space, lifting hazards, traffic hazards, and spider bites. Worse yet, if the subsurface treatment system retains water after the end of a storm event, an outside service would be required to perform the cleanout and handle any wastes removed. As described by the Schuler and Shepp study, the end result of installing subsurface storm water treatment systems in Maryland was that none of the more than 100 systems inspected were ever maintained and what was initially installed to improve storm water quality actually created a significant water quality concern.

Conclusions

In summary, the RWQCB's Technical Report fails to justify the need for storm water treatment at RGOs. There is no information provided in the Technical Report that proves that storm water quality concerns can't be effectively addressed through implementation of the Task Force BMPs. The RWQCB's fail to recognize the advantages of the pollution prevention approach provided by the Task Force BMPs, including the fact that all stations, whether existing, remodeled, or newly constructed, will realize improvements in storm water quality. Furthermore, as described in this report, there are significant technical concerns regarding the treatment BMPs recommended in the Technical Report, including significant and unrealistic maintenance requirements, questions regarding true performance, potential pollutant export, and the actual costs to install, operate, and maintain the treatment devices.

Abstract

The performance of Drain Inlet Inserts (Fossil Filter™ and StreamGuard™) in treating runoff from three California Department of Transportation (Caltrans) maintenance stations was evaluated as part of the Best Management Practice (BMP) Retrofit Pilot Program. Additionally, the effectiveness of an oil/water separator was evaluated at one Caltrans maintenance station. The study included 1) retrofitting the structural BMPs in existing maintenance stations and documenting those costs; 2) estimating percent pollutant removal efficiencies; 3) assessing the causes and frequency of flow bypass; and 4) documenting the type and level of effort required to maintain the structural BMPs. Drain Inlet Insert results to date show that reductions in metals, hydrocarbons, and solids are consistent with expectations for the technology; however, frequent flow bypass required more maintenance than anticipated. Oil/water separator results show no discernable difference between influent and effluent hydrocarbon concentrations at the low levels measured.

Introduction

Concern about the potential adverse impacts of urban and highway runoff on receiving waters has resulted in increased pressure on municipal and highway agencies to treat stormwater discharges. There are a variety of land uses managed by highway agencies and the runoff quality from these areas may differ significantly. In addition, receiving waters have different designated beneficial uses and varying sensitivity to stormwater discharges. Consequently, there is a need to identify a "toolbox" of structural Best Management Practices (BMPs) for implementation downstream of specific land uses to achieve a quality of discharge sufficient to preserve the environmental quality of a given receiving water.

The California Department of Transportation (Caltrans) has embarked on a comprehensive analysis of the siting requirements, cost (both installation and maintenance), and performance of a number of structural BMPs for retrofitting existing highway infrastructure. Elsewhere, use of Drain Inlet Inserts (DIIs) is becoming common but with little understanding of their effectiveness and maintenance needs. Oil/water separators are commonly used near industrial processes where hydrocarbon concentrations are in excess of 15 mg/L, but their effectiveness in treating stormwater discharge from a transportation facility is not well understood. These are important considerations for assessing the overall feasibility of this type of device. The goal of

R0007566

this paper is to present the interim findings related to the evaluation of two DII types and an oil/water separator.

Siting and Selection

Drain Inlet Inserts

A total of six DIIs were sited, installed, maintained, and monitored for this study in Caltrans District 7 (Los Angeles County) maintenance stations (MSs). A wide-range of proprietary DII products was commercially available. Initial candidates for the study included the Aquafend Filter, Fossil Filter™, Gullywasher® Geotextile CB Insert, Hydro-Kleen, StreamGuard™, and Zero Discharge Storm Drain Liner. These candidates use a variety of treatment mechanisms (e.g., trays, bags, and baskets), are manufactured from a variety of materials (e.g., stainless steel, fiberglass, polypropylene, PVC, and galvanized steel), have different flow capacities, and have anywhere from less than 10 to more than 20,000 installations (according to the manufacturers). The process of selecting two DIIs for the study was restricted to review of manufacturer's literature and the limited test data available. Also, because the purpose of the study was to determine the effectiveness of the DII technology as a BMP, consideration was not necessarily given to any one specific proprietary product. Given that, the Fossil Filter™ "Drop In" insert, which is manufactured by KriStar Enterprises, Inc.; and the StreamGuard™ Oil & Grease Catch Basin Insert (#3001), which is manufactured by Foss Environmental Services were selected for the study.

The original siting criteria for identifying locations where DIIs could operate effectively were established with the aid of manufacturer's literature. For example, Fossil Filter™ literature said "*Fossil Filter was developed and designed to remove petroleum hydrocarbons from water runoff and its most logical use is where motor vehicles park, are refueled or serviced. Customer and employee parking lots and corporation yards, service stations, airport ramps and refueling areas, even some marinas, are excellent prospects for the installation of Fossil Filter...*" The process of locating sites involved extensive field review. Each site required at least two drain inlet structures so that comparison between each DII type could be made. Consideration was also given to the types of maintenance activities and equipment storage at the station. Since the primary function of the DIIs tested is to remove petroleum hydrocarbons, the DIIs were sited in locations where vehicular storage, fueling, and/or maintenance operations were conducted. For comparability, each DII was installed in similar-sized watersheds. Also, maintenance stations were selected because of the routine use of source controls (e.g., sweeping), which minimized the potential for sediment clogging the DIIs.

In the case of the Fossil Filter™ DII, there were locations where sediment, leaves, and debris discharged into the DII and blocked the filter cartridges. Even though source controls were practiced at maintenance stations, small quantities of sediment, leaves, and debris clogged the filter cartridges, rendering the DII ineffective in removing petroleum hydrocarbons. Though installed and tested in locations meeting the manufacturer's guidance, it seems that this may not be the application for which the DII was designed.

In the case of the StreamGuard™ DII, their literature says "*Great for parking lots and storage areas.*" However, when consulting with Mr. John Macpherson (StreamGuard™ DII inventor) during the study, he said that the StreamGuard™ was best suited for industrial locations where

R0007567

high hydrocarbon concentrations could be expected. He also noted that the StreamGuard™ DII was developed to improve water quality at a reasonable price but was not intended to be implemented as a long-term BMP.

Characteristics of the contributing watersheds for the selected sites are shown in Table 1.

Oil/Water Separator

The oil/water separator selected for the study was an Areo-Power® 5,000-gallon ST1-P3. As with the DIIs, the process of locating sites involved extensive field review of twenty-two maintenance stations. Site characteristics considered included presence of heavy equipment, method of asphalt containment, likelihood of oil storage, site exposure to rain, type of onsite drainage, and availability of operating hydraulic head. In addition, runoff from top ranking sites were sampled during storms and analyzed for oil and grease. Locations with concentrations less than 10 mg/L of oil and grease were not considered. Characteristics of the contributing watersheds for the selected sites are shown in Table 1.

Table 1: Summary of Contributing Watershed Characteristics for Drain Inlet Inserts and the Oil/Water Separator

Site Location	BMP Type	Watershed Area (ha)	Imp. Cover(%)
Foothill MS	Fossil Filter™	0.64	100
Las Flores MS	Fossil Filter™	0.32	70
Rosemead MS	Fossil Filter™	0.10	100
Foothill MS	StreamGuard™	0.07	100
Las Flores MS	StreamGuard™	0.09	62
Rosemead MS	StreamGuard™	0.49	100
Alameda MS	Oil/Water Separator	0.32	100

Design

Fossil Filter™ Drain Inlet Insert

The Fossil Filter™ DII (Figure 1) is a trough structure that is installed under the grate of a drain inlet. Within the structure are stainless steel filter cartridges containing amorphous alumina silicate for the removal of petroleum hydrocarbons and other potential contaminants. The trough is fabricated using fiberglass material and consists of a large center opening for the bypass of water when the filter's flow-through capability is exceeded.

StreamGuard™ Drain Inlet Insert

The StreamGuard™ DII (Figure 2) is a conical-shaped porous sock made of polypropylene fabric. The StreamGuard™ Oil and Grease model used in this study is equipped with an oil absorbent polymer. As runoff enters the insert, the fabric absorbs oil and retains sediment. Floating oil and grease are absorbed by the absorbent polymer. The insert is also fabricated with two overflow cutouts near the top of the cone to allow bypass when the fabric's flow-through capacity is exceeded.

R0007568

Oil/Water Separator

The Areo-Power® 5,000-gallon ST1-P3 Oil/Water Separator (Figure 3) is designed to remove free oil and grease from stormwater runoff. This oil/water separator separates oil and water by allowing oil droplets to collide and coalesce to become larger globules, which are captured in the separator. The separator consists of three compartments: a forebay, an oil separation cell, and an afterbay. The forebay is a cistern that traps and collects sediments. The central oil separation cell captures and holds oil. Vertical metal plates allow oil to migrate away from the stormwater. The afterbay is designed to discharge stormwater at concentrations of 10 ug/L of oil and grease or less.

R0007569

Installation

Typically, installation of DIIs is simple and requires no specialized equipment. Both DIIs used in this study are sized to fit standard Caltrans G2 drain inlets. Conversely, retrofit of the oil/water separator required extensive construction including excavation, construction of storm drain conveyance system, and field modifications to accommodate unanticipated buried utilities. Runoff from the maintenance station generally sheet flowed offsite. To maximize the amount of runoff treated by the oil/water separator, a trench drain had to be retrofitted at the MS; this trench drain channelized flow directly into the oil/water separator. Excavation for the oil/water separator became complicated because of unanticipated buried utilities. Consequently, the oil/water separator had to be rotated ninety degrees to accommodate the buried utilities.

Operation and Maintenance

Maintenance is dependent on the rate pollutants accumulate, storage capacity, and requirements to maintain hydraulic function. Consequently, DIIs had greater maintenance requirements than many other types of stormwater treatment BMPs. Conversely, the oil/water separator required less maintenance. Following is a summary of maintenance conducted at each BMP.

Fossil Filter™ Drain Inlet Inserts

Early in the study manufacturers maintenance guidance was followed to ensure proper functioning of the DII. Based on empirical observations during initial storm events, it was noted that the DIIs were highly subject to flow bypass because of sediment and debris clogging the cartridges. Additional steps were subsequently taken to remove sediment and debris from on top the cartridges both before and once during storm events. Even with this excessive maintenance, moderate flow continued to bypass the DIIs because of flow exceeding the capacity of the filter cartridges or more material flowing into the DII and impeding its filtering ability.

Routine inspections were conducted at each site prior to and during each storm event as well as monthly. Generally, small amounts of trash, debris, and sediment were removed from the DII both before and once during a storm event. Removed trash, debris, and sediment were placed in an on-site storage container designed to emulate DII conditions, and were subsequently sent to a laboratory with the DII for analysis. In addition, each DII was inspected weekly for the presence of vectors.

The thresholds for replacement of the DII filter media provided by the manufacturer were not reached. The adsorbent granules were removed at the end of the wet season. Subsequently, the adsorbent granules from the cartridges and trash, debris, and sediment collected during the wet season were sent to the laboratory for analysis. Results of the analyses were used to estimate pollutant removal efficiencies.

StreamGuard™ Drain Inlet Inserts

As with the Fossil Filter DII, manufacturer's maintenance guidance was followed to ensure proper DII functioning. Based on observations during storm events, oil sheens were observed passing through the DII and water was observed to pond within the DII. Subsequently, the manufacturer was consulted as to whether maintenance was required. The manufacturer responded that seeing an oil sheen passing through the DII and water ponding within the DII was to be expected and that maintenance was not required. The most common maintenance activity

R0007570

of the StreamGuard™ DII was the need to refit the DII in the drain inlet after it had slipped because of the weight of water and material collected within it. Close pre-storm inspection and maintenance of the insert fit were necessary to minimize it slipping into the drain inlet during storms.

Routine inspections were conducted at each site prior to and during each storm event and monthly. At one location, organic material, mostly leaves, was removed from the DII once during the fall. Removed material was placed in an on-site storage container designed to emulate DII conditions. The thresholds for replacement of the DIIs provided in the manufacturer were not reached. At the end of the wet season, the DIIs and trash, debris, and sediment collected during the wet season were sent to the laboratory for analysis. Results of the analyses were used to estimate pollutant removal efficiencies. In addition, each DII was inspected weekly for the presence of vectors. Figure 4a summarizes the frequency of maintenance activities (i.e., number of times maintenance was conducted at the BMP) and Figure 4b summarizes the average amount of time spent performing each activity.

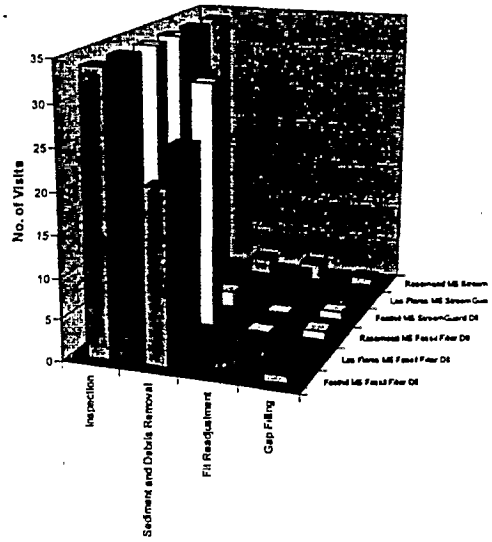

Figure 4a: Frequency of Maintenance Activities at the DII Sites (1999-2000)

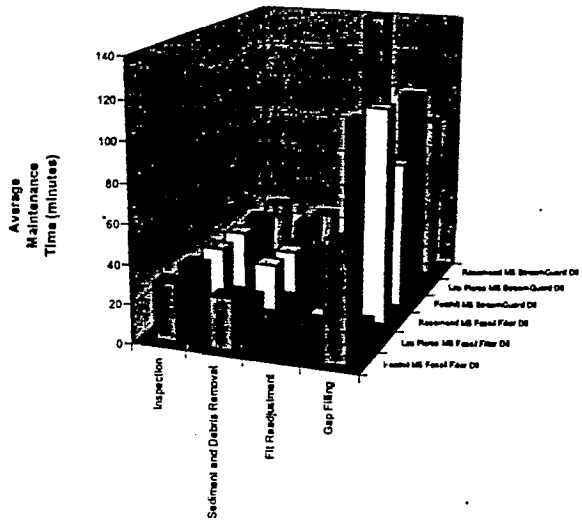

Figure 4b: Average Maintenance Times at the DII Sites (1999-2000)

Oil/Water Separator

Unlike the DIIs, monthly inspection of the internal components of the oil/water separator appeared to be excessive. This was because the amount of sediment and oil collected by the oil/water separator were far below manufacturer's maintenance thresholds. Consequently, inspection of the oil/water separators internal components was reduced to a quarterly frequency.

As expected, minimal maintenance was required of the oil/water separator. Maintenance conducted at the site included monthly inspections, removing debris from the conveyance system upstream of the oil/water separator, general site maintenance, and vector inspection. Figure 5a summarizes the frequency of maintenance activities (i.e., number of times maintenance was conducted at the BMP) and Figure 5b summarizes the average amount of time spent performing each activity.

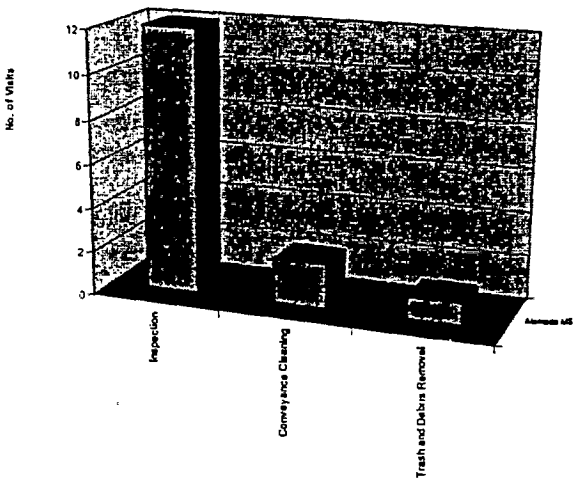

Figure 5a: Frequency of Maintenance Activities at the Oil/Water Separator (1999-2000)

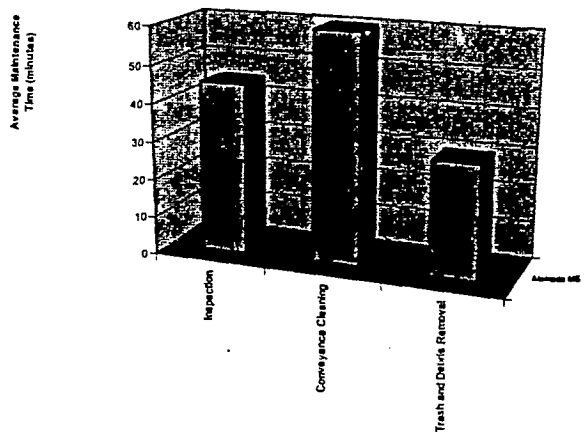

Figure 5b: Average Maintenance Times at the Oil/Water Separator (1999-2000)

Performance (Chemical Monitoring)

Drain Inlet Inserts

Pollutant removal efficiencies were estimated using a mass-balance approach for three Fossil Filter™ DIIs and three StreamGuard™ DIIs at the Foothill, Las Flores, and Rosemead Maintenance Stations, which were installed on 27 September 1999 and removed on 1 June 2000. Because of the inability to capture litter and debris bypassing the DIIs (a key component in estimating efficiency using a mass-balance approach), efficiencies presented in Table 2a do not account for the entrapment of litter and debris by the DIIs. However, the mass and associated pollutant load of the entrapped material is presented in Table 2b as anecdotal information.

To estimate the removal of contaminants by a DII, the procedure below was used. For purposes of these calculations, the value of the reporting limit was used in cases where an analyte was reported as undetected.

1. Calculate percent efficiency representing the time interval since the last time the insert medium was changed, using the equation:

$$\text{Efficiency (\%)} = \frac{\text{Estimated Influent Pollutant Mass} - \text{Effluent Pollutant Mass}}{\text{Estimated Influent Pollutant Mass}} \times 100$$

R0007572

2. Estimate the influent pollutant mass for the time interval according to:

Estimated Influent Pollutant Mass = Insert Medium Pollutant Mass + Total Effluent Pollutant Mass for the Time Interval

3. Calculate total effluent pollutant mass in two ways, and compute efficiency with each method for comparison:

I. Storm-by-storm method:

A. Estimate the effluent mass for each storm event in the time interval according to:

Estimated Event Effluent Pollutant Mass = Effluent Event Mean Concentration (EMC) x Event Runoff Volume

B. For storm events that were successfully monitored, use the measured data.

C. For any storm event during the time interval that met the deployment criteria but was not successfully monitored, estimate the EMC for that event as the mean of all EMCs measured for that case in all storm events during the time interval. How the mean EMC is determined depends on whether the data tend more to be normally or log-normally distributed. If the concentrations tend more to be normally distributed, use the arithmetic mean of the effluent EMCs. If they tend more to be log-normally distributed, calculate the mean effluent EMC by log-transforming individual storm EMCs, averaging, and then transforming back.

D. Add the effluent pollutant masses from all storm events in the time interval.

II. Aggregated storm method:

A. Estimate the total effluent mass for all storm events in the time interval according to:

Estimated Total Effluent Pollutant Mass = Mean EMC x Total Runoff Volume

B. How the mean EMC is determined depends on whether the data tend more to be normally or log-normally distributed. If the concentrations tend more to be normally distributed, use the arithmetic mean of the effluent EMCs measured for that case in all storm events during the time interval. If they tend more to be log-normally distributed, calculate the mean effluent EMC by log-transforming individual storm EMCs, averaging, and then transforming back.

4. Compute mean efficiencies for each pollutant and each wet season by averaging results computed according to Steps 1-3 for all time intervals in that wet season.

Pollutant removal was within expectations for both DII types. Solids, metals, and hydrocarbon removal efficiency by the Fossil Filter™ DII decreased with increased flow volume. Solids removal efficiency by the Fossil Filter™ DII at Rosemead MS and the StreamGuard™ DIIs at

R0007573

Foothill and Las Flores MSs was comparatively higher than the other DIIs because of the quantity of wind-blown material and leaves entrapped by the DIIs. Efficiencies by the StreamGuard™ DII at Rosemead MS were especially poor and are attributed to the large flow volume passing through the DII and the relatively small amount of sediment and debris in its watershed.

Oil/Water Separator

Pollutant removal efficiencies (based on load reduction) were estimated for the oil/water separator using analytical data from first-flush grab samples collected at the influent and effluent monitoring sites and flow data. Table 3 summarizes average, minimum, and maximum wet season efficiencies based on loads. Minimum and maximum constituent concentrations are also listed in the table. For purposes of these calculations, the value of the reporting limit was used in cases where an analyte was reported as undetected. Negative values indicate increases in loads. The following equation was used:

$$\text{Efficiency}\,(\%) = \frac{\text{Load in} - \text{Load out}}{\text{Load in}} \times 100$$

With the exception of Total Petroleum Hydrocarbon (Diesel), pollutant removal efficiency by the oil/water separator was generally poor. In fact, there was a net export of total suspended solids over the wet season. The relatively poor hydrocarbon removal efficiencies are attributed to the inability of the oil/water separator to remove hydrocarbons at low concentrations.

Performance (Empirical Observations)

Performance assessments of BMP operations were determined using empirical observations. Empirical observations were taken at variable times during monitored events.

Fossil Filter™ Drain Inlet Inserts

Prior to the 1999-2000 storm season, steps were taken to eliminate or minimize flow bypass around the peripheral of the Fossil Filter™ DIIs. This was accomplished by sealing the DII-inlet interface with foam material. Additionally, to promote flow into the DII at Rosemead MS, a section of rubber was attached along interface of the curb inlet and the insert.

Hydraulic capacity of the units is an inherent limiting factor in the performance of the DIIs. The Fossil Filter™ DIIs are designed not to impede flow (due to flood control considerations). During higher discharge rates, runoff has sufficient velocity and/or volume to pass over the lip of the cartridges and go directly into the storm drain system. No alterations in the design of the units were undertaken to eliminate this factor.

A third factor that caused flow bypass was blockage and clogging of the DII. Blockage occurred from the accumulation of trash, debris, and/or sediment on top of the filter cartridge screens. This accumulation blocked the filter cartridge screens so that stormwater runoff could not pass through the screens. The resultant standing water pooled and eventually achieved a depth where it spilled over the cartridge lip into the storm drain. Clogging also occurred when sediment passed through the cartridge screens and settled in the pore spaces between the adsorbent granules. This appeared to cause a slowing in the infiltration of water through the adsorbent. Water pooled and reached a depth where it spilled over the cartridge lip into the storm drain.

To minimize flow bypass because of blockage and clogging, it was decided to increase the maintenance of the units to maintain hydraulic capacity. Trash, debris, and/or sediment were removed from the units once prior to a storm event and once during a storm event. The removed trash, debris, and sediment were placed in an on-site storage container designed to emulate ambient conditions at the top of the cartridges.

Although extreme measures were taken to prevent or minimize flow bypass during moderate events, flow bypass still occurred because of the following reasons:

1. Hydraulic capacity. This was observed at both Foothill and Rosemead MSs. Based on several observations of hydraulic capacity exceedance at the Foothill MS, bypass generally was observed to occur when a flow rate of 0.07 cfs (31 gpm) was reached.

R0007575

2. Blockage and clogging of cartridges. Despite removing trash/debris/sediment prior to a storm event and once during a storm event, bypass continued to be observed. Typically, after the removal of trash, debris, and sediment, more trash, debris, and sediment would be deposited during the course of the storm, again leading to more bypass.
3. During the last storm at Foothill MS, the stainless steel flange holding the cartridges bent upward due to the weight of water, and bypass occurred beneath the flange.

StreamGuard™ Drain Inlet Inserts

At the beginning of the wet season StreamGuard™ DIIs were installed in the three MSs per the manufacturer's installation guidance However, due to concern that there could be flow bypass between the insert fabric-inlet interface, wood was inserted into the area between the insert and inlet edge to form a tight seal.

Flow bypass was observed at StreamGuard™ DIIs at all three sites. There were two reasons for this:

1. Hydraulic capacity. Runoff filled the cone and flowed through the overflow cut-outs. The cone of the StreamGuard™ DIIs is 24 inches in depth. When standing water in the cone reaches a depth of approximately 22 inches, bypass can occur through the two overflow cut-outs on the sides.
2. The weight of the standing water in the cone caused the insert to slip downward into the inlet, thereby causing a gap in the inlet-insert interface and subsequent bypass.

The first reason for flow bypass was investigated by evaluating the manufacturing process of the filter fabric. It was determined that the fabric pore size can vary from roll to roll of the fabric. Even though the manufacturing process is the same for each roll of fabric, variation in pore size is normal and is not subject to control. It is possible that the inserts used during the 1999/2000 wet season were constructed with a fabric having small pore size, thereby potentially reducing flow rate through the filter fabric and consequently causing standing water within the insert. Generally, standing water in the cones resulted in flow bypass only. However, on three occasions at Rosemead MS flooding was observed. The second reason for bypass was related to the first reason. More standing water in the cones meant more weight in the cones, thereby causing the inserts to slip downward into the inlet. Slippage of the insert was observed at Las Flores and Rosemead MSs, and bypass through the gap was observed once at Las Flores MS.

Oil/Water Separator

Observations of the oil/water separator indicated no bypass or short-circuiting. Influent water quality was generally brown with suspended solids with a slight oily sheen. Recent observations indicated clear effluent discharge with black suspended solids. Hydrocarbon odor was also noticed from the discharge of the oil/water separator.

Cost

Costs for the retrofit of the DIIs and oil/water separator are summarized in Table 4. Actual costs are those costs incurred for the installation of the BMP for the project including associated monitoring facilities (e.g., installation of flumes). Estimated costs without monitoring facilities

are costs incurred for the installation of the BMPs including site-specific costs. Estimated product costs are costs for the BMP itself without installation.

Table 4: Installation Costs

Site	BMP Type	Actual Cost	Estimated Cost without Monitoring Facilities*	Estimated Product Cost
Foothill MS	Fossil Filter™ DII	$36,879	$1,186	$500
Las Flores MS	Fossil Filter™ DII	$51,696	$1,186	$500
Rosemead MS	Fossil Filter™ DII	$32,116	$1,186	$500
Foothill MS	StreamGuard™ DII	$36,879	$1,186	$100
Las Flores MS	StreamGuard™ DII	$51,696	$1,186	$100
Rosemead MS	StreamGuard™ DII	$32,116	$1,186	$100
Alameda MS	Oil/Water Separator	$179,437	$165,043	$45,000

* Total cost to install both types of DIIs at a site were equally divided.

Conclusions

Siting and Selection

The selection of DIIs and oil/water separators over other stormwater treatment controls should consider relative removal efficiencies and maintenance requirements and logistics.

Drain Inlet Inserts

Consideration of anticipated flow rates should be evaluated, as flows exceeding ~ 0.07 cfs (31 gpm) tend to bypass the Fossil Filter™ DII. In the case of the StreamGuard™ DII, consideration should be given to the potential for flooding. As seen during the study, flooding has occurred and facilities upstream could be potentially impacted. Also, consider treatment goals and maintenance requirements and logistics.

Oil/Water Separator

Knowing the oil and grease concentration at a prospective site is essential when considering use of an oil/water separator. Few if any, maintenance station sites were found to have oil and grease concentration sufficiently high to be effectively removed by coalescing plate oil/water separators. The one applicable site found only had temporarily high oil and grease concentrations; these concentrations were subsequently reduced using source controls. Consequently, oil/water separators are not a recommended technology for stormwater treatment.

Installation

Fossil Filter™ Drain Inlet Inserts

A design problem noted at the Fossil Filter™ DII sites is that even though the units are sized for standard Caltrans drain inlets, the fit is imperfect, resulting in a gap between the inlet and the DII. This gap can lead to flow bypass. Sealant was used to close the gap and eliminate the potential for this type of flow bypass.

StreamGuard™ Drain Inlet Inserts

A design problem noted at the StreamGuard™ DII sites is that when the units are installed per manufacturer's direction, a gap exists between the filter fabric and the edge of the inlet. This gap can lead to flow bypass and allow for DII slippage into the drain inlet. Wood shim was forced into each gap, thereby closing it and eliminating the potential for flow bypass due to it.

Oil/Water Separator

Configuration of existing storm drain systems should be considered when selecting a site for retrofit. Where stormwater runoff is not concentrated, additional stormwater conveyance systems may need to be constructed. Also, since determining the locations of all utilities prior to construction is not practical due to limited documentation, it is suggested that a small budgetary contingency be reserved in case unknown utilities are encountered.

Operation and Maintenance

Both DII types tested required maintenance before and after storm events as small as 2.54 mm (0.1 inch). Trash, debris, and sediment in the catchment had a significant impact on the frequency of maintenance.

Oil/water separators had minimal accumulation of oil and grease. This resulted in no major clean-out activity in the two years monitored.

Acknowledgements

This is a pilot project of the Caltrans Storm Water Program. Project success was due to contributions from Caltrans staff and several companies. RBF Consulting was responsible for siting. Montgomery Watson was responsible for the design and initial installation of the DIIs and Brown and Caldwell was responsible for the design and installation of the oil/water separator. Law Engineering and Environmental Services, Inc. and Brown and Caldwell operated, maintained, and monitored the BMP pilot facilities. Yulya Borroum (formerly of University of California, Davis) was instrumental in developing the operation and maintenance plans as well as assisting in siting, design, and construction activities. Special thanks to Doug Robison of Brown and Caldwell for his effort in this project.

Best Management Practice Guide

Retail Gasoline Outlets

California
Stormwater Quality Task Force

Prepared by
Retail Gasoline Outlet Work Group

March 1997

R0007580

Acknowledgments

The Stormwater Quality Task Force would like to thank the following individuals for their extra efforts developing these best management practices.

Richard Boon	County of Orange Environmental Management Agency
Geoff Brosseau	Bay Area Stormwater Management Agencies Association
Linda Cohu	ARCO
Chris Crompton	County of Orange Environmental Management Agency
Bruce Fujimoto	State Water Resources Control Board
Robert Hale	Alameda Countywide Clean Water Program
John Norton	State Water Resources Control Board
Tim Simpson	Geomatrix
Xavier Swamikannu	Regional Water Quality Control Board - Los Angeles
Pavlova Vitale	Regional Water Quality Control Board - Santa Ana
Ron Wilkniss	Western States Petroleum Association
Jean Young	Unocal
Nancy Zavesky	Chevron
Don Zedrick	Environmental Resource Council

Disclaimer

The statements and conclusions of this guide are those of the California Stormwater Quality Task Force (Task Force) and not necessarily those of the State of California. The mention of commercial products, their source, or their use in connection with material reported herein is not to be construed as either an actual or implied endorsement of such products.

The guide was produced and published by the California Stormwater Quality Task Force, an advisory body of municipal agencies regulated by the storm water program. This guide is not a publication of the State Water Resources Control Board or any Regional Water Quality Control Board, and none of these Boards has specifically endorsed the contents thereof. The purpose of this guide is to assist municipal agencies and retail gasoline outlets subject to storm water regulations, in attaining compliance with such regulations. This guide is not specifically intended for use in geographic areas not subject to federal or state storm water regulations, or at facilities that do not discharge storm water either directly to surface waters or indirectly, through municipal separate storm drain systems. Implementation of these best management practices can not be construed as compliance with all other applicable regulations, including local requirements.

Introduction

This guide represents the work of the California Stormwater Quality Task Force's (SWQTF) Retail Gasoline Outlet Work Group. The Work Group formed in May 1996 and met on a regular basis to review and discuss appropriate best management practices for fueling and other closely related activities likely to be found at retail fueling operations. Representatives from industry, municipalities, and regulatory agencies participated. Best management practices (BMPs) from throughout California, and elsewhere, were reviewed and considered for inclusion in this guide. The Work Group worked in the tradition of the SWQTF by raising and discussing issues in an open forum, and working to reach consensus on each issue. The Work Group worked in parallel and communicated with State and Regional Board staff responsible for storm water permit compliance.

These best management practices were developed with retail gasoline outlets primarily in mind, and may or may not have applicability to other facility types (e.g., cardlocks, bulk plants, fleet operations). The need for and application of these BMPs to other facility-types should be carefully reviewed on a case-by-case basis. During the development of this guide, storm water and wastewater issues were addressed together to avoid cross-media transfers of waste. In addition, the potential of these BMPs to affect other environmental media/regulations (e.g., hazardous waste) was considered before their inclusion in this guide.

Regulatory Context

The Federal Clean Water Act, as amended in 1987, and the State Porter-Cologne Act are the principle regulations for control of storm water pollutants. There are, however, other regulations that deal with the control of storm water pollutants. Examples include the Federal Coastal Zone Act Reauthorization Amendments of 1990, and the State Hazardous Waste Source Reduction and Management Review Act. The 1987 amendments to the Federal Clean Water Act added section 402(p) which establishes a framework for regulating municipal, industrial, and construction storm water discharges under the National Pollutant Discharge Elimination System (NPDES) program. On November 16, 1990, the USEPA published final regulations that establish application requirements for storm water permits from five classes of discharges (Phase 1) including storm water associated with industrial activity (industrial storm water) that discharges either directly to surface waters or indirectly through municipal separate storm drain systems. Municipalities with a population over 100,000 or those that have been determined to be a significant contributor of pollutants are also required to obtain a NPDES storm water permit.

As part of its storm water management program, a municipality is required to develop a program to monitor and control pollutants in storm water discharges from its municipal system. These programs must include structural and source control measures to reduce pollutants from runoff from commercial and industrial areas. Thus it is important for commercial and industrial facilities located within municipalities to realize that there may be municipal requirements on storm water discharges from their facilities.

In addition to the storm water requirements, both the Federal Clean Water Act and the State Porter-Cologne Act require the control of pollutants in wastewater discharges. The Porter-Cologne Act requires the development of Basin Plans for drainage basins in California. These basin plans are used in turn to identify more specific controls for discharges (e.g., wastewater treatment plant effluent). The basin plans are implemented through the NPDES program. Many municipalities, being subject to both storm water and wastewater regulations, will develop water quality protection programs that deal with both types of discharges in a coordinated and integrated way.

Purpose and Intent

The purpose of this guide is two-fold. First, to be a compilation of peer-reviewed best management practices for fueling and other closely related activities found at retail fueling operations. Second, to be a reference for municipalities, regulators, and facility owners and operators.

The intent of the SWQTF is that these best management practices serve as a "default" set of BMPs for use throughout California. Municipalities and retail gasoline outlets that have not yet adopted best management practices for these activities should give these practices strong consideration. Municipalities and retail gasoline outlets that do have and use BMPs should compare their current practices with those presented here. Substantive differences should be identified and re-evaluated. Successful implementation of these BMPs depends on a partnership between municipalities, regulators, and facility owners and operators. Each has a role to play:

- Municipalities should become familiar with these BMPs and incorporate them into their water quality protection programs, as appropriate.
- Regulators and inspectors should use these or similar BMPs to measure the pollution prevention efforts of facilities.

R0007583

- Facility owners and operators should become familiar with these BMPs, teach their employees about them, and ensure that they are used on-site.

How to Use the Best Management Practices

Coverage - These best management practices cover three activities or areas:

- Fuel dispensing
- Air/water supply
- Outdoor waste receptacles

Retail gasoline outlets will have every combination of these activities/areas on-site, including other activities not covered by this guide. For example, a facility may have a fuel dispensing area, air/water supply area, indoor service bay, but no outdoor waste receptacles. These BMPs cover the first two areas but not the indoor service bay. Best management practices for the indoor service bay may be found elsewhere. The inclusion of best management practices for air/water supply areas is not intended to suggest that air and/or water must be supplied by retail gasoline outlets in geographic areas not otherwise required to do so.

Design - The design of this guide is purposely different from many BMP lists that are designed as a menu of BMPs from which the facility owner/operator, and the inspector, may choose some but not necessarily all BMPs. These BMP lists are designed so that if the activity/area is on-site, each numbered BMP listed below the activity should be implemented. For some BMPs, as described below, several implementation options are provided. The best management practices are meant to be implemented, monitored, and maintained on a year round basis. The guide also makes an important distinction between existing facilities and new or substantially remodeled facilities. A definition of new or substantially remodeled is also provided. The Work Group used these design elements to help clarify and unify expectations.

Options - Several of the best management practices provide facility owners and operators options for compliance. For example, one best management practice is:

- Minimize the possibility of storm water pollution from outside waste receptacles by doing at least one of the following:
  a) use only watertight waste receptacle(s) and keep the lid(s) closed, or
  b) grade and pave the waste receptacle area to prevent run-on of storm water, or
  c) install a roof over the waste receptacle area, or
  d) install a low containment berm around the waste receptacle area, or
  e) use and maintain drip pans under waste receptacles.

R0007584

It is the intent of these BMPs that a) through e) are options. Effective implementation of at least one of these options, chosen by the facility owner/operator, should be deemed implementation of this best management practice.

Other BMPs - The Work Group considered other BMPs not listed here including:

- Oil/water separators
- Catch basin inserts

The evidence reviewed by the Work Group indicated that the effectiveness and efficiency of these and other BMPs not listed was insufficient for them to pass peer review and therefore these BMPs can not be generally recommended for use statewide. There may be situations in which these BMPs would be effective and efficient (as evidenced by research), and therefore appropriate, but these situations should be the exception, not the rule. Members of the SWQTF are conducting studies on these and other BMPs. If that research shows that a particular BMP is effective and efficient, the SWQTF will consider adding it to this guide.

Best Management Practices

Existing Facilities

Fuel Dispensing Areas

1. Maintain fuel dispensing areas using dry cleanup methods such as sweeping for removal of litter and debris, or use of rags and absorbents for leaks and spills. Fueling areas should never be washed down unless the wash water is collected and disposed of properly.

2. Fit underground storage tanks with spill containment and overfill prevention systems meeting the requirements of Section 2635(b) of Title 23 of the California Code of Regulations.

3. Fit fuel dispensing nozzles with "hold-open latches" (automatic shutoffs) except where prohibited by local fire departments.

4. Post signs at the fuel dispenser or fuel island warning vehicle owners/operators against "topping off" of vehicle fuel tanks.

Facility - General

1. "Spot clean" leaks and drips routinely. Leaks are not cleaned up until the absorbent is picked up and disposed of properly.

2. Maintain and keep current, as required by other regulations, a spill response plan and ensure that employees are trained on the elements of the plan.

3. Manage materials and waste to reduce adverse impacts on storm water quality.

4. Train all employees upon hiring and annually thereafter on proper methods for handling and disposing of waste. Make sure that all employees understand storm water discharge prohibitions, wastewater discharge requirements, and these best management practices. Use a training log or similar method to document training.

5. Label drains within the facility boundary, by paint/stencil (or equivalent), to indicate whether they flow to an oil/water separator, directly to the sewer, or to a storm drain. Labels are not necessary for plumbing fixtures directly connected to the sanitary sewer.

6. Inspect and clean if necessary, storm drain inlets and catch basins within the facility boundary before October 1 each year.

Outdoor Waste Receptacle Area

1. Spot clean leaks and drips routinely to prevent runoff of spillage.

2. Minimize the possibility of storm water pollution from outside waste receptacles by doing at least one of the following:
   a) use only watertight waste receptacle(s) and keep the lid(s) closed, or
   b) grade and pave the waste receptacle area to prevent run-on of storm water, or
   c) install a roof over the waste receptacle area, or
   d) install a low containment berm around the waste receptacle area, or
   e) use and maintain drip pans under waste receptacles.

Air/Water Supply Area

1. Minimize the possibility of storm water pollution from air/water supply areas by doing at least one of the following:
   a) spot clean leaks and drips routinely to prevent runoff of spillage, or
   b) grade and pave the air/water supply area to prevent run-on of storm water, or
   c) install a roof over the air/water supply area, or
   d) install a low containment berm around the air/water supply area.

R0007586

New or Substantially Remodeled Facilities

The elements listed below should be included in the design and construction of new or substantially remodeled facilities.

Fuel Dispensing Areas

1. Fuel dispensing areas must be paved with portland cement concrete (or, equivalent smooth impervious surface), with a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water to the extent practicable. The fuel dispensing area is defined as extending 6.5 feet from the corner of each fuel dispenser or the length at which the hose and nozzle assembly may be operated plus 1 foot, whichever is less. The paving around the fuel dispensing area may exceed the minimum dimensions of the "fuel dispensing area" stated above.

2. The fuel dispensing area must be covered, and the cover's minimum dimensions must be equal to or greater than the area within the grade break or the fuel dispensing area, as defined above. The cover must not drain onto the fuel dispensing area.

Outdoor Waste Receptacle Area

1. Grade and pave the outdoor waste receptacle area to prevent run-on of storm water to the extent practicable.

Air/Water Supply Area

1. Grade and pave the air/water supply area to prevent run-on of storm water to the extent practicable.

Substantially Remodeled Facilities

One of the following criteria must be met before a facility is deemed to be substantially remodeled and the design elements described above are required to be included in the new design and construction:

- the canopy cover over the fuel dispensing area is new or is being substantially replaced (not including cosmetic/facial appearance changes only) and the footing is structurally sufficient to support a cover of the minimum dimensions described above, or

- one or more fuel dispensers are relocated or added in such a way that the portland cement concrete (or, equivalent) paving and grade break or the canopy cover over the fuel

dispensing area do not meet the minimum dimensions as defined above. Replacement of existing dispensers or underground storage tanks do not, by themselves, constitute a substantial remodel.

Special note on the paving BMP (#1 only) addressing Fuel Dispensing Areas under New or Substantially Remodeled Facilities

This best management practice is not specifically intended to apply to facilities that install a new canopy where no canopy existed.

Special note on the canopy BMP (#2 only) addressing Fuel Dispensing Areas under New or Substantially Remodeled Facilities

This best management practice is not specifically intended to apply to facilities that:

- are located in geographic areas not subject to federal or state storm water regulations
- do not discharge storm water either directly to surface waters or indirectly, through municipal separate storm drain systems
- do not add fuel dispensers
- replace, relocate, or add fuel dispensers within the parameters described in the BMP
- increase their throughput of fuel dispensed without modifying their equipment
- make only cosmetic or facial appearance changes to their existing canopy

For the purposes of the waste receptacle area and air/water supply area BMPs only, the facility is considered substantially remodeled if the area around the waste receptacle area or air/water supply area is being regraded or repaved.

Help

For assistance with implementation of these best management practices, municipal staff or facility owners and operators should contact their local storm water program representative, Regional Board or State Board storm water contact, or the Stormwater Quality Task Force.

Response to
Comments

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

LOS ANGELES COUNTY MUNICIPAL STORM WATER DISCHARGE PERMIT

Summary of Comments and Regional Board Staff Response
Tentative Draft [October 11, 2001]

The Response here supplements the '*Summary of Comments and Regional Board Staff Response, Second Draft (June 29, 2001)*' (October 2001). In general comments responded to in that document are not revisited here. Legal matters are addressed in Regional Counsel's legal brief, *'Legal Issues Concerning Renewal of Order No. 96-054 as Reflected in Tentative Waste Discharge Requirements Dated October 11, 2001'* (Nov. 9, 2001)

Commentors	Comment	Staff Response
Santa Monica Bay Keeper (SMBK)	1. Completeness of Permit Application Permittees have not complied with storm water permit application requirements at 40 CFR 122.26(d).	The Regional Board issued the first municipal storm water permit consistent with NPDES application requirements in effect in 1990, and processed the reapplications consistent with U.S. EPA policies. Please see also p. 1 in 'Summary of Comments and Regional Board Staff Response' (October 11, 2001), and p. 20 Regional Counsel's legal brief (November 9, 2001)
CAA, CICWQ, LAEDC, BWS, ALH, CAM, COM, ELS, GAR, IND, LAW, LOM, LYN, MOO, SCL, SFS, SIH, SMA, TOR	2. Economic Consideration Give further consideration to economic cost of implementation. Compliance costs will be substantial and projected to exceed $50 billion.	The iterative process to meet receiving water limits explicitly takes into account the economics of compliance. Permittees self-reported budget for implementation of the permit requirements for 2001-2002 is about $145 million, a fraction of the projected cost claimed in the $50 billion. More than likely, Permittees current budget overstates costs because it includes activities being conducted for other than storm water purposes (such as street sweeping and corporation yards maintenance). The Regional Board staff has significantly reduced the scope of the industrial/ commercial inspection program after facilitation by the U.S. EPA mediator.

CAR, CAA, EAC, CPR, RT, BWP, BCSMW, CUD, CUL, BEH, BEF, BEG, HAW, HIH, LAK, LCF, LMI, PAR, ROS, RWG, SCL, SFE, SGA, SOG, VRN, WEH, WEV	3. Executive Advisory Committee Reinsert into the permit the EAC, which is a representative and coordinating body for Permittees. How will they now coordinate?	The Regional Board cannot create the EAC under any authority. The EAC is the Permittees prerogative to organize. The EAC can continue to perform its role for Permittees and interact with the Regional Board irrespective of whether or not it is recognized in the permit. The Regional Board encourages Permittees to better use the Watershed Management Committees (WMCs) for permit coordination and implementation because the WMC is a functional unit based on common water quality protection interests.
MWD, [City of Los Angeles Department of Water and Power, California Water Service Company, Southern California Water Company,	4. Non-Storm Water Discharges Authorize releases of potable water discharges that are in accordance with an equivalent document to Industry-wide practice guidelines developed by the American Water Works Association (AWWA)	For purposes of standardization, the AWWA whose membership, includes the commentors, should develop guidance (technical bulletins) for potable water discharge releases, if they have not already done so.
BRB, DB, AR, RT, R&T, RWG, BWS, LAC, LA, CPR, EAC	5. Industrial/ Commercial/ Construction Inspections The State should not transfer its responsibility to inspect facilities and construction sites covered under statewide general permits.	The MS4 Permittee has a responsibility to make sure that industrial sites (including construction) comply with local government storm water and urban runoff ordinances. The USEPA clearly contemplates a dual and a cooperative oversight of facilities 'discharging storm water associated with industrial activity', between the permitting authority and the MS4 permittee (55 *Fed. Reg.* 222, 48000; and Storm Water Phase II Compliance Assistance Guide (USEPA 2000), p 4-32 and 5-11). See also, Radulescu (2001), *A Case for Inspection*, and Regional Board Counsel's brief at p. 2. Regional Board staff have considerably reduced the scope of the industrial/ commercial inspection program through the efforts of a U.S. EPA mediator.
CLA DHS	6. Restaurant Inspections Since restaurant inspections will involve health inspectors, reference requirements from the California Uniform Food Facilities Law	The Regional Board is the permitting authority for the CWA and Cal. Water Code. The County of Los Angeles (including the Departments of Public Health and Health Services) are best positioned in deciding on the appropriate changes to the County Code to enforce compliance by restaurants with the Cal. Uniform Food Facilities Law and the Cal. Water Code.

Commentors	Comment	Staff Response
WSPA, RT	7. RGOs RGOs should be exempted from new development requirements because the Regional Board has provided no proper justification.	Proper justification for inclusion of RGOs has been developed and the basis has been specified in the permit. Please see p. 8 in Summary of Comments and Regional Board Staff Response (October 11, 2001), p. 7 in Regional Counsel's legal brief (November 9, 2001), Technical Report - *Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts* (Radulescu et al., 2001), *Storm Water Quality Task Force BMP Guide for Retail Gasoline Outlets: Review and Comment* (Radulescu, 2001), and *Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts: Supplement* (Radulescu and Swamikannu, 2001)
BCSMW , PAS, RPV, BUR, DB, AR, RT, R&T, RWG, BWS, CPR, EAC, BCSMW, BIA, SEM, SOG, WEH,	8. ESAs Allow cities to submit designations for ESAs in addition to the other listed agencies. Reasonableness depends on what is approved by the Regional Board as constituting ESAs.	Regional Board staff has proposed thresholds for ESAs to be responsive to the State Board decision in Order No. WQ 2000-11. In that decision, the State Board set forth types of evidence and criteria necessary for inclusion of ESAs in subsequent permits, including thresholds (See memorandum from Office of Chief Counsel to Regional Board Executive Officers dated December 26, 2000). For a complete discussion of the ESA matter see, Fact Sheet/ Staff Report – Attachment, Technical Report: 'Mitigation of Storm Water Impacts from New Development in Environmentally Sensitive Areas'.
ULARAW	9. Infiltration Concern Infiltration practices can inadvertently contaminate ground water basins.	Permittees may impose restrictions where there is a threat of ground water contamination. Storm water mitigation for new development includes the option to treat, filter, or infiltrate (not just infiltration). Infiltration studies conducted by the USGS and university researchers demonstrate that where conditions for infiltration are favorable, infiltration is effective in removing common pollutants of concern in storm water, and the risk of ground water contamination is minimal. For a discussion, see U.S. EPA Report No./600/R-94/051 (1994); Pitt et al. (1996) *Groundwater Contamination from Storm Water Infiltration*, Ann Arbor Press, 218 pp.; USGS Water Resources Investigation Report No. 93-4140 (1995)
CAA, CLA, LACo	10. Definition of MEP Retain the MEP definition in the current permit instead of the revised definition. MEP definition is contrary to the CWA. It does not require the balancing of other factors.	The definition of MEP references its expression in the CWA, and its interpretation by State Board Senior Staff Counsel in a legal memorandum (Feb. 11, 1993). So long as the memorandum states that multiple interests have to be balanced, the need to make such analyses is incorporated by reference.

Commentors	Comment	Staff Response
BWS, CPR, LAK, POM, RT, SGA, VRN,	11. Definition of Redevelopment The definition of "redevelopment" is overly broad and should be limited to addition or creation of 5,000 square feet or more of surface area (exclude replacement). U.S. EPA defines the threshold for redevelopment as one acre or more which should be criterion instead of 5,000 sq. ft. Requirement may discourage property improvement.	The definition has been revised to exclude exterior remodeling and replacement of roofs. It is inclusive of the replacement of building footprint. U.S. EPA Phase II guidance do recommend a threshold of 1 acre to trigger requirements for Phase II MS4s. However the Regional Board adopted the 5,000 sq. ft. threshold for redevelopment in the LA SUSMP, an action which was upheld by the State Board (Board Order No. WQ 2000-11). The 5,000 sq. ft. threshold is consistent with thresholds established for redevelopment triggers by other States (such as Washington, Maryland, Virginia, and Florida) for U.S. EPA Phase I MS4 Permittees. Please see also p. 9 in Summary of Comments and Regional Board Staff Response (October 11, 2001), and p. 5 Regional Counsel's legal brief (November 9, 2001).
BCSMW , CUD, CUL, HAG, PAR, PAS, ROS, SOG,	12. Public Agency Activities: Fire Truck Washing Fleet vehicles deserve the same exemption as fire-fighting vehicles for wash-down to the MS4. Why is this wash-down exempt from discharge prohibitions?	The allowance for wash-down of fire trucks at existing fire stations was made because a prohibition would involve taking the trucks off service. The trucks would have had to be sent to a dedicated washing facility, thus compromising their availability to respond to situations of public health and safety.
BCSMW, DIA, CLA, PAS, RPV, SOG, WEH, LACo,	13. Public Agency Activities: Trash Receptacles at Transit Stops Requirement to place trash receptacles at all transit stops is unreasonable and premature	More time has been provided. The provision has been revised to require receptacles at transit stops with rain shelters within 6 months and all other transit stops within a year from permit effective date.
LACo	14. Monitoring: Trash Requirements to monitor trash in watersheds not listed as impaired for trash will cost as much as $5 million.	This monitoring requirement for unimpaired watersheds has been changed to eliminate trash sampling. It now requires photographic documentation after qualifying storm events.
BCSMW, BUR, SEM, SOG, WEH,	15. Reporting Provide Permittees with 180 days to propose an alternative reporting format from the one in the permit.	The purpose in providing a sample reporting form is to assist permittees in collecting information to document compliance with the permit requirements. The reporting format under the existing permit appears deficient because permittees report in multiple ways. Permittees can always develop an equivalent reporting form so long as it provides the same information as that which is requested by the Regional Board in the sample reporting form.

RETAIL GASOLINE OUTLETS: NEW DEVELOPMENT DESIGN STANDARDS FOR MITIGATION OF STORM WATER IMPACTS

SUPPLEMENT

(To June 2001 Technical Report)

December 2001 [Revised 12/10/01]

Dan Radulescu and Xavier Swamikannu
California Water Quality Control Board, Los Angeles Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Introduction

On March 23, 2001, the Western States Petroleum Association (WSPA), a trade association for the petroleum industry in the Western U.S., submitted a petition to the State Water Resources Control Board (State Board) which challenged the inclusion of numerical design standards for Retail Gasoline Outlets (RGOs) in the Municipal Separate Storm Sewer (MS4) permit for San Diego County.[1]

In June 2001, the California Water Quality Control Board, Los Angeles Region (LA Regional Board) and the California Water Quality Control Board, San Diego Region (SD Regional Board) issued a Technical Report, 'Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts' (RGO Technical Report). The Technical Report was prepared in response to the direction provided by the State Board in its decision in, *In Re*: City of Bellflower et al. (Order No. WQ 200-11, hereafter the LA SUSMP Decision) for the inclusion of numerical design standards for RGOs in future MS4 permits. The RGO Technical Report addressed presumptive concerns expressed by the State Water Resources Control Board (State Board) in the LA SUSMP Decision such as, (i) heavily regulated; (ii) limitations of space; (iii) feasibility and safety of treatment; (iv) absence of a threshold relative to RGO size. It also recommends a threshold relative to RGO size as directed by the State Board. WSPA claims that the Regional Board's evidence and findings are not "proper justification" as

[1] The State Board upheld WSPA's petition on procedural grounds. See *In Re*: Building Industry Association of San Diego and Western States Petroleum Association (Order No. WQ 2001-15)

R0007598

required by the State Board. In contrast, Regional Board Counsel has determined that the criteria established are lawful and proper.[2]

On August 6, 200, WSPA submitted a critique of the RGO Technical Report in its comment on the second draft of the Los Angeles County MS4 permit. WSPA, in large part, contended that the justification was not proper. The LA Regional Board staff has prepared this Supplement to the RGO Technical Report to clarify issues raised by WSPA in its critique of the RGO Technical Report, and WSPA's comments on applicability of numerical design standards to RGOs in reference to the October 11 tentative draft of the Los Angeles County MS4 permit.[3]

Lack of Specific Analyses by WSPA

We are concerned as to the lack of substantive documentation by WSPA of its assertions that the treatment of storm water to remove pollutants of concern in California is technically not feasible, not safe, and prohibitively costly. WSPA has not technically documented the bases of such claims or conducted any analyses of such conditions at RGOs. Regional Board staff and WSPA and its consultants differ in opinion on data from other studies; facts; inferences, and important differences. Regional Board staff conducted independent analyses of these factors and facts to ensure "proper justification" for the inclusion of RGOs.

For example contrary to WSPA's claims, (i) WSPA member RGOs in Western Washington and Northern Oregon have been required by their municipalities to utilize tiered treatment since 1992 to remove petroleum hydrocarbons in storm water runoff from the fueling areas and other pollutants such as heavy metals from adjacent areas, and not after "August 2001" (Figure 1);[4] (ii) treatment control BMP pollutant concentrations were higher in the effluent at a Washington State RGO study site only because the parameters were either a component of the treatment media (phosphorous and nitrates) or the influent concentration was low (oil and grease), not because the BMP was ineffective;[5] (iii) treatment control BMPs tested by Caltrans performed as expected but needed more maintenance because of undersizing and no pre-treatment, not because they were ineffective;[6] (iv) space at RGOs for installation of treatment

R0007599

control BMPs is not constrained to render it infeasible (Table 1)[7], (iv) subsurface treatment control BMPs are safe, as demonstrated by WSPA member RGOs in Washington and Oregon who have installed these systems for some years; and (v) cost of installation of treatment control BMPs (actually a retrofit of existing facilities) tested by Caltrans was well within estimated costs; the larger expense was for monitoring and analysis...not installation.[8]

RGOs are Storm Water Pollutant Hotspots

RGOs are incontrovertible hot spots for pollutants of concern in storm water and have been widely documented as such. The most common pollutants of concern in storm water runoff from RGOs are heavy metals, petroleum hydrocarbons (such as Polycyclic Aromatic Hydrocarbons (PAHs)), and oil and grease.[9] These pollutants have been identified through analyses of: (i) trapped sediments in on-line oil water separators; (ii) particulates removed by treatment control BMPs such as media filters; (iii) simulated runoff; or (iv) storm water runoff leaving RGOs. In studies conducted, since 1970, in relation to automotive related activities and their impact on the quality of storm water runoff, a strong correlation has emerged between the volume and duration of automotive exposure and its impact on water quality and sediment quality criteria. As a result, several areawide storm water management programs already identify RGOs as pollutant hotspots and require the implementation of treatment control BMPs.[10,11,12]

An 18-month study was performed in the Washington Metropolitan area ("Washington Study"), to compare storm water quality with the National Urban Runoff Program (NURP) monitoring results.[13] One of the monitoring locations was situated at a

[7] Table 1 illustrates that more than two-thirds of the surface area (at a sampling of RGOs in the Los Angeles area) is available for installation for WQF treatment control BMPs (some which are as compact as 50 sq. ft in dimension).

gasoline station. The Washington Study confirmed NURP findings, i.e., water quality criteria for metals and Chemical Oxygen Demand (COD) are exceeded for storm water runoff from sites exposed to vehicular traffic (such as gasoline stations, parking lots and streets).[14] In the Washington Study the high COD values were attributed to the presence of high concentrations of petroleum hydrocarbons in the runoff from the gasoline station site. In addition, the U.S. General Accounting Office, in its report to Congressional requesters on urban runoff water quality (Report No. GAO-01-679) cites research in Texas that shows PAH concentrations are related to the volume of vehicular traffic.[15] Nationwide studies confirm the increased concentrations of PAHs in sediments deposited by storm water from urban watersheds.[16] A similar link between the duration and volume of automotive exposure at automotive-intensive land uses, including RGOs, demonstrated that, even at moderate duration and volume of automotive exposure, the observed hydrocarbon concentrations in storm water runoff were high.[17] For the Los Angeles area, a number of studies have identified PAHs and heavy metals as pollutants of concern in storm water runoff discharging to Santa Monica Bay.[18,19]

Implementation of Storm Water Quality Task Force (Source Control) BMPs Alone is Inadequate to Control Pollutants in Storm Water

WSPA's total reliance on the Storm Water Quality Task Force RGO BMP Guide (RGO BMP Guide) is misplaced. We have reviewed the RGO BMP Guide[20] and found it to be obsolete.[21] The recommendations of the Task Force were for the implementation of a default set of source control BMPs to control

---

[14] WSPA has never disputed the fact that pollutants in storm water discharges from RGOs often exceed water quality criteria. Their claim has been that it is no worse than the quality of storm water from urban land-uses characterized in the NURP study from the 1970s.

the discharge of pollutants in storm water runoff from RGOs. In fact, the Task Force contemplated the addition of treatment control BMPs in the future to the recommended BMPs menu. The RGO BMP Guide was intended to provide a default menu of source control BMPs as a pre-treatment step, until treatment BMPs were added to the Guide. The RGO BMP Guide has not been updated, and as a result is woefully inadequate for guidance to reduce the discharge of pollutants in storm water to protect the beneficial uses of receiving waters in the Los Angeles Region.[22]

WSPA's reliance on the RGO Guide originates from two unsupported assumptions – that source control BMPs: (i) alone are sufficient to control the discharge of pollutants in storm water runoff from RGOs so that no exceedances of water quality standards will occur, and (ii) are consistently and diligently implemented. A study conducted recently in the Los Angeles Region deflates both assumptions.[23] The results from the study demonstrate that the implementation of source control BMPs alone (similar to those recommended in the RGO BMP Guide) are insufficient to reduce the concentration of pollutants discharged in storm water to meet water quality standards. Treatment control BMPs must be employed to adequately reduce pollutants in storm water to meet water quality standards. Secondly, source control BMPs by their nature are difficult to verify and often are at the operator's discretion. While pollution prevention practices recommended in the RGO BMP Guide are desirable, neither WSPA nor others have demonstrated that the implementation of such practices reduces pollutants successfully to where water quality impacts are eliminated.[24] In fact the opposite evidence now exists.[25]

Implementation of Properly Designed Treatment Control BMPs is Necessary

Treatment control BMPs in order to be effective have to be properly designed based on either the Water Quality Flow (WQF) or Water Quality Volume (WQV) criteria or both. The WQF and WQV criteria developed by the Los Angeles Regional Board are based on characteristics of precipitation in the region. The most common precipitation events are small size storms and extreme events are rare. Consequently, for water quality purposes, the design standards ensure proper design for the treatment of the small more frequent precipitation events.

More than likely a multi-chamber treatment train or a set of treatment control BMPs will be necessary to remove the full suite of pollutants of concern in storm water

[22] *Ibid.*

[23] *Los Angeles County 1994-2000 Integrated Receiving Water Impacts Report* – 2000. Part of the critical sources study was conducted at automotive service facilities which have similar traffic volume and duration exposure as RGOs.

[24] See Letter from Professor L.D. Duke at UCLA to Mr. Radulescu dated Nov. 15, 2001, explaining the meaning of his statement on pollution prevention in a report cited by WSPA as proof that source control BMPs are all that are needed.

[25] *Supra.* See Footnote 23

discharges from RGOs, and regular maintenance of the treatment systems will be necessary to keep it performing optimally. Current approaches to treating runoff from RGOs include isolation of the fuel servicing area to treat VOCs, petroleum hydrocarbons, and oil and grease. The area should not be connected to an infiltration type of BMP because of the potential for soil and groundwater contamination from gasoline. These areas should be connected to the sanitary sewer system with the permission of the sewer agency or to an oil water separator and a basic treatment control BMP (such as a media filter or a biofilter). VOC concentrations in storm water because of their volatility are seldom detectable. Storm water from the general area is separately treated to remove pollutants of concern adhering to particulates. Basic treatment control BMPs being implemented elsewhere in the U.S. include sand filters, vegetated buffers, biofilters, flow-through filter cartridges, and multi-chamber treatment train.[25]

The percent removal efficiencies of treatment control BMPs are highly dependent on the influent concentration of pollutants. The higher the influent concentration the higher the percent removal. For filter media based treatment control BMPs the characteristics of the medium also matter and removal efficiencies vary according to the type of filter material.[27]

Implementation of BMPs is Safe

WSPA contends that the installation of subsurface treatment control BMPs raises safety concerns because gasoline spills would purposely be routed below grade thus presenting a potentially explosive environment. We agree that the fueling area, vehicle maintenance areas, and vehicle traffic areas represent different problems. They require different solutions. To control spills, the fuel-island may be designed with a dead-end sump or spill control separator in compliance with the Uniform Fire Code (UFC); and as a spill containment pad (UFC § 790.18). The canopy should be designed to prevent the entry of rain into the fuel pad area. Storm water collected in the fuel island area may be conveyed to the sanitary sewer system after pre-treatment (if the sewer authority approves) or discharged after passing through a treatment train that includes an oil-water separator and basic treatment BMPs (media filters, biofilters, etc.). Storm water from the vehicle traffic areas may be treated using biofilters, linear sand filters, media filters or similar BMPs.[28] Contrary to WSPA's assertions, it is feasible to minimize safety concerns by designing the fueling area at RGOs consistent with UFC standards to

R0007603

control spills, while also incorporating treatment control BMPs to reduce the discharge of storm waters pollutants.

Treatment Control BMPs are Reasonable in Cost

We have previously reviewed the literature on the cost of treatment control BMPs for RGOs and determined them to be reasonable.[29] Biofilters are expected to cost about $6,500 per 5,000 square feet.[30] The multi-chamber treatment train has been estimated to cost between $5,000 and $10,000 per 5,000 square feet of drainage area.[31] Based on the estimated project cost to build a RGO (Table 2), the cost of installation of treatment control BMPs appears to be between 1.75 – 2.3 percent of the project cost. These estimates are consistent with the Regional Board's empirical basis of reasonable cost to meet the mitigation criteria (1-2 percent of the project development cost).[32]

Conclusion

Water quality protection should be no less important for RGO operators in California than they are for their counterparts in other Western states. The RGO BMP Guide which emphasizes pollution prevention practices may be considered as the pre-treatment step that optimizes the cost-effectiveness of treatment control BMPs. Both source control and treatment control BMPs are essential to reduce the discharge the pollutants in storm water effectively and to minimize treatment costs. A suite of treatment control BMPs or a treatment train of BMPs most likely will be needed to remove the range of pollutants of concern in storm water runoff from RGOs. The thresholds established by the Regional Board for the numerical mitigation criteria to apply to RGOs are reasonable and fair, have been properly justified, and have fully met all evidentiary requirements set forth in the LA SUSMP Decision by the State Board for the inclusion of RGOs.

Subject: RE: Manual and Questions

Would you kindly respond to the following two questions:

1. Does a new gas station development that creates 5,000 square feet or more of impervious surface be subject to storm water treatment for post-construction use?
2. Does an existing gas station that replaces 5,000 square feet or more of impervious surface be subject to storm water treatment for post-construction use?

Thanks for your assistance.

Sincerely
Xavier

Subject: FW: Manual and Questions

Stan,
Please answer these gas station questions. Thanks.

>>> "Ciuba, Stan" <sciu461@ECY.WA.GOV> 09/12/01 01:37PM >>>
Xavier, the new manual, which should be published in the next couple of weeks, applies to new and redevelopments. Local governments can also use it for retrofits as they judge necessary. The impervious containment area of the fuel island is considered a pollutant generating source requiring treatment for hydrocarbon pollutants. The 5000 square foot threshold pollutant generating surface applies to the parking area adjacent to the fuel island and includes any convenience store parking area. Hope this helps.
Stan

Subject: Re: FW: Manual and Questions

Hello Stan:

Some follow-up questions.
Have these requirements for gas-stations been in effect for certain parts of Western Washington State for some time....for e.g. the Puget Sound Area?
What were the requirements for gas stations in the Stormwater Management Manual for the Puget Sound Basin (1992)?
Xavier

"The answer to your question is that the gas station BMPs in the new Manual (published last week), is virtually the same as in the 1992 Manual. The language has been changed and several items are expressed more directly. The new 2001 Manual applies to Western WA and is offered as technical guidance to local governments and others. However, the BMPs in the new Manual may be incorporated into the various municipal and industrial general NPDES Stormwater Permits. Exactly how and when that will happen has not been determined.
Best regards, Stan

November 2001

INTRODUCTION

A question that has been frequently asked during the process to renew the Los Angeles NPDES Municipal Stormwater Permit was if the storm water regulations require municipalities to conduct inspections at industrial or commercial facilities. This requirement establishes municipalities' responsibility to verify the effective implementation of best management practices to control the contribution of pollutants to the municipal storm drain system from industrial or commercial sites.

A second issue raised was the extent of responsibility municipalities have to control the contribution of pollutants from industrial or commercial sites and what is the relationship with the responsibilities that the Regional Board has over the same type of facilities.

This document attempts to answer to those specific questions raised by the Permittees and other stakeholders. The author adds emphases in the text.

I. Federal Mandate

The Federal Water Pollution Control Act Amendments (FWPCA) of 1972 created the framework for addressing critical pollution problems in the Nation's waters. Section 101, "Congressional Declaration of Goals and Policy", concisely summarized the new act. Section 101(a) stated, "The objective of this Act is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." This way a strong emphasis was put on the ecological and environmental aspects of protecting water quality. Elaborating on that position, the same section set down two "national goals": (1) eliminating the discharge of pollutants into navigable waters by 1985, and (2) achieving an interim water quality level that would protect fish, shellfish, and wildlife while providing for recreation in and on the water wherever attainable. The 1972 Amendments focused their attention on point sources such as municipal discharges through publicly owned treatment works and direct industrial discharges. The Act also focused the efforts on two categories of pollutants: conventional (BOD, SS, and pH), and what was classified as toxic.

Much of the effort following the enactment of FWPCA was to establish the United States Environmental Protection Agency (U.S. EPA) and the framework of the National **Pollutant Discharge Elimination** System (NPDES) permit program. Many other efforts were initiated in areas of construction of treatment plants, basin planning, treatment technologies development, establishment of effluent standards for toxic pollutants and the creation of appropriate regulations to implement the intent of the Act.

Under the provisions of the Act, the U.S. EPA could delegate NPDES permitting authority to the States. California is a delegated State and has full authority to issue NPDES permits with U.S. EPA's concurrence.

Between 1972 and 1987, the law has been subject to mid-course corrections and a change of name to the Clean Water Act (CWA).

The 1987 amendments, known as the Water Quality Act (WQA) of 1987, were aimed at addressing a number of issues on which progress was deemed to have been unsatisfactory. These issues included toxics, nonpoint sources, storm water, coastal

pollution, and others. States were required to identify waters not meeting designated uses because of toxic pollutants even after the application of technology based controls and to develop strategies for controlling them.

New provisions to permit discharges of storm water from separate storm sewers were also added. Section 402 phases in storm water permits. Originally, the 1972 Act required U.S. EPA to issue a NPDES permit for all point sources of pollution. The Agency interpreted that requirement so that it could issue areawide permits for separate storm sewers, rather than each storm water outfall.

The first phase of the program, commonly referred to as "Phase I", was promulgated on November 16, 1990 (55 FR 47990, 40 CFR 122). Phase I requires NPDES permits for storm water discharge from a large number of priority sources including municipal separate storm sewer systems (MS4s) generally serving populations of 100,000 or more and several categories of industrial activity, including construction sites that disturb five or more acres of land.

The second phase of the storm water program, recently promulgated on December 8, 1999 (64 FR 68722) expands the existing program to include discharges of storm water from smaller municipalities in urbanized areas and from construction sites that disturb between one and five acres of land. The new rule allows certain sources to be excluded from the national program based on a demonstrable lack of impact on water quality. The rule also allows other sources not automatically regulated on a national basis to be designated for inclusion based on increased likelihood for localized adverse impact on water quality.

II. Water Quality Concerns

After FWPCA was adopted in 1972, the implementation of end-of-pipe control methods from traditional point sources started to show improvement in the quality of the effluent discharged from Publicly Owned Treatment Works (POTW) and industrial wastewater treatment plants. However, it also become evident that receiving waters still did not attain designated uses, and water quality standards were frequently exceeded. That focused the attention to the other major component contributing to beneficial use impairments of the receiving water quality: pollution from diffuse sources, such as runoff from urban areas, construction sites, agricultural areas, land disposal and resource extraction. Early on, the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA), along with U.S. EPA, conducted a comprehensive study of diffuse pollution sources that resulted in the 1985 report, "America's Clean Water – The States Nonpoint Source Assessment." This report indicated that 38 States reported urban runoff as a major cause of beneficial use impairment. In addition, 21 States reported construction site runoff as a major cause of impairment.

To provide a better understanding of the nature of urban runoff from commercial and residential areas, from 1978 through 1983, U.S. EPA provided funding and guidance to the Nationwide Urban Runoff Program (NURP)[1]. The NURP included 28 projects across the Nation. One focus of the NURP was to characterize the water quality of discharges from separate storm sewers that drain residential, commercial, and light industrial (industrial parks) sites. The majority of samples collected in the study were analyzed for

eight conventional pollutants and three metals. Data collected under the NURP indicated that on an annual loading basis, suspended solids in discharges from separate storm sewers draining runoff from residential, commercial and light industrial areas are around an order of magnitude greater than solids in discharges from municipal secondary sewage treatment plants. In addition the study indicated that the annual loading of chemical oxygen demand (COD) are comparable in magnitude to effluent from secondary sewage treatment plants. When analyzing annual loadings associated with urban runoff, it is important to recognize that discharges of urban runoff are highly intermittent and that the short-term loadings associated with individual events will be high and may have shockloading effects on receiving water, such as low dissolved oxygen levels. NURP data also showed that fecal coliform counts in urban runoff are typically in the tens to hundreds of thousands per 100 ml of runoff during warm weather conditions, (although the study suggested that fecal coliform may not be the most appropriate indicator organism for identifying potential health risks in storm water runoff), with the median for all sites being around 21,000/100 ml. This is generally consistent with studies that found that fecal coliform mean values range from 1,600 coliform fecal units (cfu)/100 ml to 250,000 cfu/100 ml[2]. Makepeace, et al., summarized ranges of contaminants from storm water, including physical contaminants such as total solids (76--36,200 mg/L) and copper (up to 1.41 mg/L); organic chemicals; organic compounds, such as oil and grease (up to 110 mg/L); and microorganisms.

Although NURP did not evaluate oil and grease other studies have demonstrated that urban runoff is an extremely important source of oil pollution to receiving waters, with hydrocarbon levels in urban runoff typically being reported at a range of 2 to 15 mg/l. These hydrocarbons tend to accumulate in bottom sediments where they may persist for long periods of time and exert adverse impacts on benthic organisms.

A portion of the NURP study involved monitoring 120 priority pollutants in storm water discharges from lands used for residential, commercial and light industrial activities. Seventy-seven priority pollutants were detected in samples of storm water discharges, from residential, commercial and light industrial lands taken during the NURP study, including 14 inorganic and 63 organic pollutants. The NURP data also showed a significant number of these samples exceeded various U.S. EPA freshwater water quality criteria. The NURP study provides insight on what can be considered background levels of pollutants for urban runoff, as the study focused primarily on monitoring runoff from residential, commercial and light industrial areas. However, NURP concluded that the quality of urban runoff can be adversely impacted by several sources of pollutants that were not directly evaluated in the study and are generally not reflected in the NURP data, including illicit connections, construction site runoff, **industrial site runoff** and illegal dumping. Other studies showed that storm water from industrial facilities might contain toxics and conventional pollutants when material management practices allow exposure to storm water.

Since the NURP study many other studies and programmatic assessments confirmed the magnitude of the diffuse pollution problem. Data from the NURP study were analyzed further in the U.S. Geological Survey (USGS) Urban Storm Water Data Base for 22 Metropolitan Areas Throughout the United States survey[3]. The USGS report summarized additional monitoring data compiled during the mid-1980s, covering 717 storm events at 99 sites in 22 metropolitan areas and documented problems associated with metals and sediment concentrations in urban storm water runoff. More recent reports have confirmed the pollutant concentration data collected in the NURP study[4].

Other recent studies have not found significantly different pollutant concentrations in urban runoff when compared to the original NURP data[5].

Storm water runoff from lands modified by human activities can harm surface water resources and, in turn, cause or contribute to an exceedance of water quality standards by changing natural hydrologic patterns, accelerating stream flows, destroying aquatic habitat, and elevating pollutant concentrations and loadings. Such runoff may contain or mobilize high levels of contaminants, such as sediment, suspended solids, nutrients (phosphorous and nitrogen), heavy metals and other toxic pollutants, pathogens, toxins, oxygen-demanding substances (organic material), and floatables[6]. After a rain, storm water runoff carries these pollutants into nearby streams, rivers, lakes, estuaries, wetlands, and oceans. The highest concentrations of these contaminants often are contained in "first flush" discharges, which occur during the first major storm after an extended dry period[7]. Individually and combined, these pollutants impair water quality, threatening designated beneficial uses and causing habitat alteration or destruction. Uncontrolled storm water discharges from areas of urban development and construction activity negatively impact receiving waters by changing the physical, biological, and chemical composition of the water, resulting in an unhealthy environment for aquatic organisms, wildlife, and humans.

Urbanization alters the natural infiltration capability of the land and generates a host of pollutants that are associated with the activities of dense populations, thus causing an increase in storm water runoff volumes and pollutant loadings in storm water discharged to receiving waterbodies[8]. Urban development increases the amount of impervious surface in a watershed as farmland, forests, and meadowlands with natural infiltration characteristics are converted into buildings with rooftops, driveways, sidewalks, roads, and parking lots with virtually no ability to absorb storm water. Storm water and snow-melt runoff wash over these impervious areas, picking up pollutants along the way while gaining speed and volume because of their inability to disperse and filter into the ground. What results are storm water flows that are higher in volume, pollutants, and temperature than the flows in less impervious areas, which have more natural vegetation and soil to filter the runoff[9].

Studies reveal that the level of imperviousness in an area strongly correlates with the quality of the nearby receiving waters. For example, a study in the Puget Sound lowland ecoregion found that when the level of basin development exceeded 5 percent of the total impervious area, the biological integrity and physical habitat conditions that are necessary to support natural biological diversity and complexity declined precipitously[10]. Research conducted in numerous geographical areas, concentrating on various variables and employing widely different methods, has revealed a similar conclusion: stream degradation occurs at relatively low levels of imperviousness, such as 10 to 20 percent (even as low as 5 to 10 percent according to the findings of the Washington study referenced above)[11]. Furthermore, research has indicated that few, if any, urban streams can support diverse benthic communities at imperviousness levels of 25 percent or more. An area of medium density single family homes can be anywhere from 25 percent to nearly 60 percent impervious, depending on the design of the streets and parking[12].

In addition to impervious areas, urban development creates new pollution sources as population density increases, and brings with it proportionately higher levels of car emissions, car maintenance wastes, pet waste, litter, pesticides, and household

hazardous wastes, which may be washed into receiving waters by storm water or dumped directly into storm drains designed to discharge to receiving waters. More people in less space results in a greater concentration of pollutants that can be mobilized by, or disposed into, storm water discharges from municipal separate storm sewer systems. A modeling system developed for the Chesapeake Bay indicated that contamination of the Bay and its tributaries from runoff is comparable to, if not greater than, contamination from industrial and sewage sources[13].

In addition, the 1996 305(b) Report, provides a national assessment of water quality based on biennial reports submitted by the States as required under CWA section 305(b)[14]. In the CWA 305(b) reports, States, Tribes, and Territories assess their individual water quality control programs by examining the attainment or nonattainment of the designated uses assigned to their rivers, lakes, estuaries, wetlands, and ocean shores. A designated use is the legally applicable use specified in a water quality standard for a watershed, waterbody, or segment of a waterbody. The designated use is the desirable use that the water quality should support. Examples of designated uses include drinking water supply, primary contact recreation (swimming), and aquatic life support. Each CWA 305(b) report indicates the assessed fraction of a State's waters that are fully supporting, partially supporting, or not supporting designated beneficial uses. In their reports, States, Tribes, and Territories first identified and then assigned the sources of water quality impairment for each impaired waterbody using the following categories: industrial, municipal sewage, combined sewer overflows, urban runoff/storm sewers, agricultural, silvicultural, construction, resource extraction, land disposal, hydrologic modification, and habitat modification.

The 1996 Inventory, based on a compilation of 60 individual 305(b) reports submitted by States, Tribes, and Territories, assessed the following percentages of total waters nationwide: 19 percent of river and stream miles; 40 percent of lake, pond, and reservoir acres; 72 percent of estuary square miles; and 6 percent of ocean shoreline waters. The 1996 Inventory indicated that approximately 40 percent of the Nation's assessed rivers, lakes, and estuaries are impaired. Waterbodies deemed as "impaired" are either partially supporting designated uses or not supporting designated uses. The 1996 Inventory also found urban runoff/discharges from storm sewers to be a major source of water quality impairment nationwide. Urban runoff/storm sewers were found to be a source of pollution in 13 percent of impaired rivers; 21 percent of impaired lakes, ponds, and reservoirs; and 45 percent of impaired estuaries (second only to industrial discharges). Additionally, urban runoff was found to be the leading cause of ocean impairment for those ocean miles surveyed.

In addition, a recent USGS study of urban watersheds across the United States has revealed a link between urban development and contamination of local waterbodies. The study found the highest levels of organic contaminants, known as polycyclic aromatic hydrocarbons (PAHs) (products of combustion of wood, grass, and fossil fuels), in the reservoirs of urbanized watersheds[15].

In addition to the large-scale nationwide studies and assessments, a number of local and watershed-based studies from across the country have documented the detrimental effects of urban storm water runoff on water quality. A study of urban streams in Milwaukee County, Wisconsin found local streams to be highly degraded due primarily to urban runoff, while three studies in the Atlanta, Georgia region were characterized as being, "the first documentation in the Southeast of the strong negative relationship

between urbanization and stream quality that has been observed in other ecoregions"[16]. Several other studies, including those performed in Arizona (*Maricopa County*), California (*San Jose's Coyote Creek*), Massachusetts (*Green River*), Virginia (*Tuckahoe Creek*), and Washington (*Puget Sound lowland ecoregion*), all had the same finding: runoff from urban areas greatly impair stream ecology and the health of aquatic life; the more heavily developed the area, the more detrimental the effects[17]. Pitt and others also described the receiving water effects on aquatic organisms associated with urban runoff[18]. In Wisconsin runoff samples were collected from streets, parking lots, roofs, driveways, and lawns. Source areas were broken up into residential, commercial, and industrial. Geometric mean concentration data for residential areas included total solids of about 500-800 mg/L from streets and 600 mg/L from lawns. Fecal coliform data from residential areas ranged from 34,000 to 92,000 cfu/100 mL for streets and driveways. Contaminant concentration data from commercial and industrial source areas were lower for total solids and fecal coliform, but higher for total zinc[19,20]. A number of other studies have indicated that urban roadways often contain significant quantities of metal elements and solids[21].

Automotive service stations have been characterized as potential "hot spots" for hydrocarbon pollutants and heavy metals in urban storm water discharges[22]. In an urban area, **industrial and commercial activities** can also be considered hot spots as sources of pollutants[23]. Urban storm water also can contribute significant amounts of toxicants to receiving waters. Pitt et. al., found heavy metal concentrations in the majority of samples analyzed. Industrial or commercial areas were likely to be the most significant pollutant source areas[24].

Wet weather flows have been recognized as the primary sources of estuarine pollution in coastal communities. Urban storm water runoff, sanitary sewer overflows, and combined sewer overflows have become the largest causes of beach closings in the United States in the past years. Storm water discharges from urban areas not only pose a threat to the ecological environment, they also can substantially affect human health. A survey of coastal and Great Lakes communities reports that in 1998, more than 1,500 beach closings and advisories were associated with storm water runoff[25]. Other reports also document public health, shellfish bed, and habitat impacts from storm water runoff, including more than 823 beach closings/advisories issued in 1995 and more than 407 beach closing/advisories issued in 1996 due to urban runoff[26].

The studies and research performed in the Southern California area, including Los Angeles County, show the similar impacts of polluted urban runoff on the local receiving waters, with significant impacts on the health of the environment and local economy. The "Epidemiological Study of Possible Adverse Health Effects of Swimming in Santa Monica Bay", concluded that there is a 57 percent higher rate of illness in swimmers who swim adjacent to storm drains than in swimmers who swim more than 400 yards away from storm drains[27]. This and other studies document a relationship between gastrointestinal illness in swimmers and water quality, the latter of which can be heavily compromised by polluted storm water discharges. Other impacts on the Santa Monica Bay from the discharge of polluted storm water runoff have been documented[28].

In addition, the situation analysis of the "Los Angeles County Five-Year Public Education Overview" concluded:

Even after a generation of fighting water pollution, studies show the danger of illness to people swimming in waters near urban storm drain outfalls. The urban runoff that drains into the County's storm channels first litters and contaminates neighborhood streets and walks. Litter, fertilizers, pesticides, automobile soot and oil drippings, pet waste, and deteriorating leaves and plant debris not only make our communities unattractive, but also are swept untreated down the storm drains into our waterways...In total, the impacts of stormwater/urban runoff pollution encompass:

- losses to the County's $2 billion a year tourism economy
- health risks associated with swimming in areas near storm drain outfalls
- loss of recreational resources
- dramatic cost increases for cleaning up contaminated sediments
- impaired function and vitality of our natural resources
- losses to Southern California's commercial and sportfishing industry
- contamination to marine life[29].

III. Responsibility of Municipal Operators of Large and Medium Municipal Separate Storm Sewer Systems

The water quality impacts of urban runoff are well documented and identified as a leading cause of receiving water beneficial uses impairments. Many States and Municipalities in cooperation with U.S. EPA moved aggressively to control the sources of pollution within the framework of the NPDES permitting system and through other non-point source programs.

A. Role of Municipal Operator

As early as the promulgation of the 1990 Phase I storm water regulations, U.S. EPA clearly defined the roles and identified the responsibilities of all parties involved in the permitting process. Early on, the agency envisioned a partnership, a cooperative approach between U.S. EPA, States and Municipalities, recognizing that only through a coordinated effort will the difficult and complex issues of diffuse pollution be addressed appropriately. In the preamble to the 1990 Phase I storm water regulations, the agency stated that the:

> ...EPA still believes that municipal operators of large and medium municipal systems have an important role in **source identification** and the **development of pollutant controls for industries** that discharge storm water through municipal separate storm sewer systems is appropriate. Under the CWA, large and medium municipalities are responsible for reducing pollutants in discharges from municipal separate storm sewers to the maximum extent practicable. Because **storm water from industrial facilities may be a major contributor of pollutants** to municipal separate storm sewer systems, **municipalities are obligated to develop controls for storm water discharges associated with industrial activity through their system in their storm water management program**... EPA believes that the permitting of municipal storm sewer systems and the industrial discharges through them will act in a complimentary manner to

fully control the pollutants in those sewer systems. This will fully implement the intent of Congress to control industrial as well as large and medium municipal storm water discharges as expeditiously and effectively as possible.

U.S. EPA continued to clarify its intent for:

> "...[t]he permit application requirements for large and medium municipal separate storm sewer systems, discussed in more detail later in today's preamble, **address the responsibilities of the municipal operators of these systems to identify and control pollutants in storm water discharges associated with industrial activity**. Permit applications for large and medium municipal separate storm sewer systems are to identify the location of facilities which discharge storm water associated with industrial activity to the municipal system... In addition, municipal applicants will provide a description of a proposed management program to reduce, to the maximum extent practicable, pollutants from storm water discharges associated with industrial activity which discharge to the municipal system... Controls developed in management plans for municipal permits may take a variety of forms. Where necessary, municipal permittees can pursue local remedies to develop **measures to reduce pollutants or halt** storm water discharges with high level of pollutants through municipal storm sewer systems. Some local entities have already implemented ordinances or laws that are designated to reduce the discharge of pollutants to municipal separate storm sewers, while other municipalities have developed a variety of techniques to control pollutants in storm water."

U.S. EPA reconfirmed its position in regard to the role of municipal operators of large and medium MS4s when it issued, in 1993 (58 FR 61146), the notice for the proposed multi-sector stormwater general permit for discharges of storm water associated with industrial activity (multi-sector permit).

In the Fact Sheet for the proposed multi-sector permit, U.S. EPA reiterated its position regarding the complimentary permit approach envisioned to address storm water discharges associated with industrial activity:

> "A second permit issued to the operator of the large or medium municipal storm sewer, establishes the **responsibilities** of the municipal operators in controlling pollutants from storm water associated with industrial activity which discharge through their system... The municipal storm water management programs that will be incorporated into NPDES permits for discharges from MS4s will generally address (in addition to other possible requirements) the following three major components:
>
> - Reducing pollutants in storm water discharges from municipal landfills; hazardous waste treatment, storage and disposal facilities; facilities subject to the Emergency Planning and Community Right-to-Know Act (EPCRA), section 313; and other priority industrial facilities through municipal separate storm sewers.
> - Reducing pollutants in construction site runoff through municipal separate storm sewers.
> - Identifying and controlling non-storm water discharges to municipal separate storm sewers...

> Municipal programs to reduce pollutants in industrial site runoff and construction site runoff through MS4s **specifically will address municipal responsibilities in controlling pollutants from industrial facilities.**"

Recently, in its Storm Water Phase II Compliance Assistance Guide (Guide)[30], U.S. EPA restated and further clarified its intention regarding the integration of NPDES programs for storm water discharges: "...[t]he Phase I permits for MS4s mostly cover larger cities, and require them to develop a storm water management program, **track and oversee industrial facilities** regulated under the NPDES storm water program, conduct some monitoring, and submit periodic reports."

Furthermore, when referring to integration of NPDES program for construction (which is one of the eleven industrial categories addressed by the storm water program) with NPDES program for MS4s, the Guide specifies:

- "These are two **separate** and **distinct** construction programs.
- A construction operator is subject to requirements under **BOTH** programs if it is located in an NPDES-regulated MS4's jurisdiction."

In addition, the No Exposure Certification Form for Exclusion from NPDES Storm Water Permitting[31], includes in the certification section the following statements:

> "I understand that I am obligated to submit a no exposure certification form once every five years to the NPDES permitting authority and, if requested, to the operator of the local municipal separate storm sewer system (MS4) into which the facility discharges (where applicable). I understand that **I must allow the NPDES permitting authority, or MS4 operator where the discharge is into the local MS4, to perform inspections** to confirm the condition of no exposure and to make such inspection reports publicly available upon request."

Once more, U.S. EPA clearly states its standpoint that NPDES permitting authority responsibilities are intertwined with those of the local agency.

It can be reasonably inferred from the regulatory record and actions that U.S. EPA clearly envisioned a dual coverage and a strong role and clear responsibilities for the municipal operator in controlling pollutants from industrial sites as distinct from the activities required by the NPDES permitting agency. However, activities required by both entities should be coordinated and integrated as much as possible to achieve to common goal of effectively controlling and reducing the discharge of pollutants into the storm water runoff.

B. Legal Authority

40 CFR §122.26(d)(2)(i) ***Adequate legal authority.*** A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:
(A) Control through ordinance, permit, contract, order or similar means, the **contribution of pollutants to the municipal storm sewer by storm water discharges associated**

with industrial activity and the quality of storm water discharged from sites of industrial activity;
(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;
(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;
(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;
(E) Require compliance with conditions in ordinances, permits, contracts or orders; and
(F) **Carry out all inspection, surveillance** and monitoring procedures necessary to determine compliance and noncompliance with permit conditions **including** the prohibition on illicit discharges to the municipal separate storm sewer.

40 CFR §122.26(d)(2)(iv)(A)(*5*) A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, which shall identify priorities and procedures for **inspections** and establishing and implementing control measures for such discharges (this program can be coordinated with the program developed under paragraph (d)(2)(iv)(C) of this section);

40 CFR §122.26(d)(2)(iv)(C) A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), **and industrial facilities** that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program shall:
(*1*) **Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges;**...

In its Guidance Manual[32] U.S. EPA explicitly states on what the municipalities must achieve: "The municipality, as a permittee, is responsible for compliance with its permit and must have the authority to implement the conditions in its permit. To comply with its permit, a municipality must have the authority to **hold dischargers accountable for their contributions** to separate storm sewers."

The Guidance Manual provides more clarification in regard to the extent of facilities that must be addressed and the link that must be made with the potential sources of pollutants: "However, a municipality, to satisfy its permit conditions, **may need to impose additional requirements** on **discharges from permitted industrial facilities, as well as discharges from industrial facilities** and construction sites ***not* required to obtain permits**... [t]he Source Identification component requires the applicant to provide **an inventory of pollutant sources**, organized by watershed. This inventory **identifies and describes the products and services** of each industrial facility that may discharge storm water to the MS4. The Source identification component suggests applicants to use standard industrial classification codes (SIC) codes for this description. EPA strongly recommends this information be used to identify priority waste handling sites and industrial facilities. A similar technique could be developed for sites ***that do not meet*** the ***regulatory definition of "storm water discharge associated with industrial activity"*** (i.e. not included in the Source Identification and Discharge Characterization

components), but ***are identified as a high priority*** under the proposed management program." It can be concluded that the scheme envisioned by the regulations do not only address industrial sites covered under the definition of storm water discharge associated with industrial activity, but depending on the identified significant sources contributing pollutants to the storm water runoff, other types of industrial facilities, such as commercial, must be addressed in the municipal program to inspect facilities contributing pollutants to the municipal separate storm drain system.

Many existing permits issued by U.S. EPA or authorized States, nationwide, already include these kind of requirements and municipalities are actively implementing them.[33] Regional Boards in California also issued MS4 permits requiring a program for inspections at industrial or commercial facilities.[34] Municipalities used a large spectrum of methods and innovative ways to implement the inspection program, and many local jurisdictions have the adequate required legal authority or have adopted ordinances giving them the necessary legal authority. Even smaller cities, to be covered under Phase II, not required to obtain the legal authorities for inspections as yet, decided to pass ordinances giving them the necessary authority for the implementation of the storm water program, including the authority to inspect industrial or commercial facilities and adopt and impose BMPs.[35]

As early as 1993, U.S. EPA Region 9, clarified the role of municipalities in addressing industrial sources.[36] More recently the same position was restated.[37] Regional Board's position, starting with the 1990 MS4 Permit was that an inspection program was required in the municipal storm water permit and was supported by the legal analysis provided by the State Board's Office of Chief Counsel[38].

C. Source Identification

40 CFR §122.26(d)(2)(ii). Source Identification... *Provide an inventory, organized by watershed of the name and address, and a description (such as SIC Codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity.*

A very careful consideration was given to the issue of the pollutant sources in storm water discharges through MS4s and the control of those pollutant sources. The Agency continued to discuss and describe its intent of the elements needed to be addressed by a municipality through the application process in regards to the sources that contribute pollutants to the municipal storm sewers. Under the source identification heading in the preamble to the 1990 Phase I storm water regulations, U.S. EPA stated that, "...**the identification of sources which contribute pollutants** to municipal separate storm sewers is a **critical step** in characterizing **the nature and extent of pollutants in discharges** and in **developing appropriate control measures**." The agency expands the scope of the source identification concept leaving it general instead of focusing on any particular area, such as industrial, commercial, residential, roadways, etc., but linking it to the existing water quality problems. It is clear that the intent of the agency was to draw the attention of applicants to addressing, in a flexible way, the real issues and focus their limited resources on controlling the most problematic sources:

> "...**source identification** can be useful for providing **an analysis of pollutant source contribution** and for **identifying the relationship between pollutant**

sources and receiving water quality problems. In cases where end-of-pipe controls alone are not practicable, it is essential to identify the source of pollutants into the municipal storm sewer system to support **a targeted approach to control pollutant sources**."

The agency continues to comment and clarify the provisions under the application requirements of the regulations:

> "...Part 1 of the application will also include: [...]**the location of industrial facilities, open dumps, landfills or RCRA hazardous waste facilities** which discharge storm water to the municipal storm sewer system;...Part 2 of the application will supplement the information reported in part 1 of the application so that,[...]municipal or public entities responsible for and obtaining an NPDES permit will be required to **identify the location of an open dump, sanitary landfill, municipal incinerator or hazardous waste treatment, storage, and disposal facility under RCRA which may discharge storm water to the system as well as all facilities which discharge storm water with industrial activity into a large or medium municipal separate storm sewer system**. Requiring **these source identification measures is supported by the legislative history of section 405 of the WQA**, which instructs that '[i]n writing **any permit for a municipal separate storm sewer, EPA or the State should pay particular attention to the nature and uses of the drainage area and the location of any industrial facility, open dump, landfill, or hazardous waste treatment, storage, or disposal facility which may contribute pollutants to the discharge.**'[39]"

In answering some of the comments regarding the value of source identification information, the agency responded:

> [..]the **source identification** information serves several purposes. It is the first step for **identifying potential sources of pollutants** from which more in depth analysis can be accomplished...The **source identification component** of the municipal application also requires that **municipal applicants identify the industrial activity within the drainage area associated with each major outfall**...[A]pplicants identify the types of industrial facilities operating within the municipality, the municipality is free to use Standard Industrial Classification (SIC) or other systems which identify the principal products or services of the facility.

D. Los Angeles MS4 Permittees Compliance Efforts

The Permittees covered under the Los Angeles MS4 permit addressed the element of source identification and prioritization through compliance with the requirements of the 1996 permit (Board Order No. 96-054). The Critical Source Selection and Monitoring Report (Critical Source Report), identified 30 categories of industrial and commercial activities that may impact the quality of the stormwater runoff discharged to the MS4[40]. The study also ranked the critical sources on the basis of potential impact and proposed a Critical Source/BMP Monitoring program at the five highest ranked facility types: (i)

wholesale trade (scrap, auto dismantling), (ii) *automotive repair/parking*, (iii) fabricated metal products, (iv) motor freight (including trucking), (v) chemical and allied products.

At the same time, the Permittees, under the coordination of the Los Angeles County Department of Public Works, compiled, in 1997, a facilities database for the MS4 program identifying approximately 58,000 facilities that could have been potentially addressed by the public education site visit program. Out of the total universe of 58,000 facilities identified by their SIC Code, 21,000 were food or food related establishments. The 36,000 remaining facilities were in industrial/commercial sectors. An updated review of the potential number of facilities within the LA MS4 area, identified in the 30 industrial/commercial sectors Critical Source Report (not including food establishments), revealed that the number of facilities can be as high as 26,300 sites as of 2001. The survey was performed with the help of the Los Angeles City Stormwater Management Division staff. A significant portion of the total number of facilities, up to 60%, may be located within the City of Los Angeles boundaries. The SIC Code system proved to be inadequate in identifying the correct type of activity performed on-site, and also a significant number of facilities may not have activities or materials exposed to stormwater, which will make the actual number of sites potentially addressed through the municipal stormwater program much smaller than predicted.

The results of the Critical Source/BMP Monitoring program confirmed that the five highest ranking activities indeed contribute significant quantities of pollutants and source control BMPs alone were not effective in reducing the amount of pollutants into the stormwater runoff. The majority of the sampling results were in excess of the Criteria for Priority Toxic Pollutants for the State of California.[41] However, since the implementation of the source control BMPs was voluntary, the study could not determine with certainty that the apparent failure was due to the inefficacy of the BMPs or the lack of proper implementation.[42]

Furthermore, the Research Report on Issues, Pollutants and Materials[43](Research Report) accomplishes a comprehensive analysis of sources of pollutants, generation and receiving water impacts. The Research Report puts in a concise form and creates the link between typical pollutant sources, pollutants found in the County's waterbodies, pollutant of concerns for each Watershed Management Area and pollutants of concerns detected through previous monitoring. The Research Report clearly identifies the targeted pollutants: (i) heavy metals, (ii) oil and grease/PAHs, (iii) sediments, (iv) oxygen demanding substances, (v) litter/trash/debris, (vi) nutrients, (vii) other toxic materials, such as pesticides.[43] The Research Report confirms once again that the urban environment in the Los Angeles area is similar to the other urban areas in the nation when it comes to stormwater runoff characterization and receiving water impacts. The Los Angeles area is probably unique due to the highly industrialized and vast area served by an interconnected storm sewer system unlike any other in the nation. But that makes it even more imperative that significant efforts must be allocated in order to control the discharge of pollutants in the urban runoff.

CONCLUSION

From the record and all the studies referenced in this report it is evident that an inspection program at industrial and commercial facilities is not only required under the storm water

regulations but it is an essential component to control the contribution of pollutants from industrial or commercial facilities into storm water discharges through the municipal storm drain system. This inspection program is separate and in addition to the program administered by the Regional Board, and the municipalities have a clear responsibility to perform them.

The dual coverage is intended in the regulations, in order to maximize the use of limited resources at the State and local level, and assure through active coordination that significant sources of pollutants are not overlooked or missed due to lack of legal authority.

The Permittees under the Los Angeles MS4 Permit have made great strides in preparing the ground work for next phase of implementation: they performed a comprehensive source identification study confirmed by the monitoring results, the Regional Board approved the minimum menu of BMPs presented by the Permittees and they already put facilities on notice and performed the educational part through the site visits effort.

The introduction of the inspection program in the new MS4 permit is not capricious or arbitrary but based on facts. It utilizes tools already developed by Permittees and follows a widespread precedent in MS4 permits nationwide and in California.

In their part 2 applications, municipalities must propose programs to **control** the contributions of pollutants from industrial facilities **and prohibit** illicit discharges. For **both** of these activities, municipalities **must have the legal authority** to **carry out inspection, surveillance, and monitoring** procedures necessary to **determine compliance**.	Guidance Manual pag. 3-3
In their part 2 applications, municipalities should provide documentation of **their authority to enter, sample, inspect, review, and copy records,** etc. as well as demonstrate their authority to require regular reports.	Guidance Manual pag. 3-3
A description of **a program** to **monitor and control pollutants** in storm water discharges to municipal systems from **municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the**	40 CFR 122.26(d)(2)(iv)(C)

Requirement	Reference
Superfund Amendments and Reauthorization Act of 1986 (SARA), and ***industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading*** to the municipal storm sewer system. The program **shall:** (1) **Identify priorities and procedures for inspections** and **establishing and implementing control measures** for such discharges;	
NPDES permits for MS4s will establish *responsibilities* for municipal system operators to control pollutants from industrial storm water discharged through their system.	Guidance Manual pag. 6-16
Proposed storm water management programs must address the reduction of pollutants in storm water discharges from **municipal landfills, hazardous waste treatment, disposal and recovery facilities, facilities subject to SARA Title III;** and ***other priority industrial facilities***, as determined by the applicant. **Municipalities should consider** the information gathered for [..] the part 2 application **(particularly the Source Identification and Characterization Data** components) when prioritizing storm water discharges from these sites.	Guidance Manual pag. 6-16
In part 2 application, the Source Identification component requires the applicant to provide **an inventory of pollutant sources**, organized by watershed. This inventory **identifies and describes the products and services** of each industrial facility that may discharge storm water to the MS4. The Source identification component suggests applicants to use standard industrial classification codes (SIC) codes for this description. EPA strongly recommends this information be used to identify priority waste handling sites and industrial facilities. A similar technique could be developed for sites ***that do not meet*** the ***regulatory definition of "storm water discharge associated with industrial activity"*** (i.e. not included in the Source Identification and Discharge Characterization components), but ***are identified as a high priority*** under the proposed management program.	Guidance Manual pag. 6-16 [Commercial Sites]
The municipality is **ultimately responsible** for discharges from their MS4. Consequently, the proposed storm water management program should describe how **the municipality will help** EPA and authorized NPDES States: • **Identify priority industries** discharging to their systems; • **Review and evaluate storm water pollution prevention plans and other procedures that industrial facilities must develop under general or individual permits;** • **Establish and implement BMPs to reduce pollutants from these industrial facilities (or require industry to implement them);** and • ***Inspect*** **and monitor industrial facilities *to verify* that the industries discharging storm water to the municipal systems *are in compliance with their NPDES storm water permit,*** if required.	Guidance Manual pag. 6-17
At a minimum, priority facilities include: • Operating and closed municipal landfills; • Hazardous waste treatment, disposal or recovery facilities; and • Facilities subject to SARA Title III.	Guidance Manual pag. 6-17

Requirement	Reference
Municipalities must identify these **and *other priority industrial facilities* and describe the criteria used to identify them.** For example, information from the Toxics Release Inventory is one source a municipality could use to identify industrial facilities subject to SARA Title III. **Other sources** may include CWA Section 205 or 208 use-attainability studies, other studies that **indicate a site-specific beneficial use impairment immediately downstream of a storm water outfall**, or **records of industrial pretreatment programs or other permit programs that identify facilities that may be the source of a use impairment or a major contribution of pollutants.** The program should also describe procedures for modifying the inventory of priority industries based on **additional evaluation** that occurs throughout the permit term.	
During the term of the permit, as additional information becomes available, **the municipality should target and set priorities for other program elements** that emerge.	Guidance Manual pag. 6-18
As noted above, when identifying priority sites, applicants must consider all the facilities listed in 122.26(d)(2)(iv)(C)(1). When municipalities develop criteria for **identifying additional priority industrial facilities**, they are advised to consider, **at a minimum:** • The **type of industrial activity** (SIC codes can help characterize the type of industrial activity); • The **use and management of chemicals or raw products** at the facility and **the likelihood** that storm water discharge from the site **will be contaminated**; and • The **size and location of the facility in relation to sensitive watersheds.**	Guidance Manual pag. 6-18
The proposed management program **must include procedures for inspecting priority industrial sites.** The results of inspection may be used as a basis for **requiring storm water management controls and enhanced pollution prevention measures.** It should also establish an **inspection schedule** for each priority facility at the time it is identified.	Guidance Manual pag. 6-18
Applicants also should describe a procedure for **conducting follow-up inspections**, where necessary, as part of this program component. For example, follow-up inspections **might be needed to verify the installation of a specific control or implementation of a practice specified** in a negotiated agreement between the municipality and the industrial site. A system-wide approach to establishing priorities for inspection procedures is recommended. The system-wide approach should begin with the evaluation of existing information, followed by the identification and evaluation of new information during the permit term. Therefore, applicants **should link** these procedures with information from the Source Identification and Discharge Characterization components.	Guidance Manual pag. 6-19
A municipality **must consider** if it **should place more stringent controls on discharges associated with industrial activity than are required in an industrial facility's existing NPDES storm water**	Guidance Manual pag. 6-19

Requirement	Reference
permit.	
Priority industrial facilities should focus on controlling activities such as the use, storage, and handling of toxic chemicals. Standard methods for implementing control measures at different types of facilities should be described. To facilitate this, municipalities **should obtain copies of the pollution prevention plans developed by industrial permittees. Control measures** that the municipality **may suggest include preventing exposure of pollutant sources to precipitation, on-site pretreatment, and oil/water separators.**	Guidance Manual pag. 6-19
The proposed management program **should describe the inspection procedures that will be followed. Storm water inspections can be coupled with inspections for other purposes** (e.g., pretreatment programs, fire and safety). Proposed management **programs should address minimum frequency for routine inspections.** For example, **how often, how much of the site, and how long an inspection may take** are appropriate to explain in this proposed management program component. Applicants should also describe **procedures for conducting inspections and provide an inspector's checklist.** In addition, these inspection procedures should identify the **minimum number of inspectors** that will be employed and **describe the programs to train them.**	Guidance Manual pag. 6-19
Municipalities are **urged to *evaluate* pollution prevention plans and discharge monitoring data collected by the industrial facility to *ensure* that the facility is *in compliance with its NPDES storm water permit. Site inspections* should include (1) *an evaluation of the pollution prevention plan*** and any other pertinent documents, **and (2) an *on-site visual inspection of the facility*** to ***evaluate the potential*** **for *discharges of contaminated storm water*** from the site and ***to assess the effectiveness of the pollution prevention plan.***	Guidance Manual pag. 6-20
On November 16, 1990 (55 FR 47990), EPA promulgated a permitting scheme where controls for storm water discharges associated with industrial activity through large and medium municipal separate storm sewer systems may be addressed by two permits issued in a coordinated manner. This complementary permit approach envisions cooperative efforts by the permit issuing agency and municipal operators of large and medium municipal separate storm sewer systems to develop programs that will result in controls on pollutants in storm water discharges associated with industrial activity which discharge through municipal systems.	Federal Register, Vol. 58, No. 222 pag. 61158
Under the complementary permit approach, storm water discharges associated with industrial activity which discharge through large and medium municipal separate storm sewer systems are required to obtain permit coverage. Permits for these discharges will establish requirements (such as controls or monitoring) for industrial operators of the discharge into the municipal system. In addition, these permits provide a basis for enforcement actions directly against the owner or operator of storm water discharges associated with industrial activity.	Federal Register, Vol. 58, No. 222 pag. 61158
A second permit, issued to the operator of the large or medium municipal separate storm sewer, establishes the responsibilities of the	Federal Register, Vol. 58, No. 222 pag. 61158

Requirement	Reference
municipal operators in controlling pollutants from storm water associated with industrial activity which discharges through their system. The framework for permits for discharges from large and medium municipal separate storm sewer systems has been developed to establish the responsibilities of the municipals systems.	
At the heart of the permit program for discharges from municipal separate storm sewer systems serving a population of 100,000 or more are requirements that municipal applicants develop and implement municipal storm water management programs.	Federal Register, Vol. 58, No. 222 pag. 61158
The municipal storm water management programs that will be incorporated into NPDES permits for discharges from municipal separate storm sewer systems will generally address (in addition to other possible requirements) the following three major components: • Reducing pollutants in storm water discharges from municipal landfills; hazardous waste treatment, storage, and disposal facilities; facilities subject to the Emergency Planning and Community Right-to-Know Act (EPCRA), section 313; and other priority industrial facilities through municipal separate storm sewers. • Reducing pollutants in construction site runoff through municipal separate storm sewers. • Identifying and controlling non-storm water discharges to municipal separate storm sewer systems. These components of a municipal program can initiate the role of the municipality in assisting EPA and authorized NPDES States in implementing controls to reduce pollutants in storm water discharges associated with industrial activity which discharge through large and medium municipal separate storm sewer systems.	Federal Register, Vol. 58, No. 222 pag. 61158
Municipal programs to reduce pollutants in industrial site runoff and construction site runoff through municipal separate storm sewer systems specifically will address municipal responsibilities in controlling pollutants from industrial facilities.	Federal Register, Vol. 58, No. 222 pag. 61158
EPA proposed a permitting scheme that would define the requirement to obtain coverage under an NPDES permit for a storm water discharge associated with industrial activity through a municipal separate storm sewer in terms of the classification of the municipal separate storm sewer. EPA proposed holding municipal operators of large or medium municipal separate storm sewer systems primarily responsible for applying for and obtaining an NPDES permit covering system discharges as well as storm water discharges (including storm water discharges associated with industrial activity) through the system.	Federal Register, Vol. 55, No. 222 pag. 47997-98
Under the proposed approach, operators of storm water discharges associated with industrial activity which discharge through a large or medium municipal separate storm sewer system would generally not be required to obtain permit coverage for their discharge (unless designated as a significant contributor of pollution pursuant to section 402(p)(2)(E)) provided the municipality was notified of: The name, location and type of facility and a certification that the discharge has been tested (if feasible) for non-storm water (including the results of any testing). The	Federal Register, Vol. 55, No. 222 pag. 47998

Requirement	Reference
notification procedure also required the operator of the storm water discharge associated with industrial activity to determine that: The discharge is composed entirely of storm water, the discharge does not contain hazardous substances in excess of reporting quantities; and the facility is in compliance with applicable provisions of the NPDES permit issued to the municipality for storm water.	
EPA also expressed its belief, based upon an analysis of ordinance controlling construction site runoff in places in certain cities, that municipalities generally possessed legal authority sufficient to control contributions of industrial storm water pollutants to their separate storm sewers to the degree necessary to implement the proposed rule.	Federal Register, Vol. 55, No. 222 pag. 47998
Based on consideration of the comments received on the notice, EPA has decided that it is appropriate to revise the approach in its proposed rule to require direct permit coverage for all storm water discharges associated with industrial activity, including those that discharge through municipal separate storm sewers.	Federal Register, Vol. 55, No. 222 pag. 47998
In response to all of these concerns, EPA has decided to require storm water discharges associated with industrial activity which discharge through municipal separate storm sewers to obtain separate individual or general NPDES permits.	Federal Register, Vol. 55, No. 222 pag. 48000
Although today's rule will require industrial discharges through municipal storm sewers to be covered by a separate permit, EPA still believes that municipal operators of large and medium municipal systems have an important role in source identification and the development of pollutant controls for industries that discharge storm water through municipal separate storm sewer systems is appropriate.	Federal Register, Vol. 55, No. 222 pag. 48000
Under the CWA, large and medium municipalities are responsible for reducing pollutants in discharges from municipal separate storm sewers to the maximum extent practicable. Because storm water from industrial facilities may be a major contributor of pollutants to municipal separate storm sewer systems, municipalities are obligated to develop controls for storm water discharges associated with industrial activity through their system in their storm water management program.	Federal Register, Vol. 55, No. 222 pag. 48000
The CWA provides that permits for municipal separate storm sewers shall require municipalities to reduce pollutants to the maximum extent practicable. Permits issued to municipalities for discharges from municipal separate storm sewers will reflect terms, specified controls, and programs that achieve that goal.	Federal Register, Vol. 55, No. 222 pag. 48000
As with all NPDES permits, responsibility and liability is determined by the discharger's compliance with the terms of the permit. A municipality's responsibility for industrial storm water discharged through their system is governed by the terms of the permit issued. If an industrial source discharges storm water through a municipal separate storm sewer in violation of requirements incorporated into a permit for the industrial facility's discharge, that industrial operator of the discharge may be subject to an enforcement action instituted by the Director of the NPDES program.	Federal Register, Vol. 55, No. 222 pag. 48000
Today's rule also requires operators of storm water discharges associated with industrial activity through large and medium municipal	Federal Register, Vol. 55, No. 222 pag. 48000

Requirement	Reference
systems to provide municipal entities of the name, location, and type of facility that is discharging to the municipal system. This information will provide municipalities with a base of information from which management plans can be devised and implemented. This requirement is in addition to any requirements contained in the industrial facility's permit. As in the proposal, the notification process will assist cities in development of their industrial control programs.	
EPA intends for the NPDES program, through requirements in permits for storm water discharges associated with industrial activity, to work in concert with municipalities in the industrial component of their storm water management program efforts. EPA believes that permitting of municipal storm sewer systems and the industrial discharges through them will act in a complementary manner to fully control the pollutants in those sewer systems.	Federal Register, Vol. 55, No. 222 pag. 48000
This will fully implement the intent of Congress to control industrial as well as large and medium municipal storm water discharges as expeditiously and effectively as possible. This approach will also address the concerns of municipalities that they lack sufficient authority and resources to control all industrial contributions to their storm sewers and will be liable for discharges outside of their control.	Federal Register, Vol. 55, No. 222 pag. 48000-01
In addition, municipal applicants will provide a description of a proposed management program to reduce, to the maximum extent practicable, pollutants from storm water discharges associated with industrial activity which discharge to the municipal system.	Federal Register, Vol. 55, No. 222 pag. 48001

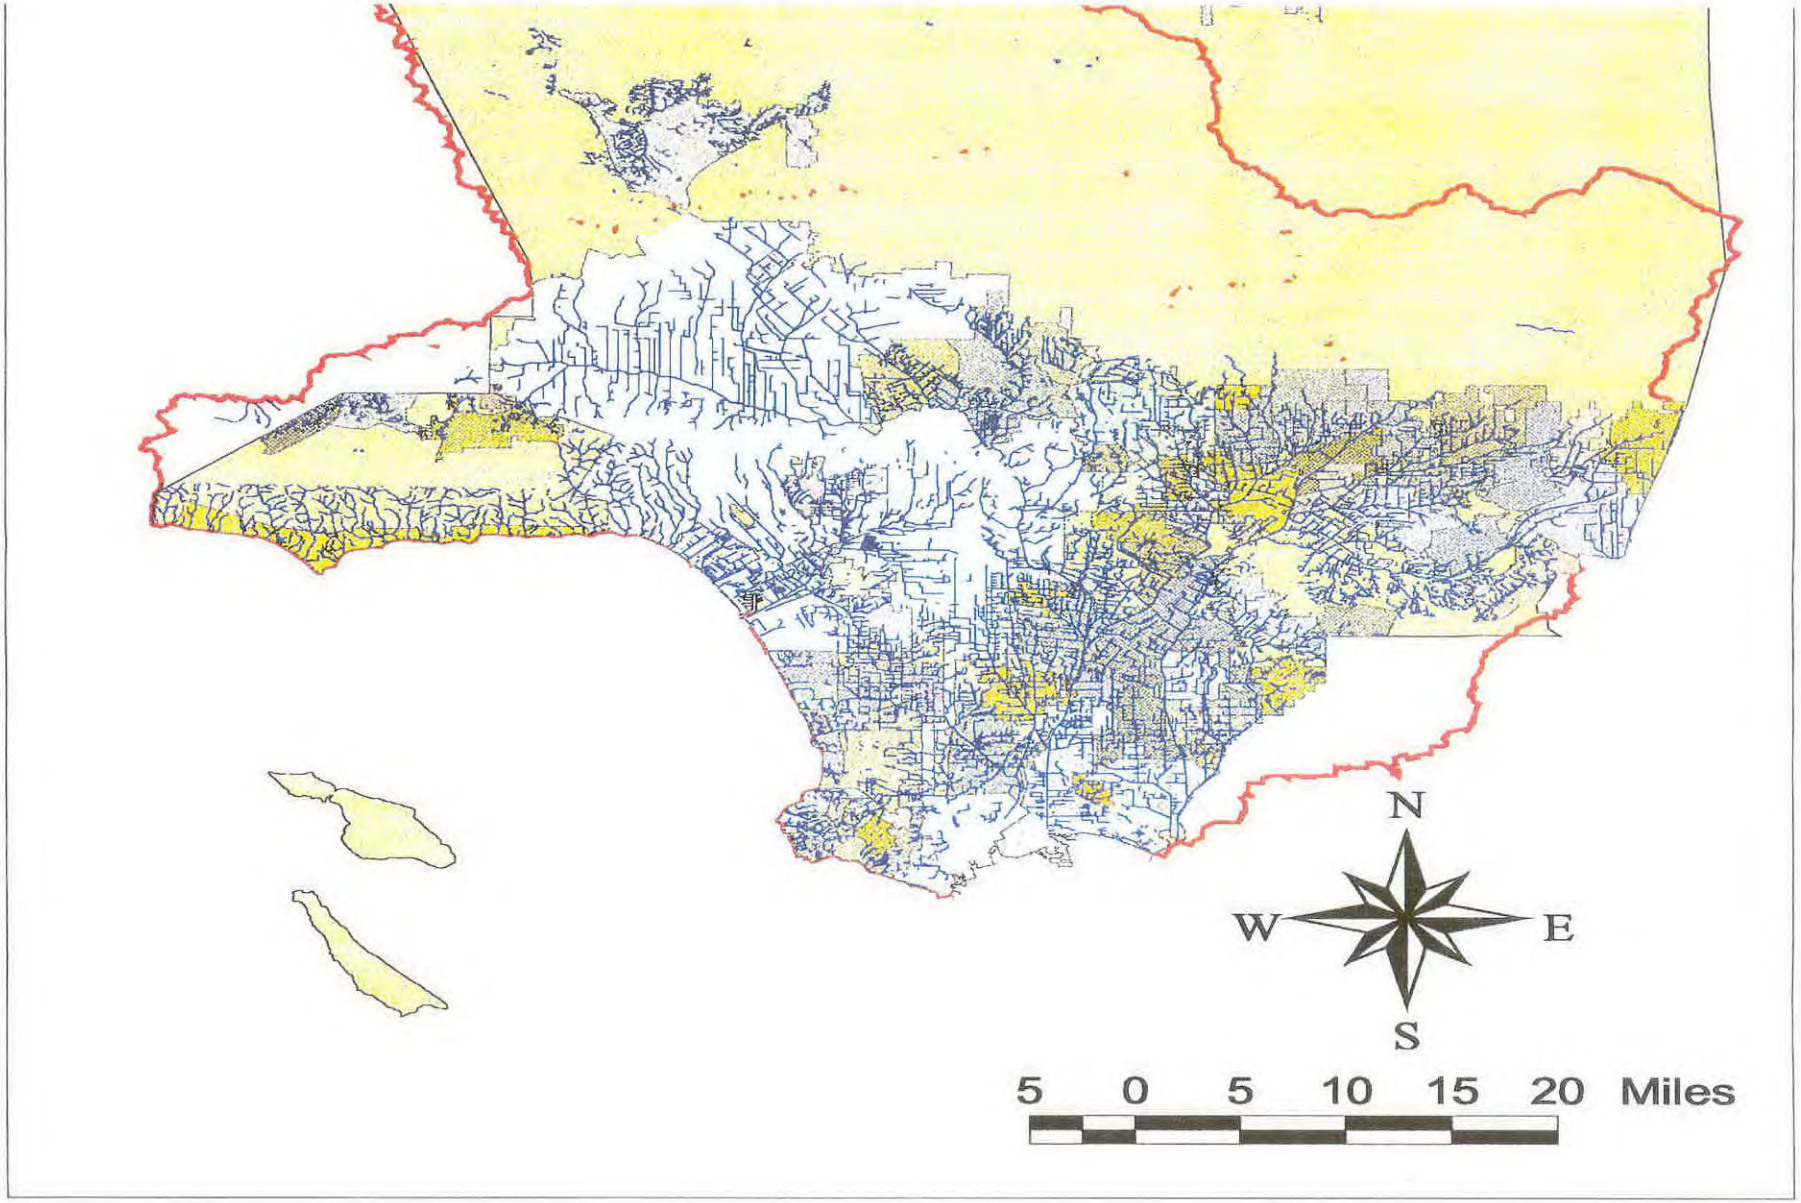
Proposed Renewal of the



County of Los Angeles "Municipal Separate Storm Sewer System" (MS4) Permit

Regional Water Quality Control Board
Los Angeles Region
December 13, 2001

Proposed Action

- Adopt a renewed storm water permit after considering:
  - Staff Report and Legal Analysis
  - Comments from Permittees, the public, and other regulatory agencies.

R0007634

COUNTY MAINTAINED STORM DRAINS

R0007635

Permit History

- 1990: First permit (Order 90-079) issued.
  - Issued prior to finalization of US EPA Regulations.
  - Required Permittees to develop storm water ordinances, 13 BMPs, and initiate monitoring.
- 1996: Second (existing) permit (Order 96-054) issued.
  - Public/residential education - strong outreach program.
  - Industrial/commercial facilities - required "site educational visits" only.

Permit History (continued)

- 1999: City of Long Beach separated from the County-wide permit, when Regional Board issues a separate permit to Long Beach.
- 2000: Regional Board adopts "SUSMPs;" State Board largely upholds SUSMPs in a petition from 33 Permittees and other parties. Not upheld:
  - retail gasoline outlets (RGOs)
  - environmentally sensitive areas (ESAs)
  - ministerial projects

Renewal Process

- February 1, 2001: Permittees filed a Report of Waste Discharge.
- 3 drafts
  - » April 13th
  - » June 29th
  - » October 13th
- Outreach
  - 2 workshops
  - 2 US EPA-facilitated sessions on inspections.
  - Countless meetings, telephone calls, and emails.

Renewal Process (continued)

- Responded to numerous oral and written comments.
  - Change Sheet, dated December 4, 2001
- Late comments
  - Change Sheet, dated December 10, 2001
  - Change Sheet, dated December 12, 2001

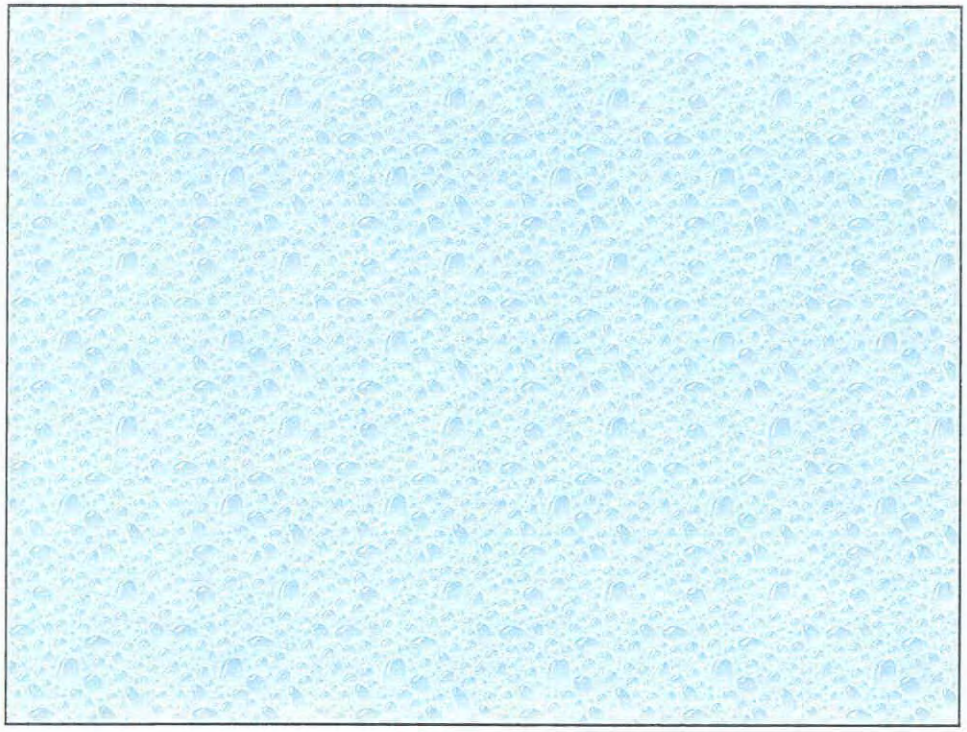
Existing Permit (96-054) Accomplishments

- Public awareness has increased.
- Watershed-based monitoring initiated.
- Industrial and selected commercial facilities have been educated.

Permit Strategy

Add performance measures to the Storm Water Quality Management Plan (SQMP)

- to control industrial/commercial facilities: upgrade site education visits to inspections.
- to eliminate illicit connections/discharges: upgraded to match Long Beach requirements.
- to increase field presence on construction sites (threshold for inspections lowered to 1 acre).



R0007638

Permit Strategy (continued)

- for Development Planning - expand scope of SUSMPs to apply to retail gasoline outlets (RGOs), Environmentally Sensitive Areas (ESAs), and ministerial projects.
- for TMDLs: automatically add allocations to permit, upon adoption of TMDL, without reopening.
- Enforcement: Eliminated a "Notice to Meet and Confer" before issuing a violation.

Objectives

- Non-storm water (i.e. dry weather) discharges to the storm drain: **prohibit.**
- Storm water: more effectively reduce pollutants, through source reduction and/or treatment.
- Based on monitoring results in receiving waters, upgrade BMPs through an "iterative" process.

Receiving Water Limitations

- **Standard for Compliance**
  - Require controls to reduce the discharge of pollutants to the maximum extent practicable
  - Shall not cause or contribute to violation of WQ standards and objectives
  - Shall not cause or contribute to a condition of nuisance
    - » CWA Section 402(p)(3)(B)(iii)
    - » CWA Section 301(b)(1) (c)
    - » CWC Section 13263 (a)
    - » *Defenders of Wildlife v Browner* (9th Cir. 1999)
    - » State Board Order 2000-15, *In Re*: BIA and WSPA (Nov. 15, 2001)
    - » Memo from Office of Chief Counsel dated Oct. 14, 1999.
    - » Memo from USEPA General Counsel dated Jan. 9, 1991

Public Information and Participation Program (PIPP)

- **Improves Current Program**
  - Increased coordination among Permittees
  - Pollutant-specific outreach
  - Principal Permittee to convene an advisory committee at least annually to receive input on PIPP implementation progress
  - Corporate Outreach Program to educate environmental managers of gas stations and restaurant chains
  - Encourages a voluntary Business Assistance Program to provide technical, non-enforcement assistance to small businesses

Development Planning Program

- **Regulatory Requirement**
  - implement and enforce controls for new development / significant redevelopment [40CFR 122.26 (d)(2)(iv)(A)(2)]
  - Develop peak discharge control criteria to prevent downstream erosion and protect habitat
  - Criteria applied to:
    - all developments meeting categories and thresholds
    - projects in environmentally sensitive areas
    - gas stations where size & traffic threshold exceeded
  - Criteria not applied to:
    - hillside homes less than 1 acre
    - routine maintenance activities

Development Planning Program

Industrial/ Commercial development threshold lowered [to 1 acre in 2003]

- Redevelopment definition clarified to cover replacement of building foot-print
- General Plan update [requires notice to Regional Board]
- Water Quality Flow criteria added for flow based BMP design
- Technical Guidance for Development Community

Development Planning Program

- **State Board SUSMP Decision (Order WQ 2000-11)**
  - Numerical design criteria appropriately identified
  - Categories identified are appropriate: commercial/ industrial development, housing development, restaurants, parking lots, automotive service facilities, and gas stations
  - Applicability to (i) ministerial projects and (ii) projects in environmentally sensitive areas set aside until supporting findings and justification are developed at permit reissuance
  - Applicability of numerical design criteria to gas stations set aside until thresholds and proper justification are developed
  - Encourages regional solutions
  - Endorses mitigation banking

Development Planning Program

- **Responsive Changes to SUSMP Decision**
  - Extends to ministerial projects [Finding B6; Agenda p B 279.]
  - Includes projects in ESAs which exceed thresholds [Agenda p B 333]
  - Establishes thresholds for gas stations (Agenda p B-334) [Findings B.10 and B.11; Agenda p B 281-282]
  - Includes provision for Regional Solutions [Agenda p B 336]
  - Encourages a mitigation banking framework [Agenda p B 337]

Development Construction Program

- **Regulatory Requirement**
  - Implement and maintain structural and non-structural BMPs to reduce pollutants in storm water runoff from construction sites [40CFR 122.26 (d)(2)(iv)(D)
- **All sites [regardless of size]**
  - Manage construction waste
  - Eliminate non-storm water discharges
  - Control Sediment
  - Minimize erosion
  - Limit grading during wet season

Development Construction Program

- **For sites 1 to 5 acres**
  - Require local SWPPP to ensure compliance with local ordinances and inspect to verify
  - Proof of coverage under the State General construction storm water permit and pollution prevention plan has been prepared [effective March 2003 per USEPA Phase II regulations, 64 *Fed. Reg.* 68722]
  - Keep record of grading permits issued

Development Construction Program

- **For sites 5 acres and greater:**
  - Require local SWPPP to ensure compliance with local ordinances and inspect to verify
  - Proof of coverage under the State General construction storm water permit and pollution prevention plan has been prepared
  - Keep record of grading permits issued

Public Agency Program

- **Regulatory Requirement**
  - Implement practices for operating and maintaining public streets, roads and highways to reduce impacts on receiving waters of discharges from the MS4 [40CFR 122.26 (d)(2)(iv)(A)(3)]
  - Implement procedures to assure that flood management projects assess impacts on water quality.... [40CFR 122.26 (d)(2)(iv)(A)(4)]
  - Implement a program to reduce pollutants in discharge from the MS4 associated with the application of pesticides, herbicide and fertilizer [40CFR 122.26 (d)(2)(iv)(A)(6)]

Public Agency Program

Continue current program with improvements:

- Site specific SWPPPs at maintenance/ repair facilities;
- Additional measures to control trash/ debris at special events;
- Prioritize catch-basins for clean-out on accumulation patterns
- BMPs for public development planning/ construction made equivalent to private development planning/ construction
- Protocol for pesticide application and storage;

Illicit Connections and Illicit Discharges (IC/ID)

- **Regulatory Requirement**
  - Implement a program, including a schedule, to detect and remove illicit discharges and improper disposal to the MS4 [40CFR 122.26 (d)(2)(iv)(A)(4)]
  - Conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated [40CFR 122.26 (d)(2)(iv)(B)(2)]
- **Move to an active program to eliminate illicit connections and illicit discharges**
  - Maintain a listing of permitted connections
  - Map illicit connections and illicit discharges
  - Screen for illicit connections and illicit discharges based on 1-5 year schedule

Storm Water Monitoring Program

- **Objectives:**
  - Assess permit compliance
  - Measure and improve SQMP effectiveness
  - Assess chemical, physical, and biological impacts of receiving waters from urban runoff
  - Characterize storm water discharges
  - Identify sources of pollutants
  - Assess overall health and long-term trends in receiving water quality
  - Provide information for TMDL development

Storm Water Monitoring Program

- **Enhanced Program**
  - Two new mass emission stations (Santa Clara River and Dominguez Channel)
  - Improved toxicity monitoring at mass emission stations
  - Tributary Monitoring
  - Shoreline Bacterial Pathogen Monitoring
  - Trash Monitoring (for TMDL Watersheds)
  - Sediment sampling in estuaries
  - Bioassessment
  - Peak Discharge Control Study
  - New Development Impact Study
  - BMP Effectiveness Study

Reporting Program

- **Improved Reporting**
  - Model Reporting Format (Attachment U-4)
  - Annual assessment of Storm Water Quality Management Program (SQMP) effectiveness on a watershed basis
  - Relate Monitoring Results to Storm Water Quality Management Program
  - Receiving Water Limitations Compliance Report - every other year once exceedances identified by Permittee or determined by Executive Officer

Tentative Permit

- **Changes from the 1996 Permit**
  - Includes State Board's Receiving Water Limitations
  - Includes provisions to enforce TMDLs without reopener
  - Eliminates the Notice of Intent to Meet and Confer provision
  - Requires inspection of industrial/ commercial facilities
  - Lowers the threshold for construction from 2 to I acre

Tentative Permit

- **Changes from the 1996 Permit**
  - Incorporates and extends new development (SUSMP) requirements
  - Requires a pro-active Illicit connection/ illicit discharges elimination program
  - Includes specific requirements for catch-basin cleaning and street sweeping to control trash.
  - Requires evaluation to reduce toxicity based on monitoring results

Edited Tentative

- **Findings**
  - Additional References [B278-292]
  - Relocation
- **Receiving Water Limitations**
  - Compliance Report submittal requested [B-294]
- **Storm Water Quality Management Plan**
  - Budget breakdown estimations accepted [B-297]
- **Public Information and Participation**
  - RB Executive Officer approval eliminated [B-301]

Edited Tentative

- **Industrial/ Commercial Inspection**
  - Version A/C included from USEPA facilitation [B324-330]
- **Development Planning**
  - For gas stations BMPs which endanger health & safety not appropriate [B-334]
- **Development Construction**
  - Referral terms for projects 5 acres or greater to Regional Board is clarified [B-341]

Edited Tentative

- **Public Agency Activities [cont'd]**
  - Requirements for new and existing facilities clearly distinguished [B-343]
  - Requirements for trash TMDL municipalities and non TMDL municipalities clearly distinguished. [B-345]
  - Street sweeping limited to curbed streets [B-347]

Edited Tentative - Definitions

- "Automotive Service" clarified to exclude facilities without outside exposure to storm water [B-351]
- "Construction"; "Development" and, Redevelopment" clarified to exclude routine maintenance activities [B-352, 357]
- "Inspection" clarified to include curb-side for restaurants [B-354]
- "Potable Water Distribution Systems Releases" clarified to exclude well-head waste water discharges
- "Screening" definition included

Edited Tentative

- **Monitoring**
  - Water column toxicity testing clarified [B-377]
  - Trash Monitoring limited to trash TMDL municipalities [B-382]

Edited Tentative - Timelines

- Local SQMP development extended from permit effective date to 6 months
- Peak flow control criteria implementation extended from 540 days to 3 years
- Implementation of SUSMP changes extended by 1 month
- Amendments to SUSMP codes/ ordinance provided 6 months
- Trash receptacles implementation extended from effective date to 6 months
- Treatment feasibility study extended by one year
- Industrial/ commercial inspections changed from once in 24 months to once in 30 months.

Inspection Program

Inspections

- Current permit (1996)
- Emphasis on education*
  - outreach materials
  - site visits, once every 24 months
    - Phase 1 facilities (designated heavy industrial sectors)
    - Automotive Service Facilities
    - Gas Stations
    - Restaurants

*Envisioned as an interim step, in response to Permittees' concerns about a more proactive approach.

Inspections

- Current permit (1996)
- Emphasis on education*
  - outreach materials
  - site visits, once every 24 months
    - Phase 1 facilities (designated heavy industrial sectors)
    - Automotive Service Facilities
    - Gas Stations
    - Restaurants

*Envisioned as an interim step, in response to Permittees' concerns about a more proactive approach.

Why Inspections are Appropriate

- The Permittees
  - identified critical source sites that contribute disproportionately to storm water pollution
- The NPDES Permit
  - envisions a partnership between the Regional Board and Permittees to advance the cause of pollution reduction
- Education Only Not Enough
  - education-only visits are simply not enough for all sites - inspections do make a difference
- Critical Source
  - many critical sources categorized by the Permittees are not inspected by Regional Board staff

Inspections - Options

- Three versions - *tentative draft*
  - Version A - modest inspection program
  - Version B - More comprehensive inspection program
  - Version C - The current "site education" program
- Mediation Outcome - Version A/C
  - Modified Version "B" reflecting comments of Permittees
  - Not "endorsed" by Permittees
  - Is a better version
  - Within the scope of an insignificant change

Inspection Universe

- Federally mandated facilities
  (40CFR 122.26(d)(2)(iv)(C) - Permittees are lead
- Phase 1 (2,600) - Regional Board is lead
- Critical Sources
  - Restaurants (20,000) - Local Health Depts are lead
  - Auto service (6,000) - Permittees are lead
  - Gas Stations (1,700) - Permittees are lead

Inspection Scope

- Frequency of inspections
  - Restaurants
    - twice in five years
  - Auto Service facilities
    - twice in five years
  - Retail Gas Outlets and Auto Dealers
    - twice in five years

Inspection Scope

- Level or intensity of inspections
  - Restaurants
    - Confirms BMPs being used via a checklist
  - Auto Service facilities
    - Confirms BMPs being used via a checklist
  - Retail Gas Outlets and Auto Dealers
    - Confirms BMPs being used via a checklist

Inspection Scope

- Frequency of inspections
  - Phase 1 Facilities (GIASPermittees and selected critical sources)
    - Tier 1 twice/five years
    - Tier 2 twice/five years, but
      - no additional inspections if no risk of exposure
      - once every five years if 20% of all Tier 2 facilities are inspected in any given year
  - Federally Mandated Facilities - twice/five years
- Facilities inspected by Regional Board staff are not required to be re-inspected by Permittees

Inspection Scope

- Level or intensity of inspections
  - Phase 1 Facilities (GIASPermittees)
    - Confirm NOI submitted and SWPPP in place, and confirm BMPs being used
  - Federally Mandated Facilities
    - Confirm NOI submitted and SWPPP in place, and confirm BMPs being used

Other Provisions

- Commitment to pursue progressive enforcement
  - Regional Board staff will take on difficult cases if there has been a "good faith" effort to obtain compliance
    - after two inspections and warning letters
    - more quickly for Phase 1 facilities
- Requires timely follow-up to complaints
- Requires support of Regional Board enforcement efforts
- Establishes a storm water enforcement task force

Inspections - Summary

- More aggressive approach needed to effect behavioral changes on the part of business, and to better protect water quality.
- Inspections need to address BMPs to prevent pollution - not just wait for an illicit discharge.
- Incremental workload between educational site visits and new inspection program should be minimal
- Shared responsibility for inspections will optimize scarce state and local resources, toward a better State and local partnership.

Conclusion

- Staff has responded to Board direction given in July 2001.
- Permit conforms to "floor" in the Long Beach permit.
- Permit is incrementally improved by adding requirements to inspect industrial and commercial sites, and to include storm water considerations in design of new and redeveoped projects, including RGOs, ESAs, and ministerial projects.
- Staff has diligently reached out to Permittees and stakeholders.

Recommendation

- Adopt the tentative permit with Option A/C for inspections.

Legal Comments

- Michael Lauffer, Staff Counsel

Costs may be Inflated.

- CalTrans estimate of $54 billion for capital improvements includes:
  - $6 billion in land acquisition costs (14,000 acres @ $435,000/acres)
- Permittees' estimates of $150 million/year
  - IC/ID analysis - costs per City ranged from $0 to $4.2 million
  - $114,000 average ($32,500 adjusted average)

Investment Needed to Support Economy

- $350 billion "Gross Metropolitan Product"
- $150 million / $350 billion = 0.0004

ADDITIONAL MATERIALS TO BE INCLUDED IN THE AGENDA PACKAGE

California Regional Water Quality Control Board, Los Angeles Region
448th Regularly-scheduled Meeting of December 3, 2001 (Los Angeles)

Item 10 (revised on December 10, 2001, as indicated by underlines and strikeouts)

Subject Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges, within the County of Los Angeles and the incorporated cities therein except for the City of Long Beach (hereafter referred to as the "municipal storm water permit" or "permit").

Purpose To conduct a public hearing on the proposed Municipal Separate Storm Sewer System (MS4) permit for Los Angeles County and incorporated cities therein except the City of Long Beach. The Regional Board at the meeting will consider adoption of the permit after receiving comment from Permittees, interested parties, and the public.

At a workshop on July 26, 2001, the Regional Board commented that the second draft permit was rather complete. Staff was asked to review the appropriateness of ambiguous terms in the second draft permit (such as "potential contribution"; "minimize"; "maximize", and "measurably") to ensure that permit requirements are enforceable, and issue a third draft in October for consideration at the November 29 Board Meeting. The tentative draft permit has been appropriately revised to be consistent with Regional Board direction. The Regional Board directed as follows:

- Ensure that the proposed permit requirements are at least as stringent as the Long Beach MS4 and Ventura County MS4 permits. Include specific language on trash Total Maximum Daily Loads (TMDLs) similar to the one in the Long Beach MS4 permit. Develop a strategy to get to compliance with water quality standards.

- Ensure that Best Management Practices (BMPs) being implemented are targeted to controlling particular pollutants of concern. Consider requiring permittees to enforce the Illicit Connection/ Illicit Discharges Elimination (ICID) programs with fines for illicit discharges and connections. Include an inspection program for gas stations in addition to outreach. Regional Board staff should upgrade their activities to monitor compliance and enforce implementation of the MS4 permit

R0007662

- Review the draft permit requirements for conflicts with other state and federal regulations such as air pollution [water and chemical stabilizers for dust control] fire code, health and safety etc.

- Provide justification for the development thresholds for projects in environmentally sensitive areas [2,500 sq. feet of impervious surface. Review the requirement to map MS4 discharge points relative to the cost of setting up such a system.

- Review the suggestions by the Santa Monica Bay Restoration Project (SMBRP) on monitoring and reporting for inclusion.

- Identify a contact person on Regional Board staff to provide and assist in information on funding sources. Convene an advisory committee on the public information and participation program before the November public hearing.

Background

The storm drain system regulated by the Board is principally owned and operated by the Los Angeles County Flood Control District (Principal Permittee). This system drains the coastal slopes of the Transverse Ranges, moving storm flows as well as a significant amount of dry weather runoff into the Santa Monica Bay and the Los Angeles/Long Beach Harbor.[1] It is one of the largest storm drain systems in the nation, when measured in terms of both aerial extent as well as differences in vertical elevations.

The storm drain system is also one of the most complex to operate, when considering that it encompasses 87 municipalities. Although principally owned and operated by the Principal Permittee, this system collects runoff from 87 municipalities, which, except for the City of Long Beach, are all Co-Permittees. These Co-Permittees have varying degrees of responsibility for development and maintenance of their portions of the overall system. The Permittees' physical assets that comprise the infrastructure of the system include over 100,000 catch basins, about 4,300 miles of underground storm drains, and about 500 miles of open channels. The City of Los Angeles alone accounts for 220 miles of open channel, 1,900 miles of storm drain pipe, and 62,660 catch basins. An exact summary of these physical assets in the system is not

[1] The Los Angeles County Flood Control District also operates a storm drain system on the inland side of the Transverse Ranges; this system falls under the jurisdiction of the Lahontan Regional Board.

possible, as the Permittees do not have a comprehensive map or database that can accurately show the location, extent, and ownership of all underground drains and catch basins – which is an illustration of difficulties arising from the complex ownership structure of the storm drain assets.

Regulatory History

1990: The Regional Board adopted the first municipal storm water permit for the County in 1990, Order No. 90-079, which required Permittees to develop storm water/ urban runoff ordinances and implement BMPs – in particular, a minimum of 13 BMPs such as public education, street sweeping and construction site controls.

1996: After 18 months of effort to renew the 1990 permit, the Board adopted Order No. 96-054 (i.e. the existing permit – see attachment 10.E). Key elements of this permit were requirements that Permittees develop and implement model programs for Public Information and Participation, Industrial/Commercial Activities, Development Construction, Illicit Connections and Illicit Discharges Elimination, Public Agency Activities, and Development Planning. The permit does not include a requirement for inspections as part of an industrial/commercial control program; rather, after significant debate, the Board included a requirement that Permittees conduct site visits of industrial facilities in their jurisdictions. This was intended as an interim step, to give Permittees a 5-year period to educate businesses before requiring a stronger industrial/commercial control program.

1999: Following a settlement of the litigation brought by the City of Long Beach on Board Order No. 96-054, the Board adopted Order No. 99-060 with separate requirements for the City of Long Beach. The Regional Board Executive Officer during 1998 and 1999 approved countywide model programs for ICID, Development Construction, and Public Agency Activities after making revisions.

2000: The Permittees' proposed model program for Development Planning was vigorously debated in public workshops in 1999 and 2000, culminating in the Board's adoption of Order 00-02, specifying design criteria for a Standard Urban Storm Water Mitigation Plan (SUSMP). In response to a petition of the Board's action by 33 of the Permittees and other interested parties, the State Water Resources Control Board (State Board) affirmed in large part the Regional Board action (See State Board Order WQ 2000-11, attachment 10.F.1).

R0007664

2001: On January 31, 2001, the Permittees submitted a renewal application for the permit, which expired on July 30, 2001.[2] Since then, staff, the Permittees, and Heal the Bay (on monitoring issues) have devoted significant time to exchanging information and reviewing drafts of the proposed permit, which will enter a third term since the initial permit was adopted in 1990. Staff conducted a staff workshop on April 24, 2001 after the first draft was issued. After the second draft was issued, staff conduct a workshop before the Regional Board on July 26, 2001. In addition, staff, on November 9, 2001, participated with some of the Permittees in a USEPA led workshop session to review inspection requirements after the tentative permit was issued.

Compliance Status

Staff took very few actions to enforce the permit between 1996 and 2000, as lack of staff resources prevented rigorous oversight of Permittees' compliance status. Had staff resources been adequate for systematic compliance checks of all Permittees, many more enforcement actions most likely would have needed to be taken. The few enforcement actions that were taken were generally in response to complaints, and included 5 Notices of Violation (NOVs) issued to the:

- City of Culver City (February 1998), for failure to maintain erosion and sediment controls at one of its construction sites, which resulted in a discharge of mud into Ballona Creek. The City ultimately implemented sediment controls, but only after repeated discussions with Regional Board staff and the City's consultant.

- Cities of Pomona and Lynwood, for failure to submit Annual Reports for 1996/97 by the due date of October 15, 1997. The City of Lynwood submitted its delinquent Annual Report after receiving the NOV. The City of Pomona did not submit its Annual Program Report until the Executive Officer issued an Administrative Civil Liability (ACL) in the amount of $6,700, which the City promptly paid.

- City of Alhambra, for a discharge of muddy water to the storm drain from a pipeline repair (1998). The City complied after receiving this NOV.

- City of Monterey Park, for failure to protect slopes from erosion at a city construction site on Ramona Boulevard (1999). The

[2] Order No. 96-054 continues to be in effect until the Regional Board acts to reissue the permit (40 CFR § 122.6 (d)).

City of Monterey Park ultimately complied but only after repeated discussions with City staff.

In July 2001, staff completed a review of the 1999/00 Annual Program Report, and issued 11 NOVs for failure to implement various programs, including, among others, requirements to: modify planning procedures (such as a CEQA checklist) to integrate storm water considerations; and require pollution prevention plans at construction sites between 2 and 5 acres. The 11 NOVs were issued to each of the Cities of: Azusa, Cerritos, Huntington Park, Inglewood, Malibu, Maywood, Monrovia, Rolling Hills Estates, San Gabriel, South Pasadena, and Vernon. Many of these Permittees have vehemently objected to these NOVs, have submitted documentation of their objections, and demanded that the Regional Board Executive Officer invoke a "Notice to Meet and Confer" provision, as set forth in the existing permit (see also a discussion on this provision on page 8 of this Item). Regional Board staff has held the matter in abeyance, pending a review of the documentation submitted to date.

In March 2001, staff issued NOVs to each of the Cities of Los Angeles and Covina for discharges of sediment to the storm drain.

Staff are currently reviewing the 2000/2001 Annual Program Report which was submitted on October 22, 2001. A preliminary review of the Development Construction compliance reporting summarized in Table 1 indicates apparent implementation deficiencies, reporting inconsistencies, and possible violations of Board Order No. 96-054 among Permittees. For example, seventy-four municipalities reported that less than 5 percent of construction project approvals were being reviewed for storm water controls. Three municipalities did not report at all. Several municipalities reported that zero percent of projects were reviewed or inspected for construction controls because they were either considered exempt or were non-priority. On the other hand, other municipalities reported that 100 percent of projects were reviewed because all were considered priority.

Permit Objectives

Staff proposes consideration of a tentative permit that implements regulations and guidance from USEPA, State Board, and Regional Board. Specific objectives for the third-term renewal are to:

- more effectively prohibit non-storm water (dry weather) discharges to the storm drain system, through elimination of illicit connections and unauthorized discharges;

R0007666

- more effectively reduce the discharge of pollutants in storm water; and
- require that Permittees implement additional control measures that the Board may determine are necessary for TMDLs that staff anticipates over the next five years.

Permit Approach

To meet these objectives, staff has structured the tentative permit with several improvements over the existing permit, as outlined below:

1. **Findings:** Strengthened, to elaborate upon the technical and legal basis for the permit requirements. Included in these Findings are references to technical analyses staff conducted regarding regulation of retail gasoline outlets (RGOs); see Findings ~~C.5 and C.6.~~ B.10. and B.11.
2. **Receiving Water Limitations** (Part 2, page ~~18~~ 17): Clarifies that discharges must meet water quality objectives, including that they must not cause nuisance (in addition to the statutory requirement to reduce the discharge of pollutants to the maximum extent practicable). Additionally, staff have added a requirement to implement load allocations approved by the Board in a TMDL, without reopening the permit.
3. **Storm Water Quality Management Plan** (SQMP): Adds specific performance measures to measure progress on the various elements of the SQMP. Furthermore, the following significant requirements have been added to the Permittees' SQMP:
   - **Industrial/Commercial Inspections** (Part 4, Section C – see discussion under critical issues on page A-10), ~~pages 33B-39B): Option B (staff's recommended option) specifies that Permittees must expand a site visit program to also include inspections of facilities in specified industrial and commercial sectors. These sectors were selected based on the results of a risk-based prioritization performed by the County of Los Angeles Department of Public Works (LACDPW) in 1996 and critical sources monitoring conducted between 1997 and 2000.~~
   - **Development Planning** (Part 4, Section D, pages 36 – 44 ~~40-48~~): Lowers the threshold of industrial/commercial development that is subject to Standard Urban Storm Water Mitigation Plan (SUSMP) requirements from 100,000 square feet to one acre (consistent with USEPA Phase II regulations), beginning in 2003; and expands SUSMPs to cover:

- environmentally sensitive areas
- ministerial as well as discretionary projects.

Also, Permittees will need to ensure that design of RGOs comply with the SUSMP numerical design standards to capture and/or treat the first ¾ inches of precipitation (or equivalent runoff volume or flow). This design standard applies to new or redeveloped RGOs that exceed a threshold of 5,000 square feet of impervious surface area and projected Average Daily Traffic (ADT) of 100 vehicles. For derivation of this threshold, see Technical Reports [Attachment 10.B-2].

- **Development Construction** (Part 4, Section E, pages 44-47 ~~48 to 51~~): Lowers the threshold for a local Storm Water Pollution Prevention Plan (SWPPP) and wet weather inspection program to construction sites one acre and greater in size (currently two acres and greater in the existing permit). Also, requires that construction projects five acres and greater have a local SWPPP to demonstrate compliance with local ordinances. The local SWPPP may substitute for the State SWPPP required under the State's General Construction Activities Storm Water Permit if the local SWPPP is at least as inclusive in BMPs and construction controls.

- **Public Agency Activities** (Part 4, Section F, pages 47-54 ~~52 to 59~~): Includes explicit requirements to control the discharge of trash to the MS4. It explicitly requires municipal departments to comply with the same development planning and development construction standards that municipalities impose on private development.

- **Illicit Connections and Discharges** (Part 4, Section G, pages 54-56 ~~60 to 62~~): Requires the Principal Permittee to take more responsibility for tracking illicit discharges and connections, and upgrades passive field screening activities (during regularly scheduled maintenance) to a proactive field screening program.

4. **Monitoring (Attachment T):** Adds mass emissions monitoring on the Santa Clara River and Dominguez Channel, and requirements to conduct a biomonitoring assessment with a minimum of 20 stations. Reduces the suite of monitoring

R0007668

parameters that are not conventional and not priority pollutants. Enhances toxicity testing. Facilitates participation in regional research and special studies.

5. **Reporting: (Attachment U):** Includes a standard reporting form to elicit information on implementation and status of progress for the various requirements in the permit.

6. **Enforcement:** Deletes the Notice to Meet and Confer provision in the existing permit, and instead relies upon the State's policy of progressive enforcement.

Permittees have not provided specific estimates of additional costs that they might be incurred by the requirements highlighted above. The Los Angeles Economic Council cites a Caltrans report that the cost of compliance may exceed $50 billion. Permittees have provided estimates of their 2000/01 and 2001/2002 budget allocations for storm water programs. These amounts aggregate to $142 million and $145 million respectively, and are reproduced in the tables 3 and 4 [3] on pages ~~22-28~~ A 25- A 30.

Critical Issues

Since receiving the application for renewal, on January 31, 2001, staff have dedicated significant time and effort to involving the public in the renewal process, and have been responsive to public comment. However, some critical issues have not been resolved to the satisfaction of all parties and are before the Regional Board, as summarized below.

Enforcement: ***Should the new permit contain a safe harbor clause (i.e. a "Notice to Meet and Confer")?***

During the 18-month renewal effort from 1995 to 1996, the Regional Board approved a "Notice to Meet and Confer" (NTMC) provision (existing permit, Part 2, section G). Many of the Permittees strongly advocated for this provision, which they envisioned as an important administrative review process for resolving permit disputes before the Board could take formal enforcement action. It was actually used only once, in 2000, when the Regional Board issued NTMC letters in order to obtain information on permittees' efforts to abate trash in the Los Angeles River and Ballona Creek watersheds. As mentioned above, several Permittees want to invoke the NTMC as an interim step to any penalties the Board might issue for the 1999/00 Annual Program Report violations.

[3] The amounts in the tables 3 and 4 (pages A 25-A30) are self-reported. As permittees may not have compiled their expenditures in a consistent manner, the amounts should be regarded as rough estimates.

Subsequent to renewal of the existing permit, the State developed an enforcement policy (State Board Resolution 96-030) and guidance, which sets forth a progressive strategy that has the goal of ensuring consistent, predicable, and fair enforcement of regulations. This is now a well-established and widely implemented policy throughout the State, and has been successfully implemented in Los Angeles Region. Therefore, staff submits that the NTMC provision should not be included in the renewed permit.

Receiving Water Limitation: ***In structuring a receiving water limitation, has staff correctly complied with State Board direction?***

Some environmentalists contend that the draft permit should contain numerical effluent limitations to protect water quality standards. Permittees, for the most part, believe that they should not be subject to either numerical or narrative receiving water limits, as their SQMP (Storm Water Quality Management Plan) is designed to reduce pollutants in storm water to the maximum extent practicable.[4]

In Part 2 (page 17 ~~16~~) of the ~~draft~~ tentative permit, staff incorporated narrative receiving water language as directed by the State Board in Order No. 99-05 (Attachment 10B-2). Subsections 2.1 and 2.2 slightly modify the State Board language in that: §§ 2.1 separately states that discharges that cause or contribute to the exceedences of water quality standards are prohibited, and §§ 2.2 separately states the discharges shall not cause a condition of nuisance [such as trash]. Some Permittees contend that these modifications exceed State Board Order No. 99-05. However, a review of language in other recent municipal storm water permits issued by the State Board itself and by other Regional Boards, indicates that the subsection language is substantially similar. The State Board upheld receiving water language, such as it appears in the tentative permit before the Board, ~~affirms this structure of the receiving water limits language~~ in its tentative decision *In Re*: Building Industry Association of San Diego County and Western States Petroleum Association (Order No. WQ 2001-15), ~~scheduled to be~~ adopted on November 15, 2001. See also Regional

[4] Regulations do not define what exactly constitutes the Maximum Extent Practicable (MEP) standard. However, the Office of Chief Counsel has issued a memorandum on the matter (dated February 11, 1993). In general, MEP relies on best management practices that emphasize pollution prevention and source control (i.e. the first line of defense), with additional structural controls as needed (an additional line of defense). Municipalities are required to implement technically feasible BMPs to reduce storm water pollutants unless they can show locational impracticability or that the costs outweigh the water quality benefits to be derived.

R0007670

Counsel's legal memorandum dated November 9, 2001 (Attachment 10.D)

Some Permittees also contend that the draft language is inconsistent with the U.S. Court of Appeals decision in, *Defenders of Wildlife v. Browner* (9th Cir. 1999). This decision held that the Clean Water Act does not require MS4 discharges to strictly comply with water quality standards. However, the decision also found that the permitting authority can compel compliance with water quality standards, as it deemed necessary. As discussed in State Board's Office of Chief Counsel memorandum (Attachment 10.A-1), States can include such provisions under the Clean Water Act. In any case, the memorandum concluded that the 9th Circuit decision did not contradict State Board Order No. 99-05. See also, *In Re*: Building Industry Association of San Diego County and Western States Petroleum Association (Order No. WQ 2001- 15 ~~**~~)

Inspections: ***Should the Regional Board require Permittees to inspect industrial/commercial facilities?***

Yes. The County of Los Angeles is one of the most urbanized areas in the nation. If the Regional Board is to make significant progress toward cleaning up impaired waters, control of conventional and toxic pollutants from industrialized and commercial activities is critical. Indeed, the federal regulations clearly acknowledge the significance of pollutants from heavy industry, and mandate that municipal permittees have source control programs for facilities in specified industrial sectors. The significance of these industrial activities – plus commercial activities such as automotive repair – was underscored in a critical source identification program that the Principal Permittee undertook per a requirement in the existing permit.[5] Accordingly, staff proposes that the Board upgrade the Permittees' industrial control program to specify inspections of facilities in specified sectors at specified intervals.

In Table 4, staff has compared requirements among the existing permit and various options discussed with Permittees during this

[5] Critical Source Selection and Monitoring Report, County of Los Angeles Department of Public Works (September 3, 1996), in which the Principal Permittee identified high risk activities that pollute storm water in the County. Five of these activities – scrap metals, trucking, chemical, primary metal, metal fabricating – are partly regulated by the State's General Industrial Activities Storm Water Permit for Industrial Activities. The other activity – automotive services – is not subject to the State's General Industrial Activities Storm Water Permit or to USEPA Phase 1 regulations. Also, through industrial waste inspections conducted during the first permit term for sanitation departments, several Permittees identified two additional activities – retail gas outlets (RGOs) and restaurants – as high risk for storm water pollution.

renewal process. Under the existing permit, no inspections are required; rather, the Board has allowed the Permittees and industry 10 years (i.e. the first two permit terms) to educate industrial and commercial facilities through "site visits." Various options have evolved as follows:

First draft (April 13, 2001): Staff took a "top-down" approach to inspections, proposing that Permittees screen databases of tens of thousands of industrial and commercial facilities to identify facilities that should be targeted for an inspection program.

Second draft (June 29, 2001): In response to comments submitted on the first draft, staff attempted to better structure a partnership between the Regional Board and Permittees. The Regional Board would lead efforts to regulate "Phase 1" industrial facilities (which are subject to the State's General Industrial Activities Storm Water Permit[6]), and the Permittees lead efforts to regulate other problem sectors, such as automotive service facilities, restaurants, and RGOs.

Third draft (October 11, 2001) Edited Tentative (December 12, 2001): Staff structured an Option A (pages 33A-39A) (pages 29A-35A in Edited Tentative) to encompass inspections of:

- USEPA mandated facilities (i.e. landfills, Resource Conservation and Recovery facilities, and toxics treatment storage disposal facilities "TSDF"),
- the automotive sector,
- restaurants, and
- retail gasoline outlets.

In Regional Board staff's opinion, such a minimal requirement fails to address other critical industrial sources of pollutants. To address this concern and to ensure that pollutants from other critical sources are controlled, staff recommends that the Board adopt Option B (pages 33B-39B) (pages 29-35 in Edited Tentative). This Option B captures sectors in Option A plus five other priority sectors, which are sources of pollutants that match many of the

[6] For select cities, Table 5 lists the number of facilities currently on record as covered under the State's General Industrial Activities Storm Water Permit. For many of the cities (with the exception of the City of Los Angeles) the number of industrial facilities to be inspected is going to be similar if not the same because these facilities predominate in there jurisdiction.

R0007672

causes of impairments to surface waters in Los Angeles County. These five priority sectors:

- scrap recycling,
- automotive dismantling,
- metal fabrication,
- motor freight,
- chemical manufacturing, and
- primary metal products.

Option C (pages 33C-36C) (pages 29C-35C in Edited Tentative) is status quo – it retains the site visit program as required by permits issued by the Regional Board since 1990. It does not recognize what staff believes was the Board's long-term intent to upgrade the site visit program to an inspection-based program.

For a discussion on legal issues related to inspection, please refer to the Regional Counsel's legal brief (Attachment 10.D. at pages 2 and 14).

At the request of certain Permittees, the US EPA facilitated two day-long sessions, on November 9th and 29th, during which discussions among permittees, Regional Board staff, and environmental representatives focused on inspection requirements. Participants made diligent attempts to understand various positions and limitations and, as a result, may have agreed in concept[7] to another option that is outlined in Version A/C. As this A/C option blends elements of the other options previously submitted to the Board and to the public, staff do not believe that they constitute significant changes. Rather, Version A/C provides greater clarity with regard to Regional Boad expectations and responds to Permittees' concerns over funding by better coordinating State (i.e. Regional Board) inspection efforts with those of the Permittees. Please refer to the Executive Officer's letter, dated December 3, 2001, for a summary of the changes.

Development Planning: Does *the extension of SUSMP requirements to cover RGOs, ministerial projects, and environmentally sensitive areas, comply with the State Board's SUSMP decision?*

Yes. The Development Planning subsection (Part 4, Section D, pages 36-44 ~~26-53~~) incorporates SUSMP requirements as upheld by the

[7] As of the morning of December 10, 2001, Regional Board staff are awaiting a decision from participants in that meeting regarding their support for the new Version A/C.

State Board in State Board Order No. 2000-11 "SUSMP Order" (Attachment 10.F.1) and corrects deficiencies that were identified.

The SUSMP Order set aside the applicability of the SUSMP requirements to development projects in environmentally sensitive areas and to ministerial projects, as defined in the California Environmental Quality Act (CEQA), until full and fair consideration by the Regional Board during permit reissuance. The SUSMP Order also set aside the applicability of numerical mitigation criteria to RGOs until the Regional Board provided proper justification and established thresholds. While some commenters have suggested that the proposed permit violates the SUSMP Order by the extension, a memorandum issued by the State Board Chief Counsel identifies these three areas as potential areas for extension of SUSMP requirements by Regional Boards in the future consistent with State Board guidance in its SUSMP Order (Attachment 10.F.1). Staff has prepared technical reports to support the extension of the SUSMP requirements (Attachment 10 B).

It is proper to extend coverage of SUSMP requirements to developments within, adjacent to or discharging directly to environmentally sensitive areas. Development and urbanization especially threaten environmentally sensitive areas, because these areas have a much lower capacity to withstand pollutant shocks than might be acceptable in the general circumstance. A development that is ordinarily insignificant in its impact on the environment may in a particular sensitive environment become significant. Staff has provided thresholds for developments in environmentally sensitive areas to exclude small developments (less than 2,500 square feet impervious surface) Edited Tentative at page 38 ~~Findings B.6, B.7, and E.4.~~

It is appropriate to apply numerical design criteria for storm water mitigation to new and redeveloped retail gasoline outlet developments. RGOs are points of convergence for vehicular traffic and are similar to parking lots and urban roads. Studies indicate that storm water discharges from RGOs have high concentrations of hydrocarbons and heavy metals. Pilot studies indicate that treatment control best management practices installed at retail gasoline stations are effective in removing pollutants, reasonable in capital cost, easy to operate, and do not present safety risks. RGOs in western States such as Oregon and Washington are already subject to storm water numerical mitigation criteria. As recommended by the State Board in its SUSMP Order, Board staff has established thresholds for the criteria to apply to

RGOs (5,000 square feet or more of impervious surface and projected Average Daily Traffic of 100 vehicles or more) with proper justification. Finding C.6., Edited Tentative at page 39~~Attachment 10.B.~~

It is proper to apply SUSMP requirements to all planning priority project SUSMP categories, including ministerial projects. The California Environmental Quality Act (CEQA) (Cal Pub Resources Code Section 21000 *et seq.*) requires that public agencies consider the environmental impacts of the projects they approve. CEQA applies to projects that are considered discretionary and does not apply to ministerial projects (i.e., projects which involve the use of established standards or objective measurements). For purposes of water quality, CEQA distinctions are not germane because it is a procedural statute that provides a public forum for consideration of environmental impacts of governmental decision-making. CEQA is not a statute for water quality protection. Municipalities have multiple ways of ensuring that SUSMP requirements are applied in a consistent manner within SUSMP categories. A municipality may give itself discretionary authority by adopting local ordinance provisions that create decision-making discretion for SUSMP categories. Alternatively, a municipality may establish standards and objective criteria for review of ministerial projects that are in SUSMP categories administratively.

Consistent with the Regional Board's action in the Ventura County municipal storm water permit, the proposed permit includes numerical design criteria for water quality flow in addition to water quality volume.

Development Construction: ***Are new requirements to inspect construction sites 1 acre or greater appropriate, and are they consistent with regulations and other permits?***

Small construction sites (1-5 acres) account for a significant amount of pollution from construction activities, in addition to construction sites five acres or greater. In response to this concern, the Development Construction subsection (starting in Part 4, Section E, Edited Tentative at page 44 ~~48 of the draft permit~~) requires that Permittees inspect all construction projects one acre or greater to ensure compliance with local agency ordinances and model programs to prevent erosion, control sediment, and manage on-site construction wastes.

The existing permit has a similar requirement for construction sites two acres or greater. Staff proposes to lower the threshold to 1 acre

beginning 2003, when USEPA Phase II regulations for small construction sites become effective. Also, the Regional Board has already issued municipal permits with such a requirement, to the City of Long Beach in 1999 and the County of Ventura in 2000.

Total Maximum Daily Loads (TMDLs): ***Should the Board include a provision requiring implementation of TMDL load reductions, without reopening the permit?***

TMDLs are one of the Board's highest priorities. In view of the Region's highly urbanized environment, it is likely that pollutants in storm water will be allocated significant load reductions. While specific load reductions can't be forecast at this time, staff has structured the permit as a vehicle for achieving load reductions (Part 3, Section C).

Public review of TMDLs, which will typically be in the form of an amendment to the Basin Plan, will occur during the TMDL adoption process; and staff does not anticipate that there will be a need for an additional public process for TMDL implementation measures. Therefore, upon approval of a TMDL, implementation of municipal storm water requirements (specified in that TMDL) will become effective and enforceable under the permit. In other words, municipal storm water requirements will be automatically included in this proposed permit upon adoption of a TMDL by the Board, without reopening this permit. This TMDL requirement and structure is consistent with TMDL provisions in the City of Long Beach and County of Ventura permits.

Monitoring: ***In the event that monitoring indicates storm water from a particular municipality as a source of toxicity, should the Regional Board require that Permittee to implement additional BMPs needed to reduce toxicity?***

Per the *Basin Plan*, there should be no toxicity in receiving waters. Per Parts 2 and 3 of the draft permit, Permittees must revise their Storm Water Management Plan (SQMP), as necessary, to meet receiving water limitations, including water quality objectives. Attachment T to the Monitoring and Reporting Program requires the Principal Permittee to monitor for toxicity and, upon finding toxicity, to conduct a "Toxicity Identification Evaluation" (TIE) and submit a "Toxicity Reduction Evaluation" (TRE) to the Regional Board. As a result of the TRE, the affected Permittee would then be responsible for modifying its SQMP to implement BMPs to eliminate toxicity based on the sources of toxicity within its jurisdiction.

Illicit Connections and Discharges: ***Should the Regional Board require the Principal Permittee to better track IC/ID (illicit discharge and illicit connection) problem areas, and should the Regional Board also upgrade Permittees' passive field screening program to better identify and eliminate IC/ID problems?***

During dry weather, much of the flow to the storm drain system consists of illicit discharges.[8] Reporting of these problems, as summarized in the Fact Sheet/Staff Report (pages 26 to 35), shows erratic IC/ID occurrences that bear no relationship to land uses or to estimated expenditures by Permittees. Under current operating practices, the Principal Permittee is unable to track reports of illicit connections and discharges in order to identify problem areas and prioritize corrective action. Many of the Permittees cannot estimate the length of their portion of the storm drain system. Many more of these Permittees are unable to estimate how much of their portion of the storm drain system has been field screened for IC/ID problems over the past 5 years, partly because the Permittees' existing SQMP requires field screening only "during regularly scheduled maintenance."

In the first draft, staff proposed that the Permittees develop a Geographical Information System (GIS) to better track IC/ID problems and, based upon annual evaluations of IC/ID problems, to implement an active screening program in problem areas. Several Permittees objected to this, stating that a GIS was too expensive to develop, and that simpler systems (e.g. pin maps) could suffice. In this draft, staff is proposing that the Principal Permittee – with the cooperation of Permittees – develop a system (type of system unspecified) to track and prioritize IC/ID problems. The Principal Permittee objects to this requirement out of concern over: (a) anticipated difficulties in coordinating with other Permittees, and (b) the cost of a GIS (as the Principal Permittee feels this is the only system that is sophisticated enough to comprehensively track IC/ID occurrences in the storm drain system), which cost could be well in excess of $15 million.

Staff submits that a comprehensive map[9] or system is needed to track and evaluate IC/ID occurrences, that the Principal Permittee is the

[8] Federal regulations (at 40 CFR 122.26 (b). 2.) define an illicit discharge as "...any discharge to an MS4 that is not composed entirely of storm water..." with some exceptions (such as NPDES-permitted discharges and emergency fire fighting flows).

[9] Indeed, basic requirements such as a map demonstrating a basic awareness of the storm drain system, are part of a Permittees' initial application requirements, and should have been met back in 1990 when the permit was first issued.

appropriate entity with adequate control to take on this responsibly, and that other Permittees should be required to undertake active field screening such needs are indicated by better tracking.

Conclusion

Pollutants in dry weather runoff and storm water are the most significant source of impairment to water quality in the Los Angeles Region. For the third 5-year term of the Los Angeles County MS4 permit, staff has tried to carefully and reasonably structure requirements – including specific performance objectives – that are needed to better focus Permittees' storm water management programs in order to more effectively control pollutants in storm water.

Recommendation

Staff proposes that the Regional Board adopt the tentative permit - including Option B in the Industrial/ Commercial Inspection Program (pending concurrence from the Permittees, staff may change its recommendation to Option A/C). Comment letters submitted by the Permittees and interested persons, which were received by November 13, have been provided to the Board in Volumes 2 and 3 of Item 10, and an edited tentative permit (dated December 10, 2001) a change sheet (dated December 4, 2001) and a supplemental change sheet (dated December 10, 2001) should be inserted at the end of Section 10.B. ~~will be compiled and forwarded to the Regional Board no later than November 21.~~

Gray Davis
Governor

December 3, 2001

Mr. Harry Seraydarian
US Environmental Protection Agency, Region IX
75 Hawthorne Street
San Francisco, California 94105

Dear Mr. Seraydarian:

MUNICIPAL STORM WATER PERMIT – FOR THE COUNTY OF LOS ANGELES

We would like to thank you for facilitating a second facilitation session on Thursday, November 29th at the Signal Hill Community Center. At that session, staff at the Regional Board committed to rapidly producing another version of the proposed permit requirement for an Industrial/Commercial Facilities Control Program, which blends elements from Options A, B, and C which we are have presented to our Board for possible adoption on December 13, 2001. We have attached this new version, designated Version A/C, for the purpose of discussion. This version blends elements from both Option A and Option C (many of the Permittees' preferred option).

We believe that this new Version A/C reflects the start of a promising partnership among the Regional Board and municipalities. In this new draft, the Regional Board has tried to be responsive to several of the permittees' concerns over funding requirements and a preference, on the part of several permittees, for a program based solely on an education approach. To respond to these concerns, we have modified and clarified the scope of the inspections and clarified our expectation for enforcement on the part of permittees. Specifically, we have:

- Clarified and Reduced the Scope of Inspections.

  - Inspection Frequencies: In general, frequencies have been reduced from once every 24 months to once every 30 months. In addition, we have designated Tier 1 and Tier 2 categories for Phase 1 facilities, and further reduced the frequency of inspections for Tier 2 categories to once every 5 years. Finally, those Tier 2 categories with no exposure of industrial activity to storm water need not be inspected, after the initial determination of no exposure.

  - Phase 1 Categories: We have reduced the categories to be inspected, by eliminating Petroleum Refining.

California Environmental Protection Agency
The energy challenge facing California is real. Every Californian needs to take immediate action to reduce energy consumption
For a list of simple ways to reduce demand and cut your energy costs, see the tips at: http://www.swrcb.ca.gov/news/echallenge.html
Recycled Paper

- Duplication of Regional Board and Permittee Inspections: We have added a requirement relieving permittees of the responsibility to inspect those Phase 1 facilities that the Regional Board has inspected within the previous 24 months. We intend to work out a system with the Permittees to efficiently communicate facilities that have been inspected by the Regional Board.

- Level of inspections: We have clarified our expectations regarding minimum Best Management Practices that Permittees' inspectors need to check during inspections.

- Tiered inspections: We have modified the definition of inspections, to allow permittees to conduct inspections of restaurants from the curbside.

➢ Provided a clearer definition of expectations concerning the scope of enforcement.

- Progressive enforcement: We have clarified minimum steps that permittees must take in their progressive efforts to enforce their municipalities' storm water requirements.
- Referrals to the Regional Board: In recognition of some of the permittees' concern regarding the resource intensive efforts needed to elevate enforcement actions, we have added a mechanism by which permittees can refer cases to the Regional Board.
- Accelerated referrals to the Regional Board: For violations of the State's General Permit for Industrial Activities, we have made provision for expedited referrals.
- Complaints: We have clarified the complaints will be referred by the Regional Board staff.
- Support of Regional Board enforcement actions: We have noted that permittees must provide staff for joint inspections with the Regional Board when available.

We have made other minor editorial changes as suggested by participants at the meeting, again to achieve greater clarity.

We are providing this draft to address your underlying concern regarding the cost of implementing program. We also want to acknowledge, as discussed at our meeting, a commitment on our part to support Permittees' efforts to strengthen their storm water ordinances. Toward this end, we are elaborating upon findings in the proposed permit, and we also are prepared to attend City Council meetings and testify on the requirement for storm water ordinances.

With this Version A/C, we hope we have achieved consensus on the requirement for an Industrial/Commercial Facilities Control Program. We believe that this consensus addresses our common interests to protect water quality while optimizing both State (Regional Board) and local resources, without significantly changing requirements in the existing Version A, B, and C. We need the participants at the meeting on November 29th to indicate, as soon as possible (but no later than Monday, December 10th), their consensus on these issues and support for Version A/C. Please do not hesitate to contact me at (213) 576-6605, Wendy Phillips (Acting Assistant

Table 2. Comparison of Changes to the Industrial/ Commercial Facilities Program and Options for Consideration in the Tentative Draft

Item	Existing Permit	Second Draft	Tentative Option A	Tentative Option B	Tentative Option C
Focus	USEPA Phase I facilities, Restaurants, RGOs, Automotive Service facilities	USEPA Phase I facilities, Restaurants, RGOs, Automotive Service facilities	Critical sources prioritization (regardless if they are industrial or commercial) based on the critical sources identification study prioritizing 34 categories	Critical sources prioritization (regardless if they are industrial or commercial) based on the critical sources identification study prioritizing 34 categories	USEPA Phase I facilities, Restaurants, RGOs, Automotive Service facilities
Inspection	NO	Restaurants, Automotive Service Facilities	USEPA Mandated: Municipal Landfills, Hazardous Waste Treatment, Disposal and Recovery Facilities, Facilities Subject to SARA Title III (also known as EPCRA), Restaurants (focus on Municipal BMPs), RGOs (focus on Municipal BMPs), Automotive Service Facilities (focus on Municipal BMPs)	**Same as Option A with the addition of** facilities identified as highest ranking in the critical sources evaluation: Wholesale trade (scrap, auto dismantling), Fabricated metal products, Motor freight, Chemical/allied products, Primary metals products	NO
Site Visits	USEPA Phase I facilities, Restaurants, RGOs, Automotive Service facilities	USEPA Phase I facilities	The remaining lower priority categories facility site visits All in the first 24 months, including "no-exposure" facilities. In the second inspection cycle spot check visits at minimum 20% of the remaining total number/per year (excluded facilities deemed "no-exposure")	The remaining lower priority categories facility site visits All in the first 24 months, including "no-exposure" facilities In the second inspection cycle spot check visits at minimum 20% of the remaining total number/per year (excluded facilities deemed "no-exposure")	USEPA Phase I facilities, Restaurants, RGOs, Automotive Service facilities
Frequency	Once every 24 months	Once every 24 months	Once every 24 months	Once every 24 months	Once every 24 months

"USEPA Phase I Facilities" means facilities in specified industrial categories that are required to obtain an NPDES permit for storm water discharges, as required by 40 CFR 122.26(c). These categories include:

i. facilities subject to storm water effluent limitation guidelines, new source performance standards, or toxic pollutant effluent standards (40 CFR N)
ii. manufacturing facilities
iii. oil and gas/mining facilities
iv. hazardous waste treatment, storage, or disposal facilities
v. landfills, land application sites, and open dumps
vi. recycling facilities
vii. steam electric power generating facilities
viii. transportation facilities
ix. sewage of wastewater treatment works
x. light manufacturing facilities

Table 3. Summary of Fiscal Resources Budgeted for FY 2000/2001

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

LOS ANGELES COUNTY MUNICIPAL STORM WATER DISCHARGE PERMIT

Summary of Comments and Regional Board Staff Response
Tentative Draft [October 11, 2001]

The Response here supplements the '*Summary of Comments and Regional Board Staff Response, Second Draft (June 29, 2001)*' (October 2001). In general comments responded to in that document are not revisited here. Legal matters are addressed in Regional Counsel's legal brief, *'Legal Issues Concerning Renewal of Order No. 96-054 as Reflected in Tentative Waste Discharge Requirements Dated October 11, 2001'* (Nov. 9, 2001)

Commentors	Comment	Staff Response
Santa Monica Bay Keeper (SMBK)	1. Completeness of Permit Application Permittees have not complied with storm water permit application requirements at 40 CFR 122.26(d).	The Regional Board issued the first municipal storm water permit consistent with NPDES application requirements in effect in 1990, and processed the reapplications consistent with U.S. EPA policies. Please see also p. 1 in 'Summary of Comments and Regional Board Staff Response' (October 11, 2001), and p. 20 Regional Counsel's legal brief (November 9, 2001)
CAA, CICWQ, LAEDC, BWS, ALH, CAM, COM, ELS, GAR, IND, LAW, LOM, LYN, MOO, SCL, SFS, SIH, SMA, TOR	2. Economic Consideration Give further consideration to economic cost of implementation. Compliance costs will be substantial and projected to exceed $50 billion.	The iterative process to meet receiving water limits explicitly takes into account the economics of compliance. Permittees self-reported budget for implementation of the permit requirements for 2001-2002 is about $145 million, a fraction of the projected cost claimed in the $50 billion. More than likely, Permittees current budget overstates costs because it includes activities being conducted for other than storm water purposes (such as street sweeping and corporation yards maintenance). The Regional Board staff has significantly reduced the scope of the industrial/ commercial inspection program after facilitation by the U.S. EPA mediator.

Commentors	Comment	Staff Response
CAR, CAA, EAC, CPR, RT, BWP, BCSMW, CUD, CUL, BEH, BEF, BEG, HAW, HIH, LAK, LCF, LMI, PAR, ROS, RWG, SCL, SFE, SGA, SOG, VRN, WEH, WEV	3. Executive Advisory Committee Reinsert into the permit the EAC, which is a representative and coordinating body for Permittees. How will they now coordinate?	The Regional Board cannot create the EAC under any authority. The EAC is the Permittees prerogative to organize. The EAC can continue to perform its role for Permittees and interact with the Regional Board irrespective of whether or not it is recognized in the permit. The Regional Board encourages Permittees to better use the Watershed Management Committees (WMCs) for permit coordination and implementation because the WMC is a functional unit based on common water quality protection interests.
MWD, [City of Los Angeles Department of Water and Power, California Water Service Company, Southern California Water Company,	4. Non-Storm Water Discharges Authorize releases of potable water discharges that are in accordance with an equivalent document to Industry-wide practice guidelines developed by the American Water Works Association (AWWA)	For purposes of standardization, the AWWA whose membership, includes the commentors, should develop guidance (technical bulletins) for potable water discharge releases, if they have not already done so.
BRB, DB, AR, RT, R&T, RWG, BWS, LAC, LA, CPR, EAC	5. Industrial/ Commercial/ Construction Inspections The State should not transfer its responsibility to inspect facilities and construction sites covered under statewide general permits.	The MS4 Permittee has a responsibility to make sure that industrial sites (including construction) comply with local government storm water and urban runoff ordinances. The USEPA clearly contemplates a dual and a cooperative oversight of facilities 'discharging storm water associated with industrial activity', between the permitting authority and the MS4 permittee (55 *Fed. Reg.* 222, 48000; and Storm Water Phase II Compliance Assistance Guide (USEPA 2000), p 4-32 and 5-11). See also, Radulescu (2001), *A Case for Inspection*, and Regional Board Counsel's brief at p. 2. Regional Board staff have considerably reduced the scope of the industrial/ commercial inspection program through the efforts of a U.S. EPA mediator.
CLA DHS	6. Restaurant Inspections Since restaurant inspections will involve health inspectors, reference requirements from the California Uniform Food Facilities Law	The Regional Board is the permitting authority for the CWA and Cal. Water Code. The County of Los Angeles (including the Departments of Public Health and Health Services) are best positioned in deciding on the appropriate changes to the County Code to enforce compliance by restaurants with the Cal. Uniform Food Facilities Law and the Cal. Water Code.

WSPA, RT	7. RGOs RGOs should be exempted from new development requirements because the Regional Board has provided no proper justification.	Proper justification for inclusion of RGOs has been developed and the basis has been specified in the permit. Please see p. 8 in Summary of Comments and Regional Board Staff Response (October 11, 2001), p. 7 in Regional Counsel's legal brief (November 9, 2001), Technical Report - *Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts* (Radulescu et al., 2001), *Storm Water Quality Task Force BMP Guide for Retail Gasoline Outlets: Review and Comment* (Radulescu, 2001), and *Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts: Supplement* (Radulescu and Swamikannu, 2001)
BCSMW , PAS, RPV, BUR, DB, AR, RT, R&T, RWG, BWS, CPR, EAC, BCSMW, BIA, SEM, SOG, WEH,	8. ESAs Allow cities to submit designations for ESAs in addition to the other listed agencies. Reasonableness depends on what is approved by the Regional Board as constituting ESAs.	Regional Board staff has proposed thresholds for ESAs to be responsive to the State Board decision in Order No. WQ 2000-11. In that decision, the State Board set forth types of evidence and criteria necessary for inclusion of ESAs in subsequent permits, including thresholds (See memorandum from Office of Chief Counsel to Regional Board Executive Officers dated December 26, 2000). For a complete discussion of the ESA matter see, Fact Sheet/ Staff Report – Attachment, Technical Report: 'Mitigation of Storm Water Impacts from New Development in Environmentally Sensitive Areas'.
ULARAW	9. Infiltration Concern Infiltration practices can inadvertently contaminate ground water basins.	Permittees may impose restrictions where there is a threat of ground water contamination. Storm water mitigation for new development includes the option to treat, filter, or infiltrate (not just infiltration). Infiltration studies conducted by the USGS and university researchers demonstrate that where conditions for infiltration are favorable, infiltration is effective in removing common pollutants of concern in storm water, and the risk of ground water contamination is minimal. For a discussion, see U.S. EPA Report No./600/R-94/051 (1994); Pitt et al. (1996) *Groundwater Contamination from Storm Water Infiltration*, Ann Arbor Press, 218 pp.; USGS Water Resources Investigation Report No. 93-4140 (1995)
CAA, CLA, LACo	10. Definition of MEP Retain the MEP definition in the current permit instead of the revised definition. MEP definition is contrary to the CWA. It does not require the balancing of other factors.	The definition of MEP references its expression in the CWA, and its interpretation by State Board Senior Staff Counsel in a legal memorandum (Feb. 11, 1993). So long as the memorandum states that multiple interests have to be balanced, the need to make such analyses is incorporated by reference.

Commentors	Comment	Staff Response
BWS, CPR, LAK, POM, RT, SGA, VRN,	11. Definition of Redevelopment The definition of "redevelopment" is overly broad and should be limited to addition or creation of 5,000 square feet or more of surface area (exclude replacement). U.S. EPA defines the threshold for redevelopment as one acre or more which should be criterion instead of 5,000 sq. ft. Requirement may discourage property improvement.	The definition has been revised to exclude exterior remodeling and replacement of roofs. It is inclusive of the replacement of building footprint. U.S. EPA Phase II guidance do recommend a threshold of 1 acre to trigger requirements for Phase II MS4s. However the Regional Board adopted the 5,000 sq. ft. threshold for redevelopment in the LA SUSMP, an action which was upheld by the State Board (Board Order No. WQ 2000-11). The 5,000 sq. ft. threshold is consistent with thresholds established for redevelopment triggers by other States (such as Washington, Maryland, Virginia, and Florida) for U.S. EPA Phase I MS4 Permittees. Please see also p. 9 in Summary of Comments and Regional Board Staff Response (October 11, 2001), and p. 5 Regional Counsel's legal brief (November 9, 2001).
BCSMW , CUD, CUL, HAG, PAR, PAS, ROS, SOG,	12. Public Agency Activities: Fire Truck Washing Fleet vehicles deserve the same exemption as fire-fighting vehicles for wash-down to the MS4. Why is this wash-down exempt from discharge prohibitions?	The allowance for wash-down of fire trucks at existing fire stations was made because a prohibition would involve taking the trucks off service. The trucks would have had to be sent to a dedicated washing facility, thus compromising their availability to respond to situations of public health and safety.
BCSMW, DIA, CLA, PAS, RPV, SOG, WEH, LACo,	13. Public Agency Activities: Trash Receptacles at Transit Stops Requirement to place trash receptacles at all transit stops is unreasonable and premature	More time has been provided. The provision has been revised to require receptacles at transit stops with rain shelters within 6 months and all other transit stops within a year from permit effective date.
LACo	14. Monitoring: Trash Requirements to monitor trash in watersheds not listed as impaired for trash will cost as much as $5 million.	This monitoring requirement for unimpaired watersheds has been changed to eliminate trash sampling. It now requires photographic documentation after qualifying storm events.
BCSMW, BUR, SEM, SOG, WEH,	15. Reporting Provide Permittees with 180 days to propose an alternative reporting format from the one in the permit.	The purpose in providing a sample reporting form is to assist permittees in collecting information to document compliance with the permit requirements. The reporting format under the existing permit appears deficient because permittees report in multiple ways. Permittees can always develop an equivalent reporting form so long as it provides the same information as that which is requested by the Regional Board in the sample reporting form.

RETAIL GASOLINE OUTLETS: NEW DEVELOPMENT DESIGN STANDARDS FOR MITIGATION OF STORM WATER IMPACTS

SUPPLEMENT

(To June 2001 Technical Report)

December 2001

Dan Radulescu and Xavier Swamikannu
California Water Quality Control Board, Los Angeles Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Introduction

On March 23, 2001, the Western States Petroleum Association (WSPA), a trade association for the petroleum industry in the Western U.S., submitted a petition to the State Water Resources Control Board (State Board) which challenged the inclusion of numerical design standards for Retail Gasoline Outlets (RGOs) in the Municipal Separate Storm Sewer (MS4) permit for San Diego County.[1]

In June 2001, the California Water Quality Control Board, Los Angeles Region (LA Regional Board) and the California Water Quality Control Board, San Diego Region (SD Regional Board) issued a Technical Report, 'Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts' (RGO Technical Report). The Technical Report was prepared in response to the direction provided by the State Board in its decision in, *In Re*: City of Bellflower et al. (Order No. WQ 200-11, hereafter the LA SUSMP Decision) for the inclusion of numerical design standards for RGOs in future MS4 permits. The RGO Technical Report addressed presumptive concerns expressed by the State Water Resources Control Board (State Board) in the LA SUSMP Decision such as, (i) heavily regulated; (ii) limitations of space; (iii) feasibility and safety of treatment; (iv) absence of a threshold relative to RGO size. It also recommends a threshold relative to RGO size as directed by the State Board. WSPA claims that the Regional Board's evidence and findings are not "proper justification" as

---

[1] The State Board upheld WSPA's petition on procedural grounds. See *In Re*: Building Industry Association of San Diego and Western States Petroleum Association (Order No. WQ 2001-15)

required by the State Board. In contrast, Regional Board Counsel has determined that the criteria established are lawful and proper.[2]

On August 6, 200, WSPA submitted a critique of the RGO Technical Report in its comment on the second draft of the Los Angeles County MS4 permit. WSPA, in large part, contended that the justification was not proper. The LA Regional Board staff has prepared this Supplement to the RGO Technical Report to clarify issues raised by WSPA in its critique of the RGO Technical Report, and WSPA's comments on applicability of numerical design standards to RGOs in reference to the October 11 tentative draft of the Los Angeles County MS4 permit.[3]

Lack of Specific Analyses by WSPA

We are concerned as to the lack of substantive documentation by WSPA of its assertions that the treatment of storm water to remove pollutants of concern in California is technically not feasible, not safe, and prohibitively costly. WSPA has not technically documented the bases of such claims or conducted any analyses of such conditions at RGOs. Rather WSPA and its consultants appear to misinterpret data from other studies; misstate facts; draw questionable inferences, and gloss over important differences. Regional Board staff on the hand have conducted independent analyses of these factors and facts to ensure "proper justification" for the inclusion of RGOs.

For example contrary to WSPA's claims, (i) WSPA member RGOs in Western Washington and Northern Oregon have been required by their municipalities to utilize tiered treatment since 1992 to remove petroleum hydrocarbons in storm water runoff from the fueling areas and other pollutants such as heavy metals from adjacent areas, and not after "August 2001" (Figure 1);[4] (ii) treatment control BMP pollutant concentrations were higher in the effluent at a Washington State RGO study site only because the parameters were either a component of the treatment media (phosphorous and nitrates) or the influent concentration was low (oil and grease), not because the BMP was ineffective;[5] (iii) treatment control BMPs tested by Caltrans performed as expected but needed more maintenance because of undersizing and no pre-treatment, not because they were ineffective;[6] (iv) space at RGOs for installation of treatment

control BMPs is not constrained to render it infeasible (Table 1)[7], (iv) subsurface treatment control BMPs are safe, as demonstrated by WSPA member RGOs in Washington and Oregon who have installed these systems for some years; and (v) cost of installation of treatment control BMPs (actually a retrofit of existing facilities) tested by Caltrans was well within estimated costs; the larger expense was for monitoring and analysis...not installation.[8]

RGOs are Storm Water Pollutant Hotspots

RGOs are incontrovertible hot spots for pollutants of concern in storm water and have been widely documented as such. The most common pollutants of concern in storm water runoff from RGOs are heavy metals, petroleum hydrocarbons (such as Polycyclic Aromatic Hydrocarbons (PAHs)), and oil and grease.[9] These pollutants have been identified through analyses of: (i) trapped sediments in on-line oil water separators; (ii) particulates removed by treatment control BMPs such as media filters; (iii) simulated runoff; or (iv) storm water runoff leaving RGOs. In studies conducted, since 1970, in relation to automotive related activities and their impact on the quality of storm water runoff, a strong correlation has emerged between the volume and duration of automotive exposure and its impact on water quality and sediment quality criteria. As a result, several areawide storm water management programs already identify RGOs as pollutant hotspots and require the implementation of treatment control BMPs.[10,11,12]

An 18-month study was performed in the Washington Metropolitan area ("Washington Study"), to compare storm water quality with the National Urban Runoff Program (NURP) monitoring results.[13] One of the monitoring locations was situated at a

---

[7] Table 1 illustrates that more than two-thirds of the surface area (at a sampling of RGOs in the Los Angeles area) is available for installation for WQF treatment control BMPs (some which are as compact as 50 sq. ft in dimension).

Grizzard (1995), Proceedings of the 4th Biennial Conference on Stormwater, FL. Note that NURP catchments generally contained both pervious and impervious surfaces, while the study surfaces here were completely impervious, which may account for comparability in some pollutant concentrations.

gasoline station. The Washington Study confirmed NURP findings, i.e., water quality criteria for metals and Chemical Oxygen Demand (COD) are exceeded for storm water runoff from sites exposed to vehicular traffic (such as gasoline stations, parking lots and streets).[14] In the Washington Study the high COD values were attributed to the presence of high concentrations of petroleum hydrocarbons in the runoff from the gasoline station site. In addition, the U.S. General Accounting Office, in its report to Congressional requesters on urban runoff water quality (Report No. GAO-01-679) cites research in Texas that shows PAH concentrations are related to the volume of vehicular traffic.[15] Nationwide studies confirm the increased concentrations of PAHs in sediments deposited by storm water from urban watersheds.[16] A similar link between the duration and volume of automotive exposure at automotive-intensive land uses, including RGOs, demonstrated that, even at moderate duration and volume of automotive exposure, the observed hydrocarbon concentrations in storm water runoff were high.[17] For the Los Angeles area, a number of studies have identified PAHs and heavy metals as pollutants of concern in storm water runoff discharging to Santa Monica Bay.[18,19]

Implementation of Storm Water Quality Task Force (Source Control) BMPs Alone is Inadequate to Control Pollutants in Storm Water

WSPA's total reliance on the Storm Water Quality Task Force RGO BMP Guide (RGO BMP Guide) is misplaced. We have reviewed the RGO BMP Guide[20] and found it to be obsolete.[21] The recommendations of the Task Force for the implementation of default source control BMPs were not an "end all" and ultimate method to control storm water pollution at RGOs. The Task Force itself suggested that these source control

[14] WSPA has never disputed the fact that pollutants in storm water discharges from RGOs often exceed water quality criteria. Their claim has been that it is no worse than the quality of storm water from urban land-uses characterized in the NURP study from the 1970s.

BMPs were not the one and only method to address the discharge of pollutants in storm water runoff from RGOs. In fact, the Task Force contemplated the addition of treatment control BMPs in the future to the recommended BMPs menu. The RGO BMP Guide was intended to provide a default menu of source control BMPs as a pre-treatment step, until treatment BMPs were added to the Guide. The RGO BMP Guide has not been updated, and as a result is woefully inadequate for guidance to reduce the discharge of pollutants in storm water to protect the beneficial uses of receiving waters in the Los Angeles Region.[22]

WSPA's contention that the RGO Guide is the 'end all' originates from two unsupported assumptions – that source control BMPs: (i) alone are sufficient to control the discharge of pollutants in storm water runoff from RGOs so that no exceedances of water quality standards will occur, and (ii) are consistently and diligently implemented. A study conducted recently in the Los Angeles Region deflates both assumptions.[23] The results from the study demonstrate that the implementation of source control BMPs alone (similar to those recommended in the RGO BMP Guide) are insufficient to reduce the concentration of pollutants discharged in storm water to meet water quality standards. Treatment control BMPs must be employed to adequately reduce pollutants in storm water to meet water quality standards. Secondly, source control BMPs by their nature are difficult to verify and often are at the operator's discretion. While pollution prevention practices recommended in the RGO BMP Guide are desirable, neither WSPA nor others have demonstrated that the implementation of such practices reduces pollutants successfully to where water quality impacts are eliminated.[24] In fact the opposite evidence now exists.[25]

Implementation of Properly Designed Treatment Control BMPs is Necessary

Treatment control BMPs in order to be effective have to be properly designed based on either the Water Quality Flow (WQF) or Water Quality Volume (WQV) criteria or both. The WQF and WQV criteria developed by the Los Angeles Regional Board are based on characteristics of precipitation in the region. The most common precipitation events are small size storms and extreme events are rare. Consequently, for water quality purposes, the design standards ensure proper design for the treatment of the small more frequent precipitation events.

More than likely a multi-chamber treatment train or a set of treatment control BMPs will be necessary to remove the full suite of pollutants of concern in storm water

---

[22] *Ibid.*

[23] *Los Angeles County 1994-2000 Integrated Receiving Water Impacts Report* – 2000. Part of the critical sources study was conducted at automotive service facilities which have similar traffic volume and duration exposure as RGOs.

[24] See Letter from Professor L.D. Duke at UCLA to Mr. Radulescu dated Nov. 15, 2001, explaining the meaning of his statement on pollution prevention in a report cited by WSPA as proof that source control BMPs are all that are needed.

[25] *Supra.* See Footnote 23

R0007703

discharges from RGOs, and regular maintenance of the treatment systems will be necessary to keep it performing optimally. Current approaches to treating runoff from RGOs include isolation of the fuel servicing area to treat VOCs, petroleum hydrocarbons, and oil and grease. The area should not be connected to an infiltration type of BMP because of the potential for soil and groundwater contamination from gasoline. These areas should be connected to the sanitary sewer system with the permission of the sewer agency or to an oil water separator and a basic treatment control BMP (such as a media filter or a biofilter). VOC concentrations in storm water because of their volatility are seldom detectable. Storm water from the general area is separately treated to remove pollutants of concern adhering to particulates. Basic treatment control BMPs being implemented elsewhere in the U.S. include sand filters, vegetated buffers, biofilters, flow-through filter cartridges, and multi-chamber treatment train.[26]

The percent removal efficiencies of treatment control BMPs are highly dependent on the influent concentration of pollutants. The higher the influent concentration the higher the percent removal. For filter media based treatment control BMPs the characteristics of the medium also matter and removal efficiencies vary according to the type of filter material.[27]

Implementation of BMPs is Safe

WSPA contends that the installation of subsurface treatment control BMPs raises safety concerns because gasoline spills would purposely be routed below grade thus presenting a potentially explosive environment. We agree that the fueling area, vehicle maintenance areas, and vehicle traffic areas represent different problems. They require different solutions. To control spills, the fuel-island may be designed with a dead-end sump or spill control separator in compliance with the Uniform Fire Code (UFC); and as a spill containment pad (UFC § 790.18). The canopy should be designed to prevent the entry of rain into the fuel pad area. Storm water collected in the fuel island area may be conveyed to the sanitary sewer system after pre-treatment (if the sewer authority approves) or discharged after passing through a treatment train that includes an oil-water separator and basic treatment BMPs (media filters, biofilters, etc.). Storm water from the vehicle traffic areas may be treated using biofilters, linear sand filters, media filters or similar BMPs.[28] Contrary to WSPA's assertions, it is feasible to minimize safety concerns by designing the fueling area at RGOs consistent with UFC standards to

[28] See Table 4.1, which lists treatment control BMP options, *Storm Water Management Manual for Western Washington* (2001) Vol. 1, at p. 4-11.

control spills, while also incorporating treatment control BMPs to reduce the discharge of storm waters pollutants.

Treatment Control BMPs are Reasonable in Cost

We have previously reviewed the literature on the cost of treatment control BMPs for RGOs and determined them to be reasonable.[29] Biofilters are expected to cost about $6,500 per 5,000 square feet.[30] The multi-chamber treatment train has been estimated to cost between $5,000 and $10,000 per 5,000 square feet of drainage area.[31] Based on the estimated project cost to build a RGO (Table 2), the cost of installation of treatment control BMPs appears to be between 1.75 – 2.3 percent of the project cost. These estimates are consistent with the Regional Board's empirical basis of reasonable cost to meet the mitigation criteria (1-2 percent of the project development cost).[32]

Conclusion

Water quality protection should be no less important for RGO operators in California than they are for their counterparts in other Western states. The RGO BMP Guide which emphasizes pollution prevention practices may be considered as the pre-treatment step that optimizes the cost-effectiveness of treatment control BMPs. Both source control and treatment control BMPs are essential to reduce the discharge the pollutants in storm water effectively and to minimize treatment costs. A suite of treatment control BMPs or a treatment train of BMPs most likely will be needed to remove the range of pollutants of concern in storm water runoff from RGOs. The thresholds established by the Regional Board for the numerical mitigation criteria to apply to RGOs are reasonable and fair, have been properly justified, and have fully met all evidentiary requirements set forth in the LA SUSMP Decision by the State Board for the inclusion of RGOs.

Subject: RE: Manual and Questions

Would you kindly respond to the following two questions:

1. Does a new gas station development that creates 5,000 square feet or more of impervious surface be subject to storm water treatment for post-construction use?
2. Does an existing gas station that replaces 5,000 square feet or more of impervious surface be subject to storm water treatment for post-construction use?

Thanks for your assistance.

Sincerely
Xavier

Subject: FW: Manual and Questions

Stan,
Please answer these gas station questions. Thanks.

>>> "Ciuba, Stan" <sciu461@ECY.WA.GOV> 09/12/01 01:37PM >>>
Xavier, the new manual, which should be published in the next couple of weeks, applies to new and redevelopments. Local governments can also use it for retrofits as they judge necessary. The impervious containment area of the fuel island is considered a pollutant generating source requiring treatment for hydrocarbon pollutants. The 5000 square foot threshold pollutant generating surface applies to the parking area adjacent to the fuel island and includes any convenience store parking area. Hope this helps.
Stan

Subject: Re: FW: Manual and Questions

Hello Stan:

Some follow-up questions.
Have these requirements for gas-stations been in effect for certain parts of Western Washington State for some time....for e.g. the Puget Sound Area?
What were the requirements for gas stations in the Stormwater Management Manual for the Puget Sound Basin (1992)?
Xavier

"The answer to your question is that the gas station BMPs in the new Manual (published last week), is virtually the same as in the 1992 Manual. The language has been changed and several items are expressed more directly. The new 2001 Manual applies to Western WA and is offered as technical guidance to local governments and others. However, the BMPs in the new Manual may be incorporated into the various municipal and industrial general NPDES Stormwater Permits. Exactly how and when that will happen has not been determined.
Best regards, Stan

Figure 1. Text of e-mail communications between staff from the Regional Board and Washington Department of Ecology on treatment control BMPs at RGOs (Sept 10 to Sept. 20, 2001).

Table 1. Summary of surface and underground spatial areas of typical structures at a sample of RGOs in the Los Angeles area.

	Mobil Station #18-EDP (Gardena)	United Oil Station #51 (Harbor City)	United Oil Station #4 (Lawndale)	Thrifty Station #1 (Maywood)	Mobil Station #18-L81 (Torrance)

November 2001

INTRODUCTION

A question that has been frequently asked during the process to renew the Los Angeles NPDES Municipal Stormwater Permit was if the storm water regulations require municipalities to conduct inspections at industrial or commercial facilities. This requirement establishes municipalities' responsibility to verify the effective implementation of best management practices to control the contribution of pollutants to the municipal storm drain system from industrial or commercial sites.

A second issue raised was the extent of responsibility municipalities have to control the contribution of pollutants from industrial or commercial sites and what is the relationship with the responsibilities that the Regional Board has over the same type of facilities.

This document attempts to answer to those specific questions raised by the Permittees and other stakeholders. The author adds emphases in the text.

I. Federal Mandate

The Federal Water Pollution Control Act Amendments (FWPCA) of 1972 created the framework for addressing critical pollution problems in the Nation's waters. Section 101, "Congressional Declaration of Goals and Policy", concisely summarized the new act. Section 101(a) stated, "The objective of this Act is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." This way a strong emphasis was put on the ecological and environmental aspects of protecting water quality. Elaborating on that position, the same section set down two "national goals": (1) eliminating the discharge of pollutants into navigable waters by 1985, and (2) achieving an interim water quality level that would protect fish, shellfish, and wildlife while providing for recreation in and on the water wherever attainable. The 1972 Amendments focused their attention on point sources such as municipal discharges through publicly owned treatment works and direct industrial discharges. The Act also focused the efforts on two categories of pollutants: conventional (BOD, SS, and pH), and what was classified as toxic.

Much of the effort following the enactment of FWPCA was to establish the United States Environmental Protection Agency (U.S. EPA) and the framework of the National **Pollutant Discharge Elimination** System (NPDES) permit program. Many other efforts were initiated in areas of construction of treatment plants, basin planning, treatment technologies development, establishment of effluent standards for toxic pollutants and the creation of appropriate regulations to implement the intent of the Act.

Under the provisions of the Act, the U.S. EPA could delegate NPDES permitting authority to the States. California is a delegated State and has full authority to issue NPDES permits with U.S. EPA's concurrence.

Between 1972 and 1987, the law has been subject to mid-course corrections and a change of name to the Clean Water Act (CWA).

The 1987 amendments, known as the Water Quality Act (WQA) of 1987, were aimed at addressing a number of issues on which progress was deemed to have been unsatisfactory. These issues included toxics, nonpoint sources, storm water, coastal

pollution, and others. States were required to identify waters not meeting designated uses because of toxic pollutants even after the application of technology based controls and to develop strategies for controlling them.

New provisions to permit discharges of storm water from separate storm sewers were also added. Section 402 phases in storm water permits. Originally, the 1972 Act required U.S. EPA to issue a NPDES permit for all point sources of pollution. The Agency interpreted that requirement so that it could issue areawide permits for separate storm sewers, rather than each storm water outfall.

The first phase of the program, commonly referred to as "Phase I", was promulgated on November 16, 1990 (55 FR 47990, 40 CFR 122). Phase I requires NPDES permits for storm water discharge from a large number of priority sources including municipal separate storm sewer systems (MS4s) generally serving populations of 100,000 or more and several categories of industrial activity, including construction sites that disturb five or more acres of land.

The second phase of the storm water program, recently promulgated on December 8, 1999 (64 FR 68722) expands the existing program to include discharges of storm water from smaller municipalities in urbanized areas and from construction sites that disturb between one and five acres of land. The new rule allows certain sources to be excluded from the national program based on a demonstrable lack of impact on water quality. The rule also allows other sources not automatically regulated on a national basis to be designated for inclusion based on increased likelihood for localized adverse impact on water quality.

II. Water Quality Concerns

After FWPCA was adopted in 1972, the implementation of end-of-pipe control methods from traditional point sources started to show improvement in the quality of the effluent discharged from Publicly Owned Treatment Works (POTW) and industrial wastewater treatment plants. However, it also become evident that receiving waters still did not attain designated uses, and water quality standards were frequently exceeded. That focused the attention to the other major component contributing to beneficial use impairments of the receiving water quality: pollution from diffuse sources, such as runoff from urban areas, construction sites, agricultural areas, land disposal and resource extraction. Early on, the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA), along with U.S. EPA, conducted a comprehensive study of diffuse pollution sources that resulted in the 1985 report, "America's Clean Water – The States Nonpoint Source Assessment." This report indicated that 38 States reported urban runoff as a major cause of beneficial use impairment. In addition, 21 States reported construction site runoff as a major cause of impairment.

To provide a better understanding of the nature of urban runoff from commercial and residential areas, from 1978 through 1983, U.S. EPA provided funding and guidance to the Nationwide Urban Runoff Program (NURP)[1]. The NURP included 28 projects across the Nation. One focus of the NURP was to characterize the water quality of discharges from separate storm sewers that drain residential, commercial, and light industrial (industrial parks) sites. The majority of samples collected in the study were analyzed for

eight conventional pollutants and three metals. Data collected under the NURP indicated that on an annual loading basis, suspended solids in discharges from separate storm sewers draining runoff from residential, commercial and light industrial areas are around an order of magnitude greater than solids in discharges from municipal secondary sewage treatment plants. In addition the study indicated that the annual loading of chemical oxygen demand (COD) are comparable in magnitude to effluent from secondary sewage treatment plants. When analyzing annual loadings associated with urban runoff, it is important to recognize that discharges of urban runoff are highly intermittent and that the short-term loadings associated with individual events will be high and may have shockloading effects on receiving water, such as low dissolved oxygen levels. NURP data also showed that fecal coliform counts in urban runoff are typically in the tens to hundreds of thousands per 100 ml of runoff during warm weather conditions, (although the study suggested that fecal coliform may not be the most appropriate indicator organism for identifying potential health risks in storm water runoff), with the median for all sites being around 21,000/100 ml. This is generally consistent with studies that found that fecal coliform mean values range from 1,600 coliform fecal units (cfu)/100 ml to 250,000 cfu/100 ml[2]. Makepeace, et al., summarized ranges of contaminants from storm water, including physical contaminants such as total solids (76--36,200 mg/L) and copper (up to 1.41 mg/L); organic chemicals; organic compounds, such as oil and grease (up to 110 mg/L); and microorganisms.

Although NURP did not evaluate oil and grease other studies have demonstrated that urban runoff is an extremely important source of oil pollution to receiving waters, with hydrocarbon levels in urban runoff typically being reported at a range of 2 to 15 mg/l. These hydrocarbons tend to accumulate in bottom sediments where they may persist for long periods of time and exert adverse impacts on benthic organisms.

A portion of the NURP study involved monitoring 120 priority pollutants in storm water discharges from lands used for residential, commercial and light industrial activities. Seventy-seven priority pollutants were detected in samples of storm water discharges, from residential, commercial and light industrial lands taken during the NURP study, including 14 inorganic and 63 organic pollutants. The NURP data also showed a significant number of these samples exceeded various U.S. EPA freshwater water quality criteria. The NURP study provides insight on what can be considered background levels of pollutants for urban runoff, as the study focused primarily on monitoring runoff from residential, commercial and light industrial areas. However, NURP concluded that the quality of urban runoff can be adversely impacted by several sources of pollutants that were not directly evaluated in the study and are generally not reflected in the NURP data, including illicit connections, construction site runoff, **industrial site runoff** and illegal dumping. Other studies showed that storm water from industrial facilities might contain toxics and conventional pollutants when material management practices allow exposure to storm water.

Since the NURP study many other studies and programmatic assessments confirmed the magnitude of the diffuse pollution problem. Data from the NURP study were analyzed further in the U.S. Geological Survey (USGS) Urban Storm Water Data Base for 22 Metropolitan Areas Throughout the United States survey[3]. The USGS report summarized additional monitoring data compiled during the mid-1980s, covering 717 storm events at 99 sites in 22 metropolitan areas and documented problems associated with metals and sediment concentrations in urban storm water runoff. More recent reports have confirmed the pollutant concentration data collected in the NURP study[4].

Other recent studies have not found significantly different pollutant concentrations in urban runoff when compared to the original NURP data[5].

Storm water runoff from lands modified by human activities can harm surface water resources and, in turn, cause or contribute to an exceedance of water quality standards by changing natural hydrologic patterns, accelerating stream flows, destroying aquatic habitat, and elevating pollutant concentrations and loadings. Such runoff may contain or mobilize high levels of contaminants, such as sediment, suspended solids, nutrients (phosphorous and nitrogen), heavy metals and other toxic pollutants, pathogens, toxins, oxygen-demanding substances (organic material), and floatables[6]. After a rain, storm water runoff carries these pollutants into nearby streams, rivers, lakes, estuaries, wetlands, and oceans. The highest concentrations of these contaminants often are contained in "first flush" discharges, which occur during the first major storm after an extended dry period[7]. Individually and combined, these pollutants impair water quality, threatening designated beneficial uses and causing habitat alteration or destruction. Uncontrolled storm water discharges from areas of urban development and construction activity negatively impact receiving waters by changing the physical, biological, and chemical composition of the water, resulting in an unhealthy environment for aquatic organisms, wildlife, and humans.

Urbanization alters the natural infiltration capability of the land and generates a host of pollutants that are associated with the activities of dense populations, thus causing an increase in storm water runoff volumes and pollutant loadings in storm water discharged to receiving waterbodies[8]. Urban development increases the amount of impervious surface in a watershed as farmland, forests, and meadowlands with natural infiltration characteristics are converted into buildings with rooftops, driveways, sidewalks, roads, and parking lots with virtually no ability to absorb storm water. Storm water and snow-melt runoff wash over these impervious areas, picking up pollutants along the way while gaining speed and volume because of their inability to disperse and filter into the ground. What results are storm water flows that are higher in volume, pollutants, and temperature than the flows in less impervious areas, which have more natural vegetation and soil to filter the runoff[9].

Studies reveal that the level of imperviousness in an area strongly correlates with the quality of the nearby receiving waters. For example, a study in the Puget Sound lowland ecoregion found that when the level of basin development exceeded 5 percent of the total impervious area, the biological integrity and physical habitat conditions that are necessary to support natural biological diversity and complexity declined precipitously[10]. Research conducted in numerous geographical areas, concentrating on various variables and employing widely different methods, has revealed a similar conclusion: stream degradation occurs at relatively low levels of imperviousness, such as 10 to 20 percent (even as low as 5 to 10 percent according to the findings of the Washington study referenced above)[11]. Furthermore, research has indicated that few, if any, urban streams can support diverse benthic communities at imperviousness levels of 25 percent or more. An area of medium density single family homes can be anywhere from 25 percent to nearly 60 percent impervious, depending on the design of the streets and parking[12].

In addition to impervious areas, urban development creates new pollution sources as population density increases, and brings with it proportionately higher levels of car emissions, car maintenance wastes, pet waste, litter, pesticides, and household

hazardous wastes, which may be washed into receiving waters by storm water or dumped directly into storm drains designed to discharge to receiving waters. More people in less space results in a greater concentration of pollutants that can be mobilized by, or disposed into, storm water discharges from municipal separate storm sewer systems. A modeling system developed for the Chesapeake Bay indicated that contamination of the Bay and its tributaries from runoff is comparable to, if not greater than, contamination from industrial and sewage sources[13].

In addition, the 1996 305(b) Report, provides a national assessment of water quality based on biennial reports submitted by the States as required under CWA section 305(b)[14]. In the CWA 305(b) reports, States, Tribes, and Territories assess their individual water quality control programs by examining the attainment or nonattainment of the designated uses assigned to their rivers, lakes, estuaries, wetlands, and ocean shores. A designated use is the legally applicable use specified in a water quality standard for a watershed, waterbody, or segment of a waterbody. The designated use is the desirable use that the water quality should support. Examples of designated uses include drinking water supply, primary contact recreation (swimming), and aquatic life support. Each CWA 305(b) report indicates the assessed fraction of a State's waters that are fully supporting, partially supporting, or not supporting designated beneficial uses. In their reports, States, Tribes, and Territories first identified and then assigned the sources of water quality impairment for each impaired waterbody using the following categories: industrial, municipal sewage, combined sewer overflows, urban runoff/storm sewers, agricultural, silvicultural, construction, resource extraction, land disposal, hydrologic modification, and habitat modification.

The 1996 Inventory, based on a compilation of 60 individual 305(b) reports submitted by States, Tribes, and Territories, assessed the following percentages of total waters nationwide: 19 percent of river and stream miles; 40 percent of lake, pond, and reservoir acres; 72 percent of estuary square miles; and 6 percent of ocean shoreline waters. The 1996 Inventory indicated that approximately 40 percent of the Nation's assessed rivers, lakes, and estuaries are impaired. Waterbodies deemed as "impaired" are either partially supporting designated uses or not supporting designated uses. The 1996 Inventory also found urban runoff/discharges from storm sewers to be a major source of water quality impairment nationwide. Urban runoff/storm sewers were found to be a source of pollution in 13 percent of impaired rivers; 21 percent of impaired lakes, ponds, and reservoirs; and 45 percent of impaired estuaries (second only to industrial discharges). Additionally, urban runoff was found to be the leading cause of ocean impairment for those ocean miles surveyed.

In addition, a recent USGS study of urban watersheds across the United States has revealed a link between urban development and contamination of local waterbodies. The study found the highest levels of organic contaminants, known as polycyclic aromatic hydrocarbons (PAHs) (products of combustion of wood, grass, and fossil fuels), in the reservoirs of urbanized watersheds[15].

In addition to the large-scale nationwide studies and assessments, a number of local and watershed-based studies from across the country have documented the detrimental effects of urban storm water runoff on water quality. A study of urban streams in Milwaukee County, Wisconsin found local streams to be highly degraded due primarily to urban runoff, while three studies in the Atlanta, Georgia region were characterized as being, "the first documentation in the Southeast of the strong negative relationship

between urbanization and stream quality that has been observed in other ecoregions"[16]. Several other studies, including those performed in Arizona (*Maricopa County*), California (*San Jose's Coyote Creek*), Massachusetts (*Green River*), Virginia (*Tuckahoe Creek*), and Washington (*Puget Sound lowland ecoregion*), all had the same finding: runoff from urban areas greatly impair stream ecology and the health of aquatic life; the more heavily developed the area, the more detrimental the effects[17]. Pitt and others also described the receiving water effects on aquatic organisms associated with urban runoff[18]. In Wisconsin runoff samples were collected from streets, parking lots, roofs, driveways, and lawns. Source areas were broken up into residential, commercial, and industrial. Geometric mean concentration data for residential areas included total solids of about 500-800 mg/L from streets and 600 mg/L from lawns. Fecal coliform data from residential areas ranged from 34,000 to 92,000 cfu/100 mL for streets and driveways. Contaminant concentration data from commercial and industrial source areas were lower for total solids and fecal coliform, but higher for total zinc[19,20]. A number of other studies have indicated that urban roadways often contain significant quantities of metal elements and solids[21].

Automotive service stations have been characterized as potential "hot spots" for hydrocarbon pollutants and heavy metals in urban storm water discharges[22]. In an urban area, **industrial and commercial activities** can also be considered hot spots as sources of pollutants[23]. Urban storm water also can contribute significant amounts of toxicants to receiving waters. Pitt et. al., found heavy metal concentrations in the majority of samples analyzed. Industrial or commercial areas were likely to be the most significant pollutant source areas[24].

Wet weather flows have been recognized as the primary sources of estuarine pollution in coastal communities. Urban storm water runoff, sanitary sewer overflows, and combined sewer overflows have become the largest causes of beach closings in the United States in the past years. Storm water discharges from urban areas not only pose a threat to the ecological environment, they also can substantially affect human health. A survey of coastal and Great Lakes communities reports that in 1998, more than 1,500 beach closings and advisories were associated with storm water runoff[25]. Other reports also document public health, shellfish bed, and habitat impacts from storm water runoff, including more than 823 beach closings/advisories issued in 1995 and more than 407 beach closing/advisories issued in 1996 due to urban runoff[26].

The studies and research performed in the Southern California area, including Los Angeles County, show the similar impacts of polluted urban runoff on the local receiving waters, with significant impacts on the health of the environment and local economy. The "Epidemiological Study of Possible Adverse Health Effects of Swimming in Santa Monica Bay", concluded that there is a 57 percent higher rate of illness in swimmers who swim adjacent to storm drains than in swimmers who swim more than 400 yards away from storm drains[27]. This and other studies document a relationship between gastrointestinal illness in swimmers and water quality, the latter of which can be heavily compromised by polluted storm water discharges. Other impacts on the Santa Monica Bay from the discharge of polluted storm water runoff have been documented[28].

In addition, the situation analysis of the "Los Angeles County Five-Year Public Education Overview" concluded:

Even after a generation of fighting water pollution, studies show the danger of illness to people swimming in waters near urban storm drain outfalls. The urban runoff that drains into the County's storm channels first litters and contaminates neighborhood streets and walks. Litter, fertilizers, pesticides, automobile soot and oil drippings, pet waste, and deteriorating leaves and plant debris not only make our communities unattractive, but also are swept untreated down the storm drains into our waterways...In total, the impacts of stormwater/urban runoff pollution encompass:

- losses to the County's $2 billion a year tourism economy
- health risks associated with swimming in areas near storm drain outfalls
- loss of recreational resources
- dramatic cost increases for cleaning up contaminated sediments
- impaired function and vitality of our natural resources
- losses to Southern California's commercial and sportfishing industry
- contamination to marine life[29].

III. Responsibility of Municipal Operators of Large and Medium Municipal Separate Storm Sewer Systems

The water quality impacts of urban runoff are well documented and identified as a leading cause of receiving water beneficial uses impairments. Many States and Municipalities in cooperation with U.S. EPA moved aggressively to control the sources of pollution within the framework of the NPDES permitting system and through other non-point source programs.

A. Role of Municipal Operator

As early as the promulgation of the 1990 Phase I storm water regulations, U.S. EPA clearly defined the roles and identified the responsibilities of all parties involved in the permitting process. Early on, the agency envisioned a partnership, a cooperative approach between U.S. EPA, States and Municipalities, recognizing that only through a coordinated effort will the difficult and complex issues of diffuse pollution be addressed appropriately. In the preamble to the 1990 Phase I storm water regulations, the agency stated that the:

> ...EPA still believes that municipal operators of large and medium municipal systems have an important role in **source identification** and the **development of pollutant controls for industries** that discharge storm water through municipal separate storm sewer systems is appropriate. Under the CWA, large and medium municipalities are responsible for reducing pollutants in discharges from municipal separate storm sewers to the maximum extent practicable. Because **storm water from industrial facilities may be a major contributor of pollutants** to municipal separate storm sewer systems, **municipalities are obligated to develop controls for storm water discharges associated with industrial activity through their system in their storm water management program**... EPA believes that the permitting of municipal storm sewer systems and the industrial discharges through them will act in a complimentary manner to

fully control the pollutants in those sewer systems. This will fully implement the intent of Congress to control industrial as well as large and medium municipal storm water discharges as expeditiously and effectively as possible.

U.S. EPA continued to clarify its intent for:

> "...[t]he permit application requirements for large and medium municipal separate storm sewer systems, discussed in more detail later in today's preamble, **address the responsibilities of the municipal operators of these systems to identify and control pollutants in storm water discharges associated with industrial activity**. Permit applications for large and medium municipal separate storm sewer systems are to identify the location of facilities which discharge storm water associated with industrial activity to the municipal system... In addition, municipal applicants will provide a description of a proposed management program to reduce, to the maximum extent practicable, pollutants from storm water discharges associated with industrial activity which discharge to the municipal system... Controls developed in management plans for municipal permits may take a variety of forms. Where necessary, municipal permittees can pursue local remedies to develop **measures to reduce pollutants or halt** storm water discharges with high level of pollutants through municipal storm sewer systems. Some local entities have already implemented ordinances or laws that are designated to reduce the discharge of pollutants to municipal separate storm sewers, while other municipalities have developed a variety of techniques to control pollutants in storm water."

U.S. EPA reconfirmed its position in regard to the role of municipal operators of large and medium MS4s when it issued, in 1993 (58 FR 61146), the notice for the proposed multi-sector stormwater general permit for discharges of storm water associated with industrial activity (multi-sector permit).

In the Fact Sheet for the proposed multi-sector permit, U.S. EPA reiterated its position regarding the complimentary permit approach envisioned to address storm water discharges associated with industrial activity:

> "A second permit issued to the operator of the large or medium municipal storm sewer, establishes the **responsibilities** of the municipal operators in controlling pollutants from storm water associated with industrial activity which discharge through their system... The municipal storm water management programs that will be incorporated into NPDES permits for discharges from MS4s will generally address (in addition to other possible requirements) the following three major components:
>
> - Reducing pollutants in storm water discharges from municipal landfills; hazardous waste treatment, storage and disposal facilities; facilities subject to the Emergency Planning and Community Right-to-Know Act (EPCRA), section 313; and other priority industrial facilities through municipal separate storm sewers.
> - Reducing pollutants in construction site runoff through municipal separate storm sewers.
> - Identifying and controlling non-storm water discharges to municipal separate storm sewers...

> Municipal programs to reduce pollutants in industrial site runoff and construction site runoff through MS4s **specifically will address municipal responsibilities in controlling pollutants from industrial facilities.**"

Recently, in its Storm Water Phase II Compliance Assistance Guide (Guide)[30], U.S. EPA restated and further clarified its intention regarding the integration of NPDES programs for storm water discharges: "...[t]he Phase I permits for MS4s mostly cover larger cities, and require them to develop a storm water management program, **track and oversee industrial facilities** regulated under the NPDES storm water program, conduct some monitoring, and submit periodic reports."

Furthermore, when referring to integration of NPDES program for construction (which is one of the eleven industrial categories addressed by the storm water program) with NPDES program for MS4s, the Guide specifies:

- "These are two **separate** and **distinct** construction programs.
- A construction operator is subject to requirements under **BOTH** programs if it is located in an NPDES-regulated MS4's jurisdiction."

In addition, the No Exposure Certification Form for Exclusion from NPDES Storm Water Permitting[31], includes in the certification section the following statements:

> "I understand that I am obligated to submit a no exposure certification form once every five years to the NPDES permitting authority and, if requested, to the operator of the local municipal separate storm sewer system (MS4) into which the facility discharges (where applicable). I understand that **I must allow the NPDES permitting authority, or MS4 operator where the discharge is into the local MS4, to perform inspections** to confirm the condition of no exposure and to make such inspection reports publicly available upon request."

Once more, U.S. EPA clearly states its standpoint that NPDES permitting authority responsibilities are intertwined with those of the local agency.

It can be reasonably inferred from the regulatory record and actions that U.S. EPA clearly envisioned a dual coverage and a strong role and clear responsibilities for the municipal operator in controlling pollutants from industrial sites as distinct from the activities required by the NPDES permitting agency. However, activities required by both entities should be coordinated and integrated as much as possible to achieve to common goal of effectively controlling and reducing the discharge of pollutants into the storm water runoff.

B. Legal Authority

40 CFR §122.26(d)(2)(i) ***Adequate legal authority.*** A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:
(A) Control through ordinance, permit, contract, order or similar means, the **contribution of pollutants to the municipal storm sewer by storm water discharges associated**

with industrial activity and the quality of storm water discharged from sites of industrial activity;
(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;
(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;
(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;
(E) Require compliance with conditions in ordinances, permits, contracts or orders; and
(F) **Carry out all inspection, surveillance** and monitoring procedures necessary to determine compliance and noncompliance with permit conditions **including** the prohibition on illicit discharges to the municipal separate storm sewer.

40 CFR §122.26(d)(2)(iv)(A)(*5*) A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, which shall identify priorities and procedures for **inspections** and establishing and implementing control measures for such discharges (this program can be coordinated with the program developed under paragraph (d)(2)(iv)(C) of this section);

40 CFR §122.26(d)(2)(iv)(C) A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), **and industrial facilities** that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program shall:
(*1*) **Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges;**...

In its Guidance Manual[32] U.S. EPA explicitly states on what the municipalities must achieve: "The municipality, as a permittee, is responsible for compliance with its permit and must have the authority to implement the conditions in its permit. To comply with its permit, a municipality must have the authority to **hold dischargers accountable for their contributions** to separate storm sewers."

The Guidance Manual provides more clarification in regard to the extent of facilities that must be addressed and the link that must be made with the potential sources of pollutants: "However, a municipality, to satisfy its permit conditions, **may need to impose additional requirements** on **discharges from permitted industrial facilities, as well as discharges from industrial facilities** and construction sites ***not* required to obtain permits**... [t]he Source Identification component requires the applicant to provide **an inventory of pollutant sources**, organized by watershed. This inventory **identifies and describes the products and services** of each industrial facility that may discharge storm water to the MS4. The Source identification component suggests applicants to use standard industrial classification codes (SIC) codes for this description. EPA strongly recommends this information be used to identify priority waste handling sites and industrial facilities. A similar technique could be developed for sites ***that do not meet*** the ***regulatory definition of "storm water discharge associated with industrial activity"*** (i.e. not included in the Source Identification and Discharge Characterization

components), but ***are identified as a high priority*** under the proposed management program." It can be concluded that the scheme envisioned by the regulations do not only address industrial sites covered under the definition of storm water discharge associated with industrial activity, but depending on the identified significant sources contributing pollutants to the storm water runoff, other types of industrial facilities, such as commercial, must be addressed in the municipal program to inspect facilities contributing pollutants to the municipal separate storm drain system.

Many existing permits issued by U.S. EPA or authorized States, nationwide, already include these kind of requirements and municipalities are actively implementing them.[33] Regional Boards in California also issued MS4 permits requiring a program for inspections at industrial or commercial facilities.[34] Municipalities used a large spectrum of methods and innovative ways to implement the inspection program, and many local jurisdictions have the adequate required legal authority or have adopted ordinances giving them the necessary legal authority. Even smaller cities, to be covered under Phase II, not required to obtain the legal authorities for inspections as yet, decided to pass ordinances giving them the necessary authority for the implementation of the storm water program, including the authority to inspect industrial or commercial facilities and adopt and impose BMPs.[35]

As early as 1993, U.S. EPA Region 9, clarified the role of municipalities in addressing industrial sources.[36] More recently the same position was restated.[37] Regional Board's position, starting with the 1990 MS4 Permit was that an inspection program was required in the municipal storm water permit and was supported by the legal analysis provided by the State Board's Office of Chief Counsel[38].

C. Source Identification

40 CFR §122.26(d)(2)(ii). Source Identification... *Provide an inventory, organized by watershed of the name and address, and a description (such as SIC Codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity.*

A very careful consideration was given to the issue of the pollutant sources in storm water discharges through MS4s and the control of those pollutant sources. The Agency continued to discuss and describe its intent of the elements needed to be addressed by a municipality through the application process in regards to the sources that contribute pollutants to the municipal storm sewers. Under the source identification heading in the preamble to the 1990 Phase I storm water regulations, U.S. EPA stated that, "...**the identification of sources which contribute pollutants** to municipal separate storm sewers is a **critical step** in characterizing **the nature and extent of pollutants in discharges** and in **developing appropriate control measures.**" The agency expands the scope of the source identification concept leaving it general instead of focusing on any particular area, such as industrial, commercial, residential, roadways, etc., but linking it to the existing water quality problems. It is clear that the intent of the agency was to draw the attention of applicants to addressing, in a flexible way, the real issues and focus their limited resources on controlling the most problematic sources:

> "...**source identification** can be useful for providing **an analysis of pollutant source contribution** and for **identifying the relationship between pollutant**

sources and receiving water quality problems. In cases where end-of-pipe controls alone are not practicable, it is essential to identify the source of pollutants into the municipal storm sewer system to support **a targeted approach to control pollutant sources.**"

The agency continues to comment and clarify the provisions under the application requirements of the regulations:

> "...Part 1 of the application will also include: [...]**the location of industrial facilities, open dumps, landfills or RCRA hazardous waste facilities** which discharge storm water to the municipal storm sewer system;...Part 2 of the application will supplement the information reported in part 1 of the application so that,[...]municipal or public entities responsible for and obtaining an NPDES permit will be required to **identify the location of an open dump, sanitary landfill, municipal incinerator or hazardous waste treatment, storage, and disposal facility under RCRA which may discharge storm water to the system as well as all facilities which discharge storm water with industrial activity into a large or medium municipal separate storm sewer system.** Requiring **these source identification measures is supported by the legislative history of section 405 of the WQA**, which instructs that '[i]n writing **any permit for a municipal separate storm sewer, EPA or the State should pay particular attention to the nature and uses of the drainage area and the location of any industrial facility, open dump, landfill, or hazardous waste treatment, storage, or disposal facility which may contribute pollutants to the discharge.**'[39]"

In answering some of the comments regarding the value of source identification information, the agency responded:

> [..]the **source identification** information serves several purposes. It is the first step for **identifying potential sources of pollutants** from which more in depth analysis can be accomplished...The **source identification component** of the municipal application also requires that **municipal applicants identify the industrial activity within the drainage area associated with each major outfall**...[A]pplicants identify the types of industrial facilities operating within the municipality, the municipality is free to use Standard Industrial Classification (SIC) or other systems which identify the principal products or services of the facility.

D. Los Angeles MS4 Permittees Compliance Efforts

The Permittees covered under the Los Angeles MS4 permit addressed the element of source identification and prioritization through compliance with the requirements of the 1996 permit (Board Order No. 96-054). The Critical Source Selection and Monitoring Report (Critical Source Report), identified 30 categories of industrial and commercial activities that may impact the quality of the stormwater runoff discharged to the MS4[40]. The study also ranked the critical sources on the basis of potential impact and proposed a Critical Source/BMP Monitoring program at the five highest ranked facility types: (i)

wholesale trade (scrap, auto dismantling), (ii) *automotive repair/parking*, (iii) fabricated metal products, (iv) motor freight (including trucking), (v) chemical and allied products.

At the same time, the Permittees, under the coordination of the Los Angeles County Department of Public Works, compiled, in 1997, a facilities database for the MS4 program identifying approximately 58,000 facilities that could have been potentially addressed by the public education site visit program. Out of the total universe of 58,000 facilities identified by their SIC Code, 21,000 were food or food related establishments. The 36,000 remaining facilities were in industrial/commercial sectors. An updated review of the potential number of facilities within the LA MS4 area, identified in the 30 industrial/commercial sectors Critical Source Report (not including food establishments), revealed that the number of facilities can be as high as 26,300 sites as of 2001. The survey was performed with the help of the Los Angeles City Stormwater Management Division staff. A significant portion of the total number of facilities, up to 60%, may be located within the City of Los Angeles boundaries. The SIC Code system proved to be inadequate in identifying the correct type of activity performed on-site, and also a significant number of facilities may not have activities or materials exposed to stormwater, which will make the actual number of sites potentially addressed through the municipal stormwater program much smaller than predicted.

The results of the Critical Source/BMP Monitoring program confirmed that the five highest ranking activities indeed contribute significant quantities of pollutants and source control BMPs alone were not effective in reducing the amount of pollutants into the stormwater runoff. The majority of the sampling results were in excess of the Criteria for Priority Toxic Pollutants for the State of California.[41] However, since the implementation of the source control BMPs was voluntary, the study could not determine with certainty that the apparent failure was due to the inefficacy of the BMPs or the lack of proper implementation.[42]

Furthermore, the Research Report on Issues, Pollutants and Materials[43](Research Report) accomplishes a comprehensive analysis of sources of pollutants, generation and receiving water impacts. The Research Report puts in a concise form and creates the link between typical pollutant sources, pollutants found in the County's waterbodies, pollutant of concerns for each Watershed Management Area and pollutants of concerns detected through previous monitoring. The Research Report clearly identifies the targeted pollutants: (i) heavy metals, (ii) oil and grease/PAHs, (iii) sediments, (iv) oxygen demanding substances, (v) litter/trash/debris, (vi) nutrients, (vii) other toxic materials, such as pesticides.[43] The Research Report confirms once again that the urban environment in the Los Angeles area is similar to the other urban areas in the nation when it comes to stormwater runoff characterization and receiving water impacts. The Los Angeles area is probably unique due to the highly industrialized and vast area served by an interconnected storm sewer system unlike any other in the nation. But that makes it even more imperative that significant efforts must be allocated in order to control the discharge of pollutants in the urban runoff.

CONCLUSION

From the record and all the studies referenced in this report it is evident that an inspection program at industrial and commercial facilities is not only required under the storm water

regulations but it is an essential component to control the contribution of pollutants from industrial or commercial facilities into storm water discharges through the municipal storm drain system. This inspection program is separate and in addition to the program administered by the Regional Board, and the municipalities have a clear responsibility to perform them.

The dual coverage is intended in the regulations, in order to maximize the use of limited resources at the State and local level, and assure through active coordination that significant sources of pollutants are not overlooked or missed due to lack of legal authority.

The Permittees under the Los Angeles MS4 Permit have made great strides in preparing the ground work for next phase of implementation: they performed a comprehensive source identification study confirmed by the monitoring results, the Regional Board approved the minimum menu of BMPs presented by the Permittees and they already put facilities on notice and performed the educational part through the site visits effort.

The introduction of the inspection program in the new MS4 permit is not capricious or arbitrary but based on facts. It utilizes tools already developed by Permittees and follows a widespread precedent in MS4 permits nationwide and in California.

Requirement	Reference
Superfund Amendments and Reauthorization Act of 1986 (SARA), and ***industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading*** to the municipal storm sewer system. The program **shall:** (1) **Identify priorities and procedures for inspections** and **establishing and implementing control measures** for such discharges;	
NPDES permits for MS4s will establish *responsibilities* for municipal system operators to control pollutants from industrial storm water discharged through their system.	Guidance Manual pag. 6-16
Proposed storm water management programs must address the reduction of pollutants in storm water discharges from **municipal landfills, hazardous waste treatment, disposal and recovery facilities, facilities subject to SARA Title III;** and ***other priority industrial facilities***, as determined by the applicant. **Municipalities should consider** the information gathered for [..] the part 2 application (**particularly the Source Identification and Characterization Data** components) when prioritizing storm water discharges from these sites.	Guidance Manual pag. 6-16
In part 2 application, the Source Identification component requires the applicant to provide **an inventory of pollutant sources,** organized by watershed. This inventory **identifies and describes the products and services** of each industrial facility that may discharge storm water to the MS4. The Source identification component suggests applicants to use standard industrial classification codes (SIC) codes for this description. EPA strongly recommends this information be used to identify priority waste handling sites and industrial facilities. A similar technique could be developed for sites ***that do not meet*** the ***regulatory definition of "storm water discharge associated with industrial activity"*** (i.e. not included in the Source Identification and Discharge Characterization components), but ***are identified as a high priority*** under the proposed management program.	Guidance Manual pag. 6-16 [Commercial Sites]
The municipality is **ultimately responsible** for discharges from their MS4. Consequently, the proposed storm water management program should describe how **the municipality will help** EPA and authorized NPDES States: • **Identify priority industries** discharging to their systems; • **Review. and evaluate storm water pollution prevention plans and other procedures that industrial facilities must develop under general or individual permits;** • **Establish and implement BMPs to reduce pollutants from these industrial facilities (or require industry to implement them);** and • ***Inspect* and monitor industrial facilities *to verify* that the industries discharging storm water to the municipal systems *are in compliance with their NPDES storm water permit***, if required.	Guidance Manual pag. 6-17
At a minimum, priority facilities include: • Operating and closed municipal landfills; • Hazardous waste treatment, disposal or recovery facilities; and • Facilities subject to SARA Title III.	Guidance Manual pag. 6-17

R0007725

Requirement	Reference
Municipalities must identify these **and *other priority industrial facilities* and describe the criteria used to identify them.** For example, information from the Toxics Release Inventory is one source a municipality could use to identify industrial facilities subject to SARA Title III. **Other sources** may include CWA Section 205 or 208 use-attainability studies, other studies that **indicate a site-specific beneficial use impairment immediately downstream of a storm water outfall,** or **records of industrial pretreatment programs or other permit programs that identify facilities that may be the source of a use impairment or a major contribution of pollutants.** The program should also describe procedures for modifying the inventory of priority industries based on **additional evaluation** that occurs throughout the permit term.	
During the term of the permit, as additional information becomes available, **the municipality should target and set priorities for other program elements** that emerge.	Guidance Manual pag. 6-18
As noted above, when identifying priority sites, applicants must consider all the facilities listed in 122.26(d)(2)(iv)(C)(1). When municipalities develop criteria for **identifying additional priority industrial facilities**, they are advised to consider, **at a minimum:** • The **type of industrial activity** (SIC codes can help characterize the type of industrial activity); • The **use and management of chemicals or raw products** at the facility and **the likelihood** that storm water discharge from the site **will be contaminated**; and • The **size and location of the facility in relation to sensitive watersheds.**	Guidance Manual pag. 6-18
The proposed management program **must include procedures for inspecting priority industrial sites.** The results of inspection may be used as a basis for **requiring storm water management controls and enhanced pollution prevention measures.** It should also establish an **inspection schedule** for each priority facility at the time it is identified.	Guidance Manual pag. 6-18
Applicants also should describe a procedure for **conducting follow-up inspections**, where necessary, as part of this program component. For example, follow-up inspections **might be needed to verify the installation of a specific control or implementation of a practice specified** in a negotiated agreement between the municipality and the industrial site. A system-wide approach to establishing priorities for inspection procedures is recommended. The system-wide approach should begin with the evaluation of existing information, followed by the identification and evaluation of new information during the permit term. Therefore, applicants **should link** these procedures with information from the Source Identification and Discharge Characterization components.	Guidance Manual pag. 6-19
A municipality **must consider** if it **should place more stringent controls on discharges associated with industrial activity than are required in an industrial facility's existing NPDES storm water**	Guidance Manual pag. 6-19

R0007726

Requirement	Reference
permit.	
Priority industrial facilities should focus on controlling activities such as the use, storage, and handling of toxic chemicals. Standard methods for implementing control measures at different types of facilities should be described. To facilitate this, municipalities **should obtain copies of the pollution prevention plans developed by industrial permittees. Control measures** that the municipality **may suggest include preventing exposure of pollutant sources to precipitation, on-site pretreatment, and oil/water separators.**	Guidance Manual pag. 6-19
The proposed management program **should describe the inspection procedures that will be followed. Storm water inspections can be coupled with inspections for other purposes** (e.g., pretreatment programs, fire and safety). Proposed management **programs should address minimum frequency for routine inspections.** For example, **how often, how much of the site, and how long an inspection may take** are appropriate to explain in this proposed management program component. Applicants should also describe **procedures for conducting inspections and provide an inspector's checklist.** In addition, these inspection procedures should identify the **minimum number of inspectors** that will be employed and **describe the programs to train them.**	Guidance Manual pag. 6-19
Municipalities are **urged to *evaluate* pollution prevention plans and discharge monitoring data collected by the industrial facility to *ensure* that the facility is *in compliance with its NPDES storm water permit. Site inspections* should include (1) *an evaluation of the pollution prevention plan*** and any other pertinent documents, **and (2)** an ***on-site visual inspection of the facility*** to ***evaluate the potential*** **for *discharges of contaminated storm water*** from the site and ***to assess the effectiveness of the pollution prevention plan.***	Guidance Manual pag. 6-20
On November 16, 1990 (55 FR 47990), EPA promulgated a permitting scheme where controls for storm water discharges associated with industrial activity through large and medium municipal separate storm sewer systems may be addressed by two permits issued in a coordinated manner. This complementary permit approach envisions cooperative efforts by the permit issuing agency and municipal operators of large and medium municipal separate storm sewer systems to develop programs that will result in controls on pollutants in storm water discharges associated with industrial activity which discharge through municipal systems.	Federal Register, Vol. 58, No. 222 pag. 61158
Under the complementary permit approach, storm water discharges associated with industrial activity which discharge through large and medium municipal separate storm sewer systems are required to obtain permit coverage. Permits for these discharges will establish requirements (such as controls or monitoring) for industrial operators of the discharge into the municipal system. In addition, these permits provide a basis for enforcement actions directly against the owner or operator of storm water discharges associated with industrial activity.	Federal Register, Vol. 58, No. 222 pag. 61158
A second permit, issued to the operator of the large or medium municipal separate storm sewer, establishes the responsibilities of the	Federal Register, Vol. 58, No. 222 pag. 61158

Requirement	Reference
municipal operators in controlling pollutants from storm water associated with industrial activity which discharges through their system. The framework for permits for discharges from large and medium municipal separate storm sewer systems has been developed to establish the responsibilities of the municipals systems.	
At the heart of the permit program for discharges from municipal separate storm sewer systems serving a population of 100,000 or more are requirements that municipal applicants develop and implement municipal storm water management programs.	Federal Register, Vol. 58, No. 222 pag. 61158
The municipal storm water management programs that will be incorporated into NPDES permits for discharges from municipal separate storm sewer systems will generally address (in addition to other possible requirements) the following three major components: • Reducing pollutants in storm water discharges from municipal landfills; hazardous waste treatment, storage, and disposal facilities; facilities subject to the Emergency Planning and Community Right-to-Know Act (EPCRA), section 313; and other priority industrial facilities through municipal separate storm sewers. • Reducing pollutants in construction site runoff through municipal separate storm sewers. • Identifying and controlling non-storm water discharges to municipal separate storm sewer systems. These components of a municipal program can initiate the role of the municipality in assisting EPA and authorized NPDES States in implementing controls to reduce pollutants in storm water discharges associated with industrial activity which discharge through large and medium municipal separate storm sewer systems.	Federal Register, Vol. 58, No. 222 pag. 61158
Municipal programs to reduce pollutants in industrial site runoff and construction site runoff through municipal separate storm sewer systems specifically will address municipal responsibilities in controlling pollutants from industrial facilities.	Federal Register, Vol. 58, No. 222 pag. 61158
EPA proposed a permitting scheme that would define the requirement to obtain coverage under an NPDES permit for a storm water discharge associated with industrial activity through a municipal separate storm sewer in terms of the classification of the municipal separate storm sewer. EPA proposed holding municipal operators of large or medium municipal separate storm sewer systems primarily responsible for applying for and obtaining an NPDES permit covering system discharges as well as storm water discharges (including storm water discharges associated with industrial activity) through the system.	Federal Register, Vol. 55, No. 222 pag. 47997-98
Under the proposed approach, operators of storm water discharges associated with industrial activity which discharge through a large or medium municipal separate storm sewer system would generally not be required to obtain permit coverage for their discharge (unless designated as a significant contributor of pollution pursuant to section 402(p)(2)(E)) provided the municipality was notified of: The name, location and type of facility and a certification that the discharge has been tested (if feasible) for non-storm water (including the results of any testing). The	Federal Register, Vol. 55, No. 222 pag. 47998

R0007728

Requirement	Reference
notification procedure also required the operator of the storm water discharge associated with industrial activity to determine that: The discharge is composed entirely of storm water, the discharge does not contain hazardous substances in excess of reporting quantities; and the facility is in compliance with applicable provisions of the NPDES permit issued to the municipality for storm water.	
EPA also expressed its belief, based upon an analysis of ordinance controlling construction site runoff in places in certain cities, that municipalities generally possessed legal authority sufficient to control contributions of industrial storm water pollutants to their separate storm sewers to the degree necessary to implement the proposed rule.	Federal Register, Vol. 55, No. 222 pag. 47998
Based on consideration of the comments received on the notice, EPA has decided that it is appropriate to revise the approach in its proposed rule to require direct permit coverage for all storm water discharges associated with industrial activity, including those that discharge through municipal separate storm sewers.	Federal Register, Vol. 55, No. 222 pag. 47998
In response to all of these concerns, EPA has decided to require storm water discharges associated with industrial activity which discharge through municipal separate storm sewers to obtain separate individual or general NPDES permits.	Federal Register, Vol. 55, No. 222 pag. 48000
Although today's rule will require industrial discharges through municipal storm sewers to be covered by a separate permit, EPA still believes that municipal operators of large and medium municipal systems have an important role in source identification and the development of pollutant controls for industries that discharge storm water through municipal separate storm sewer systems is appropriate.	Federal Register, Vol. 55, No. 222 pag. 48000
Under the CWA, large and medium municipalities are responsible for reducing pollutants in discharges from municipal separate storm sewers to the maximum extent practicable. Because storm water from industrial facilities may be a major contributor of pollutants to municipal separate storm sewer systems, municipalities are obligated to develop controls for storm water discharges associated with industrial activity through their system in their storm water management program.	Federal Register, Vol. 55, No. 222 pag. 48000
The CWA provides that permits for municipal separate storm sewers shall require municipalities to reduce pollutants to the maximum extent practicable. Permits issued to municipalities for discharges from municipal separate storm sewers will reflect terms, specified controls, and programs that achieve that goal.	Federal Register, Vol. 55, No. 222 pag. 48000
As with all NPDES permits, responsibility and liability is determined by the discharger's compliance with the terms of the permit. A municipality's responsibility for industrial storm water discharged through their system is governed by the terms of the permit issued. If an industrial source discharges storm water through a municipal separate storm sewer in violation of requirements incorporated into a permit for the industrial facility's discharge, that industrial operator of the discharge may be subject to an enforcement action instituted by the Director of the NPDES program.	Federal Register, Vol. 55, No. 222 pag. 48000
Today's rule also requires operators of storm water discharges associated with industrial activity through large and medium municipal	Federal Register, Vol. 55, No. 222 pag. 48000

Requirement	Reference
systems to provide municipal entities of the name, location, and type of facility that is discharging to the municipal system. This information will provide municipalities with a base of information from which management plans can be devised and implemented. This requirement is in addition to any requirements contained in the industrial facility's permit. As in the proposal, the notification process will assist cities in development of their industrial control programs.	
EPA intends for the NPDES program, through requirements in permits for storm water discharges associated with industrial activity, to work in concert with municipalities in the industrial component of their storm water management program efforts. EPA believes that permitting of municipal storm sewer systems and the industrial discharges through them will act in a complementary manner to fully control the pollutants in those sewer systems.	Federal Register, Vol. 55, No. 222 pag. 48000
This will fully implement the intent of Congress to control industrial as well as large and medium municipal storm water discharges as expeditiously and effectively as possible. This approach will also address the concerns of municipalities that they lack sufficient authority and resources to control all industrial contributions to their storm sewers and will be liable for discharges outside of their control.	Federal Register, Vol. 55, No. 222 pag. 48000-01
In addition, municipal applicants will provide a description of a proposed management program to reduce, to the maximum extent practicable, pollutants from storm water discharges associated with industrial activity which discharge to the municipal system.	Federal Register, Vol. 55, No. 222 pag. 48001

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD

ORDER WQ 2001-15

In the Matter of the Petitions of

BUILDING INDUSTRY ASSOCIATION OF SAN DIEGO COUNTY
AND
WESTERN STATES PETROLEUM ASSOCIATION

For Review Of Waste Discharge Requirements Order No. 2001-01
for Urban Runoff from San Diego County
[NPDES No. CAS0108758]
Issued by the
California Water Quality Control Board,
San Diego Region

SWRCB/OCC FILES A-1362, A-1362(a)

BY THE BOARD:

On February 21, 2001, the San Diego Regional Water Quality Control Board (Regional Water Board) issued a revised national pollutant discharge elimination system (NPDES) permit in Order No. 2001-01 (permit) to the County of San Diego (County), the 18 incorporated cities within the County, and the San Diego Unified Port District. The permit covers storm water discharges from municipal separate storm sewer systems (MS4) throughout the County. The permit is the second MS4 permit issued for the County, although the first permit was issued more than ten years earlier.[1]

[1] NPDES permits generally expire after five years, but can be extended administratively where the Regional Water Board is unable to issue a new permit prior to the expiration date. As the record in this matter amply demonstrates, the Regional Water Board engaged in an extensive process of issuing draft permits, accepting comments, and holding workshops and hearings since at least 1995.

R0007735

The permit includes various programmatic and planning requirements for the permittees, including construction and development controls, controls on municipal activities, controls on runoff from industrial, commercial, and residential sources, and public education. The types of controls and requirements included in the permit are similar to those in other MS4 permits, but also reflect the expansion of the storm water program since the first MS4 permit was adopted for San Diego County 11 years ago.[2]

On March 23, 2001, the State Water Resources Control Board (State Water Board or Board) received petitions for review of the permit from the Building Industry Association of San Diego County (BIA) and from the Western States Petroleum Association (WSPA).[3] The petitions are legally and factually related, and have therefore been consolidated for purposes of review.[4] None of the municipal dischargers subject to the permit filed a petition, nor did they file responses to the petitions.

I. BACKGROUND

MS4 permits are adopted pursuant to Clean Water Act section 402(p). This federal law sets forth specific requirements for permits for discharges from municipal storm sewers. One of the requirements is that permits "shall require controls to reduce the discharge of pollutants to the maximum

[2] For a discussion of the evolution of the storm water program, consistent with guidance from the United States Environmental Protection Agency (U.S. EPA), see Board Order WQ 2000-11.

[3] On March 23, the State Water Board also received brief letters from the Ramona Chamber of Commerce, the North San Diego County Association of Realtors, the San Diego County Apartment Association, the National Association of Industrial and Office Properties, and the California Building Industry Association. All of these letters state that they are "joining in" the petition filed by BIA. None of the letters contain any of the required information for petitions, which is listed at Cal. Code of Regs., tit. 23, section 2050. These letters will be treated as comments on the BIA petition. To the extent the authors intended the letters be considered petitions, they are dismissed.

[4] Cal. Code of Regs., tit. 23, section 2054.

extent practicable [MEP]." States establish appropriate requirements for the control of pollutants in the permits.

This Board very recently reviewed the need for controls on urban runoff in MS4 permits, the emphasis on best management practices (BMPs) in lieu of numeric effluent limitations, and the expectation that the level of effort to control urban runoff will increase over time.[5] We pointed out that urban runoff is a significant contributor of impairment to waters throughout the state, and that additional controls are needed. Specifically, in Board Order WQ 2000-11 (hereinafter, LA SUSMP order), we concluded that the Los Angeles Regional Water Board acted appropriately in determining that numeric standards for the design of BMPs to control runoff from new construction and redevelopment constituted controls to the MEP.[6]

The San Diego permit incorporates numeric design standards for runoff from new construction and redevelopment similar to those considered in the LA SUSMP order.[7] In addition, the permit addresses programmatic requirements in other areas. The LA SUSMP order was a precedential decision,[8] and we will not reiterate our findings and conclusions from that decision.[9]

---

[5] Board Order WQ 2000-11.

[6] As explained in that Order, numeric design standards are not the same as numeric effluent limitations. While BIA contends that the permit under review includes numeric effluent limitations, it does not. A numeric design standard only tells the dischargers how much runoff must be treated or infiltrated; it does not establish numeric effluent limitations proscribing the quality of effluent that can be discharged following infiltration or treatment.

[7] The San Diego permit also includes provisions that are different from those approved in the LA SUSMP Order, but which were not the subject of either petition. Such provisions include the inclusion of non-discretionary projects. We do not make any ruling in this Order on matters that were not addressed in either petition.

[8] Government Code section 11425.60; State Board Order WR 96-1 (Lagunitas Creek), at footnote 11.

[9] BIA restates some of the issues this Board considered in the LA SUSMP order. For instance, BIA contends that it is inappropriate for the permit to regulate erosion control. While this argument was not specifically addressed in our prior Order, it is obvious that the most serious concern with runoff from construction is the potential for increased erosion. It is absurd to contend that the permit should have ignored this impact from urban runoff.

The petitioners make numerous contentions, mostly concerning requirements that they claim the dischargers will not be able to, or should not be required to, comply with. We note that none of the dischargers has joined in these contentions. We further note that BIA raises contentions that were already addressed in the LA SUSMP order. In this Order, we have attempted to glean from the petition issues that are not already fully addressed in Board Order Board Order WQ 2000-11, and which may have some impact on BIA and its members. WSPA restated the contentions it made in the petition it filed challenging the LA SUSMP order. We will not address those contentions again.[10] But we will address whether the Regional Water Board followed the precedent established there as it relates to retail gasoline outlets.[11]

---

[10] On November 8, 2001, following the October 31 workshop meeting that was held to discuss the draft order, BIA submitted a "supplemental brief" that includes many new contentions raised for the first time. (Interested persons who were not petitioners filed comments on the draft order asking the State Water Board to address some of these.) The State Water Board will not address these contentions, as they were not timely raised. (Wat. Code § 13320; Cal. Code of Regs., tit. 23, § 2050(a).) Specific contentions that are not properly subject to review under Water Code section 13320 are objections to findings 16, 17, and 38 of the permit, the contention that permit provisions constitute illegal unfunded mandates, challenges to the permit's inspection and enforcement provisions, objections to permit provisions regarding construction sites, the contention that post-construction requirements should be limited to "discretionary" approvals, the challenge to the provisions regarding local government compliance with the California Environmental Quality Act, and contentions regarding the term "discharge" in the permit. BIA did not meet the legal requirements for seeking review of these portions of the permit.

[11] On November 8, 2001, the State Water Board received eight boxes of documents from BIA, along with a "Request for Entry of Documents into the Administrative Record." BIA failed to comply with Cal. Code of Regs., tit. 23, section 2066(b), which requires such requests be made "prior to or during the workshop meeting." The workshop meeting was held on October 31, 2001. The request will therefore not be considered. BIA also objected in this submittal that the Regional Water Board did not include these documents in its record. The Regional Water Board's record was created at the time the permit was adopted, and was submitted to the State Water Board on June 11, 2001. BIA's objection is not timely.

II. CONTENTIONS AND FINDINGS[12]

Contention: BIA contends that the discharge prohibitions contained in the permit are "absolute" and "inflexible," are not consistent with the standard of "maximum extent practicable" (MEP), and financially cannot be met.

Finding: The gist of BIA's contention concerns Discharge Prohibition A.2, concerning exceedance of water quality objectives for receiving waters: "Discharges from MS4s which cause or contribute to exceedances of receiving water quality objectives for surface water or groundwater are prohibited." BIA generally contends that this prohibition amounts to an inflexible "zero contribution" requirement.

BIA advances numerous arguments regarding the alleged inability of the dischargers to comply with this prohibition and the impropriety of requiring compliance with water quality standards in municipal storm water permits. These arguments mirror arguments made in earlier petitions that required compliance with water quality objectives by municipal storm water permittees. (See, e.g., Board Orders WQ 91-03, WQ 98-01, and WQ 99-05.) This Board has already considered and upheld the requirement that municipal storm water discharges must not cause or contribute to exceedances of water quality objectives in the receiving water. We adopted an iterative procedure for complying with this requirement, wherein municipalities must report instances where they cause or contribute to exceedances, and then must review and improve BMPs so as to protect the receiving

[12] This Order does not address all of the issues raised by the petitioners. The Board finds that the issues that are not addressed are insubstantial and not appropriate for State Water Board review. (See *People v. Barry* (1987) 194 Cal.App.3d 158 [239 Cal.Rptr. 349]; Cal. Code Regs., tit. 23, § 2052.) We make no determination as to whether we will address the same or similar issues when raised in future petitions.

waters. The language in the permit in Receiving Water Limitation C.1 and 2 is consistent with the language required in Board Order WQ 99-05, our most recent direction on this issue.[13]

While the issue of the propriety of requiring compliance with water quality objectives has been addressed before in several orders, BIA does raise one new issue that was not addressed previously. In 1999, the Ninth Circuit Court of Appeals issued an opinion addressing whether municipal storm water permits must require "strict compliance" with water quality standards.[14] (*Defenders of Wildlife v. Browner* (9th Cir. 1999) 191 F.3d 1159.) The court in *Browner* held that the Clean Water Act provisions regarding storm water permits do not require that municipal storm-sewer discharge permits ensure strict compliance with water quality standards, unlike other permits.[15] The court determined that: "Instead, [the provision for municipal storm water permits] *replaces* the requirements of [section 301] with the requirement that municipal storm-sewer dischargers 'reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator . . . determines appropriate for the control of such pollutants'." (191 F.3d at 1165.) The court further held that the Clean Water Act does grant the permitting agency discretion to determine what pollution controls are appropriate for municipal storm water discharges. (*Id.* at 1166.) Specifically, the court stated that U.S.

[13] In addition to Discharge Prohibition A.2, quoted above, the permit includes Receiving Water Limitation C.1, with almost identical language: "Discharges from MS4s that cause or contribute to the violation of water quality standards (designated beneficial uses and water quality objectives developed to protect beneficial uses) are prohibited." Receiving Water Limitation C.2 sets forth the iterative process for compliance with C.1, as required by Board Order WQ 99-05.

[14] "Water quality objectives" generally refers to criteria adopted by the state, while "water quality standards" generally refers to criteria adopted or approved for the state by the U.S. EPA. Those terms are used interchangeably for purposes of this Order.

[15] Clean Water Act § 301(b)(1)(C) requires that most NPDES permits require strict compliance with quality standards.

EPA had the authority either to require "strict compliance" with water quality standards through the imposition of numeric effluent limitations, or to employ an iterative approach toward compliance with water quality standards, by requiring improved BMPs over time. (*Id.*) The court in *Browner* upheld the EPA permit language, which included an iterative, BMP-based approach comparable to the language endorsed by this Board in Order WQ 99-05.

In reviewing the language in this permit, and that in Board Order WQ 99-05, we point out that our language, similar to U.S. EPA's permit language discussed in the *Browner* case, does not require strict compliance with water quality standards. Our language requires that storm water management plans be designed to achieve compliance with water quality standards. Compliance is to be achieved over time, through an iterative approach requiring improved BMPs. As pointed out by the *Browner* court, there is nothing inconsistent between this approach and the determination that the Clean Water Act does not mandate strict compliance with water quality standards. Instead, the iterative approach is consistent with U.S. EPA's general approach to storm water regulation, which relies on BMPs instead of numeric effluent limitations.

It is true that the holding in *Browner* allows the issuance of municipal storm water permits that limit their provisions to BMPs that control pollutants to the maximum extent practicable (MEP), and which do not require compliance with water quality standards. For the reasons discussed below, we decline to adopt that approach. The evidence in the record before us is consistent with records in previous municipal permits we have considered, and with the data we have in our records, including data supporting our list prepared pursuant to Clean Water Act section 303(d). Urban runoff is causing and contributing to impacts on receiving waters throughout the state and impairing their

beneficial uses. In order to protect beneficial uses and to achieve compliance with water quality objectives in our streams, rivers, lakes, and the ocean, we must look to controls on urban runoff. It is not enough simply to apply the technology-based standards of controlling discharges of pollutants to the MEP; where urban runoff is causing or contributing to exceedances of water quality standards, it is appropriate to require improvements to BMPs that address those exceedances.

While we will continue to address water quality standards in municipal storm water permits, we also continue to believe that the iterative approach, which focuses on timely improvement of BMPs, is appropriate. We will generally not require "strict compliance" with water quality standards through numeric effluent limitations and we will continue to follow an iterative approach, which seeks compliance over time.[16] The iterative approach is protective of water quality, but at the same time considers the difficulties of achieving full compliance through BMPs that must be enforced throughout large and medium municipal storm sewer systems.[17]

We have reviewed the language in the permit, and compared it to the model language in Board Order WQ 99-05. The language in the Receiving Water Limitations is virtually identical to the language in Board Order WQ 99-05. It sets a limitation on discharges that cause or contribute to violation of water quality standards, and then it establishes an iterative approach to complying with the limitation. We are concerned, however, with the language in Discharge Prohibition A.2, which is

[16] Exceptions to this general rule are appropriate where site-specific conditions warrant. For example, the Basin Plan for the Lake Tahoe basin, which protects an outstanding national resource water, includes numeric effluent limitations for storm water discharges.

[17] While BIA argues that the permit requires "zero contribution" of pollutants in runoff, and "in effect" contains numeric effluent limitations, this is simply not true. The permit is clearly BMP-based, and there are no numeric effluent limitations. BIA also claims that the permit will require the construction of treatment plants for storm water similar to the publicly-owned treatment works for sanitary sewage. There is no basis for this contention; there is no requirement in the permit to treat all storm water. The emphasis is on BMPs.

challenged by BIA. This discharge prohibition is similar to the Receiving Water Limitation, prohibiting discharges that cause or contribute to exceedance of water quality objectives. The difficulty with this language, however, is that it is not modified by the iterative process. To clarify that this prohibition also must be complied with through the iterative process, Receiving Water Limitation C.2 must state that it is also applicable to Discharge Prohibition A.2. The permit, in Discharge Prohibition A.5, also incorporates a list of Basin Plan prohibitions, one of which also prohibits discharges that are not in compliance with water quality objectives. (See, Attachment A, prohibition 5.) Language clarifying that the iterative approach applies to that prohibition is also necessary.[18]

BIA also objects to Discharge Prohibition A.3, which appears to require that treatment and control of discharges must always occur prior to entry into the MS4: "Discharges into and from MS4s containing pollutants which have not been reduced to the [MEP] are prohibited."[19] An NPDES permit is properly issued for "discharge of a pollutant" to waters of the United States.[20] (Clean Water Act § 402(a).) The Clean Water Act defines "discharge of a pollutant" as an "addition" of a pollutant to waters of the United States from a point source. (Clean Water Act section 502(12).) Section 402(p)(3)(B) authorizes the issuance of permits for discharges "from municipal storm sewers."

---

[18] The iterative approach is not necessary for all Discharge Prohibitions. For example, a prohibition against pollution, contamination or nuisance should generally be complied with at all times. (See, Discharge Prohibition A.1.) Also, there may be discharge prohibitions for particularly sensitive water bodies, such as the prohibition in the Ocean Plan applicable to Areas of Special Biological Significance.

[19] Discharge Prohibition A.1 also refers to discharges into the MS4, but it only prohibits pollution, contamination, or nuisance that occurs "in waters of the state." Therefore, it is interpreted to apply only to discharges to receiving waters.

[20] Since NPDES permits are adopted as waste discharge requirements in California, they can more broadly protect "waters of the state," rather than being limited to "waters of the United States." In general, the inclusion of "waters of the state" allows the protection of groundwater, which is generally not considered to be "waters of the United States."

We find that the permit language is overly broad because it applies the MEP standard not only to discharges "from" MS4s, but also to discharges "into" MS4s. It is certainly true that in most instances it is more practical and effective to prevent and control pollution at its source. We also agree with the Regional Water Board's concern, stated in its response, that there may be instances where MS4s use "waters of the United States" as part of their sewer system, and that the Board is charged with protecting all such waters. Nonetheless, the specific language in this prohibition too broadly restricts all discharges "into" an MS4, and does not

allow flexibility to use regional solutions, where they could be applied in a manner that fully protects receiving waters.[21] It is important to emphasize that dischargers into MS4s continue to be required to implement a full range of BMPs, including source control. In particular, dischargers subject to industrial and construction permits must comply with all conditions in those permits prior to discharging storm water into MS4s.

Contention: State law requires the adoption of wet weather water quality standards, and the permit improperly enforces water quality standards that were not specifically adopted for wet weather discharges.

Finding: This contention is clearly without merit. There is no provision in state or federal law that mandates adoption of separate water quality standards for wet weather conditions. In arguing that the permit violates state law, BIA states that because the permit applies the water quality

[21] There are other provisions in the permit that refer to restrictions "into" the MS4. (See, e.g., Legal Authority D.1.) Those provisions are appropriate because they do not apply the MEP standard to the permittees, but instead require the permittees to demand appropriate controls for discharges into their system. For example, the federal regulations require that MS4s have a program "to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system . . . ." (40 C.F.R. § 122.26(d)(2)(iv)(D).)

objectives that were adopted in its Basin Plan, and those objectives were not specifically adopted for wet weather conditions only, the Regional Water Board violated Water Code section 13241. These allegations appear to challenge water quality objectives that were adopted years ago. Such a challenge is clearly inappropriate as both untimely, and because Basin Plan provisions cannot be challenged through the water quality petition process. (See Wat. Code § 13320.) Moreover, there is nothing in section 13241 that supports the claim that Regional Water Boards must adopt separate wet weather water quality objectives. Instead, the Regional Water Board's response indicates that the water quality objectives were based on all water conditions in the area. There is nothing in the record to support the claim that the Regional Water Board did not in fact consider wet weather conditions when it adopted its Basin Plan. Finally, Water Code section 13263 mandates the Regional Water Board to implement its Basin Plan when adopting waste discharge requirements. The Regional Water Board acted properly in doing so.

BIA points to certain federal policy documents that authorize states to promulgate water quality standards specific to wet-weather conditions.[22] Each Regional Water Board considers revisions to its Basin Plan in a triennial review. That would be the appropriate forum for BIA to make these comments.

Contention: BIA contends that the permit improperly classifies urban runoff as "waste" within the meaning of the Water Code.

[22] These documents do not support the claim that U.S. EPA and the Clinton Administration indicated that the absence of such regulations "is a major problem that needs to be addressed," as claimed in BIA's Points and Authorities, at page 18.

Finding: BIA challenges Finding 2, which states that urban runoff is a waste, as defined in the Water Code, and that it is a "discharge of pollutants from a point source" under the federal Clean Water Act. BIA contends that the legislative history of section 13050(d) supports its position that "waste" should be interpreted to exclude urban runoff. The Final Report of the Study Panel to the California State Water Resources Control Board (March, 1969) is the definitive document describing the legislative intent of the Porter-Cologne Water Quality Control Act. In discussing the definition of "waste," this document discusses its broad application to "current drainage, flow, or seepage into waters of the state of harmful concentrations" of materials, including eroded earth and garbage.

As we stated in Board Order WQ 95-2, the requirement to adopt permits for urban runoff is undisputed, and Regional Water Boards are not required to obtain any information on the impacts of runoff prior to issuing a permit. (At page 3.) It is also undisputed that urban runoff contains "waste" within the meaning of Water Code section 13050(d), and that the federal regulations define "discharge of a pollutant" to include "additions of pollutants into waters of the United States from: surface runoff which is collected or channeled by man." (40 C.F.R. § 122.2.) But it is the waste or pollutants in the runoff that meet these definitions of "waste" and "pollutant," and not the runoff itself.[23] The finding does create some confusion, since there are discharge prohibitions that have been incorporated into the permit that broadly prohibit the discharge of "waste" in certain circumstances.

[23] The Regional Water Board is appropriately concerned not only with pollutants in runoff but also the volume of runoff, since the volume of runoff can affect the discharge of pollutants in the runoff. (See Board Order WQ 2000-11, at page 5.)

(See Attachment A to the permit.) The finding will therefore be amended to state that urban runoff contains waste and pollutants.

Contention: BIA contends that the Regional Water Board violated California Environmental Quality Act (CEQA).

Finding: As we have stated in several prior orders, the provisions of CEQA requiring adoption of environmental documents do not apply to NPDES permits.[24] BIA contends that the exemption from CEQA contained in section 13389 applies only to the extent that the specific provisions of the permit are required by the federal Clean Water Act. This contention is easily rejected without addressing whether federal law mandated all of the permit provisions. The plain language of section 13389 broadly exempts the Regional Water Board from the requirements of CEQA to prepare environmental documents when adopting "any waste discharge requirement" pursuant to Chapter 5.5 (§§ 13370 et seq., which applies to NPDES permits).[25] BIA cites the decision in *Committee for a Progressive Gilroy v. State Water Resources Control Board* (1987) 192 Cal.App.3d 847. That case upheld the State Water Board's view that section 13389 applies only to NPDES permits, and not to waste discharge requirements that are adopted pursuant only to state law. The case did not concern an NPDES permit, and does not support BIA's argument.

Contention: WSPA contends that the Regional Water Board did not follow this Board's precedent for retail gasoline outlets (RGOs) established in the LA SUSMP order.

---

[24] Water Code section 13389; see, e.g., Board Order WQ 2000-11.

[25] The exemption does have an exception for permits for "new sources" as defined in the Clean Water Act, which is not applicable here.

Finding: In the LA SUSMP order, this Board concluded that construction of RGOs is already heavily regulated and that owners may be limited in their ability to construct infiltration facilities. We also noted that, in light of the small size of many RGOs and the proximity to underground tanks, it might not always be feasible or safe to employ treatment methodologies. We directed the Los Angeles Regional Water Board to mandate that RGOs employ the BMPs listed in a publication of the California Storm Water Quality Task Force. (*Best Management Practice Guide – Retail Gasoline Outlets* (March 1997).) We also concluded that RGOs should not be subject to the BMP design standards at this time. Instead, we recommended that the Regional Water Board undertake further consideration of a threshold relative to size of the RGO, number of fueling nozzles, or some other relevant factor. The LA SUSMP order did not preclude inclusion of RGOs in the SUSMP design standards, with proper justification, when the permit is reissued.

The permit adopted by the Regional Water Board did not comply with the directions we set forth in the LA SUSMP order for the regulation of RGOs. The permit contains no findings specific to the issues discussed in our prior order regarding RGOs, and includes no threshold for inclusion of RGOs in SUSMPs. Instead, the permit requires the dischargers to develop and implement SUSMPs within one year that include requirements for "Priority Development Project Categories," including "retail gasoline outlets." While other priority categories have thresholds for their inclusion in SUSMPs, the permit states: "Retail Gasoline Outlet is defined as any facility engaged in selling gasoline."[26]

[26] Permit at F.1.b(2)(a)(x).

The Regional Water Board responded that it did follow the directions in the LA SUSMP order. First, it points to findings that vehicles and pollutants they generate impact receiving water quality. But the only finding that even mentions RGOs is finding 4, which simply lists RGOs among the other priority development project categories as land uses that generate more pollutants. The Regional Water Board staff also did state some justifications for the inclusion of RGOs in two documents. The Draft Fact Sheet explains that RGOs contribute pollutants to runoff, and opines that there are appropriate BMPs for RGOs. The staff also prepared another document after the public hearing, which was distributed to Board Members prior to their vote on the permit, and which includes similar justifications and references to studies.[27] The LA SUSMP order called for some type of threshold for inclusion of RGOs in SUSMPs. The permit does not do so. Also, justifications for permit provisions should be stated in the permit findings or the final fact sheet, and should be subject to public review and debate.[28] The discussion in the document submitted after the hearing did not meet these criteria. There was some justification in the "Draft Fact Sheet," but the fact sheet has not been finalized.[29] In light of our concerns over whether SUSMP sizing criteria should apply to RGOs, it was incumbent on the Regional Water Board to justify the inclusion of RGOs in the permit findings or in a final fact sheet, and to consider an appropriate threshold, addressing the concerns we stated. The Regional Water Board also responded that when the dischargers develop the SUSMPs, the dischargers

[27] See "Comparison Between Tentative Order No. 2001-01 SUSMP Requirements and LARWQCB SUSMP Requirements (as Supported by SWRCB Order WQ 2000-11)."

[28] See 40 C.F.R. sections 124.6(e) and 124.8.

[29] U.S. EPA regulations require that there be a fact sheet accompanying the permit. (40 C.F.R. § 124.8.) The record contains only a draft fact sheet, which was never published or distributed in final form. The Regional Water Board should finalize the fact sheet, accounting for any revisions made in the final permit, and publish it on its web site as a final document.

might add specific BMPs and a threshold as directed in the LA SUSMP order. But the order specifically directed that any threshold, and the justification therefore, should be included in the permit. The Regional Water Board did not comply with these directions.

III. CONCLUSIONS

Based on the discussion above, the Board concludes that:

1. The Regional Water Board appropriately required compliance with water quality standards and included requirements to achieve reduction of pollutants to the maximum extent practicable. The permit must be clarified so that the reference to the iterative process for achieving compliance applies not only to the receiving water limitation, but also to the discharge prohibitions that require compliance with water quality standards. The permit should also be revised so that it requires that MEP be achieved for discharges "from" the municipal sewer system, and for discharges "to" waters of the United States, but not for discharges "into" the sewer system.

2. The Regional Water Board was not required to adopt wet-weather specific water quality objectives.

3. The Regional Water Board inappropriately defined urban runoff as "waste."

4. The Regional Water Board did not violate the California Environmental Quality Act.

5. The permit will be revised to delete retail gasoline outlets from the Priority Development Project Categories for Standard Urban Storm Water Mitigation Plans. The Regional Water Board may consider adding retail gasoline outlets, upon inclusion of appropriate findings and a threshold describing which outlets are included in the requirements.

IV. ORDER

IT IS HEREBY ORDERED that the Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems in San Diego County (Order No. 2001-01) are revised as follows:

1. Part A.3: The words "into and" are deleted.

2. Part C.2: Throughout the first paragraph, the words ", Part A.2, and Part A.5 as it applies to Prohibition 5 in Attachment A" shall be inserted following "Part C.1."

3. Finding 2: Revise the finding to read: **URBAN RUNOFF CONTAINS "WASTE" AND "POLLUTANTS"**: Urban runoff contains waste, as defined in the California Water Code, and pollutants, as defined in the federal Clean Water Act, and adversely affects the quality of the waters of the State.

4. Part F.1.b(2)(a): Delete section "x."

In all other respects the petitions are dismissed.

CERTIFICATION

The undersigned, Clerk to the Board, does hereby certify that the foregoing is a full, true, and correct copy of a resolution duly and regularly adopted at a meeting of the State Water Resources Control Board held on November 15, 2001.

Clerk to the Board

Thursday, December 13,2001 – 448th Regular Board Meeting
CA Regional Water Quality Control Board – Los Angeles Region
AGENDA ITEM #10: Municipal Storm Water NPDES Permit Renewal for Los Angeles County and unincorporated cities therein, except the City of Long Beach .

Good morning Board Members, my name is Jacqueline Lambrichts, representing **Friends of the San Gabriel River, P.O. Box 3725, South El Monte CA 91733.** Friends of the San Gabriel River supports the efforts of the Natural Resources Defense Council, the Santa Monica Baykeeper, and Heal the Bay in their efforts to convince the Los Angeles Regional Water Quality Control Board to approve a strong Municipal Storm Water Permit for Los Angeles County.

Mr. Dennis Dickerson, Executive Officer
Los Angeles Regional Water Quality Control Board
320 W. 4th Street
Los Angeles, CA 90013

Mr. Dennis Dickerson,

Please pass a stormwater permit that protects our rivers, bays and beaches from polluted runoff.

I urge the Board to include these crucial items in the water quality standards for the new County Stormwater Permit. Please require mandatory inspections and tough treatment requirements for all new and redevelopment sites, housing complexes, restaurants, automotive repair facilities and gas stations. The Board must develop monitoring programs that will identify the impacts of polluted runoff on aquatic life.

We can't afford five more years of inaction!

The Regional Board must implement and enforce tough stormwater permits to protect public health and our aquatic resources. Please don't back down!

Sincerely,

Annette L. Lazare

Ms. Annette L. Lazare
Los Angeles, CA

Statement by Larry Forester
Mayor, City of Signal Hill
Coalition for Practical Regulation
December 13, 2001

Good morning Chairman Nahai and members of the Board. Thank you for the opportunity to comment on the NPDES Permit. My comments will be brief and focused on four issues. The Coalition wants to thank Dennis Dickerson and his staff for the time spent in the Mediation Sessions. We felt the Mediation Sessions were productive. We also wanted to thank the US EPA for their assistance in conducting Mediation. We believe that the time spent in Mediation clarifying the Permit makes for better use of State and local resources in the long run.

Storm Water Inspection Programs

The Mediation Sessions focused on an alternative inspection program. This inspection program is more sensitive to the resource constraints raised by the cities, than Versions A & B. The alternative makes significant changes to address resource concerns. There are two resource questions the Board can help clarify. The Permit directs cities to inspect State Permitted facilities. Mr. Dickerson indicated that

2175 Cherry Avenue ♦ Signal Hill, CA 90806 ♦ (562) 989-7302 ♦ (562) 989-7393 Fax

the State will inspect 2/3 of the State Permitted facilities. He is requesting that the cities inspect the remaining 1/3 of the State Permitted facilities.

The cities requested two clarifications. First, that the Board forward to the cities the inspection fees for the State permitted facilities that the cities are being asked to inspect. The Board is collecting an inspection fee, but not performing the inspection. It only seems fair that the cities should not be financially penalized for picking up the State inspections. It also seems fair that we not "double fee" the business community, by charging both a State and local inspection fee of State permitted facilities.

Second – the cities requested that the State's responsibility for the State Permitted inspections be specified in the Permit. What happens if the State budget reductions impact your inspection program? Will the cities now be responsible for 50% of the State's inspections? We are requesting a list of the categories of State permitted facilities that you are committed to inspecting. There are some facilities, such as airports, railroad yards or regional transit facilities, where the Board has the resources and background to continue these inspections. The draft Permit is now "open ended", with no reasonable limit on the number of inspections the cities may be ordered to undertake. One suggestion is that the Board direct staff to enter into an Memorandum of Understanding with the permittees to clarify these issues,

similar to the MOU between the San Francisco Bay Regional Board and the Alameda County permittees.

Permit Time Schedules

During the November 29th Mediation Session we presented a list of the Permit's new or revised programs, in chronological form. There are 44 new or revised programs, from increased street sweeping, to installing trash receptacles at all transit stops in the County. Thirty-four of the new programs are required in the first year of the Permit. Twenty-five programs are required in the first six months. This is an extremely aggressive and excessive number of first year programs, considering that our communities are facing revenue reductions brought by the economic recession, home land security demands after the September 11th incidents and the looming State budget crisis.

The Permit originally required that the cities complete a dry weather diversion report in the first six months. We want to thank the staff for moving this deadline to July of 2003. Seventy-seven of the cities will need the assistance of the Sanitation Districts in order to complete these reports, which will require resources from the cities, the Flood Control District and the Sanitation Districts. We understand that the Sanitation Districts will complete a report on 40 storm drains in coastal communities, as part of an environmental special project for the Board. This prioritization makes sense.

This is one example of working with the cities on moderating the resource intensive programs required in the first year of the Permit. There are a series of other expensive reports and programs all required in the first year – a numeric criteria study, an illicit connection program, storm water ordinances and technical manuals for the BMP's, and the list goes on. The Mediation Session ended abruptly without our ability to address the resource problems presented by requiring the cities to implement 34 programs in the first year of the Permit. All of our city budgets are synchronized with the State's budget and must be adopted by July 1st. The cities are currently in mid-budget and will begin preparing new budgets in January. This is the time to design new programs, estimate their financial impact, search for funding and balance the new programs with other critical services. The Permit does not recognize the time constraints and financial burdens it imposes on the Cities. We ask that the Permit be modified to address funding sources from the State, and to reduce the number of burdensome programs being imposed on the Permittees.

Receiving Waters – Legal Safe Harbor and Regional Solutions

There has been much discussion about the Legal Safe Harbor for the cities. It is a complex issue. On one hand the Board wants to retain enforcement ability over cities who do not comply. The environmental community wants to monitor both the State and the Permittees, with the threat of third-party lawsuits. Cities who are acting in good faith do not want to be subjected to fines and third-party litigation, while they are implementing expensive and untested programs. Everyone recognizes that the process is progressive and educational, where certain programs may work, and others may not. The process assumes there will be some programs that will fail. The Permittees should not be subject to enforcement action for experimental programs that are ineffective.

The experience of the City of Laguna Niguel is a case example for the necessity of a legal safe harbor. In 1997 the city volunteered to participate in a study to develop new strategies to reduce bacteria levels in storm water discharges. They volunteered one of their storm drains, serving 1,400 homes. They then began the study. Without prior warning or notice, the San Diego Regional Water Quality Control Board issued a Clean-up and Abatement Order.

The Abatement Order was open-ended – providing no guidance or information on what bacteria level was acceptable and what programs the Board would accept. During the last two years the City of Laguna Niguel has invested over $550,000 implementing a series of "iterative measures" to reduce bacteria, including a $150,000 grant. They have completed extensive investigations, installed low flow diversion to the regional sewage plant, increased street sweeping and catch basin cleaning in the watershed. They have conducted extensive public education programs and instituted a program of water conservation. In the Spring of this year they installed an end-of-pipe filtration/ultra-violet treatment system.

The benefits from all of these efforts are uncertain, at best. The diversion/treatment projects have had minimal impact on the water quality and the REC-2 water quality objective is still not consistently met. After four years, the Regional Board still has not provided direction to the City on how they can comply with the Clean-Up and Abatement Order.

The National Academy of Sciences recently reported to Congress on the problems created by holding cities legal accountable to achieve storm water standards where the science and clean-up technologies are imperfect.

This study is part of your Administrative record and we hope that you have had an opportunity to review it.

The Permit contains a section discussing regional solutions, which are widely recognized as the most cost-effective means of dealing with storm water clean-up. Perhaps the City of Laguna Niguel would benefit from a regional solution. In our opinion, the regional solution language in the Permit does not go far enough, but our alterative language was rejected by staff.

We suggest that the Board modify the Regional Solution provisions and the Receiving Waters Limitations language to provide a "legal safe" harbor to cities that implement, design and fund regional solutions. Since regional solutions would take additional time to coordinate with the various entities, extending the "safe harbor" both for regional solutions and for good faith compliance with the MEP standard would make sense.

Timing of Permit Approval

My final comment is based on your tentative action today to approve the NPDES Permit. This is an especially bad time of the year to approve such a controversial Permit of this magnitude. Many city council's will not meet until the second week in January, due to the holiday season. Many meetings have been rescheduled, since they fall on both Christmas and New Year's Day (both

holidays fall on Tuesdays this year). We have sent several letters to Mr. Dickerson outlining this concern. We believe that your adoption today will not permit the cities sufficient time to study the merits of the Permit, and the numerous changes that have been made. You may trigger more appeals to the State Board by your premature action today. Clearly there are problems with this permit.

We believe that the proper Board action today is to continue the hearing on the NPDES Permit and to direct staff to continue with the US EPA Mediation Sessions. US EPA has indicated that they will devote the necessary resources to complete Mediation. The Coalition is committed to mediation. Board Member Cloke asked a very good question at the workshop on July 26th, – why can't the cities work with the Board? We took that comment to heart and worked hard with our Congressional delegation to have US EPA mediate. We have shown our ability to work with the Board – with the revised inspection program, with the permit time schedules, the proposed MOU's, regional solutions and other improvements. The question before you now is – will you work with the cities?

Thank you Chairman Nahai and members of the Board.

R0007772

LOS ANGELES, CALIFORNIA; THURSDAY, DECEMBER 13, 2001

ITEM 10

CHAIRMAN NAHAI: With that, I think we can move on to Item 10. Could we have the opening state, please.

MS. HARRIS: This is a public hearing to consider adoption by this board in accordance with state and federal legislation and the National Pollutant Discharge Elimination System for discharges into navigable waters or tributaries thereto.

A notice of this hearing and of the Board's intent to prescribe waste discharge requirements was published in a daily newspaper of general circulation within the geographical area of the discharge as prescribed by law.

Copies of the proposed renewal of the Municipal Storm Water Permit was sent to the dischargers, the Environmental Protection Agency, and other interested agencies, persons, and organizations.

The order of presentation of testimony at this hearing will be Board staff, public agencies, and other interested agencies and groups. Mr. Chairman, will you now open the hearing and administer the oath.

CHAIRMAN NAHAI: I shall. Will all those who are

going to give testimony in connection with this matter, please rise. I mean, everybody who wants to come up to the podium and give a comment, please rise at this time. Repeat after me: I do solemnly swear.

STANDING AUDIENCE: I do solemnly swear.

CHAIRMAN NAHAI: That the testimony I am about to give.

STANDING AUDIENCE: That the testimony I am about to give.

CHAIRMAN NAHAI: Will be the truth.

STANDING AUDIENCE: Will be the truth.

CHAIRMAN NAHAI: The whole truth.

STANDING AUDIENCE: The whole truth.

CHAIRMAN NAHAI: And nothing but the truth.

STANDING AUDIENCE: And nothing but the truth.

CHAIRMAN NAHAI: Under penalty of perjury.

STANDING AUDIENCE: Under penalty of perjury.

CHAIRMAN NAHAI: Thank you.

WENDY PHILLIPS,

MS. PHILLIPS: Good morning, members of the Board, interested parties. My name is Wendy Phillips, and I am an acting assistant executive officer at the Regional Board.

Under consideration is the storm water permit for municipalities in the County of Los Angeles.

After listening to a summary of our staff report and legal analysis, you will have an opportunity to hear comments from permittees, from trade organizations, environmentalists, and other interested parties.

Following these comments, we will ask that the Board take action to adopt or renew the Municipal Storm Water Permit -- we call them MS4 permits -- for the County of Los Angeles and 84 municipalities. Not included in these municipalities is the City of Long Beach, which has its own storm water permit, and the City of Avalon on Catalina Island which obviously is not a part of the county's mainland storm drain system.

The storm drain system we're permitting drains to the coastal slope of the transverse ranges, from the San Gabriel Mountains to the northeast, to the Santa Monica Mountains along the northwest. In general, water flows through the two inland valleys -- I don't have my pointer, but I think you know where the San Gabriel and San Fernando Valleys are -- and then across the coastal plane to our world-class beaches.

As I can best determine, this is the largest storm water permit in the nation. It's the largest in terms of aerial extent, covering almost 3,000 square miles. It's the largest in terms of vertical drop, from the crest of the San Gabriel Mountains, down to our beaches which

constitutes a drop of over one mile over a very short distance. It's also the largest in terms of the number of co-permittees: 84 municipalities, in addition to the County of Los Angeles and our principal permittee, the L.A. County Flood Control District.

Physical assets: there are 4,300 miles of underground pipes of a diameter of, I believe, 36 inches or greater, 500 miles of open channels, over 100,000 catch basins. And these numbers represent just a portion of the entire storm drain system as it is not completely mapped.

Our board issued L.A. County's first MS4 permit in 1990. This was just before the new municipal storm water regulations took effect which established rigorous application requirements. So with this first permit, permittees had flexibility for meeting the new storm water regulations. And under the permit, permittees were required to implement 13 best management practices such as public education, street sweeping, and construction site best management practices or BMPs. None of these BMPs have substantive performance measures put in the permit.

In 1996 after an arduous renewal process lasting one and a half years, the Board issued Order No. 96-54, our existing permit today. And over the past five and a half years, permittees have raised public

awareness of storm water problems through a strong public education program.

The challenge over the next term of the permit will be to assess how effectively public behavior has indeed changed as a result of this increased awareness. Also, during the past five and a half year term of this permit, permittees have been educating business, that is, visiting certain categories of commercial facilities such as gas stations and restaurants and also heavy industrial facilities to educate them about storm water problems and requirements.

This educational approach to industry and commercial facilities was perhaps the most contentious item before the Board back in 1996. Many of us thought the permittees should have more rigorous programs that included inspections. But in 1996, the Board determined that it was appropriate to allow the permittees to start with an educational approach. Our expectation was that this would be upgraded to an inspection program.

In 1999 following litigation and negotiation of a settlement, we split off the City of Long Beach from the county-wide permit by issuing the city its own storm water permit. And then in January 2000, the Board approved Standard Urban Storm Water Mitigation Plans, or SUSMPS, with the requirement that certain categories of new

R0007777

development and redevelopment incorporate designs to capture and/or treat the first three-quarter-inch of precipitation in every storm.

This Regional Board, 34 permittees who petitioned this action, environmental groups, and the State Board invested a significant effort throughout 2000 in a petition to resolve the issues raised by the 34 permittees.

In October 2000, the State Board largely upheld the Regional Board's original action as set forth in State Board Order 2000-11. That's in section 10.F of your binder. However, there were certain requirements in the SUSMP that were not upheld by the State Board order. These pertained to applying the three-quarter capture requirement to retail gasoline outlets, RGOs, and environmentally sensitive areas, or ESAs, ministerial projects.

We believe that the tentative permit before you today along with the staff report and technical report supplements address State Board concerns as Dr. Xavier Swamikannu will explain in a moment.

The tentative permit before you today has been in the renewal process for almost a year. The permittees submitted their application for renewal -- we refer to that as a Report of Waste Discharge -- in February. And since that time, we've worked very hard on this permit. We've issued three drafts and provided for a

R0007778

public comment period of one month on each draft.

We've also had two workshops, and most recently we delayed or continued adoption of this permit to allow for a special EPA-facilitated session of two days made at the request of the Coalition for Practical Regulation and State Senator Bob Margett.

The first staff we've had working on this have been available for countless meetings, phone discussions, E-mail communications. And at this point, I do want to recognize the exceptional effort by my colleagues.

Dr. Xavier Swamikannu is renown throughout the nation for his storm water expertise. He's led our team, key players on this team: Megan Fisher and Dan Radulescu. The associate-level staff have done an excellent job on this.

Weindy Abarquez, our secretary, has done wonders keeping us organized and getting all of this paper out. Dennis Dickerson has been a strong member of this team. He has gotten us over quite a few rough patches. And Carlos Urrunaga, who is not here today, because Carlos is covering for us making a presentation to the L.A. County Unified School District.

Now, I also want to mention that we're grateful to the USEPA, Laura Gentile, who is here today,

and Harry Saledarian (phonetic) have set aside a lot of their time to make this permit a priority.

One of the ways in which EPA contributed to our process was to facilitate two days of discussion, mostly on inspections which Dennis will cover later. And although we're disappointed that the permittees wouldn't meet us at a point that we felt was halfway, I do want to express on behalf of our team here, our gratitude for the permittees' efforts. We've been able to make this a better permit as a result of some, not all of their comments.

I also want to explain that we've tried to be responsive to all reasonable concerns up until the last minute. This is also by way of an apology. This has led unfortunately to three sets of change sheets. Most of the changes are in response to permittees' concerns for clarity and requests for editing.

Now, on the overhead there I show a change sheet dated December 4th that's on page B-438 of the agenda, and also a second change sheet dated December 10th which is on B-455. The changes on both these change sheets have already been incorporated into a version that I'm going to call the "edited tentative draft" dated December 10th. And that starts on page 276. So I would recommend that as we're working with the permit today, that you use that edited tentative draft dated December 10th.

R0007780

CHAIRMAN NAHAI: It's B-276.

MS. PHILLIPS: Thank you. It's B-276. Now, that edited tentative draft which is dated December 10th does not include some changes that we made late yesterday. Those are in a third change sheet which was handed out to you this morning, and that change sheet is dated December 12th. I believe it's just one page, front and back.

I also want to make it clear that we've brought numerous handouts to this. I think there have been plenty of edited tentative versions of the draft permit available for the public. I see a large stack of them still at the front on that blue table. And the third change sheet is also available as a handout.

Also, this morning I did slip in several late letters which I asked you to place at the front of Volume II. And I'll be glad to highlight issues raised in those letters if you would like. However, most of the comments are similar to comments made in other letters and will have similar responses.

Before going into the tentative permit, I do want to highlight particular accomplishments under the existing permit. Again, I'd like to mention a very good strong public education program, and we do believe that public awareness of storm water issues has increased. The

R0007781

question remains: Has behavior changed?

The permittees have also established a good regional base for storm water and watershed-based monitoring leveraging up of monitoring efforts by other permittees along the coast of Southern California and coordinating through SCCWRP.

And even though the permittees didn't inspect industrial and commercial facilities, they have completed five and a half years of educating them. So business in L.A. County should be educated with regard to storm water.

The permittees' efforts are guided by a Storm Water Quality Management Plan. You see that referred to as the SQMP throughout the permit. This establishes numerous management programs and best management practices that permittees can use depending upon the pollutant, the source, the site, the cost.

Our strategy in renewing this permit has been to try to eliminate ambiguous language in the prior permit and in the Storm Water Quality Management Plan, and add very specific and clear performance measures in critical areas of their management plan, such as an inspection program for certain industrial and commercial sectors, such as a program to eliminate illicit connections and discharges. This has been upgraded to match the

requirements that the Board now has in place for the Long Beach permit.

On construction sites, we have a requirement in there to increase field presence. What we've done is we lowered the threshold for inspection down to one acre. These are key changes between the existing permit and the tentative that we're proposing you adopt.

Other key changes are in the area of development planning. As Xavier will explain, we've expanded our SUSMP to gas stations, environmentally sensitive areas, ministerial projects.

We've added a TMDL, total maximum daily load provision. As we're all aware, TMDLs are one of this board's highest priorities. As the storm water permit will be a mechanism for implementing load reductions in the TMDLs, this provision will allow TMDLs, upon approval, to be implemented through this permit without actually re-opening the permit. In other words, there will be a single public process for a TMDL. And this provision in our tentative permit is consistent with the Long Beach permit and the Ventura permit.

Finally, enforcement. During the renewal process in 1996, the Board agreed to a Notice to Meet and Confer process. This was envisioned as an administrative review process for resolving permit disputes before the

Board could take enforcement action. Subsequently, the State Board adopted an enforcement policy which sets forth a progressive enforcement process with the goal of ensuring consistent, predictable, and fair enforcement. This is now a well-established and widely-implemented policy throughout the state, including our region. So with this policy of progressive enforcement, we do not believe another Notice to Meet and Confer process is appropriate, and we have eliminated that.

In specifying programs and performance measures, I want to remind you what we're trying to accomplish. We have three objectives. First, we want the permittees to prohibit, that is, eliminate all nonstorm water discharges or dry weather flow that is such a significant source of impairment to beneficial uses such as swimming.

Second, we want permittees to ensure that pollutants are reduced through BMPs that will prevent or treat pollutants. Thirdly, we want permittees to use monitoring results to indicate where or which BMPs need to be upgraded to meet all water quality objectives.

And at this point, I'm going to let Xavier Swamikannu take you through the permit.

//

//

R0007784

XAVIER SWAMIKANNU,

DR. SWAMIKANNU: For the record, my name is Xavier Swamikannu. I'm on Regional Board staff.

The standard of compliance for municipalities under the Storm Water Program is a tierred approach. At the bottom of the slide are a list of statutory authorities, precedential decisions, and legal opinions that support the language in the tentative permit.

The basic standard is a performance one to reduce the discharge of pollutants in storm water to the maximum extent practicable. However, where receiving water objectives are being exceeded or conditions of nuisance are being created, the permittees will be required to eliminate such exceedences and nuisance conditions through an iterative process of more and better BMPs.

Most recently, the State Board upheld the receiving water limitations language in the San Diego County Municipal Storm Water Permit which is identical to the one in the tentative L.A. County Storm Water Permit.

In the next few slides, I will provide an overview of the Storm Water Quality Management Program elements in the tentative permit. As Wendy indicated, all reference in the slides are to page numbers in the agenda binder.

First, under the Public Information and

Participation Program, the tentative permit augments the current requirements of general outreach to the public and business. Included now are specific outreach programs some of which are voluntary to corporate managers, businesses, and residents in watersheds that have been identified as impaired by particular types of storm water pollutants such as pathogens and heavy metals.

For new development, the tentative permit requires the implementation of criteria to control peak discharges so as to prevent downstream erosion and habitat modification. In addition, the numerical mitigation criteria had been extended to cover ministerial, that is, nondiscretionary projects, projects in environmentally sensitive areas, and gas stations.

These areas were set aside by the State Board in its L.A. SUSMP decision previously to be reconsidered by this Regional Board after due process and proper justification during permit re-issuance. This is what we are doing today.

Staff also recommends easing of the application of the numerical criteria to hillside homes to be consistent with how developments on flatland are treated. There appears to be no defensible basis for the distinction. The statement that the criteria do not apply to routine maintenance activities is simply a clarification

sought by some permittees.

For industrial/commercial developments, we have lowered the application criteria from about 100,000 square feet -- that's two and a half acres -- to one acre beginning 2003 to be consistent with USEPA Phase II regulations.

We have also clarified that the definition of "redevelopment" includes replacement of building footprints, which was our original intent. Some permittees have contended that the term only applies to additions and extensions. Under such an interpretation, as communities replace themselves over generations, storm water quality will never get any better, only less worse (sic).

In addition, we have required notice to the Regional Board as an interested party when general plans are updated to ensure that municipalities incorporate storm water quality policy considerations. And we have incorporated water quality flow criteria to be consistent with the advancement of storm water science and to be consistent with the Ventura County Municipal Storm Water Permit that was adopted by this Regional Board in 1999. In order to assist the development community, we have required the development of a technical guidance document.

The State Board's L.A. SUSMP decision was precedential for the entire state. The central issue of

controversy then was whether municipalities under the new development element should require new developments to implement post-construction treatment controls that are designed based on water quality numerical mitigation criteria. The State Board said yes.

The State Board set aside certain applications of a numerical mitigation criteria adopted by this Regional Board at that time because of concerns of lack of due process or that sufficient justification was lacking. In Regional Board staff's opinion, which is supported by staff counsel in his brief, agenda binder on page D-4 through D-7, we have remedied the articulated deficiencies. This time they're meeting the criteria set forth by the State Board for future inclusion at permit re-issuance.

In this slide, we identify reference pages in the agenda binder wherein we specifically address the justifications required by the State Board for the inclusion of ministerial projects, projects in environmentally sensitive areas, and gas stations. Several technical papers have been prepared, and they are included in the agenda binder as well. Also listed are provisions supported by the State Board in its L.A. SUSMP decision such as regional solutions and mitigation banking.

The next component of the Storm Water

Quality Management Program is a construction program. Essentially, here we require some basic controls that are required at all construction sites regardless of size. These include managing construction waste and sediment in a manner that does not contaminate storm water.

In addition to the basic controls for construction sites that are between one and five acres, we require verification of coverage under the State Storm Water Program beginning the year 2003 pursuant to federal regulations promulgated in 1999. A record of grading permits issued to these construction sites are to be kept for tracking purposes.

For construction sites five acres and greater, the verification for coverage under the state's Construction Storm Water Permit takes effect from permit effective date.

Next is a public agency activities program component. The tentative permit explicitly requires that public agency activities conform to the same requirements that municipalities impose on private development planning and construction. Also included are special measures to control trash because of its significance in impairing certain watersheds in the Los Angeles region.

The principal emphasis of the Illicit Connection/Illicit Discharge Elimination Program component

R0007789

is to advance from the current passive program of responding to complaints, to one that also includes searching out proactively for illicit connections and illicit discharges.

To this end, we require a listing of connections, a mapping of illicit discharges and connections, and a schedule to priority screen the storm drain system over the five-year permit term.

Next, we move to the objectives of the Storm Water Monitoring Program which are multifaceted. We continue to advance our understanding of storm water impacts on receiving waters from a Southern California perspective. In the tentative permit, we advocate that permittees participate in regional monitoring initiatives such as those conducted under the Southern California Monitoring Coalition and the Southern California Coastal Water Research Project.

Specific monitoring enhancements include a whole variety from tracking improvements in water quality as a result of program implementation, to effectiveness of particular best management practices in the Southern California environment, to assessment of biocommunities as to the quality of the aquatic environment, to getting a more comprehensive picture by adding mass emission and tributary stations.

R0007790

In order to promote more consistent and comparable reporting, we have included a model reporting form to assist permittees in their self-reporting on permit compliance. Further, we have required permittees to utilize the results of the monitoring program in modifying their Storm Water Quality Management Program to control problem pollutants causing receiving water exceedences or conditions of nuisance.

Listed here are advancements included in the tentative permit from the current permit. The current permit is referenced to 1996. I will not go over what Ms. Phillips has already done.

We have included the receiving water limitations language. Then next, as was covered by Ms. Phillips, we have gone from a site education program to an inspection-based one. And we have lowered the threshold at the construction sites from two to one acres.

Other changes include the extension of SUSMP requirements, a proactive Illicit Connection/Illicit Discharge Elimination Program, catch basin cleaning and street sweeping to control trash, and requiring evaluation to reduce toxicity based on monitoring results.

Next, I wish to walk you through the nonmaterial changes in the edited tentative you have before you. These changes are mostly requested by permittees for

purposes of clarity. Additional references have been included in the findings section. A receiving water limits compliance report is being requested only after determination that exceedences are occurring in the receiving waters.

The budget breakdown reporting for program implementation and public information participation program implementation have been made more flexible at the request of the principal permittee. Staff has also included the USEPA facilitated Version A/C in addition to Versions A, B, and C in the tentative permit.

In response to the Western States Petroleum Association's concern that municipalities may mandate BMPs at gas stations that pose a safety hazard, language has been included to state that such BMPs are inappropriate at those sites.

At the request of the City of Los Angeles, language has been included to clarify the terms of "refer" for construction projects that are also covered under the state's General Construction Storm Water Permit.

Under public agency activities, it's here intended to provide clear distinctions and avoid ambiguities. In Los Angeles County, less than 1 percent of streets are not curbed and often difficult to clean as a result. But it's a small percentage.

Next, the edits in the definitions section -- The edits in the definition section were requested by permittees for purposes of clarification and to avoid ambiguities. The edits in the monitoring section were requested by Los Angeles County which is a major entity implementing the monitoring program.

The time line extension in the edited tentative are largely due to requests by the city manager for Signal Hill and CPR Chairman, Mr. Farfsing, and the County of Los Angeles.

And, finally, before Dennis takes over, I wish to recognize the committed contribution of my co-colleagues to this process. In addition to Ms. Phillips and Mr. Dickerson, they include Mr. Radulescu, Ms. Fisher, Ms. Abarquez, ably supported by Mr. Soloman, Mr. Yeager, and Mr. Urrunaga, Ms. Martinez, and Ms. Sumara (phonetic). What a team. Thank you.

DENNIS DICKERSON,

MR. DICKERSON: Thank you, Dr. Swamikannu, I appreciate that. I'd like to turn the Board's attention to the inspection program. This has been one of the most controversial of the items that the Board has before it. And I will, hopefully, walk you through and give you a good understanding of what the inspection program, as we're

proposing it, is all about.

The current permit, which was adopted in 1996, does not have an inspection program, even though an inspection program is encouraged by USEPA. The current permit has an emphasis on education conducted through site visitations. These site visits occur once every 24 months and are identified as covering Phase I facilities, automotive service facilities, gas stations, and restaurants. Now, I want to draw your attention to the fact that these activities are required already to have this kind of site visitation. Next.

Why inspections are appropriate: the permittees themselves have identified various critical sources which are contributing disproportionately to storm water pollution. It's important for us to tackle this problem to address storm water pollution at these sites.

The NPDES permit itself envisions a partnership between the permittees and the Regional Board. We are conducting inspections, but we simply cannot get out to every possible facility. And education is simply not enough. As our own experience has identified, education can take permittees and some of these critical services part of the way, but certainly not all the way that's necessary.

This photograph gives you an example of I

would say not untypical site of the kind that we're talking about. And you can imagine this being the back of a service station, an auto service warehouse area, a body shop. It's an outdoor area where you have a lot of potential for storm water pollutants to migrate off site. This particular site, an example, of course, is one that is not practicing the best possible best management practices. Next.

The inspection options that are before you today, there are actually four options. Three options were considered and included in the third draft of the permit. Version A we consider to be a modest inspection program. Version B is a more comprehensive program. Version C is the current site program that is in the '96 permit.

A fourth option is available for you today to consider. That is version, as it's designated, A/C. It's a modified version that is really the outcome of a mediation process that we entered into with the cities.

Now, I want to emphasize that that particular version is not one which has been endorsed widely by permittees. In fact, we don't have any formal endorsement at all. But as a result of that discussion that we had, we started out, in essence, with a reformatted Version B. We listened carefully to the comments of the various cities and the county. And we included a lot of

their recommendations, and we modified substantially. So you do have this modified version which is actually a better version of that particular permit. It is in your packet. And we don't consider it to be a --

CHAIRMAN NAHAI: Let me just point out to the Board, the Version A/C is at page B-324 in the edited revised.

MR. MINDLIN: This is the one that came up on the 10th?

CHAIRMAN NAHAI: Yes.

MR. DICKERSON: Thank you, Mr. Chairman.

And it is to be considered, from our point of view, within the scope of an insignificant change. We've been mostly moving the language around.

Now, the inspection universe that we're talking about is quite significant. We have federally-mandated facilities where permittees have the lead. We have Phase I facilities where the Regional Board is the lead. And Phase I facilities are those facilities which are required to have a General Industrial Storm Water Permit. Critical sources have been identified by the county and the cities much earlier in this process. They include restaurants, auto service facilities, and gas stations.

Now, the Version A/C, I'd like to walk you

through just the basic provisions. One element of that is frequency of inspections. For restaurants we're looking at an inspection twice in five years; auto service facilities, twice in five years; retail gas outlets and auto dealers, also, twice in five years.

For those same facilities, the level or intensity of inspection is to, in essence, confirm that best management practices are being used and the best approach to using that would be to have a checklist where you visit the site, simply quickly observe the site, go through the checklist, check "yes" or "no" whether or not the inspector feels that they're meeting the various best management practices. And that's really the case for all three of these restaurants, auto service, and retail gas and auto dealers.

With regard to the other group of sites, the frequency of inspections, Phase I facilities, they're broken out in two tiers. I have a couple of slides, and, in fact, on your handouts there should be a complete list. We'll come up to that momentarily.

Phase I facilities include general industrial storm water permittees and selected critical sources. These are the critical sources identified by the cities. Tier 1, twice in five years inspection visit; Tier 2, twice in five years. But for those Tier 2

facilities, no additional inspections are required if there is no risk of exposure that's been identified, and once every five years if 20 percent of all Tier 2 facilities are inspected in any given year. It's really a way to cut down the workload substantially on the part of the permittees.

Now, facilities that may be inspected by Regional Board staff are not required to be re-inspected by the permittees. It basically counts for one of those particular permit inspection visits.

Now, the Tier 1 categories, in the back of your handout you have a handout of all the slides. The very back gives you a table or a list, I should say, of the Tier 1 and Tier 2 categories. That's just for your information.

Now, the inspection scope or level of intensity of inspections for Phase I facilities is to confirm that a Notice of intent -- that's coverage under the General Industrial Storm Water Permit -- has been submitted to the State Board, and that they have a Storm Water Pollution Prevention Plan in place. We do ask that they simply confirm that best management practices are being used. To the extent that they can go beyond that and determine efficiency and effectiveness, so much the better. Federally-mandated facilities confirm that the NOI, the

Notice of Intent, is submitted and the Storm Water Pollution Prevention Plan is in place and, again, confirm BMPs and their effectiveness. Next, please.

To summarize, we believe at staff that there is a more aggressive approach necessary to effect behavioral changes that are required to protect water quality. We believe that inspections are needed to address BMPs to prevent pollution, to ensure that they are being utilized, and not just to wait for an illicit discharge to occur. Additionally, we believe that there is an incremental workload between educational site visits and the new inspection program. We believe that the difference in work level effort is minimal.

Also, we believe that there is a shared responsibility for inspections between Regional Board and the permittees intended to optimize scarce state resources and local resources toward a better state and local partnership.

Now, I do want to mention that I have added a few additional slides -- not slides for the presentation, they are part of your packet. It's a couple of comparison tables. It's intended to give you a very quick overview to be able to compare between the various options, and we also provided you some information regarding the number of facilities that are covered by the General Industrial Storm

Water Permit for selected cities in the area. Next line, please.

To conclude, staff has responded to the board direction given at our workshop that was held in July. We believe the permit that's before you conforms to a floor that was established by the Long Beach Permit. The permit is incrementally improved. It's added various requirements, and we believe that it is a substantial improvement over previous permits, and it's advancing the cause of storm water protection. And staff has diligently -- and I have to emphasize this -- we have made extensive efforts to reach out to the various permittees to incorporate as many comments as we possible could and to keep the integrity of the program that is before you today.

And I would like to conclude, once again, by thanking all of the staff who have participated in this effort. Their names have already been mentioned, but obviously the level of effort by them has been nothing less than exceptional in my opinion, and I thank them very much.

So with that, I would like to recommend to the Board the adoption of the tentative permit. I would like to strongly recommend that you consider Version A/C as one of the preferred options for the inspection program.

We do believe it is a -- I had intended to recommend B, but the language in A/C does include various

comments from the cities that they wanted to have included, and it does read quite a bit better than Version B that is in your permit currently. Thank you very much.

CHAIRMAN NAHAI: Thank you. I'd like to first before going on to hear from the County of L.A. and the Coalition for Practical Regulation, I'd like to call on Ms. Laura Gentile from the USEPA to speak to us.

LAURA GENTILE,

MS. GENTILE: Good morning, Chairman Nahai, and board members. I'd like to start by acknowledging the efforts of the Regional Board, the permittees, and the environmental groups for their participation in the recent mediation sessions that we had.

Through their efforts, everyone was made to work together constructively, and significant progress was made resulting in major improvements to this draft permit, specifically the language regarding the draft inspection permit for industrial and commercial facilities.

The Regional Board, in particular, went to great lengths during this mediation process to try to find solutions to the concerns raised by the permittees. In response to the concerns, the Regional Board developed the fourth option as described by Mr. Dickerson earlier, A/C.

EPA strongly supports this mediated solution

option A/C for the following reasons: this option more efficiently utilizes state and local resources. This option has various wide-stated permit goals and also clarifies rules and expectations of the Regional Board and of the cities. This option goes very far towards addressing the concerns identified by many of the cities regarding the cost of program implementation. This option very easily meets EPA expectations and requirements.

In assisting the Regional Board with the various mediation sessions that we had, our intent was to help the permittees and the Regional Board as well as the environmental groups to get to a point where they could work collaboratively together to find creative and constructive solutions to some of the problems they had been expressing. While significant progress was made during these sessions, we realized that not all of the issues were resolved to the satisfaction of all the parties.

Of the various ways that exist to resolve these ongoing concerns, we considered several options, including the option of enrolling into this permit only those cities that are in agreement with the mediation solution that we came up with during our sessions. With this option, the cities still in disagreement would have to apply to the Regional Board for an individual permit.

In general, the feedback that we got on the mediation sessions was quite good. Most parties indicated to us that this was a step in the right direction towards improving communication between all of the parties.

Following permit adoption, if the Regional Board chooses to continue the dialogue with the permittees and with the environmental groups to work out any remaining issues that they would like to do so, EPA will do whatever we can to be of assistance in this area.

In conclusion, we would like to recommend that the Regional Board adopt this very much improved draft permit with mediated solution option A/C as the Industrial and Commercial Inspection Control Program, and we look forward to re-issuance of this permit so that Regional Board and MS4 staff can start redirecting our resources from permit negotiations towards permit implementation. Thank you, very much.

CHAIRMAN NAHAI: Thank you very much. With that, I'm going to -- the cards have been arranged for me, so I'm just going to read them out. I understand that we're going to provide a total of 45 minutes to the County of Los Angeles, County of L.A. Department of Public Works, and the Coalition for Practical Regulation. After that, we will hear from the environmental groups for a joint presentation, and then we'll go to the speaker cards. And

R0007803

depending on time, we'll provide either three or four minutes per speaker. And I think -- Are you worried about lunch?

MS. CLOKE: You're the man who never has to get off the podium for any reason.

CHAIRMAN NAHAI: I just don't like to -- I want to accommodate everybody who is here. Let's go until one o'clock. I think by then we should conclude the hearing from the county and the coalition, and then we'll break for lunch at that time.

The first card that I have is from Mr. Adam Ariki. I'm sorry, I can't read it very well.

MR. ARIKI: It's Ariki.

CHAIRMAN NAHAI: Of course. I apologize.

ADAM ARIKI,

MR. ARIKI: That's fine. My name is Adam Ariki, storm water manager from Los Angeles County Department of Public Works, Flood Control District.

Mr. Chairman of the Board, Board members, again, I already stated my name and what I do. I would like to thank you for the opportunity to express our concerns and thank the Board staff for the time they spent with the permittee discussing permit requirements.

While the principal permittee is in general

agreement with the permit and strongly supports the storm water pollution prevention, we have different opinions on how some of the permit requirements should be structured. I will present some of these defenses and how to reconcile these differences on behalf of the principal permittee. And Ms. Carolina Trevizo will present additional concerns on behalf of the County of Los Angeles as a permittee.

The first concern that we have, and you've heard a lot about it in the second draft and again here this morning, is the receiving water limitation. I heard Dr. Swamikannu stating that where receiving water quality standards are violated, what the Board intends is to have the permittee implement iterative process of best management practices.

We are not asking you to change that. What we're asking here is if that's the Board's intent, then let's add language to clarify that. And the language we are proposing to clarify is in the proposed change. The format of the presentation goes like: requirements, the concerns, and the proposed language for the permit.

We would propose that you add a sentence at the end that states that so long as the permittee has complied with the procedures set forth which is the iterative process, and is implementing the revised SQMP, the Storm Water Quality Management Plan, and its

components, the permittee is in compliance with this order. I think that line would go a long way, and it will clear any future disputes about that.

The second concern that we have is the inspection of state-permitted facilities. The issue here that we have with this is a legal one. We believe that state-permitted facilities, facilities that are issued a state permit, are the responsibility of the state and not the permittees. Again, we proposed a change to the language under the section where it says "Proposed Changed Language" to reflect that.

The third issue that I'm going to go over, and I'm going to turn it over to Ms. Trevizo, is the responsibility of the principal permittee. This is a major issue to the principal permittee. The permit as it states requires that the principal permittee identify municipalities that have jurisdiction over the source of pollutants identified by the water quality permit requirements, and also to ensure that watershed-based integrated reports be prepared as part of the annual reports.

The principal permittee has always voluntarily agreed to do administrative tasks, such as organizing the reports, compiling the data, and passing this information to the Water Quality Control Board. We

R0007806

will continue to do that. We'll even further agree to continue to work with the Board in forming some sort of an ad hoc committee to be responsible for that watershed-based integrated report. But the principal permittee cannot and must not take that responsibility. We're in no position to take that responsibility. We cannot tell the cities what to do politically or otherwise.

So, again, we propose a modification to the existing language, a very minor modification, that an ad hoc committee chaired by a Regional Water Quality Control Board staff be formed, and we will work with them very collaboratively to ensure that such a report is accomplished. Thank you for your time, and I'm going to turn it over to Mr. Trevizo.

CAROLINA TREVIZO,

MS. TREVIZO: Thank you. Good afternoon, Mr. Chairman, members of the Board. For the record, my name is Carolina Trevizo, and I am a storm water engineer for the Los Angeles County Department of Public Works.

I would like to thank you for the opportunity to express the additional concerns of the County of Los Angeles regarding the MS4 permit. I would like to join my colleague, Mr. Ariki, in thanking the Regional Board staff and Mr. Dickerson for their efforts.

R0007807

I would now like to continue with remaining concerns.

Here we have the definition of "maximum extent practicable." Originally, we were prepared to make a comment on this definition. We now understand that a change to the permit language has been made and has been issued in the most current change sheet as Item No. 6. This item appears to address our concern with this issue. So I am going to defer this. I again state that we feel that the change sheet issued today in Item No. 6 reflects this issue for us.

Our presentation was prepared before today's recent change sheets, excuse us. The next item is the definition of "environmentally sensitive areas." In this, the permittees are required to prepare an ESA delineation map for the determination of SUSMP application. The map is to be based on the definition of ESAs which includes Los Angeles County Regional Planning, Department of Fish & Game, and the Basin Plan designations.

Our concern is that we feel areas which are not field-verified should not be used for any planning or regulatory purpose in this permit, such as the area designated as a significant natural area by the Department of Fish & Game.

Again, we understand that an editorial change has been made in Item No. 5 of your most current

change sheet, and we feel that this partially addresses our concern. However, we would like the change to apply to all elements of the definition. Therefore, we would like the addition to be moved as in the following example: areas subject to storm water mitigation requirements are -- using Regional Board staff language -- provided the area had been field-verified areas designated as significant ecological areas as defined in and so on and so forth.

So in this case, we would just like that that addition be moved up in the definition. Thank you, and thank you for your time.

CHAIRMAN NAHAI: Thank you very much. The next card I have next in order is Mr. Shahram Kharaghani.

SHAHRAM KHARAGHANI,

MR. KHARAGHANI: Good afternoon, Mr. Chairman, Board members. My name is Shahram Kharaghani. I am the Watershed Protection Division manager for the City of Los Angeles.

I would like to take this opportunity to thank Mr. Dickerson and his staff for working very closely with myself and my staff for the past eight months to resolve most of our outstanding issues.

As a result of that, there remain only two issues to be discussed today before your board. Issue

R0007809

No. 1 has to do with receiving water limitations. This section prohibits a violation of water quality standards for water quality objectives from MS4 discharges to the receiving water of the Los Angeles County.

While we support the intent of this section, we believe the way the section currently reads it could place the city in increased risk and liability. Section also includes an iterative process by which water quality standards and objectives can be sought. However, compliance with strict numerical limits is a daunting task to overcome over such a short period of time due to the current conditions of the region's receiving waters and the magnitude and the number of pollutants of concern.

While we support the intent of this section, we need to have a "safe harbor" language to protect the city as we are implementing in good faith the best management practices to comply with the permit requirements. That's Item No. 1.

Item No. 2 is state-permitted facilities, currently the Regional Board issues general activity permits for certain industrial and commercial facilities and construction sites. The Board collects fees to perform certain tasks. The new permit is passing on to the city the inspection function of these permitted facilities that is currently being done by the Regional Board.

We respectfully ask the Regional Board to continue to perform the inspection function for their permitted facilities or alternatively provide monetary compensation to the city if they want us to perform that function on their behalf.

I would also like to submit a letter that I have from Mayor Hahn to Mr. Chairman, that was written yesterday and signed, to the record. And I'd also like to ask that the change sheet that was prepared today to also be submitted to the record. Last but not least, I strongly support the Version A/C of the industrial and commercial facilities inspection.

Thank you so much. I would like to ask now Ms. Katharine Wagner, our legal counsel, to elaborate on legal aspects of the receiving water limitations. Thank you.

CHAIRMAN NAHAI: Thank you.

KATHARINE WAGNER,

MS. WAGNER: Good afternoon. I'm Katharine Wagner of the law firm Downey, Brand, Seymour, and Rohwer in Sacramento representing the City of Los Angeles and just adding comments on very limited subjects here.

The gist of our comments simply go to the receiving water limitations and one addition to the

definition of "water quality standards" that was made in the December 10th changes.

I also have a text of what I'm going to say about the receiving water limitations entitled "Addition of Title 22" in the December 10th changes that I would simply ask to submit so that you have the text of the change that we're proposing, and it will be the statement we're submitting...

You have heard about the receiving water limitations already, so I won't plan to belabor the point. The city has previously submitted written comments on the language in Part 2, specifically Part 2.1 through 2.3, and has suggested specific changes that would indicate that the permittees shall not be in violation of receiving water limitation Part 2.1 and 2.2 as long as the permittee has timely implemented the specified control measures, making a change to the first sentence of Part 2.3.

That is in the previous comments which also pointed out there was some precedent in the State Board's adoption of the general permit for aquatic pesticide applications, just showing that from a point of view of federal and state legality that language could be used.

However, if the Regional Board chooses not to -- Oh, and I wanted to comment since I heard the change suggested by the county that we may be in accord on that

language if you prefer that language. I have not seen it, but it sounded very similar to what we proposed.

If the Regional Board chooses not to make the changes the city has proposed or similar changes, the city requests that findings be included in the permit clarifying the intent of the receiving water limitation language. These findings can be entirely consistent with and drawn directly from statements made recently in the San Diego County permit appealed decision by the State Water Resources Control Board. This decision was mentioned by staff.

Specifically, we suggest that findings be added with phrasing drawn from the wording on page 8 of the San Diego order as follows: the receiving water limitations of this permit do not require strict compliance with water quality standards. These limitations require that storm water management plans be designed to achieve compliance with water quality standards. Compliance is to be achieved over time through an iterative approach requiring improved BMPs.

Again, our preference would be a very strong preference to have the clarifying language in the provisions. However, we did note this specific language in the State Board order which we think would also be appropriate to include in findings.

I think everyone senses there's a bit of grasping to simply document what everybody understands to be the intent of these provisions. We also had a comment originally on the "maximum extent practicable" definition which we feel was taken care of, the changes to the maximum extent practicable definition in the third draft, and we believe that was taken care of by the striking of the sentence in Item 6 of the staff's additions to supplemental change sheet which we would support.

Finally, on the definition of "water quality standards," this is in Part 5 of the permit, and it's on page B-361 of the package according to the version of the permit I picked up at the front of the room. This came from proposed change No. 21 in the Additions to Draft Change Sheet issued December 10th. And in that change, what staff did was insert the phrase "Title 22 of the California Water Code" inside the definition of "water quality standards" and "water quality objectives."

I see that they have made a late change to change Title 22 of the Water Code to Code of Regulations because, of course, it was not part of the Water Code which was our first point. However, it still refers to an entire title of the Code of Regulations which was passed for entirely different reasons than the adoption of water quality objectives and standards in the technical and

R0007814

formal and important legal sense.

Therefore, reference to inserting the phrase "Title 22 of the California Water Code" or "Title 22 of the Code of Regulations" is simply incorrect. I think for anybody who has looked at this really closely, this will make sense. It sounds rather like a technicality, but it is important as it plays out.

As you know, water quality objectives and criteria are actually things that are adopted into water quality control plans. This is specifically provided for in 13241 of the Water Code which refers to adopting water quality objectives in water quality control plans.

You may be familiar with the fact that basin plans and water quality control plans on occasion make reference to specific parts of Title 22, and that would not be the point here. If they do and to the extent that they do, you don't need that insert. You already have in the definition reference to the water quality control plans themselves, and this simply is a technical incorrectness which doesn't really achieve anything beneficial and causes confusion and it's erroneous.

Of course, 13241 outlines how you adopt objectives, and that process wasn't followed in the issuance of Title 22 regulations. So you already have reference in your definition to -- references to criteria

contained in the Basin Plan. If the Basin Plan has criteria cross-referencing Title 22, you don't need this new language to be inserted.

So proposed change No. 21 should not be adopted. The phrase "Title 22 of the California Water Code" should not be inserted into the definition of "water quality standards."

That's the conclusion of my testimony. If you have any questions... Thank you very much.

CHAIRMAN NAHAI: We're going to keep our questions until the end of the presentation. But I have just one quick question to ask you. As part of our agenda package, we've been given a certain something called "Summary of Fiscal Resources" for the year 2001 and 2002. And part of that is the city's projections of costs on its storm water program. I have some questions on that. Should I pose those questions to Mr. Kharaghani?

MS. WAGNER: Yes. Mr. Kharaghani would be the appropriate person.

CHAIRMAN NAHAI: Well, I just wanted to make sure that we have somebody here who is competent to respond to those questions.

MS. WAGNER: Yes.

CHAIRMAN NAHAI: Thank you.

MS. WAGNER: Thank you.

R0007816

CHAIRMAN NAHAI: The next card I have is from the Mayor of the City of Signal Hill, the Honorable Larry Forester.

MAYOR LARRY FORESTER,

MAYOR FORESTER: Thank you, Chairman Nahai, and Board. I appreciate the time you've given for me to speak as Mayor of the City of Signal Hill, but also as chair of the Coalition for Practical Regulation representing 35 cities in the L.A. basin.

First of all, I realize that I was answering a phone call from City Hall when they swore people, so I'm not sworn in. So does somebody want to swear me in?

CHAIRMAN NAHAI: Yes, I'll do that. Repeat after me: I do solemnly swear.

MAYOR FORESTER: I do solemnly swear.

CHAIRMAN NAHAI: That the testimony I am about to give.

MAYOR FORESTER: That the testimony I am about to give.

CHAIRMAN NAHAI: Will be the truth.

MAYOR FORESTER: Will be the truth.

CHAIRMAN NAHAI: The whole truth.

MAYOR FORESTER: The whole truth.

CHAIRMAN NAHAI: And nothing but the truth.

R0007817

MAYOR FORESTER: And nothing but the truth.

CHAIRMAN NAHAI: Under penalty of perjury.

MAYOR FORESTER: Under penalty of perjury. Thank you.

Well, thank you for, again, allowing me the time to be here. My comments will hopefully be brief, and I want to focus on four issues. I want to thank Dennis Dickerson and staff for the time spent in mediation. I also would be remiss if I didn't thank Congressman Dreier and Congressman Horn for their hard work with EPA Washington D.C. in conjunction with EPA Region 9 in getting us the mediation setups put together. And I really appreciate both congressmen coming to our help in that area and working with the D.C. office and with Region 9 office. So I really appreciate that. Really, the time spent in mediation clarifying the permit makes a better state and local resources to be used in the long run.

My first issue: Storm Water Inspection Program. The mediation session focused on an alternative inspection program. This inspection program is more sensitive to the resource constraints by cities of the Version A and B.

Now, I will note that some changes here were not received in time for me to make, meaning, what was put in your packet. And I realize the recommendation of A/C is

R0007818

in the packet. But one of our concerns is the resources that are needed for those inspection programs.

There were two resource questions the Board can help clarify. The permit directs cities to inspect state-permitted facilities. Mr. Dickerson indicated the state will inspect two-thirds of the state-permitted facilities. He was requesting the cities to inspect the remaining one-third of the state-permitted facilities.

The cities request two clarifications. First, the Board forward to the cities the inspection fees for the state-permitted facilities that the cities are being asked to inspect.

The Board is collecting an inspection fee, but not performing the inspection. It only seems fair that the city should not be financially penalized for picking up the state inspections. It also seems fair that we not double-fee the business community by charging both a state and local inspection fee for state-permitted facilities.

Second, the city is requesting the state's responsibility for state-permitted inspection be specified in the permit. What happens if the state budget reductions impact your inspection program? Will the cities now be responsible for 50 percent of the state's inspections? We are requesting a list of categories of state-permitted facilities that you are committed to inspecting.

R0007819

There are some facilities such as airports, railroad yards, or regional transit facilities where the Board has the resources and the background to continue these inspections.

The draft permit now is open-ended with no reasonable limit on the number of inspections the cities may be ordered to undertake, although I did see some clarification in Mr. Dickerson's slide to you. So if that's appropriately modified, so be it.

We're looking at particularly a memorandum of understanding of what is to be inspected and not inspected, very similar to the one that the San Francisco Regional Board and the Alameda County permittees signed.

My issue No. 2: permit time schedule. In the packet I just passed out to the Board was a letter to Mr. Dickerson dated December 10th showing a year time schedule that we have some problems with, although I did understand from Mr. Dickerson's comments that he has made some modifications which I have not seen on that. But I will go through with my comments.

During the November 29th mediation session, we presented a list of permit's new or revised programs in chronological order. There are 44 new or revised programs from increased street sweeping, to installing trash receptacles at all transit stops in the county.

R0007820

34 of the new programs are required in the first year of the permit. That might be modified; I haven't seen the changes. 25 programs are required in the first 6 months. This is an extremely aggressive and excessive number of first-year programs, considering that our communities are facing revenue reductions brought by the economic recession, homeland security issues, and the demands of September 11th on all of us from many regions of budget cutting or budget tightening.

The permit originally required that the cities complete a dry-weather diversion report in the first six months. I appreciate and I did get that update that that has now been moved out to, I believe, the year 2003 if I'm not mistaken. I want to thank the staff for moving it to 2003.

77 of the cities will need assistance from the Sanitation District in order to complete these reports which will require resources from cities, the Flood Control District, and the Sanitation District. We understand that the Sanitation District will complete a report on 40 storm drains in coastal communities as part of an environmental special project for the Board. This prioritization makes sense. This is one example of working with the cities on moderating the resource-intensive programs required in the first year of the permit.

R0007821

There are a series of other expensive reports and programs that are required in the first year: again, numeric criteria study, illicit connection program, storm water ordinances, and technical manuals for BMPs, and the list goes on.

The mediation session ended abruptly without our ability to address the resource problems presented by requiring the cities to implement 34 programs in the first year of the permit. All of our city budgets are synchronized with the state budget and must be adopted by July 1.

The cities are currently in mid-budget and will begin preparing new budgets in January. This is the time to design new programs, estimate their financial impact, search for funding, and balance the new programs with other critical services.

The permit does not recognize the time constraints and the financial burdens it imposes on the cities. We ask that the permit be modified to address funding sources from the state and to reduce the number of burdensome programs being imposed on the permittees.

Issue No. 3: receiving waters, legal "safe harbor" and regional solutions. There has been much discussion about the legal "safe harbor" for the cities. It's a complex issue. On the one hand, the Board wants to

R0007822

retain enforcement ability over the cities who do not comply. The environmental community wants to monitor both state and permittees and has a threat of third-party lawsuits allowed by the EPA Clean Water Act.

Cities who are acting in good faith do not want to be subject to fines and third-party litigation while they implement expensive and untested programs. Everyone recognizes that the process is progressive and educational where certain programs may work and others may not. The process assumes there will be some programs that will fail. The permittees should not be subject to enforcement action for experimental programs that are ineffective.

I cite a case: the City of Laguna Niguel. In 1997 the city volunteered to participate to study development new strategies to reduce bacterial level in storm water discharges. They volunteered one of their storm drains serving 1,400 homes. They began the study.

Without prior warning or notice, the San Diego Regional Water Quality Control Board issued a cleanup and abatement order. The abatement order was open-ended, providing no guidance or information on what bacterial level was acceptable and what programs the Board would accept.

During the last two years, the City of

R0007823

Laguna Niguel has invested over a half a million dollars implementing a series of iterative measures to reduce bacteria. They did have a grant for $150,000 for part of it.

They have completed extensive investigations and installed low flow diversions to the regional sewage plant, increased street sweeping and catch basin cleaning in the watershed. They have conducted extensive public education programs and instituted a program of water conservation. In the spring of this year they installed an end-of-pipe filtration and ultraviolet treatment system. The benefits from all of these are uncertain at best. The diversion/treatment projects had minimal impact on water quality, and the REC-2 water quality objective is still not consistently met.

After four years the Regional Board still has not provided direction to the city on how they can comply with the cleanup and abatement order. And I emphasize, the National Academy of Sciences recently reported to congress on the problems created by holding cities legally accountable to achieve storm water standards where the science and cleanup technologies are imperfect. This study is part of the administrative record, and we hope that you had an opportunity to review it.

The permit contains a section discussing

R0007824

regional solutions which are widely recognized as the most cost effective means of dealing with storm water cleanup. Perhaps the City of Laguna Niguel could have benefitted from a regional solution in our opinion.

The regional solution language in the permit does not go far enough, but our alternative language that was submitted to you in a previous meeting was rejected by staff. We suggest that the Board modify the regional solution provisions and the receiving water limitation language to provide a legal "safe harbor" to cities that implement, design, and fund regional solutions.

Since regional solutions would take time to coordinate with various entities, extending this "safe harbor" both for regional solutions and for good-faith compliance with MEP standards would make sense.

Item No. 4/Issue No. 4: timing of approval. My final comment is based on your tentative action today to approve the NPDES permit. This is an essentially bad time of year for such a controversial permit of this magnitude. Many cities will not meet until the second week in January due to the holiday season. Many meetings had to be rescheduled since they fall on Christmas and New Years, both holidays fall on Tuesdays, and most of us meet on Tuesdays in the Southern California area.

We have sent several letters to

R0007825

Mr. Dickerson outlining this concern. We believe that your adoption today will not permit the cities sufficient time to study the merits of the permit and the numerous changes that have been made. You may trigger more appeals to the State Board by your premature action today.

Clearly there are problems with the permit. We believe the Board action today is to continue -- We believe the Board action today should be to continue the NPDES permit and to direct staff to continue with us EPA mediation sessions. USEPA has indicated that they would devote the necessary resources to complete mediation. The coalition is committed to mediation.

Board Member Cloke asked a very good question at a workshop on July 26th: Why can't the cities work with the Board? We took that comment to heart and worked hard with our congressional delegation to have USEPA mediate. We've shown our ability to work with the Board with the revised inspection program and with the permit schedules, the proposed MEUs, regional solutions, and other improvements. The question before you now: Will you work with the cities?

Thank you for your time. I appreciate it. I know that you're going to have questions at the end. As many of you know, I'm suffering from a virus that causes me to take 22 pills a day. Right now and on certain days

those don't kick in real well. So I'm leaving right after we're finished here. If you have any questions for me, I'll take them now or you might refer them to me later. But I appreciate your time.

CHAIRMAN NAHAI: How long will you be with us before you leave?

MAYOR FORESTER: I'm leaving at 1 o'clock. I shouldn't really be here today with the reaction I'm having with the drugs I'm on right now. But that's a chance I take, and I felt it was my responsibility as chair of the coalition to be here to represent both the city and the 35 members of the coalition.

CHAIRMAN NAHAI: Are there any other members of the coalition present to whom we could address questions?

MAYOR FORESTER: There's staff here that can answer some of the questions. The Public Works director from the City of Signal Hill who is working with the coalition probably could answer some of those questions for you. So I leave that open for you, unless somebody had a particular question for me with the statements I've just made.

CHAIRMAN NAHAI: Okay. I had some questions about costs and so on, but I wanted to keep those until...

MAYOR FORESTER: I believe that the county can answer some of those. I believe that a statement made to the press by Nate Holden and myself in a press conference

R0007827

held two days ago had some clarifications on those and where those estimates came from.

And one study was done by the State of California, and had it researched. And I think it's the one that everyone keeps referencing, $53 billion. It was also mentioned of a $75 million cost to the City of Los Angeles. Those I think can be answered by people that are here today.

CHAIRMAN NAHAI: So they'll stay, because I do have questions about that.

MAYOR FORESTER: Yeah. I have to go. I apologize, but it's just one of those circumstances that when I get on these pills, sometimes the reaction is not the best in the world. So thank you very much.

CHAIRMAN NAHAI: Thank you for coming. The next card is from Mr. Montevideo. We had provided until, I thought, one o'clock which is about 10 minutes away, and I still have three more cards in this section. So I hope that you'll be brief. Mr. Montevideo followed by Mr. Alvarez, followed by Mr. Young. Time is passing.

RICHARD MONTEVIDEO,

MR. MONTEVIDEO: Good afternoon, Mr. Chair, and members of the Board. Thank you for the time today. My name is Richard Montevideo. I'm here on behalf of the

R0007828

35 cities who are part of the coalition, an ad hoc coalition under the Coalition for Practical Regulation.

On behalf of the coalition, we have already submitted extensive comments on the various drafts of the permit. And I presume that those comments are already part of the administrative record, so I will not address each of the points, the legal issues that are set forth therein.

I would note that there are a number of concerns that we have raised in our comment papers that have not yet been addressed by the third or now the fourth draft of this permit. I would also note that procedurally there were a number of changes that were made on December 4th and December 10th and even today, some of which in our minds are significant. There are changes made to Findings 4 and 5, for example, and some references to some authority and some reports that were conducted.

We have not really had an opportunity to look at all those reports and to perform a full evaluation of these changes. The changes in our mind were significant in number and were significant in substance. For that reason, we would submit that the permit under the federal regulations would need to be re-circulated and the public given an additional 30 days to review these significant changes.

In terms of the merits of what's before you

R0007829

today, I want to first say that the coalition is not alone in its various objections to the numerous provisions of this permit. An example is raised by the petition that was brought to the State Board on the San Diego permit that was actually adopted by the San Diego board in February.

You should know that there a number of other permits that are in the works, draft permits, workshops that are being conducted up and down the state, hearings that are presently scheduled, and permittees in those other regions similar to these permittees have similar, if not identical, concerns and objections to the language that has been proposed in those other permits.

These objections include the appropriateness of the expansion of the MEP standard, maximum extent practicable standard. The lack of a "safe harbor" and the variance of the receiving water limitation language from 99-05 and Water Board Order 2001-12.

The breadth and cost of the inspection program and the transfer of responsibility for that program, the infringement on local land use authority is a significant issue to many municipalities up and down the state. The unknown benefits, frankly, and the propriety of the SUSMP program remain at issue for many municipalities.

And, in general, whether the benefits of the numerous programs that are outlined in the discussion and

handout that Mr. Forester was referring to -- actually, I have a copy of that here which I can pass out for the Board. It was a letter to Mr. Dickerson within the last week or so. Whether those benefits, frankly, outweigh the cost of the various programs that are being imposed upon the permittees. These are frankly the core issues. There are many others, but these are the core issues that we have concerns with that we believe cause the present permit before you to be re-evaluated, reconsidered, and maybe revised.

Part of the problem from our perspective, frankly, is the lack of understanding of the affairs of municipal government, that is, what it takes to run the city, the numerous public services that a municipality offers on a daily basis, things such as police, fire, emergency services, paramedic services, libraries, public parks, community service centers, senior citizen centers, streets, public roads, all sorts of different public projects. In our minds, we have an obligation to maintain and provide those services in addition to working with the Regional Board to address water quality issues

It appears from the permit that in your minds, as municipalities, we have an obligation to effectively control and eliminate -- I heard that word earlier today in staff's presentation -- eliminate

pollutants in storm water from all of our citizens, apparently before it even enters our storm drain system; that this obligation, apparently, is to be imposed upon us regardless of the cost to actually implement this program.

In our minds, yes, we have an obligation when it comes to clean water, and everyone supports clean water. But that obligation is set forth under the Clean Water Act, and it's an obligation to work to the maximum extent practicable. That's the standard to reduce discharges of pollutants from our municipal separate storm sewer system.

Cities must provide all these resources with, frankly, limited budgets even more so these days, limited staff and limited resources. The Regional Board as a public body is charged with protecting the quality of the waters of the state. In that charge, they must take direction from the State Board and obviously must act in accordance with the Porter-Cologne Act and the Clean Water Act.

And the Clean Water Act is very specific in terms of permits that are to be issued to municipalities. Those are permits to be issued to address pollutants discharged from an MS4, and those discharges of pollutants should be reduced to the maximum extent practicable.

When you review the Clean Water Act and the

R0007832

regulations, it's apparent that the MEP standard is a standard. That's been adopted, in part, recognizing that municipalities are not the generators of the pollutants in the waste. We're not the culprits, so to speak, of the pollutants at issue. We're simply the ones at the end of the day holding the bag. We think the Clean Water Act recognizes that with the MEP standard.

We also think the Clean Water Act recognizes that municipalities have other responsibilities, including land use responsibilities and overseeing development. Yet the very first sentence of your definition of MEP says that we're required to reduce pollutants in storm water as opposed to reducing discharges from MS4s to the maximum extent practicable. This clearly is a liberty and exceeds the standard under the Clean Water Act.

The 9th Circuit recently recognized in "Defenders of Wildlife vs. Browner" that the Clean Water Act -- I'm quoting-- generally prohibits the discharge of any pollutants from a point source into navigable waters of the United States. An entity can, however, obtain an NPDES permit that allows for the discharge of some pollutants, close quote.

The whole purpose of the permit process under the Clean Water Act is to allow for the discharge of pollutants to the MS4. And when it comes to

municipalities, the controls that are to be placed upon them and the controls that they are to place upon the regulated community are controls to the maximum extent practicable.

The divergence from the MEP standard, frankly, is a fundamental point of disagreement and changes the entire scope of the permit that's before you. Clearly the standard that you have proposed spills over into all sorts of provisions within the permit. Things such as the broad inspection program, the cost of the inspection program, the transfer of responsibility that we've heard of today, all that comes from a tweaking or an expansion of the MEP standard, the SUSMP provisions, the provisions in the permit dealing with land use and tweaking and interfering with our land use obligations, interfering with our CEQA jurisdiction, the receiving water limitations, and so on and so forth.

These are all expansions of the MEP standard. Even the language within the Clean Water Act itself, frankly, recognizes that municipalities, local governments have primary responsibility for regulating land uses and for overseeing development within their respective jurisdictions. And what you've done with the various provisions, in our estimation, conflicts with the Clean Water Act and, specifically, the MEP standard.

State law similarly recognizes that a municipality has land use authority and recognizes the general jurisdiction of the municipality. There is a reason that CEQA and the state general plan provisions, and, frankly, Water Code Section 13360 gives cities the discretion and authority to review and approve development and redevelopment projects and to regulate land uses.

These unique municipal issues are within our jurisdiction. It's our view that your jurisdiction is water quality. Under the law, it is our job, not the Regional Board's, to regulate land uses within the city's jurisdiction, including imposing general plan amendments. Under the law, it is our job, not the Regional Board's, to review development projects under CEQA and to come up with appropriate mitigation measures to assure protection of the environment. And that includes issuing and requiring SUSMPs.

Under the law, it is our job and not the Regional Board's to determine whether and to what extent a project may go forward within an environmentally sensitive area. With the exception of the area being sensitive because of water quality, it's our job to determine how that project is to be conditioned.

Under the law, it is our job and not the Regional Board's to determine whether a particular

commercial or industrial facility is complying with our storm water ordinance and whether and when and who to inspect.

And, finally, under the law it is our job and not the Regional Board's to determine whether or not to place trash receptacles at bus stops. The Regional Board is charged with the responsibility of protecting the quality of the waters of the state; we are charged with the responsibility of providing a vast array of public services to the community. Clearly we need to work together to address all of these issues.

Yet in working together, we must recognize and honor our respective jurisdictions and act in accordance with the bounds of the law. We ask that you work with us to address the issues of water quality envisioned by the Clean Water Act. At the same time, please respect the importance of these other public services that we have to provide to our community.

We are willing to work with you to help you do your job, but you need to allow us to do our job. Thank you.

CHAIRMAN NAHAI: I have, again, within this 45-minute segment, there are also two more cards from Mr. Alvarez and from Mr. Young. How much time were you each going to take?

MR. YOUNG: There I was safely in the back of the room with my coat off. I'm Rufus Young. I am not part of CPR's presentation, so I'd like to be deferred until a later point in the proceedings.

CHAIRMAN NAHAI: Since you're at the -- I thought I had deja vu looking through these cards here because there are no less than seven from you.

MR. YOUNG: Well, that's, if I may, because I didn't submit them on behalf of three other cities which we also represent because one of them has a representative, in fact, an elected official, a councilmember who will be speaking, and that's Councilmember Kellar for the City of Santa Clarita. And the two other cities are in Ventura County, and they can be deferred until a later proceeding. I will be making presentations on behalf of seven other co-permittees.

CHAIRMAN NAHAI: You know very well that when it comes to -- you know, we have a rule of four minutes per speaker, not four minutes per city, or four minutes per association, or four minutes, you know, per capita of people we might think we represent.

So when it comes to it, I'll make an accommodation for you and provide you with some additional time given the cities that you represent, but I'm not going to provide you with a 35-minute block.

MR. YOUNG: Deja vu also comes to mind, Mr. Chair. I made a similar objection previously suggesting that it's the right of the co-permittee to have adequate time, whether that co-permittee is represented by the same lawyer as another co-permittee.

CHAIRMAN NAHAI: I understand that, Mr. Young. What I'm asking you to do is in the spirit of cooperation to think during the lunch break how much time you realistically need in order to make your point to us.

MR. YOUNG: I would be pleased to do that.

CHAIRMAN NAHAI: I don't think that 35 minutes is a reasonable request.

MR. YOUNG: Nor did I enter the room expecting I'd ever get anywhere near 35 minutes. Thank you, though.

CHAIRMAN NAHAI: Then why give me seven cards? Never mind.

MR. YOUNG: To underscore the point, and I think it's a very serious one, that it's the right of the co-permittee to have adequate time. Thank you very much, and I will ponder that request over the lunch break, which I hope is coming soon, and will reduce the time significantly. Thank you.

CHAIRMAN NAHAI: So the gentleman who was going to speak on behalf of Mr. Alvarez, can we hear from you now, please?

R0007838

HECTOR BORDAS (PHONETIC),

MR. BORDAS: Good afternoon, Chair, Board. My name is Hector Bordas. I am with the City of Downey. Mr. Alvarez is my boss. He unfortunately had to step out, and I'll be reading his statement on his behalf.

"I would like to thank the Board and their staff for their hard work and effort in working with all parties in developing the draft permit. Additionally, I would like to thank the environmental organizations and all the parties that have played an active role in addressing issues regarding the draft permit.

"A continued cooperative effort and dialogue by all parties can lead to a permit that's in the best interest of Los Angeles County. The mediations conducted by the USEPA have shown that with more time, we can come to a permit that will improve water quality in an effective way.

"The draft before you is not quite there yet. And we request that you not adopt it today, and instead have your staff work with the permittees and environmental groups on a version that we can all agree on. The areas that we still need to address are as follows: the first point is receiving water limitations language." Evidently,

this has been changed so I'll skip this.

"Monitoring requirements: the permit requirements for water quality toxicity, shoreline monitoring, estuary sampling, and bioassessments are well-intended. However, it has not been shown how these requirements will result in determining the effectiveness of implementing specific control measures and other actions in accordance with the Storm Water Quality Management Plan.

"Monitoring and data collection programs should be developed and implemented that better target the specific measures and actions. The responsibilty of the principal permittee to assess permit compliance: the monitoring and reporting program for the permit proposes that a principal permittee assess the effectiveness of the SQMP and the level of effort of the permittees. This is not the role of the principal permittees. The concept of a principal permittee is for the administrative convenience of the Board staff. The principal permittee has agreed to organize the data and compile your five annual reports.

"Coordination of permit activities: the permit establishes six watershed management committees to develop programs within each

watershed. However, the permit is issued for all watersheds and does not differentiate among them. It is beneficial to have one group coordinate the efforts of the committees and to serve as a primary contact for the Board regarding the permit requirements. The permit still does not recognize that this role has been met by the L.A. County Storm Water Program Executive Advisory Committee.

"Inspection of facilities: it's the Board's responsibility to inspect facilities subject to the General Industrial Storm Water Permit and the General Construction Activities Storm Water Permit for the purpose of enforcement with the GISP and the GCASP. It appears that it is the intent of the permit to transfer this responsibility and the responsibility for commercial establishments to the permittees. This is a costly and unfunded mandate that cannot be transferred to the permittees. And we encourage you to adopt Version C for inspection.

"Development planning: the permit changes recently adopted State Board SUSMP requirements. These requirements have been in effect for a short while in the development community, and permittees are just becoming comfortable with them. These requirements are effective in reducing the impact

R0007841

of development and redevelopment in our communities (sic.) For these reasons, it is not appropriate to expand the SUSMP requirements at this time. Additionally, the requirement to control peak flow is unwarranted. This is not the only solution to prevent stream erosion and to protect stream habitat.

"In closing, it's important that the implementation schedule for the permit requirements be realistic and acceptable to all parties, and, additionally, that the Board strongly consider my comments and those of other parties before making any decision on the current draft permit. Therefore, I request that the Board not consider the permit at this time, but a later date when comments are clearly addressed. Thank you for your time."

CHAIRMAN NAHAI: Thank you very much. At this time we'll take a break for lunch, and we'll be back by two o'clock.

(Whereupon, a recess was taken.)

CHAIRMAN NAHAI: We're going to start, everyone. Please sit down. Please take your seats, everybody. Sit down so we can continue. We are going to continue the testimony now by hearing from the environmental groups.

Take your seats.

I would like to ask Mr. David Beckman to come to the podium, please.

DAVID BECKMAN,

MR. BECKMAN: Thank you, Mr. Chairman, and members of the Board. I am David Beckman, a senior attorney with the Natural Resources Defense Council in Los Angeles, and I'm going to be leading off comments today from environmental organizations, in addition to NRDC, the Santa Monica Baykeeper and Heal the Bay. I wanted to welcome on behalf of all of us Mr. McDonald to the Board. Congratulations on your appointment.

MR. McDONALD: Thank you very much.

MR. BECKMAN: It's nice to see almost a full board, I guess, for the first time in many years.

For some of the newer members of the Board, I wanted to start out by giving you the perspective that illuminates a lot of our comments. NRDC, for those of you who don't know, is a nonprofit environmental organization. We have over half a million members in the United States and other countries. We have 100,000 members in California. And we've been working to protect the environment including our water resources, but not just water resources, since the early 1970s.

In fact, NRDC was working on clean water issues before there was a federal Clean Water Act. And it was due in a large part, if not directly, to NRDC prodding of EPA and ultimately litigation against EPA that storm water is even regulated under the Clean Water Act. In the '70s and '80s it was not. It took litigation in order to get EPA and then, subsequently, in 1987, congress, to treat urban runoff and storm water as something worthy of permitting under the system that you administer.

NRDC has been working on these issues locally since the early 1990s. And that's the background to some of our comments and some of our concern about the pace at which we are working toward clean water issues, toward achieving clean water in Southern California.

I have prepared remarks, but I wanted to respond, Mr. Chairman, to a few comments that have been made if that's okay with you. And if you're not interested in these responses as I go, you can tell me and I'll move on.

One comment about staff's presentation, Xavier I think said that the nuisance prohibition is subject to the iterative process, at least that's my recollection of what he said. That is not the case. And, in fact, the San Diego decision by the State Board, Footnote 16, expressly addresses this issue and says that

R0007844

generally speaking the nuisance prohibitions should be met at all times by permittees. So to the extent that that is part of the permit, we'd hope that you make that clarification, page 8 of the order, Footnote 16. Actually, it's not Footnote 16. Page 9 of the order, Footnote 18, addresses this issue.

The receiving water language issue, the request by permittees to put in a "safe harbor," also directly addressed just last month by the State Water Board. The exact arguments that you heard today were made by some of the same lawyers or law firms, the Building Industry Association, and permittees in San Diego. They wanted language just like they're asking you to insert in the permit, and the State Board refused to do that.

In fact, the State Board -- it's not reflected in the order, but I participated in those proceedings -- they clearly wanted to make it evident to the cities that a violation of the permit includes a failure to design the storm water program to meet water quality standards. Therefore, if it's not simply enough to be part of an iterative process, there's some discretion left with the Regional Board to consider it to be a violation of the permit if, in fact, there's been a failure to design the program to meet water quality standards.

So, again, that issue has been resolved. If

this was a court, it would be somewhat frivolous to raise it again. We're not in a court, but I still think that the argument is somewhat frivolous since, again, it's just been dealt with by the State Water Board on a municipal storm water permit last month.

We object to a change that was made recently to make the ESA provisions of the SUSMP conditional upon some inspection of the resource, presumably so that the county or some city can decide whether in their judgment the resources is deserving of protection.

These resources are called out in the Basin Plan for the most part, and we should take the presumption or operate with the presumption that the Basin Plan is a duly, lawfully-enacted regulation. And until and unless somebody changes it or shows you that it's wrong, it should govern. It would be like saying that water quality standards don't apply until and unless the county goes out and does a test and decides whether they think it's still valid, and that's not the way the system works.

It wouldn't be right for us to say, the environmental community, that we want to consider anything we think to be an environmentally sensitive area to be subject to that provision, and it's not right for the cities to seek that kind of discretion. So we hope that you would not include that in the permit.

And then, finally, Richard Montevideo's comments about the MEP standard and this supposed expansion and the way in which this affects the whole permit. I simply don't understand what Mr. Montevideo is arguing. I would just point out to you that all of the provisions with municipal inspections and the whole litany that your staff explained to you in terms of the scope of the permit come right out of the federal regulations directly. They've been there for 10 years.

There's no -- First of all, the MEP standard as you're articulating is not flawed. And, second, there's no taint that's occurring here with respect to the breadth of the permit. It's directly supported by the federal regulations. If you have any questions, EPA representatives here today, I'm sure, can tell you the same thing. So that's by way of just some of the things we heard today.

My comments are brief, but what I wanted to tell you is that I think the thing that you should be thinking about as you consider the permit is that you're addressing the region's No. 1 source of water pollution, by far the most significant source of pollution that we're dealing with in Southern California.

This is the issue. You're a regional water board. You are vested with the responsibility to protect

regional water resources. This is the No. 1 threat, and this should be your No. 1 concern as a consequence. It just seems logical.

Local studies -- forget the scientific literature. Local studies by USC and UCLA and SCCWRP and others demonstrate that storm water is acutely toxic in the marine ecosystem even when it's diluted 10 to 1. We all know that storm water carries pathogens, viruses, and bacteria that have been demonstrated to make people sick, to our beaches during the winter and during the dry season.

We also know that sediment in storm water interferes with the photosynthetic process, and that storm water is associated with nutrient blooms, with red tides off the Ventura coast. This is a very serious water pollution problem that has public health impacts and environmental impacts. And even though this is a permit that applies to cities that supposedly would like to think represent the public and the public interest, you didn't hear one comment today, not one that expressed any real concern about these issues. And I think that's really regrettable.

One of the primary reasons we have the problem we do, unfortunately, is because of the attitude, often a recalcitrant attitude, of many of the permittees. Now, there's some exceptions to this: the City of

R0007848

Santa Monica and to some extent the County of Los Angeles and some others. But many permittees seem to be more interested in creating a cottage industry to fight the Regional Board with an ever-increasing flotilla of attorneys and consultants and other hangers-on who seem more interested in creating new coalitions, like the Coalition for Practical Regulation, than really getting down to the job at hand, really getting down to tackling the problem.

They seek to negotiate every word in the permit, and they want your permission now to go back and engage in more negotiations. Well, if you don't know, they couldn't even -- this coalition could not even agree on one small aspect of the permit when we engaged in over two days of negotiations with them. It's a complete waste of time.

If you're in business or in any other endeavor in life, you don't negotiate with a party that can't deliver a deal. And these 80-some cities cannot deliver a deal, and, therefore, to engage in further negotiations is a waste of time and nearly an abrogation of your responsibility, in my judgment, to move this program forward.

One of the other things which I think is important to keep in mind and perhaps essential depending on your perspective is that beyond the public health and

the environmental degradation issues, there is a rich coastal economy that is protected or not protected depending on what you do and what these cities do in terms of urban runoff.

The L.A. Convention & Visitors Bureau in 2000 noted that $13.6 billion was spent by tourists in Southern California; in fact, in L.A. County, not in Southern California. And according to the Visitors Bureau, the stated purpose of 1 in 6 of these trips was to visit the beach, 15 percent roughly.

Now, if you just do the math and you ignore all of the related multiplier effects, all of the local expenditures, all of the ways that the coast affects real estate, that's $2 billion with a "B" every year, $10 billion in current dollars over the course of this five-year permit directly related to tourism, directly related to the beach.

So would you spend a dollar to make ten? Would you spend $10 to make $100? Would you spend $50 million to make a billion? Those are conservative ways to look at the local economy. And spending money may be necessary, but it's going to make the region money and it's going to protect an engine of the local economy.

Would Santa Monica be like Santa Monica if it were in the Central Valley? Would Laguna Beach be like

Laguna Beach if it were at the top of the Sacramento Valley? No, the answer is obvious. Yet all we hear from cities like Downey and Signal Hill is it's too expensive. Well, frankly, you don't need to be an environmentalist, you don't need to have any expertise in these issues to recognize that that is an economically absurd argument. And it's a one-sided argument that really is not fitting to representatives of local governments that have an obligation to look at the costs, certainly, but they have an obligation to look at the benefits, also.

NRDC and the environmental community have asked you to put more stringent provisions in the permit than you have, numerous more stringent provisions including numeric effluent limits which we think would not only provide accountability, but would provide a real answer to the problem.

And so I want it to be clear that when you hear all these complaints about this provision and that provision, that there's two sides to the equation, that we in the environmental community are hardly getting everything that we think is appropriate as we begin the third five-year permit term. This is the beginning of Decade II in addressing this problem, and it would be hard to say that there has been significant progress, if any real progress, unfortunately, in addressing storm water

pollution because whatever progress we make can be canceled out by growth. That was the whole SUSMP debate.

Nevertheless, this permit is a significant improvement over the past efforts of this Board. And with all due credit to the Board and to Dennis and his staff, if you adopt the permit with the strong municipal inspection program that Mr. Dickerson recommends, all of you will have done more in that vote than all of the previous boards in this region to address the storm water problem. For that reason, we think it's a significant step forward, if not what we would have you do, and we strongly support passage today.

Before I turn it over to Steve, I just want to make one final comment. And that is for all of you to hopefully realize that the beginning of your responsibility really is with the adoption of the permit; that the implementation of this permit or the lack of implementation will make the difference. You can have a long permit and you can have a lot of paper, but if it's not implemented, it will do nobody any good. And I hope that you will send a message today to the cities that you intend to vigorously enforce the permit, and that you intend at this time with this permit that something actually be done one way or the other.

They had 10 years to do it their way, and it

R0007852

hasn't worked. And we respectfully submit to you that this time one way or the other we need to make meaningful progress in addressing the region's No. 1 source of water pollution. Thank you very much.

CHAIRMAN NAHAI: Mr. Fleischli, please.

STEVE FLEISCHLI,

MR. FLEISCHLI: Good afternoon, members of the Board, Mr. Chairman. I'm Steve Fleischli, executive director of the Santa Monica Baykeeper. I just want to follow up with some of the comments David made. Obviously, the environmental community is in agreement in terms of where we should be going with this.

And I want to steal something from Richard Montevideo. Hopefully, I won't be prosecuted for this. But his phrase "under the law," he made lots of references of what the law is and what you can and cannot do. I want to remind this board, not that you need reminding, that under the law is this Board's responsibility to clean up our waterways. That's one thing that Mr. Montevideo did not point out in his comments of what the law is and what the law is supposedly not.

Mr. Montevideo also pointed out that the purpose of the permitting process under the Clean Water Act is to, quote, allow for the discharge of pollutants,

unquote, into waters of the United States. Well, unfortunately, you're only hearing half of the story. What Mr. Montevideo and others seem to ignore is that there are other purposes in the Clean Water Act which are enumerated right at the very beginning, which is to eliminate pollution to our waterways and to make our waters fishable and swimmable by 1983.

I know every time I say that people chuckle and laugh because we obviously haven't gotten there. But that still is part of the law. And the permitting process was really put in place to sort of wean people off the idea of putting pollutants into our waterways, not to give them a permit to pollute and move forward in that regard.

As Mr. Beckman pointed out, we are pleased with many aspects of this permit. I did want to commend Mr. Dickerson and his staff. I do think they put a lot of time into this effort. And we can see it in the environmental community, and I think even the cities can see it in terms of some of the comments they made.

We're starting to see the puzzle come together in terms of where we're going and what it looks like for clean water in Los Angeles. We need to move forward, though, in those efforts. The receiving water limitations that have been talked about a lot today are absolutely critical. As David pointed out, numeric

R0007854

effluent limits would certainly be preferable to the environmental community, but we continue to move forward towards this idea.

Certainly, the Defenders of Wildlife case gives you the discretion to move in that direction. That said that while you're not required to put in numeric effluent limits, you have the discretion to essentially do what you feel you need to do in order to protect water quality.

The receiving water limitations, as you are aware, are not a new advent in this permit. The language is almost identical to language that has been appealed various times in the past on second generation permits. The Environmental Health Coalition case that went up to the State Board in 1998 was the first permit to contain the iterative language.

Long Beach you might remember and the negotiated settlement in that case had receiving water language on a second generation permit in the Los Angeles region with the iterative standards. Ventura has very similar language. As Mr. Beckman pointed out, the San Diego permit that was appealed to the State Water Board, although I think the dischargers expected a lot more in terms of language in their favor on that, the State Water Board did reject many of their arguments. And you

can see the order, and it speaks for itself, I think.

David did point out that nuisance -- discharges that cause or contribute to nuisances are not necessarily or generally should not be subject to the iterative process. I would strongly agree with that. I think common law principals would be consistent with that.

Actually, in terms of the data as well, there are a variety of studies that we talked about. I did want to submit a study that Santa Monica Baykeeper has just completed our Beachkeeper Storm Drain Monitoring Report of water samples we've collected along Santa Monica Bay from 342 drains that discharge into Santa Monica Bay. I just want to make that a part of the record at some point.

I'm not here to berate the Board even though we feel that we could have a stronger permit, but I feel that there are pieces of the puzzle that are still missing. And, really, I think it comes down to the fact that we're very troubled in the environmental community by the willingness and the ability of the cities to recognize that this is the way things need to be and that we need to move forward towards cleaner water.

My comments -- and you've probably seen my comment letter -- focuses on the application requirements for getting a municipal storm water permit. You might say

to yourself, well, how is that really relevant given the fact that the first application came in sometime in 1990, and here we are in 2001, almost at the end of it, and Mr. Fleischli is raising all these application issues? And I think the failure to be firm in terms of what's required in the application process has led to a lot of the problems that we see here today and a lot of the resistance that we see from the cities.

You might recall that the 1996 permit was really the product of consensus between a lot of different entities, including one environmental group that was part of that process. It was not, though, focused on compliance with the law.

In terms of the application requirements, there's a litany of them that I believe have been violated and I have highlighted in the letter. But there's only really a couple I want to focus on today in terms of my presentation. I want to put them into perspective as to why these are important and why they lead to a breakdown in the process of regulating to achieve clean water.

Many of these requirements have never been met, and the way the regulations are set up is before you get a permit from an NPDES-delegated authority, you need to provide certain information to that authority to assure them that your permit is going to be up to snuff,

essentially.

The ones I want to focus on today are the industrial inspections, the mapping requirements, and estimates of load reductions from implementation of the Storm Water Management Plan. Again, these may seem trivial, but it fits into the overall process of the Clean Water Act and the scheme that congress wanted to put down, not that necessarily EPA wanted to put down.

In terms of industrial inspections, you've heard an awful lot today about disagreement from the cities about the provisions in the permit regarding industrial inspections and also with regard to the costs of industrial inspections. And with anywhere between 2,500 and 25,000 industrial facilities in the Los Angeles area, it's very important that we address this in this venue. Certainly, the Regional Water Board by itself cannot deal with these problems.

I would like the Regional Board to try to deal with as many as they can, and we certainly made progress in the last couple of years on that front. But I think it's very reasonable for the regional boards to look for the municipalities to supplement those efforts for industrial facilities in their jurisdictions.

Unfortunately, as you can tell, many of the cities are opposed to this. And yet I ask you why are we

even having this debate? Because the federal regulations are very, very clear that in the application process before you give a permit to these municipalities, they are supposed to demonstrate to you that they have the authority to conduct necessary inspections to control runoff from industrial facilities and to implement the ordinances that supposedly they have provided to you to demonstrate that they have the legal authority to control discharges within their jurisdictions. Instead, what the municipalities want is they want you to for some reason justify to them why this is necessary or prudent in this regard, and it should be the other way around.

In terms of the compromised language, the A/C language that has been put forth for you, we do agree with that language. We can live with that language. Both myself and Mark Gold participated in that mediation process for two days. And we thought -- although we went in reluctantly -- we thought it was productive for a time. But what happened is we were essentially negotiating against ourselves.

And at the end -- it did end abruptly because what happened was the cities came back after we made concessions on restaurants, for example, suggesting -- and the language is now in this draft permit -- that restaurants could be inspected from the curb to see if

people are hosing things down because a lot of the municipalities felt that they couldn't actually get on site. And I said, well, the Baykeeper can see if restaurants are illegally discharging from the curb, so I'm willing to tolerate that.

We make these concessions, and the cities come back at the last minute and say, you know what, we talked about it and we have serious concerns about the cost of this whole thing, and we really don't think we can get on board with this. We'll talk about it with our counsels and such, but can't make any assurances.

So in essence, we spent two days, and I commend Mr. Dickerson for being as polite as he was in the meeting. I likely would not have been as constrained as he was, but then, again, I'm not the executive officer of the Water Board. He did do a very good job there, but I do feel that it was a fruitless process.

If any cities are suggesting that this is -- actually, you heard one city stand up today and say that they would support after that process, it was very meaningful and it was great and let's do more of this. Oh, by the way, we support C. It's like, well, if it was such a great process, why are you supporting C when we spent two days talking about this stuff? Where did it get us? I would say it didn't get us anywhere. If the cities feel

R0007860

that there is a substantial change for that, I would suggest that you simply go with B and move on with it.

In terms of mapping requirements, the federal regulations are also very, very clear that municipalities are supposed to provide in their applications maps of the various locations of their discharges to waters of the United States.

You heard Wendy Phillips this morning say that it's not completely mapped. So we don't have all of that information. In the staff report page A-16, Footnote 9, there was a statement from staff, indeed, basic requirements such as a map demonstrating the basic awareness of the storm drain system are part of the permit's initial application requirements, and should have been met back in 1990 when the permit was first issued.

Very troubling, why do we need to know where the drains are at all? I think it's pretty obvious that it's helpful to know where the drains are. But if you look long term in terms of TMDL development and other regulations that this board has to deal with, if you don't know where the discharges are coming from, you're not going to know how to allocate loads to those sources. You're not going know the potential impacts from those sources. If we don't have a map of the drains that are discharging to our waters, we don't have an understanding of what's happening

R0007861

here. And I think staff has even recognized that, and that's problematic for me.

In terms of the GIS discussion that I know nobody has brought up yet today, the GIS and the GPS issues, in terms of how we map drains, or perhaps more importantly for this context the Illicit Connection/Illicit Discharge Program. There was a lot of discussion last time we had the workshop on how are we going map this. What's required? I will acknowledge that the federal regulations do not mandate what type of mapping system you need to have. They don't say you have to have a GIS system.

I saw in the comments statements that it might cost upwards of $15 million or, actually, in excess of $15 million to do a GIS mapping of illicit connections and illicit discharges in the municipalities. It's rather startling to me.

GIS to me is a critical mapping tool that many, many people use. The Baykeeper even uses it, and we're tiny. But thanks to the help of the Water Board, we've been able to use this technology. We have GPS equipment, and we can go out in the field. We've been borrowing some from the Water Board for quite some time. But we now have our own, and we can go out on the field. And I know Heal the Bay has the same equipment. And we take readings about where these things are, and then we can

put them in a computer, and it will map it out nice and pretty for us.

It's a very accurate way to do it. In terms of the other methodologies that might be proposed, I don't see how you're going to be able to use them as effectively and that information in a computer system. That certainly is the way -- most things are done this way. The 305(b) reports by the State Board also require information to be submitted in GIS format.

I just wanted to put up a map for you of what a GIS looks like. This is a map that we did with help from Regional Board staff in the presentation of our Beachkeeper Report. The section of coastline, you can see the red dots are just storm drains along the coast that we went out in the field with and took our little GPS unit out, and then we came back to the Water Board and they helped us put it into their computer.

Just to show you what it looks like. You can actually use this data, though. It's better than having a little map with pins on it. It's better than having some of the maps that I've seen in the cities where it's just a paper map, and maybe half the drains aren't even on there. Malibu, I've seen their maps and I would say that maybe 10 percent of the drains are mapped, and the rest of them aren't even on there. But you can actually

R0007863

use this, you can add to it and things like that.

In terms of the cost issue, I wanted to break it down. The idea of it costing $15 million -- and I think this goes to some of the larger issues about the cost estimates that you're hearing, and, unfortunately, David left the room. But hopefully if you talk about the Caltrans cost information, you'll recognize that all of that information is the subject of litigation right now between NRDC, Baykeeper, and Caltrans that we've been in for five years with them. And until those reports go final, they should not be relied upon.

But in terms of this context for $15 million, I counted up the illicit connections and illicit discharges in the staff report that were totaled in there, and there was somewhere on the order of 5,875 illicit connections and illicit discharges. $15 million, if you broke it down for that, it's about $2,500 per drain or illicit connection or illicit discharge.

It's rather absurd. When the Baykeeper did this report, we mapped 640 or so drains on the bay in GIS format. It probably took us about 120 hours to do it which for a nonprofit runs about $2,500. We can double that for expenses and overhead and all that. It's about $5,000 to do 600, and then about 30 hours of help from the Regional Water Board.

So however generous you want to be, 600 drains GPSed, maybe $10,000. Under their calculations, it would have cost us $1.5 million to just map our little drains.

And I would submit to them that if they want to pay me $15 million to go out and take little readings of 6,000 drains, I'd be more than happy to do it. I'd be a very, very rich man.

In some of these cities it's, in fact, a complete and utter joke. And I can hear people laughing a little bit, but it gets even more funny. Signal Hill, for example, recorded 13 illicit discharges and no illicit connections in their city according to the staff report. 13 I would submit to you, you can probably do a GIS of 13 drains in an afternoon. It's not a very expensive endeavor at all.

In terms of the next category and the last category I wanted to talk about is the load reduction requirements in the applications. In these storm water application requirements there's supposed to be an estimation and an assessment of the efficacy of pollution reductions as a result of the Storm Water Quality Management Plan. They have not provided that information to you, and yet at the same time they criticize you for imposing programs on them that they do not know the

benefits of.

So to me it's very troubling because it should, again, be the other way around. They should be demonstrating to you that the things that they want to do are going to improve water quality, and yet they keep telling you the law says that you cannot impose these types of regulations on you, when really the law says let's clean up our waterways and move forward.

Lastly, I just want to say that I would definitely support the idea of the environmentally sensitive areas. Removing that language for field verification, I think that is very troubling and problematic. These areas have been designated for a reason. Why should we have to go back and do additional studies? What's the purpose of the original designations? My apologies.

In terms of the delay that is caused by all this, it's their gamesmanship that's led to delay. It's been 11 years. We need to move forward. Thank you.

CHAIRMAN NAHAI: Thank you, Mr. Fleischli. Mark Gold?

DR. MARK GOLD,

DR. GOLD: Mark Gold representing Heal the Bay. First, I'd like to in the time left over to praise Board

R0007866

staff individually because I think they have done a very exceptional job. And that's Xavier Swamikannu, Wendy Phyllis, Carlos Urrunaga, Megan Fisher, Dan Radulescu, and, of course, Dennis Dickerson.

And they've put an extraordinary amount of effort into this, and I'm sure I forgot somebody. If I did, I apologize. But the comparison between the level of effort on this permit and the previous two is really no comparison. I've worked on both the '90 permit and the 1996 permit. And 11 years of nearly a complete lack of progress must come to an end, and I think this permit really moves us in that direction.

Quickly addressing a budgetary issue that we heard quite a bit earlier, I think what wasn't taken into account on the cost side was that there's a lot of stuff within this permit where the Regional Board did indeed take into account costs, in everything from SUSMP standards, which deal with the three-quarter-inch storm rather than, say, the five-year storm; or a monitoring program that surely would be if it was commensurate in scope with what you see from the sewage treatment plants, it would probably be a $2 million program rather than a $400,000 program, and on and on and on.

The iterative process is another example of clearly where that language was put in to save the

co-permittees money. So to say that cost has not been taken into consideration is definitely false.

On a broad issue on the watershed approach, which keeps getting talked about, is what we need to do... What I'm going to do is in the limited time left is sort of give the actual pages of where I think changes need to be made rather than giving you the discussion because I don't think I have time to do that. So 3.A. page 18, we think right up front suggested language for the watershed issues --

MS. CLOKE: Say where you're going.

DR. GOLD: Sorry. I will get cut off, though. The big one, December 10th draft, page 18, 3.A. suggested language right up front. And there will be, like, nine of these so bear with me.

MR. MINDLIN: Did you say page 18?

CHAIRMAN NAHAI: It will be page B-295.

DR. GOLD: Unfortunately, I didn't do the B dash stuff so... All right. So the suggested language should be, "Permittees must implement --" I'm sorry, "For discharges to the MS4 that cause or contribute to water quality impairments, by 2003 permittees must implement watershed-specific BMPs. The implementation strategy including BMPs and the rationale for implementing the chosen BMPs must be included as part of the 2002 annual

R0007868

report, and progress on BMP implementation and the efficacy of the BMPs shall be summarized in subsequent annual reports."

That's specific language from our comments as well.

On the receiving water limit issue --

MR. MINDLIN: Mark, I didn't follow you on that one.

MS. DIAMOND: Can you point to where on that page?

DR. GOLD: It would go right up front.

MR. MINDLIN: You're on 3.A.?

DR. MARK: 3.A. right up front.

MS. CLOKE: I don't think we're on the same version of the permit.

DR. GOLD: We're not?

CHAIRMAN NAHAI: We're not on the same page with you, Dr. Gold.

DR. GOLD: Storm Water Quality Management Program implementation general requirements.

CHAIRMAN NAHAI: There is A.1., 2., 3., 4. --

DR. GOLD: Page 18, 3.A. So it would be under "general requirements." It would be to insert that language to deal with the watershed-specific issue.

CHAIRMAN NAHAI: So you're asking for the language that you just read to be inserted?

R0007869

DR. GOLD: Correct.

CHAIRMAN NAHAI: You're not reading from what is here already?

DR. GOLD: Correct.

CHAIRMAN NAHAI: The reason why you are unable to follow him is because he's reading language that he's requesting to be inserted by you.

DR. GOLD: Because the watershed-specific stuff should be right up front. I'm sorry for sort of rushing it. By rushing it, I've slown things down quite a bit.

CHAIRMAN NAHAI: Go ahead.

DR. GOLD: Moving along, on receiving water limits, in Section 2.3.(d) what we'd like to -- and this isn't specific language -- so what we're stating is that for the revised SQMP and for the monitoring program, what we'd like to see is the following: to implement the revised SQMP and the monitoring program according to their approved schedule, to submit a report detailing changes to the SQMP and monitoring results to the Regional Board. If the monitoring does not show abatement of the exceedence, steps 3.(a) through 3.(d) shall be repeated until monitoring show the exceedence has been abated.

Right now in the current language the way it's written it's open-ended. And so really what that is is to make sure that there's still going to be a best-faith

effort to continue trying to make sure that water quality standards are met. So that's what that clarification is in regards to on receiving water limits.

On the issues in regards to environmentally sensitive areas and retail gasoline outlets and the whole SUSMP provision, one very, very small change. On page A-6 in the revised agenda item description, there was a report in that front report and it said that there was going to be the change from 100,000 square feet to 1 acre for commercial and industrial for the SUSMP in the year 2003, but there's no language to that effect.

So for the Phase II implementation, it was going to move from 100,000 square feet for commercial industrial, down to 1 acre by 2003 to coincide with the Phase II requirements, and I could not find any language on page 37 D.3.(c)(2) to back that up. So that was something that was up front in the latest report for what the permit was about.

(Whereupon, Board Member Buckner-Levy joins the board meeting.)

On the inspection issue, I think Steve summarized that very, very well on the hypocrisy of what happened with the Coalition for Practical Regulation. It was very, very frustrating. So we support that.

The one thing I would like to say is on the

R0007871

restaurant curbside inspection, there needs to be a definition of "curbside inspection." To me that implies literally you're going to drive by and do this. And I assume the assumption is that somebody is actually going to go out, walk the perimeter, and at least provide the educational materials to the people who own and operate the restaurant, and that has not been clarified.

On illicit connections and illicit discharges, on page 55 on the open channels, that they should be screened annually; just a very, very brief change. That's G.2.(a)(1)(i) on a clarification. It should just say "and annually thereafter" because the channels are already required to be cleaned annually. So looking for illicit connections and illicit discharges annually while they're already doing cleaning shouldn't be that much of a burden. I think that was the intent of your staff.

On sediments, strengthening language, and this is specifically for the development construction program only, for Section 4.E.1.(a) we feel that the language -- and that's on page 44 -- that the language should be added that sediments -- there's a modification of 4.E.1.(a) -- which is sediments shall not be discharged to the MS4 or receiving waters.

And then a follow-up to that on 4.E.1.(b):

R0007872

no construction-related materials, wastes, spills, or residues shall be discharged from the project site to streets, drainage facilities, receiving waters, or adjacent properties by wind or runoff. And the point there is just to make it clear that discharge of construction-related sediment should be prohibited. And right now it's pretty squishy language, and that was something that we felt needed to be changed. And corresponding with that under the legal authority section is that there should be a sediment discharge prohibition added for construction and grading activities.

Under sewage spills, and we have submitted this comment as well. Unfortunately, the response to comments didn't come, and so specifically this was, I guess, written by us in frustration after the City of L.A. spill issue. And the language that we wanted to see inserted on page 47, 4.F.1. to augment what's already there is, "When a sewage spill or leak results in a beach closure or closures by the Department of Health Services, the responsible permittees must notify the public immediately. Notification must include, at a minimum, appropriate sign placement at beaches within two daylight hours of beach closure determination, indicating the reason for the beach closure and the health risk of water contact, telephone calls and electronic mail messages to relevant public

agencies and nonprofit organizations within two hours of the closure and press releases to major newspapers, radio stations, and TV stations including nonEnglish language papers and stations within two hours of the closure."

And that's something that needs to occur to protect public health because when those spills go to the MS4, this becomes an MS4 storm water issue.

Finally, in relation to that or right after that is: "...where storm drains contribute to chronic water quality problems at beaches, the permittee must conduct a sanitary survey to investigate potential illegal discharges, illicit connections, or leaky sewer lines. Also, the permittee must revise the SQMP and implement appropriate BMPs to abate the water quality problems as quickly as possible." Right now that's not occurring, so basically notification is the best you're going to get the way that language is written.

On the monitoring program, we want to commend staff for doing an excellent job on putting together the program. Our remaining major concern is the lack of benthic monitoring in estuaries on more than a once-every-five-year basis. We realize that in light of where the discussions ended up, that won't be changed here in the permit, but we strongly recommend for this Regional Board to look into if there is indeed a fine, a

R0007874

supplemental environmental project of some sort, that this is something very worthwhile to increase the monitoring frequency, especially for the L.A. River, Dominguez Channel, and Ballona Creek. And so I strongly encourage you to do that.

Then there was a brand new amendment on Toxicity Identification Evaluation Change Sheet 12-4, Section 11.B. on page 14-3(A), the change sheet on 12-4. It's tough for me to do this because there's so many change sheets.

MS. PHILLIPS: That change should already be in the edited tentative version.

DR. GOLD: Well, no, it's not because what I'm suggesting is what needs to be new language. It's for clarification.

CHAIRMAN NAHAI: Hold on just a second. Wendy, can you show us where Dr. Gold is in relation to our agenda package.

MR. MINDLIN: Dr. Gold, do you have any things written down where we can see them? Dr. Gold, do you have these written down in some way that we can see them? Because we're hearing what you're saying, but we're having a hard time following you, actually.

DR. GOLD: Yeah. Normally things aren't this complex, as you know. But it's tough to make a typical

comment. The TIA language...

AUDIENCE MEMBER: It's B-378.

DR. GOLD: But that's not the brand new TIA language.

AUDIENCE MEMBER: Yeah, it is.

DR. GOLD: Okay. Page B-378 under TRE 3.(a), I should have used the Bs rather than the change sheet. All right. What language to clarify the new amendments, because unfortunately the language you're going to see on 378 isn't the new language. That, of course, is in the change sheet.

AUDIENCE MEMBER: No, this draft reflects that.

DR. GOLD: That does? Okay. So what it is is: "When a toxicity identification evaluation identifies a class of pollutants as causing over 50 percent of runoff toxicity on three separate occasions at a given site, further TIE shall be conducted to determine which individual pollutants are responsible for the majority of the toxicity. And then toxicity reduction evaluations shall be focused on those individual pollutants in order to be most effective."

And so what that paragraph is that I just read would clarify what's already written right now to the best of my understanding. If you want to ask staff whether there's a significant modification, that would be fine.

R0007876

But it's very unclear right now when you do further analysis of a toxicity identification evaluation and when a TRE truly kicks in based on that further analysis under TIE. And so what that language is is to basically clarify that.

CHAIRMAN NAHAI: You've seen the changed language that we're looking at already? You've seen that?

DR. GOLD: Yes.

CHAIRMAN NAHAI: Okay.

DR. GOLD: Okay. Under storm drain management -- and I'm going to get in the same trouble -- it's under change sheet 12-10. That one is not reflected; right? December 10th?

MS. PHILLIPS: Yeah, the December 10th changes are in here.

DR. GOLD: Are in that latest permit. That's the one you handed out today?

MS. PHILLIPS: Yes. This doesn't have the December 12th changes. It has everything but December 12th.

DR. GOLD: I don't think so on that particular issue. All right. Well, let me talk about what -- this is the catch basin cleaning.

CHAIRMAN NAHAI: Are we about to wrap up?

DR. GOLD: Yeah, I'm almost there.

R0007877

CHAIRMAN NAHAI: Because we're running over here.

DR. GOLD: Then I'll do it without giving you all the things, and I'll just give you the background on what they are.

On the catch basin cleaning issues on A, B, and C, right now there's the TMDL language which is completely separated from the other catch basin cleaning language, the tierred approach of A, B and C. There's a couple of problems. One, there is no definition of what A, B, and C is. It just says low priority, high priority, medium priority. We strongly recommend that Priority A basins should be those that are half full every three months. Priority B basins should be those that are half full every six months. Priority C should be everything else.

And as for the whole differentiation between the TMDL and the rest of the catch basins, that doesn't really make much sense in light of the TMDL for trash probably will be held up in litigation for quite some time. There's not an implementation plan in place right now. And so at a minimum, it should default on the same frequency for Tier A, Tier B, Tier C that's already written there in addition to the tracking and monitoring requirements that are put up front. So that needs to be clarified. And, again, the fact that you're in a highly-polluted watershed

that needs a TMDL shouldn't be an excuse to do less. And I don't think that's what staff intended, but I think one can easily read it that way.

And then, finally, on reporting, there needs to be an additional of a section on structural BMPs implemented, the location of those structural BMPs, the pollutants targeted by these structural BMPs, and the expected pollutant removal efficacy of these BMPs. And related to that -- to reiterate what Mr. Fleischli said -- is that there needs to be a section for the permittee and the co-permittees to assess the efficacy of the SQMP, including reductions in pollutant loadings, toxicity, et cetera.

Because right now if you look at that 40-page form that needs to be filled out on an annual basis, really determining how well the SQMP is implemented and whether or not the BMPs are being effective, that is one of the few things that were omitted in that 40 pages and needed to be added.

So that wraps up a complicated set of detailed comments. And if you have any questions later, obviously I'll be here to answer them.

MS. CLOKE: Could you give a copy of what you just said to...

CHAIRMAN NAHAI: Let's move on, please.

R0007879

MR. MINDLIN: Dr. Gold, do you have a copy of your November 13th letter here?

DR. GOLD: Yeah.

MR. MINDLIN: Can you give it to staff, please.

CHAIRMAN NAHAI: Could we hear from Ms. Lambrichts, please. All right. With that, I'm going to move on to the -- I'd like to hear from Mr. Rufus Young. Is he here? Come on down.

Mr. Young, you indicated to staff that six minutes would be sufficient time for you to make your presentation to us?

MR. YOUNG: I indicated that that was my best estimate. If I'm close to being finished, I would appreciate being given an opportunity to finish up.

CHAIRMAN NAHAI: Sure.

MR. YOUNG: But I'd also like to not start just yet. One of the cities that our firm is proud to represent is the City of Santa Clarita. There is an elected official, Councilmember Kellar, here who protocol requires that a member of the law firm that represents the city defer to...

CHAIRMAN NAHAI: No problem. We'd be more than happy to hear from the councilmember first.

MR. YOUNG: Thank you.

//

R0007880

BOB KELLAR,

MR. KELLAR: Mr. Chairman, Board members, thank you very much for permitting me to come before you. My name is Bob Kellar. I'm a city councilman with the City of Santa Clarita.

We have a great sense of pride for and a commitment to the protection of our quality of life. One of the things that we care most deeply for in our valley is the Santa Clara River, one of the last natural rivers in Southern California and a constant reminder of the importance of water quality.

Great strides have been made with the current Los Angeles County NPDES permit, and our city looks forward to accomplishing more with the implementation of the anticipated new NPDES permit. However, although Santa Clarita generally supports the water quality changes that the tentative draft proposes to address, we are greatly concerned with our ability to implement some of the proposed requirements, from both a fiscal and a land use perspective.

As noted in our written comments on the tentative draft that were submitted on November 9th, the city is particularly concerned with the following areas: receiving water limitations. The language, as currently written, creates significant potential liability for the

R0007881

city. As written, we are directly responsible for discharges that cause or contribute to the violation of water quality objectives regardless of the source of the discharge and regardless of the controls implemented to prohibit the discharge. It is fiscally irresponsible for the Board to adopt the permit with this language because it will expose the city to costly third-party litigation for implementing untested and unproven new programs.

Industrial and commercial facilities programs: the city of Santa Clarita does not have the legal authority nor the personnel or monetary resources to assume regular responsibility for the inspection of industrial and commercial facilities. We believe that Version C is the most feasible and realistic to implement and strongly urge the Board to adopt this version.

Standard urban storm water mitigation plans: the city is concerned with the proposed expansion of the applicability of the SUSMPs because it infringes on local land use authority, and it is likely to jeopardize essential redevelopment activity. We firmly believe that we should continue to implement SUSMPs based on the State Board 2000-11 water quality order. And the Board should direct staff to modify all references to SUSMPs in the tentative draft to reflect the State Board 2000-11 water quality order.

R0007882

In conclusion, I urge you to carefully consider the cost implications on the permittees for the implementation of all of the new programs proposed in the tentative draft of the permit. As a governing body, you must consider and give weight to the public benefit to be obtained through the implementation of these programs and requirements.

I want to emphasize that water quality and the preservation of our Santa Clara River are very important to our community and central to maintaining our high quality of life. However, as policymakers, we must strive to balance all the essential needs of our communities: public safety, education and schools, economic development, roads and transportation, and parks and open space.

Adoption of the tentative draft today as currently written does not support a balanced approach and, in fact, undermines our ability to develop and maintain sustainable, livable communities. Please give careful consideration to the comments offered to you from the permittees that reflect our willingness and interest to cooperate and collaborate.

Our comments and suggestions provide an avenue for us to work together to accomplish our mutual goal of protecting and preserving water quality. Based on

the revisions recently submitted, and in particular the recommended Version A/C inspection period, we request, as have other concerned communities, additional time for responsible review. Thus, I request that you delay approval of the permit today until such time as all parties can agree.

On behalf of the 155,000 citizens of Santa Clarita, I thank you and I urge you to listen, respect, and consider all that's been brought forward to you by the various cities relevant to this very, very important matter. Have a good day.

CHAIRMAN NAHAI: Thank you very much. Thank you, Councilman. Mr. Young, go ahead, please.

RUFUS YOUNG,

MR. YOUNG: Thank you very much, Chairman Nahai. For the record, my name is Rufus C. Young, Jr. I'm with the Law Firm of Burke, Williams, and Sorensen, and we're proud to represent a number of cities here. I'd like to start by inviting your attention to the mortal words of Clint Eastwood's character, the philosopher/inspector, "Dirty" Harry Callahan. "Dirty" Harry said, "A man's got to know his limitations."

I am here to respectfully suggest that there are limitations imposed by the Congress of the United

R0007884

States, state law, and the EPA through its regulations, on just what and how the Board goes about carrying out its obligations.

In that regard, let me invite your attention, if I may, to comment letters submitted by our firm dated November 12th. It's toward the back of Volume II in the legal comments. Although I suggested that the comment letter should not be considered the comments of Burke, Williams & Sorensen because my partners have not taken a position on this storm water permit, those are comments of the city and should have been listed as such. But that's a different issue.

There are three issues that I'd like to focus and then three other points that I'd like to make. The first issue is cost of compliance and economics. On page 2 of our comment letter of November 12th, I reiterate that comment letters dated November 6th and November 8th we submitted for the Board staff and the Board's consideration three economic studies, three of which were prepared by Brown & Caldwell, one by Stanley R. Hop (phonetic) & Associates, all four of which -- excuse me, one was a staff report by SCAG. Those, too, are in the materials that have been provided to you, I'm assured.

Those singularly and in combination reached the same conclusion, that the cost of compliance of storm

water programs for the Los Angeles region will exceed $50 billion. I won't belabor the point that the Clean Water Act and the Water Code require consideration of economic considerations and costs. I'll simply comment that the response to comments dated December 3rd, comment No. 2, acknowledged the submission of those studies, acknowledged the dollar figure: $50 billion. But it did not come to grips with those studies, did not meet them head-on, and did not address what's good and what's bad. Are the studies valid? Are there other studies that rebut those? In fact, my examination of the record of this matter is that there are no studies that rebut the four studies I referred to a minute ago.

What we ask is that the permit adoption be continued, that those studies be squarely addressed -- I mean, we're talking $50 billion here -- and that once addressed, the matter be brought back to the Board for its consideration. This would also provide an opportunity to address, for example, Dr. Gold's comments of several minutes ago, which I have a hard time following and others perhaps had the same problem.

The second point I'd like to address -- and this is on page 4 of our comment letter of November 12th -- our land use and redevelopment issues. I point out in our comment letter that the tentative draft fact sheet and the

R0007886

otherwise excellent Fisher/Swamikannu technical report do not address the statutory and constitutional limitations on the authority of the Board.

There is one statement that I think is telling, and that is EPA has said -- and this appears on page 5 -- EPA has said that EPA recognizes that land use planning is within the authority of local governments. We suggest to you that for a storm water permit to impose conditions on the exercise of land use authority by local governments in whether or not they're to approve a land owner or developer's project is the exercise of land use control. EPA says it can't go there. You're acting pursuant to a delegation of authority from the USEPA. I suggest that the EPA's restrictions -- and it's in the very first section of the Clean Water Act -- are equally binding on you. In that regard, the response to comments, and this is the December 3rd response to comment No. 11, and councilmember at Section B-4 on page 5, again, failed to come to grips with those issues, the constitutional statutory and regulatory limitations on the authority of the Board.

And with that, I will conclude my presentation with the invitation to you to again revisit the comment letters that we've submitted. In that regard, I would point out that we submitted not only comment

letters on November 12th, November 6th, and November 8th, but multiple E-mails, prior comment letters, all of which -- and I'm building up to something here -- all of which Dr. Swamikannu and others on the staff, including the executive officer, I'm convinced have read them because when I discussed them with them, which was a delight to be able to do, they were knowledgeable about them. They understood them. They didn't always agree with them. And I didn't want to be the only person making a presentation here this afternoon who failed to commend their excellent staff work. I know good staff work when I see it. Theirs is good, not quite as thorough as I'd like on a couple of the points that I raised here this afternoon.

With that, I'll thank you very much, but conclude with the observation that the speaker cards, all seven of them submitted, note that I'm speaking in favor of adoption of the storm water permit as modified as suggested in our several comments letters.

CHAIRMAN NAHAI: Thank you very much.

MR. YOUNG: Thank you very much.

CHAIRMAN NAHAI: With that, we'll move now to the remainder of the cards. There are about 15 of them here.

We will restrict each speaker to three minutes only. There is a timer right there, and it will go to yellow and then to red. And when it starts flashing

R0007888

red, please stop so I don't have to stop you. And if your testimony is going to be duplicative of what others have said, you might want to consider refraining from saying it. It doesn't do any good for us to hear the same points over and over again.

MR. MINDLIN: Mr. Chair, I think we also have a paddle today, too, to lift up when the time is up.

CHAIRMAN NAHAI: Great, thank you. We also have a paddle. And if that doesn't do it, we have a gavel, and various other types of weapons. First, Mr. Brian Wall, please.

I'm going to read two or three names in a row so you will be prepared to come down. And if we can come down a little bit more quickly, that would be helpful. Following Mr. Wall, I'd like to hear from Captain Angus Alexander. Following Captain Angus Alexander is Sergeant Heineman. Go ahead, please, three minutes.

BRIAN WALL,

MR. WALL: Thank you. Good afternoon, Mr. Chairman, and members of the Board. For the record, my name is Brian Wall with Mayer, Brown & Platt. Address is 350 South Grand Avenue, 25th Floor in Los Angeles.

I'm here today representing the Western States Petroleum Association. My comments specifically

R0007889

relate to retail gasoline outlets or RGOs. Last year the State Board concluded that RGOs should be excluded from the structural treatment requirements until proper justification is shown.

In June, staff issued a technical report purporting to provide this justification. And on August 6th WSPA submitted our assessment and some critiques of that report. Just last week a supplement to that report that cites significant new arguments and cites significant new documents was issued with additional changes just a few days ago. WSPA objects to the late issuance of the supplemental report that purports to provide additional justification in that we haven't had time to review it, we haven't had time to review the reports that it is based on, and we feel that it is inappropriate to issue it so close to the hearing without an opportunity to comment, and that it must be re-circulated before adoption of this permit.

Although it's not possible for me to fully comment on that report in the three minutes provided, I would like to make a couple of points. First, WSPA pointed out that one of the studies staff relies on is showing that these devices are effective at RGOs. It failed to disclose that for two constituents, nutrients and oil and grease, the concentrations actually went up.

Staff's response to that was, well, one,

that's the type of media used for the nutrients. But these are the same devices and media that have been advocated by staff. And, second, it said that low concentrations of these devices are less effective -- or higher concentrations result in higher removal efficiencies. Therefore, the corollary is true: lower concentrations result in lower efficiencies. And that's kind of our point.

The task force BMPs are designed to significantly reduce pollutants at RGOs. In doing that, it renders -- in our belief it renders these devices ineffective despite the significant cost of maintaining these devices.

So where does that leave us? We have some new safety concerns where they have included a safety exclusion because subsurface structures provide an opportunity for gas and air to mix. We have infiltration devices that are found to be inappropriate for RGOs, and we have these other treatment devices that when lower concentrations are involved, the efficiencies are lower.

We respectfully assert that these devices are not effective at RGOs that are implementing the task force BMPs for that very reason, and we urge this Board to comply with the decision of the State Board that proper justification be shown, and we believe that hasn't been

done. Sorry I had to rush through that. I have a little more to say, but I'm trying to keep with your time.

CHAIRMAN NAHAI: Thank you. But you've made all the points that you wish to make?

MR. WALL: Well, I think the main point is just that given the unique characteristics of RGOs and the risk of fuel being spilled into these devices, these devices are not practicable and at low concentrations that would result from use of the task force BMPs which is already required, they're not that effective.

CHAIRMAN NAHAI: Thank you very much. Captain Alexander, please. Sergeant Heineman?

SERGEANT STEVE HEINEMAN,

SGT. HEINEMAN: Good afternoon. I believe that Captain Angus Alexander isn't here yet, so I'll speak if that's okay.

My name is Steve Heineman, Sergeant Steve Heineman, Santa Monica Police Department. And I currently supervisor our harbor patrol division. I'd like to thank the gentleman who spoke a little while ago from Burke, Williams & Sorensen for quoting such an esteemed member of our law enforcement profession, Harry Callahan. It's interesting that part of his name is also "dirty" which is something that we're talking about here, dirty water.

Currently, I supervise 17 nonsworn individuals all of whom are certified divers. Many of our functions in and around the pier and the beach areas regard the breakwater, the buoys, open-water rescues. And the quality of the water -- we're right near the Pico storm drain -- is a strong issue with us. It affects our ability to train effectively because we don't go in at certain times if the water quality is a certain level.

Part of their duties as divers are maintaining the buoys and the pilings under the pier. It requires them to be under water for significant periods of time. And we've had people who -- members of my staff have been adversely affected. While we can't directly attribute it to the quality of the water, a lot of concerns expressed by them are the fact of the water quality.

So I have a tremendous respect for your mission here today, and I thank you for the attention you're showing to this. And I appreciate anything you can do to safeguard the water and safeguard the individuals that are under my command. Thank you very much.

CHAIRMAN NAHAI: Thank you. Thank you for coming. The next three speakers will be Mr. Brian Smith, Mr. John Harris, and Mr. Matthew Spies. Mr. Brian Smith, please. Calling once, twice.

//

RAY TAHIR,

MR. TAHIR: Actually, Mr. Smith from the City of Bellflower has instructed me to use his three minutes as part of my presentation which will only be six minutes. And there's another city, the City of Monterey Park who wants me to do the same thing. I won't abuse my time; I'll be in and out, I mean, real quick.

CHAIRMAN NAHAI: Do you want to speak now?

MR. TAHIR: Yeah, please.

CHAIRMAN NAHAI: Can you make it five minutes?

MR. TAHIR: How about six, but I'll strive for five.

CHAIRMAN NAHAI: Try for five.

MR. TAHIR: You know we're going to be out of here early.

CHAIRMAN NAHAI: We're not. There are a bunch of other items to go on after this.

MR. TAHIR: Mr. Chairman, members of the Board, staff, good afternoon. It's a pleasure to be here before you once again. The cities that I represent thank the Regional Board truly --

CHAIRMAN NAHAI: Could you repeat your name.

MR. TAHIR: I'm sorry. I'm so nervous I forgot to mention my name. My name is Ray Tahir, and I represent a number of cities' storm water management matters in

Los Angeles County. And today I'm speaking on behalf of the City of Bellflower and Monterey Park and a few others.

Anyway, once again, I'd like to -- the cities, that is, would like to thank the Regional Board staff for crafting a draft permit that is a substantial improvement over the current one in terms of clarity and consistency. This permit does not contain contradictory and confusing language, thank God.

Still, unfortunately, the cities cannot support the draft permit because it contains several unacceptable provisions. Most of them you're aware of. These include, but are not limited to, the Industrial/Commercial Pollution Control Program, enforcement of the General Construction Storm Water Activity Permit, receiving water limitation language, and the Standard Urban Storm Water Mitigation Plan which is a subset of the Development Planning Program.

With regard to the Industrial/Commercial Pollution Control Program, the cities have no objections to inspecting commercial facilities, critical source facilities; namely, gas stations, restaurants, and automotive repair shops. Nor do the cities object to enforcing pollution reduction control requirements to these facilities.

However, the cities strenuously object to

having to inspect industrial facilities for enforcement purposes for the following reasons: by right these facilities should be inspected by the Regional Board because they require coverage under a state-issued General Industrial Storm Water Permit which is issued by the State Water Resources Control Board and is supposed to be inspected by the Regional Board or enforced by the Regional Board.

The cities understand the Regional Board does not have the resources to perform this regulatory task; however, the statement poses a $250-per-year fee on such facilities to cover inspection. Further, the Regional Board could generate additional fees if it were to notify the several thousands of noncompliant facilities that exist in Los Angeles County of the need to obtain coverage. This, by the way, could be done cheaply by mail, for example.

Beyond that, facilities that aren't covered under the general permit cannot be regulated by the municipalities because of exemption. It is understood that cities would not be enforcing permit requirements, per say, but instead would be required to establish legal authority to do things such as copy records on site, impose best management practices, and take other enforcement actions. However, the industrial facilities are allowed under the general permit to select BMPs based on iterative

R0007896

self-evaluations.

The language in the general permit even says that minor violations should be tolerated. Further, the cities don't believe that such industrial facilities would take too kindly to being regulated by the state and local government on the same issue.

Three, the Regional Board has on several occasions insisted that municipalities have a duty and responsibility to improve water quality. It seems only right and fair that the Regional Board enforce a general permit on such industrial facilities, thereby meeting one of its most important responsibilities that should improve water quality.

It is important to note that congress has determined that these subject industrial facilities, also referred to as Phase I facilities, are significant contributors of receiving water pollution as specified in the Code of Federal Regulations.

Nevertheless, the cities will be willing to compromise with the Regional Board on this matter in exchange for certain concessions. The cities would be willing to conduct noninvasive site inspections on behalf of the Regional Board so long as it is not required to enforce the general permit. So this is a distinction between enforcing and inspecting.

In terms of adopting additional codes that resemble regulatory language contained in them: a more detailed description of this proposition is attached herewith and will be submitted as part of the public record. I'm almost finished.

In terms of receiving water limitation language, the proposed RWL language is unacceptable because it would place cities into instant noncompliance. In the event of exceedence for trash, for example, for the San Gabriel and Dominguez Channel, this would trigger -- well, cause an exceedence which would require cities to do something about that exceedence which could include the Regional Board requiring vortex separation systems. Regional Board staff has indicated that this would not be their intention, however. But the cities just as a matter of being prudent operate on a principal not judging intentions, but judging capabilities.

Therefore, the city suggests that Regional Board revise receiving water limitation language based on the Riverside Municipal NPDES Permit which is now being considered by the Santa Ana Regional Board.

In terms of the SUSMP -- I'm almost through -- the SUSMP is more stringent in the proposed permit because the special approval has been eliminated. Essentially, all subject developments and redevelopment

R0007898

projects would be required to install various post-construction pollution mitigation controls, including infiltration and treatment controls.

The cities understand the Regional Board eliminated discretionary approval because some cities were using it as a loophole to evade any kind of post-construction control for such projects. The cities believe that this is not necessary, however. The cities would be made to require the use of specific controls for projects; for example, canopies for gas station regardless of discretionary approval.

However, if the project is subject to discretionary approval, infiltration treatment controls would be required only if a chemical constituent is expected to be transported into receiving water from a completed project that is listed on the 303(d) list as a special pollutant for that water body. Thus this requirement would be beneficial-use-driven as opposed to being willy-nilly. If the Regional Board doesn't want to do this, it should consider using the equivalent SUSMP requirements that are found in the Riverside Municipal Permit.

There are other permit issues of concern that the cities have, but all the affected parties would be better served by continuing the USEPA sponsored mediation

R0007899

to resolve, and perhaps we can postpone adoption of this permit pending results of mediation. Thank you very much for bearing with me. I think I was five minutes.

CHAIRMAN NAHAI: I thought we timed you for seven minutes. Next is Mr. John Harris.

JOHN HARRIS,

MR. HARRIS: Good afternoon, Chairman Nahai, and members of the Board. My name is John Harris. I'm with the law firm of Richards, Watson & Gershon, and I'm here representing the cities of Agoura Hills, Artesia, Beverly Hills, Carson, La Mirada, Monrovia, Norwalk, Rancho Palos Verdes, San Fernando, San Marino, and Westlake Village. I'm not asking for three minutes each.

Three minutes, and the reason for it is we have submitted comments on each of the drafts of the permit, and they are in the record so there's no need for me to reiterate those comments. I did want to at least point out and make a clarification with respect to the comments as to the "safe harbor" provisions that were in the 1996 permit with respect to the discharge prohibitions and the receiving water limitations.

It's been characterized that our request for a "safe harbor" provision is somehow watering down the receiving water limitations. In fact, that's not the case

at all. We recognize that the Board is bound by water quality Orders 98-01 and 99-05 setting forth receiving water limitations.

What we're asking is to bring back the "safe harbor" provisions because the State Board has specifically held the "safe harbor" provisions are complementary of the receiving water limitations. It's important to bear in mind that our receiving water limitations come from the State Board's Order 98-01. They were modified in 99-05, but otherwise 99-05 specifically affirmed the Board's prior order.

In that prior order the State Board was considering, as I recall, the Santa Ana permit, and that that very language, the "safe harbor" provision, and in a form very much similar to what the county has outlined was specifically dealt with and specifically approved by the State Board. Contrary to the comments of other people, that "safe harbor" provision has never been rejected by the State Board. As a matter of fact, there's at least two decisions specifically affirming that.

So the point is that the State Board and I think this Board recognizes that we are involved in an iterative process. And in order to make that iterative process work, it's important that the cities don't have the sword hanging over them constantly if they are in good

faith implementing the clean water programs that are dictated by this permit. And that's all we're asking for, those cities, those permittees, like any other permittee under the Clean Water Act, to the extent they are complying with the permit, they ought to have the protections of the Clean Water Act.

Lastly, on a separate matter I've been asked by the City of Norwalk to express its support for the positions presented by the City of Los Angeles, the County of Los Angeles, and the Coalition for Practical Regulation. Thank you.

CHAIRMAN NAHAI: Thank you. Mr. Matthew Spies, and following Mr. Spies I'd like to hear from Mr. Wally Baker, Ms. Susannah Mitchell, followed by Mr. Jose Saez.

MATTHEW SPIES,

MR. SPIES: Good afternoon. I'm Matt Spies. I am representing the Los Angeles County Superintendent of Schools. I apologize for our late involvement in your process here, but we just recently became aware of what's been going on here.

Our message is a little different than what you've been hearing today, but we think it's an important statement for you to hear. We're concerned that the

R0007902

adoption of the proposed language will delay construction and increase the cost of schools that are needed in L.A. County.

We represent 81 school districts in L.A. County. Most of the districts have an enrollment that exceeds the capacity of their existing facilities, and they're looking at constructing new schools and expanding or modernizing older ones. The funding source for this is inadequate. It's the State of California it's through state bonds.

We feel that placing additional requirements will delay construction and exacerbate our problem of educating and housing students in L.A. County. Just this week we spoke to two representatives from the Water Board, and we got statements that what you're considering does apply to school construction and it does not apply to school construction.

With that in mind, we respectfully request that you delay your decision until representatives from your agency and our agency can talk about the impact on school construction. I have a letter that states most of this, and I will give it to you when I leave. Thank you very much.

CHAIRMAN NAHAI: Thank you. Mr. Spies, will you stay around or...

MR. SPIES: Yes, I'll be here.

CHAIRMAN NAHAI: Okay. Thank you. Mr. Baker?

WALLY BAKER,

MR. BAKER: Nice to see you again.

CHAIRMAN NAHAI: Nice to see you again.

MR. BAKER: I will be very brief. You have our comments through Burke, Williams & Sorensen and other cities, but I did want to talk to you very briefly about what we're doing to the cities. We're concerned that in the whole government structure, there's a deficit. And Jack Kaiser, our chief economist, said that we're in a recession and it's going to be there a while. That's definitely not a misprint. That's what's going to happen.

We think that's something that you're capable of understanding and taking into consideration along with everything else that is on your plate as it relates to this permit. But we would ask you to consider that. Certainly, the cost benefit analysis of this has to be considered. We didn't really hear much about that.

I'm very familiar with the fact that Caltrans has done a number of studies, and the $50 billion one has not really been challenged and it is not under litigation according to Caltrans. So we think that that's worthy of a further look by the Board. We would encourage

you to do that.

The injustice of it, in our opinion, is that the minority businesses, little businesses, they're going to be more impacted by a recession, but they're also going to be more impacted by this permit. And we would like to find a way to deal with that. We believe that redevelopment -- which is going to be necessary, and we work hard at redeveloping Brownfields -- and remediating land is going to be even more difficult with the way the permits are structured.

So we see that as a problem. And we believe that, yes, it will discourage job growth. And construction is typically the industry that you will see take off first when the economy starts recovering. And you'll see that six months later after construction is really going, that you'll come out of a recession. Partly that's because it has so many jobs that are impacted to build or do something, and we see this permit as, again, having a negative economic impact.

So in summary, we would like you to consider this further from the economic perspective, and, of course, anything that we can do to be of assistance we would be more than happy to do. And we would recommend that you look at this further from the economic perspective based upon the kind of times that we're in right now. Thank you

very much.

CHAIRMAN NAHAI: Thank you so much. Ms. Susannah Mitchell is the next card followed by Mr. Jose Saez and followed by Mr. Louis Celaya.

SUSANNAH MITCHELL,

MS. MITCHELL: Good afternoon, Mr. Chairman, and members of the Board. My name is Susannah Mitchell. I'm with Manatt, Phelps & Phillips, a law firm here in Los Angeles. And we're speaking to you on behalf of an ad hoc coalition of trade industries in the Southern California region.

Some of our members are the Building Industry Association of Southern California, certain chapters; the National Association of Industry and Office Property, Southern California Chapter; and the California Association of Community Managers.

Like the school district, we're not necessarily new to the storm water game, but we are new to the L.A. permit and we just wanted to get some comments on the record. We appreciate all the work that's been done by the Board and its staff. And from the previous drafts and what we've come to see, we realize that a lot of work has been done on this permit.

But we still, like the previous speaker,

R0007906

believe that the permit as written is going to have a negative impact on the economy of the Southern California region. And in particular, we're concerned that the permit will result in fewer, but more expensive development projects due to the additional costs and restrictions involved in complying with these regulations, and that this, in turn, will compromise job growth, housing production, the ability of residents to obtain affordable housing, commercial real estate development, and the ability of businesses to grow and succeed in the Southern California region.

I want to be brief, so I basically would just like to incorporate by reference the written and oral comments provided to you by the Coalition for Practical Regulation. We support many of their comments, and we believe that there's still issues that need to be determined like the no "safe harbor" in the receiving water limitations, the possible infringement on the municipalities land use and planning authority based on some of the language in the permit, and we feel that it needs to be made clear that the practicability standard is the standard that should be qualifying all of the issues in the permit so that permittees aren't required to implement BMPs and other permit programs that aren't economically or technologically feasible.

And, finally, I just have two quick comments. There have been comments by staff and the environmental community that the State Board decision supports the receiving water limitation language that's in this permit. And while it may make that language allowable, it doesn't necessarily make it necessary. And, in fact, the Santa Ana Regional Board has modified its receiving water limitation language with some of the comments that I've heard here today, so that it is not so vague and does not basically put permittees out of compliance from day one.

And, finally, just another comment about the State Board order, there was a lot of evidence and comments that were submitted by interested parties and the petitioners in that case that were rejected by the State Board as untimely. So I do feel that there is additional evidence out there that supports these comments here even if the State Board didn't listen to that or did not accept that evidence. And I guess I'm out of time, I'm sorry. Thank you.

CHAIRMAN NAHAI: Thank you very much. Mr. Saez followed by Mr. Celaya, followed by Mr. Tim Piasky, please.

JOSE SAEZ,

MR. SAEZ: Good afternoon, Chairman, and Board

R0007908

members. My name is Jose Saez, and I want to thank you for the opportunity to provide you these brief comments. I work with the Sanitation Districts of L.A. County.

We have submitted a number of letters on the different drafts of this MS4 permit. I just want to focus on two specific issues very short. The first one is the treatment feasibility study that is mentioned in the permit. It's on page 349 of the latest draft. And we basically want to mention that the districts have committed to cooperate and help with the dry weather diversion study that is being proposed in the permit, and to help also with the cities and the different agencies involved in coordinating this effort even though we're not a permittee, per say. But we're mentioned in the permit.

And we also are happy that the deadline to submit the priority list to the Regional Board has been extended to July of 2003 because this is a very monumental task for us to comply with. So we thank you for that, and personally I want to thank you because it will affect me in my duties.

The second brief comment I want to make also is in relation to a previous comment made by Ms. Wagner who was representing the City of L.A., and it had to do with the definitions of water quality standards and applicability. She pointed quite well that it is

unnecessary to bring up Title 22 as a reference of water quality standards since it's already applicable, you know, at least the corrected portions of it in the Basin Plan. Basically, the Basin Plan references the appropriate portions of Title 22.

So we agree with this recommendation because it will help also avoid confusion. And such recommendation not only applies to the particular section that she pointed out, but also on page 374, Item 6, and there may be some other items in there. So I wanted to just bring that to your attention. We want to further submit to you that we believe that by just referencing the Basin Plan, that by itself that document which is really what governs the waters of the region references the correct and the appropriate regulations such as Title 22, the Ocean Plan, and other regulations that are applicable. So that's it. Thank you.

CHAIRMAN NAHAI: Thank you very much. Mr. Celaya?

LOUIS CELAYA,

MR. CELAYA: Good afternoon, Chairman Nahai, and members of the Regional Water Quality Control Board. My name is Louis Celaya. I am with the City of Monrovia, Department of Public Works. Before I begin this letter from our mayor, I'd like to commend Dennis Dickerson and

his staff on their development of the permit.

"Dear Chairman Nahai, and members of the Regional Water Quality Control Board, on behalf of the City of Monrovia and the city council of the City of Monrovia, I would like to express the city's concern regarding pending adoption of the County of Los Angeles Municipal Storm Water NPDES Permit.

"Our staff has indicated that the tentative draft will be costly with respect to the programs being requested under the new NPDES permit. If the permit is adopted today, the City of Monrovia will be challenged to continue to meet all of its requirements while still endeavoring to provide other important city services.

"Like many of the other co-permittees under this permit, we concur with the points raised by the County of Los Angeles, the Executive Advisory Committee, and the Coalition for Practical Regulation, and would like to go again on record as objecting to the receiving water limitations language and its removal of the legal "safe harbor" for the municipalities, the new inspection element associated with the Industrial and Commercial Facilities Control Program, and its requirement to

inspect state-permitted facilities, the unknown cost and difficult time frames for various program implementation, the revised SUSMP development regulations, storm water diversion studies, illicit storm drain connection inspections, changes to the CEQA and the general plan program associated with the permit, and the elimination of the Executive Advisory Committee.

"We hope the Regional Board will postpone or continue the adoption of the tentative NPDES permit until the discussions between the Regional Quality Control Board staff, the USEPA, the permittees, and other stakeholders to resolve outstanding permit issues are completed.

"Like many municipalities covered under this permit, the City of Monrovia is committed to keeping the water quality of the state's tributaries free of pollutants to the maximum extent practicable. Through a cooperative effort between the Regional Board and the permittees, this goal can be achieved. Thank you for your consideration. Respectfully, Lara L. Blakely, Mayor of the City of Monrovia."

I'd like to submit this letter for the record.

CHAIRMAN NAHAI: Thank you, Mr. Celaya. Next is Mr. Piasky, please, followed by Mr. Jason Wen and then by Ms. Maryann Gonzalez.

TIM PIASKY,

MR. PIASKY: Good afternoon, Chairman Nahai, and members of the Board. My name is Tim Piasky with the Construction Industry Coalition on Water Quality. You know, we've had a lot of talk today about the cost of this program. I think it's time to step back, actually, and say, okay, we know that this program is going to have huge costs. We know it's going to impact housing. We know it's going to impact the economy. But what are we getting for it? I think we really need to look at the benefits.

If we look back over the last 11 years, I think it's safe to say that there's probably been close to $1 billion spent on this program because I know the budget just for this year, just for the municipalities for program management was close to $150 million. That was just for one year and just for the municipalities. So I think if you take that over 10 years and add in the industry as well, we're probably looking at a billion dollar cost just for the last 11 years.

I haven't really seen anybody stand up here and tell me what the benefits have been on this program

R0007913

we've been doing for the last 11 years. And now we have a program that's coming up for the next 5 years that we're looking at spending -- you know, obviously we're hearing these numbers out here, maybe $55 billion on this next program. And what are we going to get out of it? I know you look at the SUSMP, and you're looking at putting these restrictions onto residential property, 10-plus homes or more. And the monitoring data shows that the residential properties are not a huge concern for the pollutants of concern. Yet we're requiring these things to go in on 10-plus homes. It just doesn't balance, the cost benefit.

You also have, you know, Mark Gold bringing up these proposed changes to the construction program. I think, No. 1, I haven't had a chance to take a look at any of those, but it sounds to me like they're trying to put a zero discharge limit on sediment. Well, it's not too hard to understand that the sediment itself coming off of natural property is not going to be zero. So does it make sense to put a zero discharge limit on developed property? I don't think so.

I think what it is is we need to stick to implementing BMPs to the maximum extent practicable, and we need to keep in mind that the greatest threat to clean and safe beaches that we've seen coming out of some studies is coming from broken sewer lines, sewage from boats, natural

R0007914

pollution from animal waste and wetlands.

So we may talk about urban runoff being a big problem and it is, but I think we need to step back and say, well, urban runoff, that's kind of huge. What portions of the urban runoff are the problem? What are the real sources of the problem? And then let's start getting at those. And I think that's where we look at the watersheds and we look at doing more of the regional-type programs. Thank you.

CHAIRMAN NAHAI: Thank you, Mr. Piasky. Dr. Jason Wen? Ms. Maryann Gonzalez?

MARYANN GONZALEZ,

MS. GONZALEZ: Good afternoon, Mr. Chairman, and Board members. My name is Maryann Gonzalez, and I am here today representing BP. BP owns and operates numerous retail gasoline outlets, or RGOs, in the State of California and operates under the brand name of ARCO.

Firstly, I would like to state that BP supports comments provided by WSPA here today. We support the adoption and implementation of the task force BMPs for RGOs in place of the structural treatment requirements proposed in the SUSMP guidelines.

The task force BMPs I refer to were developed and finalized by the Storm Water Quality Task

Force back in March of 1997. This work group was comprised of representatives from the State Water Board, the L.A. Regional Board, industry, and municipalities.

The State Board recently directed that the task force BMPs for RGOs should be required and may meet the maximum extent practicable standard. Despite this finding and without any supporting information, the L.A. Regional Board staff has summarily rejected them as ineffective. Notably, the exact opposite finding was made in the Long Beach permit.

We are unaware of any field activities where the effectiveness of the task force BMPs for RGOs have been measured. We also believe that the structural treatment devices being proposed have questionable effectiveness in addition to potentially presenting adverse safety and environmental impacts to RGO operations.

We submit that the task force BMPs for RGOs be adopted and required as the first step towards the control of storm water from RGOs. We also submit that the effectiveness of these BMPs be measured and assessed before moving to structural treatment requirements. Thank you.

CHAIRMAN NAHAI: Thank you, Ms. Gonzalez. The final card I have is from Mr. Michael Lewis. Whenever I say the final card, Ronji always produces yet another one. If I call this the final card, then she'll bring me another one.

R0007916

MICHAEL LEWIS,

MR. LEWIS: Thank you. On behalf of the Construction Industry Coalition on Water Quality I want to thank you for the three minutes we've been given to educate you on the devastating impacts that this regulation is going to have on the 350,000 working men and women in construction in Southern California.

I think we all recognize that much of today's exercise is merely window-dressing to create the appearance of some concern on the part of the district, and we're willing to play our role in that exercise, that charade, I guess, if it will move this to an appeal in a timely fashion.

Our industry has submitted 50 pages of comments on this rule. We've had the obligatory and perfunctory meetings with the staff, and it hasn't resulted in a single comma's change in the document. This by the way, from some folks who most of them haven't been on a construction site, have never built a BMP, have no idea what those things cost, and who are not going to lose a single day's pay with the adoption of this regulation; unlike our employees who are being asked to forego five months of income in order to comply with this rule.

All of this has been an exercise in futility. This is a case of some very ill-informed

R0007917

bureaucrats being supervised by some unaccountable and disinterested public officials. This rule is too vague. It is contradictory. In most sections it is unenforceable. It represents the most expensive compliance costs of any regulation in the history of government in this state. No one will be able to comply with 100 percent of its provisions.

But I can assume that that is the intent because 99 percent isn't going to be good enough. That 1 percent leaves you open to interpretation and violation, and that's probably what this is really all about. This is not about water quality. The staff has already said that they're not going to see any significant improvement for at least a couple of generations. It's not about public benefit because the surfers who go surfing in the rain are still going to get sick when they do. And it's not about measurable and achievable goals because you haven't taken the time to define the problem so that you can measure the solution.

No, I think this is about something else. I think it's about allowing some environmental groups the opportunity to start filing lawsuits so they can get rich. It's about spending the next 20 years paying off environmentalists and their lawyers because you can't do the 1 percent. It's about taking money out of the pockets

of construction laborers and putting it in the hands of some white liberal well-to-do minority who want to dictate how and where the rest of us should live and work.

It's been very clear to us that nothing we've had to say on this subject matters at this agency. But I'd like to ask you to prove at least one thing, that you've heard at least one thing that we've said. When you vote today, I'd like you to call the roll because I want you to prove that you have the huevos to put your name on your handiwork just like our contractors have to do every single day.

And I want you to call the roll so when we go to Sacramento and the State Board asks us who did this when they're staring at a room full of hundreds of angry construction workers, we can point to those names and show them who did this. And I want our labor leaders and the operating engineers and the laborers' unions and the cement masons and the carpenters when they have their visit with the governor to ask why it is that their members have to give up five months of income in order to implement this rule, they're going to be able to point to those names and say, "Here's the people that did this. There are the names, every one of them."

So please do us that favor and call the roll, thanks.

CHAIRMAN NAHAI: Thank you, Mr. Lewis. I do need to point out to you -- Sir, please come back to the podium. I will say this, that in -- what is it now? -- four or five years of serving on this Board, I have never heard testimony so offensive as what I've just listened to you. But thank you for it, and it will be part of the record, and I'm sure it will be considered in due course and in the full bloom of time.

MR. LEWIS: You're more than welcome.

CHAIRMAN NAHAI: The last card I have is from Ms. Brittany Burk.

BRITTANY BURK,

MS. BURK: Hi, I'm Brittany Burk. I'm not on any boards, I'm not representing any municipalities, but I thought you guys might like to hear the voice of a 16-year-old just on the issue of what's going on. So here we go.

One of nature's most brilliant creations is being destroyed. She's being poisoned by the humans who were put here on earth to work together in a balance with nature. It is our poisonous wastes that collects here every day from small gutters to large streets that pull together to drain into her pure waters. I'm talking about our mother ocean.

R0007920

As a rower, surfer, and diver, salt water is the blood that flows through my veins. I have a connection with the ocean. To see her in pain hurts me. I'm a competitive rower, and I workout several hours each day of the week with a rowing club in Marina Del Rey after attending school in Hancock Park.

Whenever it rains in Los Angeles County, all the gutters drain to Ballona Creek and the marina which then opens up to the ocean. No longer can I sit on the dock staring into the horizon. No longer can I smell the salt air and feel the salt breeze on my body. No, now I am choked by the smell of toxic waste flowing into its pure water.

It's come to the point where it's unsafe. Rain is now a threat to our practicing on the water for fear of excess runoff, increasing the chances of hepatitis, gardia, and many other harmful diseases we had to sign a release for removing the liabilities.

Living an hour inland from the ocean, I get noxious driving through the innercity when I do the drive every day. I see people finish a canned drink and miss the trash can, letting the material waste drop to the street. It is accompanied by wrappers, empty bottles, toilet paper, plastic bags, and oil from cars which all collect in the gutter and the street.

When people curb their dogs, those feces do not disappear into thin air. Many people fail to realize that when your waste is out of sight, it's not out of mind. People need to realize it all has to go somewhere, and I happen to be the one a couple of hours later in the day once I drive to the coast to be rowing in it, pulling my oar through the once water and now thick brown, warm waste.

When rowing in the marina, we fear getting splashed by the oar in front of us infecting us with exposure to the diseases it carries. I'm appalled after it rains even off the water, especially after going on six-mile runs but losing the bike path because there's a layer of trash covering the beach. You would realize as well that something has to be done.

Crunching through this trash on the beach I wonder how it's come to this. I ponder over it every day, what we've done and what we can do to fix what we've broken. I believe this problem needs to be stopped at the source. No matter how many beach cleanups we organize, the trash is going to keep on coming.

I firmly believe that the No. 1 solution is awareness. How is someone to know that his or her actions an hour from the ocean will be affecting his or her health? I think it's a good tactic in getting people to realize the potential that can be caused that maybe instead of drawing

a fish's skeleton, such as a few posted, more realistic pictures might be shown of the animals whose fate lie in the hands of these polluters.

I also know that the filter for the creek cannot handle all of the trash when the rain rushes in in masses. I see that it works some of the time when the water level is low. But most of the problems occur when the water level is at its highest.

These are the times at which trash coats the top of the water. It troubles me to think that this is only the trash that is still floating, and a large amount has probably sunk.

I hope you hear my frustrations. I know I'm not alone in them. I can assure you that the people I get the privilege of sharing this water with feel the same. It shouldn't even be an argument. We're the ones killing nature, and it is our duty to restore her life. Thank you so much for your time.

CHAIRMAN NAHAI: Thank you. Thank you for your testimony. That ends the public comments. We will take now a break of hopefully no more than 10 minutes. And I will ask my fellow board members to provide me with the names of whom they'd like to call back for questions.

(Whereupon, a brief recess was taken.)

CHAIRMAN NAHAI: We're going to have Board

R0007923

questions at this time. Then we'll follow that with Board comments and discussion amongst Board members and then proceed to a vote.

There are a number of people that Board members would like to call back up. I'll just state their names, but we won't necessarily call them in this order. The staff members, I think we have questions for Dennis Dickerson, Wendy Phillips, Xavier Swamikannu, and Michael Lauffer. I have a question of Mr. Ariki and Mr. Kharaghani. I also have a question to ask of Dr. Gold. Any others? Oh, and for Mr. Matthew Spies. I did mention Michael Lauffer.

So let's start with -- shall we start with Wendy?

MS. CLOKE: I'd like to start with Michael.

CHAIRMAN NAHAI: Okay. We'll start with Michael.

MR. LAUFFER: You said you wouldn't call us in order.

MS. CLOKE: Mr. Lauffer, the first question I'd like to ask you is one that was raised today by some of the speakers. It had to do with the question of the changes that were discussed today to the permit and issues having to do with due process and notice, and I'd like to hear your thinking on that matter.

MR. LAUFFER: Certainly. Ms. Cloke, whenever we

R0007924

look at a matter that the Board will be voting on, obviously we pay particular attention and have extreme sensitivity to issues of due process and notice and whether or not the regulated community and the public at large and the interested persons -- in this case representing the environmental groups -- have had adequate notice of those changes and the opportunity to incorporate them.

Now, part of that goes forward through the ordinary response-to-comment process. Part of that goes forward, actually, at the hearing. The Board's action at a board meeting is designed to conform whatever action is taken by the Board to the evidence presented.

Now, as staff revealed various change sheets to me over the last couple of days, we've been careful to step back and analyze whether or not any of the changes being proposed by staff rise to a level that would trigger concerns with respect to due process, and whether or not the Board would have to re-notice the permit.

All along the conclusion has been mine that so far the changes are insignificant. As you look at them, there are a number of pages of change sheets. However, most of that paper is taken up by trying to document very clearly so it's clear what action the Board is considering, what pages are being changed, what paragraphs are being changed, what text is being stricken, and what text is

being added. In that respect, there are very small changes in these change sheets.

From a substantive standpoint, all of them are logical outgrowths of what was originally noticed out by the Board. All of these changes are fairly minor. Now, whether or not they rise to a cumulative change that would trigger a due process concern, I think they certainly don't cross that threshold either because they are not, for example, cumulatively adding requirements to the dischargers.

I think the issue that staff asked me to look at most carefully yesterday was the issue of preferring and proposing to you today the amalgam of options A and C. And in reaching a conclusion that the Board could go forward without re-noticing the permit, I thought it was appropriate to look at the fact that there are three different versions of the Industrial/Commercial Facilities Inspection Program that had been noticed.

I think that was a very pragmatic step on staff's part because it allowed the regulated community, the environmental community, and the interested public to look at the full panoply of options, and to comment as to which provisions they thought were most appropriate.

What has happened as a result of the USEPA facilitated process -- I'm not going to call it a mediation

R0007926

because I don't think we should be mediating over permits -- but as a result of that process, it was realized by staff that you could combine A and C without having any real significant change. And, in fact, in many respects A and C combined is less stringent than the most stringent option that had been noticed by staff, Provision B.

All that said, from a due process perspective, you have a fair notice to the community as to the actions the Board was going to take or consider taking. Anyone who was interested had an opportunity to be present today at the hearing to provide comments. The staff prepared a staff report that included a new preference of an amalgam of A and C that was within the scope of what was originally noticed. And it is certainly no less stringent than the most stringent option available for consideration.

And to that extent, looking at all of the factors, we're very sensitive to the due process issues, but we do not see a need at -- or my conclusion at this point in time is in conformance with Title 40 Code of Federal Regulations which requires it has provisions governing the re-noticing of permits, we did not trigger any requirement to re-notice there. And in light of sound administrative procedure and public policy, the changes are not so significant that the Board would need to re-notice the permit. Instead, they just reflect minor changes in

response to comments to make for a tighter permit and in many cases, to accommodate the concerns of the commentors.

MS. CLOKE: Thank you very much. I have a couple more questions. Should I just complete my list?

CHAIRMAN NAHAI: Yes, go ahead, please.

MS. CLOKE: I believe it was Mr. Ariki who said that there were issues around designating a principal permittee. And that is certainly the way this permit is organized, and I would just like to also hear your thoughts on or your response to that comment by him and others.

MR. LAUFFER: Certainly. The Code of Federal Regulations, Ms. Cloke, provide the opportunity for there to be multiple applicants on a municipal separate storm sewer system permit. That's the process that's been adopted here.

It is certainly within the discretionary authority of the permitting authority -- in this case, the Regional Water Quality Control Board -- to designate a principal permittee to serve as a coordinating and facilitating entity for all of the other applicants.

Los Angeles County, through its Flood Control District, has that designation in this particular iteration of the permit. That has not historically been the case. My understanding, and I think Ms. Phillips and Dr. Swamikannu would be more able to discuss this point,

R0007928

but it seems like L.A. County has stepped in quite ably to fill that position.

And we don't feel that there are any additional obligations being put upon them because they're in that position. They happen to own a substantial portion of the MS4 system, so it is appropriate that they take a lead role.

MS. CLOKE: My next question has to do with the comments that were made on whether or not we're usurping the local government land use authorities. When I think of land use authorities, I think of zoning and planning regulations and building development regulations having to do with building envelope and design issues and so on. So it doesn't seem to me that we are stepping outside of our rightful role. But I did want to hear your counsel response.

MR. LAUFFER: Certainly. And I appreciate Rufus Young's comments on that matter. I think he always addresses issues quite ably for his clients.

For the most part, I encourage you to look back -- and I'm sure you've had an opportunity to review it in the last couple of weeks -- the legal analysis that I prepared for Board staff on this issue.

Mr. Young is correct that in its most essence the Clean Water Act federal and state laws assume

that local agencies will carry out land use and make land use decisions. The analysis that I put forward in my memo concedes that point. That is absolutely true. This permit in our view, however, does not go beyond that traditional dichotomy.

The state is, through the Regional Water Quality Control Board in carrying out the obligations under the Federal Clean Water Act and the Porter-Cologne Water Quality Control Act, establishing various mitigation requirements, SUSMPs, that have been proposed initially by many of the permittees to address storm water impacts.

And it is not, in essence, making land use decisions. However, the language I use in my memo is the fact that the Regional Board through the MS4 permit is providing some of the contours that will shape land use planning and decisions ultimately made by the local agencies, the municipalities.

They still have their full spectrum of land use authority. However, when they carry out decisions about siting, or when they authorize projects of a certain size meeting certain characteristics, they have to take into account the storm water issues related to those projects and mitigate them in conformance with the SUSMP provisions.

MS. CLOKE: That would be similar to other

environmental issues that every project has to meet. Everybody has to go through their checklist and so on, and those also shape plans and decisions...

MR. LAUFFER: Correct. It's much like -- The analogy I prefer is that the state does not make land use decisions with respect to general planning law. However, the state's general planning law identifies certain characteristics and certain land uses that cities need to account for. The storm water permit supplements that and augments that in conformance within the Federal Clean Water Act and the Porter-Cologne Water Quality Control Act.

MS. CLOKE: Another issue that was raised was the "safe harbor" issue.

MR. LAUFFER: Okay. Fairly open-ended question. The receiving water language has been the subject of much dispute. And what we look to is the decisions of the State Water Resources Control Board and how they crafted out the provisions with respect to receiving water limitations.

The most recent permit adopted or affirmed by the State Water Resources Control Board is the San Diego SUSMP order from literally one month ago. I think it was adopted on November 15th. I remember that because it's my birthday. And in there the State Board went through a couple of iterations. And I think Mr. Beckman has actually done the best job today, perhaps even a better job than I

can do, in explaining the evolution of that adopted order because he was intimately involved. And I think there were other attorneys who were intimately involved in it.

And I think one point that he made today that I think is important for the Board to understand is there was a provision, an interim draft, if you will, of that State Water Resources Control Board order that tried to flush out in greater detail the "safe harbor" provisions, tried to make it more explicit, tried to indicate the Regional Board should refrain.

Ultimately, the State Board did not adopt that language. It was stricken from the interim draft. And it is because the State Board has stepped back, looked at the receiving water limitation language, language that is almost identical to what the Regional Board staff is advocating in the tentative order, and concluded, one, that that language affirmed the iterative process.

There was an exchange in the July workshop between Chairman Nahai and myself about what the receiving water limitation means. And because that iterative language is in there, it must serve some purpose. And what it serves to underscore is that the iterative process is the preferred approach.

However, trying to go any further and put in a specific protection above and beyond the iterative

process protection that's already delineated in the receiving water language, we'd just see too much enforcement responsibility from the Regional Board when dischargers, for example, are not developing their individual SQMPs to reflect the necessary receiving water standards that they need to achieve ultimately.

So our view is that the existing receiving water language -- and this is a collective staff view -- is in conformance with the State Water Resources Control Board's order, underscores the fact that the iterative process is a necessary component at this time of MS4 permitting for achieving receiving water limitations, and still preserves for the Regional Board the necessary enforcement discretion in cases where dischargers do not fully either develop their Storm Water Quality Management Plan or consider and adopt BMPs.

MS. CLOKE: My last question has to do with the question of the issue that was raised by the man from the school district and what the jurisdictional relationship is there.

MR. LAUFFER: I actually may have been one of the people that was alluded to in that call. I received a call yesterday from a Mr. Magneson (phonetic) who is with the L.A. County School District. I'm not sure which school district. And I tried to walk him through the overall

permitting approach.

Schools as an entity are not segregated out. There are specific SUSMP provisions that may apply to schools, certain classes or projects that may need to implement SUSMPs. And those in certain instances, for example, if they cross the 25 parking spot threshold, would be subject to SUSMP provisions.

Now, it's entirely possible that schools may or may not fall into that provision. You know, a larger high school that may be accommodating students who can drive may cross over that threshold, and other schools may not. It's going to be a fact-specific inquiry, but it is to the same extent that it is for any other development. And that's the same under the existing SUSMP provisions that this Board has already affirmed and the State Board upheld last year.

MS. CLOKE: Thank you very much. That's all I have.

CHAIRMAN NAHAI: Any other questions of Mr. Lauffer?

MS. DIAMOND: I just had one. Did you have one, Chris?

CHAIRMAN NAHAI: He keeps saying he doesn't have a question.

MS. DIAMOND: Sorry. In regard to the testimony of Katharine Wagner on behalf of the City of Los Angeles --

she's from the Downey branch -- she mentioned that Title 22 of the California Water Code should not apply in discussions about the definition of water quality standards, and I wanted to give you an opportunity to respond to that.

MR. LAUFFER: Actually, I've already gone one step further. I've recommended to staff that the reference to Title 22 -- and we were going to try to combine all of our recommendations at the end -- that that reference to Title 22 that was proposed first in the December 10th draft and then corrected in the December 13th errata sheet, that that reference to Title 22 be eliminated. Because what happens is the Basin Plan, as Ms. Wagner correctly points out, already includes certain references to Title 22. That definition of water quality standards that exists in the tentative order already references the Basin Plan. So from our perspective, water quality standards and water quality objectives are already defined by the Basin Plan. So we're going to recommend accepting Ms. Wagner's change.

MS. DIAMOND: Thank you.

CHAIRMAN NAHAI: Any other questions for Mr. Lauffer at this point? In that case, Wendy, would you like to come up.

MS. PHILLIPS: Good afternoon. For the record, Wendy Phillips, Regional Board staff.

CHAIRMAN NAHAI: Does anybody have a lead-off question? I have a couple of questions to ask you. Could you turn to page A-5 of the staff report, if you have it there. I'm looking at the fourth paragraph, and it says halfway through the page -- and I'm going to read from this -- it says, quote, Example, 74 municipalities reported less than 5 percent of construction project approvals were being read and reviewed for storm water controls. Three municipalities did not report at all. Several municipalities reported that zero percent of projects were reviewed or inspected for construction controls because they were either considered exempt or were nonpriority.

On the other hand, other municipalities recorded that 100 percent of projects were reviewed because they were all but considered priority. The three municipalities that didn't report at all, do you know which municipalities those are? Well, if you don't have that --

MS. PHILLIPS: We have a table toward the back of that section.

DR. SWAMIKANNU: A-21, chairman.

CHAIRMAN NAHAI: I see it. All right. Let me then ask you -- if you could go to Table 4, it reads "Summary of fiscal resources budgeted for fiscal year 2001, 2002."

MS. PHILLIPS: Okay.

CHAIRMAN NAHAI: This was compiled from what the

R0007936

municipalities and the county have provided?

MS. PHILLIPS: Correct. These are self-reported.

CHAIRMAN NAHAI: This is the municipalities' projections --

MS. PHILLIPS: Correct.

CHAIRMAN NAHAI: -- of the administration of the MS4 permit for the coming year?

MS. PHILLIPS: Yes, it is.

CHAIRMAN NAHAI: Well, $145 million is a far cry from $50 billion. Do you have any explanation for that discrepancy?

MS. PHILLIPS: I would like to address several of the comments that you've heard this morning and this afternoon about the negative economic impact of this proposed storm water permit.

What I would like to suggest is that this is, actually, an investment in water quality, that is, good water quality that helps drive our economy. And the first point I want to make is that I think many of the costs that you've been looking at may be inflated.

Let me start with the Caltrans report that you heard a bit about this morning. In that report, Caltrans estimated $50 billion in capital improvement costs. Now, I want to show you why I think these are inflated. If you look into those numbers, $6 billion of

R0007937

that is in land acquisition costs. And here they're assuming 14,000 acres at a cost of $435,000 per acre.

Now, another example of why we think the costs may be inflated, permittees estimate their storm water costs under the existing permit are almost $150 million a year. But if you look on page B-194 in the staff report, we took a special look at the program to eliminate illicit discharges and connections. And here we found numbers that were all over the map.

Some cities reported zero dollars budgeted or expended for elimination of illicit discharges and connections. And, indeed, some cities do not own or operate a storm drain system. But on the other hand, we had one city reporting up to $4.2 million. That was Culver City.

So if you took that average using those raw numbers, that's an average of $114,000 a year spent on ICID. But if you throw out the outliers, the average is $32,500, one-fourth of what you might think it is if you just looked at the raw numbers.

Now, I want to make one more point, and that is that, again, we strongly believe that the storm water program is an investment needed to support the economy. In L.A. County our gross metropolitan product, that's the value of our goods and services -- it's a similar concept

R0007938

to gross domestic product -- is about $350 billion. It makes us the 16th largest economy in the world when you compare it to other nations.

We would submit, staff would submit that our investment in protecting water quality, especially from nonpoint source pollutants, is necessary and, indeed, contributes to the success of the county's economy.

If you assume that the permittees' numbers that I talked about a minute ago, that is, expenditures for storm water on the order of $150 million a year are indeed correct, then this $150 million cost for storm water is .0004 of our gross metropolitan product. That's four ten-thousandths or .04 percent.

Now I take the numbers that David Beckman mentioned this morning. I think he said that our tourist economy related to our beaches is on the order of $10 billion. Again, using the permittees' budgeted estimates, $150 million, that's about for every one and a half cents we spend on storm water, we're generating a dollar in tourist revenues. So I hope that sheds some light on the economics here.

MR. MINDLIN: With that $150 million, am I understanding that's going to be every year where it's going to increase or decrease?

MS. PHILLIPS: The changes that we put in this new

R0007939

permit are incremental. We don't think that the cities are going to have to go out and hire armies of inspectors. They've got inspectors, building inspectors, for example, who can very easily go out and look at storm water issues, too. The same with restaurant inspectors.

The building code enforcement officials, as Dennis Dickerson mentioned this morning, they ought to be able to incrementally assume some of the responsibilities of the industrial and commercial facility inspections.

MS. DIAMOND: I have a couple of questions, Wendy. One is in regard to the catch basins. Given the various -- the permits that we've seen over the last two weeks, including the one of December 10th, I wanted you to tell me or to tell the Board how specific or how defined are Priority A and Priority B, and, also, what kind of recordkeeping and reporting is being required of the permittees on the catch basins?

MS. PHILLIPS: I'm going to ask Xavier, my colleague, to respond to that question.

CHAIRMAN NAHAI: Let's finish because I've got a whole host of Xavier questions. Questions regarding the technical aspects of the permit I think are more proper.

MS. CLOKE: I have two questions, one of which I'd like you to speak to. Another issue that was brought up by many of the speakers today was the request for a

R0007940

continuance. And I would just like you to say for the record, because I know this to be a fact, how many times we have responded to requests for a continuance in the meetings and so on and so forth. I just want to make sure that people understand this is not the first time this issue has been before us and so on.

MS. PHILLIPS: When we started this process at the beginning of the year, we made a very serious intent to do this in a professional, organized manner to make sure that the permittees, the environmentalists, and other interested parties all had appropriate input into this.

So the past year has been very intensive. We put out three separate drafts of this permit. We've made sure that on each draft the public, the permittees have at least a month to submit comments on that. We've taken those comments. We've been very diligent about incorporating those comments in issuing subsequent drafts.

We had two workshops, most recently the July workshop before the Board which lasted an entire day. We had a previous workshop back in April where we spent half a day with the permittees and with the public. And then I can't begin to count the meetings we've had with all parties, the telephone calls, the E-mails. We have done -- we have truly tried to reach out to the permittees and to the public here.

R0007941

MS. CLOKE: I know you have because I've been hearing about it continuously. I just thought it was important to have this both said to the people in the room today who might not be aware of it, and also to have it on the record.

My other question is a question about the mapping systems, and I don't know whether you want me to save that for...

MS. PHILLIPS: No, go ahead and ask me about that.

MS. CLOKE: Okay. It seems to me that even to reasonably run a system, you would want to have it mapped. I don't know how you can understand what was a legal and what wasn't a illegal discharge if you didn't know where your legal outfalls were.

So I don't understand why mapping and knowing your pathway is not necessary, not for us but just for the operation and the maintenance of your own system. And yet we've heard a lot of people today seem to indicate that this mapping is both expensive and also not necessary. And I would like to ask you to talk about that a little bit and help me understand that a little better.

MS. PHILLIPS: As we started to look at the issues of illicit connections and illicit discharges, it became very apparent to us that a comprehensive map was needed.

Now, there is not one comprehensive map that

R0007942

captures 100 percent of the storm drain system at this point. The map as presently constituted I think will capture 85, maybe 90 percent of it. And I have yet to see it at an appropriate scale.

But we started out, just as you've said, thinking that you need a map. And in our very first drafted permit, we included a requirement for that. In fact, we got specific. We said you need a geographic information system. The permittees objected to that on the basis of cost, and also they thought we were dictating the manner in which they comply.

What we've ended up with here is -- and I'm looking at page B-349 -- is an agreement that permittees will map at a scale and in a format specified by the principal permittee all illicit connections and discharges on their baseline maps, and shall transmit this to the permittee. And within one year of adoption of the order, the permittee will use the results of this information and the baseline priority screening for illicit connections to start an annual evaluation of patterns and trends of illicit connections and discharges.

That is our ultimate objective. So even though we still don't today have the map that we think we need at the scale, I think we're working toward that. More importantly, we've got a means in place to fix the problem

R0007943

of illicit connections and discharges.

MS. CLOKE: So you're satisfied with the language on B-349?

MS. PHILLIPS: Yes.

MS. CLOKE: Okay.

CHAIRMAN NAHAI: Any other questions for Wendy? In that case, thank you. Xavier, will you come up, please.

MS. DIAMOND: Xavier, I'll repeat the question that I had asked before about catch basins. How specific is the final draft with the change sheet on the Priority A and Priority B, and what recordkeeping and reporting requirements are there for catch basin cleanup?

DR. SWAMIKANNU: Ms. Diamond, if you look at the change sheet that was handed out today dated December 13th, and if you look at Item 3, we attempted to provide a clarification for what constitutes Priority A catch basins.

Essentially, what it says is these are catch basins that are at least 40 percent full of trash and debris. That threshold goes to 25 percent beginning the year 2003. What we have not identified at this time is what constitutes Priority B and Priority C. Those have been left to the discretion of the permittees to propose as they report annually.

MS. DIAMOND: As far as the requirements to report, what kind of requirements are there to report, and what

R0007944

kind of recordkeeping must they keep?

DR. SWAMIKANNU: Go to B-427. You basically have questions in the annual report as to how many times these priority basins were cleaned, "attach a record of all catch basins in the jurisdiction." So that's how we try to illicit information on records.

I think the issue is that these records are being retained at the office, meaning, not our office but at the municipality. So that when we do review their programs, we have that information available.

MS. DIAMOND: So it's adequate for your needs?

DR. SWAMIKANNU: At this point, yes.

MS. DIAMOND: I wanted to ask you a question about the illicit connections and illicit discharges. The same kind of question: is there required reporting of these, and is there and how soon? How soon after an illicit discharge is found must the permittee report it?

DR. SWAMIKANNU: I'll let Wendy answer that question because she is familiar with that section.

MS. PHILLIPS: I'm going to slip in an overall comment here, and that is that I think one of the values that we've realized in upgrading this permit is that we switched this program from a passive program, whereby in the past they've been inspecting for illicit connections during regularly-scheduled maintenance, to a more active

one.

And if you look on page B-350, you'll see that permittees are required to report to the principal permittee, and then there's a long list of information: location, length of open channels, pipes, what's been screened, and the status of suspected, confirmed, and terminated illicit connections. And there's some reporting detail back in the section of the permit that specifies "reporting details." That's page B-432 and 433.

MS. DIAMOND: Let me just ask you this, on that page B-350, "Determination of Illicit Connections," it says the permittee shall ensure termination of a connection within 180 days. It seems like it's a long time. I'd just like you to comment about that.

MS. PHILLIPS: The long termination period there -- and we did have some discussions. I'm quickly trying to recollect what was behind that. First of all, I think the county was looking at their typical field experience, and we were pushing them, of course, to expedite that.

But they're looking at sending crews out I believe on the order of once every week, once every two weeks. In the past, I think it's been once every three or four weeks. Once they find the suspected illicit connections, then they need to confirm that. And the confirmation process can be long. They might need to do

smoke tests. They might need to do some videotaping of the connection itself.

Then after you confirm that this is, indeed, an illicit connection, you've got some enforcement action that needs to take place. And the enforcement process on the part of the municipalities requires time also. And so that's why we ended up with the six-month period.

MS. DIAMOND: One last question on ESAs. Mr. Beckman talked about the cities having the discretion to condition ESAs upon their inspection. Do you remember that conversation? And I wanted to know your response to that.

DR. SWAMIKANNU: The manner in which we have structured the ESA definition right now is ESAs essentially are either designated by the State Board or the State Resources Agency or the County of Los Angeles. That is the basis. I recall that many of the permittees requested that they be given permission to designate without going through this public process because the other designations formerly involved the public process.

And so that is how we have structured it. I don't think anywhere we have provided the discretion of cities to pick ESAs based on their own designations. I think the comment probably was more towards an issue that was brought up by the county where we have said where --

particularly ESA, especially one called "significant natural areas" designated by the resources agency where it has not been field verified, it's difficult to know the boundaries. And in that situation, they're not required to consider that as an ESA unless it has been field-verified by the state agency.

CHAIRMAN NAHAI: Just looking at the change sheet, just for clarification, that would be the California Department of Fish & Game?

DR. SWAMIKANNU: That is correct.

CHAIRMAN NAHAI: But would we need to add here "...provided that the area has been field-verified by the Department of Fish & Game," or is that obvious?

DR. SWAMIKANNU: If you are asking that question, it's not obvious. So I think it is a valuable clarification.

MR. NAHAI: Any other questions for Xavier?

MS. CLOKE: I just wanted to -- he pointed to the area on mitigation banking with John. Can you point it to me? Can you tell me where it is? Mitigation banking, somebody referred to it and I just wanted to check something.

CHAIRMAN NAHAI: Xavier, can you refer us to the --

DR. SWAMIKANNU: Yes, B-337.

CHAIRMAN NAHAI: While you're looking at that, let

R0007948

me pose my questions so we can try to move forward.

Xavier, there were a number of people who testified, who said that they were new to this process and new to the storm water issue and the SUSMP issue, and they voiced concern about the effect of what we were doing on the economy.

I think for their benefit, I would like to -- I mean, I was here when we adopted the SUSMPs in January of 2000 and, you know, we were presented with evidence that similar requirements had been adopted in Florida, in Massachusetts, and in Delaware, and here locally in Santa Monica, and Calabasas, and that the real estate industry had gone on to do very well, and that no economic catastrophe had occurred as a result.

Could you just respond to that? Since these people said that they were new, I think it's worth it for you to respond to them on that issue of the effect as we've seen it on the economy of adopting SUSMPs and these regulations.

DR. SWAMIKANNU: First, let's put it in the context of where the SUSMP or the new development requirements really are based on the State Board decision. As applied presently, they only include discretionary actions and they exclude retail gas stations. They include residential house developments, and they include industrial/commercial

R0007949

developments and parking lots.

There is a body of evidence on the effectiveness of BMPs. The fact that some of them or many of them have not been tested in the arid climate is not reason in itself that they do not work. For example, the American Society of Civil Engineers has a database of BMPs that are appropriate for these kind of land uses. In fact, if you look at the implementation of these treatment BMPs in Florida, it started as early as probably 1980s, early 1980s; similarly in Washington, Western Washington, probably mid-'80s. And so at least in those areas on the Pacific Coast these have been tested and found to be effective.

Similarly, in the northeast in the states of Virginia and Maryland and now even New York, these treatment BMPs are being implemented. When we were looking at the SUSMP requirements and we looked at the cost basis, we determined that it was no more than 1 to 2 percent of the project cost. And so we did go through the economic analysis, though not in the detail that some permittees might want. But we did take economic impacts into consideration at that time.

CHAIRMAN NAHAI: We are, in fact, not legally required to do a cost benefit analysis.

DR. SWAMIKANNU: That is correct.

R0007950

CHAIRMAN NAHAI: But we nevertheless considered the cost implications and determined that we're talking about a cost of 1 to 2 percent of the project cost in order to implement these provisions.

DR. SWAMIKANNU: That's correct.

CHAIRMAN NAHAI: Okay. Xavier, there was an issue raised about whether the permit itself calls for the 100,000-square-foot threshold to become 1 acre come 2003. And I thought that I saw that provision at B-335 in Section 6. So I wonder if you can tell me whether I read this correctly.

DR. SWAMIKANNU: Yes, Mr. Chairman, that comment was made by Dr. Gold, and I did point out to him that we did~~n't~~ include that provision. And he has agreed that he did not see it, and that was the reason that he brought that up. But it does occur in the permit at the location that he talked about.

CHAIRMAN NAHAI: Thank you. The next question that I have is with respect to impervious surface, for instance, for the 100,000-square-foot criteria, and it says 100,000 square feet of impervious surface, is it your interpretation that a roof would be counted as part of that impervious surface?

MS. CLOKE: It better be.

DR. SWAMIKANNU: I think under the roof is a floor,

R0007951

and so that would be considered an impervious surface not because of the roof but because of the floor that's underneath it.

CHAIRMAN NAHAI: You're saying because the footprint would necessarily include the roof.

DR. SWAMIKANNU: Right. Because the real issue under the new development requirements is really the disturbance of land. So when you're replacing a roof, you would not be triggered into these requirements. But when you dig up the footprint of a building, then you would be subject. And so under that definition, the roof itself is not a factor, it's the footprint.

And I think that addresses some of the concerns that the State Board expressed about exterior remodeling when land is not being disturbed to impose a requirement. That interpretation is consistent with USEPA's determination of what constitutes redevelopment at an existing site.

CHAIRMAN NAHAI: All right. I can see Chris Pak's mind just going with all kinds of designs.

DR. SWAMIKANNU: Do they agree or not agree with me? I am not an architect.

MR. PAK: Well, I can see why, because when the rain falls it goes on the roof, and it gets collected in the gutter, and then on to the storm drain, it goes onto

the curb, or it goes onto the parking lot, and it drains somewhere.

But I guess my question is how much of that, you know, adds to the overall pollution of the water, that runoff water, compared to some of the other bigger issues that we have. And, also, when you look at residential areas, apartment buildings, really, the impervious surface of an apartment complex whether it's 100 units or maybe 200 units, it's really the roof under your definition because the rest of it is landscape that we take the setbacks.

And at what point do we sort of regulate land use? Because we have very loosely-interpreted wording here that we can ask for maximized impervious surface. So I guess some of the concerns of the -- whether we overstep the land use issue is how do we determine what's maximized? Every city in their land use has setback requirements. When do we say we're going to need to increase that setback?

DR. SWAMIKANNU: Can I handle Mr. Pak's question? Basically, there are two issues we're talking about here. The first one is application of the treatment requirements, the numerical mitigation criteria, and that's where the roof discussion came in.

On the issue of where you talk about directing rainfall runoff to pervious areas, that's a

R0007953

narrative requirement, and that's in the Standard Urban Storm Water Mitigation Plan and applies to all the categories that we have listed. So there are two different issues.

As to the question of how is roof runoff contaminated, I think there are some studies in Southern California which definitely tell you that aerial deposition accumulates on the roof, and there's some concentrations of pollutants that we ought to be concerned about depending on where we are. That's one side of it.

The other thing is a lot of storm water contamination is from just human activity, and that is what we are trying to treat at the site. So the roof in some cases can contribute, especially in industrial areas. But the larger contamination around land uses is human road vehicular activity, in fact, which is why we talk about parking lots and gas stations and other areas.

MR. PAK: I understand that. I guess the cost analysis, you said 1 to 2 percent.

DR. SWAMIKANNU: Yes.

MR. PAK: How did you derive at that basis? Did you actually cost out what...

DR. SWAMIKANNU: Thank you for that question. We basically before we developed the requirements, we used the City of Los Angeles Planning Department to go through an

R0007954

analysis that they had, an actual project that came in. And we looked at the costs of the project construction and whatever, and how much it would take to mitigate this storm water runoff from that facility. There's an industrial site somewhere in Los Angeles. And based on that calculation, it was 1 to 2 percent.

And that's been consistently shown and it's a rule of thumb. It's a formula that's used by many of the other states as well. Florida uses a slightly different version. They use up to 10 percent of the land acquisition cost. That's not the formula we applied. We simply looked at how much the treatment would cost and how is that related to project cost.

CHAIRMAN NAHAI: Thank you. Just to get back to the impervious issue for a second, I just did want to note that at one point there was a rooftop exemption in the permit, and that that was taken out, and that the elimination of the rooftop exemption from the permit was actually upheld by the State Board.

DR. SWAMIKANNU: Let me explain that because that's a slightly different issue than what you asked me before. The rooftop exemption originally was suggested by the permittees because they wanted credit for an impervious area. They basically said, take the rooftop area out of your calculation because it's not contributing to

pollution.

And so if the roof was 50 percent of your site, you would be only required to treat runoff from the other 50 percent ignoring the roof part of it. And based on discussions before this Board and the concerns about contamination on rooftops or potential pollutants, we took the rooftop exemption out. That's from new sites.

CHAIRMAN NAHAI: I want to push ahead. Any more further questions for Dr. Swamikannu? Thank you very much.

DR. SWAMIKANNU: Thank you.

CHAIRMAN NAHAI: Did anybody have a question for Dennis?

MS. CLOKE: I had a question, but I've had it answered.

CHAIRMAN NAHAI: Okay. Keith, you had a question for Dennis?

MR. McDONALD: Dennis, we've heard from legal counsel, staff, and I've heard from both sides saying pros and cons how more negotiation would bring about a better permit. Could you speak to that issue as the executive director of the Board?

MR. DICKERSON: Yes. Thank you, Mr. McDonald. The issue of additional mediation or discussion as to whether or not that would be productive at this point in the permit, we have spent a huge amount of time, as already has

R0007956

been outlined, in various workshops responding to comments and so forth.

At the last two mediation sessions that we had -- and one was an extraordinary session which took place at the board meeting that this item was actually scheduled to be heard -- we thought we were making some fairly good progress with regard to Version A/C which is the inspection program. We really focused on that particular issue.

While on the one hand I thought we were making progress on the actual details of the language, it was also quite clear that there was not going to be consensus, there was not going to be strong recommendations coming to the Board as a result of that mediation process and specifically on that version. We've heard today some, I think, modest support for it, but certainly not the ringing endorsement that we were hoping to achieve.

My experience out of that mediation session was that it was quite clear that the challenges that were being raised -- or I should say not so much challenges, but issues that were yet being raised at the end of what I thought was a very productive session, just made it impossible, really, to go forward to have productive, meaningful mediation that would end up in a resolution as it's been conveyed by many people here that we would

achieve consensus. I'm really quite confident that we did not achieve consensus.

CHAIRMAN NAHAI: Thank you very much. Any more questions of Mr. Dickerson? Could we have Dr. Gold back, please? Dr. Gold, I wanted to call you back because we were trying at breakneck speed to follow the suggestions that you were making. And I think --

DR. GOLD: I have a comment on that after further review, if that's okay. First of all, I apologize for bringing up -- really, I think it was overly-ambitious the changes that Heal the Bay was attempting to achieve in such a short period of time with the complexity of the changes.

And I think the reason that we went for a lot of the complex changes that we did is because, in all honesty, the permit is a very good permit. And, really, I don't want it to be lost with all the other comments that we were making to try to further strengthen a few ambiguous sections of the permit that could use additional strengthening and clarification.

I don't want it to be lost the fact that, really, this is a permit that needs to pass and needs to pass as soon as possible, hopefully in the next 15 or 20 minutes which I'm sure you'd all prefer.

CHAIRMAN NAHAI: Thank you very much.

DR. GOLD: So that being said, there are a couple

R0007958

of issues.

CHAIRMAN NAHAI: You're not going to let go of your ambition altogether?

DR. GOLD: No, I never will. But the one thing I do want to bring up is there are a couple of issues, and I'll narrow them very, very much. One of the things I'm going to bring up will make it much easier to deal with is that from the standpoint of modifications to the reporting requirements to make sure that BMP efficacy is dealt with as well as SQMP effectiveness, and, in addition, the monitoring program changes on toxicity identification evaluation which is a pretty complex issue.

You well know, Chairman Nahai, those are issues that could occur outside the course of this vote today. And so what I'm suggesting for the Regional Board to do is that Heal the Bay is more than willing to sit down with the permittee as well as the Regional Board staff to try to further rectify those particular issues. And so that's one particular instance that I think could be dealt with outside of the vote in the next few minutes.

But one issue that I can't defer is the whole issue on catch basin maintenance. And, really, the environmental community is very concerned about the precedent that this particularly sets, and that the Regional Board should not distinguish between requirements

for dischargers based upon whether or not there's an adopted implementation plan for a TMDL.

That particular issue we feel really should be addressed in this permit right now from the standpoint of really differentiating between what's going on in Ballona and what's going on in the L.A. River watersheds and saying that that's different than what's going on in the rest of L.A. County.

We don't particularly agree with it at all. And we think that, really, the definitions that are here already for how frequently Priority A, B, and C basins should be cleaned up is really what the default should be until there is a new implementation plan that's approved and being implemented under the TMDL. But anything different from that is completely premature.

So in the interest of time, I'll drop the rest of the issues. But that one in particular I think really needs to be addressed tonight.

CHAIRMAN NAHAI: I understand.

DR. GOLD: Any questions? No, you want me out. All right.

MS. CLOKE: I'm ready to have the chairman make a motion.

CHAIRMAN NAHAI: All right. I'm being told that I must. All right. I'll put a motion out, and I'll forego

R0007960

the other questions that I had.

You know, before doing that, though, I think I must congratulate our staff: Wendy, Xavier, the whole team, Dennis. The amount of work that has gone into this permit really shows, and the permittees for all of their time that they put in and all of the comments that they provided, thank you very much. But I really would like to add congratulations, I'm sure, on behalf of all of the Board to staff.

Let me also say that I think there is no doubt that urban runoff is now the major threat to our waters in Southern California, and I believe this permit really is a decisive step in the right direction for dealing with the problem.

So having said that, I am very pleased to move adoption of staff's recommendation subject to the change sheet that we received today with the following changes: the deletion of the reference to Title 22 which was mentioned; the addition of a reference to the Department of Fish & Game in connection with the field-verified language that was added in the change sheet we received today.

MS. CLOKE: So we're taking out field verification?

CHAIRMAN NAHAI: No. It would be saying provided the area has been field-verified by the California

Department of Fish & Game.

MS. CLOKE: Is that who puts it in our Basin Plan is the Department of Fish & Game?

CHAIRMAN NAHAI: What this is is this, it reads "an area designated as a significant natural area by the California Department of Fish & Game's Significant Natural Areas Program."

And staff's testimony to us is that that area is not clear unless it's been field-verified. And we just want to make sure that it's not field-verified by the municipalities, it's field-verified by the Department of Fish & Game. So I suggest that we add that.

And I'm happy to have some discussion on Dr. Gold's suggestion regarding the deletion of the distinction between whether a TMDL program is in place or isn't in place with respect to catch basin clean out and maintenance. To be honest, the distinction does not make a great deal of sense to me.

We have catch basins, and we're adopting regulations for their clean out, and whether that's, you know, in an area for which a TMDL has been adopted or hasn't been adopted I don't think should be the determining factor. But I'm happy to listen to discussion on that issue.

My recommendation would be that the

R0007962

distinction be eliminated, but, Xavier, go ahead and respond.

DR. SWAMIKANNU: Can I just comment on the background of that so you have some...

Let me give you some context of that change so that it facilitates your discussion. Basically, some of the municipalities were concerned about that after the implementation of certain measures for trash controls which augments our current program, that they might choose different measures because they are then subject to a TMDL at the different locations, and all the resources that go into these original measures might be wasted because they probably will get a more aggressive schedule.

So one manner to address it might be to have a default here if by the time no plan is in place, then the same requirements as those that apply to nonTMDL cities now does apply at that point. I think Dr. Gold's concern was what happens if we go into litigation and the TMDL plan is not approved, then we have nothing to fall back to.

CHAIRMAN NAHAI: I think it's a bigger issue than that. We should have regular -- well, let me stop. So what is your suggestion again then?

DR. SWAMIKANNU: There is currently, at least in the TMDL program, a certain year by which the permittees are required to submit a TMDL plan for implementation, and

R0007963

I forget the year. It might be 2003.

So if by 2003 there's no plan implemented for these TMDL cities, then we fall back on the requirement that applies to all cities at this point, to the other cities at this point.

CHAIRMAN NAHAI: All right. Well, I understand what you're saying. How would that -- how would it work in terms of the language here on B-345?

MR. PAK: What was the number again?

CHAIRMAN NAHAI: B-345.

MR. SWAMIKANNU: John is trying to check the date when the implementation plan is due. So you would include language that says something like if the TMDL implementation plan is not effective by a certain date -- and John is providing that date -- then the requirements in this order as applicable to the other permittees shall take effect. It's under B.

CHAIRMAN NAHAI: Let me ask you this, in B-2, that has already been amended by the change sheet to say that in July of 2003 that number has to go from 40 percent to 25 percent; correct?

MR. SWAMIKANNU: That's right.

CHAIRMAN NAHAI: I think the issue is does this mean -- does the interplay of B and C mean that an entity for which a trash TMDL has been adopted, but which hasn't

R0007964

taken effect because of appeals, will therefore be in a position of having less stringent requirements than an entity for which no TMDL has been adopted?

I think that's the issue. And maybe the change in No. 2 from 40 percent to 25 percent in 2003, maybe that goes a long way to equalizing the situation. I'm not sure, though.

MR. SWAMIKANNU: That probably does, but I think the issue also is that these -- the additional measures, for example, like for all permittees to be required that shelters have waste receptacles. Now, if that is the purpose -- it's an additional requirement compared to where we are presently.

So if, for example, a huge city has to invest in trash receptacles, but then comes up three years from now with a treatment of -- a capture system because that's how they meet the TMDL, the cost in implementing these shelters is an unnecessary expense.

CHAIRMAN NAHAI: Okay. I understand. Let me listen again to your proposal because I want to get beyond it.

MR. SWAMIKANNU: Okay.

CHAIRMAN NAHAI: Xavier, was it your proposal that we would add language that would say that in the event permittees -- that in the event TMDL implementation

measures are not adopted prior to March of 2003, the permittees shall comply with the requirements of --

MR. SWAMIKANNU: Under section, whatever.

CHAIRMAN NAHAI: -- C-1? Is that what we're proposing?

MR. SWAMIKANNU: That would be one way to structure it, right.

CHAIRMAN NAHAI: Okay. I understand. Do people who are noting this understand it? Because I want to make it part of my motion, then.

I'll make that part of my motion, and I will also just direct that staff meet with Heal the Bay with respect to the monitoring issues that were brought up. And I understand that the executive officer would have the authority of implementing additional monitoring requirements if the executive officer deems appropriate. Is that correct?

MR. LAUFFER: That's correct. However, because of the number of change sheets that are out there, which I think are very crystal clear as to what changes are being proposed, I want to make crystal clear what the proposed motion is here.

CHAIRMAN NAHAI: Do we have a second?

MS. DIAMOND: Second.

MS. CLOKE: I think that we should put in the time

that we notify when there's a spill and the beaches are closed. Dr. Gold suggested a notification time. I'd like to add that.

CHAIRMAN NAHAI: I'm just concerned about whether that would now start to rise to the level of a material change, especially with respect to a two-hour time limit which could have a significant effect.

MS. CLOKE: Then let's hold off on that one, something we can discuss in the future.

CHAIRMAN NAHAI: I think Dr. Gold will hear what it is that he's concerned about.

MR. LAUFFER: Now, if I can, Mr. Nahai, what I'd like to do is just quickly walk through the three elements of your -- the three proposed amendments. The first is on page B-361 of the permit of the edited tentative draft for the definition of water quality standards and water quality objectives, the two change sheets over the last -- the course of the last week have reference to Title 22 of the Water Code. That amendment would be stricken so that now the definition of water quality standards and water quality objectives would read, "Water quality standards and water quality objectives means water quality criteria contained in the Basin Plan, the California Ocean Plan, the National Toxics Rule, the California Toxics Rule, and other state or federally-approved surface water quality plans. Such plans

R0007967

are used by the Regional Board to regulate all discharges including storm water discharges."

The second element of your motion would have been with respect -- I've lost my notes -- would have been with respect to the Department of Fish & Game and field verification.

CHAIRMAN NAHAI: Right.

MR. LAUFFER: And that is in the definition of environmentally sensitive areas.

CHAIRMAN NAHAI: Right.

MR. LAUFFER: And I'm not going to bother reading out the entire definition again.

CHAIRMAN NAHAI: No, and I'll tell you, it is contained in the change sheet we received today entitled "Additions to Supplemental Change Sheet." It is in paragraph 5 of that change sheet and in the third line from the bottom of that entire paragraph after the word "verified," we would insert the words "by California Department of Fish & Game."

MR. LAUFFER: I think that's clear for the record. The third element of your motion, I would prefer that you walk through because I am not entirely clear at this point in time. I know it involves page 345 concerning catch basins. But if you can indicate the specific changes because I think that's what's been lacking from the

characterization of the motion so far.

CHAIRMAN NAHAI: Give me a minute, and I'll do it. What we would do is at the very end of Subsection B on page B-345, we would add language to the effect, and it would be, I think, to the following effect: that with respect to permittees subject to a trash TMDL, comma, in the event TMDL implementation measures have not been adopted by -- you know, what did we say? -- March of 2003, comma, that such permittees shall be subject to the requirements set forth in Subsection C, ditto, and then we can add until such TMDL implementation measures are adopted in which event the subject permittees shall implement programs in conformance with the TMDL implementation schedule.

MS. SMITH: Mr. Chairman, similar to the introduction to part B of the permit, you mentioned permittees subject to the trash TMDL. I will propose that you also include the programs for those two watersheds.

CHAIRMAN NAHAI: The Los Angeles River and Ballona Creek?

MS. SMITH: There may be future trash TMDLs. They're on a different schedule.

CHAIRMAN NAHAI: Okay, done. So that would be that. There is one other element to my motion which is the adoption of alternative A/C as far as inspections are

concerned. So is that motion clear enough, counsel?

MR. LAUFFER: I believe so, yes.

CHAIRMAN NAHAI: So that's my motion.

MS. DIAMOND: Second.

CHAIRMAN NAHAI: All in favor?

(All board members respond "aye" with the exception of Ms. Buckner-Levy who abstained.)

MS. DIAMOND: Any opposed? Hearing none, it's carried.

MS. CLOKE: You know I have to leave.

CHAIRMAN NAHAI: Thank you very much for staying.

(Whereupon, Item 10 was concluded.)

R0007970

REPORTER'S CERTIFICATE

Mr. Donald L. Wolfe, Assistant Director
County of Los Angeles Department of Public Works
900 South Freemont Avenue
Alhambra, CA 91803-1331

Dear Mr. Wolfe:

INSPECTION OF FACILITIES COVERED UNDER THE CALIFORNIA GENERAL INDUSTRIAL ACTIVITIES STORM WATER GENERAL PERMIT (GENERAL PERMIT)

During the last several months, staff from the County of Los Angeles and the Regional Board met a number of times and worked together in an effort to develop a contract proposal with the County to inspect facilities covered under the General Permit. These efforts were an attempt to further the partnership between the Regional Board and local agencies in the arena of storm water management in the region. They were also an attempt to tap into the County's staff expertise in an efficient way in order to thoroughly and expeditiously address the challenging task of overseeing a large number of industrial sites covered under the General Permit and identifying the significant number of facilities that have not yet obtained coverage.

Your staff worked diligently and was very helpful and cooperative during the whole process.

Unfortunately, we are unable to proceed in further developing this proposal at this time. I hope that in the future the opportunity to renew our discussion will present itself.

Should you have any questions regarding this matter, please do not hesitate to contact me at (213) 576-6605, or Dan Radulescu at (213) 576-6668.

Sincerely,

Dennis A. Dickerson

Gray Davis

December 21, 2001

James A. Noyes
Director of Public Works
Los Angeles County Department of Public Works
900 South Fremont Avenue
Alhambra CA 91803

Dear Mr. Noyes:

REQUIREMENTS FOR BASELINE MONITORING OF TRASH IN THE LOS ANGELES RIVER AND BALLONA CREEK AND WETLAND; TO BE REGULATED IN THE LOS ANGELES COUNTY STORMWATER NPDES PERMIT (PERMIT NO. CAS004001, ORDER NO. 01-182).

On September 19, 2001, the Los Angeles Regional Water Quality Control Board adopted amendments to the Water Quality Control Plan for the Los Angeles Region to incorporate Total Maximum Daily Loads (TMDLs) for Trash in the Los Angeles River Watershed, and the Ballona Creek and Wetland. These TMDLs were developed in accordance with the Federal Clean Water Act; specifically Sections 303(d)(1)(A) and 303(d)(1)(C), which direct the Regional Water Quality Control Board (Regional Board) to establish TMDLs for impairing pollutants in water bodies within its region. Trash was determined to be impairing the beneficial uses of the Los Angeles River, and the Ballona Creek and Wetland, hence the need for this amendment.

Section 13267 of the California Water Code authorizes the Regional Board to require dischargers to furnish technical or monitoring program reports. As the Executive Officer of the California Regional Water Quality Control Board – Los Angeles Region, I hereby require the Los Angeles County Department of Public Works (LADPW) and its [municipal storm water] co-permittees to provide data necessary to determine representative trash discharge rates for various land uses across the watersheds of the Los Angeles River and Ballona Creek and Wetland. These data will be used to refine the default baseline Waste Load Allocations for trash provided in the TMDL Staff Reports. This request is made under the authority of the Porter-Cologne Water Quality Control Act, and does not rely on the trash TMDL being in effect. However, the information developed as a result of this letter shall be used in implementing the TMDL.

Regional Board staff have met with the staff of LADPW, regarding the baseline monitoring requirements, on a number of occasions since May 2001. LADPW staff have presented and discussed drafts of proposed baseline monitoring plans at these meetings. Based on the interactions between the staff of both agencies, the Regional Board is confident that LADPW is prepared to meet the deadline for submission of the final plan.

The general monitoring requirements, methodology, and reporting requirements for the above request are listed below.

A. Baseline Monitoring Plan General Requirements

The following general requirements are required for the trash monitoring plan.

- The plan should provide representative monitoring sites for the following land uses across the watershed:
  - High density residential,
  - Low density residential,
  - Commercial and services,
  - Industrial, and
  - Open space and recreation.

- City and County streets within each land use shall be included in the monitoring plan.

- Each proposed monitoring site shall have at least 2 (two) alternative monitoring locations, and maps of the drainage area, and storm drain data for these proposed and alternative locations shall be provided.

- The LADPW and its co-permittees shall provide the Regional Board with a list of municipal, state, or federal entities located within their boundaries that are not subject to the LADPW or its co-permitees' jurisdiction.

- Baseline data shall be collected from over a period of at least two years. Monitoring shall include dates in both rainy and dry seasons. The LADPW shall have the option of continuing the monitoring program for an additional two years in the event that precipitation is below normal during this period.

- Any and all data generated shall be reported in units of measurement that are easily reproducible and that can subsequently be compared to data collected during compliance.

- The proposed monitoring plan shall be subject to review and approval by the Regional Board's Executive Officer.

B. Baseline Monitoring Plan Methodology

Pursuant to California Water Code section 13267, LADPW and its co-permittees under the municipal storm water permit are hereby directed to conduct two years (from January 2002 to December 2003) of baseline trash monitoring. To ensure the quality, reliability, and comparability of the information collected, the following are the minimum standards for data collection, analysis, and reporting.

- Trash monitoring shall be conducted using partial- or full-capture trash collection devices at all the monitoring sites listed in the approved monitoring plan.

- In the areas where full-capture devices are installed, all the catch basins upstream of them shall be fitted with partial-capture devices. The full-capture devices shall be used as a reference to determine the relative effectiveness of the partial capture devices.

- During wet weather, trash shall be removed from collection devices and measured within 72 (seventy-two) hours of each rain event of 0.25 inch or more.

- Every 3 (three) months during dry weather trash collection devices shall be cleaned out in order to measure and record the devices' content.

- The permittees may exclude vegetation from their reported discharge except where there is evidence that the vegetation is as a result of the illegal discharge of yard waste. All monitoring data shall be reported consistently – either with or without vegetation.

- Trash collected during the monitoring program shall be disposed of in accordance with all applicable laws and regulations.

The units of measurement and the composition (with or without vegetation) of the waste reported during baseline monitoring shall be maintained during implementation and compliance.

C. Baseline Monitoring Reporting Requirements

The schedule of requirements for the baseline monitoring program is summarized below.

Requirement	Due date
Submittal of Baseline Monitoring Plan(s)	February 1, 2002
Submittal of list of facilities that are outside the permittee's jurisdiction but drain to a portion of the permittees storm drain system, which discharges to the Los Angeles River or Ballona Creek and Wetland.	May 30, 2002
Collection of Baseline data	January 2002 - December 2003 (optional extension by permittee to December 2005)
Submittal of Final Baseline Monitoring Report	February 15, 2004

- The final baseline monitoring report under this program is due to this Regional Board on February 15, 2004. These analytical results shall be provided in both electronic- (available as a Microsoft Excel Spreadsheet) and paper-format.

- In the event that any deadline provided in the above table cannot be met, the Regional Board would be willing to entertain an extension of the due date provided that adequate justification is provide by the permittee

- Please forward all monitoring data and the report to the Regional Board, Attn: Ginachi Amah, TMDL Unit.

Pursuant to section 13268 of the California Water Code, failure to conduct the required monitoring and/or to provide the required information in a timely manner may result in civil liability imposed by the Regional Board in an amount not to exceed one thousand dollars ($1000) for each day the information is not received.

If you have any other questions, please contact Melinda Becker, TMDL Unit Chief, at (213) 576-6681.

Sincerely,

Dennis A. Dickerson

TRANSMITTAL OF THE LOS ANGELES COUNTY MUNICIPAL STORM WATER NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT (BOARD ORDER 01-182; NPDES PERMIT No. CAS004001)

R0007977

Dear Mr. Wolfe, et al:

We are pleased to transmit to you a copy of the municipal storm water permit for the County of Los Angeles (LA Storm Water Permit) that was adopted by the Regional Water Quality Control Board at its meeting on December 13, 2001 pursuant to Division 7 of the California Water Code. Board Order 01-182 serves as the permit under the National Pollutant Discharge Elimination System (NPDES), for storm water discharges and urban runoff within the County of Los Angeles, and will expire on December 13, 2006. We thank you and your staff for your tireless efforts to help develop workable language that helps the County and the Cities provide the services that they are known for while also being more protective of the environment. The renewal process was long and at times contentious, but we look forward to a positive working relationship between County, City, and State staff as we move to implementation of the 2001 LA Storm Water Permit.

The Permit requires the Los Angeles County Flood Control District, herein referred to as the Principal Permittee, and all Co-Permittee Cities to implement the requirements of the NPDES Permit. To summarize, the requirements include: Monitoring and Reporting Program, Receiving Water Limitations (which clarifies that discharges must meet water quality objectives); Public Information and Participation Program; Industrial/Commercial Facilities Control Program (upgrades the existing site visit program to an inspection program of select industrial/commercial sectors); Development Planning Program (lowers the threshold of industrial/commercial development that is subject to Standard Urban Storm Water Mitigation Plan (SUSMP) requirements from 100,000 square feet to one acre beginning in 2003; and expands SUSMPs to cover: environmentally sensitive areas, ministerial and discretionary projects, and retail gasoline outlets); Development Construction Program; Public Agency

Activities Program (includes explicit requirements to control the discharge of trash to the MS4); and Illicit Connections and Illicit Discharges Elimination Program (requires the tracking of illicit discharges and connections, and upgrades passive field screening activities (during regularly scheduled maintenance) to a more proactive field screening program).

For your use and public dissemination, an electronic copy of the LA Storm Water Permit may be downloaded from our website at http://www.swrcb.ca.gov/rwqcb4/html/programs/Stormwater/la_ms4_final.html . We would greatly appreciate your staff directing other staff and interested parties to the website for further information on storm water management updates as necessary.

Again, thank you very much for your interest and participation during the development and adoption of the Permit. Should you have any comments or questions please do not hesitate to call me directly at (213) 576-6605, or Dr. Xavier Swamikannu at (213) 576-6654.

Sincerely,

Dennis A. Dickerson

ATTACHMENT U-1
LIST OF CONSTITUENTS FOR THE STORM WATER MONITORING PROGRAM AND ASSOCIATED MINIMUM LEVELS (MLs)[1]

CONSTITUENTS	MLs
CONVENTIONAL POLLUTANTS	**mg/L**
Oil and Grease	5
Total Phenols	0.1
Cyanide	0.005
pH	0 - 14
Temperature	None
Dissolved Oxygen	Sensitivity to 5 mg/L
BACTERIA	
Total coliform	<20mpn/100ml
Fecal coliform	<20mpn/100ml
Enterococcus (marine waters)	<20mpn/100ml
E. coli (fresh waters)	
GENERAL	**mg/L**
Dissolved Phosphorus	0.05
Total Phosphorus	0.05
Turbidity	0.1NTU
Total Suspended Solids	2
Total Dissolved Solids	2
Volatile Suspended Solids	2
Total Organic Carbon	1
Total Petroleum Hydrocarbon	5
Biochemical Oxygen Demand	2
Chemical Oxygen Demand	20-900
Total Ammonia-Nitrogen	0.1
Total Kjeldahl Nitrogen	0.1
Nitrate-Nitrite	0.1
Alkalinity	2
Specific Conductance	1umho/cm
Total Hardness	2
MBAS	0.5
Chloride	2
Fluoride	0.1
Methyl tertiary butyl ether (MTBE)	1

[1] For Priority Pollutants, the MLs represent the lowest value listed in Appendix 4 of SIP. MDLs must be lower than or equal to the ML value. If a particular ML is not attainable in accordance with procedures set forth in 40 CFR 136, the lowest quantifiable concentration of the lowest calibration standard analyzed by a specific analytical procedure may be used instead.

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

This form summarizes the requirements in Order No. 01-182. Each Permittee must complete this form in its entirety, except for those requirements applicable only to the Principal Permittee. Only report activities that were performed during the previous fiscal year. Upon completion, this form shall be submitted to the Principal Permittee, by the date specified by the Principal Permittee, for inclusion in the unified Annual Storm Water Program Report. Attachments should be included where necessary to provide sufficient information on program implementation.

The goals of this Report are to: 1) concisely document implementation of the Storm Water Quality Management Program (SQMP) during the past fiscal year; 2) evaluate program results for continuous improvement; 3) to determine compliance with Order 01-182; and 4) to share this information with other Permittees, municipal decision makers, and the public.

!	YOU MUST FILL OUT ALL THE INFORMATION REQUESTED *Do not leave any of the sections blank.*
N/A	If the question does not apply to your municipality, please indicate N/A in the space provided and provide a brief explanation
U	If the information requested is currently unavailable, please indicate U in the space provided and give a brief explanation.

This Report Form consists of the following sections:

SECTION	PAGE
I. Program Management	2-4
II. Receiving Water Limitations	5
III. SQMP Implementation	5-7
IV. Special Provisions	8
IV.A. Public Information and Participation Program	8-14
IV.B. Industrial/Commercial Facilities Program	15-17
IV.C. Development Planning Program	18-21
IV.D. Development Construction Program	22-23
IV.E. Public Agency Activities Program	24-33
IV.F. IC/ID Elimination Program	34-37
V. Monitoring	38
VI. Assessment of Program Effectiveness	38
VII. Certification	39

Individual Annual Report Form
Attachment U-4

Reporting Year 200__- 200__

I. Program Management

A. Permittee Name: _____

B. Permittee Program Supervisor: _____
Title:
Address:
City: Zip Code:
Phone: Fax:

C. In the space below, briefly describe how the storm water program is coordinated within your agency's departments and divisions. Include a description of any problems with coordination between departments. To facilitate this, complete the Table 1.

TABLE 1 - Program Management

Storm Water Management Activity	Division/Department	# of Individuals Responsible for Implementing
1. Outreach & Education		
2. Industrial/Commercial Inspections		
3. Construction Permits/Inspections		
4. IC/ID Inspections		
5. Street sweeping		
6. Catch Basin Cleaning		
7. Spill Response		
8. Development Planning (project/SUSMP review and approval)		
9. Trash Collection		

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

D. Staff and Training

Attach a summary of staff training over the last fiscal year. This shall include the staff name, department, type of training, and date of training.

E. Budget Summary

1. Does your municipality have a storm water utility? Yes ☐ No ☐

If no, describe the funding source(s) used to implement the requirements of Order No. 01-182.

2. Are the existing financial resources sufficient to accomplish all required activities? Yes ☐ No ☐

3. Complete Table 2 to the extent that accurate information is available (indicate U in the spaces where the information is unavailable), and report any supplemental dedicated budgets for the same categories on the lines below the table.

4. List any additional state/federally funded projects related to storm water.

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

TABLE 2

Program Element	Expenditures in Previous Fiscal Year	Estimated Amount Needed to implement Order 01-182
1. Program management a. Administrative costs b. Capital costs		
2. Public Information and Participation a. Public Outreach/Education b. Employee Training c. Corporate Outreach d. Business Assistance		
3. Industrial/Commercial inspection/ site visit activities		
4. Development Planning		
5. Development Construction a. Construction inspections		
6. Public Agency Activities a. Maintenance of structural and treatment control BMPs b. Municipal street sweeping c. Catch basin cleaning d. Trash collection/recycling e. Capital costs f. Other		
7. IC/ID Program a. Operations and Maintenance b. Capitol Costs		
8. Monitoring		
9. Other		
10. TOTAL		

List any supplemental dedicated budgets for the above categories:

List any activities that have been contracted out to consultants/other agencies:

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

II. Receiving Water Limitations (Part 2)

A. Are you aware, or have you been notified, of any discharges from your MS4 that cause or contribute to a condition of nuisance or to the violation of any applicable water quality standards? Yes ☐ No ☐

B. Has the Regional Board notified you that discharges from your MS4 are causing or contributing to an exceedance of water quality standards? Yes ☐ No ☐

C. If you answered Yes to either of the above questions, you must attach a Receiving Water Limitations (RWL) Compliance Report. The Report must include the following:

1. A description of the pollutants that are in exceedance and an analysis of possible sources;
2. A plan to comply with the RWL (Permit, Part 2);
3. Changes to the SQMP to eliminate water quality exceedances;
4. Enhanced monitoring to demonstrate compliance; and
5. Results of implementation.

III. SQMP Implementation (Part 3)

A. Has your agency implemented the SQMP and any additional controls necessary to reduce the discharges of pollutants in storm water to the maximum extent practicable? Yes ☐ No ☐

B. If your agency has implemented additional or different controls than described in the countywide SQMP, has your agency developed a local SQMP that reflects the conditions in its jurisdiction and specifies activities being implemented under the appropriate elements described in the countywide SQMP? Yes ☐ No ☐

C. Describe the status of developing a local SQMP in the box below.

D. If applicable, describe an additional BMP, in addition to those in the countywide SQMP, that your city has implemented to reduce pollutants in storm water to the maximum extent practicable.

E. Watershed Management Committees (WMCs)

1. Which WMC are you in?
2. Who is your designated representative to the WMC?
3. How many WMC meetings did you participate in last year?
4. Describe specific improvements to your storm water management program as a result of WMC meetings.
5. Attach any comments or suggestions regarding your WMC.

F. Storm Water Ordinance

1. Have you adopted a storm water and urban runoff ordinance to enforce all requirements of Order 01-182? Yes ☐ No ☐
   If not, describe the status of adopting such an ordinance.
2. If yes, have you already submitted a copy of the ordinance to the Regional Board? Yes ☐ No ☐
   If not, please attach a copy to this Report.

3. Were any amendments made to your storm water ordinance during the last fiscal year? Yes ☐ No ☐
   If yes, attach a copy of amendments to this Report.

G. Discharge Prohibitions

1. List any non-storm water discharges you feel should be further regulated:

2. List any non-storm water discharges you feel should be exempt, and provide an explanation for each:

IV. Special Provisions (Part 4)

A. Public Information and Participation (Part 4.B)

In addition to answering the following questions, attach a summary of all storm water education activities that your agency conducted or participated in last year.

1. No Dumping Message

a) How many storm drain inlets does your agency own?

b) How many storm drain inlets were marked with a no dumping message in the last fiscal year?

c) What is the total number of storm drain inlets that are legibly marked with a no dumping message?

If this number is less than the number in question 1.b, describe why all inlets have not been marked, the process used to implement this requirement, and the expected completion date.

d) How many public access points to creeks, channels, and other water bodies within your jurisdiction have been posted with no dumping signage in the past year?

Describe your agency's status of implementing this requirement by the date required in Order No. 01-182.

2. Reporting Hotline

a) Has your agency established its own hotline for reporting and for general storm water management information? Yes ☐ No ☐

b) If so, what is the number?

c) Is this information listed in the government pages of the telephone book? Yes ☐ No ☐

d) If no, is your agency coordinated with the countywide hotline? Yes ☐ No ☐

e) Do you keep record of the number of calls received and how they were responded to? Yes ☐ No ☐

f) How many calls were received in the last fiscal year?

g) Describe the process used to respond to hotline calls.

h) Have you provided the Principal Permittee with your current reporting contact information? Yes ☐ No ☐

i) Have you compiled a list of the general public reporting contacts for all Permittees and posted it on the www.888CleanLA.com web site *(Principal Permittee only)?* Yes ☐ No ☐

If not, when is this scheduled to occur?

3. Outreach and Education

a) Describe the strategy developed to provide outreach and bilingual materials to target ethnic communities. Include an explanation of why each community was chosen as a target, how program effectiveness will be determined, and status of implementation. *(Principal Permittee only)*

b) Did the Principal Permittee organize quarterly Public Outreach Strategy meetings that you were aware of? Yes ☐ No ☐

How many Public Outreach Strategy meetings did your agency participate in last year?

Explain why your agency did not attend any or all of the organized meetings.

Identify specific improvements to your storm water education program as a result of these meetings:

List suggestions to increase the usefulness of quarterly meetings:

If quarterly Public Outreach Strategy meetings were not organized, explain why not and when this requirement will be implemented *(Principal Permittee only)*.

c) Approximately how many impressions were made last year on the general public about storm water quality via print, local TV, local radio, or other media?

d) Describe efforts your agency made to educate local schools on storm water pollution.

e) Did you provide all schools within each school district in Los Angeles County with materials necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution *(Principal Permittee only)*? Yes ☐ No ☐

If not, explain why.

f) Describe the strategy developed to measure the effectiveness of in-school educational programs, including assessing students' knowledge of storm water pollution problems and solutions before and after educational efforts *(Principal Permittee only)*.

For Permit Years 2-5, attach an assessment of the effectiveness of in-school storm water education programs.

g) What is the behavioral change target that was developed based on sociological data and other studies *(Principal Permittee only)?*

If no target has been developed, explain why and describe the status of developing a target.

What is the status of meeting the target by the end of Year 5?

4. Pollutant-Specific Outreach

   a) Attach a description of each watershed-specific outreach program that your agency developed *(Principal Permittee only)*. All pollutants listed in Table 1 (Section B.1.d.) must be included.

   b) Did your agency cooperate with the Principal Permittee to develop specific outreach programs to target pollutants in your area? Yes ☐ No ☐

   c) Did your agency help distribute pollutant-specific materials in your city? Yes ☐ No ☐

   d) Describe how your agency has made outreach material available to the general public, schools, community groups, contractors and developers, etc...

5. Businesses Program

   a) Briefly describe the Corporate Outreach Program that has been developed to target gas stations and restaurant chains *(Principal Permittee only)*.

   b) How many corporate managers did your agency *(Principal Permittee only)* reach last year?

   c) What is the total number of corporations to be reached through this program *(Principal Permittee only)*?

   d) Is your agency meeting the requirement of reaching all gas station and restaurant corporations once every two years *(Principal Permittee only)*? Yes ☐ No ☐

   If not, describe measures that will be taken to fully implement this requirement.

e) Has your agency developed and/or implemented a Business Assistance Program? Yes ☐ No ☐

If so, briefly describe your agency's program, including the number of businesses assisted, the type of assistance, and an assessment of the program's effectiveness.

6. Did you encourage local radio stations and newspapers to use public service announcements? Yes ☐ No ☐

How many media outlets were contacted?

Which newspapers or radio stations ran them?

Who was the audience?

7. Did you supplement the County's media purchase by funding additional media buys? Yes ☐ No ☐

Estimated dollar value/in-kind contribution:

Type of media purchased:

Frequency of the buys:

Did another agency help with the purchase? Yes ☐ No ☐

8. Did you work with local business, the County, or other Permittees to place non-traditional advertising? Yes ☐ No ☐

If so, describe the type of advertising.

9. Did you establish local community partnerships to distribute educational storm water pollution prevention material? Yes ☐ No ☐

Describe the materials that were distributed:

Who were the key partners?
Who was the audience (businesses, schools, etc.)?

10. Did you participate in or publicize workshops or community events to discuss storm water pollution? Yes ☐ No ☐
How many events did you attend?

11. Does your agency have a website that provides storm water pollution prevention information? Yes ☐ No ☐
If so, what is the address?

12. Has awareness increased in your community regarding storm water pollution? Yes ☐ No ☐
Do you feel that behaviors have changed? Yes ☐ No ☐
Explain the basis for your answers. Include a description of any evaluation methods that are used to determine the effectiveness of your agency's outreach.

13. How would you modify the storm water public education program to improve it on the City or County level?

B. Industrial/Commercial Facilities Program

1. Critical Source Inventory Database

Did you (individually or jointly) update the Database for Critical Sources Inventory? Yes ☐ No ☐

Comments/Explanation/Conclusion:

2. Inspection Program

Provide the reporting data as suggested in the following tables.

Category	Initial Number of Facilities at the start of cycle proposed for inspection by categories (after the initial year, the updated number based on the new data)	Number of facilities inspected in the current reporting year	% Completed at the time of this report for present cycle (from the initial value, and from the updated value after first cycle)	Total number since permit adoption
Landfills				
TSDF				
...				

Comments/Explanation/Conclusion:

3. BMPs Implementation

Provide the reporting data as suggested in the following table.

R0008007

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form

Attachment U-4

Category	Number of facilities inspected by category in this reporting year	Number of facilities identified as adequately implementing BMPs as specified in this reporting year	% adequately implementing out of total in this reporting year	Number of facilities required to implement or upgrade in this reporting year	Number of facilities inspected by category in this reporting cycle	Number of facilities identified as adequately implementing BMPs as specified in this reporting cycle	% adequately implementing out of total in this reporting cycle	Number of facilities required to implement or upgrade in this reporting cycle	Total Number during this permit adequately implementing	Total Number during this permit required to implement or upgrade
Landfills										
...										

Comments/Explanation/Conclusion:

4. Enforcement Activities

Provide the reporting data as suggested in the following tables.

Enforcement Actions by categories (e.g. Warning letter, NOV, referral to D.A., etc.)	Number of facilities issued enforcement actions in the current reporting year	Number of facilities issued enforcement actions in the current reporting cycle	Number of facilities (re)inspected due to enforcement actions in current reporting year	Number of facilities (re)inspected due to enforcement actions in current reporting cycle	Number of facilities brought into compliance in the current reporting year	Number of facilities brought into compliance in current reporting cycle	Total number of enforcement actions since permit adoption (by category)

Facilities by category	Number of Warning letters	Number of NOVs	Number of Referral	Number of Other

Comments/Explanation/Conclusion:

R0008008

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form

Attachment U-4

5. Program Implementation Effectiveness Assessment

Please give a brief assessment of the implementation of the program in removing pollutants from the storm water discharges. Please provide an explanation. Suggested improvements or adjustments based on the knowledge gained through this reporting period activities must be reflected in a change in the SQMP, if warranted.

Highly Effective ☐ Somewhat Effective ☐ Non-effective ☐

Comments/Explanation/Conclusion:

6. You must also submit a quarterly electronic submittal of your Industrial/Commercial Facilities Program activities.

R0008009

C. Development Planning Program (Part 4.D)

1. Does your agency have a process to minimize impacts from storm water and urban runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA, Section 404 of the CWA, local ordinances, and other legal authorities? Yes ☐ No ☐
   Attach examples showing how storm water quality impacts were addressed in environmental documents for projects over the past year.

2. Does your agency have procedures to include the following requirements in all priority development and redevelopment projects:

   a) Maximize the percentage of permeable surfaces to allow more percolation of storm water into the ground? Yes ☐ No ☐

   b) Minimize the quantity of storm water directed to impermeable surfaces and the MS4? Yes ☐ No ☐

   c) Minimize pollution emanating from parking lots through the use of appropriate treatment control BMPs and good housekeeping practices? Yes ☐ No ☐

   d) Provide for appropriate permanent measures to reduce storm water pollutant loads from the development site? Yes ☐ No ☐

3. List the types and numbers of BMPs that your agency required for priority projects to meet the requirements described above.

4. Describe the status of the development or implementation of peak flow controls in Natural Drainage Systems.

5. Has your agency amended codes and/or ordinances to give legal effect to the SUSMP changes required in the Permit? Yes ☐ No ☐

6. Describe the process your agency uses to include SUSMP design standards in new development and redevelopment project approvals.

7. How many of each of the following projects did your agency review and condition to meet SUSMP requirements last year?

   a) Residential

   b) Commercial

   c) Industrial

   d) Automotive Service Facilities

   e) Retail Gasoline Outlets

   f) Restaurants

   g) Parking Lots

   h) Projects located in or directly adjacent to or discharging directly to an environmentally sensitive area

   i) Total number of permits issued to priority projects

8. What is the percentage of total development projects that were conditioned to meet SUSMP requirements? %

9. How has your agency prepared to reduce the SUSMP threshold for industrial/commercial facilities to 1 acre from 100,000 square feet in 2003?

10. After 2003, how many additional projects per year will require/did require implementation of SUSMP requirements as a result of the lower threshold?

11. Does your agency participate in an approved regional or sub-regional storm water mitigation program to substitute in part or wholly SUSMP requirements for new development? Yes ☐ No ☐

12. Has your agency modified its planning procedures for preparing and reviewing CEQA documents to consider potential storm water quality impacts and provide for appropriate mitigation? Yes ☐ No ☐

If no, provide an explanation and an expected date of completion.

13. Did your agency update any of the following General Plan elements in the past year?

a) Land Use Yes ☐ No ☐

b) Housing Yes ☐ No ☐

c) Conservation Yes ☐ No ☐

d) Open Space Yes ☐ No ☐

If yes, please describe how watershed and storm water quality and quantity management considerations were included.

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

14. How many targeted staff were trained last year?

15. How many targeted staff are trained annually?

16. What percentage of total staff are trained annually? %

17. Has your agency developed and made available development planning guidelines? Yes ☐ No ☐

18. If no, what is the expected date that guidelines will be developed and available to developers?

19. What is the status of completion of the technical manual for siting and design of BMPs for the development community?

D. Development Construction Program

1. Describe your agency's program to control runoff from construction activity at all construction sites within its jurisdiction.

2. Does your agency require the preparation, submittal, and implementation of a Local Storm Water Pollution Prevention Plan (Local SWPPP) prior to the issuance of a grading permit for all sites that meet one or all of the following criteria?

   a) Will result in soil disturbance of one acre or greater — Yes ☐ No ☐

   b) Is within, directly adjacent to, or is discharging directly to an environmentally sensitive area — Yes ☐ No ☐

   c) Is located in a hillside area — Yes ☐ No ☐

3. Attach one example of a local SWPPP

4. Describe the process your agency uses to require proof of filing a Notice of Intent for coverage under the State General Construction Activity Storm Water permit and a certification that a SWPPP has been prepared prior to issuing a grading permit?

5. How many building/grading permits were issued to sites requiring Local SWPPPs last year?

6. How many building/grading permits were issued to sites requiring coverage under the General Construction Activities Storm Water Permit last year?

7. How many building/grading permits were issued to construction site less than one acre in size last year?

8. How many construction sites were inspected during the last wet season?

9. Complete the table below.

Type of Violation	# of Violations	% of Total Inspections	# of Follow-up Inspections	# of Enforcement Actions
Off-site discharge of sediment				
Off-site discharge of other pollutants				
No or inadequate SWPPP				
Inadequate BMP/SWPPP implementation				

10. Describe the process for taking enforcement actions against construction site violations, including the types of actions that are taken.

11. Describe the system that your agency uses to track the issuance of grading permits.

E. Public Agency Activities (Part 4.F)

1. Sewage System Maintenance, Overflow, and Spill Prevention (*only applicable to agencies that own and/or operate a sanitary sewer system*)

a) Has your agency developed and implemented a response plan for sanitary sewer overflows that includes the requirements in Order 01-182? Yes ☐ No ☐

b) How many sanitary sewer overflows occurred within your jurisdiction?

c) How many did your agency respond to?

d) Did your agency investigate all complaints received? Yes ☐ No ☐

e) How many complaints were received?

f) Upon notification, did your agency immediately respond to overflows by containment? Yes ☐ No ☐

g) Did your agency notify appropriate sewer and public health agencies when a sewer overflowed to the MS4? Yes ☐ No ☐

h) Did your agency implement a program to prevent sewage spills or leaks from sewage facilities from entering the MS4? Yes ☐ No ☐

If so, describe the program:

i) Did your agency implement a program to identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers to the MS4? Yes ☐ No ☐

If so, describe the program:

2. Public Construction Activities Management

a) What percentage of public construction sites 5 acres or greater in size did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit ? ☐ %

b) Give an explanation for any sites greater than 5 acres that were not covered:

c) What is the total number of active public construction sites?

How many were 5 acres or greater in size?

d) (After March, 2003) Did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit coverage for public construction sites for sites one acre or greater? Yes ☐ No ☐

3. Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management

a) Did your agency implement pollution prevention plans for each public vehicle maintenance facility, material storage facility, and corporation yard? Yes ☐ No ☐

b) Briefly describe how your agency implements the following, and any additional, BMPs to minimize pollutant discharges in storm water:

(1) Good housekeeping practices

(2) Material storage control

(3) Vehicle leaks and spill control

(4) Illicit discharge control

c) Are all Permittee owned and/or operated vehicle/equipment wash areas self-contained, covered, equipped with a clarifier, and properly connected to the sanitary sewer? Yes ☐ No ☐

If not, what is the status of implementing this requirement?

d) How many Permittee owned and/or operated vehicle/equipment wash areas are scheduled to be redeveloped to include the BMPs listed above?

4. Landscape and Recreational Facilities Management

a) Has your agency developed a standardized protocol for the routine and non-routine application of pesticides, herbicides (including pre-emergents), and fertilizers? Yes ☐ No ☐

Briefly describe this protocol:

b) How does your agency ensure that there is no application of pesticides or fertilizers immediately before, during, or immediately after a rain event or when water is flowing off the area to be applied?

c) Are any banned pesticides, herbicides, fungicides, or rodenticides stored or applied in your agency's jurisdiction that you know of? Yes ☐ No ☐

If so, list them:

d) What percentage of your agency's staff that apply pesticides are certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator?

e) Describe procedures your agency has implemented to encourage retention and planting of native vegetation and to reduce water, fertilizer, and pesticide needs:

5. Storm Drain Operation and Management

a) Did your agency designate catch basin inlets within its jurisdiction as Priority A; Priority B; and Priority C? Yes ☐ No ☐

b) How many of each designation exist in your jurisdiction?

Priority A:
Priority B:
Priority C:

c) Is your city subject to a trash TMDL? Yes ☐ No ☐

d) If yes, describe the activities and/or implementation measures that your agency conducted pursuant to the TMDL and any other trash reduction efforts that occurred.

e) How many times were all Priority A basins cleaned last year?

f) How many times were all Priority B basins cleaned last year?

g) How many times were all Priority C basins cleaned last year?

h) How much total waste was collected in tons from catch basin clean-outs last year?

i) Attach a record of all catch basins in your jurisdiction. This shall identify each basin as City or County owned, and Priority A, B, or C. For all basins that are owned and operated by your agency, include dates that each was cleaned out over the past year.

j) Did your agency place and maintain trash receptacles at all transit stops within its jurisdiction. Yes ☐ No ☐

k) How many new trash receptacles were installed last year?

l) Did your agency place special conditions for events that generated substantial quantities of trash and litter including provisions that:

(1) Provide for the proper management of trash and litter generated from the event? Yes ☐ No ☐

(2) Arrange for temporary screens to be placed on catch basins? Yes ☐ No ☐

(3) Or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain? Yes ☐ No ☐

m) Did your agency inspect the legibility of the catch basin stencil or labels? Yes ☐ No ☐

What percentage of stencils were legible?

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

n) Were illegible stencils recorded and re-stenciled or re-labeled within 180 days of inspection? Yes ☐ No ☐

o) Did your agency visually monitor Permittee-owned open channel storm drains and other drainage structures for debris at least annually and identify and prioritize problem areas of illicit discharge for regular inspection? Yes ☐ No ☐

Is the prioritization attached? Yes ☐ No ☐

p) Did your agency review its maintenance activities to assure that appropriate storm water BMPs are being utilized to protect water quality? Yes ☐ No ☐

What changes have been made?

q) Did your agency remove trash and debris from open channel storm drains a minimum of once per year before the storm season? Yes ☐ No ☐

r) How did your agency minimize the discharge of contaminants during MS4 maintenance and clean outs?

s) Where is removed material disposed of?

6. Streets and Roads Maintenance

a) Did your agency designate streets and/or street segments within its jurisdiction as one of the following:

(1) Priority A – streets and/or street segments that are designated as consistently generating the highest volumes of trash and/or litter? Yes ☐ No ☐

(2) Priority B - streets and/or street segments that are designated as consistently generating moderate volumes of trash and/or litter? Yes ☐ No ☐

(3) Priority C – streets and/or street segments that are designated as generating low volumes of trash and/or litter? Yes ☐ No ☐

b) Did your agency perform all street sweeping in compliance with the permit and according to the following schedule:

(1) Priority A – These streets and/or street segments shall be swept at least two times per month? Yes ☐ No ☐

(2) Priority B - Each Permittee shall ensure that each streets and/or street segments is cleaned at least once per month? Yes ☐ No ☐

(3) Priority C – These streets and/or street segments shall be cleaned as necessary but in no case less than once per year? Yes ☐ No ☐

c) Did your agency require that saw cutting wastes be recovered and disposed of properly and that in no case shall waste be left on a roadway or allowed to enter the storm drain? Yes ☐ No ☐

d) Did your agency require that concrete and other street and road maintenance materials and wastes be managed to prevent pollutant discharges? Yes ☐ No ☐

e) Did your agency require that the washout of concrete trucks and chutes only occur in designated areas and never into storm drains, open ditches, streets, or catch basins leading to the storm drain system? Yes ☐ No ☐

f) Did your agency train its employees in targeted positions (whose interactions, jobs, and activities affect storm water quality) regarding the requirements of the storm water management program to:

(1) Promote a clear understanding of the potential for maintenance activities to pollute storm water? and Yes ☐ No ☐

(2) Identify and select appropriate BMPs? Yes ☐ No ☐

7. Parking Facilities Management

a) Did your agency ensure that Permittee-owned parking lots be kept clear of debris and excessive oil buildup and cleaned no less than 2 times per month and/or inspected no less than 2 times per month to determine if cleaning is necessary. Yes ☐ No ☐

b) Were any Permittee-owned parking lots cleaned less than once a month? Yes ☐ No ☐
How many?

8. Public Industrial Activities Management

   a) Did your agency, for all municipal activity considered an industrial activity under USEPA Phase I storm water regulations, obtain separate coverage under the State of California General Industrial Activities Storm Water Discharge Permit no later than December 31, 2001? Yes ☐ No ☐

   b) Does your agency serve a population of less than 100,000 people? Yes ☐ No ☐

9. Emergency Procedures

   a) In case of real emergencies, did your agency repair essential public services and infrastructure in a manner to minimize environmental damage? Yes ☐ No ☐

   b) Were BMPs implemented to the extent that measures did not compromise public health and safety? Yes ☐ No ☐

10. Feasibility Study

   a) Did your agency cooperate with the County Sanitation Districts of Los Angeles County to prepare a study which investigates the possible diversion of dry weather flows or the use of alternative treatment control BMPs? Yes ☐ No ☐

   b) Did your agency review its individual prioritized list and create a watershed based priority list of drains for potential diversion and submit a listing of priority diversions to the Regional Board Executive Officer? Yes ☐ No ☐

F. Illicit Connections and Illicit Discharges (IC/ID) Elimination Program (Part 4.G)

1. Attach a copy of your agency's IC/ID Elimination Implementation Program (Part 4.G.1.a.).

2. Attach a map of your storm drain system showing all permitted connections (if available), and the locations of all illicit connections and discharges that occurred last year (Part 4.G.1.b). If your agency has not completed this requirement, describe the status of the development of a baseline map, including an expected completion date.

3. Describe your enforcement procedures for eliminating illicit discharges and terminating illicit connections.

4. Describe your record keeping system to document all illicit connections and discharges.

5. What is the total length of open channel that your agency owns and operates?

6. What length was screened last year for illicit connections?

7. What is the total length of closed storm drain that your agency owns and operates?

8. What length was screened last year for illicit connections?

9. Describe the method used to screen your storm drains.

10. Provide the reporting data for illicit connections as suggested in the following table (you may submit a spreadsheet from your database that contains the information).

Year	Total # reported/ identified	Total # investigated	# that conveyed exempt discharges or NPDES permitted	# that conveyed illicit discharges that were terminated	# that were removed	# that resulted in enforcement action	# that resulted in *other* actions
01/02							
02/03							
03/04							
04/05							
05/06							

11. Explain any *other* actions that occurred in the last year.

12. What is the average time it takes your agency to initiate an illicit connection investigation after it is reported?

    a) Were all identified connections terminated within 180 days? Yes ☐ No ☐

    b) If not, explain why.

13. Provide the reporting data for illicit discharges as suggested in the following table (you may submit a spreadsheet from you database that contains this information).

Year	Total # reported	Total # that were discontinued/ cleaned up voluntarily through enforcement and the source was identified	# that were cleaned up but the source could not be identified	# that resulted in no evidence of discharge	# that were determined to be conditionally exempt	# that were exempt or in compliance and the source identified	# that resulted in enforcement action
01/02							
02/03							
03/04							
04/05							
05/06							

14. What is the average response time after an illicit discharge is reported?

    a) Did any response times exceed 72 hours? Yes ☐ No ☐

    b) If yes, explain why.

15. Describe the your agency's spill response procedures.

16. What would you do differently to improve your agency's IC/ID Elimination Program?

17. Attach a list of all permitted connections to your storm sewer system.

V. Monitoring

Briefly describe any storm water monitoring activities that are not required by Order No. 01-182 that your municipality conducted, participated in, or received funding to conduct in the past fiscal year. These activities should correspond with the dollar amount you listed in Table 2.

VI. Assessment of Program Effectiveness

A. Attach a summary of the effectiveness of your storm water management program. This summary should include, at a minimum, the following:

1. An assessment of your agency's compliance with permit requirements, based on your responses to the questions in this form;
2. Descriptions of any evaluation methods that your agency uses to determine the effectiveness of your storm water management program;
3. A summary of the strengths and weaknesses of your agency's storm water management program;
4. A list of specific program highlights and accomplishments;
5. A description of water quality improvements or degradation in your watershed over the past fiscal year;
6. Interagency coordination between cities to improve the storm water management program;
7. Future plans to improve your agency's storm water management program; and
8. Suggestions to improve the effectiveness of your program or the County model programs.

B. On a scale of 1 to 10 (10 being full implementation of requirements by their deadlines), rate your municipality's level of compliance with Order No. 01-182.

C. List any suggestions your agency has for improving program reporting and assessment.

14. What is the average response time after an illicit discharge is reported?

    a) Did any response times exceed 72 hours? Yes ☐ No ☐

    b) If yes, explain why.

15. Describe the your agency's spill response procedures.

16. What would you do differently to improve your agency's IC/ID Elimination Program?

17. Attach a list of all permitted connections to your storm sewer system.

V. Monitoring

Briefly describe any storm water monitoring activities that are not required by Order No. 01-182 that your municipality conducted, participated in, or received funding to conduct in the past fiscal year. These activities should correspond with the dollar amount you listed in Table 2.

VI. Assessment of Program Effectiveness

A. Attach a summary of the effectiveness of your storm water management program. This summary should include, at a minimum, the following:

1. An assessment of your agency's compliance with permit requirements, based on your responses to the questions in this form;
2. Descriptions of any evaluation methods that your agency uses to determine the effectiveness of your storm water management program;
3. A summary of the strengths and weaknesses of your agency's storm water management program;
4. A list of specific program highlights and accomplishments;
5. A description of water quality improvements or degradation in your watershed over the past fiscal year;
6. Interagency coordination between cities to improve the storm water management program;
7. Future plans to improve your agency's storm water management program; and
8. Suggestions to improve the effectiveness of your program or the County model programs.

B. On a scale of 1 to 10 (10 being full implementation of requirements by their deadlines), rate your municipality's level of compliance with Order No. 01-182.

C. List any suggestions your agency has for improving program reporting and assessment.

VII. Certification Statement

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility, of a fine and imprisonment for knowing violations.

FACT SHEET/STAFF REPORT

State of California
California Regional Water Quality Control Board Los Angeles Region
National Pollutant Discharge Elimination System (NPDES)
Permit No. CAS004001, CI 6948
Regional Board Order No. 01-182

I. PURPOSE

The purpose of this Fact Sheet/Staff Report is to give the Permittees and interested parties an overview of the final NPDES storm water permit for the County of Los Angeles and the incorporated cities (except Long Beach), adopted on December 13, 2001, as well as to provide the technical basis for the permit requirements. Sections I through IV describe water quality problems from storm water and urban runoff, and permit conditions to address these problems. Sections V and VI discuss each major element of the Permittees' Storm Water Quality Management Plan (SQMP), and are meant to be used as a companion reference document to the permit. Section VII addresses changes that were made at the December 13, 2001 Regional Board Meeting.

II. INTRODUCTION - THE NEED TO REGULATE STORM WATER DISCHARGES

A. Impacts

The quality of storm water and urban runoff is fundamentally important to the health of the environment and the quality of life in Southern California. Polluted storm water runoff is a leading cause of water quality impairment in the Los Angeles Region. Storm water and urban runoff (during dry and wet weather) are often contaminated with pesticides, fertilizers, animal droppings, trash, food wastes, automotive byproducts, and many other toxic substances generated by our urban environment. Water that flows over streets, parking lots, construction sites, and industrial, commercial, residential, and municipal areas carries these untreated pollutants through the storm drain networks directly into the receiving waters of the Region. The water quality impacts and increased public health risks from Municipal Separate Storm Sewer System (MS4) discharges that affect receiving waters nationwide and Los Angeles County and its coastline are well documented.

The **National Urban Runoff Program** (NURP) Study (USEPA 1983) showed that MS4 discharges draining from residential, commercial, and light industrial areas contain significant loadings of total suspended solids and other pollutants. Although the NURP Study did not cover industrial sites, the study suggested that runoff from industrial sites may have significantly higher contaminant levels than runoff from other urban land use sites. Several studies tend to support this observation, for e.g., the City of Fresno, California, a NURP project site, industrial areas there had the poorest storm water quality of the four land-uses evaluated. The study found that pollutant levels from illicit discharges were high enough to significantly degrade receiving water quality, and threaten aquatic life, wildlife, and human health.

R0008036

The 1992, 1994, and 1996 National Water Quality Inventory Reports to Congress prepared by USEPA showed a trend of impairment in the Nation's waters from contaminated storm water and urban runoff. The recent 1998 National Water Quality Inventory (305(b) Report)[1] showed that urban runoff/storm water discharges affect 11% of rivers, 12% of lakes, and 28% of estuaries. The report states that ocean shoreline impairment due to urban runoff/storm sewers increased from 55% in 1996 to 63% in 1998. The report notes that urban runoff and storm water discharges are the leading source of pollution and the main factor in the degradation of surface water quality[2] in California's coastal waters, rivers and streams.

The Natural Resources Defense Council (NRDC) 1999 Report, **"Stormwater Strategies, Community Responses to Runoff Pollution"**[3] identifies two main causes of the storm water pollution problem in urban areas. Both causes are directly related to development in urban and urbanizing areas:

1. Increased volume and velocity of surface runoff. There are three types of human-made impervious covers that increase the volume and velocity of runoff: (i) rooftop, (ii) transportation imperviousness, and (iii) non-porous (impervious) surfaces. As these impervious surfaces increase, infiltration will decrease, forcing more water to run off the surface, picking up speed and pollutants.

2. The concentration of pollutants in the runoff. Certain activities, such as those from industrial sites, are large contributors of pollutant concentrations to the storm water system.

The report also identified several activities causing storm water pollution from urban areas, practices of homeowners, businesses, and government agencies.

More recent studies conducted by **United States Geological Survey** (USGS)[4] confirms the link between urbanization and water quality impairments in urban watersheds due to contaminated storm water runoff.

Furthermore, the water quality impacts of urbanization and urban storm water discharges have been summarized by several other recent USEPA reports.[5] Urbanization causes changes in hydrology and increases pollutant loads which adversely impact water quality and impairs the beneficial uses of receiving waters. Increases in population density and imperviousness result in changes to stream hydrology including:

a) increased peak discharges compared to predevelopment levels;

[5] *Storm Water Phase II Report to Congress* (USEPA 1995); Report to Congress on the Phase II Storm Water Regulations (USEPA1999); Coastal Zone Management Measures Guidance (USEPA 1992)

b) increased volume of storm water runoff with each storm compared to pre-development levels;

c) decreased travel time to reach receiving water; increased frequency and severity of floods;

d) reduced stream flow during prolonged periods of dry weather due to reduced levels of infiltration;

e) increased runoff velocity during storms due to a combination of effects of higher discharge peaks, rapid time of concentration, and smoother hydraulic surfaces from channelization, and

f) decreased infiltration and diminished groundwater recharge.

The Los Angeles County MS4 program has conducted monitoring to:

1. quantify mass emissions for pollutants;
2. identify critical sources for pollutants of concern in storm water;
3. evaluate BMP effectiveness; and
4. evaluate receiving water impacts.

The monitoring indicates that instream concentrations of pathogen indicators (fecal coliform and streptococcus), heavy metals (such as Pb, Cu, Zn,) and pesticides (such as diazinon) exceed state and federal water quality criteria.[6] The mass emissions of pollutants to the ocean are significant from the urban WMAs such as the Los Angeles River WMA, Ballona Creek WMA, and Coyote Creek WMA, with the Los Angeles River WMA providing more than seventy percent of the loadings. Critical source data for facilities (such as auto-salvage yards, primary metal facilities, and automotive repair shops) show that total and dissolved heavy metals (Pb, Cu, Zn, and Cd), and total suspended solids (TSS) exceeded state and federal water quality criteria by as much as 2 orders of magnitude. The results are consistent with a limited term study conducted by the Regional Board to characterize storm water runoff in the Los Angeles region in 1988 before the issuance of first MS4 permit.[7] Storm water runoff data from predominant land uses in Los Angeles County showed similar patterns. Light-industrial, commercial and transportation land uses showed the highest range of exceedances. A pesticide (diazinon) was detected in higher concentrations from residential land use. The data for polycyclic aromatic hydrocarbons (PAHs), a known pollutant of concern in urban storm water runoff, is inconclusive but improved analytical methods may yield more definitive results in the future. Receiving water impacts studies found that storm water discharges from urban watersheds exhibit toxicity that are attributable to heavy metals. Biosurveys of the benthic communities showed bioaccumulation of toxicants. Sediment analysis showed higher concentrations of pollutants, such as Pb and PAHs, in urban watersheds than in rural watersheds (2 to 4 times higher). In addition, toxicity of dry weather flows

This study found the highest mean concentrations of pollutants of concern such as heavy metals in the urban watershed rivers and that they contributed significant loads to the ocean.

R0008038

was observed with the cause of toxicity undetermined.[8] Other studies have found chemical concentration of pollutants that exceed state and federal water quality criteria in storm drains flowing to the ocean during dry weather,[9] and that there are adverse health impacts from swimming near them.[10]

B. Benefits of Permit Program Implementation

Implementation of the MS4 permit requirements will significantly reduce pollutants in urban storm water in a cost-effective manner. Implementation of Best Management Practices (BMPs) should also reduce pollutant discharges, and improve surface water quality. The expected benefits of implementing the provisions of the Los Angeles County MS4 NPDES permit include:

- **Enhanced Aesthetic Value**: Storm water affects the appearance and quality of a water body, and the desirability of working, living, traveling, or owning property near that water body. Reducing storm water pollution will increase benefits as these water bodies recover and become more desirable.
- **Enhanced Opportunities for Boating**: reducing sediment and other pollutants, and increasing water clarity, which enhances the boating experience for users, offer additional benefits.
- **Enhanced Commercial Fishing**: Important because commercial fisheries are a part of the region's economy, and 28% of the estuaries are reportedly impacted by storm water/urban runoff.
- **Enhanced Recreational and Subsistence Fishing**: Pollutants in storm water can eliminate or decrease the numbers, or size, of sport fish and shell fish in receiving waters.
- **Reduced Flood Damage**: Storm water runoff controls may mitigate flood damage by addressing problems due to the diversion of runoff, insufficient storage capacity, and reduced channel capacity from sedimentation.
- **Reduced Illness from Consuming Contaminated Seafood**: Storm water controls may reduce the presence of pathogens in seafood caught by commercial or recreational anglers.
- **Reduced Illness from Swimming in Contaminated Water**: Epidemiological studies indicate that swimmers in water contaminated by storm water runoff are more likely to experience illness than those who swim farther away from a storm water outfall.
- **Enhanced Opportunities for Non-contact Recreation**: Storm water controls reduce turbidity, odors, floating trash, and other pollutants, which then allow waters to be used as focal point for recreation, and enhance the experience of the users.
- **Drinking Water Benefits**: Pollutants from storm water runoff, such as solids, toxic pollutants, and bacteria may pose additional costs for treatment, or render the water unusable for drinking.

[10] *The Health Effects of Swimming in Ocean Water Contaminated by Storm Drain Runoff*, Haile, R.W. et al. (1999), Epidemiology 10: 355-363). The study found higher risks of respiratory and gastrointestinal symptoms from swimmers.

R0008039

- **Water Storage Benefits**: Storm water is a major source of impairment for reservoirs. The heavy load of solids deposited by storm water runoff can lead to rapid sedimentation of reservoirs and the loss of needed water storage capacity.[11]
- **Ground Water Replenishment**: Storm water can be a significant resource that can be used to recharge ground water basins in the region and reduce its dependence on imported water.

III. STATUTORY AND REGULATORY HISTORY OF THE STORM WATER PROGRAM

Over the past 29 years, water pollution control efforts have focused primarily on certain process wastewater discharges from facilities such as factories and sewage treatment plants, with less emphasis on diffuse sources. The 1972 amendments to the Federal Clean Water Act (CWA) prohibit the discharge of any pollutant to waters from a point source, unless a NPDES permit authorizes the discharge. Because the focus on reducing pollutants was centered on industrial and sewage treatment discharges, the U.S. Congress amended the CWA in 1987, requiring the USEPA to create phased NPDES requirements for storm water discharges.

In response to the 1987 Amendments to the CWA, the USEPA developed Phase I of the NPDES Storm Water Program in 1990. Phase I requires NPDES permits for storm water discharges from: (i) "medium" and "large" MS4s generally serving, or located in incorporated places or counties with, populations of 100,000 or more people; and (ii) eleven categories of industrial activity (including construction activity that disturbs five acres or greater of land). Phase II, adopted in December 2000 and scheduled to take effect in March 2003, requires operators of small MS4s and small construction sites (construction activity disturbing between 1 and 5 acres of land) in urban areas to control storm water runoff discharges.

A. Basis for Permit Conditions

1. **Statutory Basis for Permit Conditions.** The conditions established by this permit are based on CWA § 402(p)(3)(B) which mandates that a permit for discharges from MS4s must: effectively prohibit the discharges of non-storm water to the MS4; and require controls to reduce pollutants in discharges from MS4 to the maximum extent practicable (MEP) including best management practices, control techniques, and system, design and engineering methods, and such other provisions determined to be appropriate. MS4s are not exempted from compliance with Water Quality Standards. CWA § 301(b)(1)(C) requires NPDES permits to incorporate effluent limitations, including those necessary to meet water quality standards, applies. The permit conditions have been developed to meet the statutory mandate of the CWA.

   The permit requires the implementation of a comprehensive Storm Water Quality Management Program (SQMP) through a selection of Best Management Practices (BMPs) (40 CFR 122.44(k)) as the mechanism to

[11] *Report to Congress on Phase II Storm Water Regulations.* USEPA, Office of Water. EPA-833-R-99-001, Oct. 1999.

R0008040

achieving the reduction of pollutants in storm water to the maximum extent practicable (MEP) (CWA. § 402(p)(3)(B)(iii)).

2. **Regulatory Basis for Permit Conditions.** As a result of the statutory requirements of the CWA the USEPA promulgated MS4 permit application regulations (40 CFR 122.26(d)). These regulations describe in detail permit application information to be submitted by MS4s operators. The information in the application or Report of Waste Discharge (ROWD) is utilized to develop the permit conditions.

3. **Discharge limitations.** No numeric effluent limitations are proposed at this time. In accordance with 40 CFR 122.44(k), the USEPA has required a series of increasingly more effective BMPs,[12] in the form of a comprehensive SQMP and performance criteria in lieu of numeric limitations.[13]

B. Public Review and Participation Process

Los Angeles County Flood Control District submitted the ROWD for on January 31, 2001. Since that time Regional Board staff dedicated significant time and effort to providing the opportunities for public participation and comment. More than 30 meetings, 2 workshops, and numerous outreach efforts were conducted to ensure that the public, the Permittees, and other interested parties had ample opportunity to participate in the development and comment on permit requirements and language prior to consideration by the Regional Board for adoption.

To invite public comment at the beginning of the renewal process, a preliminary draft, dated March 16, 2001, was issued to a working group of interested parties. This draft was used as a starting point for discussion. The workgroup had approximately 30 days to review it prior to the issuance of the first draft, on April 13, 2001. The first draft was sent to all Permittees, storm water consultants, environmental organizations, and other interested parties. It was also made available on the Regional Board Storm Water web page at www.swrcb.ca.gov/rwqcb4/html/programs/Stormwater/renewal.html. More than 30 days were provided for the submittal of written comments. After considering comments submitted, Regional Board staff issued the second draft permit on June 29, 2001. Comments on the second draft (due by August 6, 2001) were considered and incorporated as appropriate in the tentative draft issued on October 11, 2001. Permittees and interested parties had over thirty days to submit written comments and over forty-five days for review prior to Regional Board consideration. Comments on the tentative draft were considered and incorporated as appropriate in the edited tentative draft, which was proposed for adoption before the Regional Board on December 13, 2001. At the Board Meeting, Regional Board staff gave a presentation of the proposed permit and significant changes, and then all interested parties were invited to comment. The Regional Board members asked questions, addressed the significant public comments, and then adopted the edited tentative draft with minor changes, which are described in Section VII. A public notice announcing the Regional Board Hearing was

[12] *Interpretative Policy Memorandum on Reapplication Requirements* of MS4s issued by USEPA (61 Fed. Reg. 41697)
[13] *Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits* (61 Fed. Reg. 43761)

published in the Los Angeles Times on October 3, 2001, more than 45 days prior to the date of the Board meeting.

Furthermore, Regional Board staff conducted separate meetings to review particular special provisions with Permittees and interested parties as necessary. In addition to these meetings, Regional Board staff held two workshops to review the permit and listen to comments, including one formal workshop with the Board members on July 26, 2001. Two full-day facilitation sessions to discuss the Industrial/Commercial Facilities Program requirements, with the Regional Board, US EPA and Permittees, were also held. Regional Board staff also participated in monthly Executive Advisory Committee meetings conducted by Permittees where they answered questions and discussed permit issues. Staff was also available for public outreach via telephone. The following table outlines some of the many opportunities for Permittee and public input provided by Regional Board staff.

Date	Public Involvement Activity

IV. BACKGROUND - LOS ANGELES COUNTY MS4

A. Los Angeles County MS4 Permit History

In 1990, the Los Angeles Regional Board (Regional Board) adopted Order No. 90-079, the Los Angeles County MS4 Permit. That permit required the Los Angeles County Flood Control District, the County of Los Angeles and the incorporated cities in Los Angeles County to implement storm water pollution controls including amending ordinances, optimizing existing pollutant controls such as street sweeping, construction site controls, and others. The Regional Board required all Permittees to implement a minimum list of 13 BMPs for consistency across the County. The 1990 permit was issued on a system wide basis due to the highly interconnected storm drain system serving a population well in excess of 100,000 inhabitants. An NPDES permit is valid for a five-year period after the date is issued.[14]

On July 15, 1996, the Regional Board adopted Order No. 96-054 that revised the 1990 permit. The 1996 LA County MS4 permit required model programs be developed and implemented by the Permittees for Public Information and Public Participation, Industrial/Commercial Activities, Development Construction, Illicit Connections and Illicit Discharges, Public Agency Activities, and Development Planning. These model programs were intended to be dynamic and expected to change with time, as more information on storm water impacts became available.

Following the adoption of Order 96-054, the City of Long Beach submitted a ROWD as an application for its own MS4 permit. The City of Long Beach Municipal Storm Water Permit (Order No. 99-060) was adopted on June 30,

[14] 40 CFR §122.46 (a)

1999. This Order superseded the countywide permit requirements for the City of Long Beach, and the City now operates under its separate MS4 permit.

On January 31, 2001, the Los Angeles County Department of Public Works submitted an application for renewal of their MS4 permit in the form of an ROWD for Los Angeles County and the incorporated cities, except for the City of Long Beach. This application started the process for reissuance of the permit, which enters into its third permit term now.

B. Los Angeles County Storm Drain System

The MS4 covered by this proposed permit for the County of Los Angeles and 83 incorporated cities drains the coastal slopes of the Transverse Mountain Ranges, and flows into the Santa Monica Bay and the Los Angeles/Long Beach Harbor. The storm drain structure consists of thousands of catch basins, thousands of miles of underground storm drains, as well as open channels, all owned and operated separately by Permittees. The length of the system, and the locations of all storm drain connections, are not known exactly, as a comprehensive map for the storm drain system does not exist. Rough estimates, based on information from large municipalities (population > 100,000), indicate that the length exceeds 4,300 miles, as shown below.

Permittee	Area (Square Miles)	Catch Basins	Storm Drain Length	Open Channel Length
LA County	3,100	73,000	2,650 miles	450 miles
City of LA	469	30,000	1,600 miles	31 miles
El Monte	10	316	11 miles	0.4 mile
Glendale	30.6	1,100	Unknown	Unknown
Inglewood	9	1,157	12 miles	Unknown
Pasadena	26	1,050	30	Unknown
Santa Monica	8.3	850	Unknown	Unknown
Torrance	20	2,000	20 miles	3 miles
TOTAL		**109,473**	**4,323**	**484.4**

C. Summary of Water Quality Issues in Los Angeles County Watersheds

Watersheds are geographic areas draining into a river system, ocean or other bodies of water through a single outlet. There are six Watershed Management Areas (WMAs) that represent the six major watersheds covered by the Los

Angeles County MS4 NPDES permit. The following is a summary of some significant issues in each watershed.[15]

Dominguez Channel/Los Angeles-Long Beach Harbor Watershed

Permitted discharges

- 415 dischargers covered under an industrial storm water permit
- 69 dischargers covered under a construction storm water permit

Potential sources of pollution

- Historical deposits of DDT and PCBs in sediment
- Spills from ships and industrial facilities
- Leakages contaminating groundwater
- **Urban and storm water runoff**
- Impairments: metals, PCBs, PAHs, historic pesticides, coliform, trash, and nitrogen

Los Angeles River Watershed

Permitted discharges

- 1,327 dischargers covered under an industrial storm water permit
- 147 dischargers covered under a construction storm water permit

Potential sources of pollution

- Nitrogen and coliform contributions from septic systems
- Other nonpoint sources (horse stables, golf courses)
- Leakage of MTBE from underground storage tanks
- **Urban and storm water runoff**
- Impairments: nitrogen, trash, selenium, other metals, coliform, PCBs, historic pesticides, chlorpyrifos

San Gabriel River Watershed[16]

Permitted discharges

- 549 dischargers covered under an industrial storm water permit
- 175 dischargers covered under a construction storm water permit

Potential sources of pollution

- Excessive trash in recreational areas of upper watershed
- Nonpoint source loadings from nurseries and horse stables

[15] *Watershed Management Initiative Chapter.* California Regional Water Quality Control Board – Los Angeles Region. Dec. 2000.
[16] *San Gabriel Watershed State of The Watershed* - RWQCB - LA Region - June 2000

R0008045

- **Urban and storm water runoff**
- Impairments: nitrogen and effects, trash, metals, historic pesticides, coliform, chlorides, and PCBs

Santa Monica Bay Watershed

- 147 dischargers covered under an industrial storm water permit
- 107 dischargers covered under a construction storm water permit

Potential sources of pollution

- Discharges from Ballona and Malibu Creeks contribute to impairments in the Santa Monica Bay and its beaches.
- Impairments: mercury, selenium, other metals, historical pesticides, PAHs, PCBs, nitrogen, coliform, trash, TBT, habitat alteration, exotic vegetation, and salts

Coastline

- **Acute health risk associated with swimming in runoff contaminated surfzone waters**
- Chronic risk associated with consuming seafood from areas impacted by DDT and PCB contamination
- Historic deposits of DDT and PCBs in sediment

Ballona Creek Watershed

- Trash loading from creek
- Sediment contamination by heavy metals form creek to Marina del Rey Harbor and offshore
- **Toxicity of both dry weather and storm water runoff in creek**
- High bacterial indicators at mouth of creek

Malibu Creek Watershed

- Excessive freshwater, nutrients, and coliform in lagoon; contribution from POTW and other sources
- **Urban runoff from upper watersheds**
- Septic tanks in lower watershed

Santa Clara River Watershed

Permitted discharges

- 4 POTWs
- 98 dischargers covered under an industrial storm water permit
- 190 dischargers covered under a construction storm water permit

Potential sources of pollution

- Agriculture
- Increasing loads of nitrogen and salts in supplies of ground water

- POTW discharges
- Increasing development and channelization that results in increased runoff volumes and velocities, erosion, and loss of habitat
- Septic tanks
- Impairments: chloride, nutrients (nitrogen), coliform, trash (in parts of watershed)

D. Enforcement Provision

During the renewal process for the existing permit (i.e. in 1995 and 1996), the permittees proposed and the Regional Board agreed to addition of a "Notice to Meet and Confer" provision (Part 2, section G of the existing permit). This was envisioned as an administrative review process for resolving permit disputes before the Regional Board would take formal enforcement action. It has been actually used only once (in 2000), when the Regional Board issued Notice to Meet and Confer letters to permittees in the Los Angeles River and Ballona Creek watersheds. The purpose of this process was to determine the effectiveness of municipalities' efforts to reduce trash in waters that are impaired by trash.

Subsequent to renewal of the existing permit, the State developed an enforcement policy (State Board Resolution 96-030) and guidance, which sets forth a progressive strategy that has the goal of ensuring consistent, predicable, and fair enforcement of regulations. This is now a well-established and widely implemented policy throughout the State, including in the Los Angeles Region. Therefore, with this policy of progressive enforcement in place the Notice to Meet and Confer provision is not needed; accordingly, the proposed permit does not contain this provision.

E. Total Maximum Daily Loads (TMDLs)

Part 3, Section C. of the proposed permit specifies that the Permittees shall amend the SQMP to comply with load allocations approved pursuant to adoption and approval of Total Maximum Daily Loads (TMDLs). The addition of this provision represents a significant difference from the existing permit, which does not contain a provision for implementation of TMDLs. In addition, the Special Provisions for the Permittees' Program for Public Agencies (Part 4, Sections F.7. and F.8.) specifies performance measures for watersheds subject to a trash TMDL.

TMDLs are one of the Regional Board's highest priorities. In view of the Region's highly urbanized environment, it is likely that pollutants in storm water will be allocated significant load reductions. While specific load reductions can't be forecast at this time, the Board does envision that storm water permits will be an important mechanism for implementing pollutant load reductions. An early example of the relationship between TMDLs and storm water permits is the trash TMDL adopted for the Los Angeles River and Ballona Creek on September 13, 2001, which directs municipalities to monitor for baseline trash levels for 2-4

years, and then to start implementing trash prevention and/ or control measures to reduce trash to "zero" by the year 2013. This 5-year permit incorporates the monitoring requirements of the TMDL and, based on the results of the monitoring requirements, specified load reductions of 60% by 2006. Permits that are adopted subsequent to this MS4 permit are expected to incorporate the remaining load allocation reductions to achieve "zero" trash in the Los Angeles River and Ballona Creek by 2013.

Public review of the Regional Board's TMDLs, will occur during the TMDL adoption process (there need not be an additional public process for TMDL implementation and Basin Plan amendment). Upon approval of a TMDL, the waste load allocations and load allocations (specified in that TMDL) will become effective and enforceable under this permit. This TMDL provision is consistent with TMDL provisions in the Long Beach and Ventura County MS4 permits.

F. Revision of the Permittees' Storm Water Quality Management Program

In general, MS4 permits such as the Los Angeles County MS4 Permit do not have numeric effluent limits for storm water discharges. Rather, the Regional Board relies on a BMP approach implemented by the Permittees to reduce the discharge of pollutants in storm water to the MEP. Therefore the development and implementation of the special provisions (i.e. the model programs) become of paramount importance.

The Special Provisions in the next section are - for the most part - based on the Permitees' existing model programs, which they've been implementing since at least 1999. The incremental changes Regional Board staff has made to the current permit include greater specificity, and better measures to determine implementation. Some of the Permittees are already meeting these performance measures. The performance measures in the permit help to clarify the MEP compliance expectations and set a consistent bar for all Permittees.

V. DISCUSSION OF SPECIAL PROVISIONS

A. Public Information and Participation Program (PIPP)

Legal Authority:

CWA § 402(p)(3)(B)(ii-iii), CWC section 13377, and NPDES regulations at 40 CFR 122.26(d)(2)(I)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(6) provides that the proposed management program include "A description of a program to reduce to the maximum extent practicable, pollutants in discharges from MS4s associated with the application of pesticides, herbicides, and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications, and

other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities."

NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(6) provides that the proposed management program include " A description of education activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials."

To satisfy the Public Education and Outreach minimum control measure, the Permittees need to: (i) implement a public education program to distribute educational materials to the community, or conduct equivalent outreach activities about the impacts of storm water discharges on local waterbodies and the steps that can be taken to reduce storm water pollution; and (ii) determine the appropriate BMPs and measurable goals for this minimum control measure.

Background:

Implementation of a PIPP is a critical BMP and a necessary component of a storm water management program. The State Board Technical Advisory Committee "recognizes that education with an emphasis on pollution prevention is the fundamental basis for solving nonpoint source pollution problems." The USEPA Phase II Fact Sheet 2.3 (Fact Sheet 2.3) finds that "An informed and knowledgeable community is critical to the success of a storm water management program since it helps insure the following: (i) greater support for the program as the public gains a greater understanding of the reasons why it is necessary and important, and (ii) greater compliance with the program as the public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters."[17]

Furthermore, the public can provide valuable input and assistance to a municipal storm water management program and, therefore, should play an active role in the development and implementation of the program. An active and involved community is essential to the success of a storm water management program because it allows for:

- Broader public support since residents who participate in the development and decision making process are partially responsible for the program and, therefore, are more likely to take an active role in its implementation;
- Shorter implementation schedules due to fewer obstacles in the form of public and legal challenges and increased sources in the form of residents volunteers;
- A broader base of expertise and economic benefits since the community can be a valuable, and free, intellectual resource; and
- A conduit to other programs as residents involved in the storm water program development process make important cross-connections and relationships with other community and government programs. This benefit is particularly

[17] *Storm Water Phase II Final Rule - Public Education and Outreach Minimum Control Measure.* USEPA Fact Sheet 2.3, January 2000.

valuable when trying to implement a storm water program on a watershed basis.

Discussion of New Requirements:

Los Angeles County should continue its comprehensive educational storm water and urban runoff outreach program, which is designed to measurably increase public knowledge and change behavior regarding storm water pollution. The first five-year public education program initiated in 1996 was successful at studying segments of Los Angeles County residents to identify those who pose the greatest threat to storm water quality and those who represent the greatest opportunity to respond positively to a public education program, as well as providing a baseline measurement of residents' storm water-related practices and habits. This information was used to target the residents who are most likely to change their behaviors to improve storm water quality. Using various communication tactics and activities, the program successfully reached 83% of County residents with pollution prevention messages through the Storm Water/Urban Runoff Public Education Program Five-Year Storm Water Public Education Strategic Analysis (Five-Year Strategy).[18]

Although the Program has been successful at certain goals, it must be augmented to continue increasing public awareness of specific storm water issues. According to the USEPA, materials and activities should be relevant to local situations and issues, and incorporate a variety of strategies to ensure maximum coverage.[19] To help address local situations and sources of specific pollutants, section B.1.d. of the PIPP requires the development of watershed and pollutant-specific education programs.

A need also exists to target ethnic groups that may not be reached by or understand existing storm water educational materials. In an effort to reach these groups the PIPP requires the development of a strategy to provide outreach and bilingual materials to target ethnic communities.

Also, the USEPA encourages partnerships and cooperation among Permittees, businesses and the public.[20] Quarterly meetings will provide the opportunity for Permittees to coordinate their outreach efforts and efficiently build on the County's existing program with local, watershed-specific efforts. Since the Program's inception, Permittees have been required to conduct educational activities within their own jurisdictions. The lack of guidance and coordination has led to duplicate efforts and confusion about developing appropriate programs that are consistent with, and enhance the Principal Permittee's regional education program. This requirement will ensure that all Permittees are coordinated for the most efficient and effective Program. It will also help identify Permittees with insufficient Programs.

[18] Storm Water/Urban Runoff Public Education Program Five-Year Storm Water Public Education Strategic Analysis, Los Angeles County of Public Works, July 31, 2000.
[19] Phase II Fact Sheet 2.3
[20] *Id.*

It is generally more cost-effective to have numerous operators coordinate to use an existing program than all developing their own local programs. Therefore, Permittees should build on the regional program with additional information specific to local needs.

Furthermore, directing materials or outreach programs toward specific groups of commercial, industrial, and institutional entities likely to have significant storm water impacts is recommended.[21] Pursuant to Order 96-054, the Principal Permittee conducted educational site visits to Phase I industrial facilities, auto repair shops, retail gasoline outlets, and restaurants over the last 5 years. The next step in this targeted outreach program is education at the corporate level to facilitate employee compliance.[22] Therefore, the Principal Permittee is required to implement a corporate outreach program to educate corporate management at gas stations and restaurant chains about storm water regulations.[23] Also, a non-regulatory business assistance program would encourage small businesses that lack access to the expertise necessary to comply with storm water regulations and to implement pollution prevention measures. The business assistance program is not a requirement, however, its implementation is encouraged.

Program Performance Measures:

The previous public information program did not include a protocol to measure the effectiveness of the different public education efforts. The new permit includes requirements to measure the outcome of outreach efforts and demonstrate that they are effective at increasing knowledge and changing the behavior of the public in regards to storm water pollution. The permit includes requirements for the Principal Permittee to develop a strategy for measuring the effectiveness of different educational programs and to develop a behavioral change target that will become a performance measure that must be reported on in Annual Reports.

In addition to the assessment requirements mentioned above, the Principal Permittee is also required to: (a) ensure that a minimum of 35 million impressions per year are made on the general public about storm water via print, local TV access, local radio, or other appropriate media; and (b) provide all School Districts within its jurisdiction with materials, including videos, live presentations, brochures, and other media necessary to educate a minimum of fifty percent of all school children (K-12) every 2 years on storm water pollution. These performance measure are justified based on their consistency with requirements in the City of Long Beach and Ventura County MS4 permits, and on the Principal Permittee's previous performance of PIPP requirements.

According to the Principal Permittee's Year Four (1999-2000) Highlights, approximately 85 million impressions were made through advertising, media relations, customized coffee jackets, corporate partnerships, special events, and

[21] Phase II Fact Sheet 2.3
[22] *Storm Water/Urban Runoff Public Education Program Five-Year Storm Water Public Education Strategic Analysis*, Los Angeles County Public Works, July 31, 2000. Part P.5.
[23] Permit, Part 4, section B.2.a.

business outreach. Hits on the www.888CleanLA.com web site have been consistently increasing, indicating a growing public interest, as well as greater awareness. Also, increased media attention and public interest in current issues, such as trash TMDLs, is expected. Los Angeles County has committed to making a minimum of 35 million impressions per year.

Furthermore, the requirement is consistent with the number of impressions (3 - 3.5 per resident) required in the Long Beach MS4 Permit and the Ventura County MS4 Permit. The City of Long Beach is required to make a minimum of 1.5 million impressions per year. With a total population of approximately 426,000 people, this amounts to 3.5 impressions per resident per year. Ventura County is required to achieve 3 impressions per resident per year. Los Angeles County's population is 9.5 million people.[24]

According to data provided by Los Angeles County, the School Environmental Education Program has been reaching approximately 50 percent of elementary and secondary schools in the County every 2 years. It is also expected that the required coordination among Permittees will increase the effectiveness and scope of this Program.

B. Industrial/Commercial Facilities Program

Legal Authority:

The Phase I regulations require, in part, that the applicant (i) develop adequate legal authority, (ii) perform a source identification, and (iv) develop a management program to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system design and engineering methods, and such other provisions which are appropriate.[25] Specifically, with regards to industrial controls, the management plan shall include the following.

40 CFR 122.26(d)(2)(iv)(C), A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program shall:

> *(1) Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges.*
> *(2) Describe a monitoring program for storm water discharges associated with industrial facilities [...]*

Background:

The municipality is ultimately responsible for discharges from the MS4. Because industrial awareness of the program may not be complete, there may be facilities

[24] 2000 U.S. Census Bureau
[25] 40 CFR 122.26(d)(2)

R0008052

within the MS4 area that should be permitted but are not (non-filers). In addition, the Phase I regulations that require industries to obtain permit coverage for storm water discharges is largely based on SIC Code. This has been shown to be incomplete in identifying industries that may be significant sources of storm water pollution (*"industries" includes commercial businesses). The word "industries" is used in a broad sense*). Another concern is that the permitting authority may not have adequate resources to provide the necessary oversight of permitted facilities. Therefore, it is in the municipality's best interest to assess the specific situation and implement an industrial/commercial inspection/site visit and enforcement program to control the contribution of pollutants to the MS4 from all high risk sources.

In the preamble to the 1990 regulations, the USEPA clearly states the intended strategy for discharges of storm water associated with industrial activity:

"...Municipal operators of large and medium municipal separate storm sewer systems are responsible for obtaining system-wide or area permits for their system's discharges. These permits are expected to require that controls be placed on storm water discharges associated with industrial activity which discharge through the municipal system." The USEPA also notes in the preamble that *"... municipalities will be required to meet the terms of their permits related to industrial dischargers.*"

Similarly, in the USEPA's Guidance Manual[1] (Chapter 3.0), it is specified that MS4 applicants must demonstrate that they possess adequate legal authority to:

- Control construction site and other industrial discharges to MS4s;
- Prohibit illicit discharges and control spills and dumping;
- Carry out inspection, surveillance, and monitoring procedures.[26]

The document goes on to explain that *"control"*, in this context means not only to require disclosure of information, but also to *limit, discourage, or terminate* a storm water discharge to the MS4. Further, to satisfy its permit conditions, a municipality may need to impose additional requirements on discharges from permitted industrial facilities, as well as discharges from industrial facilities and construction sites *not* required to obtain permits.

In the same Guidance Manual[27] (Chapter 6.3.3), it is stated that the municipality is ultimately responsible for discharges from their MS4. Consequently, the MS4 applicant must describe how the municipality will help the USEPA and authorized NPDES States to:

- Identify priority industries discharging to their systems;
- Review and evaluate storm water pollution prevention plans (SWPPPs) and other procedures that industrial facilities must develop under general or individual permits;

[26] *Guidance Manual For the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems* - USEPA -November 1992
[27] *Id.*

- Establish and implement BMPs to reduce pollutants from these industrial facilities (or require industry to implement them); and
- Inspect and monitor industrial facilities discharging storm water to the municipal systems to ensure these facilities are in compliance with their NPDES storm water permit, if required.

Discussion:

Recognizing that the municipality is ultimately responsible for the quality of storm water discharges from the MS4, the municipalities must evaluate industrial/commercial facilities and determine their compliance with the permit requirements, as well as their contribution to the MS4 and potential impacts to the receiving waters. The following areas are to be addressed in order to implement a meaningful industrial/commercial inspection/site visit and enforcement program.

- **Source Identification**
  - Identification of industrial/commercial sites discharging to the MS4 (by SIC codes and narrative if needed)
  - Characterization of activities, materials used, and potential for contributing pollutants along with the type of pollutants

- **Pollution Prevention**
  - Key concepts are many times overlooked: Prevent, before it happens, and be pro-active rather than reactive. It is more difficult to treat after the pollutant is released or mixes with storm water. BMPs and other site-specific controls are often most appropriate for reducing pollutants in storm water discharges from industrial and commercial facilities.

- **Threat to Water Quality Prioritization**
  - Identify impaired water bodies by pollutants and link with activities and industrial/commercial sites that may contribute those particular pollutants (or potentially contribute to) the water quality impairment

- **Through existing ordinance, order, or similar means, the ability to**
  - enter premises;
  - conduct inspections;
  - review and evaluate SWPPPs and monitoring results review;
  - require control methods (BMPs) implementation; and,
  - take appropriate enforcement actions, if necessary.

It may be necessary to update existing ordinances if they do not provide sufficient legal authority to implement the above mentioned components as required by the regulations.

Integration of NPDES Program for MS4 with NPDES Program for Industrial Activities

Recognizing the dual coverage envisioned by the USEPA regulations[28], and suggested partnership between local and State authorities, municipalities shall coordinate with State activities for the implementation of the General Industrial Activities Storm Water Permit (GIASP). The goal is to control industrial sources and other sources not specifically covered under Phase I storm water regulations but identified as significant contributors of pollutants by the municipalities through their identification and prioritization studies. The net result should be a better and improved coordinated program with greater impact on limiting and eliminating (as a final goal) the contribution of pollutants to the receiving water while maintaining and/or restore the capacity of the receiving water to sustain the beneficial uses without impairments.

The *Critical Source Selection and Monitoring Report*[29] identified seven highest ranked pollution potential activities to be, in order of ranking: (i) wholesale trade (scrap, auto dismantling), (ii) *automotive repair/parking*, (iii) fabricated metal products, (iv) motor freight (including trucking), (v) chemical and allied products, (vi) automotive dealers/gas stations, (vii) primary metals products. The report also outlined a complete study plan to be implemented by the Permittees during the permit term. It is significant to note that five out of seven categories of activities are subject to Phase I industrial storm water regulations. Although *automotive repair/parking* and automotive dealers/gas stations categories were not the focus of the Phase I storm water regulations, the study identified these commercial categories as significant potential pollutant contributors based on the criteria developed in the critical source criteria study.

Rank (pollution potential)[30]	Industrial Category	SIC Code	No. Facilities (estimated)
1	Wholesale trade (scrap, auto dismantling)	50	587
2	*Automotive repair/parking*	*75*	*6,067*
3	Fabricated metal products	34	3,283
4	Motor freight (including trucking)	42	872
5	Chemical and allied products	28	1,069
6	*Automotive Dealers/Gas Stations*	*55*	*2,744*
7	Primary Metals Products	33	703

It is also important to note that heavy metals are significant pollutants transported in storm water discharges and cause impairment of receiving waters in the Los Angeles Region. The above table identifies at least two industrial categories that have the highest potential to contribute those pollutants: fabricated metal products and primary metal products. During the previous permit term, Los Angeles County conducted a Critical Source Study (1998-2000). The aim of the study was to monitor for two years the previously identified

[28] Federal Register Vol. 55, No 222, pp. 48000; USEPA Storm Water Phase II Compliance Assistance Guide, 2000, pp. 4-32 and 5-11, where it clarifies the dual responsibility
[29] Critical Source Selection and Monitoring Report, Woodward-Clyde, 1997
[30] *Critical Source Selection and Monitoring Report (Table 1-3)* - Woodward-Clyde 1996

five priority industrial and/or commercial critical source categories. The results of the study confirmed that the critical source industries are indeed high risk. Storm water discharges exceeded water quality standards for almost all toxic pollutants in all categories.

Based on the dual coverage and partnership approach between the permitting authority and municipalities that the USEPA called for in the storm water regulations (see letters from Alexis Strauss, USEPA Water Division Director),[31,32] and in order to best use limited resources at the State and local level, the permit includes the following improvements.

Recognizing that this permit represents a *third term* permit, and building upon the experience and tools developed under the previous permits, the Industrial/Commercial program has been elevated to an inspection and enforcement program. The municipalities are required to (i) control the storm water discharges associated with industrial activities and other commercial facilities identified as significant contributors of pollutants, and (ii) assist the Regional Board in ensuring that industrial activities are covered by the general industrial storm water permit. This requirement is consistent with the nationwide approach used by the USEPA in issuing *second term* MS4 permits.[33] Also, this requirement is consistent with other MS4 permits issued in California: San Diego and Santa Clara MS4 permits. Business education and outreach should be continued under the auspices of the Public Education program.

The strategy as outlined in the draft permit builds on the State/municipalities partnership by focusing their limited resources on the following activities:

- The Permittees will take a lead role in inspecting restaurants, automotive service facilities, retail gasoline outlets, industrial facilities mandated specifically by the regulations, top five highest ranking industrial categories identified by the Permittees through their critical sources identification and monitoring studies and site visits at the remaining industrial categories identified through their critical sources identification study while
- The Regional Board will be the lead agency for inspections of facilities covered or in need of coverage under GIASP;
- The Permittees will assist Regional Board in its activities to fully enforce the GIASP through spot check inspections, referrals, data information research, joint inspections;
- The Regional Board and Permittees will coordinate their information systems and task scheduling to avoid duplication and strengthen harmonization of activities;
- The Regional Board may, based on available funding, enter into agreement with Permittees to contract some of the inspection activities required by the GIASP to be done by the Permittees.

[32] Letter dated April 30, 2001, from Alexis Strauss, Director, Water Division, USEPA Region IX, to Honorable Stephen Horn, U.S. House of Representatives
[33] MS4 NPDES Permits issued to Palm Beach County, Broward County, Sarasota County, Florida, Tulsa, Oklahoma, Denver, Colorado.

R0008056

Based on comments received from interested parties, various options have been considered for inclusion in the permit, based on the legal requirements and background data already provided by the Permittees:

- First draft (April 13, 2001): Staff took a "top-down" approach to inspections, proposing that Permittees screen databases of tens of thousands of industrial and commercial facilities to identify facilities that should be targeted for an inspection program.

- Second draft (June 29, 2001): In response to comments submitted on the first draft, staff attempted to better structure a partnership between the Regional Board and Permittees. The Regional Board would lead efforts to regulate "Phase 1" industrial facilities (which are subject to the State's General Industrial Activities Storm Water Permit), and the Permittees lead efforts to regulate other problem sectors, such as automotive service facilities, restaurants, and RGOs.

- Third draft (October 11, 2001): Staff proposed three options for Board's consideration. Staff structured an **Option A** to encompass inspections of:
  - USEPA mandated facilities (i.e. landfills, Resource Conservation and Recovery facilities, and toxics treatment storage disposal facilities "TSDF"),
  - the automotive sector,
  - restaurants, and
  - retail gasoline outlets.

  In Regional Board staff's opinion, such a minimal requirement fails to address other critical industrial sources of pollutants. To address this concern and to ensure that pollutants from other critical sources are controlled, staff presented **Option B**. This Option B captures sectors in Option A plus five other priority sectors, which are sources of pollutants that cause many of the impairments to surface waters in Los Angeles County. These five priority sectors are:

  - scrap recycling,
  - automotive dismantling,
  - metal fabrication,
  - motor freight,
  - chemical manufacturing, and
  - primary metal products.

  Option C is status quo – it retains the site visit program as required by the MS4 permit issued by the Regional Board in 1996. It does not recognize the Board's original intent to upgrade the site visit program to an inspection-based program in the long term.

At the request of certain Permittees, the US EPA facilitated two day-long sessions, on November 9th and 29th, during which discussions among Permittees, Regional Board staff, and environmental representatives focused on inspection requirements as presented in the third draft as Options A, B, and C.

R0008057

Participants made diligent attempts to understand various positions and limitations and, as a result, another option, **Version A/C,** emerged as converging toward a potential consensus.

Version A/C blends elements of the other options previously submitted to the Board and to the public, provides greater clarity with regard to Regional Board expectations and responds to Permittees' concerns over funding by better coordinating State (i.e. Regional Board) inspection efforts with those of the Permittees.

Version A/C clarified and reduced the scope of inspections. In general, frequencies have been reduced from once every 24 months to once every 30 months. In addition, Phase I facilities have been separated in Tier 1 and Tier 2 sites and further reduced the frequency of inspections for Tier 2 category to once every 5 years. The facilities with no exposure of industrial activity to storm water need not be inspected, after the initial determination of no-exposure, during the term of the permit..

Another significant adjustment was the addition of a provision relieving permittees of the responsibility to inspect those Phase I facilities that the Regional Board has inspected within the previous 24 months. In regards to the level of inspection, it was clarified that the Permittees are expected to check during inspections for compliance with the implementation of minimum BMPs, as previously approved by Board Order 98-08, and compliance with the local storm water ordinances.

Version A/C also provides better clarity concerning the scope of enforcement. A progressive enforcement procedure was outlined including minimum steps that Permittees must take in their program to enforce their municipalities' storm water requirements. In recognition of some of the Permittees concerns regarding the resource intensive efforts needed to elevate enforcement actions, a mechanism was provided through which Permittees can refer cases to the Regional Board, and for violations of the State's General Industrial Activities Storm Water permit, the referral can be expedited.

C. Construction Sites Program

Legal Authority:

USEPA storm water regulations at 40 CFR 122.26(d)(2)(iv)(D) provide that a proposed management program must include "a description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system".

The permit provides consistency with the Long Beach MS4 permit and the Ventura County MS4 permit.

Background:

There are several environmental impacts associated with construction activity.

As stated in the *California Storm Water Best Management Practice Handbook for Construction Activity* (BMP Handbook), "Construction usually increases the amount of impervious area causing more of the rainfall to runoff, and increasing the speed at which runoff occurs. Unless properly managed, this increased runoff will erode natural and/or unprotected watercourses causing the watercourse to widen...Sedimentation can also contribute to accelerated filling of reservoirs, harbors, and drainage systems.[34]

Discussion:

The prevention of erosion is a key objective of the permit modifications to the construction program. The Permittees currently oversee construction sites within their respective jurisdiction. The oversight of smaller construction sites (those sites under five acres) is inconsistent among Permittees. Some Permittees have incorrectly assumed that responsibility begins only after a discharge of pollutants, sediments for example, has left the site. USEPA storm water regulations do not support such interpretations. Regional Board staff has clarified this in the permit to require that the municipalities better coordinate oversight of construction activity within their jurisdiction. The Permittees are ultimately responsible for what enters and exits the MS4 that they own and/or operate. It is in the best interest of the Permittees to control what enters their storm drain system.

Justifications for New Requirements:

NEW REQUIREMENT: The new permit requires that Permittees promote the use of effective erosion and sediment controls at construction sites regardless of size.

JUSTIFICATION: The need for proper erosion and sediment controls is very apparent during, and immediately after, the rains that occur in Southern California. The environmental effects of erosion are well documented. Erosion can be prevented or reduced with the proper planning and implementation of appropriate BMPs.

NEW REQUIREMENT: Requirements for source control and treatment control BMPs for controlling runoff at construction sites.

JUSTIFICATION: Erosion occurs when land is exposed and the sediments are mobilized. With adequately engineered and implemented structural or non-structural BMPs, the detrimental environmental effects can be eliminated or minimized. Currently, there are many manuals and guidance handbooks available to guide a developer. The municipalities, in general, are aware of

[34] *California Storm Water Best Management Practice Handbook for Construction Activity.* 1993.

these BMPs, and can work with Regional Board staff to ensure that they are being implemented.

NEW REQUIREMENT: Each Permittee shall require the preparation, submittal, and implementation of a Local SWPPP prior to issuance of a grading permit for construction projects that meet one or more of the following criteria: will result in soil disturbance of one acre or more in size.

JUSTIFICATION: This is to ensure that a site that is being graded, but is less than the required size threshold (5 acres) for a General Construction Activities Storm Water Permit (GCASP) has oversight by the Permittee to ensure implementation of erosion controls and construction waste management practices. Currently, grading requirements are inconsistently applied. Beginning March 2003, USEPA Phase II storm water regulations require that sites one acre to five acres become subject to permitting as well.

NEW REQUIREMENT: The Permittees shall implement a process to review, approve, and enforce any erosion control plan submitted to the Permittee for implementation at construction sites, regardless of size and GCASP coverage of the sites. Local SWPPPs shall be required for projects of one acre or more in size.

JUSTIFICATION: The Permittees need to enforce local storm water ordinances at construction sites to prevent erosion. They should not wait for a discharge to occur before initiating enforcement action.

REQUIREMENT: For sites that require a construction storm water permit, Permittees are required to ensure that a Notice of Intent (NOI) has been filed with the State Board prior to issuing a grading permit. This requirement also applies to land transfers between developers on common plans of sale or development that were five or more acres initially.

JUSTIFICATION: This is currently a requirement in Board Order No. 96-054, but not all Permittees have consistently implemented this provision. Regional Board staff inspect construction sites covered by a GCASP. Some Permittees have issued a grading permit where a GCASP was not obtained. State/municipal coordination will ensure that all construction sites have obtained the required permits.

NEW REQUIREMENT: Wet weather inspections are required of all construction sites one acre or greater. The Permittees need to conduct wet weather inspections to ensure compliance with local ordinances.

JUSTIFICATION: If all sites are inspected, this allows the Permittees to ascertain compliance and focus educational and enforcement efforts on those that most need it. Additionally, Regional Board staff can assist the Permittees in compliance oversight by conducting joint inspections.

R0008060

D. Illicit Connections and Illicit Discharges Elimination Program

Legal Authority:

A proposed management program "shall be based on a description of a program, including a schedule, to detect and remove (or require the discharger to the municipal storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer," per 40 CFR 122.26(d)(2)(iv)(B). A Permittee must include in its proposed management program "a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal storm sewer system," per subsection (1) of the above regulation.

Background:

During dry weather, much of the discharge to storm drain systems consists of wastes and wastewater from non-storm water sources. A significant amount of such discharges may be from illicit discharges or connections, or both. Illicit discharges may occur either through direct connections, such as deliberate or mistaken piping, or through indirect connections, such as dumping, spillage, subsurface infiltration, and washdowns.

The objective of a municipality's illicit connection/illicit discharge (IC/ID) elimination program should be to detect illicit connections and illicit discharges to the storm drain system, and to promptly remove such discharges and connections. Municipalities typically employ the approaches listed below to achieve this objective:

1. Permitting connections to the municipal storm drain.
2. Mapping the storm drain system, locations of catch basins, outfalls, permitted connections, and the names and locations of all waters of the U.S. that receive discharges from the outfalls.
3. Adopting a storm water/ urban runoff ordinance to prohibit unauthorized non-storm water discharges into the MS4, and implementing appropriate enforcement procedures and actions.
4. Implementing a program to detect and eliminate non-storm water discharges to the MS4, including illegal dumping.
5. Educating public employees, businesses, and the general public about the dangers associated with illegal discharges and improper disposal.
6. Establishing a public reporting hotline or other mechanism to report illicit discharges and illegal dumping.
7. Establishing measurable goals to evaluate successful program implementation.

Discussion:

Existing IC/ID Elimination Program

The Regional Board approved a model IC/ID elimination program for the Permittees' SQMP on March 23, 1999. However, only vague performance standards were specified in this model program.

By July 1999, all Permittees reported that they implemented an IC/ID elimination program. For the most part, however, this was a passive program, and relied upon IC/ID detection during regularly scheduled maintenance. Most Permittees are unable to estimate the extent of their storm drain they have screened during regularly scheduled maintenance.

Results of the Permittees' efforts to eliminate illicit connections are summarized in Tables 1 through 5. Their estimates of fiscal resources required to implement these activities for 1999/00 range widely, with two cities – Culver City and Hermosa Beach – estimating budgets of $4.2 million and $2.8 million, respectively. At the other end, four cities estimated $0 expenditures, namely La Habra Heights, Lawndale, Maywood (which does not operate a storm drain system), and West Covina. Based on the Permittees' estimates of expenditures, the Permittees budgeted an average of $113,900 in 1999/00. Removing the anomalous estimates for Culver City and Hermosa Beach, the high ranges up to $564,809, as estimated by the City of Los Angeles, and averaged $32,500. These activities, as summarized in the tables, do not appear to bear a relationship with IC/ID expenditures by each Permittee.

Illicit Connections: As designed in the model program, Permittees with storm drain systems under their management rely upon field screening, during regularly scheduled maintenance of the storm drain system, to locate illicit connections. However, most Permittees cannot estimate the length of the storm drain system that was field-screened; nor did the Regional Board require reporting such information.

For the 1999/00 annual reporting period, very few Permittees reported illicit connections. The attached tables show that the numbers of illicit connections varied widely among Permittees, with about half reporting no illicit connections, and with the County reporting 877 suspected illicit connections. Part of the reason for this range is that the County is responsible for maintaining over half[35] of the storm drain system. Also, several Permittees believe that few – if any – illicit connections have been identified in many cities because: (a) many cities are primarily residential, and illicit connections are unlikely to occur from residential land use; and (b) cities in the County of Los Angeles are relatively new vis a vis their eastern counterparts, and adequate controls were in place at the time storm drain connections were installed.

[35] The exact length of storm drain systems operated by most cities is unknown.

Illicit Discharges: As designed in the model program, Permittees eliminate illicit discharges by preventing spills and, for those that do occur, by responding promptly. To prevent spills, Permittees enacted ordinances prohibiting non-storm water runoff, and are implementing spill prevention guidance. To respond to discharges, Permittees implement containment and cleanup procedures, coordinate with other agencies, investigate the cause of the discharge and – when the source and responsible party is know – take enforcement action. Additionally, employee training is provided on all of the above.

As with illicit connections, the numbers of illicit discharges varies widely for the annual reporting period 1999/00. The County reported a total of 788 suspected illicit discharges. Among the Cities, results at the high end include 1,876 in the City of Los Angeles, 700 in the City of Beverly Hills, and 450 in Santa Monica. At the other end of the range, many cities reported no incidents of suspected illicit

R0008066

discharges. Based on information provided to date, staff cannot account for this wide range. Audits of the Permittees' programs in the future should help clarify this.

Reporting: As designed in the model program, Permittees have implemented procedures to receive reports of illicit discharge and disposal incidents, and to promptly respond and report such incidents. Most rely upon the countywide hotline system, which is maintained by the County. For hazardous substances, Permittees implement additional reporting procedures.

New IC/ID Elimination Program Requirements

The Special Provisions Section of the permit (Board Order No. 01-182) requires the Permittees to revise their IC/ID Elimination Program in the SQMP to meet the following proposed requirements in the permit:

- General requirements, among which include development (if necessary) and update of a list of permitted connections to the storm drain system, a tracking system for illicit connections and discharges, and compilation of this information in coordination with the Principal Permittee, as well as identification of priority areas for proactive screening.

- Illicit connection requirements for proactive screening of the storm drain system over a 5-year period, including:

  - Field screening of open channels and underground pipes (with a diameter of 36 inches or greater);[39]

  - Permit screening, to ensure that all facilities with connections are effectively implementing the prohibition on non-storm water discharges;

  - Requirements to investigate and terminate illicit connections, including response times; and

- Illicit discharge requirements, specifying response times for abatement and cleanup (within one business day), and investigation (as soon as practicable).

As Permittees have pointed out, and as staff acknowledges, residential land uses are less likely to have illicit connections. However, staff remains concerned that adequate controls be in place at all times to prevent improper connections to the storm drain system. Staff's concern is based upon the wide range of illicit connections reported by Permittees with no apparent relation to land use, the poor water quality of dry weather flows in inland receiving waters, and also incidents of illicit connections reported separately or directly to the Regional Board.

[39] As set forth on page 3-3 and in Appendix I of the Permittees' model program, screening tools for the proactive program will include dye tests, smoke tests, and TV inspections.

E. Public Agency Activities Program

Legal Authority:

USEPA storm water regulations 40 CFR 122.26(d)(2)(iv)(A)(1,3,4,5,and 6). Each Permittee must develop a program to reduce the discharge of pollutants to and from the MS4 to the maximum extent practicable for all urban land uses and activities, including municipal areas and activities.

Background:

Many Permittees provide services that ultimately result in the enhancement of the lives of the residents. Some of these services include but are not limited to: sewage system operations; public construction activities; vehicle maintenance; material storage; street and road maintenance; landscaping; recreational facility management; parking facility management; public industrial activities; and many other activities.

Justifications for New Requirements:

NEW REQUIREMENT: In sewage system operations, each Permittee is required to implement a response plan in case of an overflow of the sewage system to the storm drain system.

JUSTIFICATION: The response plan will have different requirements dependent upon whether the Permittee owns or operates the sanitary sewer system.

NEW REQUIREMENT: All requirements in the Development Construction Program apply to public construction activities.

JUSTIFICATION: This is proposed to reduce the possibility of a public construction site from becoming a source of pollutants. A public construction site should be a model of what to do efficiently and effectively (preceding a discharge).

NEW REQUIREMENT: Each Permittee with a construction site that meets the size requirements for a GCASP must obtain coverage under the general permit for construction activity. Currently the size threshold is 5 acres but will change to 1 acre on March 10, 2003. However, a municipality of less than 100,000 people (1990 Census) need not apply for coverage for a construction activity until March 10, 2003.

JUSTIFICATION: This change is consistent with USEPA Phase II storm water regulations, and will assist in the tracking of construction sites operated by Permittees.

NEW REQUIREMENT: Each Permittee is required to ensure that public facilities are designed and constructed using construction and post-construction BMPs consistent with the Standard Urban Storm Water Mitigation Plans (SUSMPs) required in the Development Planning section of the permit.

JUSTIFICATION: This requirement ensures consistency with the planning, design, and construction requirements for private projects. Public projects will be treated the same as private projects.

NEW REQUIREMENT: For Permittee owned or operated vehicle maintenance, material storage areas, and corporation yards the Permittees will implement site specific SWPPPs to minimize pollutants in storm water discharges. Vehicle and equipment wash areas will be required to be self contained or covered, equipped with a clarifier, or other pretreatment device, and/or properly connected to the sanitary sewer. This requirement will take effect when a new facility is constructed or when an existing site is remodeled or reconstructed.

JUSTIFICATION: This requirement ensures consistency with the City of Long Beach MS4 and the Ventura County MS4 permits.

NEW REQUIREMENT: For storm drain operation and maintenance, Permittees are now required to prioritize all catch basins and clean them out according to the permit requirements (Part 4.F.5, Permit). The previous permit required catch basins to be inspected and cleaned once a year. Also, any catch basin greater than 40% full must be cleaned, and after July 1, 2003, any catch basin greater than 25% full must be cleaned. In addition to catch basin cleaning, Permittees must also implement other trash reduction measures. These measures include placing trash receptacles at all transit stops and implementing special actions to cleanup trash when hosting a special event.

Permittees subject to a trash TMDL (Los Angeles River and Ballona Creek WMAs) may continue with their current catch basin cleaning schedule until TMDL implementation measures are developed. The TMDL implementation measures may be different than permit provisions, and requiring Permittees subject to a TMDL to implement different permit requirements would be premature and result in unnecessary expenses for these Permittees. However, if TMDL implementation measures are not in place by October 2003, Permittees subject to a trash TMDL must implement all permit requirements to control trash.

At the December 13, 2001 Board Meeting, concern was raised regarding the storm drain operation and management requirements described above. At the time of the Board Meeting, the requirement did not include a clause in case TMDL implementation measures were not implemented as currently scheduled. Therefore, it was possible that Permittees in the Los Angeles River and Ballona Creek WMAs would be allowed to continue their current practices without any additional trash reduction requirements. This issue was discussed, and the Board approved inserting a phrase that required the TMDL subject Permittees to implement regular storm drain operation and management requirements in the case that the TMDL implementation phase has not begun by 2003.

NEW REQUIREMENT: For storm drain maintenance each Permittee must visually monitor their open channels for debris and identify and prioritize areas of illicit discharge for regular inspection and at least annually remove trash and

debris from the channels. Permittees must properly dispose of removed material.

NEW REQUIREMENT: The streets and roads maintenance section (Part 4.F.6, Permit) requires each Permittee to designate streets based on the volume of trash that is consistently generated. Priority A (highest) streets must be swept twice a month. Priority B (medium) streets must be swept once a month, and Priority C (lowest) streets must be swept as necessary, but no less than once a year. The basis of prioritization was left for the Permittees to establish and implement.

JUSTIFICATION: The new streets and roads maintenance requirements will allow Permittees to more efficiently use resources to target high priority areas.

NEW REQUIREMENT: Permittees, in cooperation with the Los Angeles County Sanitation District, are required to conduct a study to investigate the possible diversion of dry weather discharges or the use of alternate treatment control BMPs to treat storm water from their jurisdiction. A priority list of possible diversions must be submitted to the Regional Board Executive Officer no later than July 1, 2003. The permit does not require Permittees to implement the list. The purpose of the requirement is to have the prioritized lists available for consideration for possible funding through grants, bonds, supplemental environmental projects (SEPs), or other sources.

F. New Development And Significant Redevelopment Program

Impacts from New Development:

Treatment control BMP requirements on new development and redevelopment offer the most cost-effective strategy to reduce pollutant loads to surface waters. Retrofit of existing development will be expensive and may be considered on a targeted basis. Studies on the economic impacts of watershed protection indicate that storm water quality management has a positive or at least neutral economic effect while greatly improving the quality of surface waters.[40]

USEPA storm water regulations at 40 CFR 122.26 require that pollutants in storm water be reduced to MEP. The USEPA's definition is intentionally broad to provide maximum flexibility in MS4 permitting and to give municipalities the opportunity to optimize pollutant reductions on a program-to-program basis.[41] The definition of MEP has generally been applied to mean implementation of economically achievable management practices. Because storm water runoff rates can vary from storm to storm, the statistical probabilities of rainfall or runoff events become economically significant and are central to the control of pollutants through cost effective BMPs. Further, it is recommended that storm water BMPs be designed to manage both flows and water quality for best

[40] *The Economics of Watershed Protection*, T. Schueler (1999), Center for Watershed Protection, Endicott, MD. The article summarizes nationwide studies to support the statement that watershed planning and storm water management provides positive economic benefits.

[41] *Storm Water Phase II Final Rule* – Pre-Federal Register Version, p 87 (USEPA 1999). See USEPA's discussion in response to challenges that the definition is sufficiently vague to be deemed adequate notice for purposes of compliance with the regulation.

performance. [42] It is equally important that treatment control BMPs once implemented be routinely maintained.

Financing the MS4 program offers a considerable challenge for municipalities. A proven successful financing mechanism is the establishment of a storm water utility.[43] Utility fees, which are assessed on the property owner based on some estimate of storm water runoff generated for the site, are a predictable and dedicated source of funds. Utility fees can also provide a mechanism to provide incentives to commercial and industrial property owners to reduce impervious surface areas. Such incentives offer flexibility to property owners to choose the better economic option – paying more fees or making improvements to reduce runoff from the site.

Review of Design Standards:

The American Society of Civil Engineers (ASCE) and the Water Environment Federation (WEF) have recommended a numerical BMP design standard for storm water that is derived from a mathematical equation to maximize treatment of runoff volume for water quality based on rainfall/ runoff statistics and which is economically sound.[44] The maximized treatment volume is cut-off at the point of diminishing returns for rainfall/ runoff frequency. On the basis of this equation the maximized runoff volume for eighty-five percent treatment of annual runoff volumes in California can range from 0.08 to 0.86 inches depending on the imperviousness of the watershed area and the mean rainfall.[45]

Other methods of establishing numerical BMP design standards include: (i) Percent treatment of the annual runoff; (ii) Full treatment of runoff from rainfall event equal to or less than a predetermined size; and (iii) Percent reduction in runoff based on a rainfall event of standard size.[46] These numerical design standards have been applied to Development Planning in Puget Sound, WA; Alexandria, VA; Montgomery County, MD; Denver, CO; Orlando, FL; Portland, OR; and Austin, TX.

The City of Seattle requires that where new development coverage is 750 square feet or more, storm water detention be provided based on a 25 year storm return frequency, and a peak discharge rate not to exceed 0.2 cubic feet per second.[47] Additionally, for projects that add more than 9,000 square feet in developmental coverage, the peak drainage water discharge rate is limited to 0.15 cubic feet per second per acre for a two-year storm. The City of Denver requires new residential, commercial, and industrial developments to capture and treat the 80th percentile runoff event. This capture and proper treatment is estimated to

remove 80 to 90 percent of the annual TSS load which is a surrogate measure for heavy metal and petroleum hydrocarbon pollutants.[48]

Some States have established numerical standards for sizing storm water post-construction BMPs for new development and significant redevelopment. The State of Maryland has established storm water numerical criteria for water quality of 0.9 to 1 inch, and BMP design standards in a unified approach combining water quality, stream erosion potential reduction, groundwater recharge, and flood control objectives.[49] The State of Florida has used numerical criteria to require treatment of storm water from new development since 1982, including BMPs sized for 80 percent reduction (95 percent for impaired waters) in annual TSS loads derived from the 90 percent (or greater for impaired waters) annual runoff treatment volume method for water quality.[50] The State of Washington has proposed at least six different approaches of establishing storm water numerical mitigation criteria for new development, which add 10,000 square feet of impervious surface or more for residential development, and 5,000 square feet of impervious surface or more for other types of development.[51] Other mitigation criteria options include the 90th percentile 24-hour rainfall event (used by the State of Maryland) and the six month 24 hour rainfall event (used by the State of Washington).

On a national level, the USEPA is planning to standardize minimum BMP design and performance criteria for post-construction BMPs, and will likely build from the experience of effective state and local programs to establish national criteria.[52] The USEPA, based on the NURP, supports the first half-inch of rainfall as generating first flush runoff.[53] First flush runoff is associated with the highest pollutant concentrations, and not pollutant load. The USEPA considers the first flush treatment method, the rainfall volume method, and the runoff capture volume method as common approaches for sizing of water quality BMPs.

Background:

On April 22, 1999, the Regional Board approved a List of BMPs for MS4 Permittees to select from and required implementation of the most effective BMPs in their Development Planning and Development Construction programs.[54]

The Final SUSMP was issued on March 8, 2000. It established new development and significant redevelopment conditions for all projects in the following categories:

[48] *Urban Storm Drainage, Criteria Manual – Volume 3, Best Management Practices, Urban Drainage and Flood Control District, Denver*, CO (1999). Manual provides detail design criteria for new development for the Denver Metropolitan area.
[49] *Maryland Storm Water Design Manual* - (Maryland Department of the Environment 2000).
[50] *Florida Development Manual: A Guide to Sound Land and Water Management* (Florida Department of Environmental Protection 19xx). The manual describes structural and non-structural construction and post construction BMPs design criteria.
[51] *Storm Water Management in Washington State Volumes 1 – 5.* (Washington Department of Ecology 2001). The volumes 1,3 and 5 are most relevant to new development standards and cover Hydrologic and Flow Control Designs, Minimum Technical Requirements and Treatment BMPs. The volumes were adopted as statewide standards in late 2001.

[54] (Board Resolution No. 99-03).

- 10 or more home subdivision;
- 100,000+ square-foot commercial development;
- Automotive repair facilities;
- Retail Gasoline Outlets;
- Restaurants;
- Parking lots more than 5,000 square feet or more than 25 parking spaces
- Hillside located single-family dwelling,
- Construction projects adjacent to, in, or discharging directly to Environmentally Sensitive Areas

The SUSMP included numerical design criteria for structural and treatment control BMPs. These criteria are:

Mitigate (infiltrate or treat) storm water runoff from either:

a) the 85th percentile 24-hour runoff event, determined as the maximized capture storm water volume for the area from the formula recommended by the WEF and ASCE study[55];

b) the annual runoff volume, based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in the BMP Handbook;[56]

c) the volume of runoff produced from each and every storm event up to and including 0.75 inch of rainfall, prior to its discharge to a storm water conveyance system; or

[55] *In Urban Runoff Quality Management, WEF Manual of Practice No. 23, ASCE Manual and Report on Engineering Practice No. 87.* WEF, Alexandria, VA; ASCE, Reston, VA. (1998).
[56] *California Storm water Best Management Practices Handbook – Industrial/ Commercial,* (1993)

R0008076

d) the volume of runoff produced from each and every storm event up to and including a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event; and/or

e) the flow of runoff produced from a rain event equal to at least 0.2 inches per hour intensity; or

f) the flow of runoff produced from a rain event equal to at least two times the 85th percentile hourly rainfall intensity for Los Angeles County; or

g) the flow of runoff produced from a rain event that will result in treatment of the same portion of runoff as treated using volumetric standards above.

The State Board issued a precedential decision[57] on the matter in Order WQ 2000-11, largely sustaining the SUSMP as approved by the Regional Board. The State Board amended the SUSMP to limit its application to discretionary projects as defined by CEQA, eliminated the category for projects in environmentally sensitive areas, and set aside the requirement for retail gasoline outlets to treat storm water until a threshold is developed in the future. In addition, the State Board articulated its support for regional solutions and the mitigation banking.

The new permit amends the SUSMP requirements to clarify implementation, make it consistent with recent Regional Board actions, and where appropriate correct procedural and other deficiencies identified by the State Board in its SUSMP ruling. The proposed changes include:

- SUSMPs for hillside developments that are 1 acre or more. Hillside residential homes below the threshold would be required to incorporate BMPs to facilitate drainage and pollutant removal but would not be subject to the numerical mitigation criteria. Currently, all hillside developments regardless of size are subject to the numerical mitigation criteria. This change normalizes post-construction controls for home developments irrespective of location.

- Numerical design criteria retail gasoline stations, where they meet both thresholds, (i) projected average daily traffic of 100 cars or more; and (ii) 5,000 square feet or more of surface area.

- Clarify that the 100,000 square feet commercial development includes heavy industrial development. The category is designated 'industrial/commercial'.

[57] *State Water Board Order WQ 2000-11*: SUSMP; Memorandum from Chief Counsel to Regional Board Executive Officers, (December 26, 2000) discusses statewide policy implications of the decision.

- Lower the industrial/commercial category threshold from 100,000 square feet to 1-acre (43,560 square feet) beginning March 9, 2003, to be consistent with the USEPA Phase 2 storm water regulations for small construction projects.

- SUSMP requirements apply to all developments, both ministerial and discretionary. As presently implemented the SUSMP requirements apply to only discretionary projects as defined under CEQA.

- SUSMP requirements apply to projects situated in, adjacent to, or discharging directly to environmentally sensitive areas where the development (a) creates 2,500 square feet or more of impervious area, and (b) discharge storm water and urban runoff that is likely to impact a sensitive biological species or habitat.

- Redevelopment clarification.

Technical papers that provide more detail have been prepared and are included in the Administrative record.

VI. MONITORING PROGRAM

Background:

Using data collected from a monitoring program, storm water management efforts can be prioritized, helping limited resources be most effective in improving receiving water quality. For example, a monitoring program can provide data that can allow for specific receiving waters and watersheds to be targeted for urban runoff management and education efforts based on their need. Particular pollutants and their sources can also be identified and targeted using monitoring data. In addition, monitoring data can be useful in assessing the effectiveness of an urban runoff management program. Successful efforts that have resulted in receiving water quality improvements can be analyzed for use elsewhere, while areas that need follow-up efforts can also be identified. In general, a comprehensive monitoring program can supply a wealth of data that can be used in a wide range of applications for improving water quality.

Storm Water Monitoring History:

In the 1994-95 storm season, the Los Angeles County Department of Public Works began monitoring storm water quality in Los Angeles County. The first two years of monitoring were conducted pursuant to the 1990 permit. Over the past five years, the Los Angeles County storm water monitoring program consisted of four main components: mass emission monitoring, land use monitoring, critical source monitoring, and a Santa Monica Bay receiving water study. The results of each objective are summarized below.

- **Mass Emission Monitoring**

  Mass emissions were monitored for four major watersheds: Ballona Creek, Malibu Creek, Los Angeles River, and San Gabriel River. The County also monitored mass

emissions from Coyote Creek, although it was not a requirement of Order 96-045. The mass emission monitoring identified the Los Angeles River as consistently contributing the most zinc, copper, and suspended solids[58]. Sixteen chemical constituents of concern were identified from the comparison of mass emission annual concentrations to the objectives of the Ocean Plan, Basin Plan, and the CTR (several other constituents of concern were identified through research)[1]. The mass emission monitoring was also successful at identifying toxic levels of zinc and copper from Ballona Creek discharge, toxicity in the Los Angeles and San Gabriel Rivers, and the extent of severity of bacterial indicators in both dry and wet weather.

- **Land Use Monitoring**

  The County selected eight land use types to be monitored to identify sources of pollutants in storm water monitoring. These land uses include retail/commercial, vacant, high-density single family residential, transportation, light industrial, education, multifamily residential, and mixed residential. The land use monitoring identified light industrial, transportation, and retail/commercial land uses as producing the highest median concentrations for total and dissolved zinc[1]. Light industrial and transportation displayed the highest median concentrations for total and dissolved copper, and light industrial produced the highest concentrations of suspended solids. The majority of the Land Use monitoring requirement was completed, however, Event Mean Concentrations (EMCs) for several constituents (many due to the lowering of method detection limits) were not achieved. Pesticide, nutrient, and PAHs are among the constituents that do not have EMCs for most land uses.

- **Critical Source Monitoring**

  Five critical sources, including industrial and commercial facilities, were monitored to evaluate the effectiveness of voluntary good housekeeping and preventative BMPs. The critical sources included in the study were motor freight, auto dealers, chemical manufacturing, machinery manufacturing, and rubber/plastics. The critical source monitoring program identified fabricated metal businesses as producing the highest median concentrations for zinc, copper, and suspended solids[59]. The inability to require or control the implementation of BMPs made this study somewhat ineffective at evaluating BMP effectiveness. In most cases, there was no significant difference in pollutant levels from critical sources with and without BMPs. However, levels of total and dissolved copper at the fabricated metal industry were significantly reduced with the implementation of BMPs[1].

- **Receiving Water Study**

  A three-year study was conducted to assess the impacts of urban storm water runoff, specifically ecosystem health, on the receiving waters of the Santa Monica Bay. The study examined plume characteristics, water column and seafloor biology. Ballona and Malibu Creek were compared to evaluate the effects of different watershed types. The study discerned the presence of well-developed plumes

[58] Los Angeles County 1994-2000 Integrated Receiving Water impacts Report, Los Angeles County Department of Public Works

[59] *Ibid.*

containing toxic materials, identified zinc and copper as contaminants in Ballona Creek, and concluded that sediments offshore of Ballona Creek generally had higher concentrations of urban contaminants. These findings demonstrate the need for further studies and for the identification of sources of toxic pollutants.

New Storm Water Monitoring Program:

The objectives of the Storm Water Monitoring Program include, but are not limited to: 1) assessing compliance with the MS4 permit; 2) measuring and improving the effectiveness of the SQMP; 3) assessing the chemical, physical, and biological impacts of receiving waters resulting from urban runoff; 4) characterization of storm water discharges; 5) identifying sources of pollutants; and 6) assessing the overall health and evaluating long-term trends in receiving water quality.

Mass Emissions Monitoring

Seven mass emissions stations will be monitored. Monitoring at the five existing stations will continue, and new stations were required in Dominguez Channel, and the Santa Clara River.

The Dominguez Channel watershed contains the highest percentage of impervious area. Studies reveal that the level of imperviousness in an area strongly correlates with the quality of the nearby receiving waters.[60] Also, the Dominguez Channel Watershed is a highly industrialized area and the storm water runoff needs to be characterized to determine its contribution of pollutants in the San Pedro Bay.

A new mass emission station in the Santa Clara watershed is also required. The purpose of this station is to characterize mass emissions from Los Angeles County and to monitor the impacts from new development. Therefore, the station should be located as close to the Ventura County line as practicable. The Santa Clara is currently the most natural and least impacted watershed in the County. However, it is rapidly urbanizing and contains a significant amount of proposed development. Several factors, including the natural state of the river and the lack of accessibility, have made it difficult to select a location for a sampling station. However, Regional Board and Los Angeles County DPW staff conducted a field investigation of the watershed that revealed a couple of potential monitoring locations. Prior to the next rainy season, the County will determine the location that is most feasible for them.

Method Detection Limits

The Minimum Levels (MLs) listed in Appendix 4 of the State Board Policy for Implementation of Toxics Standards for Inland Surface Water, Enclosed bays, and Estuaries of California, 2000 (SIP) represent the lowest quantifiable concentration in a sample based on the proper application of all method-based analytical procedures and the absence of any matrix interferences.[61] These MLs must be incorporated into all water quality monitoring programs to detect priority toxic pollutants. The MLs are the only established criteria that take into consideration recent improvements in chemical analytical methods. If they are not used in the storm water program, concentrations of

[60] 64 *Fed. Reg.* 68725
[61] SIP

concern of priority toxic pollutants may not be detected, which has occurred throughout the history of the Los Angeles County storm water monitoring program. Detection and control of toxic pollutants in surface waters is necessary to achieve the CWA's goals and objectives.[62] Numeric criteria for toxic pollutants is necessary to evaluate the adequacy of existing and potential control measures to protect aquatic ecosystems and human health.[63] Also, using MLs will provide quantifiable data that is necessary to better assess water quality and to develop Waste Load Allocations and Load Allocations for TMDLs. Furthermore, non-detects cannot be used to accurately determine mass loadings. The criteria established in the CTR are legally applicable in the State of California for inland surface waters, enclosed bays and estuaries for all purposes and programs under the CWA.[64] Section 402(p)(3)(B)(iii) gives USEPA and states the authority to incorporate appropriate water quality-based effluent limitations in NPDES permits for discharges from MS4s.[65] The MLs have been incorporated in Attachment U-1 of the Monitoring and Reporting Program.

TSS Monitoring

Every storm greater than .25 inch shall be sampled and analyzed for TSS. The purpose of this requirement is to consider the high variability of storm water discharges and determine more accurate average mass emission values. The high variability of storm water makes it unlikely to characterize a storm season based on a few mass emission samples. Studies show that the median event mean concentration for storm water programs that do not sample every storm is consistently biased low, relative to the annual flow-weighted mean[66]. To adequately characterize a storm and capture central tendencies, many storms would need to be sampled. However, this is cost-prohibitive. Therefore, the correlation between TSS and trace metals should be used. Studies have indicated that runoff contaminants tend to be highly correlated with suspended solids in large rivers and creeks throughout southern California[67]. TSS measurements are one-tenth the cost of trace metal analyses. However, TSS concentrations accounted for up to 95% of the variability in some trace metal concentrations in a study of the Santa Ana River (urbanized watershed in Orange County) conducted by the Southern California Coastal Water Research Project (SCCWRP)[2].

Water Column Toxicity Monitoring

Storm water samples were found to be toxic in the Los Angeles River, the San Gabriel River, Ballona Creek, and the Santa Monica Bay, demonstrating the need for this toxicity monitoring requirement.

Toxicity testing is used to assess the impact of storm water pollutants on the overall quality of aquatic systems[68]. It can be a very useful tool for storm water managers. The Center for Watershed Protection rated toxicity testing as a "very useful" indicator for assessing municipal storm water programs. Toxicity testing can also be used to evaluate the effectiveness of storm water BMPs and other storm water pollution

[68] Center for Watershed Protection, Environmental Indicators to Assess Stormwater Control Programs and Practices (1996).

reduction measures[69]. Managers can use the results of toxicity testing to identify areas of high concern and to establish priority locations for BMPs. Furthermore, Toxicity Identification Evaluations (TIEs) and Toxicity Reduction Evaluations (TREs) can be used to identify specific pollutants and their sources so that management actions can be more specifically prioritized.

Previous toxicity testing was only conducted using the *Stronglyocentrotus purpuratus* (sea urchin) fertilization test, a marine species. Toxicity testing using multiple species is needed to provide a more complete assessment of the causes of toxicity in storm water[70]. The identification of zinc and copper as contaminants of concern in previous studies in the County were based primarily on studies with the sea urchin. Reliance on single species tests may not provide an accurate assessment of toxicity[71]. Because different species vary in their sensitivity to contaminants, tests with multiple species are needed to determine if other contaminants are present at toxic concentrations[72]. Specifically, an organism that is sensitive to pesticides, which have been found to be important factors in the toxicity of storm water from other watersheds, should be used[73]. USEPA recommends the use of the *Ceriodaphnia dubia* (water flea) reproduction and survival test for the measurement of receiving water toxicity. The water flea is one of the most sensitive aquatic species to diazinon, whereas the sea urchin fertilization test is insensitive to organophosphorus pesticides[74]. By contrast, sea urchin sperm are approximately 10 times more sensitive to trace metals than are water fleas.

Furthermore, the toxicity component of the Monitoring Program should include toxicity identification procedures so that potential constituents of concern can be confirmed and others can be discounted. TIEs are needed to prioritize management actions.

Two wet weather and two dry weather samples will be analyzed for toxicity from each mass emission station every year. When a sample is substantially toxic to either test species, a Phase I TIE will begin immediately. Substantial toxicity means the amount of toxicity necessary to successfully conduct a Phase I TIE. For example, Ceriodaphnia TIEs require at least 50% mortality in undiluted sample at any time during the 7-day duration of the initial chronic bioassay.[75] If enough toxicity is not present at the beginning of a TIE, it cannot be successfully completed. The City of Long Beach Storm Water Monitoring Program has been modified to include similar TIE procedures.

Based on the results from the Long Beach Monitoring Report, the Regional Board determined that using consecutive hits of toxicity in storm water as a trigger for a TIE does not yield adequate results. For example, every single storm event sampled at the Long Beach mass emission stations was toxic to some extent to at least one of the three species tested, but only one TIE was conducted on one species.[76] Also, due to the high variability of storm water, there is no guarantee that substantial toxicity will be present after the two consecutive hits. To increase the chances of a successful TIE and to better identify all causes of toxicity in storm water, TIEs should begin immediately when substantial toxicity is detected in a sample.

[75] SCCWRP
[76] City of Long Beach Storm Water Monitoring Report, 2000-2001. Kinnetic Labs, Inc. and SCCWRP

R0008082

Furthermore, after a toxic pollutant or class of pollutants is identified as causing at least 50% of the toxic responses in at least 3 samples at a sampling location, Toxicity Reduction Evaluations (TRE) will be conducted. If a Phase I TIE only identifies a broad category of toxicants (i.e., nonpolar organics), additional TIE analysis, to the extent possible, will be conducted until the source of toxicity is identified. The purpose of this requirement is to evaluate the extent and causes of toxicity in inland and coastal receiving waters, and to eliminate or reduce the sources of toxicity in storm water.

TRE development and implementation is directly tied to the SQMP, to ensure that management actions are taken when problems are identified. The Principal Permittee expressed concern to Regional Board staff that the TRE requirement could potentially be too involved and costly to be completed with the available funds and resources during the course of the Order. To address this concern, the Regional Board clarified the TRE language. It was decided that a third party should be involved in the source analysis and BMP recommendations, and that each Permittee shall be responsible for the implementation of BMPs in their areas of jurisdiction that are causing or contributing to toxicity. The Principal Permittee is responsible for retaining a neutral third party to evaluate possible sources of toxicity and recommend appropriate BMPs, based on available information. Regional Board staff agreed with the Principal Permittee's proposed funding limit for TRE development, to ensure that the majority of the monitoring budget is not used for TRE purposes.

In addition to the funding limit, the Principal Permittee is also encouraged to coordinate TREs with concurrent TMDLs where overlap exists. If a TMDL is being developed or implemented for an identified toxic pollutant, much of the work necessary to meet the objectives of a TRE may already be underway, and information and implementation measures should be shared.

Overall, the toxicity monitoring program will assess the impact of storm water on the overall quality of aquatic systems and implement measures to ensure that those impacts are eliminated or reduced. Chemical monitoring does not necessarily reveal the impacts of storm water on aquatic life or beneficial uses of water bodies. Therefore, toxicity monitoring is a necessary component of a storm water monitoring program.

Tributary/Source Identification Monitoring

Based on the results of previous storm water quality monitoring and toxicity testing, there is a need to monitor subwatersheds to determine pollutant sources and prioritize management actions. Exceedances of various pollutants, including toxic levels of zinc and copper in the Ballona Watershed, have been occurring at the mass emission stations for many years, but there has not yet been an effort to monitor tributaries to determine where the pollutants are actually coming from.[77] Regional Board staff worked with Los Angeles County staff, and other interested stakeholders, to design a tributary monitoring program.

[77] Los Angeles County 1994-2000 Integrated Receiving Water Impacts Report, July 31, 2000. LA County DPW, SCCWRP, Woodward Clyde.

R0008083

Shoreline Monitoring

The City of Los Angeles has conducted shoreline and nearshore water quality monitoring off the Santa Monica Bay since the 1950s under the monitoring program for the Hyperion Waste Water Treatment Plant (NPDES No. CA0109991). The monitoring results indicate that effluent from Hyperion's 5-Mile Outfall does not impinge the shoreline, and that elevated bacterial counts are associated with runoff from storm drains and discharges from piers. In 1994, the Regional Board approved the relocation of Hyperion's shoreline stations to implement a bay-wide, regional shoreline monitoring program associated with storm drain outfalls in the Santa Monica Bay. The City of Los Angeles requested that the shoreline monitoring requirement be incorporated in this Order. Regional Board staff and the County of Los Angeles determined that the shoreline monitoring is an appropriate requirement for the storm water monitoring program, per the conditions listed in Section D of the Monitoring Program.

Trash Monitoring

Trash is a pollutant that impacts storm water runoff, and a trash monitoring program should be included in the MS4 permit. The permit requirement is consistent with the monitoring language in the trash TMDL for the Los Angeles River watershed[78]. The Regional Board Executive Officer issued a CWC § 13267 Request for Trash Monitoring letter, dated December 21, 2001, which required this monitoring. The Regional Board does not intend to require two separate monitoring programs through the MS4 permit and the TMDL. The letter is referenced in the trash monitoring requirement to clarify that monitoring conducted pursuant to the TMDL is sufficient for the permit requirement.

Regional Monitoring

Regional Monitoring efforts address public health concerns, monitor trends in natural resources and nearshore habitats, and assess regional impacts from all pollutant sources. Los Angeles County is a major discharger in this region and should participate in regional programs. Also, participation in Regional Monitoring, such as the SCCWRP Bight-wide study in 2003, can accomplish several goals of the Monitoring Program.

Estuary Sampling

The main goal of the estuary sampling is to determine the spatial extent of sediment fate from storm water, and the magnitude of its effects. Previous studies indicate that contaminated sediments can be linked to suspended solids in storm water[79]. From the information this sampling effort generates, a map of each estuary that depicts the impacted areas will be produced. Such a map will be used to direct future monitoring efforts. Once the impacted areas are identified, regular monitoring can be conducted to determine trends and accumulation of sediment from storm water. The specific sampling requirements are consistent with the Hyperion Waste Water Treatment Plant NPDES permit. This sampling program is also consistent with the objectives of the SCCWRP Bight-wide 2003 study. The results will be incorporated into a larger study of the entire coast of Southern California, from Santa Barbara to the boarder of Mexico.

[78] Trash Total Maximum Daily Loads for the Los Angeles River Watershed, June 18, 2001, Regional Board
[79] Los Angeles County 1994-2000 integrated Receiving Water Impacts Report, Los Angeles County Department of Public Works, Contaminated Sediments and Total Suspended Solids (Section 4.2.4)

R0008084

This will provide a comparison of the storm water impacts from Los Angeles County to other larger MS4s, as well as individual dischargers.

Bioassessment

Bioassessment data can be an important indicator of stream health and storm water impacts. It can detect impacts that chemical and physical monitoring cannot. In the Interpretive Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems, EPA encourages permitting authorities to consider requiring biological monitoring methods to fully characterize the nature and extent of storm water problems. Therefore, this Regional Board and other Regional Boards commonly require bioassessment monitoring in storm water and point source NPDES permits.

However, the fact that a biological index does not yet exist for this region is an issue that Regional Board staff took into consideration for this requirement. Without a biological index, including reference conditions and knowledge of background variability, data cannot be fully analyzed to accurately indicate stream health or impacts. However, it can be used to determine trends in the biological community, and it is necessary for index development. Also, bioassessment data can be analyzed in the future, after an index is developed.

Considering the importance of bioassessment and the need for an index, the Principal Permittee is required to develop a bioassessment program as part of a regional effort (Southern California Stormwater Research/Monitoring Program) and to coordinate with the Surface Water Ambient Monitoring Program (SWAMP), organized by the Regional Board. This is to ensure that the most useful data is collected for the purposes of detecting biological trends in receiving waters and for developing a biological index.

New Development Impact Study in the Santa Clara Watershed

The Santa Clara River is the largest river system in southern California that remains in a relatively natural state. For much of its length, it is a high quality natural resource[80]. There is also a great amount of current and future development in the watershed. Therefore, it is important to monitor this watershed to detect water quality impacts from new development and implement measures to prevent degradation from occurring. To accomplish this, a special study is appropriate.

The special study will consist of monitoring tributaries in the Santa Clara watershed to accomplish two goals. The first is to determine impacts from new development. The second is to assess the effectiveness of SUSMPs by comparing storm water quality between subwatersheds with and without post-construction storm water BMPs. Two tributary stations will be selected and monitored for this study. One will be chosen that is representative of a subwatershed in which the majority of development has occurred without SUSMP implementation. The second station will be representative of a subwatershed in which the majority of development has/will include SUSMP implementation.

The City of Santa Clarita will cooperate with the County to conduct the New Development Impact Study (as well as the Peak Discharge Study, if they are combined). The City has proposed to contribute a maximum of $100,000 over the course of the New

[80] Watershed Management Initiative Chapter, January 2000. California Regional Water Quality Control Board, Los Angeles Region

R0008085

Development Impact Study. The City also has 2 field staff that may be available for sampling and other field measurements during normal working hours. The City is also interested in participating in site selection and study design.

Peak Discharge Impact Study

The Development Planning section (Part 4.C.2) of the permit requires that the Principal Permittee determine numeric criteria to prevent or minimize erosion of natural stream channels and banks caused by urbanization. The purpose of the Peak Discharge Impact Study is to help meet that requirement and to study the extent of physical impacts to Natural Drainage Systems from storm water discharges. The Ventura County MS4 permit contains a similar requirement. The Ventura County Flood Control District has designed a study that can possibly be extended to a watershed in Los Angeles County.

Since this study and the New Development Impact Study are both related to monitoring impacts from developed areas, selected sites may be similar. It may be possible to meet the requirements of both studies by studying the chemical characteristics of storm water runoff from a site, and the physical characteristics in the water body downstream of the same site before and after rain events.

BMP Effectiveness Study

The BMP Effectiveness Study is an integral part of the storm water monitoring program. It is necessary to document the effectiveness of treatment control BMPs so that the storm water management agency can make informed decisions on the use of BMPs.

VII. FINAL QUESTIONS AND CHANGES

After the staff presentation and public hearing at the December 13, 2001 Board Meeting, a few questions and issues remained. Prior to adoption, Board Members asked staff and the public to discuss these issues. The main questions were in regards to due process and noticing, the Receiving Water Limitations language, and the storm drain operation and management requirements. The issues and their outcomes are described below.

First, many interested parties expressed a concern that additional time was needed to review and comment on the change sheets. The change sheets contained detailed descriptions of minor changes that were proposed after the issuance of the third draft on October 11, 2001. Almost all of these changes were made at the request of Permittees for clarification. Questions regarding due process and notice procedures for these changes were asked of staff attorney Michael Lauffer. Lauffer Esq. responded by saying that particular attention had been paid to this issue. Prior to the Board Meeting, staff counsel analyzed whether or not any of the changes contained in the change sheets were significant enough to trigger concerns with respect to due process and permit re-noticing. He concluded that the changes were all insignificant and represented logical outgrowths of what the Regional Board had already noticed.[81]

[81] Reporter's Transcript of Proceedings from the December 13, 2001 Regional Board Meeting, Item 10. Pages 155-59.

In regards to Version A/C of the Industrial/Commercial Facilities Program, staff counsel concluded that it was not a significant change, since it is a combination of Versions A and C, which had already been public noticed. Lauffer stated that none of the changes triggered a requirement to re-notice the proposed permit.[82]

Next, the Receiving Water Limitations (Part 2, Permit) and lack of a "safe harbor" clause were raised as issues during the public hearing. Some Permittees and other interested parties expressed concern that under the new permit municipalities will be in immediate violation due to exceedances of water quality standards which may occur during storm events. Counsel Lauffer referenced the State Board's precedential decision on the San Diego County MS4 permit petition and the State Board's rationale for not including some of the language requested by municipalities.[83] He explained that the Receiving Water Limitations language affirms that an iterative process is the preferred approach. Including specific protection for Permittees above and beyond what the iterative process provides may hinder the Regional Board's enforcement ability in cases where Permittees do not fully implement their SQMPs or appropriate BMPs and exceedances persist.[84] Overall, staff counsel concluded that the existing Receiving Water Limitation language is consistent with the State Board Order WQ 2001-15, and is a necessary component of MS4 permits.

The last issue that was discussed in detail at the Board Meeting was the storm drain operation and management requirements. The concern was raised that Permittees subject to a trash TMDL would not be required to implement any additional trash reduction BMPs, as all other Permittees are, if the trash TMDL implementation phase is delayed or held up in litigation. This issue is described in Section V.E. of this report. In summary, the Board approved inserting a phrase that required TMDL subject Permittees to implement the regular storm drain operation and management requirements in case TMDL implementation has not begun by October 2003.

ADOPTION OF THE LOS ANGELES COUNTY MUNICIPAL STORM WATER NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT (BOARD ORDER 01-182; NPDES PERMIT No. CAS004001)

Dear Interested Party:

We are pleased to advise you that the municipal storm water permit for the County of Los Angeles (Permit) was adopted by the Regional Water Quality Control Board at its meeting on December 13, 2001 pursuant to Division 7 of the California Water Code. Board Order 01-182 serves as the permit under the National Pollutant Discharge Elimination System (NPDES), for storm water discharges and urban runoff within the County of Los Angeles, and will expire on December 13, 2006.

The Permit requires the Los Angeles County Flood Control District, herein referred to as the Principal Permittee, and all Co-Permittee cities to implement NPDES Permit number CAS004001, including the: Monitoring and Reporting Program, Receiving Water Limitations (which clarifies that discharges must meet water quality objectives); Public Information and Participation Program; Industrial/Commercial Facilities Control Program (upgrades the existing site visit program to an inspection program of select industrial/commercial sectors); Development Planning Program (lowers the threshold of industrial/commercial development that is subject to Standard Urban Storm Water Mitigation Plan (SUSMP) requirements from 100,000 square feet to one acre beginning in 2003; and expands SUSMPs to cover: environmentally sensitive areas, ministerial and discretionary projects, and retail gasoline outlets); Development Construction Program; Public Agency Activities Program (includes explicit requirements to control the discharge of trash to the MS4); and Illicit Connections and Illicit Discharges Elimination Program (requires the Principal Permittee to take more responsibility for tracking illicit discharges and connections, and upgrades passive field screening activities (during regularly scheduled maintenance) to a proactive field screening program).

If you would like a hard copy of the permit, please call our storm water hotline at (213) 576-6753. The entire permit renewal process was an open and public process. For your use and public dissemination, an electronic copy of the LA Storm Water Permit may be downloaded from our website at: www.swrcb.ca.gov/rwqcb4/html/programs/Stormwater/la_ms4_final.html . We would greatly appreciate you directing other interested parties to the website for further information on storm water management updates as necessary.

Thank you very much for your interest and participation during the development and adoption of the Permit. Should you have any comments or questions in regards to the LA Storm Water

R0008088

Permit or program, please do not hesitate to call us at the Regional Board's Storm Water Hotline at (213) 576-6753.

Sincerely,

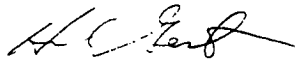
Re: Petition for Review of Order No. 01-182 and Request for Preparation of Administrative Record and List of Interested Persons

Dear Mr. Dickerson:

Enclosed please find a Petition for Review and accompanying Statement of Point and Authorities filed with the State Water Resources Control Board on behalf of our clients, the County of Los Angeles and the Los Angeles County Flood Control District, concerning certain elements of Order No. 01-182, NPDES Permit No. CAS00401, Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges Within the County of Los Angeles, and the Incorporated Cities Therein, Except the City of Long Beach ("Stormwater Permit").



In accordance with 23 Cal. Code Reg. § 2050(a)(10), we respectfully request that the Board prepare the full administrative record on the action of the Board in adopting the Stormwater Permit, including a copy of the tape recording of the Board hearing on December 13, 2001 and the Regional Board workshops held April 24, 2001 and July 26, 2001, as well as a copy of all reporter's transcripts of such hearing and workshops, if available.

In addition, pursuant to 23 Cal. Code Reg. § 2050(a)(8), please provide a list of persons that are known to the Regional Board to have an interest

in the subject matter of this Petition and please forward such list to this office and to the State Water Resources Control Board.

Thank you for your assistance in this matter. Please call me at the number noted above if you have any questions.

Very truly yours,

Howard Gest

REPLY TO YOUR LETTER OF DECEMBER 7, 2001 REGARDING THE COUNTY OF LOS ANGELES NPDES MUNICIPAL STORM WATER PERMIT RENEWAL

Dear Senator Margett:

Thank you for your letter dated December 7, 2001 regarding the re-issuance of the County of Los Angeles Municipal Storm Water Discharge Permit (LA Storm Water Permit). On behalf of Chairman Nahai, I am formally replying to your letter.

Please note that immediately upon receipt of your letter in early December, I did contact a member of your staff to express appreciation for your letter and to convey the intent of the Regional Board to move forward with consideration of the permit on December 13th. As you already are no doubt aware, the Regional Board did act on the permit that day and approved the tentative permit with many additional changes that were requested by various cities and the County of Los Angeles.

We are currently preparing additional informational materials to help clarify those elements of the permit that have been the subject of discussion. I will convey those materials to you as soon as they are prepared, which should be sometime next week. I would also be pleased to provide you or members of your staff with a personal briefing on the permit should you so desire.

To schedule a briefing or should you have any questions, please feel free to call me at (213) 576-6605 at your convenience.

Sincerely,

Dennis A. Dickerson
Executive Officer
