2. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind, or are restricted in distribution on a regional basis.

[1] The 61 existing SEAs represent the findings of a study that was completed in 1976 by England and Nelson, Environmental Consultants, as amended through the adoption of a revised Los Angeles County General Plan in 1980. The results of an update study to evaluate existing SEAs within unincorporated Los Angeles County is currently being proposed to the Los Angeles County Planning Commission (*Los Angeles County Significant Ecological Area Update Study 2000, Background Report*, PCR Services Corporation). The *Update Study 2000*, which contains existing and proposed SEA boundaries, can be downloaded from the Los Angeles County Department of Planning website at http://planning.co.la.ca.us/drp_revw.html#SEA

3. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind or are restricted in distribution in Los Angeles County.
4. Habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, migrating grounds and is limited in availability either regionally or within Los Angeles County.
5. Biotic resources that are of scientific interest because they are either an extreme in physical/geographical limitations, or represent an unusual variation in a population or community.
6. Areas important as game species habitat or as fisheries.
7. Areas that would provide for the preservation of relatively undisturbed examples of natural biotic communities in Los Angeles County.
8. Special areas.[2]

"Significant Natural Area (SNA)" means an area defined by the California Department of Fish and Game (DFG), Significant Natural Areas Program, as an area that contains an important example of California's biological diversity. The most current SNA maps, reports, and descriptions can be downloaded from the DFG website at ftp://maphost.dfg.ca.gov/outgoing/whdab/sna/. These areas are identified using the following biological criteria only, irrespective of any administrative or jurisdictional considerations:

1. Areas supporting extremely rare species or habitats.
2. Areas supporting associations or concentrations of rare species or habitats.
3. Areas exhibiting the best examples of rare species and habitats in the state.

"Site" means the land or water area where any "facility or activity" is physically located or conducted, including adjacent land used in connection with the facility or activity.

"Source Control BMP" means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

"SQMP" means the Los Angeles Countywide Stormwater Quality Management Program.

"State Storm Water Pollution Prevention Plan (State SWPPP)" means a plan, as required by a State General Permit, identifying potential pollutant sources and describing the design, placement and implementation of BMPs, to effectively prevent non-stormwater Discharges and reduce Pollutants in Stormwater Discharges during activities covered by the General Permit.

"Storm Water" means storm water runoff, snow melt runoff, and surface runoff and drainage.

"Storm Water Discharge Associated with Industrial Activity" means industrial discharge as defined in 40 CFR 122.26(b)(14)

"Stormwater Quality Management Program" means the Los Angeles Countywide Stormwater Quality Management Program, which includes descriptions of programs, collectively developed by the Permittees in accordance with provisions of the NPDES Permit, to comply with applicable federal and state law, as the same is amended from time to time.

---

[2] These criteria from the 1976 study have been modified in the *Update Study 2000.*

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both treatment control BMPs and source control BMPs.

"SUSMP" means the Los Angeles Countywide Standard Urban Stormwater Mitigation Plan. The SUSMP shall address conditions and requirements of new development.

"Total Maximum Daily Load (TMDL)" means the sum of the individual waste load allocations for point sources and load allocations for nonpoint sources and natural background.

"Toxicity Identification Evaluation" means a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

"Toxicity Reduction Evaluation" means a study conducted in a step-wise process to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity.

"Treatment" means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media absorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment Control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

"USEPA Phase I Facilities" means facilities in specified industrial categories that are required to obtain an NPDES permit for storm water discharges, as required by 40 CFR 122.26(c). These categories include:

i. facilities subject to storm water effluent limitation guidelines, new source performance standards, or toxic pollutant effluent standards (40 CFR N)
ii. manufacturing facilities
iii. oil and gas/mining facilities
iv. hazardous waste treatment, storage, or disposal facilities
v. landfills, land application sites, and open dumps
vi. recycling facilities
vii. steam electric power generating facilities
viii. transportation facilities
ix. sewage of wastewater treatment works
x. light manufacturing facilities

"Vehicle Maintenance/Material Storage Facilities/Corporation Yards" means any Permittee owned or operated facility or portion thereof that:

i. Conducts industrial activity, operates equipment, handles materials, and provides services similar to Federal Phase I facilities;

ii. Performs fleet vehicle on ten or more vehicles per day including repair, maintenance, washing, and fueling;
iii. Performs maintenance and/or repair of heavy industrial machinery/equipment ; and
iv. Stores chemicals, raw materials, or waste materials in quantities that require a hazardous materials business plan or a Spill Prevention, Control , and Counter-measures (SPCC) plan.

"Water Column Toxicity" means a 70 percent survival rate for a single test or an average of 90 percent survival for three consecutive tests.

"Water Quality Standards and Water Quality Objectives" means water quality criteria contained in the Basin Plan, the California Ocean Plan, the National Toxics Rule, the California Toxics Rule, and other state or federally approved surface water quality plans. Such plans are used by the Regional Board to regulate all discharges, including storm water discharges.

"Waters of the State" means any surface water or groundwater, including saline waters, within boundaries of the state.

"Waters of the United States" or "Waters of the U.S." means:

a. All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
b. All interstate waters, including interstate "wetlands";
c. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:
    1. Which are or could be used by interstate or foreign travelers for recreational or other purposes;
    2. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
    3. Which are used or could be used for industrial purposes by industries in interstate commerce;
a. All impoundments of waters otherwise defined as waters of the United States under this definition;
b. Tributaries of waters identified in paragraphs (a) through (d) of this definition;
c. The territorial sea; and
d. "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraph (a) through (f) of this definition.

Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.22(m), which also meet the criteria of this definition) are not waters of the United States. This exclusion applies only to man-made bodies of water, which neither were originally created in waters of the United States (such as disposal area in wetlands) nor resulted from the impoundment of waters of the United States. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's

status as prior converted cropland by any other federal agency, for the purposes of the CWA, the final authority regarding CWA jurisdiction remains with US EPA.

"Wet Season" means the calendar period beginning October 1 through April 15.

Part 7. STANDARD PROVISIONS

A. Standard Requirements

1. Each Permittee shall comply with all provisions and requirements of this permit.

2. Should a Permittee discover a failure to submit any relevant facts or that it submitted incorrect information in a report, it shall promptly submit the missing or correct information.

3. Each Permittee shall report all instances of non-compliance not otherwise reported at the time monitoring reports are submitted.

4. This Order includes the attached Monitoring and Reporting Program, and SUSMP(Regional Board Resolution No. R00-02), which are a part of the permit and must be complied with in the same manner as with the rest of the requirements in the permit.

B. Regional Board Review

Any formal determination or approval made by the Regional Board Executive Officer pursuant to the provisions of this Order may be reviewed by the Regional Board. A Permittee(s) or a member of the public may request such review upon petition within 30 days of the effective date of the notification of such decision to the Permittee(s) and interested parties on file at the Regional Board.

C. Public Review

1. All documents submitted to the Regional Board in compliance with the terms and conditions of this Order shall be made available to members of the public pursuant to the Freedom of Information Act (5 U.S.C. § 552 (as amended) and the Public Records Act (Cal Government Code Section 6250 *et seq.*).

2. All documents submitted to the Regional Board Executive Officer for approval shall be made available to the public for a 30-day period to allow for public comment.

D. Duty to Comply

1. Each Permittee must comply with all of the terms, requirements, and conditions of this Order. Any violation of this order constitutes a violation of the Clean Water Act, its regulations and the California Water Code, and is grounds for enforcement action, Order termination, Order revocation and reissuance, denial of an application for reissuance; or a

combination thereof [40 CFR 122.41(a), CWC Section 13261, 13263, 13265, 13268, 13300, 13301, 13304, 13340, 13350].

2. A copy of these waste discharge specifications shall be maintained by each Permittee so as to be available during normal business hours to Permittee employees and members of the public.

3. Any discharge of wastes at any point(s) other than specifically described in this Order is prohibited, and constitutes a violation of the Order.

E. Duty to Mitigate [40 CFR 122.41 (d)]

Each Permittee shall take all reasonable steps to minimize or prevent any discharge that has a reasonable likelihood of adversely affecting human health or the environment.

F. Inspection and Entry [40 CFR 122.41(i), CWC Section 13267]

The Regional Board, USEPA, and other authorized representatives shall be allowed:

1. Entry upon premises where a regulated facility is located or conducted, or where records are kept under conditions of this Order;

2. Access to copy any records, at reasonable times, that are kept under the conditions of this Order;

3. To inspect at reasonable times any facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; and,

4. To photograph, sample, and monitor at reasonable times for the purpose of assuring compliance with this Order, or as otherwise authorized by the Clean Water Act and the California Water Code.

G. Proper Operation and Maintenance [40 CFR 122.41 (e), CWC Section 13263(f)]

The Permittees shall at all times properly operate and maintain all facilities and systems of treatment (and related appurtenances) that are installed or used by the Permittees to achieve compliance with this Order. Proper operation and maintenance includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar system that are installed by a Permittee only when necessary to achieve compliance with the conditions of this Order.

H. Signatory Requirements [40 CFR 122.41(k) & 122.22]

Except as otherwise provided in this Order, all applications, reports, or information submitted to the Regional Board shall be signed by the Director of

Public Works, City Engineer, or authorized designee and certified as set forth in 40 CFR 122.22.

I. **Reopener and Modification [40 CFR 122.41(f) & 122.62]**

1. This Order may only be modified, revoked, or reissued, prior to the expiration date, by the Regional Board, in accordance with the procedural requirements of the Water Code and Title 23 of the California Code of Regulations for the issuance of waste discharge requirements, 40 CFR 122.62, and upon prior notice and hearing, to:

   ~~a) Address changed conditions identified in the required reports or other sources deemed significant by the Regional Board;~~

   b) ~~Incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;~~

   c) Comply with any applicable requirements, guidelines, and/or regulations issued or approved pursuant to CWA Section 402(p); and/or,

   ~~d) Consider any other federal, or state laws or regulations that became effective after adoption of this Order.~~

   The U.S. EPA Regulations provide detailed criteria for the amendment of a permit, which are not reflected in current language.

2. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:

   a) Violation of any term or condition contained in this Order;

   b) Obtaining this Order by misrepresentation, or failure to disclose all relevant facts; or,

   c) A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.

~~3. This Order may be modified, revoked and reissued, or terminated for cause.~~

This provision is superfluous.

4. The filing of a request by the Principal Permittee or Permittees for a modification, revocation and re-issuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any condition of this Order.

5. This Order may be modified to make corrections or allowances for changes in the permitted activity listed in this section, following the procedures at 40 CFR Part 122.63, if processed as a minor modification. Minor modifications may only:

   a) Correct typographical errors, or

   b) Require more frequent monitoring or reporting by the Permittee.

J. Severability

The provisions of this permit are severable; and if any provision of this permit or the application of any provision of this permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this permit shall not be affected.

K. Duty to Provide Information [40 CFR 122.41(h)]

The Permittees shall furnish, within a reasonable time, any information the Regional Board or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order. The Permittees shall also furnish to the Regional Board, upon request, copies of records required to be kept by this Order.

L. Twenty-four Hour Reporting [40 CFR 122.41(l)(6)][3]

1. The Permittees shall report to the Regional Board ~~any noncompliance~~ the exceedance of any narrative effluent limitations that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time any Permittee becomes aware of the circumstances. A written submission shall also be provided within five days of the time the Permittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times and, if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

   As noted above, footnote moved into the text, and assumption made that violation effluent limit is the only circumstance requiring reporting under this provision.

2. The Regional Board may waive the required written report on a case-by-case basis.

M. Bypass [40 CFR 122.41(m)][4]

Bypass (the intentional diversion of waste streams from any portion of a treatment facility) of any storm water control or BMP as provided in this Order or in the SQMP and installed by a Permittee is prohibited. The Regional Board may take enforcement action against Permittees for bypass unless:
Footnote moved in the text for clarity.

1. Bypass was unavoidable to prevent loss of life, personal injury or severe property damage. (Severe property damage means substantial physical

[3] ~~This provision applies to incidents where effluent limitations (numerical or narrative) as provided in this Order or in the Los Angeles County SQMP are exceeded, and which endanger public health or the environment.~~

[4] This provision applies to the operation and maintenance of storm water controls and BMPs as provided in this Order or in the SQMP.

damage to property, damage to the treatment facilities that causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.);

2. There were no feasible alternatives to bypass, such as the use of auxiliary treatment facilities, retention of untreated waste, or maintenance during normal periods of equipment down time. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that could occur during normal periods of equipment downtime or preventive maintenance;

3. The Permittee submitted a notice at least ten days in advance of the need for a bypass to the Regional Board; or,

4. Permittees may allow a bypass to occur that does not cause effluent limitations to be exceeded, but only if it is for essential maintenance to assure efficient operation. In such a case, the above bypass conditions are not applicable. The Permittee shall submit notice of an unanticipated bypass as required.

N. Upset [40 CFR 122.41(n)][5]

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.

1. A Permittee that wishes to establish the affirmative defense of an upset in an action brought for non compliance shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:

   a) An upset occurred and that the Permittee can identify the cause(s) of the upset;

   b) The permitted facility was being properly operated by the time of the upset;

   c) The Permittee submitted notice of the upset as required; and,

   d) The Permittee complied with any remedial measures required.

2. No determination made before an action for noncompliance, such as during administrative review of claims that non-compliance was caused by an upset, is final administrative action subject to judicial review.

[5] *Supra*. See footnote number 2.

3. In any enforcement proceeding, the Permittee seeking to establish the occurrence of an upset has the burden of proof.

O. Property Rights [40 CFR 122.41(g)]

This Order does not convey any property rights of any sort, or any exclusive privilege.

P. Enforcement

1. Violation of any of the provisions of the NPDES permit or any of the provisions of this Order may subject the violator to any of the penalties described herein, or any combination thereof, at the discretion of the prosecuting authority; except that only one kind of penalties may be applied for each kind of violation. The Clean Water Act provides the following:

   a) Criminal Penalties for:

      (1) Negligent Violations:

      The CWA provides that any person who negligently violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $2,500 nor more than $25,000 per day for each violation, or by imprisonment for not more than 1 year, or both.

      (2) Knowing Violations:

      The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

      (3) Knowing Endangerment:

      The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than $250,000, or by imprisonment for not more than 15 years, or both.

      (4) False Statement:

      The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine

of not more than $10,000 or by imprisonment for not more than two years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than four years, or by both. (See section 309(c)(4) of the Clean Water Act.)

b) Civil Penalties

The CWA provides that any person who violates a permit condition implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed $27,500 per day for each violation.

2. The CWC provides that any person who violates a waste discharge requirement provision of the CWC is subject to civil penalties of up to $5,000 per day, $10,000 per day, or $25,000 per day of violation; or when the violation involves the discharge of pollutants, is subject to civil penalties of up to $10 per gallon per day or $25 per gallon per day of violation; or some combination thereof, depending on the violation or combination violations.

Q. Need to Halt or Reduce Activity not a Defense [40 CFR 122.41(c)]

It shall not be a defense for a Permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order.

R. Rescission

Regional Board Order No. 96-054 is hereby rescinded.

S. Expiration

This Order expires on November 29, 2006. The Principal Permittee must submit a Report of Waste Discharges and a proposed Storm Water Quality Management Program in accordance with Title 23, California Code of Regulation, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

I, Dennis A. Dickerson, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on November 29, 2001.

_____

Dennis A. Dickerson

Executive Officer

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

MONITORING AND REPORTING PROGRAM - CI 6948

FOR

MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES, AND THE INCORPORATED CITIES, EXCEPT THE CITY OF LONG BEACH

(NPDES PERMIT NO. CAS004001)

I. Program Reporting Requirements

The Principal Permittee shall submit, no later than October 15 of each year beginning in the year 2002, a unified Annual Storm Water Report (unified Annual Report) documenting the progress of Permittee implementation of the SQMP and the requirements of this Order. The unified Annual Report shall contain a section covering common activities conducted collectively by the Permittees, and an integrated summary of the Monitoring Program results. Each Permittee shall submit an individual Annual Report to the Principal Permittee, by the date determined by the Principal Permittee, to be included in the unified Annual Report. The unified Annual Reports shall cover each fiscal year from July 1 through June 30. The first unified Annual Report, to be submitted on October 15, 2002, shall include the period from July 1, 2001 through June 30, 2002. Specific requirements that must be addressed in the Annual Reports are listed below.

A. Unified Annual Report

The Principal Permittee shall include the following in the unified Annual Report:

1. A compilation of Permittee Individual Annual Reports.

2. Proposed changes to the SQMP, as recommended by the WMCs.

~~3. An assessment of the effectiveness of SQMP requirements to reduce storm water pollution. This assessment will be based upon the specific record-keeping information requirement in each major section of the permit, monitoring data, summaries of program effectiveness from each Permittee, and any other information related to program effectiveness. The program assessment shall include summaries of the following:~~

~~a) Summary of common activities conducted by all Permittees;~~

~~b) County-wide BMP implementation;~~

~~c) Identification of management measures proven to be effective and/or ineffective at reducing urban runoff pollutants and flow;~~

~~d) Permittee level of effort;~~

~~e) Integrated summary of Monitoring Program results, including the identification of water quality improvements or degradation, and~~

~~recommendations for improvements to the SQMP (including proposed BMPs) based on the results from the monitoring program. When exceedances of applicable water quality standards have been identified, a discussion of how Permittees will comply with the requirements in Part 2 of this Order (Receiving Water Limitations) shall be included.~~

Evaluate the results of analyses from the Monitoring Program to measure the effectiveness of the SQMP.

The principal permittee will organize the data and compile the annual report. The principal permittee will not evaluate the performance of the 84 other permittees.

The concept of a principal permittee is for the administrative convenience of Regional Board staff. There is no statutory or regulatory basis for designating a party as a principal permittee. Instead, the regulations specifically provide that co-permittees stand on equal footing to each other. 40 CFR §122.26(d) specifically provides "Where more than one public entity owns or operates a municipal separate storm sewer system within a geographic area (including adjacent or interconnected municipal separate storm sewer systems), such operators may be a coapplicant to the same application."

The Los Angeles Flood Control District has voluntarily agreed to assume significant administrative tasks as the "principal permittee" in order to further the interests of the storm water program. The principal permittee is not, however, in a position where it can assume the task of evaluating the performance of the other permittees, nor would it be appropriate for the principal permittee to do so.

It is more appropriate to link the SQMP and the result of analyses from the Monitoring Program together. The Regional Board should specify how to relate the result of the monitoring program with the SQMP.

~~4. A Receiving Water Limitations (RWL) Compliance Report shall be attached to the unified Annual Report every alternate year, beginning in 2003. The RWL Compliance Report shall include the following:~~

~~a) A plan to comply with the RWL (Order 01-XXX, Part 2);~~

~~b) Changes to the SQMP to eliminate water quality exceedances;~~

~~c) Enhanced monitoring to demonstrate compliance; and~~

~~d) Results of implementation.~~

~~If all water quality exceedances have been abated, a RWL Compliance Report is not required.~~

There is no authority to order a Receiving Water Limitations Compliance Report as part of the annual report. In addition, this paragraph is inconsistent with the procedure set forth in Part 2.3.a of the Permit (Receiving Water Limitations).

There is no statutory authority for a "Receiving Water Limitations Compliance Report" to be attached to the Annual Report. 40 CFR § 122.42(c) requires an operator of a MS4 that has been designated under §122.26(a)(1)(v) to submit an annual report. The report shall include, in pertinent part, "(4) A summary of data, including monitoring data, that is accumulated throughout the reporting year." There is no requirement that the report contain a "Receiving Water Limitations Compliance Report."

This paragraph is also inconsistent with the part of the permit it seeks to implement. Part 2 of the Permit sets forth receiving water limitations. Paragraph 3 of that part sets forth the procedure to be followed upon a determination that discharges are causing or contributing to an exceedance of an applicable water quality standard. The procedure set forth herein is inconsistent with the procedure in Part 2 of the Permit. This paragraph unilaterally orders a report in 2003, and a second report two years later whereas Part 2 states that as long as a permittee has complied with the procedures of that paragraph, the permittee does not have to repeat the same procedure.

B. Individual Annual Reports

Each individual Annual Report shall document and describe all activities conducted by a Permittee to meet all requirements of this Order, during the past annual reporting period. Individual Annual Reports shall use the attached form (Attachment U-5), or create another reporting format that includes all items on the attached form. Each Permittee shall complete the form in its entirety, except for those requirements applicable only to the Principal Permittee, as indicated on the form. Status of compliance with permit requirements including implementation dates for all time-specific deadlines should be included for each program area. If permit deadlines are not met, Permittees shall report the reasons why the requirement was not met and how the requirements will be met in the future, including projected implementation dates. A comparison of program implementation results to performance standards established in this Order and in the SQMP shall be included for each program area.

C. Monitoring Program Management

The Principal Permittee shall submit a Storm Water Monitoring Report (Monitoring Report) on August 15, 2002, and annually on August 15, thereafter. The Monitoring Report to be submitted on August 15, 2002 shall include the results of monitoring from July 1, 2001 through June 30, 2002. Each Monitoring Report shall include:

1. Status of implementation of the monitoring program.

2. Data, results, methods of evaluating the data, graphical summaries of the data, and an explanation/discussion of the data for each component of

the monitoring program, including any specific reporting requirements included in Section II. Monitoring Program. ~~All data shall be compared to applicable water quality standards in the Ocean Plan, the Basin Plan, the California Toxics Rule (CTR), and California Title 22 (Title 22).~~

It is not clear what water quality standards are applicable to each monitoring component. Detailed guidelines need to be provided if the comparison is necessary.

3. An analysis of the findings of each monitoring program component. The analysis shall identify and prioritize water quality problems. Based on the identification and prioritization of water quality problems, the analysis shall identify potential sources of the problems, and recommend future monitoring and BMP implementation measures for identifying and addressing the sources. The analysis shall also include an evaluation of the effectiveness of existing control measures. The analyses described above will be conducted if appropriate data is available.

   Structure of the monitoring program in this draft may not provide enough information to perform pollutant source analysis and evaluate the effectiveness of control measures. In addition, the mechanism of the analyses is not specified. We recommend that the Regional Board develop a manual that describes all procedures and responsible parties that identify and prioritize water quality problems, identify potential sources and evaluate the effectiveness of control measures.

4. Identification and analysis of any long-term trends in storm water or receiving water quality.

5. An estimation of total pollutant loads due to storm water/urban runoff for each mass emission station.

6. ~~An assessment of compliance with applicable water quality standards for each component of the monitoring program. The lowest applicable standard from the Basin Plan, the Ocean Plan, the CTR, or Title 22 shall be used as a comparison. When data indicate that discharges are causing or contributing to exceedances of applicable water quality standards, a discussion of how Permittees plan to comply with the requirements of Part 2 of this Order (RWL) shall be included.~~

   This paragraph is inconsistent with the part of the permit it seeks to implement. Part 2 of the Permit sets forth receiving water limitations. Paragraph 3 of that part sets forth the procedure to be followed upon a determination that discharges are causing or contributing to an exceedance of an applicable water quality standard. The procedure set forth herein is inconsistent with the procedure in Part 2. Part 2 of the permit requires the permittee whose discharge is contributing to an exceedance of an applicable water quality standard to notify the Board and submit a report. This paragraph appears to place the burden on the Principal Permittee to undertake this task as part of the Storm Water Monitoring Report. There is no legal basis for imposing this obligation on the Principal Permittee as part of its voluntary agreement to prepare the Storm Water Monitoring Report.

Additionally, this paragraph appears to require a report each time there is an exceedance. Part 2 of the permit states that as long as a permittee has complied with the procedures of that paragraph, the permittee does not have to repeat the same procedure.

7. Recommendations for improvements ~~to the SQMP and~~ to the monitoring program ~~to address water quality exceedances and potential pollutant sources~~.

   The SQMP evaluation is redundant with Part I.A.3. The language for recommendations to the monitoring program is vague. It needs to describe how to evaluate the monitoring program and make recommendations for improvements in detail.

8. For each monitoring component, maps of all monitoring station locations and descriptions of each location.

9. All monitoring reports shall be submitted in both electronic and paper formats.

D. The Principal Permittee shall, not later than December 15, 2005, prepare and submit an Integrated Receiving Water Impacts Report. The report shall include, but not be limited to, a comprehensive analysis of the results of the data from each component of the monitoring program, and other pertinent studies available, and feasible environmental indicators. It should also include a budget summary for each monitoring requirement and recommendations on future monitoring requirements. This report will be an integral part of the ROWD.

Does the 2004-2005 annual monitoring report need to be submitted on August 15, 2005 in addition to the integrated report?

E. All applications, reports, or information submitted to the Regional Board shall be signed and certified pursuant to US EPA regulations at 40 CFR 122.41 (k). Each report shall contain the following completed declaration:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility, of a fine and imprisonment for knowing violations.

Executed on the ___ day of _____ , 20_,

at _____.

(Signature)_____(Title)_____";

Permittee submittals to the Principal Permittee shall also be signed and certified pursuant to EPA regulations 40 CFR 122.41 (k).

The Principal Permittee shall mail the original of each annual report to:

INFORMATION TECHNOLOGY
CALIFORNIA REGIONAL WATER QUALITY
CONTROL BOARD - LOS ANGELES REGION
320 W. 4TH STREET, SUITE 200
LOS ANGELES, CA 90013

A copy of the annual report shall also be mailed to:

REGIONAL ADMINISTRATOR
ENVIRONMENTAL PROTECTION AGENCY
REGION 9
75 Hawthorne Street
San Francisco, CA 94105

II. Monitoring Program

The primary objectives of the Monitoring Program include, but are not limited to: 1) assessing compliance with this Order; 2) measuring and improving the effectiveness of the SQMPs; 3) assessing the chemical, physical, and biological impacts of receiving waters resulting from urban runoff; 4) characterization of storm water discharges; 5) identifying sources of pollutants; and 6) assessing the overall health and evaluating long-term trends in receiving water quality. Ultimately, the results of the monitoring requirements outlined below should be used to refine the SQMP for the reduction of pollutant loadings and the protection and enhancement of the beneficial uses of the receiving waters in Los Angeles County.

The Principal Permittee and Permittees shall implement the Monitoring Program as follows:

CORE MONITORING

A. Mass Emissions

The Principal Permittee shall monitor mass emissions to accomplish the following objectives: 1) estimate the mass emissions from the MS4; 2) assess trends in the mass emissions over time; and 3) determine if the MS4 is contributing to exceedances of water quality objectives by comparing results to objectives in the Basin Plan, the Ocean Plan, the CTR, Title 22, and with emissions from other dischargers.

1. The Principal Permittee shall monitor mass emissions from the following seven mass emission stations: Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, Coyote Creek, Dominguez Channel, and the Santa Clara River[1]. The Principal Permittee shall monitor the first storm event and a minimum of 2 additional storm events for each season. A minimum of two dry weather samples per year at each mass emission

[1] Regional Board staff will work with the Principal Permittee to determine an appropriate location for the Santa Clara River station.

station shall also be analyzed. Sampling at all stations shall begin no later than (the effective date of this Order), except for sampling in the Santa Clara River, which will begin no later than (the following wet season).

2. All storms events, in addition to those required above, that result in at least 0.25 inches of rainfall shall be sampled and analyzed for TSS. Results shall be used to assess the variability of storm water constituents and provide a more accurate estimate of mass emissions (pollutant correlation with TSS). This requirement does not apply to manual sampling stations.

3. Samples for mass emission monitoring may be taken with the same type of automatic sampler used under Order 96-054. Grab samples shall be taken for pathogen indicators and oil and grease. The samplers shall be set to monitor storms that produce 0.25 inches or greater of rainfall. Samples taken at mass emission stations during the first storm event of the wet season shall be analyzed for all constituents listed in Attachment U-1.

4. Manual samples shall be collected from mass emission stations where it is not feasible to install an automatic sampler (Santa Clara River). Manual samples shall be flow-weighted composites, collected during the first 3 hours, or for the duration of the storm if it is less than 3 hours. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge[2], unless the Regional Board Executive Officer approves an alternate protocol.

5. Samples from mass emission stations shall be analyzed for all constituents listed in Attachment U-1. If a constituent is not detected at the method detection limit for its respective test method listed in Attachment U-1 in more than 75 percent of the first 48 (?) sampling events, it need not be further analyzed unless the observed occurrences show concentrations greater than state water quality standards. The Principal Permittee will also conduct annual confirmation sampling for non-detected constituents during the first storm of the wet season every year at each station.

   There will be 15 and 10 station-events per station for wet weather and dry weather, respectively, during this permit period; therefore, the total station-events per station will be up to 25.

6. The Principal Permittee shall perform an annual analysis, to be included in the Monitoring Report, of the correlation between pollutants of concern (including but not limited to metals and PAHs) and TSS loadings for the sampling events that are analyzed for the full suite of constituents.

B. Water Column Toxicity Monitoring

The Principal Permittee shall analyze mass emission samples for toxicity to evaluate the extent and causes of toxicity in receiving waters and to modify and

[2] Required in 40 CFR 122.21(g)(7)(ii), and described in NPDES Storm Water Sampling Guidance Document EPA 833-B-92-001. Time-weighted samples may be appropriate if flow is measured during sampling.

utilize the SQMP to implement practices that eliminate or reduce sources of toxicity in storm water.

1. The Principal Permittee shall analyze samples from two storm events (including the first storm of each year) and two dry weather events from each mass emission station for toxicity every year. A minimum of one freshwater and one marine species shall be used for toxicity testing. Specifically, *Ceriodaphnia dubia* (water flea) survival and *Strongylocentrotus purpuratus* (sea urchin) fertilization shall be used. Only *Ceriodaphnia dubia* shall be used for toxicity testing of samples from the Santa Clara mass emission station.

   Since the portion of the Santa Clara River watershed in LA County doesn't drain into the ocean directly, toxicity test with *Strongylocentrotus purpuratus* (sea urchin) is not necessary. During the 2001-2002 storm season, the first storm of the year may be missed because the storm season has already started before issuance of the permit.

2. Toxicity Identification Evaluations (TIE)

   The Principal Permittee shall begin a Phase I TIE ~~immediately on all samples that are substantially toxic to either test species~~ on wet weather samples when three consecutive samples from the same monitoring station show substantial toxicity and on dry weather samples when three consecutive dry weather samples from the same monitoring station show substantial toxicity. If a sample is substantially toxic to both species, a TIE shall be performed for both species. Substantial toxicity means the amount of toxicity necessary to successfully conduct a Phase I TIE. For example, *Ceriodaphnia* TIEs require at least 50% mortality in undiluted sample at any time during the 7-day duration of the initial chronic bioassay.[3]

   The criterion for a TIE described above is not consistent with ones used in other studies. For example, the trigger to performing a TIE for the Long Beach study conducted in 2000-2001 was the presence of substantial toxicity for three consecutive samples at a given site.

3. Toxicity Reduction Evaluations (TRE)

   a) If a discharge from the MS4 is identified to cause or contribute to toxicity in a receiving water body, a TRE shall be performed. TRE development shall be performed by a neutral third party (retained by the Principal Permittee), with input from Permittees and Regional Board staff. The TRE shall include all reasonable steps to identify the source(s) of toxicity and discuss appropriate BMPs to eliminate the causes of toxicity. Once the source of toxicity and appropriate BMPs are identified, the Principal Permittee shall submit the TRE to the Regional Board Executive Officer for approval. At a minimum, it shall include a discussion of the following items:

      (1) The potential sources of pollutant(s) causing toxicity;

[3] SCCRWP

~~(2) A list of municipalities that may have jurisdiction over sources of pollutant(s) causing toxicity;~~

Once locations of the potential sources of pollutant(s) are identified, it is the Regional Board's role to identify municipalities that may have jurisdiction over the sources.

(3) Recommended BMPs to reduce the pollutant(s) causing toxicity;

(4) Proposed changes to the SQMP to reduce the pollutant(s) causing toxicity; and

(5) Suggested follow-up monitoring to demonstrate that toxicity has been removed.

b) If TRE implementation for a specific pollutant coincides with TMDL implementation for that pollutant, the efforts may be coordinated.

c) Upon approval by the Regional Board Executive Officer, the Permittee(s) having jurisdiction over sources causing or contributing to toxicity shall implement the recommended BMPs and take all reasonable steps necessary to eliminate toxicity.

d) The Principal Permittee shall be responsible for the development of a maximum of two TREs per year. If applicable, the Principal Permittee may use the same TRE for the same toxic pollutant or pollutant class in different watersheds. The TRE process shall be coordinated with TMDL development and implementation (ie. If a TMDL for zinc is being implemented when a TRE for zinc is required, the efforts shall be coordinated to avoid overlap).

e) The Principal Permittee shall report on the development, implementation, and results for each TRE in the annual Monitoring Reports, beginning the year following the identification of each pollutant or pollutant class causing toxicity.

C. Tributary Monitoring

The Principal Permittee shall monitor tributaries to identify sub-watersheds where storm water discharges are causing or contributing to exceedances of water quality standards, and to prioritize drainage and sub-drainage areas that need management actions.

1. The Principal Permittee shall develop and implement a watershed-based tributary monitoring program, in which a minimum of six tributaries per WMA will be monitored, based on the schedule described below:

a) Monitoring station locations will be rotated so that a minimum total of six tributaries will be monitored per year. Each tributary shall be monitored for a minimum period of one year. If no exceedances of applicable water quality standards occur during one year of monitoring at a single tributary station, the Principal Permittee may move that monitoring station to another tributary,

subject to the approval of the Regional Board Executive Officer. When an applicable water quality standard is exceeded in three out of four sampling events in a given monitoring year, the Permittees shall initiate a focused effort to identify sources of pollutants within that subwatershed.

b) Tributary monitoring shall begin in the Los Angeles River WMA, and shall be rotated to locations in other watersheds as monitoring at each station is complete, as approved by the Regional Board Executive Officer. The Principal Permittee shall include a description and explanation of each proposed station location and a summary of the prior year's results of the tributary monitoring program in the annual Monitoring Report.

c) Monitoring shall begin at the following tributaries:

(1) Aliso Creek
(2) Bull Creek
~~(3) Compton Creek~~
(4) Rio Hondo Channel
(5) Burbank Western
(6) ~~Verdigo~~ Verdugo Wash

The site at Compton Creek and Greenleaf has security problems for sampling personnel. We recommend the Regional Board choose an alternative location.

2. Tributary monitoring shall begin (no later than the effective date of this Order).

3. The Principal Permittee shall monitor the first storm event and at least 3 additional storm events during each storm season. At least one dry weather event per year will also be sampled at each station.

4. Samples shall be flow-weighted composites, collected during the first 3 hours or for the duration of the storm if it is less than 3 hours. Samples may be collected manually or automatically. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge[4], unless the Regional Board Executive Officer approves an alternate protocol. Samples shall be taken just upstream of the tributary's confluence with the mainstem. Constituents to be analyzed for each location shall include the following:

a) pH, dissolved oxygen, temperature, conductivity, and total suspended solids;

b) Indicator bacteria;

[4] Required in 40 CFR 122.21(g)(7)(ii), and described in NPDES Storm Water Sampling Guidance Document EPA 833-B-92-001. Time-weighted samples may be appropriate if flow is measured during sampling.

c) All priority pollutants (Attachment U-1) for the first storm of the year;

d) All constituents for which the water body is impaired downstream of the monitoring station[5];

e) All constituents that caused toxicity or exceeded any applicable water quality criteria at the associated mass emission station the previous year. These constituents shall be listed in each Monitoring Report.

There is a need for more discussion about selection of the constituents described above.

~~f) Flow (flow may be estimated using EPA methods[6] at sites where flow measurement devices are not in place).~~

Measuring flow is not necessary to meet the objectives of this component.

D. Shoreline Monitoring

The City of Los Angeles shall monitor shoreline stations to evaluate the impacts to coastal receiving waters and the loss of recreational beneficial uses resulting from storm water/urban runoff. This component shall be integrated and coordinated with similar monitoring programs in the region.

1. The City of Los Angeles shall monitor eighteen water quality sampling stations along the shoreline of the Pacific Ocean within the Santa Monica Bay to determine compliance with the California's bathing water standards for public beaches and ocean water-contact sport areas[7], and the related impacts of discharges from storm drains and piers. The shoreline monitoring program shall be implemented as follows:

   a) The eighteen established shoreline water quality stations listed in Attachment U-3 shall be monitored. Station locations may be modified based on recommendations from the Santa Monica Bay Restoration Project (SMBRP) and approval from the Regional Board Executive Officer;

   b) Three indicator groups shall be tested for using either membrane filtration, multiple tube fermentation, or chromogenic substrate test kits. Monitoring shall include the following types and frequencies of sampling:

Parameter	Units	Sample Frequency
Total coliforms	CFU or MPN/100 ml	6/week (Mon-Sat)[8]
Fecal coliform[9]	CFU or MPN/100 ml	6/week (Mon-Sat)[5]
Enterococcus	CFU or MPN/100 ml	6/week (Mon-Sat)[5]

[5] The 1998 California 303(d) List and TMDL Priority Schedule lists pollutants for which each water body is impaired, www.swrcb.ca.gov/tmdl/docs/303d98.pdf#reg4

[6] NPDES Storm Water Sampling Guidance Document, EPA 833-B-92-001, July 1992

[7] California Department of Health Services, Health and Safety Code §115880 (Assembly Bill 411, Statutes of 1997, Chapter 765

[8] Samples will be collected on Sundays preceding Monday holidays

[9] *Escherichia Coli (E. Coli)* may be substituted for Fecal Coliform if chromogenic substrate test kits are used

c) Shoreline monitoring shall occur during daylight hours. Samples may be omitted in the event of hazardous weather;

d) Shoreline monitoring frequencies at certain stations may be modified based on the use of the adjacent beaches and their proximity to storm drains, as recommended by the SMBRP's Technical Advisory Committee and the Los Angeles County Department of Health Services (LA County DHS).

e) Data collected shall be transmitted daily to the LA County DHS. The City of Los Angeles will annually assess the data and submit it to the Principal Permittee for inclusion in the Monitoring Report;

f) When exceedances of public health standards for bacteria occur, the LA County DHS shall take the appropriate action, as described in the Regulations for Public Beaches and Ocean Water-Contact Sports Areas[10].

g) The City of Los Angeles will continue to conduct all monitoring, testing, and data transferring actions as part of the SMBRP regional program for the Santa Monica Bay.

~~E. Trash Monitoring~~

~~Permittees shall conduct trash monitoring to assess likely sources and to identify areas impaired for trash. The Principal Permittee and the Permittees in the Los Angeles River and Ballona Creek WMAs (listed in Attachment A) shall develop and implement a trash monitoring program for the Los Angeles River and Ballona Creek watersheds no later than October 15, 2002. The monitoring program and schedule shall be consistent with and pursuant to the CWC §13267 Request for Trash Monitoring, issued by the Regional Board on [date letter issued]. All other Permittees shall begin implementation of the trash monitoring program in watersheds that are not presently listed on the CWA §303(d) list for impairment for trash no later than October 15, 2003.~~

~~1. Either of the following formats for monitoring plans may be used:~~

~~a) For each watershed, the group of Permittees in that watershed will capture and quantify trash from an area no less than 10% of the total land area over which they have jurisdiction. The monitoring areas shall represent 10% of every land use the group of Permittees has jurisdiction over. If storm drain configuration versus land use make the representation of 10% of a land use infeasible, the Permittees can choose areas that represent their land uses as accurately as possible, as long as the extent of the surface being monitored represents 10%. This monitoring shall use full capture devices. During wet weather, all sampling devices will be emptied within 72 hours of every rain event of 0.25 inch or greater. During dry weather, sampling devices will be emptied and analyzed every three months in the absence of precipitation.~~

[10] Regulations for Public Beaches and Ocean Water-Contact Sports Areas, Title 17 CCR Group 10, developed in response to Health and Safety Code §115880

~~b) For each watershed, the group of Permittees in that watershed will sample a minimum of ten representative sites for each land use monitored. For each sampling site, a minimum of five catch basins will be fitted with inserts, for a total of not less than 50 catch basin inserts per land use monitored. The existing littler removal practices that the cities implement will remain in place, so that monitoring will evaluate how much trash is washed into the system under current practices. A structural, full capture device shall be installed downstream of at least one sampling site for each land use monitored. For this sampling site, all of the catch basins that are upstream of the full capture monitoring device must be fitted with inserts. This configuration will provide information on the relative effectiveness of the catch basin inserts as opposed to the full capture systems in varying land uses and under varying weather conditions. During wet weather, all sampling devices will be emptied within 72 hours of every rain event of 0.25 inch or greater. During dry weather, sampling devices will be emptied and analyzed every three months in the absence of precipitation.~~

~~2. Permittees shall report data in a single unit of measure that is reproducible and measures the amount of trash, irrespective of water content (e.g. compacted volume based on a standardized compaction rate, or dry weight). Permittees may select the unit, but all Permittees must use the same unit of measure.~~

~~3. Following the first two years of data collection, Permittees shall calculate trash loading as a running three-year average (estimated total load discharged from 2003-2006, divided by three).~~

~~4. All trash collected shall be disposed of in compliance with all applicable regulations.~~

This section is inconsistent with the monitoring provisions of the newly adopted Trash TMDLs for the Los Angeles River and the Ballona Creek watersheds. The Trash TMDLs provide for baseline monitoring for two years. Thereafter, a compliance monitoring program is to be implemented. Compliance monitoring may be different than baseline monitoring. In contrast, this permit imposes the baseline monitoring procedures on the permittees for the entire 5-year period of the permit.

In addition, it is neither appropriate nor necessary to impose the same monitoring provisions on unimpaired watersheds commencing October 15, 2003. The monitoring program for trash in the unimpaired watersheds could cost as much as $5 million for those watersheds alone. Expenditure of this money for this purpose will leave no money for other monitoring programs.

REGIONAL MONITORING

The Principal Permittee shall participate on regional monitoring committees to help establish on-going regional programs that address public health concerns, monitor trends in natural resources and nearshore habitats, and assess regional impacts from all pollutant sources. Regional Monitoring participation shall include, but not necessarily be limited to, the efforts described below.

F. Estuary Sampling

The Southern California Coastal Waters Research Project (SCCWRP), in conjunction with the USEPA, the State Board, three Regional Boards, and participating dischargers, has organized an effort to implement a regional monitoring program for the southern California bight. Previous studies (in 1994 and 1998) included microbiology, water quality, sediment chemistry, sediment toxicity testing, benthic infauna, demersal fish, and bioaccumulation. A similar bight-wide monitoring effort is planned to be conducted in 2003. The Principal Permittee shall participate on the Steering Committee for this bight-wide monitoring project, and should complete the estuary sampling requirement described below in parallel with this effort.

In addition to participation in the Bight-wide study, the goal of this requirement is to sample estuaries for sediment chemistry, sediment toxicity, and benthic macroinvertibrate community to determine the spatial extent of sediment fate from storm water, and the magnitude of its effects. A map of each estuary which depicts the impacted areas shall be produced. The maps shall provide the information necessary to conduct effective sediment monitoring to determine trends and accumulation, as a future permit requirement.

1. The Principal Permittee shall sample a maximum of 25 sites in each estuary/mouth (Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, and Dominguez Channel) once during the permit cycle. Sediment samples shall be taken at each station by means of a $0.1m^2$ ($1.1 ft^2$) modified Van Veen sediment grab sampler.

2. The Principal Permittee shall also sample a total of 25 sites outside of the direct outfalls to assess cumulative effects.

3. All samples shall be analyzed for the following:
   a) Sediment Chemistry (priority pollutants)
   b) Total Organic Carbon (TOC)
   c) Grain size
   d) Sediment Toxicity
      (1) Amphipod survival bioassays shall be conducted on each sediment sample. Toxicity shall be indicated by an amphipod survival rate of 70% or less in a single test.
      (2) Phase I TIEs of interstitial water, using Ceriodaphnia dubia and Strongylocentrotus purpuratus (sea urchin) fertilization, shall be conducted for samples from stations identified to be toxic in a single amphipod survival bioassay.
   e) Benthic Macroinvertibrates
      (1) All sediment samples shall be passed through a 1.0mm (0.039 in) screen to retrieve the benthic organisms. Benthic epifauna and infauna shall be analyzed to determine the structure of the benthic community.

(2) The Principal Permittee shall identify all organisms to lowest possible taxon.

(3) The Principal Permittee shall determine the Total Biomass of:

(i) Mollusks
(ii) Echinoderms
(iii) Annelids/polychaetes
(iv) Crustaceans
(v) All other macroinvertebrates

(4) The Principal Permittee shall determine the community structure analysis, including wet weight of each taxonomic group (listed above), number of species, number of individuals per species, total numerical abundance, species abundance per grab, species richness, species diversity, species evenness and dominance, similarity analysis, cluster analyses, or other appropriate multivariate statistical techniques approved by the Regional Board Executive Officer, and the Infaunal Index[11].

4. The Principal Permittee shall create a map of each estuary depicting degraded areas and the spatial distribution of sediment from storm water. In the Integrated Monitoring Report, the Principal Permittee shall suggest appropriate locations for regular sediment monitoring, based on the results of this study.

G. Bioassessment

The Principal Permittee shall continue participation on the Stormwater Monitoring Coalition (SMC), as well as coordinate with the Surface Water Ambient Monitoring Program (SWAMP) being developed the State Board to complete this requirement. The Regional Board anticipates that the SMC will organize an effort to evaluate the biological index approach for southern California and to design a research project for developing an Index of Biological Integrity (IBI) for this region. The SWAMP has begun work on a statewide effort to determine how to identify reference sites with the goal of IBI development.

The purpose of this requirement is to detect biological trends in receiving waters and to collect data for the development of an IBI for southern California. The ultimate goals of bioassessment are to assess the biological integrity of receiving waters, to detect biological responses to pollution, and to identify probable causes of impairment not detected by chemical and physical water quality analysis.

1. The Principal Permittee shall coordinate with the SMC and SWAMP to identify the most appropriate locations for bioassessment stations within Los Angeles County.

[11] Benthic Response Index for Assessing Infaunal Communities on the Mainland Shelf of Southern California, the SCCWRP

2. Station selection shall be complete within one year from the date this Order is adopted, and sampling shall begin no later than October of 2003.

3. The Principal Permittee shall monitor a minimum of 20 bioassessment stations in October of each year, beginning in 2003. A minimum of three replicate samples shall be collected at each station during each sampling event.

4. A professional environmental laboratory shall perform all laboratory, quality assurance, and analytical procedures. The Principal Permittee may collect samples when properly trained in CSBP methods. The Principal Permittee shall develop Standard Operation Procedures (SOPs) for the Bioassessment Monitoring Program that describes all procedures and responsible parties. The SOPs must contain step-by-step field, laboratory and data entry procedures, as well as, related QA/QC procedures. There must also be specific information about the bioassessment program including: assessment program description, its organization and the responsibilities of all its personnel; assessment project description and objectives; qualifications of all personnel; and the type of training each member has received. A copy of the SOPs shall be available to the Regional Boar Executive Officer upon request.

5. Field sampling must conform to the SOP established for the California Stream Bioassessment Procedure (CSBP) when appropriate. For sampling of aquatic environments where the CSBP is not appropriate (i.e., an estuary or unwadable stream), California Department of Fish and Game and the Regional Board Executive Officer shall be consulted in order to determine the most appropriate protocol to be implemented. Field crews shall be trained on aspects of the protocol and appropriate safety issues. All field data and sample Chain of Custody (COC) forms must be examined for completion and gross errors by the field crews, the receiving laboratory, and the Principal Permittee. These forms shall be available to California Department of Fish and Game or the Regional Board Executive Officer upon request. Field inspections should be planned with random visits and should be performed by the Principal Permittee, if properly trained in CSBP methods, or an independent auditor. These visits should report on all aspects of the field procedure with corrective action occurring immediately.

6. Taxonomic identification laboratories process the biological samples that usually consist of subsampling organisms, enumerating and identifying taxonomic groups and entering the information into an electronic format. There should be intra-laboratory QA/QC results for subsampling, taxonomic validation and corrective actions. Biological laboratories should also maintain reference collections, vouchered specimens (the Principal Permittee can request return of their sample voucher collections) and remnant collections. Biological laboratories shall participate in an inter-laboratory (external) taxonomic validation program at a recommended level of 20% for the first two years of the program. If there are no substantial QA/QC problems, the level of external validation may be decreased to 10% in year three upon approval from the Regional

Board. External QA/QC should be arranged through the California Department of Fish and Game's Aquatic Bioassessment Laboratory in Rancho Cordova.

7. Sampling, laboratory, quality assurance, and analysis procedures shall follow the standardized "Non-point Source Bioassessment Sampling Procedures" for professional bioassessment as set forth in the California Department of Fish and Game California Stream Bioassessment Procedure (CSBP)[12]. The following results and information shall be included in the annual Monitoring Report:

   a) All physical, chemical and biological data collected in the assessment;

   b) Photographs and GPS locations of all stations;

   c) Documentation of quality assurance and control procedures;

   d) Analysis that shall include calculation of the metrics used in the CSBP;

   e) Comparison of mean biological and habitat assessment metric values between stations and year-to-year trends;

   f) Electronic data formatted to the California Department of Fish and Game Aquatic Bioassessment Laboratory for inclusion in the Statewide Access Bioassessment Database; and

   g) Copies of all QA/AC documents from laboratories.

SPECIAL STUDIES

H. New Development Impacts Study in the Santa Clara Watershed

The Principal Permittee, with support from the City of Santa Clarita, shall monitor tributaries in the Santa Clara watershed to determine impacts from new development and to compare storm water quality between subwatersheds with and without SUSMPs.

1. The Principal Permittee, in cooperation with the City of Santa Clarita, shall select one station that is representative of a subwatershed in which the majority of development has occurred without SUSMP implementation, and one station (SUSMP station) in a subwatershed in which the majority of the development has/will include SUSMP implementation. Other inputs to runoff, such as septic systems, in the two subwatersheds should be similar.

2. The Principal Permittee shall coordinate with the City of Santa Clarita and the Regional Board to develop a proposed study design, including a description of the drainage areas to be monitored and sampling locations, no later than 180 days from the date this Order is adopted. If appropriate,

[12] California Stream Bioassessment Procedure (Protocol Brief for Biological and Physical/Habitat Assessment in Wadeable Streams), California Department of Fish and Game - Aquatic Bioassessment Laboratory, May 1999. Located at www.dfg.ca.gov/cabw/protocols.html.

this study may be conducted in conjunction with the Peak Discharge Impact Study, described below.

3. The Principal Permittee shall monitor the first storm event and at least 2 additional storm events during each storm season. At least one dry weather event per year will also be sampled at each station.

4. Samples shall be flow-weighted composites, collected during the first 3 hours, or for the duration of the storm if it is less than 3 hours. Samples may be collected manually or automatically. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge[13], unless the Regional Board Executive Officer approves alternate protocol. Constituents to be analyzed for each location shall include the following:

a) pH, dissolved oxygen, temperature, conductivity, chloride, nitrogen, and TSS

b) Metals: aluminum, arsenic, beryllium, cadmium, chromium, copper, iron, lead, mercury, nickel, selenium, silver, and zinc.

c) Pathogen Indicators (Coliform)

d) PAHs

There is a need for more discussion about selection of the constituents described above.

e) Flow (flow may be estimated using EPA methods at sites where flow measurement devices are not in place)

5. The Principal Permittee shall submit an analysis of the data, including a description of each subwatershed, year-to-year changes compared to the amount of development that occurred in each, comparisons between stations, and an analysis of SUSMP effectiveness, with the fourth year Monitoring Report.

I. Peak Discharge Impact Study

~~The Principal Permittee shall conduct a study to evaluate peak flow control and to determine numeric criteria to prevent or minimize erosion of natural stream channels and banks caused by urbanization.[14] The Principal Permittee may partner with the Ventura County Flood Control District to expand the stream erosion study to the Santa Clara River watershed.~~ The Principal Permittee shall participate on the Stormwater Monitoring Coalition (SMC), and shall conduct exploratory assessment of peak flow control impact on erosion of natural stream channels and banks caused by urbanization. The study shall begin no later than (180 days from the effective date this Order).

[13] Required in 40 CFR 122.21(g)(7)(ii), and described in NPDES Storm Water Sampling Guidance Document EPA 833-B-92-001. Time-weighted samples may be appropriate if flow is measured during sampling.
[14] Permit, Part 4.D.2 (Development Planning Program) requires the development of numerical criteria for peak flow control in natural drainage systems.

J. BMP Effectiveness Study

The Principal Permittee shall conduct or participate in studies to evaluate the effectiveness of structural and treatment control BMPs. The objective of this study shall include the following:

1. Monitor the reduction of pollutants of concern in storm water (including, but not limited to: trash, suspended sediment, pathogen indicators, nutrients, heavy metals, and oil and grease) from five or more different types of BMPs that have been properly installed within the year preceding monitoring. Monitoring shall be continued until the effectiveness of the BMP can be determined.

2. Evaluate the requirements, feasibility and cost of maintenance for each BMP.

3. Develop recommendations for appropriate BMPs for the reduction of pollutants of concern in storm water in Los Angeles County.

The Principal Permittee may participate in the SMBRP's, "Performance Evaluation of Structural BMPs for Storm Water Pollution Control in the Santa Monica Bay Watershed" study to meet this requirement. Participation includes collaboration and fund contribution to cover the scope of the proposed study.

K. Standard Monitoring Provisions

All monitoring activities shall meet the following requirements:

1. Monitoring and Records [40 CFR 122.41(j)(1)]
   Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

2. Monitoring and Records [40 CFR 122.41(j)(2)] [California Water Code §13383(a)]
   The Principal Permittee and Permittees shall retain records of all monitoring information, including all calibration and maintenance of monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the Report of Waste Discharge and application for this Order, for a period of at least five (5) years from the date of the sample, measurement, report, or application. This period may be extended by request of the Regional Board or EPA at any time and shall be extended during the course of any unresolved litigation regarding this discharge.

3. Monitoring and Records [40 CFR 122.21(j)(3)]
   Records of monitoring information shall include:

   a) The date, exact place, and time of sampling or measurements;

   b) The individual(s) who performed the sampling or measurements;

   c) The date(s) analyses were performed;

d) The individual(s) who performed the analyses;

e) The analytical techniques or methods used; and,

f) The results of such analyses.

4. Monitoring and Records [40 CFR 122.21(j)(4)]

All sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this Order.

5. Monitoring and Records [40 CFR 122.21(j)(5)]

The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this Order shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than two years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by both.

6. All chemical, bacteriological, and toxicity analyses shall be conducted at a laboratory certified for such analyses by an appropriate governmental regulatory agency.

7. For priority toxic pollutants that are identified in the CTR (65 *Fed. Reg.* 31682), the MLs published in Appendix 4 of the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California - 2000* (SIP) shall be used for all analyses, unless otherwise specified. Appendix 4 of the SIP is included as Attachment U-2. For pollutants not contained in Appendix 4 of the SIP, the test method and method detection limit (MDL) listed in Appendix U-1 shall be used for all analyses, and the ML for these parameters shall be lower than or equal to the lowest applicable water quality criteria from the Basin Plan and/or the Ocean Plan.

8. The Monitoring Report shall specify the analytical method used, the MDL and the ML for each pollutant. For the purpose of reporting compliance with numerical limitations, performance goals, and receiving water limitations, analytical data shall be reported with one of the following methods, as appropriate:

   a) An actual numerical value for sample results greater than or equal to the ML;

   b) "Not-detected (ND)" for sample results less than the laboratory's MDL with the MDL indicated for the analytical method used; or

   c) "Detected, but Not Quantified (DNQ)" if results are greater than or equal to the laboratory's MDL but less than the ML. The estimated chemical concentration of the sample shall also be reported. This is the concentration that results from the confirmed detection of the substance by the analytical method below the ML value.

9. For priority toxic pollutants, if the Principal Permittee or Permittee can demonstrate that a particular ML is not attainable, in accordance with procedures set forth in 40 CFR 136, the lowest quantifiable concentration of the lowest calibration standard analyzed by a specific analytical procedure (assuming that all the method specified sample weights, volumes, and processing steps have been followed) may be used instead of the ML listed in Appendix 4 of the SIP. The Principal Permittee must submit documentation from the laboratory to the Regional Board Executive Officer for approval prior to raising the ML for any constituent.

10. Monitoring Reports [40 CFR 122.41(l)(4)(ii)]

    If the Principal Permittee monitors any pollutant more frequently than required by the permit using test procedures approved under 40 CFR part 136, unless otherwise specified in the Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the annual Monitoring Reports.

11. Monitoring Reports [40 CFR 122.41(l)(4)(iii)]
Calculations for all limitations which require averaging of measurements shall utilize an arithmetic mean unless otherwise specified in this Order.

12. If no flow occurred during the reporting period, the Monitoring Report shall so state.

13. The Regional Board Executive Officer or the Regional Board, consistent with 40 CFR 122.41, may approve changes to the Monitoring Program, after providing the opportunity for public comment, either:

    a) By petition of the Principal Permittee or by petition of interested parties after the submittal of the annual Monitoring Report. Such petition shall be filed not later than 60 days after the Monitoring Report submittal date, or

    b) As deemed necessary by the Regional Board Executive Officer following notice to the Principal Permittee.

Ordered by:

Dennis A. Dickerson
Executive Officer
Date:

Los Angeles County Municipal Storm Water Permit (Order 01-XXX)
Individual Annual Report Form

This form summarizes the requirements in Order No. 01-XXX. Each Permittee must complete this form in its entirety, except for those requirements applicable only to the Principal Permittee. Only report activities that were performed during the previous fiscal year. Upon completion, this form shall be submitted to the Principal Permittee, by the date specified by the Principal Permittee, for inclusion in the unified Annual Storm Water Program Report. Attachments should be included where necessary to provide sufficient information on program implementation.

The goals of this Report are to: 1) concisely document implementation of the Storm Water Quality Management Plan (SQMP) during the past fiscal year; 2) evaluate program results for continuous improvement; 3) to determine compliance with order 01-XXX; and 4) to share this information with other Permittees, municipal decision makers, and the public.

!	YOU MUST FILL OUT ALL THE INFORMATION REQUESTED *Do not leave any of the sections blank.*
N/A	If the question does not apply to your municipality, please indicate N/A in the space provided and provide a brief explanation
U	If the information requested is currently unavailable, please indicate U in the space provided and give a brief explanation.

Reporting Year 200__ - 200__

I. Program Management

A. Permittee Name: _____

B. Permittee Program Supervisor: _____
Title: _____
Address: _____
City: _____ Zip Code: _____
Phone: _____ Fax: _____

R0005902

C. In the space below, briefly describe how the storm water program is coordinated within your agency's departments and divisions. Include a description of any problems with coordination between departments. To facilitate this, complete the Table 1.

TABLE 1

Storm Water Management Activity	Division/Department	# of Individuals Responsible for Implementing
1. Outreach & Education		
2. Industrial/Commercial Inspections		
3. Construction Permits/Inspections		
4. IC/ID Inspections		
5. Street sweeping		
6. Catch Basin Cleaning		
7. Spill Response		
8. Development Planning (project/SUSMP review and approval)		
9. Trash Collection		

Los Angeles County Municipal Storm Water Permit (Order 01-XXX)
Individual Annual Report Form

D. Staff and Training

Attach a summary of staff training over the last fiscal year. This shall include the staff name, department, type of training, and date of training.

E. Budget Summary (Part 3.E.5)

1. Does your municipality have a storm water utility? Yes ☐ No ☐

If no, describe the funding source(s) used to implement the requirements of Order No. 01-XXX.

2. Are the existing financial resources sufficient to accomplish all required activities? Yes ☐ No ☐

3. Complete Table 2, and report any supplemental dedicated budgets for the same categories on the lines below the table.

4. List any additional state/federally funded projects related to storm water.

Los Angeles County Municipal Storm Water Permit (Order 01-XXX)
Individual Annual Report Form

TABLE 2

Program Element	Expenditures in Previous Fiscal Year	Estimated Amount Needed to implement Order 01-XXX
1. Program management a. Administrative costs b. Capital costs		
2. Public Information and Participation a. Public Outreach/Education b. Employee Training c. Corporate Outreach d. Business Assistance		
3. Industrial/Commercial inspection/ site visit activities		
4. Development Planning		
5. Development Construction a. Construction inspections		
6. Public Agency Activities a. Maintenance of structural and treatment control BMPs b. Municipal street sweeping c. Catch basin cleaning d. Trash collection/recycling e. Capital costs f. Other		
7. IC/ID Program a. Operations and Maintenance b. ~~Capitol~~ Capital Costs		
8. Monitoring		
9. Other		
10. TOTAL		

List any supplemental dedicated budgets for the above categories:

List any activities that have been contracted out to consultants/other agencies:

R0005905

Los Angeles County Municipal Storm Water Permit (Order 01-XXX)
Individual Annual Report Form

F. Receiving Water Limitations (Part 2)

1. Are you aware, or have you been notified, of any discharges from your MS4 that cause or contribute to a condition of nuisance or to the violation of any applicable water quality standards? Yes ☐ No ☐
2. Has the Regional Board notified you that discharges from your MS4 are causing or contributing to an exceedance of water quality standards? Yes ☐ No ☐
3. If you answered Yes to either of the above questions, you must attach a Receiving Water Limitations (RWL) Compliance Report. The Report must include the following:
   a) A description of the pollutants that are in exceedance and an analysis of possible sources;
   b) A plan to comply with the RWL (Order 01-XXX, Part 2);
   c) Changes to the SQMP to eliminate water quality exceedances;
   d) Enhanced monitoring to demonstrate compliance; and
   e) Results of implementation.

G. Storm Water Quality Management Plan (SQMP) Implementation (Part 3)

1. Have you developed a SQMP specific to your city that incorporates the countywide SQMP, and identifies additional provisions intended to reduce the discharges of pollutants in storm water to the maximum extent practicable? Yes ☐ No ☐
2. Describe the status of SQMP implementation.

3. List the BMPs that your city has implemented to reduce pollutants in storm water to the maximum extent practicable.

4. Watershed Management Committees (WMCs)
   a) Which WMC are you in?
   b) Who is your designated representative to the WMC?
   c) How many WMC meetings did you participate in last year?
   d) Describe specific improvements to your storm water management program as a result of WMC meetings.

e) Attach any comments or suggestions regarding your WMC.

5. Storm Water Ordinance

a) Have you adopted a Permittee-specific storm water and urban runoff ordinance to enforce all requirements of Order 01-XXX? Yes ☐ No ☐
If not, describe the status of adopting such an ordinance.

b) If yes, have you already submitted a copy of the ordinance to the Regional Board? Yes ☐ No ☐
If not, please attach a copy to this Report.

c) Were any amendments made to your storm water ordinance during the last fiscal year? Yes ☐ No ☐
If yes, submit a copy of amendments to the Regional Board.

6. Discharge Prohibitions

a) List any non-storm water discharges you feel should be further regulated:

b) List any non-storm water discharges you feel should be exempt, and provide an explanation for each:

II. Special Provisions (Part 4)

A. Public Information and Participation (Part 4.B)

In addition to answering the following questions, attach a summary of all storm water education activities that your agency conducted or participated in last year.

1. No Dumping Message (Part 4.B.1.a.)

a) How many storm drain inlets does your agency own?

b) How many storm drain inlets were marked with a no dumping message in the last fiscal year?

c) What is the total number of storm drain inlets that are legibly marked with a no dumping message?

If this number is less than the number in question 1, describe why all inlets have not been marked, the process used to implement this requirement, and the expected completion date.

d) How many public access points to creeks, channels, and other water bodies within your jurisdiction have been posted with no dumping signage in the past year?

Describe your agency's status of implementing this requirement by November 29, 2003.

2. Reporting Hotline

b) Has your agency established its own hotline for reporting and for general storm water management information? Yes ☐ No ☐

b) If so, what is the number?

c) Is this information listed in the government pages of the telephone book? Yes ☐ No ☐

d) If no, is your agency coordinated with the countywide hotline? Yes ☐ No ☐

e) How many calls were received in the last fiscal year?

f) Do you keep record of the number of calls received and how they were responded to? Yes ☐ No ☐

g) Describe the process used to respond to hotline calls.

h) Have you provided the Principal Permittee with your current reporting contact information? Yes ☐ No ☐

i) Have you compiled a list of the general public reporting contacts for all Permittees and posted it on the www.888CleanLA.com web site (*Principal Permittee only)?* Yes ☐ No ☐

If not, when is this scheduled to occur?

3. Outreach and Education

a) Describe the strategy developed to provide outreach and bilingual materials to target ethnic communities. Include an explanation of why each community was chosen as a target, how program effectiveness will be determined, and status of implementation. *(Principal Permittee only)*

b) Did the Principal Permittee organize quarterly Public Outreach Strategy meetings that you were aware of? Yes ☐ No ☐

How many Public Outreach Strategy meetings did your agency participate in last year?

Explain why your agency did not attend any or all of the organized meetings.

Identify specific improvements to your storm water management program as a result of these meetings:

List suggestions to increase the usefulness of quarterly meetings:

If quarterly Public Outreach Strategy meetings were not organized, explain why not and when this requirement will be implemented *(Principal Permittee only).*

c) Approximately how many impressions were made last year on the general public about storm water quality via print, local TV, local radio, or other media?

d) Describe efforts your agency made to educate local schools on storm water pollution.

e) Did you, in cooperation with other Permittees, provide all schools within each school district in Los Angeles County with materials necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution *(Principal Permittee only)*? Yes ☐ No ☐

If not, explain why.

f) Describe the strategy developed to measure the effectiveness of in-school educational programs, including assessing students' knowledge of storm water pollution problems and solutions before and after educational efforts *(Principal Permittee only)*.

For Permit Years 2-5, attach an assessment of the effectiveness of in-school storm water education programs.

g) What is the behavioral change target that was developed based on sociological data and other studies *(Principal Permittee only)?*

If no target has been developed, explain why and describe the status of developing a target.

What is the status of meeting the target by the end of Year 5?

4. Pollutant-Specific Outreach

a) Attach a description of each watershed-specific outreach programs that your agency developed *(Principal Permittee only)*. All pollutants listed in Table 1 (Section B.1.d.) must be included.

b) Did your agency cooperate with the Principal Permittee to develop specific outreach programs to target pollutants in your area? Yes ☐ No ☐

c) Describe, or attach, the pollutant-specific material that was distributed.

d) Describe how your agency has made outreach material available to the general public, schools, community groups, contractors and developers, etc...

5. Businesses Program

a) Briefly describe the Corporate Outreach Program that has been developed to target gas stations and restaurant chains *(Principal Permittee only)*.

b) How many corporate managers did your agency reach last year?

c) What is the total number of corporations to be reached through this program?

d) Is your agency meeting the requirement of reaching all gas station and restaurant corporations once every two years? Yes ☐ No ☐
If not, describe measures that will be taken to fully implement this requirement.

e) Has your agency developed and/or implemented a Business Assistance Program? Yes ☐ No ☐
If so, briefly describe your agency's program, including the number of businesses assisted, the type of assistance, and an assessment of the program's effectiveness.

6. Did you encourage local radio stations and newspapers to use public service announcements? Yes ☐ No ☐
How many media outlets were contacted?
Which newspapers or radio stations ran them?

Who was the audience?

7. Did you supplement the County's media purchase by funding additional media buys? Yes ☐ No ☐
   Estimated dollar value/in-kind contribution:
   Type of media purchased:
   Frequency of the buys:
   Did another agency help with the purchase? Yes ☐ No ☐
8. Did you work with local business, the County, or other Permittees to place non-traditional advertising? Yes ☐ No ☐
   If so, describe the type of advertising.

9. Did you establish local community partnerships to distribute educational storm water pollution prevention material? Yes ☐ No ☐
   Describe the materials that were distributed:

   Who were the key partners?
   Who was the audience (businesses, schools, etc.)?

10. Did you participate in or publicize workshops or community events to discuss storm water pollution? Yes ☐ No ☐
    How many events did you attend?
11. Does your agency have a website that provides storm water pollution prevention information? Yes ☐ No ☐
    If so, what is the address?
12. Has awareness increased in your community regarding storm water pollution? Yes ☐ No ☐
    Do you feel that behaviors have changed? Yes ☐ No ☐
    Explain the basis for your answers. Include a description of any evaluation methods that are used to determine the effectiveness of your agency's outreach.

13. How would you modify the storm water public education program to improve it on the City or County level?

B. Industrial/Commercial Facilities Program

Did you (individually or jointly) update the Database for Critical Sources Identification? Yes ☐ No ☐

Comments/Explanation/Conclusion:

Inspection and Site Visit Program

Provide the reporting data as suggested in the following tables.

Initial Number of Facilities at the start of cycle proposed for inspection by categories (after the initial year, the updated number based on the new data)	Number of facilities inspected in the current reporting year	% Completed at the time of this report for present cycle (from the initial value, and from the updated value after first cycle)	Total number since permit adoption

R0005915

Los Angeles County Municipal Storm Water Permit (Order 01-XXX)

Individual Annual Report Form

Initial Number of Facilities at the start of cycle proposed for site visit by categories (after the initial year, the updated number based on the new data)	Number of facilities site visited in the current reporting year	% Completed at the time of this report for this cycle (from the initial value, and from the updated value after first cycle)	Total number since permit adoption

Comments/Explanation/Conclusion:

BMPs Implementation

Provide the reporting data as suggested in the following table.

Number of facilities inspected/ site visited by category in this reporting year	Number of facilities identified as adequately implementing BMPs as specified in this reporting year	% adequately implementing out of total in this reporting year	Number of facilities required to implement or upgrade in this reporting year	Number of facilities inspected/ site visited by category in this reporting cycle	Number of facilities identified as adequately implementing BMPs as specified in this reporting cycle	% adequately implementing out of total in this reporting cycle	Number of facilities required to implement or upgrade in this reporting cycle	Total Number during this permit adequately implementing	Total Number during this permit required to implement or upgrade

R0005916

Comments/Explanation/Conclusion:

Enforcement Activities

Provide the reporting data as suggested in the following tables.

Enforcement Actions by categories (e.g. Warning letter, NOV, referral to D.A., etc.)	Number of facilities issued enforcement actions in the current reporting year	Number of facilities issued enforcement actions in the current reporting cycle	Number of facilities (re)inspected due to enforcement actions in current reporting year	Number of facilities (re)inspected due to enforcement actions in current reporting cycle	Number of facilities brought into compliance in the current reporting year	Number of facilities brought into compliance in current reporting cycle	Total number since permit adoption

Facilities by category	Number of enforcement actions by type (Warning letter)	Number of NOVs	Number of Referral	Number of Other

Program Implementation Effectiveness Assessment

Please give a brief assessment of the implementation of the program in removing pollutants from the storm water discharges. Please provide an explanation. Suggested improvements or adjustments based on the

R0005917

knowledge gained through this reporting period activities must be reflected in a change in the SQMP, if warranted.

Highly Effective ☐ Somewhat Effective ☐ Non-effective ☐

Comments/Explanation/Conclusion:

You must also submit a quarterly electronic submittal of your Industrial/Commercial Facilities Program activities.

R0005918

C. Development Planning Program (Part 4.D)

1. Does your agency have a process to minimize impacts from storm water and urban runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA, Section 404 of the CWA, local ordinances, and other legal authorities? Yes ☐ No ☐
   Attach a copy of your CEQA checklist, and any other examples showing how storm water quality impacts were addressed in environmental documents for projects over the past year.
2. Does your agency have procedures to include the following requirements in all priority development and redevelopment projects:
   a) Maximize the percentage of permeable surfaces to allow more percolation of storm water into the ground? Yes ☐ No ☐
   b) Minimize the quantity of storm water directed to impermeable surfaces and the MS4? Yes ☐ No ☐
   c) Minimize pollution emanating from parking lots through the use of appropriate treatment control BMPs and good housekeeping practices? Yes ☐ No ☐
   d) Provide for appropriate permanent measures to reduce storm water pollutant loads from the development site? Yes ☐ No ☐

   ~~Briefly describe each procedure and attach examples of how each was required in a priority development or redevelopment project.~~

   The details of the above requirements are already included in the Model Program.

3. Describe the status of the development or implementation of peak flow controls in natural drainage systems.
4. Describe the process your agency uses to include SUSMP design standards in new development and redevelopment project approvals.

5. How many ~~of each of the following~~ projects did your agency review and condition to meet SUSMP requirements last year?

Due to complex review process among different divisions' involvement, SUSMP projects can not be tracked by types as required in the following.

~~a) Residential~~
~~b) Commercial~~
~~c) Industrial~~
~~d) Automotive service facilities~~
~~e) Retail gasoline outlets~~
~~f) Restaurants~~
~~g) Parking lots~~
~~h) Projects located in or directly adjacent to or discharging directly to an environmentally sensitive area~~
~~i) Total number of permits issued to priority projects~~

6. What is the percentage of total development projects that were conditioned to meet SUSMP requirements? %

~~7. How has your agency prepared to reduce the SUSMP threshold for industrial/commercial facilities to 1 acre from 100,000 square feet in 2003?~~

This is based on a requirement that doesn't currently exist and therefore shouldn't be included at this time.

~~After 2003, how many additional projects per year will require/did require implementation of SUSMP requirements as a result of the lower threshold?~~

8. Does your agency participate in an approved regional or sub-regional storm water mitigation program to substitute in part or wholly SUSMP requirements for new development? Yes ☐ No ☐

9. Has your agency modified its planning procedures for preparing and reviewing CEQA documents to consider potential storm water quality impacts and provide for appropriate mitigation? Yes ☐ No ☐

If yes, attach a copy of your CEQA checklist.

If no, provide an explanation and an expected date of completion.

10. Did your agency update any of the following General Plan elements in the past year?

a)	Land Use	Yes ☐	No ☐
b)	Housing	Yes ☐	No ☐
c)	Conservation	Yes ☐	No ☐
d)	Open Space	Yes ☐	No ☐

If yes, please describe how watershed and storm water quality and quantity management considerations were included. Attach a copy of the amendment, if you have not already provided the Regional Board with a copy.

11. How many targeted staff were trained last year?
How many targeted staff are trained annually?
What percentage of total staff (listed on page 2) are trained annually? %

12. Has your agency developed and made available development planning guidelines? Yes ☐ No ☐
If no, what is the expected date that guidelines will be developed and available to developers?

13. What is the status of completion of the technical manual for siting and design of BMPs for the development community?

D. Development Construction Program

1. Describe your agency's program to control runoff from construction activity at all construction sites within its jurisdiction.

2. Does your agency require the preparation, submittal, and implementation of a Local Storm Water Pollution Prevention Plan (Local SWPPP) prior to the issuance of a grading permit for all sites that meet one or all of the following criteria?
   a) Will result in soil disturbance of one acre or greater Yes ☐ No ☐
   b) Is within, directly adjacent to, or is discharging directly to an environmentally sensitive area Yes ☐ No ☐
   c) Is located in a hillside area Yes ☐ No ☐

   Attach one example of a local SWPPP

3. Describe the process your agency uses to require proof of filing a Notice of Intent for coverage under the State General Construction Activity Storm Water permit and a certification that a SWPPP has been prepared prior to issuing a grading permit?

4. How many building/grading permits were issued to sites requiring Local SWPPPs last year?
5. How many building/grading permits were issued to sites requiring coverage under the General Construction Activities Storm Water Permit last year?
6. How many building/grading permits were issued to construction site less than one acre in size last year?
7. How many construction sites were inspected during the last wet season?

8. Complete the following table.

Type of Violation	# of Violations	% of Total Inspections	# of Follow-up Inspections	# of Enforcement Actions
Off-site discharge of sediment				

R0005922

Off-site discharge of other pollutants				
No or inadequate SWPPP				
Inadequate BMP/SWPPP implementation				

9. Describe the process for taking enforcement actions against construction site violations, including the types of actions that are taken.

10. Describe the system that your agency uses to track the issuance of grading permits.

E. Public Agency Activities (Part 4.F)

1. Trash Receptacles
   a) Did your agency place trash receptacles at all transit stops within its jurisdiction and maintain the receptacles? Yes ☐ No ☐
   b) How many trash receptacles within your jurisdiction are near transit stops or commercial areas?

2. Sewage System Maintenance, Overflow, and Spill Prevention (*only applicable to agencies that own and/or operate a sanitary sewer system*)
   a) Did your jurisdiction submit its Sewage System Response Plan to the Regional Board? Yes ☐ No ☐
   b) How many sanitary sewer overflows occurred within your jurisdiction?
      How many did your agency respond to?
   c) Did your agency investigate all complaints received? Yes ☐ No ☐
   d) How many complaints were received?
   e) Upon notification, did your agency immediately respond to overflows by containment? Yes ☐ No ☐
   f) Did your agency notify appropriate sewer and public health agencies when a sewer overflowed to the MS4? Yes ☐ No ☐
   g) Did your agency implement a program to prevent sewage spills or leaks from sewage facilities from entering the MS4? Yes ☐ No ☐
      If so, describe the program:

   h) Did your agency implement a program to identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers to the MS4? Yes ☐ No ☐
      If so, describe the program:

3. Public Construction Activities Management

a) What percentage of public construction sites 5 acres or greater in size did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit ? Yes ☐ No ☐

Give an explanation for any sites greater than 5 acres that were not covered:

b) What is the total number of active public construction sites?

How many were 5 acres or greater in size?

c) (In March, 2003) Did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit coverage for public construction sites for sites one acre or greater? Yes ☐ No ☐

4. Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management

a) Did your agency implement pollution prevention plans for each public vehicle maintenance facility, material storage facility, and corporation yard? Yes ☐ No ☐

b) Have you submitted a list to the Regional Board that includes contact person, location and telephone number for each public vehicle maintenance facility, material storage facility, and corporation yard? Yes ☐ No ☐

If not, explain why:

c) Briefly describe how your agency implements the following, and any additional, BMPs to minimize pollutant discharges in storm water:

1) Good housekeeping practices
2) Material storage control
3) Vehicle leaks and spill control
4) Illicit discharge control

d) Are all Permittee owned and/or operated vehicle/equipment wash areas self-contained, covered, equipped with a clarifier, and properly connected to the sanitary sewer? Yes ☐ No ☐

If not, what is the status of implementing this requirement?

e) How many Permittee owned and/or operated vehicle/equipment wash areas are scheduled to be redeveloped to include the BMPs listed above? Yes ☐ No ☐

5. Landscape and Recreational Facilities Management

a) Has your agency developed a standardized protocol for the routine and non-routine application of pesticides, herbicides (including pre-emergents), and fertilizers? Yes ☐ No ☐

Briefly describe this protocol:

b) How does your agency ensure that there is no application of pesticides or fertilizers immediately before, during, or immediately after a rain event or when water is flowing off the area to be applied?

c) Are any banned pesticides, herbicides, fungicides, or rodenticides stored or applied in your agency's jurisdiction that you know of? Yes ☐ No ☐

If so, list them:

d) What percentage of your agency's staff that apply pesticides are certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator?

e) Describe procedures your agency has implemented to encourage retention and planting of native vegetation and to reduce water, fertilizer, and pesticide needs:

f) How often are storage areas for fertilizers and pesticides inspected?

What BMPs are commonly implemented in storage areas?

6. Storm Drain Operation and Management

a) Did your agency designate catch basin inlets within its jurisdiction as Priority A; Priority B; and Priority C? Yes ☐ No ☐

How many of each designation exist in your jurisdiction?

Priority A:
Priority B:
Priority C:

b) How many times were all Priority A basins cleaned last year?

c) How many times were all Priority B basins cleaned last year?

d) How many times were all Priority C basins cleaned last year?

e) How much total waste was collected in tons from catch basin clean-outs last year?

f) Attach a record of all catch basins in your jurisdiction. This shall identify each basin as City or County owned, and Priority A, B, or C. For all basins that are owned and operated by your agency, include dates that each was cleaned out over the past year.

g) Did your agency place special conditions for events that generated substantial quantities of trash and litter including provisions that:

1) Provide for the proper management of trash and litter generated from the event? Yes ☐ No ☐

2) Arrange for temporary screens to be placed on catch basins? Yes ☐ No ☐

3) Or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain? Yes ☐ No ☐

h) Has your Agency conducted an assessment of measures that can be implemented to reduce and/or prevent trash from entering the MS4 system? Yes ☐ No ☐

If yes, has this assessment been submitted to the Regional Board? Yes ☐ No ☐

If no, what is the status of conducting this assessment?

i) Did your agency inspect the legibility of the catch basin stencil or labels? Yes ☐ No ☐

What percentage of stencils were legible?

j) Were illegible stencils recorded and re-stenciled or re-labeled within 180 days of inspection? Yes ☐ No ☐

k) Did your agency visually monitor Permittee-owned open channel storm drains and other drainage structures for debris at least annually and identify and prioritize problem areas of illicit discharge for regular inspection? Yes ☐ No ☐

Is the prioritization attached? Yes ☐ No ☐

l) Did your agency review its maintenance activities to assure that appropriate storm water BMPs are being utilized to protect water quality? Yes ☐ No ☐

What changes have been made?

m) Did your agency remove trash and debris from open channel storm drains a minimum of once per year before the storm season? Yes ☐ No ☐

n) How did your agency minimize the discharge of contaminants during MS4 maintenance and clean outs?

o) How much total waste was collected (in tons) by stream or channel segment from Permittee-owned open channels or other drainage structures?

p) Where was the removed material disposed of?

7. Streets and Roads Maintenance

a) Did your agency designate streets and/or street segments within its jurisdiction as one of the following:

Priority A – streets and/or street segments that are designated as consistently generating the highest volumes of trash and/or litter? Yes ☐ No ☐

Priority B - streets and/or street segments that are designated as consistently generating moderate volumes of trash and/or litter? Yes ☐ No ☐

Priority C – streets and/or street segments that are designated as generating low volumes of trash and/or litter? Yes ☐ No ☐

b) Did your agency perform all street sweeping in compliance with the permit and according to the following schedule:

Priority A – These streets and/or street segments shall be swept at least two times per month? Yes ☐ No ☐

Priority B - Each Permittee shall ensure that each streets and/or street segments is cleaned at least once per month? Yes ☐ No ☐

Priority C – These streets and/or street segments shall be cleaned as necessary but in no case less than once per year? Yes ☐ No ☐

c) Did your agency require that saw cutting wastes be recovered and disposed of properly and that in no case shall waste be left on a roadway or allowed to enter the storm drain? Yes ☐ No ☐

d) Did your agency require that concrete and other street and road maintenance materials and wastes be managed to prevent pollutant discharges? Yes ☐ No ☐

e) Did your agency require that the washout of concrete trucks and chutes only occur in designated areas and never into storm drains, open ditches, streets, or catch basins leading to the storm drain system? Yes ☐ No ☐

f) Did your agency train its employees in targeted positions (whose interactions, jobs, and activities affect storm water quality) regarding the requirements of the storm water management program to:

1) Promote a clear understanding of the potential for maintenance activities to pollute storm water? and Yes ☐ No ☐

2) Identify and select appropriate BMPs? Yes ☐ No ☐

8. Parking Facilities Management

a) Did your agency ensure that Permittee-owned parking lots be kept clear of debris and excessive oil buildup and cleaned no less than 2 times per month and/or inspected no less than 2 times per month to determine if cleaning is necessary. Yes ☐ No ☐

b) Were any Permittee-owned parking lots cleaned less than once a month? Yes ☐ No ☐
How many?

9. Public Industrial Activities Management

a) Did your agency, for all municipal activity considered an industrial activity under USEPA Phase I storm water regulations, obtain separate coverage under the State of California General Industrial Activities Storm Water Discharge Permit no later than December 31, 2001? Yes ☐ No ☐

b) Does your agency serve a population of less than 100,000 people? Yes ☐ No ☐

10. Emergency Procedures

a) In case of real emergencies, did your agency repair essential public services and infrastructure in a manner to minimize environmental damage? Yes ☐ No ☐

b) Were BMPs implemented to the extent that measures did not compromise public health and safety? Yes ☐ No ☐

11. Feasibility Study

a) Did your agency cooperate with the County Sanitation Districts of Los Angeles County to prepare a study which investigates the possible diversion of dry weather flows or the use of alternative treatment control BMPs? Yes ☐ No ☐

b) Did your agency review its individual prioritized list and create a watershed based priority list of drains for potential diversion and submit a listing of priority diversions to the Regional Board Executive Officer? Yes ☐ No ☐

Los Angeles County Municipal Storm Water Permit (Order 01-XXX)
Individual Annual Report Form

F. Illicit Connections and Illicit Discharges (IC/ID) Elimination Program (Part 4.G)

1. Attach a copy of your agency's IC/ID Elimination Implementation Program (Part 4.G.1.a.).

2. Attach a map of your storm drain system showing ~~all permitted connections, and~~ the locations of all illicit connections and discharges that occurred last year (Part 4.G.1.b). If your agency has not completed this requirement, describe the status of the development of a baseline map, including an expected completion date.

As explained during our presentations, meetings and in our written comments on the previous drafts, the existing County's storm drain connections database is extremely large and mapping all permitted connections would be extremely costly because it requires the existence of a GIS storm drain file suited for analysis. Again, mapping illicit connections and illicit discharges should be the focus of this element.

3. Describe your enforcement procedures for eliminating illicit discharges and terminating illicit connections.

4. Describe your record keeping system to document all illicit connections and discharges.

5. What is the total length of open channel that your agency owns and operates?
   What length was screened last year for illicit connections?
6. What is the total length of closed storm drain that your agency owns and operates?
   What length was screened last year for illicit connections?
7. Describe the method used to screen your storm drains.

8. Attach a copy of your agency's plan for proactive storm drain screening of priority areas (Part 4.G.2.b). If a plan has not been developed, describe the status of development.

9. Provide the reporting data for illicit connections as suggested in the following table (you may submit a spreadsheet from your database that contains the information).

Year	Total # reported/ identified	Total # investigated	# that conveyed exempt discharges or NPDES permitted	# that conveyed illicit discharges that were terminated	# that were removed	# that resulted in enforcement action	# not identified ???? What does this mean?
01/02							
02/03							
03/04							
04/05							
05/06							

10. What is the average time it takes your agency to initiate an illicit connection investigation after it is reported?

a) Were all identified connections terminated within 180 days? Yes ☐ No ☐

b) If not, explain why.

11. Provide the reporting data for illicit discharges as suggested in the following table (you may submit a spreadsheet from you database that contains this information).

Year	Total # reported	Total # that were discontinued/ cleaned up voluntarily through enforcement and the source was identified	# that were cleaned up but the source could not be identified	# that resulted in no evidence of discharge	# that were determined to be conditionally exempt	# that were exempt or in compliance and the source identified	# that resulted in enforcement action
01/02							
02/03							
03/04							
04/05							
05/06							

12. What is the average response time after an illicit discharge is reported?
    a) Did any response times exceed 72 hours? Yes ☐ No ☐
    b) If yes, explain why.

13. Describe the your agency's spill response procedures.

14. What would you do differently to improve your agency's IC/ID Elimination Program?

15. Attach a list of all permitted connections to your storm sewer system.

III. Monitoring

Briefly describe any storm water monitoring activities that are not required by Order No. 01-XXX that your municipality conducted, participated in, or received funding to conduct in the past fiscal year. These activities should correspond with the dollar amount you listed in Table 3.

IV. Assessment of Program Effectiveness

F. Attach a summary of the effectiveness of your storm water management program. This summary should include, at a minimum, the following:

1. An assessment of your agency's compliance with permit requirements, based on your responses to the questions in this form;
2. Descriptions of any evaluation methods that your agency uses to determine the effectiveness of your storm water management program;
3. A summary of the strengths and weaknesses of your agency's storm water management program;
4. A list of specific program highlights and accomplishments;
5. A description of water quality improvements or degradation in your watershed over the past fiscal year;
6. Interagency coordination between cities to improve the storm water management program;
7. Future plans to improve your agency's storm water management program; and
8. Suggestions to improve the effectiveness of your program or the County model programs.

G. On a scale of 1 to 10, rate your municipality's level of compliance with Order No. 01-XXX.

Certification Statement

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility, of a fine and imprisonment for knowing violations.

Re: **Initial Comments and Submission of Evidence of Financial and Economic Impacts of "*Tentative Draft-October 11, 2001*, CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD LOS ANGELES REGIONAL ORDER No. 01-xxx NPDES No. CAS004001 WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES AND THE INCORPORATED CITIES THEREIN, EXCEPT FOR THE CITY OF LONG BEACH"**

Dear Mr. Dickerson and Dr. Swamikannu:

By this letter, the Los Angeles County Economic Development Corporation ("LAEDC") and the Cities of Alhambra, Camarillo, Compton, El Segundo, Industry, Lawndale, Lomita, Moorpark, Santa Clarita and Torrance (the "Cities") submit evidence that compliance costs for storm water permit programs in Los Angeles County will exceed $50 billion. This evidence is directly relevant, and, as a matter of law, must be addressed in revisions to the "*Tentative Draft-October 11, 2001*, CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD LOS ANGELES REGIONAL ORDER No. 01-xxx NPDES No. CAS004001 WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS

ANGELES AND THE INCORPORATED CITIES THEREIN, EXCEPT FOR THE CITY OF LONG BEACH" (the "Third Draft") and the accompanying document, "Tentative Draft – FACT SHEET/STAFF REPORT State of California Regional Water Quality Control Board Los Angeles Region National Pollutant Discharge Elimination System (NPDES) Permit No. CAS004001, CI 6948 Regional Board Order No. 01-XXX."

Please list this letter as having been submitted by LAEDC and each of the respective cities. (It is not a comment letter of the firm of Burke, Williams & Sorensen, LLP, which has not taken a position in this matter. However, please continue to keep the undersigned on the list of interested persons in this matter.) This letter supplements the Cities' previous letters of July 19, 2001, and August 6, 2001, which offered comments on the Second Draft.

By this letter, the LAEDC and the Cities submit for your careful consideration and for you to address the following reports:

1. "Southern California Association of Governments Staff Report to Energy and Environment Committee dated August 23, 2001, Subject: Regional Solutions for Managing Stormwater Pollution" (the "SCAG Report");

2. "COST OF STORM WATER TREATMENT FOR THE LOS ANGELES COUNTY NPDES PERMIT AREA" June, 1998, by Brown & Caldwell, prepared for California Department of Transportation; and

3. "Financial and Economic Impacts of Storm Water Treatment Los Angeles County NPDES Permit Area" presented to California Department of Transportation Environmental Program, Report I.D. #CTSWRT-98-72, November, 1998, by Stanley R. Hoffman Associates, (the "Caltrans Financial and Economic Impacts Study").

These studies and reports (to which I shall refer collectively as the "Storm Water Financial Impact Studies") are evidence to be considered and addressed by the Board and the Staff in the revision of the "*Tentative Draft-October 11, 2001*, CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD LOS ANGELES REGIONAL ORDER No. 01-xxx NPDES No. CAS004001 WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES AND THE INCORPORATED CITIES THEREIN, EXCEPT FOR THE CITY OF LONG BEACH" and the "Tentative Draft – FACT SHEET/STAFF REPORT State of California Regional Water Quality Control Board Los Angeles Region National Pollutant Discharge Elimination System (NPDES) Permit No. CAS004001, CI 6948 Regional Board Order No. 01-XXX."

The Storm Water Financial Impact Studies, which conclude that the cost of storm water compliance for the areas affected by storm water permits issued by the Board for Los Angeles County will exceed $50 Billion, must be taken into consideration in re-evaluating the requirements to be imposed on the co-permittees. This is because MS4 permits are issued under Section 402(p)(3)(B)(iii) of the CWA, 33 U.S.C. § 1342(p)(3)(B)(iii). **That section** does not impose an absolute prohibition on the discharge of pollutants. Instead, the section **requires that:**

> **Permits for discharges from municipal storm sewers --**
>
> > **(iii) shall require controls to reduce the discharge of pollutants to the *maximum extent practicable*,** including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. (Emphasis added.)

Similarly, section 13263(a) of the California Water Code requires regional boards, when prescribing waste discharge requirements, to take into consideration the provisions of §§ 13241(c) and (d). Those sections require a balancing similar to that required by § 402(p)(3)(B)(iii) of the CWA, 33 U.S.C. § 1342(p)(3)(B)(iii). **Among the factors regional boards must consider are**:

> (c) ***Water quality conditions that could reasonably be achieved*** through the coordinated control of all factors which affect water quality in the area.
>
> (d) ***Economic considerations***.

The balancing required by CWA § 402(p)(3)(B)(iii) and California Water Code §§ 13241(c) and (d) clearly require the Regional Board to consider, and to justify, the costs of permit compliance.

The LAEDC and the Cities fully support the objectives of the Clean Water Act. However, the magnitude of the compliance cost estimates referred to in the Storm Water Financial Impact Studies, over $50 Billion, would make it necessary for the Cities named above, and all other Cities in Los Angeles County, to ask the Congress and the California Legislature to appropriate nearly all of the funds estimated to be necessary for compliance. Given the current downturn in the economy and the priorities for funding Operation Enduring Freedom and Homeland Defense, Congress and the State Legislature may be unable to make necessary funds available.

The LAEDC and the Cities will expect the Board and Staff to give most careful consideration to the evidence submitted with this letter. We are not aware of any published studies, by any reputable and qualified persons, which rebut the studies submitted with this letter. We ask that this letter, and its enclosures, be included in the administrative record of this matter. The LAEDC and the Cities reserve the right to offer further comments.

Very truly yours,

RUFUS C. YOUNG, JR.

SUBJECT: Regional Solutions for Managing Stormwater Pollution

2001 NOV -9 P 2:00

RECOMMENDED ACTION:

Consider for policy direction.

BACKGROUND:

In the nearly 30 years since its enactment, the Clean Water Act has had its greatest success in improving water quality by regulating those sites that use water and discharge water into water bodies such as our rivers and oceans. Examples of these "point source" dischargers are industrial plants and sanitation agencies. Each discharger of this kind is required to obtain a permit for any discharges that will be made into a water body. The permit specifies the maximum level of pollutants that are allowed. Any excesses of this limit are illegal and subject to enforcement.

Only in the last 10 years have environmental regulators turned their attention to a much more challenging aspect of water quality in the urban setting: the "non-point" water pollution. Examples of "non-point" pollution are storm water and urban run-off. The challenge created by this kind of pollution is its general origins, its magnitude, and its complex constituents. As population growth occurs in the SCAG region, along with related new community development, the nature of storm weather flooding and runoff from impervious surfaces have become increasingly severe problems.

In response to these problems, water quality regulators in Los Angeles County have moved to establish new rules requiring the cities and County to take greater responsibility for managing storm water and dry weather run-off that flows through each locale. One great difficulty with this regulatory approach is the absence of larger-scale solutions for problems that are "everywhere" by location and that are often more affordable when rationalized over a larger area with varieties of terrain and open space. Without a larger-scale approach to this kind of pollution each city will struggle to meet mandates individually, inevitably duplicating efforts made by neighboring communities.

Studies conducted to estimate the cost of removing pollutants from Los Angeles County storm water indicate that capital plant alone needed for this mission will cost more than $50 billion. A price tag of this magnitude requires not only new thinking about financing urban environmental improvements, it also calls for new thinking about regional approaches and institutions for achieving water quality goals.

REPORT

Regional Solutions for Managing Stormwater Pollution (cont.)
September 6, 2001
Energy and Environment Committee

SUMMARY:

Ken Farfsing, City Manager of Signal Hill, will address the Committee on behalf of the Coalition for Practical Regulation. The Coalition is comprised of 35 Los Angeles County cities that are seeking new, regional approaches to "non-point" water pollution. The Coalition has taken its concerns to not only to the Los Angeles Regional Water Quality Control Board, it has appealed issues related to the Municipal Storm Water permit and to the Trash TMDLs to the State Water Resources Control Board.

Mr. Farfsing will bring to the Committee a variety of ideas for regional problem-solving, drawing on the models already in place for managing flooding and sanitation.

Attached to this report are three Coalition memorandums: the first two address the need for Regional/Subregional Programs; the third addresses inspection and enforcement activities mandated for cities by the proposed municipal storm water permit for Los Angeles County cities.

FISCAL IMPACT:

The fiscal impact on the region is substantial. The fiscal impact on SCAG is unknown.

SECTION 1
EXECUTIVE SUMMARY

This report evaluates the potential financial and economic impacts of implementing an enhanced storm water treatment program in the Los Angeles National Pollutant Discharge Elimination System (NPDES) Permit area as part of the Caltrans District 7 Storm Water Facilities Retrofit Evaluation. The full storm water treatment system would require about $53.6 billion in capital improvement costs which includes land and $198.9 million in annual operations and maintenance costs. Land requirements for the estimated 480 treatment facilities would total about 13,950 acres. The evaluation methodology applies the EPA Municipal Screener approach and other selected economic indicators.

1.1 Preliminary Municipal Screener Impacts

The EPA publication, Economic Guidance for Water Standards Workbook, describes a methodology for measuring economic impacts. One test in the described methodology is called the Preliminary Municipal Screener. According to the Workbook:

> "This guidance is presented to assist States and applicants in understanding the economic factors that may be considered, and the types of tests that can be used to determine if a designated use cannot be attained, if a variance can be granted, or if degradation of high-quality water is warranted. To remove a designated use or obtain a variance, the State or discharger must demonstrate that attaining the designated use would result in substantial and widespread economic and social impacts."

The Municipal Screener test indicates whether a public entity will *not* incur any substantial economic impacts from the proposed pollution control program. This Screener is the estimated Total Annual Pollution Control Cost per Household as a percent of Median Household Income in the community deemed "affordable" by the United States Environmental Protection Agency (EPA). The test specifies that local pollution control costs between 1 percent and 2 percent of median household income constitute "Mid-Range" impacts and greater than 2 percent constitute "Large" impacts. The estimated cost for existing pollution controls plus the full storm water system is about $1,295 per household annually which results in impacts over 2 percent of median household income, therefore; this is judged to create a substantial economic impact. This total cost is comprised of the annual existing non-storm water pollution control cost of $554 per household plus the annual average storm water cost estimate of $741 per household.

R0005949

1.2 Secondary Municipal Screener Impacts

The EPA standards workbook also specifies that a secondary test must be done if the Municipal Screener is not clearly less than 1 percent of median household income. The secondary test is intended to characterize the community's ability to obtain financing and to indicate the socioeconomic health of the community. As applied to the Los Angeles area, this test generates a score that is within EPA's Mid-Range level of economic impacts.

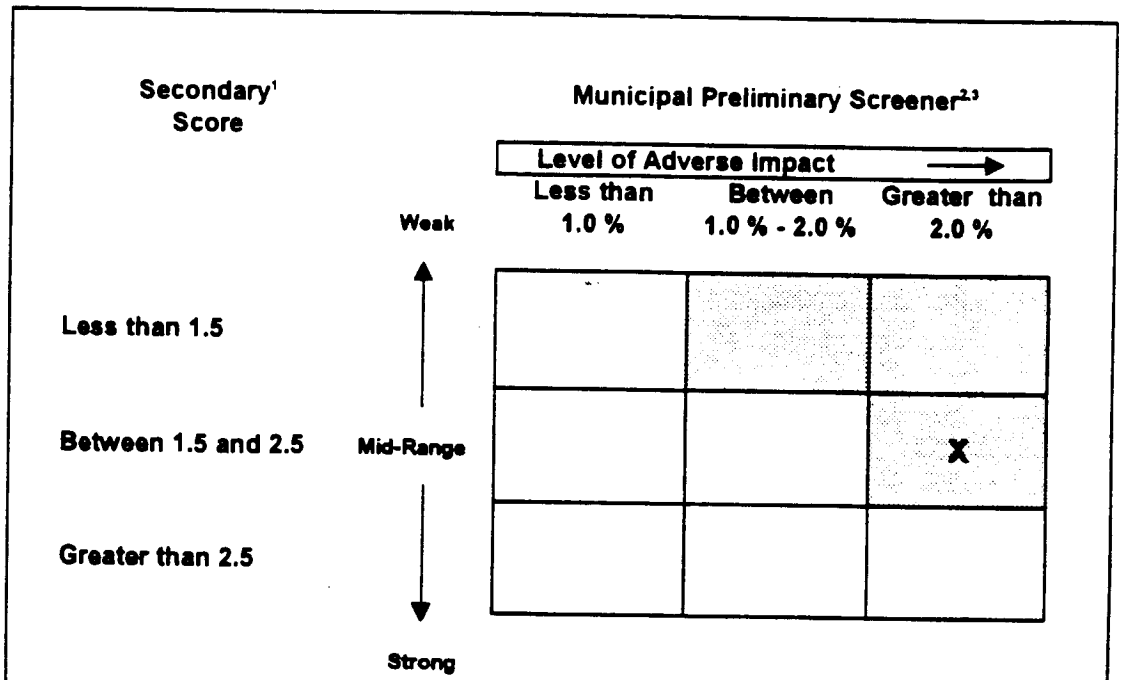
The Secondary Test utilizes five indicators to form a composite assessment of the community's economic health and the financial impact of the pollution control project. Besides providing guidance on how to calculate each indicator, the Workbook supplies criteria for scoring each as 1-weak, 2-mid-

range or 3-strong. For each of the five indicators the community is rated as weak, mid-range, or strong, based on various thresholds that apply to specific indicators. For example, overall net debt is used as an indicator of a community's ability to meet debt obligations and its capacity to finance infrastructure. For example, if the Overall Net Debt Per Capita is greater than $3,000, the community would have less capacity to fund additional infrastructure and would therefore be rated weak with a rating of 1. However, if the debt per capita is less than $1,000 it would be considered strong and assigned a rating of 3. The indicators are then averaged to derive the Secondary Score.

The results from the Preliminary Municipal Screener and the Secondary Screener are measured jointly to determine whether the community would be expected to incur substantial impacts due to the proposed pollution control project. As shown on Table 1-1, for the Los Angeles area based on the secondary screener analysis, the score falls within the 1.5 to 2.5 range. When combined with an annualized cost greater than 2 percent of median household income, the joint score results in estimated substantial impacts, according to EPA's Substantial Impacts Matrix, as indicated by the "X" in Table 1-1.

1.3 Widespread Impacts

Based on the EPA methodology and other economic indicators presented below, the economic impacts are judged to be both substantial and widespread for the full system storm water treatment costs. Other levels of treatment or funding sources may be considered to mitigate these impacts.



1.3.1 Property Tax Impacts

One measure of financial feasibility is the estimated impact on the property tax rate. The property tax rate for a single family unit is estimated to increase by 0.87 percentage points for the full system. When added to the median base property tax of 1.19 percent, this results in a total property tax of 2.06 percent, increasing the annual property tax bill by about 70 percent. Given the current economic climate in California, this estimated increase is clearly more than is likely to be absorbed by local single family households alone. For multi-family units, the estimated increase of 0.67 percentage points would also represent a potential sizable rental pass through.

1.3.2 Sales Tax Impacts

To compare the annualized storm water treatment costs to other economic indicators, a hypothetical increase of 6 percentage points above the present sales tax rate, to a level of about 12 percent, was estimated in lieu of increasing the property tax for the cost of full treatment. This impact is judged to be widespread and much higher than most households would consider acceptable.

Economic Guidance for Water Quality Standards Workbook,
U.S. Environmental Protection Agency

1. The Secondary Score represents a weighted average based on a number of economic criteria described in the text.

2. The Municipal Preliminary Screener represents a percentage of median household income.

3. Shaded area denotes where substantial impacts are estimated to occur according to the EPA Preliminary and Secondary Municipal Screeners. The combined score for the Los Angeles NPDES area results in substantial impacts as shown in the figure by the "X."

1.3.3 Land Requirement and Displacement Impacts

Treatment facilities for storm water runoff are land intensive. The land and land cost requirements for the full system are about 13,950 acres and 6.1 billion dollars, requiring multiple treatment plants. About 67 percent of this acreage would be required for treatment Level 1 and the rest for treatment Level 2. While marginal or vacant parcels would initially be sought, potential displacement of many households and businesses as well as relocation and land acquisition costs would be required.

1.3.4 Employment Impacts

The Los Angeles area economy has been recovering from the deep recession of the early 1990s when the total County economy lost more than 400,000 jobs. The County is currently on a recovery path. The additional costs per household and per business are likely to slow this recovery and cause some businesses to relocate or expand elsewhere. Again, while specific estimates of impacts are not made, the burden of additional costs of a substantial nature is viewed as widespread because the potential treatment plants would be distributed throughout the Los Angeles drainage areas. Since specific locations are not identified, these displacement impacts are not quantified as part of this study.

As was indicated earlier, the average household share of the financing burden would amount to about a 73 percent increase in annual property taxes. For many households, such an increase in property taxes would cause a significant reduction in their consumption and savings. Over time, landowners would also pass forward tax increases to renters as increased rents which would produce a reduction in consumption by renters. Such potentially widespread reduction in consumption among households would likely cause loss of retailing and other local serving jobs.

1.3.5 Impacts on Outstanding Local Debt

According to California Municipal Statistics, Inc., there is an estimated $11.6 billion of outstanding local public debt in Los Angeles County. The estimated cost of $53.6 billion for full storm water treatment would represent almost a fivefold increase in debt. Even the Secondary Municipal Screener level of $5.3 billion of estimated capital costs represents about 46 percent of existing unpaid local public debt.

1.4 Estimated Non-Storm Water Pollution Control Costs

According to the EPA guidelines, the Municipal Screener approach provides an estimate of what is deemed "affordable" for pollution control programs. The present study first examined the incremental financial and economic burden of storm water treatment in the Los Angeles County NPDES Permit Area. However, other public pollution control programs also require funding and must be considered in setting expenditure priorities. According to the EPA Municipal Screener, the estimated incremental cost of any new pollution control program should be added to the existing and future costs for other types of pollution control programs, such as air quality, wastewater treatment, and solid and toxic waste disposal.

R0005952

In Section 10 of this report, estimates of existing and future non-storm water pollution controls are made which can be added to the incremental costs for storm water treatment by area to determine whether they exceed the 2 percent of median household income criteria prescribed by the EPA methodology. Two approaches were utilized to estimate the impacts of existing and future non-storm water pollution control costs in combination with estimated incremental storm water treatment costs: 1) analysis of estimated localized, direct costs in California; and 2) a literature review, including a 1990 comprehensive study by the EPA updated to 1998 dollars. Both methods result in estimated substantial impacts according to the EPA Municipal Screener methodology.

These additional annual pollution control costs per household were based on localized California costs of wastewater user fees, tire/oil disposal, automobile emissions testing and repairs, drinking water treatment and solid waste disposal. This amount was estimated to be about $554 annually per household for the Los Angeles area compared with $537 annually per household based on the nationwide EPA study.

1.5 Costs Limited by EPA Municipal Screeners

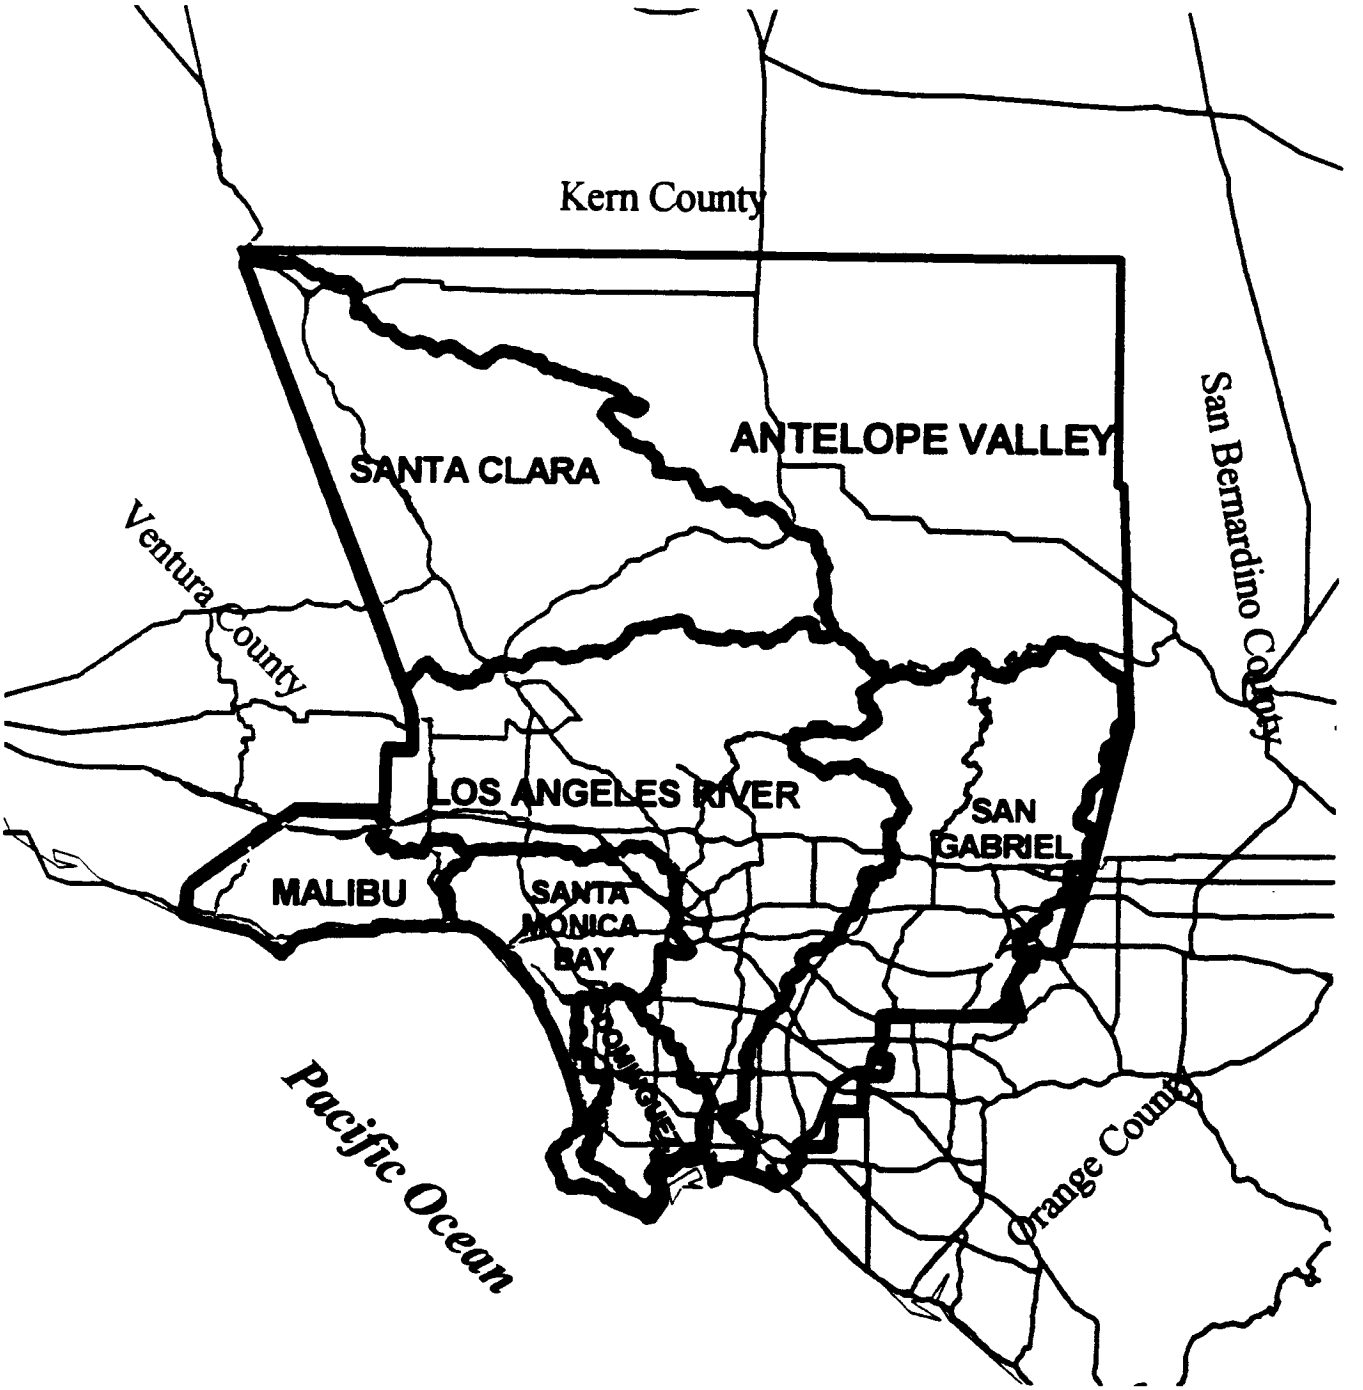
When the estimated amount of $703 per household at the Secondary Municipal Screener level of 1.6 percent of median household income level ($43,916), is reduced by the estimated cost of $554 for existing and future pollution controls, this results in a net amount of $149 per household for storm water treatment. If this annual amount of $149 is multiplied by the estimated 3,228,269 households in the Los Angeles County NPDES study area and is then capitalized using a 6 percent interest rate and a term of 20 years, this results in an estimated affordable capital cost of $5.3 billion. This represents about 9.9 percent of the estimated full storm water treatment cost of $53.6 billion.

SECTION 2
INTRODUCTION

2.1 Project Description and Purpose

This economic and financing analysis was prepared for the Los Angeles NPDES Permit Area as part of the Caltrans District 7 Storm Water Facilities Retrofit Evaluation. The analysis examines the economic and financial impacts that may arise for communities due to the increasing costs associated with successive levels of storm water treatment implementation. The project description and costs were defined by Brown and Caldwell. This included storm water treatment technologies designed to meet water quality standards and objectives for a one year return frequency 24 hour storm.

2.2 Project Area



The study area was limited to the Caltrans District 7 areas that drain to the Pacific Ocean in Los Angeles County as shown on Figure 2-1. The Los Angeles NPDES Permit Area includes those areas within Los Angeles County and within the watershed defined by the Santa Susana Mountains, Simi Hills and San Gabriel Mountains. Los Angeles County areas not represented in the study include Avalon, Lancaster, Palmdale and unincorporated areas near these cities. The Los Angeles County NPDES Permit Area is divided into six drainage basins and consists of approximately 1,702,404 acres of land. A relatively small portion of the Santa Ana River Basin is aggregated with the San Gabriel River Basin. The drainage basins that cover this area include the following:

- Dominguez Channel
- Los Angeles River
- Malibu
- San Gabriel River
- Santa Clara River
- Santa Monica Bay

Land-use and acreage for this area were categorized into several classifications and formed the foundation for analysis along with basic demographic and financial data. Of the total acreage, almost 60 percent is open space, which represents the largest land use of the total NPDES area. The next most dominant land use is residential at about 22 percent. The remaining acreage covers other uses such as public, commercial and industrial.

Figure 2-1

Drainage Basins in LA County NPDES Permit Area

Stanley R. Hoffman and Associates, 1998

R0005955

2.3 Data Sources

To determine the impact on households, businesses and communities, data was analyzed based on several economic indicators. Examples of these indicators include the ability to pay as measured by the ratio of per household annualized storm water pollution costs to median household income, or the ability of local land uses to carry new debt. The following is a summary of the data sources used in preparing this analysis:

- Population, housing and employment data from the Southern California Association of Governments (SCAG), Regional Statistical Area Projections from 1994 to 2020.
- Land use acreages were provided through the SCAG Geographical Information System (GIS) Land Use database.
- City and County Summary Report of Population and Housing, Department of Finance (DOF), 1994 to 1998.
- Consumer Price Index (CPI) for Los Angeles, Anaheim, and Riverside areas, U.S. Bureau of Labor Statistics Data.
- Taxable Sales in California during 1996, California State Board of Equalization, and updated to 1998 using the CPI.
- The 1997-1998 Assessment Roll Release, Los Angeles County Assessor.

Basic demographic variables including median household income and housing value from the 1990 United States Census were updated to 1998 using the Consumer Price Index.

2.4 Organization of the Report

Sections organize the report in the following manner:

Section 3 – Environmental Protection Agency (EPA) Economic Guidelines: This section includes the project's key economic criteria based on EPA's guidelines.

Section 4 – Costs of Storm Water Retrofit: The estimated costs of storm water treatment retrofit for specified treatment levels for both capital and annual operations and maintenance cost is shown.

Section 5 – Los Angeles NPDES Permit Area Land Uses: A description of the study area land uses and their relationship to the analysis variables of population, housing and income.

Section 6 – Financing Approaches: Financing approaches to be considered are identified. Key issues include funding ability, practical means of implementation and political feasibility.

Section 7 – Financial Capacity of Local Jurisdictions: This includes the analysis of the ability of local communities to carry substantial new debt.

Section 8 – Assessment of Market Conditions: An assessment of the market conditions under which some combination of financing strategies may be implemented is presented.

Section 9 – Financial Spread of Costs: Presents the allocation of estimated capital and operations and maintenance costs of storm water retrofit among private sector land uses.

Section 10 - Estimated Non-Storm Water Pollution Control Costs: This section presents the estimated costs of other pollution control programs using two approaches. These include costs related to air quality regulations, drinking water treatment, solid waste disposal and wastewater treatment.

Section 11 – Evaluation of Financial Impacts: An evaluation of the financial impacts of implementing the costs of storm water treatment according to EPA's economic guidelines.

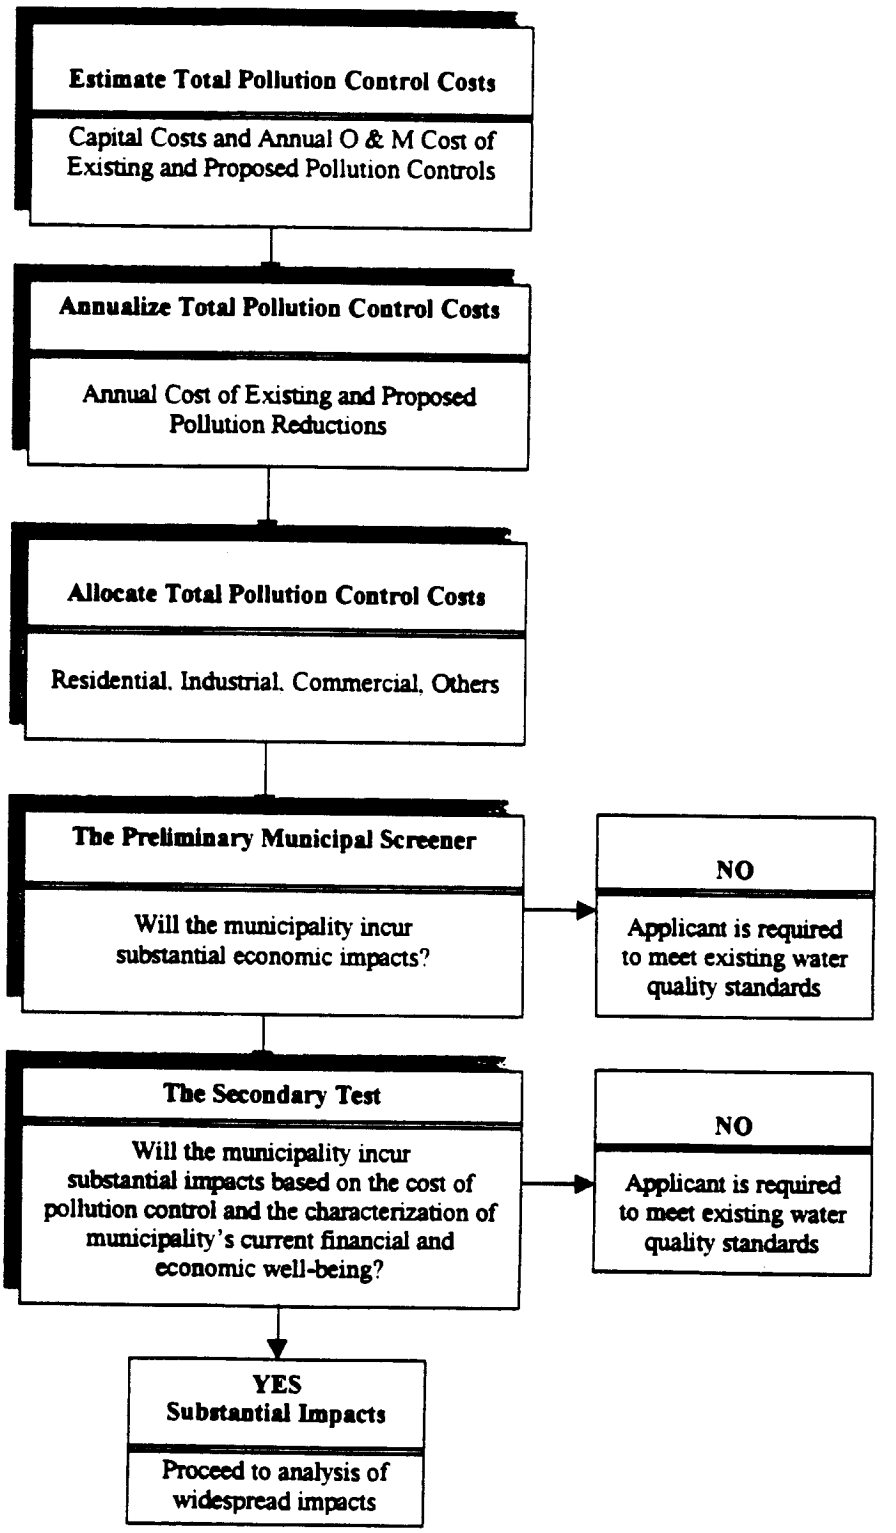
SECTION 3
ENVIRONMENTAL PROTECTION AGENCY (EPA) ECONOMIC GUIDELINES

The approach used to evaluate the economic impacts of the storm water runoff collection and treatment facilities under consideration is based upon the approach and methods presented by EPA's Economic Guidance for Water Quality Standards Workbook and summarized in Figure 3-1. This analysis has focused on incremental costs for existing storm water treatment for residential and non-residential land uses. The Workbook provides guidance to assist interested parties in determining whether attaining a specified water quality standard would result in "substantial and widespread economic and social impacts." The Workbook guidance "is not an exhaustive description of appropriate economic impact analyses," but it does describe "the types of information and analyses that should be considered."

The Workbook calls for a financial analysis to determine "if the capital and the operating and maintenance costs of pollution control will have a substantial impact." For public entities, the Workbook notes, "the households in the community will bear the cost either through an increase in user fees, an increase in taxes or a combination of both." Therefore, "the burden to households resulting from total annual pollution control costs must be estimated. In addition, the financial impact analysis must consider the community's ability to obtain financing and the general economic health of the community."

Demonstrating that substantial economic impacts would occur from implementing pollution control "is not sufficient reason to modify...or grant a variance from water quality standards" according to the Workbook. Rather, the analysis must also include consideration of whether or not "compliance would create widespread socioeconomic impacts on the affected community." Financial impacts are those "that could cause far reaching and serious impacts to the community." While the Workbook states that "there are no correct economic ratios or tests per se to evaluate socioeconomic impacts," it does say that each community must evaluate its own unique circumstances. The guidelines suggest the types of factors that should be considered, including changes in median household income, unemployment, and overall debt burden.

3.1 Step-by-Step Methodology



As shown on Figure 3-1, the Workbook identifies a five-step analysis to determine if the costs of a proposed project will likely result in substantial impacts.

1. Verify Project Costs and Calculate the Annual Cost of the Pollution Control[1]
2. Calculate Total Annualized Pollution Control Cost per Household
3. Calculate and Evaluate the Municipal Preliminary Screener Score
4. Apply the Secondary Test
5. Assess where the community falls in The Substantial Impacts Matrix

R0005958

[1] The project costs were prepared by Brown and Caldwell and independently assessed by other reviewers.

Figure 3-1
EPA Economic Guidelines
Measuring Substantial Impacts (Public Entities)

Source: Stanley R. Hoffman Associates, Inc.
EPA Economic Guidance For Water Quality Standards
Note: Some text has been modified for presentation purposes.

R0005959

The *Municipal Preliminary Screener* (Step 3) is the estimated Total Annual Pollution Control Cost per Household as a percent of Median Household Income in the community. The Screener indicates whether a public entity will *not* incur any substantial economic impacts because of the proposed pollution control program. The Workbook identifies less than 1% as "Little Impact," 1% to 2% as "Mid-Range Impact" and greater than 2% as Large Impact. If the Preliminary Screener results in either a Mid-Range or Large Impact, then the analysis is to proceed to the Secondary Test.

3.2 The Secondary Test

The Secondary Test includes five to six indicators:

Initial Indicators Considered	Final Indicators Used
1. Bond Rating	1. Bond Rating
2. Overall net debt as percent of full market value of taxable property	2. Overall net debt per capita
3. Unemployment	3. Unemployment
4. Median Household Income	4. Median Household Income
5. Property tax collection rate	5. Property tax collection rate
6. Property tax revenues as a percent of full market value of taxable properties	6. Not applied

In states with property tax limitations such as California, the Workbook notes that two of the indicators may not be appropriate: Indicator #2 - Overall Net Debt as Percent of Full Market Value of Taxable Property; and Indicator #6 - Property Tax Revenue as a Percent of Full Market Value of Taxable Properties. The Workbook recommends that Overall Net Debt Per Capita be used in place of Indicator #2 - Overall Net Debt as Percent of Full Market Value of Taxable Property. Also, the Workbook recommends that for states where indicator #6 has no appropriate substitute, it can be dropped and the other five factors assigned equal weight.

The final five indicators are used to form a composite assessment of the community's economic health and the financial impact of the required project. In addition to guidance on how to calculate each indicator, the Workbook provides criteria for scoring each indicator as 1-weak, 2-mid-range or 3-strong. For each of the five indicators the community is rated as weak, mid-range, or strong, based on various thresholds that apply to that specific indicator. For example, overall net debt is used as an indicator of a community's ability to meet debt obligations and its capacity to fund infrastructure. If the Overall Net Debt Per Capita is greater than $3,000, the community would be rated weak in its capacity to fund additional infrastructure and assigned a rating of 1; however, if the debt per capita is less than $1,000 it would have relatively more funding capacity and would be assigned a rating of 3. The indicators are then averaged to derive the Secondary Score.

The results from the first two tests (Preliminary Municipal Screener and Secondary Test) are regarded jointly in the Assessment of Substantial Impacts Matrix to ascertain whether the

community would be expected to incur substantial impacts due to the proposed pollution control project.

3.3 Evaluating Widespread Impacts

The final test is the consideration of *Widespread Impacts*. This test must be done even if substantial impacts are likely to be determined based on earlier tests. This analysis will include both the quantitative indicators and a discussion of potential financial and economic ramifications throughout the community.

SECTION 4
COSTS OF STORM WATER RETROFIT

A cost analysis was prepared by Brown and Caldwell to determine the cost of treating storm water runoff to meet water quality objectives for the Los Angeles NPDES Permit area. The capital costs for the designated drainage basins, as estimated by Brown and Caldwell, have been used for this analysis. These estimates are for a specified number of treatment plants per drainage basin projected to treat storm water from a design storm conforming to a one year return frequency with a duration of 24 hours. The costs have been specified and estimated for three treatment levels plus collection costs as defined below and will be assumed to be incurred in 1998, the first year. The operations and maintenance costs are ongoing costs that will be much less than the capital costs, and can typically be funded on an annual basis rather than through debt financing.

4.1 Storm Water Treatment Levels

The costs for this study have been organized into three levels of increasingly higher costs according to treatment level. Three treatment levels were defined in the Brown and Caldwell June 1998 report, Cost of Storm Water Treatment for Los Angeles County NPDES Permit Area, and were established using the water quality objectives set forth in the Los Angeles RWQCB (Regional Water Quality Control Board) Basin Plan. As stated in this report, the division points between treatment levels are basically the ability to remove sediment and trash; the ability to remove or kill bacteria; and the ability to remove metals. In addition to the three levels described below, there is a cost component of additional collection piping and distribution, which allows collection for treatment before the water runoff enters the major water courses. The three treatment levels include:

Level 1: Detention and Screening
This is the most commonly used storm water treatment technology and is used to remove floating debris and settle solids picked up by storm water. Level 1 is a conventional storm water treatment technology and represents a treatment technology that could be implemented for a large drainage area. The level 1 detention facilities were sized to capture the design storm and hold it for twenty-four to seventy-two hours to allow the solids to settle and clarify the water. Level 1 will decrease pollutant concentrations but cannot meet all the objectives for beneficial use.

Level 2: Filtration and Disinfection
This cost level is cumulative with the preceding level, adding filtration and disinfection costs to level 1 costs of detention and screening facilities. Storm water runoff often contains coliform, which are bacterial indicator organisms used to determine sanitary conditions. The levels of coliform in urban storm water will generally cause the receiving water to exceed levels considered safe for recreational contact. Most waters in California are designated to have a recreational beneficial use and the coliform objective linked to the beneficial use will be exceeded by inflow of storm water. Filtration and disinfection will kill bacterial organisms and allow the objectives for the recreational beneficial use to be met. High rate filtration and chlorination were added to the discharge from the detention basins in level 1. Dechlorination was also provided to protect organisms in the receiving water from the toxicity of any residual chlorination. The flow through treatment units have been designed to treat the captured storm water over a seventy-two hour period following the storm. Level 2 will allow storm water to meet the requirements for the recreational beneficial uses.

Level 3: Advanced Treatment

This level of advanced treatment adds a highly sophisticated treatment process to remove very small concentrations of toxic materials that are often found in urban runoff. Many of the waters in California are designated as potential drinking water sources. The objectives for the beneficial use designation of municipal water supply may require advanced treatment. Even more restrictive than the drinking water standards, are the standards for toxicity as it relates to sensitive species that could potentially exist in the receiving waters. Most waters have beneficial use designations that describe the aquatic environment and have objectives to protect these beneficial uses. Meeting these objectives with structural treatment units will require advanced treatment beyond what is normally expected of water treatment facilities. Reverse osmosis is included as the typical technology representing advanced toxic removal to achieve the required low concentrations. Storm water treated to level 3 is free of almost all pollutants and is suitable for all beneficial uses.

4.2 Capital Costs

The capital costs represent the costs of land and facilities. The costs of the facilities were developed from representative designs then scaled up for the individual watersheds and are based on flow rates. The number of treatment plants required is estimated at 480. For the purposes of this analysis, construction and land purchase is assumed to take place at the beginning of the project in the first year and the annualized cost is assumed to stay constant over the life of the project.

Table 4-1 shows the estimated 1998 total capital costs of $53.6 billion. As indicated, the total capital costs include $12.5 billion in collection of flow costs, which are 23 percent of the total costs. The largest share of the cost is for treatment level 2 at $20.5 billion, or 38 percent of the total.

4.3 Operations & Maintenance Costs

Operations and Maintenance costs include those costs required to operate and maintain the facilities on an annual basis. These include labor, routine materials and supplies, electric power and chemical costs for storm water treatment. Labor costs for operating the facilities are based on crews going to the treatment sites for 12 hours during each storm. Table 4-1 indicates that the annual operations and maintenance costs increase with each treatment level to an annual total of $198.9 million. The largest amount is for treatment level 3 at $82.2 million per year or 41 percent of the total.

4.4 Land Requirements and Cost

Land cost requirements for 480 treatment units are estimated at $6.1 billion as shown in Table 4-2. This represents a total of 13,950 acres, split over treatment levels 1 and 2 at 67 percent and 33 percent respectively. Land costs for properties that might accommodate treatment facilities were estimated at an average of $435,600 per acre based on discussion with appraiser, John J. Bihary, Jr.

Table 4-2
Land Acreage and Land Cost Requirements:
Financing and Economic Impacts of Storm Water Treatment

SECTION 5
LOS ANGELES COUNTY NPDES PERMIT AREA: LAND USES

The land use classification used for this analysis was taken from the Southern California Association of Governments' (SCAG) 1994 land use classifications as shown on Table 5-1.

- Single family residential, including mobile homes
- Multi-family residential
- Commercial areas, including wholesale and retail trade and general services
- Public uses, including public facilities, educational, military, and transportation
- Light and heavy industrial uses
- Other urban areas not included under other categories
- Open spaces including parks and undeveloped lands
- Unknown, including acreage not elsewhere categorized and vacant land

5.1 Land Use Classification

The land use acreage breakdown from SCAG's Geographic Information System (GIS) database utilizes the following land-use classifications. The residential category includes single family, multi-family, mobile homes and trailer parks and mixed residential. Mixed residential refers to an area in which there are both single and multi-family uses but where no single use predominates. The commercial category includes general office use, retail stores and commercial services and mixed commercial and industrial. The public category includes public facilities, educational institutions, military and transportation uses. Light industrial includes manufacturing, assembly and industrial services but not manufacturing which consists of processing raw materials or discharging industrial waste products. The other urban category involves railroads, truck terminals, communication facilities, mixed urban uses and areas under construction. The Open space category consists of local and regional parks, golf courses, cemeteries, gardens and arboreta and other open space and recreation. The miscellaneous category entails unknown land use, which is acreage that cannot be classified elsewhere and vacant land. Agricultural land use and water, except beaches and harbor and marina facilities, were not included.

5.2 Design Flow

The design flow is the millions of gallons of runoff that would be generated by a representative design storm: a Los Angeles area rainstorm conforming to a one year return frequency with a duration of 24 hours. The runoff was developed by a coefficient of runoff that estimates the percentage of precipitation in the design storm that will become runoff based on the land use of the area and the imperviousness associated with that type of land use. Impervious areas are those areas where rainfall cannot be absorbed and thus surface runoff occurs. In areas of high urbanization, there are more areas such as roof surfaces on structures and paved surfaces that do not allow infiltration of storm water as compared to undeveloped open spaces. The imperviousness for each type of land use was based on the values reported by the Santa Monica Bay Restoration Project Report.

As shown in Table 5-1, residential use accounts for only 25.6 percent of the total land area but 33.6 percent of the total runoff. In contrast, open space accounts for 59.3 percent of total land uses but

Table 5-1
Land Uses and Design Flow
Financing and Economic Impacts of Storm Water Treatment
Los Angeles County NPDES Permit Area

Drainage Basin	Total Acres	Percent of Total Acres	Design Flow (mg)[1]	Percent of Design Flow
Single Family	378,494	22.2%	6,018	27.8%
Multi-Family	57,619	3.4%	1,192	5.5%
Commercial	59,427	3.5%	1,486	6.9%
Public	90,892	5.3%	2,079	9.6%
Industrial	75,391	4.4%	1,869	8.6%
Other Urban	18,618	1.1%	426	2.0%
Open	1,010,244	59.3%	8,514	39.3%
Miscellaneous	11,719	0.7%	99	0.5%
Total	**1,702,404**	**100%**	**21,683**	**100%**

[1] (mg): millions of gallons

Source: Stanley R. Hoffman Associates, Inc.
Brown and Caldwell

R0005968

only 39.3 percent of the total runoff flows. This illustrates the relationship of imperviousness to urbanization described above. Runoff is critical in determining costs because of the size of the facilities required to capture and treat storm water, and the concentrations of constituents of concern in the water. The Santa Monica Bay Restoration Project Report indicated that significant concentrations are coming from residential areas.

5.3 Variables for Land Use Analysis

The purpose of this study is to determine the potential economic and financial impact on entities within the Los Angeles Area NPDES Permit area because of storm water retrofit costs. The above discussion of land use and runoff indicates that a highly urbanized area will generate more runoff and a higher concentration of potential constituents of concern than less urbanized areas. Therefore, the costs for storm water management will be higher for communities in these areas. To determine the potential impact over various land uses, the following data was utilized:

- Population, housing, and employment statistics from the Southern California Association of Governments (SCAG)
- Household annual median and average income projections based on U.S. Census data, updated using the Consumer Price Index (CPI)
- Single and multi-family housing units and current population estimates from the California Department of Finance (DOF) to determine density and persons per household ratios

5.3.1Population, Housing and Employment

The 1994–1998 population, housing, and employment data from SCAG were tabulated for all the census tracts within the designated drainage areas as shown on Table 5-2. An estimate for 1998 was made based on the predicted average annual change from 1994 to 2000.The 1998 total population for the drainage basins of about 9.3 million is 97 percent of the total Los Angeles County population estimate of 9.6 million for 1998 based on DOF and is projected to increase annually at an average of about 1 percent from 1998 to 2020.

5.3.2Household Income

Estimates for 1998 for median household income were made based on 1990 United States Census data obtained from the 1989 survey, and updated using the 1989 to 1998 change in the CPI of 26.0 percent as shown on Table 5-3. Household income is used as an indicator with the EPA Municipal Screener described earlier in Section 3 to determine storm water facilities retrofit costs for single family and other land uses. The estimated 1998 median income for Los Angeles County is $43,916.

5.3.3Density

The 1994 land uses from the GIS data base and the 1994 housing units from the Department of Finance were used to determine density as to housing units per acre for single family and multi-family housing units as shown in Table 5-4. The Los Angeles River and Santa Monica Bay basins show the highest overall density at 8.35 and 9.30 units per acre. The Malibu basin has the lowest density at 2.71 units per acre. As shown in Table 5-4, the Los Angeles River and Santa Monica basins have the highest single and multi-family densities.

SECTION 6
FINANCING APPROACHES

This section provides a brief overview of various sources and methods for financing the construction, operation and maintenance of the major storm water treatment facilities that would be required to meet water quality standards. While no financing strategy is recommended at this time, there is a range of financing approaches used in California. Typically, in California more than one financing approach is utilized for major projects, including a combination of local and outside sources.

6.1 Federal

The Federal government historically has played a leading role in financing various environmental enhancement programs. A Federal program to pay for all or a significant part of the costs of storm water runoff treatment facilities is currently not available nor expected in the near future. Currently, national attention is on balancing the Federal budget and on maintaining the long-term soundness of Social Security and Medicare, not on major new grant programs.

6.2 State

At the State level of government, a possible approach for financing part of the capital costs of storm water treatment would be through some form of State grants program or allocation of some state's current surplus after existing funding priorities have been completed. Such a grant program would require state legislative action and statewide voter approval since it would likely involve the issuance of general obligation bonds by the State. The State policy as established, both from the Department of Finance and the State Treasurer, is to keep the general fund debt ratio below 6 percent. In other words, the prudent maximum annual cost of servicing debt from the General Fund is by policy established at 6 percent.

Even if approved by the voters, it would be very unlikely to fund any sizable level of statewide storm water treatment costs. The State Department of Finance estimates that as of January 1, 1998, the total capacity for new general obligation bonds issuance over the next 10 years is $40 billion statewide. The $40 billion estimate does not include new bond measures taken to voters in 1998. For example, the November 1998 election ballot included a $9.2 billion school finance measure, which is the largest statewide General Obligation bond measure ever approved by California voters.

6.3 Local

The ability of local governments in California to finance public improvements has been increasingly circumscribed over the last 20 years. In June 1978, the voters of California amended the state constitution to limit the ability of local governments to impose property taxes. That amendment, commonly known as Proposition 13, added Article XIIIA to the state constitution that limits the maximum ad valorem tax on real property to one percent of the assessed value of that property. Proposition 13 also limited annual assessed value increases to 2 percent or the inflation rate, whichever is smaller, until a property is sold. Since the passage of Proposition 13, more than dozen other statewide propositions have been passed that further restrict how local revenues can be raised

or spent. In 1979, the voters passed Proposition 4, known as the Gann Initiative, which added Article XIIIB to the state constitution. This article limits the permitted growth in the rate of local government spending from general revenues to changes in population and inflation growth rates. Voter approval is required to increase spending limits. This vote must be reaffirmed every four years.

Proposition 46 in 1986 allowed local governments by a 2/3 majority vote to impose a property tax above the Proposition 13 one percent for the period required to finance new general obligation bonds. The proposition also restricted the use of general obligation bond proceeds to the purchase or improvement of real property.

While many other measures were passed during the late 1980's and early 1990's, the measure that has had the most widespread impact since Propositions 13 and 4, was passed in 1996 as Proposition 218. This measure adds Articles XIIIC and XIIID to the state constitution. The measure does the following:

1. Limits authority of local governments to impose taxes and property-related assessments, fees and charges. It requires that a majority of voters approve increases in general taxes and reiterates that two-thirds must approve a special tax.
2. Requires that assessments, fees, and charges must be submitted to property owners for approval or rejection, after notice and public hearing.
3. Limits the amount of an assessment on a property to the "special benefit" conferred on the property.
4. Limits fees and charges to the cost of providing the service and establishes that such fees and charges may not be imposed for general governmental services that are generally available to the public.

Within the restrictive context described above, the following are some financing mechanisms used by local governments to finance various public improvements in California:

- Community Facilities Districts
- Special Benefit Assessments
- General Obligation Bonds
- Local Option Sales Tax
- Fees and Charges
- Certificates of Participation, with lease payments from the General Fund
- Development impact fees
- Redevelopment Tax Increment Financing

Community Facility Districts. The Mello-Roos Community Facilities Act permits various local governments to establish a Community Facilities District to finance new facilities and/or to pay for operations and maintenance through the levying of a special tax. This Act plus Proposition 218 discussed earlier requires a two-thirds vote for approving the special tax in inhabited areas.

Special Benefit Assessments. Benefit assessments can be levied on real property by cities, counties and special districts to acquire, construct, operate and maintain public improvements that convey an

identifiable special benefit to the defined properties. As was discussed earlier, Proposition 218 establishes a strict requirement for formal landowner approval before such assessments can be put in place.

General Obligation Bonds (G.O. bonds). Cities, counties and certain other local government entities may issue G.O. Bonds to finance specific projects. Debt service for G.O. bonds is provided by an earmarked property tax above the one percent general property tax mandated by Proposition 13 (often called a "property tax override"). These overrides typically show up on the annual tax bill as "voted indebtedness." The proceeds from G.O. bonds can be used to finance the acquisition, construction and improvement of real property, but cannot be used to pay for equipment, supplies, operations or maintenance costs.

Local Option Sales Tax. Twenty-one counties impose a sales and use tax added onto the basic 6 percent rate. Los Angeles County imposes a sales tax of 8.25 percent. The local share of the basic sales tax is one percent. Local option sales taxes have been used for public safety, traffic, hospitals, education, earthquake recovery and other purposes. If such taxes are earmarked for a specific purpose or if a special district levies them, then they are deemed Special Taxes under Proposition 218 and require a two-thirds voter approval.

Fees and Charges. Local governments can levy various fees and charges to recover the cost of providing services. Under Proposition 218, many of these fees and charges that are "incident to property" are now also subject to landowner approval.

Certificates of Participation (COPs). A COP is a form of lease purchase agreement that does not constitute indebtedness under the state constitution and does not require voter or landowner approval. The lease payments typically are made from the local government's general fund.

Development Impact Fees. These are fees charged to new development to pay for facilities required to serve the new development. State law, and Federal case law, establishes a rigorous set of tests that such fees must meet to be valid. In short, these fees can only be used to pay for those facilities or portions of facilities required to serve new development. They cannot be used to correct existing problems or cure existing capital or operating and maintenance deficiencies.

Redevelopment Tax Increment Financing. A city or county can establish a redevelopment agency to undertake the revitalization of an area that it finds to be "blighted." The redevelopment agency may incur indebtedness to finance improvements needed to accomplish the goals of its redevelopment plan. The property tax base in the redevelopment area is "frozen," and increments in property taxes after the tax base is frozen go into the redevelopment fund to be used for the financing of improvements. Voter approval is not required for tax increment financing. Such financing may be used only for facilities to support the needs of redevelopment. Further, it usually takes many years before significant property tax increment, derived from new development, is available for financing.

6.4 Funding Assumptions

For purposes of this analysis, it was assumed that the financing would be based on the issuance of bonds with a 20-year life as suggested in the EPA Workbook. The tax-exempt interest rate for such

bonds was assumed to be 6 percent. Based on municipal bond rates over the past 10 to 20 years provided by the California Debt Advisory Commission, this is judged to be a reasonable rate for planning purposes. Funding costs of such bonds were assumed to be 12.5 percent of the total issue amount. Funding costs include the cost of debt issuance, underwriters discount, reserve fund and other related costs. These assumptions allow the total capital costs to be annualized and combined with the annual operations and maintenance costs.

SECTION 7
FINANCIAL CAPACITY OF LOCAL JURISDICTIONS

7.1 Overall Net Debt per Capita

Financial capacity of local jurisdictions means the ability of the local community to incur additional debt to pay for public improvements and services, here storm water retrofit facilities and annual operations and maintenance. In California, after the passage of Proposition 13 in 1978 and more recently Proposition 218, significant restrictions have been placed on any increases in property taxes or property related fees and charges. Also, the revenue potential of local jurisdictions to assume additional debt has been further constrained by the effects of the recession in the early 1990s.

Net debt per capita is one indicator of financial capacity of local jurisdictions. Each community, depending upon its infrastructure needs and level of development, will have a different mix of debt instruments, such as general obligation, special assessment or Mello-Roos bonds. Also, besides each community's direct debt, there is overlapping debt from other special purpose districts such as schools, water and sewer, fire protection and flood control. In evaluating the impact of existing debt per capita and the addition of new debt on a community, the EPA has suggested the use of following ranges:

- Greater than $3,000: weak = 1
- $1,000 - $3,000: mid-range = 2
- Less than $1,000: strong = 3

The overall debt per capita estimate of $1,207 for Los Angeles County is used subsequently in the evaluation of local financial and economic impacts. This estimate is based on total outstanding and direct and overlapping debt of about $11.6 billion for Los Angeles County provided by California Municipal Statistics, Inc. This debt per capita is already within the mid-range of $1,000 to $3,000 per capita as prescribed by the EPA. When the total net debt for full treatment of $5,788 per capita ($53.6 billion divided by the study area population of 9,259,750) is added to this debt, it results in $6,995 of debt per capita. This is above the weak range limit of $3,000. The total new net debt represents a 480 percent increase over the existing net debt per capita.

7.2 Analysis of Sample Property Tax Bills

In contrast to the more global overall net debt analysis, a summary of sample local property tax bills for several single family residential units in Los Angeles NPDES area is presented on Table 7-1. Three properties from each basin are shown and the payments through the property tax bill are divided into three categories: 1) the basic 1 percent local property tax rate established by Proposition 13; 2) voter approved bonded indebtedness; and 3) direct assessments. The voter-approved portion includes City, County, MWD, Flood Control and Unified School District debt payments. The direct assessments include annual payments for many purposes, including flood control, storm water, fire/paramedics, parks, lighting maintenance, emergency 911 and mosquito abatement.

Source: Stanley R. Hoffman Associates, Inc.
Los Angeles County Assessor

The range of assessed value for these properties is broad, with a median of $500,947. The total taxes range from 1.043 percent to 1.932 percent of assessed value. Examining the median property, the total charges including the basic one-percent, voter-improved indebtedness, and direct assessments, account for about 1.197 percent of the total assessed value. A typical rule of thumb in municipal finance indicates that the upper limit for reasonable annual charges to a property should not exceed 2 percent.

7.3 EPA Municipal Preliminary Screener Approach

The U.S. Environmental Protection Agency (EPA) has prescribed a methodology, the Municipal Preliminary Screener, to establish whether a community is expected to incur "substantial" economic impacts due to the pollution control project costs. There are two tests with this Municipal Preliminary Screener to establish whether the community can clearly pay for the project without incurring any substantial impacts under the EPA guidelines. The screener is defined as follows:

$$\textit{Municipal Preliminary Screener} = \frac{\textit{Average Total Pollution Control Cost Per Household}}{\textit{Median Household Income}}$$

The EPA has established a lower threshold of below 1 percent of median household income as representing a cost that is not expected to impose a substantial economic hardship on households. A cost between 1 and 2 percent is considered a mid-range impact. If the cost is over 2 percent of median household income, then the project may create an unreasonable financial burden on many households within the community, according to the EPA methodology.

The estimates of 1, 1.5 and 2 percent of median household income are presented in Table 7-2 for the Los Angeles County area. They range from $439 per household to $878 per household annually. When this per household amount is multiplied by the estimated 3,228,269 households in the Los Angeles NPDES permit area, it generates a range of annual revenue potential of $1.4 to $2.8 billion. This revenue represents from about 29 to 58 percent of the total annualized cost for full storm water treatment.

The estimated cost for existing pollution controls plus the full storm water system is about $1,295 per household annually which results in impacts over 2 percent of median household income, therefore, this is judged to create a substantial economic impact. The total cost is comprised of the annualized average storm water cost estimate of $741 plus existing pollution control costs of $554 per household. Using the Preliminary Screener, the level of median household income required for the estimated total pollution control costs exceeds the 2 percent level indicating potentially a substantial economic hardship on households. The EPA guidelines now suggest proceeding to the Secondary Test.

Table 7-2
EPA Municipal Preliminary Screener Analysis
Financing and Economic Impacts of Storm Water Treatment
Los Angeles County NPDES Permit Area

Municipal Screener Categories[1]	Estimate
Households[2]	3,228,269
1998 Median Household Income	$43,916
1 Percent of Median HH Income	$439
1.5 Percent of Median HH Income	$659
2 Percent of Median HH Income	$878
Annual Revenue Potential @ 1 Percent	$1,417,726,614
Annual Revenue Potential @ 1.5 Percent	$2,126,589,921
Annual Revenue Potential @ 2 Percent	$2,835,453,228

1. EPA has suggested a Municipal Screener range of less than 1 percent for representing little impact, 1 to 2 percent for mid-range impact and over 2 percent for large impact.

2. Estimated households for Los Angeles NPDES Permit Area 1998.

7.4 The Secondary Test

According to the EPA, the Secondary Test builds upon the characterization of the financial burden identified in the Municipal Preliminary Screener. This test provides an indication of the community's ability to obtain financing and describes its socioeconomic health. According to the EPA Guidelines, the indicators describe precompliance debt and socioeconomic and financial management conditions in the community. In states, such as California, with statutory limits on property tax rates and where data on full market value of taxable property are not generally available, the indicator Overall Net Debt Per Capita can be substituted for other indicators that rely on full market value information. The following five indicators suggested by the EPA have been applied for the Secondary Test:

1. Debt Indicators
   - Bond Rating
   - Overall Net Debt Per Capita

2. Socioeconomic Indicators
   - Unemployment Rate
   - Median Household Income

3. Financial Management Indicators
   - Property Tax Collection Rate

The overall methodology, illustrated on Table 7-3, ranks each indicator on a scale from 1 to 3 and then calculates a simple average of the five indicators, where a score of 1 is Weak, 2 is Mid-Range and 3 is considered Strong. As shown in Table 7-3, the five indicators add to a total score of 11 and an average of 2.2 indicating that the Los Angeles NPDES Permit Area falls in the Mid-Range of the socioeconomic and financial management indicators. The Secondary Test shows a bond rating of Strong with ratings generally above BBB and a score of 3; an overall net debt per capita in the Mid-Range with a score of 2; an unemployment rate of 6.1 percent, or over 1.0 percent higher than the national rate of 4.7 percent, for a Weak ranking and a score of 1; a median household income of $43,916, which is roughly equivalent to the State median, for a mid-range ranking and a score of 2; and a generally Strong property tax collection rate for a score of 3. When this score of 2.2 is prorated across the 1 percent to 2 percent mid-range, it results in an estimated Secondary Test score of 1.6 percent and will be used later as part of the evaluation of substantial economic impacts.

SECTION 8
ASSESSMENT OF MARKET CONDITIONS

The purpose of assessing market conditions is to determine the potential ability of the various land uses to absorb new taxes, assessments, fees or charges. Two measures used in this section for this purpose are the assessed valuation of property and the amount of taxable sales generated by a community. In addition to household income, these are both indicators of local financial strength and the ability to accommodate additional debt. Assessed value along with the property tax rate determines how much property tax revenue is generated each year. The maximum basic rate of property taxation is limited in California by Proposition 13 to 1 percent. The taxes available for financing debt exceeding the one-percent level now must be approved by a two-thirds vote of the local electorate.

8.1 Assessed Value Trends for Los Angeles County and the Los Angeles NPDES Permit Area

The recession in the early 1990s in California had a dramatic dampening effect on the rate of increase in assessed property valuation in Los Angeles County. This, in turn, constrained property tax revenues for many local jurisdictions. Table 8-1 shows the average annual growth of assessed value from 1989 to 1998 according to the Metropolitan Water District (MWD) for areas in Southern California in their jurisdiction, including Los Angeles County. This indicates an average annual percentage change in total assessed valuation from 1989 to 1998 of 4.7 percent. This growth rate has slowed considerably since 1993.

The assessed valuation from the 1996-1997 annual Los Angeles County Tax Roll was used to analyze the local ability of jurisdictions in the Los Angeles NPDES Permit Area to finance additional costs through property tax revenues. Assessed value and market value per acre of private sector land uses were estimated for use in the analysis. Table 8-2 summarizes assessed valuation for the County with estimates ranging from about $632,900 per acre for single family units to $1.2 million per acre for commercial/industrial land.

When the total estimated assessed valuation of about $457.3 billion for all three categories is averaged over approximately 564,654 acres of residential and commercial/industrial in the Los Angeles NPDES area, this results in an estimated assessed valuation of about $809,915 per acre.

8.2 Taxable Sales Trends

Taxable sales for Los Angeles County can indicate a local jurisdiction's ability to generate additional revenues. Since the passage of Proposition 13, the sales tax has become the preferred source of local government funding for ongoing operations and maintenance. However, some local jurisdictions have traded a share of their sales tax to fund public infrastructure that has attracted revenue generating commercial land uses.

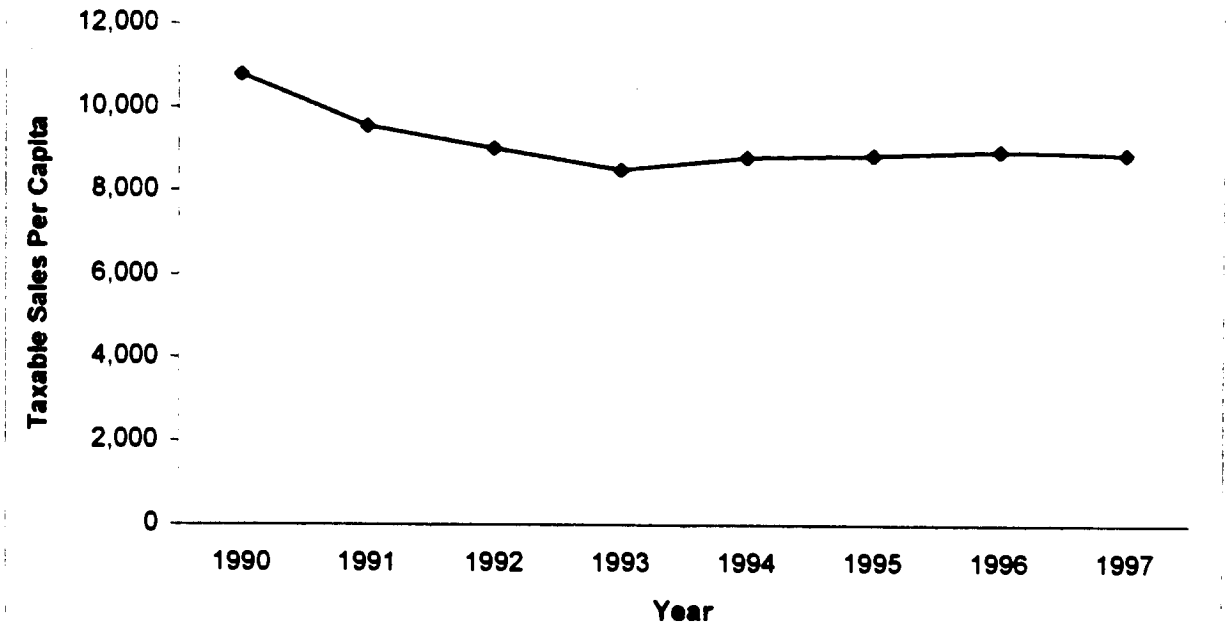
Los Angeles County Assessor 1996-1997 Roll Release



R0005986

From 1990 to 1997, taxable retail sales for Los Angeles County, according to the California Board of Equalization, declined from $94.7 billion to an estimated $84.7 billion in 1998 inflation-adjusted dollars. This was a decline of approximately $10 billion in taxable sales. Per capita taxable sales are shown in Figure 8-1. The overall decline of per capita taxable sales for the 1990 to 1997 period is 17 percent, declining from $10,802 in 1990 to an estimated $8,925 in 1997. However, since 1993, real per capita taxable sales have been stable and even showed slight increases.

Estimated 1998 taxable sales for the Los Angeles NPDES Permit Area are shown in Table 8-3. The per capita range for communities in this area is quite large, with a low of $8,559 in the Los Angeles River Drainage Basin and a high of $13,336 for the Dominguez Drainage Basin. This indicates a large disparity in both locational selection of shopping and in the income levels of the population as well. The overall taxable sales per capita is $9,050 dollars for the Los Angeles County NPDES area.

SECTION 9
FINANCIAL SPREAD OF COSTS

This section analyzes the potential financing of the 1998 estimated storm water treatment costs for the Los Angeles County NPDES Permit Area under the following two scenarios:

1. Full Storm Water Retrofit Treatment
   - $53.6 billion capital costs; $198.9 million annual operations and maintenance

2. Debt capacity limited by EPA Preliminary & Secondary Screeners
   - $5.3 billion capital; $20.0 million annual operations and maintenance

The first scenario presents the financing of the full system including collection costs and all three levels of treatment. The second scenario reflects the EPA Preliminary and Secondary Municipal Screeners. This combines the revenue potential based on 1.6 percent of median household income to reflect the estimated average Secondary Test screener score, as discussed in Section 7.4, reduced by estimated existing non-storm water pollution control costs of $554 per household.

The financial analysis of the first scenario spreads capital and operations and maintenance costs to both residential and non-residential land uses. The spread is based on the proportionate share of flow from each type of privately owned land use. For example, single family residential land use generates an estimated 38.2 percent of the runoff flow while the commercial and industrial categories generate an estimated 21.3 percent of the flow. The capital costs spread by land use are then annualized assuming bond interest of 6.0 percent, a term of 20 years and estimated bond issuance costs of an additional 12.5 percent above the construction costs.

These annualized capital costs are then converted to a cost per unit basis for single or multi-family land uses or to a cost per acre basis for commercial, industrial and other urban land uses. It is further estimated that the "Open" land use includes about 55 percent privately owned open space. This estimate was based on a geographic information system entitled "GOVOWNERSHIP." It shows groupings of land ownership and was originally digitized by the Forest and Rangeland Resources Assessment Program of the California Department of Forestry. The annualized capital costs are added to the annual operations and maintenance costs to estimate a total annual cost per unit or acre.

The model can analyze the financial implications of outside funding, such as from the State or Federal levels, possible sales tax subventions or redevelopment agency contributions. However, these sources of funds are considered both limited and uncertain. Currently, there are no funding programs for storm water costs of this magnitude.

The basic assumption is that successful implementation is primarily a local responsibility and will require major financial commitments from local sources. In presenting the analysis, a residential land use category has been used for illustration. Each scenario will be discussed in detail, but in summary, the estimated annual storm water treatment cost for each scenario is as follows:

	Cost Per Residential Unit	Cost Per Single Family Unit	Cost Per Per Household
Scenario 1:	$741	$1,024	$1,509
Scenario 2:	$ 73	$ 101	$ 149

9.1 Scenario 1 – Full Storm Water Retrofit Treatment

Scenario 1, Table 9-1, presents the analysis for the full treatment costs of $53.6 billion, including $12.5 billion for storm water collection costs. The annual operations and maintenance costs are $198.9 million. The spread of costs to private sector land uses is based on the distribution of storm water runoff flow from the engineering analysis prepared by Brown and Caldwell.

Using this flow analysis and the single family dwelling unit for illustration, the total allocated capital cost was estimated at $10,062 per single family unit. This was annualized to about $987 and when added to the allocated share of annual operations and maintenance costs of about $37, resulted in $1,024 per single family unit for the full system costs. Based on the average assessed value per single family unit of $117,860 this would be an estimated increase in the property tax rate of 0.87 percentage points.

When the cost of $1,024 per single family unit is weighted with the cost of $309 per multi-family unit, this results in a per residential unit cost estimate of $741. Correspondingly, the cost is $1,509 when allocated on a per household basis. This estimate represents all costs allocated to households with no spread of costs to non-residential land uses. This is for the cost of full storm water treatment before accounting for existing pollution control costs of $554 per household.

9.2 Scenario 2 – Debt Capacity Limited by EPA Secondary Municipal Screener

Scenario 2 summary analysis is presented in Table 9-1 reflecting the Preliminary and Secondary Municipal Screener. For this analysis, it is estimated that the income potential is 1.6 percent of median household income ($703) based on the Secondary Screener. When the estimated amount of $703 per household at the Secondary Municipal Screener level of 1.6 percent of median household income level ($43,916) is reduced by the estimated cost of $554 for non-storm water pollution controls, this results in a net amount of $149 per household available for storm water treatment. If this annual amount of $149 is multiplied by the estimated 3,228,269 households in the Los Angeles County NPDES Permit area and is then capitalized using a 6 percent interest rate and a term of 20 years, this results in an estimated affordable capital cost of $5.3 billion. This represents about 9.9 percent of the estimated full storm water treatment cost of $53.6 billion. On a comparative basis, this yields an estimated cost of $73 per residential unit or $101 per single family unit.

SECTION 10
ESTIMATED NON-STORM WATER POLLUTION CONTROL COSTS

So far his report has only examined the incremental costs of storm water treatment and has not included the costs of other non-storm water pollution control programs. In this section, estimates of existing and future non-storm water pollution control costs per household were added to the estimated incremental costs for storm water treatment in the Los Angeles County NPDES permit area. The estimated costs to households of other pollution control measures cover the following:

- Air Quality Regulations
- Drinking Water Treatment
- Solid Waste Disposal
- Wastewater Treatment

The analysis in this section represents a preliminary examination of this issue, as a comprehensive study would require a major commitment of resources. When estimating existing or future pollution control costs, there is a wide range of pollution programs for consideration which would require extensive research. In developing the estimated initial costs, two approaches were utilized: 1) analysis of estimated localized, direct costs in California; and 2) a literature review including a 1990 comprehensive study by the EPA updated to 1998 dollars. Because of the widespread effects of pollution controls on the economy and the difficulty of calculating the full effects as they ripple through it, these two approaches likely underestimate the total level of pollution control costs.

10.1 Summary

According to the EPA Municipal Screener, the estimated incremental cost of any new pollution control program should be added to the existing pollution control costs. Therefore, the per household cost estimates of existing pollution control made in this study are added to the incremental costs for storm water treatment by area to determine whether they exceed the 2 percent of median household income criteria prescribed by the EPA municipal screener methodology. The approaches used to estimate the impacts of existing and future pollution control costs in combination with estimated incremental storm water treatment costs are described in this section and summarized below:

1) Localized estimate: $554 annually per household
2) EPA nationwide study estimate: $537 annually per household

10.2 Localized Estimates for Existing Non-Storm Water Pollution Control Costs

Estimates were made for the additional annual pollution control costs per household unit based on localized costs for the Los Angeles area of wastewater user fees, tire/oil disposal, automobile emissions and repairs, drinking water treatment and solid waste disposal. This amount was estimated to be about $554 annually per household for the Los Angeles area as shown on Table 10-1.

Data was compiled using several sources in order to determine the existing residential costs of non-storm water pollution control programs in the Los Angeles area. These costs are analyzed by three

Table 10-1
Financial and Economic Impacts of Storm Water Treatment
Estimated Annual Localized Non-Storm Water Pollution Control Costs Per Household
Los Angeles Area

Description of Localized Cost	Estimated Annual Cost
Annual Wastewater User Charge[1]	$194
Other Localized Pollution Control Costs	
Automobile Tire/Oil Disposal[2]	$8
Average Emissions Costs[3]	$74
Drinking Water[4]	$144
Solid Waste	$134
Total Other Costs	$360
Total Estimated Localized Pollution Costs	**$554**

[1] This estimate is based on the California Environmental Agency's, Wastewater User Charge Survey Report, Fiscal Year 1997-98.

[2] Based on oil disposal costs of $5 and tire disposal costs of $3 per year.

[3] Based on average emissions cost calculations as shown below:

Annual Median smog inspection fee	$14.00
Annual Median smog certificate	$5.00
Annual Average emissions repairs	$55.00
	$74.00

[4] Estimated Water treatment cost based on Metropolitan Water District (MWD) jurisdictions as shown on Table 10-3 has been applied as an average cost to the Los Angeles area.

Sources: Stanley R. Hoffman Associates, Inc.
EPA, Environmental Investments, 1990; US Census Bureau
Wastewater user Charge Survey Report, Fiscal Year 1997-98, California Environmental Protection Agency
Metropolitan Water District of Southern California, 1998

Notes:			Per Household Annual Estimated Charges
Calculations are based on the following estimates:			
Tires changed @ 50,000 miles or 2 tires/yr.at $1.50 each			$3.00
Oil changed @ $1.00	4.86	times per yr.	$5.00
Annual Median smog inspection fee			$14.00
Annual Median smog certificate			$5.00
Annual Average emissions repairs			$55.00
Per Capita Vehicle Miles Travelled			8,635
Annual VMT per household			17,270

primary environmental media: air, land and water. The detailed annual cost estimates per residential unit for each of these categories, as shown on Table 10-1, include annual wasterwater user charges plus other costs. The estimated other localized pollution costs include: tire/oil disposal fees, smog check and related emissions repairs, drinking water treatment and solid waste disposal and are about $360 per household for the Southern California area.

These total costs are then added to the estimated annual wastewater user charge to arrive at a total estimated annual localized pollution control cost per household. When this total localized amount of $554 is added to the incremental cost of storm water treatment, it represents the total amount that a household is estimated to pay for pollution control on an annual basis if the full storm water treatment system was implemented.

The cost estimates for the air category include costs related to meeting the requirements for automobile smog check, smog certificate, and related emissions repairs every two years. These costs were derived based on estimates received from the California Bureau of Automotive Repairs (BAR) and then annualized on a per household basis. Smog activity is reviewed statewide each month by BAR. Table 10-2 summarizes the emissions related repair costs from July 1997 through March 1998 plus other smog control related costs. The annualized amount was calculated based on the California regulation that automobiles must pass smog certification every two years.

The land category includes costs related to solid waste disposal, as well as those for automobile oil and waste tires. The estimates for solid waste in dollars per household were presented in the EPA study. The costs for tire and oil disposal were derived based on estimates provided by the Integrated Waste Management Board of California. The calculations used in the analysis are referenced on Table 10-1.

The water category includes those costs related to the treatment of drinking water and user fees for wastewater. The costs for the treatment of drinking water were calculated based on the Southern California Metropolitan Water District's (MWD) price schedule for areas within their jurisdiction. A summary of these water treatment costs is shown on Table 10-3. The estimated annual wastewater costs were based on the California Environmental Protection Agency's report, Wastewater User Charge Survey Report, Fiscal Year 1997-98.

10.3 Pollution Control Cost Estimates Based on EPA Study

This approach utilizes a 1990 study by the EPA, Environmental Investments: The Cost of a Clean Environment, which estimates the direct costs of public and private pollution control activities in the United States. Although this report was prepared in 1990, it represents an extensive analysis of environmental costs by economic sector and environmental medium. The study also includes a projection to the year 2000 of what EPA estimated at the time to be the cost of full compliance with existing regulations. According to the report, overall there is expected to be a significant increase in the real costs of pollution control on local government which will require significant additional capital investments and increases in rates charged to customers for expanded environmental services.

R0005997

10.3.1 Overall Costs of Environmental Protection

Based on the EPA study, the estimated future annual cost of pollution controls per household in 1998 dollars would be about $537. These costs are shown in detail on Tables 10-4 and 10-5 and would likely be higher if the effects of more recent pollution control legislation were included. The estimated costs include pollution abatement, control and prevention expenditures. Only the direct costs associated with implementing control measures and compliance activities are included in the analysis.

The report presents data on environmental pollution control costs from 1972 through 1987 and projects those costs for each year through 2000 under various assumptions related to full compliance with existing regulations. The report presents the results in a variety of ways including by type of cost (capital, operating, etc.), by medium (land, air, water), by program and by economic sector which directly bears the cost of the control (public versus private). The report is based upon surveys of spending conducted by the Department of Commerce, EPA Regulatory Impact Analyses and an earlier EPA study, The Municipal Sector Study: Impacts of Environmental Regulations on Municipalities (September 1988).

The EPA study found that in the year 2000, total annualized costs for all pollution control activities in the nation would likely be in the range of $171 billion to $185 billion (in constant 1990 dollars). These costs would represent 2.6 to 2.8 percent of Gross National Product.

The largest share of pollution control costs – 61 percent – is directly borne by the private sector. The second largest share – 23 percent – is directly borne by local governments. Local government costs relate mostly to wastewater, drinking water, sewage sludge and solid waste. According to the report, "...it is projected that over the next several years real pollution control burdens on municipalities will increase dramatically and result in large increases in the fees charged to consumers for locally-provided environmental services."

10.3.2 Estimated Costs per Household

While the EPA report provides a comprehensive analysis of pollution control costs and does estimate which sector initially bears the costs, it does not attempt to estimate how much of these costs are ultimately passed on to households, businesses, and other entities. However, the Municipal Sector Study found that households in smaller communities will pay an average of 0.7 percent of their incomes for environmental services while those in larger communities will pay on average 0.5 percent.

Tables 10-4 and 10-5 show selected annualized cost estimates for mobile source and other selected pollution control programs. This is derived from the EPA report, when combined, results in an estimated cost of $537 per household. The cost estimates in Table 10-4 were projected by the EPA as local government's share in the year 2000. This assumes full compliance with national standards for water quality point sources, drinking water and solid waste.

EPA, Environmental Investments, 1990; US Census Bureau

Table 10-5 presents estimated air pollution control costs for mobile sources. The EPA study annualized the estimated capital costs using a 7 percent annual amortization rate for capital expenditures and combined them with annual operations and maintenance costs. The first data column shows the cost estimates in 1986 dollars. The second data column converts the cost estimates to 1998 dollars using an adjustment based on the Consumer Price Index. The third column shows the cost per household based on the Census Bureau's forecast of households for 2000 (Series 2) of approximately 103.1 million.

Cost estimates are presented for the three programs with the largest local government financial responsibility. In order to avoid double counting with the incremental storm water treatment cost estimates, EPA estimated non-point source water quality control costs were not included in the table. No attempt was made by EPA to estimate either how much of these costs would be passed back to the consumers of municipally provided environmental services in the form of periodic fees or how much of such fees would be borne by households, businesses and other entities. Such user fees are common for wastewater treatment, drinking water supply and solid waste collection and disposal. Conversely, no attempt was made to include the costs of private providers of the same services. Some drinking water and solid waste collection and disposal services, for example, are provided by private companies who charge user fees in the same manner as municipal providers.

The total annual local cost for local government programs in the year 2000 is projected at about $45.1 billion as shown on Table 10-4. This would be the equivalent of $438 per household based on the Census Bureau's projection of 103,058 million households. The total annual cost of mobile source air pollution controls is shown on Table 10-5 and is projected to be $10.18 billion. Assuming one half of this is for commercial vehicles and the other half is for vehicles owned by households, then the average annual cost per household is estimated at $99. This is considered a conservative assumption since slightly less than one third of the total registered vehicles in California are commercial. When these two estimates are combined, a total cost per household of $537 results.

SECTION 11
EVALUATION OF FINANCIAL IMPACTS

This section discusses the findings of potential financial and economic impacts on the Los Angeles NPDES Permit Area. The EPA Municipal Screener methodology and other selected socioeconomic indicators are used in this evaluation. A set of summary indicators are presented in Table 11-1 for the two scenarios: 1) Full retrofit treatment; 2) Retrofit expenditures limited by the Preliminary and Secondary Screener. The cost of full storm water treatment is first evaluated followed by an evaluation of costs as limited by the Secondary Screener test.

11.1 Widespread Impacts

The financial and economic inpacts are first evaluated for the cost of full storm water retrofit treatment. Based on the EPA methodology and other economic indicators presented below, the economic impacts are judged to be both substantial and widespread for the full system storm water treatment costs as summarized on Table 11-2.

11.1.1 Property Tax Impacts

One measure of financial feasibility is the estimated impact on the property tax rate. The property tax rate for a single-family unit is estimated to increase by about 0.87 percentage points for the full system as shown previously on Table 9-1. When added to the median base property tax of 1.19 percent, this results in a total property tax of 2.06 percent, an increase of about 73 percent in the annual property tax bill. Given the current economic climate in California, this estimated total rate of 2.06 percent is clearly more than is likely to be absorbed by local single family households alone. For multi-family units, the estimated increase of 0.67 percentage points would also represent a sizable increase if translated into a potential rental pass through.

11.1.2 Sales Tax Impacts

To compare the annualized storm water treatment costs to other economic indicators, a hypothetical increase in the sales current tax rate of 8.25 percent was estimated in lieu of increasing the property tax for the cost of full treatment. For the cost of full treatment, the sales tax increase was estimated at about 6.0 percentage points. This impact, on top of the current rate, is judged to be both widespread and probably far higher than most households would consider acceptable.

11.1.3 Land Requirement and Displacement Impacts

Treatment facilities for storm water runoff are land intensive. The land acreage and cost requirements for the full system are about 13,950 acres and $6.1 billion, requiring multiple treatment plants per drainage basin. The land cost estimate was included in the full treatment costs of $53.6 billion. About 67 percent of this acreage would be required for treatment Level 1 with the remaining 33 percent for treatment Level 2. While marginal or vacant parcels would be initially sought, this still would require potential displacement of many households and businesses in addition to relocation and land costs.

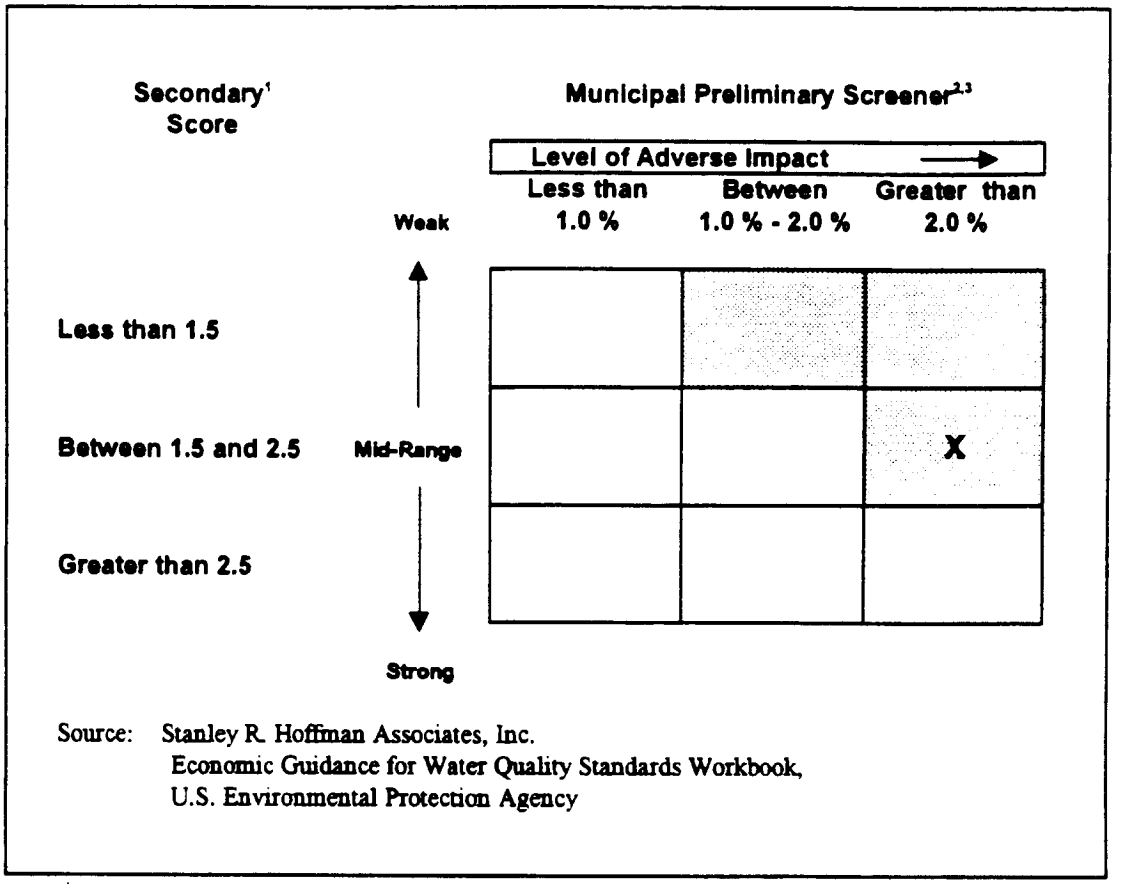

Table 11-1
Summary of Evaluation Indicators
Financing and Economic Impacts of Storm Water Treatment
Los Angeles County NPDES Permit Area

Indicators	Full Retrofit Treatment		Limited by EPA screener: preliminary & secondary	
Capital Cost	53,605	millions $	5,280	millions $
Annual O&M cost	199	millions $/yr	20	millions $/yr
Total Annual Cost	4,872	millions $/yr	480	millions $/yr
Allocated cost per SFD	$1,024	dollars	$101	dollars
Allocated cost / acre Com/Ind	8,577	dollars	845	dollars
If funded only by Sales Tax increase	5.95%	percent	0.59%	percent
Percent of current outstanding debt	477%	percent	47%	percent
Cost per household	$1,509	dollars	$149	dollars

U.S. Environmental Protection Agency

1. The Secondary Score represents a weighted average based on a number of economic criteria described in the text.

2. The Municipal Preliminary Screener represents a percentage of median household income.

3. Shaded area denotes where substantial impacts are estimated to occur according to the EPA Preliminary and Secondary Municipal Screeners. The combined score for the Los Angeles NPDES area results in substantial impacts as shown in the figure by the "X."

R0006004

11.1.4 Employment Impacts

The Los Angeles area economy has been recovering from the deep recession of the early 1990s when the total County economy lost more than 400,000 jobs. The County is currently on a recovery path. The additional costs per household and per business would likely slow economic growth and cause some businesses to relocate or expand elsewhere. Again, while specific estimates of impacts are not made, the burden of additional costs of a substantial nature is viewed as widespread because the potential treatment plants would be distributed throughout the Los Angeles drainage areas. Since specific locations are not identified, these displacement impacts are not quantified as part of this study.

Employment trends for Los Angeles County are summarized in Table 11-3 based on estimated projections from 1994 to 2000 from the Southern California Association of Governments (SCAG). According to these projections, the overall County employment is growing at an average annual rate of about 1.4 percent.

As was indicated earlier, the average household share of the financing burden would amount to about a 73 percent increase of annual property taxes for a single family unit. For many households, this increase would cause a significant reduction in their consumption and savings potential. Over time, landowners would pass forward these tax increases in the form of higher rents which would result in consumption reduction. Such potential widespread reduced consumption among households would likely cause loss of retail and other local serving jobs.

Based on the EPA methodology and the other economic indicators presented, the economic impacts are judged to be both substantial and widespread for the full system storm water treatment costs.

11.1.5 Impacts on Outstanding Local Debt

According to California Municipal Statistics, Inc., there is an estimated $11.6 billion of outstanding local public debt in Los Angeles County. The estimated cost of $53.6 billion for full storm water treatment represents almost a fivefold increase in existing debt. This level of debt increase would be not only considered extremely large but would foreclose capital funding for other non-storm water projects.

11.2 Costs Limited by EPA Screeners

When the estimated costs of storm water treatment are limited by the EPA Preliminary and Secondary Municipal Screeners, this results in an estimated fundable capital cost of about $5.3 billion. This is based on a cost of $149 per household calculated by taking the estimated Secondary Screener amount of 1.6 percent of median household income ($43,916) or $703 per household and reducing it by the estimated existing and future non-storm water pollution control costs of $554 per household. While this amount is estimated to be affordable based on the EPA Preliminary and Secondary Screener methodology, it is likely that it would still be considered too high if directly charged to most households on an annual basis over the bond period of 20 years or longer.

Table 11-3
Financial and Economic Impacts of Storm Water Treatment
Employment Trends for Los Angeles County NPDES Permit Area: 1994 - 2000

Basin/Area	1994	1998	2000	1994 to 2000

R0006008

COST OF STORM WATER TREATMENT FOR THE LOS ANGELES COUNTY NPDES PERMIT AREA

An analysis was performed to determine the cost of treating storm water runoff in the Los Angeles County watershed. Treatment costs were developed based upon different treatment levels required to meet water quality objectives. The costs in this report were prepared as a basis for a further analysis of the economic impact of storm water treatment on the community. The costs in this report are intended to be used in the economic analysis and will be refined as the economic impact analysis progresses and the data needs are refined.

All costs for treatment were calculated in the same manner as the treatment costs in the *Caltrans Storm Water Facilities Retrofit Evaluation* (1). That report described the evaluation of the costs of treating storm water runoff from Caltrans facilities in the Los Angeles area.

DESIGN STORM CHARACTERISTICS

The design storm selected for this study is the one-year storm for a 24-hour period in most of the Los Angeles area. The selected storm allows the storm water treatment facilities to capture most of the runoff for a normal rainfall year. The capacity will be exceeded only when storms greater than the one-year return frequency are experienced. On a long term, several year basis, the design storm will result in treatment of 80 to 90 percent of the runoff. The storm represents a compromise between the cost of attempting to design for a higher intensity storm and desire to maximize pollutant capture. The one year, 24-hour storm is the minimum rainfall with a statistical probability of reoccurring one or more times per year. Rainfall varies depending on the Los Angeles terrain and averages approximately 1.25 inches for the area included in this study.

Treatment systems in this report are designed to contain all of the flow generated by the design storm, and treat and release this volume within a 24-hour period. Therefore, to calculate the average release rate, the volume of water generated by the design storm in 24-hours is calculated and then divided by 24-hours. A treatment period of 24-hours was chosen rather than a longer treatment period such as 72-hours to permit the collection and treatment of two consecutive storms.

The design storm concept is similar to storm water design assumptions made by flood control agencies within Los Angeles County, California. However, flood control designs use longer return frequency storms and greater quantities of runoff. This approach incorporates input from the Caltrans/UCD/CSUS Oversight Committee provided on the previous Retrofit Evaluation.

SIZE OF DRAINAGE AREA WITHIN LOS ANGELES COUNTY

The entire urban Los Angeles County watershed that drains directly to the Pacific Ocean measures approximately 1,702,404 acres. The area has been divided into seven drainage basins and the areas for each obtained from the Southern California Area Governments (SCAG) GIS Land Use Data Base. The size and descriptive name of each basin is listed below:

Table 1. Los Angeles Drainage Basins

Drainage Basin Description	Drainage Area, acres
Dominguez	69,091
Los Angeles River	522,061
Malibu	98,729
San Gabriel	370,468
Santa Ana (Part)	15,680
Santa Clara	491,947
Santa Monica Bay	134,429
Total	**1,702,404**

STORM WATER RUNOFF

The volume of storm water runoff was developed using a modified coefficient of runoff. The runoff coefficient estimates the percentage of the precipitation that will become runoff based on the land use and the imperviousness associated with each land use. This method is similar to the method described in the *California Storm Water Best Management Handbook, Municipal Volume* (5) The modified runoff coefficient predicts 90 percent of the precipitation will runoff from impervious area and 15 percent from the pervious area as described in the Handbook.. Below is the formula used to calculate the modified runoff coefficient.

$$Runoff\ Coefficient = 0.90 \times (impervious\ fraction) + 0.15 \times (1\text{-}impervious\ fraction)$$

In addition, the first 0.06 inches of precipitation was assumed to pond in localized depressions and not be available as runoff. The runoff coefficients and formula above can be found in Appendix D of the *California Storm Water Best Management Handbook, Municipal Volume.* The imperviousness for each type of land use was assumed to be similar to the values reported by the *Santa Monica Bay Restoration Project* (4). Listed below are assumed imperviousness and land uses:

Table 2. Runoff Coefficients by Land Use

Land Use	Impervious	Runoff Coefficient
Single family residential	42 %	0.46
Multi family residential	68 %	0.66
Commercial	92 %	0.84
Public	80 %	0.75
Industrial	91 %	0.83
Other urban	80 %	0.75
Vacant Developable	0 %	0.15
Open	0 %	0.15
Unknown	65 %	0.63

Based on a land use pattern in Los Angeles County, the runoff coefficient for each drainage basin was determined. In turn, this coefficient is used to determine the amount of storm water runoff as related to precipitation.

Table 3. Runoff Coefficient by Basin

Drainage Basin Description	Runoff Coefficient
Dominguez	0.599
Los Angeles River	0.452
Malibu	0.299
San Gabriel	0.403
Santa Ana	0.423
Santa Clara	0.294
Santa Monica Bay	0.504

DESIGN STORM WATER QUALITY

In addition to the storm water quantity, typical storm water quality is an important consideration in determining the types of appropriate treatment. Design storm water quality values were developed by examining the storm water quality data generated from Los Angeles County monitoring and Caltrans statewide sampling which contained a significant amount of Los Angeles area data. Treatment processes were developed from water quality objectives.

The following table shows the typical water quality objectives for Los Angeles and the range of sampling data for various constituents.

Table 4. Water Quality Objectives and Monitoring Results

(i) From LA Co. DPW, 1997 Summary of Database of Sampling Results obtained from M. Ramos, LA Co. DPW.

* Based on Los Angeles Basin Plan, Table 3-5 (RWQCB 1994), unless otherwise noted.
** Infers a required minimum of 75% solids removal from waste stream.

There are several constituents indicated that would potentially violate the water quality objectives. Treatment systems discussed in this report have been developed to treat storm water to meet the objectives.

The monitoring values were then combined to obtain a typical constituent concentration expected in County of Los Angeles runoff. These water quality values were considered in developing levels of treatment which meet the water quality objectives of the receiving water body. The design storm water quality values in the table below are typical urban runoff in Los Angeles County. The values are the average values from a database of county storm water monitoring from 1988 to 1995.

Table 5. Typical Storm Water Runoff Quality

Constituent	Typical Value, mg/L
Total suspended solids	510
Total dissolved solids	285
Biochemical oxidation demand	50
Nitrate	1.9
Phosphate	0.5
Cadmium	0.001
Copper	0.03
Lead	0.04
Zinc	0.19
Oil & grease	2
Fecal coliform, MPN/100 mL	180,000
Total coliform, MPN/100 mL	750,000

The quality data shows that storm water treatment should address suspended solids, which is basically the dirt picked up during runoff, the high levels of bacteria indicated by the coliform tests and the variable levels of metals. The coliform indicates a high potential for contamination by disease carrying bacteria. Metals requirements are especially difficult because of the large variation in sampling results, the stringent requirements that are both existing and proposed and the high cost of removing small concentrations of metals from large quantities of water.

STORM WATER TREATMENT

Storm water treatment was developed to meet the basic requirements of the *Los Angeles Basin Water Quality Control Plan* (6). Three progressive levels of potential treatment are proposed to meet higher levels of water quality objectives required to preserve potential beneficial uses of receiving waters. Beneficial uses of receiving waters are further discussed in the Basin Plan.

Presented in the table below are water quality objectives achieved by each progressive treatment level.

Table 6. Treatment Objectives

Treatment Level	Objective of Treatment
Level 1 Treatment	Settle and remove suspended solids and particulate pollutants
Level 2 Treatment	Filter and disinfect to remove biological contamination
Level 3 Treatment	Remove small concentrations of toxics and heavy metals

Level 1 treatment includes screening and detention of storm water to remove floating debris and settle solids that were picked up by the storm water. Level 1 is a traditional storm water treatment technology and represents a treatment technology that could be implemented for a large drainage area. The level 1 detention facilities were sized to capture the design storm and hold it for twenty-four hours to allow the solids to settle and clarify the water. Level 1 will decrease pollutant concentrations but cannot meet all the objectives for beneficial use.

Level 2 treatment adds filtration and disinfection to level 1 detention facilities. Storm water runoff is contaminated with coliform, which are bacterial indicator organisms used to determine sanitary conditions. The levels of coliform in urban storm water will generally cause the receiving water to exceed levels considered safe for recreational contact. Most waters in California are designated to have a recreational beneficial use and the coliform objective linked to the beneficial use will be exceeded by inflow of storm water. Filtration and disinfection will kill bacterial organisms and allow the objectives for the recreational beneficial use to be met. High rate filtration and chlorination were added to the discharge from the detention basins in level 1. Dechlorination was also provided to protect organisms in the receiving water from the toxicity of any residual chlorination. Level 2 will allow storm water to meet the requirements for the recreational beneficial uses.

Level 3 treatment adds a highly sophisticated treatment process to remove very small concentrations of toxic materials that are normally found in urban runoff. Many of the waters in California are designated as potential drinking water sources. The objectives for the beneficial use designation of municipal water supply may require advanced treatment. Even more restrictive than the drinking water standards, are the standards for toxicity as it relates to sensitive species that could potentially exist in the receiving waters. Most waters have a beneficial use designation that describes the aquatic environment and have objectives to protect that beneficial use. Meeting these objectives with structural treatment units will require advanced treatment beyond what is normally expected of water treatment facilities. Reverse osmosis is included as the typical technology representing advanced toxics removal to achieve the required low concentrations. Storm water treated to level 3 is free of almost all pollutants and is suitable for all beneficial uses.

RUNOFF QUANTITY AND TREATMENT FACILITY SIZE

Drainage from each basin within Los Angeles County is based a 24-hour, one-year storm equaling 1.25-inch and the modified runoff coefficient described above. The total runoff from each drainage basin is shown on the following table.

Table 7. Storm Water Runoff by Drainage Area

Drainage Basin Description	Drainage Area, acres	Total Runoff, Million Gallons
Dominguez	69,091	1,337
Upper Los Angeles River	522,061	7,572
Malibu	98,729	956
San Gabriel	370,468	4,774
Santa Ana	15,680	214
Santa Clara	491,947	4,641
Santa Monica Bay	134,429	2,190
Total	1,702,404	21,684

Considering the economy of scale that is evident in the construction of treatment facilities, building numerous small treatment facilities is not as cost effective as the construction of a few large regional treatment plants. Although political or land use requirements may require some smaller facilities, the economics favor larger plants. Therefore, treatment selection, design and cost estimates are based upon the assumption that a few large regional treatment plants will be built. The capacity and number of treatment plants is shown on the following table:

Table 8. Storm Water Treatment Plant Capacity

Location and Description	Size and Number Million Gallons (MG)
Dominguez	
Total Runoff to be Treated, MG	1,337
Number of Treatment Plants Required	27
Los Angeles River	
Total Runoff to be Treated, MG	7,572
Number of Treatment Plants Required	173
Malibu	
Total Runoff to be Treated, MG	956
Number of Treatment Plants Required	20
San Gabriel	
Total Runoff to be Treated, MG	4,774
Number of Treatment Plants Required	107
Santa Ana	
Total Runoff to be Treated, MG	214
Number of Treatment Plants Required	5
Santa Clara	
Total Runoff to be Treated, MG	4,641
Number of Treatment Plants Required	104
Santa Monica Bay	
Total Runoff to be Treated, MG	2,190
Number of Treatment Plants Required	44
Entire Los Angeles Area	
Total Runoff, MG	21,684
Number of Treatment Plants	480

The maximum size of any individual treatment plant is assumed to be 500 million gallons.

ESTIMATED COSTS FOR STORM WATER TREATMENT IN LOS ANGELES

The treatment cost estimate for the entire Los Angeles area was done by preparing composite cost curves to represent relative cost savings for construction of a few large treatment plants versus construction of small treatment plants. The cost curves were developed by using the cost determined from the Van Nuys quadrangle study area contained in *the Caltrans District 7 Storm Water Retrofit Plan (1).*

The total flow within the Los Angeles County drainage area is significantly larger than the flow from the Van Nuys quadrangle study area. There are no existing costs available for large storm water treatment facilities which would be required for the larger drainage area, so it was necessary develop new cost curves based upon the cost curves used in the Van Nuys study area. The new treatment cost curves are intended for estimating the cost of treatment for capacities ranging from 10 to 500 million gallons. As a comparison, to test the accuracy of the new cost curves for Los Angeles County, storm water treatment costs were compared with other similar treatment systems. This comparison was done by using the cost estimating curves developed for the City of San Diego *(San Diego Wastewater Programs Managers Technical Advisory Board San Diego Metropolitan Sewerage System Preliminary Cost Estimating Curves, December 8, 1988)* (8). All costs estimate are based upon an ENR Index of 6710 (7).

The costs of the treatment facilities were developed from representative designs and then scaled up for the watershed. Simplifying assumptions were made that part time staff would be available during storm events by drawing municipal labor forces, means for disposal of residual solids would be available through municipal landfills and wastewater plants, and the large land needs for the sites could be accomplished through purchase. These simplifying assumptions may lead to lower costs than would be possible for a large scale treatment project but should not compromise cost estimate for undertaking a storm water treatment program. These are planning level costs and the accuracy is reflective of the preliminary nature of the designs and the general assumptions made. Shown in the table below are capital and operation and maintenance (O & M) costs for each drainage basin within Los Angeles County. Costs were prepared which include and exclude collection costs.

Separate costs estimates were prepared including and excluding collection costs. This was done because of an uncertainty in the locations of large treatment plants proposed.

Costs without collection represent a system where large treatment plants are located at the downstream discharge of major drainage areas. The existing conveyance system is used to bring storm water to the treatment locations. Some of the conveyance systems are actually local channels and waterways that will not receive the benefits of treatment.

Costs with collection represent an effort to parallel important tributary streams and channels with collection systems to protect them from storm water pollution. The parallel collection systems would divert flow to the treatment locations. Obviously, building parallel storm water collection systems is expensive.

Table 9. Treatment Costs by Drainage Area

Dominguez	Cost without Collection, ($1,000,000)	Cost with Collection, ($1,000,000)
Capital Costs		
Collection System		$628

Level 3	$188.5	$198.9

The construction and land purchase was assumed to take place at the beginning of the project in year one and the annual cost was assumed to stay constant over the life of the project. All costs are based upon the 1998 calendar year. The capital costs for the project levels include 100 acres for each 500 million gallon level 1 treatment facility at an average cost of approximately $900,000 per acre. The level 2, 500 million gallon facility includes an additional 100 acres at the same unit cost. Level 3 is assumed to not require additional land. Land use for smaller treatment plants is assumed to be proportional to capacity.

The background for the cost estimates is included in the attachments. Attachment 1 is the design basis for a typical 500 million gallon facility and includes a schematic layout. Attachment 2 is the design basis for a typical 200 million gallon facility. Attachment 3 includes the standardized cost estimation curves for storm water treatment facilities. Attachment 4 includes the standardized cost estimation curves for wastewater treatment facilities to 10 million gallons.

DISCUSSION

The cost estimates developed in this analysis include several assumptions needed to build the capital cost estimates and develop the operating and maintenance costs. Historical data for the costs is based on municipal utility construction projects which have not been developed specifically for storm water treatment. The assumptions and general municipal background of the estimates result in costs that are potentially low for the storm water treatment project. Potential concerns are:

- Storm facilities will be operated intermittently and seasonally. Treatment levels 2 and 3 require operators skilled in treatment equipment; however, they are only needed for storm events. The availability of these operators is difficult to arrange since they would have to have other more full time positions within the managing municipality or utility. The cost of labor would be higher because of inefficiencies. Level 1 also requires intermittent operation but it may be able to be contracted out to the private construction industry.

- Power costs are relatively more expensive on an intermittent basis and the utility's cost of supplying the seasonal loads imposed by pumps and the equipment in levels 2 and 3 will have to recovered in higher per energy unit costs. Chemical costs will also be higher do to seasonal purchasing needs and the need to not store some chemicals, such as chlorine, during the dry season. There are also risks with chemical storage and delivery in residential and commercial neighborhoods that must be mitigated.

- Land costs have been assumed to represent an average cost in the Los Angeles area. However, a storm water treatment project would need to acquire large tracts of contiguous land to build the facilities. No matter how much community support there is for clean water, residents always want the facilities somewhere away from their property and certainly do not want their land taken. Acquisition of the necessary land would be difficult and expensive. More numerous smaller facilities would increase the number of impacted communities and residents. The treatment units simply cannot be built without land and there is not much available land in metropolitan Los Angeles.

- As indicated in the cost analysis, the protection of the drainage channels and natural waterways that are currently used to convey storm water from storm water pollutants would either require a vast number of small treatment units at every discharge or a parallel collection system for the design storm. The numerous facilities sacrifice the economy of scale found in larger units and the alternative parallel collection system is very expensive. Decisions would have to be made as to where parallel systems were needed based on the streams to be protected.

- The analysis assumes conventional costs for the removal of residual products such as solids and brine. Again they would be seasonal and would require the additional costs of setting up disposal procedures for only seasonal use. In addition there may be the potential requirements for the disposal of hazardous waste.

Although the costs may be conservatively low, they are relatively large. The following table summarizes the Los Angeles area costs with a limited amount of collection facilities.

SUMMARY

Capital Costs

Level 1 - Detention and settling including limited collection	33 billion dollars
Level 2 - Filtration and disinfection in addition to Level 1	45 billion dollars
Level 3 - Advanced treatment for toxics in addition to Level 2	73 billion dollars

Land Required

9,300 to 18,600 acres depending on treatment level

Operating and Maintenance Costs

Level 1 - Detention and settling including limited collection	68 million dollars per year
Level 2 - Filtration and disinfection in addition to Level 1	117 million dollars per year
Level 3 - Advanced treatment for toxics in addition to Level 2	199 million dollars per year

ATTACHMENT 1

DESIGN BASIS FOR A TYPICAL 500 MILLION GALLON FACILITY

Definitions and Abbreviations Contained in Cost Estimates:

LF – Linear feet
INCH – Inches of rainfall
MGD / mgd – Million gallons per day
LS – Lump sum
SF – Square feet
MG – Million gallons
AC – Acres
gpm – Gallons per minute
CFS / cfs – Cubic feet per second
RO – Reverse osmosis
ft. - Feet
kWh – Kilowatt per hour
MWh – Megawatt per hour
fps – Feet per second
mg/L – Milligram per liter
O & M – Operation and maintenance
sq. – square
mi – miles
Quad – Quadrangle

DESIGN BASIS FOR A TYPICAL 200 MILLION GALLON FACILITY

LOS ANGELES COUNTY SITE SPECIFIC DESIGN PARAMETERS		
ITEM	**VALUE**	**COMMENTS**
Site Details		
Type : Typical 200 MG Plant		
Name : Prototype 200 MG Plant		Exact location of treatment plant is unknown.
Address : Los Angeles County		
Existing Storm Drain Facilities :Use existing Los Angeles County Collection System		
Site Specifications		
Drainage Area		
Acres	15,400	
Square Feet	670,824,000	
Approximate Percent Impervious	48%	Estimated - refer to design write-up
Weighted runoff coefficient	0.51	((%Impervious)*0.90)+((1-(%IMP))*0.15) Assumed 90% runoff from impervious surfaces and 15% runoff from pervious surfaces.
Rainfall Details		
Total Rainfall		
One year, 24 hour Storm, inches	1.00	Derived from 50 years of rainfall data. Typical for Greater Los Angeles area.

R0006038

200 MG Treatment Plant

ITEM	VALUE	COMMENTS
Stormwater Runoff Volume		
Cubic Feet	26,799,000	Assumed 0.06 inches of rain loss due to local ponding
Million Gallons	200	
Peak Rainfall Intensity		
inches/hour	1.40	Refer to Appendix-C of 6/17/96 Summary of Task 2
Peak Flow		
Cubic feet per second (cfs)	5,200	Rational Formula Q = C*I*A (Runoff coeff*Peak rainfall intensity*Drainage area) from Caltrans Hydraulics Design Manual
Million gallons per day (mgd)	3,400	Assume a 50% reduction in peak flow because of delay in intensity due to size of drainage area.
Treatment Plant Site Details		
Site Characteristics		
Acres	72	Size required to fit treatment units.
Percentage of land used for treatment versus drainage area	0.47%	
Approximate shape of site	rectangular	Shape - triangle, rectangle etc.
Length of site, ft.	1500	
Width of site, ft.	2100	
Approximate Slope of Site Terrain	Level	

R0006039

200 MG Treatment Plant

ITEM	VALUE	COMMENTS
Existing Land Use	Unknown	
Existing Owner	Unknown	
Distance from Collection Point to Treatment Plant Site, ft.	1,500	Assumes construction next to existing river.
Treatment Processes		
Level 1		Bar Screens plus detention basins
Level 2		Gravity filtration with disinfection
Level 3		Advanced treatment, with Reverse Osmosis
Design Criteria		
Collection system inlet pipe, rectangular		
Width, ft.	15.0	
Height, ft.	10.0	
Number of inlet pipes	4	
Capacity, cfs	6,000	Capacity based upon 10 fps max. flow
Velocity, fps	8.7	
Bar Screens	2-inch spacing	Screens located at enterance to detention basin pumping station inlets

R0006040

200 MG Treatment Plant

ITEM	VALUE	COMMENTS
Detention Basin		
Minimum volume in gallons	200,457,000	Assume vertical walls for detention basin
Number of required detention basins	4	Ingnore capacity of sloped basin sides
Length of detention basin (ft)	1,200	Includes 1.5' freeboard.
Width of detention basin (ft)	240	
Depth of detention basin (ft)	25	
Actual capacity of detention basin, gallons	202,526,000	
Capacity, cubic feet per sec	27,072,000	Calculated based on detention basin dimensions
Time to Drain Detention Basin		
Hours (All levels)	24	
Pump Rate		
Gallons per minute (gpm)	139,206	Runoff Volume (gal.)/hr. det./ 60 min.
Million gallons per day (mgd)	200	
Capacity, (cfs)	310	
Number of pumping stations	4	Provide one pumping station per detention basin
Capacity of each pump stations, gpm	34,802	
Capacity of pump stations, cfs	77.5	
Level 2 and 3 Treatment Plant Avg. Capacity, mgd	200	
Max surface loading, @ 7200 gpd/sf (5 gpm/sf)		
Required filter size, square feet	27,800	

R0006041

200 MG Treatment Plant

ITEM	VALUE	COMMENTS
Rectangular filters		
Number of filters, including two back-up filter	20	
Width of filter, ft.	40	
Length of filter, ft.	40	
Filter surface area per filter, square feet	1,600	
Total filter surface area, square feet	28,800	
Wash Water Volume		
Backwash time, minutes/cycle	20	Use two tanks for redundancy
Backwash rate, gpm/sf	25	
Minimum volume, gallons	800,000	
Tank diameter, ft.	92	
Tank, height. ft.	24	
Actual tank capacity, gallons	1,193,300	
Number of tanks	2	
Total backwash water capacity, gallons	2,386,600	
Disinfection		
Hypochlorite criteria		
Hypochlorite concentration, percent	6%	Alternatively, chlorine gas might be used
Hypochlorite available Cl2, pounds/gal	0.5	
Chlorine dosage rate, mg/L	30	
Feed rate, gallons per day (gpd)	100,309	
Feed rate, gallons per minute (gpm)	70	

R0006042

200 MG Treatment Plant

ITEM	VALUE	COMMENTS
Hypochlorite tank capacity		
Number of design storms	3	
Hypochlorite tank capacity, gallons	300,926	
Actual tank capacity, gallons	325,000	Mulitple tanks will be used
Volume of Contact Tank		
Contact detention time, minutes	60	
Volume of contact tank, gallons	8,352,375	
Length of tank, feet.	460	
Width of tank	205	
Depth of tank, feet	12.0	
Actual volume of tank, gallons	8,465,500	
Dechlorination		
Sodium Bisulfite criteria		
Sodium Bisulfite available SO, pounds/gal	2.5	
Sodium Bisulfite rate, mg/L	15	
Feed rate, gallons per day (gpd)	10,031	
Sodium Bisulfite tank capacity		
Storage capacity, number of design storms	3	
Hypochlorite tank capacity	30,093	
Actual tank capacity, gallons	35,000	Multiple tanks used
Reverse Osmosis		Provide building.
Req. capacity of RO units, gpd	150,342,750	25% bypass around filters
Capacity of RO units (racks), gpd	1,000,000	Unit capacity 1,000,000 gpd

R0006043

200 MG Treatment Plant

ITEM	VALUE	COMMENTS
Capacity of RO treatment system, gpd	150,000,000	Unit are 40' in length, 1.5' in dia. Each
Number of RO units	170	Allow 20 for backwashing
Building size for RO units, sq. ft.	85,000	Each unit with access area 500 sq. ft.
Power requirements for RO units, kWh	37,586	6 kWh per 1000 gal. (Water Treatment Design, Robert L. Sanks)
Plant's total power requirements, MWh	41.3	Assume 10% higher than RO unit
Brine Storage Basin (Water not Recovered by RO)		
Minimum Volume, gallons	5,414,400	Storage for 1 storm event at 20% per storm
Minimum Volume, cubic feet	723,754	
Storage Basin , length, ft.	500.0	
Storage Basin , length, ft.	420.0	
Tank depth, feet	3.5	Annual evaporation rate, 42-inches per year.

Re: **Initial Comments and Submission of Evidence of Financial and Economic Impacts of "*Tentative Draft-October 11, 2001*, CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD LOS ANGELES REGIONAL ORDER No. 01-xxx NPDES No. CAS004001 WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES AND THE INCORPORATED CITIES THEREIN, EXCEPT FOR THE CITY OF LONG BEACH"**

Dear Mr. Dickerson and Dr. Swamikannu:

By this letter, the Los Angeles County Economic Development Corporation ("LAEDC") and the Cities of Alhambra, Camarillo, Compton, El Segundo, Industry, Lawndale, Lomita, Moorpark, Santa Clarita and Torrance (the "Cities") submit evidence that compliance costs for storm water permit programs in Los Angeles County will exceed $50 billion. This evidence is directly relevant, and, as a matter of law, must be addressed in revisions to the "*Tentative Draft-October 11, 2001*, CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD LOS ANGELES REGIONAL ORDER No. 01-xxx NPDES No. CAS004001 WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS

ANGELES AND THE INCORPORATED CITIES THEREIN, EXCEPT FOR THE CITY OF LONG BEACH" (the "Third Draft") and the accompanying document, "Tentative Draft – FACT SHEET/STAFF REPORT State of California Regional Water Quality Control Board Los Angeles Region National Pollutant Discharge Elimination System (NPDES) Permit No. CAS004001, CI 6948 Regional Board Order No. 01-XXX."

Please list this letter as having been submitted by LAEDC and each of the respective cities. (It is not a comment letter of the firm of Burke, Williams & Sorensen, LLP, which has not taken a position in this matter. However, please continue to keep the undersigned on the list of interested persons in this matter.) This letter supplements the Cities' previous letters of July 19, 2001, and August 6, 2001, which offered comments on the Second Draft.

By this letter, the LAEDC and the Cities submit for your careful consideration and for you to address the following reports:

1. "Southern California Association of Governments Staff Report to Energy and Environment Committee dated August 23, 2001, Subject: Regional Solutions for Managing Stormwater Pollution" (the "SCAG Report");

2. "COST OF STORM WATER TREATMENT FOR THE LOS ANGELES COUNTY NPDES PERMIT AREA" June, 1998, by Brown & Caldwell, prepared for California Department of Transportation; and

3. "Financial and Economic Impacts of Storm Water Treatment Los Angeles County NPDES Permit Area" presented to California Department of Transportation Environmental Program, Report I.D. #CTSWRT-98-72, November, 1998, by Stanley R. Hoffman Associates, (the "Caltrans Financial and Economic Impacts Study").

These studies and reports (to which I shall refer collectively as the "Storm Water Financial Impact Studies") are evidence to be considered and addressed by the Board and the Staff in the revision of the "*Tentative Draft-October 11, 2001*, CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD LOS ANGELES REGIONAL ORDER No. 01-xxx NPDES No. CAS004001 WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES AND THE INCORPORATED CITIES THEREIN, EXCEPT FOR THE CITY OF LONG BEACH" and the "Tentative Draft – FACT SHEET/STAFF REPORT State of California Regional Water Quality Control Board Los Angeles Region National Pollutant Discharge Elimination System (NPDES) Permit No. CAS004001, CI 6948 Regional Board Order No. 01-XXX."

The Storm Water Financial Impact Studies, which conclude that the cost of storm water compliance for the areas affected by storm water permits issued by the Board for Los Angeles County will exceed $50 Billion, must be taken into consideration in re-evaluating the requirements to be imposed on the co-permittees. This is because MS4 permits are issued under Section 402(p)(3)(B)(iii) of the CWA, 33 U.S.C. § 1342(p)(3)(B)(iii). **That section** does not impose an absolute prohibition on the discharge of pollutants. Instead, the section **requires that:**

> **Permits for discharges from municipal storm sewers --**
>
> > **(iii) shall require controls to reduce the discharge of pollutants to the *maximum extent practicable*,** including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. (Emphasis added.)

Similarly, section 13263(a) of the California Water Code requires regional boards, when prescribing waste discharge requirements, to take into consideration the provisions of §§ 13241(c) and (d). Those sections require a balancing similar to that required by § 402(p)(3)(B)(iii) of the CWA, 33 U.S.C. § 1342(p)(3)(B)(iii). **Among the factors regional boards must consider are:**

> (c) ***Water quality conditions that could reasonably be achieved*** through the coordinated control of all factors which affect water quality in the area.
>
> (d) ***Economic considerations***.

The balancing required by CWA § 402(p)(3)(B)(iii) and California Water Code §§ 13241(c) and (d) clearly require the Regional Board to consider, and to justify, the costs of permit compliance.

The LAEDC and the Cities fully support the objectives of the Clean Water Act. However, the magnitude of the compliance cost estimates referred to in the Storm Water Financial Impact Studies, over $50 Billion, would make it necessary for the Cities named above, and all other Cities in Los Angeles County, to ask the Congress and the California Legislature to appropriate nearly all of the funds estimated to be necessary for compliance. Given the current downturn in the economy and the priorities for funding Operation Enduring Freedom and Homeland Defense, Congress and the State Legislature may be unable to make necessary funds available.

The LAEDC and the Cities will expect the Board and Staff to give most careful consideration to the evidence submitted with this letter. We are not aware of any published studies, by any reputable and qualified persons, which rebut the studies submitted with this letter. We ask that this letter, and its enclosures, be included in the administrative record of this matter. The LAEDC and the Cities reserve the right to offer further comments.

Very truly yours,

RUFUS C. YOUNG, JR.

SUBJECT: Regional Solutions for Managing Stormwater Pollution

2001 NOV -9 P 2:00

RECOMMENDED ACTION:

Consider for policy direction.

BACKGROUND:

In the nearly 30 years since its enactment, the Clean Water Act has had its greatest success in improving water quality by regulating those sites that use water and discharge water into water bodies such as our rivers and oceans. Examples of these "point source" dischargers are industrial plants and sanitation agencies. Each discharger of this kind is required to obtain a permit for any discharges that will be made into a water body. The permit specifies the maximum level of pollutants that are allowed. Any excesses of this limit are illegal and subject to enforcement.

Only in the last 10 years have environmental regulators turned their attention to a much more challenging aspect of water quality in the urban setting: the "non-point" water pollution. Examples of "non-point" pollution are storm water and urban run-off. The challenge created by this kind of pollution is its general origins, its magnitude, and its complex constituents. As population growth occurs in the SCAG region, along with related new community development, the nature of storm weather flooding and runoff from impervious surfaces have become increasingly severe problems.

In response to these problems, water quality regulators in Los Angeles County have moved to establish new rules requiring the cities and County to take greater responsibility for managing storm water and dry weather run-off that flows through each locale. One great difficulty with this regulatory approach is the absence of larger-scale solutions for problems that are "everywhere" by location and that are often more affordable when rationalized over a larger area with varieties of terrain and open space. Without a larger-scale approach to this kind of pollution each city will struggle to meet mandates individually, inevitably duplicating efforts made by neighboring communities.

Studies conducted to estimate the cost of removing pollutants from Los Angeles County storm water indicate that capital plant alone needed for this mission will cost more than $50 billion. A price tag of this magnitude requires not only new thinking about financing urban environmental improvements, it also calls for new thinking about regional approaches and institutions for achieving water quality goals.

SECTION 1
EXECUTIVE SUMMARY

This report evaluates the potential financial and economic impacts of implementing an enhanced storm water treatment program in the Los Angeles National Pollutant Discharge Elimination System (NPDES) Permit area as part of the Caltrans District 7 Storm Water Facilities Retrofit Evaluation. The full storm water treatment system would require about $53.6 billion in capital improvement costs which includes land and $198.9 million in annual operations and maintenance costs. Land requirements for the estimated 480 treatment facilities would total about 13,950 acres. The evaluation methodology applies the EPA Municipal Screener approach and other selected economic indicators.

1.1 Preliminary Municipal Screener Impacts

The EPA publication, Economic Guidance for Water Standards Workbook, describes a methodology for measuring economic impacts. One test in the described methodology is called the Preliminary Municipal Screener. According to the Workbook:

> "This guidance is presented to assist States and applicants in understanding the economic factors that may be considered, and the types of tests that can be used to determine if a designated use cannot be attained, if a variance can be granted, or if degradation of high-quality water is warranted. To remove a designated use or obtain a variance, the State or discharger must demonstrate that attaining the designated use would result in substantial and widespread economic and social impacts."

The Municipal Screener test indicates whether a public entity will *not* incur any substantial economic impacts from the proposed pollution control program. This Screener is the estimated Total Annual Pollution Control Cost per Household as a percent of Median Household Income in the community deemed "affordable" by the United States Environmental Protection Agency (EPA). The test specifies that local pollution control costs between 1 percent and 2 percent of median household income constitute "Mid-Range" impacts and greater than 2 percent constitute "Large" impacts. The estimated cost for existing pollution controls plus the full storm water system is about $1,295 per household annually which results in impacts over 2 percent of median household income, therefore; this is judged to create a substantial economic impact. This total cost is comprised of the annual existing non-storm water pollution control cost of $554 per household plus the annual average storm water cost estimate of $741 per household.

1.2 Secondary Municipal Screener Impacts

The EPA standards workbook also specifies that a secondary test must be done if the Municipal Screener is not clearly less than 1 percent of median household income. The secondary test is intended to characterize the community's ability to obtain financing and to indicate the socioeconomic health of the community. As applied to the Los Angeles area, this test generates a score that is within EPA's Mid-Range level of economic impacts.

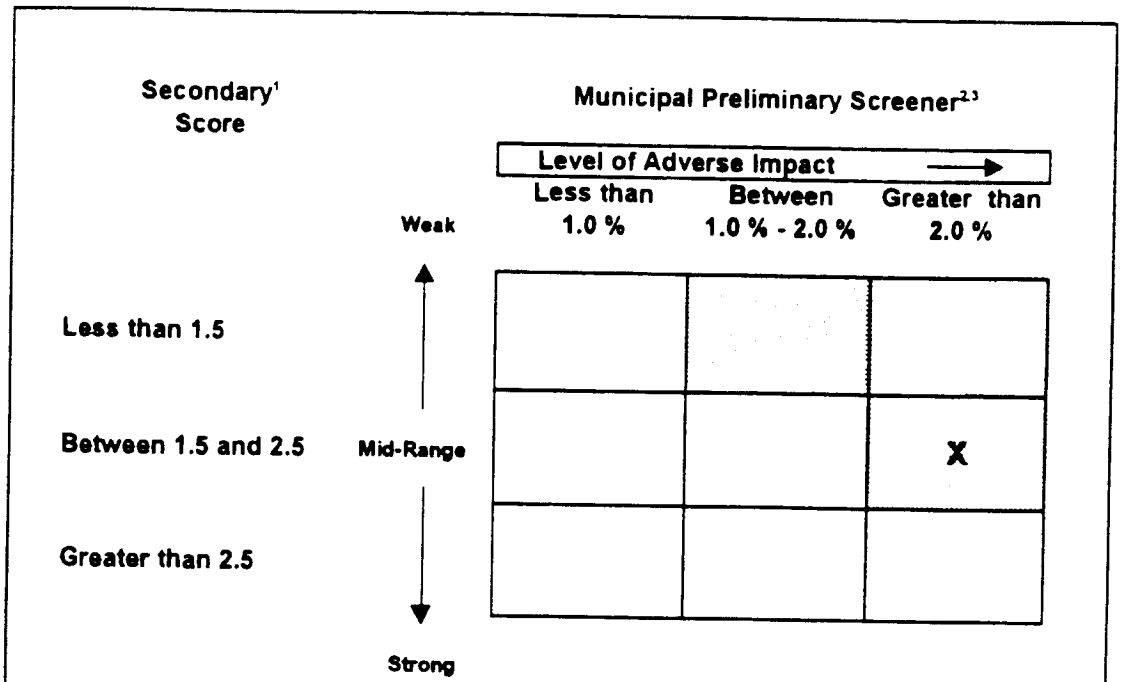
The Secondary Test utilizes five indicators to form a composite assessment of the community's economic health and the financial impact of the pollution control project. Besides providing guidance on how to calculate each indicator, the Workbook supplies criteria for scoring each as 1-weak, 2-mid-

range or 3-strong. For each of the five indicators the community is rated as weak, mid-range, or strong, based on various thresholds that apply to specific indicators. For example, overall net debt is used as an indicator of a community's ability to meet debt obligations and its capacity to finance infrastructure. For example, if the Overall Net Debt Per Capita is greater than $3,000, the community would have less capacity to fund additional infrastructure and would therefore be rated weak with a rating of 1. However, if the debt per capita is less than $1,000 it would be considered strong and assigned a rating of 3. The indicators are then averaged to derive the Secondary Score.

The results from the Preliminary Municipal Screener and the Secondary Screener are measured jointly to determine whether the community would be expected to incur substantial impacts due to the proposed pollution control project. As shown on Table 1-1, for the Los Angeles area based on the secondary screener analysis, the score falls within the 1.5 to 2.5 range. When combined with an annualized cost greater than 2 percent of median household income, the joint score results in estimated substantial impacts, according to EPA's Substantial Impacts Matrix, as indicated by the "X" in Table 1-1.

1.3 Widespread Impacts

Based on the EPA methodology and other economic indicators presented below, the economic impacts are judged to be both substantial and widespread for the full system storm water treatment costs. Other levels of treatment or funding sources may be considered to mitigate these impacts.



1.3.1 Property Tax Impacts

One measure of financial feasibility is the estimated impact on the property tax rate. The property tax rate for a single family unit is estimated to increase by 0.87 percentage points for the full system. When added to the median base property tax of 1.19 percent, this results in a total property tax of 2.06 percent, increasing the annual property tax bill by about 70 percent. Given the current economic climate in California, this estimated increase is clearly more than is likely to be absorbed by local single family households alone. For multi-family units, the estimated increase of 0.67 percentage points would also represent a potential sizable rental pass through.

1.3.2 Sales Tax Impacts

To compare the annualized storm water treatment costs to other economic indicators, a hypothetical increase of 6 percentage points above the present sales tax rate, to a level of about 12 percent, was estimated in lieu of increasing the property tax for the cost of full treatment. This impact is judged to be widespread and much higher than most households would consider acceptable.

1. The Secondary Score represents a weighted average based on a number of economic criteria described in the text.

2. The Municipal Preliminary Screener represents a percentage of median household income.

3. Shaded area denotes where substantial impacts are estimated to occur according to the EPA Preliminary and Secondary Municipal Screeners. The combined score for the Los Angeles NPDES area results in substantial impacts as shown in the figure by the "X."

R0006077

1.3.3 Land Requirement and Displacement Impacts

Treatment facilities for storm water runoff are land intensive. The land and land cost requirements for the full system are about 13,950 acres and 6.1 billion dollars, requiring multiple treatment plants. About 67 percent of this acreage would be required for treatment Level 1 and the rest for treatment Level 2. While marginal or vacant parcels would initially be sought, potential displacement of many households and businesses as well as relocation and land acquisition costs would be required.

1.3.4 Employment Impacts

The Los Angeles area economy has been recovering from the deep recession of the early 1990s when the total County economy lost more than 400,000 jobs. The County is currently on a recovery path. The additional costs per household and per business are likely to slow this recovery and cause some businesses to relocate or expand elsewhere. Again, while specific estimates of impacts are not made, the burden of additional costs of a substantial nature is viewed as widespread because the potential treatment plants would be distributed throughout the Los Angeles drainage areas. Since specific locations are not identified, these displacement impacts are not quantified as part of this study.

As was indicated earlier, the average household share of the financing burden would amount to about a 73 percent increase in annual property taxes. For many households, such an increase in property taxes would cause a significant reduction in their consumption and savings. Over time, landowners would also pass forward tax increases to renters as increased rents which would produce a reduction in consumption by renters. Such potentially widespread reduction in consumption among households would likely cause loss of retailing and other local serving jobs.

1.3.5 Impacts on Outstanding Local Debt

According to California Municipal Statistics, Inc., there is an estimated $11.6 billion of outstanding local public debt in Los Angeles County. The estimated cost of $53.6 billion for full storm water treatment would represent almost a fivefold increase in debt. Even the Secondary Municipal Screener level of $5.3 billion of estimated capital costs represents about 46 percent of existing unpaid local public debt.

1.4 Estimated Non-Storm Water Pollution Control Costs

According to the EPA guidelines, the Municipal Screener approach provides an estimate of what is deemed "affordable" for pollution control programs. The present study first examined the incremental financial and economic burden of storm water treatment in the Los Angeles County NPDES Permit Area. However, other public pollution control programs also require funding and must be considered in setting expenditure priorities. According to the EPA Municipal Screener, the estimated incremental cost of any new pollution control program should be added to the existing and future costs for other types of pollution control programs, such as air quality, wastewater treatment, and solid and toxic waste disposal.

R0006078

In Section 10 of this report, estimates of existing and future non-storm water pollution controls are made which can be added to the incremental costs for storm water treatment by area to determine whether they exceed the 2 percent of median household income criteria prescribed by the EPA methodology. Two approaches were utilized to estimate the impacts of existing and future non-storm water pollution control costs in combination with estimated incremental storm water treatment costs: 1) analysis of estimated localized, direct costs in California; and 2) a literature review, including a 1990 comprehensive study by the EPA updated to 1998 dollars. Both methods result in estimated substantial impacts according to the EPA Municipal Screener methodology.

These additional annual pollution control costs per household were based on localized California costs of wastewater user fees, tire/oil disposal, automobile emissions testing and repairs, drinking water treatment and solid waste disposal. This amount was estimated to be about $554 annually per household for the Los Angeles area compared with $537 annually per household based on the nationwide EPA study.

1.5 Costs Limited by EPA Municipal Screeners

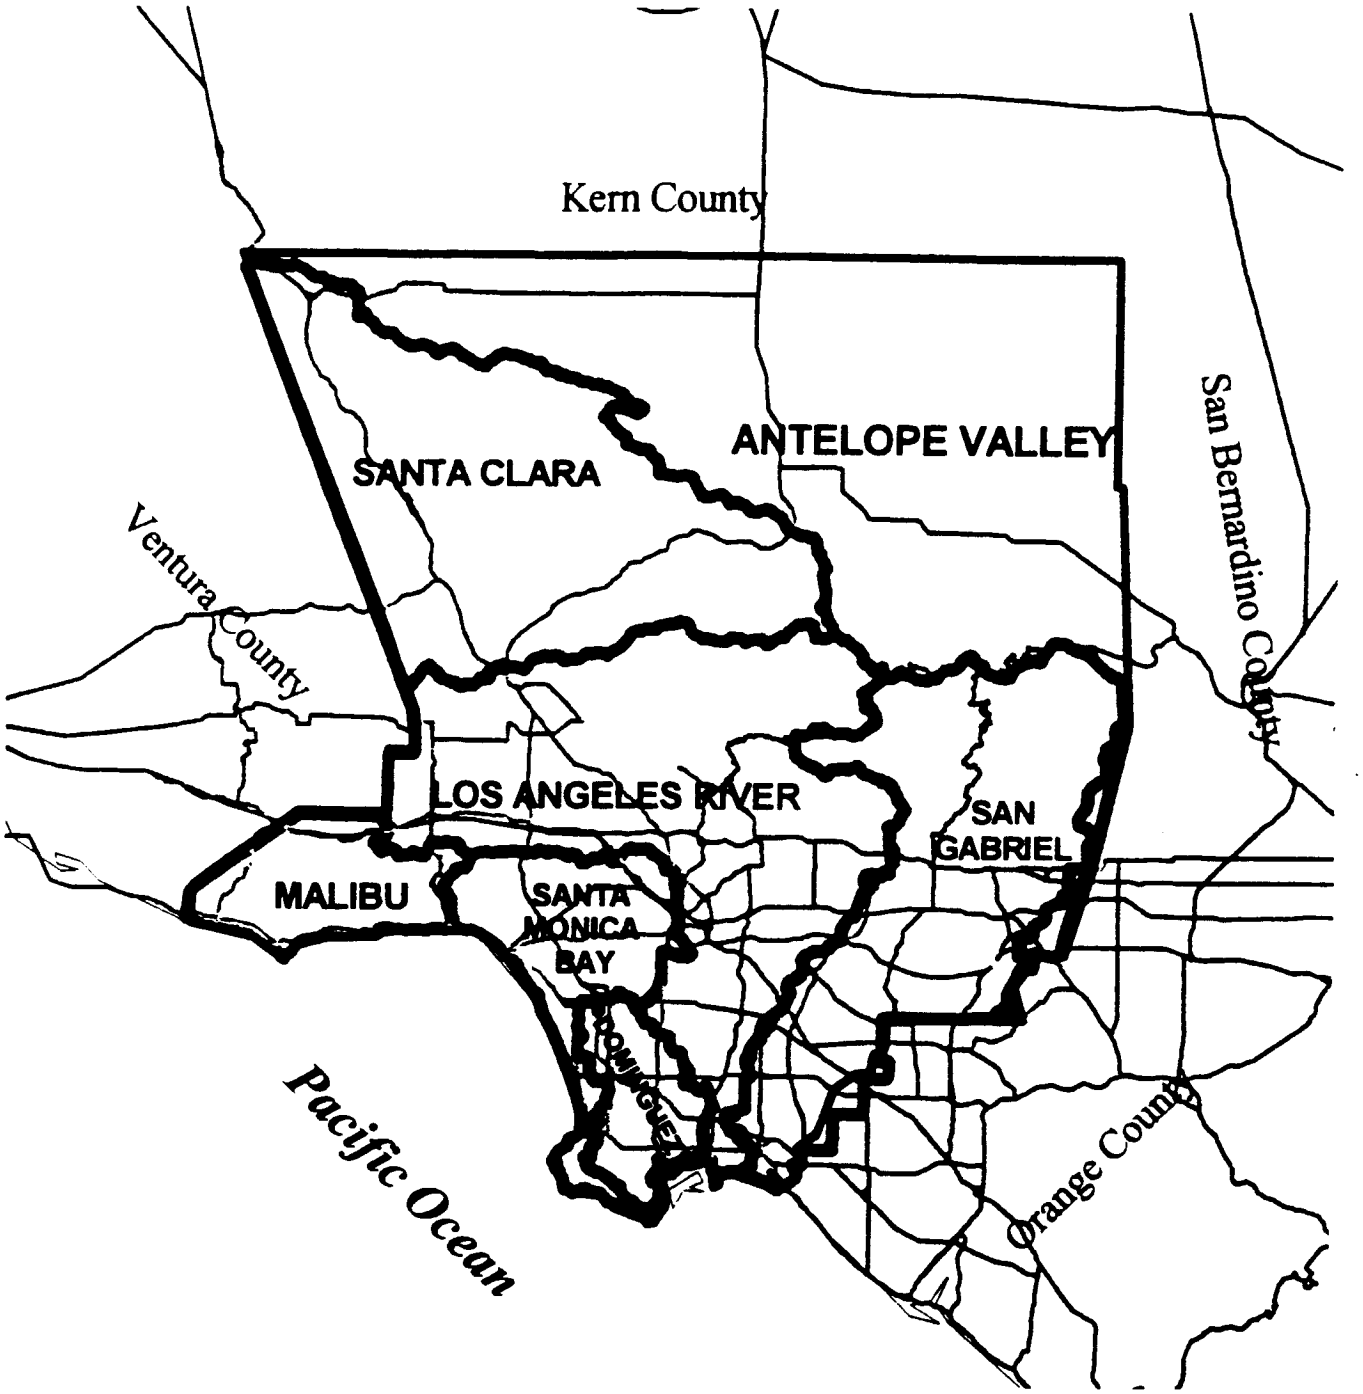
When the estimated amount of $703 per household at the Secondary Municipal Screener level of 1.6 percent of median household income level ($43,916), is reduced by the estimated cost of $554 for existing and future pollution controls, this results in a net amount of $149 per household for storm water treatment. If this annual amount of $149 is multiplied by the estimated 3,228,269 households in the Los Angeles County NPDES study area and is then capitalized using a 6 percent interest rate and a term of 20 years, this results in an estimated affordable capital cost of $5.3 billion. This represents about 9.9 percent of the estimated full storm water treatment cost of $53.6 billion.

SECTION 2
INTRODUCTION

2.1 Project Description and Purpose

This economic and financing analysis was prepared for the Los Angeles NPDES Permit Area as part of the Caltrans District 7 Storm Water Facilities Retrofit Evaluation. The analysis examines the economic and financial impacts that may arise for communities due to the increasing costs associated with successive levels of storm water treatment implementation. The project description and costs were defined by Brown and Caldwell. This included storm water treatment technologies designed to meet water quality standards and objectives for a one year return frequency 24 hour storm.

2.2 Project Area



The study area was limited to the Caltrans District 7 areas that drain to the Pacific Ocean in Los Angeles County as shown on Figure 2-1. The Los Angeles NPDES Permit Area includes those areas within Los Angeles County and within the watershed defined by the Santa Susana Mountains, Simi Hills and San Gabriel Mountains. Los Angeles County areas not represented in the study include Avalon, Lancaster, Palmdale and unincorporated areas near these cities. The Los Angeles County NPDES Permit Area is divided into six drainage basins and consists of approximately 1,702,404 acres of land. A relatively small portion of the Santa Ana River Basin is aggregated with the San Gabriel River Basin. The drainage basins that cover this area include the following:

- Dominguez Channel
- Los Angeles River
- Malibu
- San Gabriel River
- Santa Clara River
- Santa Monica Bay

Land-use and acreage for this area were categorized into several classifications and formed the foundation for analysis along with basic demographic and financial data. Of the total acreage, almost 60 percent is open space, which represents the largest land use of the total NPDES area. The next most dominant land use is residential at about 22 percent. The remaining acreage covers other uses such as public, commercial and industrial.

Figure 2-1

Drainage Basins in LA County NPDES Permit Area

Stanley R. Hoffman and Associates, 1998

R0006081

2.3 Data Sources

To determine the impact on households, businesses and communities, data was analyzed based on several economic indicators. Examples of these indicators include the ability to pay as measured by the ratio of per household annualized storm water pollution costs to median household income, or the ability of local land uses to carry new debt. The following is a summary of the data sources used in preparing this analysis:

- Population, housing and employment data from the Southern California Association of Governments (SCAG), Regional Statistical Area Projections from 1994 to 2020.
- Land use acreages were provided through the SCAG Geographical Information System (GIS) Land Use database.
- City and County Summary Report of Population and Housing, Department of Finance (DOF), 1994 to 1998.
- Consumer Price Index (CPI) for Los Angeles, Anaheim, and Riverside areas, U.S. Bureau of Labor Statistics Data.
- Taxable Sales in California during 1996, California State Board of Equalization, and updated to 1998 using the CPI.
- The 1997-1998 Assessment Roll Release, Los Angeles County Assessor.

Basic demographic variables including median household income and housing value from the 1990 United States Census were updated to 1998 using the Consumer Price Index.

2.4 Organization of the Report

Sections organize the report in the following manner:

Section 3 – Environmental Protection Agency (EPA) Economic Guidelines: This section includes the project's key economic criteria based on EPA's guidelines.

Section 4 – Costs of Storm Water Retrofit: The estimated costs of storm water treatment retrofit for specified treatment levels for both capital and annual operations and maintenance cost is shown.

Section 5 – Los Angeles NPDES Permit Area Land Uses: A description of the study area land uses and their relationship to the analysis variables of population, housing and income.

Section 6 – Financing Approaches: Financing approaches to be considered are identified. Key issues include funding ability, practical means of implementation and political feasibility.

Section 7 – Financial Capacity of Local Jurisdictions: This includes the analysis of the ability of local communities to carry substantial new debt.

Section 8 – Assessment of Market Conditions: An assessment of the market conditions under which some combination of financing strategies may be implemented is presented.

Section 9 – Financial Spread of Costs: Presents the allocation of estimated capital and operations and maintenance costs of storm water retrofit among private sector land uses.

Section 10 - Estimated Non-Storm Water Pollution Control Costs: This section presents the estimated costs of other pollution control programs using two approaches. These include costs related to air quality regulations, drinking water treatment, solid waste disposal and wastewater treatment.

Section 11 – Evaluation of Financial Impacts: An evaluation of the financial impacts of implementing the costs of storm water treatment according to EPA's economic guidelines.

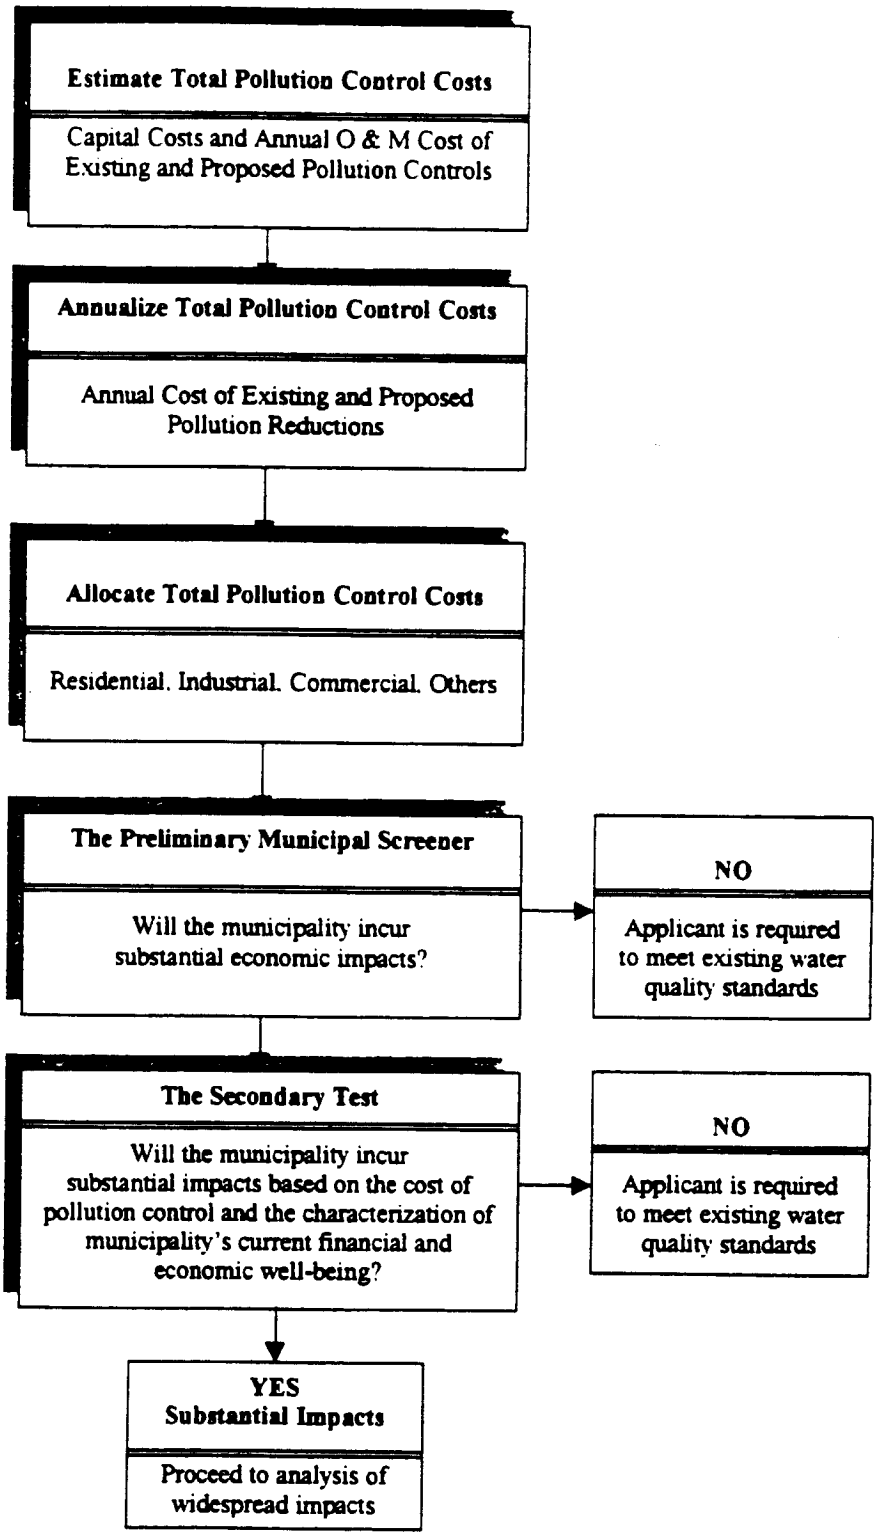
SECTION 3
ENVIRONMENTAL PROTECTION AGENCY (EPA) ECONOMIC GUIDELINES

The approach used to evaluate the economic impacts of the storm water runoff collection and treatment facilities under consideration is based upon the approach and methods presented by EPA's Economic Guidance for Water Quality Standards Workbook and summarized in Figure 3-1. This analysis has focused on incremental costs for existing storm water treatment for residential and non-residential land uses. The Workbook provides guidance to assist interested parties in determining whether attaining a specified water quality standard would result in "substantial and widespread economic and social impacts." The Workbook guidance "is not an exhaustive description of appropriate economic impact analyses," but it does describe "the types of information and analyses that should be considered."

The Workbook calls for a financial analysis to determine "if the capital and the operating and maintenance costs of pollution control will have a substantial impact." For public entities, the Workbook notes, "the households in the community will bear the cost either through an increase in user fees, an increase in taxes or a combination of both." Therefore, "the burden to households resulting from total annual pollution control costs must be estimated. In addition, the financial impact analysis must consider the community's ability to obtain financing and the general economic health of the community."

Demonstrating that substantial economic impacts would occur from implementing pollution control "is not sufficient reason to modify...or grant a variance from water quality standards" according to the Workbook. Rather, the analysis must also include consideration of whether or not "compliance would create widespread socioeconomic impacts on the affected community." Financial impacts are those "that could cause far reaching and serious impacts to the community." While the Workbook states that "there are no correct economic ratios or tests per se to evaluate socioeconomic impacts," it does say that each community must evaluate its own unique circumstances. The guidelines suggest the types of factors that should be considered, including changes in median household income, unemployment, and overall debt burden.

3.1 Step-by-Step Methodology



As shown on Figure 3-1, the Workbook identifies a five-step analysis to determine if the costs of a proposed project will likely result in substantial impacts.

1. Verify Project Costs and Calculate the Annual Cost of the Pollution Control[1]
2. Calculate Total Annualized Pollution Control Cost per Household
3. Calculate and Evaluate the Municipal Preliminary Screener Score
4. Apply the Secondary Test
5. Assess where the community falls in The Substantial Impacts Matrix

R0006084

[1] The project costs were prepared by Brown and Caldwell and independently assessed by other reviewers.

Figure 3-1
EPA Economic Guidelines
Measuring Substantial Impacts (Public Entities)

Source: Stanley R. Hoffman Associates, Inc.
EPA Economic Guidance For Water Quality Standards
Note: Some text has been modified for presentation purposes.

R0006085

The *Municipal Preliminary Screener* (Step 3) is the estimated Total Annual Pollution Control Cost per Household as a percent of Median Household Income in the community. The Screener indicates whether a public entity will *not* incur any substantial economic impacts because of the proposed pollution control program. The Workbook identifies less than 1% as "Little Impact," 1% to 2% as "Mid-Range Impact" and greater than 2% as Large Impact. If the Preliminary Screener results in either a Mid-Range or Large Impact, then the analysis is to proceed to the Secondary Test.

3.2 The Secondary Test

The Secondary Test includes five to six indicators:

Initial Indicators Considered	Final Indicators Used
1. Bond Rating	1. Bond Rating
2. Overall net debt as percent of full market value of taxable property	2. Overall net debt per capita
3. Unemployment	3. Unemployment
4. Median Household Income	4. Median Household Income
5. Property tax collection rate	5. Property tax collection rate
6. Property tax revenues as a percent of full market value of taxable properties	6. Not applied

In states with property tax limitations such as California, the Workbook notes that two of the indicators may not be appropriate: Indicator #2 - Overall Net Debt as Percent of Full Market Value of Taxable Property; and Indicator #6 - Property Tax Revenue as a Percent of Full Market Value of Taxable Properties. The Workbook recommends that Overall Net Debt Per Capita be used in place of Indicator #2 - Overall Net Debt as Percent of Full Market Value of Taxable Property. Also, the Workbook recommends that for states where indicator #6 has no appropriate substitute, it can be dropped and the other five factors assigned equal weight.

The final five indicators are used to form a composite assessment of the community's economic health and the financial impact of the required project. In addition to guidance on how to calculate each indicator, the Workbook provides criteria for scoring each indicator as 1-weak, 2-mid-range or 3-strong. For each of the five indicators the community is rated as weak, mid-range, or strong, based on various thresholds that apply to that specific indicator. For example, overall net debt is used as an indicator of a community's ability to meet debt obligations and its capacity to fund infrastructure. If the Overall Net Debt Per Capita is greater than $3,000, the community would be rated weak in its capacity to fund additional infrastructure and assigned a rating of 1; however, if the debt per capita is less than $1,000 it would have relatively more funding capacity and would be assigned a rating of 3. The indicators are then averaged to derive the Secondary Score.

The results from the first two tests (Preliminary Municipal Screener and Secondary Test) are regarded jointly in the Assessment of Substantial Impacts Matrix to ascertain whether the

community would be expected to incur substantial impacts due to the proposed pollution control project.

3.3 Evaluating Widespread Impacts

The final test is the consideration of *Widespread Impacts*. This test must be done even if substantial impacts are likely to be determined based on earlier tests. This analysis will include both the quantitative indicators and a discussion of potential financial and economic ramifications throughout the community.

SECTION 4
COSTS OF STORM WATER RETROFIT

A cost analysis was prepared by Brown and Caldwell to determine the cost of treating storm water runoff to meet water quality objectives for the Los Angeles NPDES Permit area. The capital costs for the designated drainage basins, as estimated by Brown and Caldwell, have been used for this analysis. These estimates are for a specified number of treatment plants per drainage basin projected to treat storm water from a design storm conforming to a one year return frequency with a duration of 24 hours. The costs have been specified and estimated for three treatment levels plus collection costs as defined below and will be assumed to be incurred in 1998, the first year. The operations and maintenance costs are ongoing costs that will be much less than the capital costs, and can typically be funded on an annual basis rather than through debt financing.

4.1 Storm Water Treatment Levels

The costs for this study have been organized into three levels of increasingly higher costs according to treatment level. Three treatment levels were defined in the Brown and Caldwell June 1998 report, Cost of Storm Water Treatment for Los Angeles County NPDES Permit Area, and were established using the water quality objectives set forth in the Los Angeles RWQCB (Regional Water Quality Control Board) Basin Plan. As stated in this report, the division points between treatment levels are basically the ability to remove sediment and trash; the ability to remove or kill bacteria; and the ability to remove metals. In addition to the three levels described below, there is a cost component of additional collection piping and distribution, which allows collection for treatment before the water runoff enters the major water courses. The three treatment levels include:

Level 1: Detention and Screening
This is the most commonly used storm water treatment technology and is used to remove floating debris and settle solids picked up by storm water. Level 1 is a conventional storm water treatment technology and represents a treatment technology that could be implemented for a large drainage area. The level 1 detention facilities were sized to capture the design storm and hold it for twenty-four to seventy-two hours to allow the solids to settle and clarify the water. Level 1 will decrease pollutant concentrations but cannot meet all the objectives for beneficial use.

Level 2: Filtration and Disinfection
This cost level is cumulative with the preceding level, adding filtration and disinfection costs to level 1 costs of detention and screening facilities. Storm water runoff often contains coliform, which are bacterial indicator organisms used to determine sanitary conditions. The levels of coliform in urban storm water will generally cause the receiving water to exceed levels considered safe for recreational contact. Most waters in California are designated to have a recreational beneficial use and the coliform objective linked to the beneficial use will be exceeded by inflow of storm water. Filtration and disinfection will kill bacterial organisms and allow the objectives for the recreational beneficial use to be met. High rate filtration and chlorination were added to the discharge from the detention basins in level 1. Dechlorination was also provided to protect organisms in the receiving water from the toxicity of any residual chlorination. The flow through treatment units have been designed to treat the captured storm water over a seventy-two hour period following the storm. Level 2 will allow storm water to meet the requirements for the recreational beneficial uses.

Level 3: Advanced Treatment

This level of advanced treatment adds a highly sophisticated treatment process to remove very small concentrations of toxic materials that are often found in urban runoff. Many of the waters in California are designated as potential drinking water sources. The objectives for the beneficial use designation of municipal water supply may require advanced treatment. Even more restrictive than the drinking water standards, are the standards for toxicity as it relates to sensitive species that could potentially exist in the receiving waters. Most waters have beneficial use designations that describe the aquatic environment and have objectives to protect these beneficial uses. Meeting these objectives with structural treatment units will require advanced treatment beyond what is normally expected of water treatment facilities. Reverse osmosis is included as the typical technology representing advanced toxic removal to achieve the required low concentrations. Storm water treated to level 3 is free of almost all pollutants and is suitable for all beneficial uses.

4.2 Capital Costs

The capital costs represent the costs of land and facilities. The costs of the facilities were developed from representative designs then scaled up for the individual watersheds and are based on flow rates. The number of treatment plants required is estimated at 480. For the purposes of this analysis, construction and land purchase is assumed to take place at the beginning of the project in the first year and the annualized cost is assumed to stay constant over the life of the project.

Table 4-1 shows the estimated 1998 total capital costs of $53.6 billion. As indicated, the total capital costs include $12.5 billion in collection of flow costs, which are 23 percent of the total costs. The largest share of the cost is for treatment level 2 at $20.5 billion, or 38 percent of the total.

4.3 Operations & Maintenance Costs

Operations and Maintenance costs include those costs required to operate and maintain the facilities on an annual basis. These include labor, routine materials and supplies, electric power and chemical costs for storm water treatment. Labor costs for operating the facilities are based on crews going to the treatment sites for 12 hours during each storm. Table 4-1 indicates that the annual operations and maintenance costs increase with each treatment level to an annual total of $198.9 million. The largest amount is for treatment level 3 at $82.2 million per year or 41 percent of the total.

4.4 Land Requirements and Cost

Land cost requirements for 480 treatment units are estimated at $6.1 billion as shown in Table 4-2. This represents a total of 13,950 acres, split over treatment levels 1 and 2 at 67 percent and 33 percent respectively. Land costs for properties that might accommodate treatment facilities were estimated at an average of $435,600 per acre based on discussion with appraiser, John J. Bihary, Jr.

SECTION 5
LOS ANGELES COUNTY NPDES PERMIT AREA: LAND USES

The land use classification used for this analysis was taken from the Southern California Association of Governments' (SCAG) 1994 land use classifications as shown on Table 5-1.

- Single family residential, including mobile homes
- Multi-family residential
- Commercial areas, including wholesale and retail trade and general services
- Public uses, including public facilities, educational, military, and transportation
- Light and heavy industrial uses
- Other urban areas not included under other categories
- Open spaces including parks and undeveloped lands
- Unknown, including acreage not elsewhere categorized and vacant land

5.1 Land Use Classification

The land use acreage breakdown from SCAG's Geographic Information System (GIS) database utilizes the following land-use classifications. The residential category includes single family, multi-family, mobile homes and trailer parks and mixed residential. Mixed residential refers to an area in which there are both single and multi-family uses but where no single use predominates. The commercial category includes general office use, retail stores and commercial services and mixed commercial and industrial. The public category includes public facilities, educational institutions, military and transportation uses. Light industrial includes manufacturing, assembly and industrial services but not manufacturing which consists of processing raw materials or discharging industrial waste products. The other urban category involves railroads, truck terminals, communication facilities, mixed urban uses and areas under construction. The Open space category consists of local and regional parks, golf courses, cemeteries, gardens and arboreta and other open space and recreation. The miscellaneous category entails unknown land use, which is acreage that cannot be classified elsewhere and vacant land. Agricultural land use and water, except beaches and harbor and marina facilities, were not included.

5.2 Design Flow

The design flow is the millions of gallons of runoff that would be generated by a representative design storm: a Los Angeles area rainstorm conforming to a one year return frequency with a duration of 24 hours. The runoff was developed by a coefficient of runoff that estimates the percentage of precipitation in the design storm that will become runoff based on the land use of the area and the imperviousness associated with that type of land use. Impervious areas are those areas where rainfall cannot be absorbed and thus surface runoff occurs. In areas of high urbanization, there are more areas such as roof surfaces on structures and paved surfaces that do not allow infiltration of storm water as compared to undeveloped open spaces. The imperviousness for each type of land use was based on the values reported by the Santa Monica Bay Restoration Project Report.

As shown in Table 5-1, residential use accounts for only 25.6 percent of the total land area but 33.6 percent of the total runoff. In contrast, open space accounts for 59.3 percent of total land uses but

R0006094

only 39.3 percent of the total runoff flows. This illustrates the relationship of imperviousness to urbanization described above. Runoff is critical in determining costs because of the size of the facilities required to capture and treat storm water, and the concentrations of constituents of concern in the water. The Santa Monica Bay Restoration Project Report indicated that significant concentrations are coming from residential areas.

5.3 Variables for Land Use Analysis

The purpose of this study is to determine the potential economic and financial impact on entities within the Los Angeles Area NPDES Permit area because of storm water retrofit costs. The above discussion of land use and runoff indicates that a highly urbanized area will generate more runoff and a higher concentration of potential constituents of concern than less urbanized areas. Therefore, the costs for storm water management will be higher for communities in these areas. To determine the potential impact over various land uses, the following data was utilized:

- Population, housing, and employment statistics from the Southern California Association of Governments (SCAG)
- Household annual median and average income projections based on U.S. Census data, updated using the Consumer Price Index (CPI)
- Single and multi-family housing units and current population estimates from the California Department of Finance (DOF) to determine density and persons per household ratios

5.3.1Population, Housing and Employment

The 1994–1998 population, housing, and employment data from SCAG were tabulated for all the census tracts within the designated drainage areas as shown on Table 5-2. An estimate for 1998 was made based on the predicted average annual change from 1994 to 2000.The 1998 total population for the drainage basins of about 9.3 million is 97 percent of the total Los Angeles County population estimate of 9.6 million for 1998 based on DOF and is projected to increase annually at an average of about 1 percent from 1998 to 2020.

5.3.2Household Income

Estimates for 1998 for median household income were made based on 1990 United States Census data obtained from the 1989 survey, and updated using the 1989 to 1998 change in the CPI of 26.0 percent as shown on Table 5-3. Household income is used as an indicator with the EPA Municipal Screener described earlier in Section 3 to determine storm water facilities retrofit costs for single family and other land uses. The estimated 1998 median income for Los Angeles County is $43,916.

5.3.3Density

The 1994 land uses from the GIS data base and the 1994 housing units from the Department of Finance were used to determine density as to housing units per acre for single family and multi-family housing units as shown in Table 5-4. The Los Angeles River and Santa Monica Bay basins show the highest overall density at 8.35 and 9.30 units per acre. The Malibu basin has the lowest density at 2.71 units per acre. As shown in Table 5-4, the Los Angeles River and Santa Monica basins have the highest single and multi-family densities.

SECTION 6
FINANCING APPROACHES

This section provides a brief overview of various sources and methods for financing the construction, operation and maintenance of the major storm water treatment facilities that would be required to meet water quality standards. While no financing strategy is recommended at this time, there is a range of financing approaches used in California. Typically, in California more than one financing approach is utilized for major projects, including a combination of local and outside sources.

6.1 Federal

The Federal government historically has played a leading role in financing various environmental enhancement programs. A Federal program to pay for all or a significant part of the costs of storm water runoff treatment facilities is currently not available nor expected in the near future. Currently, national attention is on balancing the Federal budget and on maintaining the long-term soundness of Social Security and Medicare, not on major new grant programs.

6.2 State

At the State level of government, a possible approach for financing part of the capital costs of storm water treatment would be through some form of State grants program or allocation of some state's current surplus after existing funding priorities have been completed. Such a grant program would require state legislative action and statewide voter approval since it would likely involve the issuance of general obligation bonds by the State. The State policy as established, both from the Department of Finance and the State Treasurer, is to keep the general fund debt ratio below 6 percent. In other words, the prudent maximum annual cost of servicing debt from the General Fund is by policy established at 6 percent.

Even if approved by the voters, it would be very unlikely to fund any sizable level of statewide storm water treatment costs. The State Department of Finance estimates that as of January 1, 1998, the total capacity for new general obligation bonds issuance over the next 10 years is $40 billion statewide. The $40 billion estimate does not include new bond measures taken to voters in 1998. For example, the November 1998 election ballot included a $9.2 billion school finance measure, which is the largest statewide General Obligation bond measure ever approved by California voters.

6.3 Local

The ability of local governments in California to finance public improvements has been increasingly circumscribed over the last 20 years. In June 1978, the voters of California amended the state constitution to limit the ability of local governments to impose property taxes. That amendment, commonly known as Proposition 13, added Article XIIIA to the state constitution that limits the maximum ad valorem tax on real property to one percent of the assessed value of that property. Proposition 13 also limited annual assessed value increases to 2 percent or the inflation rate, whichever is smaller, until a property is sold. Since the passage of Proposition 13, more than dozen other statewide propositions have been passed that further restrict how local revenues can be raised

or spent. In 1979, the voters passed Proposition 4, known as the Gann Initiative, which added Article XIIIB to the state constitution. This article limits the permitted growth in the rate of local government spending from general revenues to changes in population and inflation growth rates. Voter approval is required to increase spending limits. This vote must be reaffirmed every four years.

Proposition 46 in 1986 allowed local governments by a 2/3 majority vote to impose a property tax above the Proposition 13 one percent for the period required to finance new general obligation bonds. The proposition also restricted the use of general obligation bond proceeds to the purchase or improvement of real property.

While many other measures were passed during the late 1980's and early 1990's, the measure that has had the most widespread impact since Propositions 13 and 4, was passed in 1996 as Proposition 218. This measure adds Articles XIIIC and XIIID to the state constitution. The measure does the following:

1. Limits authority of local governments to impose taxes and property-related assessments, fees and charges. It requires that a majority of voters approve increases in general taxes and reiterates that two-thirds must approve a special tax.
2. Requires that assessments, fees, and charges must be submitted to property owners for approval or rejection, after notice and public hearing.
3. Limits the amount of an assessment on a property to the "special benefit" conferred on the property.
4. Limits fees and charges to the cost of providing the service and establishes that such fees and charges may not be imposed for general governmental services that are generally available to the public.

Within the restrictive context described above, the following are some financing mechanisms used by local governments to finance various public improvements in California:

- Community Facilities Districts
- Special Benefit Assessments
- General Obligation Bonds
- Local Option Sales Tax
- Fees and Charges
- Certificates of Participation, with lease payments from the General Fund
- Development impact fees
- Redevelopment Tax Increment Financing

Community Facility Districts. The Mello-Roos Community Facilities Act permits various local governments to establish a Community Facilities District to finance new facilities and/or to pay for operations and maintenance through the levying of a special tax. This Act plus Proposition 218 discussed earlier requires a two-thirds vote for approving the special tax in inhabited areas.

Special Benefit Assessments. Benefit assessments can be levied on real property by cities, counties and special districts to acquire, construct, operate and maintain public improvements that convey an

identifiable special benefit to the defined properties. As was discussed earlier, Proposition 218 establishes a strict requirement for formal landowner approval before such assessments can be put in place.

General Obligation Bonds (G.O. bonds). Cities, counties and certain other local government entities may issue G.O. Bonds to finance specific projects. Debt service for G.O. bonds is provided by an earmarked property tax above the one percent general property tax mandated by Proposition 13 (often called a "property tax override"). These overrides typically show up on the annual tax bill as "voted indebtedness." The proceeds from G.O. bonds can be used to finance the acquisition, construction and improvement of real property, but cannot be used to pay for equipment, supplies, operations or maintenance costs.

Local Option Sales Tax. Twenty-one counties impose a sales and use tax added onto the basic 6 percent rate. Los Angeles County imposes a sales tax of 8.25 percent. The local share of the basic sales tax is one percent. Local option sales taxes have been used for public safety, traffic, hospitals, education, earthquake recovery and other purposes. If such taxes are earmarked for a specific purpose or if a special district levies them, then they are deemed Special Taxes under Proposition 218 and require a two-thirds voter approval.

Fees and Charges. Local governments can levy various fees and charges to recover the cost of providing services. Under Proposition 218, many of these fees and charges that are "incident to property" are now also subject to landowner approval.

Certificates of Participation (COPs). A COP is a form of lease purchase agreement that does not constitute indebtedness under the state constitution and does not require voter or landowner approval. The lease payments typically are made from the local government's general fund.

Development Impact Fees. These are fees charged to new development to pay for facilities required to serve the new development. State law, and Federal case law, establishes a rigorous set of tests that such fees must meet to be valid. In short, these fees can only be used to pay for those facilities or portions of facilities required to serve new development. They cannot be used to correct existing problems or cure existing capital or operating and maintenance deficiencies.

Redevelopment Tax Increment Financing. A city or county can establish a redevelopment agency to undertake the revitalization of an area that it finds to be "blighted." The redevelopment agency may incur indebtedness to finance improvements needed to accomplish the goals of its redevelopment plan. The property tax base in the redevelopment area is "frozen," and increments in property taxes after the tax base is frozen go into the redevelopment fund to be used for the financing of improvements. Voter approval is not required for tax increment financing. Such financing may be used only for facilities to support the needs of redevelopment. Further, it usually takes many years before significant property tax increment, derived from new development, is available for financing.

6.4 Funding Assumptions

For purposes of this analysis, it was assumed that the financing would be based on the issuance of bonds with a 20-year life as suggested in the EPA Workbook. The tax-exempt interest rate for such

bonds was assumed to be 6 percent. Based on municipal bond rates over the past 10 to 20 years provided by the California Debt Advisory Commission, this is judged to be a reasonable rate for planning purposes. Funding costs of such bonds were assumed to be 12.5 percent of the total issue amount. Funding costs include the cost of debt issuance, underwriters discount, reserve fund and other related costs. These assumptions allow the total capital costs to be annualized and combined with the annual operations and maintenance costs.

SECTION 7
FINANCIAL CAPACITY OF LOCAL JURISDICTIONS

7.1 Overall Net Debt per Capita

Financial capacity of local jurisdictions means the ability of the local community to incur additional debt to pay for public improvements and services, here storm water retrofit facilities and annual operations and maintenance. In California, after the passage of Proposition 13 in 1978 and more recently Proposition 218, significant restrictions have been placed on any increases in property taxes or property related fees and charges. Also, the revenue potential of local jurisdictions to assume additional debt has been further constrained by the effects of the recession in the early 1990s.

Net debt per capita is one indicator of financial capacity of local jurisdictions. Each community, depending upon its infrastructure needs and level of development, will have a different mix of debt instruments, such as general obligation, special assessment or Mello-Roos bonds. Also, besides each community's direct debt, there is overlapping debt from other special purpose districts such as schools, water and sewer, fire protection and flood control. In evaluating the impact of existing debt per capita and the addition of new debt on a community, the EPA has suggested the use of following ranges:

- Greater than $3,000: weak = 1
- $1,000 - $3,000: mid-range = 2
- Less than $1,000: strong = 3

The overall debt per capita estimate of $1,207 for Los Angeles County is used subsequently in the evaluation of local financial and economic impacts. This estimate is based on total outstanding and direct and overlapping debt of about $11.6 billion for Los Angeles County provided by California Municipal Statistics, Inc. This debt per capita is already within the mid-range of $1,000 to $3,000 per capita as prescribed by the EPA. When the total net debt for full treatment of $5,788 per capita ($53.6 billion divided by the study area population of 9,259,750) is added to this debt, it results in $6,995 of debt per capita. This is above the weak range limit of $3,000. The total new net debt represents a 480 percent increase over the existing net debt per capita.

7.2 Analysis of Sample Property Tax Bills

In contrast to the more global overall net debt analysis, a summary of sample local property tax bills for several single family residential units in Los Angeles NPDES area is presented on Table 7-1. Three properties from each basin are shown and the payments through the property tax bill are divided into three categories: 1) the basic 1 percent local property tax rate established by Proposition 13; 2) voter approved bonded indebtedness; and 3) direct assessments. The voter-approved portion includes City, County, MWD, Flood Control and Unified School District debt payments. The direct assessments include annual payments for many purposes, including flood control, storm water, fire/paramedics, parks, lighting maintenance, emergency 911 and mosquito abatement.

Los Angeles County Assessor

The range of assessed value for these properties is broad, with a median of $500,947. The total taxes range from 1.043 percent to 1.932 percent of assessed value. Examining the median property, the total charges including the basic one-percent, voter-improved indebtedness, and direct assessments, account for about 1.197 percent of the total assessed value. A typical rule of thumb in municipal finance indicates that the upper limit for reasonable annual charges to a property should not exceed 2 percent.

7.3 EPA Municipal Preliminary Screener Approach

The U.S. Environmental Protection Agency (EPA) has prescribed a methodology, the Municipal Preliminary Screener, to establish whether a community is expected to incur "substantial" economic impacts due to the pollution control project costs. There are two tests with this Municipal Preliminary Screener to establish whether the community can clearly pay for the project without incurring any substantial impacts under the EPA guidelines. The screener is defined as follows:

$$\textit{Municipal Preliminary Screener} = \frac{\textit{Average Total Pollution Control Cost Per Household}}{\textit{Median Household Income}}$$

The EPA has established a lower threshold of below 1 percent of median household income as representing a cost that is not expected to impose a substantial economic hardship on households. A cost between 1 and 2 percent is considered a mid-range impact. If the cost is over 2 percent of median household income, then the project may create an unreasonable financial burden on many households within the community, according to the EPA methodology.

The estimates of 1, 1.5 and 2 percent of median household income are presented in Table 7-2 for the Los Angeles County area. They range from $439 per household to $878 per household annually. When this per household amount is multiplied by the estimated 3,228,269 households in the Los Angeles NPDES permit area, it generates a range of annual revenue potential of $1.4 to $2.8 billion. This revenue represents from about 29 to 58 percent of the total annualized cost for full storm water treatment.

The estimated cost for existing pollution controls plus the full storm water system is about $1,295 per household annually which results in impacts over 2 percent of median household income, therefore, this is judged to create a substantial economic impact. The total cost is comprised of the annualized average storm water cost estimate of $741 plus existing pollution control costs of $554 per household. Using the Preliminary Screener, the level of median household income required for the estimated total pollution control costs exceeds the 2 percent level indicating potentially a substantial economic hardship on households. The EPA guidelines now suggest proceeding to the Secondary Test.

Table 7-2
EPA Municipal Preliminary Screener Analysis
Financing and Economic Impacts of Storm Water Treatment
Los Angeles County NPDES Permit Area

Municipal Screener Categories[1]	Estimate
Households[2]	3,228,269
1998 Median Household Income	$43,916
1 Percent of Median HH Income	$439
1.5 Percent of Median HH Income	$659
2 Percent of Median HH Income	$878
Annual Revenue Potential @ 1 Percent	$1,417,726,614
Annual Revenue Potential @ 1.5 Percent	$2,126,589,921
Annual Revenue Potential @ 2 Percent	$2,835,453,228

1. EPA has suggested a Municipal Screener range of less than 1 percent for representing little impact, 1 to 2 percent for mid-range impact and over 2 percent for large impact.

2. Estimated households for Los Angeles NPDES Permit Area 1998.

7.4 The Secondary Test

According to the EPA, the Secondary Test builds upon the characterization of the financial burden identified in the Municipal Preliminary Screener. This test provides an indication of the community's ability to obtain financing and describes its socioeconomic health. According to the EPA Guidelines, the indicators describe precompliance debt and socioeconomic and financial management conditions in the community. In states, such as California, with statutory limits on property tax rates and where data on full market value of taxable property are not generally available, the indicator Overall Net Debt Per Capita can be substituted for other indicators that rely on full market value information. The following five indicators suggested by the EPA have been applied for the Secondary Test:

1. Debt Indicators
   - Bond Rating
   - Overall Net Debt Per Capita

2. Socioeconomic Indicators
   - Unemployment Rate
   - Median Household Income

3. Financial Management Indicators
   - Property Tax Collection Rate

The overall methodology, illustrated on Table 7-3, ranks each indicator on a scale from 1 to 3 and then calculates a simple average of the five indicators, where a score of 1 is Weak, 2 is Mid-Range and 3 is considered Strong. As shown in Table 7-3, the five indicators add to a total score of 11 and an average of 2.2 indicating that the Los Angeles NPDES Permit Area falls in the Mid-Range of the socioeconomic and financial management indicators. The Secondary Test shows a bond rating of Strong with ratings generally above BBB and a score of 3; an overall net debt per capita in the Mid-Range with a score of 2; an unemployment rate of 6.1 percent, or over 1.0 percent higher than the national rate of 4.7 percent, for a Weak ranking and a score of 1; a median household income of $43,916, which is roughly equivalent to the State median, for a mid-range ranking and a score of 2; and a generally Strong property tax collection rate for a score of 3. When this score of 2.2 is prorated across the 1 percent to 2 percent mid-range, it results in an estimated Secondary Test score of 1.6 percent and will be used later as part of the evaluation of substantial economic impacts.

Table 7-3
EPA Municipal Screener: The Secondary Test
Financing and Economic Impacts of Storm Water Treatment
Los Angeles County NPDES Permit Area

Indicator	Secondary Indicators[1]			Value	Score
	Weak	Mid-Range	Strong		
Bond Rating	Below BBB (S&P) Below Baa (Moody's)	BBB (S&P)	Above BBB (S&P) BAA (Moody's)	Above BBB	3
Overall Net Debt per Capita	Greater than $3,000	Between $1,000 & $3,000	Less than $1,000	$1,207	2
Unemployment	More than 1% above National Average	National Average (4.7%, March 1998)	More than 1%below National Average	6.1%	1
Median Household Income	More than 10% below State median	State Median ($44,640)	More than 10% above State median	$43,916	2
Property Tax Collection Rate	Less than 94%	94% - 98%	Greater than 98%	98.2%	3

Notes: 1) A Weak rating is assigned a score of 1 point; a Mid-Range rating is assigned a score of 2 points; and 3) a Strong rating is assigned a score of 3 points.

SECTION 8
ASSESSMENT OF MARKET CONDITIONS

The purpose of assessing market conditions is to determine the potential ability of the various land uses to absorb new taxes, assessments, fees or charges. Two measures used in this section for this purpose are the assessed valuation of property and the amount of taxable sales generated by a community. In addition to household income, these are both indicators of local financial strength and the ability to accommodate additional debt. Assessed value along with the property tax rate determines how much property tax revenue is generated each year. The maximum basic rate of property taxation is limited in California by Proposition 13 to 1 percent. The taxes available for financing debt exceeding the one-percent level now must be approved by a two-thirds vote of the local electorate.

8.1 Assessed Value Trends for Los Angeles County and the Los Angeles NPDES Permit Area

The recession in the early 1990s in California had a dramatic dampening effect on the rate of increase in assessed property valuation in Los Angeles County. This, in turn, constrained property tax revenues for many local jurisdictions. Table 8-1 shows the average annual growth of assessed value from 1989 to 1998 according to the Metropolitan Water District (MWD) for areas in Southern California in their jurisdiction, including Los Angeles County. This indicates an average annual percentage change in total assessed valuation from 1989 to 1998 of 4.7 percent. This growth rate has slowed considerably since 1993.

The assessed valuation from the 1996-1997 annual Los Angeles County Tax Roll was used to analyze the local ability of jurisdictions in the Los Angeles NPDES Permit Area to finance additional costs through property tax revenues. Assessed value and market value per acre of private sector land uses were estimated for use in the analysis. Table 8-2 summarizes assessed valuation for the County with estimates ranging from about $632,900 per acre for single family units to $1.2 million per acre for commercial/industrial land.

When the total estimated assessed valuation of about $457.3 billion for all three categories is averaged over approximately 564,654 acres of residential and commercial/industrial in the Los Angeles NPDES area, this results in an estimated assessed valuation of about $809,915 per acre.

8.2 Taxable Sales Trends

Taxable sales for Los Angeles County can indicate a local jurisdiction's ability to generate additional revenues. Since the passage of Proposition 13, the sales tax has become the preferred source of local government funding for ongoing operations and maintenance. However, some local jurisdictions have traded a share of their sales tax to fund public infrastructure that has attracted revenue generating commercial land uses.

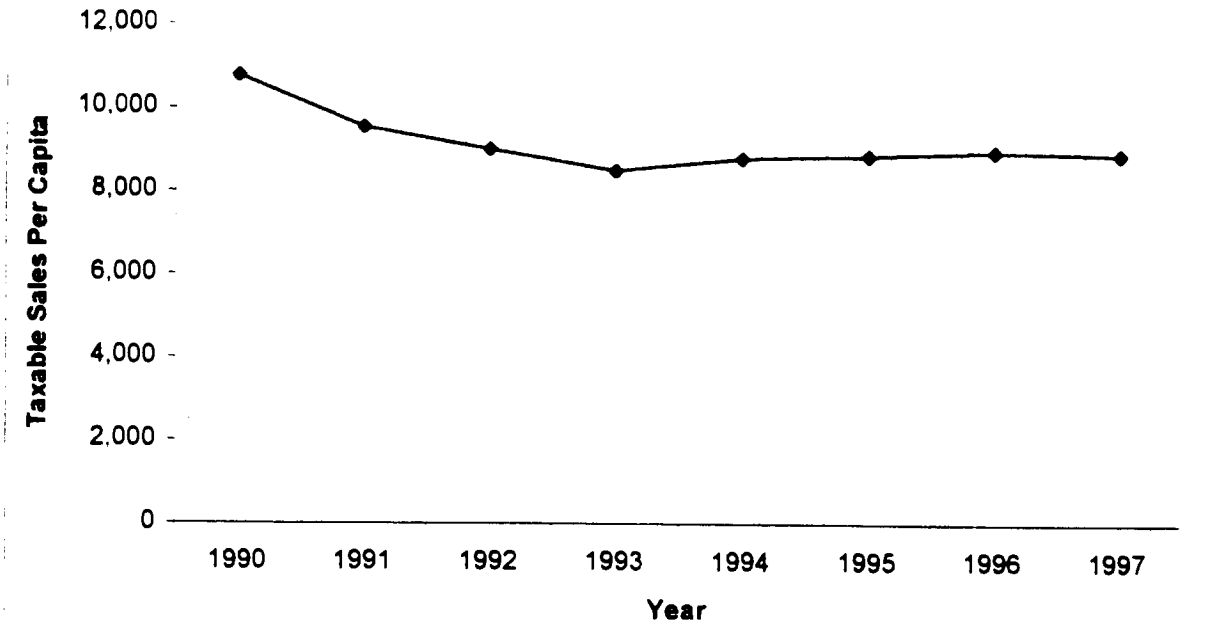
Los Angeles County Assessor 1996-1997 Roll Release



R0006112

From 1990 to 1997, taxable retail sales for Los Angeles County, according to the California Board of Equalization, declined from $94.7 billion to an estimated $84.7 billion in 1998 inflation-adjusted dollars. This was a decline of approximately $10 billion in taxable sales. Per capita taxable sales are shown in Figure 8-1. The overall decline of per capita taxable sales for the 1990 to 1997 period is 17 percent, declining from $10,802 in 1990 to an estimated $8,925 in 1997. However, since 1993, real per capita taxable sales have been stable and even showed slight increases.

Estimated 1998 taxable sales for the Los Angeles NPDES Permit Area are shown in Table 8-3. The per capita range for communities in this area is quite large, with a low of $8,559 in the Los Angeles River Drainage Basin and a high of $13,336 for the Dominguez Drainage Basin. This indicates a large disparity in both locational selection of shopping and in the income levels of the population as well. The overall taxable sales per capita is $9,050 dollars for the Los Angeles County NPDES area.

SECTION 9
FINANCIAL SPREAD OF COSTS

This section analyzes the potential financing of the 1998 estimated storm water treatment costs for the Los Angeles County NPDES Permit Area under the following two scenarios:

1. Full Storm Water Retrofit Treatment
   - $53.6 billion capital costs; $198.9 million annual operations and maintenance

2. Debt capacity limited by EPA Preliminary & Secondary Screeners
   - $5.3 billion capital; $20.0 million annual operations and maintenance

The first scenario presents the financing of the full system including collection costs and all three levels of treatment. The second scenario reflects the EPA Preliminary and Secondary Municipal Screeners. This combines the revenue potential based on 1.6 percent of median household income to reflect the estimated average Secondary Test screener score, as discussed in Section 7.4, reduced by estimated existing non-storm water pollution control costs of $554 per household.

The financial analysis of the first scenario spreads capital and operations and maintenance costs to both residential and non-residential land uses. The spread is based on the proportionate share of flow from each type of privately owned land use. For example, single family residential land use generates an estimated 38.2 percent of the runoff flow while the commercial and industrial categories generate an estimated 21.3 percent of the flow. The capital costs spread by land use are then annualized assuming bond interest of 6.0 percent, a term of 20 years and estimated bond issuance costs of an additional 12.5 percent above the construction costs.

These annualized capital costs are then converted to a cost per unit basis for single or multi-family land uses or to a cost per acre basis for commercial, industrial and other urban land uses. It is further estimated that the "Open" land use includes about 55 percent privately owned open space. This estimate was based on a geographic information system entitled "GOVOWNERSHIP." It shows groupings of land ownership and was originally digitized by the Forest and Rangeland Resources Assessment Program of the California Department of Forestry. The annualized capital costs are added to the annual operations and maintenance costs to estimate a total annual cost per unit or acre.

The model can analyze the financial implications of outside funding, such as from the State or Federal levels, possible sales tax subventions or redevelopment agency contributions. However, these sources of funds are considered both limited and uncertain. Currently, there are no funding programs for storm water costs of this magnitude.

The basic assumption is that successful implementation is primarily a local responsibility and will require major financial commitments from local sources. In presenting the analysis, a residential land use category has been used for illustration. Each scenario will be discussed in detail, but in summary, the estimated annual storm water treatment cost for each scenario is as follows:

	Cost Per Residential Unit	Cost Per Single Family Unit	Cost Per Per Household
Scenario 1:	$741	$1,024	$1,509
Scenario 2:	$ 73	$ 101	$ 149

9.1 Scenario 1 – Full Storm Water Retrofit Treatment

Scenario 1, Table 9-1, presents the analysis for the full treatment costs of $53.6 billion, including $12.5 billion for storm water collection costs. The annual operations and maintenance costs are $198.9 million. The spread of costs to private sector land uses is based on the distribution of storm water runoff flow from the engineering analysis prepared by Brown and Caldwell.

Using this flow analysis and the single family dwelling unit for illustration, the total allocated capital cost was estimated at $10,062 per single family unit. This was annualized to about $987 and when added to the allocated share of annual operations and maintenance costs of about $37, resulted in $1,024 per single family unit for the full system costs. Based on the average assessed value per single family unit of $117,860 this would be an estimated increase in the property tax rate of 0.87 percentage points.

When the cost of $1,024 per single family unit is weighted with the cost of $309 per multi-family unit, this results in a per residential unit cost estimate of $741. Correspondingly, the cost is $1,509 when allocated on a per household basis. This estimate represents all costs allocated to households with no spread of costs to non-residential land uses. This is for the cost of full storm water treatment before accounting for existing pollution control costs of $554 per household.

9.2 Scenario 2 – Debt Capacity Limited by EPA Secondary Municipal Screener

Scenario 2 summary analysis is presented in Table 9-1 reflecting the Preliminary and Secondary Municipal Screener. For this analysis, it is estimated that the income potential is 1.6 percent of median household income ($703) based on the Secondary Screener. When the estimated amount of $703 per household at the Secondary Municipal Screener level of 1.6 percent of median household income level ($43,916) is reduced by the estimated cost of $554 for non-storm water pollution controls, this results in a net amount of $149 per household available for storm water treatment. If this annual amount of $149 is multiplied by the estimated 3,228,269 households in the Los Angeles County NPDES Permit area and is then capitalized using a 6 percent interest rate and a term of 20 years, this results in an estimated affordable capital cost of $5.3 billion. This represents about 9.9 percent of the estimated full storm water treatment cost of $53.6 billion. On a comparative basis, this yields an estimated cost of $73 per residential unit or $101 per single family unit.

SECTION 10
ESTIMATED NON-STORM WATER POLLUTION CONTROL COSTS

So far his report has only examined the incremental costs of storm water treatment and has not included the costs of other non-storm water pollution control programs. In this section, estimates of existing and future non-storm water pollution control costs per household were added to the estimated incremental costs for storm water treatment in the Los Angeles County NPDES permit area. The estimated costs to households of other pollution control measures cover the following:

- Air Quality Regulations
- Drinking Water Treatment
- Solid Waste Disposal
- Wastewater Treatment

The analysis in this section represents a preliminary examination of this issue, as a comprehensive study would require a major commitment of resources. When estimating existing or future pollution control costs, there is a wide range of pollution programs for consideration which would require extensive research. In developing the estimated initial costs, two approaches were utilized: 1) analysis of estimated localized, direct costs in California; and 2) a literature review including a 1990 comprehensive study by the EPA updated to 1998 dollars. Because of the widespread effects of pollution controls on the economy and the difficulty of calculating the full effects as they ripple through it, these two approaches likely underestimate the total level of pollution control costs.

10.1 Summary

According to the EPA Municipal Screener, the estimated incremental cost of any new pollution control program should be added to the existing pollution control costs. Therefore, the per household cost estimates of existing pollution control made in this study are added to the incremental costs for storm water treatment by area to determine whether they exceed the 2 percent of median household income criteria prescribed by the EPA municipal screener methodology. The approaches used to estimate the impacts of existing and future pollution control costs in combination with estimated incremental storm water treatment costs are described in this section and summarized below:

1) Localized estimate: $554 annually per household
2) EPA nationwide study estimate: $537 annually per household

10.2 Localized Estimates for Existing Non-Storm Water Pollution Control Costs

Estimates were made for the additional annual pollution control costs per household unit based on localized costs for the Los Angeles area of wastewater user fees, tire/oil disposal, automobile emissions and repairs, drinking water treatment and solid waste disposal. This amount was estimated to be about $554 annually per household for the Los Angeles area as shown on Table 10-1.

Data was compiled using several sources in order to determine the existing residential costs of non-storm water pollution control programs in the Los Angeles area. These costs are analyzed by three

Table 10-1
Financial and Economic Impacts of Storm Water Treatment
Estimated Annual Localized Non-Storm Water Pollution Control Costs Per Household
Los Angeles Area

Description of Localized Cost	Estimated Annual Cost
Annual Wastewater User Charge[1]	$194
Other Localized Pollution Control Costs	
Automobile Tire/Oil Disposal[2]	$8
Average Emissions Costs[3]	$74
Drinking Water[4]	$144
Solid Waste	$134
Total Other Costs	$360
Total Estimated Localized Pollution Costs	**$554**

[1] This estimate is based on the California Environmental Agency's, Wastewater User Charge Survey Report, Fiscal Year 1997-98.

[2] Based on oil disposal costs of $5 and tire disposal costs of $3 per year.

[3] Based on average emissions cost calculations as shown below:

Annual Median smog inspection fee	$14.00
Annual Median smog certificate	$5.00
Annual Average emissions repairs	$55.00
	$74.00

[4] Estimated Water treatment cost based on Metropolitan Water District (MWD) jurisdictions as shown on Table 10-3 has been applied as an average cost to the Los Angeles area.

Metropolitan Water District of Southern California, 1998

Notes:			Per Household Annual Estimated Charges
Calculations are based on the following estimates:			
Tires changed @ 50,000 miles or 2 tires/yr.at $1.50 each			$3.00
Oil changed @ $1.00	4.86	times per yr.	$5.00
Annual Median smog inspection fee			$14.00
Annual Median smog certificate			$5.00
Annual Average emissions repairs			$55.00
Per Capita Vehicle Miles Travelled			8,635
Annual VMT per household			17,270

R0006120

primary environmental media: air, land and water. The detailed annual cost estimates per residential unit for each of these categories, as shown on Table 10-1, include annual wasterwater user charges plus other costs. The estimated other localized pollution costs include: tire/oil disposal fees, smog check and related emissions repairs, drinking water treatment and solid waste disposal and are about $360 per household for the Southern California area.

These total costs are then added to the estimated annual wastewater user charge to arrive at a total estimated annual localized pollution control cost per household. When this total localized amount of $554 is added to the incremental cost of storm water treatment, it represents the total amount that a household is estimated to pay for pollution control on an annual basis if the full storm water treatment system was implemented.

The cost estimates for the air category include costs related to meeting the requirements for automobile smog check, smog certificate, and related emissions repairs every two years. These costs were derived based on estimates received from the California Bureau of Automotive Repairs (BAR) and then annualized on a per household basis. Smog activity is reviewed statewide each month by BAR. Table 10-2 summarizes the emissions related repair costs from July 1997 through March 1998 plus other smog control related costs. The annualized amount was calculated based on the California regulation that automobiles must pass smog certification every two years.

The land category includes costs related to solid waste disposal, as well as those for automobile oil and waste tires. The estimates for solid waste in dollars per household were presented in the EPA study. The costs for tire and oil disposal were derived based on estimates provided by the Integrated Waste Management Board of California. The calculations used in the analysis are referenced on Table 10-1.

The water category includes those costs related to the treatment of drinking water and user fees for wastewater. The costs for the treatment of drinking water were calculated based on the Southern California Metropolitan Water District's (MWD) price schedule for areas within their jurisdiction. A summary of these water treatment costs is shown on Table 10-3. The estimated annual wastewater costs were based on the California Environmental Protection Agency's report, Wastewater User Charge Survey Report, Fiscal Year 1997-98.

10.3 Pollution Control Cost Estimates Based on EPA Study

This approach utilizes a 1990 study by the EPA, Environmental Investments: The Cost of a Clean Environment, which estimates the direct costs of public and private pollution control activities in the United States. Although this report was prepared in 1990, it represents an extensive analysis of environmental costs by economic sector and environmental medium. The study also includes a projection to the year 2000 of what EPA estimated at the time to be the cost of full compliance with existing regulations. According to the report, overall there is expected to be a significant increase in the real costs of pollution control on local government which will require significant additional capital investments and increases in rates charged to customers for expanded environmental services.

R0006123

10.3.1 Overall Costs of Environmental Protection

Based on the EPA study, the estimated future annual cost of pollution controls per household in 1998 dollars would be about $537. These costs are shown in detail on Tables 10-4 and 10-5 and would likely be higher if the effects of more recent pollution control legislation were included. The estimated costs include pollution abatement, control and prevention expenditures. Only the direct costs associated with implementing control measures and compliance activities are included in the analysis.

The report presents data on environmental pollution control costs from 1972 through 1987 and projects those costs for each year through 2000 under various assumptions related to full compliance with existing regulations. The report presents the results in a variety of ways including by type of cost (capital, operating, etc.), by medium (land, air, water), by program and by economic sector which directly bears the cost of the control (public versus private). The report is based upon surveys of spending conducted by the Department of Commerce, EPA Regulatory Impact Analyses and an earlier EPA study, The Municipal Sector Study: Impacts of Environmental Regulations on Municipalities (September 1988).

The EPA study found that in the year 2000, total annualized costs for all pollution control activities in the nation would likely be in the range of $171 billion to $185 billion (in constant 1990 dollars). These costs would represent 2.6 to 2.8 percent of Gross National Product.

The largest share of pollution control costs – 61 percent – is directly borne by the private sector. The second largest share – 23 percent – is directly borne by local governments. Local government costs relate mostly to wastewater, drinking water, sewage sludge and solid waste. According to the report, "...it is projected that over the next several years real pollution control burdens on municipalities will increase dramatically and result in large increases in the fees charged to consumers for locally-provided environmental services."

10.3.2 Estimated Costs per Household

While the EPA report provides a comprehensive analysis of pollution control costs and does estimate which sector initially bears the costs, it does not attempt to estimate how much of these costs are ultimately passed on to households, businesses, and other entities. However, the Municipal Sector Study found that households in smaller communities will pay an average of 0.7 percent of their incomes for environmental services while those in larger communities will pay on average 0.5 percent.

Tables 10-4 and 10-5 show selected annualized cost estimates for mobile source and other selected pollution control programs. This is derived from the EPA report, when combined, results in an estimated cost of $537 per household. The cost estimates in Table 10-4 were projected by the EPA as local government's share in the year 2000. This assumes full compliance with national standards for water quality point sources, drinking water and solid waste.

R0006126

Table 10-5 presents estimated air pollution control costs for mobile sources. The EPA study annualized the estimated capital costs using a 7 percent annual amortization rate for capital expenditures and combined them with annual operations and maintenance costs. The first data column shows the cost estimates in 1986 dollars. The second data column converts the cost estimates to 1998 dollars using an adjustment based on the Consumer Price Index. The third column shows the cost per household based on the Census Bureau's forecast of households for 2000 (Series 2) of approximately 103.1 million.

Cost estimates are presented for the three programs with the largest local government financial responsibility. In order to avoid double counting with the incremental storm water treatment cost estimates, EPA estimated non-point source water quality control costs were not included in the table. No attempt was made by EPA to estimate either how much of these costs would be passed back to the consumers of municipally provided environmental services in the form of periodic fees or how much of such fees would be borne by households, businesses and other entities. Such user fees are common for wastewater treatment, drinking water supply and solid waste collection and disposal. Conversely, no attempt was made to include the costs of private providers of the same services. Some drinking water and solid waste collection and disposal services, for example, are provided by private companies who charge user fees in the same manner as municipal providers.

The total annual local cost for local government programs in the year 2000 is projected at about $45.1 billion as shown on Table 10-4. This would be the equivalent of $438 per household based on the Census Bureau's projection of 103.058 million households. The total annual cost of mobile source air pollution controls is shown on Table 10-5 and is projected to be $10.18 billion. Assuming one half of this is for commercial vehicles and the other half is for vehicles owned by households, then the average annual cost per household is estimated at $99. This is considered a conservative assumption since slightly less than one third of the total registered vehicles in California are commercial. When these two estimates are combined, a total cost per household of $537 results.

SECTION 11
EVALUATION OF FINANCIAL IMPACTS

This section discusses the findings of potential financial and economic impacts on the Los Angeles NPDES Permit Area. The EPA Municipal Screener methodology and other selected socioeconomic indicators are used in this evaluation. A set of summary indicators are presented in Table 11-1 for the two scenarios: 1) Full retrofit treatment; 2) Retrofit expenditures limited by the Preliminary and Secondary Screener. The cost of full storm water treatment is first evaluated followed by an evaluation of costs as limited by the Secondary Screener test.

11.1 Widespread Impacts

The financial and economic inpacts are first evaluated for the cost of full storm water retrofit treatment. Based on the EPA methodology and other economic indicators presented below, the economic impacts are judged to be both substantial and widespread for the full system storm water treatment costs as summarized on Table 11-2.

11.1.1 Property Tax Impacts

One measure of financial feasibility is the estimated impact on the property tax rate. The property tax rate for a single-family unit is estimated to increase by about 0.87 percentage points for the full system as shown previously on Table 9-1. When added to the median base property tax of 1.19 percent, this results in a total property tax of 2.06 percent, an increase of about 73 percent in the annual property tax bill. Given the current economic climate in California, this estimated total rate of 2.06 percent is clearly more than is likely to be absorbed by local single family households alone. For multi-family units, the estimated increase of 0.67 percentage points would also represent a sizable increase if translated into a potential rental pass through.

11.1.2 Sales Tax Impacts

To compare the annualized storm water treatment costs to other economic indicators, a hypothetical increase in the sales current tax rate of 8.25 percent was estimated in lieu of increasing the property tax for the cost of full treatment. For the cost of full treatment, the sales tax increase was estimated at about 6.0 percentage points. This impact, on top of the current rate, is judged to be both widespread and probably far higher than most households would consider acceptable.

11.1.3 Land Requirement and Displacement Impacts

Treatment facilities for storm water runoff are land intensive. The land acreage and cost requirements for the full system are about 13,950 acres and $6.1 billion, requiring multiple treatment plants per drainage basin. The land cost estimate was included in the full treatment costs of $53.6 billion. About 67 percent of this acreage would be required for treatment Level 1 with the remaining 33 percent for treatment Level 2. While marginal or vacant parcels would be initially sought, this still would require potential displacement of many households and businesses in addition to relocation and land costs.

1. The Secondary Score represents a weighted average based on a number of economic criteria described in the text.

2. The Municipal Preliminary Screener represents a percentage of median household income.

3. Shaded area denotes where substantial impacts are estimated to occur according to the EPA Preliminary and Secondary Municipal Screeners. The combined score for the Los Angeles NPDES area results in substantial impacts as shown in the figure by the "X."

R0006130

11.1.4 Employment Impacts

The Los Angeles area economy has been recovering from the deep recession of the early 1990s when the total County economy lost more than 400,000 jobs. The County is currently on a recovery path. The additional costs per household and per business would likely slow economic growth and cause some businesses to relocate or expand elsewhere. Again, while specific estimates of impacts are not made, the burden of additional costs of a substantial nature is viewed as widespread because the potential treatment plants would be distributed throughout the Los Angeles drainage areas. Since specific locations are not identified, these displacement impacts are not quantified as part of this study.

Employment trends for Los Angeles County are summarized in Table 11-3 based on estimated projections from 1994 to 2000 from the Southern California Association of Governments (SCAG). According to these projections, the overall County employment is growing at an average annual rate of about 1.4 percent.

As was indicated earlier, the average household share of the financing burden would amount to about a 73 percent increase of annual property taxes for a single family unit. For many households, this increase would cause a significant reduction in their consumption and savings potential. Over time, landowners would pass forward these tax increases in the form of higher rents which would result in consumption reduction. Such potential widespread reduced consumption among households would likely cause loss of retail and other local serving jobs.

Based on the EPA methodology and the other economic indicators presented, the economic impacts are judged to be both substantial and widespread for the full system storm water treatment costs.

11.1.5 Impacts on Outstanding Local Debt

According to California Municipal Statistics, Inc., there is an estimated $11.6 billion of outstanding local public debt in Los Angeles County. The estimated cost of $53.6 billion for full storm water treatment represents almost a fivefold increase in existing debt. This level of debt increase would be not only considered extremely large but would foreclose capital funding for other non-storm water projects.

11.2 Costs Limited by EPA Screeners

When the estimated costs of storm water treatment are limited by the EPA Preliminary and Secondary Municipal Screeners, this results in an estimated fundable capital cost of about $5.3 billion. This is based on a cost of $149 per household calculated by taking the estimated Secondary Screener amount of 1.6 percent of median household income ($43,916) or $703 per household and reducing it by the estimated existing and future non-storm water pollution control costs of $554 per household. While this amount is estimated to be affordable based on the EPA Preliminary and Secondary Screener methodology, it is likely that it would still be considered too high if directly charged to most households on an annual basis over the bond period of 20 years or longer.

COST OF STORM WATER TREATMENT FOR THE LOS ANGELES COUNTY NPDES PERMIT AREA

An analysis was performed to determine the cost of treating storm water runoff in the Los Angeles County watershed. Treatment costs were developed based upon different treatment levels required to meet water quality objectives. The costs in this report were prepared as a basis for a further analysis of the economic impact of storm water treatment on the community. The costs in this report are intended to be used in the economic analysis and will be refined as the economic impact analysis progresses and the data needs are refined.

All costs for treatment were calculated in the same manner as the treatment costs in the *Caltrans Storm Water Facilities Retrofit Evaluation* (1). That report described the evaluation of the costs of treating storm water runoff from Caltrans facilities in the Los Angeles area.

DESIGN STORM CHARACTERISTICS

The design storm selected for this study is the one-year storm for a 24-hour period in most of the Los Angeles area. The selected storm allows the storm water treatment facilities to capture most of the runoff for a normal rainfall year. The capacity will be exceeded only when storms greater than the one-year return frequency are experienced. On a long term, several year basis, the design storm will result in treatment of 80 to 90 percent of the runoff. The storm represents a compromise between the cost of attempting to design for a higher intensity storm and desire to maximize pollutant capture. The one year, 24-hour storm is the minimum rainfall with a statistical probability of reoccurring one or more times per year. Rainfall varies depending on the Los Angeles terrain and averages approximately 1.25 inches for the area included in this study.

Treatment systems in this report are designed to contain all of the flow generated by the design storm, and treat and release this volume within a 24-hour period. Therefore, to calculate the average release rate, the volume of water generated by the design storm in 24-hours is calculated and then divided by 24-hours. A treatment period of 24-hours was chosen rather than a longer treatment period such as 72-hours to permit the collection and treatment of two consecutive storms.

The design storm concept is similar to storm water design assumptions made by flood control agencies within Los Angeles County, California. However, flood control designs use longer return frequency storms and greater quantities of runoff. This approach incorporates input from the Caltrans/UCD/CSUS Oversight Committee provided on the previous Retrofit Evaluation.

SIZE OF DRAINAGE AREA WITHIN LOS ANGELES COUNTY

The entire urban Los Angeles County watershed that drains directly to the Pacific Ocean measures approximately 1,702,404 acres. The area has been divided into seven drainage basins and the areas for each obtained from the Southern California Area Governments (SCAG) GIS Land Use Data Base. The size and descriptive name of each basin is listed below:

Table 1. Los Angeles Drainage Basins

Drainage Basin Description	Drainage Area, acres
Dominguez	69,091
Los Angeles River	522,061
Malibu	98,729
San Gabriel	370,468
Santa Ana (Part)	15,680
Santa Clara	491,947
Santa Monica Bay	134,429
Total	**1,702,404**

STORM WATER RUNOFF

The volume of storm water runoff was developed using a modified coefficient of runoff. The runoff coefficient estimates the percentage of the precipitation that will become runoff based on the land use and the imperviousness associated with each land use. This method is similar to the method described in the *California Storm Water Best Management Handbook, Municipal Volume* (5) The modified runoff coefficient predicts 90 percent of the precipitation will runoff from impervious area and 15 percent from the pervious area as described in the Handbook.. Below is the formula used to calculate the modified runoff coefficient.

$$Runoff\ Coefficient = 0.90 \times (impervious\ fraction) + 0.15 \times (1\text{-}impervious\ fraction)$$

In addition, the first 0.06 inches of precipitation was assumed to pond in localized depressions and not be available as runoff. The runoff coefficients and formula above can be found in Appendix D of the *California Storm Water Best Management Handbook, Municipal Volume*. The imperviousness for each type of land use was assumed to be similar to the values reported by the *Santa Monica Bay Restoration Project* (4). Listed below are assumed imperviousness and land uses:

Table 2. Runoff Coefficients by Land Use

Land Use	Impervious	Runoff Coefficient
Single family residential	42 %	0.46
Multi family residential	68 %	0.66
Commercial	92 %	0.84
Public	80 %	0.75
Industrial	91 %	0.83
Other urban	80 %	0.75
Vacant Developable	0 %	0.15
Open	0 %	0.15
Unknown	65 %	0.63

Based on a land use pattern in Los Angeles County, the runoff coefficient for each drainage basin was determined. In turn, this coefficient is used to determine the amount of storm water runoff as related to precipitation.

Table 3. Runoff Coefficient by Basin

Drainage Basin Description	Runoff Coefficient
Dominguez	0.599
Los Angeles River	0.452
Malibu	0.299
San Gabriel	0.403
Santa Ana	0.423
Santa Clara	0.294
Santa Monica Bay	0.504

DESIGN STORM WATER QUALITY

In addition to the storm water quantity, typical storm water quality is an important consideration in determining the types of appropriate treatment. Design storm water quality values were developed by examining the storm water quality data generated from Los Angeles County monitoring and Caltrans statewide sampling which contained a significant amount of Los Angeles area data. Treatment processes were developed from water quality objectives.

The following table shows the typical water quality objectives for Los Angeles and the range of sampling data for various constituents.

Table 4. Water Quality Objectives and Monitoring Results

CONSTITUENT	WATER QUALITY OBJECTIVES (mg/L or MPN/100 mL)					RAINFALL MONITORING DATA (mg/L or MPN/100mL)

* Based on Los Angeles Basin Plan, Table 3-5 (RWQCB 1994), unless otherwise noted.
** Infers a required minimum of 75% solids removal from waste stream.

R0006138

There are several constituents indicated that would potentially violate the water quality objectives. Treatment systems discussed in this report have been developed to treat storm water to meet the objectives.

The monitoring values were then combined to obtain a typical constituent concentration expected in County of Los Angeles runoff. These water quality values were considered in developing levels of treatment which meet the water quality objectives of the receiving water body. The design storm water quality values in the table below are typical urban runoff in Los Angeles County. The values are the average values from a database of county storm water monitoring from 1988 to 1995.

Table 5. Typical Storm Water Runoff Quality

Constituent	Typical Value, mg/L
Total suspended solids	510
Total dissolved solids	285
Biochemical oxidation demand	50
Nitrate	1.9
Phosphate	0.5
Cadmium	0.001
Copper	0.03
Lead	0.04
Zinc	0.19
Oil & grease	2
Fecal coliform, MPN/100 mL	180,000
Total coliform, MPN/100 mL	750,000

The quality data shows that storm water treatment should address suspended solids, which is basically the dirt picked up during runoff, the high levels of bacteria indicated by the coliform tests and the variable levels of metals. The coliform indicates a high potential for contamination by disease carrying bacteria. Metals requirements are especially difficult because of the large variation in sampling results, the stringent requirements that are both existing and proposed and the high cost of removing small concentrations of metals from large quantities of water.

STORM WATER TREATMENT

Storm water treatment was developed to meet the basic requirements of the *Los Angeles Basin Water Quality Control Plan* (6). Three progressive levels of potential treatment are proposed to meet higher levels of water quality objectives required to preserve potential beneficial uses of receiving waters. Beneficial uses of receiving waters are further discussed in the Basin Plan.

RUNOFF QUANTITY AND TREATMENT FACILITY SIZE

Drainage from each basin within Los Angeles County is based a 24-hour, one-year storm equaling 1.25-inch and the modified runoff coefficient described above. The total runoff from each drainage basin is shown on the following table.

Table 7. Storm Water Runoff by Drainage Area

Drainage Basin Description	Drainage Area, acres	Total Runoff, Million Gallons
Dominguez	69,091	1,337
Upper Los Angeles River	522,061	7,572
Malibu	98,729	956
San Gabriel	370,468	4,774
Santa Ana	15,680	214
Santa Clara	491,947	4,641
Santa Monica Bay	134,429	2,190
Total	1,702,404	21,684

Considering the economy of scale that is evident in the construction of treatment facilities, building numerous small treatment facilities is not as cost effective as the construction of a few large regional treatment plants. Although political or land use requirements may require some smaller facilities, the economics favor larger plants. Therefore, treatment selection, design and cost estimates are based upon the assumption that a few large regional treatment plants will be built. The capacity and number of treatment plants is shown on the following table:

Table 8. Storm Water Treatment Plant Capacity

Location and Description	Size and Number Million Gallons (MG)
Dominguez	
Total Runoff to be Treated, MG	1,337
Number of Treatment Plants Required	27
Los Angeles River	
Total Runoff to be Treated, MG	7,572
Number of Treatment Plants Required	173
Malibu	
Total Runoff to be Treated, MG	956
Number of Treatment Plants Required	20
San Gabriel	
Total Runoff to be Treated, MG	4,774
Number of Treatment Plants Required	107
Santa Ana	
Total Runoff to be Treated, MG	214
Number of Treatment Plants Required	5
Santa Clara	
Total Runoff to be Treated, MG	4,641
Number of Treatment Plants Required	104
Santa Monica Bay	
Total Runoff to be Treated, MG	2,190
Number of Treatment Plants Required	44
Entire Los Angeles Area	
Total Runoff, MG	21,684
Number of Treatment Plants	480

The maximum size of any individual treatment plant is assumed to be 500 million gallons.

ESTIMATED COSTS FOR STORM WATER TREATMENT IN LOS ANGELES

The treatment cost estimate for the entire Los Angeles area was done by preparing composite cost curves to represent relative cost savings for construction of a few large treatment plants versus construction of small treatment plants. The cost curves were developed by using the cost determined from the Van Nuys quadrangle study area contained in *the Caltrans District 7 Storm Water Retrofit Plan (1).*

The total flow within the Los Angeles County drainage area is significantly larger than the flow from the Van Nuys quadrangle study area. There are no existing costs available for large storm water treatment facilities which would be required for the larger drainage area, so it was necessary develop new cost curves based upon the cost curves used in the Van Nuys study area. The new treatment cost curves are intended for estimating the cost of treatment for capacities ranging from 10 to 500 million gallons. As a comparison, to test the accuracy of the new cost curves for Los Angeles County, storm water treatment costs were compared with other similar treatment systems. This comparison was done by using the cost estimating curves developed for the City of San Diego *(San Diego Wastewater Programs Managers Technical Advisory Board San Diego Metropolitan Sewerage System Preliminary Cost Estimating Curves, December 8, 1988)* (8). All costs estimate are based upon an ENR Index of 6710 (7).

The costs of the treatment facilities were developed from representative designs and then scaled up for the watershed. Simplifying assumptions were made that part time staff would be available during storm events by drawing municipal labor forces, means for disposal of residual solids would be available through municipal landfills and wastewater plants, and the large land needs for the sites could be accomplished through purchase. These simplifying assumptions may lead to lower costs than would be possible for a large scale treatment project but should not compromise cost estimate for undertaking a storm water treatment program. These are planning level costs and the accuracy is reflective of the preliminary nature of the designs and the general assumptions made. Shown in the table below are capital and operation and maintenance (O & M) costs for each drainage basin within Los Angeles County. Costs were prepared which include and exclude collection costs.

Separate costs estimates were prepared including and excluding collection costs. This was done because of an uncertainty in the locations of large treatment plants proposed.

Costs without collection represent a system where large treatment plants are located at the downstream discharge of major drainage areas. The existing conveyance system is used to bring storm water to the treatment locations. Some of the conveyance systems are actually local channels and waterways that will not receive the benefits of treatment.

Costs with collection represent an effort to parallel important tributary streams and channels with collection systems to protect them from storm water pollution. The parallel collection systems would divert flow to the treatment locations. Obviously, building parallel storm water collection systems is expensive.

Level 3	$188.5	$198.9

The construction and land purchase was assumed to take place at the beginning of the project in year one and the annual cost was assumed to stay constant over the life of the project. All costs are based upon the 1998 calendar year. The capital costs for the project levels include 100 acres for each 500 million gallon level 1 treatment facility at an average cost of approximately $900,000 per acre. The level 2, 500 million gallon facility includes an additional 100 acres at the same unit cost. Level 3 is assumed to not require additional land. Land use for smaller treatment plants is assumed to be proportional to capacity.

The background for the cost estimates is included in the attachments. Attachment 1 is the design basis for a typical 500 million gallon facility and includes a schematic layout. Attachment 2 is the design basis for a typical 200 million gallon facility. Attachment 3 includes the standardized cost estimation curves for storm water treatment facilities. Attachment 4 includes the standardized cost estimation curves for wastewater treatment facilities to 10 million gallons.

DISCUSSION

The cost estimates developed in this analysis include several assumptions needed to build the capital cost estimates and develop the operating and maintenance costs. Historical data for the costs is based on municipal utility construction projects which have not been developed specifically for storm water treatment. The assumptions and general municipal background of the estimates result in costs that are potentially low for the storm water treatment project. Potential concerns are:

- Storm facilities will be operated intermittently and seasonally. Treatment levels 2 and 3 require operators skilled in treatment equipment; however, they are only needed for storm events. The availability of these operators is difficult to arrange since they would have to have other more full time positions within the managing municipality or utility. The cost of labor would be higher because of inefficiencies. Level 1 also requires intermittent operation but it may be able to be contracted out to the private construction industry.

- Power costs are relatively more expensive on an intermittent basis and the utility's cost of supplying the seasonal loads imposed by pumps and the equipment in levels 2 and 3 will have to recovered in higher per energy unit costs. Chemical costs will also be higher do to seasonal purchasing needs and the need to not store some chemicals, such as chlorine, during the dry season. There are also risks with chemical storage and delivery in residential and commercial neighborhoods that must be mitigated.

- Land costs have been assumed to represent an average cost in the Los Angeles area. However, a storm water treatment project would need to acquire large tracts of contiguous land to build the facilities. No matter how much community support there is for clean water, residents always want the facilities somewhere away from their property and certainly do not want their land taken. Acquisition of the necessary land would be difficult and expensive. More numerous smaller facilities would increase the number of impacted communities and residents. The treatment units simply cannot be built without land and there is not much available land in metropolitan Los Angeles.

- As indicated in the cost analysis, the protection of the drainage channels and natural waterways that are currently used to convey storm water from storm water pollutants would either require a vast number of small treatment units at every discharge or a parallel collection system for the design storm. The numerous facilities sacrifice the economy of scale found in larger units and the alternative parallel collection system is very expensive. Decisions would have to be made as to where parallel systems were needed based on the streams to be protected.

- The analysis assumes conventional costs for the removal of residual products such as solids and brine. Again they would be seasonal and would require the additional costs of setting up disposal procedures for only seasonal use. In addition there may be the potential requirements for the disposal of hazardous waste.

Although the costs may be conservatively low, they are relatively large. The following table summarizes the Los Angeles area costs with a limited amount of collection facilities.

SUMMARY

Capital Costs

Level 1 - Detention and settling including limited collection	33 billion dollars
Level 2 - Filtration and disinfection in addition to Level 1	45 billion dollars
Level 3 - Advanced treatment for toxics in addition to Level 2	73 billion dollars

Land Required

9,300 to 18,600 acres depending on treatment level

Operating and Maintenance Costs

Level 1 - Detention and settling including limited collection	68 million dollars per year
Level 2 - Filtration and disinfection in addition to Level 1	117 million dollars per year
Level 3 - Advanced treatment for toxics in addition to Level 2	199 million dollars per year

DESIGN BASIS FOR A TYPICAL 500 MILLION GALLON FACILITY

Definitions and Abbreviations Contained in Cost Estimates:

LF – Linear feet
INCH – Inches of rainfall
MGD / mgd – Million gallons per day
LS – Lump sum
SF – Square feet
MG – Million gallons
AC – Acres
gpm – Gallons per minute
CFS / cfs – Cubic feet per second
RO – Reverse osmosis
ft. - Feet
kWh – Kilowatt per hour
MWh – Megawatt per hour
fps – Feet per second
mg/L – Milligram per liter
O & M – Operation and maintenance
sq. – square
mi – miles
Quad – Quadrangle

LOS ANGELES COUNTY SITE SPECIFIC DESIGN PARAMETERS		
ITEM	**VALUE**	**COMMENTS**
Site Details		
Type : Typical 500 MG Plant		
Name : Prototype 500 MG Plant		Exact location of treatment plant is unknown.
Address : Los Angeles County		
Existing Storm Drain Facilities :Use existing Los Angeles County Collection System		
SW2 Specifications		
Drainage Area		
Acres	38,400	
Square Feet	1,672,704,000	
Approximate Percent Impervious	48%	Estimated - refer to design write-up
Weighted runoff coefficient	0.51	((%Impervious)*0.90)+((1-(%IMP))*0.15) Assumed 90% runoff from impervious surfaces and 15% runoff from pervious surfaces.
Rainfall Details		
Total Rainfall		
One year, 24 hour Storm, inches	1.00	Derived from 50 years of rainfall data. Typical for Greater Los Angeles area.

R0006151

500 MG Treatment Plant

ITEM	VALUE	COMMENTS
Stormwater Runoff Volume		Assumed 0.06 inches of rain loss due to local ponding
Cubic Feet	66,825,000	
Million Gallons	500	
Peak Rainfall Intensity		
inches/hour	1.41	
Peak Flow		Rational Formula Q = C*I*A (Runoff coeff*Peak rainfall intensity*Drainage area) from Caltrans Hydraulics Design Manual
Cubic feet per second (cfs)	13,000	
Million gallons per day (mgd)	8,400	Assume a 50% reduction in peak flow because of delay in intensity due to size of drainage area.
Treatment Plant Site Details		
Site Characteristics		
Acres	201	Size required to fit treatment units.
Percentage of land used for treatment versus drainage area	0.52%	
Approximate shape of site	rectangular	Shape - triangle, rectangle etc.
Length of site, ft.	2500	
Width of site, ft.	3500	
Approximate Slope of Site Terrain	Level

Los Angeles, California 90013

Re: **Submission of "COST OF STORM WATER TREATMENT FOR CALIFORNIA URBANIZED AREAS," October, 1998, prepared for California Department of Transportation, Sacramento, California, by Brown and Caldwell as Evidence of Economic Impacts of "*Tentative Draft-October 11, 2001*, CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD LOS ANGELES REGIONAL ORDER No. 01-xxx NPDES No. CAS004001 WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES AND THE INCORPORATED CITIES THEREIN, EXCEPT FOR THE CITY OF LONG BEACH"**

Dear Mr. Dickerson and Dr. Swamikannu:

By this letter, the Cities of Alhambra, Camarillo, Compton, El Segundo, Industry, Lawndale, Lomita, Moorpark, Santa Clarita and Torrance (the "Cities") and the Los Angeles County Economic Development Corporation ("LAEDC"), submit an important study:

> **"COST OF STORM WATER TREATMENT FOR CALIFORNIA URBANIZED AREAS," October, 1998, prepared for California Department of Transportation, Sacramento, California, by Brown and Caldwell,**

as additional evidence of economic considerations. This evidence is directly relevant, and, as a matter of law, must be addressed in revisions to the "*Tentative Draft-October 11, 2001*, CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD LOS ANGELES REGIONAL ORDER No. 01-xxx NPDES No. CAS004001 WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES AND THE INCORPORATED CITIES THEREIN, EXCEPT FOR THE CITY OF LONG BEACH" (the "Third Draft") and the accompanying document, "Tentative Draft – FACT SHEET/STAFF REPORT State of California Regional Water Quality Control Board Los Angeles Region National Pollutant Discharge Elimination System (NPDES) Permit No. CAS004001, CI 6948 Regional Board Order No. 01-XXX."

The "COST OF STORM WATER TREATMENT FOR CALIFORNIA URBANIZED AREAS" study must be taken into consideration in re-evaluating the requirements to be imposed on the co-permittees. MS4 permits are issued by the Board under section 402(p)(3)(B)(iii) of the CWA.[1] **That section** does not impose an absolute prohibition on the discharge of pollutants. Instead, the section **requires that:**

> **Permits for discharges from municipal storm sewers --**
>
> > **(iii) shall require controls to reduce the discharge of pollutants to the *maximum extent practicable*,** including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. (Emphasis added.)

Similarly, section 13263(a) of the California Water Code requires regional boards, when prescribing waste discharge requirements, to take into consideration the provisions of California Water Code §§ 13241(c) and (d). Those sections require a balancing similar to that required by § 402(p)(3)(B)(iii) of the CWA. Among the factors regional boards must consider are:

---

[1] 33 U.S.C. § 1342(p)(3)(B)(iii).

(c) ***Water quality conditions that could reasonably be achieved*** through the coordinated control of all factors which affect water quality in the area.

(d) ***Economic considerations***.

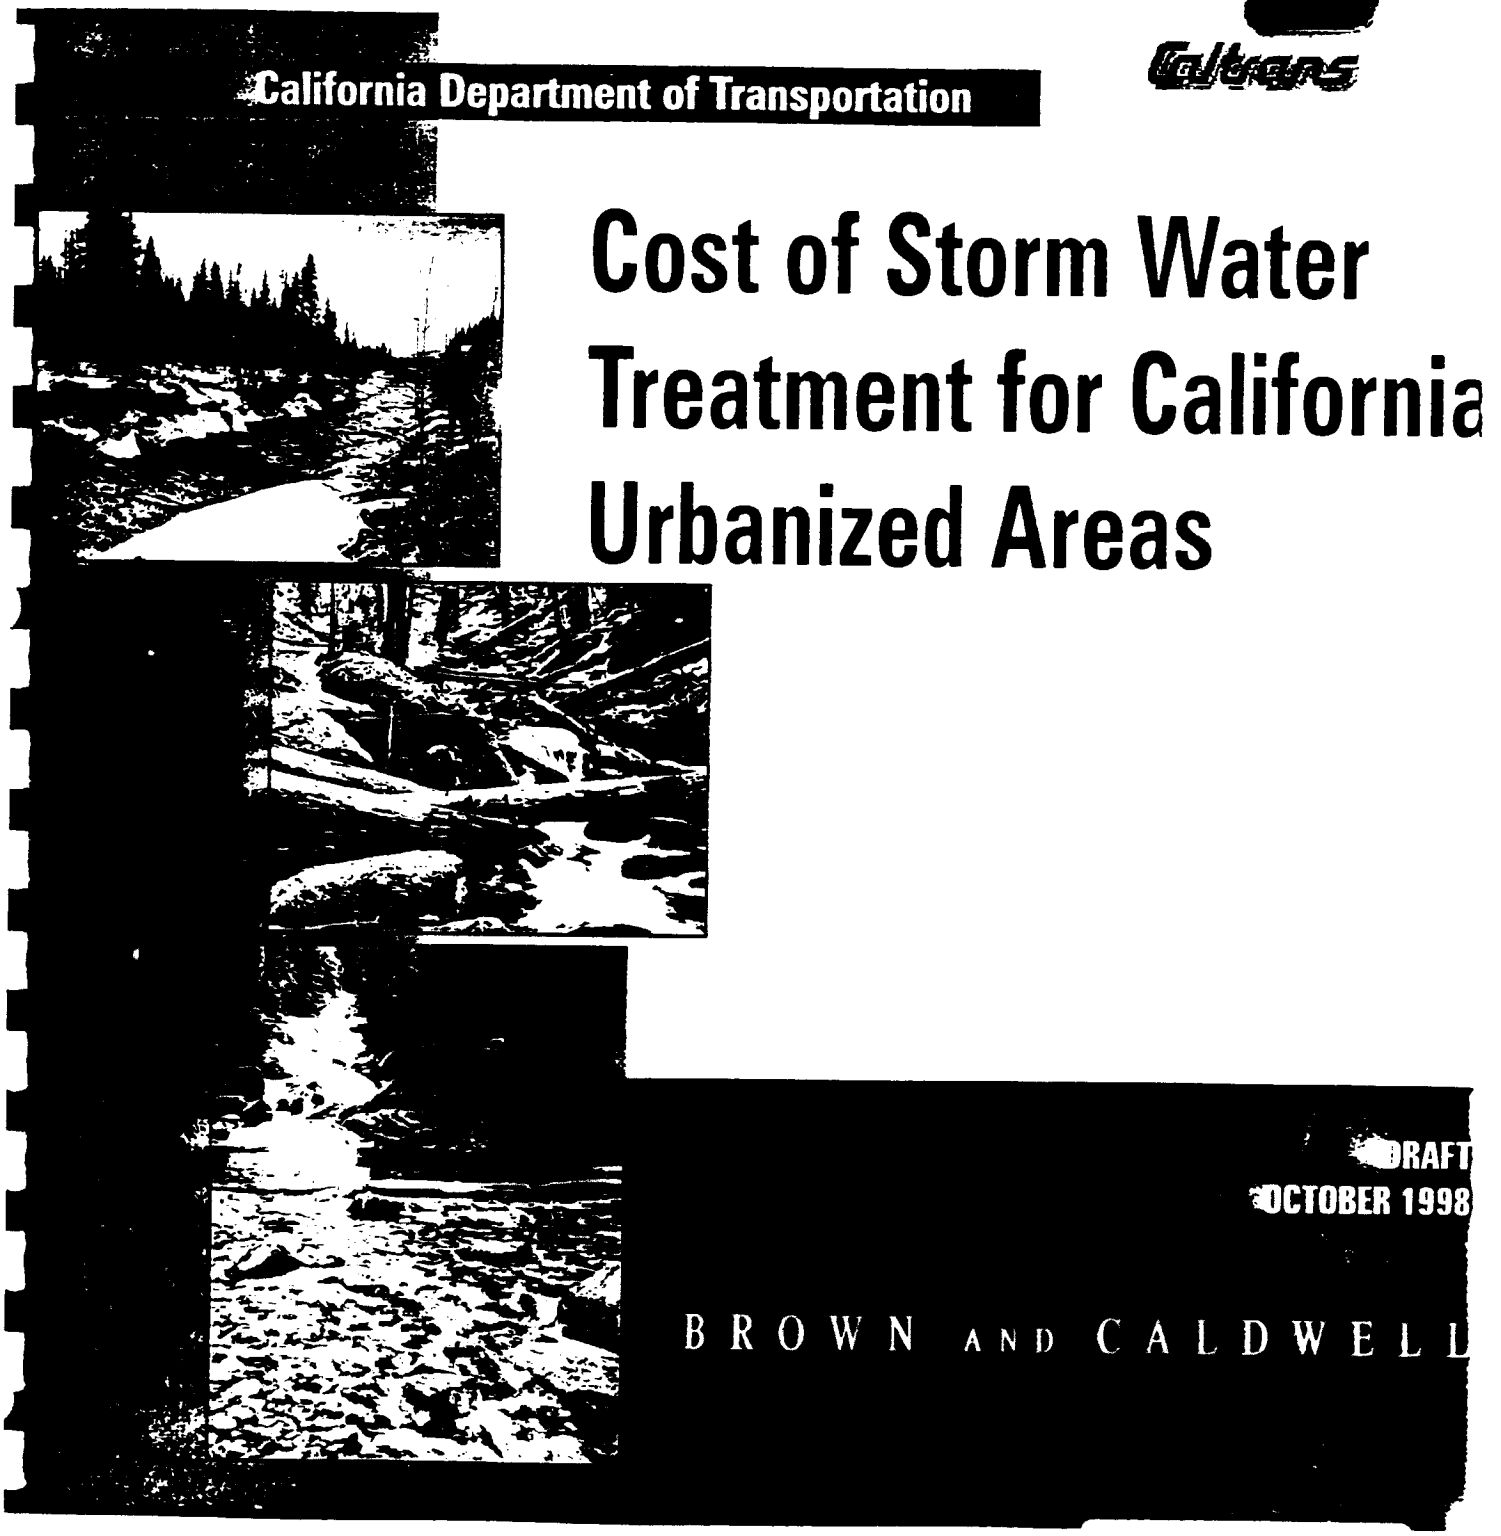
The balancing required by CWA § 402(p)(3)(B)(iii) and California Water Code §§ 13241(c) and (d) clearly require the Regional Board to consider the "COST OF STORM WATER TREATMENT FOR CALIFORNIA URBANIZED AREAS" study.

The LAEDC and the Cities fully support the objectives of the Clean Water Act. However, the magnitude of the compliance costs will make it necessary for the Cities named above, and all other Cities in Los Angeles County, to ask the Congress and the California Legislature to appropriate nearly all of the funds estimated to be necessary for compliance.

The LAEDC and the Cities will expect the Board and Staff to give most careful consideration to "COST OF STORM WATER TREATMENT FOR CALIFORNIA URBANIZED AREAS." We are not aware of any published studies, by any reputable and qualified persons, which rebut the studies submitted with this letter.

We ask that this letter, and "COST OF STORM WATER TREATMENT FOR CALIFORNIA URBANIZED AREAS" be included in the administrative record of this matter. The LAEDC and the Cities reserve the right to offer further comments. Please list this letter as having been submitted by LAEDC and each of the respective cities. (It is not a comment letter of the firm of Burke, Williams & Sorensen, LLP, which has not taken a position in this matter. However, please continue to keep the undersigned on the list of interested persons in this matter.) This letter supplements the Cities' previous letters of July 19, 2001, and August 6, 2001, which offered comments on the Second Draft, and November 6, 2001, which submitted additional evidence of costs of storm water permit compliance.

Very truly yours,



RUFUS C. YOUNG, JR.
Of BURKE, WILLIAMS & SORENSEN, LLP

CHAPTER 1

INTRODUCTION

This report summarizes an analysis of the cost of treating storm water runoff from major urbanized areas throughout the state. The analysis was one component of a number of concurrent studies conducted by Caltrans to evaluate costs and other issues associated with storm water compliance. The costs presented herein were prepared as a basis for further analysis of the economic impact of storm water treatment on the residents of California.

This report builds on the storm water treatment cost analysis presented in two previous projects. The *Caltrans Storm Water Retrofit Evaluation* (Caltrans, 1997) evaluated the practicability of retrofitting the storm water drainage system in District 7 (Los Angeles County) roadways. The report analyzed the cost of retrofitting storm water treatment for 434 miles of freeways, 223 miles of highways, 40 interchanges, 56 pumping stations, 37 maintenance stations, and 43 park-and-ride lots within District 7. A detailed assessment was completed for a smaller study area within District 7, which comprised 27.5 miles of freeway, and the storm water treatment costs were extrapolated to all of District 7. *The Analysis of the Cost of Storm Water Treatment for Los Angeles County* (Caltrans, 1998) extended the storm water treatment retrofit cost analysis to the Phase I storm water permit area within Los Angeles County. This subsequent study evaluated the costs of storm water collection and treatment for the entire permit area, which included a variety of land uses in addition to transportation.

Given the scope and time available for this study, a geographic information system (GIS) database was compiled from existing data sources to evaluate the cost of storm water collection and treatment within major urbanized areas throughout California. Data on rainfall, hydrologic drainage basins, urbanized area boundaries, and land use were incorporated into this database so that a uniform statewide approach could be used. The most powerful feature of the GIS database is its ability to perform calculations using several pieces of spatially linked data that would not be possible with any other approach.

The GIS database developed for this study represents a framework for a systematic evaluation of storm water retrofit costs throughout the state. Any of the components of the database, such as land use, can easily be refined with more detailed and/or more recent data from other sources as additional data needs are developed.

CHAPTER 2

AREAS OF INTEREST

This chapter summarizes the urbanized areas of interest analyzed in this study.

Data on the location and extent of urbanized areas were obtained from Teale Data Center through Caltrans and are based on 1990 U.S. Census Bureau data. A description of the urbanized area data (i.e., "metadata") is included in Appendix D. An urbanized area is defined as a place and the adjacent densely settled surrounding territory that together have a population of 50,000 people or more. Therefore, an urbanized area boundary does not necessarily coincide with a city political boundary (*i.e.*, city limit) and or county political boundary. The densely settled surrounding territory consists of an area with continuous residential development and an overall population density of at least 1,000 people per square mile (1.6 people per acre). Based on this definition, there are 36 urbanized areas within California.

The major urbanized areas of interest for this study were selected based on the Phase I storm water permits issued to counties and municipalities throughout the state. These permitted counties include:

- Alameda
- Contra Costa
- Fresno
- Kern
- Los Angeles
- Marin
- Orange
- Riverside
- Sacramento
- San Bernardino
- San Diego
- San Joaquin
- San Mateo
- Santa Clara

- Solano
- Sonoma
- Stanislaus
- Ventura

Note that Marin County is not a Phase I permitee, but participates in the storm water programs and so was included in this analysis. Eighteen of the urbanized areas defined for California fall within the permitted counties. The urbanized areas of interest within these counties are shown in Figure 2-1 and include:

- Antioch-Pittsburg
- Bakersfield
- Fairfield
- Fresno
- Hemet-San Jacinto
- Indio-Coachella
- Los Angeles
- Modesto
- Oxnard-Ventura
- Palm Springs
- Riverside-San Bernardino
- Sacramento
- San Diego
- San Francisco-Oakland
- San Jose
- Santa Rosa
- Simi Valley
- Stockton

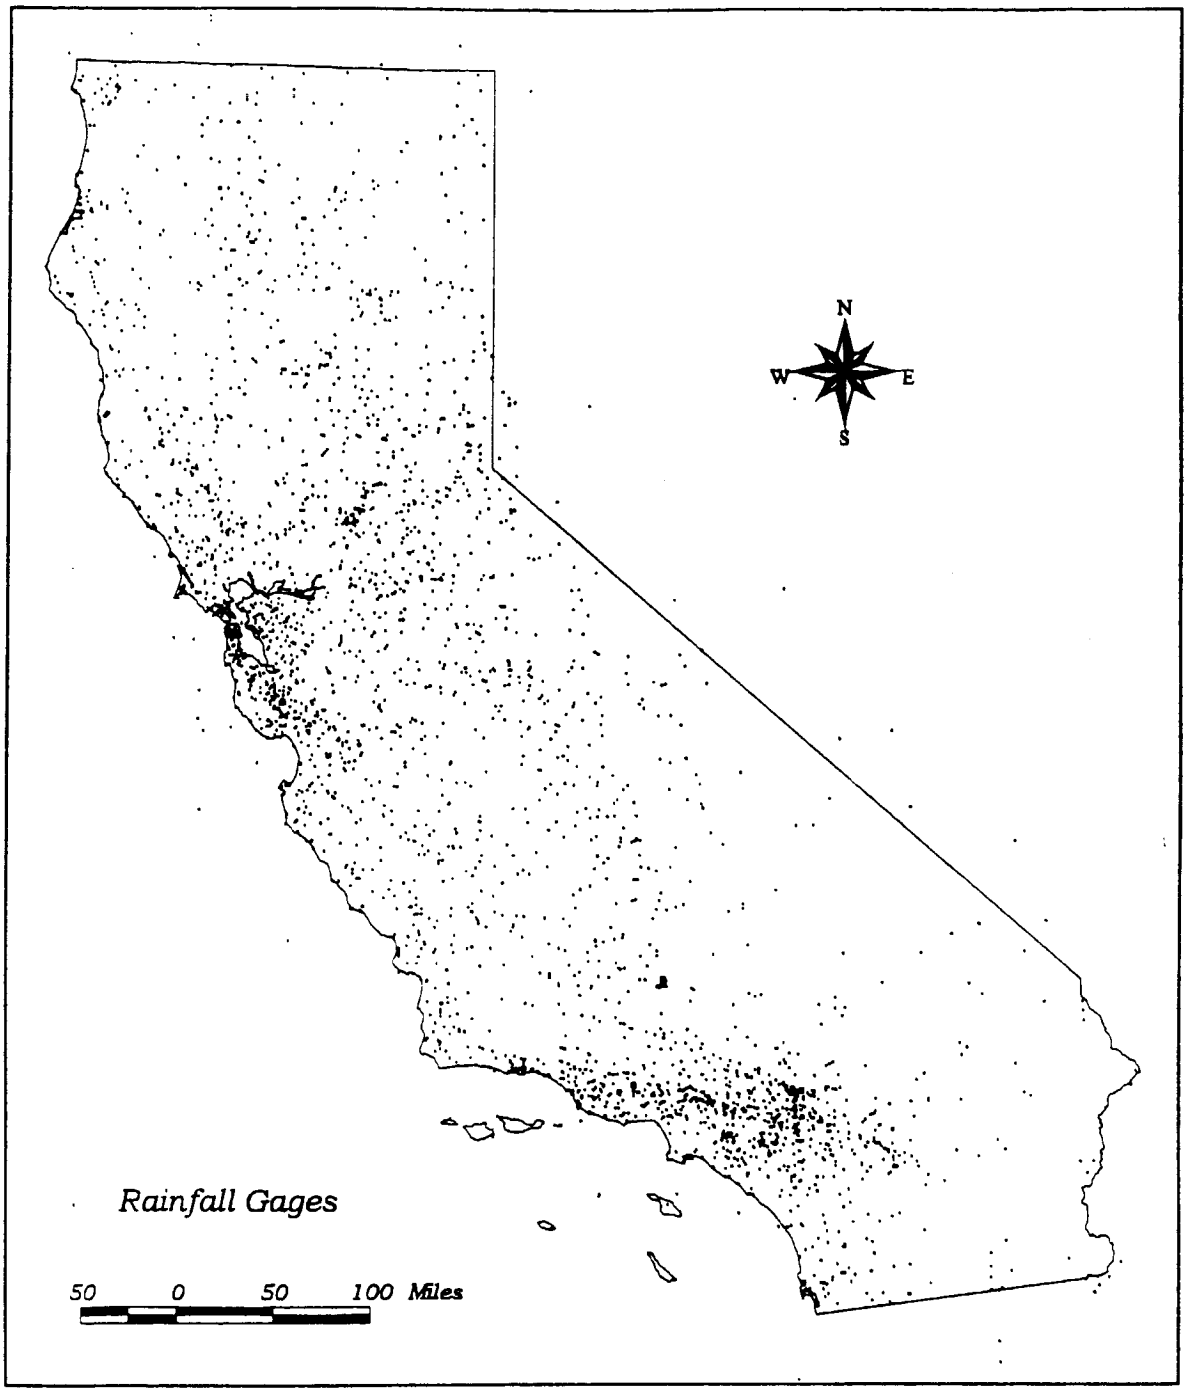
Individual maps of the 18 counties showing the urbanized areas of interest within each county are included in Appendix B.

CHAPTER 3

DESIGN STORM

The design storm used for runoff calculations in this study is a 24-hour duration, 1-year return period storm, similar to that used in the *Caltrans Storm Water Retrofit Evaluation* (Caltrans, 1997) and *The Analysis of the Cost of Storm Water Treatment for Los Angeles County* (Caltrans, 1998). Statewide design storm rainfall contours were developed as part of this study and were used for runoff calculations as described in Chapter 4.

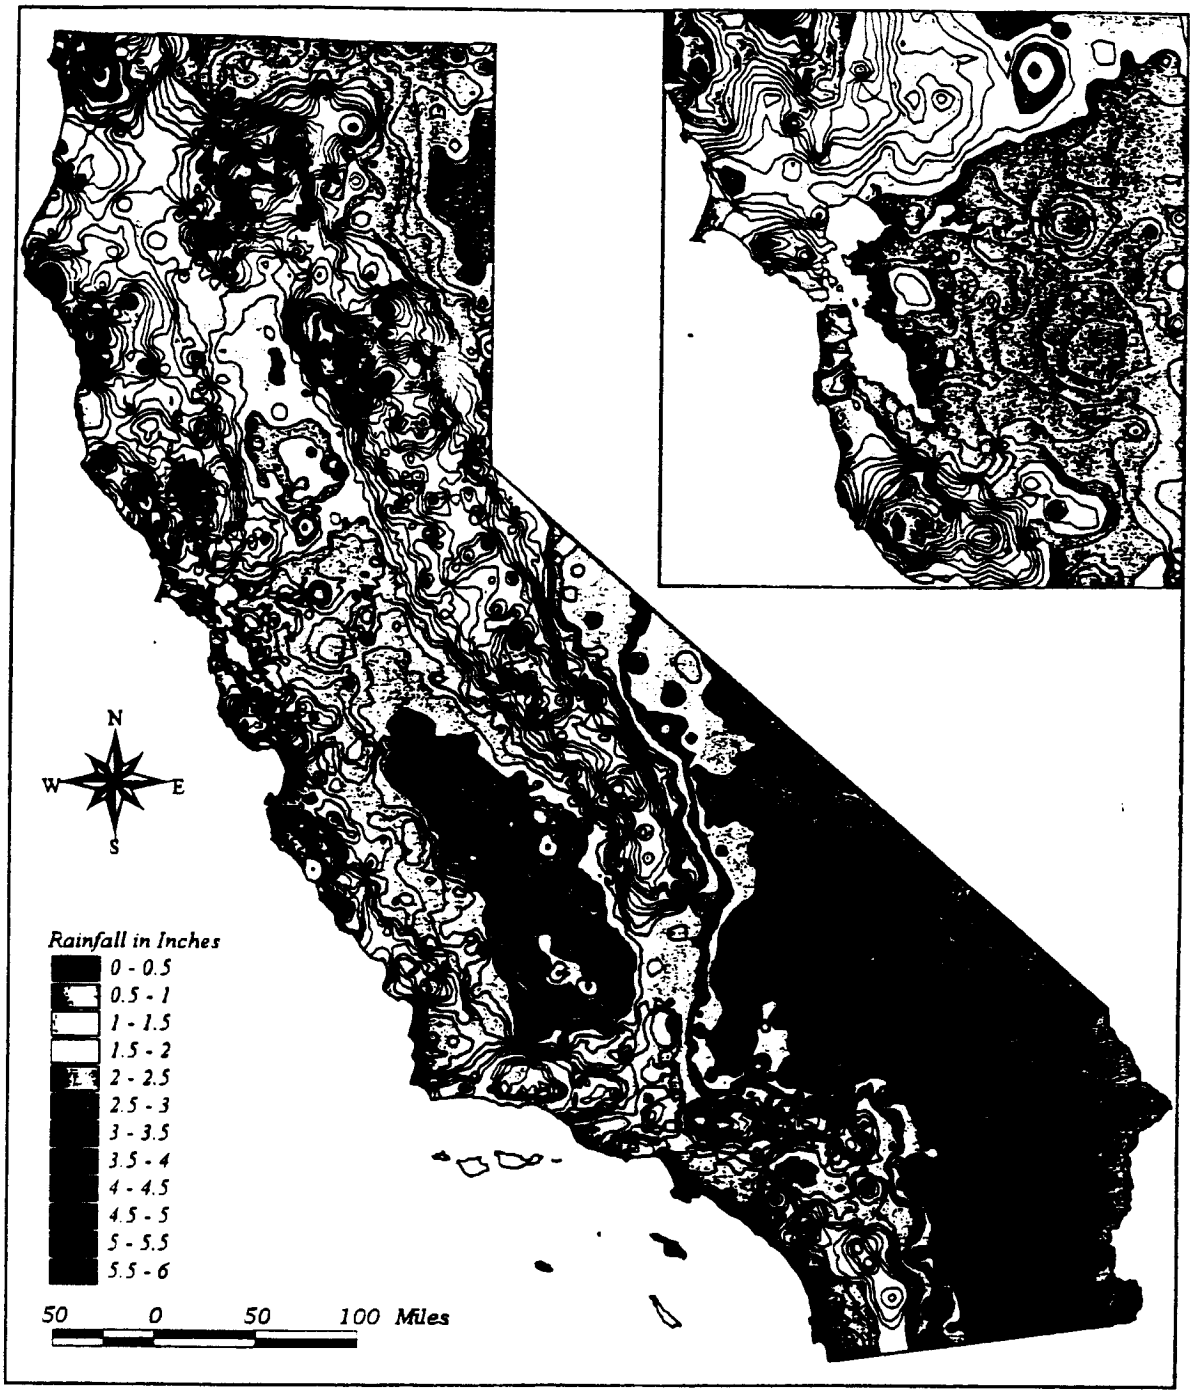
Historical rainfall data throughout California for a range of storm durations (*e.g.*, 1-hour, 24-hour, 7-day) are compiled by the Department of Water Resources (DWR). Figure 3-1 shows the location of approximately 3,000 rainfall gage locations in the state. Caltrans maintains spreadsheet files of the DWR data for highway drainage calculations and copies of these files were provided for this study (Glenn DeCou, 1998).



Design storm rainfall amounts were calculated using the approach described in *Rainfall Depth-Duration-Frequency for California* (Department of Water Resources, 1982). The design storm precipitation was calculated using the equation:

$$X_{ji} = X_{mean,i} + K_j S_i \qquad [1]$$

where X_{ji} is the precipitation in inches for return period j (*i.e.*, 1-year) and duration i (*i.e.*, 24-hour), $X_{mean,i}$ is the mean maximum annual storm for duration i (*i.e.*, 24-hour), K_j is the frequency factor (in standard deviations) for a return period j (*i.e.*, 1-year), and S_i is the standard deviation of the maximum annual storm for duration i (*i.e.*, 24-hour). Regional values for skew and coefficient of variation as reported in Department of Water Resources (1982) were used in the calculation. Values for the frequency factor for a Pearson Type III distribution, which are a function of skew, were obtained from Department of Water Resources (1982) and Haan (1977).



A summary table of precipitation for a 24-hour, 10-year return interval storm provided by Caltrans was used to calculate precipitation for a 24-hour, 1-year return interval storm for the approximately 3,000 rainfall stations in the state. Equation 1 was rearranged to calculate the mean maximum annual 24-hour storm, $X_{mean,i}$ given the 10-year return interval precipitation. The equation was then used to calculate the design storm precipitation for a 1-year return interval. The rainfall data are included in Appendix Table C-20.

The design storm precipitation data were used to calculate rainfall contours, shown in Figure 3-2. . To illustrate rainfall contours on a larger scale, Figure 3-3 shows the rainfall contours for Sacramento County. Maps showing rainfall contours for all the counties of interest are included in Appendix B. Note that the rainfall contour ranges shown in these figures were selected for clarity; rainfall contours of 0.1 inches were used for runoff calculations described in the next chapter.

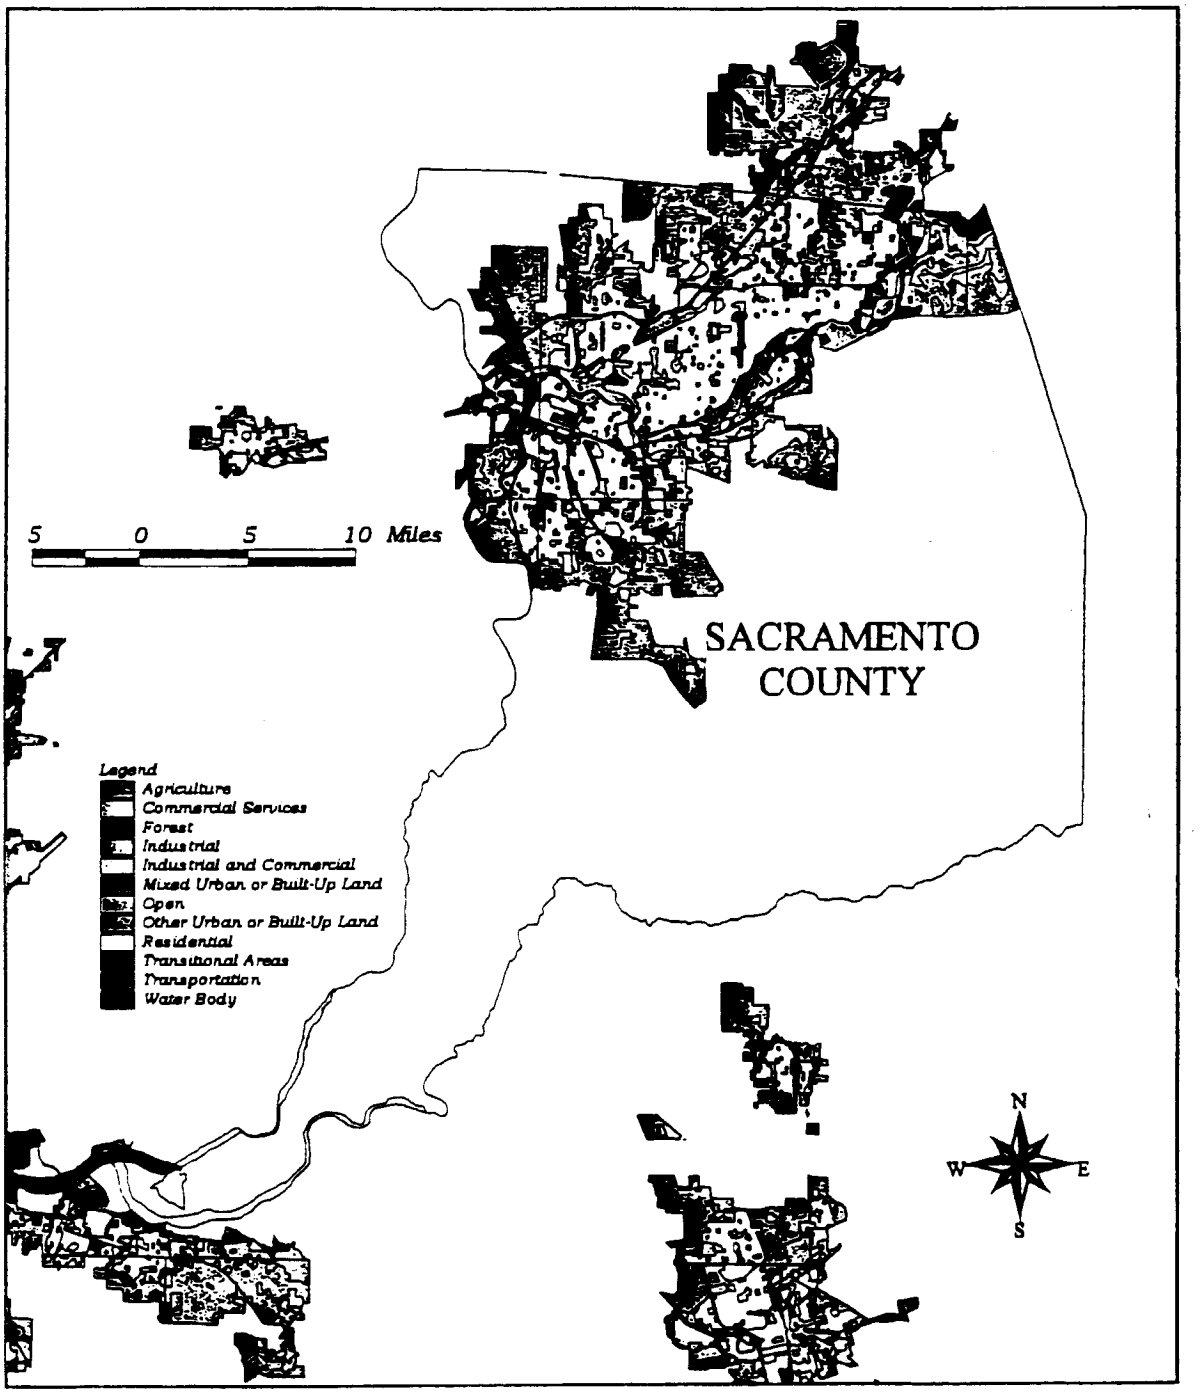
CHAPTER 4

RUNOFF CALCULATION



The volume of storm water runoff was calculated similar to the volumes calculated in the previous studies for District 7 and Los Angeles County. Runoff coefficients were used to estimate the fraction of rainfall occurring as runoff from impervious and pervious areas of urbanized areas. The GIS database was a key component in linking landuse (and runoff coefficient) patterns with rainfall patterns to calculate runoff volumes.

4.1 Urbanized Areas

4.1.1 Runoff Coefficients. Runoff coefficients were estimated for urbanized areas based on available land use/landcover data, which were incorporated into the GIS database. The 36 land use/land cover categories within the original land use/land cover data file are based on the Level I and Level II classifications of the Anderson classification scheme (Anderson, et al, 1976). The Anderson classification scheme is based on four levels, with each level providing a more specific definition of a given land use/land cover category. The two classification levels included in the data file used for this analysis provided adequate refinement for calculating urbanized area storm water runoff.

A description of the land use/land cover data file, which typically reflects land use circa the mid- to late-1980s, is included in Appendix D. More recent land use data may be available for certain areas of the state (i.e., Los Angeles County), but the data file used represents the most recent comprehensive compilation of statewide land use/land cover data. Level II classifications were maintained for urban or built-up land use classifications (i.e., land use category codes within the 10 series) for the runoff analysis. These classifications include residential, commercial services, industrial, transportation and communications, industrial and commercial, mixed urban or built-up land, and other urban or built-up land categories. Level II classifications for all other land use/land cover categories were aggregated into their respective Level I classifications for the runoff analysis. These aggregated classifications include agricultural land, rangeland, forest land, water, wetland, and barren land categories. A total of 13 land use/land cover categories were used for the runoff analysis. To illustrate the distribution of land use, Figure 4-1 shows the land use categories within the urbanized area in Sacramento County. Maps showing the land use categories within the urbanized areas of interest in all the counties of interest are included in Appendix B.

Table 4-1 summarizes the urbanized area land use for the 18 counties of interest by land use/landcover category. Note that the area boundaries within Los Angeles County do not strictly correspond to the urbanized area boundaries in the Teale Data Center file. The boundaries within Los Angeles County were set to correspond to the NPDES permit area used for the previous Los Angeles County studies (Caltrans, 1998a; Caltrans, 1998b). The total area represented by these urbanized areas of interest is 6,863 sq mi, which is approximately 4.4 percent of the total land area in the state.

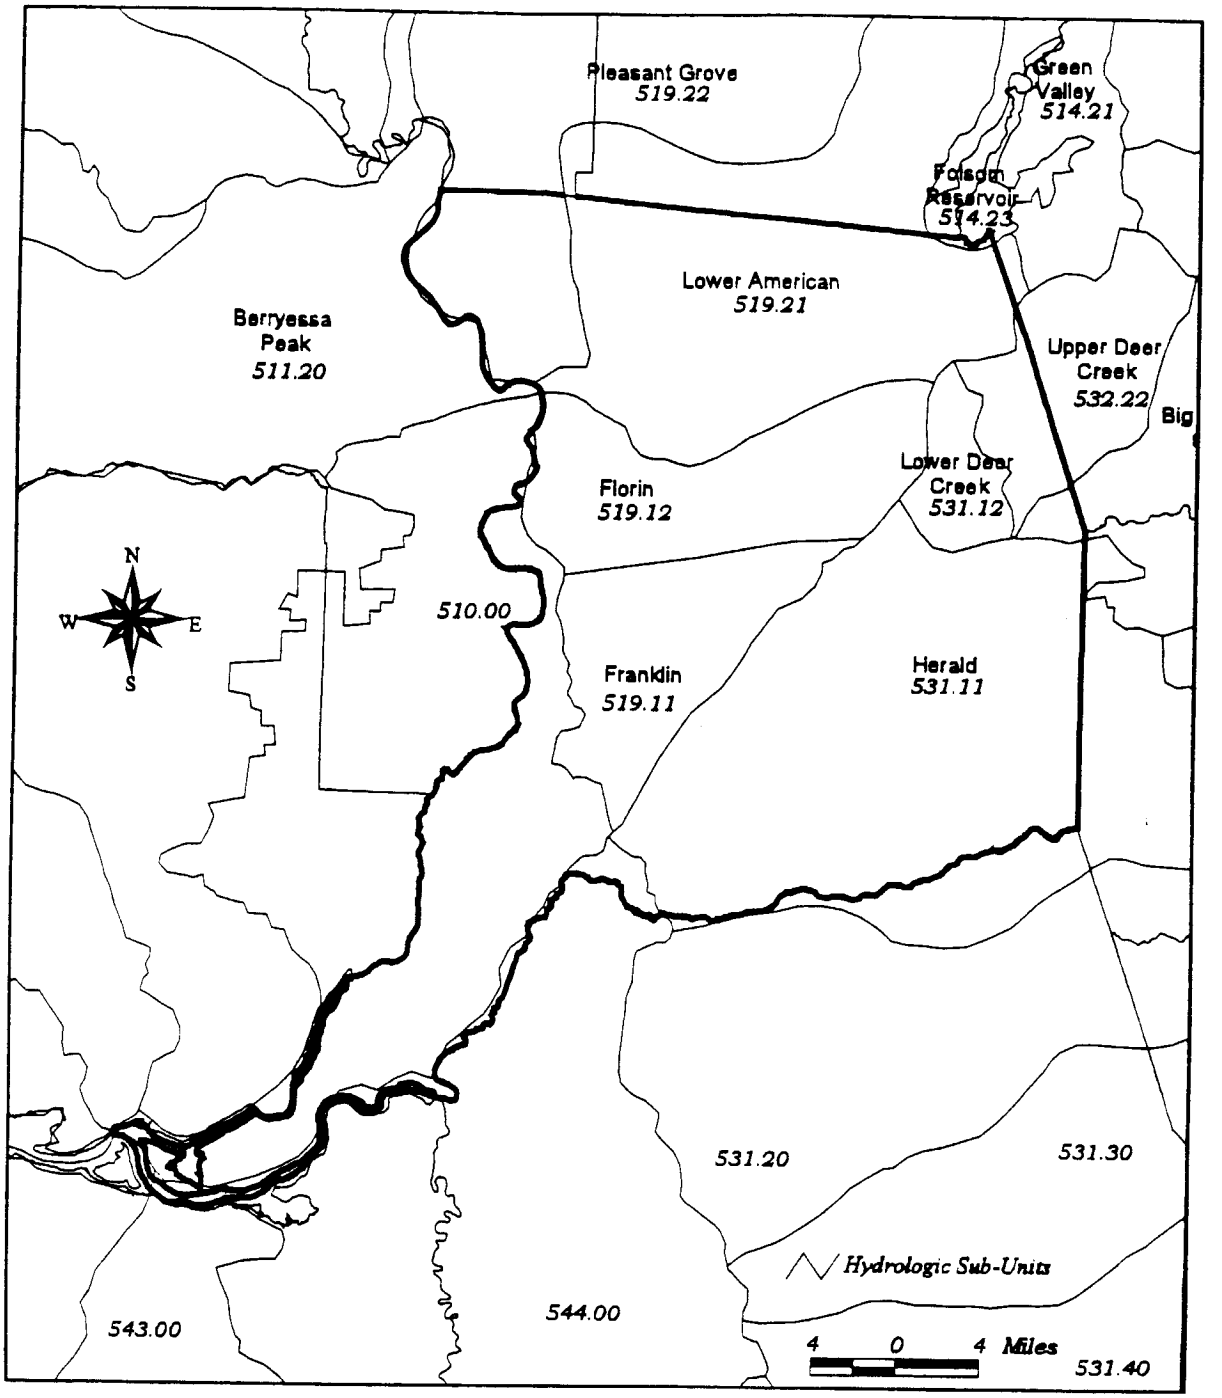
a - Urbanized area defined as Phase I storm water NPDES boundary.

R0006215



The following runoff coefficients for each land use category were selected for the runoff analysis based on a review of previous studies (Caltrans, 1995; San Jose, 1997; UCLA, 1993):

- Residential 0.50
- Commercial Services 0.70
- Industrial 0.75
- Transportation, Communication 0.80
- Industrial and Commercial 0.65
- Mixed Urban 0.60
- Other Urban 0.60
- Agricultural Land 0.00
- Rangeland 0.38
- Forest Land 0.38
- Water 0.00
- Wetland 0.38
- Barren Land 0.38

Runoff from agricultural land and water areas was not included in this analysis as reflected by their runoff coefficient values of zero. The runoff coefficient of 0.38 selected for the other aggregated, non-urban land use/land cover classifications is based on the median value of pervious area runoff coefficients included in the "Highway Design Manual" (Caltrans, 1995).

4.1.2 Runoff Calculation. Urbanized area runoff from a given parcel of land was calculated by multiplying the rainfall, land area, and runoff coefficient. Runoff was totaled by hydrologic sub-unit (or sub-area) to reflect storm water runoff within natural drainage areas. . To illustrate the natural drainage area boundaries, Figure 4-2 shows the hydrologic sub-unit boundaries in Sacramento County. Maps showing the hydrologic sub-unit boundaries in all the counties of interest are included in Appendix B. The runoff calculation results are summarized in a series of tables in Appendix C.

Runoff contributions by land use/land cover categories for each county of interest are summarized in Table 4-1. These contributions are approximate in that they assume a constant rainfall across the urbanized area(s) of interest within each county. The fractional runoff contribution was calculated as the fractional land area weighted by the runoff coefficient. The table shows that the residential land use category contributes a large fraction of the runoff within each county.

BROWN AND CALDWELL

Cost of Storm Water Treatment for California Urbanized Areas
Hydrologic Sub-Units in Sacramento County
Figure 4-2

CHAPTER 5

STORM WATER TREATMENT FACILITIES

The objective of this study was to establish the basic tools necessary to estimate the total cost of storm water treatment for urbanized areas within California. As discussed in the previous chapters, hydrologic sub-units (or sub-areas) in California were defined, and the associated runoff volume from rainfall for each area was calculated using a geographic information system (GIS) database. In this chapter, the types of treatment facilities proposed to treat storm water to meet water quality objectives, the collection system requirements, and assumptions for treatment facility siting are described. Based on these assumptions, storm water treatment cost estimates are developed in Chapter 6.

5.1 Water Quality Objectives

Water quality objectives and permitting in California are designated and controlled by nine Regional Water Quality Control Boards (RWQCBs) pursuant to the Porter-Cologne Act (the basic California water quality act) and its subsequent amendments. The State Water Resources Control Board (SWRCB) has oversight and appeal functions concerning actions of the local RWQCBs. Federal law (i.e., Clean Water Act) authority also rests with the SWRCB and the RWQCBs through acceptance of federal pass-through authority and the close similarity of federal and state environmental laws. There are some exceptions, but in general, each RWQCB sets water quality objectives and issues water quality-related discharge permits, including storm water discharge permits.

Each RWQCB has designated specific beneficial uses for water bodies within its jurisdiction. The RWQCBs have been very aggressive in describing benefits, and, therefore, all water bodies have beneficial uses attributed to them that require stringent water quality objectives that, in turn, seek to insure high water quality. Beneficial uses and their associated water quality objectives were used as the basis for defining the level of storm water treatment.

At the time this study was prepared, Brown and Caldwell was preparing a separate study that summarizes the specific water quality objectives for particular water bodies in the State. The results of that study, taken together with the storm water quality data being developed by Larry Walker and Associates, will allow a more quantitative assessment of water quality and treatment goals for all water bodies in California. This study addresses the level of storm water treatment necessary to meet water quality objectives by associating beneficial uses with three storm water treatment levels on a qualitative basis. This study assumes no dilution of treated storm water nor concentration time averaging, so treated storm water discharge requirements were assumed equal to the receiving water quality objective.

Beneficial uses have been aggregated into six categories to simplify the qualitative assessment of the level of storm water treatment required. The groupings of the beneficial use categories are based on potential end use at the receiving water body. The six categories are:

- Potable water (MUN, GWR, FRSH, AGR)
- Body contact recreation (REC1)
- Non-body contact recreation (REC2)
- Human consumption (COMM, SHELL)
- Commercial use (PROC, IND, NAV)
- Habitat (WARM, COLD, BIOL, SAL, EST, WET, MAR, MIGR, WILD, RARE, SPWN)

5.1.1 Potable water. Water bodies with this classification are potential potable water sources. Water should be free of pollutants that would impair its use as a potable water source.

5.1.2 Body contact recreation. Water bodies with this classification are used for recreational activities involving proximity to water or direct contact with water where ingestion of water is reasonably possible. For this category, water should be free from bacteria and nutrients that would promote algae growth.

5.1.3 Non-body contact recreation. Water bodies with this classification are used for non-body contact recreational activities involving proximity to water, but not normally involving contact with water where water ingestion is reasonably possible. For this category, water should be free from bacteria.

5.1.4 Human consumption. Water bodies in this classification are used for collection of fish, shellfish, or other organisms in oceans, bays, and estuaries, including, but not limited to, uses involving organisms intended for human consumption or bait purposes. For this category, water should be free from pollutants that would impair human consumption of fish or shellfish (e.g., pathogenic bacteria).

5.1.5 Commercial use. Water bodies in this classification are used for shipping, travel, or industrial activities. For shipping or travel, direct contact with water is unlikely. For industrial activities, subsequent treatment is assumed water to meet specific process water requirements. Water for commercial use should be free from particulates.

5.1.6 Habitat. Water bodies in this classification support habitats necessary for the preservation, enhancement, survival and successful maintenance of plant or animal species. Water for habitat should be free from pollutants that would impair plant and animal species' activities.

5.2 Storm Water Treatment Methods

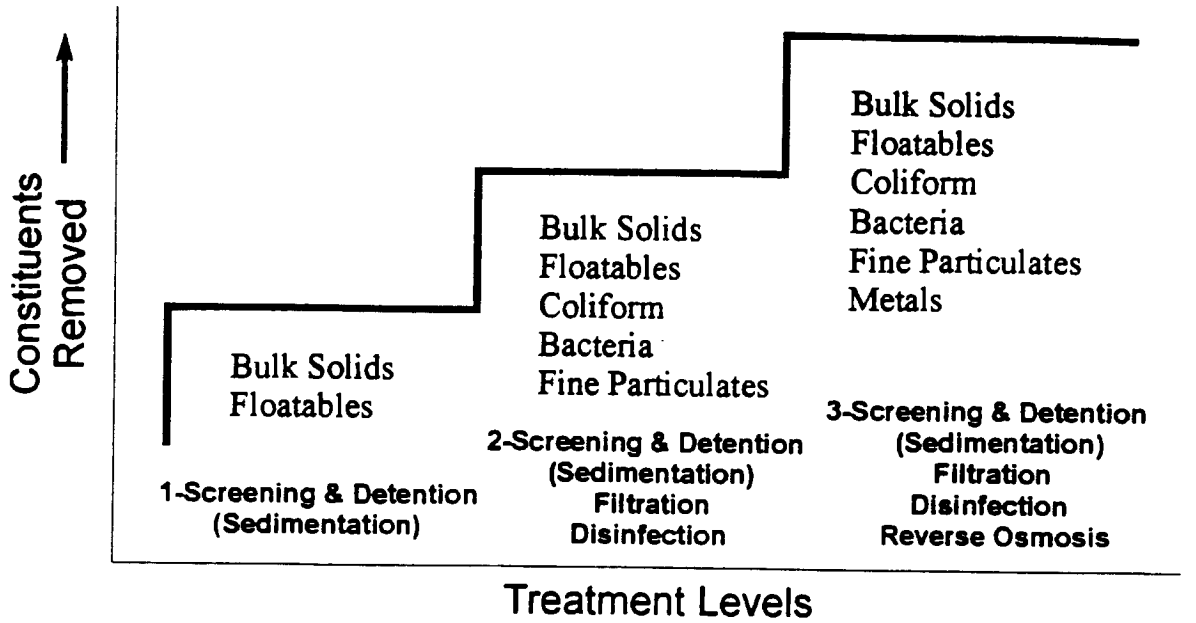
Storm water collection, storage, and treatment techniques were evaluated in the *Caltrans District 7 Storm Water Retrofit Plan* (Caltrans, May 1997). In anticipation of the need to conduct design, cost, and benefit evaluation, various management practices were subdivided into categories based on the general level of treatment provided. At present, there is limited regulatory experience for establishing treatment levels of storm water discharges. Several generalized treatment categories representing successively more stringent levels of treatment were considered for this analysis. The treatment categories were selected based on an evaluation of the types of pollutants removed by treatment systems and the types of beneficial uses that the treatment would support. Increasing levels of treatment, i.e., combining the lower categories of treatment with higher ones, could potentially meet higher levels of water quality objectives that are required to preserve potential beneficial uses of receiving waters. The division points between treatment categories are basically the ability to remove sediment, bulk solids and trash; the ability to kill bacteria; the ability to remove fine particulates that are associated with bacterial and algae growth; and the ability to remove soluble metals. The treatment alternative for each category was chosen as a representative management practice that achieves "greater or substantially the same pollution control benefits" as the other management practices within that category.

Level 1 treatment includes screening and detention of storm water to remove floating debris and settle bulk solids picked up by storm water. Screening is an important step to remove large debris that could interfere with subsequent pumping operations. Level 1 treatment is commonly recommended and represents a treatment technology that could be implemented for a large drainage area. The Level 1 detention facilities were sized to capture the 24-hour design storm and allow the solids to settle and clarify the water. Level 1 treatment will reduce concentrations of constituents of concern through sedimentation, but is unlikely meet the objectives for any beneficial use. Detention basins have been successful at removing up to 89 percent of total suspended solids and up to 66 percent of carbonaceous oxygen demand (COD) in a study performed by the University of Texas and the Texas Department of Transportation (Keblin, et. al., 1995). As a consequence of suspended solids removed, metals that are adsorbed to particles or occur as insoluble precipitates (i.e., particulate metals) are removed to some degree as well. Level 1 treatment is an important initial step for effective subsequent performance of Levels 2 and 3 treatment.

Level 2 treatment includes filtration and disinfection in addition to screening and detention. Storm water runoff is often contaminated with coliform bacteria, which are indicator organisms used to indicate the potential for the presence of human pathogens. Coliform levels can be high in urban storm water, and may cause the receiving water to exceed levels considered safe for recreational contact, a designated beneficial use of most waters within the state. High-rate filtration physically removes a large fraction of the coliform organisms. Subsequent chlorine disinfection inactivates a large fraction of the remaining coliform bacteria. Dechlorination protects receiving water organisms from residual chlorine toxicity. Level 2 treatment using high-rate filtration and chlorine disinfection following screening and detention will likely meet the requirements for non-contact and body contact recreational beneficial use.

Level 3 treatment is a highly sophisticated treatment process to remove very low concentrations of toxic and soluble constituents that are typically found in urban runoff. Many of the waters in California are designated as potential drinking water sources which may require advanced treatment to meet water quality objectives. The standards for toxicity, as they relate to sensitive species that could potentially exist in the receiving waters, are even more restrictive than the drinking water standards. Most waters have a beneficial use designation that describes aquatic environment and have objectives to protect that beneficial use. Meeting these objectives with structural treatment units would require advanced treatment beyond what is normally expected of water treatment facilities. Reverse osmosis, following screening, detention, filtration, and disinfection, is included as the typical technology representing advanced toxics removal to achieve the required low concentrations. Storm water treated by Level 3 would be free of almost all constituents of concern and likely would be suitable for all beneficial uses.

Brine is a concentrate of dissolved salts and solids from reverse osmosis treatment process. In southern California, brine is typically disposed into the Pacific Ocean. In other areas, where ocean disposal is not possible (i.e., inland areas like the Central Valley) or where brine poses potential environmental impacts, additional brine treatment and/or transport will be required.



5.3 Collection System

Urbanized area storm water collection system requirements were analyzed by natural drainage basin boundaries (i.e., hydrographic sub-units) within the counties of interest. It was assumed that storm water collection systems exist within the urbanized areas of interest analyzed for this study to collect and transport storm water to natural or constructed drainage channels. Therefore, new interceptor systems to route the runoff to one or more treatment units within each hydrographic sub-unit were identified for this study.

5.4 Treatment Facility Description

Three levels of storm water treatment were developed to treat storm water to meet specific benefit use criteria for water bodies. Figure 5-1 shows a schematic of examples of constituents removed at progressively higher levels of treatment.

Figure 5-1 – Storm Water Treatment Constituent Removal

Level 1 – this level of treatment consists of sedimentation achieved through detention. This level of treatment would be effective at removing bulk solids and floatable materials. Level 1 treatment would most likely meet the water quality for commercial use (PROC, IND, NAV).

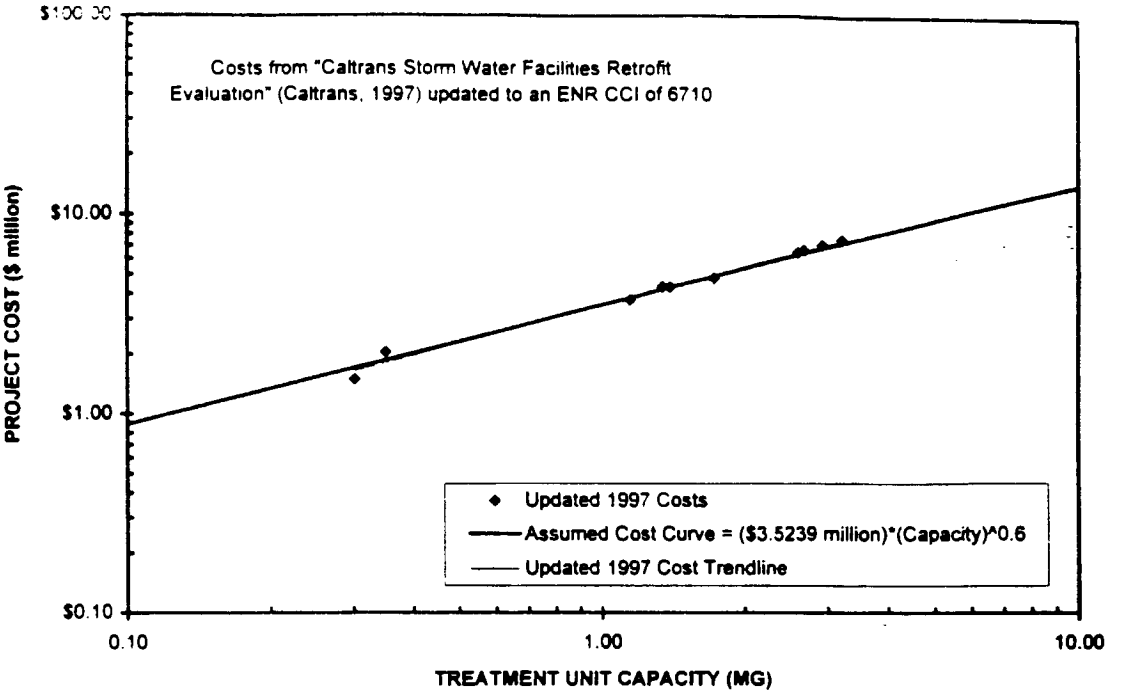
Level 2 – this level of treatment combines sedimentation (i.e., Level 1) with filtration and chlorine disinfection. Level 2 treatment would most likely meet the water quality criteria for non-body contact recreational use (REC2) and body contact recreational use (REC1).

Level 3 – this level of treatment combines sedimentation (i.e., Level 1), filtration and disinfection (i.e., Level 2), and reverse osmosis. This highest level of treatment would be effective in removing metals and soluble materials in addition to removing residual solids, floatable materials, and bacteria remaining after Level 1 and Level 2 treatment. Level 3 treatment would most likely meet the water quality for drinking water sources (MUN, GWR, FRSH, AGR), human consumption (COMM, SHELL), and habitat uses (WARM, COLD, BIOL, SAL, EST, WET, MAR, MIGR, WILD, RARE, SPWN).

CHAPTER 6

STORM WATER TREATMENT COSTS

Capital and annual operations and maintenance costs were estimated for urbanized area storm water treatment facilities using information generated from the GIS database. Runoff volume within natural drainage basins (i.e., hydrologic sub-units) in the counties of interest and other criteria were used to estimate the number and size of treatment units. Cost curves were used to estimate capital and operations and maintenance costs for varying levels of treatment. Specific levels of treatment for specific urbanized areas may be refined in the future based on ongoing projects addressing water quality objectives and storm water quality.

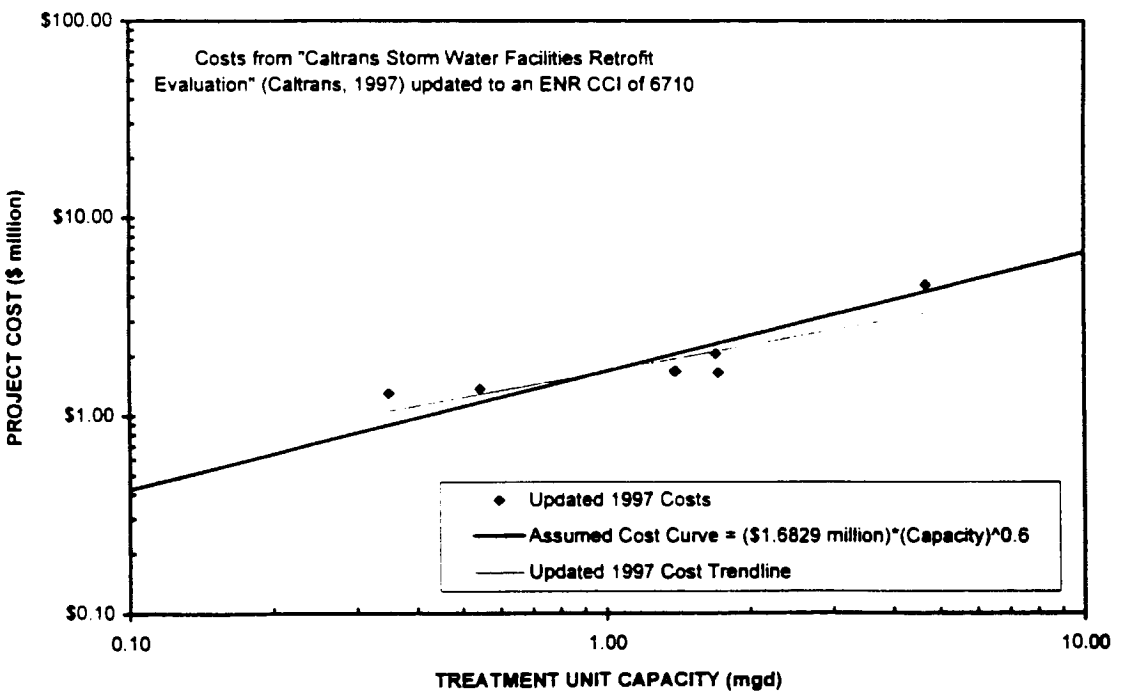


6.1 Cost Estimating Approach

The costs of storm water collection and treatment facilities were estimated using an approach similar to that in two previous studies (Caltrans, 1997; Caltrans, 1998). The following sections summarize how cost curves were developed for capital and operations and maintenance.

6.1.1 Capital Costs. Project costs from the *Storm Water Facilities Retrofit Evaluation* (Caltrans, 1997) were updated and analyzed for this study to derive a series of project cost curves. Project costs include a 30 percent construction cost contingency and a 20 percent allowance for engineering, legal, and administration. Project costs do not include any costs for property acquisition. Project costs from the 1997 report were updated to an Engineering News Record Construction Cost Index (ENR CCI) of 6710, which represents the average of the Los Angeles and San Francisco ENR CCIs for March 1998.

Figures 6-1 through 6-3 show the project costs as a function of treatment unit size for three storm water treatment levels. The relationship between the treatment unit size and the project cost can be represented as a power function, as shown in the figures. The individual treatment unit costs are plotted in each figure and a best-fit line was determined to estimate the cost of a 1.0 mil gal treatment facility. A power function with an exponent of 0.6, a typical value reflecting treatment facility "economy of scale", was developed for each treatment level as shown in the figures.



6.1.2 Operations and Maintenance Cost. Operations and maintenance costs were also derived from the *Storm Water Facilities Retrofit Evaluation* (Caltrans, 1997). Annual operations and maintenance costs per MG treated for each of the three treatment levels were calculated from the total analytical study area cost and volume treated per rainfall event. Annual operations and maintenance costs were estimated based on ten rainfall events per year.

Cost of Storm Water Treatment for California Urbanized Areas

Level 1 Treatment Project Costs

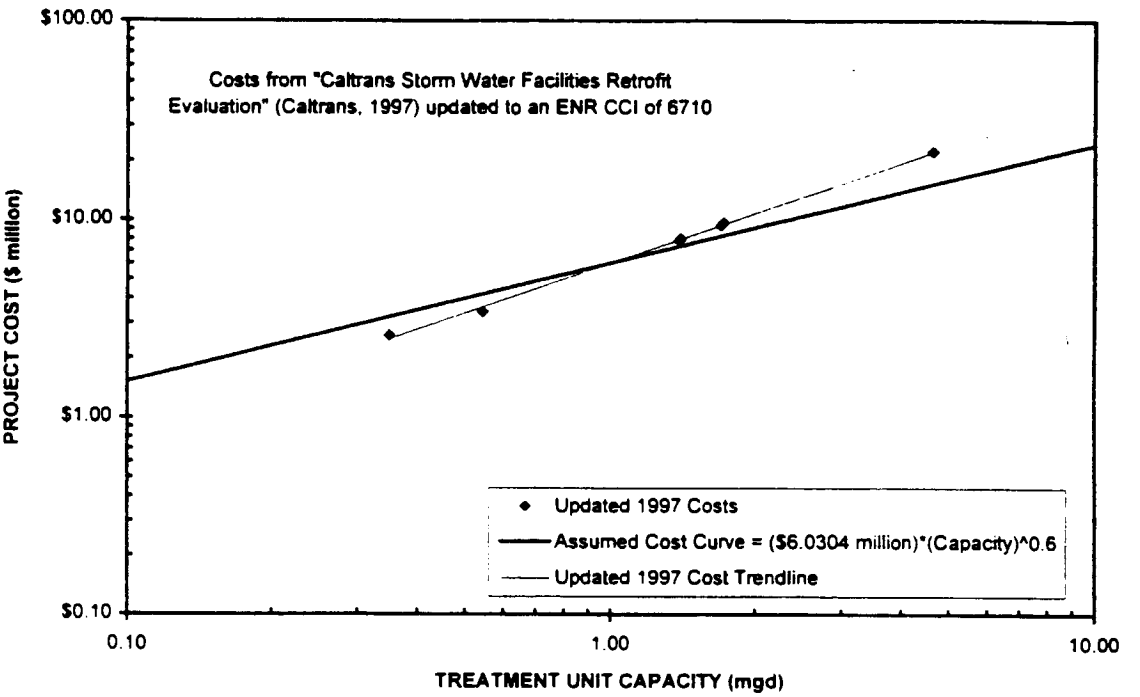


Figure 6-1

Cost of Storm Water Treatment for California Urbanized Areas

Level 2 Treatment Incremental Project Costs

Figure 6-2

Cost of Storm Water Treatment for California Urbanized Areas

Level 3 Treatment Incremental Project Costs

Figure 6-3

Operations and maintenance costs were calculated for this study as a function of volume treated using a power function, similar to the approach used for calculating capital costs. Operations and maintenance cost relationships for primary sedimentation, dual-media filtration, chlorination, dechlorination, and reverse osmosis treatment systems were evaluated to identify a range of power function exponents (EPA, 1980; AWWARF, *et al*, 1996). The median of the range of values, 0.67, was selected for scaling annual operations and maintenance costs.

6.2 Urbanized Areas

Capital and operations and maintenance cost calculations for urbanized areas are summarized by county in a series of tables in Appendix C. The capital costs include an interceptor system for each treatment unit to capture the storm water runoff. The total volume of runoff per rainfall event is 45,205 MG from 6,864 sq mi of urbanized area.

The number of treatment units per hydrologic sub-unit within each urbanized area was calculated based on a maximum Level 1 treatment unit size. A number of calculations were performed to evaluate the total number of treatment units required over a range of maximum treatment unit sizes. A maximum Level 1 treatment unit size of 50 MG was used for the cost calculations summarized in the tables in Appendix C. The Level 2 and Level 3 treatment unit sizes were based on a three-day period to treat and discharge captured storm water. That is; if a 3.0 MG basin was required to capture the 24-hour design storm for a given area, the filtration, disinfection, and reverse osmosis treatment systems were sized for 1.0 million gallons per day (mgd) capacity. The capital costs include county-specific land costs, which were provided by Stanley R. Hoffman Associates.

Statewide storm water collection and treatment capital costs range from $70.5 billion for Level 1 to $113.7 billion for Level 3. Annual operations and maintenance costs range from $145.2 million/year for Level 1 to $423.9 million/year for Level 3. The present worth of the treatment cost was calculated at an interest rate of 4 percent and a period of 20 years, similar to the values used in previous Caltrans studies. The present worth ranges from $72.5 billion for Level 1 to $119.5 billion for Level 3 assuming that a uniform treatment level is used for all urbanized area storm water throughout the State.

Costs based on storage of a 24-hour duration event with subsequent treatment of a 72-hour period.
a - Operations and maintenance costs based on 10 rainfall events per year.
b - Based on a maximum treatment unit size of 50 MG
c - Level 1 treatment unit area = (2.0 acres) * (Treatment unit size) ^ 0.6. Level 2 and Level 3 total treatment unit area = 1.52 times Level 1 treatment unit area
d - Interceptor system length based on the sum of the lengths of two sides and the diagonal of an assumed square tributary area.
e - Project cost = ($2,867,310) * (Length, mi) * (Diameter) ^ 1.0256, where interceptor diameter is calculated relative to that used for the study area used in Caltrans (1997).
f - Project cost = ($3.5239M) * (Treatment unit size, MG) ^ 0.6
g - Land cost = $196,020/acre
h - Project cost = ($1.6829M) * (Treatment unit size, MG) ^ 0.6
i - Project cost = ($6.0304M) * (Treatment unit size, MG) ^ 0.6
j - Annual operations and maintenance cost = 0.1 percent of interceptor system construction cost
k - Annual operations and maintenance cost = ($9,384) * (Storage unit size, MG) ^ 0.67
l - Annual operations and maintenance cost = ($8,070) * (Storage unit size, MG) ^ 0.67
m - Annual operations and maintenance cost = ($13,494) * (Storage unit size, MG) ^ 0.67

Costs based on storage of a 24-hour duration event with subsequent treatment of a 72-hour period.
a - Operations and maintenance costs based on 10 rainfall events per year.
b - Based on a maximum treatment unit size of 50 MG
c - Level 1 treatment unit area = (2.0 acres) * (Treatment unit size) ^ 0.6. Level 2 and Level 3 total treatment unit area = 1.52 times Level 1 treatment unit area
d - Interceptor system length based on the sum of the lengths of two sides and the diagonal of an assumed square tributary area.
e - Project cost = ($2,867,310) * (Length, mi) * (Diameter) ^ 1.0256, where interceptor diameter is calculated relative to that used for the study area used in Caltrans (1997).
f - Project cost = ($3.5239M) * (Treatment unit size, MG) ^ 0.6
g - Land cost = $261,360/acre
h - Project cost = ($1.6829M) * (Treatment unit size, MG) ^0.6
i - Project cost = ($6.0304M) * (Treatment unit size, MG) ^ 0.6
j - Annual operations and maintenance cost = 0.1 percent of interceptor system construction cost
k - Annual operations and maintenance cost = ($9,384) * (Storage unit size, MG) ^ 0.67
l - Annual operations and maintenance cost = ($8,070) * (Storage unit size, MG) ^ 0.67
m - Annual operations and maintenance cost = ($13,494) * (Storage unit size, MG) ^ 0.67

Costs based on storage of a 24-hour duration event with subsequent treatment of a 72-hour period.
a - Operations and maintenance costs based on 10 rainfall events per year.
b - Based on a maximum treatment unit size of 50 MG
c - Level 1 treatment unit area = (2.0 acres) * (Treatment unit size) ^ 0.6. Level 2 and Level 3 total treatment unit area = 1.52 times Level 1 treatment unit area
d - Interceptor system length based on the sum of the lengths of two sides and the diagonal of an assumed square tributary area.
e - Project cost = ($2,867,310) * (Length, mi) * (Diameter) ^ 1.0256, where interceptor diameter is calculated relative to that used for the study area used in Caltrans (1997).
f - Project cost = ($3.5239M) * (Treatment unit size, MG) ^ 0.6
g - Land cost = $348,480/acre
h - Project cost = ($1.6829M) * (Treatment unit size, MG) ^ 0.6
i - Project cost = ($6.0304M) * (Treatment unit size, MG) ^ 0.6
j - Annual operations and maintenance cost = 0.1 percent of interceptor system construction cost
k - Annual operations and maintenance cost = ($9,384) * (Storage unit size, MG) ^ 0.67
l - Annual operations and maintenance cost = ($8,070) * (Storage unit size, MG) ^ 0.67
m - Annual operations and maintenance cost = ($13,494) * (Storage unit size, MG) ^ 0.67

Costs based on storage of a 24-hour duration event with subsequent treatment of a 72-hour period.
a - Operations and maintenance costs based on 10 rainfall events per year.
b - Based on a maximum treatment unit size of 50 MG
c - Level 1 treatment unit area = (2.0 acres) * (Treatment unit size) ^ 0.6. Level 2 and Level 3 total treatment unit area = 1.52 times Level 1 treatment unit area
d - Interceptor system length based on the sum of the lengths of two sides and the diagonal of an assumed square tributary area.
e - Project cost = ($2,867,310) * (Length, mi) * (Diameter) ^ 1.0256, where interceptor diameter is calculated relative to that used for the study area used in Caltrans (1997).
f - Project cost = ($3.5239M) * (Treatment unit size, MG) ^ 0.6
g - Land cost = $174,240/acre
h - Project cost = ($1.6829M) * (Treatment unit size, MG) ^ 0.6
i - Project cost = ($6.0304M) * (Treatment unit size, MG) ^ 0.6
j - Annual operations and maintenance cost = 0.1 percent of interceptor system construction cost
k - Annual operations and maintenance cost = ($9,384) * (Storage unit size, MG) ^ 0.67
l - Annual operations and maintenance cost = ($8,070) * (Storage unit size, MG) ^ 0.67
m - Annual operations and maintenance cost = ($13,494) * (Storage unit size, MG) ^ 0.67

R0006389

Table C-11
Urban Runoff Treatment Cost Calculations - San Diego County

Hydrologic Sub-Unit	Urbanized Area	Area (sq mi)	Runoff (MG per rainfall event)	Number of Treatment Units[a]	Storage Unit Size (MG)	Total Level 1 Treatment Unit Area[c] (acres)	Tributary Runoff Area (sq mi/ treatment unit)	Interceptor System Length[d] (mi/unit)	Total Interceptor System Length (mi)	Project Cost ($ million @ ENR CCI 6710)									Annual Operations and Maintenance Costs[a] ($ million/year)			
										Collection System	Level 1			Level 2			Level 3

Costs based on storage of a 24-hour duration event with subsequent treatment of a 72-hour period.
a - Operations and maintenance costs based on 10 rainfall events per year.
b - Based on a maximum treatment unit size of 50 MG
c - Level 1 treatment unit area = (2.0 acres) * (Treatment unit size) ^ 0.6. Level 2 and Level 3 total treatment unit area = 1.52 times Level 1 treatment unit area
d - Interceptor system length based on the sum of the lengths of two sides and the diagonal of an assumed square tributary area.
e - Project cost = ($2,867,310) * (Length, mi) * (Diameter) ^ 1.0256, where interceptor diameter is calculated relative to that used for the study area used in Caltrans (1997)
f - Project cost = ($3.5239M) * (Treatment unit size, MG) ^ 0.6
g - Land cost = $174,240/acre
h - Project cost = ($1.6629M) * (Treatment unit size, MG) ^ 0.6
i - Project cost = ($6.0304M) * (Treatment unit size, MG) ^ 0.6
j - Annual operations and maintenance cost = 0.1 percent of interceptor system construction cost
k - Annual operations and maintenance cost = ($9,384) * (Storage unit size, MG) ^ 0.67
l - Annual operations and maintenance cost = ($8,070) * (Storage unit size, MG) ^ 0.67
m - Annual operations and maintenance cost = ($13,494) * (Storage unit size, MG) ^ 0.67

Costs based on storage of a 24-hour duration event with subsequent treatment of a 72-hour period.
a - Operations and maintenance costs based on 10 rainfall events per year.
b - Based on a maximum treatment unit size of 50 MG
c - Level 1 treatment unit area = (2.0 acres) * (Treatment unit size) ^ 0.6. Level 2 and Level 3 total treatment unit area = 1.52 times Level 1 treatment unit area
d - Interceptor system length based on the sum of the lengths of two sides and the diagonal of an assumed square tributary area.
e - Project cost = ($2,867,310) * (Length, mi) * (Diameter) ^ 1.0256, where interceptor diameter is calculated relative to that used for the study area used in Caltrans (1997).
f - Project cost = ($3.5239M) * (Treatment unit size, MG) ^ 0.6
g - Land cost = $392,040/acre
h - Project cost = ($1.6829M) * (Treatment unit size, MG) ^ 0.6
i - Project cost = ($6.0304M) * (Treatment unit size, MG) ^ 0.6
j - Annual operations and maintenance cost = 0.1 percent of interceptor system construction cost
k - Annual operations and maintenance cost = ($9,384) * (Storage unit size, MG) ^ 0.67
l - Annual operations and maintenance cost = ($8,070) * (Storage unit size, MG) ^ 0.67
m - Annual operations and maintenance cost = ($13,494) * (Storage unit size, MG) ^ 0.67

Costs based on storage of a 24-hour duration event with subsequent treatment of a 72-hour period.
a - Operations and maintenance costs based on 10 rainfall events per year.
b - Based on a maximum treatment unit size of 50 MG
c - Level 1 treatment unit area = (2.0 acres) * (Treatment unit size) ^ 0.6. Level 2 and Level 3 total treatment unit area = 1.52 times Level 1 treatment unit area
d - Interceptor system length based on the sum of the lengths of two sides and the diagonal of an assumed square tributary area.
e - Project cost = ($2,867,310) * (Length, mi) * (Diameter) ^ 1.0256, where interceptor diameter is calculated relative to that used for the study area used in Caltrans (1997).
f - Project cost = ($3.5239M) * (Treatment unit size, MG) ^ 0.6
g - Land cost = $283,140/acre
h - Project cost = ($1.6829M) * (Treatment unit size, MG) ^ 0.6
i - Project cost = ($6.0304M) * (Treatment unit size, MG) ^ 0.6
j - Annual operations and maintenance cost = 0.1 percent of interceptor system construction cost
k - Annual operations and maintenance cost = ($9,384) * (Storage unit size, MG) ^ 0.67
l - Annual operations and maintenance cost = ($8,070) * (Storage unit size, MG) ^ 0.67
m - Annual operations and maintenance cost = ($13,494) * (Storage unit size, MG) ^ 0.67

APPENDIX D

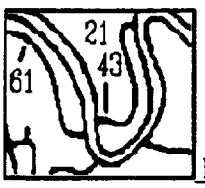
GIS DATABASE METADATA DESCRIPTIONS

APPENDIX D

GIS DATABASE METADATA DESCRIPTIONS

This appendix contains the descriptions of data sources used in the development of the GIS database. The data sources include:

- Land Use and Land Cover Data from the U. S. Geological Survey
- Hydrobasins Coverage from the California Department of Fish and Game
- Urbanized Area Designations in California from the U. S. Census Bureau



USGS Land Use and Land Cover Data

- Appendix

Background

The Land Use and Land Cover (LULC) data files describe the vegetation, water, natural surface, and cultural features on the land surface. The United States Geological Survey (USGS) provides these data sets and associated maps as a part of its National Mapping Program. The LULC mapping program is designed so that standard topographic maps of a scale of 1:250,000 can be used for compilation and organization of the land use and land cover data. In some cases, such as Hawaii, 1:100,000 scale maps are also used.

Land Use and Land Cover Example (6.8 kb)

Compilation is based upon a classification scheme identified in the Appendix.

Extent of Coverage

Land Use and Land Cover (LULC) data are available for most of the contiguous United States and Hawaii.

Acquisition

Processing Steps

Manual interpretation of aerial photographs acquired from NASA high-altitude missions and other sources were first used to compile the land use land cover maps. Secondary sources from earlier land use maps and field surveys were also incorporated into the LULC maps as needed. At a later time, the LULC maps were digitized to create a national digital LULC database. The evolution of this process resulted in the creation of the Geographic Information Retrieval Analysis System (GIRAS).

Initial source preparation involves the transfer of field survey information, photo classification detail and associated line work to a base map for digitization. This may be done through stereo compilation or monoscopic transfer techniques. Adjacent maps are also checked to ensure continuity. The maps are digitized and the appropriate classification codes are assigned for processing through GIRAS and

checked for accuracy. All LULC data conform to the Universal Transverse Mercator (UTM) projection.

Data Characteristics

All LULC features are delineated by curved or straight lines that depict the actual boundary of an area, commonly referred to as a polygon. These polygons have a minimum size of 10 acres or 4 hectares. Each polygon represents a homogeneous element in the mapping scheme that is labeled with an integer or attribute code. The arcs and nodes of the polygon are further defined by an X,Y point or string of points that provide direction and location for the polygon. This relationship may be defined by the labeled area within the polygon or outside of it. Such positional data can be manipulated to meet a variety of user needs by reprojecting the data or re-scaling them.

Spatial Resolution

The minimum area representing the man made features of the LULC polygons are 10 acres (4 hectares) that have a minimum width of 660 feet (200 meters). This minimum width precludes the existence of very narrow or long tracts of data classification. Non-urban and non-man made features may be mapped with polygons with a minimal area of 40 acres (16 hectares) that have a minimum width of 1320 feet (400 meters).

Data Organization

The LULC data are available in two different formats. The first format was developed as a part of the Geographic Information Retrieval and Analysis System (GIRAS). This data structure evolved as the USGS developed the LULC program in the late 70's. The other format is the Composite Theme Grid (CTG) format. This format is grid cell oriented instead of polygonal. Both formats are further defined in the Appendix under GIRAS and CTG.

Data Availability

The LULC data are available (at no cost) through an Internet anonymous File Transfer Protocol (FTP) account at the EDC. The data are also available (at cost of reproduction) on magnetic tape from the U.S. Geological Survey's Earth Science Information Centers.

Procedures for Obtaining Data

FTP Instructions

To access the account:

- FTP to edcftp.cr.usgs.gov
- Enter "anonymous" at the Name prompt.
- Enter your complete e-mail address at the Password prompt.
- Change (cd) to the "pub/data/LULC/250K" subdirectory to access 1:250,000-scale LULC data, or cd to the "pub/data/LULC/100K" subdirectory to access 1:100,000-scale data.
- Set the file transfer mode to binary by typing the word "binary".
- Use the "get" and "mget" commands to download the 00README or data files.
- The 00README file located under "/pub/data/LULC/250K" and "/pub/data/LULC/100K" contains an explanation of the directory structure and instructions for uncompressing data files.

The FTP files are also available sorted by state:

- 1:250,000-scale sorted by state,
- 1:100,000-scale sorted by state,

The data on magnetic tape are ordered by 1:250,000-scale map name or by southeast latitude and longitude of the 1:250,000-scale map.

R0006431

To place magnetic tape orders and to obtain additional information regarding technical details and price schedules, contact:
Customer Services, EROS Data Center
Earth Science Information Centers (ESICs)

Online requests for these data can be placed via the USGS Global Land Information System (GLIS) interactive query system. The GLIS system contains metadata and online samples of Earth science data. With GLIS, you may review metadata, determine product availability, and place online requests for products.

Products and Services

LULC data are distributed in the GIRAS or CTG formats through an anonymous FTP account or as ANSI-standard ASCII labeled or unlabeled magnetic tape. Published maps and other hard copy photo products are also available upon request.

Applications and Related Data Sets

The LULC data sets are intended to be compatible with a variety of digital data prepared by the USGS and other government agencies. For example, socioeconomic data compiled by the Bureau of Census can be compared to LULC data of the same area. LULC data can also be used in conjunction with DLG and DEM data to assist river basin planning, barrier island change analysis, environmental impact statement preparation and urban development studies.

Record Descriptions

Geographic Information Retrieval and Analysis System (GIRAS)

- The GIRAS format involves a standard character fixed length record (usually ASCII-coded, 80 character card images). Each record may consist of 1 to 16 data-element fields. Each data-element field may be one of three different types: 1) 16 bit binary integer; 2) 32 bit binary integer or 3) a string of text characters. The GIRAS file structure is comprised of a map header, section header, arc records subfile, coordinate subfile, polygon records subfile, file of arcs by polygon (FAP) subfile, text subfile and an associated data subfile.

Composite Theme Grid (CTG)

- The CTG files are sequential and consist of fixed length records (except for header files) with one grid cell for each logical record. The grid cells are actually a regular point sample of the quad

R0006433

where the center point of each cell is 200 meters apart from other center points in adjacent cells. The cells are mapped to the UTM projection, oriented in the north-south, east-west directions and sequenced by row from north to south, within each row, by column east to west.

LIBRARY : COUNTY, CA
LAYER NAME : HYDROBASINS
COVERAGE NAME : HBASA2

COVERAGE DESCRIPTION

The coverage hbasa2 was prepared by the California Department of Fish and Game (DFG) as a task within an interagency agreement for geographic information system (GIS) support to the California State Water Resources Control Board (SWRCB) Non-Point Source (NPS) Unit. Hbasa2 is a statewide version of the Teale GIS Technology Center (Teale) County Library data layer for hydrologic basins, called hbasa. DFG performed various corrections to the original data, such as basin coding, sliver polygon removal, and digitizing of missing boundaries. The intended use of hbasa2 is as an interim reference in digital form, accurately (but not precisely) corresponding to SWRCB-delineated basins, and as a cross-reference to Department of Water Resources (DWR) basin codes as presented in the Areal Designation map of February 10, 1981 and in "Hydrologic Data", Bulletin 130-85 (DWR, May 1988).

See the related database swrcbhc.dbf, which contains all Regional Water Quality Control Board (RWQCB) surface hydrologic basin names and codes as published by the SWRCB on the Hydrologic Basin Planning Area (HBPA) map series (1:500,000-scale; SWRCB, 1973, as revised). Metadata on this database is contained in the file swrcbhc.txt.

See also metadata (documentation) file calwater.txt for a description of the California Department of Forestry and Fire Protection (CDF) Planning Watersheds (CALWATER), which are further subdivisions of the SWRCB basin delineations. See also California Teale GIS Technology Center (Teale) ARC/INFO coverages and metadata (hbasa.txt) and DFG refinements of federal hydrologic unit codes (USGS HUCs, 1978) (hucdfg1.txt).

CALWATER, USGS, and SWRCB surface hydrologic basin delineations are being reviewed by the California Interagency Hydrologic Basin Map Committee, Chaired by the California Department of Water Resources. Basin names, codes, and boundary delineation reviews are expected to be completed within fiscal year 95/96. This coverage and the 1:500,000-scale SWRCB maps and the Teale GIS library "hbasa" coverages will be superceded by the CALWATER system, digitized on a 1:24,000-scale base (USGS 7.5'-series quadrangles), as modified by DWR and Teale.

Layer Size:	appx. 3.3 megabytes (uncompressed export)
Data Updated:	under development (November 1995)

DATA DICTIONARY

Structure of table HBASA2.PAT

(standard ARC/INFO fields AREA, PERIMETER, HBASA2#, and HBASA2-ID are not described here)

COL	ITEM NAME	WIDTH	TYPE	N.DEC	DESCRIPTION
17	BASIN	5	I	-	integer form of SWRCB code (w/o decimal)
22	NHCODE	6	N	2	numeric representation of SWRCB HSA code
28	ADCODE	6	C	-	DWR Areal Designation code (Bulletin 130-85)
34	CHBPA	2	C	-	Hydrologic Basin Planning Area code
36	CHUNAME	50	C	-	SWRCB Hydrologic Unit (HU) name
86	CHANAME	50	C	-	SWRCB Hydrologic Area (HA) name
136	CHSANAME	50	C	-	SWRCB Hydrologic Sub-Area (HSA) name
186	CHUCODE	6	C	-	SWRCB HU code as character string
192	CHACODE	6	C	-	SWRCB HA code as character string
198	CHSACODE	6	C	-	SWRCB HSA code as character string
204	R	1	I	-	integer code for SWRCB Hydrologic Region
205	RU	3	I	-	integer combining Region and HU codes
208	RUA	4	I	-	combines Region, HU, and HA
212	RUAS	5	I	-	combines Region, HU, HA, and HSA
					(same as BASIN, as present in original Teale "hbasa" coverage)

SWRCB HYDROLOGIC BASIN CODES

SWRCB Hydrologic codes are 6-byte strings composed of numbers and a decimal point. The meanings associated with each byte position and the decoding of a typical code are shown below. Allowable value ranges shown in parentheses.

The first byte (first position in the code string) indicates the Hydrologic Region (there are 9 statewide). Other byte positions are described below. A code ending in .00 indicates an entire major river basin, called a Hydrologic Unit (HU) (e.g. 105.00 - KLAMATH RIVER HYDROLOGIC UNIT). Large tributaries of major rivers are designated as Hydrologic Areas (HA), and their codes end in a single zero. In turn, HAs are subdivided into Hydrologic Sub-Areas (HSA), and a single digit replaces the last zero in the HA code. HSA codes ending in zero or double zeroes indicates that that the HA or HU is not subdivided (see

R0006436

further explanations under CHSANAME below).

Byte(s)	Meaning	Value Range
1	Hydrologic Region (R)	(1 <= R <= 9)
2,3	HYDROLOGIC UNIT (HU)	(00<= HU <=59);(=81)*
4	always a decimal point	(.)
5	Hydrologic Area (HA)	(0 <= HA <= 9)
6	Hydrologic Sub-Area (HSA)	(0 <= HSA<= 9)

Example: Scott Bar HSA (105.41)

1 = North Coast
05 = KLAMATH RIVER (1-digit HUs include leading zero)
4 = Scott River Hydrologic Area
1 = Scott Bar

NOTE:
Regions 4 and 8 use county lines to "split" some of their HUs. * See 481.21, 845.15, etc and REMARKS(4). In Region 5, HU values 28, 29, 30, 46 thru 50 inclusive, are skipped.

Normally, HUs and HAs are subdivided into lower categories (HUs are divided into HAs, HAs are divided into HSAs). Some HUs and HAs are not subdivided. Examples:

Name	Code	Name	Code
LUCERNE LAKE HU	701.00	Blue Lake HA	109.10
JOHNSON HU	702.00	Ruth HA	109.40
BESSEMER HU	703.00	Suisun Bay HA	207.10

Byte position 1 contains the numeric code of the SWRCB Hydrologic Regions:

R	Hydrologic Region Name	CHBPA (Hydrologic Basin Planning Area)
1	= North Coast	NC
2	= San Francisco Bay	SF
3	= Central Coast	CC
4	= Los Angeles	LA
5	= Central Valley	SB = Sacramento
5	= Central Valley	SJ = San Joaquin
5	= Central Valley	TL = Tulare Lake
6	= Lahontan	NL = North Lahontan
6	= Lahontan	SL = South Lahontan
7	= Colorado River Basin	CR
8	= Santa Ana	SA
9	= San Diego	SD

Note: The Central Valley and Lahontan Hydrologic Regions are subdivided into Hydrologic Basin Planning Areas (HBPA), each with separate names and maps. All other HBPA names are the same as Hydrologic Region names. The numeric sequence of Hydrologic Unit (HU) codes is continuous across Central Valley HBPAs, except for skipped values 528, 529, 530, and 546 through 550 inclusive. HUs 535 and 545 have the same name (San Joaquin Valley Floor), as do HUs 551, 557, and 558 (South Valley Floor).

R0006437

DWR AREAL DESIGNATION CODES

Areal Designation codes used in coverage hbasa2 were copied from a hardcopy DWR map dated February 10, 1981. The map codes were cross-checked with those contained in "Hydrologic Data", DWR Bulletin 130-85 (DWR, May 1988). Other versions of the DWR system may be in use (see DWR Bulletin 230 and other series). Discrepencies between the above two sources are listed in the table below.

DWR uses one letter to designate a "Hydrologic Basin" (HB) in byte position 1 of item ADCODE. These letter codes correspond to the SWRCB Hydrologic Regions (HR) and Hydrologic Basin Planning Areas (HBPA, see table below).

As with the SWRCB system, the DWR Areal Designation codes ending in .00 indicate entire Hydrologic Units (HU) (e.g. W14.00 - CHEMEHUEVIS HYDROLOGIC UNIT), and codes ending in a single zero indicate undivided Hydrologic Areas.

DWR Areal Designation

Byte(s)	Meaning	Value Range
1	Hydrologic Basin (HB)	(A <= HB <= Z) see below
2,3	Hydrologic Unit (HU)	(00<= HU <=??)
4	always a decimal point	(.)
5	Hydrologic Area (HA)	(0 <= HA <= Z)
6	Hydrologic Sub-Area (HSA)	(0 <= HSA<= 9)

DWR HB	SWRCB HR	SWRCB HBPA	SWRCB HR / HBPA Name
F	1	NC	North Coast
E	2	SF	San Francisco Bay
T	3	CC	Central Coast
U	4	LA	Los Angeles
A	5	SB	Central Valley / Sacramento Basin
B	5	SJ	Central Valley / San Joaquin
C	5	TL	Central Valley / Tulare Lake
G	6	NL	Lahontan / North Lahontan
W	6	SL	Lahontan / South Lahontan
X	7	CR	Colorado River Basin
Y	8	SA	Santa Ana
Z	9	SD	San Diego

Examples:

F05.D1 = 105.41 = Scott Bar HSA
A07.B1 = 520.21 = Colusa Trough HSA
B06.B0 = 541.20 = Los Banos HA
C01.T0 = 558.80 = North Kern HA
Z07.D3 = 907.43 = Cuyamaca HSA

Byte positions 2 and 3 of the Areal Designation do not always match

R0006438

in numeric value to the corresponding SWRCB HU codes.

In byte position 5 of the DWR code, the letters A, B, C, etc sometimes correspond with SWRCB HA codes 1, 2, 3, but not always. The table below shows the discrepencies discovered to-date among three sources:

AREA DESIGNATION MAP OF CALIFORNIA (DWR, 2-10-81)	HYDROLOGIC DATA Bulletin 130-85 (DWR, May 1988)	REGIONAL WATER QUALIY CONTROL BOARD (12 maps, SWRCB, 1986)

*** Polygon doesn't appear on original hbasa coverage from Teale.

Additional metadata on the Areal Designation system may be available from DWR.

SWRCB MAP REVISION HISTORY

CALWATER, USGS, and SWRCB surface hydrologic basin delineations are being reviewed by the California Interagency Hydrologic Basin Map Committee, Chaired by the California Department of Water Resources. Basin names, codes, and boundary delineation reviews are expected to be completed within fiscal year 95/96. The 1:500,000-scale SWRCB maps and their digital representations in the Teale GIS library will be superceded by the CALWATER system, which is digitized on a 1:24,000-scale base (USGS 7.5'-series quadrangles).

The 12 SWRCB HBPA maps whose legend indexes of hydrologic names were used to compile the coverage hbasa2 and the database swrcbhc.dbf also contain revision information. This information is reproduced here for reference.

This portion of the revision history is the same on each of the 12 maps: ("Standard Revisions" hereafter)

> April 1973
> Revised: July 1976
> Revised: August 1986
> State Water Resources Control Board
> Surveillance and Monitoring Section
> T.E. Lavenda, P.E. (signature)

Beyond the above annotation, individual map sheets differ in their content of additional revisions and notes. Text sections beginning with "REMARKS(n):" are comments by metadata author by Region, not part of the map contents.

North Coast Region (1)

The North Coast HBPA map available at this writing contained an additional revision entry and notes:

> **Revised:** July 1991
> California Regional Water Quality Control Board
> North Coast Region
> Surveillance, Monitoring, and Planning
> Don F. Hoirup, Jr. (no signature)
>
> NOTE:
>
> 1. The names and areas shown on this map are the same as used by the Department of Water Resources (DWR) in their Bulletin 94 Series.
>
> 2. The 1980 updated names and areas shown on this map are in accordance with an agreement with DWR and U.S. Geological Survey.
>
> 3. Boundaries have been modified in areas 5.81, 5.82, 5.83; 7.10, 7.20; 11.21, 11.22, 11.23; 11.31, 11.32; 11.41, 11.42. These modifications are adjustments in boundary locations from map revision August 1986.

REMARKS(1): The North Coast revisions do not result in code changes. The full Hydrologic Area (HA) and Hydrologic Sub-Area (HSA) codes involved are listed below by HYDROLOGIC UNIT for consistency with hbasa2.pat and with swrcbhc.dbf:

KLAMATH RIVER	REDWOOD CREEK	EEL RIVER
105.81	107.10	111.21
105.82	107.20	111.22
105.83		111.23
		111.31
	111.32	
	111.41	
	111.42	

As of July 20, 1995 the above boundary changes have not yet been included in the coverage hbasa2, nor in Teale's hbasa data layer, nor in CDF's CALWATER digital coverage of SWRCB boundaries. Expect additional boundary modifications in other SWRCB Hydrologic Regions. Note 2 may be referring to August 1986 revision, not 1980; or to a 1978 Interagency Agreement on basin names. Boundaries of DWR Bulletins 94-, 130-, and 230-series maps and those of the SWRCB do not always agree.

San Francisco Bay Hydrologic Region (2)

> Standard Revisions; no additional Notes.

Central Coast Region (3)

> Standard Revisions; no additional Notes.

Los Angeles Region (4)

Standard Revisions; additional Notes:

NOTE:

1. The names and areas shown on this map are the same as used by the Department of Water Resources (DWR) in their Bulletin 130 Series except as noted below.

2. The numbering system used on this map is an adaptation of the numbering system used in the 130 Series.

3. The boundary between Region 8 and Region 4 follows the boundary between Los Angeles County and Orange or San Bernardino Counties, not the Hydrologic Boundary. The San Bernardino County line splits Hydrologic Unit 1 (Santa Ana River HU) so that Sub-Areas 481.21, 481.22, and 481.23 are legally in Region 4 but drain into Region 8. The Orange County line splits Hydrologic Unit 5 (Los Angeles-San Gabriel River HU) so that Sub-Areas 845.15, 845.61, 845.62, and 845.63 are legally in Region 8 but drain into Region 4. Therefore, a 5-digit number on the map indicates that a Regional Boundary divides a Hydrologic Unit, area, or subarea. In these cases the second digit is the number of the region from which the hydrologic area has been separated by the regional boundary. All other digits are described in the legend.

4. The 1986 updated names and boundaries shown on the map are in accordance with an agreement with DWR and US Geological Survey.

REMARKS(4): Note 1 refers to DWR Bulletin 130 Series, titled "Hydrologic Data". See also DWR Bulletin series 94- and 230-. Note 2 refers to SWRCB code adaptation of the DWR "Areal Designation" system of basin coding as used in Bulletins 94, 130, and 230 (see Areal Designation system description in DATA DICTIONARY above).

Central Valley Region (5), Sacramento Basin (SB) HBPA

Standard Revisions; additional Notes:

NOTE:

1. The 1986 revised numbers and boundaries shown on this map are in accordance with an interagency agreement between the State Board, the Department of Water Resources, and the U.S. Geological Survey.

Central Valley Region (5), San Joaquin (SJ) HBPA

Standard Revisions; additional Notes:

NOTE:

1. (same as for SB HBPA above)

2. San Joaquin Valley Floor Hydrologic Unit includes Hydrologic Unit numbers 535 and 545.

REMARKS(5/SJ): HU codes 535 and 545 have the same name. HU codes 528, 529, and 530 are skipped in the Central Valley sequence.

Central Valley Region (5), Tulare Lake (TL) HBPA

Standard Revisions; additional Notes:

NOTE:

1. (same as for SB HBPA above)

2. South Valley Floor Hydrologic Unit includes Hydrologic Unit numbers 551, 557, and 558 due to the large number of Hydrologic Areas contained in this unit.

REMARKS(5/TL): HU codes 551, 557 and 558 have the same name. HU codes 546 through 550 inclusive are skipped in the Central Valley sequence.

Lahontan Region (6), North Lahontan (NL) HBPA

Standard Revisions; additional Notes:

NOTE:

1. The 1986 updated names and boundaries shown on this map are in accordance with an agreement with the Department of Water Resources and the U.S. Geological Survey.

Lahontan Region (6), South Lahontan (SL) HBPA

Standard Revisions; additional Notes:

NOTE:

1. The names and areas shown on this map are the same as used by the Department of Water Resources (DWR) in their Bulletin 130 Series except as explained below.

2. The numbering system used on this map is an adaptation of the numbering system used in the 130 Series.

3. The 1986 updated names and boundaries shown on the map are in accordance with an agreement with DWR and the U.S. Geological Survey.

REMARKS(6/SL): Note 1 refers to DWR Bulletin 130 Series, titled "Hydrologic Data". See also DWR Bulletins 94 and 230. Note 2 refers to SWRCB code adaptation of the DWR "Areal Designation" system of basin coding as used in Bulletin 230 and elsewhere. See REMARKS(4).

R0006443

Colorado River Basin Region (7)

Standard Revisions; additional Notes, REMARKS: same as SL HBPA above.

Santa Ana Region (8)

Standard Revisions; additional Notes, REMARKS: same as Region 4 above.

San Diego Region (9)

Standard Revisions; additional Notes, REMARKS: same as SL HBPA above.

DATA QUALITY ASSESSMENT

All SWRCB hydrologic names and codes were verified for consistency with 1:500,000-scale, SWRCB-published maps as of their August 1986 revision. Regional (RWQCB) and State (SWRCB) Boards have performed subsequent revisions. Expect updates of the database swrcbhc.dbf and this metadata file (see also REVISION HISTORY section above).

Several discrepencies among alternative basin coding systems with respect to the coverage hbasa2 are described in the DATA DICTIONARY above. Users are cautioned to also examine the boundaries of the following SWRCB basins for consistency with CALWATER delineations (other discrepencies may also exist as CALWATER is under development):

See field HCODE in the polygon attribute table HBASA2.PAT:

111.21
526.44
637.31
518.41
508.10
509.63
536.20
537.10
535.90
405.62
845.62
405.63
845.62
630.30
506.10
515.10
535.40

Users should contact their local Regional Water Quality Control Board offices to obtain the most current basin delineations and codes.

Revised: November 29, 1995

LIBRARY : COUNTY
LAYER NAME : URBANIZEDAREAS
COVERAGE NAME : URBAREA

COVERAGE DESCRIPTION:

The 'URBANIZEDAREAS' layer contains arcs and polygons that correspond to the U.S Census Bureau's urbanized area designations in California. These files were derived from the 1992 TIGER files (TIGER V5) for Teale Data Center by Geographic Data Technology, Inc. in September 1994.

An excerpt from the TIGER technical documentation which discusses urbanized areas and urban/rural areas is included below.

	** REDEFINED ITEMS **				
30	FLAGN	5	5	I	-

AREA : The area of the polygon in square coverage units.

PERIMETER : The length of the polygon perimeter of the polygon in coverage units.

URBAREA# : The software-assigned unique integer identification number.

URBAREA-ID : A user-assigned identification number.

STATE: 06 (California)

COUNTY: Federal FIPS county code (odd numbers from 001 - 115)

UA: Urbanized area code

NAME: Name of urbanized area

CENSUS: unknown - all records contain blanks for this item.

FLAG: (0 or 1) 0 = non-urbanized area; 1 = urbanized area

FLAGN: Numeric version of item FLAG.

TIGER TECHNICAL DOCUMENTATION EXCERPT:

Urbanized Areas (UA's)

Identification

A UA comprises a place and the adjacent densely-settled surrounding territory that together have a minimum population of 50,000 people. The densely-settled surrounding territory generally consists of an area with continuous residential development and an overall population density of at least 1,000 people per square mile. The TIGER/Line(TM) files identify UA's with a 4-character numeric code field.

All polygons that have a UA code (other than blank) will have a U/R flag equal "U." See the discussion on U/R flags.

Record Locations: UA Codes

RT	Field Name	Description
A	UA	1990 census UA code (polygon)

Codes: UA's

The UA code is a 4-character numeric census code. The names associated with the code appear in the TIGER/GICS product. Appendix G lists the UA names and codes.

Urban/Rural Designation (U/R)

Identification

The TIGER/Line(TM) files include a 1-character U/R flag:

"R" Rural, not urban
"U" Urban, in a UA or an urban place

The Census Bureau defines "urban" for the 1990 census as comprising all territory and population in UA's and in places of 2,500 or more people located outside of the UA's.

The Census Bureau also distinguishes the urban and rural population, within incorporated places whose boundaries contain large, sparsely populated--or even unpopulated--area. These "extended cities" have either 25 percent of their land area or at least 25 square miles classified as "sparsely-settled." The sparsely-settled area must consist of at least one group of one or more contiguous census blocks. Each group must be at least 5 square miles in area and have an overall population density of less than 100 people per square mile. Polygons in the group of sparsely-settled blocks will have a flag equal to "R;" the densely-populated blocks will have a flag equal to "U." Incorporated places (based on 1990 census boundaries) with both urban and rural flagged polygons are extended cities. For the 1990 census, 280 incorporated places were defined as extended cities. Extended cities exist both inside and outside of UA's.

The Census Bureau assigns the U/R flag to tabulation blocks, so all GT-polygons within a block have the same U/R flag. All blocks that have a UA code (other than blank) will have an U/R flag equal "U." Blocks in places that qualify as urban places, but not in a UA, do not have a UA code, but do have a U/R flag equal to "U." Rural areas are identified by a "R" flag and will not have a UA code.

Record Locations: U/R Flags

RT	Field Name	Description
A	URBFLAG	1990 census U/R flag (polygon)

Codes: U/R Flags

Urban:	"U"
Rural:	"R"

Re: **Comments on "*Tentative Draft-October 11, 2001*, CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD LOS ANGELES REGIONAL ORDER No. 01-xxx NPDES No. CAS004001 WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES AND THE INCORPORATED CITIES THEREIN, EXCEPT FOR THE CITY OF LONG BEACH"**

Dear Mr. Dickerson and Dr. Swamikannu:

By this letter, the Los Angeles County Economic Development Corporation ("LAEDC") and the Cities of Alhambra, Camarillo, Compton, El Segundo, Industry, Lawndale, Lomita, Moorpark, Santa Clarita and Torrance (the "Cities") offer comments on the "*Tentative Draft-October 11, 2001*, CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD LOS ANGELES REGIONAL ORDER No. 01-xxx NPDES No. CAS004001 WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES AND THE INCORPORATED CITIES THEREIN, EXCEPT FOR THE CITY OF LONG BEACH" (the "Third Draft") and the accompanying document, "Tentative Draft–FACT SHEET/STAFF REPORT State of California Regional Water Quality Control Board Los Angeles Region National Pollutant Discharge Elimination System (NPDES) Permit No. CAS004001, CI 6948 Regional Board Order No. 01-XXX."

Interest of the Cities and the Los Angeles County Economic Development Corporation

The Order to be issued by the Board will directly affect the Cities of Alhambra, Compton, El Segundo, Industry, Lawndale, Lomita, Santa Clarita and Torrance, which will be co-permittees under the Order.

The City of Moorpark and the City of Camarillo, in Ventura County, will be affected by the Board's Order as those cities petitioned the SWRCB for review of an action of the Executive Officer of the Los Angeles Regional Board with respect to the modification of their MS4 NPDES permit. The issue in their petition is whether certain land use provisions, referred to as SUSMPs in this Permit and SQUIMPs in the Ventura County Permit, would be made applicable to non-discretionary permits to be issued by the co-permittees in the Ventura County permit. The Camarillo/Moorpark appeal to the SWRCB is being held in abeyance[1] pending decision by the Los Angeles Regional Board on provisions in the Los Angeles County permit.[2]

LAEDC is the premier business leadership organization in Los Angeles County. The LAEDC's mission is to attract, retain and grow businesses and jobs in the regions of Los Angeles County. LAEDC has a vital interest in growth and development in Los Angeles County. The Board's action in this matter will affect the ability of LAEDC to carry out its mission.

Issues Not Adequately Addressed in the Tentative Draft Order

The LAEDC and the Cities submit that the Tentative Draft fails to address adequately a number of issues of concern. These are: Cost of Compliance; Land Use and Redevelopment; and Inconsistencies With Controlling Statutes and Regulations. These are addressed in detail in the enclosed Comments and Statement of Points and Authorities. However, there are several points to which we wish to invite the Board's early attention, and these are set out below.

Cost of Compliance

By letter of November 6, 2001, the LAEDC and the Cities submitted the following reports:

---

[1] See CRWQCB-LA letter of May 4, 2001, to Brian A. Pierik and Rufus C. Young, Jr.

[2] See Fisher and Swamikannu, "STORM WATER MITIGATION REQUIREMENTS FOR PRIORITY PLANNING PROJECTS FOR THE PROTECTION OF WATER QUALITY – TECHNICAL REPORT," October 2001, Attachment 1 to Tentative Draft – FACT SHEET/STAFF REPORT, NPDES CAS004001 (the "Fisher-Swamikannu Technical Report").

1. "Southern California Association of Governments Staff Report to Energy and Environment Committee dated August 23, 2001, Subject: Regional Solutions for Managing Stormwater Pollution" (the "SCAG Report");

2. "COST OF STORM WATER TREATMENT FOR THE LOS ANGELES COUNTY NPDES PERMIT AREA" June, 1998, by Brown & Caldwell, prepared for California Department of Transportation; and

3. "Financial and Economic Impacts of Storm Water Treatment Los Angeles County NPDES Permit Area" presented to California Department of Transportation Environmental Program, Report I.D. #CTSWRT-98-72, November, 1998, by Stanley R. Hoffman Associates, (the "Caltrans Financial and Economic Impacts Study").

By letter of November 8, 2001, the LAEDC and the Cities submitted an additional report:

"COST OF STORM WATER TREATMENT FOR CALIFORNIA URBANIZED AREAS," October, 1998, prepared for California Department of Transportation, Sacramento, California, by Brown and Caldwell

These studies and reports (to which I shall refer collectively as the "Storm Water Permit Cost Studies") are evidence to be considered and addressed by the Board and the Staff in the revision of the Tentative Draft and the Tentative Draft – Fact Sheet/Staff Report.

The Storm Water Permit Cost Studies conclude that the cost of storm water compliance for the Los Angeles County area will exceed $50 Billion. These Storm Water Permit Cost Studies must be taken into consideration in re-evaluating the requirements to be imposed on the co-permittees. This is because Municipal Separate Storm Sewer System ("MS4s") permits are issued under section 402(p)(3)(B)(iii) of the Clean Water Act (the "CWA").[3] **That section** does not impose an absolute prohibition on the discharge of pollutants. Instead, the section **requires that:**

Permits for discharges from municipal storm sewers --

> **(iii) shall require controls to reduce the discharge of pollutants to the *maximum extent practicable*,** including management practices, control techniques and system, design and engineering methods, and such other

[3] 33 U.S.C. § 1342(p)(3)(B)(iii).

provisions as the Administrator or the State determines appropriate for the control of such pollutants. (Emphasis added.)

Similarly, section 13263(a) of the California Water Code requires regional boards, when prescribing waste discharge requirements, to take into consideration the provisions of California Water Code §§ 13241(c) and (d). Those sections require a balancing similar to that required by § 402(p)(3)(B)(iii) of the CWA, 33 U.S.C. § 1342(p)(3)(B)(iii). **Among the factors regional boards must consider are**:

(c) ***Water quality conditions that could reasonably be achieved*** through the coordinated control of all factors which affect water quality in the area.

(d) ***Economic considerations***.

The balancing required by CWA § 402(p)(3)(B)(iii) and California Water Code §§ 13241(c) and (d) clearly require the Regional Board to consider the Storm Water Permit Cost Studies as they are direct evidence of economic considerations of the permit.

The LAEDC and the Cities fully support the objectives of the Clean Water Act, and the expenditure of funds necessary to achieve its goals. However, the magnitude of the compliance cost estimates referred to in the Storm Water Permit Cost Studies, over $50 Billion for the region affected by the Order, would make it necessary for the Cities named above, and all other Cities in Los Angeles County, to ask the Congress and the California Legislature to appropriate nearly all of the funds estimated to be necessary for compliance. Given the current downturn in the economy and the priorities for funding Operation Enduring Freedom and Homeland Defense, Congress and the State Legislature may be unable to make necessary funds available.

The LAEDC and the Cities are not aware of any published studies, by any reputable and qualified persons, which rebut the Storm Water Permit Cost Studies which they submitted.

Land Use and Redevelopment

While the Tentative Draft–Fact Sheet/Staff Report, at pages 41-42, refers to SWRCB Order WQ 2000-11 (the LA SUSMP decision), neither the Tentative Draft–Fact Sheet/Staff Report nor Board Order WQ 2000-11, nor the Fisher-Swamikannu Technical Report discusses statutory and constitutional limitations on the authority of Regional Boards to condition the issuance of MS4 permits on requirements that permitees must impose land use constraints as a condition of land use approvals. The LAEDC and the Cities respectfully submit that in enacting the CWA, Congress made it very clear, in the first section of

the CWA, that the CWA, including the National Pollutant Discharge Elimination System ("NPDES") program for MS4s is ***not*** meant to infringe on local land use authority:

> It is the policy of the Congress to recognize, preserve, and protect the primary responsibilities and rights of States . . . to plan the development and use (including restoration, preservation, and enhancement) of land and water resources . . . .

33 U.S.C. § 1251(b), CWA § 101(b). The US EPA's position on this issue is clear. In promulgating the Phase II storm water regulations, EPA said flatly **"EPA recognizes that land use planning is within the authority of local governments."** 64 Fed.Reg. 68761, December 8, 1999. As the Regional Board acts in this context pursuant to a delegation of authority from the EPA, we suggest that the Regional Board is bound by EPA's pronouncements as to the reach of its authority.

The Tentative Draft –Fact Sheet/Staff Report also fails to reconcile the Tentative Draft's requirements regarding redevelopment, which reach far beyond the limits set by the US EPA. The LAEDC and the Cities invite the Board's attention to the constraints cities would be required to impose on property owners who seek permits for redevelopment, found in PART 4.D.3.b).(7), on page 42, of the Tentative Draft. The Tentative Draft, at page 70, defines **"Redevelopment" to mean "the creation, addition or replacement of 5,000 square feet of impervious surface area on an already developed site."** The definition of "Redevelopment" in the Tentative Draft conflict with the EPA's definition of the term. In promulgating the Phase II final rules, EPA stated

> **EPA intends the term "redevelopment" to refer to alterations of a property that change the "footprint" of a site or building in such a way that results in the disturbance of equal to or greater than 1 acre of land. The term is not intended to include such activities as exterior remodeling,** which would not be expected to cause adverse storm water quality impacts and offer no new opportunity for storm water controls.

64 Fed.Reg. 68760, December 8, 1999. Neither the Cities nor the LAEDC are aware of any evidence to support the use of a 5,000 square foot, rather than EPA's one-acre, threshold for the application of source control and structural BMPs (Best Management Practices) such as construction of detention basins. Similarly, neither the Cities nor LAEDC are aware of any authority for the proposition that the EPA's one-acre threshold is not binding for purposes of this Order, Regional Boards act in this context pursuant to a delegation of authority from the EPA.

Finally, we note that in setting the threshold for the application of construction permits for Phase II, the EPA examined considerable scientific evidence before concluding that one acre was the proper threshold. The Cities and the LAEDC suggest that the same considerations apply to redevelopment.

If the Regional Board's 5,000 square foot threshold is permitted to stand, the redevelopment of built out areas will be significantly hindered, without any evidence that there are any benefits from this lower threshold. A requirement for projects under one acre to meet the SUSMP redevelopment requirements will be difficult and expensive. The result will be to discourage redevelopment of areas which would benefit the most. The consequence of that will be the promotion of urban sprawl, dumb growth, not smart growth. The Tentative Draft should be revised to require the Permit to incorporate the EPA definition of redevelopment.

Peak Flow Control

The Tentative Draft, in Parts 4.D.2 and 4.D.4, on pages 40-44, discusses, albeit briefly, Peak Flow Control and Numerical Design Criteria measures, which are to reduce post-development flows of water, whether or the water is pure or carries any "pollutants" into the storm water system. The Tentative Draft–Fact Sheet/Staff Report fails to address a point addressed more fully in the enclosed Comments and Points and Authorities: whether the Regional Board's authority under the Clean Water Act extends to the regulation of the **rate** of discharge of water, independent of the presence or absence of pollutants.

Conclusion

More detailed comments may be found in the enclosed Comments and Points and Authorities. The LAEDC and the Cities ask that this letter and the enclosed Comments and Statement of Points and Authorities be made a part of the record of this matter. The Cities and the LAEDC reserve the right to offer further comments. The firm of Burke, Williams & Sorensen, LLP, is special counsel for the LAEDC and for each of the Cities in this matter.

Very truly yours,

RUFUS C. YOUNG, JR.

COMMENTS AND STATEMENT OF POINTS AND AUTHORITIES REGARDING "*Tentative Draft-October 11, 2001*, CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD LOS ANGELES REGIONAL ORDER No. 01-xxx NPDES No. CAS004001 WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES AND THE INCORPORATED CITIES THEREIN, EXCEPT FOR THE CITY OF LONG BEACH" (the "Third Draft") and "Tentative Draft – FACT SHEET/STAFF REPORT State of California Regional Water Quality Control Board Los Angeles Region National Pollutant Discharge Elimination System (NPDES) Permit No. CAS004001, CI 6948 Regional Board Order No. 01-XXX."

1. Interest of the Cities and the Los Angeles County Economic Development Corporation

The Order to be issued by the Board will directly affect the Cities of Alhambra, Compton, El Segundo, Industry, Lawndale, Lomita, Santa Clarita and Torrance, which will be co-permittees under the Order.

The City of Moorpark and the City of Camarillo, in Ventura County, will be affected by the Board's Order as those cities petitioned the SWRCB for review of an action of the Executive Officer of the Los Angeles Regional Board with respect to the modification of their MS4 NPDES permit. The issue in their petition is whether certain land use provisions, referred to as SUSMPs in this Tentative Draft and SQUIMPs in the Ventura County Permit, would be made applicable to non-discretionary permits to be issued by the co-permittees in the Ventura County permit. The Camarillo/Moorpark appeal to the SWRCB is being held in abeyance[4] pending decision by the Los Angeles Regional Board on provisions in the Los Angeles County permit.[5]

LAEDC is the premier business leadership organization in Los Angeles County. The LAEDC's mission is to attract, retain and grow businesses and jobs in the regions of Los Angeles County. LAEDC has a vital interest in growth and development in Los Angeles County. The SWRCB's action in this matter will affect the ability of LAEDC to carry out its mission.

---

[5] See Fisher and Swamikannu, "STORM WATER MITIGATION REQUIREMENTS FOR PRIORITY PLANNING PROJECTS FOR THE PROTECTION OF WATER QUALITY – TECHNICAL REPORT," October 2001, Attachment 1 to Tentative Draft – FACT SHEET/STAFF REPORT, NPDES CAS004001.

2. **The Storm Water Permit Cost Studies, which conclude that the cost of storm water compliance for the areas affected by storm water permits issued by the Board for Los Angeles County will exceed $50 Billion, must be taken into consideration in re-evaluating the requirements to be imposed on the co-permittees.**

Consideration must be given to the Storm Water Permit Cost Studies because MS4 permits are issued under section 402(p)(3)(B)(iii) of the CWA.[6] **That section** does not impose an absolute prohibition on the discharge of pollutants. Instead, the section **requires that:**

> **Permits for discharges from municipal storm sewers --**
>
> **(iii) shall require controls to reduce the discharge of pollutants to the *maximum extent practicable*,** including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. (Emphasis added.)

Similarly, section 13263(a) of the California Water Code requires regional boards, when prescribing waste discharge requirements, to take into consideration the provisions of California Water Code §§ 13241(c) and (d). Those sections require a balancing similar to that required by § 402(p)(3)(B)(iii) of the CWA, 33 U.S.C. § 1342(p)(3)(B)(iii). **Among the factors regional boards must consider are**:

(c) ***Water quality conditions that could reasonably be achieved*** through the coordinated control of all factors which affect water quality in the area.

(d) ***Economic considerations***.

The balancing required by CWA § 402(p)(3)(B)(iii) and California Water Code §§ 13241(c) and (d) clearly require the Regional Board to consider the costs of permit compliance.

The LAEDC and the Cities fully support the objectives of the Clean Water Act. However, the magnitude of the compliance cost estimates referred to in the Storm Water Permit Cost Studies, over $50 Billion, would make it necessary for the Cities named above, and all other Cities in Los Angeles County, to ask the Congress and the California Legislature to appropriate nearly all of the funds estimated to be necessary for compliance. Given the current downturn in the economy and the priorities for funding Operation Enduring Freedom and Homeland Defense, Congress and the State Legislature may be unable to make necessary funds available.

---

[6] 33 U.S.C. § 1342(p)(3)(B)(iii).

The LAEDC and the Cities are not aware of any published studies, by any reputable and qualified persons, which rebut the Storm Water Permit Cost Studies which they submitted.

3. **The Tentative Draft Exceeds the Limits Imposed by the CWA by Attempting to Regulate the Manner in Which Cities Exercise Land Use Authority; A Matter Over Which the Regional Board Has No Authority.**

The Tentative Draft fails to address a jurisdictional matter of fundamental importance. Contrary to the provisions of the Clean Water Act and California law, the Tentative Draft, in numerous places, but especially Part 4.D.3, at pages 41-42, would impose restrictions on how permittees exercise their authority to regulate land use, rather than simply requiring the Co-permittees to reduce the discharge of pollutants to the maximum extent practicable. In the very first section of the Clean Water Act, Congress made it clear that the CWA, including the NPDES program, is not meant to infringe on local land use authority:

> **It is the policy of the Congress to recognize, preserve, and protect the primary responsibilities and rights of States . . . to plan the development and use (including restoration, preservation, and enhancement) of land and water resources . . . .**

CWA § 101(b), 33 U.S.C. § 1251(b). This policy was relied on recently by the Supreme Court of the United States in a case in which the Court limited federal authority over local land use matters. In *Solid Waste Agency of Northern Cook County v. Army Corps of Engineers*, 531 U.S. 159 (2001), the Court struck down a rule of the Army Corps of Engineers under which the Corps claimed jurisdiction under the Clean Water Act over isolated intra-state wetlands. **The Court found that the rule:**

> **would result in a significant impingement of the States' traditional and primary power over land and water use.** *See, e.g., Hess v. Port Authority Trans-Hudson Corporation,* 513 U.S. 30, 44 (1994) **("[R]egulation of land use [is] a function traditionally performed by local governments").** Rather than expressing a desire to readjust the federal-state balance in this manner, Congress [through the CWA] chose to "recognize, preserve, and protect the primary responsibilities and rights of States ... to plan the development and use . . . of land and water resources . . . ." 33 U.S.C. § 1251(b).

The US EPA has recognized that a "command and control" approach is inappropriate in the context of post-construction measures. In promulgating the Phase II regulations, EPA said

> **EPA *recommends* that municipalities consider policies and ordinances that encourage infill development in higher density urban areas, and**

> **areas with existing infrastructure, in order to meet the measure's intent.**

64 Fed.Reg. 68742, December 8, 1999. EPA has acknowledged the sensitivity of the issue: **"EPA is very aware of municipal concerns about possible federal interference with local land use planning."** 64 Fed.Reg. 68742, December 8, 1999. EPA declined to impose specific requirements for permits issued to small MS4s, instead stating

> **EPA *encourages* operators of regulated small MS4s** to identify specific problem areas within their jurisdictions and initiate innovative solutions and designs **to focus attention on those areas through local planning**.

64 Fed.Reg. 68759, December 8, 1999. **Finally, and most tellingly, in responding to comments on the Phase II regulations regarding Post-Construction Storm Water Management in New Development and Redevelopment, EPA said flatly "EPA recognizes that land use planning is within the authority of local governments."** 64 Fed.Reg. 68761, December 8, 1999.[7]

It should be clear, then, that if there is authority for a Regional Board to regulate local land use, it does not come from the CWA, as Congress, with the express approval of the Supreme Court in the *SWANCC* case, and the EPA, have unequivocally disavowed any suggestion that the CWA grants EPA, or the states when acting for EPA, any land use control authority. Therefore, if a Regional Board is to prescribe land use controls as a condition of a WDR/NPDES Storm Water permit, that authority must come from California law.

However, under California law, it is local governments, cities and counties, and not state executive agencies, which exercise land use authority. The authority of cities and counties to regulate land use comes from the California Constitution. Article XI, §7 confers on local governments, and not on Regional Boards, the authority to regulate land use, through the exercise of the "police power." The California Legislature, in enacting Government Code § 65800, declared

> **its intention to provide only a minimum of limitation in order that counties and cities may exercise the maximum degree of control over local zoning matters.**

Case law confirms the authority of cities and counties, recognizing that in their intrinsic character and by express declaration, state laws on county and city zoning are designed as standardizing limitations over local zoning practices, not as specific grants of authority to

---

[7] The EPA's acknowledgement of its lack of authority to control local land use may be based, in part, on this exchange which occurred during hearings on the adoption of the CWA:

> Senator BAKER: The hobby of a politician is to watch the ebb and flow of words that are created. Land use creates not a ripple today, but I think in a year or two we will have a strong reaction to it, as people come to realize that we are talking about a national zoning system.
> Mr. RUCKELSHAUS: That is not in the proposals before us, Senator.

legislate. *Scrutton v. Sacramento County*, 275 Cal.App.2d 412 (1969). Furthermore, in *Los Angeles v. California*, 138 Cal.App.3d 526, 533 (1982), it was recognized that

> the Legislature has been sensitive to the fact that **planning and zoning in the conventional sense have traditionally been deemed municipal affairs.** It [the Legislature] has thus made **no attempt to deprive local governments (chartered city or otherwise) of their right to manage and control such matters**, bur rather has attempted to impinge upon local control only to the limited degree necessary to further legitimate state interests.

Through the Standard Urban Storm Water Mitigation Program ("SUSMP") provisions of the Tentative Draft, the Regional Board attempts to regulate local land use by requiring the Co-permittees to impose constraints on land use. **Part 4.D.3, on page 41-42, for example, requires Cities to subject development project land use approvals to the condition that the property owner**

> **Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural unaltered condition.**

For a Regional Board to dictate conditions which cities must impose on land use approvals, violates the separation of powers doctrine. To put this another way, it is the California Constitution and the California Legislature, and not the Regional Boards, which authorize Cities to prescribe land use conditions.

None of the foregoing points are addressed in the Tentative Draft–Fact Sheet/Staff Report or the Fisher-Swamikannu Technical Report. Instead, the Tentative Draft–Fact Sheet/Staff Report simply relies on Order WQ 2000-11, brushing aside the Cities' previous SUSMP contentions. We must now point out that, notwithstanding Order WQ 2000-11, the Tentative Draft's encroachments upon local land use authority not only violate § 101(b) of the CWA, and are contrary to EPA express acknowledgement of the limits of its authority, they are contrary to California law, which places land use control firmly in the hands of local governments, not Regional Boards. Order WQ 2000-11 does not merit the deference accorded it. It was flawed from the outset, as Regional Boards have never had any authority to impose constraints over land use approvals. The Tentative Draft–Fact Sheet/Staff Report should address the foregoing points and the Tentative Draft should be revised in light of the constraints of the Clean Water Act and the EPA's acknowledgement of the limits of its authority.

4. **The Provisions of Part 4.d.3.b) of the Tentative Draft, page 41, by Incorporating Regional Board Resolution No. R. 00-02, Requiring Property Owners to "Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural unaltered condition" Could be Argued to Violate the "Takings Clause" of the U.S. Constitution.**

The Fifth Amendment to the United States Constitution provides that

> **no person shall ... be deprived of ... property without due process of law; nor shall private property be taken for public use, without just compensation.**[8]

No consideration is given in the Tentative Draft–Fact Sheet/Staff Report; an accompanying Technical Report;[9] or Order WQ 2000-11, to the "Takings Clause" issues created by the Tentative Draft's SUSMP requirements which the Cities are to impose on private property owners to "**Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural unaltered condition**" and other land use provisions. We suggest that cities (and the Regional Board, joined as a necessary party) may face "takings" claims if cities attempt to condition land development approvals on the imposition of these undefined and elastic requirements.[10] Property owners might well claim that the requirement to "minimize impervious coverage," when applied to their property, is a taking of private property for public use.

Consider this example: an application for a residential development permit by an owner of ten acres, who seeks to develop ten homes, each on a one-acre lot. The "**Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural unaltered condition**" requirement incorporated into the Tentative Draft could be seen as requiring local government co-permittees to condition development approval on a requirement that the property owner build all ten homes on one acre, and to deny the owner any rights to develop the remaining nine one-acre lots. In *Lucas v. South Carolina Coastal Council*, 505 U.S. 1003 (1992), the Supreme Court held that where a regulation denies all economically beneficial or productive use of land (in this example, the nine one-acre lots), a "taking" has occurred, requiring that the owner be compensated.[11] The reduction of runoff of polluted storm water is a critically important objective, one which the Cities and LAEDC fully support. However, the Cities and LAEDC are constrained to point out that a property owner who is denied the opportunity to develop nine one-acre lots, by application of the "**Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural unaltered condition**" provision, may argue that she is being forced to bear a disproportionate share of the burden relative to other members of the community and may well raise a takings challenge (to which the Regional Board would seem to be a necessary party).

---

[8] This provision is commonly referred to as the "Takings Clause."

[9] M. Fisher & X. Swamikannu, STORM WATER MITIGATION REQUIREMENTS FOR PRIORITY PLANNING PROJECTS FOR THE PROTECTION OF WATER QUALITY, October 2001.

[10] This discussion sets aside for the moment, but should not be construed to waive, the Cities and LAEDC's argument that the Congress never intended to authorize the EPA, or the states, when acting pursuant to a delegation of authority from EPA, to invade the well-established land use prerogatives of local government, an issue raised in Point #1, above.

[11] *See also, Palazzolo v. Rhode Island*, 533 U.S. ___, 121 S.Ct. 2448 (2001) (landowner's claim that a state's application of its wetlands regulations took his property without compensation in violation of the Takings Clause ripe for review); *Florida Rock Industries, Inc. v. United States*, 45 Fed.Cl. 21 (Fed.Cl. 1999)(the notion that the government can take two thirds of your property and not compensate you but must compensate you if it takes 100% has a ring of irrationality and unfairness about it; the court held that 73.1% of the value of the land was diminished, a regulatory taking had occurred and Florida Rock was entitled to just compensation).

A regulation adopted by the Tahoe Regional Planning Agency, intended to protect Lake Tahoe from storm water runoff, which prohibited residential single-family home construction was held to be not defensible under the "nuisance exception" of the *Lucas* case, because under California law, construction of a single-family house does not constitute a nuisance. The regulation was held to have effected a taking, entitling property owners to compensation. *Tahoe-Sierra Preservation Council, Inc. v. Tahoe Regional Planning Agency*, 34 F.Supp.2d 1226, 1251-55 (D. Nev., 1999). Although the trial court's decision was reversed in part, and remanded by *Tahoe-Sierra Preservation Council, Inc. v. Tahoe Regional Planning Agency*, 216 F.3d 764 (9th Cir., 2000), *Rehearing denied by, Rehearing en banc denied by Tahoe-Sierra Preservation Council, Inc. v. Tahoe Regional Planning Agency*, 228 F.3d 998 (9th Cir., 2000), the Supreme Court of the United States has granted certiorari, apparently to examine the decision by the Ninth Circuit. *Tahoe-Sierra Preservation Council, Inc. v. Tahoe Regional Planning Agency*, (Writ of Certiorari granted), 150 L.Ed.2d 749, 121 S.Ct. 2589, 2001 U.S. LEXIS 5208 (2001).

The Cities and LAEDC also point out that the provisions requiring that impervious coverage be minimized appear to be intended to apply to all land use approvals, regardless of the physical setting and runoff potential of the subdivision in question. This lack of any requirement for a "nexus" between the condition for approval and the benefit to be achieved, is not discussed in the Tentative Draft or Order WQ 2000-11, but it raises due process and equal protection issues.

5. The Application of Standard Urban Storm Water Mitigation Plans ("SUSMPs") to Non-Discretionary, or Ministerial, Approvals Could Violate the "Takings Clause."

An important matter discussed in the Tentative Draft–Fact Sheet/Staff Report and elaborated on in the Fisher-Swamikannu Technical Report, is that not only are the SUSMPs to be applied to the co-permittees' discretionary land use decisions, the Regional Board Staff contemplates that the co-permittees will apply the SUSMPs to non-discretionary, or ministerial decisions. Apparently Staff does not appreciate that the reason some decisions are called non-discretionary is that the property owner has a vested right to the permit in question, and the local official has no discretion to deny the permit. Any attempt to impose additional requirements, after a right has vested, could result in a claim by the property owner that her property has been taken without just compensation, as required by the California and federal Constitutions. Consider this example: a property owner already has satisfied all requirements for discretionary approvals for construction of homes in a 100-home subdivision, through the approval of a "vesting tentative map"[12] and now seeks to pull building permits for construction of a last phase of 10 homes. Absent the SUSMP, a City, typically through its Building Official, would be required to issue the building permits if the Building Official determines that the permit application meets fixed, defined requirements, *e.g.*, single family residences on lots zoned for single

[12] A vesting tentative map, if granted, will confer a vested right to proceed with the development in accordance with ordinances, policies and standards in effect at the time the application for approval of the vesting tentative map is complete. California Gov't Code § 66498.1; *see, Kaufman & Broad Central Valley, Inc. v. City of Modesto*, 25 Cal.App.4th 1577 (1994).

family. **Imposition of a new requirement, to "Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural unaltered condition" for the last ten single-family homes in the development, after the right to develop those lots had vested, could be argued to be a "taking" of private property (the nine lots which now must be left in a natural unaltered condition), for public use without just compensation.** It is one thing to condition the issuance of a building permit on adherence to a new building code requirement. It is another thing altogether to require a landowner with a vested right to develop ten lots to leave nine out of ten lots in a natural undisturbed condition and to concentrate or cluster development on one lot.

6. **The Tentative Draft–Fact Sheet/Staff Report Fails to Address the Practical Difficulties of Application of the SUSMPS to Non-Discretionary Approvals, An Application Which Render the SUSMPs Unworkable.**

The Regional Board Staff apparently fails to appreciate the practical and legal difficulties presented by what appears to be a well-intentioned attempt to apply the development approval process not only to projects subject to local discretionary approvals ("discretionary projects"), but also apparently to projects that have been processed to the point that they have already obtained all locally-required discretionary approvals ("non-discretionary projects").[13] Ordinarily, the authority of an official such as a Building Official, who issues building permits, would not extend to land use design decisions already approved by a planning commission or a city council.

Generally, developers pull building permits only after all other approvals have been received, and only for the lots they are going to build upon immediately. If the Regional Board intends the SUSMPs to apply to the issuance of building permits, after all other approvals have been received, this would put the local jurisdiction in the position of having to alter its development standards after development has been approved, for projects that had already achieved all required discretionary approvals when the SUSMPs were adopted, by requiring an official such as a building official to refer an application for building permits back to a planning commission or city council to gain approval of just how the project is to be "concentrated or clustered." Therefore, it would appear that imposing a requirement to "**Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural unaltered condition**" would not be within the authority of a building official at the building permit application stage. The Cities and LAEDC suggest that it is entirely possible that a court might regard this last-

[13] M. Fisher & X. Swamikannu, STORM WATER MITIGATION REQUIREMENTS FOR PRIORITY PLANNING PROJECTS FOR THE PROTECTION OF WATER QUALITY, October 2001. Please note that CEQA applies only to discretionary projects. Public Resources Code § 21080(a). To the extent that a particular development project has obtained its local entitlements, by definition the local CEQA analysis would have been completed. This raises the issue that any subsequent modification of the project (i.e., clustering a non-clustered subdivision) would not have been analyzed. Further analysis may be required to address new or changed significant impacts associated with the altered development should a subsequent approval be required, for instance, the issuance of building permits.

minute referral back to the start, or at least the middle, of the approval process as a compensable temporary taking based on bureaucratic re-referrals.[14]

These takings issues are not discussed in the Tentative Draft or the Fisher-Swamikannu Technical Report, and were not raised in prior SUSMP proceedings. We respectfully request that the Board carefully reconsider the SUSMPs, and that the application of the SUSMPs to nondiscretionary projects be deleted.

7. **The "cause or contribute" Language of Parts 2.1 and 2.2, on page 18, Should be Revised.**

Receiving Water Limitations must reflect an iterative approach, as pointed out in the SWRCB's Draft Order in the San Diego Petitions, SWRCB/OCC Files A-1362, and a-1362(a).

8. **The Tentative Draft–Fact Sheet/Staff Report Incorrectly Asserts that the Imposition of "Peak Flow Control" Measures is Within the Authority of the Regional Board.**

Part 4.D.2, of the Tentative Draft, on page 40, would impose the following requirement:

> [c]ontrol the post-development peak storm water runoff discharge rates, velocities (peak flow control).

The Cities and LAEDC respectfully submit that such effects do not constitute the "discharge of pollutants," as that phrase is defined in the CWA or "wastes" as that term is used in the California Water Code. The Board's authority under the CWA's MS4 program is limited to controls on pollutant discharges. MS4 permits are to include "controls to reduce the *discharge of pollutants* ... and such other provisions ... appropriate for the control of such *pollutants*." CWA § 402(p)(3)(b)(iii), 33 U.S.C. § 1342(p)(3)(b)(iii), (emphasis added). The term "pollutant" as used in sections 301 and 402 is defined by the CWA to mean:

> dredged spoil, solid waste, incinerator residue, sewage, garbage, sewage sludge, munitions, chemical wastes, biological materials, radioactive materials, heat, wrecked or discarded equipment, rock, sand, cellar dirt and industrial, municipal, and agricultural waste discharged into water.

33 U.S.C § 1362(6), CWA § 502(a). Water itself is simply not within this statutory definition of "pollutant." The erosive capacity of water discharged from an MS4 into waters of the United States or the State, is not subject to the CWA's MS4 program.

CWA case law has found the definition of "pollutant" to not include the release of water which causes downstream erosion. In *National Wildlife Fed'n v. Gorsuch*, 693 F.2d 156

[14] *See, e.g., City of Monterey v. Del Monte Dunes at Monterey, Ltd.*, 526 U.S. 687, 698 (1999); *Littoral Development Co. v. San Francisco Bay Conservation Com.* 33 Cal. App.4th 211, 221 (1995).

(D.C. Cir. 1982), the National Wildlife Federation argued that dams require NPDES permits, and that discharges from dams amounted to a "discharge of a pollutant." The court acknowledged that among the water quality problems that may be caused by dams is the discharge of waters with the potential to cause downstream erosion. While stating that discharges from dams usually contain less sediment than upstream water, the court stated that, "the river will 'tend to restore its equilibrium [sediment] loading by scouring the downstream channel.'" *Id.* at 164 (alteration in original). However, the court held that discharges of water from dams were not discharges of pollutants, and did not fall within the CWA definition of "pollutant" and did not require a NPDES permit. *See id.* at 171-72.

The Cities and LAEDC respectfully invite the attention of the Board to the "Response to Comments," October 11, 2001, at page 7 of 12. There, Staff relies on a Supreme Court case, *Public Utilities District No. 1 v. Washington Dep't of Ecology*, 511 U.S. 700 (1994) as authority for the proposition that the Board has the authority to require municipalities to regulate storm water flow rates in a CWA MS4 permit. The Cities and LAEDC suggest that a close reading of the cited case reveals that the *PUD No. 1* case is not on point. *PUD No. 1* was a hydroelectric power plant licensing case which arose under CWA § 401(d), not CWA § 402(p), which has to do with minimizing the discharge of pollutants from MS4s. CWA § 401(d) has nothing to do with minimizing storm water flows from MS4s. Similarly, the quote from 64 Federal Register 68761 in "Response to Comments," October 11, 2001, at page 7 of 12, is incomplete. The missing language makes it clear that EPA intends peak flow controls to be a matter within the discretion of local governments, not an item to be dictated by a state, acting pursuant to a delegation of EPA's authority:

> EPA recommends that municipalities consider these factors when developing their post-construction storm water management program.

64 Fed. Reg. 68761, December 8, 1999.

The Cities and LAEDC urge the Board to delete Part 4.D.2, of the Tentative Draft, on page 40.

9. The Tentative Draft Should be Revised to Exclude Retail Gasoline Outlets.

Parts 4.D.3.b)(4) and (5), on page 42 of the Tentative Draft, require each Co-permittee to apply the SUSMPs to commercial developments, including restaurants and Retail Gasoline Outlets. The Tentative Draft–Fact Sheet/Staff Report fails to mention a significant point: **in the preamble to the promulgation of the Phase I regulations, the U.S. EPA stated that "EPA views gas stations as retail commercial facilities not covered by this regulation. It should be noted that SIC classifies gas stations as retail."** 55 Fed.Reg. 48013-14, Nov. 16, 1990.

In view of EPA's determination that gas stations, as they are retail facilities, are not covered by the Phase I regulations, Parts 4.D.3.b)(4) and (5), on page 42, should be

revised to cite specific authority for the proposition that restaurants may be covered by the Order, or Parts 4.D.3.b)(4) and (5), on page 42 of the Order should be deleted.

10. **The Board Lacks the Authority to Impose the Requirement of Part 4.D.13, on page 47 of the Tentative Draft, for Co-permittees to Conduct a "General Plan Update."**

There is nothing in California Law which assigns to Regional Boards the authority to require local governments to conduct a "General Plan Update." See Point 3, above.

11. **The Tentative Draft Should Assign Responsibility for Sanitary Sewer Overflows to POTWs, Not Cities.**

The Tentative Draft, at Part 4.F.1, under the heading of minimizing "storm water impact from public agency activities" would assign responsibility for implementing "a response plan for overflows of the sanitary sewer system...." The response is to include "immediate response to overflows for containment...." Sanitary sewers are part of publicly owned treatment works ("POTWs"). The duty to respond to sanitary sewer overflows ("SSOs") should rest with the operator of the POTW, not the city through which the POTWs sanitary sewers flow. POTW operators know where their sanitary sewer lines are, and have the duty under the CWA to deal with SSOs. The Board should not attempt to shift that burden to the Cities.

12. **Requiring Each City to Install Trash Receptacles at "All Transit Stops Within Its Jurisdiction" Exceeds the Board's Authority, and is a Responsibility Which Should Rest with Transit Agencies, Not Cities.**

Part 4.F.5.d) of the Tentative Draft would require each "Permittee" (i.e., each city) to "Place trash receptacles at all transit stops within its jurisdiction and maintain them." The term "transit stops" is not defined, and it is not clear whether it includes bus stops, school bus stops, and rail stops. No studies are cited to establish whether the litter recovered would be sufficient to justify this major capital expenditure. No lead time is provided to procure and distribute the "trash receptacles" or to hire staff and obtain equipment necessary to empty the receptacles, or to provide for a competitive process to hire a contractor to provide these services.

Part 4.F.5.d) of the Tentative Draft should be deleted or deferred and reevaluated following consultation with the California Integrated Waste Management Board.

13. **The Definition of "Redevelopment" in the Order is Inconsistent with the Controlling EPA Definition of "Redevelopment."** A point with great significance for the economic redevelopment of developed cities, but not addressed in the Tentative Draft–Fact Sheet/Staff Report, is that the Tentative Draft, at page 70, defines "Redevelopment" to mean "the creation, or addition or replacement of at least 5,000 square feet of impervious surface area on an already developed site." The definition of "Redevelopment" conflicts with the EPA's definition. In promulgating the Phase II final rules, EPA stated

> **EPA intends the term "redevelopment" to refer to alterations of a property that change the "footprint" of a site or building in such a way that results in the disturbance of equal to or greater than 1 acre of land. The term is not intended to include such activities as exterior remodeling,** which would not be expected to cause adverse storm water quality impacts and offer no new opportunity for storm water controls.

64 Fed.Reg. 68760, December 8, 1999. The Cities and LAEDC are aware of **no** evidence to support the Regional Board's use of a 5,000 square foot, rather than EPA's one acre, threshold. Similarly, the Cities and LAEDC are aware of no authority for the proposition that the EPA's one-acre threshold, and its exemption for remodeling, are not binding on the Regional Board for purposes of this Order.

The definition of "Redevelopment" should be changed to

> alterations of a property that change the "footprint" of a site or building in such a way that results in the disturbance of equal to or greater than 1 acre of land. The term is not intended to include such activities as exterior remodeling, which would not be expected to cause adverse storm water quality impacts and offer no new opportunity for storm water controls.

14. Part 3.E, Regarding "Discharges Within Boundaries," Fails to Exempt Discharges from Federal and State Facilities Within a Co-permittee's Boundaries.

In Part 3.E, "Responsibility of the Permittees," on page 21, the first sentence of the introductory paragraph provides "Each Permittee is required to comply with the requirements of this Order applicable to discharges within its boundaries, and not...." This statement does not reflect consideration of the possibility that pollutants may be present in flows (e.g., sheet flows from parking lots or streets) which originate on a federal or state facility within a Permittee's boundaries, but which, because it is a federal or state facility, such as a public high school, is not subject to the Permittee's authority. Nor does this provision recognize the limitations on the authority of the Co-permittees set forth in Findings B.2.

Recommendation: Revise the sentence to read, in pertinent part: "Each Co-permittee is required to comply with the requirements of this Order applicable to discharges which originate within its boundaries at places which are subject to its authority, and subject to the limitations of Finding B.2, and not...."

15. Part 3.G.2.c), Which Attempts to Extend the Order to Reach "Potential Contribution" of Pollutants is Overbroad.

Part 3.G.2.c), (on page 25) which implements 40 CFR § 122.26(d)(2)(i)(A), without citing that section, goes beyond the requirements of the CWA and 40 CFR § 122.26(d)(2)(i)(A) by attempting to impose a requirement that Co-permittees are to possess the legal authority to control something called "potential contribution." of

Pollutants. Neither the Clean Water Act nor EPA's Storm Water regulations say anything about "potential contribution" of pollutants. The "potential contribution" notion is also contrary to the exemption afforded by the "no exposure" conditional exclusion of 40 C.F.R. § 122.26(g). Drawing a line between the presence of a pollutant within city boundaries, but within the "no exposure" exclusion and the point at which the potential pollutant lapses to a state of "potential contribution" is to ask the impossible. The Board's authority is limited to requiring permitees to reduce the discharge of pollutants to the maximum extent practicable, and does not extend to the regulation of "potential contributions."

Recommendation: Part 3.G.2.c), (on page 25) should be revised by deleting the parenthetical "(including potential contribution)."

16. The Definition of "Illicit Disposal" is Overbroad.

In PART 5, DEFINITIONS, on page 66, "Illicit Disposal" is defined to mean "any disposal, either intentionally (sic) or unintentionally (sic) of material(s) or waste(s) that can pollute storm water." This definition would carry this Order far beyond the reach of the Clean Water Act. The Congress, in enacting the Clean Water Act, prohibited the discharge of "Pollutants," a term which it defined. While the term "Pollutant" is defined in PART 5, DEFINITIONS, that definition is not used here in the definition of "Illicit Disposal." Instead, the definition of "Illicit Disposal" uses the vague term "can pollute." The use of the term "can pollute" rather than the defined term "Discharge of a Pollutant" might be construed as meaning something other than "Discharge of a Pollutant." This lack of precision invites disagreement and, potentially, litigation. Moreover, the definition is not limited to discharges into MS4s, but could be construed to apply to disposal into solid waste containers.

Recommendation: The definition of "Illicit Disposal" should be changed to "the unpermitted Discharge of a Pollutant into a Municipal Separate Storm Sewer System."

Dated: November 12, 2001

Respectfully submitted,

Burke, Williams & Sorensen, LLP

Re: Tentative Draft Municipal NPDES Permit, October 11, 2001
Review Comments from Charles Abbott Associates, Inc.

Dear Dr. Swamikannu:

Attached please find comments on the referenced draft permit document, "County of Los Angeles Municipal Storm Water NPDES Permit – Tentative Draft" (Draft Permit). These comments are respectfully submitted on behalf of the cities of Bell, Hidden Hills, and Norwalk.

I am an environmental consultant who provides services in support of the Municipal NPDES Programs of the three aforementioned cities. If you have any questions or comments regarding this matter, please contact me at (310) 548-8454.

Sincerely,

Mark Smith

GENERAL COMMENTS

1. With regard to securing sufficient funding for the many programs and activities required, municipalities generally face significant ongoing constraints. This is especially true with regard to unfunded government mandates such as the NPDES program. At this time in particular, as the Regional Board applies its discretion in establishing new NPDES program requirements, please consider the unexpected additional demands placed on the Permittees to commit more resources for public security and safety in the wake of the September 11, 2001 terrorist attacks on the United States.

2. We did not have an opportunity to review the final written comments of other Permittees with regard to this Tentative Draft NPDES Permit (Draft Permit). However, we did hear the concerns of several important Permittee representatives – the Coalition for Practical Regulation (CPR), the Executive Advisory Committee (EAC), the Southern California Association of Governments (SCAG), the County of Los Angeles, and the City of Los Angeles – expressed during a recent meeting of Permittees on this subject. Based on our understanding of their concerns, we give our general support for their comments and ask that their views be given careful attention by the Regional Board as the development of this Permit progresses.

3. The Draft Permit does not provide for the continuance of the Administrative Review process (see current NPDES Permit, Order No. 96-054, Part 2.I.G., page 21). The Administrative Review process under the current Permit provides for a very important interactive process between the Regional Board and any Permittee(s) that the Regional Board may believe is in non-compliance with one or more Permit requirements. The language that provides for this process has been completely deleted from the Draft Permit. We believe that this language, in similar form to its appearance in the current Permit, should be reinserted into the new Permit. The Administrative Review process promotes a productive dialogue between the Regional Board and Permitees in a spirit of cooperation toward the common goal of improving water quality. This type of cooperative relationship is an objective of the Regional Board, as stated in this Draft Permit.

PERMIT-SPECIFIC COMMENTS

FINDINGS

PAGE 7

D.4 (page 7, Paragraph 4)
This is the best paragraph in the Draft Permit in terms of a direct and succinct statement of the overall purpose of the Permit. This paragraph should have greater emphasis in the Permit. It is also important to note that the language includes the consideration of the cost effectiveness of storm water pollution control measures as a factor in determining MEP compliance.

PAGE 11

D.19 (page 11, Paragraph 4)
This paragraph indicates that structural/treatment control BMPs are not permitted to be installed within water bodies of the State because that would be tantamount to accepting that waste assimilation is an appropriate use of State waters, and that's against Federal policy [40 CFR 131.10(a)]. This is in direct conflict with the Regional Board's existing policy, under which several structural BMPs have been installed in State waters (e.g., the trash nets in the Los Angeles River and Ballona Creek). We believe that this same point was raised with regard to the 2nd Draft Permit. It is our understanding that the Regional Board has acknowledged that the inclusion of this language in the Permit was an oversight and it would be omitted from future versions of the Permit.

D.20 (page 11, Paragraph 5)
In this paragraph describing its Watershed Management Approach toward achieving the best water quality with available resources, the Regional Board acknowledges the importance of balancing environmental and economic impacts while emphasizing cooperative relationships between the interested parties. In practice, however, these program objectives have not been getting the level of attention they deserve. For example, at the public workshop for the 2nd Draft Permit, the Chairman of the Regional Board directed the Regional Board's Executive Officer to cease the extensive effort he had been making to work cooperatively with the Permittees in developing mutually acceptable Permit requirements. The Chairman indicated that the Executive Officer's efforts were not consistent with the Regional Board's mandate to achieve water quality objectives. Earlier during the workshop, the EAC director had thanked and commended the Executive Officer on his efforts. The Chairman also indicated that water quality goals must be achieved without regard to consideration of cost, or even time. Significantly, all references to the EAC that were in the 2nd Draft Permit have been completely deleted from this Tentative Draft Permit, and some Permittees have observed that the cooperative process has completely broken

down in recent months. Presently, the Permittees are pursuing the services of a third party mediator through the USEPA to resolve issues. We are alarmed at this trend and hope that all parties can work together to reverse it. The Watershed Management Approach, as described in Item No. D.20, is a sound approach that needs to be consistently followed by all parties involved in this Permit.

PAGE 13

Former F.1 Implementation (formerly Paragraph F.1, now a completely struck-out paragraph) (page 13, Paragraph 3)
This is a completely struck-out (deleted) section that, in the 2nd Draft Permit, had provided the Regional Board's formal written recognition of the EAC. By striking out this paragraph, the Regional Board is effectively rescinding its approval of the Permittees' foremost voice in ensuring reasonable Permit requirements and implementation. This is an essential paragraph to have in the Permit. By including this paragraph in the 2nd Draft Permit, the Regional Board took a major step in supporting its policy as stated above in Findings, D.20. The Regional Board's stated policy in D.20, is an approach emphasizing cooperative relationships between the interested parties, including the Regional Board and the regulated community. As the primary executive type of steering committee, the EAC is the most important Permittees' representative organization. As such, the Regional Board's formal written recognition of the EAC and its vital role should be a standard element of this Permit.

F.1 Implementation (page 13, 4th paragraph)
Indirectly, this paragraph seems to announce the Regional Board's policy that Development Planning Program requirements apply to specified project categories, regardless of whether a project is discretionary or ministerial. We believe that, as upheld by a recent State Board decision, these requirements should only apply to discretionary projects under the this Permit. The many requirements under the program, including SUSMP requirements, are still relatively new requirements and it's too soon to apply them more widely. We are now developing the third draft of the Permit and we recognize the need for increasingly stringent requirements. However, considering the decades-long flood control and business practices that have been in place, municipal NPDES requirements are very new developments that require significant and rapid changes for the regulated community.

PAGE 15

G.3 Public Process (page 15, last paragraph)
This paragraph describes the commendable effort put forth by Regional Board staff in working cooperatively with the Permittees throughout most of the development of this Permit. This includes two public workshops and numerous working meetings between Regional Board staff and Permittee representatives. We thank the Regional Board staff for their extensive efforts in this regard and urge a continuance of this approach and policy.

PAGE 18

Part 2. Receiving Waters Limitations (page 18)

As has been repeatedly emphasized by the Permittees, this section of the Draft Permit is a point of major contention because it would effectively place every Permittee in violation of the Permit immediately upon Permit adoption. This is one of the most important issues of concern we have with the Draft Permit. At recent public workshops, the Regional Board and environmental groups have provided verbal assurances to the Permittees that they do not interpret the language as strictly as written in this section of the Permit. With all due respect, the Permittees cannot rely on verbal assurances for such crucial elements of the Permit, but need all such unreasonable language to be revised. It is absolutely essential that the "safe harbor" type language present in the current Permit be written into this section in order to make it workable (i.e., that, notwithstanding any violations of water quality standards, a Permittee is not in violation of the Permit provided that the SQMP and other Permit requirements are properly implemented).

As currently written in the Draft Permit, every Permittee would immediately be in Permit violation for any pollutant in their watershed that currently exceeds water quality standards (e.g., pollutants for which TMDLs are currently being developed). That's because their MS4 would be discharging some level of virtually every pollutant, thereby contributing to violations of water quality objectives and water quality standards. Then every Permittee would immediately be forced into the procedure described in Part 2.3 for identifying and scheduling the timely implementation of additional BMPs. The Part 2.3 procedure is inappropriate for addressing these problems as it fails to address the enormous complexity and cost involved. All water quality problems that persist in spite of proper SQMP implementation under the Permit need to be handled through the TMDL process and be based on well quantified scientific analysis.

In the "Notice of Public Hearing" it issued for this Tentative Draft Permit, the Regional Board defines the 7 programs under the New Permit that will comprise the SQMP and states that "These programs collectively are expected to reduce pollutants in storm water discharges to the Maximum Extent Practicable." This language was used in the current Permit and should also apply in this section of the renewed permit. That is, any Permittee who adequately implements all seven programs of the SWQMP as required under the Permit have met the MEP standard of compliance required under Federal/State NPDES regulations, and should therefore be deemed by the Regional Board to be in compliance regardless of any water quality objective or standards violations that may exist within their watershed.

PAGE 23

Part 3.G. Executive Advisory Committee (EAC) (Page 23, last three paragraphs)

This section, as it appeared in the 2nd Draft Permit, provided the Regional Board's formal recognition of the EAC and defined EAC's roles and responsibilities. In this Tentative Draft Permit, this section has been completely struck out and has not been replaced with any similar section. In removing this section, the Regional Board appears to be attempting to abolish the EAC. The EAC is the foremost entity in representing the Permittees' concerns and voicing them to the Regional Board. The removal of all Permit sections referring to the EAC that were present in the 2nd Draft Permit contradicts the Regional Board's policy, as stated in several areas of the Tentative Draft Permit, of forging cooperative relationships with the Permittees. We request that all of the struck-out language referring to the EAC be reinstated in the Permit. This is one of the most important issues of concern we have with the Draft Permit.

PAGE 27

Part 4. SPECIAL PROVISIONS

A.2. Customized SQMP (page 27, 1st line under Part 4.A.2.)

This section appears to require each Permittee to prepare and implement a written local SQMP. If this is its intent, the Regional Board may wish to consider inserting the word, "written" in, "Each Permittee shall have available a written local SQMP ..." as clarification.

PAGE 31

Table 1 (page 31, table)

This table lists target pollutants for the watersheds under this Permit. Some additional clarification identifying those pollutants, either as a footnote to the table or in the Part 5 – "Definitions" section of the Permit, may be warranted.

- Does "Nutrients (Nitrogen)" mean that the target pollutant is only nitrogen, or nutrients in general and especially nitrogen? Some clarification would be helpful.

PAGE 33

INDUSTRIAL/COMMERCIAL FACILITIES PROGRAM

General Comments

1. Facility Inspections versus Site Visits – This section of the Permit contains three different versions of Industrial/Commercial programs proposed as options from which the Board will select one for inclusion in the final adopted version of the Permit. We request that the Regional Board select Version C – "Industrial/Commercial Educational Program". Version C appears to essentially continue the existing educational site visit program. The emphasis on education, rather than inspection/enforcement, is appropriate at this time. The other two proposed Industrial/Commercial Facilities Program options, Versions A and B, contain requirements for Permittees to inspect facilities rather than provide educational visits. We believe that the entire program should remain outreach and education based, rather than changing to an emphasis on inspection and enforcement. While we understand that this is a third generation permit and the Regional Board wants to "ratchet up" requirements with each successive permit, it is too soon to place so much emphasis on inspection/enforcement over outreach/education. Most of these businesses only received one or two visits under the second Permit. It may have been a number of years since a facility received its latest visit. In addition, a business may be under new management. NPDES requirements are still new to many business owners, and they should be given more time to fully understand these requirements and required changes to their business practices. After decades of conducting business in the context of viewing storm water issues only in terms of flood control, the business community should be allowed more time to

assimilate the relatively very new emphasis on storm water quality management.

Attachment B – Critical Sources Categories Prioritization – This attached list of facility categories is helpful in identifying the types of facilities that need to be inspected and visited. However, it is imperative that it go one step further and also include the corresponding SIC codes per Table A-1 in Appendix A of the current Countywide site visit program guidance manual (*Program Summary and Guidance – Industrial/Commercial Educational Program*, May 1997). Those of us involved in implementing the current site visit program have found Table A-1 to be indispensable in identifying those sites that are subject to the program. The same level of detail needs to be incorporated into Attachment B of the new permit. By merely stating the names of the facility categories subject to the program, Attachment B leaves a great amount of subjective discretion to individual Permittees when determining what specific businesses within their jurisdictions are in each category. This situation will completely undermine the Countywide consistency that is so important to this program. The SIC system provides a universal mechanism to objectively and consistently identify the appropriate facilities. Moreover, the entire existing site visit program is already founded on the SIC system. SIC codes are a mandatory element of all Permittees existing programs. To go one step further, Attachment B should also include the corresponding NAIC codes. Keeping in step with the rapid globalization of the world economy, cities are beginning to use the NAIC system in place of the SIC code system that they have used for many years. We are still in the early phase of that transition, however, so I believe the SIC system is the more important of the two.

PAGE 33-A

C.1.(a), 1st Paragraph, 1st Sentence Database for Critical Sources Identification This section requires each Permittee to develop a watershed-based inventory of all facilities identified as priority though the Permittees critical sources identification program. We don't understand the scope of the "critical sources identification program" as we were unable to find an adequate description of the program in the Draft Permit. Some additional explanation of the Regional Board's intent may be needed on this program.

PAGE 35-A

3.(c) Restaurant Inspections It should be noted by the Regional Board that the Permittee inspector will have to take the restaurant owner's word when verifying compliance with some of these measures (e.g., oil and grease residue is not poured into an catch basin, trash bin is not washed out, and no washing of

floormats and parking lots, etc.). The inspector is unlikely to catch the owner in the act of violating these requirements.

3.(c) (4) Hosing Down Parking Lots The last phrase, "... or creating a nuisance through hosing down the area." Should be reworded. As currently worded, it implies that hosing down the parking lot is acceptable as long as a condition of nuisance is not created. Apparently, this is not the Regional Board's intent as the preceding paragraph, 3.(c) (3), indicates that parking lot washdown is not permitted in any case. Perhaps the phrase should be deleted

---

PAGE 36-A

4.(c)(4) Requires that "Drains and flow patterns are labeled at the facility;" What does this mean? Usually, when drains are required to be labeled it is reference to stenciling them with the "No Dumping" (dead fish) logo. How are flow patterns to be labeled? Some elaboration of this requirement seems warranted to clarify intent.

5.(c)(1) Requires that automotive service facilities be inspected to verify that the "facility area is clean and dry without evident stains;". Virtually all automotive service facilities will have evident stains on the paved areas, so perhaps some rewording may be appropriate.

PAGE 37-A

C.6.(a)(1) Frequency of Site Visits to Lower Priority Categories – This sentence should be reworded to improve clarity. Presumably, the Regional Board intends for these facilities to be visited (at least) one time during the 5-year effective term of this permit, and that visit must be done within the first two years of the permit. Also, the parenthetical statement, "... (except those subject to the inspection program) ..." is confusing and misleading.

PAGE 55

PUBLIC AGENCY ACTIVITIES PROGRAM

F.5(a) and (b) Storm Drain Operation and Management (page 55, bottom half of the page)

The criteria for classifying catch basin inlets in 5(a) as Priority A, B, or C are too loosely defined. The large degree of subjectivity involved in the classification process would result in a wide disparity among Permittees as to which catch basins would be designated as Priority A, B, or C. Instead, the criteria should be

based on the rate of a catch basin's filling with trash and/or litter over a period of time. Consider that the Regional Board wants to use the criterion of "40% full during the wet season" as the level at which a catch basin must be cleaned [see 5(b), Priority B]. If a Priority A catch basin is to be cleaned monthly during the wet season, then a Priority A catch basin should be one that becomes 40% full during each month of the wet season.

The catch basin cleaning requirements under 5(b) are excessive and not consistent with the MEP standard as they don't adequately consider cost and technical feasibility. Any Permittee with a significant number of Priority A catch basins would see their annual catch basin cleaning costs sky rocket as those basins would be cleaned out seven or eight times per year.

Under the proposed requirements of 5(b), Permittees would be absolutely required to clean catch basins monthly regardless of whether a particular monthly cleaning was actually warranted. For example, a Priority A catch basin would have to be cleaned even if only 5% full in a given month. Countywide, this approach is likely to result in a tremendous waste of taxpayer dollars that should have been spent mitigating an actual identified storm water pollution problem. The approach should be to require inspections, at a specified frequency for a representative sampling of Priority A catch basins. Cleaning would then be conducted as warranted based on the observance of trash and litter at or above a specified threshold such as 40% full.

There is also a problem with requiring each Permittee to be responsible for classifying and cleaning all catch basins within its jurisdiction. In many instances, most of the catch basins within a Permittee's jurisdiction are owned by the County and cleaned by the County. The County is therefore in the best position to implement this program for those catch basins. The language in sections F.5(a) and (b) should be revised to make each Permittee responsible for only the catch basins which it owns.

PAGE 56

F.5(d) Trash Receptacles at Transit Stops (page 56, 2nd paragraph)
This requirement has been widely objected to by Permittees because they believe it would require them to place a trash receptacle at every transit stop (e.g., bus stop) in their jurisdiction. Actually, based on the plurality in the wording, it could be interpreted as requiring at least two trash receptacles to be placed at each transit stop ("Place trash receptacles at all transit stops ..."). In any case, this is excessive and could create a significant unnecessary expense. This type of requirement should use an inspection based approach. Trash receptacles should be installed as needed based on inspections. Better still, the requirement should be deleted altogether for Permittees who are subject to a Trash TMDL because the issue of trash and litter control will be thoroughly

addressed under that program. This requirement is overly prescriptive. Permittees need to be allowed some flexibility on how to address the problem in the most cost-effective manner possible.

F.6 Streets and Roads Maintenance
Some of the same comments above, for catch basin cleaning [F.5(a) and (b)] apply. This approach presumes that all Permittees must have some Priority A streets for trash and/or litter that need to swept twice monthly. This approach fails to acknowledge that some Permittees, such as small residential communities, may have very little trash or litter on any of their streets. Under this approach, a Priority A street in one of these small cities may have been classified as a Priority B or even Priority C street were it located in a larger city.

PAGE 65

Part 5 DEFINITIONS

"Executive Advisory Committee" (page 65, 5th paragraph)
The entire definition for this fundamental Permittees' organization has been completely struck out in the Tentative Draft Permit. For the reasons cited on this subject in the above comments, we request that this term and its definition be maintained in the Permit.

PAGE 66

"Maximum Extent Practicable (MEP)" (page 66, last paragraph)
In this Tentative Draft Permit, the Regional Board has struck out the very important elements of the Federal definition of MEP, "...taking into account equitable consideration and competing facts, including ... cost and technical feasibility." The retention of the original definition of MEP is essential in assuring the successful development and implementation of effective NPDES programs. We request that this struck out language be included in the Permit.

PAGE 68

"Permittees" (page 68, 1st paragraph)
In the list of Permittees to this Order provided as part of this definition, the City of Bell has been inadvertently omitted. We request that "Bell" be added to this list.

PAGE T-1

MONITORING PROGRAM

When describing the monitoring program for this Permit, the Regional Board emphasizes that the purpose of the program is to "assess permit compliance" and to "identify sources of water quality exceedances and toxic pollutants." While these are important objectives of the monitoring program, by omitting additional language on what should be the overriding goal of the program, the Regional Board is sending the wrong message to the community. The first and foremost purpose of the program should be to provide a mechanism by which all interested parties can obtain a objective and ongoing science-based assessment of the BMP control measures that are being implemented by the Permittees. The program should primarily be the path toward ever-improving BMPs so that we can all achieve our common goal of the best water quality possible for the community. By omitting this type of language from the Draft Permit and only emphasizing the currently used command and control type of language, the Regional Board is communicating that the program is primarily intended to be used as an enforcement tool to identify violations and penalize the Permittees.

Mr. Dennis Dickerson
Executive Officer
California Regional Water Quality Control Board
Los Angeles Region
320 W. 4th Street, Suite 200
Los Angeles, California 90013

Re: October 11, 2001 Draft Waste Discharge Requirements for Discharge of Stormwater in Los Angeles County (NPDES No. CAS614001)

Dear Mr. Dickerson:

We have received and have reviewed the Regional Water Quality Control Board's October 11, 2001 final draft of the Waste Discharge Requirements for Discharge of Stormwater in Los Angeles County (NPDES No. CAS614001) which, upon adoption, will serve as the NPDES Permit for the discharge of storm water and urban runoff from the municipal separate storm sewer system (the "MS4") in Los Angeles County (the "Draft Permit"). We have been asked by the Cities of Agoura Hills, Carson, Artesia, Beverly Hills, Hidden Hills, Norwalk, La Mirada, Monrovia, Rancho Palos Verdes, San Marino, San Fernando and Westlake Village (the "Cities") to submit comments to the Draft Permit on their behalf. (Some of these cities will also be submitting their own separate comments.) This letter supplements our letters of May 16, 2001 and August 6, 2001, which included our comments on the First and Second Drafts of the proposed NPDES permit, as well as our oral comments at the Regional Boards' workshop on the second draft of the Permit held on July 26, 2001 (the "Comments"). Our Comments are incorporated herein by this reference.

A number of fundamental policy issues regarding the scope and cost of the storm water management program prescribed by the Draft Permit have still not been completely resolved. However, the cities that we represent remain committed to work with the Regional Board to continue the substantial progress made by the Permittees in reducing pollution in and to Southern California water bodies through

the implementation of the programs developed under the 1990 and 1996 Permits for the Los Angeles Basin and new programs which the Permittees have proposed for the renewed NPDES Permit.

While our comments address a number of different issues and unresolved questions, we thought it important to once again highlight some substantial issues in the Draft Permit which have not been fully addressed or considered by the Regional Board's staff.

As I discussed at the second Board workshop, as well as in our Comments, we are particularly troubled about the deletion of the "Safe Harbor" provisions that were included in Receiving Water Limitations and Discharge Prohibition sections of the current Los Angeles County Municipal Storm Water Permit, Order No. 96-054 (the "Current Permit"). Neither the Discharge Prohibition provisions (Part 1, pp. 17-18), nor the Receiving Water Limitations provisions (Part 2, pp. 18-19) of the Draft Permit provide any assurance to our Cities that, once they have implemented the storm water management programs set forth in the Draft Permit in a timely and complete manner, they then will be deemed to be in compliance with the Discharge Prohibitions and Receiving Water Limitations provisions.

These "Safe Harbor" provisions provide the Permittees with important protections from third-party liability once they have implemented the storm water management programs prescribed in the Permit. If these provisions are not included in the Permit, then the Cities and the other Co-Permittees may potentially be exposed to unwarranted third party suits.

Our concerns are not just academic. In Carson Harbor Village, Ltd. v. Unocal Corporation, 990 F. Supp. 1188 (C.D. Cal 1997), the owner of land, which was allegedly contaminated by small quantities of lead contained in storm water runoff sued the County of Los Angeles and two Permittee cities under the Clean Water Act ("CWA"), CERCLA, RCRA and California common law. The District Court granted summary judgment on the CWA and state common law claims, based on the Permittees' compliance with the 1990 and 1996 Permits. That determination was affirmed on appeal. (See, Carson Harbor Village, Ltd. v. Unocal Corporation, et al., _____ F.3d _____; 2001 U.S.App.Lexis 2100; 2001 Daily Journal DAR 1647

(9th Cir. 2001).

Regional Board staff have stated that they feel constrained by the State Board's adoption of Receiving Water Limitation language for municipal NPDES permits in its WQO No. 98-01, which was subsequently amended in WQO No. 99-05. However, the State Board *specifically approved* the inclusion of these Safe Harbor provisions in WQO Order No. 98-01. In Environmental Health Coalition, WQO No. 98-01 (1998), the petitioner contended that the receiving water limitations section in the NPDES Permit for certain Orange County cities violated the CWA and implementing regulations because it did not require compliance with water quality standards. That permit, like the Current Permit, stated "...that the permittees 'will not be in violation of [receiving water limitations] so long as they are in compliance with the requirements' for evaluating the DAMP." The State Board specifically rejected the petitioners' contention, noting that it had previously approved the same "Safe Harbor" provision in SWRCB WQO No. 96-13, with respect to the storm water permit for certain permittees in the Santa Clara Valley issued by the San Francisco Bay Regional Board. As the State Board stated:

> "The SWRCB has already determined that the use of BMPs to achieve both the technology-based effluent limitations and the water quality-based effluent limitations complies with the CWA and the Porter-Cologne Act. See SWRCB WQO No. 91-03. Accordingly, the SWRCB agrees that use of the phrase that the "permittees will not be in violation of . . ." complies with the CWA and, in fact, used that same phrase in SWRCB Water Quality Order 97-03-DWQ (Waste Discharge Requirements for Discharges of Storm Water Associated with Industrial Activities Excluding Construction Activities, NPDES General Permit No. CAS000001) (the General Industrial Permit)."

Furthermore, as the State Board noted in In the Matter of the Petition of Save San Francisco Bay Association, et al., WQO No. 96-13 , USEPA has approved the inclusion of a Safe Harbor provision in the Receiving Water Limitations.

Accordingly, the retention of the "Safe Harbor" provision found in the last two

permits certainly would not be contrary to the State Board's order dictating the Receiving Water Limitations found in the Draft Permit, and, in fact, would be complementary to those limitations. No State Board order or directive dictates the deletion of the Safe Harbor provision from the Discharge Prohibitions.

Another important provision omitted from the Draft Permit, and referenced in our Comments, is the "Meet and Confer" procedure found in the Current Permit at Part I, Section G, page 21, which provides that, if the Executive Officer determines that a Permittee's storm water program is insufficient to meet the provisions of the Current Permit, then a "Notice of Intent to Meet and Confer" ("NIMC") will be issued to the Permittee. The NIMC is a very important, productive and non-contentious vehicle for Permittees to resolve storm water management program issues with the Regional Board without litigation.

The Regional Board has stated in discussions regarding the Draft Permit that, rather than utilizing the NIMC procedure, staff will rely on the issuance of a Notice of Violation ("NOV"). That sentiment was further echoed at the July 26, 2001 Public Workshop where legal counsel for the State Water Resources Control Board ("SWRCB") stated that the NIMC process is not an element of SWRCB Water Quality Enforcement Policy Resolution No. 96-030, as amended by Resolution No. 97-085 ("Enforcement Policy"), or its "Guidance to Implement the Water Quality Enforcement Policy" ("Guidance Document") and, therefore, should not be contained in the Draft Permit.

We do not believe that the NIMC process is contrary in any respect to the State Board's Resolution Nos. 96-030 and 97-085, or to the effective development of regional storm water programs. The Enforcement Policy is based on the premise that actual violation of a WDR has occurred. The Enforcement Policy does not really address disagreements regarding the development or implementation of storm water programs, nor do the specific events identified in Sections III A. through H of the Enforcement Policy, which would trigger an enforcement referral, fit the circumstances of a Municipal NPDES Permit. The development and implementation of the regional storm water management programs will only be feasible and effective if state and local governmental agencies can work together in an open and collaborative manner. The enforcement process is,

necessarily, adversarial and, in our view, would be counterproductive to the effective development or regional storm under programs.

In our Comments, we raised a number of questions regarding the legal implications of the process by which the Draft Permit was developed. To date, we have not received a full or direct response to those questions and concerns. We continue to believe that the Draft Permit, and the process which generated it, does not comply with applicable principles of California administrative law, and as a result, the Draft Permit has been developed without compliance with California's Administrative Procedure Act. California Government Code §§11340, et seq. (the "APA").

Also, as referenced in the Comments, we are concerned that, by setting specific design standards, the Regional Board and the State Board are crossing the line into an area typically handled through building codes which are supposed to be uniform throughout the state.

We would also like to express our concern on behalf of the Cities that the Regional Board may be exceeding its authority by attempting to prohibit the discharge of all storm water rather than the discharge of pollutants. In addition, the "Peak Flow Control" and post-construction "Numerical Design Criteria" requirements in the Draft Permit exceed the Regional Board's authority by specifically providing how the Permittees are to achieve the goal of reducing the discharge of pollutants to the waters of the United States. We also believe that this precise directive to the Permittees violates the limitations of Water Code § 13360(a), which provides in pertinent part:

> "No waste discharge requirements or other order of a regional board or the state board or decree of a court issued under this division shall specify the design, location, type of construction, or particular manner in which compliance may be had with that requirement, order, or decree, and the person so ordered shall be permitted to comply therewith in any lawful manner."

Lastly, we would like to point out that our Cities are extremely disappointed with

the elimination of the Executive Advisory Committee ("EAC") from the Draft Permit. To our Cities, the EAC has been a vehicle through which productive negotiations with the Regional Board regarding the Draft Permit have taken place. Additionally, at least our Cities have viewed the EAC negotiating process as being very useful in creating open and honest dialogue with the Regional Board regarding many of the difficult issues regarding implementation and enforcement of the Draft Permit. Even though the Regional Board and our Cities may not see eye-to-eye on all the issues, the EAC has provided a forum where the concerns from all stakeholders are acknowledged and discussed. In our opinion, the removal of the EAC from the Draft Permit will be taking a step backwards, rather than forward, in fostering a stronger relationship with the Regional Board, which is where our Cities believe we should be heading.

Our Cities have the same objectives of the Regional Board and the other stakeholders to achieve a consensus to preserve, restore and enhance the many beneficial uses of the ocean and the water bodies of Southern California. We hope that you will consider our comments and suggested changes in this spirit.

Very truly yours,

John J. Harris

Enclosure

COMMENTS ON OCTOBER 11, 2001 DRAFT WASTE DISCHARGE REQUIREMENTS FOR DISCHARGE OF STORM WATER IN LOS ANGELES COUNTY (NPDES NO. CAS614001)

by
John J. Harris
Jay F. Golida
Richards, Watson & Gershon

1. Finding D.2, Page 6. - The second sentence should be revised to read: "The Permittees may lack legal jurisdiction over these entities under state and federal constitutions and shall not be held responsible to ensure compliance with this Order."

2. Finding D.4, Page 7. - This finding should be modified as follows:

   "This Permit is intended **to allow the Permittees** to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water and urban runoff to the waters of the United States to the maximum extent practicable (MEP) from the permitted areas in the County of Los Angeles **subject to their jurisdiction**."

3. Finding D.5, Page 7. - The second sentence of this finding, "Permittees may control the contribution of pollutants to the MS4 from non-permittee dischargers such as CalTrans, the U.S. Department Defense, and other state and federal facilities, through interagency agreements" should be deleted. These other state and federal agencies have resisted any efforts by local agencies to exercise any jurisdiction over their property. The most practicable way of approaching the problems relating to discharges from non-jurisdictional facilities is through the separate NPDES permits for these facilities.

4. Finding E.5, Page 8. - This finding overstates the requirements of 40 C.F.R. 122.26 as it relates to the inspection of industrial and commercial facilities. At most, the regulations control potentially the inspection of priority industrial and commercial facilities, that is, those which contribute a substantial pollutant load to the MS4, as opposed to all industrial and commercial facilities. Finding No. 5 should be modified to reflect the regulations accurately.

5. Finding E.6, Page 8. - This finding states "The State Board's Chief Counsel has issued a statewide policy memorandum (dated December 26, 2000) which interprets the Order to provide broad discretion to Regional Boards and identifies potential future areas for inclusion in SUSMPs and the types of evidence and findings necessary." A legal memorandum by the State Board's Chief Counsel, while informative, is not a regulation and has no legal effect. We believe the reference should be deleted.

R0006489

6. Finding E.8, Page 9. - The NPDES Permit is not a vehicle to "implement and enforce" the TMDLs. The last sentence of this section should be deleted.

7. Finding E.18, Pages 10-11, bullet 1. - The State Board's Order in the Bellflower case, WQO No. 2000-11, specifically stated:

" We conclude that because RGOs are already heavily regulated and may be limited in their ability to construct infiltration facilities or to perform treatment, they should not be subject to the BMP design standards at this time, and **recommend that the Regional Water Board undertake further consideration of a threshold relative to size of the RGO, number of fueling nozzles, or some other relevant factor.** This Order should not be construed to preclude inclusion of RGOs in the SUSMP design standards, with proper justification, when the permit is reissued."

The Draft Permit does not reflect the State Board's directive regarding "a threshold relative to size of the RGO, number of fueling nozzles,..." or other factors. Similarly, the State Board's recent draft order, which will most likely be adopted on November 15, 2001, on the petitions of the Building Industry Association of San Diego County, et al., for review of the San Diego County Municipal Permit [NPDES NO. CAS0108758] deleted RGO's from the Priority Development Project Categories requiring a SUSMP.

Similarly, Order 2000-11 stated:

"While it may be appropriate to include more stringent controls for developments in ESAs, we also note that such developments are already subject to extensive regulation under other regulatory programs. Moreover, in light of the permit language limiting the SUSMPs to development categories, ESAs are not an appropriate category within the SUSMPs. The Regional Water Board may choose to consider the issue further when it reissues the permit."

The Draft Permit does not reflect any further consideration as to how the proposed controls of "environmentally sensitive areas" enhance the existing "extensive regulation under other regulatory programs."

8. Finding E.19, Page 11. - Among other things, this finding states "The Regional Board has determined that the creation of structural or treatment control BMPs for stormwater mitigation in waters of the U.S. is not permissible." However, no citation or reference to that "determination" is included. The statement appears to be inconsistent with the Board's position with respect to requiring structural and treatment control BMPs as part of SUSMP requirements.

9. Finding E.20, Page 11. - The term "Watershed Management Approach" appears to be used as a defined term, but this term is not defined in the Draft Permit. Accordingly, change "Watershed Management Approach" to "watershed management approach" or on the

alternative, provide a definition in the new Permit.

10. Finding E.25, Page 13. - This finding should be modified to include the following sentence: "The California Water Code Section 13360(a) prohibits the Regional Board from issuing a waste discharge requirement that specifies the design, location, type of construction, and particular manner in which compliance with this Order may be had.

11. Section F.1, Page 13. - The Draft Permit unilaterally eliminates the Executive Advisory Committee ("EAC") Permit. The EAC is a creation of the Current Permit. The EAC has played an important role during negotiations with the Regional Board and in providing assistance to the co-permittees. There is no legitimate reason for the EAC to be removed from the Draft Permit as it serves an important function to the Permittees. We recommend that this section, as well as the other references to the EAC in prior versions of the Draft Permit, be reinstated.

12. New Finding, F.1, Page 13. - We disagree with the proposed language that: "For water quality purposes, the Regional Board considers that all new development and significant redevelopment activity in specified categories, that receive approval or permits from a municipality, are subject to storm water mitigation requirements." As discussed in the comments of other Permittees, cities have a very limited ability to prescribe storm water mitigation requirements for ministerial permits. Similarly, there is no factual basis for a broad finding that any development or redevelopment project has an impact on water quality.

13. Finding F.3, Page 14. - The clause in the second sentence of this finding, "... the discharge of non-storm water has been effectively prohibited.", should be deleted.

14. Finding F.8, Page 15. - The reference to a "petition" to the Executive Officer appears to be unsupported. Neither the Draft permit nor the applicable statutes and regulations provide a procedure for such a petition. As discussed in our Comments, the "Notice of Intent to Meet and Confer" process ("NIMC") from the Current Permit should be retained.

15. Part 1, Section 2(c)- Discharge Prohibitions- Page 16 - We believe that the discharges which were conditionally exempt under Part II, Section II.C.2.(a), (g) and (h) of the existing Permit for landscape irrigation and lawn watering should be included in Part1, Section 2(c) of the Draft Permit, in accordance with applicable federal regulations.

16. Part1- Discharge Prohibitions- Page 16. - The proposed Discharge Prohibitions omit a important exception set forth in Section1(C) of Part 1 at Page 12 of the Current Permit for "Discharges originating from federal, state or other facilities which the Permittee is pre-empted from regulating." This provision should be included in the new Permit.

17. Part1- Discharge Prohibitions- Page 16. - As discussed in detail in our cover letter, the Discharge Prohibitions omit a very significant and critically important provision of the Current Permit found in Section 1 of Part 1 at Page 12, which states:

"Compliance with this Order through the timely development and implementation of programs described herein shall constitute compliance with this prohibition."

This provision which has been approved by the State Board, should be included in the new Permit.

18. Part 2- Receiving Water Limitations, Sections 1 and 2- Page 18. - As referenced in our Comments, if this language is to remain, we propose that it be consistent with the draft language of Part III., Sections 1 and 2, Page 16, the Santa Ana Region Permit. We recommend that the Regional Board replace Section 1 and Section 2 with the following:

1. "Discharges of storm water from the MS4s to waters of the United States containing pollutants that have not been reduced to the maximum extent practicable is prohibited."

2. "Discharges from the MS4s shall not cause or contribute to a condition of contamination, nuisance, or pollution in waters of the State as defined in Section 13050 of the Water Code."

It should also be noted that in the recently released draft order of the State Water Resources Control Board, which will most likely be adopted on November 15, 2001, in response to the Petitions of the Building Industry Association of San Diego County and Western States Petroleum Association for Review of Waste Discharge Requirements Order No. 2001-01 for Urban Runoff from San Diego County [NPDES NO. CAS0108758], the State Board stated that, among other things, "The permit should be revised to reflect that MEP be achieved for discharges from the MS4, to waters of the United States, but not for discharges into the MS4."

19. Part 2- Receiving Water Limitations- Page 18. - The Receiving Water Limitations also omits an important provision of the Current Permit in Part II at Page 12, which states:

"Timely development and complete implementation of the storm water management programs described in this Order shall satisfy the requirements of this section and constitute compliance with receiving water limitations."

This provision should also be included in the new Permit after Section 4 on page 19.

20. Part 2- Receiving Water Limitations- Section 3(a)- Page 18. - The imposition of additional discharge reporting requirements, as et forth in this section, is not supported by state or federal statutory or regulatory authority. This section would appear to require Permittees to report third party discharges.

21. Part 3.G.1(f)- Legal Authority- Page 24. - The reference to discharges from swimming pools should match the existing permit language to "prohibit the discharge of commercial swimming pool filter backwash to the MS4." (See, Section 1.E.1.(a)(v)of the current Permit, at page 18).

22. Part 3.G.1(h)- Legal Authority- Page 24. - This section should be modified to track the language of Section 1.E.1(a)(vii), at page 18 of the existing permit, and, in particular, to refer to *untreated* runoff.

23. Part 3.G.1(j)(2) - Legal Authority- Page 24. - A list setting forth the state or federally banned pesticides, fungicides or herbicides should be provided.

24. Part 3.G.2(a)- Legal Authority- Page 25. Insert the word "to" after "Require persons within their jurisdictions" in the first sentence.

25. Part 3.G.2(c)- Legal Authority- Page 25. Delete the reference to "potential contribution"in the first sentence as it is vague, subject to varying interpretation and contrary to the specific direction stated by Chairman Nahai at the Regional board workshop for the second Draft Permit held on July 26, 2001 which was that the Regional Board should eliminate the use of vague terminology which may be subject to varying interpretation.

26. Part 3.G.2(d)- Legal Authority- Page 25. - We agree with the County's and other Permittees' concerns regarding both the feasibility and enforceability of the new inspection requirements set forth in the Draft Permit, which go far beyond the scope of the provisions of 40 CFR 122.26(d)(2)(iv).

27. Administrative Review- As discussed in our cover letter, we are particularly concerned by the Board's failure to include the Administrative Review and "Meet and Confer" provisions from Part 2, Section G.2 of the existing Permit at pages 21 and 22. These provisions provide a very important and informal procedure for resolving differences and misunderstandings regarding permit interpretation and implementation.

28. Part 4. - Industrial /Commercial Facilities Program - Pages 33-39. - As a general comment, we agree with the comments of most of the Permittees with respect to questionable legality and practicality of the proposed inspection program, particularly as it relates to facilities which may already be regulated by the Regional Board itself pursuant to the Statewide

R0006493

General Construction Permit. Furthermore, the Permittees believe that the current permit provides sufficient outreach and guidance to these facilities through the educational site visit program.

29. Part 4, Industrial Commercial Facilities Program, Section C(7), Pages 30-31. We believe that the additional outreach and education requirements set forth in this provision may be too costly for our Cities to develop. We recommend that the reference to "50 percent" should be deleted from this section.

30. Part 4.D.1-Development Planning- Page 40. The current Permit clearly provides that it applies to "all development projects requiring discretionary approval" (See, II.A.1. at page 33). The broad definitions of "development"and "redevelopment" contained in the Draft Permit greatly extend the scope of the proposed controls without consideration of either the municipalities' primacy in local land use decisions or the limitations on their authority. Nothing in the Draft Permit or the Board's fact sheet provides any justification for this extension.

    Furthermore, the scope of the proposed controls on *all* "development"and "redevelopment" goes beyond the scope of EPA's Phase I and Phase II Rules for Construction and Post-Construction Runoff Control. We believe that development control should only apply to"Discretionary Projects", as defined in Section 15357 of the Guidelines for Implementation of the California Environmental Quality, which applies to projects requiring the exercise of judgment or deliberation by a city in connection with the decision to approve or disapprove the project, as distinguished from situations where the city merely must determine whether there has been conformity with applicable statutes, ordinances, or regulations.

31. Part 4.D.1- Development Planning- Page 40. - The term "planning priority development" should be substituted with "Planning Priority Development" and "redevelopment" should be uppercase as it is a defined term.

32. Part 4.D.3. - SUSMP- Page 41. - Without re-arguing the issues and questions regarding the original SUSMP as ultimately revised and adopted by the State Board, the fundamental issue remains regarding the Board's compliance with Water Code § 13360 while dictating specific design standards in the Draft Permit.

33. Part 4.D.3.b.(7) - SUSMP- Page 42. - "Redevelopment" is a defined term in the Draft Permit and all references to it should be uppercase.

34. Part 4.D.4.- Applicability of Numerical Criteria - Page 42. - The term "planning priority project" is a defined term and should be uppercase.

35. Part 4.E.2(b) - Development Construction - Page 50. - The inspection requirements set forth in this provision are already the responsibility of the Regional Board under the Statewide General Construction Permit. If the Regional Board is unable to satisfy its obligation under the Statewide General Construction Permit, the Permittees may agree to carry out these inspections. However, any costs incurred by the Permittees should be reimbursed by the Regional Board from the fees collected for the Statewide General Construction Permit.

36. Part 4.F.2(c).-Public Construction Activities Management - Page 53 . We agree with the County that public agencies should be not be required to obtain a general construction permit for activities not currently regulated by the State Board.

37. Part 4.F.5(d) - Storm Drain Operation and Management - Page 56. The Draft Permit requires each Permittee to install and maintain trash receptacles at all transit stops within its jurisdiction. We agree with our Cities that the Regional Board has failed to consider the cost to each city for complying with this additional requirement. Consistent with the TMDL, the Permittees should be permitted to implement the most effective and cost efficient method for reducing trash. This requirement should be removed from the Draft Permit.

38. Part 4.F.6(c)(1)-(3) - Streets and Roads Maintenance - Page 58. The Draft Permit language in this section is overly broad and should be deleted. Section 402(p)(3)(B) of the CWA authorizes the issuance of permits for discharges "from municipal storm sewers" and not "into the MS4." (See comment 12.)

39. Part 4.G(1) - Illicit Connections and Illicit Discharges Elimination Program - Page 60. - We agree with the separate comments of our Cities that the mapping required under this provision of the Draft Permit is not practical, unduly burdensome. And not cost-effective.

40. Definitions-"Environmentally Sensitive Areas"- Page 65. - The project categories identified in the current NPDES Permit were based upon a conclusion that these types of projects have a greater likelihood of contributing contaminated run-off to the MS4. The State Water Resources Control Board in Order WQO No. 2000-11 excluded the additional category of "environmentally sensitive areas" from the SUSMP proposed by the RWQCB. The State Board did state that the "Regional Board may choose to consider the issue further when it reissues the permit." We can appreciate the Board's desire to protect wetlands from the impacts of development. However, the fundamental question still has not been addressed as to whether these areas, as defined in Public Resources Code § 30107.5, are adequately regulated and protected under existing laws and regulations administered by other agencies.

41. Section D.3 - p.63. The permit only addresses discharges from the MS4. This section should be modified to reflect that fact.

Reference: Revised - October 11, 2001 Draft Waste Discharge Requirements for Discharge of Stormwater in Los Angeles County (NPDES No. CAS614001)

Dear Xavier:

After reviewing our comment letter dated November 13, 2001 enclosing our comments regarding the final draft of the municipal NPDES Permit, we noticed a few non-substantive typographical errors. Accordingly, I have enclosed correct copies of our letter and comments.

I would appreciate it if you could substitute the corrected copies for those that we sent last week and include the corrected copies in the administrative record.

Please call me if you have any questions. Thank you for your cooperation.

Very truly yours,

John J. Harris

VIA FACSIMILE AND HAND DELIVERED

Mr. Dennis Dickerson
Executive Officer
California Regional Water Quality Control Board
Los Angeles Region
320 W. 4th Street, Suite 200
Los Angeles, California 90013

Re: October 11, 2001 Draft Waste Discharge Requirements for Discharge of Stormwater in Los Angeles County (NPDES No. CAS614001)

Dear Mr. Dickerson:

We have received and have reviewed the Regional Water Quality Control Board's (the "Regional Board") October 11, 2001 final draft of the Waste Discharge Requirements for Discharge of Stormwater in Los Angeles County (NPDES No. CAS614001) which, upon adoption, will serve as the NPDES Permit for the discharge of storm water and urban runoff from the municipal separate storm sewer system (the "MS4") in Los Angeles County (the "Draft Permit"). We have been asked by the Cities of Agoura Hills, Carson, Artesia, Beverly Hills, Hidden Hills, Norwalk, La Mirada, Monrovia, Rancho Palos Verdes, San Marino, San Fernando and Westlake Village (the "Cities") to submit comments to the Draft Permit on their behalf. (Some of these cities will also be submitting their own separate comments.) This letter supplements our letters of May 16, 2001 and August 6, 2001, which included our comments on the First and Second Drafts of the proposed NPDES permit, as well as our oral comments at the Regional Boards' workshop on the second draft of the Permit held on July 26, 2001 (the "Comments"). Our Comments are incorporated herein by this reference.

A number of fundamental policy issues regarding the scope and cost of the storm water management program prescribed by the Draft Permit have still not been completely resolved. However, the cities that we represent remain committed to work with the Regional Board to continue the substantial progress made by the Permittees in reducing pollution in and to Southern California water bodies through the implementation of the programs developed under the 1990 and 1996 Permits for the Los Angeles Basin and new programs which the Permittees have proposed for the renewed NPDES Permit.

While our comments address a number of different issues and unresolved questions, we thought it important to once again highlight some substantial issues in the Draft Permit

which have not been fully addressed or considered by the Regional Board's staff.

As I discussed at the second Board workshop, as well as in our Comments, we are particularly troubled about the deletion of the "Safe Harbor" provisions that were included in Receiving Water Limitations and Discharge Prohibition sections of the current Los Angeles County Municipal Storm Water Permit, Order No. 96-054 (the "Current Permit"). Neither the Discharge Prohibition provisions (Part 1, pp. 17-18), nor the Receiving Water Limitations provisions (Part 2, pp. 18-19) of the Draft Permit provide any assurance to our Cities that, once they have implemented the storm water management programs set forth in the Draft Permit in a timely and complete manner, they then will be deemed to be in compliance with the Discharge Prohibitions and Receiving Water Limitations provisions.

These "Safe Harbor" provisions provide the Permittees with important protections from third-party liability once they have implemented the storm water management programs prescribed in the Permit. If these provisions are not included in the Permit, then the Cities and the other Co-Permittees may potentially be exposed to unwarranted third party suits.

Our concerns are not just academic. In Carson Harbor Village, Ltd. v. Unocal Corporation, 990 F. Supp. 1188 (C.D. Cal 1997), the owner of land, which was allegedly contaminated by small quantities of lead contained in storm water runoff sued the County of Los Angeles and two Permittee cities under the Clean Water Act ("CWA"), CERCLA, RCRA and California common law. The District Court granted summary judgment on the CWA and state common law claims, based on the Permittees' compliance with the 1990 and 1996 Permits. That determination was affirmed on appeal. (See, Carson Harbor Village, Ltd. v. Unocal Corporation, et al., _____ F.3d _____; 2001 U.S.App.Lexis 2100; 2001 Daily Journal DAR 1647 (9th Cir. 2001).

Regional Board staff have stated that they feel constrained by the State Board's adoption of Receiving Water Limitation language for municipal NPDES permits in its WQO No. 98-01, which was subsequently amended in WQO No. 99-05. However, the State Board *specifically approved* the inclusion of these Safe Harbor provisions in WQO Order No. 98-01. In Environmental Health Coalition, WQO No. 98-01 (1998), the petitioner contended that the receiving water limitations section in the NPDES Permit for certain Orange County cities violated the CWA and implementing regulations because it did not require compliance with water quality standards. That permit, like the Current Permit, stated "...that the permittees 'will not be in violation of [receiving water limitations] so long as they are in compliance with the requirements' for evaluating the DAMP." The State Board specifically rejected the petitioners' contention, noting that it had previously approved the same "Safe Harbor" provision in SWRCB WQO No. 96-13, with respect to the storm water permit for certain permittees in the Santa Clara Valley issued by the San Francisco Bay

Regional Board. As the State Board stated:

> "The SWRCB has already determined that the use of BMPs to achieve both the technology-based effluent limitations and the water quality-based effluent limitations complies with the CWA and the Porter-Cologne Act. See SWRCB WQO No. 91-03. Accordingly, the SWRCB agrees that use of the phrase that the "permittees will not be in violation of . . ." complies with the CWA and, in fact, used that same phrase in SWRCB Water Quality Order 97-03-DWQ (Waste Discharge Requirements for Discharges of Storm Water Associated with Industrial Activities Excluding Construction Activities, NPDES General Permit No. CAS000001) (the General Industrial Permit)."

Furthermore, as the State Board noted in In the Matter of the Petition of Save San Francisco Bay Association, et al., WQO No. 96-13 , USEPA has approved the inclusion of a Safe Harbor provision in the Receiving Water Limitations.

Accordingly, the retention of the "Safe Harbor" provision found in the last two permits certainly would not be contrary to the State Board's order dictating the Receiving Water Limitations found in the Draft Permit, and, in fact, would be complementary to those limitations. No State Board order or directive dictates the deletion of the Safe Harbor provision from the Discharge Prohibitions.

Another important provision omitted from the Draft Permit, and referenced in our Comments, is the "Meet and Confer" procedure found in the Current Permit at Part I, Section G, page 21, which provides that, if the Executive Officer determines that a Permittee's storm water program is insufficient to meet the provisions of the Current Permit, then a "Notice of Intent to Meet and Confer" ("NIMC") will be issued to the Permittee. The NIMC is a very important, productive and non-contentious vehicle for Permittees to resolve storm water management program issues with the Regional Board without litigation.

The Regional Board has stated in discussions regarding the Draft Permit that, rather than utilizing the NIMC procedure, staff will rely on the issuance of a Notice of Violation ("NOV"). That sentiment was further echoed at the July 26, 2001 Public Workshop where legal counsel for the State Water Resources Control Board ("SWRCB") stated that the NIMC process is not an element of SWRCB Water Quality Enforcement Policy Resolution No. 96-030, as amended by Resolution No. 97-085 ("Enforcement Policy"), or its "Guidance to Implement the Water Quality Enforcement Policy" ("Guidance Document")

and, therefore, should not be contained in the Draft Permit.

We do not believe that the NIMC process is contrary in any respect to the State Board's Resolution Nos. 96-030 and 97-085, or to the effective development of regional storm water programs. The Enforcement Policy is based on the premise that actual violation of a WDR has occurred. The Enforcement Policy does not really address disagreements regarding the development or implementation of storm water programs, nor do the specific events identified in Sections III A. through H of the Enforcement Policy, which would trigger an enforcement referral, fit the circumstances of a Municipal NPDES Permit. The development and implementation of the regional storm water management programs will only be feasible and effective if state and local governmental agencies can work together in an open and collaborative manner. The enforcement process is, necessarily, adversarial and, in our view, would be counterproductive to the effective development of regional storm water programs.

In our Comments, we raised a number of questions regarding the legal implications of the process by which the Draft Permit was developed. To date, we have not received a full or direct response to those questions and concerns. We continue to believe that the Draft Permit, and the process which generated it, does not comply with applicable principles of California administrative law, and as a result, the Draft Permit has been developed without compliance with California's Administrative Procedure Act. California Government Code §§11340, et seq. (the "APA").

Also, as referenced in the Comments, we are concerned that, by setting specific design standards, the Regional Board and the State Board are crossing the line into an area typically handled through building codes which are supposed to be uniform throughout the state.

We would also like to express our concern on behalf of the Cities that the Regional Board may be exceeding its authority by attempting to prohibit the discharge of all storm water rather than the discharge of pollutants. In addition, the "Peak Flow Control" and post-construction "Numerical Design Criteria" requirements in the Draft Permit exceed the Regional Board's authority by specifically providing how the Permittees are to achieve the goal of reducing the discharge of pollutants to the waters of the United States. We also believe that this precise directive to the Permittees violates the limitations of Water Code § 13360(a), which provides in pertinent part:

> "No waste discharge requirements or other order of a regional board or the state board or decree of a court issued under this division shall specify the design, location, type of construction, or particular manner in which compliance may be

had with that requirement, order, or decree, and the person so ordered shall be permitted to comply therewith in any lawful manner."

Lastly, we would like to point out that our Cities are extremely disappointed with the elimination of the Executive Advisory Committee ("EAC") from the Draft Permit. To our Cities, the EAC has been a vehicle through which productive negotiations with the Regional Board regarding the Draft Permit have taken place. Additionally, at least our Cities have viewed the EAC negotiating process as being very useful in creating open and honest dialogue with the Regional Board regarding many of the difficult issues regarding implementation and enforcement of the Draft Permit. Even though the Regional Board and our Cities may not see eye-to-eye on all the issues, the EAC has provided a forum where the concerns from all stakeholders are acknowledged and discussed. In our opinion, the removal of the EAC from the Draft Permit will be taking a step backwards, rather than forward, in fostering a stronger relationship with the Regional Board, which is where our Cities believe we should be heading.

Our Cities have the same objectives of the Regional Board and the other stakeholders to achieve a consensus to preserve, restore and enhance the many beneficial uses of the ocean and the water bodies of Southern California. We hope that you will consider our comments and suggested changes in this spirit.

Very truly yours,

John J. Harris

Enclosure

COMMENTS ON OCTOBER 11, 2001 DRAFT WASTE DISCHARGE REQUIREMENTS FOR DISCHARGE OF STORM WATER IN LOS ANGELES COUNTY (NPDES NO. CAS614001)

by
John J. Harris
Jay F. Golida
Richards, Watson & Gershon

1. Finding D.2, Page 6. - The second sentence should be revised to read: "The Permittees may lack legal jurisdiction over these entities under state and federal constitutions and shall not be held responsible to ensure compliance with this Order."

2. Finding D.4, Page 7. - This finding should be modified as follows:

   "This Permit is intended **to allow the Permittees** to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water and urban runoff to the waters of the United States to the maximum extent practicable (MEP) from the permitted areas in the County of Los Angeles **subject to their jurisdiction**."

3. Finding D.5, Page 7. - The second sentence of this finding, "Permittees may control the contribution of pollutants to the MS4 from non-permittee dischargers such as CalTrans, the U.S. Department Defense, and other state and federal facilities, through interagency agreements" should be deleted. These other state and federal agencies have resisted any efforts by local agencies to exercise any jurisdiction over their property. The most practicable way of approaching the problems relating to discharges from non-jurisdictional facilities is through the separate NPDES permits for these facilities.

4. Finding E.5, Page 8. - This finding overstates the requirements of 40 C.F.R. 122.26 as it relates to the inspection of industrial and commercial facilities. At most, the regulations control potentially the inspection of priority industrial and commercial facilities, that is, those which contribute a substantial pollutant load to the MS4, as opposed to all industrial and commercial facilities. Finding No. 5 should be modified to reflect the regulations accurately.

5. Finding E.6, Page 8. - This finding states "The State Board's Chief Counsel has issued a statewide policy memorandum (dated December 26, 2000) which interprets the Order to provide broad discretion to Regional Boards and identifies potential future areas for inclusion in SUSMPs and the types of evidence and findings necessary." A legal memorandum by the State Board's Chief Counsel, while informative, is not a regulation and has no legal effect. We believe the reference should be deleted.

R0006502

6. Finding E.8, Page 9. - The NPDES Permit is not a vehicle to "implement and enforce" the TMDLs. The last sentence of this section should be deleted.

7. Finding E.18, Pages 10-11, bullet 1. - The State Board's Order in the Bellflower case, WQO No. 2000-11, specifically stated:

" We conclude that because RGOs are already heavily regulated and may be limited in their ability to construct infiltration facilities or to perform treatment, they should not be subject to the BMP design standards at this time, and **recommend that the Regional Water Board undertake further consideration of a threshold relative to size of the RGO, number of fueling nozzles, or some other relevant factor.** This Order should not be construed to preclude inclusion of RGOs in the SUSMP design standards, with proper justification, when the permit is reissued."

The Draft Permit does not reflect the State Board's directive regarding "a threshold relative to size of the RGO, number of fueling nozzles,..." or other factors. Similarly, the State Board's recent draft order, which will most likely be adopted on November 15, 2001, on the petitions of the Building Industry Association of San Diego County, et al., for review of the San Diego County Municipal Permit [NPDES NO. CAS0108758] deleted RGO's from the Priority Development Project Categories requiring a SUSMP.

Similarly, Order 2000-11 stated:

"While it may be appropriate to include more stringent controls for developments in ESAs, we also note that such developments are already subject to extensive regulation under other regulatory programs. Moreover, in light of the permit language limiting the SUSMPs to development categories, ESAs are not an appropriate category within the SUSMPs. The Regional Water Board may choose to consider the issue further when it reissues the permit."

The Draft Permit does not reflect any further consideration as to how the proposed controls of "environmentally sensitive areas" enhance the existing "extensive regulation under other regulatory programs."

8. Finding E.19, Page 11. - Among other things, this finding states "The Regional Board has determined that the creation of structural or treatment control BMPs for stormwater mitigation in waters of the U.S. is not permissible." However, no citation or reference to that "determination" is included. The statement appears to be inconsistent with the Board's position with respect to requiring structural and treatment control BMPs as part of SUSMP requirements.

9. Finding E.20, Page 11. - The term "Watershed Management Approach" appears to be used as a defined term, but this term is not defined in the Draft Permit. Accordingly, change "Watershed Management Approach" to "watershed management approach" or in the

alternative, provide a definition in the new Permit.

10. Finding E.25, Page 13. - This finding should be modified to include the following sentence: "The California Water Code Section 13360(a) prohibits the Regional Board from issuing a waste discharge requirement that specifies the design, location, type of construction, and particular manner in which compliance with this Order may be had.

11. Section F.1, Page 13. - The Draft Permit unilaterally eliminates the Executive Advisory Committee ("EAC") Permit. The EAC is a creation of the Current Permit. The EAC has played an important role during negotiations with the Regional Board and in providing assistance to the co-permittees. There is no legitimate reason for the EAC to be removed from the Draft Permit as it serves an important function to the Permittees. We recommend that this section, as well as the other references to the EAC in prior versions of the Draft Permit, be reinstated.

12. New Finding, F.1, Page 13. - We disagree with the proposed language that: "For water quality purposes, the Regional Board considers that all new development and significant redevelopment activity in specified categories, that receive approval or permits from a municipality, are subject to storm water mitigation requirements." As discussed in the comments of other Permittees, cities have a very limited ability to prescribe storm water mitigation requirements for ministerial permits. Similarly, there is no factual basis for a broad finding that any development or redevelopment project has an impact on water quality.

13. Finding F.3, Page 14. - The clause in the second sentence of this finding, "... the discharge of non-storm water has been effectively prohibited.", should be deleted.

14. Finding F.8, Page 15. - The reference to a "petition" to the Executive Officer appears to be unsupported. Neither the Draft permit nor the applicable statutes and regulations provide a procedure for such a petition. As discussed in our Comments, the "Notice of Intent to Meet and Confer" process ("NIMC") from the Current Permit should be retained.

15. Part 1, Section 2(c)- Discharge Prohibitions- Page 16 - We believe that the discharges which were conditionally exempt under Part II, Section II.C.2.(a), (g) and (h) of the existing Permit for landscape irrigation and lawn watering should be included in Part1, Section 2(c) of the Draft Permit, in accordance with applicable federal regulations.

16. Part1- Discharge Prohibitions- Page 16. - The proposed Discharge Prohibitions omit a important exception set forth in Section1(C) of Part 1 at Page 12 of the Current Permit for "Discharges originating from federal, state or other facilities which the Permittee is pre-empted from regulating." This provision should be included in the new Permit.

R0006504

17. Part1- Discharge Prohibitions- Page 16. - As discussed in detail in our cover letter, the Discharge Prohibitions omit a very significant and critically important provision of the Current Permit found in Section 1 of Part 1 at Page 12, which states:

"Compliance with this Order through the timely development and implementation of programs described herein shall constitute compliance with this prohibition."

This provision which has been approved by the State Board, should be included in the new Permit.

18. Part 2- Receiving Water Limitations, Sections 1 and 2- Page 18. - As referenced in our Comments, if this language is to remain, we propose that it be consistent with the draft language of Part III., Sections 1 and 2, Page 16, the Santa Ana Region Permit. We recommend that the Regional Board replace Section 1 and Section 2 with the following:

1. "Discharges of storm water from the MS4s to waters of the United States containing pollutants that have not been reduced to the maximum extent practicable is prohibited."

2. "Discharges from the MS4s shall not cause or contribute to a condition of contamination, nuisance, or pollution in waters of the State as defined in Section 13050 of the Water Code."

It should also be noted that in the recently released draft order of the State Water Resources Control Board, which will most likely be adopted on November 15, 2001, in response to the Petitions of the Building Industry Association of San Diego County and Western States Petroleum Association for Review of Waste Discharge Requirements Order No. 2001-01 for Urban Runoff from San Diego County [NPDES NO. CAS0108758], the State Board stated that, among other things, "The permit should be revised to reflect that MEP be achieved for discharges from the MS4, to waters of the United States, but not for discharges into the MS4."

19. Part 2- Receiving Water Limitations- Page 18. - The Receiving Water Limitations also omits an important provision of the Current Permit in Part II at Page 12, which states:

"Timely development and complete implementation of the storm water management programs described in this Order shall satisfy the requirements of this section and constitute compliance with receiving water limitations."

This provision should also be included in the new Permit after Section 4 on page 19.

R0006505

20. Part 2- Receiving Water Limitations- Section 3(a)- Page 18. - The imposition of additional discharge reporting requirements, as set forth in this section, is not supported by state or federal statutory or regulatory authority. This section would appear to require Permittees to report third party discharges.

21. Part 3.G.1(f)- Legal Authority- Page 24. - The reference to discharges from swimming pools should match the existing permit language to "prohibit the discharge of commercial swimming pool filter backwash to the MS4." (See, Section 1.E.1.(a)(v)of the current Permit, at page 18).

22. Part 3.G.1(h)- Legal Authority- Page 24. - This section should be modified to track the language of Section 1.E.1(a)(vii), at page 18 of the existing permit, and, in particular, to refer to *untreated* runoff.

23. Part 3.G.1(j)(2) - Legal Authority- Page 24. - A list setting forth the state or federally banned pesticides, fungicides or herbicides should be provided.

24. Part 3.G.2(a)- Legal Authority- Page 25. Insert the word "to" after "Require persons within their jurisdictions" in the first sentence.

25. Part 3.G.2(c)- Legal Authority- Page 25. Delete the reference to "potential contribution"in the first sentence as it is vague, subject to varying interpretation and contrary to the specific direction stated by Chairman Nahai at the Regional Board workshop for the second Draft Permit held on July 26, 2001 which was that the Regional Board should eliminate the use of vague terminology which may be subject to varying interpretation.

26. Part 3.G.2(d)- Legal Authority- Page 25. - We agree with the County's and other Permittees' concerns regarding both the feasibility and enforceability of the new inspection requirements set forth in the Draft Permit, which go far beyond the scope of the provisions of 40 CFR 122.26(d)(2)(iv).

27. Administrative Review- As discussed in our cover letter, we are particularly concerned by the Board's failure to include the Administrative Review and "Meet and Confer" provisions from Part 2, Section G.2 of the existing Permit at pages 21 and 22. These provisions provide a very important and informal procedure for resolving differences and misunderstandings regarding permit interpretation and implementation.

28. Part 4. - Industrial /Commercial Facilities Program - Pages 33-39. - As a general comment, we agree with the comments of most of the Permittees with respect to questionable legality and practicality of the proposed inspection program, particularly as it relates to facilities which may already be regulated by the Regional Board itself pursuant to the Statewide

R0006506

General Construction Permit. Furthermore, the Permittees believe that the current permit provides sufficient outreach and guidance to these facilities through the educational site visit program.

29. Part 4, Industrial Commercial Facilities Program, Section C(7), Pages 30-31. We believe that the additional outreach and education requirements set forth in this provision may be too costly for our Cities to develop. We recommend that the reference to "50 percent" should be deleted from this section.

30. Part 4.D.1-Development Planning- Page 40. The current Permit clearly provides that it applies to "all development projects requiring discretionary approval" (See, II.A.1. at page 33). The broad definitions of "development"and "redevelopment" contained in the Draft Permit greatly extend the scope of the proposed controls without consideration of either the municipalities' primacy in local land use decisions or the limitations on their authority. Nothing in the Draft Permit or the Board's fact sheet provides any justification for this extension.

    Furthermore, the scope of the proposed controls on *all* "development"and "redevelopment" goes beyond the scope of EPA's Phase I and Phase II Rules for Construction and Post-Construction Runoff Control. We believe that development control should only apply to"Discretionary Projects", as defined in Section 15357 of the Guidelines for Implementation of the California Environmental Quality Act, which applies to projects requiring the exercise of judgment or deliberation by a city in connection with the decision to approve or disapprove the project, as distinguished from situations where the city merely must determine whether there has been conformity with applicable statutes, ordinances, or regulations.

31. Part 4.D.1- Development Planning- Page 40. - The term "planning priority development" should be substituted with "Planning Priority Development" and "redevelopment" should be uppercase as it is a defined term.

32. Part 4.D.3. - SUSMP- Page 41. - Without re-arguing the issues and questions regarding the original SUSMP as ultimately revised and adopted by the State Board, the fundamental issue remains regarding the Board's compliance with Water Code § 13360 while dictating specific design standards in the Draft Permit.

33. Part 4.D.3.b.(7) - SUSMP- Page 42. - "Redevelopment" is a defined term in the Draft Permit and all references to it should be uppercase.

34. Part 4.D.4.- Applicability of Numerical Criteria - Page 42. - The term "planning priority project" is a defined term and should be uppercase.

R0006507

35. Part 4.E.2(b) - Development Construction - Page 50. - The inspection requirements set forth in this provision are already the responsibility of the Regional Board under the Statewide General Construction Permit. If the Regional Board is unable to satisfy its obligation under the Statewide General Construction Permit, the Permittees may agree to carry out these inspections. However, any costs incurred by the Permittees should be reimbursed by the Regional Board from the fees collected for the Statewide General Construction Permit.

36. Part 4.F.2(c).-Public Construction Activities Management - Page 53 . We agree with the County that public agencies should be not be required to obtain a general construction permit for activities not currently regulated by the State Board.

37. Part 4.F.5(d) - Storm Drain Operation and Management - Page 56. The Draft Permit requires each Permittee to install and maintain trash receptacles at all transit stops within its jurisdiction. We agree with our Cities that the Regional Board has failed to consider the cost to each city for complying with this additional requirement. Consistent with the TMDL, the Permittees should be permitted to implement the most effective and cost efficient method for reducing trash. This requirement should be removed from the Draft Permit.

38. Part 4.F.6(c)(1)-(3) - Streets and Roads Maintenance - Page 58. The Draft Permit language in this section is overly broad and should be deleted. Section 402(p)(3)(B) of the CWA authorizes the issuance of permits for discharges "from municipal storm sewers" and not "into the MS4." (See comment 12.)

39. Part 4.G(1) - Illicit Connections and Illicit Discharges Elimination Program - Page 60. - We agree with the separate comments of our Cities that the mapping required under this provision of the Draft Permit is not practical, unduly burdensome, and not cost-effective.

40. Definitions-"Environmentally Sensitive Areas"- Page 65. - The project categories identified in the current NPDES Permit were based upon a conclusion that these types of projects have a greater likelihood of contributing contaminated run-off to the MS4. The State Water Resources Control Board in Order WQO No. 2000-11 excluded the additional category of "environmentally sensitive areas" from the SUSMP proposed by the RWQCB. The State Board did state that the "Regional Board may choose to consider the issue further when it reissues the permit." We can appreciate the Board's desire to protect wetlands from the impacts of development. However, the fundamental question still has not been addressed as to whether these areas, as defined in Public Resources Code § 30107.5, are adequately regulated and protected under existing laws and regulations administered by other agencies.

41. Section D.3 - p.63. The permit only addresses discharges from the MS4. This section should be modified to reflect that fact.

Dr. Xavier Swamikannu
Calif. Regional Water
Quality Control Board
Los Angeles Region
Storm Water Program
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Re: Los Angeles Regional Water Quality Control Board, October 11, 2001
Draft NPDES Permit No. CAS004001

Dear Dr. Swamikannu:

This office represents The City of Signal Hill and a number of other Cities in the County of Los Angeles who are members of an ad hoc coalition known as the Coalition For Practical Regulation, in connection with the above referenced permit. The purpose of this letter and the attached comments, is to provide further comment to the Regional Board on its Third Draft of the subject NPDES permit, dated October 11, 2001 (hereinafter "Tentative Permit"), and to further ***supplement*** the extensive comments already provided to Regional Board in prior written comments and in meetings with Regional Board representatives. Although changes were made to the Second Draft of the Permit to address certain deficiencies, numerous concerns and problems remain.

Accordingly, the attached comments are intended to further supplement the comments previously submitted on behalf of the Coalition to the Regional Board on May 15, 2001 and October 11, 2001. Thank you for your consideration of these comments.

In addition, given the ongoing Facilitation Process presided over by US EPA concerning the subject Permit, and the attempt by US EPA to resolve some of the disputes over the language in the Tentative Permit, these Permittees respectfully request that the US EPA Facilitator be given sufficient time to attempt to resolve many

of the key disputes in issue, and that the adoption of the Permit be delayed at least for 90 days to allow the Facilitation Process to move forward.

We look forward to the adoption of an NPDES permit for Los Angeles County that complies with the requirements of the State and federal law. Please do not hesitate to contact the undersigned, should you have any questions with respect to the above or the enclosed.

Sincerely,

RUTAN & TUCKER, LLP

Richard Montevideo

O. VARIOUS DEFINITIONS WITHIN THE PERMIT ARE IMPROPER AND CONTRARY TO LAW. 30

A. THE LEGAL AUTHORITY PROVISIONS IN THE PERMIT CONFLICT WITH STATE AND FEDERAL LAW AND THE PERMIT VIOLATES THE MEP STANDARD

Under Section 402 of the Clean Water Act, ("CWA"), (33 U.S.C. § 1342(p)(3)(B), the CWA authorizes the issuance of permits for discharges "***from***" municipal storm sewers." (33 U.S.C. § 1342(p)(3)(B).) NPDES Permits are not authorized for discharges "***to***" the municipal storm sewer under the CWA or otherwise. The State Water Resources Control Board recently supported this interpretation in a draft order dated November 2, 2001 ("Draft Order") concerning a petition involving the San Diego Regional Board's MS4 NPDES Permit for San Diego County. The State Board commented that: "[w]e find that the permit language is overly broad because it applies the MEP standard not only to discharges "***from***" MS4s, but also to discharges "***into***" MS4s." (Draft Order, p. 11.) The Tentative Permit in issue is similarly overly broad, as it misapplies the MEP standard and attempts to require municipalities to control, inspect and regulate the discharge of pollutants ***to*** MS4s," as opposed to "***from***" MS4s. As such, the Tentative Permit is contrary to the Clean Water Act and the Porter-Cologne Act.

Moreover, the regulations under the CWA only require that municipalities demonstrate "Adequate Legal Authority" as necessary to "[c]ontrol through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with ***industrial activity*** and the quality of storm water discharges from sites of ***industrial activity***." There are no other requirements imposed upon a municipality to "control" the contribution of pollutants ***to*** the MS4 and thus, no authority to require municipalities to regulate through "ordinance, permit, contract, order or similar means" discharges from any other facilities "***to***" its MS4.

The terms of the Tentative Permit thus exceed the MEP standard and the terms of the CWA in each location where it requires that municipalities "control" the discharge of pollutants "***to***" their MS4. For example, on page 25 of the Tentative Permit, under section G, entitled "Legal Authority," subsection 2, the Permit requires that the Permittees possess adequate legal authority to: (c) "Control pollutants, ***including potential contribution***, in discharges of storm water runoff associated with industrial activities (including construction activities) to its MS4 and control of the quality of storm water from industrial sites (including construction sites)..., [and] (d) Carry out all inspection, surveillance, and monitoring procedures necessary to determine compliance and non-compliance with permit conditions, including the prohibition of illicit discharges to the MS4. Permittees must possess authority to ***enter, sample, inspect, review and copy records, and require regular reports*** from industrial facilities (including construction sites) discharging polluted or with the potential to discharge polluted storm water runoff into its MS4." (Tentative Permit, p. 25.)

The requirement of "controlling" pollutants "to" the MS4 including "***potential contribution,***" and requiring the entry, inspection, and copying of records and regular

reporting, from industrial facilities that have the "potential to discharge polluted storm water runoff," are requirements that are ***not*** authorized anywhere under the Clean Water Act ("CWA") or the Porter-Cologne Act, and are requirements that go beyond the MEP standard and any authority that either the Regional Board or the Permittees may otherwise have under State or federal law.

The regulations to the CWA further confirm this legal standard in part in the "Adequate Legal Authority" section of the regulations, wherein the "control" of the storm water discharges in an MS4 Permit is clearly to be limited to storm water discharges that are associated with ***industrial activity***, and, moreover, specifically the "contribution ***of pollutants***," rather than the "***potential contribution***" of pollutants. Thus, the expansion of the MEP standard to "controlling" the discharge of any pollutants in storm water "***to***" the MS4, conflicts with State and federal law, as does the attempt to require municipalities to control the "***potential contribution***" of pollutants to or from the MS4.

Additionally, Section 2(e) on page 25 of the Permit requires that the Permittees: "Require the use of best management practices ("BMPs") to prevent or reduce the discharge of pollutants ***to*** MS4s to the maximum extent practicable," and subsection (f) provides that the Permittees are to "[r]equire that treatment control BMPs be properly operated and maintained to prevent the breeding of vectors." (Tentative Permit p. 25.) Such provisions of the Permit again are in conflict with the terms of the Clean Water Act and the MEP standard and must be revised accordingly. As set forth in the State Board's Draft Order in connection with the San Diego Permit:

> The permit should also be revised so that it requires that MEP be achieved for discharges "from" the municipal sewer system, and for discharges "to" waters of the United States, but not for discharges "into" the sewer system. (See Draft Order, p. 17.)

Similarly, under Part 3.A of the Tentative Permit in issue, the Regional Board seeks to impose certain requirements on the Permittees as a part of the Stormwater Quality Management Program "SQMP," "so as to reduce the discharges of pollutants ***in*** storm water to the maximum extent practicable," and which is to be implemented by the Permittees, along with additional controls where necessary, "to reduce the discharge of pollutants ***in*** storm water to the maximum extent practicable." (See Tentative Permit, p. 20, Part 3.A. and Part 3.B.)

Similar language is utilized in the definition of "Maximum Extent Practicable Standard" set forth in Part 4 on page 27 of the Tentative Permit, whereby the Permit seeks to define the standard as one of reducing "the discharge of pollutants ***in*** storm water to the MEP from the permitted areas in the County of Los Angeles to the waters of the State," as opposed to reducing the discharge of pollutants "***from***" municipal storm sewers. (See 33 USC § 1342(p)(3)(B).)

Further, similar language is contained in Versions A and B of the Industrial/Commercial Facilities Program which again conflicts with the MEP Standard

(i.e., "[t]he objective is to reduce pollutants ***in*** storm water runoff to the maximum extent practicable . . . ."). Finally, there is language in the Industrial/Commercial Facilities Program Versions A and B in connection with BMP implementation, which mandates Permittees require implementation of other BMP's that will achieve the equivalent reduction of pollutants "***in***" storm water discharges.

In sum, throughout the Tentative Permit, the Regional Board has attempted to improperly expand the MEP standard and the requirements Clean Water Act and the Porter-Cologne Act, adopted in part to carry out the requirements of the Clean Water Act, see Water Code § 13370 *et seq.*), in a fashion that goes beyond the terms of these statutory requirements.

B. THE VARIOUS VERSIONS OF THE INSPECTION, ENFORCEMENT, MONITORING AND REPORTING OBLIGATIONS TO BE IMPOSED ON THE PERMITTEES FOR INDUSTRIAL/COMMERCIAL FACILITIES CONTINUE TO BE IN EXCESS OF THE AUTHORITY PROVIDED UNDER STATE AND FEDERAL LAW.

With respect to those portions of the Permit requiring Permittees to inspect certain industrial and commercial facilities, such as restaurants, automotive repair shops, and retail gasoline outlets, the CWA regulations are very clear that municipalities are only required to conduct inspections of "industrial facilities," and even further, with limited exception not applicable here, only those industrial facilities that "***the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system.***" (See 40 CFR § 122.26(d)(2)(iv)(C).)

Thus, under the plain language of the CWA regulations, the inspection obligations on municipalities are expressly limited to inspections of "industrial facilities," and at that, only as necessary to determine compliance and noncompliance with permit conditions where the "***municipal permit applicant***" determines that such industrial facilities "***are contributing a substantial pollutant*** loading to the municipal storm sewer system." There is, moreover, no requirement or other legal authority to compel municipalities to "***control***" pollutants from any "***commercial***" facility, or to inspect any "***commercial***" facility.

In addition, there is no authority that either requires or authorizes Permittees to ***enter, sample, inspect, review*** and ***copy records*** of facilities without a warrant and probable cause. Without the consent of the property owner, and without at least reasonable suspicion of a violation, combined with exigent circumstances, warrantless searches of facilities, along with the seizure of company, records plainly violates the Fourth Amendment to the United States Constitution. Similarly, in the definition of "Inspection" in the Tentative Permit, the Regional Board seeks to require, as a part of all such inspections, the interrogation of facility personnel ("interview of facility personnel"), which, if is done in the context of a "violation," may in and of itself result in a violation of the Fifth Amendment to the U.S. Constitution. (See Tentative Permit, p. 66.)

As discussed in our prior Comment Letter of August 6, 2001, Regional Board staff had previously relied upon ordinances adopted by certain Los Angeles County cities, to claim that warrantless inspections of facilities would be legally appropriate. Board Staff further claimed that such Ordinances were broad enough to comply with the inspection requirements of the Permit. Yet, the Ordinances of three of the cities referenced at the workshop (Beverly Hills, Hermosa Beach and El Monte) were reviewed, and, all contained language showing that these Cities were in fact concerned about appropriate authority to enter upon private property, without a warrant, and, each Ordinance expressly conditioned warrantless entry upon consent by the property owner. (See attachments to August 6, 2001 Comment Letter.)

The inspection process set forth under Part 4.C. of the Permit includes three different versions of the program, presumably with Version A being Staff's preferred version, and Version C being Staff's least preferred version. All three versions include a requirement of inventorying certain facilities by the Permittees, but with Version C entitled "Industrial/Commercial Education Program," requiring the Principal Permittee (in consultation with the Permittees) to maintain and update a database for listing industrial/commercial facilities by SIC number.

Both Versions A and B, without appropriate findings and without evidentiary support, identify facilities such as restaurants, automotive service stations, automotive dealers/gas stations and wholesale trade (scrap, auto dismantling, fabricated metal products, motor freight, chemical/allied products, and primary metal product facilities) as high priority categories. Yet, none of these facilities, unless subject to a Phase I permit, are "industrial facilities" subject to "control" by the Permittees under either the CWA or the regulations thereunder. Accordingly, there is no authority for the Regional Board to include these facilities or any others except those identified in the regulations, as "high priority" categories, as such is contrary to the express language in the regulations (which gives this discretion to the municipalities, i.e., those facilities the "***municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system***" (40 CFR 122.26(d)(iv)(C)).)

In addition, under Versions A and B of the Industrial/Commercial Program, "lower priority categories" facilities are to be visited within 24 months from the Permit's effective date, and the Permittees are to develop and implement a program to conduct "spot checks" of such lower priority facilities after the initial 24 months, excepting only those facilities that pose "no risk of exposure." As the provisions of the CWA and the regulations thereto do ***not*** provide the authority for the Regional Board to impose such inspection requirements on municipalities, these provisions are again contrary to the express language of the regulations, and similarly violate the MEP standard, as they constitute controls on discharges "***to***" the MS4.

To the extent the CWA regulations are being interpreted by the Regional Board to impose on municipalities, requirements that go beyond controlling the discharge of pollutants to the maximum extent practicable "from" the MS4, such an interpretation is contrary to the clear terms of the Clean Water Act itself, and the regulations. Further, to the extent the Regional Board interprets the regulations in such a manner so as to

exceed the authority provided to EPA in the CWA, or to be contrary to the CWA, such an interpretation is similarly invalid. (See, e.g. *Chevron USA v. Natural Resources Defense Council, Inc.* 467 U.S. 837, 842-844 (1984).)

In addition to the lack of authority to impose such obligations under federal law, it is apparent that under State law as well, the Regional Board cannot compel municipalities to conduct such inspections, unless there is express statutory authority to do so. In a 1993 California Attorney General Opinion involving the responsibility of local building departments to enforce the access requirements of the Americans with Disabilities Act ("ADA") (see 76 Op. Atty. Gen. Cal. 130), the Attorney General concluded that since the ADA did not provide for the enforcement of federal law by local building officials, State law did not and could not mandate local building officials to enforce the federal access requirements under the ADA. The Attorney General found that in enforcing State and local building regulations, local building officials may not elect to assume greater or different enforcement powers than those specifically or necessarily implied under California law (citing *Ferdig v. State Personnel Board* (1969) 71 Cal.2d 96, 103-104), and concluded that: ***"[w]e therefore conclude that local building departments are not responsible for enforcing the access requirements of the ADA;*** however, they are required to enforce State and local building codes which have incorporated the federal requirements. ***Local building departments are not authorized to elect to enforce the federal access standards apart from the CBSC and local codes."***

Similarly, in a 1984 Attorney General decision involving whether a city or county has the authority to establish a licensing and inspection program to regulate the transportation of hazardous materials over roadways within its jurisdiction (67 Op. Atty. Gen. Cal.1), the Attorney General again concluded that a city or county has only limited authority and that, unless the State Legislature "expressly authorized" a licensing or inspection program at the local level, a local program would be in conflict with among other matters, the "***constitutional grant of the police powers authority***".

Accordingly, the terms of the Tentative Permit concerning the inspection of industrial/commercial facilities are not authorized anywhere under the Clean Water Act or the Porter-Cologne Act, and are invalid, as neither the Regional Board nor the Permittees have the respective authority to impose such inspection requirements or to conduct such inspections.

C. THE RECEIVING WATER LIMITATION LANGUAGE UNDER PART 2 OF THE DRAFT PERMIT EXCEEDS THE STANDARDS AND AUTHORITY PROVIDED UNDER STATE AND FEDERAL LAW

As discussed above, under Section 402 of the CWA, permits for discharges "**from** municipal storm sewers" are to be issued to "require controls to reduce the discharge of pollutants to the ***maximum extent practicable*** . . . ." Similarly, under Section 13263(a) of the Porter-Cologne Act, waste discharge requirements ("WDRs") are to be issued:

> . . . with relation to the conditions existing in the disposal area or receiving waters upon, or into which, the discharge is made or proposed. The requirements shall implement any relevant water quality control plans that have been adopted, and shall take into consideration the beneficial uses to be protected, ***the water quality objectives reasonably required for that purpose,*** other waste discharges, the need to prevent nuisance, and the provisions of ***Section 13241.*** (Cal. Water Code § 13263.)

Under Section 13241 of the Porter-Cologne Act, the factors to be considered are to include: (a) Past, present, and probable future beneficial uses of water; (b) Environmental characteristics of the hydrographic unit under consideration, including the quality of water available thereto; (c) Water quality conditions ***that could reasonably be achieved*** through the coordinated control of all factors which affect water quality in the area; (d) ***Economic considerations***; (e) ***The need for developing housing within the region***. (See Cal. Water Code § 13241).

As written, Parts 2.1 and 2.2 of the draft Permit prohibit "discharges from the MS4 that cause or contribute to the violation of water quality standards or water quality objectives," and discharges from the MS4 storm water which "cause or contribute to a condition of nuisance." Such prohibitions and requirements are contrary to the MEP standard under the CWA, i.e., to control the discharge of pollutants "from" MS4s "***to the maximum extent practicable***," and the standards under the Porter-Cologne Act, i.e., water quality objectives "***reasonably required***" and water quality conditions that "***could reasonably be achieved***." (Water Code §13263(a) and 13241(c).)

The very purpose of issuing an NPDES Permit and WDRs is to specifically allow for the discharge of storm water (which, by definition, includes storm water runoff) and to specifically allow for the discharge of "waste" (to the extent the pollutants in storm water runoff constitute waste) to, among other areas, "receiving waters." In fact, the CWA includes a very specific process, i.e., the TMDL process, which recognizes that water quality objectives are to be met over time through an "iterative process." The "iterative process" was moreover, recently supported by the State Board in Order No. 99-05, and more recently in the State Board's Draft Order in connection with the San Diego MS4 NPDES permit. In the Draft Order, the State Board confirmed that the process to be followed is to be an "iterative approach," which focuses on timely improvement of BMPs: "We will generally not require 'strict compliance' with water quality standards through numeric effluent limitations and we continue to follow an iterative approach, ***which seeks compliance over time***. The iterative approach is protective of water quality, but at the same time considers ***the difficulty of achieving full compliance through BMPs that must be enforced throughout large and medium municipal storm sewer systems***." (Draft Order, p. 9.)

With respect to the San Diego MS4 Permit, the State Board tentatively determined[1] that the receiving water limitation language was deficient as it did not make clear that the "iterative process" was to be applied to both the receiving water limitation language as well as the language concerning exceedances of water quality objectives.[2]

With the Tentative Permit, additional language must be added to clarify that compliance with the iterative process constitutes compliance with the terms of the Permit, and that so long as Permittees are taking significant steps towards achieving compliance with water quality objectives and are making reasonable progress in this regard, the Permittees are in compliance with the relevant terms of the Permit and thus, are in compliance with the Clean Water Act and the Porter-Cologne Act. In a recent State Board Order, State-Wide General NPDES Permit for Discharges of Aquatic Pesticides to Surface Waters, Order No. 2001-12 DWQ, in fact the State Board included language consistent with the change requested herein. In the Receiving Waters Limitation Section in Order No. 2001-12 DWQ, the State Board concluded that: "A discharger will not be in violation of receiving water limitation F.2 as long as the discharger has implemented the BMPs required by this General Permit and the following procedure is followed: . . . ." (See Order No. 2001-12-DWQ, p. 9.)

Accordingly, similar language must be added to the Tentative Permit since, without such language, the Permit will be inconsistent with the MEP standard and in conflict with the standard for issuing WDRs under the Porter-Cologne Act.

D. THE PERMIT VIOLATES THE CALIFORNIA ENVIRONMENTAL QUALITY ACT.

1. The Development Planning Requirements are Pre-empted by CEQA.

The provisions of the California Environmental Quality Act ("CEQA") "occupy the field" of mitigating adverse environmental impacts from development "projects" and the imposition of mitigation measures by a public agency to mitigate potentially significant adverse impacts created by such projects. In *Leslie v. Superior Court* (1999) 73 Cal.App.4th 1042, the Court found that the State Legislature had expressed its intent to fully occupy the field of building standards by enacting uniform Statewide building laws,

---

[1] The State Board is scheduled to conduct a hearing on its proposed Order concerning the Petition on the San Diego Permit on November 15, 2001. Once issued, Permittees herein request that a copy of the State Board's final Order be made a part of this Administrative Record.

[2] In the Draft Order, the State Board commented on the ability of the San Diego Regional Board to take enforcement action for discharges causing or contributing to exceedances of water quality objectives while the MS4 Permittees are similarly complying with the requirements to improve BMPs over time. In reviewing this portion of the San Diego Permit, the State Board determined not to strike those provisions, but did state that "it is our review that it would ***not*** be appropriate for the Regional Water Board to take enforcement action against a Permittee for causing or contributing to an exceedance of a water quality standard if the Permittee is complying with the procedure set forth in receiving water limitation C.2. We reached this conclusion with the understanding that dischargers must take significant steps to achieve compliance with water quality objectives, and that if there is not reasonable progress in improving BMPs, that Regional Water Boards may take enforcement action ." (See Draft Order, p. 10).

and demanding that local governments adopt Uniform Building Codes and California building standards. There, the local government was precluded by the doctrine of preemption from enacting building standards that differed from State standards, unless a State statute specifically authorized the local government to do so. Also *see Building Industry Assn. v. City of Livermore* (1996) 45 Cal.App.4th 719, cited by *Leslie v. Superior Court*, where the Court found that:

> "Our state Legislature has clearly expressed its intent to ***fully occupy the field*** of building standards. Consequently, a local government is precluded from enacting building standards that differ from state standards unless a state statute specifically authorizes the local government to do so." (*Id.* at 724; emphasis added.)

In Public Resources Code sections 21000 and 21001, the Legislature expressed its intent with the adoption of CEQA, that:

> "(f) The interrelationship of policies and practices in the management of natural resources and waste disposal requires systematic and concerted efforts by public and private interests to enhance environmental quality ***and to control environmental pollution.***
>
> ***(g)*** It is the intent of the Legislature that all agencies of the state government which regulate activities of private individuals, corporations, and public agencies which are found to affect the quality of the environment, shall regulate such activities ***so that major consideration is given to preventing environmental damage, while providing a decent home and satisfying living environment for every Californian."***

(Pub. Res. § 21000.)

> The Legislature further finds and declares that it is the policy of the State to:
>
> "(d) Ensure that the long-term protection of the environment, ***consistent with the provision of a decent home and suitable living environment for every Californian***, shall be the guiding criteria in public decisions.
>
> . . .
>
> (g) Require governmental agencies at all levels to consider qualitative factors as well as economic and technical factors and long-term benefits and costs, in addition to short-term benefits and costs and to consider

alternatives to proposed actions affecting the environment."

(Pub. Res. Code § 21001.)

In adopting CEQA, the State Legislature thus determined that public agencies are not to approve "projects" if there are ***feasible alternatives*** or ***feasible mitigation*** measures, which would substantially lessen the significant environmental effects of such projects. The term "feasible" is defined under CEQA to mean "capable of being accomplished in a successful manner within a reasonable period of time, ***taking into account economic, environmental, social, and technological factors.***" (Pub. Res. Code § 21061.1) It is evident from the express terms of CEQA, that the Legislature has already established a procedure to be followed to "control environmental pollution," and to establish "feasible" mitigation measures, which process requires not only the long term protection of the environment, but also the approval of projects that are consistent with the provision of a decent home and suitable living environment for every Californian, as well as the consideration of "alternatives to proposed actions" effecting the environment.

In fact, in the CWA regulations concerning Phase II Permits, EPA specifically recognized the importance of conforming with State law, and characterized the application of such NPDES Permits, stating that they are to require the permittees to "use an ordinance or other regulatory mechanism to address post-construction runoff from new development and redevelopment projects ***to the extent allowable under State, Tribal or local law.***" (64 Fed.Reg. 68721, 68760; emphasis added.) The California Legislature has already determined that public agencies are to comply with the requirements of CEQA in reviewing development "projects" and in imposing environmental mitigation measures as conditions on the approval of such "projects."

In short, the CEQA process is the legislative process to be followed in determining the appropriate methods and alternatives to mitigate adverse impacts on the environment, including "pollution to the environment" arising from development "projects." Any attempt by the Regional Board to infringe upon this process of assessing and mitigating adverse impacts is thus preempted by existing State law.

The Legislature has also identified, through statute and regulation, various statutory and categorical exemptions to CEQA, which further preempt the attempts by the Regional Board to regulate "development projects." For example, CEQA only applies to "**discretionary**" projects. "***Ministerial***" projects are expressly ***exempt*** from CEQA's application, *i.e.*, public agencies have no authority to review ministerial projects for purposes of imposing additional mitigation measures beyond those already included in the codified standard. (See Pub. Res. § 21080(b)(1).) The exemption of all "ministerial" projects from the application of CEQA, and thus, from review by local agencies for purposes of imposing additional mitigation measures under CEQA, is significant in connection with the Tentative Permit, as the Permit seeks to impose mitigation measures under the SUSMP provisions to all "projects," whether "discretionary" or "ministerial." As CEQA expressly exempts ministerial projects from its

terms, there is no authority for the Regional Board to require municipalities to, in effect, impose mitigation measures on projects that are otherwise exempt from such mitigation measures under State law. Such terms of the Permit are impliedly, if not expressly, preempted by State law.

The State CEQA guidelines also identify a series of exemptions on various types of projects from the environmental review process, many of which appear to be "projects" in which the Regional Board is now seeking to condition their approval on yet additional environmental mitigation measures. Specifically, Class 2, Class 3, Class 4, Class 11 and Class 15 "categorical exemptions" under CEQA, appear to be expressly and/or implicitly overridden by the terms of the Tentative Permit. These categorical exemptions include: the replacement or the reconstruction of the existing structures or facilities when a new structure is located on the same site as the original facility and will serve the same purpose and capacity of the original structure (14 CCR 15302); the construction of small new facilities, new equipment and facilities and small structures, and the construction of three or fewer single family homes in urban areas (14 CCR 15303); minor alterations to land such as grading, gardening and landscaping that do not affect sensitive resources (14 CCR 15304); the construction or replacement of minor structures to existing facilities (*e.g.*, signs, small parking lots, portable structures) (14 CCR 15311); and the subdivision of four or fewer parcels in urban areas (14 CCR 15315). Each of these categorical exemptions will be overridden by the Regional Board's attempt to impose the subject development planning requirements on various projects throughout the County.

Given that the State Legislature has already "occupied the field" on the process to follow in imposing mitigation measures on development projects, any attempt by a regional board to adopt provisions that are contrary to State law are impliedly, if not expressly, preempted. (See e.g., *Leslie v. Superior Court*, *supra*, 73 Cal.App.4th 1042, where the Court found that a conflict existed between a City ordinance and general State laws, where the ordinance ***duplicated, contradicted or entered an area which is fully occupied by general law, either expressly or by Legislative implication***.)

In the instant case, both the Regional Board and the Permittees are without authority to take action to adopt mitigation measures on projects that are categorically or statutorily exempt under CEQA, unless such mitigation measures are otherwise expressly required by State or federal law, or to take action that is inconsistent with or contrary to the policies and provisions of CEQA. As such, the Permittees herein request that the terms of the Tentative Permit be revised so as to be consistent with the terms under CEQA.

2. The Regional Board Has No Authority To Modify The Guidelines To CEQA.

In addition to the concerns of preemption created by the Tentative Permit, under Part 4.D.12 of the Permit entitled "California Environmental Quality Act (CEQA) Document Update," the Regional Board seeks to require modifications to existing State CEQA guidelines, i.e., the Regional Board seeks to modify State law. As the Regional

Board does not have the authority to impose regulations that modify CEQA, and given that the Regional Board has failed to comply with requirements of the Administrative Procedures Act in adopting the subject Permit (see discussion below), provisions requiring that the Permittees update their CEQA guidelines are contrary to law.

Moreover, the requested changes are unnecessary, as existing CEQA Guidelines already accomplish the apparent purpose of the Tentative Permit's proposed changes to CEQA. In addition, the CEQA guidelines contain an Environmental Checklist (Appendix G to the Regulations), and under Section VIII of this Checklist, the potential impacts on water quality and impacts to the environment from storm water runoff, are expressly identified as being impacts to be evaluated by the lead agency. A copy of this Checklist was previously provided with our August 6, 2001 Comment Letter, and should already be a part of the Administrative Record for this proceeding.

Accordingly, in light of the existing requirements under CEQA, and beyond the fact that the Regional Board does not have the authority to amend the CEQA Guidelines (and otherwise has not complied with the requirements of the Administrative Procedures Act), the proposed changes to the guidelines are unnecessary, as the matter is already addressed by the existing guidelines.

3. The Regional Board has Itself Failed to Comply with CEQA.

Water Code Section 13389 exempts the State and Regional boards from compliance with the requirements from CEQA and the adoption of "waste discharge requirements," except requirements for "new sources" as defined in the Clean Water Act. In the instant case, the Tentative Permit will impose permanent requirements on "new sources" as defined in the Clean Water Act, and thus the requirements of CEQA must be complied with by the Regional Board prior to the adoption of the subject Permit.

Under the Clean Water Act, "new sources" are defined to mean "any source, the construction of which is commenced after the publication of proposed regulations prescribing a standard of performance under this section which will be applicable to such source, if such standard is thereafter promulgated in accordance with this section." (33 U.S.C. § 1316(a)(2).) Further the term "source" is defined to mean "***any building, structure, facility, or installation from which there is or may be the discharge of pollutants.***" (33 U.S.C. § 1316(a)(3).)

With the instant Permit, any new construction or new facility is a potential "new source," and thus the requirements of CEQA apply and must be adhered to by the Regional Board.

E. THE REGIONAL BOARD HAS NO AUTHORITY TO MODIFY STATE LAW GOVERNING GENERAL PLAN/LOCAL LAND USE REQUIREMENTS.

The Permit language requiring the Permittees to amend, revise or update certain elements of their General Plans, is contrary to existing State law governing General Plans and the Regional Board has no authority to issue such an edict. Rather, land use planning is to be in the hands of local government. (See, *Yost v. Thomas* (1984) 36

Cal.3d 561,565.) Further, the draft Permits required General Plan updates to address matters that are already addressed under existing State law.

Government Code sections 65300 and 65307 require cities to prepare a Comprehensive General Plan including specific required elements of the General Plan, such as a land use element, a circulation element, a housing element, a conservation element, an open space element, a noise element and a public safety element. Under Government Code section 65302(d), a General Plan must include a conservation element "for the conservation, development and utilization of natural resources including water and its hydraulic force, soils, rivers and other waters, harbors, fisheries, wildlife, minerals and other natural resources." (Gov. Code § 65302(d)). The General Plan requirements further allow for the "conservation element" to include, among other issues, the following:

- *Prevention and control of the pollution of streams and other waters.*
- *Regulation of the use of land in stream channels and other areas required for the accomplishment of the conservation plan.*
- *Prevention, control, and correction of the erosion of soils, beaches and shores.*
- *Protection of watersheds.*
- *Flood control.*

(*See* Gov. Code § 65302(d)(2).)

Accordingly, pursuant to Government Code section 65302(d)(2), as well as the other provisions referenced above, municipalities are already required to consider within their "***conservation element***," the prevention and control of the pollution of streams and other waters. Any attempt by the Regional Board to impose additional requirements on municipalities to amend their General Plans differently, other than as prescribed by the State Legislature, is not only preempted by exiting law, it is unnecessary.

Pursuant to Government Code § 65300.9, the Legislature expressed its intent, in enacting the General Plan requirements, that such provisions are to:

> . . . provide an opportunity for ***each city and county*** to coordinate its local budget planning and local planning for federal and State program activities, such as community development, with the local land use planning process, ***recognizing that each city and county is required to establish its own appropriate balance in the context of the local situation when allocating resources to meet the purposes.*** (Gov. Code § 65300.9.)

State law thus specifically allows ***each*** city and county to establish ***its own appropriate balance*** when allocating resources and when planning for any federal and

State program activities. The attempt by the Regional Board to impose additional requirements on the Permittees to revise their individual General Plans is thus directly contrary to the Legislative policy set forth by the State Legislature, and is a clear infringement on the sovereign of the Permittees, in particular the local land use authority of the Permittees. (See Yost v. Thomas (1984) 36 Cal.3d 561, 565 ". . . the front line role in land use planning and zoning is in the hands of the local government;" also see *Leslie v. Superior Court*, *supra*, 73 Cal.App.4th 1042, 1051, where the court concluded that the California Coastal Commission can conduct only limited administrative review to ascertain whether a local general plan conforms to minimal requirements of the California Coastal Act, and that the California Coastal Commission per the Public Resources Code, "***is not authorized to . . . diminish or abridge the authority of the local government to adopt and establish, by ordinance, the precise content of its land use plan.***")

The Clean Water Act as well makes it clear that it was not the intent of Congress to regulate land use, as such regulation is a function traditionally performed by local governments. To the contrary, the CWA contains express language showing that Congress chose to "recognize, preserve and protect the primary responsibilities and rights of States . . . to plan the development and use . . . of land and water resources . . . ." (33 U.S.C. § 1251(b); *Solid Waste Agency of Northern Cook County v. Army Corps. of Engineers*, 531 U.S. 159, 174 (2001). This limitation on restricting land use authority is further supported by the CWA regulations where EPA recognizes the concerns of municipalities over "possible federal interference with local land use planning," and thereby declined to infringe upon this land use authority. (See 64 Fed. Reg. 68721, 68742.)

The Regional Board is not authorized to diminish or abridge the authority of a local government to adopt and establish its own general plan requirements, and the provisions within the Tentative Permit which infringe on such authority and other local land use authority, must be deleted from the Permit.

F. THE DEVELOPMENT PLANNING ("SUSMP") REQUIREMENTS CONFLICT WITH STATE BOARD ORDER NO. WQ-2000-11, AND VIOLATE VARIOUS OTHER STATE AND FEDERAL LEGAL REQUIREMENTS.

1. Prior Comments on SUSMP Deficiencies are Incorporated Herein.

The comments herein incorporate in their entirety the previous comments made to the Second Draft of the Permit concerning the Development Planning section, as none of the deficiencies identified in such prior comments of August 6, 2001 have been corrected. As explained in the August 6, 2001, comment letter, these defects include: (1) the inappropriateness of the .75 standard and the lack of findings and substantial evidence to support this numerical limitation; (2) the failure of the Regional Board to take into account the requirements of Water Code Sections 13263 and 13241 and important policy considerations such as housing needs in the region; (3) the failure of the Regional Board to perform a cost/benefit analysis, and to consider economic considerations as required by State and federal law; (4) the inability of the Regional

Board to regulate Environmentally Sensitive Areas in that such areas are already "subject to extensive regulation under other regulatory programs," (see State Board Order No. 2000-11, p. 25) and given that such a regulation is preempted by existing State and federal law; (5) the failure of the Regional Board to adequately consider adverse impacts to ground water quality, and other unintended consequences such as vector control problems that may be created by the SUSMP requirements; (6) the over-breadth of the definition of "redevelopment" and the refusal of the Regional Board to adhere to the definition of "redevelopment" provided in Order No. 2000-11 and in the federal regulations (64 Fed. Reg. 68721, 68760);[3] (7) the impropriety of applying the SUSMP provisions to "non-discretionary" projects and the preemption of the area under State law; (8) the failure of the Regional Board to adequately include provisions to allow for "regional solutions" as previously recommended by the State Board in Order No. WQ-2000-11; (9) the impropriety of transferring liability to municipalities for private illicit discharges, as municipalities have no authority to mandate contractual provisions in private party agreements; (10) the failure of the Regional Board in the SUSMP to consider "conditions existing in the disposal area or receiving waters" under Water Code Section 13263; and (11) the one-size-fits-all nature of the SUSMP, as well as other comments raised in the August 6, 2001, Comment Letter that remain unaddressed.

2. The SUSMP Provisions Contain Yet Additional Deficiencies

Additional deficiencies exist with the Tentative Permit. For example, an additional obligation that has been imposed upon the Permittees as a part of the Development Planning Program, is the obligation of ensuring that the treatment control BMPs are properly "designed" and maintained in a "manner" that does not promote the breeding of vectors. Yet, the concern with the breeding of vectors, as a consequence of

---

[3] The proposed SUSMP provisions remain overly broad with the revisions to the definition of "***redevelopment***," and the inclusion of non-discretionary projects into the SUSMP. The Regional Board has insisted on broadening the definition of "redevelopment" in this permit, despite some two days of hearing before the State Board challenging the previous SUSMP issued by the Regional Board, and the State Board's revision of the definition of the term "Redevelopment." Regional Board representatives have argued that their definition of "redevelopment" and the application of the SUSMP to redevelopment projects is consistent with the State Board Order, claiming that the State Board inadvertently left out the reference to "replacement" of 5,000 square feet of impervious surfaces when redefining the term "redevelopment" in the Order. A review of State Board Order No. 2000-11, clearly shows otherwise. Order No. 2000-11 recognizes that the definition previously proposed by the Regional Board was somewhat confusing, and that it was apparent from the testimony at the hearing that the parties had different understandings of the scope of the term that would be subject to SUSMPs. Nonetheless, the State Board concluded that in post-hearing briefs, the various parties appear to agree on the actual intent of the term and specifically that this intent "was to include redevelopment that adds or creates at least 5,000 square feet of impervious surface to the regional development . . . ."

Thereafter, in the revised definition provided by the State Board, the Board specifically limited the definition to "the creation or addition of at least 5,000 square feet of impervious surfaces." (Order No. 2000-11, p. 31.)

Accordingly, the State Board expressly recognized that the parties' dispute concerning the breadth of the definition of the term "redevelopment," and then recognized in two locations, one in the Order itself, and secondly, in its actual revisions to the definition, that the term was to be limited to the "creation or addition" of 5,000 square feet of impervious surfaces.

the SUSMP program, has always been an issue that the Permittees have been concerned with, as well as other unintended consequences from the SUSMP mandate (e.g., disparate treatment of economically disadvantaged citizens, i.e., the lack of environmental justice). However, imposing an obligation on the Permittees to ensure that the treatment control BMPs are properly "designed" and "maintained" in this fashion, or in any fashion, is improper, as Permittees are not responsible for controlling discharges "***to***" the MS4, and are not and cannot be held responsible for implementing and regulating BMPs on private property. Rather, the consideration of unintended consequences such as the breeding of vectors is a concern that the ***Regional Board*** should consider before imposing the .75 numeric design standard, and in evaluating and allowing for feasible alternatives to the .75 inch mitigation measure. As the Permit compels the particular mitigation measure, no feasible alternatives can be considered under CEQA or otherwise, to address these environmental consequences.

Second, the Development Planning Program has been revised to include a new provision imposing upon Permittees "peak flow control" requirements in natural drainage systems to "prevent accelerated stream erosion and to protect stream habitat." Such requirements, although laudable, are not requirements that are covered by the Clean Water Act or the waste discharge requirements under the Porter-Cologne Act, as neither statutory scheme allows for or enables the Regional Board to require the Permittees to do anything other than control the quality of the storm water being discharged into waters of the United States, rather than the "quantity" of water being discharged. Accordingly, the "peak flow" provisions of the proposed Tentative Permit, and the attempt to regulate the "quantity" as opposed to the "quality" of the discharge, is inappropriate and violates State and federal law.

Third, additional changes were made to the language involving "redevelopment projects" as well as changes in language concerning the application of SUSMPS projects within "environmentally sensitive areas." Both of these sets of changes fail to correct the deficiencies identified in our August 6, 2001 Comment Letter, and in some cases further exacerbate the legal deficiencies identified therein. The definition of "Redevelopment" is, moreover, invalid, as it conflicts with the definition provided in the CWA regulations. (See 64 Fed. Reg. 68721, 68760.) In fact, with the definition of Redevelopment and the application of SUSMP to such Redevelopment projects, the Regional Board's actions also conflict with EPAs recommendation to consider "policies and ordinances that encourage infill development in higher density urban areas, and areas with existing infrastructure, in order to meet the measure's intent." (64 Fed.Reg. 68722, 68742.)

Fourth, in spite of State Board Order No. 2000-11, and the requirements imposed upon the Regional Board to develop the basis to apply a numerical design criteria to Retail Gasoline Outlets ("RGOs"), the Regional Board has failed to do so. In the Draft Order issued by the State Board in connection with the San Diego Permit, the State Board disapproved of the San Diego Regional Board's SUSMP, as it applied to RGOs, specifically because the San Diego Regional Board failed to comply with Order No. 2000-11. Here, in its findings, the Tentative Permit relies upon a technical report prepared by both the Los Angeles Regional Board and the San Diego Regional Board,

a report which has already been reviewed by the State Board in the Draft Order and found to be nonresponsive to the concerns raised in Order No. 2000-11. Thus, RGOs should be exempted from the numerical design criteria in the Tentative Permit.

Fifth, in the Tentative Permit, the Regional Board has expanded the application of the numerical criteria to apply to all post-construction control requirements for the "industrial/commercial category," to projects that disturb one acre or more of surface area, by no later than March 9, 2003. Yet there are no supportable findings or other evidence to justify the expansion of the SUSMP provisions to all such facilities that disturb one acre or more (as opposed to 100,000 square feet of "impervious surface area") for such industrial/commercial facilities.

Sixth, the inclusion of all "industrial" facilities within the SUSMP, is inappropriate as such development planning requirements for industrial facilities are already to be complied with through the Phase I Industrial Permit regulatory process. In particular, under the CWA regulations, 40 CFR 122.26(c)(ii)(C) and (D), an application for a permit for an operator of an existing or new storm water discharge associated with a Phase I Industrial Activity or associated with a Small Construction Activity (as defined under the regulations), is to include specific information on "[p]roposed measures to control pollutants in storm water discharges that will occur ***after construction operations have been completed***," as well as proposed best management practices to control pollutants in the storm water discharges during construction. (See 40 CFR 122.26(c)(ii)(C) and (D).) The measures to be in place after construction are to include "an estimate of the runoff coefficient of the site and the increase in impervious area ***after the construction addressed in the permit application is completed***, the nature of fill material and existing data describing the soil or the quality of the discharge." (40 C.F.R. 122.26(c)(1)(ii)(D) & (E).) Accordingly, the attempt by the Regional Board to impose such post-construction control measures on municipalities for Phase I Industrial Facilities is plainly an improper attempt to transfer this obligation from the State down to the municipalities.

Seventh, the only CWA regulation that addresses the imposition of source control measures in the context of an MS4 NPDES Permit, is expressly limited to "runoff from commercial and residential areas that are discharged ***from the municipal storm sewer system,"*** and such controls are, moreover, required to be accompanied by an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls. (40 CFR 122.26(d)(iv)(A).) The regulations are thus very explicit that the source control measures to be included in the proposed management program are to "address controls to reduce pollutants and discharges ***from*** municipal separate storm source after construction is completed." (See 40 CFR 122.26(d)(iv)(A) and (A)(1) and (2).) The SUSMP provisions in the Tentative Permit have ***not*** been limited to source control measures designed to address runoff "***from the municipal storm sewer system***." As the whole concept of the SUSMP requirements involve discharges "***to"*** as opposed to "***from***" the municipal storm sewer system, the entire development planning program section imposing the SUSMP requirements on the Permittees violates the express terms of the regulations as well as the clear language of the CWA itself. (See 33 USC 1342(p)(3)(B).)

Eighth, the Tentative Permit improperly expands the development planning requirements to new development and redevelopment that did not previously require a SUSMP, but which "potentially have adverse impacts on post-development storm water quality, where one or more of the following project characteristics exist: . . . ." (Tentative Permit, p. 44.) Again there is no evidence or any findings to support such an expansion of the SUSMP requirements, and such an expansion violates the MEP standard, the CWA regulations and the Porter-Cologne Act.

Ninth, there are no findings and no indication that "***economic considerations***" have been accounted for, that ***a cost/benefit analysis*** has been performed, or that ***the need for developing housing*** within the region has been considered by the Regional Board, as required by State and federal law. (Cal. Water Code 13263-13241; 13225; and 13267; 64 Fed. Register 68722, 68732.) These failures similarly constitute violations of CEQA and general State law. (See Pub. Res. §§ 21000(g), 21001(d) and 21061.1, and Gov. Code §§ 65580 & 65589.5.) For example, Government Code Section 65580 confirms the vital statewide importance of decent housing for every Californian and the importance of considering economics:

> The Legislature finds and declares as follows:
>
> (a) ***The availability of housing is of vital statewide importance***, and the early attainment of decent housing and a suitable living environment for every Californian, including farm workers, is a priority of the highest order.
>
> . . .
>
> (c) ***The provision of housing affordable to low- and moderate-income households requires the cooperation of all levels of government.***
>
> (d) ***Local and state governments have a responsibility to use the powers vested in them to facilitate the improvement and development of housing to make adequate provision for the housing needs of all economic segments of the community.***
>
> (e) The Legislature recognizes that in carrying out this responsibility, each local government also has the responsibility to consider ***economic, environmental, and fiscal factors and community goals*** set forth in the general plan and to cooperate with other local governments and the State in addressing regional housing needs.

Accordingly, low and moderate-income housing developments should be exempted from the SUSMP requirements, and the .75 standard should not apply to ***any*** housing developments or other development property until the pollutants of concern, and their sources, have been identified, ***and*** until the ***benefits*** and ***costs*** of implementing of the .75 design standard on all developments, have been analyzed.

Tenth, the Regional Storm Water Mitigation Program provisions of the Tentative Permit were slightly modified to clarify that the regional solutions can apply to more than just SUSMPs within "new" development. This change is a welcome change that would allow for broader application of "regional solutions" to the process. Yet, in spite of the **State Board's** recommendation encouraging innovative regional approaches, and recommending that interested agencies, along with the Permittees, develop "regional solutions so that individual discharges are not forced to create small-scaled projects," (Order No. 2000-11), the Regional Storm Water Mitigation Program continues to be hampered by conditions that are not similarly applied to the site-by-site SUSMPs. The Regional Program, moreover, remains tentative at best, since even if all of the conditions imposed upon "regional projects" are complied with, the Regional Board is still not compelled to approve the regional approach, but need only "consider" the same.

Given that the benefits of "regional solutions" have already been recognized by the State Board and others, regional programs that comply with the conditions set forth in the Permit for such programs should be "approved" rather than simply "considered" for approval, and the Regional Mitigation Program should not be overly restricted.[4]

Finally, the Tentative Permit does not go far enough in developing a mitigation waiver fund to be utilized as an alternative for developing a site specific SUSMP. In Order No. 2000-11, the State Board determined that the concept of a mitigation fund was a positive approach for obtaining "regional solutions" to storm water runoff, and that as a long-term strategy, Permittees should work to establish regional mitigation measures which are more cost-effective and more technically effective than mitigation structures within individual developments. (Order No. 2000-11, p. 27.) However, the State Board advised that preliminary questions must first be answered as to who will manage the fund, what types of projects it would be used for, what entities can legally operate the funds, and how Permittees will determine the amount of the assessments. The State Board thus recommended that the Regional Board adopt such a program when it re-issues a permit "after consultation with the appropriate local agencies." Unfortunately, at least these commenting Permittees have not been consulted over the creation of a mitigation fund, and the Permittees herein recommend that such a fund be developed and be included within the subject Permit, "after consultation with the appropriate local agencies."[5]

As referenced above, the CWA Regulations concerning Phase II Permits shows that any regulation of post-construction runoff from new development and

---

[4] For example, the condition that the regional solution "protect stream habitats" should be modified to make it clear that the regional solution not cause any adverse consequences to stream habitats, as opposed to the need for the program to include specific measures, above and beyond those that would otherwise be required of individual SUSMPs, "to protect stream habitats."

[5] In addition, the "Mitigation Funding" section proposes a management framework for approval by the Executive Officer to support "regional solutions." (See Tentative Permit, Part 4, Section D(11).) Yet, it is unclear from Section D(11) whether all of the conditions set forth in subsections D(11)(a) through (d) must be met before such a Mitigation Fund may be developed. The Permit should be revised to clarify that a Mitigation Fund may be utilized for ***any*** one of the reasons set forth in said section.

redevelopment must be "***allowable under State, Tribal or local law.***" (See 64 Fed.Reg. 68721, 68760). As discussed above, the SUSMP provisions in issue conflict not only with the express terms of federal law, in particular, the application of the MEP standard and the language of the CWA regulations limiting such requirements to discharges "***from*** the municipal storm source system, but also with numerous provisions under State law, particularly, including but not limited to the infringements on local use authority, as well as the prohibition on imposing a "particular manner" of compliance on a permittee under California Water Code Section 13360. (See discussion infra.)

G. THE PERMIT CONTINUES TO IMPOSE NUMEROUS UNFUNDED MANDATES IN VIOLATION OF THE CALIFORNIA CONSTITUTION.

In spite of prior comments, to date there has been no attempt to address the unfunded mandates that are being imposed on the Permittees by the terms of the Permit, in violation of Article XIII B, Section 6 of the California Constitution. Please see the discussion in our Comment Letter of August 6, 2001.

Moreover, contrary to contentions made by the Regional Board on this issue that such unfunded mandates are appropriate where they are being imposed pursuant to a federal program, it is only where the federal program ***mandates*** a particular requirement upon the state agency that the exception to Article XIII B, Section 6 for federal mandates, applies. Thus, where the federal program provides ***discretion*** to the State agency to impose a local program, any mandate imposed upon the local municipality through the exercise of that discretion is considered an ***unfunded mandate*** and, as such, is prohibited by the California Constitution. (See *Hayes v. Commission on State Mandates* (1992) 11 Cal. App.4th 1564, 1570.) In fact, it is only when the State has no "true choice" in implementing a federal mandate, that the prohibition under the California Constitution can be avoided. (See *Hayes v. The Commission on State Mandates, supra,* 11 Cal.App.4th at 1593.)

As was recognized by the Regional Board itself in relying upon *The Defenders of Wildlife v. Browner* (9th Cir. 1999) 193 F.3d 1035, here, the State has ***discretion*** (as limited by State and federal law) to impose certain mandates, and as such, it has effectively admitted that it has a "***true choice***" in imposing the mandates delineated under the Tentative Permit. Accordingly, as the Regional Board has admitted "discretion," and thus a "true choice" to impose the programs in question, the constitutional prohibition under Article XIII B, Section 6 applies, and the Tentative Permit is invalid as it violates the California Constitution.

As discussed in the previous comments, the Tentative Permit attempts to shift the responsibility of the State and Regional Boards to Permittees, and to force Permittees to regulate and control construction and industrial sites that are otherwise subject to regulation by the State Board. This blatant attempt to shift this mandate down to municipalities is evidenced by the statement of the U.S. EPA in correspondence from Ms. Alexis Strauss of EPA dated December 19, 2000 and April 30, 2001. Therein, U.S. EPA is plainly suggesting that the State shift a State

mandate onto municipalities, but without providing sufficient funding to carry out such state mandate. (See August 6, 2001, Comment Letter.)

The Regional Board's attempt to "shift financial responsibility to local agencies that are ill-equipped to handle the task," and to put primary responsibility on the Cities to enforce a General Statewide Industrial Permit and Construction Permit issued by the State Board, is a direct violation of Article XIII B, Section 6 of the California Constitution, thereby making the draft Permit invalid, without adequate funding to the Permittees. (*County of Fresno v. State, supra*, 53 Cal. 3d at 42, 47.) Additional violations of this Constitutional prohibition exists with the shifting of other unfunded mandates to the municipalities, e.g. the SUSMP program, the Inspection Program for industrial and commercial facilities, as well as for storm drains, the trash receptacle requirements, the special event catch basin program, the illicit connection/illicit discharge program, etc.

H. THE PERMIT FAILS TO PROPERLY CONSIDER "ECONOMIC" CONSIDERATIONS AND HAS NOT BEEN DEVELOPED BASED ON A "COST/BENEFIT" ANALYSIS.

As set forth in prior comments, including the August 6, 2001 comments to the Second Draft of the permit, the Tentative Permit fails to properly consider economic considerations and has not been developed based on a "cost-benefit analysis" required by State and federal law. The Permittees herein incorporate their prior comments submitted in the August 6, 2001 submittal as support for this comment and their contentions that the Tentative Permit is defective as economic considerations have not been addressed, and a cost-benefit analysis has not been performed.

The issue is highlighted by a recent study performed by Caltrans indicating that the cost of the TMDL program for Los Angeles County alone, which is to be implemented in part, through the NPDES permitting process, could result in expenditures to Los Angeles taxpayers in excess of ***$50 billion***. Permittees herein request that a copy of this report, which has been forwarded to the Regional Board under separate cover, be included in the Administrative Record. Reports of this nature indicate the importance of performing a cost/benefit analysis ***before*** adoption of a comprehensive permitting program such as is proposed with the Tentative Permit, as well as the importance of considering the "***economics***" before mandating the numerous programs set forth under the subject Permit.

Various provisions in State and federal law require the conducting of a cost-benefit analysis (which the Regional Board has failed to perform), as well as the consideration of "economic considerations" including the similar requirements in federal law. (See 33 U.S.C. §§ 1288, 1313, 1315(b), and 64 Fed. Reg. 68722, 68732; Water Code §§ 13000, 13165, 13241, 13225 and 13267.) The need to consider economic considerations and to conduct a cost/benefit analysis are requirements that must be complied time before the State embarks upon such costly programs all with uncertain and unknown benefits.

I. THE REGIONAL BOARD HAS FAILED TO COMPLY WITH THE ADMINISTRATIVE PROCEDURES ACT IN DEVELOPING THE SUBJECT PERMIT.

As set forth in prior comments and incorporated herein in their entirety, the Regional Board continues to refuse to comply with the requirements of Administrative Procedures Act pursuant to Government Code section 11340 *et seq.* ("APA"). Ironically, in connection with the Regional Board's recent adoption of a trash TMDL for the Los Angeles River, it was recognized that action that a single TMDL for the Los Angeles River alone, constituted a "standard of general application" thereby triggering the requirements of the APA.

As the Tentative Permit is much broader and clearly is an order, a regulation and standard of general application, the requirements of the APA must be complied with.

Contentions by the Regional Board that the APA does not apply to the issuance of permits or waste discharge requirements are unpersuasive, as the Tentative Permit (on its face) is more than simply a set of waste discharge requirement, but rather is a permit that covers storm water runoff from municipal separate storm sewer system throughout the County and is an Order of general application. Clear and substantial evidence of the "regulatory" nature of the Tentative Permit is the attempt by the Regional Board to require municipalities to amend their CEQA guidelines and to amend their General Plan amendment guidelines. In this regard, the Regional Board has sought to adopt regulations with or without authority, but in doing so have failed to comply with the requirements of the APA.

J. THE REGIONAL BOARD HAS NO AUTHORITY TO ISSUE THE NPDES PERMIT IN QUESTION.

With the recent rash of administrative petitions to the State Board, it is becoming increasingly clear that the requirement of the CWA that only State agencies with "state-wide jurisdiction over a class of activities or discharges," may issue NPDES permits, must be followed. (40 CFR § 123.1(g)(1).) Again, the comments set forth in the Permittees' prior comments dated August 6, 2001 are incorporated herein in their entirety.

The absence of a "state agency" with "state-wide jurisdiction" to establish a set of regulations on discharges from MS4s, is a fatal legal and practical deficiency with the California Municipal NPDES Program. The result of this lack of state-wide direction has been a series of haphazard decisions by the State Board, in response to individual petitions and at that, only those particular issues within the petitions the State Board deems of sufficient significance to review. This patchwork of decisions is precisely the reason the federal regulations have required that NPDES authority be limited to state agencies with "state-wide jurisdictional over a class of activities or discharges," i.e., to provide for uniformity through the State and to avoid inconsistencies from region to region. Accordingly, until the State Board exercises its jurisdiction and issues a set of regulations, in accordance with the APA, that provides specific direction to the regional

boards on the issuance of MS4 NPDES permits, any individual regional board is without authority to issue an NPDES permit. (See 40 CFR § 123.1(g).)

Such a legal prohibition on "regional" agencies issuing NPDES permits is reinforced by the State-Wide General Construction Activities Permit and the State-Wide General Industrial Activities Permit, both of which although enforced by the Regional Boards, have been adopted and promulgated by the State Water Resources Control Board on a State-wide basis. Consistency has thus been provided by the State Board for Industrial and Construction permits, but remains a void to be filled by the State Board for MS4 NPDES permits.

Accordingly, the Tentative Permit remains deficient and subject to challenge unless and until appropriate State regulations have been adopted, and a uniform program for the entire State of California, has been established for regulating discharges ***from*** municipal separate storm sewer systems.

K. THE REGIONAL BOARD HAS FAILED TO CONSIDER THE TYPES AND SOURCES OF POLLUTANTS IN DEVELOPING THE DRAFT PERMIT IN QUESTION, AS REQUIRED BY STATE AND FEDERAL LAW.

The Regional Board continues to fail to rely upon quantitative data that has been developed on the types and sources of pollutants within the effective receiving waters, and to establish particular management programs based on such quantitative data. (See 40 CFR § 122.26(d)(2)(iv).) The sections of the August 6, 2001 comment letter on the requirements of the Regional Board to consider the types and sources of pollutants in developing the subject NPDES permit, are incorporated herein.

L. THE PERMIT VIOLATES THE PROHIBITION SET FORTH UNDER CALIFORNIA WATER CODE SECTION 13360.

California Water Code Section 13360(a) provides in pertinent part that:

> "No waste discharge requirement or other order of a Regional Board or the state board or decree of a court issued under this division shall specify the ***design***, location, type of construction, or ***particular manner*** in which compliance may be had with that requirement, order, or decree, and the person so ordered shall be permitted to comply with the order in any lawful manner."

As discussed in the August 6, 2001, Comment Letter, the Tentative Permit violates Water Code Section 13360(a) in each instance where the Regional Board seeks to impose a ***"particular manner"*** in which compliance may be had. In particular, specific requirements imposed on municipalities to amend CEQA, to add additional elements to their General Plans, to adopt and implement a particular Business Assistance Program, to impose particular language in private sale or lease agreements, to comply with a specific .75 numeric design criteria, to comply with a specific inspection program for industrial and/or commercial facilities and to inspect all storm drain

connections for illicit connections, or to clean catch basins after each special event or to install trash receptacles at each bus stop, all constitute a ***"particular manner"*** in which compliance may be had. The imposition of such "particular manners" of compliance violates the express prohibition under California Water Code Section 13360(a).

M. THE PERMIT FAILS TO INCLUDE A FINDING OF CONSISTENCY WITH THE AREA-WIDE WASTE TREATMENT MANAGEMENT PLAN.

As the Tentative Permit continues to ignore the requirements of the CWA, particularly 33 USC section 1288, by failing to make a finding of consistency with the area-wide waste management treatment plan, it remains defective.

N. NUMEROUS FINDINGS IN THE PERMIT ARE NOT SUPPORTED BY THE EVIDENCE, AND/OR DO NOT SUPPORT THE TERMS OF THE PERMIT.

Finding No. B.6 attempts to regulate the volume and velocity of storm water discharged from the MS4, as opposed to controlling "pollutants from" the MS4, or the discharge of waste to receiving waters. ***Finding No. B.6*** provides in relevant part, as follows: "Second, urban development creates new pollution sources as the increased density of human population brings with it proportionally higher levels of vehicle emissions, vehicle maintenance waste, municipal sewage waste, pesticides, household hazardous wastes, pet waste, trash, and other anthropogenic pollutants. Development and urbanization especially threaten environmentally sensitive areas. Such areas have a much lower capacity to withstand pollutant shocks than might be acceptable in the circumstance."

The Regional Board is thus plainly attempting to legislate on development and urbanization issues, based on its perception of the potential environmental impacts created by urban runoff and the need to impost mitigation measures on all existing and future "urban development." Yet, the creation of "new pollution sources as the density of human population brings with it proportionally higher levels of vehicle emissions, vehicle maintenance waste, municipal sewage waste, pesticides, household hazardous waste, pet waste, trash, and other anthropogenic pollutants," are all environmental factors to be considered in the evaluation of a "project" under the express requirements of the California Environmental Quality Act. Over thirty years ago, the State Legislature provided a process to follow in considering these potential environmental impacts, and the Regional Board has no authority to override this process, and to issue an NPDES Permit to, per se, regulate "urban development."

Finding No. D.2 acknowledges that Permittees "may lack legal jurisdiction" over federal and state, regional or other local entities, but yet, the reference to the lack of responsibility on the part of Permittees in the finding, has been deleted. More importantly, the Tentative Permit continues to include within the definition of an "Industrial/Commercial Facility" federal, State and municipal facilities, and thus, as now modified, the Tentative Permit requires that Permittees regulate federal, State, regional and other local facilities, even though it has no jurisdiction to do so. As such, the

Tentative Permit is deficient and again seeks to impose obligations on the Permittees where neither the Permittees nor the Regional Board, has the authority to do so.

Finding No. D.4 provides that the Permit is intended to develop, among other things, a ***"cost-effective storm water control program"*** and ***"cost-effective"*** measures to reduce the discharge of pollutants "***in***" storm water to the maximum extent practicable to the waters of the United States. Yet, the terms of the draft Permit itself are not based on these findings, as the Permit do not provide the flexibility for ***"cost-effective"*** control measures and "***cost-effective***" programs. In addition, with the Permit, the Regional Board clearly seeks to regulate discharges "***into***" the MS4, as opposed to controlling the discharge of pollutants "***from***" the MS4. This misapplication of the MEP standard violates the provisions of the CWA and is an attempt to regulate beyond the authority provided to the State Board under either the Clear Water Act or the Porter-Cologne Act.

Further, there are no findings in the draft Permit to show that its terms are "***cost effective***" or that "***economic considerations***" were considered. To the extent such evidence exists to support Finding No. D.4, i.e. to support the determination of the Regional Board that its programs and measures are "***cost-effective***," this information should be disclosed to the public and the public should be given an opportunity to review the same. To date, no such evidence has been presented.

Finding No. D.5 provides in pertinent part that: "Permittees may control the contribution of pollutants to the MS4 from non-permittee dischargers such as Caltrans, the U.S. Department of Defense, and other State and federal facilities, through interagency agreements." Obviously, without cooperation and participation with Caltrans, the U.S. Department of Defense and other State and federal facilities, through interagency agreements or otherwise, Permittees may not be in a position to ***control*** the contribution of pollutants ***to*** their MS4s, and there is nothing under the CWA or the Porter-Cologne Act that would require that Permittees control the contribution of pollutants from such State and federal facilities. Moreover, again, the Tentative Permit seeks to regulate the discharge of pollutants "***to*** the MS4" as opposed to "***from***" the MS4, in violation of the MEP Standard. Accordingly, Finding D.5 is factually inaccurate and legally deficient.

Finding No. E.1 refers to US EPA Phase II Storm water Regulations and references various provisions and requirements under the Phase II final rule published on December 8, 1999. As the existing cities are all subject to the ***Phase I*** Storm water Regulations, and are not subject to the ***Phase II*** requirements, reliance upon specific requirements of the Phase II Regulations to Phase I cities, as support for the provisions within the Permit, is inappropriate.

Finding No. E.5 states that certain EPA regulations "require that MS4 Permittees implement a program to monitor and control pollutants in discharges to the municipal system from industrial ***and commercial*** facilities that contribute a substantial pollutant load to the MS4." As discussed above, this is an ***inaccurate characterization*** of the regulations, as the referenced regulations ***only*** apply to the control of pollutants and

discharges of storm water runoff associated with ***industrial activities***, as specifically defined in the regulations themselves (see 40 CFR §122.26(b)(14)), and not "***commercial***" facilities. The requirement that the Permittees implement a program to monitor and control pollutants and discharges from all "industrial/commercial facilities" is not supported by the regulations and is directly contradicted by the CWA regulation cited in ***Finding No. E.5***.

Finding No. E.6 relies upon a memorandum issued by the State Water Resource Control Board Office of Chief Counsel interpreting the meaning of the MEP standard to put the burden on the municipalities to demonstrate compliance with MEP, by showing that an MEP is not technically feasible in the locality, or that the BMP's costs would exceed any benefit to be derived therefrom. Any memo that may be issued by the Office of Chief Counsel interpreting MEP cannot override the actual language of the Clean Water Act itself or the requirements under the Porter-Cologne Act, requirements that have been adopted by our federal and State Legislatures. Accordingly, the prevailing authority on what constitutes "MEP" is the Clean Water Act itself, and the regulations adopted thereunder, as well as precedential authority interpreting Congress' intent in adopting the MEP standard.

Finding No. E.7 provides that the State of California has in-lieu authority for an NPDES Program, and that: "The Porter-Cologne Water Quality Control Act authorizes the State Board, through the Regional Boards, to regulate and control the discharge of pollutants into the waters of the State and tributaries thereto." Yet, neither this finding nor any other finding provides authority for the Regional Board, as opposed to the State Board, to issue NPDES Permits, as the Regional Board is ***not*** an agency with "***statewide jurisdiction over a class of activities or discharges***." (40 C.F.R. § 123.1(g)(1).)

Finding No. E.14 states that the Regional Board adopted TMDLs for trash for the Los Angeles River and Ballona Creek on September 19, 2001, and that after approval by the State Board, the Office of Administrative Law and U.S. EPA, these TMDLs will become effective and enforceable. The finding improperly assumes that the State Board, Office of Administrative Law and U.S. EPA will exercise no discretion in reviewing the trash TMDLs adopted by the Regional Board, and that said trash TMDLs will be the trash TMDLs for the subject water bodies. The finding should be modified to account for the likelihood that the trash TMDLs will be modified, and that only those trash TMDLs finally approved by U.S. EPA and that are not successfully challenged, are to be incorporated into the subject Permit.

In a recent regulation concerning an EPA Proposed Rule to delay, by 18 months, the effective date of a prior rule on TMDLs (see 66 Fed.Reg. 41817), EPA relied heavily on a recent report prepared by the National Research Council ("NRC") entitled "Assessing the TMDL Approach to Water Quality Management." In fact, as indicated in the Proposed Rule, because of the conclusions of the NRC Report, EPA is proposing that the TMDL rule adopted on July 13, 2000 ***be delayed*** specifically to allow EPA to "solicit and carefully consider suggestions on how to structure the TMDL program to be more effective and flexible and to ensure that it leads to workable solutions that will

meet the Clean Water Act goals of restoring impaired waters." (66 Fed.Reg. 41817, 41818.)

Further, in the Proposed Rule EPA recognizes that local government officials have "objected to the TMDL allocation approaches that could result in municipal point sources bearing and ***an inequitable share of the pollutant load reductions*** needed to attain water quality standards." EPA also acknowledges that contentions have been made that "there is not enough data to support TMDLs, that some pollutants are not suitable for TMDL calculation, that the section 303(d) lists are not based on scientifically-defensible data, or that the delisting criteria are too inflexible." EPA further concludes that because of the NRC recommendations and findings, that "many waters now on State 303(d) lists where placed there without the benefit of adequate water quality standards, data or water bodies assessment." (66 Fed.Reg. 41817, 41819.) A copy of the NRC report will be provided to the Regional Board under separate cover, and the Coalition respectfully requests that this report be included as a part of the Administrative Record in connection with the Tentative Permit, and that EPA's regulations in this regard be fully considered.

Finding No. E.16 provides that the Regional Board, on April 13, 1998, "approved recommended BMPs for industrial/commercial facilities (Resolution No. 98-08)." A review of Resolution No. 98-08, however, shows that it only applied to a few select "commercial" facilities, and further, only imposed best management practices on certain specified industrial facilities and/or activities. The definition of "Industrial/Commercial Facility" under the Tentative Permit is far broader than the facilities described in Resolution No. 98-08, and the Tentative Permit plainly exceeds the terms of Resolution No. 98-08.

Finding No. E.18 indicates that a December 26, 2000 memorandum from the State Board's Chief Counsel constitutes "a state-wide policy" memorandum, and is cited to support the proposition that the SUSMP requirements are to include "ministerial projects, projects in an environmentally sensitive areas, and retail gasoline outlets." The December 26, 2000 directive from the State Board's Chief Counsel, if it is to be followed, can only be followed after the requirements of the Administrative Procedures Act ("APA") have been complied with, which, to date, has not occurred.

In ***Finding No. E.19*** the Regional Board has determined that the creation of structural treatment control BMPs for storm water mitigation and waters of the United States is ***not*** permissible, as it contends that 40 CFR part 131.10(a) prohibits states from designating waste transport or waste assimilation, as a use for any waters of the United States. The Regional Board misinterprets the definition of a "waters of the United States," and the regulations and the purpose of creating a structural treatment control BMP. (See *Solid Waste Agency of Northern Cook County v. Army Corps. of Engineers*, 531 U.S. 159, 174 (2001) where the Court discussed the limits placed on the definition of "navigable waters of the United States," and the fact that the regulation of land use is a function traditionally performed by local governments.) Moreover, any creation of a structural or treatment control BMP within a water of the United States is not to be designed to allow for the use of the water body to transport waste or to

assimilate waste, but rather, to do just the opposite, to remove the existence of waste from the water body. In effect, the Regional Board has turned the regulation inside out and has interpreted the prohibition in such a manner that it will prevent the removal of waste, which is directly contradictory to the regulation itself. With the finding, the Regional Board thus inappropriately concludes that storm water treatment and/or mitigation, in accordance with the SUSMPs and other requirements of the Tentative Permit must occur prior to the discharges of storm water into a water of the United States.

Finding No. E.24 references State Board Order No. WQ 99-05 as being a precedential decision identifying acceptable receiving water limitation language in municipal storm water permits issued by the State Regional Boards. First, the reference to various orders and resolutions of the State Board by the Regional Boards reinforces the importance of complying with the federal regulations and only having State agencies with state-wide jurisdiction over a class of activities or discharges, issue NPDES permits. Second, in reviewing Order No. WQ 99-05 and comparing that language with the language set forth in Part 2, entitled "Receiving Water Limitations" of the Tentative Permit, it is evident that the language set forth in the Tentative Permit exceeds the language provided in Order No. 99-05. Accordingly, the Tentative Permit should be revised to at least comply with the express language set forth in Order No. 99-05.

Furthermore, in accordance with the Draft Order of the State Board in connection with the San Diego Permit, additional language should be added to the findings and to Part 2 of the Permit to incorporate the "iterative process" referred to by the State Board. Specifically, clarifying language should be added to make it clear that so long as a municipal permittee is complying with the "iterative process," that if exceedances occur or water quality standards are not met or conditions of pollution or nuisance exist, that said municipalities will not be found to be in violation of the Clean Water Act or otherwise subject to third party lawsuits. Clearly the State Board's Draft Order shows that where the "iterative process" is being complied with, any exceedances that result are to be cured by further complying with the iterative process. Clarifying language should thus be added to the Permit so that compliance with the "iterative process" will constitute compliance with the requirements of the Permit and compliance with the requirements of the Clean Water Act.

Finding No. E.25 references California Water Code Section 13263(a) and the provisions of said section which require the Regional Board to "take into consideration the beneficial uses to be protected and the water quality objectives reasonably required for that purpose." Yet, ***Finding No. E.25*** fails to cite the complete language within Water Code Section 13263(a), and specifically fails to consider the factors delineated in Water Code Section 13241, including the need to consider "***economic considerations***," and "***the need for developing housing within the region***," along with "water quality conditions that could ***reasonably*** be achieved through the coordinated control of all factors which effect water quality in the area."

Under Section 13263(a), the waste discharge requirements are to take into consideration "the water quality objectives ***reasonably required*** for that purpose...,"

and are to be considered in "relation to the conditions existing in the disposal area or receiving waters upon, or into which the discharge is made or proposed." (Water Code §13263(a).) ***Finding E.25*** thus, omits critical language from the standard for the issuance of waste discharge requirements, and the draft Permit fails to follow the standards set forth in Water Code Section 13263. The findings throughout the Tentative Permit do not support the Regional Board's consideration of these factors and other important factors, and the terms of the Tentative Permit do not comply with the requirements of Water Code Section 13263. The language added to the Tentative Permit at the end of this finding, is a mere ***conclusory comment*** that the Regional Board has considered the requirements of Sections 13263 and 13241 and applicable plans policies, rules and regulations, in developing WDRs, without any evidentiary support or findings to support the conclusion, and more importantly, without any findings to support its compliance with these specific requirements.

In ***Finding No. F.1***, the Tentative Permit provides that "[a] ministerial project may be made discretionary by adopting local ordinance provisions or imposing conditions to create decision-making discretion in approving the project." ***Finding No. F.1*** implies that municipalities have the authority to make all ministerial projects, discretionary, and that it would make regulatory or legal sense to do so. In short, the finding suggests that every building permit, grading permit, plumbing permit, electrical permit and occupancy permit, should be issued directly by the City Council, the Board of Supervisors and/or the Flood Control District Boards. For the sole purpose of addressing some ***undefined*** and ***unidentified*** problem with the existing SUSMP program, the Regional Board is seeking to change the entire planning, building and development process throughout the County of Los Angeles and attempts to do so without complying with the requirements of the Administrative Procedures Act. ***Finding No. F.1*** is not supported by the evidence and would have disastrous consequences on planning and development throughout the County. Moreover, the inclusion of "non-discretionary" projects within the SUSMP provisions will lead to numerous unintended consequences, including having every ministerial project required to be brought before the City Council or Board of Supervisors for review, thus causing the wheels of local government to come to a grinding halt, and further, overriding the requirements set forth in CEQA.

Finally, there are no findings and no evidence to support any finding for the need to apply the SUSMP requirements to "non-discretionary" projects. Before such an expansive and overly broad application of this SUSMP is mandated on the Permittees, findings supporting the need for such an expansion, and evidence supporting such findings, must be identified. Without such, the inclusion of all "non-discretionary" projects within the development categories of the SUSMP is arbitrary and capricious and is not supported by the evidence in the record and is not otherwise shown to be "reasonably required" to protect the water quality of the region. (Water Code §13263(a).)

In ***Finding No. F.3***, the Regional Board contends that the Permit is "to protect the beneficial uses of receiving waters in Los Angeles County," and that to meet this objective, the Order requires implementation of BMPs intended to reduce pollutants "***in***" storm water and urban runoff such that ultimately their discharge will neither cause

violations of water quality objectives nor create conditions of nuisance in receiving waters. This standard, however, is contrary to the standards set forth under the Porter-Cologne Act, as discussed above, and the standards set forth in the Clean Water Act, which require the control of discharges of pollutants "***from***" MS4s "***to the maximum extent practicable***," not "***to***" MS4s. (42 USC § 1342(p)(3)(B).) ***Finding No. F.3*** is, moreover, not supported by State or federal law, since, as discussed above in connection with the receiving water limitation language, it would result in the application of an open-ended standard and one that is unobtainable within the five (5) year term of the permit. Such provisions are contrary to the standards of the CWA and State law, and violate the Permittee's right to substantive due process of law, thereby denying the municipalities a "meaningful" Permit that allows for the discharge of waste and the discharge of pollutants "***from***" their MS4s.

In ***Finding No. F.4*** the Regional Board contends that the SQMP required by the Tentative Permit "was developed with the cooperation of representatives from the regulated community . . ." The ***finding*** is not supported by the evidence and is misleading, as the majority of the regulated community in this instance, the municipalities, have opposed the program required by the Tentative Permit and did not and do not agree with the effectiveness of the program, the direction of the program, or the authority of the Regional Board to impose the Program. Further, the ***finding*** provides that the various components of the SQMP, taken as a whole, are expected to "reduce pollutants ***in*** storm water and urban runoff to the maximum extent practicable." Again, the appropriate MEP standard under the Clean Water Act is to reduce the discharge of pollutants "***from***" the MS4.

In ***Finding No. F.9*** the Regional Board indicates that the requirements of the Clean Water Act are to reduce the discharges of pollutants "***in***" municipal storm water to the maximum extent practicable, as opposed to the actual requirement which is to reduce the discharge of pollutants "***from***" the MS4. The Tentative Permit thus improperly broadens the MEP Standard in order to impose additional, but unlawful, requirements on the Permittees thereunder, particularly in connection with the regulation of new development and redevelopment activities as referenced in ***Finding No. F.9***. In this ***finding,*** the Regional Board further asserts that Permittees are to retain authority to make the final land use decisions and to retain "full statutory authority" for deciding what land uses are appropriate at specific locations, but fails to acknowledge or address the infringement on local land use authority created by the Tentative Permit, and the illegality created by such an infringement on local land use authority. The Regional Board is not permitted to "diminish or abridge the authority of the local government," and the provisions of the Tentative Permit that diminish and abridge such authority, whether or not the Permittees can make the "final" land use decision, are inappropriate and contrary to the State and federal law.

With ***Finding No. F.10***, the Regional Board, after nearly two years of the Permittees raising the issue, finally recognize that treatment control BMPs may in fact create vector problems and that the issue is not limited to some "gigantic mosquito" as asserted by representatives of the Regional Board at hearings before the State Board on the validity of the 2000 SUSMP. Yet, the finding, although attempting to impose

upon Permittees the responsibility of working with local vector control agencies to minimize the risk to public health from vector-born diseases, fails to consider the limited avenues available to comply with the .75 numerical criteria, and still avoid various unintended consequences such as risks to public health from vector-born diseases. These unintended consequences, and other unintended consequences such as potential contamination to our ground water resources, should all be considered at the outset in deriving the numerical standard in the first instance, and should be considered as one of many "costs" that arise from such a mandated standard.

Finding No. G.6 provides that: "The action to adopt an NPDES Permit is exempt from the provisions of Chapter 3 of CEQA (Cal. Pub. Resources Code Section 21100 et seq.), in accordance with CWC § 13389." Unfortunately, the ***finding*** fails to cite the entirety of Water Code Section 13389, and specifically fails to address the exception to 13389 for "requirements for new sources as defined in the Federal Water Pollution Control Act or acts amendatory thereof or supplementary thereto." (See Water Code § 13389.) As discussed, there will be "new sources" as defined in the CWA, which the Regional Board is seeking to regulate with the subject NPDES Permit, and as such, the impact of these requirements on "new sources" must be reviewed under the requirements of CEQA.

In short, the findings throughout the Tentative Permit are not supported by the evidence in the record, and such findings do not support the proposed terms of the Tentative Permit. In addition, there are numerous provisions throughout the Tentative Permit which are not supported by any findings.

O. VARIOUS DEFINITIONS WITHIN THE PERMIT ARE IMPROPER AND CONTRARY TO LAW.

A number of definitions in the Tentative Permit are improper, and contain language that is contrary to law and/or is ambiguous. The Permittees herein respectfully request that the definitions as described below, be modified to correct such deficiencies.

The definition of "**Director**" means the "**Director of a Municipality**" and the designees of such person. Permittees are unaware of what a "Director of a Municipality" is intended to mean, as no such person or office generally exists for the cities in Los Angeles County.

The definition of "**Environmentally Sensitive Areas**" is overly broad and ambiguous and includes areas that are labeled sensitive, irrespective of whether or not the receiving waters in issue contain the subject plant or animal life causing the area to be sensitive in the first instance. As such, the areas defined as "Environmentally Sensitive Areas" are overly broad and are outside the jurisdiction of the Regional Board.

The term "**Inspection**" is defined in a fashion to require the municipalities to conduct unauthorized searches and seizures and improper interrogation, in violation of both the Fourth and Fifth Amendments to the U.S. Constitution. The definition also

excludes the possibility of conducting an inspection from a public right-of-way, and to observe what may be in the "plain view" of enforcing officials. As discussed above, the "inspection" requirements in the Tentative Permit are requirements that are not supported by substantial evidence, and just as important, are not legally authorized under the CWA or the Porter-Cologne Act.

The definition of "**Maximum Extent Practicable**" ("MEP") is defined in a fashion that is contrary to the requirements of the Clean Water Act. The definition of MEP is based almost exclusively on a legal memorandum dated February 11, 1993 from the State Board's office of Chief Counsel, a legal memorandum that ***cannot legally*** be used to override the intent of Congress in adopting the Clean Water Act in the first instance, or the Porter-Cologne Act as adopted by the California Legislature. The term "Maximum Extent Practicable" should be defined as it is issued by Congress in the CWA.

The term "**Parking Lot**" is defined as being a lot size of 5,000 square feet or more of "surface area" as opposed to "impervious surface area" as referred to in other SUSMP categories.

The term "**Planning Priority Projects**" include, among other items, projects that require the implementation of a site specific plan "to mitigate post-development storm water for new development not requiring a SUSMP but which may potentially have adverse impacts on post-development storm water quality," where certain project characteristics exist. This portion of the definition, and other portions of the Development Planning/SUSMP section of the Permit, clearly violate the requirements of CEQA and the standards set forth therein, as the legislative and regulatory requirements under CEQA to be adhered to in developing mitigation measures for potentially ***significant*** adverse impacts on the environment, have not been complied with. To the extent that the language within the definition of "Planning Priority Projects" is inconsistent with CEQA, it should be deleted.

The definition of "**Redevelopment**" as described above is inconsistent with the definition provided by the State Board in Order No. 2000-11 and with EPA's definition of "redevelopment," and moreover, conflicts with other provisions of State and federal law.

Construction Industry Coalition on Water Quality

November 9, 2001

2001 NOV 13 P 3:37

Dennis Dickerson, Executive Officer
California Regional Water Quality Control Board
Los Angeles Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Municipal Storm Water Permit for Los Angeles County and Cities

Dear Mr. Dickerson:

On behalf of the more than 3,300 member companies of the Construction Industry Coalition on Water Quality (CICWQ), we would like to acknowledge the time, effort and expertise that went into developing the proposed Municipal Storm Water Permit (Permit) and thank the Los Angeles Regional Water Quality Control Board (LARWQCB) for this opportunity to express our concerns with the Permit. Please reference our August 6, 2001 letter for detailed comments that still have not been addressed. This letter will focus on general comments and the State Water Resources Control Boards' draft Order (draft Order) that was issued in response to a petition of the San Diego Municipal Stormwater Permit.

CICWQ is comprised of the four major construction and building industry trade associations in Southern California. These include the Associated General Contractors of California (AGC), Building Industry Association of Southern California (BIA/SC), Engineering Contractors Association (ECA) and the Southern California Contractors Association (SCCA). These organizations work collectively to provide the necessary infrastructure and support for the region's business and residential needs.

The membership of CICWQ is comprised of construction contractors, labor unions, landowners, developers, and homebuilders throughout the region and state. All segments of the coalition are impacted by the Permit, including construction employees who rely on jobs in the region, landowners within the Board's jurisdictional boundaries and potential builders who require land resources to satisfy the ever-growing demand for housing.

While CICWQ appreciates the LARWQCB's well-intentioned regulatory efforts to improve water quality, the Permit could have significant detrimental effects on the regional economy and every CICWQ member employee, without an accompanying benefit to the environment. This Permit will most likely exacerbate the increasing jobless rate and housing crisis without addressing the sources of our water quality problems. It will result in fewer, but more expensive

2149 E. Garvey Avenue N., Suite A-11, West Covina, California 91791
626 858-4611 Phone • 626 858-4610 Fax

construction projects being completed in the future, due to additional costs and restrictions involved in complying with the regulation. This will, in turn, compromise job growth, housing production and the ability of residents to own their own home. These factors can have a significant negative effect on the regional economy. According to the Real Estate and Land Use Institute at the California State University at Sacramento, every $1 spent on home construction generates nearly $2.60 in economic output. The National Association of Home Builders estimates that five new permanent jobs are created for every two new homes built. As you can see, construction and business are vital to a healthy economy.

Governor Davis recognizes this connection. That is why he met with California's business leaders on Friday, November 2 at a hastily scheduled economic summit. Concern is growing at the state Capitol that California's economy is in trouble. The state's unemployment rate ticked up one-half of one percent last month and budget analysts in Sacramento are forecasting revenue shortfalls for next fiscal year in the $3 billion range and as much as $9 billion to $14 billion over the next five years.

While CICWQ is very concerned with the economic impact that the Permit will have on the economy, we are also very supportive of the Board's efforts to develop new ways for improving our quality of life through improved water quality. However, the building and construction industries want to ensure that these efforts are practicable, achievable and will result in real improvements. It is extremely important that we spend our limited resources on proposed solutions that will actually lead to improved water quality. The State Water Resources Control Board (State Board) is making precedential decisions, like the SUSMP decision, which are based on an interpretation of federal and state law and the technical data that exist at the time. The problem with precedential decisions such as these is that the technical data improves over time, but the policies and regulations do not change since the regulators point to the previous precedential decision as controlling. The SUSMP decision is one example of this occurring. In addition, it appears that the State Board and regional boards are ignoring important studies that address this relationship between causes, solutions and cost. These studies include the following:

1. The National Academy of Sciences (NAS) report on recommendations for improving the Total Maximum Daily Loads (TMDLs) program. One quote from this report raises a red flag in regards to the approach the regulatory agencies are taking to both the TMDL program and the municipal stormwater permits. This quote is, "Water quality standards are the benchmark for establishing whether a waterbody is impaired; if the standards are flawed (as many are), all subsequent steps in the TMDL process will be affected."

   How does this finding relate to the Permit? The Permit requires compliance with water quality standards. Therefore, we have a finding requiring compliance with water quality standards that, according to the NAS, are more than likely flawed. As you can see, the

whole foundation of requiring water quality standard compliance in municipal storm water permits is inadequate. Yet, this Permit is still being proposed with this approach, thus requiring a huge expense of money to comply with a regulation that is based on compliance with flawed water quality standards.

2. A new study of Newport Bay, referenced in a September 1, 2001 Los Angeles Times article written by Seema Mehta, found low health risks for swimmers and concluded that attempts to curtail urban runoff pollution would be costly and inefficient. The study investigated the health risks to swimmers, the sources of Newport Bay's pollution and the cost of cleaning it up. The report says that sewage from boats is more of a threat to swimmers than urban runoff. The results of this study, although limited to Newport Beach, should be consistent in Bay's throughout California. This is more proof that some of our long-held assumptions about water quality may not actually be true.

3. The Los Angeles County Flood Control District 1994-2000 Integrated Receiving Water Impacts Report, which used the identification, from the Santa Monica Bay receiving water study prepared by the Southern California Coastal Water Research Project, of dissolved zinc and copper as stormwater toxicants, to look at land use to see if any particular land uses could be singled out as notable or significant for those constituents. Light industrial and transportation land uses displayed the highest median values for both total and dissolved zinc and copper. The report then states that, "Runoff concentrations from the remaining land use types (high density, single family residential, education, multifamily residential and mixed residential) were significantly less.

4. A report dated January 31, 2000 and prepared by URS Greiner Woodward Clyde for Alameda County Urban Runoff Clean Water Program entitled, "Stormwater Inlet Insert Devices Literature Review" which evaluated commercially-available catch basin inserts for the treatment of stormwater runoff from developed sites found that there was no discernible removal of the total or dissolved fraction of copper, lead or zinc in any of the units studied. While the removal of indicator bacteria was not reviewed in this report, it is evident that these devices are also not effective at the removal of bacteria because that would require the use of a disinfectant, such as chlorine, ozone or ultraviolet light. None of these devices have that technology because that type of technology is very expensive and also the technology has not yet been proven effective on stormwater runoff.

As you can see from these studies, there appears to be a disconnect between the approach being used in the Permit to address water quality concerns and the conclusions reached in these studies on how to address these concerns. These studies show that the approach proposed by the Permit will not help to solve our water quality problems in an effective manner. The Permit requires structural treatment controls to be implemented on residential development and redevelopment, even though stormwater runoff from these projects has not been shown to contain elevated levels

of pollutants of concern, other than bacteria indicators. In addition, the structural treatment controls being required on these projects will do nothing to address the pollutants of concern. Therefore, we have a large outlay of resources to address a problem, that may not even be a problem, in a manner that is ineffective at addressing the problem, even if the problem existed in the first place. The conclusion of this insanity is that we have potentially increased the cost of a home, decreased home ownership and increased the jobless rate, while doing nothing to improve water quality.

Draft Order on San Diego Municipal Stormwater Permit Petition

As you may know, the State Board has issued a draft Order in response to the petition filed on the San Diego Municipal Stormwater Permit. This draft Order holds that the regional boards cannot apply the relevant pollution-reduction standard to discharges "into" the public storm drain, as the point of compliance is where the stormwater comes out of the drain and enters receiving waters. This Permit fails to recognize this point of compliance, and directs the municipal permittees to control all kinds of activities before stormwater even gets into the public drain. Examples of noncompliance with the draft Order's point of compliance include the following:

1. Under Part 1. Discharge Prohibitions, the Permit states, "The Permittees shall effectively prohibit non-storm water discharges into the MS4 and watercourses...".
2. All development planning requirements which make the Permittees implement a procedure requiring project proponents to comply with peak flow and SUSMP restrictions on discharges into the MS4.
3. The requirement for the Permittees to revise their CEQA checklist and General Plan.
4. All requirements on the control of runoff from construction projects which discharge into the MS4.

The intent of the Clean Water Act is to have the municipalities responsible for implementing Best Management Practices to reduce the discharge of pollutants to waters of the US to the Maximum Extent Practicable. The municipalities are then responsible for determining what requirements they need to place on dischargers to their MS4 in order to meet the MEP standard. The State and regional boards have authority over these discharges to waters of the US and to waters of the State. They also have authority, through the General Industrial and Construction Permits to regulate discharges from sites or projects that are covered by one of these Permits. They do not have authority to regulate or require municipalities to regulate construction and industrial discharges to the MS4.

The State Board recognized this when they adopted the monitoring modifications to the State General Construction Permit. In this modification, the State Board required stormwater monitoring for construction projects discharging directly to sediment impaired water bodies, but not for construction projects that discharged into MS4s, which discharged into these sediment impaired water bodies.

CONCLUSION

We are very concerned about the cost effectiveness of the Permit in relation to specifically, what the anticipated efficacy is of this Permit in terms of improving overall water quality? The Permit should provide actual improvement of water quality, not simply attempts at incremental decreases in future contributions. As to cost, the city of San Marcos (population 54,000) is setting aside almost $1.4 million this fiscal year, which began July 1, to comply with the San Diego Municipal Stormwater Permit, regulations similar to this Permit. Beginning July 1, 2002, the City expects that the budget could rise to $2.5 million. These are huge costs for a small city with an operating budget of $29.9 million. For fiscal year 2001 ($1.4 million), that equates to almost $26/person and approximately 4.7% of the operating budget. For 2002 ($2.5 million), it equates to over $46/person and approximately 7.7% of the operating budget. As to the maximum extent practicable consideration, both the Regional and State Boards have not properly addressed key elements of the "practicality" component – i.e., technical and cost feasibility. While cleaning up a problem decades in the making certainly must be a priority, it will not be accomplished on the back of other critical social needs in California, such as housing and jobs. Even with the marginal cost estimates relied upon by Regional Board staff (figures we vigorously dispute), there is no consideration as to the effect of those marginal costs on driving the availability of housing *further* out of the reach of those residents of our state most in need.

In consideration of the aforementioned comments and recommendations, CICWQ respectfully requests that the LARWQCB give further review to the proposed Permit and make modifications that will result in a more equitable and balanced approach for addressing our collective regional water quality needs. CICWQ would be pleased to discuss these issues in greater detail at any time and assist Board staff with making any of the recommended modifications.

CICWQ recognizes that the stakes are very high with regard to the development of a permit that the Board believes will improve water quality in California. The coalition also recognizes that there are a number of stakeholders involved in the process – all of which have specific concerns they want to have addressed. Yet, the most important thing to keep in mind is that this permit, and future permits that it will influence, is not just about water quality. It is also about housing, jobs and economic growth. The absence of any meaningful consideration of these issues, in an effort to improve water quality at any cost, will have an immediate and significant impact on

affordable housing, jobs, wages and livability. Meanwhile, there would be little, if any, certainty as to just how much water quality improvement would really be achieved.

We urge you to thoroughly review the comments provided by CICWQ and ask yourselves at what point water quality improvement efforts should be allowed to compromise the economic livelihoods of our working families, diminish new home production, increase housing costs, and jeopardize our regional economic strength.

We are confident that, by working together, CICWQ can assist you in achieving balance that will greatly improve water quality while also meeting our other regional obligations and needs. We thank you for your consideration of our comments.

If you have any questions, please feel free to contact me, or our Director of Environmental Affairs, Tim Piasky at (909) 396-9993 or tpiasky@biasc.org.

Respectfully,

Michael W. Lewis
Executive Vice-President

Executive Advisory Committee

Stormwater Program – Los Angeles County

November 13, 2001

2001 NOV 13 P 3:08

Mr. Dennis A. Dickerson, Executive Officer
California Regional Water Quality
Control Board - Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, CA 90013-1105

Dear Mr. Dickerson:

**OCTOBER 11, 2001, TENTATIVE DRAFT
WASTE DISCHARGE REQUIREMENTS FOR
MUNICIPAL STORM WATER AND URBAN RUNOFF
DISCHARGES WITHIN THE COUNTY OF LOS ANGELES
AND THE INCORPORATED CITIES THEREIN, EXCEPT
THE CITY OF LONG BEACH (NPDES PERMIT NO. CAS004001)**

The Executive Advisory Committee has reviewed the October 11, 2001 Tentative Draft "Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges Within the County of Los Angeles and the Incorporated Cities Therein, Except the City of Long Beach" (the Permit) and submits the following comments. We are incorporating by reference our previously submitted comments on the first and second drafts of the Permit as well as comments submitted by or on behalf of the County of Los Angeles, individual Cities, and the Coalition for Practical Regulations (CPR).

Although the Regional Board staff and the Permitees have had various meetings to develop permit language that will provide for mitigating the adverse impacts of urban runoff, the Permit does not represent a permit that is in the best interest of Los Angeles County. The Permit continues to require inappropriate and costly measures that will not result in significant improvement in storm water quality. We hope that prior to the November 29, 2001 Permit adoption hearing we may reach some consensus on the areas of major disagreement.

The County of Los Angeles and the incorporated cities within the County (the Permitees) have been, since the issuance of the first storm water permit in 1990, committed to

improving storm water quality within Los Angeles County. During the past five years, the Permitees have spent approximately $660 million in implementing various programs to improve storm water quality. The Permitees are prepared and willing to develop and implement programs to clean up water quality. However, it is imperative that mandated programs to achieve this are cost effective.

RECEIVING WATER LIMITATIONS. The permit language still fails to address our concerns that the receiving water limitation language results in Permitees becoming noncompliant from the very issuance of the permit. Stormwater, unless it is treated, will always exceed the water quality standards and objectives set in the basin plan. The permit language should clearly reflect that as long as the Permitees are conforming to all the requirements in the permit that they are in compliance with the permit and not in violation of receiving water limitations. The Regional Board should use the receiving water limitation language used in State Water Resources Control Board Order No. 2001-12-DWQ.

MAXIMUM EXTENT PRACTICABLE IMPLEMENTATION. The Clear Water Act (CWA) properly recognized that storm drain systems do not lend themselves to structural treatment solutions without major modifications and significant cost. Accordingly, Section 402 of the CWA establishes the standard of compliance for municipal stormwater discharge to reduce storm water pollutants to the maximum extent practicable. The Permit should modify its definition of MEP to be consistent with the Federal guidelines and provide that implementation of all required programs and BMPs shall be to the maximum extent practicable.

IMPRECISE DEFINITION OF EXECUTIVE OFFICERS POWERS. The Permit lacks specific standards that will guide the Executive Officer in interpreting permit requirements or accepting modifications to various permit requirements such as the Storm Water Quality Management Program (SQMP). The Permit should provide specific criteria that will guide the Executive Officer in reviewing permit compliance and developing new requirements.

COORDINATION OF PERMIT ACTIVITIES. The Permit establishes six Watershed Management Committees to develop various programs within each of the watersheds. However, the Permit is issued for all watersheds and does not provide any differentiation of the watersheds, yet it is clearly beneficial to have one group that coordinates the efforts of the WMAs and serves as a convenient contact point for the Regional Board to discuss Permit requirements. This role has been met by the Los Angeles County Storm Water Program Executive Advisory Committee. The Permit should recognize the EAC and its role as a coordinating body to facilitate the implementation of the Permit.

INPSECTION PROGRAM. The Permitees support Version C of the industrial/commercial facilities program if modified to recognize that the Permitees shall not have responsibility for visits to any Phase I facilities.

ILLICIT CONNECTION/ILLICIT DISCHARGE. The focus on identifying illicit connection through a screening process is misplaced and results in a significant cost without any benefit. The requirement to map all illicit connections is an unfair economic burden that will not result in any significant storm water quality improvement. This section should be modified to focus on identifying illicit connections in a prudently paced manner.

DEVELOPMENT PLANNING. The Permitees would like to see the reinstatement of the SUSMP requirement recently approved by the State Board for the Los Angeles permit instead of making changes to them so soon. These SUSMP requirements have been in effect for a short while and the development community and permitees are just becoming comfortable with them. These requirements will go a long way toward reducing the impact of development and redevelopment sites in our communities and we do not feel it is appropriate to expand the SUSMP requirements at this time.

The requirement to control peak flow is unwarranted. It is inappropriate to assume that all runoff will cause erosion. A better approach is to look at the overall impact on natural drainage systems and see how that can be mitigated.

The Permitees also have significant issues with how the permit deals with existing statutes and case law on CEQA, General Plan and land use authority.

COST-EFFECTIVE CRITERIA. The permit requirements should carefully weigh the improvement in water quality that will result from their implementation versus their cost. However, the permit does not provide any justification of the cost associated with implementation of the permit.

MONITORING REQUIREMENTS. The monitoring requirements of the permit will not collect information that will assist you or us in determining the effectiveness of the storm water permit. Modifications are warranted. A recently completed report by the United States General Accounting Office – Water Quality Better Data and Evaluation of Urban

Runoff Programs Needed to Assess Effectiveness (GAO-01-679) found that the permit monitoring requirements need considerable work. The report concludes that "no systematic effort to evaluate the program's results has been started." The permit monitoring requirements should focus on collecting data to determine the effectiveness of

the programs. The requirements for water column toxicity monitoring, shoreline monitoring, estuary sampling, and bioassessments although well intended will not result in determining the effectiveness of any programs that are required in the permit and should be removed. These are costly data collection efforts that should be replaced with better-targeted monitoring programs. The imposition of a monitoring program that parallels the one required in the Trash TMDL is duplicative, unreasonable and should be deleted from the permit.

Sincerely,

Desi Alvarez

Subject: Draft Municipal Stormwater Permit

Dear Mr. Dickerson;

We appreciate the opportunity your staff has provided for us to review and comment on the draft permit for "Municipal Storm Water and Urban Runoff". Our specific comments are:

Section B.6 *Environmentally sensitive areas*	The text (Sec 4.D.3) allows cities to submit designations for environmentally sensitive areas. This section (B.6) should be consistent. Recommended wording: "These environmentally sensitive areas designated by the State and /or the County of Los Angeles and/or municipalities
Section C.2 *SQMP*	The proposed Order adopts the model programs developed under the previous (current) permit subject to the revisions of the new permit. The Permittees invested considerable effort in developing the existing model programs. It should be the Permittees' responsibility to review and revise the model programs.
Section D.2 *Responsibility over federal and state institutions*	The wording "Permittees will not be held responsible for such facilities and/or discharges" (from federal/state facilities) should be left in.
Section D.4 *Maximum Extent Practicable*	Add a sentence to the end of the paragraph. "Timely and thorough implementation of this order constitutes compliance with the Maximum Extent Practicable criteria."

Section D.6	The wording is confusing. . . . "the burden being on the municipality to demonstrate compliance with MEP by showing that a BMP is not technically feasible . . . "
Sections D.8; D.10 *TMDLs*	This section incorporates the TMDL process into the SQMP. TMDLs should only be added after appropriate public comment and review.
Section D.22 *GIASP and GCASP*	The permit identifies the Regional Board as the "enforcing authority" for the two statewide general permits. If the State is the regulating authority for these sites, then municipalities (similar to the exclusion of section D.2) should not be responsible for discharges from these sites, either under this permit or the TMDL process.
Part 1 *Exempt discharges*	The permit lists several "exempt" discharges with the provision that the Board's executive officer may remove any of these categories if determined to be a source of pollutants. The Regional Board has obviously invested a considerable amount of time in developing this list, and the permittees are likely to permit these discharges. In the event that a discharge is subsequently determined to be a source of pollutants, the permittees should not be held responsible for any excceedances caused by these discharges without first being given adequate time to develop and implement additional BMPs.
Part 1.1 *Exempt discharges*	All general NPDES permits (dewatering, hydrostatic testing, etc.) should be incorporated into this permit as an attachment so that permittees can know which discharges are covered. The Regional Board should also notify all applicable permittees of any subsequent general NPDES permits.
Part 2 *Receiving water limitations*	The wording "thorough and timely implementation of this order shall constitute compliance with the standard for Maximum Extent Practical." should be added.
Part 2.4	Add wording: "So long as the Permittee has complied with the procedures set forth above and is implementing the revised SQMP and its components, a Notice of Violation will not be issued by the Regional Board and the Permittee does not have to repeat the same procedure . . . .
Part 3.A.3 *General requirements*	The wording "Each Permittee shall implement additional controls where necessary" is too open ended and should be eliminated.

Part 3.B *Best Management Practices*	The paragraph: "The permittees shall implement or require the implementation of the most effective combination of BMPs . . . . Is similarly too open ended. Who will the permittees require implementation by? What is the criterion for "most effective combination"? And doesn't implementation of this Order constitute meeting the standard of MEP?
Part 3.G deleted *Executive Advisory Committee*	The proposed Permit eliminates the EAC as a recognized entity. How will the Permittees coordinate their efforts on a countywide basis?
Part 3.G *Legal authority*	Permittees have on several occasions, certified that their ordinances comply with the NPDES stormwater requirements. The amending of municipal ordinances each time there is a change in the permit constitutes a substantial burden on city staffs. The existing ordinances are adequate to provide a framework for implementing this Order. The proposed changes in this section should be relocated into the "Special Provisions" section so that ordinances do not need to be modified again. Municipalities will decide if their ordinances need to be modified for specific areas of the Order.
Part 3.G.d *Inspection authority*	Municipalities can authorize their inspectors to make inspections of a facility on a voluntary (by the owner) basis, but cannot make it mandatory without probable cause or a prior agreement with the business or property owner. This section should reflect this and permittees should not be held responsible for a discharge from a site that the municipality was not able to inspect.
Part 3.G.2c *Adequate Legal Authority*	The word "control" is not adequately defined.
Part 4.A.2 *Customized SQMP*	What are the standards and what is the timeline for developing the customized SQMP? More appropriate wording would be that Permittees shall evaluate the need for a customized SQMP and if necessary, shall develop standards and then develop the SQMP. Also, a municipality should be able to review the existing SQMP, and if found adequate, adopt it as the customized SQMP?

Part 4.B and Findings C.2
Public Information and Participation Program

There have been very substantial changes to this program and it appears that the 5-year implementation strategy will no longer be in force. The reference to the existing: "Public Information and Participation" as being continued with revisions, as contained in Findings Part C-2 should be removed.

Part 4.C
Site inspections

No documentation has been provided that the existing site educational visit program is not working. The site visit program should continue as is.

The State is collecting $250 from industrial and construction facilities under the State's General Construction and Industrial Activities Permits. The State should provide municipalities with demonstrable site visit and inspection programs a substantial portion.

If the State (or State's agent) is also conducting site inspections, what is the mechanism for informing municipalities of the State's inspection schedule so that overlaps and duplication can be avoided?

The inspection criteria requires inspectors to verify that BMPs are being effectively implemented. This requirement is essentially impossible to comply with. For example, how can an inspector verify that treatment BMPs are being effectively cleaned prior to each rainy season, when inspections are only made once every 2 years (and in many cases, once every 5 years starting in 2004)? The word "effectively" should be removed from all inspection criteria.

Also, Section C.2 et al requires inspectors to confirm that BMPs are being implemented in compliance with County and Municipal ordinances. The wording could lead to confusion, implying that County ordinances are to be implemented in Municipal areas. Wording to the effect of "appropriate jurisdictions" should be added.

Part 4.D.2
Peak flow control

The wording of this section requires that permittees implement peak flow controls for essentially all streams in hillside areas. This should not be a requirement unless a stream has been specifically identified as susceptible to accelerated erosion.

Table 2.1 as referred to, includes many hard-bottomed channels that represent no erosion threat.

Part 4.D.3
SUSMPs

This section marks a substantial departure from the SUMSP program as previously developed and implemented. Only discretionary Projects should be included as priority projects.

Also, as the State's General Activity Permits will be reviewed by the State and contain post construction BMPs, how will any inconsistencies and duplications with plans submitted to the municipalities for review under the SUSMP program, which also show post-construction BMPs, be avoided?

Part 4.D.3.b
ESAs

The wording "Each Permittee shall submit an Environmentally Sensitive Area (ESA) Delineation Map" should be made optional:

A Permittee may submit . . .

Also, the Staff Report (pg. 7 of attachment) indicates that they (the Board's Staff) were unable to find a legislative basis for the 2,500 square foot threshold of triggering an SUSMP in an ESA. This level was chosen based upon standard residential lot sizes. A better standard is the federal project size threshold of 1 acre, which would be consistent with the construction thresholds and therefore reduce confusion of when stormwater management plans are required.

Part 4.E.2b
Construction sites

As stated in Section D22 of the Permit, the Regional Board is the enforcement authority for sites under the General Construction Activities Permit. Municipalities should not be required to inspect these sites. By mutual agreement with the Board, municipalities could be authorized to do so, but the State should then reimburse the municipality for the cost of the inspection from the fees the State has collected

Part 4.F.3c2
Public agency

This statement could be construed as requiring pre-treatment facilities for any facility whether there is wastewater or not (ex: a senior citizens center or library). Add the wording "vehicle or equipment washing".

Also, fire fighting vehicles are excluded from this requirement. Does this mean that washwater from fire fighting vehicles is now considered an exempt discharge?

Part 4.F.5
Trash receptacles

Permittees, where trash has been designated as a pollutant, are already addressing this through the TMDL process. All reference to trash and litter under this section is redundant and will lead to confusion and should therefore be eliminated.

For example, if a Permittee has already adopted a plan under the TMDL process to reduce trash by utilizing catch basin inserts, why then require trash receptacles at all transit stops?

Suggestion: Permittees evaluate the need for addition anti-trash BMPs and take appropriate action based upon their findings.

Part 4.F.6
Street Sweeping

Similarly, if the discharge of trash is being adequately addressed through other means, why require revisions to the street sweeping program?

Part 4.G.1.b
Illicit Connections

The requirement of Permittees to map all illicit connections and discharges is excessive and not cost effective. If these illicit connections are sealed and illicit discharges stopped, what is the purpose of a map? Mapping is a very labor intensive and costly endeavor and should only be used when necessary.

Part 4.G.2.a
Field Screening

There is no definition within the Order of what "Field Screening" is. The Staff Report (pg. 37) calls for visual monitoring. Wording should be added to the Order's language for clarification that field screening is: visual monitoring during infrastructure maintenance.

Part 4.G.3a
Illicit discharges

Corrective actions are typically performed by the responsible party (the discharger). It should be clear that "activities to abate" include ordering the responsible party to initiate mitigation activities.

Annual Report

Under the previous (current) permit, permittees invested a considerable amount of resources in developing an annual reporting form. This process should be continued under the new permit. Permittees should be allowed a minimum of 180 days to develop a revised report format for submittal to the Board's executive officer for approval instead of using the form attached in the permit package.

The Annual Report asks municipalities to grade themselves on a scale of 1 to 10. Is 10 best or worst? Also, what criteria is used for grading and what is the minimum allowable score to assure compliance with this Order and the Clean Water Act?

I wish to thank you for the opportunity to comment on the next proposed Permit. Please call me if you have any questions.

Sincerely,

Sheila Kennedy

Dr. Xavier Swamikannu
Los Angeles Regional Water Quality Control Board
320 W. 4th Street. Suite 200
Los Angeles, California 90012

November 13, 2001

Re: Comments on the Third Draft of the LARWQCB NPDES No. CAS614001 – Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges Within the County of Los Angeles and the Incorporated Cities, Except for Long Beach and Santa Clarita

Dear Dr. Swamikannu:

On behalf of Heal the Bay, an environmental group with over 10,000 members dedicated to making Santa Monica Bay and Southern California coastal waters safe and healthy again for people and marine life, we have the following comments on the third draft of the L.A. County storm water NPDES permit. As in our previous comments, we have numerous concerns about the draft permit.

The following concerns are not addressed in the third draft permit. We urge the LARWQCB to make these changes before the permit is finalized, in order to fully protect receiving water quality and prevent further degradation of receiving waters.

Our greatest concerns with the third draft permit are (1) the lack of a true watershed approach to water quality regulation, (2) the failure to implement numeric effluent criteria for stormwater, (3) the weakening of certain provisions relative to the first and second drafts of the permit, and (4) the continued lack of specific requirements in a number of important sections in the permit. These concerns and others are detailed below. Our remaining concern with the Monitoring and Reporting requirements of the third draft permit are also discussed.

Waste Discharge Requirements

The permit fails to truly require a watershed approach to storm water pollution abatement. Inclusion of watershed-specific requirements for each of the watersheds within the storm water permit is long overdue. The third draft permit represents a storm water regulatory approach without watershed-specific requirements. The permit is a one-size-fits-all approach to curtailing stormwater pollution even though, for example, the runoff caused water quality problems are substantially different in different watersheds. The RWQCB has failed to require implementation of watershed management area plans (WMAPs) developed under the 1996 permit, in order to achieve receiving water quality objectives. For example: most of the Malibu Creek watershed is listed for nutrients and fecal bacteria on California's S.303d list, yet there are no specific requirements in the permit for BMP implementation to achieve the

R0006562

appropriate water quality objectives. Also, there are no requirements to implement any of the watershed's WMAPs.

In our comments on the second draft permit, we recommended six stormwater permits for L.A. County - Ballona Creek, Malibu Creek, L.A. River, San Gabriel River, Santa Clara River and Dominguez Channel. This approach would insure that site-specific water quality impairments would be prioritized for clean-up under the permits. This approach is also appropriate in light of the region's current efforts on TMDLs, watershed planning, the Santa Monica Bay Restoration Project, and the Los Angeles/San Gabriel River Watershed Council.

Since the Regional Board has chosen to go forward with a single permit for all of L.A. County, they must at least require the implementation of watershed specific BMPs, targeting water quality impairments, as soon as possible. We suggest the following language: *Permittees must implement BMPs to eliminate discharges to the MS4 that cause or contribute to water quality impairments by January 2003. The implementation strategy, including BMPs and rationale for implementing the chosen BMPs, must be included as part of the 2002 annual report. Progress on BMP implementation and the efficacy of the BMPs in pollutant removal shall be summarized in subsequent annual reports.*

Failure to set numeric effluent limits for stormwater The permit should set numeric effluent limits for stormwater to ensure that beaches and streams are safe for people and aquatic life. Due in part to the lack of regional progress towards cleaning up our beaches and watersheds, Heal the Bay continues to urge the use of numeric effluent limits for stormwater. Numeric effluent limits have led to remarkable regulatory success at pollutant reduction in industrial and sewage treatment plant point sources. The lack of numeric effluent limits and the reliance of the Regional Water Board on the ambiguous MEP standard have perpetuated the region's dismal record on protecting beneficial uses impaired by stormwater. Although the permit contains a provision that requires an out-of-compliance municipality that caused or contributed to an exceedance of a receiving water standard to implement a Best Management Practice-based plan to reduce the impairing pollutant(s), the Regional Board's sole reliance on an iterative approach to meeting water quality standards will not achieve the same results as numeric effluent limits.

Receiving Water Limitations (Part 2.) As in the second draft, the third draft permit contains no further requirements for permittees in the event that implementation of the modified SQMP fails to result in the abatement of violations of receiving water quality standards and objectives. The iterative process laid out in the permit must continue until the violations are abated, if the permittee still has the reasonable potential to cause or contribute to these violations. We repeat our request that the Regional Board modify the permit accordingly. The following language should replace Part 2.3.d: "*Implement the revised SQMP and its components and monitoring program according to the approved schedule. Submit a report detailing changes to the SQMP, monitoring and results, to the Regional Board. If monitoring does not show abatement of the violation, steps 3.a through 3.d shall be repeated until monitoring shows the violation has been abated.*"

Legal Authority, p. 24 – The section requires that permittees possess the legal authority to prohibit a wide variety of discharges, but it does not explicitly require the permittees to

fax 310 453 7927
info@healthebay.org
www.healthebay.org

prohibit those polluting activities. Also, please add the following language in this section: *All permittees have the legal obligation to assure compliance with all municipal stormwater ordinances.*

The industrial/commercial facilities program must include inspections and must cover all Phase One facilities (p. 33). Versions A and B of Part 4.C. of the permit include inspections but version C does not. The purpose of this program is to ensure implementation of pollutant reduction and control programs at industrial and commercial facilities. An additional purpose is to insure that all local ordinances that prohibit polluting activities are enforced at these facilities. Version C is an educational program without any requirements to inspect facilities, ensure compliance with discharge prohibitions, and confirm that BMPs are implemented, SWPPPs are available on-site, and permits are up-to-date. We strongly oppose the inclusion of version C in the permit and support either version A or version B. Versions A and B both require physical inspections every 24 months and represent the minimum requirements for the industrial/commercial facilities program.

The list of High and Low Priority Categories in versions A and B of the industrial/commercial facilities program must include all Phase One facilities as well as those listed in draft 3 (p.33A and 33B).

The Development Construction Program has been weakened relative to the first and second draft permits. Specifically:

- **The language of the discharge prohibitions in Parts 4.E.1.a and 4.E.1.b (p. 48), for sediment and construction related materials, has been weakened.** Please insert the following sentence at the beginning of Part 4.E.1.a: *Sediments shall not be discharged to the MS4 or receiving waters.* Please change Part 4.E.1.b to read: *No construction-related materials, wastes, spills, or residues shall be discharged from the project site to streets, drainage facilities, receiving waters, or adjacent properties by wind or runoff.*
- **Deletion of Part 4.E.1.e (p. 48), discouraging grading during the wet season, substantially weakens protection of waterbodies from sediment impairment due to construction.** Please add the following language after Part 4.E.1.d: *Discourage grading during the wet season. Proper justification for the need to grade during the wet season shall be provided to the Permittee. All erosion susceptible slopes shall be covered, netted, planted or protected in any way that prevents sediment discharge from the site.*

Why were the Applicability of Numerical Design Criteria weakened from the first draft of the permit? (Part 4.D.5 on pg 43). In the first draft, numerical design criteria applied to single-family hillside residential developments of 10,000 square feet or more. The 10,000-sq-feet requirement for housing developments has been reinstated in the third draft of the permit, but the weakened criterion for single-family hillside residential developments (one acre or more) is maintained. This is a significant weakening of the criterion, which will now apply to fewer developments. We strongly object to this change and request clarification and a rationale as to why was it made in the first place.

R0006564

Lack of specific requirements in the permit Some specific requirements have been added to the third draft of the permit, but there remain important sections without specific requirements. The following sections are still too open-ended:

- **The permit fails to state goals for site-specific mitigation plans (Part 4.D.7.a on pg. 44).** As stated in our comments on the second draft, site-specific mitigation is important for stormwater management because it applies to developments not covered by the SUSMP but which have potential adverse effects on receiving waters. Implementation requirements are necessary to insure the plans are effective. At a minimum, site-specific mitigation plans should provide details of how the project will satisfy the requirements in Part 3.G.1 on p. 24 of this permit. This section contains the list of prohibited discharges, as follows: illicit discharges and illicit connections; wash waters from cleaning gas stations, auto repair garages, or other automotive service facilities; discharge from mobile auto washing, mobile carpet cleaning and other mobile commercial and industrial operations; discharge from machinery repair areas where machinery is visibly leaking oil or antifreeze or fluids; discharge from storage areas containing grease, oil, or other hazardous substances; chlorinated/brominated swimming pool water and filter backwash; washdown of toxic materials from paved or unpaved areas; discharge from washing impervious surfaces in industrial/commercial areas; concrete or concrete-laden washwater; disposal of materials other than stormwater (such as litter, landscape debris, construction debris, banned or unregistered pesticides, food and food processing wastes, fuel wastes, chemical wastes, animal wastes, garbage, batteries, and other materials that have potential adverse impacts on water quality).

- **More specific requirements for the storm water monitoring reports should be included in the permit.** The purpose of the annual reports is to provide the Regional Board with information on the effectiveness of municipal stormwater management programs. The annual monitoring report provision should require an assessment of BMP efficacy on a programmatic (educational, site inspections, municipal staff trainings, etc.) and structural basis, and status and trends results for ongoing monitoring programs. The status and trends analysis should include loadings and receiving water impacts.

- **Specific requirements for annual reports should be summarized in the permit.** The permit includes many requirements for the annual report, but they are dispersed throughout the permit. Also, please add the following requirement: *The annual report should include a summary of the results of each permittee's compliance assurance and enforcement program.*

Other Comments

Sediment Discharges: Sediment discharges from construction and grading activities can cause major water quality and habitat degradation problems and must be prohibited. A sediment discharge prohibition must be added to the list of prohibited discharges in Part 3.G.1 on p. 24.

ph 310 453 0395
fax 310 453 7927
info@healthebay.org
www.healthebay.org

SUSMP Implementation: **Any development in or directly adjacent to, or discharging directly to, an ESA must implement SUSMP requirements.** The provisions in Part 4.D.3.c(1) stating that such developments need only implement SUSMPs if they will "discharge storm water and urban runoff that is likely to impact a sensitive biological species or habitat" is redundant since an ESA must by definition contain sensitive species and/or habitats (see Part 5 of the permit, Definitions). Storm water and urban runoff will impact sensitive species and habitats, and those designated as ESAs must be protected from impacts by requiring SUSMP implementation for any development located in or directly adjacent to, or discharging to, an ESA. Please delete subsection (1) of Part 4.D.3.c of the third draft permit.

SUSMP Implementation: **SUSMP requirements for ESAs have been weakened by the deletion of Part 4.D.3.c(2) on p.42.** Without the "ten percent or more requirement" small developments can create up to 2500 square feet of impervious surface without implementing SUSMP provisions. The cumulative impacts of numerous small developments will have an unacceptable impact on sensitive species and habitats of ESAs unless they implement SUSMP provisions. Therefore please add to Part 4.D.3.c, after subsection (2): *(3) OR alter the area of imperviousness of the site to ten or more percent of the naturally-occurring condition (whichever is less).*

Peak Flow Control: **As we stated in our comments on the second draft, it is not sufficient to focus on peak flow control. Downstream erosion and sedimentation problems may be caused by an increase in volume and/or duration of storm flows (Part 4.D.2 on pg 40).** After development, runoff flows throughout the storm must mimic pre-existing conditions in order to avoid erosion of stream channels and banks. Peak discharge rates is by no means the only important hydrologic .parameter. Maintaining a hydrograph that mimics natural conditions is the best way to prevent sedimentation and erosion. Without taking the entire hydrograph into account, one may design and implement BMPs that manage the peak storm flow without abating sedimentation and erosion problems. The new requirements in the third draft permit are insufficient because they address only peak flow, rather than flow throughout the duration of a storm.

Heal the Bay supports the Impact Study requirement which gives Permittees time to develop numeric criteria for controlling peak flow. This study and the time allowance provided allows the Permittees to develop appropriate criteria and to address site-specific concerns through the Impact Study. However, this makes the second new provision in this section unnecessary. There should be no need for a Permittee to substitute a Hydromodification Plan for peak flow numeric criteria, if they have already conducted peak flow impact studies to determine what the appropriate numeric criteria in different watersheds and locations are. We recommend deleting the last paragraph of Part 4.D.2.f of the third draft permit.

In our comments on the second draft, Heal the Bay requested clarification on what size development will be covered by the criteria, and how the five specific watersheds were chosen. This was not provided in the third draft. This information is still relevant to this issue and should be clarified in the final permit.

Sewage Spills: **The MS4 permit must contain specific procedures for notifying the public in the event of a sewage spill that enters the storm drain system and reaches recreational waters.** Please add the following language to Part 4.F.1 of the permit: *When a sewage spill or leak results in a beach closure(s) by the Department of Health Services, the responsible Permittee(s) must notify the public immediately. Notification must include, at a minimum, appropriate sign placement at beaches within two daylight hours of beach closure determination, indicating the reason for the beach closure and the health risk of water contact; telephone calls and electronic mail messages to relevant public agencies and non-profit organizations within two hours of the closure; and press releases to major newspapers, radio stations and television stations (including non-English language papers and stations within two hours of the closure).*

Permittees that may contribute to chronic poor beach water quality (high fecal bacteria densities) near a storm drain must implement a sanitary survey to determine the likely sources of beach contamination (Add to Part F.1. on pg 52). As stated in our earlier comments, sanitary surveys must be conducted where high bacteria densities are impacting beach water quality. Please insert the following language: *Where storm drains contribute to chronic water quality problems at beaches, the permittee must conduct a sanitary survey to investigate potential illegal discharges, illicit connections or leaky sewer lines. Also, the permittee must revise the SQMP and implement appropriate BMPs to abate the water quality problem as quickly as possible.* "Chronic poor water quality" at beaches may be defined as, for example, ">10% of days in one month exceed state single day health standards, or exceed the 30-day geometric mean state health standard for two consecutive dry-weather months". The permit should specify these requirements in this section.

Dam Releases: **We have pointed out in previous comments that dry-weather dam releases are not included in the discharge prohibition section. Does that make dry-weather dam releases illegal?** The discharge prohibition section makes no mention of occasional dry weather discharges from dams. These discharges can severely alter the natural dry-weather flow regime of a stream. Also, because waters held behind dams often have siltation, nutrient and fecal bacteria problems, dam releases can lead to exceedances of water quality objectives downstream. Dam releases are currently either unregulated or poorly regulated by the RWQCB. Language is needed in the permit to insure that these dry-weather runoff discharges from dams are prohibited except as needed to prevent imminent harm to public health, aquatic life, or property. At a minimum, the Regional Board must convene an effort with the County Department of Public Works, Malibu Creek watershed cities, California Department of State Parks, and other interested parties to develop a dam management plan for the watershed that does not cause or contribute to impairments in the watershed or at Malibu Surfrider Beach.

Ensuring Compliance: **Strong local compliance is necessary to impact storm water pollution. Please add the following requirement under Part 3.D.8 on page 21 - "***All permittees must ensure that residents, businesses and local government properties and employees all comply with the permittee's local storm water pollution control ordinances.***"** Without strong local compliance assurance and enforcement programs, the ordinances will have little to no impact on storm water pollution.

IC/ID Program: Permittees should examine existing and historic permits to determine their validity, rather than just listing existing permits. Part 4.G.2 As stated in our comments on the first and second drafts of the MS4 permit, permittees must determine if existing municipal stormdrain connection and/or discharge permits are valid. As part of the IC/ID program, each permittee should be required to review existing and historic local storm drain connection and/or discharge permits given to businesses. The permittee should determine which, if any, non-storm water discharges are authorized under the existing stormwater NPDES permit requirement. Those facilities that do not have a valid permit for a legal non-storm water discharge must be forced to cease discharge within 30 to 60 days, or obtain an NPDES permit from the Regional Water Board. Also, please change Part 4.G.2.a.i to read Open channels: [365 days from the effective date of this Order *and annually thereafter*].

Guidelines for prioritizing catch basins for cleaning are still not provided (Part F.5. on pg 55). The prioritization categories must be clearly defined. We strongly urge the following definition: *Priority A basins reach half full every month, Priority B reach half full in three months, and Priority C basins take more than three months to reach half full.* Furthermore, a deadline should be specified for designation of catch basin inlets as Priority A, B or C. We suggest a deadline of not later than 10-15-02 for designation and implementation of the prioritized catch basin cleaning schedule.

The record-keeping and reporting requirements for catch-basin cleaning activities deleted from the third draft permit must be included in the permit. This information will be essential for TMDL baseline monitoring and will help guide BMP decisions in the future, and should be collected by the permittees and reported to the Regional Board. Similarly, Part 4.D.5.g.5 (requirement to record quantity of open-channel waste collected) should be reinstated in the final permit. Without information on trash removal, assessment of BMP efficacy and the effectiveness of the trash TMDL will be impossible.

Public Information and Participation Program – Please remove all references to specific ethnicities in the permit. Reference to the requirement to target outreach efforts to all communities in the County will suffice. In addition, please delete the paragraph following Part 4.B.c regarding the requirement for a review panel and annual approval requirements for the PIPP. Instead, please insert the following: *The Principal Permittee shall convene an advisory panel of experts in public education to provide recommendations on PIPP development, implementation and assessment of effectiveness. These recommendations shall be forwarded to the Regional Board with the principal permittee's annual report..*

Clarification and definition issues

"Directly adjacent" should be defined as areas within 100 meters of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area (Part 5, pg 48). No justification is provided for why directly adjacent is defined as 200 feet. Clearly storm flows from developed areas can impact receiving waters more than 200 feet from the site.

R0006568

"Outdoor animal care" has not been defined (Part D.7.a.7 - pg 32). Does it include any horse stable? Commercial stable? A certain size facility? Also, **golf courses must be added to this list** because they use enormous amounts of water, pesticides, herbicides, fungicides, and fertilizers, which, without site-specific mitigation, may have serious adverse effects on receiving waters.

The mitigation funding section must be clarified (Part D.11 on pg 33). Situations that warrant a waiver for impracticability must be defined. Geologic hazard and very high groundwater are the only acceptable reasons for issuing a waiver. The waiver must apply only to the infiltration requirement of the SUSMP, since some level of treatment for site runoff can always be provided, regardless of ability to meet SUSMP infiltration requirements. Furthermore, the permit must clarify when a permittee can opt to help fund a regional solution, the process by which the funding amount will be determined, and the criteria for acceptability of the funded project as a mitigation alternative.

Part D. 15. b.2 on pg. 48 - Please add *of discharge* after duration.

As we stated in our earlier comments, we believe the following prohibitions are important and should be added for landscape and recreational facilities management (Add a section under Part F.4. on pg 54). *Disposal of landscape waste in the MS4 and receiving waters is prohibited. The storm water monitoring program must analyze runoff samples for all pesticides, herbicides, rodenticides and fungicides that are used by public agencies.*

The storm drain maintenance BMP requirement to review activities and ensure appropriate BMPs are used has not been clarified (Part 4.F.5.g.2. on pg 57). The permit must state what the Permittees will report to the RWQCB, and what actions are required if Permittees find inappropriate or insufficient BMPs in use.

Add the TMDL section that was included in the Ventura County Storm Water Permit. The language from the permit was as follows: *The permittee shall modify (either directly or through and appendix) the Los Angeles County Stormwater Management Plan to comply with waste load allocations developed and approved pursuant to the process for the designation and implementation of TMDLs for impaired water bodies.*

Monitoring and Reporting Program

The monitoring and reporting program in the third draft permit is much improved. Our only remaining concern is with the estuary monitoring program.

Estuary Monitoring

We recommend annual sediment toxicity testing and benthic community analysis at five sites in at least the Los Angeles River, Ballona Creek and the Dominguez Channel estuaries as part of the estuary monitoring program (Part F on pg T-12). As we stated in our earlier comments, monitoring these parameters once in the life of this permit may not be critical for the Malibu Creek and San Gabriel River estuaries because these receiving waters are not listed for impacts to benthic communities or sediment contamination. However, the

R0006569

Heal the Bay
3220 Nebraska Avenue
Santa Monica CA 90404
ph 310 453 0395
fax 310 453 7927
info@healthebay.org
www.healthebay.org

estuaries for the L.A. River, Ballona Creek and the Dominguez Channel are impaired for sediment toxicity and/or benthic community assemblage degradation. Also, all three creeks and rivers have contaminated sediment accumulation and subsequent disposal problems in the estuary that are exacerbated by polluted runoff. As you know, ocean dischargers are required to implement extensive programs on a quarterly or semi-annual basis. Heal the Bay is requesting annual sampling in order for the Regional Board, the County, the Contaminated Sediment Task Force, and the public to assess the biological impacts of runoff on estuary receiving waters. Fewer sites may be used in the estuary mapping studies (e.g. 15 sites instead of 25) to reduce the cost of annual monitoring. During the year that the Principal Permittee participates in the Bight Wide Study, annual sediment toxicity and benthic community analyses need not occur.

If you have any questions about our comments, please don't hesitate to call Mark Gold or Shelley Luce at 310-453-0395.

Sincerely,

Mark Gold, D.Env.

Los Angeles, CA 90013

Re: Comments on the October 11, 2001 Draft of the LARWQCB NPDES Permit No. CAS614001 – Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges Within the County of Los Angeles and the Incorporated Cities Therein

Dear Dr. Swamikannu:

On behalf of the Natural Resources Defense Council, ("NRDC") and its over 500,000 members, including over 50,000 who reside in Southern California, we submit the following comments on the third draft (October 11, 2001) of the Los Angeles County NPDES Municipal Storm Water Permit ("Draft Permit"). We appreciate the opportunity to provide these written comments on the third Draft Permit.

In addition to the specific comments set forth below, we would like to incorporate by reference our previous comments on earlier drafts of the Permit. NRDC also joins in and hereby incorporates by reference the written comments of the Santa Monica BayKeeper on the third Draft Permit.

Adequacy of SQMP

We note that the Draft Permit's General Requirements language has been amended to require that the SQMP be implemented *and* that any additional steps to comport with the MEP standard also be implemented. This is a very important and positive change, one that comports with legal requirements and sound policy.

However, Finding C.4. of the Draft Permit (page 5) still refers to the proposed SQMP as "meeting the minimum requirements of federal regulations." Draft Permit at 4 (Finding C.4). We believe that staff is attempting to say that, in terms of basic programmatic range, the SQMP covers the general subject areas set forth in federal regulations (*i.e.*, the SQMP does not fail to propose an education program, etc.) To

www.nrdc.org
6310 San Vicente Boulevard, Suite 250
Los Angeles, CA 90048
TEL 323 934-6900 FAX 323 934-1210
NEW YORK • WASHINGTON, DC • SAN FRANCISCO

Printed on 100% Post-Consumer Recycled Paper

avoid potential confusion that this language suggests that the SQMP meets MEP,[1] we propose the following language to clarify that the Board means that the SQMP proposes a broad enough range of programs to satisfy federal application requirements:

> Federal regulations specify a range of programmatic elements that an applicant for a storm water management plan must address as minimum requirements. Without addressing the sufficiency of the SQMP pursuant to the MEP standard, the Regional Board finds that the Permittees' proposed SQMP, incorporating the additional provisions contained in this Order, is of sufficient scope to address these requirements.

TMDL Language

The fact sheet indicates that it is the Board's intent that the language of Part 3.C. "Revision of the Storm Water Quality Management Program" is consistent with the language in the Long Beach and Ventura County Permits with regard to TMDL implementation, and that the the Permittees must modify the SQMP so as to comply with waste load allocations developed pursuant to the TMDL process. However, the actual language of this Paragraph in the third Draft Permit (Part 3.C. on page 20 of the Draft Permit) does not clearly convey this intent. This paragraph should be revised so that the Board's intent is clear and so that it is on its face fully consistent with the other permits in the region. The following is the language from the Ventura County MS4 Permit:

> The Permittees shall modify the SQMP to comply with waste load allocations developed and approved pursuant to the process for the designation and implementation of Total Maximum Daily Loads (TMDLs) for impaired water bodies.

The language of Part 3.C. can be easily modified to fully incorporate the Board's intent that Permittees must modify the SQMP to comply with TMDLs and WLAs by adding the following underlined language to the existing language:

> The Permittees shall revise the SQMP, at the direction of the Regional Board Executive Officer, to incorporate program implementation amendments so as to comply with regional, watershed specific requirements, and/or waste load allocations developed and approved pursuant to the process for the designation and implementation of TMDLs for impaired water bodies.

[1] There is demonstrable and undeniable evidence showing that water quality violations continue to occur as the result of storm water discharges in this region. We have received no indication to date that the SQMP has been improved to address these violations.

Industrial/Commercial Facilities Program

It is NRDC's position that the federal regulations require the Permittees to conduct *enforcement inspections* of industrial facilities. See 40 C.F.R. § 122.26(d)(2)(i); USEPA, Guidance Manual for the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems (1992). Therefore, staff's proposed Version C of the Industrial/Commercial Facilities Program would not meet the requirements of federal law because it requires only "site visits," and on that basis should be rejected.

We urge the Board to adopt the proposed Version B of the Industrial/Commercial Facilities Program. Version B is identical to Version A except that it also requires inspections of six industrial categories - wholesale trade (scrap, auto dismantling) facilities, fabricated metal products, motor freight, chemical allied products, and primary metals products - which were *ranked in the top seven in terms of pollution potential* on the 1997 Critical Source Selection and Monitoring Report. Clearly, these are facilities with a high potential for causing storm water pollution problems, particularly with regard to heavy metals and other toxics. As heavy metals and toxics are a significant cause of impairment to receiving waters in the Los Angeles region, it is necessary to conduct inspections at these facilities in order to protect water quality in the region.

In addition, as in the previous draft, subsections on reporting and enforcement are conspicuously absent from all three alternatives proposed in the third Draft Permit. Because inspection and enforcement provisions for industrial facilities are required by the federal regulations, the Permit must contain provisions regarding enforcement and reporting. We urge the Board to reinsert the following language from the first draft of this permit into the Industrial/Commercial Facilities Program section of the final permit:

> Enforcement: Each Permittee shall enforce its storm water ordinance at all sites as necessary to maintain compliance with this Order. The Ordinance shall include sanctions to ensure compliance.

We also urge the Board to reinsert the subsection from the first draft of the permit requiring Permittees to report non-compliant sites to the Regional Board within 5 days of the inspection or discovery. Timely reporting is critical for ensuring that the Regional Board is made aware of non-compliant sites and that appropriate action is taken.

Illicit Connections and Illicit Discharges Elimination Program

In the latest draft, the Board has deleted provisions that required documentation and reporting of all illicit connections, illicit discharges and hazardous substances entering the storm drain. (*See* page 60 third Draft Permit, Part 4.G.1.d.) There is no explanation for this deletion. Again, timely reporting and documentation is critical to evaluating the overall impact of these illegal discharges on water quality. We urge the Board to reinstate this permit requirement.

Again, we appreciate the opportunity to provide comments on the third Draft Permit. If you have any questions regarding our comments, please give us a call at 323-934-6900.

Sincerely,

David S. Beckman

RE: Los Angeles County Municipal Storm Water Permit

Dear Mr. Dickerson,

On behalf of the Santa Monica BayKeeper, we appreciate the opportunity to provide comments to the Los Angeles Regional Water Quality Control Board ("RWQCB") on the third draft of the Los Angeles County Municipal Storm Water Discharge Permit ("Municipal Permit"). The Santa Monica BayKeeper is committed to protecting the environmental water quality for the Santa Monica Bay, San Pedro Bay, and adjacent coastal waters and watersheds.

For the reasons set forth below, the Santa Monica BayKeeper respectfully opposes the issuance of the Municipal Permit in its current form. In particular, the unincorporated and incorporated cities in the Los Angeles region whose stormwater discharges are covered by the Municipal Permit ("Permittees") have never submitted the information required by law under 40 CFR 122.26(d). This failure to satisfy the U.S. EPA's application requirements for stormwater discharge permits is a violation of law.

FEDERAL REGULATIONS FOR STORMWATER PERMITS REQUIRE CERTAIN INFORMATION BE PROVIDED BEFORE ISSUANCE OF A PERMIT

Under the 1987 reauthorization of the Clean Water Act (CWA), Congress directed, among other things, the EPA to develop permit requirements designed "to effectively prohibit non-stormwater discharges into storm sewers and controls to reduce the discharge of pollutants to the maximum extent practicable." [Vol. 132 Cong. Rec. HI0576 (daily ed. October 15, 1986) Conference Report]. In interpreting this requirement, the EPA carefully considered the stormwater permit application procedure, believing that each of the requirements mandated by 40 CFR 122.26 (d)

would most effectively meet the Congressional objectives underlying section 402 (p) (3)(B) of the CWA. [*See* 55 FR 47990]. The EPA's requirements in §122.26(d) are part of "a nationally consistent structure designed to create storm water control programs." [55 FR 47990, page 11]. Although there is flexibility within the permitting process itself, "each of the operators of municipal separate storm systems . . . shall comply with the application requirements of §122.26(d)." *Id.*

Section 122.26(d) details the mandatory application requirements necessary for issuing valid permits to operators of large and medium municipal storm sewer systems seeking to discharge storm waters. The EPA deliberately selected mandatory words such as "shall" and "must" to reflect the obligatory nature of the stormwater permit application requirements in 40 CFR 122.26(d). The compulsory language of the requirements under 40 CFR 122.26(d) states that "permit applications . . . **shall** include: (1) Part 1. Part 1 of the application **shall** consist of . . . (2) Part 2. Part 2 of the application **shall** consist of . . ." [40 CFR 122.26(d) (emphasis added).]

The language in §122.26(d) not only demonstrates the compulsory nature of the stormwater permit application requirements, it also is clear on its face and unambiguously written. Section 122.26(d)(2)(viii) states that the "Director shall not exclude the operator of a discharge from a municipal separate storm sewer identified in appendix F, G, H or I of part 122, from any of the permit application requirements under this paragraph." In other words, the application requirements are mandatory. Moreover, the EPA specifically names the incorporated and unincorporated regions of Los Angeles, California, as a designated area subject to 122.26(d). 55 FR 47990, Appendix F and H. Thus, the RWQCB cannot exclude any Permittee from any of the permit application requirements under §122.26(d).

Even if, arguendo, the requirements of §122.26(d) are ambiguous, the EPA's intent behind the regulations makes clear that compliance with the permit application requirements is not optional. The EPA "**requires** municipalities to submit a two-part application" consistent with §122.26(d). 55 FR 47990, 24 (emphasis added). Moreover, the substantive requirements for stormwater permit applications have the force of law. "Substantive agency regulations have the force of law if authorized by Congress and promulgated to implement a statute." Mora v. Chem-Tronics, Inc., (1998) 16 F. Supp. 2d 1192, 1203. The stormwater permit application requirements in §122.26(d) should be strictly enforced because they constitute agency regulations pursuant to a grant of authority from Congress.

The federal regulations for stormwater permit issuance require that certain information be provided before a permit to discharge stormwater is issued. The Municipal Permit should not be issued until each of the Permittees submits a complete stormwater permit application, which satisfies all of the requirements under 40 CFR 122.26(d).

STAFF HAS FAILED TO COMPLY WITH THE APPLICATION REQUIREMENTS

Although the mandatory storm water permit application requirements articulated in 40 CFR 122.26(d) have been in effect since December 17, 1990, the RWQCB still fails to require that these obligatory provisions be satisfied before issuing the Municipal Permit. The enclosed attachments demonstrate that much of the information required by §122.26(d) is still missing

from the RWQCB's files. Also, the attachments demonstrate that staff at the RWQCB has failed to adhere to the EPA's application requirements for stormwater permits and has failed to require compliance with the clearly articulated and mandatory application requirements under §122.26(d). The Municipal Permit should not be issued until each of the Permittees has completely satisfied all of the provisions of 40 CFR 122.26(d). Based on document reviews pursuant to a Public Records Act request and conversations with Dr. Xavier Swamikannu, it is evident that the Permittees have never submitted a complete application for the Municipal Permit. See Attachments.

Despite this widespread noncompliance with the application requirements, the staff at the RWQCB defends its failed compliance with the law on three different grounds. First, the RWQCB staff relies upon a misinterpretation of *In re City of Irving, Texas* to contend that the §122.26(d) permit application "information can be developed during the permit term." *Summary of Comments and Regional Board Staff Response*, Oct 11, 2001 ("Response") Comment 2 . Second, the Response reveals the undue weight given by the RWQCB to the EPA's *Interpretative Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems* ("Reapplication Policy"), 61 Fed Reg 41697. Finally, members of the RWQCB staff have made oral representations asserting that they are not bound to comply with 40 CFR 122.26(d) because they issued the first Municipal Permit before the U.S. EPA's regulations became effective. As demonstrated below, each reason offered by the staff for its continued noncompliance with §122.26(d) is unsound.

The RWQCB staff incorrectly cites *In re City of Irving*, NPDES Appeal No. 00-18, at 23 (EAB, July 16, 2001) in support of its position that compliance with §122.26(d) is not necessary because "information can be developed during the permit term." Response, Comment 2. In *Irving*, the City of Irving objected to language in its permit that required it to develop a Storm Water Management Program (SWMP). In that case, the Environmental Appeals Board (EAB) maintained that information for the SWMP could be developed after the permit was issued. The EAB states that "the permit serves as the rule by which the SWMP, over time, will be measured." *Id.* at 23. In their reading of *Irving*, RWQCB staff confuses permissive requirements of the SWMP with the mandatory requirements of the stormwater application process. While information for a SWMP may be permissive and developed during the permit term, the §122.26(d) mandatory application requirements for a stormwater permit are the basis for establishing the rule by which the SWMP will be measured.

In addition to utilizing a misinterpretation of *Irving* to defend its continued noncompliance with 40 CFR 122.26, the RWQCB's Response pays too great deference to the EPA's Reapplication Policy. The staff at the RWQCB "reviewed the reapplication and determined that it was consistent with USEPA's Reapplication Policy (61 FR 41697)". Response, Comment 2. However, the staff should not check for consistency by comparing the Municipal Permit to the policy articulated in the Reapplication Policy, but should check that the Municipal Permit application is consistent with the law under 40 CFR 122.26(d). The law is found in 40 CFR 122.26(d), not in the Reapplication Policy. In fact, *Edward Christensen v. Harris County*, (2000) 529 U.S. 576, 587, clarifies that "interpretations contained in policy statements . . . lack the force of law [and] do not warrant Chevron-style deference." Because the EPA's Reapplication Policy lacks the force of law found in 40 CFR 122.26 (d), the RWQCB should pay less attention to the Reapplication Policy than to the law written by the EPA in §122.26(d).

Not only does the Reapplication Policy not deserve the deference paid to it by the RWQCB staff, it does not make sense to apply the Reapplication Policy when required information has never been submitted. The Regional Board points to language in the Reapplication Policy, which states,

> "the permit application deadline regulations in 40 CFR 122.26 (e) (3) & (4) clearly reflect the 'one time' nature of the Part I & II application requirements . . . [that] should have been addressed in the initial application phase. Therefore to request the same information again, where it has already been provided and has not changed, would be needlessly redundant. Thus, as a practical matter, most first-time permit application requirements are unnecessary for purposes of second round MS4 permit application." (61 Fed Reg 41697, 41698).

However, where information in the initial permit application process is still lacking, as is clearly the case here, the Permitees should be required to supply that information as part of a subsequent application process.

Oral discussions with staff members reveal their final defense for failed compliance with 40 CFR 122.26(d). This final defense conflicts with the staff's Reapplication Policy defense found in the first half of the Response. The staff contends that it issued the first Los Angeles Municipal Stormwater Permit before §122.26(d) became effective. Therefore, it seems that staff believes that the requirements of §122.26(d) do not apply to this Municipal Permit. While the staff's oral representations deny the relevance of the §122.26(d) application process, the argument based on the Reapplication Policy maintains that the Municipal Permit is a reapplication. If the Reapplication Policy argument were correct and the Municipal Permit is a reapplication, then the Permittees must have been subject to the application requirements at some time after 40 CFR 122.26 (d) became effective. Yet, the RWQCB has never required that applications for stormwater discharge comply with the EPA's regulation under §122.26(d). For the Re-application Policy to apply, it seems clear that the Permittees should have been subject to §122.26 at some stage in the stormwater permitting process.

CONCLUSION

The RWQCB staff may argue that it selected application requirements that are superior to those of the CFR. Staff may argue that the requirements of the Los Angeles Municipal Permit better satisfy the purpose underlying the Clean Water Act by more effectively improving water quality for the Los Angeles region. The RWQCB staff may also contend that 40 CFR 122.26 (d) articulates mere suggestions for the storm water permit application procedure.

However, this argument fails because the language of the EPA regulation is mandatory and not permissive. While the RWQCB may have knowledge about the peculiarities of the Los Angeles storm water system, Congress appointed the EPA to establish overall stormwater permit standards, set forth in the CFR. The RWQCB does not have the discretion to select various portions of the law to follow while neglecting to follow other portions of the law. For these

reasons, we believe a permit cannot be issued until, all of the application requirements are satisfied.

We thank you for the opportunity to comment.

Sincerely,

Jessica Farthing

REPORT OF FINDINGS
FROM REVIEW OF REGIONAL BOARD RECORDS

Review of Regional Board Records

1. The RWQCB Compliance Matrix was developed from the results of a record review conducted at the Los Angeles RWQCB (Regional Board) between October 22 and November 9, 2001.

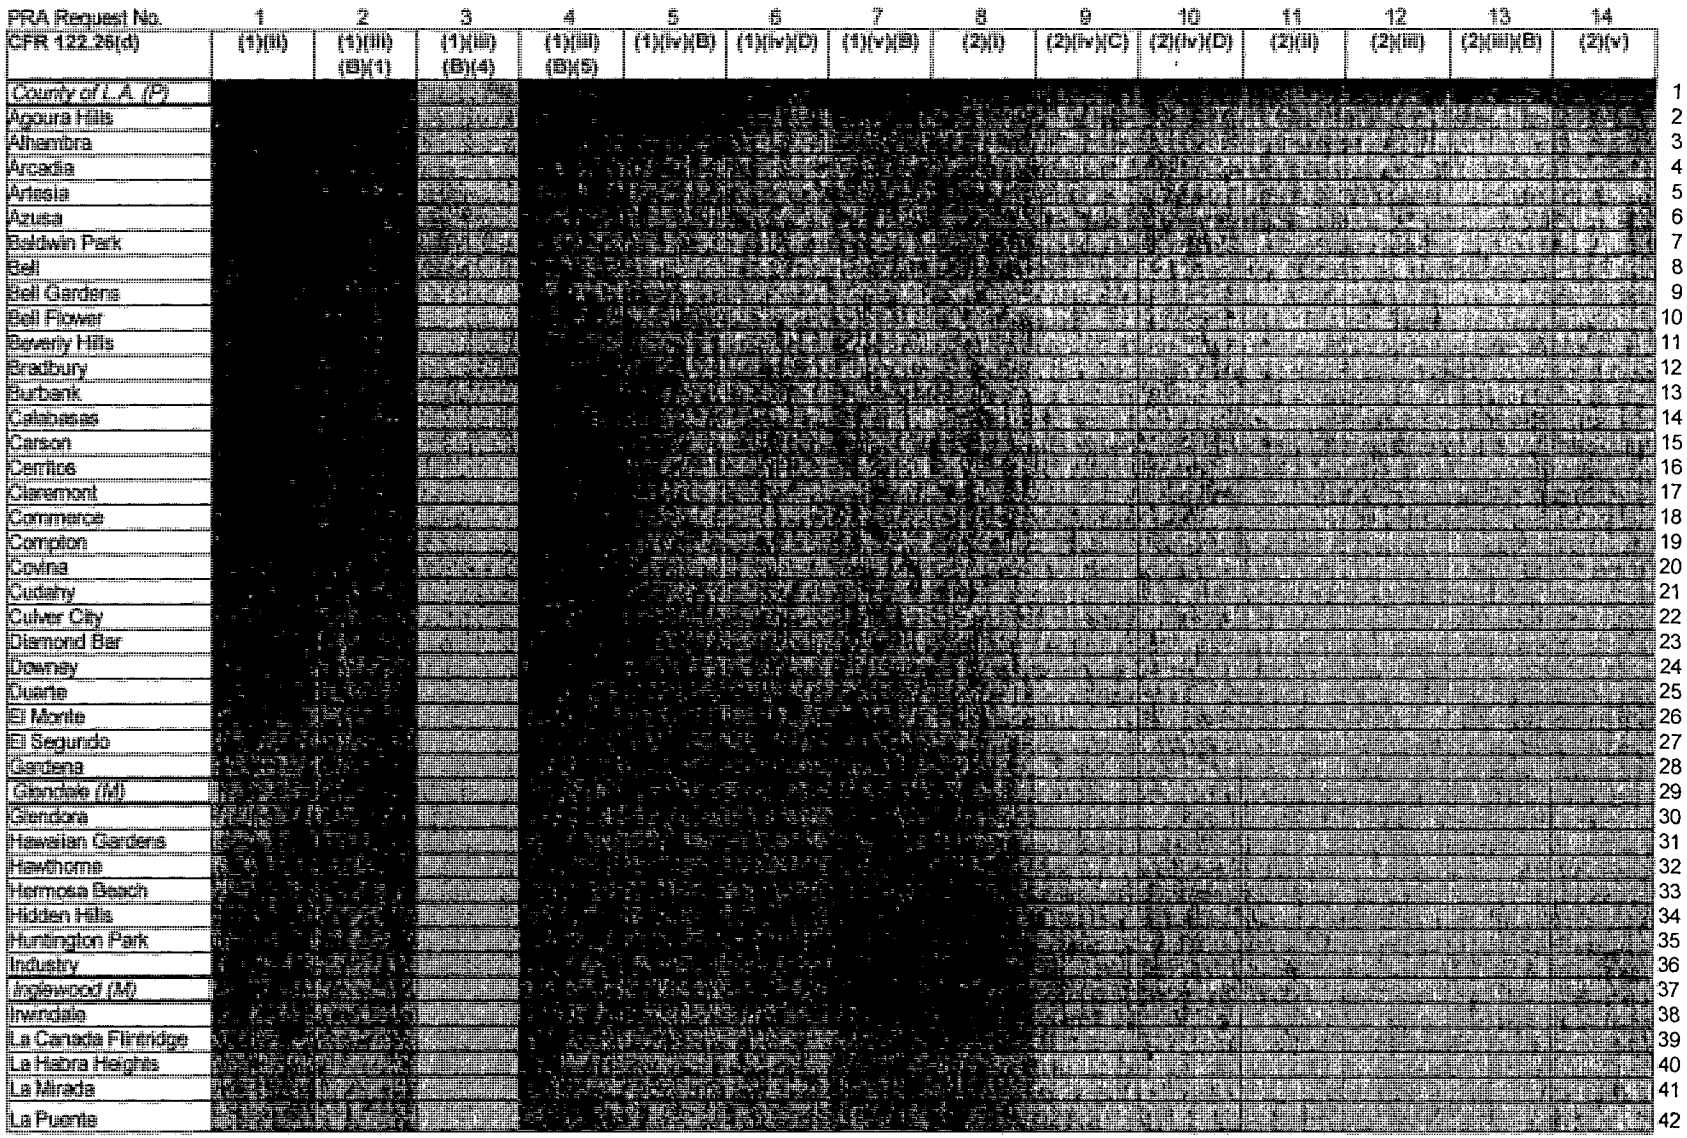
2. Dr. Xavier Swamikannu and Carlos Urrunaga, from the Regional Board, provided assistance by answering questions and directing researchers to information related to the NPDES Stormwater permits.

3. The matrix reflects the information made available and currently on record at the Regional Board. This information was obtained through a Public Records Act request.

Report of Findings

1. The applicants to the 1990 NPDES Stormwater Permit (Initial Permit) did not provide a complete application to the Regional Board as required under 40 CFR 122.26(d).

2. The Los Angeles RWQCB issued the Initial Permit without having received a complete application from any of the permit applicants.



3. The Regional Board received a partial application from seventeen (17) of eighty-five (85) total permit applicants. No applications were submitted from the remaining sixty-eight (68) permit applicants prior to the issuance of the Initial Permit.

4. The Initial Permit went into effect on June 18, 1990, and preceded the Final Rules of the NPDES Phase I requirements that were promulgated on November 16, 1990.

5. The Regional Board has received permittee applicant information through requirements set under both the Initial Permit and 1996 Permit (Permit II).

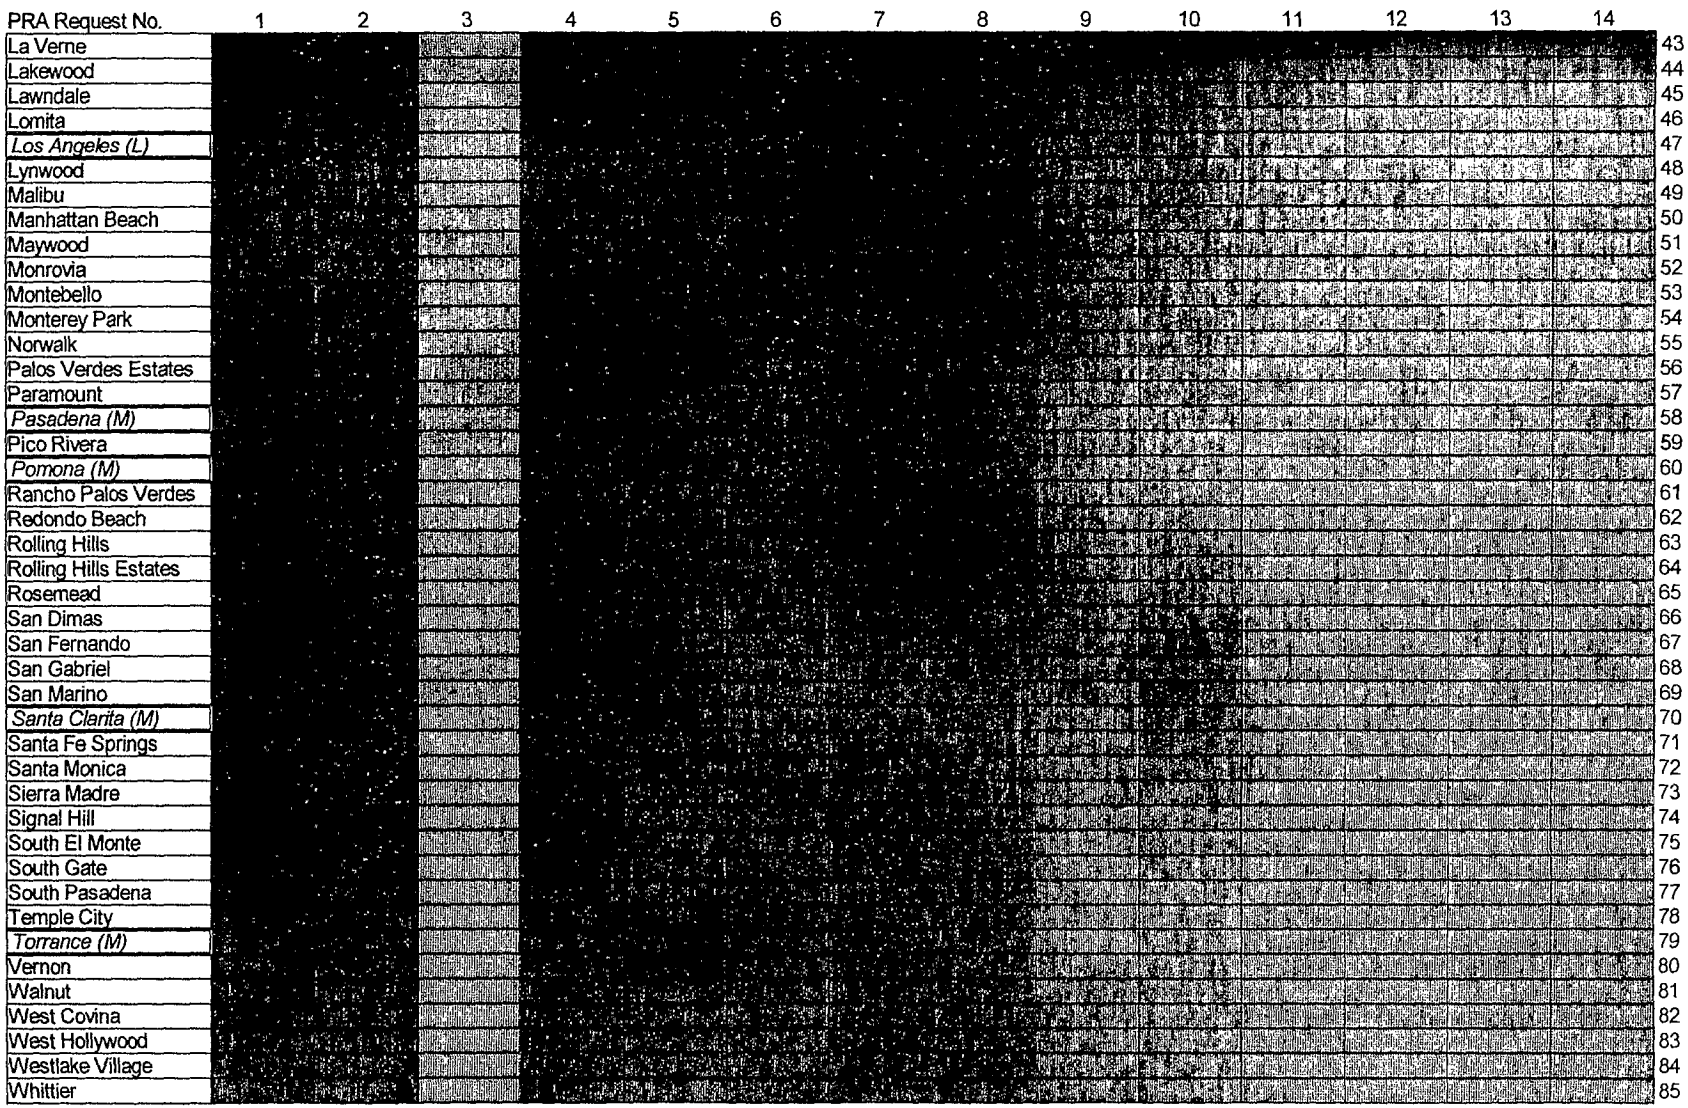
6. Presently, there are requirements under CFR 122.26(d) that remain unfulfilled over a decade after approval of 40 CFR 122.26(d).

ATTACHMENT B

CFR Requirement has not been met.

CFR Requirement has been met.

CFR Requirement has not been fully met. Part of requirement is missing



Medium (M) or Large (L) MS4s

The Regional Board has the information required by the regulation.

ATTACHMENT C

MATRIX NOTES

Arranged by PRA Request No.

1. 40 CFR 122.26(d)(1)(ii). A description of Legal Authority.

   Compliance

   The Regional Board's records indicate that only seventeen (17) municipalities responded with their description of legal authority prior to issuance of the initial NPDES Stormwater permit of 1990 (Initial Permit). All permittees have since submitted Legal Authority to the Regional Board.

2. 40 CFR 122.26(d)(1)(iii)(B)(1). A map depicting the location of known municipal storm sewer system outfalls.

   Compliance

   The Regional Board requested but did not receive this information prior to the issuance of the Initial Permit. No record was found that L.A. County (County) or any of the Co-permittees provided a map of municipal storm sewer system outfalls prior to issuance of the Initial Permit. No record was found that the municipalities have since provided this information to the Regional Board. The County has gone forward with a plan to provide details of the municipal stormwater sewer system in the Regional Board's Geographic Information System (GIS). However, gaps are still present in the current system due to the unreliable and incomplete information from the older CAD system.

3. 40 CFR 122.26(d)(1)(iii)(B)(4). A map depicting the location and permit number of any known discharge to the municipal storm sewer that has been issued an NPDES permit.

   Compliance

   The Regional Board did not require this information prior to the issuance of the Initial Permit. No record was found that this requirement was met by any of the permittees. However, this information is maintained by the Regional Board in the Geographic Information System.

4. 40 CFR 122.26(d)(1)(iii)(B)(5). A map depicting the major structural controls for storm water discharges.

   Compliance

   The Regional Board did not require this information prior to the issuance of the Initial Permit. The County has this information available for the Board. No record was found that any of the co-permittees have complied with this regulation.

R0006583

5. 40 CFR 122.26(d)(1)(iv)(B). Existing quantitative data describing volume and quantity of discharges from the MS4.

   Compliance

   The Regional Board did not require or receive this information prior to the issuance of the Initial Permit. No record was found that this requirement was met, except by L.A. County. Currently, the County collects this information using the Regional Board's standards of sampling techniques and data collection.

6. 40 CFR 122.26(d)(1)(iv)(D). Results of field screening analysis for illicit connections and discharges.

   Compliance

   The Regional Board did not require or receive this information prior to the issuance of the Initial Permit. No record was found that confirms this requirement has been met by any of the permittees.

7. 40 CFR 122.26(d)(1)(v)(B). A description of existing programs to identify illicit connections to the MS4, including inspection procedures and methods for detecting and preventing illicit discharges.

   Compliance

   The Regional Board did not require or receive this information prior to the issuance of the Initial Permit. The records do support a finding that all permittees have provided a description of existing programs since the issuance of the Initial Permit.

8. 40 CFR 122.26(d)(2)(i). A demonstration of Legal Authority to:
   (a) Control contribution of pollutants and quality of storm water discharge from industrial activity sites;
   (b) Prohibit illicit discharges;
   (c) Control discharge to a municipal separate storm sewer of spills, dumping, disposal;
   (d) Control pollutants from one portion of the municipal system to another portion;
   (e) Require compliance with the conditions of ordinances, permits, contracts or order; and
   (f) Carry out all inspection, surveillance, and monitoring necessary to determine compliance.

   Compliance

   The Regional Board did not require or receive this information prior to the issuance of the Initial Permit. There are six provisions and none of the permittees have complied fully.

   (a), (b) and (c)

   Records indicate that all permittees have met these provisions.

R0006584

(d) No record was found that this provision has been met by any of the permittees. There was an earlier inter-agency agreement in the form of an MOU that has been abandoned. The Board has indicated that with the peculiar circumstances of a single region having 85 permittees under one permit, it is unlikely that such an agreement will ever be reached. The 3rd Draft of Permit III addresses this issue in the Findings section but does not set out such agreement language as a requirement.

(e) Difficult to assess. It is arguable that compliance is implicit in ordinances, permits, contracts or orders. If an affirmative statement that "compliance is mandatory" is required to be present in every municipality's Legal Authority, then most have failed this provision.

(f) No record was found that this provision has been met. The issue of whether it is consititutional to enter private property for the purposes of inspection or monitoring is ongoing.

9. 40 CFR 122.26(d)(2)(iv)(C). A description of a plan to monitor and control discharges from certain areas and facilities as set out in the regulation.

Compliance

The Regional Board did not require or receive this information prior to the issuance of the Initial Permit. No record was found that these descriptions were submitted to the Regional Board by the permittees.

10. 40 CFR 122.26(d)(2)(iv)(D). A description of a program to implement and maintain BMPs for construction sites.

Compliance

The Regional Board did not require or receive this information prior to the issuance of the Initial Permit. The records indicate that all permittees have since complied with a Model Program that includes this requirement.

11. 40 CFR 122.26(d)(2)(ii). Location of any major outfall not previously reported under these regulations.

Compliance

The Regional Board did not require or receive this information prior to the issuance of the Initial Permit. No record was found to confirm that the municipalities have complied by giving L.A. County, as the principal permittee, or the Board the "location of any major outfalls...not reported under CFR 122.26(d)(1)(iii)(B)(1)."

R0006585

12. 40 CFR 122 26(d)(2)(iii) Characterization data.

Compliance

The Regional Board did not require or receive this information prior to the issuance of the Initial Permit. The Board does have extensive sampling material that dates back to the Initial Permit. The County, as the principal permittee, has been conducting sampling under the Regional Board's evolving standards. No record was found to confirm that any of the co-permittees have conducted sampling or submitted characterization data as per this regulatory requirement.

13. 40 CFR 122.26(d)(2)(iii)(B). Annual pollutant loads, and event mean concentration of cumulative discharges from all identified outfalls.

Compliance

The Regional Board did not require or receive this information prior to the issuance of the Initial Permit. L.A. County has submitted annual pollutant loadings and event mean concentration for the six Watershed Management Areas. No record was found to confirm that any of the municipalities have submitted annual pollutant loading data or event mean concentration of cumulative discharges.

14. 40 CFR 122.26(d)(2)(v). Estimated reduction in loadings of pollutants from discharges to the MS4.

Compliance

The Regional Board did not require or receive this information prior to the issuance of the Initial Permit. No record was found that indicates the Regional Board has ever received this information from any of the permittees.

Laura Gallardo
Associate Analyst
Los Angeles Regional Water Quality Control Board
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Re: Public Records Act Request

Dear Ms. Gallardo,

This Public Records Act request is made on behalf of the Santa Monica BayKeeper. Santa Monica BayKeeper is active in protecting and restoring the ecological health of the Santa Monica Bay and its habitats. Santa Monica BayKeeper is recognized as a section 501(c)(3) charitable organization by the Internal Revenue Service.

As used in this letter, 'records' includes any writing, picture, sound or symbol, whether paper, film, magnetic media or other document, relating to the public business, which is prepared, owned, used or retained by Los Angeles Regional Water Quality Control Board ("RWQCB"). Pursuant to the California Public Records Act, Government Code §§6250 et seq, we hereby request that the Los Angeles RWQCB provide access to and/or copies of the following records relating to the Los Angeles County Municipal stormwater NPDES permit (County Stormwater Permit) as soon as possible. This request covers not only information relating to Los Angeles County but to all municipalities currently regulated under the County Stormwater Permit:

1. A description of the existing legal authority of each and every municipal entity regulated under the County Stormwater Permit to control discharges to the municipal separate storm sewer. Where this authority is not sufficient to meet the requirements of inspection and monitoring under 40 CFR 122.26 (d)(2)(i), a description of additional authorities as will be necessary to meeting the criteria. See 40 CFR 122.26(d)(1)(ii).

2. A map depicting the location of known municipal storm sewer system outfalls within the jurisdiction of each and every municipal entity regulated under the County Stormwater Permit discharging to waters of the United States. See 40 CFR 122.26(d)(1)(iii)(B)(1).

R0006587

3. A map depicting the location and permit number of any known discharge to the municipal storm sewer within the jurisdiction of each and every municipal entity regulated under the County Stormwater Permit that has been issued an NPDES permit. See 40 CFR 122.26(d)(1)(iii)(B)(4).

4. A map depicting the major structural controls for storm water discharges (retention basins, detention basins, major infiltration devices, etc.) within the jurisdiction of each and every municipal entity regulated under the County Stormwater Permit. See 40 CFR 122.26(d)(1)(iii)(B)(5).

5. Existing quantitative data describing the volume and quantity of discharges from the MS4 within the jurisdiction of each and every municipal entity regulated under the County Stormwater Permit. See 40 CFR 122.26(d)(1)(iv)(B).

6. Results of field screening analysis for illicit connections and illicit discharges, including the necessary mapping and protocol requirements under 40 CFR 122.26(d)(1)(iv)(D). If the large or medium municipal separate storm sewer system is unable to comply with CFR122.26(d)(1)(iv)(D) (1) through (6), then we request the field screen mapping of at least 500 major outfalls as required under 40 CFR 122.26(d)(1)(iv)(D)(7).

7. A description of the existing programs within the jurisdiction of each and every municipal entity regulated under the County Stormwater Permit to identify illicit connections to the MS4, including inspection procedures and methods for detecting and preventing illicit discharges. See 40 CFR 122.26(d)(1)(v)(B).

8. 40 CFR 122.26(d)(2)(i). A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance, or series of contracts which authorizes or enables the applicant at a minimum to:

    a. Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity;

    b. Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;

    c. Control through ordinance, order or similar means, the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;

d. Control through interagency agreements among co-applicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;

e. Require compliance with conditions in ordinances, permits, contracts or orders; and

f. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and non-compliance with permit conditions, including the prohibition on illicit discharges to the municipal separate storm sewer.

9. A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities, that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm water sewer system. See 40 CFR 122.26(d)(2)(iv)(C).

10. A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system within the jurisdiction of each and every municipal entity regulated under the County Stormwater Permit. See 40 CFR 122.26(d)(2)(iv)(D).

11. The location of any major outfall within the jurisdiction of each and every municipal entity regulated under the County Stormwater Permit that discharges to waters of the United States that was not reported under 40 CFR 122.26(d)(1)(iii)(B)(1), including an inventory of the name, address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge to the MS4 storm water associated with industrial activity. See 40 CFR 122.26(d)(2)(ii).

12. Characterization data as described by 40 CFR 122.26(d)(2)(iii), including sampling analysis for the listed organic, toxic and other pollutants.

13. Estimates of the annual pollutant loads from ALL identified outfalls and the event mean concentration of the cumulative discharges from all identified outfalls during a storm event for BOD, COD, TSS, dissolved solids, total nitrogen, total ammonia plus organic nitrogen, total phosphorus, dissolved phosphorus, cadmium, copper, lead and zinc. See 40 CFR 122.26(d)(2)(iii)(B).

ATTACHMENT D

14. Estimated reductions in loadings of pollutants from discharges to the MS4 expected as a result of the municipal storm water quality management program. See 40 CFR 122.26(d)(2)(v).

Pursuant to Government Code §6256, please contact us regarding the availability of the information requested in this letter within ten days after receipt of this letter. To the extent that your office claims the right to withhold any record, or portion of any record, please describe with specificity each and every record or portion that is being withheld and the claimed reason for the exemption, citing the exact language of the Public Records Act on which you rely for that particular record.

Pursuant to code §6253(a), if any portion of the document is exempt by law, please delete or black out those potions of the records and provide us with the remainder of the documents. If any such deletions are made, please identify the general nature of the material deleted and the legal basis for such deletion.

As this request is by and for a public interest organization interested in the complete execution of all applicable laws for the protection of human health and the environment, we request a waiver of any and all costs associated with the satisfaction of this request. The RWQCB is required under prevailing law to consider this fee waiver request, and the failure to do so is an abuse of discretion subject to judicial review. See North County Parent Organization v. Department of Education (1994) 23 Cal.App.4th 144, 148. Please advise us of any informational and other procedural requirements that you may have in order for this request to qualify for a fee waiver. If you are unable to provide a fee waiver, please notify us immediately.

Our phone number is (310) 390-6717. We look forward to hearing from you.

Sincerely,

Jessica Farthing

SUBJECT: **THIRD DRAFT OF THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM PERMIT**

This is in response to the Third Draft of the National Pollutant Discharge Elimination System (NPDES) Permit that was forwarded to this Department for review and comments.

The Los Angeles County Flood Control District has been designated as the Principle Permittee with the responsibility of implementing the requirements of this permit. However, the requirements of this permit will involve Environmental Health inspections of restaurants to determine that Best Management Practices (BMPs) are in effect.

To this end, the following changes should be incorporated into NPDES Tentative Permit:

Page 31:

3. **Restaurants**

The Permittee, in cooperation with their appropriate departments (such as health, public works, etc.), or using an equivalent approach, shall inspect all restaurants to determine that the following storm water BMPs are being implemented.

a) Frequency: The Permittee shall inspect each restaurant once every 24 months.

b) Level of inspection: The Permittees shall ~~confirm~~ determine that ~~BMPs are effectively~~

~~implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP~~ restaurants are in compliance with the California Uniform Food Facilities Law (CURFFL) that ensures the following BMPs are implemented. See CURFFL Sections 114035, 114040, and 114100.

c) Restaurants shall be inspected to verify that these BMPs are in place:

(1) Food oil and grease residue is ~~not poured onto a parking lot, street or adjacent catch basin;~~ properly disposed of in a sanitary manner and is not poured onto the restaurant parking lot or premises. Section 114035.

(2) The trash bin area is clean, the trash bin lid is closed, ~~not filled with liquid or washed out;~~ and the trash bin is not leaking liquid waste. Section 114035.

(3) ~~Parking lot, alley, sidewalk and street areas (in the immediate vicinity of the establishment), floormats, filters and garbage containers are not washed and that no waswater is poured in those areas;~~

All liquid waste including wash water from floormats, filters and garbage containers shall be disposed of through the plumbing system that shall discharge into public sewerage or into an approved private sewage disposal system. Section 114100.

(4) ~~Removal of food waste, rubbish or other materials from the parking lot area is not performed in an unsanitary manner or creating a nuisance through hosing down the area.~~

The restaurant premises (including the parking lot) shall be kept clean and free of litter and rubbish; all such litter and rubbish shall be disposed of in a sanitary manner. Sections 114040 and 114035.

d) ~~Inspectors shall distribute educational materials to facility operator on storm water pollution prevention practices.~~

Educational materials shall be distributed to facility owners/operators on storm water pollution prevention practices when the Public Health Permit is issued.

The Department of Health Services is supportive of this effort; however, additional funding will be required to cover the additional duties and responsibilities needed to address the stormwater issues of facilities under the jurisdiction of Environmental Health.

If you have any questions or need additional information, please let me know.

November 13, 2001
File No.: 31-370.10

Dr. Xavier Swamikannu
California Regional Water Quality Control Board
Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, CA 90013

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

Dear Dr. Swamikannu:

Draft Order No. 01-XXX (NPDES No. CAS004001)
Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges Within the County of Los Angeles, and the Incorporated Cities Therein, Except the City of Long Beach

The County Sanitation Districts of Los Angeles County (Districts) have reviewed the Third Draft (October 11, 2001) *Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles, and the Incorporated Cities Therein, Except the City of Long Beach* (Draft Permit). Below are our comments:

- **Treatment Feasibility Study**

  The Draft Permit requires the Permittees, in cooperation with the Districts, to conduct a study to investigate the possible diversion of dry weather discharges or the use of alternative treatment control BMPs to treat flows which may impact public health and safety and/or the environment. In addition, the Permittees are required to collectively review their individual prioritized lists and create a watershed-based priority list of drains for potential diversion or treatment; this watershed based priority list shall be submitted to the Regional Board by July 1, 2002. The Districts are concerned that this short time frame may not allow the completion of these two resource intensive tasks, which will require considerable investigative work covering a 1619 square mile area, and which will required the Districts to work with at least 77 individual cities. The Districts request that a more reasonable deadline be specified to coordinate this massive effort (e.g., March 31, 2003, as recommended in our previous comment letter dated August 6, 2001, regarding the Second Draft Permit).

- **Sewage Systems Maintenance, Overflow, and Spill Prevention**

  The Draft Permit includes numerous requirements for sewage system maintenance and prevention of overflows and spills. The Districts request that this requirement be revised to clarify that permittees would not be penalized if a spill occurs and enters the MS4, but is contained in the MS4 and prevented from reaching the receiving waters.

Recycled Paper

- **Use of Collected Data**

  The Districts request that the Regional Board be more specific and include details in the Permit on how monitoring data will be used in assessing the effectiveness of an urban runoff management program. The Districts believe that some of the monitoring requirements are excessive. The primary goal of collecting monitoring data should be to determine the performance or effectiveness of the BMPs. Thus, the monitoring program should be tailored to address BMP effectiveness. For example, various sites should be selected within each land use category and monitored for only those pollutants that can reasonably be expected to be present. Water quality data should be collected and compared with respect to BMPs used at each site. Results can then be used for determining the effectiveness of BMPs and perhaps setting future policies and standards.

  Furthermore, the Districts are also concerned that the Draft Permit may not include appropriate "safe harbor" language particularly for alleged exceedances of water quality objectives. Thus, even if appropriate BMPs were implemented to control pollutants "to the maximum extent practicable," cities may still be subject to enforcement actions and/or fines.

The Districts appreciate the opportunity to comment on the Third Draft Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges Within the County of Los Angeles, and the Incorporated Cities Therein, Except the City of Long Beach. If you have any questions or concerns regarding the information, please contact June Nguyen at (562) 699-7411, extension 2831.

Very truly yours,

James F. Stahl

FEDERAL EXPRESS

Dear Mr. Swamikannu:

Comments on the October 11, 2001 Tentative Draft – Los Angeles County Municipal Storm Water NPDES Permit (NPDES Permit No. CAS004001)

The Metropolitan Water District of Southern California (Metropolitan) appreciates this opportunity to provide comments to the Los Angeles Regional Water Quality Control Board (RWQCB) on the October 11, 2001 Tentative Draft of the Renewal of the Los Angeles County Municipal Storm Water NPDES Permit CAS004001 (tentative draft permit). Metropolitan distributes wholesale water obtained from the Colorado River and Northern California through 26 member agencies (cities and water districts) and serves more than one-half of the water used by approximately 17 million people in the 5,200 square-mile coastal plain of Southern California. To provide this service, Metropolitan operates an extensive system of water conveyances, reservoirs, and water treatment plants that require periodic maintenance dewatering. The comments herein reflect Metropolitan's views and concerns as an affected water agency.

Metropolitan is supportive of the Los Angeles RWQCB's Storm Water Program to minimize the discharge of pollutants to storm water within the County of Los Angeles. We attended the public workshops on April 24, 2001 and July 26, 2001 regarding renewal of this permit and previously participated in the Los Angeles County Municipal Storm Water Permit development process for the permits that were adopted in 1990 and 1996. Additionally, because of Metropolitan's wide distribution area, we have also participated in the recent Municipal Storm Water Permit reissuance processes for Orange County, San Bernardino County, Ventura County and San Diego County. We are providing these comments on behalf of Metropolitan and our member agencies in order to ensure that the Los Angeles County Municipal Storm Water NPDES Permit continues to allow water agencies to release non-storm water discharges that are critical for maintenance and also to meet compliance requirements to provide a safe drinking water supply for Southern California.

As a wholesale drinking water provider, Metropolitan wants to ensure that the tentative draft permit continues to allow water agencies to release non-storm water discharges from water line

flushing and other dewatering activities to the storm drain system, as currently allowed under the existing Los Angeles County Municipal Storm Water Permit. These types of discharges are critical because Metropolitan must routinely dewater pipelines and water storage facilities for the purpose of maintenance, repair, and pressure-relief, and also to comply with the requirements of the Federal Safe Drinking Water Act and Title 22 of the California Code of Regulations. Discharges from the processing of drinking water are unavoidable and are an integral part of the normal operation of water treatment plants and conveyance systems. Metropolitan's ability to properly maintain our pipelines and treatment and distribution facilities is necessary to ensure a safe, reliable, and adequate water supply.

Metropolitan appreciates the changes that were made from the second draft of the permit regarding "potable drinking water supply and distribution system releases". The revised wording in the tentative draft permit [page 16, Part 2 (2)(c)(2)] now more accurately describes the types of water supplier discharges. However, there are still some significant differences between the existing permit and the tentative draft permit that present a few concerns for Metropolitan and other water suppliers. These issues are discussed further below along with recommendations.

The following table compares the existing Los Angeles County Municipal Storm Water Permit (adopted July 15, 1996) with the October 11, 2001 tentative draft permit regarding allowable discharges from water agencies in order to highlight the issues of concern discussed below.

Existing Permit (Order No. 96-054, adopted July 15, 1996)		**Tentative Draft Permit** (NPDES CAS004001, Oct. 11, 2001 tentative draft)	
II. Illicit Connections and Illicit Discharges C. Non-Storm Water Discharges 2. Conditionally Exempted Discharges (page 27 of Order No. 96-054)	(c) Potable water sources provided the discharges are managed in accordance with an approved Industry-wide Standard Pollution Prevention Practices developed by the American Water Works Association, California-Nevada Section, **or equivalent document**; and in compliance with any requirements established by the Permittee(s);	Part 2 Discharge Prohibitions (2) (c) Category C - Flows incidental to urban activities (page 16 of tentative draft permit NPDES CAS004001)	(2) Potable drinking water supply and distribution system releases (consistent with American Water Works Association guidelines for dechlorination / debromination and suspended solids reduction practices);

Issue # 1:
The existing permit allows water agencies to discharge potable water sources provided "...the discharges are managed in accordance with Industry-wide Standard Pollution Prevention Practices developed by the American Water Works Association, California-Nevada Section, **or equivalent document**; and in compliance with any requirements established by the Permittee(s);".

In contrast, the tentative draft permit only allows water agencies to discharge water supply and distribution system releases "... (consistent with American Water Works Association guidelines for dechlorination/debromination and suspended solids reduction practices)". The tentative draft permit solely references American Water Works Association (AWWA) guidelines and does not allow use of an equivalent document although the existing permit does. By removing this option of using an equivalent document to ensure that discharges meet all applicable best management practices (BMPs), water agencies are limited to the types of BMPs they can utilize. This also limits flexibility to take advantage of new BMPs or technology advances that may occur within the five-year timeframe of this tentative draft permit once it is adopted. In fact, the AWWA Guidance Manual for Disposal of Chlorinated Water suggests that further work is required to develop BMPs.

Additionally, the AWWA Guidance Manual for Disposal of Chlorinated Water only addresses dechlorination and does not include any guidance on dibromination (refer to Issue # 2 below) or suspended solids reduction practices. Therefore, guidelines from an equivalent document are necessary to ensure that effective suspended solids reduction practices can be implemented.

Recommendation:
In order to allow water agencies the flexibility to take advantage of new BMP developments and technology advances and to address suspended solids reduction practices in discharges, it is recommended that the language in the tentative draft permit be revised to allow the following:

Category C – Flows incidental to urban activities:

(2) Potable drinking water supply and distribution system releases (consistent with American Water Works Association guidelines, or equivalent document, for dechlorination and suspended solids reduction practices);

Issue # 2:
The tentative draft permit allows water agencies to discharge water supply and distribution system releases "... (consistent with American Water Works Association guidelines for dechlorination/debromination and suspended solids reduction practices)". The inclusion of debromination practices would indicate that bromine is used in potable drinking water supply systems and therefore debromination is necessary. However, Metropolitan has no knowledge of any water agencies in Los Angeles County using bromine as a disinfectant. In fact, according to AWWA[1], "Bromine has been used in swimming pools for disinfection and in cooling towers, but its use in drinking water has not been recommended." It therefore appears that this reference to debromination is not applicable to water supply and distribution system releases.

[1] F. W. Pontius, *AWWA Water Quality and Treatment, A Handbook of Community Water Supplies*, 4th ed., American Water Works Association, Denver, CO, 1990, p. 98

Recommendation:
Delete the reference to debromination because it is not applicable or relevant to potable drinking water supply and distribution releases. Bromine is not known to be used as a disinfectant for potable drinking water systems.

Issue # 3:
The tentative draft permit includes the following definition:

> "*Potable Water Distribution Systems*" means sources of flows from drinking water storage, supply and distribution systems including, but not limited to, flows from system failures, pressure releases, system maintenance, well development, pump testing fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults, and wells.

This definition does not actually define what a potable water distribution system is, but instead defines the types of various releases from potable water supply and distribution systems..

Recommendation:
To better clarify terms used in the tentative draft permit, it is recommended that the definition of " *Potable Water Distribution Systems*" be revised to define releases from water supply systems as follows:

> "*Potable Drinking Water Supply and Distribution System Releases*" means sources of flows from drinking water storage, supply and distribution systems including, but not limited to, flows from system failures, pressure releases, system maintenance, well development, pump testing, fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults, and wells.

If you have any questions regarding these comments, or if we can be of further assistance, please contact Joyce T. Clark at (213) 217-5593 (e-mail: jtruhan@mwdH2O.com).

Very truly yours,

Jill T. Wicke

LOS ANGELES REGION

Subject: **Comments on Final Draft *(October 10, 2001)***
NPDES No. CAS004001
County of Los Angeles Municipal Storm Water NPDES Permit

Dear Mr. Dickerson:

The Southern California Water Company (SCWC) appreciates your responses to our comments on the second draft and the opportunity to comment on the Final Draft (October 10, 2001) of the County of Los Angeles Municipal Stormwater NPDES Permit. As a major potable water purveyor throughout California, SCWC operates 12 water systems in Los Angeles County and provides potable water service to more than 500,000 persons.

As a major potable water purveyor, we must provide continuous, reliable supply to our customers and the water we serve must meet all drinking water standards. Many operational and maintenance activities are therefore important to ensure the continuous and reliable operation of our facilities. The water from these activities meets drinking water standards. All activities are carried out in accordance with industry-wide water works standards. Any chemical we use must meet NSF certification for drinking water purposes. Most of discharges pose an insignificant (De Minimus) threat to water quality within the basin.

We noticed that the RWQCB has incorporated our comments (on the 2nd Draft) in the current version. For the current version, we have comments on the following three issues:

1. Debromination

Under Part 2, Section II, 2., c) of the current draft:

"The Permittees shall effectively prohibit non-storm water discharges into the MS4 and watercourses, except where such discharges are:

...

(2) Potable water supply and distribution system release (consistent with AWWA guidelines for dechlorination/debromination and suspended solids reduction practices):"

For potable water supply, we use various chlorine for disinfection but not bromine. So debromination does not apply.

R0006599

2. Permittee coverage for Private Water Utilities

In the existing permit (Order 96-054) under Findings, Item 9, the permit discussed the coverage:

"For those entities within the Permittees' boundaries, the Regional Board may consider designating them as Permittees under this Order or issuing separate NPDES permits consistent with this Order...."

As you know, private water utilities are not on the list of Permittees although the nature and operation of the water systems are the same as Cities. It is noted in the current draft that it does not have a similar statement as in the old permit. Based on our understanding, the private utilities will report to LA County for similar coverage. Please verify the coverage.

3. Potable Water Definition and Coverage

Under Part 6. Definitions,

"Potable Water Distribution Systems means sources of flows from drinking water storage, supply and distribution systems including flows from system failures, pressure releases, system maintenance, well development, pump testing, fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults and wells."

It seems the intent here is to include most (if not all) O&M activities for potable water system as long as they are potable. Another critically important maintenance activity is well maintenance, and it is requested that you incorporate *well maintenance* into the above, which is associated with well development activity.

We appreciate your careful consideration of these comments.

If you have any questions, please contact me at 909.394.3600 ext. 624 or Dr. Jason Wen at 562.907.9200 ext. 402.

Very truly yours,

William C. Gedney

Dear Dr. Swamikannu:

Comments on October 11, 2001 DRAFT
National Pollutant Discharge Elimination System (NPDES) Permit

This is in response to your request for comments on the October 11, 2001 DRAFT of the Los Angeles County Municipal Storm Water NPDES Permit. My letter dated July 27, 2001 (copy enclosed) expressed my concern over infiltration of untreated, contaminated storm water into the potable groundwater supply. I am still concerned by these provisions of the NPDES Permit, and I noticed in the latest DRAFT a continued effort by the Los Angeles Regional Water Quality Control Board (Regional Board) to promote unmonitored infiltration as a remedy to reduce surface water contamination.

Specifically, Item 6 on Page 3 states that "Natural vegetated soil can both absorb rainwater and remove pollutants providing an effective natural purification process." Further, "...urban development creates new pollution sources as the increased density of human population brings proportionately higher levels of vehicle emissions, vehicle maintenance waste, municipal sewage waste, pesticides, household hazardous wastes, pet wastes, trash, and other anthropogenic pollutants."

It is precisely this kind of pollution that we are attempting to keep out of our groundwater basins. There are no restrictions in the DRAFT on the quality of infiltrated runoff, nor are there any requirements for testing or treatment prior to infiltration. Furthermore, soil aquifer treatment is not always effective, and the capacity of the soil to adsorb non-biodegradable contaminants is not limitless.

That is why the Watermaster Office has been very active in the Water Augmentation Study of the Los Angeles and San Gabriel Rivers Watershed Council. Through various demonstration projects involving the infiltration of storm water and monitoring the effects on groundwater, we hope to prove the efficacy of using infiltration as a way to clean up storm water while enhancing the conjunctive use of our groundwater basins.

However, our understanding of soil aquifer treatment is far from complete, and infiltrating contaminated runoff may, in some cases, result in simply transferring the problem from one medium to another. For municipalities that rely on groundwater for their supply, out of sight is not out of mind.

I urge you to reconsider all provisions in the NPDES permit requirements that mandate, or even allow, the unrestricted infiltration of contaminated runoff into potable groundwater supplies. Our groundwater basins are fragile and valuable. We should not treat them with any less care than surface water resources.

If you have any questions, please contact me at (213) 367-1020.

Sincerely,

MELVIN L. BLEVINS
ULARA Watermaster

RE: WSPA Comments on the October Draft NPDES Stormwater Permit for Los Angeles County (NPDES No. CAS614001)

Dear Dr. Swamikannu:

The Western States Petroleum Association ("WSPA") appreciates the opportunity to submit comments on the Regional Board's October 11, 2001 draft of the proposed Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges in Los Angeles County (NPDES No. CAS614001) (the "Draft Permit"). WSPA is a trade association representing approximately thirty companies engaged in all aspects of exploration, production, refining, transportation and marketing of petroleum and petroleum products in the Western United States. WSPA continues to be concerned that subjecting retail gasoline outlets ("RGOs") to the structural treatment requirements contained in the Draft Permit does not comply with State Board Order No. WQ 2000-11 ("State Board Order"), will impose significant unnecessary costs and expenses on WSPA members without a demonstrable environmental benefit, and may, in fact, result in unintended safety risks or harm to the environment.

The State Board Order requires "proper justification" before imposing structural treatment requirements on RGOs. *State Board Order No. WQ 2000-11*, p. 23. The "Technical Report"[1] prepared jointly by staff of the Los Angeles and San Diego Regional Boards fails to provide the necessary justification.

On June 15, 2001, WSPA submitted comments asserting that imposition of the structural treatment requirements on RGOs exceeds the Maximum Extent Practicable ("MEP") standard, violates the State Board Order and Section 13360 of the California Water Code ("CWC"), is overly broad, and constitutes an unfunded mandate. In addition, WSPA asserted that the Los Angeles Regional Water Quality Control Board ("Regional Board") failed to adequately evaluate economic considerations and has not satisfied the requirements of the California Environmental

[1] Radulescu, et. al., *Technical Report, Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts*, June 2001.

(818) 545-4105 • FAX: (818) 545-0954 • www.wspa.org

Quality Act ("CEQA") and the California Administrative Procedures Act ("APA"). WSPA also submitted comments dated August 6, 2001 relating to the sufficiency of the Technical Report as "proper justification" for the re-inclusion of RGOs in the structural treatment requirements. Our August 6, 2001 comments also included an analysis of the Technical Report conducted by Mr. Timothy Simpson of Geomatrix Consultants. Inc. ("Geomatrix Report"), and a copy of a recent study conducted by the California Department of Transportation ("Caltrans Report")[2] on the efficiency and costs associated with the same types of structural treatment devices required by the Draft Permit. Because these previous comments, including testimony provided by WSPA at the July 26, 2001 workshop, remain applicable, we hereby incorporate these materials by reference. Please include this letter and all previous correspondence, including the Geomatrix Report and Caltrans Report, in the administrative record for these proceedings.

COMMENTS

1. Stormwater Pollution at RGOs is Best Controlled By Implementation of the Task Force BMPs.

WSPA remains convinced that the best means to control storm water pollution at RGOs is through the implementation of the best management practices ("BMPs") for RGOs published by the California Storm Water Quality Task Force in March 1997 (the "Task Force BMPs"). The stated purpose of the Task Force BMPs is to assist municipal agencies and RGOs in attaining compliance with storm water regulations. By controlling potential sources of storm water pollution from RGOs at their source, the Task Force BMPs will prevent and/or reduce pollution in a safer, more efficient and more cost-effective manner than the structural treatment controls required by the Draft Permit.

There is no evidence in the record that RGOs implementing the Task Force BMPs present a storm water pollution problem. The State Board Order directed the Regional Board to require implementation of all of the Task Force BMPs, stating that these source control measures may be adequate to achieve the MEP standard at RGOs. *State Board Order No. WQ 2000-11*, pp. 22-23.[3] In addition, the draft State Board Order relating to the San Diego County Municipal Storm

[2] *"Performance Evaluation of Structural BMPs: Drain Inlet Inserts and Oil/Water Separators,"* by Othmer, Edward et al. (May 2001).

[3] Notably, this Regional Board found that implementation of the Task Force BMPs was adequate to meet the MEP standard in the Municipal Storm Water Permit for the City of Long Beach (Order No. 99-060, NPDES No. CAS004003, p. 18). There is no evidence in the record or otherwise which shows that RGOs present a storm water pollution problem that cannot be managed by implementation of the Task Force BMPs.

Water Permit (San Diego Regional Board Order No. 2001-01, NPDES No. CAS0108758) adopts the iterative approach.[4]

> "[W]here urban runoff is causing or contributing to exceedances of water quality standards, it is appropriate to require improvements to BMPs that address those exceedances. While we continue to address water quality standards in municipal storm water permits, we also continue to believe that the iterative approach, which focuses on timely improvements of BMPs, is appropriate." *Draft State Board Order No. WQ 2001-XX*, p. 9. (Emphasis added.)

The State Board only recently required implementation of the Task Force BMPs which were specifically developed to help municipalities and RGOs attain compliance with water quality standards. There is no evidence in the record to suggest that RGOs implementing the Task Force BMPs cause or contribute to exceedances of water quality standards. Under the State Board's iterative approach, the Regional Board should first assess the sufficiency of the Task Force BMPs before requiring additional controls which pose unique problems at RGOs due to the possibility of gasoline spills that are not within the control of the RGO operator.

Consistent with the State Board's iterative approach, and absent any evidence that RGOs implementing all of the Task Force BMPs present a storm water pollution problem, WSPA requests that the Regional Board exclude RGOs from the application of the structural treatment requirements.

2. The Technical Report Fails to Provide "Proper Justification" as Required by the State Board Order.

To comply with the State Board Order, the Regional Board must provide "proper justification" that the numeric design criteria meets the MEP standard. Staff has prepared a Technical Report that purports to provide this justification; however, an analysis of this report indicates that it is wholly inadequate to either support a finding that RGOs present a water pollution problem that cannot be remedied through the use of the Task Force BMPs, or to demonstrate the appropriateness and effectiveness of infiltration and/or structural treatment controls for RGOs.

The most glaring deficiency of the Technical Report is that it fails to assess the efficiency of the Task Force BMPs. Unlike some other priority categories identified by Staff, the Task Force BMPs are specifically tailored to address storm water pollution at RGOs. The Technical Report doesn't even acknowledge the existence of the Task Force BMPs, let alone assess their effectiveness. WSPA believes that this omission is unacceptable, and contrary to the iterative

[4] The Draft Order is scheduled for adoption by the State Board on November 15, 2001.

approach recently supported by the State Board. The Task Force BMPs serve the same purpose as the treatment devices by reducing pollutants contained in storm water runoff that is discharged from the facility, and nothing in the Technical Report suggests, let alone demonstrates, that the Task Force BMPs are not appropriate or effective. Because the Technical Report fails to consider this necessary aspect, it cannot constitute "proper justification" as required in the State Board Order.

In addition to this obvious deficiency, the Technical Report does not support Staff's position because it cites inapplicable studies, mischaracterizes their findings, and fails to address or even recognize the substantial evidence contradicting Staff's position.[5] First, the Technical Report characterizes RGOs as toxic hotspots to justify the use of structural treatment devices; however, none of the studies cited as supporting this finding assessed storm water runoff from RGOs that were implementing the Task Force BMPs.[6] In fact, in an egregious mischaracterization, the Technical Report cites a Santa Monica Bay study as supporting the proposition that discharges from RGOs are significant contributors of toxicity in the Santa Monica Bay. However, that study does not speculate as to the source of toxicity, and certainly does not support a finding that storm water runoff from RGOs, let alone runoff from RGOs implementing the Task Force BMPs, is the cause.

There continues to be no evidence that RGOs implementing the Task Force BMPs present storm water pollution problems. The only support for a broad statement in the Technical Report that "existing BMPs do not address pollutants generated by motor-vehicle traffic" is Staff's own self serving statement at the State Board hearing.[7] However, this statement is simply false. As the Geomatrix Report describes, the presence of heavy metals in storm water is correlated with sediment. *Geomatrix Report*, p. 6. Regular sweeping, one of the Task Force BMPs required by the State Board, is effective at reducing sediment, and therefore, will be effective at reducing heavy metals in storm water runoff from RGOs.

---

[5] A complete summary of our analysis of the Technical Report is provided in our August 6, 2001 comment letter and attached Geomatrix Report.

[6] The Technical Report relies on several studies to suggest that storm water from RGOs are a significant source of pollutants; however, in the case of the Rouge River study, no source control BMPs were being employed. As to the other studies, including a WSPA study, the Task Force BMPs were not being employed because they did not exist at the time the studies were performed. WSPA believes that these studies are not sufficient to support a finding that RGOs implementing the Task Force BMPs present a storm water pollution problem.

[7] Footnote 12 of the Technical Report cites to Staff's own testimony. However, the Technical Report points to no additional data that would support such a finding.

Finally, the Technical Report ignores the substantial information that contradicts Staff's findings that structural treatment devices are effective. The Technical Report primarily cites two studies as supporting the effectiveness of structural treatment devices. The first, the Rouge River study, simply performed an analysis of accumulated debris and filter media at an RGO that was specifically instructed not to use any BMPs rather than sampling actual storm water discharges. Merely sampling filter media at a facility employing no source control measures is not an accurate measure of the effectiveness of these devices at RGOs employing the Task Force BMPs. Staff cites a second study, conducted at a large RGO in Washington, as also supporting its position that these devices are effective. However, not only does the Technical Report overstate the results of this study, it fails to mention that this study actually showed a net increase in the export of oil and grease and nutrients, suggesting that the use of these devices may result in unintended environmental impacts.

Staff has also completely ignored the numerous other studies which have found these devices to be ineffective and costly to maintain due to well documented problems with clogging and flow bypass. Most recently, Caltrans conducted a study of these very same filter devices finding that removal efficiencies ranged between 5.8% and 17.8% for hydrocarbons, total suspended solids, copper, lead and zinc.[8] In addition, the Caltrans study reported maintenance costs of $15,000 per year, considerably more than the $250 to $900 per year estimate contained in the Technical Report. Staff has simply chosen to ignore this contradictory information because it doesn't suit its purposes. Such an approach of selectively using information does not constitute "proper justification," especially when the Technical Report fails to point to any information to support the conclusion that the Task Force BMPs are inadequate or ineffective in preventing water quality impacts due to storm water runoff from RGOs.

3. The Regional Board Conducted No Independent Analysis in Determining Appropriate Sizing Criteria

To the extent that the Regional Board persists in attempting to mandate structural treatment controls for RGOs, the Regional Board must make a closer examination of an appropriate threshold for this requirement. The Technical Report suggests the following criteria: "(i) creates 5,000 square feet or more of impervious surface; and (ii) has a projected trip generation of 100 or more motor vehicles ADT." *Technical Report*, p. 9. Use of these criteria are so overbroad that it would cover virtually every RGO in Los Angeles county which will be constructed or remodeled.

[8] *"Performance Evaluation of Structural BMPs: Drain Inlet Inserts and Oil/Water Separators,"* by Othmer, Edward et al. (May 2001).

The Regional Board appears to take these criteria from regulations in Washington and Oregon without any further analysis or justification.[9] To the extent that the Regional Board intends to apply a threshold to RGOs, such a threshold must be chosen based on independent justification and analysis, rather than simply parroting language used in a different regulation of another state. WSPA is unaware of any independent analysis of the average daily traffic at RGOs in Los Angeles undertaken by the Regional Board, any studies which show that storm water runoff at stations above 5,000 square feet and 100 cars per day requires additional treatment beyond application of the Task Force BMPs, or any independent analysis that installation of structural treatment controls at facilities of this size is feasible given the presence of large underground storage tanks and other subsurface piping and equipment.

To the extent that the Regional Board intends to apply a threshold, the Regional Board is obligated to undertake a thorough analysis of appropriate criteria and provide independent justification which has not been done here.

4. The Regional Board has Failed to Address the State Board's Safety Concerns.

The Technical Report virtually ignores the safety concerns that the more sophisticated structural treatment devices present. Instead, it attempts to analogize the use of structural treatment devices for storm water with oil-water separators currently used at RGOs. "In California, subsurface fabricated treatment systems have been commonly used at RGOs to separate waste-oil before discharge to the sanitary sewer system. Safety or feasibility has not been an issue when sanitation districts require RGOs to install treatment systems in order to obtain connection permits to the sanitary sewer system." *Technical Report*, p. 8. However, common sense reveals that this is not a valid comparison.

The use of oil-water separators is significantly different than the structural treatment devices required by the Draft Permit. As the Geomatrix Report indicates, oil-water separators are connected to drains in maintenance shops or other areas that are isolated from the pump islands where gasoline spills may occur. Lube and waste oils have a much higher flashpoint, lower volatility, or both than gasoline making the collection of gasoline in these devices far more problematic. Normally, gasoline spills occurring at RGOs would take place in an open air environment allowing for rapid evaporation of the fuel. Unlike oil-water separators where there is little chance for gasoline to reach the device, gasoline spills would be purposely routed and contained below grade creating the potential for flammable vapor concentrations to develop and mix with air inside the device itself, a potential safety hazard if exposed to a source of ignition such as automotive engines, smoking or excessive static electricity. Staff has undertaken no independent analysis of whether mitigation measures are available to reduce these potential

[9] Notably, the Washington regulations were adopted in August 2001, after the Technical Report citing these regulations was written.

safety concerns, or whether the cost of such measures, if they exist, would exceed the benefit provided by these devices at RGOs already implementing the Task Force BMPs.

5. The Draft Permit Requirements Applicable to Retail Gasoline Outlets Exceed the "Maximum Extent Practicable" Standard of the Clean Water Act.

The Clean Water Act only requires that storm water control measures be implemented to the "maximum extent practicable." 33 U.S.C. § 1342(p)(3)(B). As the record shows, the Task Force BMPs meet this standard for RGOs. The Draft Permit's structural treatment requirements and use of numeric design criteria, however, are neither effective nor practical for RGOs which are already required to implement the Task Force BMPs. RGOs should not be required to apply the Draft Permit's "belt and suspenders" approach in light of the unique practical problems of implementing structural treatment controls at RGOs.

The State Board Order has elaborated on what is required to meet the MEP standard. The standard focuses not just on technical feasibility, but also on cost and effectiveness.

> "[I]f a permittee employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, **or whose cost would exceed any benefit derived**, it would have met the standard. MEP requires permittees to choose effective BMPs, and to reject applicable BMPs only where **other effective BMPs will serve the same purpose**, the BMPs would not be technically feasible, or the **cost would be prohibitive**." *State Board Order No. WQ 2000-11*, p. 20. (Emphasis added.)

Based on the direction provided by the State Board, a permittee has complied with the MEP standard if other effective BMPs that serve the same purpose are employed, or if costs of a particular BMP exceed any benefit derived. Therefore, any justification for requiring structural treatment devices for storm water runoff from RGOs must consider, among other things, (1) whether effective BMPs that are already identified, such as the Task Force BMPs, serve the same purpose as the structural treatment devices, (2) whether the structural treatment devices are effective, and (3) whether such devices are cost prohibitive.

Unlike other facilities, RGOs are unique in that the use of structural treatment devices present many practical problems due to the possibility of gasoline spills, a risk not present at other facilities. For example, infiltration provides a direct pathway for liquid runoff to soak into the soil and could lead to groundwater contamination from accidental spills of gasoline since infiltration mechanisms do not distinguish between gasoline and storm water runoff. Accidental spillage is caused by events which are beyond the control of the station owner/operator (e.g. motorist carelessness during refueling, the motorist driving off with the hose/nozzle still in the fuel tank fill neck, and accidental spillage during gasoline deliveries). Such events are recognized and incorporated into the Task Force BMPs.

There is insufficient evidence in the record to show that catch-basin inserts and oil/water separators are effective for controlling storm water pollutants at RGOs. In fact, recent studies show that the effectiveness of such devices have not been proven. See "Investigation of Structural Control Measures for New Development" by Larry Walker Associates, Inc. (November 1999); Task Force BMP Guide, p. 5. See also *"Performance Evaluation of Structural BMPs: Drain Inlet Inserts and Oil/Water Separators,"* by Othmer, Edward et al. (May 2001).

The Rouge River study cited by the Regional Board does not impugn this conclusion since it did not evaluate the impact on water quality, test how the pollutant concentrations in storm water runoff changed as a result of the use of filters or examine how implementing source control practices might have achieved better results. According to a principal author of the Rouge River study, the facilities chosen for the study did not use source control measures (i.e. BMPs) and were instructed not to do so during the study period.

Other types of treatment devices which might be used to meet the Draft Permit requirements (such as oil/water separators, sand filters, and compost filters) would require that an additional subterranean structure be built beneath the retail gasoline outlet. As discussed above, such enclosed spaces can allow gasoline and gasoline vapors to mix with air, resulting in a potentially hazardous situation and public safety concerns.

Based on the record, there is no evidence to justify requiring RGOs already implementing the Task Force BMPs to build structural treatment controls and to meet numeric design standards as required by the Draft Permit. By imposing additional controls on RGOs beyond those that are practicable, the Regional Board exceeds its authority under the Clean Water Act.

In conclusion, WSPA believes that the Technical Report does not provide sufficient justification to require the installation of structural treatment devices at new and redeveloped RGOs. As such, application of the numeric design criteria to RGOs violates the State Board Order. Therefore, WSPA respectfully urges the Regional Board to modify the Draft Permit by exempting RGOs from the structural treatment controls and the numeric design standards.

Sincerely,

R. E. Wilkniss for

LA County MS4 Monitoring Meeting
November 19, 2001
Library at 2:00
Tentative Agenda

1. Peak Discharge Study
   - SCCWRP's involvement in study (County/SCCWRP to explain)
   - Study timeframe (County concerns/questions)

2. New Development Impact Study
   - Discuss possibility of combining with peak discharge study
   - Sampling locations - discuss possible locations that would satisfy the objectives of both studies
   - Status of locations that have already been identified (Matt Yeager)

3. Trash Monitoring (County concerns/questions)

4. Assessment of compliance with applicable water quality standards (County questions/concerns)

5. Toxicity Monitoring
   - County questions
   - Implementation date (County may need more time for RFP)

6. TIE & TRE procedures (County questions/concerns)

7. Tributary Monitoring
   - County questions
   - Implementation date
   - Compton Creek

8. Other

Monitoring Meeting 11-19-01

Peak Discharge

2 phase approach

1st phase - identify problems

Make change to 3 years in development planning section

Water Quality Assessment

Check with TMDL - how much can criteria be scaled down for non-listed waters

reduce # of catch basins

scale to storms

is it just good to list? - can they list in easier way? Can they take pictures - that's listing criteria

talk to Dennis

TRE - clarify when to go into TRE

must have confidence in TIE results

identify priority constituents in each watershed

min. of 3 TIEs 3-5 to determine consistent constituents of concern

is cause of toxicity the same in wet & dry

Can't be successful in TRE if moving target

be able to identify that majority (>50%) of toxicity due to a particular compound or class of constituent

Subject: Re: LA County tox language

Megan,
The attached file contains my suggested revisions to your draft language. I have tried to make the information more specific in order to reduce the need for clarification later. I have used the "track changes" feature of word so you can identify my suggestions.

I also suggest that you make a change to item F.3.d.2 (Sediment toxicity for regional monitoring). This section should be changed to state that "Phase I TIEs of interstitial water, using the amphipod test species, shall be conducted ...". It is always preferable to conduct the TIE using the same species that detected the toxicity in the initial test.

Please call if you have questions.

Steve

> I added a few things to the toxicity language (attached), per our discussion yesterday. If you get a minute, please let me know if it makes sense, and if you have any suggestions. I'm not sure if my description of substantial toxicity is accurate, but I really want to have a number in there so there is no uncertaintly about when a TIE is required. Also, I'm still hesitant about the range from 3-5, so I used a minimum of 3, but I want to use the most scientifically sound method, so please let me know if you think it would be better another way.

A. Water Column Toxicity Monitoring

The Principal Permittee shall analyze mass emission samples for toxicity to evaluate the extent and causes of toxicity in receiving waters and to modify and utilize the SQMP to implement practices that eliminate or reduce sources of toxicity in storm water.

1. The Principal Permittee shall analyze samples from two storm events (including the first storm of each year) and two dry weather events from each mass emission station for toxicity every year. A minimum of one freshwater and one marine species shall be used for toxicity testing for each station event. Specifically, the *Ceriodaphnia dubia* (water flea) 7-day survival/reproduction and *Strongylocentrotus purpuratus* (sea urchin) fertilization tests shall be used. These tests should include a dilution series (0.5x steps) that ranges from the undiluted sample (or the highest concentration that can be tested within the limitations of the test method or sample type) to ≤ 6% sample.

2. Toxicity Identification Evaluations (TIE)

   The Principal Permittee shall begin a Phase I TIE immediately on all samples that are substantially toxic (≥ 1 Toxic Unit) to either test species.[1] If a sample is substantially toxic to both species, a TIE shall be performed for both species. ~~At a minimum, 2 Toxic Units shall be considered substantial toxicity in any test.~~ The Phase I TIE shall include the following treatments and corresponding blanks:

   (1) Baseline toxicity;

   (2) Particle removal by centrifugation;

   (3) Solid phase extraction of the centrifuged sample using C18 media;

   (4) Complexation of metals using EDTA addition to the raw sample;

   (5) Neutralization of oxidants/metals using sodium thiosulfate addition to the raw sample; and

   (6) Inhibition of OP pesticide activation using piperonyl butoxide addition to the raw sample (crustacean toxicity tests only).

3. Toxicity Reduction Evaluations (TRE)

   a) When the same ~~a~~ pollutant or class of pollutants is identified through the TIE process as causing at least 50%

[1] Substantial toxicity means the amount of toxicity necessary to successfully conduct a Phase I TIE. Toxic Units are calculated by dividing 100 by the calculated median test response value (*e.g.*, LC50 or EC50). For example, a LC50 of 50% sample equals 2 Toxic Units. ~~For example, C~~*Ceriodaphnia* TIEs require at least 50% mortality in undiluted sample (1 Toxic Unit) at any time during the 7-day duration of the initial chronic bioassay. (SCCWRP)

of the toxic responses in at least 3 samples at a sampling location, a TRE shall be performed for that identified toxic pollutant. ~~If a discharge from the MS4 is identified to cause or contribute to toxicity in a receiving water body, a TRE shall be performed.~~ TRE development shall be performed by a neutral third party (retained by the Principal Permittee), with input from Permittees and Regional Board staff. The TRE shall include all reasonable steps to identify the source(s) of toxicity and discuss appropriate BMPs to eliminate the causes of toxicity. Once the source of toxicity and appropriate BMPs are identified, the Principal Permittee shall submit the TRE to the Regional Board Executive Officer for approval. At a minimum, it shall include a discussion of the following items:

(1) The potential sources of pollutant(s) causing toxicity;

(2) A list of municipalities that may have jurisdiction over sources of pollutant(s) causing toxicity;

(3) Recommended BMPs to reduce the pollutant(s) causing toxicity;

(4) Proposed changes to the SQMP to reduce the pollutant(s) causing toxicity; and

(5) Suggested follow-up monitoring to demonstrate that toxicity has been removed.

b) Since the Phase I TIEs may only identify a broad category of toxicants (e.g., nonpolar organics), additional TIE analyses may be required in order to identify or confirm the identity of the pollutants causing toxicity before the TRE can be completed.

~~b)~~c) If TRE implementation for a specific pollutant coincides with TMDL implementation for that pollutant, the efforts may be coordinated.

~~c)~~d) Upon approval by the Regional Board Executive Officer, the Permittee(s) having jurisdiction over sources causing or contributing to toxicity shall implement the recommended BMPs and take all reasonable steps necessary to eliminate toxicity.

~~d)~~e) The Principal Permittee shall be responsible for the development of a maximum of two TREs per year. If applicable, the Principal Permittee may use the same TRE for the same toxic pollutant or pollutant class in different watersheds. The TRE process shall be coordinated with TMDL development and implementation (ie. If a TMDL for

zinc is being implemented when a TRE for zinc is required, the efforts shall be coordinated to avoid overlap).

~~e)~~f) The Principal Permittee shall report on the development, implementation, and results for each TRE in the annual Monitoring Reports, beginning the year following the identification of each pollutant or pollutant class causing toxicity.

November 14, 2001

2001 NOV 15 P 2:30

Mr. Dennis A. Dickerson
Executive Officer
Los Angeles Regional Water Quality Control Board
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Subject: Request to Complete Mediation/ Continuance of NPDES Permit Agenda Item on November 29th

Dear Mr. Dickerson:

We wanted to personally thank you for taking time from your busy schedule to participate in the USEPA sponsored mediation session on the inspection requirements of the proposed NPDES permit. We felt that the discussions were very productive in identifying areas of agreement between Board staff, permittees, and environmental community. We also felt that EPA provided a steady hand in conducting the mediation. It is our hope that we can mediate the remaining permit issues.

It is regretful that you had to leave prior to the end of the mediation session and before we had the opportunity to discuss the issue of inspections of industrial facilities. We acknowledge that the permittees have a federal requirement to perform some level of inspection on Phase I facilities, complimenting the State's responsibilities. However, up to this point it appears that the two parties have not been able to discuss implementation of joint inspections. I feel that given the opportunity, we can develop such a plan. It is my hope that we can complete the mediation process sponsored by USEPA and design this plan, as well as resolve the remaining permit issues.

2175 Cherry Avenue ♦ Signal Hill, CA 90806 ♦ (562) 989-7302 ♦ (562) 989-7393 Fax

R0006619

We understand that the Board has tentatively scheduled the NPDES Permit for adoption on November 29th and this will not leave enough time to complete mediation. We believe this timing is unfortunate, since all the parties made good progress at Friday's meeting. We also believe that USEPA would lend their resources to completing mediation on the inspection issue and in resolving the remaining Permit issues. We would request that the Board continue the NPDES Permit agenda item and support USEPA mediation. The cities are committed to resolving the remaining issues and will devote the necessary resources to complete the mediation sessions in a timely manner.

Once again, thank you for your time last Friday. Please let me know if you or the Board accept the offer to continue the USEPA mediation.

Sincerely,

Ken Farfsing
City Manager

Dan Radulescu
California Regional Water Quality Control Board, Los Angeles
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

November 15, 2001

Dear Mr. Radulescu:

This is in response to your request for me to comment on the GeoMatrix document, "Review of Retail Gasoline Outlets: New Development Design Standards for Mitigation of Stormwater Impacts." On page 3 of their document, GeoMatrix uses the following quote from a document I co-authored (Duke and Shannon, 1992):

> The intend [sic—error in the GeoMatrix quote, not in the original] of the pollution prevention approach is to control pollutants so well that stormwater need not be treated in a hydraulic detention facility or a pollutant removal device. The approach is highly practical from a business standpoint because it focuses on industrial operations and low-cost pollution control practices rather than expensive constructed solutions like new industrial structures or new storm water detention or treatment facilities. This approach is especially preferable in the kind of highly seasonal semi-arid rainfall regimes that are found in much of California and most of the western U.S. (emphasis added by GeoMatrix).

The GeoMatrix document appears to offer the above quote in support of an argument that the Los Angeles municipal stormwater NPDES permit should not require structural BMPs for automobile service stations but that water quality objectives of the Los Angeles region may be attained with non-structural pollution prevention measures. I do not agree that the quote supports that argument.

The Duke and Shannon document was not a technical analysis, but rather a textual overview description of various types of non-structural BMPs and other pollution prevention methods appropriate for stormwater discharges from automotive-service facilities. The document provided basic background information on a wide range of possible pollution prevention measures, with the intent to encourage automotive facility operators to learn more about those measures as they might apply to their own facilities, and for them to then identify pollution prevention activities as part of their efforts to reduce pollutants in runoff. The quote appears to be from an introduction or other material intended to describe motivation for the interest in non-structural BMPs.

The Duke and Shannon statement that "the intent...is to control pollutants so well that stormwater need not be treated...." should not be taken to imply that such thorough control is necessarily possible at any given industrial facility; but that should non-structural, pollution prevention BMPs be sufficiently successful at a facility, then the more-costly structural measures may be avoided. The success of non-structural measures at any given facility is of course a function of a large number of variables and factors, such as: the topography, grading, and paving of the facility; the suitability of the facility's particular business activities for non-structural BMPs; the presence or absence of existing structures such as roofs, drains, buildings to accommodate vehicles, and other infrastructure that can be used to avoid pollutants contacting runoff; success at training personnel to rigorously implement the non-structural BMPs; and many others. I am not aware of any study that documents quantitative reduction of pollutants in storm runoff from automotive service facilities that may be achieved by non-structural pollution prevention measures, and or even any study that demonstrates correlation between on-site activities, the quantity of pollutants that may be expected from those activities, and the efficacy of specific non-structural BMPs at reducing those pollutants. The Duke and Shannon document certainly is not such a study. It is my opinion that such a study would be necessary if an agency were to conclude that structural BMPs will not be necessary in any facilities of a given region, in order for that region to attain water quality objectives impaired by stormwater runoff.

As to the particular appropriateness for California, the statement in Duke and Shannon was intended to convey that for hydrologic reasons, one might expect hydraulic treatment methods such as detention ponds to be quite expensive in the rainfall regimes of California. In semi-arid, 'Mediterranean' climate regions of California, rainfall occurs in discrete events which are highly concentrated seasonally and therefore require much greater capital investment because constructed treatment facilities must have sufficient capacity to capture large storms, but are used only a few times per year when such large storms occur. The statement in Duke and Shannon was not meant to suggest that pollution prevention is especially effective in semi-arid rainfall regimes, only that the most widely-used alternatives are more costly in such locations.

The quote from Duke and Shannon (1992) is, in my judgment, consistent with GeoMatrix's quote on page 2 from an article by Schuler and Shepp, which includes the sentences "Source control may hold the greatest promise to reduce the delivery of pollutants from hotspots...can reduce the chance that automotive fluids and cleaning solvents come into contact with rainwater and run off the site...the Santa Clara Valley Nonpoint Source Program has published an excellent summary [i.e., Duke and Shannon 1992] of pollution prevention practices for gas stations." This quotation similarly points out the relative desirability of pollution prevention from an implementation standpoint, but to my understanding also similarly does not cite or base its conclusions on any data that demonstrate pollution prevention as implemented at filling stations has in fact been proven successful at reducing pollutants to the point where water quality impacts can be removed. The intent of the Shuler and Shepp statement, in my judgment, is similar to the intent of the Duke and Shannon statement, which is to encourage pollution prevention as a first step but not to suggest any conclusions as to whether further steps may be necessary to achieve water quality objectives.

I appreciate the opportunity to comment on this document and hope my discussion above is of some use in your deliberations. If I may be of further assistance, please feel free to contact me by phone at 310-794-2164; or by e-mail at ldduke@ucla.edu.

via FAX

Dear Mr. Farfsing:

Renewal of the Municipal Storm Water Permit for the County of Los Angeles

Thank you for your letter, dated November 14, 2001, on behalf of the Coalition for Practical Regulation. In this letter, you indicated that you believe that our meeting on November 9th was productive, and requested that we have further discussion in a similar format, to be facilitated by the US Environmental Protection Agency (US EPA).

We have contacted the US EPA to request that representatives again facilitate a meeting, on November 29th, to address additional issues. At that meeting, our staff would like to start by presenting a revised section on the inspection requirements that we believe reflects the consensus achieved at our last meeting. Assuming concurrence, we may then proceed to other issues.

As I have already informed you, we have postponed our Board's proposed adoption of the permit, formerly scheduled for November 29th, until a public meeting on December 13th. We are ready to work together in the meantime to try to reach consensus on other issues.

Should you have questions, please do not hesitate to contact me at (213) 576-6605 or Wendy Phillips at (213) 576-6618.

Sincerely,

Dennis A. Dickerson
Executive Officer

November 26, 2001

Congressman David Dreier
U. S. House of Representatives, 28th District
112 North Second Ave.
Covina, CA 91723

SUBJECT: REQUEST SUPPORT FOR USEPA, REGIONAL WATER BOARD, AND LOS ANGELES AREA CITIES MEDIATION EFFORT

William R. Kelly
City Manager

Dear Congressman Dreier:

The City of Arcadia requests your support for the U.S. EPA's mediation effort to resolve differences between the California Regional Water Quality Control Board – Los Angeles Region – and Los Angeles Area Cities regarding the Area-wide Municipal Stormwater Permit. It would be very helpful if you would express your support by contacting the Regional Board Chairman, David Nahai, to recommend continuation of these efforts. Time is of the essence, because the Regional Board is expected to adopt the Permit at their November 29th meeting.

An initial mediation session held on November 9, 2001, was such a success that the cities believe it would be worthwhile to delay the scheduled November 29th Permit adoption date to allow these efforts to continue. While consensus was reached on a number of items at the meeting, the Regional Board Executive Officer was unable to stay until the end, so some important issues remain.

I believe you are familiar with the background of the Area-wide Municipal Stormwater Permit adoption process. The State, through the Regional Board, is attempting to transfer more and more responsibilities to the Cities without providing support and working in partnership. The state has taken an enforcement attitude from the outset. The differences between the Cities and the Regional Board are substantial and will cost millions of dollars for dubious results. Mediation can help to resolve the tremendous cost issues.

240 West Huntington Drive
Post Office Box 60021
Arcadia, CA 91066 - 6021
(626) 574 - 5402
(626) 446 - 5729 Fax

We recognize that the State and Regional Board staff have limited resources and cannot resolve all the issues without assistance from the EPA's mediator. We believe there is common ground, which is yet to be explored. The City of Arcadia and other cities in your District are committed to the goal of improving stormwater quality in cooperation with regulatory agencies and the environmental community.

Again, it would be helpful if you would contact the Regional Board Chairman, David Nahai, to express your support for mediation that will involve the cities, environmental groups, and regulatory agencies. Mr. Nahai can be reached at (310) 201-6800.

Thank you for your time, support, and continued interest.

Sincerely,

William R. Kelly

We recognize that the State and Regional Board staff have limited resources and cannot resolve all the issues without assistance from the EPA's mediator. We believe there is common ground, which is yet to be explored. The City of Arcadia and other cities in your District are committed to the goal of improving stormwater quality in cooperation with regulatory agencies and the environmental community.

Again, it would be helpful if you would contact the Regional Board Chairman, David Nahai, to express your support for mediation that will involve the cities, environmental groups, and regulatory agencies. Mr. Nahai can be reached at (310) 201-6800.

Thank you for your time, support, and continued interest.

Sincerely,

William R. Kelly
City Manager

Ms. Sandy Mathews, Chair
California Stormwater Quality Task Force
Lawrence Livermore National Laboratory
7000 East Avenue, I-627
Livermore, CA 94550-9234

Dear Ms. Mathews:

REVIEW OF THE BEST MANAGEMENT PRACTICE GUIDE FOR THE RETAIL GASOLINE OUTLETS ISSUED BY THE CALIFORNIA STORMWATER QUALITY TASK FORCE (SWQTF BMP GUIDE)

In preparation to reissue the Los Angeles County Municipal Storm Water Permit, Regional Board staff performed a review of the SWQTF BMP Guide for RGOs (1997). The conclusions of this review can be found in the report that is attached. We are forwarding it to you for your information.

We appreciate the opportunity to work with the members of the Task Force in addressing the storm water quality program issues.

Should you have any questions, please do not hesitate to contact Dan Radulescu at (213) 576-6668.

Sincerely,

Xavier Swamikannu, D.Env.
Acting Chief, Storm Water Section

To: Los Angeles County Municipal Storm Water Permittees

REGIONAL BOARD APPROVAL OF RECOMMENDED BEST MANAGEMENT PRACTICES (NPDES Permit No. CAS614001)

Dear Permittees.

On March 31, 1998, we sent you a copy of the Tentative Board Resolution approving the recommended BMPs for Development Construction and Industrial/Commercial Education (Site Visits) Programs, and for Municipal Sidewalk and Street Washing Activities.

On April 13, 1998, after a public hearing, the Regional Board considered and approved (contained in the attached Resolution No. 98-08) the recommended BMPs for the Industrial/Commercial Education (Site Visits) Program and for the Municipal Sidewalk and Street Washing Activities The BMPs for Development Construction will be resubmitted for the Board's consideration after the revised Development Construction Model Program has been approved by the Board's Executive Officer.

If you have any questions or need additional information, please call me at (213) 266-7593 or Dr. Xavier Swamikannu at (213) 266-7592.

Sincerely,

WINNIE D. JESENA, P.E.
Chief, Los Angeles Coastal
Watershed Unit

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

Resolution No. 98-08

APPROVING BEST MANAGEMENT PRACTICES
FOR
MUNICIPAL STORM WATER AND URBAN RUNOFF MANAGEMENT PROGRAMS
IN
LOS ANGELES COUNTY

(NPDES NO. CAS614001)

WHEREAS, THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION FINDS:

1. Pursuant to the requirements of Order No. 96-054, Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges Within the County of Los Angeles (Permit), the Principal Permittee, in consultation with Permittees, has developed a model program for Industrial/Commercial Education. This program must include Best Management Practices (BMPs) to control/minimize the discharge of pollutants to receiving waters.

2. The Permit required the City of Los Angeles to conduct a study on pollutants entering storm drains from street and sidewalk washing operation by: (i) characterizing municipal street washing and sidewalk washing; (ii) assessing the impacts of such activities; and (iii) recommending appropriate BMPs to control any adverse impact. Accordingly, the City of Los Angeles has completed and submitted a final report entitled *A Study of Pollutants Entering Storm Drains from Street and Sidewalk Washing Operations in Los Angeles, California* that includes recommended BMPs for said activities.

3. The Permit also requires that the BMPs be approved by the Regional Board before the Permittees incorporate them into their regulatory programs.

4. The BMPs have been evaluated and are considered appropriate for the respective program/activity.

THEREFORE BE IT RESOLVED THAT:

1. The Best Management Practices contained in the following Attachments are approved:

   a. Attachment 1 -- Industrial/Commercial Program (Site Visit); and

   b. Attachment 2 -- Sidewalk and Street Washing.

2. Permittees consider these BMPs in their regulatory programs in accordance with the provisions of Order No. 96-054.

I, Dennis Dickerson, Executive Officer, do hereby certify that the foregoing is a full, true and correct copy of a Resolution adopted by the California Regional Water Quality Control Board, Los Angeles Region, on April 13, 1998.

DENNIS A. DICKERSON
Executive Officer

ATTACHMENT 2

Recommended Best Management Practices
for
Municipal Sidewalk and Street Washing Operations

TYPE OF DISCHARGE	RECOMMENDED BMPS
SIDEWALK WASH WATER	1. Remove trash, debris, and free standing oil/grease spills/leaks (use absorbent material, if necessary) from the area before washing; and 2. Use high-pressure, low volume spray washing using only potable water with no cleaning agents at an average usage of 0.006 gallon per square feet of sidewalk area
STREET/ALLEY WASH WATER FROM AREAS WITH UNSANITARY CONDITIONS*	Collect and divert wash water to the sanitary sewer - publicly-owned treatment works (POTW) Note: POTW approval may be needed.

* This BMP is only to be applied in areas impacted by transient populations. Each Permittee is required to apply this BMP in areas where the congregation of transient populations can reasonably be expected to result in a significant threat to water quality.

The Role of Municipal Operators In Controlling the Discharge of Pollutants in Storm Water Runoff from Industrial/Commercial Facilities

A Case for Inspection Activities in the Large and Medium Municipal Separate Storm Sewer System Permits

Dan Radulescu
California Regional Water Quality Control Board, Los Angeles Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

November 2001

R0006638

INTRODUCTION

A question that has been frequently asked during the process to renew the Los Angeles NPDES Municipal Stormwater Permit was if the storm water regulations require municipalities to conduct inspections at industrial or commercial facilities. This requirement establishes municipalities' responsibility to verify the effective implementation of best management practices to control the contribution of pollutants to the municipal storm drain system from industrial or commercial sites.

A second issue raised was the extent of responsibility municipalities have to control the contribution of pollutants from industrial or commercial sites and what is the relationship with the responsibilities that the Regional Board has over the same type of facilities.

This document attempts to answer to those specific questions raised by the Permittees and other stakeholders. The author adds emphases in the text.

I. Federal Mandate

The Federal Water Pollution Control Act Amendments (FWPCA) of 1972 created the framework for addressing critical pollution problems in the Nation's waters. Section 101, "Congressional Declaration of Goals and Policy", concisely summarized the new act. Section 101(a) stated, "The objective of this Act is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." This way a strong emphasis was put on the ecological and environmental aspects of protecting water quality. Elaborating on that position, the same section set down two "national goals": (1) eliminating the discharge of pollutants into navigable waters by 1985, and (2) achieving an interim water quality level that would protect fish, shellfish, and wildlife while providing for recreation in and on the water wherever attainable. The 1972 Amendments focused their attention on point sources such as municipal discharges through publicly owned treatment works and direct industrial discharges. The Act also focused the efforts on two categories of pollutants: conventional (BOD, SS, and pH), and what was classified as toxic.

Much of the effort following the enactment of FWPCA was to establish the United States Environmental Protection Agency (U.S. EPA) and the framework of the National **Pollutant Discharge Elimination** System (NPDES) permit program. Many other efforts were initiated in areas of construction of treatment plants, basin planning, treatment technologies development, establishment of effluent standards for toxic pollutants and the creation of appropriate regulations to implement the intent of the Act.

Under the provisions of the Act, the U.S. EPA could delegate NPDES permitting authority to the States. California is a delegated State and has full authority to issue NPDES permits with U.S. EPA's concurrence.

Between 1972 and 1987, the law has been subject to mid-course corrections and a change of name to the Clean Water Act (CWA).

The 1987 amendments, known as the Water Quality Act (WQA) of 1987, were aimed at addressing a number of issues on which progress was deemed to have been unsatisfactory. These issues included toxics, nonpoint sources, storm water, coastal

pollution, and others. States were required to identify waters not meeting designated uses because of toxic pollutants even after the application of technology based controls and to develop strategies for controlling them.

New provisions to permit discharges of storm water from separate storm sewers were also added. Section 402 phases in storm water permits. Originally, the 1972 Act required U.S. EPA to issue a NPDES permit for all point sources of pollution. The Agency interpreted that requirement so that it could issue areawide permits for separate storm sewers, rather than each storm water outfall.

The first phase of the program, commonly referred to as "Phase I", was promulgated on November 16, 1990 (55 FR 47990, 40 CFR 122). Phase I requires NPDES permits for storm water discharge from a large number of priority sources including municipal separate storm sewer systems (MS4s) generally serving populations of 100,000 or more and several categories of industrial activity, including construction sites that disturb five or more acres of land.

The second phase of the storm water program, recently promulgated on December 8, 1999 (64 FR 68722) expands the existing program to include discharges of storm water from smaller municipalities in urbanized areas and from construction sites that disturb between one and five acres of land. The new rule allows certain sources to be excluded from the national program based on a demonstrable lack of impact on water quality. The rule also allows other sources not automatically regulated on a national basis to be designated for inclusion based on increased likelihood for localized adverse impact on water quality.

II. Water Quality Concerns

After FWPCA was adopted in 1972, the implementation of end-of-pipe control methods from traditional point sources started to show improvement in the quality of the effluent discharged from Publicly Owned Treatment Works (POTW) and industrial wastewater treatment plants. However, it also become evident that receiving waters still did not attain designated uses, and water quality standards were frequently exceeded. That focused the attention to the other major component contributing to beneficial use impairments of the receiving water quality: pollution from diffuse sources, such as runoff from urban areas, construction sites, agricultural areas, land disposal and resource extraction. Early on, the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA), along with U.S. EPA, conducted a comprehensive study of diffuse pollution sources that resulted in the 1985 report, "America's Clean Water – The States Nonpoint Source Assessment." This report indicated that 38 States reported urban runoff as a major cause of beneficial use impairment. In addition, 21 States reported construction site runoff as a major cause of impairment.

To provide a better understanding of the nature of urban runoff from commercial and residential areas, from 1978 through 1983, U.S. EPA provided funding and guidance to the Nationwide Urban Runoff Program (NURP)[1]. The NURP included 28 projects across the Nation. One focus of the NURP was to characterize the water quality of discharges from separate storm sewers that drain residential, commercial, and light industrial (industrial parks) sites. The majority of samples collected in the study were analyzed for

eight conventional pollutants and three metals. Data collected under the NURP indicated that on an annual loading basis, suspended solids in discharges from separate storm sewers draining runoff from residential, commercial and light industrial areas are around an order of magnitude greater than solids in discharges from municipal secondary sewage treatment plants. In addition the study indicated that the annual loading of chemical oxygen demand (COD) are comparable in magnitude to effluent from secondary sewage treatment plants. When analyzing annual loadings associated with urban runoff, it is important to recognize that discharges of urban runoff are highly intermittent and that the short-term loadings associated with individual events will be high and may have shockloading effects on receiving water, such as low dissolved oxygen levels. NURP data also showed that fecal coliform counts in urban runoff are typically in the tens to hundreds of thousands per 100 ml of runoff during warm weather conditions, (although the study suggested that fecal coliform may not be the most appropriate indicator organism for identifying potential health risks in storm water runoff), with the median for all sites being around 21,000/100 ml. This is generally consistent with studies that found that fecal coliform mean values range from 1,600 coliform fecal units (cfu)/100 ml to 250,000 cfu/100 ml[2]. Makepeace, et al., summarized ranges of contaminants from storm water, including physical contaminants such as total solids (76--36,200 mg/L) and copper (up to 1.41 mg/L); organic chemicals; organic compounds, such as oil and grease (up to 110 mg/L); and microorganisms.

Although NURP did not evaluate oil and grease other studies have demonstrated that urban runoff is an extremely important source of oil pollution to receiving waters, with hydrocarbon levels in urban runoff typically being reported at a range of 2 to 15 mg/l. These hydrocarbons tend to accumulate in bottom sediments where they may persist for long periods of time and exert adverse impacts on benthic organisms.

A portion of the NURP study involved monitoring 120 priority pollutants in storm water discharges from lands used for residential, commercial and light industrial activities. Seventy-seven priority pollutants were detected in samples of storm water discharges, from residential, commercial and light industrial lands taken during the NURP study, including 14 inorganic and 63 organic pollutants. The NURP data also showed a significant number of these samples exceeded various U.S. EPA freshwater water quality criteria. The NURP study provides insight on what can be considered background levels of pollutants for urban runoff, as the study focused primarily on monitoring runoff from residential, commercial and light industrial areas. However, NURP concluded that the quality of urban runoff can be adversely impacted by several sources of pollutants that were not directly evaluated in the study and are generally not reflected in the NURP data, including illicit connections, construction site runoff, **industrial site runoff** and illegal dumping. Other studies showed that storm water from industrial facilities might contain toxics and conventional pollutants when material management practices allow exposure to storm water.

Since the NURP study many other studies and programmatic assessments confirmed the magnitude of the diffuse pollution problem. Data from the NURP study were analyzed further in the U.S. Geological Survey (USGS) Urban Storm Water Data Base for 22 Metropolitan Areas Throughout the United States survey[3]. The USGS report summarized additional monitoring data compiled during the mid-1980s, covering 717 storm events at 99 sites in 22 metropolitan areas and documented problems associated with metals and sediment concentrations in urban storm water runoff. More recent reports have confirmed the pollutant concentration data collected in the NURP study[4].

Other recent studies have not found significantly different pollutant concentrations in urban runoff when compared to the original NURP data[5].

Storm water runoff from lands modified by human activities can harm surface water resources and, in turn, cause or contribute to an exceedance of water quality standards by changing natural hydrologic patterns, accelerating stream flows, destroying aquatic habitat, and elevating pollutant concentrations and loadings. Such runoff may contain or mobilize high levels of contaminants, such as sediment, suspended solids, nutrients (phosphorous and nitrogen), heavy metals and other toxic pollutants, pathogens, toxins, oxygen-demanding substances (organic material), and floatables[6]. After a rain, storm water runoff carries these pollutants into nearby streams, rivers, lakes, estuaries, wetlands, and oceans. The highest concentrations of these contaminants often are contained in "first flush" discharges, which occur during the first major storm after an extended dry period[7]. Individually and combined, these pollutants impair water quality, threatening designated beneficial uses and causing habitat alteration or destruction. Uncontrolled storm water discharges from areas of urban development and construction activity negatively impact receiving waters by changing the physical, biological, and chemical composition of the water, resulting in an unhealthy environment for aquatic organisms, wildlife, and humans.

Urbanization alters the natural infiltration capability of the land and generates a host of pollutants that are associated with the activities of dense populations, thus causing an increase in storm water runoff volumes and pollutant loadings in storm water discharged to receiving waterbodies[8]. Urban development increases the amount of impervious surface in a watershed as farmland, forests, and meadowlands with natural infiltration characteristics are converted into buildings with rooftops, driveways, sidewalks, roads, and parking lots with virtually no ability to absorb storm water. Storm water and snow-melt runoff wash over these impervious areas, picking up pollutants along the way while gaining speed and volume because of their inability to disperse and filter into the ground. What results are storm water flows that are higher in volume, pollutants, and temperature than the flows in less impervious areas, which have more natural vegetation and soil to filter the runoff[9].

Studies reveal that the level of imperviousness in an area strongly correlates with the quality of the nearby receiving waters. For example, a study in the Puget Sound lowland ecoregion found that when the level of basin development exceeded 5 percent of the total impervious area, the biological integrity and physical habitat conditions that are necessary to support natural biological diversity and complexity declined precipitously[10]. Research conducted in numerous geographical areas, concentrating on various variables and employing widely different methods, has revealed a similar conclusion: stream degradation occurs at relatively low levels of imperviousness, such as 10 to 20 percent (even as low as 5 to 10 percent according to the findings of the Washington study referenced above)[11]. Furthermore, research has indicated that few, if any, urban streams can support diverse benthic communities at imperviousness levels of 25 percent or more. An area of medium density single family homes can be anywhere from 25 percent to nearly 60 percent impervious, depending on the design of the streets and parking[12].

In addition to impervious areas, urban development creates new pollution sources as population density increases, and brings with it proportionately higher levels of car emissions, car maintenance wastes, pet waste, litter, pesticides, and household

hazardous wastes, which may be washed into receiving waters by storm water or dumped directly into storm drains designed to discharge to receiving waters. More people in less space results in a greater concentration of pollutants that can be mobilized by, or disposed into, storm water discharges from municipal separate storm sewer systems. A modeling system developed for the Chesapeake Bay indicated that contamination of the Bay and its tributaries from runoff is comparable to, if not greater than, contamination from industrial and sewage sources[13].

In addition, the 1996 305(b) Report, provides a national assessment of water quality based on biennial reports submitted by the States as required under CWA section 305(b)[14]. In the CWA 305(b) reports, States, Tribes, and Territories assess their individual water quality control programs by examining the attainment or nonattainment of the designated uses assigned to their rivers, lakes, estuaries, wetlands, and ocean shores. A designated use is the legally applicable use specified in a water quality standard for a watershed, waterbody, or segment of a waterbody. The designated use is the desirable use that the water quality should support. Examples of designated uses include drinking water supply, primary contact recreation (swimming), and aquatic life support. Each CWA 305(b) report indicates the assessed fraction of a State's waters that are fully supporting, partially supporting, or not supporting designated beneficial uses. In their reports, States, Tribes, and Territories first identified and then assigned the sources of water quality impairment for each impaired waterbody using the following categories: industrial, municipal sewage, combined sewer overflows, urban runoff/storm sewers, agricultural, silvicultural, construction, resource extraction, land disposal, hydrologic modification, and habitat modification.

The 1996 Inventory, based on a compilation of 60 individual 305(b) reports submitted by States, Tribes, and Territories, assessed the following percentages of total waters nationwide: 19 percent of river and stream miles; 40 percent of lake, pond, and reservoir acres; 72 percent of estuary square miles; and 6 percent of ocean shoreline waters. The 1996 Inventory indicated that approximately 40 percent of the Nation's assessed rivers, lakes, and estuaries are impaired. Waterbodies deemed as "impaired" are either partially supporting designated uses or not supporting designated uses. The 1996 Inventory also found urban runoff/discharges from storm sewers to be a major source of water quality impairment nationwide. Urban runoff/storm sewers were found to be a source of pollution in 13 percent of impaired rivers; 21 percent of impaired lakes, ponds, and reservoirs; and 45 percent of impaired estuaries (second only to industrial discharges). Additionally, urban runoff was found to be the leading cause of ocean impairment for those ocean miles surveyed.

In addition, a recent USGS study of urban watersheds across the United States has revealed a link between urban development and contamination of local waterbodies. The study found the highest levels of organic contaminants, known as polycyclic aromatic hydrocarbons (PAHs) (products of combustion of wood, grass, and fossil fuels), in the reservoirs of urbanized watersheds[15].

In addition to the large-scale nationwide studies and assessments, a number of local and watershed-based studies from across the country have documented the detrimental effects of urban storm water runoff on water quality. A study of urban streams in Milwaukee County, Wisconsin found local streams to be highly degraded due primarily to urban runoff, while three studies in the Atlanta, Georgia region were characterized as being, "the first documentation in the Southeast of the strong negative relationship

between urbanization and stream quality that has been observed in other ecoregions"[16]. Several other studies, including those performed in Arizona (*Maricopa County*), California (*San Jose's Coyote Creek*), Massachusetts (*Green River*), Virginia (*Tuckahoe Creek*), and Washington (*Puget Sound lowland ecoregion*), all had the same finding: runoff from urban areas greatly impair stream ecology and the health of aquatic life; the more heavily developed the area, the more detrimental the effects[17]. Pitt and others also described the receiving water effects on aquatic organisms associated with urban runoff[18]. In Wisconsin runoff samples were collected from streets, parking lots, roofs, driveways, and lawns. Source areas were broken up into residential, commercial, and industrial. Geometric mean concentration data for residential areas included total solids of about 500-800 mg/L from streets and 600 mg/L from lawns. Fecal coliform data from residential areas ranged from 34,000 to 92,000 cfu/100 mL for streets and driveways. Contaminant concentration data from commercial and industrial source areas were lower for total solids and fecal coliform, but higher for total zinc[19,20]. A number of other studies have indicated that urban roadways often contain significant quantities of metal elements and solids[21].

Automotive service stations have been characterized as potential "hot spots" for hydrocarbon pollutants and heavy metals in urban storm water discharges[22]. In an urban area, **industrial and commercial activities** can also be considered hot spots as sources of pollutants[23]. Urban storm water also can contribute significant amounts of toxicants to receiving waters. Pitt et. al., found heavy metal concentrations in the majority of samples analyzed. Industrial or commercial areas were likely to be the most significant pollutant source areas[24].

Wet weather flows have been recognized as the primary sources of estuarine pollution in coastal communities. Urban storm water runoff, sanitary sewer overflows, and combined sewer overflows have become the largest causes of beach closings in the United States in the past years. Storm water discharges from urban areas not only pose a threat to the ecological environment, they also can substantially affect human health. A survey of coastal and Great Lakes communities reports that in 1998, more than 1,500 beach closings and advisories were associated with storm water runoff[25]. Other reports also document public health, shellfish bed, and habitat impacts from storm water runoff, including more than 823 beach closings/advisories issued in 1995 and more than 407 beach closing/advisories issued in 1996 due to urban runoff[26].

The studies and research performed in the Southern California area, including Los Angeles County, show the similar impacts of polluted urban runoff on the local receiving waters, with significant impacts on the health of the environment and local economy. The "Epidemiological Study of Possible Adverse Health Effects of Swimming in Santa Monica Bay", concluded that there is a 57 percent higher rate of illness in swimmers who swim adjacent to storm drains than in swimmers who swim more than 400 yards away from storm drains[27]. This and other studies document a relationship between gastrointestinal illness in swimmers and water quality, the latter of which can be heavily compromised by polluted storm water discharges. Other impacts on the Santa Monica Bay from the discharge of polluted storm water runoff have been documented[28].

In addition, the situation analysis of the "Los Angeles County Five-Year Public Education Overview" concluded:

Even after a generation of fighting water pollution, studies show the danger of illness to people swimming in waters near urban storm drain outfalls. The urban runoff that drains into the County's storm channels first litters and contaminates neighborhood streets and walks. Litter, fertilizers, pesticides, automobile soot and oil drippings, pet waste, and deteriorating leaves and plant debris not only make our communities unattractive, but also are swept untreated down the storm drains into our waterways...In total, the impacts of stormwater/urban runoff pollution encompass:

- losses to the County's $2 billion a year tourism economy
- health risks associated with swimming in areas near storm drain outfalls
- loss of recreational resources
- dramatic cost increases for cleaning up contaminated sediments
- impaired function and vitality of our natural resources
- losses to Southern California's commercial and sportfishing industry
- contamination to marine life[29].

III. Responsibility of Municipal Operators of Large and Medium Municipal Separate Storm Sewer Systems

The water quality impacts of urban runoff are well documented and identified as a leading cause of receiving water beneficial uses impairments. Many States and Municipalities in cooperation with U.S. EPA moved aggressively to control the sources of pollution within the framework of the NPDES permitting system and through other non-point source programs.

A. Role of Municipal Operator

As early as the promulgation of the 1990 Phase I storm water regulations, U.S. EPA clearly defined the roles and identified the responsibilities of all parties involved in the permitting process. Early on, the agency envisioned a partnership, a cooperative approach between U.S. EPA, States and Municipalities, recognizing that only through a coordinated effort will the difficult and complex issues of diffuse pollution be addressed appropriately. In the preamble to the 1990 Phase I storm water regulations, the agency stated that the:

> ...EPA still believes that municipal operators of large and medium municipal systems have an important role in **source identification** and the **development of pollutant controls for industries** that discharge storm water through municipal separate storm sewer systems is appropriate. Under the CWA, large and medium municipalities are responsible for reducing pollutants in discharges from municipal separate storm sewers to the maximum extent practicable. Because **storm water from industrial facilities may be a major contributor of pollutants** to municipal separate storm sewer systems, **municipalities are obligated to develop controls for storm water discharges associated with industrial activity through their system in their storm water management program**... EPA believes that the permitting of municipal storm sewer systems and the industrial discharges through them will act in a complimentary manner to

fully control the pollutants in those sewer systems. This will fully implement the intent of Congress to control industrial as well as large and medium municipal storm water discharges as expeditiously and effectively as possible.

U.S. EPA continued to clarify its intent for:

> "...[t]he permit application requirements for large and medium municipal separate storm sewer systems, discussed in more detail later in today's preamble, **address the responsibilities of the municipal operators of these systems to identify and control pollutants in storm water discharges associated with industrial activity**. Permit applications for large and medium municipal separate storm sewer systems are to identify the location of facilities which discharge storm water associated with industrial activity to the municipal system... In addition, municipal applicants will provide a description of a proposed management program to reduce, to the maximum extent practicable, pollutants from storm water discharges associated with industrial activity which discharge to the municipal system... Controls developed in management plans for municipal permits may take a variety of forms. Where necessary, municipal permittees can pursue local remedies to develop **measures to reduce pollutants or halt** storm water discharges with high level of pollutants through municipal storm sewer systems. Some local entities have already implemented ordinances or laws that are designated to reduce the discharge of pollutants to municipal separate storm sewers, while other municipalities have developed a variety of techniques to control pollutants in storm water."

U.S. EPA reconfirmed its position in regard to the role of municipal operators of large and medium MS4s when it issued, in 1993 (58 FR 61146), the notice for the proposed multi-sector stormwater general permit for discharges of storm water associated with industrial activity (multi-sector permit).

In the Fact Sheet for the proposed multi-sector permit, U.S. EPA reiterated its position regarding the complimentary permit approach envisioned to address storm water discharges associated with industrial activity:

> "A second permit issued to the operator of the large or medium municipal storm sewer, establishes the **responsibilities** of the municipal operators in controlling pollutants from storm water associated with industrial activity which discharge through their system... The municipal storm water management programs that will be incorporated into NPDES permits for discharges from MS4s will generally address (in addition to other possible requirements) the following three major components:
>
> - Reducing pollutants in storm water discharges from municipal landfills; hazardous waste treatment, storage and disposal facilities; facilities subject to the Emergency Planning and Community Right-to-Know Act (EPCRA), section 313; and other priority industrial facilities through municipal separate storm sewers.
> - Reducing pollutants in construction site runoff through municipal separate storm sewers.
> - Identifying and controlling non-storm water discharges to municipal separate storm sewers...

> Municipal programs to reduce pollutants in industrial site runoff and construction site runoff through MS4s **specifically will address municipal responsibilities in controlling pollutants from industrial facilities.**"

Recently, in its Storm Water Phase II Compliance Assistance Guide (Guide)[30], U.S. EPA restated and further clarified its intention regarding the integration of NPDES programs for storm water discharges: "...[t]he Phase I permits for MS4s mostly cover larger cities, and require them to develop a storm water management program, **track and oversee industrial facilities** regulated under the NPDES storm water program, conduct some monitoring, and submit periodic reports."

Furthermore, when referring to integration of NPDES program for construction (which is one of the eleven industrial categories addressed by the storm water program) with NPDES program for MS4s, the Guide specifies:

- "These are two **separate** and **distinct** construction programs.
- A construction operator is subject to requirements under **BOTH** programs if it is located in an NPDES-regulated MS4's jurisdiction."

In addition, the No Exposure Certification Form for Exclusion from NPDES Storm Water Permitting[31], includes in the certification section the following statements:

> "I understand that I am obligated to submit a no exposure certification form once every five years to the NPDES permitting authority and, if requested, to the operator of the local municipal separate storm sewer system (MS4) into which the facility discharges (where applicable). I understand that **I must allow the NPDES permitting authority, or MS4 operator where the discharge is into the local MS4, to perform inspections** to confirm the condition of no exposure and to make such inspection reports publicly available upon request."

Once more, U.S. EPA clearly states its standpoint that NPDES permitting authority responsibilities are intertwined with those of the local agency.

It can be reasonably inferred from the regulatory record and actions that U.S. EPA clearly envisioned a dual coverage and a strong role and clear responsibilities for the municipal operator in controlling pollutants from industrial sites as distinct from the activities required by the NPDES permitting agency. However, activities required by both entities should be coordinated and integrated as much as possible to achieve to common goal of effectively controlling and reducing the discharge of pollutants into the storm water runoff.

B. Legal Authority

40 CFR §122.26(d)(2)(i) ***Adequate legal authority.*** A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:
(A) Control through ordinance, permit, contract, order or similar means, the **contribution of pollutants to the municipal storm sewer by storm water discharges associated**

with industrial activity and the quality of storm water discharged from sites of industrial activity;
(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;
(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;
(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;
(E) Require compliance with conditions in ordinances, permits, contracts or orders; and
(F) **Carry out all inspection, surveillance** and monitoring procedures necessary to determine compliance and noncompliance with permit conditions **including** the prohibition on illicit discharges to the municipal separate storm sewer.

40 CFR §122.26(d)(2)(iv)(A)(5) A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, which shall identify priorities and procedures for **inspections** and establishing and implementing control measures for such discharges (this program can be coordinated with the program developed under paragraph (d)(2)(iv)(C) of this section);

40 CFR §122.26(d)(2)(iv)(C) A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), **and industrial facilities** that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program shall:
(1) **Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges**;...

In its Guidance Manual[32] U.S. EPA explicitly states on what the municipalities must achieve: "The municipality, as a permittee, is responsible for compliance with its permit and must have the authority to implement the conditions in its permit. To comply with its permit, a municipality must have the authority to **hold dischargers accountable for their contributions** to separate storm sewers."

The Guidance Manual provides more clarification in regard to the extent of facilities that must be addressed and the link that must be made with the potential sources of pollutants: "However, a municipality, to satisfy its permit conditions, **may need to impose additional requirements** on **discharges from permitted industrial facilities, as well as discharges from industrial facilities** and construction sites ***not* required to obtain permits**... [t]he Source Identification component requires the applicant to provide **an inventory of pollutant sources**, organized by watershed. This inventory **identifies and describes the products and services** of each industrial facility that may discharge storm water to the MS4. The Source identification component suggests applicants to use standard industrial classification codes (SIC) codes for this description. EPA strongly recommends this information be used to identify priority waste handling sites and industrial facilities. A similar technique could be developed for sites ***that do not meet*** the ***regulatory definition of "storm water discharge associated with industrial activity"*** (i.e. not included in the Source Identification and Discharge Characterization

components), but ***are identified as a high priority*** under the proposed management program." It can be concluded that the scheme envisioned by the regulations do not only address industrial sites covered under the definition of storm water discharge associated with industrial activity, but depending on the identified significant sources contributing pollutants to the storm water runoff, other types of industrial facilities, such as commercial, must be addressed in the municipal program to inspect facilities contributing pollutants to the municipal separate storm drain system.

Many existing permits issued by U.S. EPA or authorized States, nationwide, already include these kind of requirements and municipalities are actively implementing them.[33] Regional Boards in California also issued MS4 permits requiring a program for inspections at industrial or commercial facilities.[34] Municipalities used a large spectrum of methods and innovative ways to implement the inspection program, and many local jurisdictions have the adequate required legal authority or have adopted ordinances giving them the necessary legal authority. Even smaller cities, to be covered under Phase II, not required to obtain the legal authorities for inspections as yet, decided to pass ordinances giving them the necessary authority for the implementation of the storm water program, including the authority to inspect industrial or commercial facilities and adopt and impose BMPs.[35]

As early as 1993, U.S. EPA Region 9, clarified the role of municipalities in addressing industrial sources.[36] More recently the same position was restated.[37] Regional Board's position, starting with the 1990 MS4 Permit was that an inspection program was required in the municipal storm water permit and was supported by the legal analysis provided by the State Board's Office of Chief Counsel[38].

C. Source Identification

40 CFR §122.26(d)(2)(ii). Source Identification... *Provide an inventory, organized by watershed of the name and address, and a description (such as SIC Codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity.*

A very careful consideration was given to the issue of the pollutant sources in storm water discharges through MS4s and the control of those pollutant sources. The Agency continued to discuss and describe its intent of the elements needed to be addressed by a municipality through the application process in regards to the sources that contribute pollutants to the municipal storm sewers. Under the source identification heading in the preamble to the 1990 Phase I storm water regulations, U.S. EPA stated that, "...**the identification of sources which contribute pollutants** to municipal separate storm sewers is a **critical step** in characterizing **the nature and extent of pollutants in discharges** and in **developing appropriate control measures**." The agency expands the scope of the source identification concept leaving it general instead of focusing on any particular area, such as industrial, commercial, residential, roadways, etc., but linking it to the existing water quality problems. It is clear that the intent of the agency was to draw the attention of applicants to addressing, in a flexible way, the real issues and focus their limited resources on controlling the most problematic sources:

> "...**source identification** can be useful for providing **an analysis of pollutant source contribution** and for **identifying the relationship between pollutant**

sources and receiving water quality problems. In cases where end-of-pipe controls alone are not practicable, it is essential to identify the source of pollutants into the municipal storm sewer system to support **a targeted approach to control pollutant sources**."

The agency continues to comment and clarify the provisions under the application requirements of the regulations:

> "...Part 1 of the application will also include: [...]**the location of industrial facilities, open dumps, landfills or RCRA hazardous waste facilities** which discharge storm water to the municipal storm sewer system;...Part 2 of the application will supplement the information reported in part 1 of the application so that,[...]municipal or public entities responsible for and obtaining an NPDES permit will be required to **identify the location of an open dump, sanitary landfill, municipal incinerator or hazardous waste treatment, storage, and disposal facility under RCRA which may discharge storm water to the system as well as all facilities which discharge storm water with industrial activity into a large or medium municipal separate storm sewer system.** Requiring **these source identification measures is supported by the legislative history of section 405 of the WQA**, which instructs that '[i]n writing **any permit for a municipal separate storm sewer, EPA or the State should pay particular attention to the nature and uses of the drainage area and the location of any industrial facility, open dump, landfill, or hazardous waste treatment, storage, or disposal facility which may contribute pollutants to the discharge.**'[39]"

In answering some of the comments regarding the value of source identification information, the agency responded:

> [..]the **source identification** information serves several purposes. It is the first step for **identifying potential sources of pollutants** from which more in depth analysis can be accomplished...The **source identification component** of the municipal application also requires that **municipal applicants identify the industrial activity within the drainage area associated with each major outfall**...[A]pplicants identify the types of industrial facilities operating within the municipality, the municipality is free to use Standard Industrial Classification (SIC) or other systems which identify the principal products or services of the facility.

D. Los Angeles MS4 Permittees Compliance Efforts

The Permittees covered under the Los Angeles MS4 permit addressed the element of source identification and prioritization through compliance with the requirements of the 1996 permit (Board Order No. 96-054). The Critical Source Selection and Monitoring Report (Critical Source Report), identified 30 categories of industrial and commercial activities that may impact the quality of the stormwater runoff discharged to the MS4[40]. The study also ranked the critical sources on the basis of potential impact and proposed a Critical Source/BMP Monitoring program at the five highest ranked facility types: (i)

wholesale trade (scrap, auto dismantling), (ii) *automotive repair/parking*, (iii) fabricated metal products, (iv) motor freight (including trucking), (v) chemical and allied products.

At the same time, the Permittees, under the coordination of the Los Angeles County Department of Public Works, compiled, in 1997, a facilities database for the MS4 program identifying approximately 58,000 facilities that could have been potentially addressed by the public education site visit program. Out of the total universe of 58,000 facilities identified by their SIC Code, 21,000 were food or food related establishments. The 36,000 remaining facilities were in industrial/commercial sectors. An updated review of the potential number of facilities within the LA MS4 area, identified in the 30 industrial/commercial sectors Critical Source Report (not including food establishments), revealed that the number of facilities can be as high as 26,300 sites as of 2001. The survey was performed with the help of the Los Angeles City Stormwater Management Division staff. A significant portion of the total number of facilities, up to 60%, may be located within the City of Los Angeles boundaries. The SIC Code system proved to be inadequate in identifying the correct type of activity performed on-site, and also a significant number of facilities may not have activities or materials exposed to stormwater, which will make the actual number of sites potentially addressed through the municipal stormwater program much smaller than predicted.

The results of the Critical Source/BMP Monitoring program confirmed that the five highest ranking activities indeed contribute significant quantities of pollutants and source control BMPs alone were not effective in reducing the amount of pollutants into the stormwater runoff. The majority of the sampling results were in excess of the Criteria for Priority Toxic Pollutants for the State of California.[41] However, since the implementation of the source control BMPs was voluntary, the study could not determine with certainty that the apparent failure was due to the inefficacy of the BMPs or the lack of proper implementation.[42]

Furthermore, the Research Report on Issues, Pollutants and Materials[43](Research Report) accomplishes a comprehensive analysis of sources of pollutants, generation and receiving water impacts. The Research Report puts in a concise form and creates the link between typical pollutant sources, pollutants found in the County's waterbodies, pollutant of concerns for each Watershed Management Area and pollutants of concerns detected through previous monitoring. The Research Report clearly identifies the targeted pollutants: (i) heavy metals, (ii) oil and grease/PAHs, (iii) sediments, (iv) oxygen demanding substances, (v) litter/trash/debris, (vi) nutrients, (vii) other toxic materials, such as pesticides.[43] The Research Report confirms once again that the urban environment in the Los Angeles area is similar to the other urban areas in the nation when it comes to stormwater runoff characterization and receiving water impacts. The Los Angeles area is probably unique due to the highly industrialized and vast area served by an interconnected storm sewer system unlike any other in the nation. But that makes it even more imperative that significant efforts must be allocated in order to control the discharge of pollutants in the urban runoff.

CONCLUSION

From the record and all the studies referenced in this report it is evident that an inspection program at industrial and commercial facilities is not only required under the storm water

regulations but it is an essential component to control the contribution of pollutants from industrial or commercial facilities into storm water discharges through the municipal storm drain system. This inspection program is separate and in addition to the program administered by the Regional Board, and the municipalities have a clear responsibility to perform them.

The dual coverage is intended in the regulations, in order to maximize the use of limited resources at the State and local level, and assure through active coordination that significant sources of pollutants are not overlooked or missed due to lack of legal authority.

The Permittees under the Los Angeles MS4 Permit have made great strides in preparing the ground work for next phase of implementation: they performed a comprehensive source identification study confirmed by the monitoring results, the Regional Board approved the minimum menu of BMPs presented by the Permittees and they already put facilities on notice and performed the educational part through the site visits effort.

The introduction of the inspection program in the new MS4 permit is not capricious or arbitrary but based on facts. It utilizes tools already developed by Permittees and follows a widespread precedent in MS4 permits nationwide and in California.

Superfund Amendments and Reauthorization Act of 1986 (SARA), and ***industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading*** to the municipal storm sewer system. The program **shall**: (1) **Identify priorities and procedures for inspections** and **establishing and implementing control measures** for such discharges;	
NPDES permits for MS4s will establish *responsibilities* for municipal system operators to control pollutants from industrial storm water discharged through their system.	Guidance Manual pag. 6-16
Proposed storm water management programs must address the reduction of pollutants in storm water discharges from **municipal landfills, hazardous waste treatment, disposal and recovery facilities, facilities subject to SARA Title III;** and ***other priority industrial facilities***, as determined by the applicant. **Municipalities should consider** the information gathered for [..] the part 2 application (**particularly the Source Identification and Characterization Data** components) when prioritizing storm water discharges from these sites.	Guidance Manual pag. 6-16
In part 2 application, the Source Identification component requires the applicant to provide **an inventory of pollutant sources**, organized by watershed. This inventory **identifies and describes the products and services** of each industrial facility that may discharge storm water to the MS4. The Source identification component suggests applicants to use standard industrial classification codes (SIC) codes for this description. EPA strongly recommends this information be used to identify priority waste handling sites and industrial facilities. A similar technique could be developed for sites ***that do not meet*** the ***regulatory definition of "storm water discharge associated with industrial activity"*** (i.e. not included in the Source Identification and Discharge Characterization components), but ***are identified as a high priority*** under the proposed management program.	Guidance Manual pag. 6-16 [Commercial Sites]
The municipality is **ultimately responsible** for discharges from their MS4. Consequently, the proposed storm water management program should describe how **the municipality will help** EPA and authorized NPDES States: • **Identify priority industries** discharging to their systems; • **Review. and evaluate storm water pollution prevention plans and other procedures that industrial facilities must develop under general or individual permits;** • **Establish and implement BMPs to reduce pollutants from these industrial facilities (or require industry to implement them);** and • ***Inspect*** **and monitor industrial facilities *to verify* that the industries discharging storm water to the municipal systems *are in compliance with their NPDES storm water permit***, if required.	Guidance Manual pag. 6-17
At a minimum, priority facilities include: • Operating and closed municipal landfills; • Hazardous waste treatment, disposal or recovery facilities; and • Facilities subject to SARA Title III.	Guidance Manual pag. 6-17

R0006654

Requirement	Reference
Municipalities must identify these **and *other priority industrial facilities* and describe the criteria used to identify them**. For example, information from the Toxics Release Inventory is one source a municipality could use to identify industrial facilities subject to SARA Title III. **Other sources** may include CWA Section 205 or 208 use-attainability studies, other studies that **indicate a site-specific beneficial use impairment immediately downstream of a storm water outfall**, or **records of industrial pretreatment programs or other permit programs that identify facilities that may be the source of a use impairment or a major contribution of pollutants**. The program should also describe procedures for modifying the inventory of priority industries based on **additional evaluation** that occurs throughout the permit term.	
During the term of the permit, as additional information becomes available, **the municipality should target and set priorities for other program elements** that emerge.	Guidance Manual pag. 6-18
As noted above, when identifying priority sites, applicants must consider all the facilities listed in 122.26(d)(2)(iv)(C)(1). When municipalities develop criteria for **identifying additional priority industrial facilities**, they are advised to consider, **at a minimum:** • The **type of industrial activity** (SIC codes can help characterize the type of industrial activity); • The **use and management of chemicals or raw products** at the facility and **the likelihood** that storm water discharge from the site **will be contaminated**; and • The **size and location of the facility in relation to sensitive watersheds.**	Guidance Manual pag. 6-18
The proposed management program **must include procedures for inspecting priority industrial sites**. The results of inspection may be used as a basis for **requiring storm water management controls and enhanced pollution prevention measures**. It should also establish an **inspection schedule** for each priority facility at the time it is identified.	Guidance Manual pag. 6-18
Applicants also should describe a procedure for **conducting follow-up inspections**, where necessary, as part of this program component. For example, follow-up inspections **might be needed to verify the installation of a specific control or implementation of a practice specified** in a negotiated agreement between the municipality and the industrial site. A system-wide approach to establishing priorities for inspection procedures is recommended. The system-wide approach should begin with the evaluation of existing information, followed by the identification and evaluation of new information during the permit term. Therefore, applicants **should link** these procedures with information from the Source Identification and Discharge Characterization components.	Guidance Manual pag. 6-19
A municipality **must consider** if it **should place more stringent controls on discharges associated with industrial activity than are required in an industrial facility's existing NPDES storm water**	Guidance Manual pag. 6-19

Requirement	Reference
permit.	
Priority industrial facilities should focus on controlling activities such as the use, storage, and handling of toxic chemicals. Standard methods for implementing control measures at different types of facilities should be described. To facilitate this, municipalities **should obtain copies of the pollution prevention plans developed by industrial permittees. Control measures** that the municipality **may suggest include preventing exposure of pollutant sources to precipitation, on-site pretreatment, and oil/water separators.**	Guidance Manual pag. 6-19
The proposed management program **should describe the inspection procedures that will be followed. Storm water inspections can be coupled with inspections for other purposes** (e.g., pretreatment programs, fire and safety). Proposed management **programs should address minimum frequency for routine inspections**. For example, **how often, how much of the site, and how long an inspection may take** are appropriate to explain in this proposed management program component. Applicants should also describe **procedures for conducting inspections and provide an inspector's checklist**. In addition, these inspection procedures should identify the **minimum number of inspectors** that will be employed and **describe the programs to train them.**	Guidance Manual pag. 6-19
Municipalities are **urged to *evaluate* pollution prevention plans and discharge monitoring data collected by the industrial facility to *ensure* that the facility is *in compliance with its NPDES storm water permit. Site inspections* should include (1) *an evaluation of the pollution prevention plan*** and any other pertinent documents, **and (2) an *on-site visual inspection of the facility*** to ***evaluate the potential* for *discharges of contaminated storm water*** from the site and ***to assess the effectiveness of the pollution prevention plan.***	Guidance Manual pag. 6-20
On November 16, 1990 (55 FR 47990), EPA promulgated a permitting scheme where controls for storm water discharges associated with industrial activity through large and medium municipal separate storm sewer systems may be addressed by two permits issued in a coordinated manner. This complementary permit approach envisions cooperative efforts by the permit issuing agency and municipal operators of large and medium municipal separate storm sewer systems to develop programs that will result in controls on pollutants in storm water discharges associated with industrial activity which discharge through municipal systems.	Federal Register, Vol. 58, No. 222 pag. 61158
Under the complementary permit approach, storm water discharges associated with industrial activity which discharge through large and medium municipal separate storm sewer systems are required to obtain permit coverage. Permits for these discharges will establish requirements (such as controls or monitoring) for industrial operators of the discharge into the municipal system. In addition, these permits provide a basis for enforcement actions directly against the owner or operator of storm water discharges associated with industrial activity.	Federal Register, Vol. 58, No. 222 pag. 61158
A second permit, issued to the operator of the large or medium municipal separate storm sewer, establishes the responsibilities of the	Federal Register, Vol. 58, No. 222 pag. 61158

Requirement	Reference
municipal operators in controlling pollutants from storm water associated with industrial activity which discharges through their system. The framework for permits for discharges from large and medium municipal separate storm sewer systems has been developed to establish the responsibilities of the municipals systems.	
At the heart of the permit program for discharges from municipal separate storm sewer systems serving a population of 100,000 or more are requirements that municipal applicants develop and implement municipal storm water management programs.	Federal Register, Vol. 58, No. 222 pag. 61158
The municipal storm water management programs that will be incorporated into NPDES permits for discharges from municipal separate storm sewer systems will generally address (in addition to other possible requirements) the following three major components: • Reducing pollutants in storm water discharges from municipal landfills; hazardous waste treatment, storage, and disposal facilities; facilities subject to the Emergency Planning and Community Right-to-Know Act (EPCRA), section 313; and other priority industrial facilities through municipal separate storm sewers. • Reducing pollutants in construction site runoff through municipal separate storm sewers. • Identifying and controlling non-storm water discharges to municipal separate storm sewer systems. These components of a municipal program can initiate the role of the municipality in assisting EPA and authorized NPDES States in implementing controls to reduce pollutants in storm water discharges associated with industrial activity which discharge through large and medium municipal separate storm sewer systems.	Federal Register, Vol. 58, No. 222 pag. 61158
Municipal programs to reduce pollutants in industrial site runoff and construction site runoff through municipal separate storm sewer systems specifically will address municipal responsibilities in controlling pollutants from industrial facilities.	Federal Register, Vol. 58, No. 222 pag. 61158
EPA proposed a permitting scheme that would define the requirement to obtain coverage under an NPDES permit for a storm water discharge associated with industrial activity through a municipal separate storm sewer in terms of the classification of the municipal separate storm sewer. EPA proposed holding municipal operators of large or medium municipal separate storm sewer systems primarily responsible for applying for and obtaining an NPDES permit covering system discharges as well as storm water discharges (including storm water discharges associated with industrial activity) through the system.	Federal Register, Vol. 55, No. 222 pag. 47997-98
Under the proposed approach, operators of storm water discharges associated with industrial activity which discharge through a large or medium municipal separate storm sewer system would generally not be required to obtain permit coverage for their discharge (unless designated as a significant contributor of pollution pursuant to section 402(p)(2)(E)) provided the municipality was notified of: The name, location and type of facility and a certification that the discharge has been tested (if feasible) for non-storm water (including the results of any testing). The	Federal Register, Vol. 55, No. 222 pag. 47998

Requirement	Reference
notification procedure also required the operator of the storm water discharge associated with industrial activity to determine that: The discharge is composed entirely of storm water, the discharge does not contain hazardous substances in excess of reporting quantities; and the facility is in compliance with applicable provisions of the NPDES permit issued to the municipality for storm water.	
EPA also expressed its belief, based upon an analysis of ordinance controlling construction site runoff in places in certain cities, that municipalities generally possessed legal authority sufficient to control contributions of industrial storm water pollutants to their separate storm sewers to the degree necessary to implement the proposed rule.	Federal Register, Vol. 55, No. 222 pag. 47998
Based on consideration of the comments received on the notice, EPA has decided that it is appropriate to revise the approach in its proposed rule to require direct permit coverage for all storm water discharges associated with industrial activity, including those that discharge through municipal separate storm sewers.	Federal Register, Vol. 55, No. 222 pag. 47998
In response to all of these concerns, EPA has decided to require storm water discharges associated with industrial activity which discharge through municipal separate storm sewers to obtain separate individual or general NPDES permits.	Federal Register, Vol. 55, No. 222 pag. 48000
Although today's rule will require industrial discharges through municipal storm sewers to be covered by a separate permit, EPA still believes that municipal operators of large and medium municipal systems have an important role in source identification and the development of pollutant controls for industries that discharge storm water through municipal separate storm sewer systems is appropriate.	Federal Register, Vol. 55, No. 222 pag. 48000
Under the CWA, large and medium municipalities are responsible for reducing pollutants in discharges from municipal separate storm sewers to the maximum extent practicable. Because storm water from industrial facilities may be a major contributor of pollutants to municipal separate storm sewer systems, municipalities are obligated to develop controls for storm water discharges associated with industrial activity through their system in their storm water management program.	Federal Register, Vol. 55, No. 222 pag. 48000
The CWA provides that permits for municipal separate storm sewers shall require municipalities to reduce pollutants to the maximum extent practicable. Permits issued to municipalities for discharges from municipal separate storm sewers will reflect terms, specified controls, and programs that achieve that goal.	Federal Register, Vol. 55, No. 222 pag. 48000
As with all NPDES permits, responsibility and liability is determined by the discharger's compliance with the terms of the permit. A municipality's responsibility for industrial storm water discharged through their system is governed by the terms of the permit issued. If an industrial source discharges storm water through a municipal separate storm sewer in violation of requirements incorporated into a permit for the industrial facility's discharge, that industrial operator of the discharge may be subject to an enforcement action instituted by the Director of the NPDES program.	Federal Register, Vol. 55, No. 222 pag. 48000
Today's rule also requires operators of storm water discharges associated with industrial activity through large and medium municipal	Federal Register, Vol. 55, No. 222 pag. 48000

Requirement	Reference
systems to provide municipal entities of the name, location, and type of facility that is discharging to the municipal system. This information will provide municipalities with a base of information from which management plans can be devised and implemented. This requirement is in addition to any requirements contained in the industrial facility's permit. As in the proposal, the notification process will assist cities in development of their industrial control programs.	
EPA intends for the NPDES program, through requirements in permits for storm water discharges associated with industrial activity, to work in concert with municipalities in the industrial component of their storm water management program efforts. EPA believes that permitting of municipal storm sewer systems and the industrial discharges through them will act in a complementary manner to fully control the pollutants in those sewer systems.	Federal Register, Vol. 55, No. 222 pag. 48000
This will fully implement the intent of Congress to control industrial as well as large and medium municipal storm water discharges as expeditiously and effectively as possible. This approach will also address the concerns of municipalities that they lack sufficient authority and resources to control all industrial contributions to their storm sewers and will be liable for discharges outside of their control.	Federal Register, Vol. 55, No. 222 pag. 48000-01
In addition, municipal applicants will provide a description of a proposed management program to reduce, to the maximum extent practicable, pollutants from storm water discharges associated with industrial activity which discharge to the municipal system.	Federal Register, Vol. 55, No. 222 pag. 48001

PERMIT NO. FLS000004
Major MS4

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IV

AUTHORIZATION TO DISCHARGE UNDER THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

In compliance with the provisions of the Clean Water Act, 33 U.S.C. 1251 et seq., as amended by the Water Quality Act of 1987, P.L. 100-4, the "Act",

Sarasota County - Municipal Separate Storm Sewer System Permittees:

Sarasota County
Engineering Department
Sarasota, Florida

Town of Longboat Key
Department of Public Works
Longboat Key, Florida

City of North Port
Roads and Drainage Department
North Port, Florida

City of Sarasota
Department of Public Works
Sarasota, Florida

City of Venice
Department of Public Works
Venice, Florida

Florida Department of Transportion
District One
Bartow, Florida

are authorized to discharge, in accordance with the approved Storm Water Management Program(s), effluent limitations, monitoring requirements, and other provisions as set forth in Parts I, II, III, IV, V, VI, VII, and VIII herein, from all portions of the

Municipal Separate Storm Sewer System owned or operated by any Permittee listed above,

to waters of the United States and all tributaries thereto.

This permit shall become effective on January 1, 1995.

This permit and the authorization to discharge under the National Pollutant Discharge Elimination System shall expire at midnight, on December 31, 1999.

DEC 0 1 1994
Date Issued

Robert F. McGhee, Acting Director
Water Management Division

R0006663

g. *Limitation of Sanitary Sewer Seepage:* The permittees shall prevent (or require the operator of the sanitary sewer to eliminate) unpermitted discharges of dry and wet weather overflows from sanitary sewers into the MS4. Each permittee shall eliminate the infiltration of seepage from sanitary sewers into the MS4.

(1) To satisfy the requirements of this section, the permittees shall implement the Storm Water Management Programs identified in Part III.A.7.g. on page 36 of this permit.

8. *Industrial and High Risk Runoff:* The permittees shall develop and implement a program to identify and control pollutants, to the MEP and shall not cause or contribute to violations of State water quality standards of the receiving stream, in storm water discharges to the MS4 from the municipal landfill(s); hazardous waste treatment, storage, disposal and recovery facilities; facilities that are subject to EPCRA Title III, Section 313; and any other industrial or commercial discharge in which the permittees determine is contributing a substantial pollutant loading to the MS4.

To satisfy the two (2) requirements of this section, the permittees shall:

a. *Identify priorities and procedures for inspections:* Identify all targeted facilities and determine priority sites in accordance with the schedule provided in Part III.A.8.a. on pages 37 and 38 of this permit. Inspection schedules and procedures for the identified facilities shall be developed and implemented. Also, the permittees shall provide a listing in each ANNUAL REPORT of additionally identified industrial facilities which discharge storm water into the MS4 which have not been previously reported. The industrial storm water discharges that must be included in this inventory fall into the eleven (11) classes of industrial activities as defined in the November 1990 regulations under 40 CFR 122.26(b)(14).

b. *Monitoring for High Risk Industries:* Develop and implement a monitoring (or self monitoring) program for facilities identified under this section in accordance with the schedule provided in Part III.A.8.b. on page 38 of this permit. The monitoring program shall include the collection of quantitative data on the following constituents:

- any pollutants limited in an existing NPDES permit for an identified facility;
- oil and grease;
- chemical oxygen demand (COD);
- pH;
- biochemical oxygen demand, five-day (BOD_5);
- total suspended solids (TSS);
- total phosphorous;
- total Kjeldahl nitrogen (TKN);
- nitrate plus nitrite nitrogen; and
- any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).

Data collected by the industrial facility to satisfy the monitoring requirements of an NPDES or State discharge permit may be used to satisfy this requirement. Permittees may require the industrial facility to conduct self-monitoring to satisfy this requirement.

9. *Construction Site Runoff:* The permittees shall develop and implement a program to reduce the discharge of pollutants from construction sites to the MEP, and to shall not cause or contribute to violations of State water quality standards of the receiving stream.

a. *Site Planning and Non-structural & Structural Best Management Practices:* The permittees shall require the use and maintenance of appropriate structural and non-structural best management practices to reduce pollutants discharged to the MS4 during the time of construction.

(1) To satisfy the requirements of this section, the permittees shall implement the Storm Water Management Programs identified in Part III.A.9.a. on page 39 of this permit.

b. *Inspection and Enforcement:* The permittees shall develop and implement a program for inspecting construction sites and for enforcing the requirement for control measures.

(1) To satisfy the requirements of this section, the permittees shall implement the Storm Water Management Programs identified in Part III.A.9.b. on pages 40 and 41 of this permit.

E. Legal Authority. To the extent allowed by law, each permittee shall ensure legal authority to control discharges to and from those portions the MS4 over which it has jurisdiction. This legal authority may be a combination of statute, ordinance, permit, contract, order or inter-jurisdictional agreements between permittees with adequate existing legal authority to accomplish Items 1 - 6 below. This legal authority for FDOT may be a combination of State statutes administered and enforced by sister agencies within the State of Florida government system which have adequate existing legal authority to accomplish Items 1 - 6 below.

1. Control the contribution of pollutants to the MS4 by Storm Water Discharges Associated with Industrial Activity and the quality of storm water discharged from sites of industrial activity;

2. Prohibit illicit discharges to the MS4;

3. Control the discharge of spills and the dumping or disposal of materials other than storm water (e.g. industrial and commercial wastes, trash, used motor vehicle fluids, leaf litter, grass clippings, animal wastes, etc.) into the MS4;

4. Control through interagency or inter-jurisdictional agreements among permittees the contribution of pollutants from one portion of the MS4 to another;

5. Require compliance with conditions in ordinances, permits, contracts or orders; and

6. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance with permit conditions.

F. Storm Water Management Program Resources. Each permittee shall provide adequate finances to implement their activities under the Storm Water Management Program. Each permittee shall also have a source of funding for implementing all other requirements included within this NPDES storm water permit.

3. Provide a Summary Table of Storm Water Management Program Elements.

a. A Summary Table of appropriate SWMP annual activities for each permittee shall be provided. The purpose of the Summary Table is to document in a concise form the program activities and permittees' compliance status with quantifiable permit requirements. Program elements that are administrative (e.g.: planning procedures, program development and pilot studies) are inappropriate for the summary table and shall be discussed in the narrative section of the ANNUAL REPORT. The following are examples of SWMP activities to be included in the Summary Table:

(1) Structural Controls - maintenance and/or inspection activities of existing structural controls

(2) Roadway Maintenance - street sweeping, litter control activities, and maintenance on storm water structures & roadside ditches

(3) Municipal Waste TSD Facilities - inspections, monitoring, and implementation of control measures

(4) Pesticide, Herbicide, and Fertilizer Application - certification training and public education

(5) Illicits - facility inspections, investigations, enforcement actions, illicit (dry weather) screening, illicit public reporting, oil/household hazardous waste collection, and storm sewer inlet stencilling

(6) High Risk Industrial Facilities - inspection activities and monitoring

(7) Construction - training of inspectors, certification of construction site operators, inspections, and enforcement actions

(8) Storm Water Treatment Projects - description of municipal storm water treatment projects that have been completed, including a brief description of the affected drainage basin

b. The Summary Table shall indicate each permittee's SWMP activities and accomplishments. The format for this information shall adhere to the example shown in Table V.C.1. on page 55. Items to be reported include:

(1) Activity description;

(2) Number of activities (with frequency) that were scheduled for implementation and/or accomplishment in program element discussion (i.e., once/6 months, 100%/5 years, 6 sites monitored once/year, all sites inspected/permit term). Enter "Not Applicable" (N/A) if no specific schedule was specified;

(3) Status of schedule for year ("yes" for schedule was adhered to, or "no" for schedule was not adhered to);

(4) Number of activities which were accomplished; and

(5) The availability of documentation (i.e., inspection reports) for those activities which were accomplished and comments describing the reason(s) for any non-compliance.

4. The ANNUAL REPORT shall contain a Narrative Report to succinctly discuss the SWMP Elements which were not included within the SWMP Summary Table. Those SWMP Elements required to be developed under Parts II and III of the permit shall be discussed within this section of the ANNUAL REPORT following development.

a. The permittees shall include a brief discussion of the following applicable SWMP Elements:

(1) Structural Controls Maintenance
(2) Development Planning Procedures
(3) Roadway Maintenance
(4) Flood Management
(5) Municipal Facilities
(6) Pesticides, Herbicides, and Fertilizers
(7) Illicits Inspection/Investigation/Enforcement
(8) Field Screening
(9) Spill Response

(10) Public Reporting of Illicit Discharges
(11) Oil and Household Hazardous Waste
(12) Sanitary Sewer Seepage
(13) High Risk Industrial Facility Inspection
(14) Construction Planing Procedures
(15) Construction Inspections
(14) Education Activities
(15) Monitoring Activities
(16) Any additional elements of Storm Water Management Program

b. The format for the Narrative Report section of the ANNUAL REPORT shall be a brief discussion of the SWMP Element. The aspects of each permittee's activities concerning a SWMP Element shall be succinctly discussed in the section of the Narrative Report dedicated to that Element. The discussion shall include the following:

(1) Objective of SWMP Element,

(2) SWMP Element activities completed and those in progress,

(3) General discussion of Element. Explanation of all Element activity deficiencies (e.g.: activities described in the program that have not been fully implemented or completed). Results of activities shall be summarized and discussed (e.g.: maintenance caused by inspection, pollutants detected by monitoring, investigations as a result of dry and wet weather screening, number and nature of enforcement items, education activities participation),

(4) Status of SWMP Element with compliance, implementation, and augmentation schedules in Part III of the permit,

(5) SWMP Element strengths and weaknesses,

(6) Assessment of controls, and

(7) Discussion of Element revisions that are summarized elsewhere in the ANNUAL REPORT.

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
8. *Industrial and High Risk Runoff*			
a.) Identification of Priorities and Procedures for Inspections	ALL	Develop an inventory of all existing high risk facilities discharging into the MS4. This inventory shall identify the outfall and surface waterbody into which each high risk facility drains.	Within 24 Months of the Effective Date of the Permit
		Based upon historical information and available monitoring & screening data, prioritize the identified high risk facilities.	Within 24 Months of the Effective Date of the Permit
	ALL **except for** FDOT	Develop procedures for inspecting high risk facilities and establish an inspection schedule. After development, include a summary of the procedures & inspection schedule in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
	FDOT	Develop procedures for the inspection of high risk facilities which hold FDOT drainage connection permits to ensure compliance with permit requirements. In cases where another regulatory agency requires a periodic certification of compliance, the program developed may allow FDOT to accept this certification of compliance in lieu of further inspections by FDOT. After development, include a summary of the procedures & inspection schedule in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
	ALL	Begin inspections of identified high risk facilities. Maintain an internal log documenting the results of the inspections performed.	Within 36 Months of the Effective Date of the Permit

R0006670

STORM WATER MANAGEMENT PROGRAM	PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
8. *Industrial and High Risk Runoff* (continued)			
a.) *Identification of Priorities and Procedures for Inspections* (continued)	ALL	Maintain a list of all industrial storm water sources discharging to MS4 & update in ANNUAL REPORTS.	Effective Date of the Permit
b.) *Monitoring for High Risk Industries*	ALL **except for** FDOT	Develop a monitoring (or self monitoring) program for high risk industrial facilities. Include a description of the specific enforcement steps to be taken to require compliance with local storm water ordinances if violations are identified. After development, include a summary of the monitoring program in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
	FDOT	Develop a monitoring (or self monitoring) program for high risk industrial facilities which hold FDOT drainage connection permits. Include a description of the specific enforcement steps to be taken to require compliance with permit conditions if violations are identified. After development, include a summary of the monitoring program in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit
	ALL	Implement the monitoring program for high risk industrial facilities.	Within 36 Months of the Effective Date of the Permit

R0006671

NPDES Permit No. OKS000201

AUTHORIZATION TO DISCHARGE UNDER THE
NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

In compliance with the provisions of the Clean Water Act, 33 U.S.C. 1251 *et seq.*, as amended by the Water Quality Act of 1987, P.L. 100-4, the "Act",

City of Tulsa
Department of Public Works
200 Civic Center
Tulsa, Oklahoma 74103

is(are) authorized to discharge, in accordance with the Storm Water Management Program(s), effluent limitations, monitoring requirements, and other provisions set forth in Parts I, II, III, IV, V, VI, VII, and VIII herein,

from all portions of the City of Tulsa Municipal Separate Storm Sewer System (MS4) owned or operated by any permittee listed above, to waters of the United States.

This permit will become effective October 1, 1994

This permit and the authorization to discharge under the National Pollutant Discharge Elimination System shall expire at midnight, on September 30, 1999

Signed this 26 day of August, 1994

Monica L. Burrell
Environmental Engineer
Municipal Section (6W-PM)

Myron O. Knudson, P.E.
Director
Water Management Division (6W)

R0006672

weather screening activities to locate portions of the Municipal Separate Storm Sewer System with suspected illicit discharges and improper disposal. Follow-up activities to eliminate illicit discharges and improper disposal may be prioritized on the basis of magnitude and nature of the suspected discharge; sensitivity of the receiving water; and/or other relevant factors. This program shall establish priorities and schedules for screening the entire Municipal Separate Storm Sewer System at least once per five years. The permittee(s) shall utilize a consistent method (e.g. by land area, by outfall, etc.) for determining the percentage of the municipal separate storm sewer system that has been screened. Facility inspections may be carried out in conjunction with other municipal programs (e.g. pretreatment inspections of industrial users, health inspections, fire inspections, etc.), but must include random inspections for facilities not normally visited by the municipality.

f. Each permittee shall require the elimination of illicit discharges and improper disposal practices as expeditiously as reasonably possible. Where elimination of an illicit discharge within thirty (30) days is not possible, the permittee shall require an expeditious schedule for removal of the discharge. In the interim, the permittee shall require the operator of the illicit discharge to take all reasonable and prudent measures to minimize the discharge of pollutants to the Municipal Separate Storm Sewer System.

g. The permittee(s) shall maintain, and update as necessary, a list of discharges to municipal separate storm sewers that has been issued a NPDES permit. The list shall include the name, location and NPDES permit number of the discharger.

7. *Spill Prevention and Response:* A program to prevent, contain, and respond to spills that may discharge into the Municipal Separate Storm Sewer System shall be implemented. The spill response program may include a combination of spill response actions by the permittee(s) (and/or another public or private entity), and legal requirements for private entities within the permittee's municipal jurisdiction.

8. *Industrial & High Risk Runoff:* A program to identify and control pollutants in storm water discharges to the Municipal Separate Storm Sewer System from municipal landfills; other treatment, storage, or disposal facilities for municipal waste (e.g. transfer stations, incinerators, etc.); hazardous waste treatment, storage, disposal and recovery facilities; facilities that are subject to EPCRA Title III, Section 313; and any other industrial or commercial discharge the permittee(s) determines are contributing a substantial pollutant loading to the Municipal Separate Storm Sewer System shall be implemented. The program shall include:

a. priorities and procedures for inspections and establishing and implementing control measures for such discharges;

b. a monitoring program (Part II.A.11.c.); and

c. a list of industrial storm water sources discharging to the Municipal Separate Storm Sewer System shall be maintained and update as necessary.

b. *Wet Weather Screening Program:* The permittee(s) shall identify, investigate, and address areas within their jurisdiction that may be contributing excessive levels of pollutants to the Municipal Separate Storm Sewer System. The wet weather screening program:

(1) shall screen the Municipal Separate Storm Sewer System, in accordance with the procedures specified in the Storm Water Management Program.

(2) shall specify the sampling and non-sampling techniques to be used for initial screening and follow-up purposes. Sample collection and analysis need not conform to the requirements of 40 CFR Part 136. However, samples taken to confirm (e.g. in support of possible legal action) a particular discharger is a source of significant quantities of pollutants should conform to the requirements of 40 CFR Part 136.

c. The *Industrial and High Risk Runoff Monitoring Program* shall include monitoring for pollutants in storm water discharges to the Municipal Separate Storm Sewer System from municipal landfills; other treatment, storage, or disposal facilities for municipal waste (e.g. transfer stations, incinerators, etc.); hazardous waste treatment, storage, disposal and recovery facilities; facilities that are subject to EPCRA Title III, Section 313; and any other industrial or commercial discharge the permittee(s) determines are contributing a substantial pollutant loading to the Municipal Separate Storm Sewer System.

(1) Except as provided in (2) below, the monitoring program shall including the collection of quantitative data on the following constituents:

(a) any pollutants limited in an existing NPDES permit for a subject facility;
(b) oil and grease;
(c) chemical oxygen demand (COD);
(d) pH;
(e) biochemical oxygen demand, five-day (BOD_5);
(f) total suspended solids (TSS);
(g) total phosphorous;
(h) total Kjeldahl nitrogen (TKN);
(i) nitrate plus nitrite nitrogen; and
(j) any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).

Data collected by the industrial facility to satisfy the monitoring requirements of an NPDES or State discharge permit may be used to satisfy this requirement. Permittee(s) may require the industrial facility to conduct self-monitoring to satisfy this requirement.

(2) Alternative Certification: In lieu of monitoring, the permittee may accept a certification from a facility that raw and waste materials, final and intermediate products, by-products, material handling equipment or activities, industrial machinery or operations, or significant materials from past industrial activity are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Where the permittee(s)

accept a "no exposure" certification, the permittee(s) shall conduct at least one site inspection of the facility every five years to verify the "no exposure" exemption.

B. Area-specific Storm Water Management Program Requirements. Reserved.

C. Deadlines for Program Implementation. Except as provided in Part III., full implementation of the Storm Water Management Program shall begin within 90 days from the effective date of the permit.

D. Roles and Responsibilities of Permittee(s). The Storm Water Management Program, together with any attached interagency agreements, shall clearly identify the roles and responsibilities of each permittee.

E. Legal Authority. Each permittee shall ensure legal authority to control discharges to and from those portions the Municipal Separate Storm Sewer System over which it has jurisdiction. This legal authority may be a combination of statute, ordinance, permit, contract, order or inter-jurisdictional agreements with permittees with existing legal authority to:

1. Control the contribution of pollutants to the Municipal Separate Storm Sewer System by Storm Water Discharges Associated with Industrial Activity and the quality of storm water discharged from sites of industrial activity;

2. Prohibit illicit discharges to the Municipal Separate Storm Sewer System;

3. Control the discharge of spills and the dumping or disposal of materials other than storm water (e.g. industrial and commercial wastes, trash, used motor vehicle fluids, leaf litter, grass clippings, animal wastes, etc.) into the Municipal Separate Storm Sewer System;

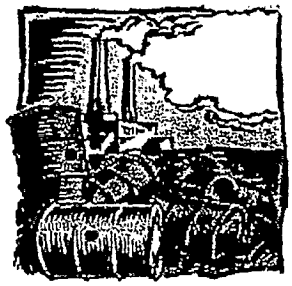
4. Control through interagency or interjurisdictional agreements among permittees the contribution of pollutants from one portion of the Municipal Separate Storm Sewer System to another;

5. Require compliance with conditions in ordinances, permits, contracts or orders; and

6. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance with permit conditions.

F. Storm Water Management Program Resources. Each permittee shall provide adequate finances, staff, equipment, and support capabilities to implement their activities under the Storm Water Management Program.

G. Storm Water Management Program Review and Update.



1. *Storm Water Management Program Review:* Each permittee shall participate in an annual review of the current Storm Water Management Program in conjunction with preparation of the annual report required under Part V.C.

2. *Storm Water Management Program Update:* The permittee(s) may change the Storm Water Management Program during the life of the permit in accordance with the following procedures:

   a. The approved Storm Water Management Program shall not be changed by the permittee(s) without the approval of the Director, unless in accordance with Parts II.G.2.b. and 2.c.

STORM WATER MANAGEMENT PROGRAM COMPONENT	ACTIVITY	DATE DUE/FREQUENCY
7. Flood Control Projects	a. Complete evaluation of existing flood control structures for feasible water quality retrofit projects.	October 1, 1998
	b. Complete schedule for proposed water quality retrofits to existing flood control structures.	November 1, 1998
8. Industrial and High Risk	a. Develop program to identify, monitor, and control pollutants from targeted facilities	July 1, 1995
	b. Implement program	July 1, 1996
9. Pesticide, Herbicide, and Fertilizer Application	a. Implement annual training/education on pesticide and fertilizer management techniques.	January 1, 1995
	b. Establish requirement for commercial pesticide applicators to be licensed under the Oklahoma Pesticide Applicators Law.	April 1, 1995

R0006676

Fort Worth's Industrial Inspection Program

The City's Industrial Inspection Program was created as a requirement of the City's NPDES Storm Water Permit with the EPA. For the purposes of compliance with the permit, the City must inspect (1) SARA Title III Section 313 industrial facilities, (2) hazardous waste treatment, disposal or recovery facilities, (3) municipal facilities under NPDES regulations and (4) industries that discharge, or have the potential to discharge, substantial pollutant loadings to the storm drain system. Each of these facilities must be inspected once every five years, at a minimum. These inspections are based upon EPA criteria and primarily include a review of the facility's Storm Water Pollution Prevention Plan (SWPPP) and a physical inspection of the facility to identify any potential sources of storm water pollution.

The City of Fort Worth Department of Environmental Management (DEM) has taken a unique approach in performing these inspections. As a regulatory agency, the City has the authority to impose fines and initiate state and federal investigations upon non-compliant industries. However, the federal storm water regulations are not only complicated, they are new to many industries.

DEM is cognizant of this and has taken an approach of education and cooperation with the industries, as opposed to enforcement. When our inspectors visit an industry for the first time, they will perform a comprehensive review of the industry's SWPPP. Any deficiencies in the SWPPP are noted and the industry is given 30 days to make appropriate corrections. During this initial phase, the inspector is willing to assist the industry gain compliance with its permit. This assistance may be in the form of supplying EPA paperwork, answering questions, performing plan reviews, interpreting data, or anything else needed by the industry.

At the end of the 30 day period, the inspector reviews the SW3P again and notes whether the facility is in compliance. In some cases, the industry may not be in compliance at the end of the 30 day period. DEM recognizes that in some special cases, 30 days may not be enough time to make major changes. In such cases, DEM will continue to work with the industry until the industry is in compliance. Industries that do not obtain permits or make reasonable efforts to implement SWPPPs are referred to the EPA for possible federal enforcement action.

For additional information on the inspection process, please call 817-871-5451 and ask for an Industrial Inspector.

Return to Storm Water Discharges Associated With Industrial Activity

FORT WORTH

This page was last modified on February 22, 2001.

HIGHLIGHTS OF TULSA'S SWMP

- **Areas of New Development and Significant Redevelopment**

  - Tulsa has until February 1, 1995, to adopt and implement the Draft Storm Water Management Criteria Manual (Criteria Manual).

- **Illicit Connections/Improper Disposal including Household Hazardous Waste/Used Motor Vehicle Fluids**

  - Operation and maintenance programs on both the storm sewers and sanitary sewers.

  - Tulsa has until May 1, 1995, to install two floatable monitoring locations for removal of floatable material in discharges to or from the Municipal separate storm sewer system. The City will also have to complete the study for targeting structural controls and develop schedule for implementation.

  - Currently have eight (8) locations for collection of used motor vehicle fluids which are open 24 hours a day, 7 days a week. They also have plans to open more recycling centers in the future.

  - Will have semi-annual collection events located within 5 miles of most folks in City.

  - Ongoing program to detect and eliminate illicit discharges and improper disposal.

- **Industrial & High Risk Runoff**

  - [redacted] operating and closed municipal landfills, all treatment, storage, and disposal facilities for municipal wastes, Hazardous waste treatment, storage and disposal facilities, and industrial facilities regulated under SARA Title III, Section 313 once per permit term.

- **Construction Runoff**

  - The city of Tulsa Stormwater Management Criteria Manual, Chapter 1500, addresses erosion and sedimentation control for construction related activities.

- **Public Education**

Part VIII. DEFINITIONS

PART I.

DISCHARGES AUTHORIZED UNDER THIS PERMIT

A. Permit Area. This permit covers all areas located within the political boundary of Broward County, excluding all areas within the City of Hollywood and the City of Fort Lauderdale, served by municipal separate storm sewer systems owned or operated by the permittees identified in Part I.C.

B. Authorized Discharges. Except for discharges prohibited under Part I.D., this permit authorizes all existing or new storm water point source discharges to waters of the United States from those portions of the Municipal Separate Storm Sewer System (MS4) owned or operated by the permittees.

C. Permittees.
The following entities are permittees subject to the conditions of this permit:

- Unincorporated Broward County
- City of Coconut Creek
- City of Cooper City
- City of Coral Springs
- City of Dania
- Town of Davie
- City of Deerfield Beach
- City of Hallandale
- Town of Lauderdale by the Sea
- City of Lauderdale Lakes
- City of Lauderhill
- City of Lighthouse Point
- City of Margate
- FDOT (District Four and Turnpike District)
- City of Miramar
- City of North Lauderdale
- City of Oakland Park
- City of Parkland
- Town of Pembroke Park
- City of Pembroke Pines
- City of Plantation
- City of Pompano Beach
- Village of Sea Ranch Lakes
- City of Sunrise
- City of Tamarac
- City of Wilton Manors

References to "permittee" in this permit include each of the entities above.

1. Each permittee is individually responsible for:

   a. Compliance with permit conditions relating to discharges from portions of the MS4 where they are the operator;

   b. Storm water management program implementation on portions of the MS4 where they are the operator;

   c. Where permit conditions are established for specific portions of the MS4, the permittee need only comply with the permit conditions relating to those portions of the MS4 for which they are the operator; and

   d. A plan of action to assume responsibility for implementation of storm water management and monitoring programs on their portions of the

into the MS4.

(1) To satisfy the requirements of this section, the permittees shall implement the Storm Water Management Programs identified in Part III.A.7.g. on page 35 of this permit.

8. *Industrial and High Risk Runoff:* The permittees shall implement the SWMP to identify and control pollutants in storm water discharges to the MS4 from the municipal landfill(s); hazardous waste treatment, storage, disposal and recovery facilities; facilities that have reported under the requirements of EPCRA Title III, Section 313; and any other industrial or commercial discharge the permittees determine is contributing a substantial pollutant loading to the MS4. The program implemented shall be consistent with State Water Policy.

To satisfy the two (2) requirements of this section, the permittees shall:

a. *Identification of priorities and procedures for inspections:* In accordance with the schedule provided in Part III.A.8.a. on page 36 of this permit, the permittee(s) shall identify all targeted facilities and determine priority sites. Inspection schedules and procedures for the identified facilities shall be implemented regularly. Also, the permittees shall provide a listing in each ANNUAL REPORT of additionally identified industrial facilities which discharge storm water into the MS4 which have not been previously reported. At a minimum, the industrial storm water discharges that shall be included in this inventory fall into the eleven (11) classes of industrial activities as defined in the November 1990 regulations under 40 CFR 122.26(b)(14).

b. *Monitoring for High Risk Industries:* Implement the monitoring program for facilities identified under this section in accordance with the schedule provided in Part III.A.8.b. on page 37 of this permit. The monitoring program shall include the collection of quantitative data on the following constituents:

- any pollutants limited in an existing NPDES permit for an identified facility;
- oil and grease;
- chemical oxygen demand (COD);
- pH;
- biochemical oxygen demand, five-day (BOD_5);
- total suspended solids (TSS);
- total phosphorous;
- total Kjeldahl nitrogen (TKN);

Management Program(s) identified in Part III.A.9.c. on page 40 of this permit.

B. Area-specific Storm Water Management Program Requirements.

NONE

C. Deadlines for Program Compliance. Except as provided in Part III, compliance with the storm water management program shall be required 90 days from the effective date of the permit.

D. Roles and Responsibilities of Permittees. The Storm Water Management Program, together with any attached interagency agreements or interagency agreements developed subsequent to the effective date of the permit, shall clearly identify the roles and responsibilities of each permittee. Following the effective date of the permit, interagency agreements developed and implemented must be included in the ANNUAL REPORT covering the permit year in which the agreement became effective.

E. Legal Authority. To the extent allowed by law, each permittee shall ensure legal authority to control discharges to and from those portions of the Municipal Separate Storm Sewer System (MS4) over which it has jurisdiction. This legal authority may be a combination of statute, ordinance, permit, contract, order or inter-jurisdictional agreements among permittees with adequate existing legal authority to accomplish items 1 - 6 below. This legal authority for FDOT may be a combination of State statutes administered and enforced by sister agencies within the State of Florida government system which have adequate existing legal authority to accomplish the following items 1 - 6:

1. **Control the contribution of pollutants to the MS4 by Storm Water Discharges Associated with Industrial Activity and the quality of storm water discharged from sites of industrial activity;**

2. Prohibit illicit discharges to the MS4;

3. Control the discharge of spills and the dumping or disposal of materials other than storm water (e.g. industrial and commercial wastes, trash, used motor vehicle fluids, leaf litter, grass clippings, animal wastes, etc.) into the MS4;

4. Control through interagency or inter-jurisdictional agreements among permittees the contribution of pollutants from one portion of the MS4 to another;

5. Require compliance with conditions in ordinances, permits, contracts or orders; and

6. Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance with permit conditions.

F. Storm Water Management Program Resources.

Each permittee shall provide adequate finances to implement their activities under the Storm Water Management Program. Each permittee shall also have a source of funding for implementing all other requirements included within this NPDES storm water permit.

G. Storm Water Management Program Review and Modification.

1. *Program Review:* Each permittee shall participate in an annual review of the current Storm Water Management Program (SWMP) in conjunction with preparation of the ANNUAL REPORT required under Part V.C. of the permit.

2. *Program Modification:* The permittee(s) may modify the SWMP during the life of the permit in accordance with the following procedures:

   a. Modifications adding (but not subtracting nor replacing) components, controls, or requirements to the approved SWMP may be made by the permittee(s) at any time. A description of the modification shall be included within the subsequent ANNUAL REPORT.

   b. Modifications replacing an ineffective or unfeasible BMP specifically identified in the SWMP with an alternate BMP may be made by the permittee(s) at any time. A description of the replacement BMP shall be included in the subsequent ANNUAL REPORT along with the following information:

      (1) an analysis of why the former BMP was ineffective or infeasible (including cost prohibitive);

      (2) expectations on the effectiveness of the replacement BMP; and

STORM WATER MANAGEMENT PROGRAM:

8. a.) Industrial and High Risk Runoff - Identification of priorities and procedures for inspections.

PERMITTEE(S)	ACTIVITY	DATE DUE / FREQUENCY
ALL except FDOT	Inventory and prioritize all existing high risk facilities discharging into the MS4 within each permittee's jurisdictional area. High risk facilities shall include municipal landfills, hazardous waste treatment, storage, disposal and recovery facilities, facilities that have reported under the requirements of EPCRA Title III, Section 313, private and municipal waste handling facilities and any other industrial or commercial discharge which the permittee determines is contributing a substantial pollutant loading to the MS4. This inventory shall identify the outfall and surface water body into which each high risk facility drains.	Within 24 Months of the Effective Date of the Permit
	Implement procedures, within each permittee's jurisdictional area, to determine if the identified high risk facilities are in compliance with all appropriate aspects of the storm water program (e.g. no illicit connections; compliance with local storm water regulation requirements; and if the facility is required to have NPDES permit coverage, a copy of the NPDES storm water pollution prevention plan on site). Maintain a list of all industrial storm water sources discharging to the MS4 and include an update in each ANNUAL REPORT of any additionally identified industrial facilities not previously listed. Maintain a log documenting the results of the inspections performed.	Effective Date of the Permit
FDOT	Develop procedures for the inspection of high risk facilities which hold FDOT drainage connection permits to verify compliance with FDOT Drainage permit requirements. In cases where another regulatory agency requires a periodic certification of compliance, the program developed may allow FDOT to accept this certification of compliance in lieu of further inspections by FDOT.	Within 24 Months of the Effective Date of the Permit

R0006685

STORM WATER MANAGEMENT PROGRAM: *8. a.) Industrial and High Risk Runoff - Identification of priorities and procedures for inspections.*		
PERMITTEE(S)	ACTIVITY	DATE DUE/ FREQUENCY
	After development, include a summary of the procedures & inspection schedule for incorporation into the permit.	Provide in the subsequent ANNUAL REPORT

STORM WATER MANAGEMENT PROGRAM: *8. b.) Industrial and High Risk Runoff - Monitoring for High Risk Industries.*		
PERMITTEE(S)	ACTIVITY	DATE DUE/ FREQUENCY
Broward County	Begin implementing Broward County's DNRP monitoring program for identified high risk industrial facilities.	Effective Date of the Permit
	Initiate enforcement action on those facilities having storm water discharges to the MS4 which violate water quality standards. Send to EPA a copy of each Notice of Violation at the address shown in Part V.E.2., page 55 of the permit.	Within 12 Months of the Effective Date of the Permit
FDOT	Develop a monitoring program which addresses the water quality criteria included in the FDOT permitting process for those high risk industrial facilities which hold FDOT drainage connection permits. Include a description of the specific enforcement steps to be taken to require compliance with permit conditions if violations are identified. After development, include a summary of the monitoring program in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit

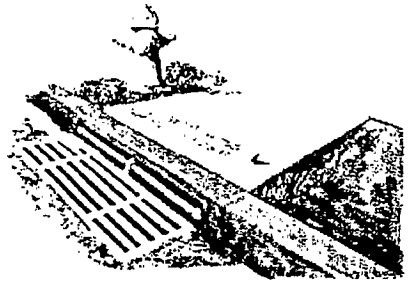
Storm Drain Pollution & You



Education Materials

Management Program

Ordinance

Model Urban Runoff Program: A How-to-Guide NEW!

Stormwater Information

Stormwater pollution is one of the top five polluters of lakes, rivers, creeks, and estuaries in the United States. We can all help to clean up our water environments by following a few simple tips. To find out more about what you can do to help reverse this trend, see Storm Drain Pollution & You.

One of the most effective tools for preventing storm drain pollution is education. We have developed educational materials for the community. Specific practices for preventing stormwater pollution have been published for the auto repair industry, the food and restaurant industry, the construction industry, and for homeowners and do-it-yourselfers. General materials have also been developed.

The City's "water quality ethic" has led to the development of a Stormwater Management Program which is continually changing and expanding. This program is the result of a commitment to protecting our resources on the Central Coast, especially to our receiving water, the Monterey Bay National Marine Sanctuary.

In an effort to regulate what is allowed to flow down the storm drain, a Stormwater Ordinance was developed and passed in 1997. This ordinance limits stormwater flows to clean rain water and non-polluted incidental flows such as lawn irrigation runoff and groundwater infiltration. This ordinance borrows elements from many other cities who have existing ordinances.

City of Monterey Stormwater Ordinance

ORDINANCE NO. _____ C.S.

ORDINANCE ADDING NEW ARTICLE 2 TO CHAPTER 31.5

OF THE MONTEREY CITY CODE REGARDING

URBAN STORM WATER QUALITY MANAGEMENT AND DISCHARGE CONTROL

- - - - -

THE COUNCIL OF THE CITY OF MONTEREY DOES ORDAIN AS FOLLOWS:

SECTION 1. A new Article 2 is hereby added to Chapter 31.5 of the Monterey City Code regarding Urban Storm Water Quality Management and Discharge Control, which shall read in its entirety as follows:

"ARTICLE 2.

URBAN STORM WATER QUALITY MANAGEMENT AND DISCHARGE CONTROL.

Division I.

Title, Purpose and General Provisions.

Section 31.5-4. Title.

This Article shall be known as the "Urban Storm Water Quality Management and Discharge Control Ordinance" of the City of Monterey and may be so cited.

Section 31.5-5. Purpose and Intent.

The purpose and intent of this Article is to ensure the health, safety, and general welfare of citizens, and protect and enhance the water quality of watercourses and water bodies in a manner pursuant to and consistent with the Federal Clean Water Act (33 U.S.C. '1251 et seq.) by reducing pollutants in storm water discharges to the maximum extent practicable and by prohibiting non-storm water discharges to the storm drain system.

Section 31.5-6. Definitions.

The terms used in this Article shall have the following meanings:

(a) Best Management Practices. Activities, practices, and procedures to prevent or reduce the discharge of pollutants directly or indirectly to the municipal storm drain system and waters of the United States. Best Management Practices include but are not limited to: treatment facilities to remove pollutants from storm water; operating and maintenance procedures; facility management practices to control runoff, spillage or leaks of non-storm water, waste disposal, and drainage from materials storage; erosion and sediment

control practices; and the prohibition of specific activities, practices, and procedures and such other provisions as the City determines appropriate for the control of pollutants. Please refer to the City of Monterey's *BMP Guidance Series*, as discussed further un Section 31.5-16(c) herein, for specific requirements.

(b) City. The City of Monterey.

(c) Clean Water Act. The federal Water Pollution Control Act (33 U.S.C. ' 1251 et seq.), and any subsequent amendments thereto.

(d) Construction Activity. Activities subject to NPDES Construction Permits. These include construction projects resulting in land disturbance of 5 acres or more. Such activities include but are not limited to clearing and grubbing, grading, excavating, and demolition.

(e) Hazardous Materials. Any material, including any substance, waste, or combination thereof, which because of its quantity, concentration, or physical, chemical, or infectious characteristics may cause, or significantly contribute to, a substantial present or potential hazard to human health, safety, property, or the environment when improperly treated, stored, transported, disposed of, or otherwise managed (California Health and Safety Code '25117).

(f) Illegal Discharge. Any direct or indirect non-storm water discharge to the storm drain system, except as exempted in Division II, Section 31.5-12 of this chapter.

(g) Illicit Connections. An illicit connection is defined as either of the following:

1. Any drain or conveyance, whether on the surface or subsurface, which allows an illegal discharge to enter the storm drain system including but not limited to any conveyances which allow any non-storm water discharge including sewage, process wastewater, and wash water to enter the storm drain system and any connections to the storm drain system from indoor drains and sinks, regardless of whether said drain or connection had been previously allowed, permitted, or approved by a government agency; or

2. Any drain or conveyance connected from a commercial or industrial land use to the storm drain system which has not been documented in plans, maps, or equivalent records and approved by the City.

(h) Industrial Activity. Activities subject to NPDES Industrial Permits as defined in 40 CFR, Section 122.26 (b)(14).

(i) National Pollutant Discharge Elimination System (NPDES) Storm Water Discharge Permits. General, group, and individual storm water discharge permits which regulate facilities defined in federal NPDES regulations pursuant to the Clean Water Act. The California Regional Water Quality Control Board, Central Coast Region (hereinafter, Regional Board) and the State Water Resources Control Board have adopted general storm water discharge permits, including but not limited to the General Construction Activity and General Industrial Activity permits.

(j) Non-Storm Water Discharge. Any discharge to the storm drain system that is not composed entirely of storm water.

(k) Pollutant. Anything which causes or contributes to pollution. Pollutants may include, but are not limited to: paints, varnishes, and solvents; oil and other automotive fluids; non-hazardous liquid and solid wastes and yard wastes; refuse, rubbish, garbage, litter, or other discarded or abandoned objects, articles, and accumulations, so that same may cause or contribute to pollution; floatables; pesticides, herbicides, and

fertilizers; hazardous substances and wastes; sewage, fecal coliform and pathogens; dissolved and particulate metals; animal wastes; wastes and residues that result from constructing a building or structure (including but not limited to sediments, slurries, and concrete rinsates); and noxious or offensive matter of any kind.

(l) Pollution. The human-made or human-induced alteration of the quality of waters by waste to a degree which unreasonably affects, or has the potential to unreasonably affect, either the waters for beneficial uses or the facilities which serve these beneficial uses (California Water Code '13050).

(m) Porter-Cologne Act. The Porter-Cologne Water Quality Control Act and as amended (California Water Code '13000 et seq.).

(n) Premises. Any building, lot, parcel of land, or portion of land whether improved or unimproved including adjacent sidewalks and parking strips.

(o) Storm Drain System. Publicly-owned facilities operated by the City by which storm water is collected and/or conveyed, including but not limited to any roads with drainage systems, municipal streets, gutters, curbs, inlets, piped storm drains, pumping facilities, retention and detention basins, natural and human-made or altered drainage channels, reservoirs, and other drainage structures which are within the City and are not part of a publicly owned treatment works as defined at 40 CFR Section 122.2.

(p) Storm Water. Any surface flow, runoff, and drainage consisting entirely of water from rain storm events.

(q) Waters of the United States. Surface watercourses and water bodies as defined at 40 CFR ' 122.2. including all natural waterways and definite channels and depressions in the earth that may carry water, even though such waterways may only carry water during rains and storms and may not carry storm water at and during all times and seasons.

Section 31.5-7. Applicability.

This Article shall apply to all water entering the storm drain system generated on any developed and undeveloped lands lying within the City of Monterey including any amendments or revisions thereto.

Section 31.5-8. Responsibility for Administration.

The Public Works Director of the City shall administer, implement, and enforce the provisions of this Article. Any powers granted or duties imposed upon the Public Works Director may be delegated in writing by the Public Works Director to persons or entities acting in the beneficial interest of or in the employ of the City.

Section 31.5-9. Severability.

The provisions of this Article are hereby declared to be severable. If any provision, clause, sentence, or paragraph of this Article or the application thereof to any person, establishment, or circumstances shall be held invalid, such invalidity shall not affect the other provisions or application of this Article.

Section 31.5-10. Regulatory Consistency.

This Article shall be construed to assure consistency with the requirements of the Clean Water Act and Porter-Cologne Act and acts amendatory thereof or supplementary thereto, or any applicable implementing

regulations.

Section 31.5-11. Ultimate Responsibility of Discharger.

The standards set forth herein and promulgated pursuant to this Article are minimum standards; therefore this Article does not intend nor imply that compliance by any person will ensure that there will be no contamination, pollution, nor unauthorized discharge of pollutants into waters of the U.S. caused by said person. This Article shall not create liability on the part of the City of Monterey, or any agent or employee thereof for any damages that result from any discharger's reliance on this Article or any administrative decision lawfully made thereunder.

Division II.

Discharge Prohibitions.

Section 31.5-12. Prohibition of Illegal Discharges.

No person shall discharge or cause to be discharged into the municipal storm drain system or watercourses any materials, including but not limited to pollutants or waters containing any pollutants that cause or contribute to a violation of applicable water quality standards, other than storm water.

The commencement, conduct or continuance of any illegal discharge to the storm drain system is prohibited except as described as follows:

(a) Discharges from the following activities will not be considered a source of pollutants to the storm drain system and to waters of the U.S. when properly managed to ensure that no potential pollutants are present, and therefore they shall not be considered illegal discharges unless determined to cause a violation of the provisions of the Porter-Cologne Act, Clean Water Act, or this ordinance: potable water line flushing; uncontaminated pumped groundwater and other discharges from potable water sources; landscape irrigation and lawn watering; diverted stream flows; rising groundwater; groundwater infiltration to the storm drain system; uncontaminated foundation and footing drains; uncontaminated water from crawl space pumps; air conditioning condensation; uncontaminated non-industrial roof drains; springs; individual residential and occasional non-commercial car washing; flows from riparian habitats and wetlands; dechlorinated swimming pool discharges; street wash waters; and flows from fire fighting.

(b) The prohibition shall not apply to any non-storm water discharge permitted under an NPDES permit, waiver, or waste discharge order issued to the discharger and administered by the State of California under the authority of the Federal Environmental Protection Agency, provided that the discharger is in full compliance with all requirements of the permit, waiver, or order and other applicable laws and regulations, and provided that written approval has been granted by the City of Monterey for any discharge to the storm drain system.

(c) With written concurrence of the Regional Board, the City of Monterey may exempt in writing other non-storm water discharges which are not a source of pollutants to the storm drain system nor waters of the U.S.

Section 31.5-13. Prohibition of Illicit Connections.

(a) The construction, use, maintenance or continued existence of illicit connections to the storm drain system is prohibited.

(b) This prohibition expressly includes, without limitation, illicit connections made in the past, regardless of whether the connection was permissible under law or practices applicable or prevailing at the time of connection.

Section 31.5-14. Waste Disposal Prohibitions.

No person shall throw, deposit, leave, maintain, keep, or permit to be thrown, deposited, left, or maintained, in or upon any public or private property, driveway, parking area, street, alley, sidewalk, component of the storm drain system, or water of the U.S., any refuse, rubbish, garbage, litter, or other discarded or abandoned objects, articles, and accumulations, so that the same may cause or contribute to pollution. Wastes deposited in streets in proper waste receptacles for the purposes of collection are exempted from this prohibition.

Section 31.5-15. Discharges in Violation of Industrial or Construction Activity NPDES Storm Water Discharge Permit.

Any person subject to an industrial or construction activity NPDES storm water discharge permit shall comply with all provisions of such permit. Proof of compliance with said permit may be required in a form acceptable to the Public Works Director prior to or as a condition of a subdivision map, site plan, building permit, or development or improvement plan; upon inspection of the facility; during any enforcement proceeding or action; or for any other reasonable cause.

Division III.

Regulations and Requirements.

Section 31.5-16. Requirement to Prevent, Control, and Reduce Storm Water Pollutants.

(a) Authorization to Adopt and Impose Best Management Practices. The City will adopt requirements identifying Best Management Practices for any activity, operation, or facility which may cause or contribute to pollution or contamination of storm water, the storm drain system, or waters of the U.S. as a separate *BMP Guidance Series*. Where Best Management Practices requirements are promulgated by the City or any federal, State of California, or regional agency for any activity, operation, or facility which would otherwise cause the discharge of pollutants to the storm drain system or water of the U.S., every person undertaking such activity or operation, or owning or operating such facility shall comply with such requirements.

The Public Works Director will report to the City Council annually on the status of implementation of BMP's, the pollutants of concern to be addressed the next year, and any new BMPs to be developed. BMP's developed under this program will be included in the City of Monterey's *BMP Guidance Series*.

R0006692

(b) New Development and Redevelopment. The City may adopt requirements identifying appropriate Best Management Practices to control the volume, rate, and potential pollutant load of storm water runoff from new development and redevelopment projects as may be appropriate to minimize the generation, transport and discharge of pollutants. The City shall incorporate such requirements in any land use entitlement and construction or building-related permit to be issued relative to such development or redevelopment. The owner and developer shall comply with the terms, provisions, and conditions of such land use entitlements and building permits as required in this Article and the City Storm Water Utility Ordinance, Chapter 31.5, Article 1.

(c) Responsibility to Implement Best Management Practices. Notwithstanding the presence or absence of requirements promulgated pursuant to subsections (a) and (b), any person engaged in activities or operations, or owning facilities or property which will or may result in pollutants entering storm water, the storm drain system, or waters of the U.S. shall implement Best Management Practices to the extent they are technologically achievable to prevent and reduce such pollutants. The owner or operator of a commercial or industrial establishment shall provide reasonable protection from aecidental discharge of prohibited materials or other wastes into the municipal storm drain system or watercourses. Facilities to prevent accidental discharge of prohibited materials or other wastes shall be provided and maintained at the owner or operator's expense.

Best Management Practices required by the City can be obtained from the Public Works Department by requesting the BMP manual appropriate to a commercial or industrial activity from the *BMP Guidance Series*. BMP's are broken into three categories: "high priority" which are required to be implemented, "medium priority" which are desirable to implement, and "low priority."

Section 31.5-17. Requirement to Eliminate Illegal Discharges.

Notwithstanding the requirements of Division IV, Section 31.5-23 herein, the Public Works Director may require by written notice that a person responsible for an illegal discharge immediately, or by a specified date, discontinue the discharge and, if necessary, take measures to eliminate the source of the discharge to prevent the occurrence of future illegal discharges.

Section 31.5-18. Requirement to Eliminate or Secure Approval for Illicit Connections.

(a) The Public Works Director may require by written notice that a person responsible for an illicit connection to the storm drain system comply with the requirements of this Article to eliminate or secure approval for the connection by a specified date, regardless of whether or not the connection or discharges to it had been established or approved prior to the effective date of this Article.

(b) If, subsequent to eliminating a connection found to be in violation of this Article, the responsible person can demonstrate that an illegal discharge will no longer occur, said person may request City approval to reconnect. The reconnection or reinstallation of the connection shall be at the responsible person's expense.

Section 31.5-19. Watercourse Protection.

Every person owning property through which a watercourse passes, or such person's lessee, shall keep and maintain that part of the watercourse within the property reasonably free of trash, debris, excessive vegetation, and other obstacles that would pollute, contaminate, or significantly retard the flow of water through the watercourse. In addition, the owner or lessee shall maintain existing privately owned structures within or adjacent to a watercourse, so that such structures will not become a hazard to the use, function, or physical integrity of the watercourse. The owner or lessee shall not remove healthy bank vegetation beyond

that actually necessary for maintenance, nor remove said vegetation in such a manner as to increase the vulnerability of the watercourse to erosion. The property owner shall be responsible for maintaining and stabilizing that portion of the watercourse that is within their property lines in order to protect against erosion and degradation of the watercourse originating or contributed from their property.

Section 31.5-20. Requirement to Remediate.

Whenever the Public Works Director finds that a discharge of pollutants is taking place or has occurred which will result in or has resulted in pollution of storm water, the storm drain system, or water of the U.S., the Public Works Director may require by written notice to the owner of the property and/or the responsible person that the pollution be remediated and the affected property restored within a specified time pursuant to the provisions of sections 31.5-25 through 31.5-28 below.

Section 31.5-21. Requirement to Monitor and Analyze.

The Public Works Director may require by written notice of requirement that any person engaged in any activity and/or owning or operating any facility which may cause or contribute to storm water pollution, illegal discharges, and/or non-storm water discharges to the storm drain system or waters of the U.S., to undertake at said person's expense such monitoring and analyses and furnish such reports to the City of Monterey as deemed necessary to determine compliance with this Article.

Section 31.5-22. Notification of Spills.

Notwithstanding other requirements of law, as soon as any person responsible for a facility or operation, or responsible for emergency response for a facility or operation has information of any known or suspected release of materials which are resulting or may result in illegal discharges or pollutants discharging into storm water, the storm drain system, or water of the U.S. from said facility, said person shall take all necessary steps to ensure the discovery, containment, and cleanup of such release. In the event of such a release of a hazardous material said person shall immediately notify emergency response officials of the occurrence via emergency dispatch services (911). In the event of a release of non-hazardous materials, said person shall notify the City's Public Works Department in person or by phone or facsimile no later than 5:00 p.m. of the next business day. Notifications in person or by phone shall be confirmed by written notice addressed and mailed to the City's Public Works Department within three business days of the phone notice. If the discharge of prohibited materials emanates from a commercial or industrial establishment, the owner or operator of such establishment shall also retain an on-site written record of the discharge and the actions taken to prevent its recurrence. Such records shall be retained for at least three years.

Division IV.

Inspection and Monitoring.

Section 31.5-23. Authority to Inspect.

Whenever necessary to make an inspection to enforce any provision of this Article, or whenever the Public Works Director has cause to believe that there exists, or potentially exists, in or upon any premises any

condition which constitutes a violation of this Article, the Director may enter such premises at all reasonable times to inspect the same and to inspect and copy records related to storm water compliance. In the event the owner or occupant refuses entry after a request to enter and inspect has been made, the City is hereby empowered to seek assistance from any court of competent jurisdiction in obtaining such entry.

Section 31.5-24. Authority to Sample, Establish Sampling Devices, and Test.

During any inspection as provided herein, the Public Works Director may take any samples and perform any testing deemed necessary to aid in the pursuit of the inquiry or to record site activities.

Division V.

Enforcement.

Section 31.5-25. Notice of Violation.

Whenever the Public Works Director finds that a person has violated a prohibition or failed to meet a requirement of this Article, the Director may order compliance by written notice of violation to the responsible person. Such notice may require without limitation:

(a) The performance of monitoring, analyses, and reporting;

(b) The elimination of illicit connections or discharges;

(c) That violating discharges, practices, or operations shall cease and desist;

(d) The abatement or remediation of storm water pollution or contamination hazards and the restoration of any affected property; and

(e) Payment of a fine to cover administrative and remediation costs; and

(f) The implementation of source control or treatment BMPs.

If abatement of a violation and/or restoration of affected property is required, the notice shall set forth a deadline within which such remediation or restoration must be completed. Said notice shall further advise that, should the violator fail to remediate or restore within the established deadline, the work will be done by the City or a contractor designated by the Public Works Director and the expense thereof shall be charged to the violator pursuant to Section 31.5-27 below.

Section 31.5-26 Appeal.

Notwithstanding the provisions of Section 31.5-29 below, any person receiving a Notice of Violation under Section 31.5-25 above may appeal the determination of the Public Works Director to the City Manager. The notice of appeal must be received by the City Manager within 5 days from the date of the Notice of Violation. Hearing on the appeal before the City Manager or his/her designee shall take place within 15

days from the date of City's receipt of the notice of appeal. The decision of the City Manager or designee shall be final.

Section 31.5-27 Abatement by City.

If the violation has not been corrected pursuant to the requirements set forth in the Notice of Violation, or , in the event of an appeal under section 31.5-26, within 10 days of the decision of the City Manager upholding the decision of the Public Works Director, then the City or a contractor designated by the Public Works Director shall enter upon the subject private property and is authorized to take any and all measures necessary to abate the violation and/or restore the property. It shall be unlawful for any person, owner, agent or person in possession of any premises to refuse to allow the City or designated contractor to enter upon the premises for the purposes set forth above.

Section 31.5-28 Charging Cost of Abatement/Liens.

Within 30 days after abatement of the nuisance by City, the Public Works Director shall notify the property owner of the property of the cost of abatement, including administrative costs. The property owner may file a written protest objecting to the amount of the assessment with the City Clerk within 15 days. The City Clerk shall set the matter for public hearing by the City Council. The decision of the City Council shall be set forth by resolution and shall be final.

If the amount due is not paid within 10 days of the decision of the City Council or the expiration of the time in which to file an appeal under this Section, the charges shall become a special assessment against the property and shall constitute a lien on the property for the amount of the assessment. A copy of the resolution shall be turned over to the County Auditor so that the auditor may enter the amounts of the assessment against the parcel as it appears on the current assessment roll, and the tax collector shall include the amount of the assessment on the bill for taxes levied against the parcel of land.

Section 31.5-29 Urgency Abatement.

The Public Works Director is authorized to require immediate abatement of any violation of this Article that constitutes an immediate threat to the health, safety or well-being of the public. If any such violation is not abated immediately as directed by the Public Works Director, the City of Monterey is authorized to enter onto private property and to take any and all measures required to remediate the violation. Any expense related to such remediation undertaken by the City of Monterey shall be fully reimbursed by the property owner and/or responsible party. Any relief obtained under this section shall not prevent City from seeking other and further relief authorized under this Article.

Section 31.5-30. Violations.

It shall be unlawful for any person to violate any provision or fail to comply with any of the requirements of this Article. A violation of or failure to comply with any of the requirements of this Article shall constitute a misdemeanor and shall be punished as set forth in City Code Section 1.7.

Section 31.5-31. Compensatory Action.

In lieu of enforcement proceedings, penalties, and remedies authorized by this Article, the Public Works Director may impose upon a violator alternative compensatory actions, such as storm drain stenciling, attendance at compliance workshops, creek cleanup, etc.

Section 31.5-32. Violations Deemed a Public Nuisance

In addition to the enforcement processes and penalties hereinbefore provided, any condition caused or permitted to exist in violation of any of the provisions of this Article is a threat to public health, safety, and welfare, and is declared and deemed a nuisance, and may be summarily abated or restored by the City at the violator's expense, and/or a civil action to abate, enjoin, or otherwise compel the cessation of such nuisance may be taken by the City.

Section 31.5-33. Acts Potentially Resulting in a Violation of the Federal Clean Water Act and/or California Porter-Cologne Act.

Any person who violates any provision of this Article or any provision of any requirement issued pursuant to this chapter, may also be in violation of the Clean Water Act and/or the Porter-Cologne Act and may be subject to the sanctions of those acts including civil and criminal penalties. Any enforcement action authorized under this Article shall also include written notice to the violator of such potential liability."

SECTION 2. All ordinances and parts of ordinances in conflict herewith are hereby repealed.

SECTION 3. This ordinance shall be in full force and effect 30 days after its final passage and adoption.

PASSED AND ADOPTED BY THE COUNCIL OF THE CITY OF MONTEREY this ____ day of _____, 19__, by the following vote:

Surface Water Pollution Prevention Home

Business Inspection Program

Seattle's waterways are vulnerable to pollution from a wide variety of human activities. Some businesses within Seattle drain to a creek, lake or bay. Spills or debris may be washed from properties into a public storm system and flow to these aquatic habitats.

Seattle Public Utilities is inspecting commercial and industrial properties to improve stormwater pollution prevention practices in the City of Seattle. The intent of this program is to work with local businesses to improve stormwater quality in Seattle's creeks, lakes and Puget Sound.

Business inspections are part of the City's stormwater pollution prevention program, a requirement of the Washington State Department of Ecology administered through the City's National Pollution Discharge Elimination System (NPDES) permit for municipal stormwater discharges.

Stormwater Pollution Prevention Requirements

Under the Seattle Stormwater, Grading, and Drainage Control Code (SMC 22.800), all businesses are required to implement certain operational and structural source controls to reduce stormwater pollution.

- **Operational stormwater source controls consist of management practices that prevent or reduce the amount of pollutants in stormwater runoff.** Best Management practices include simple housekeeping activities such as regularly sweeping parking lots and sidewalks, maintaining existing drainage systems, training employees about stormwater pollution prevention practices, and maintaining spill control supplies onsite to prevent and cleanup accidental spills.
- **Structural stormwater source controls are physical, structural, or mechanical devices or facilities that are constructed to prevent pollutants from entering stormwater.** Examples of structural source controls include: enclosing and/or containing the pollutant source; constructing berms, curbs, or dikes to prevent unpolluted stormwater from entering an area where pollution-generating activities take place; and containing and/or treating runoff from contaminated areas.

Check the Director's Rules to see what the new requirements are for public property. If your property drains are connected to the city stormwater system, then you are responsible for maintaining your drainage structures:

- conveyance systems, detention systems and treatment systems
- maintaining streets, driveways, parking lots and sidewalks
- identifying and eliminating illicit connections to the drainage control system.

Business Inspection Program FAQs

R0006698

More Information for business owners
Four Director's Rules describe City requirements for stormwater flow control, treatment, and construction-related drainage requirements for new and redevelopment projects. They also cover stormwater pollution source control requirements for existing and new or redevelopment projects.

- DR 16-2000 (5.7MB PDF), Volume 2, Construction Stormwater Control Technical Requirements Manual
  Describes requirements for construction projects (temporary erosion and sedimentation control and control of other pollutants).
- DR 17-2000 (1.6MB PDF), Volume 1, Source Control Technical Requirements Manual
  Describes the operational and structural source controls that are required to reduce stormwater pollution.
- DR 26-2000 (1.9MB PDF), Volume 3, Flow Control Technical Requirements Manual
  Describes requirements for controlling peak flow rates for new and redevelopment projects.
- DR 27-2000 (3.7MB PDF), Volume 4, Stormwater Treatment Technical Requirements Manual
  Describes requirements for treating stormwater from new and redevelopment projects.

Paper copies of these rules are also available at the DCLU Applicant Services Center, Key Tower, 700 5th Avenue, 20th Floor. However, due to their considerable length, a fee is being charged to cover production costs.

If you have any questions or concerns regarding the business inspection process, please contact our business inspectors.

Stormwater Ordinance

ORDINANCE NO. _____ C.S.

ORDINANCE ADDING NEW ARTICLE 2 TO CHAPTER 31.5 OF THE MONTEREY CITY CODE REGARDING URBAN STORM WATER QUALITY MANAGEMENT AND DISCHARGE CONTROL

THE COUNCIL OF THE CITY OF MONTEREY DOES ORDAIN AS FOLLOWS:

SECTION 1. A new Article 2 is hereby added to Chapter 31.5 of the Monterey City Code regarding Urban Storm Water Quality Management and Discharge Control, which shall read in its entirety as follows:

"ARTICLE 2. URBAN STORM WATER QUALITY MANAGEMENT AND DISCHARGE CONTROL.

Division I. Title, Purpose and General Provisions.

Section 31.5-4. Title.

This Article shall be known as the "Urban Storm Water Quality Management and Discharge Control Ordinance" of the City of Monterey and may be so cited.

Section 31.5-5. Purpose and Intent.

The purpose and intent of this Article is to ensure the health, safety, and general welfare of citizens, and protect and enhance the water quality of watercourses and water bodies in a manner pursuant to and consistent with the Federal Clean Water Act (33 U.S.C. §1251 et seq.) by reducing pollutants in storm water discharges to the maximum extent practicable and by prohibiting non-storm water discharges to the storm drain system.

Return to top

Section 31.5-6. Definitions.

The terms used in this Article shall have the following meanings:

(a) Best Management Practices. Activities, practices, and procedures to prevent or reduce the discharge of pollutants directly or indirectly to the municipal storm drain system and waters of the United States. Best Management Practices include but are not limited to: treatment facilities to remove pollutants from storm water; operating and maintenance procedures; facility management practices to control runoff, spillage or leaks of non-storm water, waste disposal, and drainage from materials storage; erosion and sediment control practices; and the prohibition of specific activities, practices, and procedures and such other provisions as the City determines appropriate for the control of pollutants. Please refer to the City of Monterey's BMP Guidance Series, as discussed further in Section 31.5-16(c) herein, for specific requirements.

R0006700

(b) City. The City of Monterey.

(c) Clean Water Act. The federal Water Pollution Control Act (33 U.S.C. § 1251 et seq.), and any subsequent amendments thereto.
Return to top

(d) Construction Activity. Activities subject to NPDES Construction Permits. These include construction projects resulting in land disturbance of 5 acres or more. Such activities include but are not limited to clearing and grubbing, grading, excavating, and demolition.

(e) Hazardous Materials. Any material, including any substance, waste, or combination thereof, which because of its quantity, concentration, or physical, chemical, or infectious characteristics may cause, or significantly contribute to, a substantial present or potential hazard to human health, safety, property, or the environment when improperly treated, stored, transported, disposed of, or otherwise managed (California Health and Safety Code §25117).

(f) Illegal Discharge. Any direct or indirect non-storm water discharge to the storm drain system, except as exempted in Division II, Section 31.5-12 of this chapter.
Return to top

(g) Illicit Connections. An illicit connection is defined as either of the following:

1. Any drain or conveyance, whether on the surface or subsurface, which allows an illegal discharge to enter the storm drain system including but not limited to any conveyances which allow any non-storm water discharge including sewage, process wastewater, and wash water to enter the storm drain system and any connections to the storm drain system from indoor drains and sinks, regardless of whether said drain or connection had been previously allowed, permitted, or approved by a government agency; or

2. Any drain or conveyance connected from a commercial or industrial land use to the storm drain system which has not been documented in plans, maps, or equivalent records and approved by the City.

(h) Industrial Activity. Activities subject to NPDES Industrial Permits as defined in 40 CFR, Section 122.26 (b)(14).

(i) National Pollutant Discharge Elimination System (NPDES) Storm Water Discharge Permits. General, group, and individual storm water discharge permits which regulate facilities defined in federal NPDES regulations pursuant to the Clean Water Act. The California Regional Water Quality Control Board, Central Coast Region (hereinafter, Regional Board) and the State Water Resources Control Board have adopted general storm water discharge permits, including but not limited to the General Construction Activity and General Industrial Activity permits.

(j) Non-Storm Water Discharge. Any discharge to the storm drain system that is not composed entirely of storm water.
Return to top

(k) Pollutant. Anything which causes or contributes to pollution. Pollutants may include, but are not limited to: paints, varnishes, and solvents; oil and other automotive fluids; non-hazardous liquid and solid wastes and yard wastes; refuse, rubbish, garbage, litter, or other discarded or abandoned objects, articles, and accumulations, so that same may cause or contribute to pollution; floatables; pesticides, herbicides, and fertilizers; hazardous substances and wastes; sewage, fecal coliform and pathogens; dissolved and particulate metals; animal wastes;

R0006701

wastes and residues that result from constructing a building or structure (including but not limited to sediments, slurries, and concrete rinsates); and noxious or offensive matter of any kind.

(l) Pollution. The human-made or human-induced alteration of the quality of waters by waste to a degree which unreasonably affects, or has the potential to unreasonably affect, either the waters for beneficial uses or the facilities which serve these beneficial uses (California Water Code §13050).

(m) Porter-Cologne Act. The Porter-Cologne Water Quality Control Act and as amended (California Water Code §13000 et seq.).

(n) Premises. Any building, lot, parcel of land, or portion of land whether improved or unimproved including adjacent sidewalks and parking strips.
Return to top

(o) Storm Drain System. Publicly-owned facilities operated by the City by which storm water is collected and/or conveyed, including but not limited to any roads with drainage systems, municipal streets, gutters, curbs, inlets, piped storm drains, pumping facilities, retention and detention basins, natural and human-made or altered drainage channels, reservoirs, and other drainage structures which are within the City and are not part of a publicly owned treatment works as defined at 40 CFR Section 122.2.

(p) Storm Water. Any surface flow, runoff, and drainage consisting entirely of water from rain storm events.

(q) Waters of the United States. Surface watercourses and water bodies as defined at 40 CFR § 122.2. including all natural waterways and definite channels and depressions in the earth that may carry water, even though such waterways may only carry water during rains and storms and may not carry storm water at and during all times and seasons.
Return to top

Section 31.5-7. Applicability.

This Article shall apply to all water entering the storm drain system generated on any developed and undeveloped lands lying within the City of Monterey including any amendments or revisions thereto.

Section 31.5-8. Responsibility for Administration.

The Public Works Director of the City shall administer, implement, and enforce the provisions of this Article. Any powers granted or duties imposed upon the Public Works Director may be delegated in writing by the Public Works Director to persons or entities acting in the beneficial interest of or in the employ of the City.
Return to top

Section 31.5-9. Severability.

The provisions of this Article are hereby declared to be severable. If any provision, clause, sentence, or paragraph of this Article or the application thereof to any person, establishment, or circumstances shall be held invalid, such invalidity shall not affect the other provisions or application of this Article.

Section 31.5-10. Regulatory Consistency.

This Article shall be construed to assure consistency with the requirements of the Clean Water Act and Porter-Cologne Act and acts amendatory thereof or supplementary thereto, or any applicable implementing regulations.

Section 31.5-11. Ultimate Responsibility of Discharger.

The standards set forth herein and promulgated pursuant to this Article are minimum standards; therefore this Article does not intend nor imply that compliance by any person will ensure that there will be no contamination, pollution, nor unauthorized discharge of pollutants into waters of the U.S. caused by said person. This Article shall not create liability on the part of the City of Monterey, or any agent or employee thereof for any damages that result from any discharger's reliance on this Article or any administrative decision lawfully made thereunder.
Return to top

Division II. Discharge Prohibitions.

Section 31.5-12. Prohibition of Illegal Discharges.

No person shall discharge or cause to be discharged into the municipal storm drain system or watercourses any materials, including but not limited to pollutants or waters containing any pollutants that cause or contribute to a violation of applicable water quality standards, other than storm water.

The commencement, conduct or continuance of any illegal discharge to the storm drain system is prohibited except as described as follows:

(a) Discharges from the following activities will not be considered a source of pollutants to the storm drain system and to waters of the U.S. when properly managed to ensure that no potential pollutants are present, and therefore they shall not be considered illegal discharges unless determined to cause a violation of the provisions of the Porter-Cologne Act, Clean Water Act, or this ordinance: potable water line flushing; uncontaminated pumped groundwater and other discharges from potable water sources; landscape irrigation and lawn watering; diverted stream flows; rising groundwater; groundwater infiltration to the storm drain system; uncontaminated foundation and footing drains; uncontaminated water from crawl space pumps; air conditioning condensation; uncontaminated non-industrial roof drains; springs; individual residential and occasional non-commercial car washing; flows from riparian habitats and wetlands; dechlorinated swimming pool discharges; street wash waters; and flows from fire fighting.
Return to top

(b) The prohibition shall not apply to any non-storm water discharge permitted under an NPDES permit, waiver, or waste discharge order issued to the discharger and administered by the State of California under the authority of the Federal Environmental Protection Agency, provided that the discharger is in full compliance with all requirements of the permit, waiver, or order and other applicable laws and regulations, and provided that written approval has been granted by the City of Monterey for any discharge to the storm drain system.

(c) With written concurrence of the Regional Board, the City of Monterey may exempt in writing other non-storm water discharges which are not a source of pollutants to the storm drain system nor waters of the U.S.
Return to top

Section 31.5-13. Prohibition of Illicit Connections.

(a) The construction, use, maintenance or continued existence of illicit connections to the storm drain system is prohibited.

(b) This prohibition expressly includes, without limitation, illicit connections made in the past, regardless of whether the connection was permissible under law or practices applicable or prevailing at the time of connection.

Section 31.5-14. Waste Disposal Prohibitions.

No person shall throw, deposit, leave, maintain, keep, or permit to be thrown,

deposited, left, or maintained, in or upon any public or private property, driveway, parking area, street, alley, sidewalk, component of the storm drain system, or water of the U.S., any refuse, rubbish, garbage, litter, or other discarded or abandoned objects, articles, and accumulations, so that the same may cause or contribute to pollution. Wastes deposited in streets in proper waste receptacles for the purposes of collection are exempted from this prohibition.
Return to top

Section 31.5-15. Discharges in Violation of Industrial or Construction Activity NPDES Storm Water Discharge Permit.

Any person subject to an industrial or construction activity NPDES storm water discharge permit shall comply with all provisions of such permit. Proof of compliance with said permit may be required in a form acceptable to the Public Works Director prior to or as a condition of a subdivision map, site plan, building permit, or development or improvement plan; upon inspection of the facility; during any enforcement proceeding or action; or for any other reasonable cause.

Division III. Regulations and Requirements.

Section 31.5-16. Requirement to Prevent, Control, and Reduce Storm Water Pollutants.

(a) Authorization to Adopt and Impose Best Management Practices. The City will adopt requirements identifying Best Management Practices for any activity, operation, or facility which may cause or contribute to pollution or contamination of storm water, the storm drain system, or waters of the U.S. as a separate BMP Guidance Series. Where Best Management Practices requirements are promulgated by the City or any federal, State of California, or regional agency for any activity, operation, or facility which would otherwise cause the discharge of pollutants to the storm drain system or water of the U.S., every person undertaking such activity or operation, or owning or operating such facility shall comply with such requirements.

The Public Works Director will report to the City Council annually on the status of implementation of BMP's, the pollutants of concern to be addressed the next year, and any new BMPs to be developed. BMP's developed under this program will be included in the City of Monterey's BMP Guidance Series.

(b) New Development and Redevelopment. The City may adopt requirements identifying appropriate Best Management Practices to control the volume, rate, and potential pollutant load of storm water runoff from new development and redevelopment projects as may be appropriate to minimize the generation, transport and discharge of pollutants. The City shall incorporate such requirements in any land use entitlement and construction or building-related permit to be issued relative to such development or redevelopment. The owner and developer shall comply with the terms, provisions, and conditions of such land use entitlements and building permits as required in this Article and the City Storm Water Utility Ordinance, Chapter 31.5, Article 1.
Return to top

(c) Responsibility to Implement Best Management Practices. Notwithstanding the presence or absence of requirements promulgated pursuant to subsections (a) and (b), any person engaged in activities or operations, or owning facilities or property which will or may result in pollutants entering storm water, the storm drain system, or waters of the U.S. shall implement Best management Practices to the extent they are technologically achievable to prevent and reduce such pollutants. The owner or operator of a commercial or industrial establishment shall provide reasonable protection from accidental discharge of prohibited materials or other wastes into the municipal storm drain system or watercourses. Facilities to prevent accidental discharge of prohibited materials or other wastes shall be provided and maintained at the owner or operator's expense.

Best Management Practices required by the City can be obtained from the Public Works Department by requesting the BMP manual appropriate to a commercial or industrial activity from the BMP Guidance Series. BMP's are broken into three categories: "high priority" which are required to be implemented, "medium priority" which are desirable to implement, and "low priority."
Return to top

Section 31.5-17. Requirement to Eliminate Illegal Discharges.

Notwithstanding the requirements of Division IV, Section 31.5-23 herein, the Public Works Director may require by written notice that a person responsible for an illegal discharge immediately, or by a specified date, discontinue the discharge and, if necessary, take measures to eliminate the source of the discharge to prevent the occurrence of future illegal discharges.

Section 31.5-18. Requirement to Eliminate or Secure Approval for Illicit Connections.

(a) The Public Works Director may require by written notice that a person responsible for an illicit connection to the storm drain system comply with the requirements of this Article to eliminate or secure approval for the connection by a specified date, regardless of whether or not the connection or discharges to it had been established or approved prior to the effective date of this Article.

(b) If, subsequent to eliminating a connection found to be in violation of this Article, the responsible person can demonstrate that an illegal discharge will no longer occur, said person may request City approval to reconnect. The reconnection or reinstallation of the connection shall be at the responsible person's expense.
Return to top

Section 31.5-19. Watercourse Protection.

Every person owning property through which a watercourse passes, or such person's lessee, shall keep and maintain that part of the watercourse within the property reasonably free of trash, debris, excessive vegetation, and other obstacles that would pollute, contaminate, or significantly retard the flow of water through the watercourse. In addition, the owner or lessee shall maintain existing privately owned structures within or adjacent to a watercourse, so that such structures will not become a hazard to the use, function, or physical integrity of the watercourse. The owner or lessee shall not remove healthy bank vegetation beyond that actually necessary for maintenance, nor remove said vegetation in such a manner as to increase the vulnerability of the watercourse to erosion. The property owner shall be responsible for maintaining and stabilizing that portion of the watercourse that is within their property lines in order to protect against erosion and degradation of the watercourse originating or contributed from their property.
Return to top

Section 31.5-20. Requirement to Remediate.

Whenever the Public Works Director finds that a discharge of pollutants is taking place or has occurred which will result in or has resulted in pollution of storm water, the storm drain system, or water of the U.S., the Public Works Director may require by written notice to the owner of the property and/or the responsible person that the pollution be remediated and the affected property restored within a specified time pursuant to the provisions of sections 31.5-25 through 31.5-28 below.

Section 31.5-21. Requirement to Monitor and Analyze.

The Public Works Director may require by written notice of requirement that any person engaged in any activity and/or owning or operating any facility which may

cause or contribute to storm water pollution, illegal discharges, and/or non-storm water discharges to the storm drain system or waters of the U.S., to undertake at said person's expense such monitoring and analyses and furnish such reports to the City of Monterey as deemed necessary to determine compliance with this Article.
Return to top

Section 31.5-22. Notification of Spills.

Notwithstanding other requirements of law, as soon as any person responsible for a facility or operation, or responsible for emergency response for a facility or operation has information of any known or suspected release of materials which are resulting or may result in illegal discharges or pollutants discharging into storm water, the storm drain system, or water of the U.S. from said facility, said person shall take all necessary steps to ensure the discovery, containment, and cleanup of such release. In the event of such a release of a hazardous material said person shall immediately notify emergency response officials of the occurrence via emergency dispatch services (911). In the event of a release of non-hazardous materials, said person shall notify the City's Public Works Department in person or by phone or facsimile no later than 5:00 p.m. of the next business day. Notifications in person or by phone shall be confirmed by written notice addressed and mailed to the City's Public Works Department within three business days of the phone notice. If the discharge of prohibited materials emanates from a commercial or industrial establishment, the owner or operator of such establishment shall also retain an on-site written record of the discharge and the actions taken to prevent its recurrence. Such records shall be retained for at least three years.
Return to top

Division IV. Inspection and Monitoring.

Section 31.5-23. Authority to Inspect.

Whenever necessary to make an inspection to enforce any provision of this Article, or whenever the Public Works Director has cause to believe that there exists, or potentially exists, in or upon any premises any condition which constitutes a violation of this Article, the Director may enter such premises at all reasonable times to inspect the same and to inspect and copy records related to storm water compliance. In the event the owner or occupant refuses entry after a request to enter and inspect has been made, the City is hereby empowered to seek assistance from any court of competent jurisdiction in obtaining such entry.

Section 31.5-24. Authority to Sample, Establish Sampling Devices, and Test.

During any inspection as provided herein, the Public Works Director may take any samples and perform any testing deemed necessary to aid in the pursuit of the inquiry or to record site activities.
Return to top

Division V. Enforcement.

Section 31.5-25. Notice of Violation.

Whenever the Public Works Director finds that a person has violated a prohibition or failed to meet a requirement of this Article, the Director may order compliance by written notice of violation to the responsible person. Such notice may require without limitation:

(a) The performance of monitoring, analyses, and reporting;

(b) The elimination of illicit connections or discharges;

(c) That violating discharges, practices, or operations shall cease and desist;

R0006706

(d) The abatement or remediation of storm water pollution or contamination hazards and the restoration of any affected property; and

(e) Payment of a fine to cover administrative and remediation costs; and

(f) The implementation of source control or treatment BMPs.

If abatement of a violation and/or restoration of affected property is required, the notice shall set forth a deadline within which such remediation or restoration must be completed. Said notice shall further advise that, should the violator fail to remediate or restore within the established deadline, the work will be done by the City or a contractor designated by the Public Works Director and the expense thereof shall be charged to the violator pursuant to Section 31.5-27 below.
Return to top

Section 31.5-26 Appeal.

Notwithstanding the provisions of Section 31.5-29 below, any person receiving a Notice of Violation under Section 31.5-25 above may appeal the determination of the Public Works Director to the City Manager. The notice of appeal must be received by the City Manager within 5 days from the date of the Notice of Violation. Hearing on the appeal before the City Manager or his/her designee shall take place within 15 days from the date of City's receipt of the notice of appeal. The decision of the City Manager or designee shall be final.

Section 31.5-27 Abatement by City.

If the violation has not been corrected pursuant to the requirements set forth in the Notice of Violation, or , in the event of an appeal under section 31.5-26, within 10 days of the decision of the City Manager upholding the decision of the Public Works Director, then the City or a contractor designated by the Public Works Director shall enter upon the subject private property and is authorized to take any and all measures necessary to abate the violation and/or restore the property. It shall be unlawful for any person, owner, agent or person in possession of any premises to refuse to allow the City or designated contractor to enter upon the premises for the purposes set forth above.
Return to top

Section 31.5-28 Charging Cost of Abatement/Liens.

Within 30 days after abatement of the nuisance by City, the Public Works Director shall notify the property owner of the property of the cost of abatement, including administrative costs. The property owner may file a written protest objecting to the amount of the assessment with the City Clerk within 15 days. The City Clerk shall set the matter for public hearing by the City Council. The decision of the City Council shall be set forth by resolution and shall be final.

If the amount due is not paid within 10 days of the decision of the City Council or the expiration of the time in which to file an appeal under this Section, the charges shall become a special assessment against the property and shall constitute a lien on the property for the amount of the assessment. A copy of the resolution shall be turned over to the County Auditor so that the auditor may enter the amounts of the assessment against the parcel as it appears on the current assessment roll, and the tax collector shall include the amount of the assessment on the bill for taxes levied against the parcel of land.
Return to top

Section 31.5-29 Urgency Abatement.

The Public Works Director is authorized to require immediate abatement of any violation of this Article that constitutes an immediate threat to the health, safety or

well-being of the public. If any such violation is not abated immediately as directed by the Public Works Director, the City of Monterey is authorized to enter onto private property and to take any and all measures required to remediate the violation. Any expense related to such remediation undertaken by the City of Monterey shall be fully reimbursed by the property owner and/or responsible party. Any relief obtained under this section shall not prevent City from seeking other and further relief authorized under this Article.

Section 31.5-30. Violations.

It shall be unlawful for any person to violate any provision or fail to comply with any of the requirements of this Article. A violation of or failure to comply with any of the requirements of this Article shall constitute a misdemeanor and shall be punished as set forth in City Code Section 1.7.
Return to top

Section 31.5-31. Compensatory Action.

In lieu of enforcement proceedings, penalties, and remedies authorized by this Article, the Public Works Director may impose upon a violator alternative compensatory actions, such as storm drain stenciling, attendance at compliance workshops, creek cleanup, etc.

Section 31.5-32. Violations Deemed a Public Nuisance

In addition to the enforcement processes and penalties hereinbefore provided, any condition caused or permitted to exist in violation of any of the provisions of this Article is a threat to public health, safety, and welfare, and is declared and deemed a nuisance, and may be summarily abated or restored by the City at the violator's expense, and/or a civil action to abate, enjoin, or otherwise compel the cessation of such nuisance may be taken by the City.
Return to top

Section 31.5-33. Acts Potentially Resulting in a Violation of the Federal Clean Water Act and/or California Porter-Cologne Act.

Any person who violates any provision of this Article or any provision of any requirement issued pursuant to this chapter, may also be in violation of the Clean Water Act and/or the Porter-Cologne Act and may be subject to the sanctions of those acts including civil and criminal penalties. Any enforcement action authorized under this Article shall also include written notice to the violator of such potential liability."

SECTION 2. All ordinances and parts of ordinances in conflict herewith are hereby repealed.

SECTION 3. This ordinance shall be in full force and effect 30 days after its final passage and adoption.

MEETING NOTES
L.A. MS-4 Mediation, November 29, 2001

Note: revisions to draft notes denoted by underlining

Agenda
Mediated Dialogue on L. A. MS-4 Permit Language
November 29, 2001

I. Introduction – **9:45 -10:00**
Introduction/expectations
Review agenda
Review Ground rules

II. Review Consensus and action items from Nov. 9 th meeting **10:00-10.20**

III Review proposed changes to Industrial/ Commercial Inspection section 10:20- 11:05
* Presentation- Dan Radelescu-5 min
* clarifying questions
* facilitated dialogue
* desired outcome- consensus on proposed changes

V. Implementation Issues **11:05-12:00**
* See attached list

* facilitated dialogue: clarify expectations, identify options and factors (possibly based on common interests)
Desired outcome: consensus on provisions and/or next steps

BREAK (12:00 -12:15)

V. Issues (continued) (working lunch) **12:15-2:45**

NOTE: permitees caucused for approximately one hour after lunch

VI. Other issues B as time permits – **2:45-3:15**
*facilitated dialogue: options and factors
Desired Outcome: consensus on next steps

VII. Wrap Up **3:15-3:30**
Consensus items
Action items
Next steps

Information from flip charts --

Implementation Issues

1) Phase I/ State permitted facilities
How can we use resources efficiently and minimize Phase I overlap?

2) Inspections
a) automotive service facilities
How can we target our resources most effectively?
b) RGOs
Need clarification- is permit consistent with SWRCB guidance?

3) Inventory of Industrial uses
How can we clarify which uses characteristics the city should inspect prior to inventory?

4) Deadlines. Submittals
Can we incorporate some flexibility in deadlines/ submittal dates?

5) Funding
How can we assure permit requirements do not limit eligibility for grant funds?

6) Land Use Authority
How can we eliminate redundancy in permit compared to CEQA guidelines and general plan guidelines?

7) MEP definition
How can we clarify the definition and application of MEP in the permit?

8) SUSMPS
How can we assure the permit is consistent with SWRCB order 2001-11?
(ESA, RGOs, Redevelopment, and ministerial projects)

Other Implementation Issues

Construction site inspections

Frequency of catch basin cleaning

Trauma scene exemption

Dry weather diversions

Illicit connections

MEETING NOTES

I. Introduction

II. Consensus and Action Items from last meeting

- **Consensus Items-- refer to meeting summary dated November x, 2001**
- **Review of Action Items:**

1. Dan (Regional Board) will provide copies of inspection provisions in other permits to all parties within one week-- attached to information handed out at meeting

2. Laura (EPA) will provide copies of MOUs used in Bay area cities to all parties within one week-- handed out today

3. Howard (County of L.A.) will propose "bridge" language on Water Quality language and provide to all parties within one week -- completed

4. Laura will ask Alexis Strauss if she wants to express an opinion on the alternative language provided by County of L.A. -- answer: no

5. Wendy (Regional Board) will consider any changes by the State Board in San Diego permit in deciding on final language for water quality limitations -- State Board final decision on November 20

6. Board will consider trial inspection approach for categories other than restaurants before finalizing the permit by November 21st -- Board indicated willing to do

III. Review proposed changes to industrial/commercial inspection section-- Regional Board presentation-provided by e-mail on November 28

- Summary of Handout by regional Board (Wendy Phillips)

-longer-term goal -- tailor to watersheds
-short-term goal -- increase field presence
-revised proposal -- reformat of Option B
  -clarify expectations
  -recognize resource constraints
-track
-inspect
  a) commercial
  b) Phase I-role of regional Board
  c) other
-ensure compliance

- Modifications to regional Board handout (note: consensus or agreed upon changes indicated by italics)

Clarifications by regional Board:

Regional Board's intent for Phase I inspections conducted by Board -- 1/3 of all permitted facilities will be inspected per year (approximately 2/3 in a 24 month period). Therefore the expectation is that the permitees inspect 1/3 of all permitted facilities every 24 months-later revised to every 30 months.

Frequency: change from 24 months to twice per permit cycle every 30 months with at least one inspection per year in between for Tier I

Need separate dialogue on coordinating Phase I inspections

Regional Board will inspect those with individual permits
Remove petroleum from the list

Permittee Concern-the designation of High vs. Low priority inspections has been removed from the permit

Definition of high priority facilities: 100 % of universe will be inspected every two years

R0006711

Definition of low priority facilities: 100% of universe will be inspected within the first two years of the permit cycle then reduced to 20% of the universe for the remainder of the permit cycle

Regional Board will put high and low designations back into the permit-- will keep concept in the permit (later reclassified as Tier I and II)

7,9, 10, add to Tier I or II
the categories below will be moved to Tier I (high)
-oil and gas
-rail yards
-airports
-transits

clarify in Tier I and II which SIC codes are covered under the general industrial storm water permit

Change p. 37 as follows:copy paragraph from page 36, 2a.iii. (Level of inspection) to page 37, b and c.

Permitees Concern: Need to identify individual storm water permitees that will be inspected by regional Board (i.e., refineries) annually-- can regional Board identify facilities they will inspect to avoid duplication of effort?

Regional Board response: yes, but not in permit

Clarification-pp. 34 and 37: add regulatory citation 122.26 (d) (2) (IV) (c) to "other federal facilities"

Clarification-page 38, ESA and impaired waters: will clarify intent to focus on pollutants violating water quality objectives; BMPs considered shall be linked to water quality impairment

Clarification on page 38: add "ensure compliance"

Change page 34 C 1 (a) replace "include" with "are"

page 39 concern-- add the following... " (when available)"... after "staff"
support of regional Board enforcement

Suggested by regional Board: Two corrections on page 39 --
-- Line 8: insert "follow-up" between "two" and "inspections"
-- Referral of complaints: replace "referral" with "investigate"

Suggestion: add language to reflect quicker referral to board if a facility is already under permit (page 38, 3c, progressive enforcement)-- will reflect 2 tiers of enforcement, one for facilities permitted by Board (Phase I) and one for facilities without permit

Permittee Concern: Page 39 (d), Referral of Complaints- "complaints", "one business day", "situations" -- need clarification-is complaint from regional Board or others?

Regional Board will add language to clarify "Tiered response" based on severity of situation) and will add language to clarify that complaints originate from regional Board

Permittee concern: can wording be provided to allow flexibility to use 319 funding where appropriate?

Regional Board response: Can this be addressed at the policy level rather than in the permit?
EPA requested to provide guidance/flexibility on this issue

Permitees Question: How can regional Board help permitees to adopt stronger ordinances allowing BMP enforcement without documented release?

Options identified to result in stronger local ordinances:
1. Strengthen language in Findings 8-9.
2.-regional Board offered *to attend city council meetings to explain the permit requirements to council members*
3. Consider Monterey ordinance

Note: consensus was reached on Option 1 and part of 2 -- see Action Items as well as subsequent letter by Dickerson e-mail to group by Gentile on 12/6/01

V. Major implementation Issues

Major Item 1- Phase I/State permitted facilities

1-3 below represents an agreement in principle (regional Board needs to develop language in the future):

1. Put information on regional Board web site regarding past inspections
2.Regional Board will work out means to communicate inspection plan to permitees
3Identify sectors (i.e. geographic category) to be inspected by regional Board

Major Item 2-Inspections

2a) Automotive Inspections
SIC codes 5013, 5014
maintenance vs. warehousing

regional Board will revise the definition of automotive service facilities as follows:
"except for wholesalers without outside exposure", page 63 definition of automotive service facilities

Major Item 3-Inventory of Industrial Uses
"addressed in modified B"

Major Item 4-Deadlines/Submittals-referred to Signal Hill handout (regional Board agreed to review schedule provided)

VI. Other Issues (not on agenda)-Funding and access

- Funding -- Major Concern of Permitees-$$for medium/small cities

Regional Board asked for commitment to proposed handout, as modified:

Dennis: need endorsement of modified proposal by those at the table; challenges of the permit are

expected; need endorsement at Board meeting by people at table "ringing endorsement", assuming we reach agreement, as follows:
-- personal support
-- acknowledge any disagreement at political level

the following parties at the table acknowledged endorsement: Signal Hill, City of L.A., County of L.A., Downey. Farfsing will recommend endorsement to the Coalition and Desi will recommend endorsement to the EAC. Baykeeper will support if cities support but still maintains the right to challenge other provisions in the permit.

- Permitees Concern regarding access -- can you determine compliance without gaining access?
- Regional Board concern regarding access -- permitees ability to determine compliance without gaining access

Need to clarify exception to definition of inspection as described in permit--- that is, those situations where BMP compliance for restaurants can be determined without access

Overall Support of modified industrial/commercial program with understanding
1. Need for additional dialogue on funding
2. Add dialogue on acceptable local ordinances regarding access

VII. Wrap up

- **Action Items**

Action Item 1-Wendy will develop stronger language for findings 8,9 with input from Rich Watson

Action Item 2-regional Board will consider adding language to the General Industrial Permit to require compliance with any local permits

Action Item 3-Montevideo will contact environmental groups (Steve and Mark) to see if they can identify and agree on other categories where a determination of compliance can be made without access

Action Item 4- Regional Board will modify November 29 proposal based on agreements made today by December 4th for close of business and will distribute to all parties.

Action Item 5- All parties can, by December 10, provide input – yes or no

Action Item 6- If consensus, will propose modified option to the Board

- **Meeting Evaluation**

What worked-
good dialogue

What didn't work-
-more time needed

-draft permit was not out early enough for review
-more time needed for caucus
-some people had to leave early

For 11/29/01 Meeting

C. Industrial/Commercial Facilities Program [Version B]

Each Permittee shall implement an Industrial and Commercial Facilities Program. The objective is to reduce pollutants in storm water runoff to the maximum extent practicable by requiring the implementation of pollutant reduction and control measures at industrial and commercial facilities. The pollutant reduction and control measures can be used alone or in combination and include nonstructural, structural controls, and operation and maintenance procedures, which can be applied before, during, and/or after pollution producing activities. At a minimum, the Program shall include the following requirements.

1. Inventory of Facilities

a) Database ~~for~~to Identify Critical Sources ~~Identification~~

Each Permittee, within its jurisdiction, shall update annually (individually or in partnership) a watershed-based inventory of all facilities identified as priority through the Permittees critical sources identification program. The database inventory of facilities may be augmented or reduced as new data becomes available. The update of the database may be accomplished through the collection of new information obtained through field activities or through other readily available intra-agency informational databases (e.g. business licenses, pretreatment permits, sanitary sewer hook-up permits). The inventory shall include the following minimum fields of information for each industrial and commercial facility:

(1) Name of facility and name of owner/operator;

(2) address;

(3) coverage under the GIASP or other individual or general NPDES permits; and

(4) a narrative description including SIC codes that best reflects the principal products or activities performed by each facility.

The use of an automated database system, such as Geographical Information System (GIS) or Internet-based system is highly recommended, but not required. The Permittees may add other fields of information, as necessary (e.g. to point out discrepancies between SIC Code designation and type of activities actually performed on-site, exposure of activities and/or materials to storm water, etc.) Facilities determined at no risk of exposure will be so identified in the inventory database. At a minimum, the type of facilities considered for the inventory, will include:

b) High Priority Categories

(1) Municipal Landfills

(2) Hazardous Waste Treatment, Disposal and Recovery Facilities

(3) Facilities Subject to SARA Title III (also known as EPCRA)

(4) Restaurants

(5) Wholesale trade (scrap, auto dismantling)

(6) Automotive service facilities

(7) Fabricated metal products

(8) Motor freight

(9) Chemical/allied products

(10) Automotive Dealers/Gas Stations

(11) Primary Metals Products

c) Lower Priority Categories

Facilities which are listed in Attachment B of the permit.

2. **Inspect Municipal Landfills, Hazardous Waste Treatment, Disposal and Recovery Facilities, Facilities Subject to SARA Title III (also known as EPCRA)**

a) The Permittees shall inspect

(1) Municipal landfills;

(2) Hazardous waste treatment, disposal and recovery facilities; and,

(3) Facilities subject to SARA Title III

once every 24 months.

b) Level of inspection: The Permittees shall confirm that

(1) BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP; and,

(2) Each owner/operator has a current Waste Discharge Identification (WDID) number, and that a Storm Water Pollution Prevention Plan is available on-site.

c) Enforcement

The Permittees shall abide by the requirements at paragraph 8.

3. Inspect Restaurants

The Permittees, in cooperation with their appropriate departments (such as health, public works, etc.), or using an equivalent approach, shall inspect all restaurants to determine that storm water BMPs are being implemented effectively.

a) Frequency: The Permittees shall inspect each restaurant once every 24 months. Inspectors shall distribute educational materials to facility operator on storm water pollution prevention practices.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

~~c)~~Restaurants shall be inspected to verify that:

(1) Oil and Grease residue is not poured onto a parking lot, street or adjacent catch basin;

(2) The trash bin area is clean, trash bin lid closed, not filled with liquid or washed out;

(3) Parking lot, alley, sidewalk and street areas (in the immediate vicinity of the establishment), floormats, filters and garbage containers are not washed and that no washwater is poured in those areas;

(4) Removal of food waste, rubbish or other materials from the parking lot area is not performed in an unsanitary manner or creating a nuisance through hosing down the area.

~~d)Inspectors shall distribute educational materials to facility operator on storm water pollution prevention practices.~~

c) Enforcement

The Permittees shall abide by the requirements at paragraph 8.

d) The Permittees, as they see fit, are free to develop additional BMPs for restaurants.

4. Inspect Retail Gasoline Outlets

The Permittees shall communicate appropriate BMPs to each RGO (in accordance with the SQMP and Regional Board Resolution 98-08, and the Stormwater Quality Task Force Best Management Practice Guide for RGOs.)

a) Frequency: The Permittees shall inspect each RGO and Automotive Service facility once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

~~c)~~RGOs shall be inspected to verify that:

(1) Fuel-dispensing areas are routinely swept for removal of litter and debris, and that rags and absorbents are ready for use in case of leaks and spills;

(2) Operator is aware that wash down of RGO area to the storm drain is prohibited;

(3) Employees are trained in management of waste materials;

(4) Drains and flow patterns are labeled at the facility;

(5) Inspection and cleans up of storm drain inlets and catch basins within the facility's boundaries are performed before October 1 each year;

(6) Posting signs are close to the fuel dispenser that warn vehicle owners/operators against "topping off" of vehicle fuel tanks and installation of automatic shutoff fuel dispensing nozzles;

(7) Outdoor waste receptacle and air/water supply area is routinely cleaned-up of leaks and drips, that only watertight waste receptacles are used and lids are closed. Check if grading is done in such a way to prevent run-on of storm water, segregation of flow, and if a roof cover or a low containment berm was built; and,

(8) Employees are trained to implement storm water pollution prevention practices.

~~d)A follow-up inspection shall be performed within one business day when a complaint related to non-storm water or contaminated storm water discharge is made against a previously inspected RGO.~~

c) Enforcement

The Permittees shall abide by the requirements at paragraph 8.

5. Inspect Automotive Service Facilities

The Permittees shall communicate appropriate BMPs to each Automotive Service facility (in accordance with the SQMP and Regional Board Resolution 98-08.)

a) Frequency: The Permittees shall inspect each Automotive Service facility once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

~~c)~~Automotive Service facilities shall be inspected to verify that:

(1) The facility area is clean and dry without evident stains;

(2) Measures are implemented to prevent spills and leaks;

(3) The facility operator properly manages wastewaters;

(4) The facility operator is aware of the prohibition on discharge of non-storm water to the storm drain;

(5) The facility operator properly manages raw and waste materials including proper disposal of hazardous waste;

(6) Outdoor work and storage areas are protected to prevent potential pollution;

(7) Storm drain inlets situated on the property are labeled, inspected and routinely cleaned out; and,

(8) Employees are trained to implement storm water pollution prevention practices.

c) Enforcement

The Permittees shall abide by the requirements at paragraph 8.

6. **Visit Wholesale Trade (scrap, auto dismantling), Fabricated Metal Products, Motor Freight, Chemical/Allied Products, Primary Metal Products Facilities**

a) Frequency: The Permittees shall inspect each facility in the following categories once every 24 months.

(1) Wholesale trade (scrap, auto dismantling);

(2) Fabricated metal products;

(3) Motor freight;

(4) Chemical/Allied products; and

(5) Primary metal products.

b) Level of inspection: The Permittees shall confirm that

(1) BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP; and,

(2) Each owner/operator has a current Waste Discharge Identification (WDID) number, and that a Storm Water Pollution Prevention Plan is available on-site.

c) Enforcement

The Permittees shall abide by the requirements at paragraph 8.

7. Visit Sites ~~Visits to~~in Lower Priority Categories

a) Based on the inventory developed under paragraph 1. above, each Permittee shall visit facilities identified as lower priority as specified below.

(1) Frequency: Each Permittee shall visit all industrial/commercial facilities (except those subject to the inspection program) no later than (24 months from the permit effective date).

(2) Level of visit: Each Permittee shall confirm that each owner/operator:

(i) has a current Waste Discharge Identification (WDID) number (for facilities discharging storm water associated with industrial activity), and that a Storm Water Pollution Prevention Plan is available on-site, and

(ii) is implementing BMPs consistent with model programs for industrial and commercial facilities, and local storm water/urban runoff ordinances. The Permittees may use appropriate enforcement mechanisms against facilities failing to comply with the municipal storm water requirements, if they deem necessary.

(3) Enforcement Referral: For any facility not complying with requirements for facilities discharging storm water associated with industrial activity (i.e. a non-filer), Permittees shall advise the owner/operator of such facility of its obligation to obtain coverage under the GIASP, and shall document this action. On a quarterly basis, Permittees shall provide the Regional Board an updated electronic record of non-filers identified during site visits.

b) Each Permittee shall develop and implement a program to conduct spot checks of lower priority facilities subject to site visits (excluding those previously determined to pose no risk of exposure). After the completion of the first site visit cycle (i.e., first 24 months) twenty percent of the total number of facilities will be visited per year. Spot check visits will be performed as described in paragraph a.2. and a.3. of section 7.

GENERAL REQUIREMENTS

8. Enforcement

In the event a Permittee determines, after initial inspection, that a facility failed to implement or appropriately implement the suitable BMPs, they shall initiate, within a reasonable time period, a follow-up thorough inspection. During a follow-up inspection the Permittees may require implementation of additional BMPs. If a facility continues to be in non-compliance even after the follow-up inspection, the Permittees shall follow the activities specified at paragraph 10.c. of this section.

9. BMPs Implementation

In the event that particular minimum BMPs are infeasible at any site, Permittees shall require implementation of other BMPs that will achieve the equivalent reduction of pollutants in the storm water discharges. Furthermore, Permittees may require additional site-specific controls (BMPs) as necessary to comply with this Order, including BMPs that are more stringent than those required under the statewide GIASP.

a) For industrial and specified commercial facilities, identified as critical sources, tributary to CWA § 303(d) impaired water bodies, Permittees shall consider requiring operators to implement additional controls as necessary.

b) For industrial and specified commercial facilities, identified as critical sources, within or directly adjacent to or discharging directly to ESAs, Permittees shall consider requiring operators to implement additional controls as necessary.

~~**8.Complaint Response**~~

~~In response to any complaint related to storm water or unauthorized non-storm water discharges or a specific request by the Regional Board Executive Officer, a Permittee shall visit any facility, to determine if the facility is effectively complying with the SQMP and municipal storm water/urban runoff ordinances.~~

~~9.~~10. Interagency Coordination

a) The Permittees shall provide compliance assistance to the Regional Board through supporting activities, including but not limited to: referrals of complaints, assisting in identification of current owners, operators, and leasees in conjunction with activities performed at any facility within municipal jurisdiction, appearing as witnesses in Regional Board enforcement hearings, and participating in joint inspections when requested by Regional Board staff.

b) In response to any complaint related to storm water or unauthorized non-storm water discharges or a specific request by the Regional Board Executive Officer, a Permittee shall visit any facility, to determine if the facility is effectively complying with the SQMP and municipal storm water/urban runoff ordinances.

c) For facilities that are still not in compliance with the municipal storm water requirements, even after the follow-up inspection, the Permittees shall pursue the progressive enforcement procedures specified in the local code or ordinance to the maximum extent reasonably possible.

After an additional follow-up inspection and after the lower level administrative enforcement procedures are exhausted, in the event the facility is still out of compliance, the Permittees may chose to refer the non compliance case to the Regional Board for further enforcement activity. The Permittees shall include the appropriate records to document the set of circumstances for referral to the Regional Board. The Permittees may also elect to pursue further judicial or recovery measures as specified in the local code, if deemed necessary.

Copies of other ~~the~~ inspection/site visit reports and any follow-up documentation shall be provided to the Regional Board Executive Officer upon request.

d) The Regional Board and the Permittees may choose to establish a joint Storm Water Enforcement Task Force to coordinate their enforcement activities. The creation and details of the Task Force activities shall be finalized through consultation and mutual agreement between the parties.

~~10.~~11. Regional Board Inspected Facilities

To the extent that the Regional Board has conducted an inspection of a facility during a particular year, or the inspection has been performed through an authorized agent on behalf of the Regional Board, the

Permittee need not inspect the facility during the same 24 month inspection period.

~~11.~~12. Facilities Not Addressed

The Permittees need not inspect State or Federal facilities that are not under their jurisdiction.

Best Management Practices
Surface Water Pollution Prevention Home

Business Inspection Program

Seattle's waterways are vulnerable to pollution from a wide variety of human activities. Some businesses within Seattle drain to a creek, lake or bay. Spills or debris may be washed from properties into a public storm system and flow to these aquatic habitats.

Seattle Public Utilities is inspecting commercial and industrial properties to improve stormwater pollution prevention practices in the City of Seattle. The intent of this program is to work with local businesses to improve stormwater quality in Seattle's creeks, lakes and Puget Sound.

Business inspections are part of the City's stormwater pollution prevention program, a requirement of the Washington State Department of Ecology administered through the City's National Pollution Discharge Elimination System (NPDES) permit for municipal stormwater discharges.

Stormwater Pollution Prevention Requirements

Under the Seattle Stormwater, Grading, and Drainage Control Code (SMC 22.800), all businesses are required to implement certain operational and structural source controls to reduce stormwater pollution.

- **Operational stormwater source controls consist of management practices that prevent or reduce the amount of pollutants in stormwater runoff.** Best Management practices include simple housekeeping activities such as regularly sweeping parking lots and sidewalks, maintaining existing drainage systems, training employees about stormwater pollution prevention practices, and maintaining spill control supplies onsite to prevent and cleanup accidental spills.
- **Structural stormwater source controls are physical, structural, or mechanical devices or facilities that are constructed to prevent pollutants from entering stormwater.** Examples of structural source controls include: enclosing and/or containing the pollutant source; constructing berms, curbs, or dikes to prevent unpolluted stormwater from entering an area where pollution-generating activities take place; and containing and/or treating runoff from contaminated areas.

Check the Director's Rules to see what the new requirements are for public property. If your property drains are connected to the city stormwater system, then you are responsible for maintaining your drainage structures:

- conveyance systems, detention systems and treatment systems
- maintaining streets, driveways, parking lots and sidewalks
- identifying and eliminating illicit connections to the drainage control system.

Business Inspection Program FAQs

More Information for business owners
Four Director's Rules describe City requirements for stormwater flow control, treatment, and construction-related drainage requirements for new and redevelopment projects. They also cover stormwater pollution source control requirements for existing and new or redevelopment projects.

- DR 16-2000 (5.7MB PDF), Volume 2, Construction Stormwater Control Technical Requirements Manual
  Describes requirements for construction projects (temporary erosion and sedimentation control and control of other pollutants).
- DR 17-2000 (1.6MB PDF), Volume 1, Source Control Technical Requirements Manual
  Describes the operational and structural source controls that are required to reduce stormwater pollution.
- DR 26-2000 (1.9MB PDF), Volume 3, Flow Control Technical Requirements Manual
  Describes requirements for controlling peak flow rates for new and redevelopment projects.
- DR 27-2000 (3.7MB PDF), Volume 4, Stormwater Treatment Technical Requirements Manual
  Describes requirements for treating stormwater from new and redevelopment projects.

Paper copies of these rules are also available at the DCLU Applicant Services Center, Key Tower, 700 5th Avenue, 20th Floor. However, due to their considerable length, a fee is being charged to cover production costs.

If you have any questions or concerns regarding the business inspection process, please contact our business inspectors.

December 3, 2001

Mr. Steve Arita
Western States Petroleum Association
1115 11th Street Suite 150
Sacramento, CA 95814

Dear Mr. Arita:

SUPPLEMENT DOCUMENT TO THE JUNE 2001 TECHNICAL REPORT - RETAIL GASOLINE OUTLETS: NEW DEVELOPMENT DESIGN STANDARDS FOR MITIGATION OF STORM WATER IMPACTS

In preparation to reissue the Los Angeles County Municipal Storm Water Permit (LA Municipal Permit), Regional Board staff prepared and issued in June 2001 a Technical Report - Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts.

On August 6, 200, WSPA submitted a critique of the RGO Technical Report in its comment on the second draft of the LA Municipal Permit.

Attached to this letter, is a supplement document discussing some of the points raised by WSPA. We appreciate WSPA's involvement in the LA Municipal Permit renewal process.

Should you have any questions, please do not hesitate to contact Dan Radulescu at (213) 576-6668.

Sincerely,

Xavier Swamikannu, D.Env.
Acting Chief, Storm Water Section

cc: Ron Wilkniss, Western States Petroleum Association

RETAIL GASOLINE OUTLETS: NEW DEVELOPMENT DESIGN STANDARDS FOR MITIGATION OF STORM WATER IMPACTS

SUPPLEMENT

(To June 2001 Technical Report)

December 2001

Dan Radulescu and Xavier Swamikannu
California Water Quality Control Board, Los Angeles Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Introduction

On March 23, 2001, the Western States Petroleum Association (WSPA), a trade association for the petroleum industry in the Western U.S., submitted a petition to the State Water Resources Control Board (State Board) which challenged the inclusion of numerical design standards for Retail Gasoline Outlets (RGOs) in the Municipal Separate Storm Sewer (MS4) permit for San Diego County.[1]

In June 2001, the California Water Quality Control Board, Los Angeles Region (LA Regional Board) and the California Water Quality Control Board, San Diego Region (SD Regional Board) issued a Technical Report, 'Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts' (RGO Technical Report). The Technical Report was prepared in response to the direction provided by the State Board in its decision in, *In Re*: City of Bellflower et al. (Order No. WQ 200-11, hereafter the LA SUSMP Decision) for the inclusion of numerical design standards for RGOs in future MS4 permits. The RGO Technical Report addressed presumptive concerns expressed by the State Water Resources Control Board (State Board) in the LA SUSMP Decision such as, (i) heavily regulated; (ii) limitations of space; (iii) feasibility and safety of treatment; (iv) absence of a threshold relative to RGO size. It also recommends a threshold relative to RGO size as directed by the State Board. WSPA claims that the Regional Board's evidence and findings are not "proper justification" as

[1] The State Board upheld WSPA's petition on procedural grounds. See *In Re*: Building Industry Association of San Diego and Western States Petroleum Association (Order No. WQ 2001-15)

R0006728

required by the State Board. In contrast, Regional Board Counsel has determined that the criteria established are lawful and proper.[2]

On August 6, 200, WSPA submitted a critique of the RGO Technical Report in its comment on the second draft of the Los Angeles County MS4 permit. WSPA, in large part, contended that the justification was not proper. The LA Regional Board staff has prepared this Supplement to the RGO Technical Report to clarify issues raised by WSPA in its critique of the RGO Technical Report, and WSPA's comments on applicability of numerical design standards to RGOs in reference to the October 11 tentative draft of the Los Angeles County MS4 permit.[3]

Lack of Specific Analyses by WSPA

We are concerned as to the lack of substantive documentation by WSPA of its assertions that the treatment of storm water to remove pollutants of concern in California is technically not feasible, not safe, and prohibitively costly. WSPA has not technically documented the bases of such claims or conducted any analyses of such conditions at RGOs. Rather WSPA and its consultants appear to misinterpret data from other studies; misstate facts; draw questionable inferences, and gloss over important differences. Regional Board staff on the hand have conducted independent analyses of these factors and facts to ensure "proper justification" for the inclusion of RGOs.

For example contrary to WSPA's claims, (i) WSPA member RGOs in Western Washington and Northern Oregon have been required by their municipalities to utilize tiered treatment since 1992 to remove petroleum hydrocarbons in storm water runoff from the fueling areas and other pollutants such as heavy metals from adjacent areas, and not after "August 2001" (Figure 1);[4] (ii) treatment control BMP pollutant concentrations were higher in the effluent at a Washington State RGO study site only because the parameters were either a component of the treatment media (phosphorous and nitrates) or the influent concentration was low (oil and grease), not because the BMP was ineffective;[5] (iii) treatment control BMPs tested by Caltrans performed as expected but needed more maintenance because of undersizing and no pre-treatment, not because they were ineffective;[6] (iv) space at RGOs for installation of treatment

control BMPs is not constrained to render it infeasible (Table 1)[7], (iv) subsurface treatment control BMPs are safe, as demonstrated by WSPA member RGOs in Washington and Oregon who have installed these systems for some years; and (v) cost of installation of treatment control BMPs (actually a retrofit of existing facilities) tested by Caltrans was well within estimated costs; the larger expense was for monitoring and analysis...not installation.[8]

RGOs are Storm Water Pollutant Hotspots

RGOs are incontrovertible hot spots for pollutants of concern in storm water and have been widely documented as such. The most common pollutants of concern in storm water runoff from RGOs are heavy metals, petroleum hydrocarbons (such as Polycyclic Aromatic Hydrocarbons (PAHs)), and oil and grease.[9] These pollutants have been identified through analyses of: (i) trapped sediments in on-line oil water separators; (ii) particulates removed by treatment control BMPs such as media filters; (iii) simulated runoff; or (iv) storm water runoff leaving RGOs. In studies conducted, since 1970, in relation to automotive related activities and their impact on the quality of storm water runoff, a strong correlation has emerged between the volume and duration of automotive exposure and its impact on water quality and sediment quality criteria. As a result, several areawide storm water management programs already identify RGOs as pollutant hotspots and require the implementation of treatment control BMPs.[10,11,12]

An 18-month study was performed in the Washington Metropolitan area ("Washington Study"), to compare storm water quality with the National Urban Runoff Program (NURP) monitoring results.[13] One of the monitoring locations was situated at a

---

[7] Table 1 illustrates that more than two-thirds of the surface area (at a sampling of RGOs in the Los Angeles area) is available for installation for WQF treatment control BMPs (some which are as compact as 50 sq. ft in dimension).

Grizzard (1995), Proceedings of the 4th Biennial Conference on Stormwater, FL. Note that NURP catchments generally contained both pervious and impervious surfaces, while the study surfaces here were completely impervious, which may account for comparability in some pollutant concentrations.

gasoline station. The Washington Study confirmed NURP findings, i.e., water quality criteria for metals and Chemical Oxygen Demand (COD) are exceeded for storm water runoff from sites exposed to vehicular traffic (such as gasoline stations, parking lots and streets).[14] In the Washington Study the high COD values were attributed to the presence of high concentrations of petroleum hydrocarbons in the runoff from the gasoline station site. In addition, the U.S. General Accounting Office, in its report to Congressional requesters on urban runoff water quality (Report No. GAO-01-679) cites research in Texas that shows PAH concentrations are related to the volume of vehicular traffic.[15] Nationwide studies confirm the increased concentrations of PAHs in sediments deposited by storm water from urban watersheds.[16] A similar link between the duration and volume of automotive exposure at automotive-intensive land uses, including RGOs, demonstrated that, even at moderate duration and volume of automotive exposure, the observed hydrocarbon concentrations in storm water runoff were high.[17] For the Los Angeles area, a number of studies have identified PAHs and heavy metals as pollutants of concern in storm water runoff discharging to Santa Monica Bay.[18,19]

Implementation of Storm Water Quality Task Force (Source Control) BMPs Alone is Inadequate to Control Pollutants in Storm Water

WSPA's total reliance on the Storm Water Quality Task Force RGO BMP Guide (RGO BMP Guide) is misplaced. We have reviewed the RGO BMP Guide[20] and found it to be obsolete.[21] The recommendations of the Task Force for the implementation of default source control BMPs were not an "end all" and ultimate method to control storm water pollution at RGOs. The Task Force itself suggested that these source control

[14] WSPA has never disputed the fact that pollutants in storm water discharges from RGOs often exceed water quality criteria. Their claim has been that it is no worse than the quality of storm water from urban land-uses characterized in the NURP study from the 1970s.

BMPs were not the one and only method to address the discharge of pollutants in storm water runoff from RGOs. In fact, the Task Force contemplated the addition of treatment control BMPs in the future to the recommended BMPs menu. The RGO BMP Guide was intended to provide a default menu of source control BMPs as a pre-treatment step, until treatment BMPs were added to the Guide. The RGO BMP Guide has not been updated, and as a result is woefully inadequate for guidance to reduce the discharge of pollutants in storm water to protect the beneficial uses of receiving waters in the Los Angeles Region.[22]

WSPA's contention that the RGO Guide is the 'end all' originates from two unsupported assumptions – that source control BMPs: (i) alone are sufficient to control the discharge of pollutants in storm water runoff from RGOs so that no exceedances of water quality standards will occur, and (ii) are consistently and diligently implemented. A study conducted recently in the Los Angeles Region deflates both assumptions.[23] The results from the study demonstrate that the implementation of source control BMPs alone (similar to those recommended in the RGO BMP Guide) are insufficient to reduce the concentration of pollutants discharged in storm water to meet water quality standards. Treatment control BMPs must be employed to adequately reduce pollutants in storm water to meet water quality standards. Secondly, source control BMPs by their nature are difficult to verify and often are at the operator's discretion. While pollution prevention practices recommended in the RGO BMP Guide are desirable, neither WSPA nor others have demonstrated that the implementation of such practices reduces pollutants successfully to where water quality impacts are eliminated.[24] In fact the opposite evidence now exists.[25]

Implementation of Properly Designed Treatment Control BMPs is Necessary

Treatment control BMPs in order to be effective have to be properly designed based on either the Water Quality Flow (WQF) or Water Quality Volume (WQV) criteria or both. The WQF and WQV criteria developed by the Los Angeles Regional Board are based on characteristics of precipitation in the region. The most common precipitation events are small size storms and extreme events are rare. Consequently, for water quality purposes, the design standards ensure proper design for the treatment of the small more frequent precipitation events.

More than likely a multi-chamber treatment train or a set of treatment control BMPs will be necessary to remove the full suite of pollutants of concern in storm water

[22] *Ibid.*

[23] *Los Angeles County 1994-2000 Integrated Receiving Water Impacts Report* – 2000. Part of the critical sources study was conducted at automotive service facilities which have similar traffic volume and duration exposure as RGOs.

[24] See Letter from Professor L.D. Duke at UCLA to Mr. Radulescu dated Nov. 15, 2001, explaining the meaning of his statement on pollution prevention in a report cited by WSPA as proof that source control BMPs are all that are needed.

[25] *Supra.* See Footnote 23

R0006732

discharges from RGOs, and regular maintenance of the treatment systems will be necessary to keep it performing optimally. Current approaches to treating runoff from RGOs include isolation of the fuel servicing area to treat VOCs, petroleum hydrocarbons, and oil and grease. The area should not be connected to an infiltration type of BMP because of the potential for soil and groundwater contamination from gasoline. These areas should be connected to the sanitary sewer system with the permission of the sewer agency or to an oil water separator and a basic treatment control BMP (such as a media filter or a biofilter). VOC concentrations in storm water because of their volatility are seldom detectable. Storm water from the general area is separately treated to remove pollutants of concern adhering to particulates. Basic treatment control BMPs being implemented elsewhere in the U.S. include sand filters, vegetated buffers, biofilters, flow-through filter cartridges, and multi-chamber treatment train.[26]

The percent removal efficiencies of treatment control BMPs are highly dependent on the influent concentration of pollutants. The higher the influent concentration the higher the percent removal. For filter media based treatment control BMPs the characteristics of the medium also matter and removal efficiencies vary according to the type of filter material.[27]

Implementation of BMPs is Safe

WSPA contends that the installation of subsurface treatment control BMPs raises safety concerns because gasoline spills would purposely be routed below grade thus presenting a potentially explosive environment. We agree that the fueling area, vehicle maintenance areas, and vehicle traffic areas represent different problems. They require different solutions. To control spills, the fuel-island may be designed with a dead-end sump or spill control separator in compliance with the Uniform Fire Code (UFC); and as a spill containment pad (UFC § 790.18). The canopy should be designed to prevent the entry of rain into the fuel pad area. Storm water collected in the fuel island area may be conveyed to the sanitary sewer system after pre-treatment (if the sewer authority approves) or discharged after passing through a treatment train that includes an oil-water separator and basic treatment BMPs (media filters, biofilters, etc.). Storm water from the vehicle traffic areas may be treated using biofilters, linear sand filters, media filters or similar BMPs.[28] Contrary to WSPA's assertions, it is feasible to minimize safety concerns by designing the fueling area at RGOs consistent with UFC standards to

R0006733

control spills, while also incorporating treatment control BMPs to reduce the discharge of storm waters pollutants.

Treatment Control BMPs are Reasonable in Cost

We have previously reviewed the literature on the cost of treatment control BMPs for RGOs and determined them to be reasonable.[29] Biofilters are expected to cost about $6,500 per 5,000 square feet.[30] The multi-chamber treatment train has been estimated to cost between $5,000 and $10,000 per 5,000 square feet of drainage area.[31] Based on the estimated project cost to build a RGO (Table 2), the cost of installation of treatment control BMPs appears to be between 1.75 – 2.3 percent of the project cost. These estimates are consistent with the Regional Board's empirical basis of reasonable cost to meet the mitigation criteria (1-2 percent of the project development cost).[32]

Conclusion

Water quality protection should be no less important for RGO operators in California than they are for their counterparts in other Western states. The RGO BMP Guide which emphasizes pollution prevention practices may be considered as the pre-treatment step that optimizes the cost-effectiveness of treatment control BMPs. Both source control and treatment control BMPs are essential to reduce the discharge the pollutants in storm water effectively and to minimize treatment costs. A suite of treatment control BMPs or a treatment train of BMPs most likely will be needed to remove the range of pollutants of concern in storm water runoff from RGOs. The thresholds established by the Regional Board for the numerical mitigation criteria to apply to RGOs are reasonable and fair, have been properly justified, and have fully met all evidentiary requirements set forth in the LA SUSMP Decision by the State Board for the inclusion of RGOs.

Subject: RE: Manual and Questions

Would you kindly respond to the following two questions:

1. Does a new gas station development that creates 5,000 square feet or more of impervious surface be subject to storm water treatment for post-construction use?
2. Does an existing gas station that replaces 5,000 square feet or more of impervious surface be subject to storm water treatment for post-construction use?

Thanks for your assistance.

Sincerely
Xavier

Stan,
Please answer these gas station questions. Thanks.

>>> "Ciuba, Stan" <sciu461@ECY.WA.GOV> 09/12/01 01:37PM >>>
Xavier, the new manual, which should be published in the next couple of weeks, applies to new and redevelopments. Local governments can also use it for retrofits as they judge necessary. The impervious containment area of the fuel island is considered a pollutant generating source requiring treatment for hydrocarbon pollutants. The 5000 square foot threshold pollutant generating surface applies to the parking area adjacent to the fuel island and includes any convenience store parking area. Hope this helps.
Stan

Subject: Re: FW: Manual and Questions

Hello Stan:

Some follow-up questions.
Have these requirements for gas-stations been in effect for certain parts of Western Washington State for some time....for e.g. the Puget Sound Area?
What were the requirements for gas stations in the Stormwater Management Manual for the Puget Sound Basin (1992)?
Xavier

"The answer to your question is that the gas station BMPs in the new Manual (published last week), is virtually the same as in the 1992 Manual. The language has been changed and several items are expressed more directly. The new 2001 Manual applies to Western WA and is offered as technical guidance to local governments and others. However, the BMPs in the new Manual may be incorporated into the various municipal and industrial general NPDES Stormwater Permits. Exactly how and when that will happen has not been determined.
Best regards, Stan

Re: Request to Complete Mediation/Continuance of NPDES Permit Agenda Item on December 13th

Dear Mr. Dickerson:

I want to thank you and your staff for taking the time to continue with the mediation presided over by US EPA on the various issues in the proposed NPDES Permit. As with the discussion on November 9th, we believe that the November 29th session was very productive in identifying areas of agreement and resolution in the proposed Inspection Plan B.

As you know, we did not have sufficient time to complete the mediation session as outlined by US EPA. We believe that it would be fruitful to continue the discussions, not only to address the remaining issues with the Inspection Program, but just as importantly, to address the remaining issues of concern. The cities are very concerned about the resources and funding necessary in order to implement the programs required in first year of the Permit. The Permit requires the implementation of 34 of the Permit's 44 programs in the first year. This item was not addressed at our session.

Mediation should focus on discussing and resolving the major issues identified by US EPA, including 1) Deadlines & Submittals, 2) Funding, 3) Land Use Authority, 4) MEP and 5) SUSMPs. Other issues were identified on EPA's agenda. However, it was clear from your comments that the Board has decided to move ahead with Permit adoption on December 13th. You also indicated that you plan to recommend the existing version of Inspection Version B, in spite of the progress made in reviewing the draft inspection plan your staff submitted at the beginning of the Mediation Session on November 29th.

2175 Cherry Avenue ♦ Signal Hill, CA 90806 ♦ (562) 989-7302 ♦ (562) 989-7393 Fax

We continue to believe that the December 13th hearing date is inappropriate, given the progress made in mediation. It is also inappropriate, given the Permittees willingness to continue mediation to resolve the remaining issues. Cities will be given very little time to consider the action of the Regional Board over the Holiday Season, since most cities cancel their meetings in late December. Also, many city council's have rescheduled their first meetings in January, since New Year's Eve falls on the first Monday of the month and New Year's Day falls on the first Tuesday, conflicting with many regular council meetings. Most cities will effectively have only one week in January to consider the permit. I believe that this short time frame will work against the Board's wish to work with the cities as partners.

Mr. Harry Seraydarian, the EPA's appointed mediator, has committed to proceed with the process, if all of the parties are willing to do so. The Permittees are committed to the mediation process and to our improving dialogue with the Regional Board. We would hope that the Regional Board has the same level of commitment. We have observed that the San Diego Regional Board and the Permittees are spending an inordinate amount of time in the same implementation and clarification discussions – only their permit has been adopted – and they are all rushing to make decisions. It has placed the Regional Board, staff and the Permittees in a difficult situation. We believe that the time would be better spent now in solving the implementation questions and issues in the proposed Permit, than in scrambling after adoption.

We are proposing that mediation move forward and the Board continue the public hearing on the NPDES Permit until January. Given the importance of these issues, the number of people within our communities they will impact, the need for improved relationships between the Regional Board and local government, we are hopeful that you will reconsider the decision to conclude the mediation process and your decision to adopt the Permit on December 13th.

Sincerely,

Kenneth C. Farfsing

Mr. Harry Seraydarian
US Environmental Protection Agency, Region IX
75 Hawthorne Street
San Francisco, California 94105

Dear Mr. Seraydarian:

MUNICIPAL STORM WATER PERMIT – FOR THE COUNTY OF LOS ANGELES

We would like to thank you for facilitating a second facilitation session on Thursday, November 29th at the Signal Hill Community Center. At that session, staff at the Regional Board committed to rapidly producing another version of the proposed permit requirement for an Industrial/Commercial Facilities Control Program, which blends elements from Options A, B, and C which we are have presented to our Board for possible adoption on December 13, 2001. We have attached this new version, designated Version A/C, for the purpose of discussion. This version blends elements from both Option A and Option C (many of the Permittees' preferred option).

We believe that this new Version A/C reflects the start of a promising partnership among the Regional Board and municipalities. In this new draft, the Regional Board has tried to be responsive to several of the permittees' concerns over funding requirements and a preference, on the part of several permittees, for a program based solely on an education approach. To respond to these concerns, we have modified and clarified the scope of the inspections and clarified our expectation for enforcement on the part of permittees. Specifically, we have:

- Clarified and Reduced the Scope of Inspections.

  - Inspection Frequencies: In general, frequencies have been reduced from once every 24 months to once every 30 months. In addition, we have designated Tier 1 and Tier 2 categories for Phase 1 facilities, and further reduced the frequency of inspections for Tier 2 categories to once every 5 years. Finally, those Tier 2 categories with no exposure of industrial activity to storm water need not be inspected, after the initial determination of no exposure.

  - Phase 1 Categories: We have reduced the categories to be inspected, by eliminating Petroleum Refining.

R0006740

- Duplication of Regional Board and Permittee Inspections: We have added a requirement relieving permittees of the responsibility to inspect those Phase 1 facilities that the Regional Board has inspected within the previous 24 months. We intend to work out a system with the Permittees to efficiently communicate facilities that have been inspected by the Regional Board.

- Level of inspections: We have clarified our expectations regarding minimum Best Management Practices that Permittees' inspectors need to check during inspections.

- Tiered inspections: We have modified the definition of inspections, to allow permittees to conduct inspections of restaurants from the curbside.

➢ Provided a clearer definition of expectations concerning the scope of enforcement.

- Progressive enforcement: We have clarified minimum steps that permittees must take in their progressive efforts to enforce their municipalities' storm water requirements.
- Referrals to the Regional Board: In recognition of some of the permittees' concern regarding the resource intensive efforts needed to elevate enforcement actions, we have added a mechanism by which permittees can refer cases to the Regional Board.
- Accelerated referrals to the Regional Board: For violations of the State's General Permit for Industrial Activities, we have made provision for expedited referrals.
- Complaints: We have clarified the complaints will be referred by the Regional Board staff.
- Support of Regional Board enforcement actions: We have noted that permittees must provide staff for joint inspections with the Regional Board when available.

We have made other minor editorial changes as suggested by participants at the meeting, again to achieve greater clarity.

We are providing this draft to address your underlying concern regarding the cost of implementing program. We also want to acknowledge, as discussed at our meeting, a commitment on our part to support Permittees' efforts to strengthen their storm water ordinances. Toward this end, we are elaborating upon findings in the proposed permit, and we also are prepared to attend City Council meetings and testify on the requirement for storm water ordinances.

With this Version A/C, we hope we have achieved consensus on the requirement for an Industrial/Commercial Facilities Control Program. We believe that this consensus addresses our common interests to protect water quality while optimizing both State (Regional Board) and local resources, without significantly changing requirements in the existing Version A, B, and C. We need the participants at the meeting on November 29th to indicate, as soon as possible (but no later than Monday, December 10th), their consensus on these issues and support for Version A/C. Please do not hesitate to contact me at (213) 576-6605, Wendy Phillips (Acting Assistant

Executive Officer) at (213) 576-6618, or Dan Radulescu (Water Resources Control Engineer) at (213) 576-6668. Again, thank you for your significant efforts to assist all of us toward reaching our goal of effectively protecting water quality.

Sincerely,

Dennis A. Dickerson
Executive Officer

Storm Water Quality Task Force BMP Guide For Retail Gasoline Outlets

Review and Comment

November 2001

Dan Radulescu
Storm Water Section

CalEPA,
California Regional Water Quality Control Board,
Los Angeles Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Introduction

The California Regional Water Quality Control Boards, Los Angeles Region (LA Regional Board) and the San Diego Region (SD Regional Board) issued a technical document (RB technical report) on new development standards for Retail Gasoline Outlets (RGOs) in June 2001. The RB technical report provided justification that RGOs should be subject to numerical design criteria for treatment control Best Management Practices (BMPs). On August 6, 2001, the Western States Petroleum Association (WSPA), a trade group for the petroleum industry in Western U.S., released a technical document that challenges the recommendations and the conclusions of the RB technical report. Among other claims, WSPA asserts that the California Storm Water Quality Task Force BMP Guide (Guide), a default collection of soft source control BMPs (Task Force BMPs) are sufficient and treatment control BMPs are not necessary at new and redeveloped RGOs.

The Storm Water Quality Task Force (Task Force) is primarily comprised of municipalities, private organizations and individuals responsible for and/or interested in the implementation of municipal separate storm sewer system (MS4) programs in California. Its Executive Committee is comprised of 17 members, including 11 municipal representatives, 2 industrial representatives, and 4 at-large members. The Executive Committee approves work products generated by the work groups, sets Task Force priorities, identifies issues of concern, appoints committees and work groups, updates the State Water Resources Control Board (State Board) on key issues, and establishes the agendas for bi-monthly meetings. Some Regional Board and State Board staff attend the Task Force meetings.

The following constitutes LA Regional Board staff review and comment on the Task Force BMPs and Guide.

R0006743

Review of the Task Force BMPs and the Guide

The Task Force BMPs, mostly a collection of source control BMPs, are a "default" set of BMPs recommended for implementation at RGOs in 1997. The Task Force BMPs listed in the Guide carry over BMPs suggested by the USEPA in 1992 in a guidance document.[1]

The Guide recommends that BMPs be included in the construction and design of new and substantially remodeled RGO facilities. These Task Force BMPs are:

(i) Fueling area design and construction - Portland cement concrete with a 2% to 4% slope around fuel dispensing areas to prevent ponding, and minimum separation by a grade break to prevents run-on of storm water; fuel dispensing area is defined as extending 6.5 feet from the corner of each fuel dispenser or the length at which the hose and nozzle assembly may be operated plus 1 foot, whichever is less. The paving around the fuel dispensing area may exceed the minimum dimensions of the "fuel dispensing area" stated above. In addition, the fuel dispensing area must be covered, and the cover's minimum dimensions must be equal to or greater than the area within the grade break or the fuel dispensing area, as defined above. The cover must not drain onto the fuel dispensing area.

(ii) Fuel-dispensing areas maintenance - routinely swept for removal of litter and debris, and use of rags and absorbents for leaks and spills. It is also suggested that wash down of fueling areas should never be performed (but avoids the use of word: "prohibited") unless the wash water is collected and disposed of properly.[2]

(iii) Employee training - training in management of waste materials, labeling drains and flow patterns at the facility (seldom observed in practice), inspection and cleans up of storm drain inlets and catch basins within the facility's boundaries (also not performed routinely).

(iv) Fuel dispenser signage - posting signs close to the fuel dispenser that warn vehicle owners/operators against "topping off" of vehicle fuel tanks and installation of automatic shutoff fuel dispensing nozzles.[3]

(v) Outdoor waste receptacle and air/water supply area design and maintenance - clean-up of leaks and drips, grading the site in such a way to prevent run-on of storm water, segregation of flow, and the installation of a roof cover or a low containment berm.

---

[1] *Storm Water Management for Industrial Activities – Developing Pollution Prevention Plans and Best Management Practices*, EPA 832-R-92-006, pg. 3-2 to 3-4

[2] One might infer from this statement that the quality of the wash water cleaning the fueling areas is not appropriate for disposal, due to contamination from spills, stains and deposits from vehicular traffic. That raises the question of whether the practice of sweeping for removal of debris or the use of rags and absorbents for leaks and spills, at RGOs is adequate in itself. Numerous studies have shown that there is pollutant build-up and entrapment in the base pavement that can not be removed even after multiple episodes of pressure washing.

[3] Although the signs are a very good educational BMP, both the heavy automobile traffic at RGOs and accidental spills invariably contribute to pollutant build-up.

The language in the Guide is overly broad, voluntary, non-specific, and vague from a regulatory perspective. It is not known if the BMPs are mandatory throughout the petroleum retailing industry and are routinely implemented.[4]

No evidence has been provided to date to demonstrate that the sole implementation of source controls BMPs is sufficient to achieve the goal of reducing the discharge of pollutants in storm water from RGOs. Rather, more recent data shows that the opposite is true. Source control BMPs while essential to pollution reduction efforts, and presumptively cost effective, do not obviate the need for treatment control BMPs to remove pollutants of concern in storm water from RGOs. Essentially, these BMPs are the pre-treatment step in the treatment train to reduce the discharge of storm water pollutants.

The Guide has not been updated, although much research on the effectiveness of treatment control BMPs has been done and well documented in the literature since 1997. Some of these studies have determined that the implementation of source control BMPs alone is not sufficient to adequately address storm water pollution[5]. There is a tremendous body of evidence and numerous studies have been conducted in recent years since the Guide was first issued.

Summary of Research to Date

The US General Accounting Office (GAO) Report to Congress[6] mentions the relationship between automobile traffic (such as at RGOs) and sources of pollutants in storm water runoff, including toxic pollutants such as heavy metals and petroleum hydrocarbons. The GAO Report discusses (i) the evidentiary direct correlation between vehicular traffic and Polycyclic Aromatic Hydrocarbon (PAH) concentrations in lake-bottom sediment and, (ii) the occurrence of toxicity from heavy metal concentrations in receiving waters in urban and suburban communities in the U.S. Both PAH and heavy metal concentrations have increased with the increase of vehicular traffic in these areas.

Studies analyzing the effectiveness of source control BMPs reveal that there is scant evidence to demonstrate that source control BMPs are by themselves adequate to prevent pollutants from entering storm water discharges. The effectiveness of most storm water treatment control practices is dependent on their ability to remove pollutant particles from the water, or possibly from intermediate accumulating locations and not through source reduction.[7] To the contrary, some of the more recent studies show that some source control BMPs (such as sweeping) are ineffective in removing pollutants.[8] Other studies, performed at RGOs specifically demonstrate that some potent treatment control BMPs (mobile high pressure water cleaning) are still not effective in removing

Wong (1999), CRC for Catchment Hydrology, Victoria, Australia.

pollutants due to the high pollutant deposition rates, heavy pollutant buildup and entrapment in the base pavement and also that soft source control BMPs are not likely to have a significant impact on the sources of pollution.[9] Furthermore, studies performed in the Los Angeles region at automotive service facilities and monitoring data collected through those studies show no improvement in storm water discharge quality after the implementation of source control BMPs, similar to those suggested by the Task Force.[4] Other studies indicate that while the data to recommend outright acceptance of a number of treatment control BMPs at this time may be limited, some of these treatment control BMPs are conditionally acceptable.[10,11,12]

Conclusion

The Guide is a basic document that has become obsolete. BMPs in the Guide are not substantive. They cannot be considered as being adequate to ensure that storm water discharges from RGOs meet the standard of Maximum Extent Practicable (MEP standard) under CWA § 402(p) and do not cause or contribute to the exceedance off water quality standards in receiving waters under CWA § 301. Rather, the Guide is a "default" list of source control BMPs identified as pollution prevention measures by the Task Force to be implemented as a first step. The Task Force, unlike WSPA, has never claimed that the Task Force BMPs constitute the MEP standard for MS4 permittees for controlling the discharge of pollutants from RGOs to the MS4. The Task Force BMPs and Guide were a recommendation of a minimal "default" set of source control BMPs agreed to by a representative workgroup in 1997, nothing more. WSPA's absolute reliance on the Guide appears misplaced, considering that nearly a decade ago, USEPA identified the need to implement treatment control BMPs at RGOs to address and control storm water pollution.[13]

In light of numerous recent studies, which demonstrate the need for aggressive treatment control BMPs at RGOs in addition to pollution prevention measures, the Guide is obsolete. The source control BMPs in the Guide are insufficient to control the sources of pollutants in storm water discharges at RGOs, where such discharges cause or contribute to an exceedance of water quality standards for toxic constituents such as heavy metals and petroleum hydrocarbons.

Regional Board staff stands behind the conclusions of the previously released *Technical Report – Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts – June 2001.* The justification in the RB technical report is valid and is supported by numerous studies and monitoring data. The recommendations in

[13] *Urban Runoff Pollution Prevention and Control Planning (Handbook)* EPA/625/R-93/004. Pag. 111: "Certain commercial and industrial sites can be responsible for disproportionate contributions of some pollutants (e.g., grit, oils, grease, and toxic materials) to the drainage system. Typical sources of potential concern include gasoline stations, railroad yards, freight loading areas, and parking lots. In specific cases where significant pollutant loadings to the system are contributed by well-defined locations of limited area, pretreatment of the runoff from these areas could be a practical and effective control measure. Pretreatment measures can be required as part of a community's regulations. Examples of pretreatment measures include oil/water separators for gasoline stations, or the use of modified catch basin designs to enhance the retention of oil and grease or solids

the document are sound, balanced, and responsive to areas of concern raised by the State Board in the SUSMP decision.

The overarching objective of new development and redevelopment requirements for RGOs is to protect an important natural resource: the quality of waters of the State. Implementation of the source control BMPs in the Guide alone will not and cannot achieve that objective. The implementation of treatment control BMPs adequately designed for water quality volume and water quality flow for pollutants of concern in storm water discharges from new and redeveloped RGOs is necessary.

Mr. Steve Arita
Western States Petroleum Association
1115 11th Street Suite 150
Sacramento, CA 95814

Dear Mr. Arita:

SUPPLEMENT DOCUMENT TO THE JUNE 2001 TECHNICAL REPORT - RETAIL GASOLINE OUTLETS: NEW DEVELOPMENT DESIGN STANDARDS FOR MITIGATION OF STORM WATER IMPACTS

In preparation to reissue the Los Angeles County Municipal Storm Water Permit (LA Municipal Permit), Regional Board staff prepared and issued in June 2001 a Technical Report - Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts.

On August 6, 200, WSPA submitted a critique of the RGO Technical Report in its comment on the second draft of the LA Municipal Permit.

Attached to this letter, is a supplement document discussing some of the points raised by WSPA. We appreciate WSPA's involvement in the LA Municipal Permit renewal process.

Should you have any questions, please do not hesitate to contact Dan Radulescu at (213) 576-6668.

Sincerely,

Xavier Swamikannu, D.Env.
Acting Chief, Storm Water Section

R0006749

WSPA Meeting Regarding the Tentative MS4 Permit for LA County

December 5, 2001

Notes from Dan Radulescu

- Maryann Gonzalez – representative for BP
- Dennis Dickerson

  ⇒ status of the permit

  ⇒ technical documents (response to comments on RGOs issues)
- Ron Wilkins

  ⇒ response to comments (supplemental)

  ⇒ are not on subject

  ⇒ maybe some quotes
- Spotty implementation of source control BMPs
- If the Task Force BMPs are applied, are they enough to address water quality objectives?
- Issues of treatment vs. spills danger

  ⇒ Explosion danger vs. waster quality
- Consistency as recommended by the State Boards
- Task Force BMPs distributed
- Iterative process

PLEASE SIGN FOR RECORD OF PARTICIPATION Meeting with WSPA regarding Tentative MS4 Permit for LA County

Location: CRWQCB - REGION 4
JUNIPERO-SERRA BUILDING
320 W. FOURTH STREET, SUITE 200, LOS ANGELES, CA 90013

Date: 12/5/01

Subject: Re: December 13th Board Meeting

One additional point. The change sheet for the MS4 permit is a condensed version (which should precede the staff report) but difficult to track against the permit itself. We are working on a corrected version of the entire permit that will show these changes. We will get this to you ASAP and have copies available for those attending the hearing.

The energy challenge facing California is real. Every Californian needs to take immediate action to reduce energy consumption
***For a list of simple ways to reduce demand and cut your energy costs, see the tips at: http://www.swrcb.ca.gov/news/echallenge.html ***

>>> Dennis Dickerson 12/05/01 06:57PM >>>
Our next meeting is scheduled for Thursday, December 13th, at 9:00 am at the MWD, 700 N. Alameda, LA. I believe all board members plan to attend. I would appreciate your sending me a confirming reply e-mail.

For board materials you should have four volumes of material (one for all items other than item 10 - the MS4 permit- and three volumes -two binders and one accordion file for the MS4 permit). If you do not thave these please let me know soonest.

Please plan for a full day, the major item on the calendar will be consideration of the LA County MS4 NPDES Stormwater permit renewal. This permit was last issued in 1996 amidst great controversy and which led to litgation by the City of Long Beach, which as you know, was successfully negotiated and set us on our current track by providing the basic framework of MS4 permits permits we have since adopted for Long Beach and Ventura County. This permit is largely similar to both.

The other significant items on the agenda are NPDES permits for Praxair and Equilon (Carson Terminal) and an information item on the development of the Regional 303(d) list of impaired waters. This latter item is the result of direction from the board last summer which approved the approach to make these listings. While highly based on the application of a scientific approach to determine listings, any new listings (or the failure to remove some listings) are always controversial. Be prepared for some critical comments on the issue since it is the critical link in the TMDL process, i.e., if you are on the list a TMDL will be developed, if not, no TMDL, so the incentive is to those who really want to avoid a listing.

Praxair is still working on some issues with us. You might want to hold off on that review until the last since it might drop.

Also on Praxair, we have sent supplemental materials including a Change Sheet. As always, pls place the change sheet at the beginning of the binder in advance of the staff report. A comment letter from Heal the Bay has been added as pages 8.1-114 and 8.1-115 (note: technically the

page number should have been 8.1-113 a and b. - pls correct your copies). Pls insert the Response to Comments Cover Sheet - comments will be forwarded following a meeting we are having with Praxair tomorrow.

Item 11 is a Prospective Purchaser Agreement. I understand from staff that the parties have been working cooperatively with us to bring this before you.

With regard to Item 10, we are sending you some supplemental materials:

First: the item which says to replace pages B-39 to B-56 is incorrect. Pls add these pages, do not remove the existing pages B-36 through B-56. instead, pls number these pages B-39a, B-39b, etc. A new set will be available at the meeting with corrected numbers if you prefer to use those.

Let me explain what these new pages are. We met with interested parties in two USEPA sponsored mediation sessions to see if we could develop some consensus language on the permittee inspection program. The outgrowth of this effort was this new language. We are incorporating it as version A/C.

Currently, you have three versions of the inspection program, Version A, Version B and Version C. We will be offering the new Version A/C for your consideration provided it does not trigger the significant change provision that would require renoticing. We believe the new version is a reworking of the language in the earlier versions that reads better and which has some minor changes that should not trigger the renoticing requirement.

This new version may not be endorsed by all, if any, of the permittees that attended the mediation session. The end result, however, we feel is a much improved version that we are offering to the Board. Only one version will be adopted by you and, of course, the version you approve is subject to additional modification during the course of your deliberations.

We are also sending the final decision of the State Board on the San Diego MS4 permit that was appealed by BIA and WSPA. We have made every effort to ensure that the draft before you is consistent with the SWRCB's decision.

Note: the response to comments already in your binder that was prepared previously addressed most of the comments that we have received. One of the supplements we are sending is a small additional response to comments document that addresses new issues from draft 2 to draft 3 (the current version before you).

There are a few other minor supplemental materials being sent on this item.

I hope the above is helpful in preparing for the meeting. If you have any questions, pls call me for assistance.

The energy challenge facing California is real. Every Californian needs to take immediate action to reduce energy consumption

Mr. H. David Nahai, Chair
Los Angeles Regional Water Quality Control Board
320 West 4th Street, Suite 200
Los Angeles, California 90013

Re: Storm water – NPDES Permit Renewal

Dear Chairman Nahai:

It has come to my attention the Los Angeles Regional Water Quality Control Board (hereinafter the Board) will be discussing the renewal of the storm water – NPDES permit. The NPDES permit will be effective for the next five-year period, mandating new programs and development controls on Los Angeles County and the municipalities.

It is my understanding issues still remain between the municipalities and the Board with regard to the permit renewal. Several of the cities within the 29th Senate District have also expressed concern over the costs associated with the more restrictive permit being forwarded. In these difficult economic times, these additional costs also concern me.

While I am supportive of efforts to protect the quality of water in Los Angeles County and its municipalities, the efforts should not be overly burdensome to the local entities that must implement the protections. Since the municipalities still have concerns over the proposed permit and are willing to continue discussions on the issues, I would request the Chairman consider postponing a vote on the permit and continue mediation with the interested parties.

I am a strong advocate for open discussions and negotiations among interested parties. This issue has numerous stakeholders and should be resolved in a manner that takes into

consideration as many views as possible. I believe continued discussions would result in a more equitable and feasible solution for all those involved.

Thank you for considering this request. If you have any questions, please do not hesitate to contact my office at (916) 445-2848.

With Kind Regards,

Bob Margett

Re: Proposed Inspection Program- Version A/C

Dear Mr. Dickerson:

I would like to thank you and your staff for the quick turn around of the revisions to the proposed storm water inspection program for the NPDES Permit (Permit) for Los Angeles County and the cities (Permittees). We appreciate the hard work of Wendy Phillips and Dan Radulescu in drafting Version A/C. This inspection program is much improved from the inspection Versions A&B in the draft Permit. I believe the efforts of all of the participants in the Mediation Sessions resulted in a better understanding of the concerns of all of the parties, including the concerns of the environmental community.

Version A/C has several improvements over Version A&B, addressing some of the resource problems presented by both Versions A&B. We appreciate the progressive enforcement section of Version A/C. This will help to alleviate expensive and sometimes inconclusive enforcement referrals in the local court system. We also appreciate the reduction in inspection frequencies and clarifications of the scope of the inspections.

I have begun a dialogue with John Schunhoff, with the Los Angeles County Health Department, over the storm water component in the restaurant inspections, as it would impact city resources. Only four of the Permittees have their own health departments. The majority of cities contract with Los Angeles County for restaurant inspections. Our goal is to coordinate the storm water component with the present restaurant inspections, maximizing the use of existing resources.

Phase I Facilities

Section 3b) of the revised inspection program indicates that the Permittees need not inspect facilities that have been inspected by the Regional Board within the past 24 months. During the Mediation Session of November 29th, we had a spirited discussion of the State permitted facilities. You anticipated that the State will be able to inspect 67% of the State's permitted facilities. Some of these facilities are a major concern to the environmental community – including refineries, airports, railroad facilities and regional transit yards.

You also indicated that the remaining 33% of the State permitted facilities will need to be inspected by the municipalities and that you would develop a system to coordinate which inspections the Regional Board was to complete versus those to be completed by the municipalities, in order to avoid confusion and double inspections. Dan Radulescu distributed copies of an MOU between Alameda County and the San Francisco Bay Regional Board that was designed to address these coordination issues. A similar MOU should be considered in connection with Version A/C Inspection Program. For example, Version A/C is unclear as to which facility categories the State intends to inspect. It is also unclear as to what will happen if the State budget is reduced and the Regional Board cannot reach your target of inspecting 67% of the State permitted facilities. Will the State require that the municipalities complete a greater number of the State's inspections?

We similarly had a spirited discussion on the State charging permit fees to these facilities, but not performing the inspections. At the Mediation Session, the cities proposed that the State pass through the inspection fees for the State permitted facilities, that you are asking the cities to inspect. You stated you would not discuss the fee issue with us. It was also unclear if the cities would be permitted to charge an additional inspection fee on already permitted State facilities. The ability of the cities to recoup their costs for State permitted facilities is a critical resource issue that remains unresolved.

During the Mediation Session of November 29th, you asked each of the participants to indicate their consensus on Version A/C by December 10th. You indicated that if you did not hear support for Version A/C, that you would recommend Version B, the most resource intensive inspection program. As you recall, we did not complete the Mediation Session. In particular two critical questions remained on the fee issue, on the ability to pass through the State's inspection fee, and the second on the ability of the cities to "double fee" a business.

I would like to recommend the Version A/C inspection plan to the CPR cities. However, we believe it is essential that the Mediation process be given time to work both on the other permit issues in dispute as identified by the US EPA Mediator, and on the remaining inspection issues. We continue to believe the effort spent prior to adoption of the Permit resolving these issues, will reduce the confusion and time demands placed on your staff and on the Permitees after Permit adoption. As evidenced of this, recognize the post permit discussions underway in San Diego County on this issue, and the Alameda County MOU. I will present Version A/C to the CPR cities at their meeting of December 12th.

Please do not hesitate to contact me if you have any questions regarding my position.

Sincerely,

Kenneth C. Farfsing
City Manager

Re: NPDES Permit Schedule

Dear Mr. Dickerson:

The proposed NPDES Permit (Permit) for Los Angeles County and the cities (Permittees) contains a series of requirements for new programs or revisions to existing programs. We have prepared a chronological review of the Permit's programs and their deadlines (see attached Exhibit). This chronological review was passed out at our Mediation Session on November 29th, but was not discussed since we ran out of time. It is important that we discuss these and come up with realistic deadlines.

Review of the Exhibit illustrates that 34 of the 44 programs in the new Permit are due within the first year. This is going to be a tremendous burden on the Permittees. Many of these programs are new unfunded mandates and present a serious resource challenge for the Permittees. Aside from the unfunded mandate question, the Permit schedule should be modified in order to reduce the resource demands in the first year of the Permit and to in order to clarify ambiguities. The Permit contains a series of unclear due dates and confusion in several of the programs.

<u>First Year – Programs for Immediate Implementation</u>

A series of new programs are to be implemented immediately after the adoption of the Permit. Some of the programs have no due dates, so is it safe to assume that they would be implemented at the end of the Permit? For example, the requirement for trash receptacles at each transit stop has no specific due date. Does this mean that the

2175 Cherry Avenue ♦ Signal Hill, CA 90806 ♦ (562) 989-7302 ♦ (562) 989-7393 Fax

requirement is left for the last year of the Permit? There are also no specific due dates for catch basin cleaning and street sweeping.

Reasonable time must be given to start these programs. Cities plan their budgets on a fiscal year matching the State of California, beginning July 1, 2001. These new programs will require time to develop the details.

The following first year programs will be difficult to implement immediately, even if funding is found:

Increased catch basin cleaning
Increased street sweeping
Twice monthly City owned parking lot cleaning
Numeric criteria study
Inspection Program
Illicit Connection Program
Dry Weather Diversion Report
Transit stop trash receptacles

Dry Weather Diversion Report

We understand that the Los Angeles County Sanitation District is funding the Dry Weather Diversion Report for the 77 cities that it serves. This requirement was approved by the Regional Board in lieu of a fine against the Sanitation Districts. It makes sense that the Sanitation Districts take the lead on this report, since they are in the best position to determine sewer and treatment facility capacities. Cities and the County Flood Control District are in the best position to submit candidate storm drains for possible diversion.

It will be extremely difficult to coordinate 77 cities and the County during the 120-day time period called out for in the Permit. A more realistic time frame would be 24 months to complete the report. Perhaps the Board should break the report into phases, concentrating on areas near the beaches and water bodies of major concern. The second phase of the report could concentrate on industrial areas or commercial areas of concern. The last phase of the report could concentrate on the remaining areas. This Permit requirement should be modified to reflect that the cities are not in position to require that a separate legal entity, the Sanitation Districts, comply with either the time schedule or the program requirement in the NPDES Permit.

Technical Manual for BMP's

The Permit requires that we develop a technical manual for the siting and design of BMP's at the 10-month period or roughly at the 300-day mark. We are supposed to train our inspection and planning staff at the 120th day. It seems logical that we would be training our staff after the development of the technical manual.

Confusion in Deadlines

The Permit is very confusing because it uses three types of deadlines in order to measure compliance. This deadline confusion may create problems in determining when a particular program is due and in turn make it difficult for the Permittee be in compliance. The following are examples of the confusion:

- Set dates (for example - October 15, 2002 to implement trash monitoring)
- Days (for example – 180 days from the date of adoption to implement the post development BMP's)
- Months (for example 9 months from the date of adoption to pass city ordinances)

Set dates have become a particular problem, since the Permit adoption date has been modified. The Permittees should be given a more realistic time frame in order to implement these programs. Also, you might also want to translate months into days in the first year of the Permit.

It is important that we discuss the program schedule more fully prior to the adoption of the Permit, since we did not complete the Mediation Sessions. Please do not hesitate to contact me at 562-989-7302 in order to arrange for a meeting.

Sincerely,

Kenneth C. Farfsing
City Manager
Signal Hill

Permit Deadlines – Chronological Order

Deadline	Detail
Immediately	CEQA Changes
	Institute 24-hour verbal notice & 5 day written notice
	Provide development planning SUSMP guidelines to developers
	Complete catch basin and street sweeping prioritization
	Clean high priority catch basins monthly (wet season)/ once during dry season
	Clean B priority catch basins 40% full in rainy season
	Place trash receptacles at all transit stops
	Begin street sweeping – Priority A – twice per month, Priority B - monthly
	Begin County/City owned parking lot cleaning – twice per month
	Inspect County/City owned parking lots – twice per month
	Begin inventory of facilities for inspection/ prioritization
	Begin numeric criteria study (County & Cities)
	Begin drafting of development ordinances, post construction BMP's (page 44 uses), inspection, enforcement and SUSMP ordinances
	Begin inspection programs
	Begin illicit connection lists
	Begin field screen lists

Deadline	Detail
30 days	Provide reporting contact information (County)
60 days	Provide reporting contact information (Cities)
120 days	Submit ESA Maps
	Train employees for Development Planning
	Targeted employee training, including construction inspectors (6 months from effective date)
	Complete dry weather diversion report (July 1, 2002)
	Complete annual report (due each fiscal year)
180 days	Require SUSMP and post construction BMPs for projects adjacent to ESA
	Require post development BMP's for non-SUSMP sites
October 15, 2002	Implement trash monitoring
9 months (270 days?)	Amend or adopt city ordinances for inspection, enforcement, SUSMP
10 months (300 days?)	Obtain legal opinion
	Develop technical manual for siting and design of BMPs (County & City) (Note: Shouldn't technical manual be completed prior to training staff?)
I year	Develop outreach materials
	Update Watershed Inventory of Priority Facilities (annual updates there after)
	Complete illicit connection tracking list
	Field screen all open channels
	Update inventory of facilities and prioritization for inspections (annually thereafter)

Deadline	Detail
540 days	Implement numeric criteria from peak flow control
2 years	Site visits to all industrial/commercial facilities in Section 1 already in inspection program
	Mark all inlets and public access points
March 9, 2003	Require SUSMP and post construction BMP's for one acre industrial/commercial sites
	Public construction projects of 1-5 acres must receive Statewide general construction permit
March 10, 2003	Require proof of WDID# and SWPPP certification prior to issuance of grading permits for projects of 1 to 5 acres
3 years	Field screen all underground pipes in priority areas (36 inches or above?)
5 years	Field screen all underground pipes less than 36 inches in diameter
	Complete review of all permitted connections to storm drains
As revisions are scheduled	Revise General Plan Elements

Subject: Alternative to Industrial/Commercial Pollution Control Program Version "A/C"

Dear Mr. Dickerson:

The City of Baldwin Park ("City") extends its most sincere appreciation to you and your staff for participating in the USEPA endorsed mediation over the industrial/commercial facilities control program (I/CFCP). Many issues associated with this program were resolved through the 2 mediation sessions. Still are there issues and problems that require further mediation. The City hopes that the Regional Board staff recognizes that is far more advantageous to continue mediation to resolve issues. To help facilitate this, a recommendation to modify the program is provided.

- Inspection/Enforcement of GIASWP Requirements

The most recent version of the I/CFCP, designated "A/C," requires municipalities to inspect industrial facilities for conformance with the General Industrial Activity Storm Water Permit (GIASWP) -- a permit that is issued by the State Water Resources Control Board. Version A/C also requires municipalities to enforce requirements against GIASWP- by requiring subject industrial facilities to adopt local codes that facilitate to (1) implement best management practices; (2) copy records and require regular reports from industrial facilities; and (3) control pollutants from them.

R0006769

The City finds Version A/C, in its current form, unsupportable for the following reasons:

1. The Regional Board is required to enforce state-mandated GIASWP requirements subject industrial facilities, not municipalities. The regional board even receives funds generated from GIASWP fees ($250.00 per year) to pay for inspections and enforcement. The Regional Board is unwilling to compensate municipalities to conduct inspections and enforcement of GIASWP requirements. Further, because the Regional Board, historically, has not bothered to inspect most of the several thousand subject industrial facilities that operate in Los Angeles County, cities fear that this program will be transferred entirely on them and without compensation. However, the City would be willing to accept some responsibility for assuring that industrial facilities comply with GIASWP, without compensation, but if certain conditions were met (see alternative to industrial enforcement and inspection).

2. GIASWP-subject industrial facilities would be subject to 2 sets of requirements: one state and one local. This would create a legal nightmare for municipalities and confusion and frustration for industrial facilities because the GIASWP calls for pollution prevention requirements that are less stringent than requirements that municipalities would be compelled to enforce. The following excerpt from the current GIASWP illustrates this point:

> *"The State Water Board recognizes that industrial activities and operating conditions at many facilities change over time. In addition, new and more effective BMPs are being developed by various facility operators and by industrial groups. The SWPPP and monitoring program requirements include various inspections, reviews, and observations all of which recognize, encourage, and mandate an* ***iterative self-evaluation process*** *that is necessary to consistently comply with this General Permit. In general, facility operators that develop and implement SWPPPs that comply with this General Permit should not be penalized when discovering minor violations through this iterative self-evaluation process. The General Permit provides facility operators up to 90 days to revise and implement the SWPPP to correct such violations."*

Thus, while a subject industrial facility would be in compliance with GIASWP requirements, it could be in non-compliance with the local codes affecting such facilities because of a "minor violation.

R0006770

3. Legally, there is sufficient reason to believe that municipalities are preempted by State law from enforcing local codes that mimic GIASWP requirements. A subject industrial discharger covered under GIASWPs, but found in violation of local requirements affecting them, would be likely to challenge a municipality for imposing the more stringent local requirement.

4. Referring GIASWP violators to the Regional Board for enforcement in the event municipal compliance efforts fail does not guarantee that the Regional Board will assume that responsibility. Under version A/C, a provision exists to refer GIASWP violators to the Regional Board. However, nothing in this provision obligates the Regional Board to act on the referral. Therefore, a non-complying subject GIASWP facility would continue to be subject to enforcement under municipal code until the Regional Board takes action in compelling GIASWP compliance -- which could be never.

- Inspection/Enforcement of Commercial Program

The City has no objection to inspecting and enforcing storm water and non-storm water pollution prevention requirements for commercial facilities (viz., gas stations, restaurants, and automotive repair facilities). However, instead of conducting two rounds of inspections during the permit period (5 years), the City would like the option of having to conduct only 1 site visit, if the facility is already in compliance with BMP requirements (listed under the legal authority section of the permit). This would give the City more time to concentrate on those commercial facilities that are problematic. The City would be exclusively responsible for enforcement and, therefore, would not need refer chronic or serious violators to the Regional Board for assisted enforcement. In this case, the City would rely on its inspection/enforcement authority to compel compliance with violating commercial facilities.

- An Alterative to Industrial Inspections and Enforcement

The City proposes a revision to the industrial/commercial pollution control program to the extent described below.

1. The City would be responsible for industrial facilities (i.e., all industries that are subject to General Industrial Activity Storm Water Permits) only to the following extent (without the expectation of being compensated by the Regional Board):

   (i) Conducting a non-invasive inspection program of subject industries that would involve:

a. Determining if the facility is covered under a GIASWP and reporting that information to the Regional Board (this may not require a site visit). If the facility is not covered under GIASWP, it shall notify the owner/operator in writing or visit the facility to convey its need to obtain one within a reasonable time (to be determined by the Regional Board). For its part, the Regional Board would be obligated to take steps to assure that the subject facility obtains GIASWP coverage.

b. Visiting each subject facility to conduct an informal evaluation of its compliance with basic BMPs (good housekeeping and source control) and to see the facility's SWPPP. If the facility has a SWPPP and the facility appears to be reasonably well managed in terms of its low potential to discharge pollutants to the MS4 and/or effective BMPs, then that facility should only be visited once during the term of the permit (5 years, in other words). If the facility has a GIASWP but does not have a SWPPP or has SWPPP but the facility is not well-managed, the City would urge the facility to prepare a SWPPP or revise the SWPPP to include BMPs to place the facility into well managed status. If, however, the facility still does not comply, the Regional Board would be obligated to take enforcement action. Municipalities, would not be responsible for copying records and requiring regular reports from industrial facilities; and would only be responsible for controlling[1] pollutants from industrial facilities to a limited extent (i.e., by enforcing illicit discharge prohibitions and relying on site visits and other public education programs.

In closing, the City looks forward to presenting this alternative at a subsequent USEPA sponsored mediation session. In the meantime, if you have any questions, please feel free to contact David Lopez at (626) 960-4011 extension 458.

Sincerely,

Shafique Naiyer, P.E.
Director of Public Works

OFFICE OF THE MAYOR

CITY OF WALNUT

December 11, 2001

Mr. H. David Nahai, Chair
Los Angeles Regional Water Quality Control Board
320 West 4th Street, Suite 200
Los Angeles, California 90013

2001 DEC 12 P 5:04

Dear Mr. Nahai:

Subject: NPDES – Storm Water/Urban Runoff Permit

On behalf of the City of Walnut I would like to express our great concern that the Los Angeles Regional Water Quality Control Board will take action at their December 13, 2001 meeting to approve the NPDES Permit for Los Angeles County and its Permittees without satisfactorily addressing unresolved issues which have been brought to your attention by several agencies serving this City. The action of the Regional Board will have a devastating impact on the vital services currently provided by the City to our residents.

It is important to reiterate some of the major issues we feel have been abandoned:

Lack of Legal "Safe Harbor"

The current Municipal NPDES Permit provides a legal "safe harbor" when cities implement the permit's provisions. The "safe harbor" clause insures that our city is in compliance when we implement the permit's programs to the maximum extent possible. The "safe harbor" clause is not included in the proposed permit. It should be added to help us focus on improving water quality, rather than spending city resources on defending against third party lawsuits.

Unknown Costs and Unrealistic Time Frames

The potential financial costs to the City to implement the new programs are not precisely known, but are estimated to be in the tens of thousands to hundreds of thousands of dollars range per year, during the next five year period. This includes a full range of storm water treatment controls, which will be included in the development of the TMDL's (Total Maximum Daily Loads) for storm water constituents – such as trash, copper, bacteria, pesticides, etc.

The Permit will require that the City implement or revise 44 separate programs during the five-year cycle. The City will be required to implement 34 new programs in the first year of the Permit alone. These include improved street sweeping, catch basin cleaning, illicit connection tracking programs, dry-weather storm water diversion reports, and other costly items.

Maximum Extent Practical

The final Permit has modified the definition of the amount of time, effort and funding a city must put into storm water programs – known as the maximum extent practical. The elimination of considerations for costs, environmental benefits and available technology from the NPDES Permit is major problem for the City of Walnut. It is inconsistent with existing state and federal law, including the requirement that new regulations must be reasonable under Water Code Section 13000. The passage of the Permit in its current form will result in exceedingly expensive requirements, with dubious or minimal environmental and human health benefits.

New Storm Water Inspection Programs

The final Permit continues to require that the City conduct inspections that are the responsibility of the Regional Board and for which they receive fees. The Permit also expands the current site education program to mandatory inspections for manufacturing facilities, restaurants, automotive uses and other businesses. The inspection program has also raised concerns about the ability of the City to gain access to properties for inspections, the costs of protracted legal enforcement and other inspection issues. In some cases, the Permit appears to require that the city adopt regulations that will violate property owner's constitutional rights against illegal searches and seizures.

General Plan and CEQA Mandates

The NPDES Permit would require that the City amend four elements of the General Plan, including the land use element. The Permit also requires that the City amend the CEQA process. These requirements are contrary and duplicative to State laws, which adequately cover both General Plans and environmental review.

Storm Drain Diversion Plans

The NPDES Permit requires that the City complete a plan for the diversion of the storm drains into the sewer system in the next six months. Although, supportive of a dry weather diversion program, the County Sanitation District expressed concern that it would be impossible to coordinate reports from the 77 cities within the next six months. It is not clear how much these reports would cost and who would pay for them. It is also not clear as to whether these reports will be used to require that the cities construct storm water diversion projects at a tremendous cost.

Illicit Sewer Connection Inspections

The Permit requires that the City complete an inspection of the entire storm drain system in the next six months to determine if any illicit connections exist. This requirement drafted after the City of Los Angeles found that a business had illegally connected their sewer to the storm drain. Based on years of field experience, very few illicit connections will be found.

A clear and workable new municipal NPDES permit is essential if we are going to achieve the goals of the Clean Water Act. The City of Walnut acknowledges that maintaining clean water is an environmentally sound policy and that we all have to do a better job maintaining water quality. However, we feel that it should not be accomplished by sacrificing the health, safety, and well-being of the residents it intends to protect.

We need to work together to implement cost-effective programs that address real water quality programs. Please consider postponing the vote on the permit and continuing the mediation process with the interested parties. The City of Walnut is prepared to work toward this end, will you help us?

Cordially,

Larry L. Waldie

IRWINDALE

2001 DEC 13 P 3:33

December 12, 2001

Dennis Dickerson, Executive Officer
California Regional Water Quality Control Board
Los Angeles Region, 320 West 4th Street
Los Angeles, California 90013

Dear Mr. Dickerson:

RE: **ALTERNATIVE TO INDUSTRIAL/COMMERCIAL POLLUTION CONTROL PROGRAM VERSION "A/C"**

The City of Irwindale ("City") extends its most sincere appreciation to you and your staff for participating in the USEPA endorsed mediation over the Industrial/Commercial Facilities Control Program (I/CFCP). Many issues associated with this program were resolved through the two mediation sessions. Still there are issues and programs that require further mediation. The City hopes that the Regional Board staff observes that it is far more advantageous to continue mediation to resolve issues than to compel their resolution by adversarial means. To help facilitate this, a recommendation to modify the program is provided as follows:

- Inspection/Enforcement of GIASWP Requirements

The most recent version of the I/CFCP, designated "A/C," requires municipalities to inspect industrial facilities for conformance with the General Industrial Activity Storm Water Permit (GIASWP) - a permit that is issued by the State Water Resources Control Board. Version A/C also requires municipalities to enforce requirements against GIASWP- subject industrial facilities by requiring the adoption of local codes that facilities (1) implement best management practices, (2) copy records and require regular reports from industrial facilities, and; (3) control pollutants from them.

The City finds Version A/C, in its current form, unsupportable for the following reasons:

1. The Regional Board is required to enforce state-mandated GIASWP requirements subject industrial facilities, not municipalities. The Regional Board also receives funds generated from GIASWP fees ($250.00 per year) to pay for inspections and enforcement. The Regional Board is unwilling to compensate municipalities to conduct inspections and enforcement of

5050 North Irwindale Ave. Irwindale, CA 91706 (626) 430-2200 Facsimile: (626) 962-4209

R0006776

GIASWP requirements. Further, because the Regional Board historically has not bothered to inspect most of the several thousand subject industrial facilities that operate in Los Angeles County, the City fears that this program will be dumped entirely on them and without compensation. However, the City would be willing to accept some responsibility for assuring that industrial facilities comply with GIASWP, without compensation, but only if certain conditions were met (see alternative to industrial enforcement and inspection).

2. GIASWP- subject industrial facilities would be subject to two sets of requirements: (1) state and (2) local. This would create a legal nightmare for municipalities with confusion and frustration for industrial facilities because the GIASWP calls for pollution prevention requirements that are less stringent than the requirements municipalities would be compelled to enforce. The following excerpt from the current GIASWP illustrates this point:

> *"The State Water Board recognizes that industrial activities and operating conditions at many facilities change over time. In addition, new and more effective BMPs are being developed by various facility operators and by industrial groups. The SWPPP and monitoring program requirements include various inspections, reviews, and observations all of which recognize, encourage, and mandate an* ***iterative self-evaluation process*** *that is necessary to consistently comply with this General Permit. In general, facility operators that develop and implement SWPPPs that comply with this General Permit should not be penalized when discovering minor violations through this iterative self-evaluation process. The General Permit provides facility operators up to 90 days to revise and implement the SWPPP to correct such violations."*

Thus, while a subject industrial facility would be in compliance with GIASWP requirements, it could be in non-compliance with the local codes affecting such facilities because of a "minor violation".

3. Legally, there is sufficient reason to believe that municipalities are preempted by State law from enforcing local codes that mimic GIASWP requirements. A subject industrial discharger covered under GIASWPs, but found in violation of local requirements affecting them, would be likely to challenge a municipality for imposing the more stringent local requirement against it.

4. Referring GIASWP violators to the Regional Board for enforcement in the event municipal compliance efforts fail does not guarantee that the Regional Board will assume that responsibility. Under version A/C, a provision exists to refer GIASWP violators to the Regional Board. However, nothing in this provision obligates the Regional Board to act on the referral. Therefore, a non-complying subject GIASWP facility would continue to be subject to enforcement under municipal code until the Regional Board takes action in compelling GIASWP compliance-which could be never.

- Inspection/Enforcement of Commercial Program

The City has no objection to inspecting and enforcing storm water and non-storm water pollution prevention requirements for commercial facilities (via gas stations, restaurants, and automotive repair facilities). However, instead of conducting two rounds of inspections during the permit period (5 years), the City would like the option of conducting only one site visit, if the facility is already in compliance with BMP requirements (listed under the legal authority section of the permit). This would give the City more time to concentrate on the commercial facilities that are problematic. The City would be exclusively responsible for enforcement, therefore, would not need to refer chronic or serious violators to the Regional Board for assisted enforcement. In this case, the City would rely on its inspection/enforcement authority to compel compliance with violating commercial facilities.

- An Alternative to Industrial Inspections and Enforcement

The City proposes a revision to the industrial/commercial pollution control program to the extent described as follows:

1. The City would be responsible for industrial facilities (i.e., all industries that are subject to General Industrial Activity Storm Water Permits) only to the following extent (without the expectation of being compensated by the Regional Board):

   Conducting a non-invasive inspection program of subject industries that would involve:

   a. Determining if the facility is covered under a GIASWP and reporting that information to the Regional Board (this may not require a site visit). If the facility is not covered under GIASWP, it shall notify the owner/operator in writing or visit the facility to convey its need to obtain one within a

reasonable time (to be determined by the Regional Board). For its part, the Regional Board would be obligated to take steps to assure that the subject facility obtains GIASWP coverage.

b. Visiting each subject facility to conduct an informal evaluation of its compliance with basic BMPs (Good Housekeeping and Source Control) and to observe the facility's SWPPP. If the facility has a SWPPP and the facility appears to be reasonably well managed in terms of its low potential to discharge pollutants to the MS4 and/or effective BMPs, then that facility should only be visited once during the term of the permit (5 years, in other words). If the facility has a GIASWP but does not have a SWPPP or has SWPPP but the facility is not well-managed, the City would urge the facility to prepare a SWPPP or revise the SWPPP to include BMPs to place the facility into well managed status. If, however, the facility still does not comply, the Regional Board would be obligated to take enforcement action. Municipalities would not be responsible for copying records and requiring regular reports from industrial facilities; and would only be responsible for controlling[1] pollutants from industrial facilities to a limited extent (i.e., by enforcing illicit discharge prohibitions and relying on sites visits and other public education programs.

In closing, the City looks forward to presenting this alternative at a subsequent USEPA sponsored mediation session. In the meantime, if you have any questions, please feel free to contact me at (626) 430-2212.

Sincerely,

Kwok Tam,
Public Works Director/City Engineer

KT:vs

[1] Control means not to require disclosure of information and to limit, discourage, or terminate a storm water discharge to the MS4".

Los Angeles Regional Water
Quality Control Board
320 West 4th Street
Los Angeles, CA 90013
Attn: Mr. Dennis Dickerson,
Executive Officer

Dear Mr. Dickerson,

I am writing regarding the "Storm Water Permit" proposal. Based on the information I have regarding this proposal, the proposal would substantially increase my property taxes. I cannot afford to pay any additional property taxes, especially during this recession period. Not only would the proposal impose a financial burden on my household, the proposal itself is unreasonable.

I can understand the need to keep our water clean and free of pollution. But the fines that would be imposed are outrageous and will end up being paid by all taxpayers. Voters should have the right to decide how to clean up our water and how much we are willing to pay to do it. The city of Bellflower already has many needs for our tax dollars. We cannot afford to cut funding from those projects to fund this one.

There has to be other ways to achieve your goal. Perhaps you should fine the individuals who contaminate our water and not entire cities. We should not all have to pay for the sins of others. Work with cities to educate their citizens on how dumping trash into our storm drains ruins our water supply. Individual cities can determine how much they can afford to promote their "clean water" campaigns. Do not rob our cities of their financial resources without considering how detrimental it would be for the individual citizens who are trying to make it through these difficult times.

Sincerely,

Angela V. Hudnall

CITY HALL
LOS ANGELES, CALIFORNIA 90012

JAMES K. HAHN
MAYOR

December 12, 2001

2001 DEC 17 P 3:57

The Honorable David Nahai
Los Angeles Regional Water Quality Control Board
320 West 4th Street, Suite 200
Los Angeles, CA 90031

Re: Municipal Storm Water and Urban Runoff Discharge Permit

Dear Chairman Nahai:

On December 13, 2001, your Board plans to consider adopting a Municipal Stormwater National Pollution Discharge Elimination System (NPDES) Permit for the Los Angeles Region. This Permit is issued to Los Angeles County as the Principal Permittee and 84 other cities as co-permittees every five years. The City of Los Angeles, one of the co-permittees, has been a leader on environmental issues in the nation over the past decades. We take pride in our environmental stewardship and have invested billions of dollars into the City's infrastructure system to improve the quality of water, air, and land and will continue to support regulations that bring about sound environmental improvements for our citizens. We also have an obligation to our citizens to ensure that money invested in meeting regulations is commensurate with the benefits to the environment and that we have the ability to fund compliance with these regulations on an on-going basis.

We have reviewed the final draft of the NPDES permit that your Board will consider tomorrow. We are very pleased that many of the outstanding issues have been resolved cooperatively between your staff and the City. We believe the final draft NPDES Permit is a great improvement from its first draft version released in April 2001. This draft is progressive and should improve the quality of our City's environment over the next five years. However, there remain three major items of concern to the City of Los Angeles:

1. **Receiving Water Limitations Clause:** This section prohibits violation of the water quality standards or objectives established for the City's receiving water bodies.

   Concern: We believe that the Permit language will place the City in non-compliance immediately on the date the Permit becomes effective. It also exposes the City to third party lawsuits. While the section provides a process to meet these water quality

objectives, there is no limit to the process and to the cost of achieving water quality objectives.

2. **Maximum Extent Practicable Definition:** This definition has been used throughout the Permit as a measure of effort that a permittee should take to meet Permit requirements.

   Concern: While we have no problem with the intent of the definition, we believe the standard set by the definition should include other issues such as cost, environmental benefits, feasibility, technology and public support in achieving the Permit requirements.

3. **State Permitted Facilities:** Currently, the State Water Resources Control Board (SWRCB) issues General Construction Activity Storm Water permits for construction developments of certain sizes. It also issues General Industrial Activity Storm Water permits for certain industrial facilities in the City. The SWRCB receives fees for these permits, and performs inspection activities.

   Concerns: The new NPDES Permit that your Board will consider for adoption shifts the inspection responsibility to the City with no monetary compensation. This is unfair when considering that the Regional Board has issued permits and collected money from these facilities. We believe the Regional Board should continue to perform the inspection of these permitted sites and not request the City to perform that function. Alternatively, if the City were provided with appropriate funding by the Regional Board for inspecting these facilities, the City would be glad to perform that function.

I am confident that your Board will understand the position that the City has taken on these three issues while supporting the remainder of the Permit. I am also hopeful that your Board will find ways to resolve these concerns before adopting the NPDES Permit. This way both the City and the Regional Board could collectively and effectively utilize energy and resources in improving our environment. Shahram Kharaghani, Program Manager of the City's Watershed Protection Division has submitted language to your staff that would address the City's concerns. He may be reached at (213) 847-6346 if you have any questions or comments. Thank you for your consideration of this matter.

Very truly yours,

James K. Hahn

JAMES K. HAHN
Mayor

STATE OF CALIFORNIA
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

NOTICE OF EXEMPTION
From the Requirements of the
California Environmental Quality Act

TO: State of California
The Resources Agency
Secretary for Resources
1416 Ninth Street, Room 1311
Sacramento, CA 95814

FROM: California Regional Water Quality Control Board
Los Angeles Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Project Title: Waste Discharge Requirements and NPDES Permit for Municipal Storm Water and Urban Runoff Discharges Within the County of Los Angeles, and the Incorporated Cities Therein, Except The City Of Long Beach (NPDES No. CAS004001)

Project location - Specific: 900 South Fremont Avenue, Alhambra, California
Project location - County: Los Angeles County

Description of Nature, Purpose, and Beneficiaries of Project:

Nature: Discharge of storm water from the municipal separate storm sewer system (MS4).
Purpose: To dispose of storm water discharged from the MS4.
Beneficiaries: Los Angeles County Flood Control District and 84 incorporated cities within the district.

Name of Public Agency Approving Project: The activity is subject to waste discharge requirements adopted by this Board.

Name of Person or Agency Carrying Out Project: Los Angeles County Flood Control District and 84 incorporated cities within the district.

Exempt Status:
__ Ministerial (Section)
__ Declared Emergency (Section)
__ Emergency Project (Section)
__ Category Exception. State type and Section Number
__ Other Exception. State type. Statutory Exception
X California Water Code, Div. 7, Chapter 5.5, Section 13389

Reason why Project is Exempt: Discharge to waters of the United States under meaning of California Water Code, Division 7, Chapter 5.5, Section 13370 et. seq., and, therefore, the actions exempt under California Water Code, Division 7, Chapter 5.5, Section 13389.

448th REGULAR BOARD MEETING

November 29, 2001

ITEM 10

CONSIDERATION OF THE RENEWAL
OF THE
MUNICIPAL STORM WATER NPDES PERMIT
FOR THE
COUNTY OF LOS ANGELES
AND THE INCORPORATED CITIES THEREIN, EXCEPT
THE CITY OF LONG BEACH

Section A

Agenda Item

California Regional Water Quality Control Board, Los Angeles Region
448th Regularly-scheduled Meeting of November 29, 2001 (Los Angeles)

Item 10

Subject Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges, within the County of Los Angeles and the incorporated cities therein except for the City of Long Beach (hereafter referred to as the "municipal storm water permit" or "permit").

Purpose To conduct a public hearing on the proposed Municipal Separate Storm Sewer System (MS4) permit for Los Angeles County and incorporated cities therein except the City of Long Beach. The Regional Board at the meeting will consider adoption of the permit after receiving comment from Permittees, interested parties, and the public.

At a workshop on July 26, 2001, the Regional Board commented that the second draft permit was rather complete. Staff was asked to review the appropriateness of ambiguous terms in the second draft permit (such as "potential contribution"; "minimize"; "maximize", and "measurably") to ensure that permit requirements are enforceable, and issue a third draft in October for consideration at the November 29 Board Meeting. The tentative draft permit has been appropriately revised to be consistent with Regional Board direction. The Regional Board directed as follows:

- Ensure that the proposed permit requirements are at least as stringent as the Long Beach MS4 and Ventura County MS4 permits. Include specific language on trash Total Maximum Daily Loads (TMDLs) similar to the one in the Long Beach MS4 permit. Develop a strategy to get to compliance with water quality standards.

- Ensure that Best Management Practices (BMPs) being implemented are targeted to controlling particular pollutants of concern. Consider requiring permittees to enforce the Illicit Connection/ Illicit Discharges Elimination (ICID) programs with fines for illicit discharges and connections. Include an inspection program for gas stations in addition to outreach. Regional Board

staff should upgrade their activities to monitor compliance and enforce implementation of the MS4 permit

- Review the draft permit requirements for conflicts with other state and federal regulations such as air pollution [water and chemical stabilizers for dust control] fire code, health and safety etc.

- Provide justification for the development thresholds for projects in environmentally sensitive areas [2,500 sq. feet of impervious surface. Review the requirement to map MS4 discharge points relative to the cost of setting up such a system.

- Review the suggestions by the Santa Monica Bay Restoration Project (SMBRP) on monitoring and reporting for inclusion.

- Identify a contact person on Regional Board staff to provide and assist in information on funding sources. Convene an advisory committee on the public information and participation program before the November public hearing.

Background

The storm drain system regulated by the Board is principally owned and operated by the Los Angeles County Flood Control District (Principal Permittee). This system drains the coastal slopes of the Transverse Ranges, moving storm flows as well as a significant amount of dry weather runoff into the Santa Monica Bay and the Los Angeles/Long Beach Harbor.[1] It is one of the largest storm drain systems in the nation, when measured in terms of both aerial extent as well as differences in vertical elevations.

The storm drain system is also one of the most complex to operate, when considering that it encompasses 87 municipalities. Although principally owned and operated by the Principal Permittee, this system collects runoff from 87 municipalities, which, except for the City of Long Beach, are all Co-Permittees. These Co-Permittees have varying degrees of responsibility for development and maintenance of their portions of the overall system. The Permittees' physical assets that comprise the infrastructure of the

[1] The Los Angeles County Flood Control District also operates a storm drain system on the inland side of the Transverse Ranges; this system falls under the jurisdiction of the Lahontan Regional Board.

system include over 100,000 catch basins, about 4,300 miles of underground storm drains, and about 500 miles of open channels. The City of Los Angeles alone accounts for 220 miles of open channel, 1,900 miles of storm drain pipe, and 62,660 catch basins. An exact summary of these physical assets in the system is not possible, as the Permittees do not have a comprehensive map or database that can accurately show the location, extent, and ownership of all underground drains and catch basins – which is an illustration of difficulties arising from the complex ownership structure of the storm drain assets.

Regulatory History

1990: The Regional Board adopted the first municipal storm water permit for the County in 1990, Order No. 90-079, which required Permittees to develop storm water/ urban runoff ordinances and implement BMPs – in particular, a minimum of 13 BMPs such as public education, street sweeping and construction site controls.

1996: After 18 months of effort to renew the 1990 permit, the Board adopted Order No. 96-054 (i.e. the existing permit – see attachment 10.E). Key elements of this permit were requirements that Permittees develop and implement model programs for Public Information and Participation, Industrial/Commercial Activities, Development Construction, Illicit Connections and Illicit Discharges Elimination, Public Agency Activities, and Development Planning. The permit does not include a requirement for inspections as part of an industrial/commercial control program; rather, after significant debate, the Board included a requirement that Permittees conduct site visits of industrial facilities in their jurisdictions. This was intended as an interim step, to give Permittees a 5-year period to educate businesses before requiring a stronger industrial/commercial control program.

1999: Following a settlement of the litigation brought by the City of Long Beach on Board Order No. 96-054, the Board adopted Order No. 99-060 with separate requirements for the City of Long Beach. The Regional Board Executive Officer during 1998 and 1999 approved countywide model programs for ICID, Development Construction, and Public Agency Activities after making revisions.

2000: The Permittees' proposed model program for Development Planning was vigorously debated in public workshops in 1999 and 2000, culminating in the Board's adoption of Order 00-02, specifying design criteria for a Standard Urban Storm Water Mitigation Plan (SUSMP). In response to a petition of the Board's action by 33 of the Permittees and other interested parties, the State

Water Resources Control Board (State Board) affirmed in large part the Regional Board action (See State Board Order WQ 2000-11, attachment 10.F.1).

2001: On January 31, 2001, the Permittees submitted a renewal application for the permit, which expired on July 30, 2001.[2] Since then, staff, the Permittees, and Heal the Bay (on monitoring issues) have devoted significant time to exchanging information and reviewing drafts of the proposed permit, which will enter a third term since the initial permit was adopted in 1990. Staff conducted a staff workshop on April 24, 2001 after the first draft was issued. After the second draft was issued, staff conduct a workshop before the Regional Board on July 26, 2001. In addition, staff, on November 9, 2001, participated with some of the Permittees in a USEPA led workshop session to review inspection requirements after the tentative permit was issued.

Compliance Status

Staff took very few actions to enforce the permit between 1996 and 2000, as lack of staff resources prevented rigorous oversight of Permittees' compliance status. Had staff resources been adequate for systematic compliance checks of all Permittees, many more enforcement actions most likely would have needed to be taken. The few enforcement actions that were taken were generally in response to complaints, and included 5 Notices of Violation (NOVs) issued to the:

- City of Culver City (February 1998), for failure to maintain erosion and sediment controls at one of its construction sites, which resulted in a discharge of mud into Ballona Creek. The City ultimately implemented sediment controls, but only after repeated discussions with Regional Board staff and the City's consultant.

- Cities of Pomona and Lynwood, for failure to submit Annual Reports for 1996/97 by the due date of October 15, 1997. The City of Lynwood submitted its delinquent Annual Report after receiving the NOV. The City of Pomona did not submit its Annual Program Report until the Executive Officer issued an Administrative Civil Liability (ACL) in the amount of $6,700, which the City promptly paid.

[2] Order No. 96-054 continues to be in effect until the Regional Board acts to reissue the permit (40 CFR § 122.6 (d)).

- City of Alhambra, for a discharge of muddy water to the storm drain from a pipeline repair (1998). The City complied after receiving this NOV.

- City of Monterey Park, for failure to protect slopes from erosion at a city construction site on Ramona Boulevard (1999). The City of Monterey Park ultimately complied but only after repeated discussions with City staff.

In July 2001, staff completed a review of the 1999/00 Annual Program Report, and issued 11 NOVs for failure to implement various programs, including, among others, requirements to: modify planning procedures (such as a CEQA checklist) to integrate storm water considerations; and require pollution prevention plans at construction sites between 2 and 5 acres. The 11 NOVs were issued to each of the Cities of: Azusa, Cerritos, Huntington Park, Inglewood, Malibu, Maywood, Monrovia, Rolling Hills Estates, San Gabriel, South Pasadena, and Vernon. Many of these Permittees have vehemently objected to these NOVs, have submitted documentation of their objections, and demanded that the Regional Board Executive Officer invoke a "Notice to Meet and Confer" provision, as set forth in the existing permit (see also a discussion on this provision on page 8 of this Item). Regional Board staff has held the matter in abeyance, pending a review of the documentation submitted to date.

In March 2001, staff issued NOVs to each of the Cities of Los Angeles and Covina for discharges of sediment to the storm drain.

Staff are currently reviewing the 2000/2001 Annual Program Report which was submitted on October 22, 2001. A preliminary review of the Development Construction compliance reporting summarized in Table 1 indicates apparent implementation deficiencies, reporting inconsistencies, and possible violations of Board Order No. 96-054 among Permittees. For example, seventy-four municipalities reported that less than 5 percent of construction project approvals were being reviewed for storm water controls. Three municipalities did not report at all. Several municipalities reported that zero percent of projects were reviewed or inspected for construction controls because they were either considered exempt or were non-priority. On the other hand, other municipalities reported that 100 percent of projects were reviewed because all were considered priority.

Permit Objectives

Staff proposes consideration of a tentative permit that implements regulations and guidance from USEPA, State Board, and Regional Board. Specific objectives for the third-term renewal are to:

- more effectively prohibit non-storm water (dry weather) discharges to the storm drain system, through elimination of illicit connections and unauthorized discharges;
- more effectively reduce the discharge of pollutants in storm water; and
- require that Permittees implement additional control measures that the Board may determine are necessary for TMDLs that staff anticipates over the next five years.

Permit Approach

To meet these objectives, staff has structured the tentative permit with several improvements over the existing permit, as outlined below:

Findings: Strengthened, to elaborate upon the technical and legal basis for the permit requirements. Included in these Findings are references to technical analyses staff conducted regarding regulation of retail gasoline outlets (RGOs); see Findings C.5 and C.6.

Receiving Water Limitations (Part 2, page 18): Clarifies that discharges must meet water quality objectives, including that they must not cause nuisance (in addition to the statutory requirement to reduce the discharge of pollutants to the maximum extent practicable). Additionally, staff have added a requirement to implement load allocations approved by the Board in a TMDL, without reopening the permit.

Storm Water Quality Management Plan (SQMP): Adds specific performance measures to measure progress on the various elements of the SQMP. Furthermore, the following significant requirements have been added to the Permittees' SQMP:

Industrial/Commercial Inspections (Part 4, Section C, pages 33B-39B): Option B (staff's recommended option) specifies that Permittees must expand a site visit program to also include inspections of facilities in specified industrial and commercial sectors. These sectors were selected based on the results of a risk-based prioritization performed by the County of Los

Angeles Department of Public Works (LACDPW) in 1996 and critical sources monitoring conducted between 1997 and 2000.

Development Planning (Part 4, Section D, pages 40-48): Lowers the threshold of industrial/commercial development that is subject to Standard Urban Storm Water Mitigation Plan (SUSMP) requirements from 100,000 square feet to one acre (consistent with USEPA Phase II regulations), beginning in 2003; and expands SUSMPs to cover:

- environmentally sensitive areas
- ministerial as well as discretionary projects.

Also, Permittees will need to ensure that design of RGOs comply with the SUSMP numerical design standards to capture and/or treat the first ¾ inches of precipitation (or equivalent runoff volume or flow). This design standard applies to new or redeveloped RGOs that exceed a threshold of 5,000 square feet of impervious surface area and projected Average Daily Traffic (ADT) of 100 vehicles. For derivation of this threshold, see Technical Reports [Attachment 10.B-2].

Development Construction (Part 4, Section E, pages 48 to 51): Lowers the threshold for a local Storm Water Pollution Prevention Plan (SWPPP) and wet weather inspection program to construction sites one acre and greater in size (currently two acres and greater in the existing permit). Also, requires that construction projects five acres and greater have a local SWPPP to demonstrate compliance with local ordinances. The local SWPPP may substitute for the State SWPPP required under the State's General Construction Activities Storm Water Permit if the local SWPPP is at least as inclusive in BMPs and construction controls.

Public Agency Activities (Part 4, Section F, pages 52 to 59): Includes explicit requirements to control the discharge of trash to the MS4. It explicitly requires municipal departments to comply with the same development planning and development construction standards that municipalities impose on private development.

Illicit Connections and Discharges (Part 4, Section G, pages 60 to 62): Requires the Principal Permittee to take more responsibility for tracking illicit discharges and connections, and upgrades passive field screening activities (during

regularly scheduled maintenance) to a proactive field screening program.

Monitoring (Attachment T): Adds mass emissions monitoring on the Santa Clara River and Dominguez Channel, and requirements to conduct a biomonitoring assessment with a minimum of 20 stations. Reduces the suite of monitoring parameters that are not conventional and not priority pollutants. Enhances toxicity testing. Facilitates participation in regional research and special studies.

Reporting: (Attachment U): Includes a standard reporting form to elicit information on implementation and status of progress for the various requirements in the permit.

Enforcement: Deletes the Notice to Meet and Confer provision in the existing permit, and instead relies upon the State's policy of progressive enforcement.

Permittees have not provided specific estimates of additional costs that they might be incurred by the requirements highlighted above. The Los Angeles Economic Council cites a Caltrans report that the cost of compliance may exceed $50 billion. Permittees have provided estimates of their 2000/01 and 2001/2002 budget allocations for storm water programs. These amounts aggregate to $142 million and $145 million respectively, and are reproduced in the tables 3 and 4 [3] on pages 22-28.

Critical Issues

Since receiving the application for renewal, on January 31, 2001, staff have dedicated significant time and effort to involving the public in the renewal process, and have been responsive to public comment. However, some critical issues have not been resolved to the satisfaction of all parties and are before the Regional Board, as summarized below.

Enforcement:

Should the new permit contain a safe harbor clause (i.e. a "Notice to Meet and Confer")?

During the 18-month renewal effort from 1995 to 1996, the Regional Board approved a "Notice to Meet and Confer" (NTMC) provision (existing permit, Part 2, section G). Many of the Permittees strongly advocated for this provision, which they

[3] The amounts in the table 3 and 4 (pages 22-27) are self-reported. As permittees may not have compiled their expenditures in a consistent manner, the amounts should be regarded as rough estimates.

envisioned as an important administrative review process for resolving permit disputes before the Board could take formal enforcement action. It was actually used only once, in 2000, when the Regional Board issued NTMC letters in order to obtain information on permittees' efforts to abate trash in the Los Angeles River and Ballona Creek watersheds. As mentioned above, several Permittees want to invoke the NTMC as an interim step to any penalties the Board might issue for the 1999/00 Annual Program Report violations.

Subsequent to renewal of the existing permit, the State developed an enforcement policy (State Board Resolution 96-030) and guidance, which sets forth a progressive strategy that has the goal of ensuring consistent, predicable, and fair enforcement of regulations. This is now a well-established and widely implemented policy throughout the State, and has been successfully implemented in Los Angeles Region. Therefore, staff submits that the NTMC provision should not be included in the renewed permit.

Receiving Water Limitation: ***In structuring a receiving water limitation, has staff correctly complied with State Board direction?***

Some environmentalists contend that the draft permit should contain numerical effluent limitations to protect water quality standards. Permittees, for the most part, believe that they should not be subject to either numerical or narrative receiving water limits, as their SQMP (Storm Water Quality Management Plan) is designed to reduce pollutants in storm water to the maximum extent practicable.[4]

In Part 2 (page 16) of the draft permit, staff incorporated narrative receiving water language as directed by the State Board in Order No. 99-05 (Attachment 10B-2). Subsections 2.1 and 2.2 slightly modify the State Board language in that: §§ 2.1 separately states that discharges that cause or contribute to the exceedences of water quality standards are prohibited, and §§ 2.2 separately states the

[4] Regulations do not define what exactly constitutes the Maximum Extent Practicable (MEP) standard. However, the Office of Chief Counsel has issued a memorandum on the matter (dated February 11, 1993). In general, MEP relies on best management practices that emphasize pollution prevention and source control (i.e. the first line of defense), with additional structural controls as needed (an additional line of defense). Municipalities are required to implement technically feasible BMPs to reduce storm water pollutants unless they can show locational impracticability or that the costs outweigh the water quality benefits to be derived.

discharges shall not cause a condition of nuisance [such as trash]. Some Permittees contend that these modifications exceed State Board Order No. 99-05. However, a review of language in other recent municipal storm water permits issued by the State Board itself and by other Regional Boards, indicates that the subsection language is substantially similar. The State Board affirms this structure of the receiving water limits language in its tentative decision in, *In Re*: Building Industry Association of San Diego County and Western States Petroleum Association (Order No. WQ 2001-xx) scheduled to be adopted on November 15, 2001. See also Regional Counsel's legal memorandum dated November 9, 2001 (Attachment 10.D)

Some Permittees also contend that the draft language is inconsistent with the U.S. Court of Appeals decision in, *Defenders of Wildlife v. Browner* (9th Cir. 1999). This decision held that the Clean Water Act does not require MS4 discharges to strictly comply with water quality standards. However, the decision also found that the permitting authority can compel compliance with water quality standards, as it deemed necessary. As discussed in State Board's Office of Chief Counsel memorandum (Attachment 10.A-1), States can include such provisions under the Clean Water Act. In any case, the memorandum concluded that the 9th Circuit decision did not contradict State Board Order No. 99-05. See also, *In Re*: Building Industry Association of San Diego County and Western States Petroleum Association (Order No. WQ 2001-xx)

Inspections: ***Should the Regional Board require Permittees to inspect industrial/commercial facilities?***

Yes. The County of Los Angeles is one of the most urbanized areas in the nation. If the Regional Board is to make significant progress toward cleaning up impaired waters, control of conventional and toxic pollutants from industrialized and commercial activities is critical. Indeed, the federal regulations clearly acknowledge the significance of pollutants from heavy industry, and mandate that municipal permittees have source control programs for facilities in specified industrial sectors. The significance of these industrial activities – plus commercial activities such as automotive repair – was underscored in a critical source identification program that the Principal Permittee

undertook per a requirement in the existing permit.[5] Accordingly, staff proposes that the Board upgrade the Permittees' industrial control program to specify inspections of facilities in specified sectors at specified intervals.

In Table 4, staff has compared requirements among the existing permit and various options discussed with Permittees during this renewal process. Under the existing permit, no inspections are required; rather, the Board has allowed the Permittees and industry 10 years (i.e. the first two permit terms) to educate industrial and commercial facilities through "site visits." Various options have evolved as follows:

First draft (April 13, 2001): Staff took a "top-down" approach to inspections, proposing that Permittees screen databases of tens of thousands of industrial and commercial facilities to identify facilities that should be targeted for an inspection program.

Second draft (June 29, 2001): In response to comments submitted on the first draft, staff attempted to better structure a partnership between the Regional Board and Permittees. The Regional Board would lead efforts to regulate "Phase 1" industrial facilities (which are subject to the State's General Industrial Activities Storm Water Permit[6]), and the Permittees lead efforts to regulate other problem sectors, such as automotive service facilities, restaurants, and RGOs.

Third draft (October 11, 2001): Staff structured an Option A (pages 33A-39A) to encompass inspections of:

---

[5] Critical Source Selection and Monitoring Report, County of Los Angeles Department of Public Works (September 3, 1996), in which the Principal Permittee identified high risk activities that pollute storm water in the County. Five of these activities – scrap metals, trucking, chemical, primary metal, metal fabricating – are partly regulated by the State's General Industrial Activities Storm Water Permit for Industrial Activities. The other activity – automotive services – is not subject to the State's General Industrial Activities Storm Water Permit or to USEPA Phase 1 regulations. Also, through industrial waste inspections conducted during the first permit term for sanitation departments, several Permittees identified two additional activities – retail gas outlets (RGOs) and restaurants – as high risk for storm water pollution.

[6] For select cities, Table 5 lists the number of facilities currently on record as covered under the State's General Industrial Activities Storm Water Permit. For many of the cities (with the exception of the City of Los Angeles) the number of industrial facilities to be inspected is going to be similar if not the same because these facilities predominate in there jurisdiction.

- USEPA mandated facilities (i.e. landfills, Resource Conservation and Recovery facilities, and toxics treatment storage disposal facilities "TSDF"),
- the automotive sector,
- restaurants, and
- retail gasoline outlets.

In Regional Board staff's opinion, such a minimal requirement fails to address other critical industrial sources of pollutants. To address this concern and to ensure that pollutants from other critical sources are controlled, staff recommends that the Board adopt Option B (pages 33B-39B). This Option B captures sectors in Option A plus five other priority sectors, which are sources of pollutants that match many of the causes of impairments to surface waters in Los Angeles County. These five priority sectors:

- scrap recycling,
- automotive dismantling,
- metal fabrication,
- motor freight,
- chemical manufacturing, and
- primary metal products.

Option C (pages 33C-36C) is status quo – it retains the site visit program as required by permits issued by the Regional Board since 1990. It does not recognize what staff believes was the Board's long-term intent to upgrade the site visit program to an inspection-based program.

For a discussion on legal issues related to inspection, please refer to the Regional Counsel's legal brief (Attachment 10.D. at pages 2 and 14)

Development Planning: ***Does the extension of SUSMP requirements to cover RGOs, ministerial projects, and environmentally sensitive areas, comply with the State Board's SUSMP decision?***

Yes. The Development Planning subsection (Part 4, Section D, pages 26-53) incorporates SUSMP requirements as upheld by the State Board in State Board Order No. 2000-11 "SUSMP Order" (Attachment 10.F.1) and corrects deficiencies that were identified.

The SUSMP Order set aside the applicability of the SUSMP requirements to development projects in environmentally sensitive

areas and to ministerial projects, as defined in the California Environmental Quality Act (CEQA), until full and fair consideration by the Regional Board during permit reissuance. The SUSMP Order also set aside the applicability of numerical mitigation criteria to RGOs until the Regional Board provided proper justification and established thresholds. While some commenters have suggested that the proposed permit violates the SUSMP Order by the extension, a memorandum issued by the State Board Chief Counsel identifies these three areas as potential areas for extension of SUSMP requirements by Regional Boards in the future consistent with State Board guidance in its SUSMP Order (Attachment 10.F.1). Staff has prepared technical reports to support the extension of the SUSMP requirements (Attachment 10 B).

It is proper to extend coverage of SUSMP requirements to developments within, adjacent to or discharging directly to environmentally sensitive areas. Development and urbanization especially threaten environmentally sensitive areas, because these areas have a much lower capacity to withstand pollutant shocks than might be acceptable in the general circumstance. A development that is ordinarily insignificant in its impact on the environment may in a particular sensitive environment become significant. Staff has provided thresholds for developments in environmentally sensitive areas to exclude small developments (less than 2,500 square feet impervious surface) Findings B.6, B.7, and E.4.

It is appropriate to apply numerical design criteria for storm water mitigation to new and redeveloped retail gasoline outlet developments. RGOs are points of convergence for vehicular traffic and are similar to parking lots and urban roads. Studies indicate that storm water discharges from RGOs have high concentrations of hydrocarbons and heavy metals. Pilot studies indicate that treatment control best management practices installed at retail gasoline stations are effective in removing pollutants, reasonable in capital cost, easy to operate, and do not present safety risks. RGOs in western States such as Oregon and Washington are already subject to storm water numerical mitigation criteria. As recommended by the State Board in its SUSMP Order, Board staff has established thresholds for the criteria to apply to RGOs (5,000 square feet or more of impervious surface and projected Average Daily Traffic of 100 vehicles or more) with proper justification. Finding C.6., Attachment 10.B.

It is proper to apply SUSMP requirements to all planning priority project SUSMP categories, including ministerial projects. The California Environmental Quality Act (CEQA) (Cal Pub Resources

Code Section 21000 *et seq.*) requires that public agencies consider the environmental impacts of the projects they approve. CEQA applies to projects that are considered discretionary and does not apply to ministerial projects (i.e., projects which involve the use of established standards or objective measurements). For purposes of water quality, CEQA distinctions are not germane because it is a procedural statute that provides a public forum for consideration of environmental impacts of governmental decision-making. CEQA is not a statute for water quality protection. Municipalities have multiple ways of ensuring that SUSMP requirements are applied in a consistent manner within SUSMP categories. A municipality may give itself discretionary authority by adopting local ordinance provisions that create decision-making discretion for SUSMP categories. Alternatively, a municipality may establish standards and objective criteria for review of ministerial projects that are in SUSMP categories administratively.

Consistent with the Regional Board's action in the Ventura County municipal storm water permit, the proposed permit includes numerical design criteria for water quality flow in addition to water quality volume.

Development Construction: ***Are new requirements to inspect construction sites 1 acre or greater appropriate, and are they consistent with regulations and other permits?***

Small construction sites (1-5 acres) account for a significant amount of pollution from construction activities, in addition to construction sites five acres or greater. In response to this concern, the Development Construction subsection (starting in Part 4, Section E, page 48 of the draft permit) requires that Permittees inspect all construction projects one acre or greater to ensure compliance with local agency ordinances and model programs to prevent erosion, control sediment, and manage on-site construction wastes.

The existing permit has a similar requirement for construction sites two acres or greater. Staff proposes to lower the threshold to 1 acre beginning 2003, when USEPA Phase II regulations for small construction sites become effective. Also, the Regional Board has already issued municipal permits with such a requirement, to the City of Long Beach in 1999 and the County of Ventura in 2000.

Total Maximum Daily Loads (TMDLs): ***Should the Board include a provision requiring implementation of TMDL load reductions, without reopening the permit?***

TMDLs are one of the Board's highest priorities. In view of the Region's highly urbanized environment, it is likely that pollutants in storm water will be allocated significant load reductions. While specific load reductions can't be forecast at this time, staff has structured the permit as a vehicle for achieving load reductions (Part 3, Section C).

Public review of TMDLs, which will typically be in the form of an amendment to the Basin Plan, will occur during the TMDL adoption process; and staff does not anticipate that there will be a need for an additional public process for TMDL implementation measures. Therefore, upon approval of a TMDL, implementation of municipal storm water requirements (specified in that TMDL) will become effective and enforceable under the permit. In other words, municipal storm water requirements will be automatically included in this proposed permit upon adoption of a TMDL by the Board, without reopening this permit. This TMDL requirement and structure is consistent with TMDL provisions in the City of Long Beach and County of Ventura permits.

Monitoring: ***In the event that monitoring indicates storm water from a particular municipality as a source of toxicity, should the Regional Board require that Permittee to implement additional BMPs needed to reduce toxicity?***

Per the *Basin Plan*, there should be no toxicity in receiving waters. Per Parts 2 and 3 of the draft permit, Permittees must revise their Storm Water Management Plan (SQMP), as necessary, to meet receiving water limitations, including water quality objectives. Attachment T to the Monitoring and Reporting Program requires the Principal Permittee to monitor for toxicity and, upon finding toxicity, to conduct a "Toxicity Identification Evaluation" (TIE) and submit a "Toxicity Reduction Evaluation" (TRE) to the Regional Board. As a result of the TRE, the affected Permittee would then be responsible for modifying its SQMP to implement BMPs to eliminate toxicity based on the sources of toxicity within its jurisdiction.

Illicit Connections and Discharges: ***Should the Regional Board require the Principal Permittee to better track IC/ID (illicit discharge and illicit connection) problem areas, and should the Regional Board also upgrade Permittees' passive field screening program to better identify and eliminate IC/ID problems?***

During dry weather, much of the flow to the storm drain system consists of illicit discharges.[7] Reporting of these problems, as summarized in the Fact Sheet/Staff Report (pages 26 to 35), shows erratic IC/ID occurrences that bear no relationship to land uses or to estimated expenditures by Permittees. Under current operating practices, the Principal Permittee is unable to track reports of illicit connections and discharges in order to identify problem areas and prioritize corrective action. Many of the Permittees cannot estimate the length of their portion of the storm drain system. Many more of these Permittees are unable to estimate how much of their portion of the storm drain system has been field screened for IC/ID problems over the past 5 years, partly because the Permittees' existing SQMP requires field screening only "during regularly scheduled maintenance."

In the first draft, staff proposed that the Permittees develop a Geographical Information System (GIS) to better track IC/ID problems and, based upon annual evaluations of IC/ID problems, to implement an active screening program in problem areas. Several Permittees objected to this, stating that a GIS was too expensive to develop, and that simpler systems (e.g. pin maps) could suffice. In this draft, staff is proposing that the Principal Permittee – with the cooperation of Permittees – develop a system (type of system unspecified) to track and prioritize IC/ID problems. The Principal Permittee objects to this requirement out of concern over: (a) anticipated difficulties in coordinating with other Permittees, and (b) the cost of a GIS (as the Principal Permittee feels this is the only system that is sophisticated enough to comprehensively track IC/ID occurrences in the storm drain system), which cost could be well in excess of $15 million.

Staff submits that a comprehensive map[8] or system is needed to track and evaluate IC/ID occurrences, that the Principal Permittee is the

[7] Federal regulations (at 40 CFR 122.26 (b). 2.) define an illicit discharge as "...any discharge to an MS4 that is not composed entirely of storm water..." with some exceptions (such as NPDES-permitted discharges and emergency fire fighting flows).

[8] Indeed, basic requirements such as a map demonstrating a basic awareness of the storm drain system, are part of a Permittees' initial application requirements, and should have been met back in 1990 when the permit was first issued.

appropriate entity with adequate control to take on this responsibly, and that other Permittees should be required to undertake active field screening such needs are indicated by better tracking.

Conclusion

Pollutants in dry weather runoff and storm water are the most significant source of impairment to water quality in the Los Angeles Region. For the third 5-year term of the Los Angeles County MS4 permit, staff has tried to carefully and reasonably structure requirements – including specific performance objectives – that are needed to better focus Permittees' storm water management programs in order to more effectively control pollutants in storm water.

Recommendation

Staff proposes that the Regional Board adopt the tentative permit - including Option B in the Industrial/ Commercial Inspection Program. Comment letters submitted by the Permittees and interested persons, which were received by November 13, will be compiled and forwarded to the Regional Board no later than November 21.

Item	Existing Permit	Second Draft	Tentative Option A	Tentative Option B	Tentative Option C
Focus	USEPA Phase I facilities, Restaurants, RGOs, Automotive Service facilities	USEPA Phase I facilities, Restaurants, RGOs, Automotive Service facilities	Critical sources prioritization (regardless if they are industrial or commercial) based on the critical sources identification study prioritizing 34 categories	Critical sources prioritization (regardless if they are industrial or commercial) based on the critical sources identification study prioritizing 34 categories	USEPA Phase I facilities, Restaurants, RGOs, Automotive Service facilities
Inspection	NO	Restaurants, Automotive Service Facilities	USEPA Mandated: Municipal Landfills, Hazardous Waste Treatment, Disposal and Recovery Facilities, Facilities Subject to SARA Title III (also known as EPCRA), Restaurants (focus on Municipal BMPs), RGOs (focus on Municipal BMPs), Automotive Service Facilities (focus on Municipal BMPs)	**Same as Option A with the addition of** facilities identified as highest ranking in the critical sources evaluation: Wholesale trade (scrap, auto dismantling), Fabricated metal products, Motor freight, Chemical/allied products, Primary metals products	NO
Site Visits	USEPA Phase I facilities, Restaurants, RGOs, Automotive Service facilities	USEPA Phase I facilities	The remaining lower priority categories facility site visits All in the first 24 months, including "no-exposure" facilities. In the second inspection cycle spot check visits at minimum 20% of the remaining total number/per year (excluded facilities deemed "no-exposure")	The remaining lower priority categories facility site visits All in the first 24 months, including "no-exposure" facilities In the second inspection cycle spot check visits at minimum 20% of the remaining total number/per year (excluded facilities deemed "no-exposure")	USEPA Phase I facilities, Restaurants, RGOs, Automotive Service facilities
Frequency	Once every 24 months	Once every 24 months	Once every 24 months	Once every 24 months	Once every 24 months

"USEPA Phase I Facilities" means facilities in specified industrial categories that are required to obtain an NPDES permit for storm water discharges, as required by 40 CFR 122.26(c) These categories include:

i. facilities subject to storm water effluent limitation guidelines, new source performance standards, or toxic pollutant effluent standards (40 CFR N)
ii. manufacturing facilities
iii. oil and gas/mining facilities
iv. hazardous waste treatment, storage, or disposal facilities
v. landfills, land application sites, and open dumps
vi. recycling facilities
vii. steam electric power generating facilities
viii. transportation facilities
ix. sewage of wastewater treatment works
x. light manufacturing facilities

California Regional Water Quality Control Board

Los Angeles Region

Over 50 Years Serving Coastal Los Angeles and Ventura Counties

Recipient of the 2001 *Environmental Leadership Award* from Keep California Beautiful

Winston H. Hickox
Secretary for
Environmental
Protection

Gray Davis
Governor

320 W. 4th Street, Suite 200, Los Angeles, California 90013
Phone (213) 576-6600 FAX (213) 576-6640 - Internet Address: http://www.swrcb.ca.gov/rwqcb4

TO: Interested Parties (see attached distribution list), including: Permittees–County of Los Angeles Municipal Storm Water Permit; Resource and Regulatory Agencies; Water Districts; Environmental Organizations; Consultants; Other Local Agencies; and Other Interested Parties

FROM: Dennis A. Dickerson
Executive Officer

DATE: October 11, 2001

SUBJECT: **Announcement of a Public Hearing and Transmittal of the Tentative Draft – County of Los Angeles Municipal Storm Water NPDES Permit**

ATTACHMENTS:

1. Public Notice
2. Tentative Permit (underline/strike-out version)
3. Staff Report
4. Response to Comments
5. Distribution List

The Regional Water Quality Control Board (Regional Board) will conduct a public hearing to consider adoption of the attached tentative permit during a public meeting on:

Thursday, November 29, 2001, starting at 9:00 a.m.
Richard H. Chambers U.S. Court of Appeals Building (Courtroom 3)
125 S. Grand Avenue, Pasadena, CA

A tentative agenda and public comment protocol for this Board Meeting will be posted on our web site by November 19, 2001. The public will have an opportunity to provide oral testimony before the Regional Board on November 29, 2001.

The County and Cities in Los Angeles County discharge storm water under a municipal storm water permit (Board Order No. 96-054), which expired on July 30, 2001. The Regional Board will consider adoption of a renewed permit at a public meeting on November 29, 2001. As part of the renewal process, we are pleased to transmit the tentative draft of the proposed new permit – the Municipal Storm Water NPDES Permit for the County of Los Angeles and incorporated cities (except for the City of Long Beach, which is covered under a separate permit). The version attached is an underlined/strike-out version to simplify the review of changes from the June 29, 2001 draft.

We have reviewed the comments received and have made changes accordingly. The main revisions are in the following programs:

1. Development Planning:
   a. Single family structures are excluded from the redevelopment requirements; and
   b. We have proposed a time period for a study to recommend peak flow controls.
2. Inspections:
   a. Option A - Focus inspections on critical sources prioritization confirmed by monitoring study; Inspect municipal landfills, hazardous waste treatment facilities, EPCRA facilities, restaurants, retail gasoline outlets, and auto service facilities; and remaining facilities are site visits.
   b. Option B - Focus inspections on critical sources prioritization confirmed by monitoring study; Inspect the same facilities as Option A with the addition of wholesale trade (scrap, auto dismantling), fabricated metal products, motor freight, chemical/allied products, primary metals products, and facilities identified as highest ranking in their critical sources evaluation; and remaining facilities are site visits.
   c. Option C – Continued Site Visits as currently in place.
3. Illicit Connections/Illicit Discharges: Development of a listing of all permitted connections to the storm drain system.
4. Monitoring and Reporting Program: Included a reporting program with reporting requirements and performance criteria.

We have attached a staff report, containing technical justifications for changes from the existing permit. If you would like a non underline/strike-out version of the permit (clean version), please contact Wendy Abarquez by phone at (213) 576-6802 or by e-mail at wabarque@rb4.swrcb.ca.gov. Alternatively, the tentative permit and other renewal documents will be placed on our website by next week for dissemination and viewing.

Please submit your comments on the attached tentative draft in writing, to this office by November 12, 2001. This will give staff time to review and consider the comments, respond to them, propose changes to the tentative permit, and if necessary, resolve issues prior to the Regional Board consideration of the tentative permit during the public hearing. Written comments should be either hand delivered or mailed to this office to the attention of: Dr. Xavier Swamikannu.

Any comments received after November 12, 2001, will be provided to the Regional Board members ex agenda, and may not receive full consideration. Following the consideration of written comments and oral testimony, the Board may take action to adopt tentative Order No. 01-XXX during a public meeting on November 29, 2001. At its discretion, however, the Board may direct further investigation.

Please call Dr. Xavier Swamikannu at (213) 576-6654 or Wendy Phillips at (213) 576-6618 should you have any questions. Thank you for your interest in and comments on this proposed regulatory action for the County of Los Angeles and the Cities of Los Angeles County.

R0006818

Public Notice

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

LOS ANGELES REGION

320 W. 4th Street, Suite 200
Los Angeles, California 90013
Tel No. (213) 576-6600; Fax No.: (213) 576-6660

Public Notice No. 01-060

NPDES No. CAS004001

NOTICE OF PUBLIC HEARING

CONSIDERATION OF A STORM WATER MANAGEMENT/URBAN RUNOFF PERMIT

FOR

THE COUNTY OF LOS ANGELES AND THE INCORPORATED CITIES THEREIN,

EXCEPT THE CITY OF LONG BEACH

Los Angeles Regional Water Quality Control Board will conduct a public hearing to consider the adoption of a municipal storm water permit for Los Angeles County (the renewal of an existing five-year permit). Regional Board staff will provide background and a brief overview of the proposed draft permit. The public will have the opportunity to testify regarding the proposed permit.

HEARING DATE AND LOCATION:

DATE: Thursday, November 29, 2001
TIME: 9:00 a.m.
PLACE: Richard S. Chambers, U.S. Court of Appeals Building
Courtroom 3
125 S. Grand Avenue
Pasadena

AVAILABILITY OF DOCUMENTS

You may contact Weindy Abarquez, at (213) 576-6802, to request a copy of the tentative draft permit and staff report. After October 15, you may also download the tentative draft permit and other related documents from the Regional Board Storm Water web page at www.swrcb.ca.gov/rwqcb4/html/programs/Stormwater/renewal.html.

BACKGROUND

On January 31, 2001, the Los Angeles County Department of Public Works submitted an application for renewal of the five-year Municipal Storm Water Management/Urban Runoff Discharges Requirements for the County of Los Angeles, and the incorporated cities, except for the City of Long Beach (Board Order No. 96-045). Regional Board staff conducted a public workshop on April 24 and a formal workshop with the Regional Board on July 26 to give

background on the permit and allow for public comment. Regional Board staff have considered comments in the issuance of each of the three draft permits.

Under the requirements of the permit, the County will implement the Storm Water Quality Management Plan which includes the following provisions: (a) Program Management; (b) Public Information and Participation Program; (c) Programs for industrial/commercial facilities; (d) Public Agency Activities; (e) Programs to eliminate illicit connections and discharges; (f) Programs for development planning; and (g) Programs for construction sites. These programs collectively are expected to reduce pollutants in storm water discharges to the Maximum Extent Practicable.

In addition, the County will conduct a storm water monitoring program to assess permit compliance, assess the chemical physical and biological impacts on receiving waters from storm water runoff, characterize storm water discharges, and identify sources of water quality exceedances and toxic pollutants.

HEARING PROCEDURE

The hearing will start at 9:00 am. Regional Board staff will present an overview of the proposed permit. Interested persons are invited to attend and to testify in front of the Regional Board. For the accuracy of the record, comments should also be submitted in writing. The Regional Board may ask questions of staff and persons who testify prior to making a decision on the adoption of the proposed permit.

Date: September 27, 2001

STATE OF CALIFORNIA

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

ORDER NO. 01-xxx
NPDES PERMIT NO. CAS004001
WASTE DISCHARGE REQUIREMENTS
FOR
MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES, AND THE INCORPORATED CITIES THEREIN, EXCEPT THE CITY OF LONG BEACH

The California Regional Water Quality Control Board, Los Angeles Region (hereinafter referred to as the Regional Board) finds:

A. **Existing Permit ~~and Report of Waste Discharge~~**

The Los Angeles County Flood Control District, the County of Los Angeles, and 84 incorporated cities within the Los Angeles County Flood Control District (see Attachment A, List of Permittees), hereinafter referred to separately as Permittees and jointly as the Discharger, discharge or contribute to discharges of storm water and urban runoff from municipal separate storm sewer systems (MS4s), also called storm drain systems. The discharges flow to water courses within the Los Angeles County Flood Control District and into receiving waters of the Los Angeles rRegion. These discharges are covered under countywide waste discharge requirements contained in Order No. 96-054 adopted by this Regional Board on July 15, 1996, ~~and~~ which replaced Order No. 90-079 adopted by this Regional Board on June 18, 1990. Order No. 96-054 also serves as a National Pollutant Discharge Elimination System (NPDES) permit for the discharge of municipal storm water.

B. **Nature of Discharges and Sources of Pollutant**

1. Storm water discharges consist of surface runoff generated from various land uses in all the hydrologic drainage basins that discharge into water bodies of the State. The quality of these discharges varies considerably and is affected by the hydrology, geology, land use, season, and sequence and duration of hydrologic events. The primary constituents of concern currently identified by the Los Angeles County Flood Control District 1994-2000 Integrated Receiving Water Impacts Report are cyanide, indicator bacteria, total dissolved solids, turbidity, total suspended solids, nutrients, total aluminum, dissolved cadmium, copper, lead, total mercury, nickel, zinc, bis(2-ethylhexyl)phthalate, polycyclic aromatic hydrocarbons (PAHs), diazinon, and chlorpyrifos.

2. Certain pollutants present in storm water and/or urban runoff may be derived from extraneous sources that Permittees have no or limited jurisdiction over. Examples of such pollutants and their respective sources are: PAHs which are products of internal combustion engine

operation, nitrates, bis (2-ethylhexyl) phthalate and mercury from atmospheric deposition, ~~heavy metals,~~ lead from fuels, copper from brake pad wear, zinc from tire wear, dioxins as products of combustion, and ~~bis (2-ethylhexyl) phthalate and mercury as resulting from atmospheric deposition~~, and natural-occurring minerals from local geology. However, the implementation of the measures set forth in this Order ~~are~~is intended to reduce ~~and will contribute to reduced~~ the entry of these pollutants into storm water and their discharge to receiving waters.

~~3.These compounds can have damaging effects on both human health and aquatic ecosystems. In addition, the high volumes of storm water discharged from MS4s in areas of urbanization can significantly impact aquatic ecosystems due to physical modifications such as bank erosion and widening of channels. It is anticipated that, due to the nature of storm water events (i.e., large volumes of water and high velocities) that there may be short term, reversible impacts to beneficial uses that are not directly related to water quality.~~

~~4.~~3. Water quality assessments conducted by the Regional Board identified impairment, or threatened impairment, of beneficial uses of water bodies in the Los Angeles Region. The causes of impairments include pollutants of concern identified in municipal storm water discharges by the County of Los Angeles in the Integrated Receiving Water Impacts Report (1994-2000). Pollutants in storm water can have damaging effects on both human health and aquatic ecosystems.

4. The Los Angeles County Grand Jury, September 2000, completed an investigation into the health risks of swimming near beaches in Los Angeles County and made several recommendations to reduce public health risks (Final Report, Grand Jury, Los Angeles County, 1999-2000). The Grand Jury recommended that the Regional Board consider among other actions, (i) a focus on setting contaminant limits rather than programmatic evaluations, (iii) audit of MS4 Permittee programs; and (iv) clarifying enforcement responsibilities between the State and local governments.

5. Studies and research conducted by other Regional agencies, academic institutions, and universities have also identified storm water and urban runoff as significant sources of pollutants to surface waters in Southern California.~~,~~ See, e.g.,- [*Surface Runoff to the Southern California Bight*, Southern California Coastal Water Research Project, (1992); *Impacts of Urban Runoff on Santa Monica Bay and Surrounding Ocean Waters* (Gersberg, R.M., 1995); *State of the Bay 1998*, Santa Monica Bay Restoration Project; *Storm Water Impact*, In, Southern California Environmental Report Card 1999, Institute of the Environment, University of California, Los Angeles (Stenstrom, M.S., 1999); *Distribution of Anthropogenic and Natural Debris on the Mainland Shelf of Southern California Bight,* Shelly L. Moore and M. James Allen (1999); *The Health Effects of Swimming in Ocean Water Contaminated by Storm Drain Runoff*, Haile, R.W. et al. (1999); *Huntington Beach Closure Investigation:*

Technical Review (University of Southern California, 2000); *A Regional Survey of the Microbiological Water Quality Along the Shoreline of the Southern California Bight,* Rachel T. Noble et al. (2001); *Integrated Receiving Water Impacts Report (1994-2000),* County of Los Angeles (2001).

6. Development and urbanization increase pollutant load, volume, and discharge velocity. First, natural vegetated pervious ground cover is converted to impervious surfaces such as paved highways, streets, rooftops and parking lots. Natural vegetated soil can both absorb rainwater and remove pollutants providing an effective natural purification process. In contrast, pavement and concrete can neither absorb water nor remove pollutants, and thus the natural purification characteristics are lost. Second, urban development creates new pollution sources as the increased density of human population brings ~~with it~~ proportionately higher levels of vehicle emissions, vehicle maintenance wastes, municipal sewage waste, pesticides, household hazardous wastes, pet wastes, trash, and other anthropogenic pollutants. Development and urbanization especially threaten environmentally sensitive areas. Such areas have a much lower capacity to withstand pollutant shocks than might be acceptable in the general circumstance. In essence, development that is ordinarily insignificant in its impact on the environment may in a particular sensitive environment become significant. These environmentally sensitive areas designated by the State and/or the County of Los Angeles include Areas of Special Biological Significance (ASBS), water bodies designated ~~with~~ as supporting a RARE beneficial use, Significant Natural Areas (SNAs), and Significant Ecological Areas (SEAs).

7. The increased volume, increased velocity, and discharge duration of storm water runoff from developed areas has the potential to greatly accelerate downstream erosion and impair stream habitat in natural drainages. Studies have demonstrated a direct correlation between the degree of imperviousness of an area and the degradation of its receiving waters. Significant declines in the biological integrity and physical habitat of streams and other receiving waters have been found to occur with as little as 10 percent conversion from natural to impervious surfaces. Percentage impervious cover is a reliable indicator and predictor of potential water quality degradation expected from new development. (*Impervious Cover as An Urban Stream Indicator and a Watershed Management Tool,* Schueler, T. and R. Claytor, In, Effects of Water Development and Management on Aquatic Ecosystems (1995), ASCE, New York.)

8. The County of Los Angeles has identified as the ~~five~~ seven highest ~~priority potential~~ priority industrial and commercial critical source types, (~~i~~i) wholesale trade (scrap recycling, auto dismantling); (ii) automotive repair/-parking; (iii) fabricated metal products; (iv) motor freight; ~~and~~ (v) chemical and allied products; (vi) automotive dealers/gas stations; (vii) primary metal products (*Critical Source Selection and Monitoring Report,* Los Angeles County Department of Public Works (-Sept 1996).

Monitoring conducted by Los Angeles County demonstrates that the priority industrial sectors and auto repair facilities (~~the only~~ one of the commercial sectors) on the list, contribute significant concentrations of heavy metals to storm water (~~-~~*Los Angeles County 1999-2000 Storm Water Monitoring Report*, Los Angeles County Department of Public Works (~~-~~July 2000)~~)~~.

9. A review of industrial waste/ pretreatment records performed in 1995 in the County of Los Angeles on illicit discharges indicates that automotive service facilities and food service facilities sometimes discharge polluted washwaters to the MS4. The pollutants of concern in such washwaters include food waste, oil and grease, and toxic chemicals. Other storm water/industrial waste programs in California have reported similar observations. Illicit discharges from automotive service facilities and food service facilities have been identified elsewhere as a major cause of widespread contamination and water quality problems (Washtenaw County Statutory Drainage Board. 1987. Huron River Pollution Abatement Program)

C. Permit Background

1. The essential components of the Storm Water Management Program, as established by federal regulations [40 CFR 122.26(d)] are: (i) adequate legal authority, (ii) fiscal resources, (iii) Storm Water Quality Management Program (SQMP) - (Public Information and Participation Program, Industrial/Commercial Facilities Program, Development Planning Program, Development Construction Program, Public Agency Activities Program, Illicit Connection and Illicit Discharges Elimination Program), and (iv) monitoring and reporting program.

2. The Permittees have filed a Report of Waste Discharge (ROWD), dated February 1, 2001, and applied for renewal of their waste discharge requirements ~~and a proposed~~ that serves as an NPDES permit to discharge wastes to surface waters. The ROWD includes a proposed ~~Storm Water Quality Management Plan (~~SQMP~~)~~ and a Monitoring Program. The proposed SQMP contains programs previously approved under Board Order No. 96-054 in the following areas:

   Public Information and Participation
   Development Planning
   Development Construction
   Public Agency Activities
   Illicit Connection/Illicit Discharge Elimination Program

   These programs are revised pursuant to the provisions of this Order after adoption.

3. The County of Los Angeles has previously conducted source identification and pollutant characterization consistent with 40 CFR 122.26(d)(1)(ii) and (iii) under its storm water monitoring program. The

R0006828

Monitoring Program submitted with the ROWD proposes to advance the assessment of receiving water impacts, identification of sources of pollution, evaluation of Best Management Practices (BMPs), and measurement of long term trends in mass emissions.

4. The Regional Board has reviewed the ROWD and has determined it to be complete under the reapplication policy of MS4s issued by the U.S. Environmental Protection Agency (USEPA) (61 *Fed. Reg.* 41697). The Regional Board finds that the Permittees' proposed SQMP~~torm Water Management Plan~~, incorporating the additional provisions contained in this Order would meet the minimum requirements of federal regulations.

5. Studies indicate that facilities with paved surfaces subject to frequent motor vehicular traffic (such as parking lots and fast food restaurants), or facilities that perform vehicle repair, maintenance, or fueling (automotive service facilities) are potential sources of pollutants of concern in storm water. [References: Pitt *et al.*, *Urban Storm Water Toxic Pollutants: Assessment, Sources, and Treatability*, Water Environment Res., 67, 260 (1995); *Results of Retail Gas Outlet and Commercial Parking Lot Storm Water Runoff Study*, Western States Petroleum Association and American Petroleum Institute, (1994); *Action Plan Demonstration Project, Demonstration of Gasoline Fueling Station Best Management Practices*, Final Report, County of Sacramento (1993); Source Characterization, R. Pitt, In Innovative Urban Wet-Weather Flow Management Systems (2000) Technomic Press, Field, R *et al.* editors; *Characteristics of Parking Lot Runoff Produced by Simulated Rainfall*, , L.L. Tiefenthaler *et al.* Technical Report 343, Southern California Coastal Water Research Project (2001).]

6. Retail gasoline outlets are points of convergence for vehicular traffic and are similar to parking lots and urban roads. Studies indicate that storm water discharges from retail gasoline outlets have high concentrations of hydrocarbons and heavy metals. [*Schueler and Shepp* (1992)]. Pilot studies indicate that treatment control best management practices installed at retail gasoline stations are effective in removing pollutants, reasonable in capital cost, easy to operate, and do not present safety risks [*Rouge River National Wet Weather Demonstration Project, Task Product Memorandum – Evaluation of On-line Media Filters RPO-NPS-TPM59.00*, Wayne County, MI, March 1999]. The LA Regional Board and the San Diego Regional Board have jointly prepared a Technical Report on the applicability of new development BMP design criteria for retail gasoline outlets, (*Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts*, (June 2001)). Retail Gasoline Outlets in Western U.S. States (such as Washington and Oregon) are already subject to numerical BMP design criteria under the MS4 program, as well in other U.S. States.

7. The City of Los Angeles has conducted shoreline and nearshore water quality monitoring off the Santa Monica Bay since the 1950s under the monitoring program for the Hyperion Waste Water Treatment Plant

(NPDES No. CA0109991). The monitoring results indicate that effluent from Hyperion's 5-Mile Outfall does not impinge the shoreline, and that elevated bacterial counts are associated with runoff from storm drains and discharges from piers. In 1994, the Regional Board approved the relocation of Hyperion's shoreline stations to implement a bay-wide, regional shoreline-monitoring program associated with storm drain outfalls in the Santa Monica Bay. The City of Los Angeles requested that the shoreline-monitoring requirement be incorporated in this Order. The shoreline pathogen monitoring requirements are outlined in the Monitoring Program for this Order.

D. Permit Coverage

1. The requirements in this Order cover all areas within the boundaries of the Permittee municipalities (see Attachment A) over which they have regulatory jurisdiction as well as unincorporated areas in Los Angeles County Flood Control District within the jurisdiction of the Regional Board. The Permittees serve a population of about 9.5 million [Reference: *2000 Census of Population and Housing*, Bureau of the Census, U.S. Department of Commerce (2001)] in an area of approximately 3,100 square miles. Attachment B shows the map of the permitted area in Los Angeles County Flood Control District.

2. Federal, state, regional or local entities within the Permittees' boundaries or in jurisdictions outside the Los Angeles County Flood Control District, and not currently named in this Order, may operate storm drain facilities and/or discharge storm water to storm drains and watercourses covered by this Order. The Permittees may lack legal jurisdiction over these entities under state and federal constitutions. ~~Consequently, the Regional Board recognizes that the Permittees will not be held responsible for such facilities and/or discharges.~~ The Regional Board will coordinate with these entities ~~facilities~~ to implement programs that are consistent with the requirements of this Order. The Regional Board will consider such facilities for coverage in 2003 under its NPDES permitting scheme pursuant to USEPA Phase II storm water regulations.

3. Sources of discharges into receiving waters in the County of Los Angeles but in jurisdictions outside its boundary include the following:

   About 34 square miles of unincorporated area in Ventura County, which drain into Malibu Creek and thence to Santa Monica Bay,

   About 9 square miles of the City of Thousand Oaks, which also drain into Malibu Creek and thence to Santa Monica Bay, and

   About 86 square miles of area in Orange County, which drain into Coyote Creek and thence into the San Gabriel River.

The Regional Board will ensure that storm water management programs for the areas in Ventura County and the City of Thousand Oaks that drain into Santa Monica Bay are consistent with the requirements of this Order. The Regional Board will coordinate with the Santa Ana Regional Board so that storm water management programs for the areas in Orange County that drain into Coyote Creek are consistent with the requirements of this Order.

4. This permit is intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to ~~control~~ reduce the discharge of pollutants in storm water to the maximum extent practicable (MEP) from the permitted areas in the County of Los Angeles to the waters of the United States.

5. Permittees have expressed their intention to work cooperatively to control the contribution of pollutants from one portion of the MS4 to another portion of the system. Permittees may control the contribution of pollutants to the ~~municipal separate storm sewer system~~ MS4 from non-permittee dischargers such as Caltrans, the U.S. Department of Defense, and other state and federal facilities, through interagency agreements.

E. Federal, State, and Regional Regulations

1. The Water Quality Act of 1987 added Section 402(p) to the federal Clean Water Act (CWA) (33 U.S.C Section 1251-1387). This section requires the ~~U.S. Environmental Protection Agency~~ (USEPA) to establish regulations setting forth NPDES requirements for storm water discharges in two phases.

   - The USEPA Phase I storm water regulations were directed at ~~municipal separate storm sewer systems~~ (MS4s) serving a population of 100,000 or more, including interconnected systems and storm water discharges associated with industrial activities, including construction activities. The Phase I Final Rule was published on November 16, 1990 (55 *Fed Reg.* 47990).

   - The USEPA Phase II storm water regulations are directed at storm water discharges not covered in Phase I, including small ~~municipal~~ MS4s (serving a population of less than 100,000), small construction projects (one to five acres), municipal facilities with delayed coverage under the Intermodal Surface Transportation Efficiency Act of 1991, and other discharges for which the USEPA Administrator or the State determines that the storm water discharge contributes to a violation of a water quality standard, or is a significant contributor of pollutants to waters of the United States. The Phase II Final Rule was published on December 8, 1999 (64 *Fed Reg.* 68722).

2. The USEPA published an 'Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits' on August 26, 1996 (61 *Fed. Reg.* 43761). This policy discusses the appropriate kinds of

water quality-based effluent limitations to be included in NPDES storm water permits to provide for the attainment of water quality standards.

3. The USEPA published an 'Interpretative Policy Memorandum on Reapplication Requirements' for MS4 permits on August 9, 1996 (61 *Fed. Reg.* 41697). This policy requires that MS4 reapplication for reissuance for a subsequent five-year permit term contains certain basic information and information for proposed changes and improvements to the storm water management program and monitoring program.

4. The USEPA has entered into a Memorandum of Agreement (MOA) with the U.S. Fish and Wildlife Service and the National Marine Fisheries Service for enhancing coordination regarding the protection of endangered and threatened species under Section 7 of the Endangered Species Act (ESA) and the CWA's Water Quality Standards and NPDES programs. Among other actions, the MOA establishes a framework for coordination of actions by the USEPA, the Services, and CWA delegated States on CWA permit issuance under Section 402 of the CWA [66 *Fed. Reg.*, 11202 – 11217].

5. USEPA regulations at 40 CFR 122.26(d)(2)(iv)(A) and 40 CFR 122.26(d)(2)(iv)(C) require that MS4 Ppermittees implement a program to monitor and control pollutants in discharges to the municipal system from industrial and commercial facilities that contribute a substantial pollutant load to the MS4. The regulations require that Ppermittees establish priorities and procedures for inspection of industrial facilities and priority commercial establishments. This permit, consistent with the USEPA policy, incorporates a cooperative partnership, including the specifications of minimum expectations, between the Regional Board and the Permittees for the inspection of industrial facilities and priority commercial establishments to control pollutants in storm water discharges (58 *Fed. Reg.* 61157).

6. Section 402 (p) of the CWA~~lean Water Act~~ (33 U.S.C. Section 1342(p) provides that MS4 permits must "require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design engineering method and such other provisions as the [EPA] Administrator or the State determines appropriate for the control of such pollutants." The State Water Resources Control Board's (State Board) Office of Chief Counsel (OCC) has issued a memorandum interpreting the meaning of MEP to include technical feasibility, cost, and benefit derived with the burden being on the municipality to demonstrate compliance with MEP by showing that a BMP is not technically feasible in the locality or that BMPs costs would exceed any benefit to be derived (dated February 11, 1993).

7. ~~Section 122.2 of t~~The CWA authorizes the USEPA to permit a state to serve as the ~~delegate its~~ NPDES permitting authority in lieu of the USEPA~~to states with an approved environmental regulatory program~~. The State of California has in-lieu authority for an NPDES program~~is a delegated State~~. The Porter-Cologne Water Quality Control Act ~~(California Water Code)~~ authorizes~~d~~ the ~~State Water Resources Control~~

~~Board~~ (State Board), through the Regional Boards, to regulate and control the discharge of pollutants into waters of the State ~~and tributaries thereto~~. The State Board entered into a ~~Memorandum of Agreement~~ [MOA] with the USEPA, on ~~22~~ September 22, 1989, to administer the NPDES Program governing discharges to waters of the United States.

8. Section 303(d) of the CWA requires that the State identify a list of impaired water-bodies and develop and implement Total Maximum Daily Loads (TMDLs) for these waterbodies (33 U.S.C. §1313(d)(1)). A TMDL specifies the maximum amount of a pollutant that a water-body can receive, ~~and~~ still meet~~implement~~ applicable water quality standards and protect beneficial uses. The USEPA entered into a consent decree with the Natural Resources Defense Council (NRDC), Heal the Bay, and the Santa Monica BayKeeper on March 22, 1999, under which the Regional Board must adopt all TMDLs for the Los Angeles Region within 13 years from that date. This permit incorporates a provision to implement and enforce approved load allocations for municipal storm water discharges and require ~~changes to~~ amending the SQMP~~torm Water Quality Management Plan~~ after pollutants loads have been allocated and approved.

9. Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point pollution impacting or threatening coastal water quality. CZARA (16 U.S.C. Sections 1451-1465), amends the Coastal Zone Management Act of 1972, to address five sources of non-point pollution: agriculture, silviculture, urban, marinas, and hydromodification. This NPDES permit addresses the management measures required for the urban category, with the exception of septic systems. The Regional Board addresses septic systems through the administration of other programs.

10. On May 18, 2000, the USEPA established numeric criteria for priority toxic pollutants for the State of California (California Toxics Rule) 65 *Fed. Reg.* 31682 (40 C.F.R. § 131.38), for the protection of human health and aquatic life. These ~~apply~~ as ambient water quality criteria for ~~inland~~ surface waters, ~~and~~ enclosed bays, and estuaries. The State Board adopted the, *(~~Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California~~ (SIP) – 2000)* on March 2, 2000, for implementation of the California Toxics Rule (State Board Resolution No. 2000-15 as amended by Board Resolution No. 2000-030). This policy requires that discharges comply with TMDL-derived load allocations as soon as possible but no later than 20 years from the effective date of the policy. ~~This Policy also establishes reporting protocols for the results on analytical determinations of chemical constituents and reporting levels (Minimum Level) in wastewater and storm water discharges.~~

11. The State Board adopted a revised Water Quality Control Plan for Ocean Waters of California (Ocean Plan) on July 23, 1997. The Ocean Plan contains water quality objectives ~~for~~ which apply to ~~-~~all discharges to the coastal waters of California.

12. The State Board *In Re*: California Department of Transportation (State Board Order WQ 2001-08), determined that the discharge of storm water to Areas of Special Biological Significance (ASBS) ~~are~~ is subject to the prohibition in the Ocean Plan against the discharge of wastes to an ASBS.

13. The Regional Board adopted an updated Water Quality Control Plan (Basin Plan) for the Los Angeles Region on June 13, 1994, *'Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties*, (1994).' The Basin Plan~~, and amendments thereto, which are incorporated in this Order by reference,~~ designates beneficial uses of receiving waters and specifies both narrative and numerical water quality objectives for the receiving waters in Los Angeles County.

14. The Regional Board on ~~January 26, 2001 and~~ September 19, 2001, adopted amendments to the ~~*Water Quality Control Plan, Los Angeles Region*~~Basin Plan, to incorporate TMDLs for trash ~~for~~ in the Los Angeles River (Resolution No. ~~01-006 amended by Resolution No.~~ 01-013) and Ballona Creek (Resolution No. 01-014). ~~The TMDLs for trash a~~After approval by the State Board, the Office of Administrative Law, and the U.S. EPA ~~and the Office of Administrative Law are~~ the TMDLs for trash will be effective and enforceable ~~under this Order for municipal storm water discharges.~~

~~14.~~15. The Regional Board on April 13, 1998, approved ~~best management practices~~ BMPs for sidewalk ~~wash~~rinsing to minimize the discharge of wash waters to the storm drain system (Resolution No. 98-08). By the same ~~R~~resolution, the Regional Board prohibited the discharge of municipal street wash waters to the storm drain system.

~~15.~~16. The Regional Board on April 13, 1998, approved recommended ~~best management practices~~ BMPs for industrial/-commercial facilities (Resolution No. 98-08).

~~16.~~17. The Regional Board on April 22, 1999, approved a list of ~~best management practice~~BMPs for use in development planning and development construction (Resolution No. 99-03)

~~17.~~18. The Regional Board adopted and approved requirements for new development and significant redevelopment projects in Los Angeles County to control the discharge of storm water pollutants in post-construction storm

water, on January 26, 2000, in Board Resolution No. R-00-02. The Regional Board Executive Officer issued the approved Standard Urban Storm Water Mitigation Plans (SUSMPs) on March 8, 2000. The State Board in large part affirmed the Regional Board action and SUSMPs in State Board Order No. WQ 2000-11 issued on October 5, 2000.

- The State Board's Chief Counsel has issued a statewide policy memorandum (dated December 26, 2000,) which interprets the Order to provide broad discretion to Regional Boards and identifies potential future areas for inclusion in SUSMPs and the types of evidence and findings necessary. Such areas include ministerial projects, projects in environmentally sensitive areas, and water quality design criteria for retail gasoline outlets.
- The State Board's Chief Counsel interprets the Order to encourage regional solutions and endorses a mitigation fund or "bank" that may be funded by developers who obtain waivers from the numerical design standards for new development and significant redevelopment.

~~18.~~19. The Regional Board has determined that the creation of structural or treatment control BMPs for storm water mitigation in waters of the U.S. is not permissible. 40 CFR Part 131.10(a) prohibits states from designating waste transport or waste assimilation as a use for any waters of the U.S. Authorizing the construction of a storm water/ urban runoff treatment facility in a jurisdictional water body would be tantamount to accepting waste assimilation as an appropriate use for that water body. Furthermore, the construction and operation of a pollution control facility in a water body can impact the physical, chemical, and biological integrity as well as the beneficial uses of the water body. Therefore, storm water treatment and/or mitigation in accordance with SUSMPs and any other requirements of this Order must occur prior to the discharge of storm water into a water of the U.S.

~~19.~~20. The Regional Board supports a Watershed Management Approach to address water quality protection in the region. The objective of the Watershed Management Approach should be to provide a comprehensive and integrated strategy towards water resource protection, enhancement, and restoration while balancing economic and environmental impacts within a hydrologically defined drainage basin or watershed. It emphasizes cooperative relationships between regulatory agencies, the regulated community, environmental groups, and other stakeholders in the watershed to achieve the greatest environmental improvements with available resources.

~~20.~~21. To promote a watershed management approach, the County of Los Angeles is divided into ~~five~~ six Watershed Management Areas (WMAs) as follows:

Malibu Creek and Rural Santa Monica Bay WMA
Ballona Creek and Urban Santa Monica Bay WMA

Los Angeles River WMA
San Gabriel River WMA
Dominguez Channel/Los Angeles Harbor WMA, and
Santa Clara River WMA

Attachment -A shows the list of Permittees under each WMA and some Permittees have expressed an intent to form sub-watershed groups within the WMA to promote regional solutions for the mitigation of storm water discharge pollution.

~~21.~~22. To facilitate compliance with federal regulation, the State Board has issued two statewide general NPDES permits for storm water discharges: one for storm water from industrial sites [NPDES No. CAS000001, General Industrial Activity Storm Water Permit (GIASP)] and the other for storm water from construction sites [NPDES No. CAS000002, General Construction Activity Storm Water Permit (GCASP)]. The GCASP was reissued on August 19, 1999. The GIASP was reissued on April 17, 1997. Facilities discharging storm water associated with industrial activities and construction projects with a disturbed area of five acres or more are required to obtain individual NPDES permits for storm water discharges, or to be covered by ~~these~~ a statewide general permits by completing and filing a Notice of Intent (NOI) with the State Board. The USEPA guidance anticipates coordination of the state-administered programs for industrial and construction activities with the local agency program to reduce pollutants in storm water discharges to the MS4.

The Regional Board is the enforcementing authority in the Los Angeles Region for the two statewide general permits regulating discharges from industrial facilities and construction sites, and all NPDES storm water and non-storm water permits issued by the Regional Board. These industrial and construction sites and discharges are also regulated under local laws and regulations.

~~22.~~23. The State Board, on October 28, 1968, adopted Resolution No. 68-16, ~~"Maintaining High Quality Water"~~ which established an anti-degradation policy for the State and Regional Boards. This ~~P~~policy restricts the degradation of surface waters and protects waterbodies where existing water quality is higher than is necessary for the protection of beneficial uses.

~~23.~~24. The State Board, on June 17, 1999, adopted Order No. WQ 99-05, which, in a precedential decision, identifies acceptable ~~specifies standard~~ receiving water limitations language to be included in ~~all~~ municipal storm water permits issued by the State and Regional Boards. The receiving water limitations included herein are consistent with the State Board Order, USEPA Policy, and the U.S. Appellate court decision in, *Defenders of Wildlife v. Browner* (9th. Cir, 1999). The State Board OCC~~ffice of Chief Counsel~~ has determined that the federal court decision did not conflict with State Board Order No. WQ 99-05 (memorandum dated October 14, 1999)

R0006836

~~24.~~25. California Water Code (CWC) Section 13263(a) requires that waste discharge requirements issued by the Regional Board shall implement any relevant water quality control plans that have been adopted; shall take into consideration the beneficial uses to be protected and the water quality objectives reasonably required for that purpose; other waste discharges; the need to prevent nuisance;~~,~~ ~~and provisions~~and provisions of CWC Section 13241. The Regional Board has ~~fully~~ considered the requirements of sections 13263 and 13241, and applicable plans, policies, rules, and regulations in developing these waste discharge requirements~~all relevant issues~~.

~~25.~~26. ~~California Water Code~~ CWC Section 13370 *et seq.* requires that waste discharge requirements issued by the Regional Boards be consistent with provisions of the Federal Clean Water Act and its amendments.

F. Implementation

~~1.Permittees established an Executive Advisory Committee (EAC) to facilitate permit compliance and enhance consistency in program implementation. The EAC is formally incorporated within this permit as a representative committee of the Permittees.~~

~~2.~~1. The California Environmental Quality Act (CEQA) (Cal Pub Resources Code Section 21000 *et seq.*) requires that public agencies consider the environmental impacts of the projects they approve for development. CEQA applies to projects that are considered discretionary and does not apply to ministerial projects, which involve the use of established standards or objective measurements. A ministerial project may be made discretionary by adopting local ordinance provisions or imposing conditions ~~that~~ to create decision-making discretion in approving the project. In the alternative, Permittees may establish standards and objective criteria ~~may be established~~ administratively for storm water mitigation for ministerial projects. For water quality purposes, the Regional Board considers that all new development and significant redevelopment activity in specified categories, that receive approval or permits from a municipality, are subject to storm water mitigation requirements.

~~3.~~2. On March 12, 2001, the United States Court of Appeals ruled that it is necessary to obtain a NPDES permit for application of aquatic pesticides to waterways. (*Headwaters, Inc. vs. Talent Irrigation District,* 243 F3d. 526 (9th Cir., 2001)) This decision is controlling in California for nonagricultural applications of pesticides to waterways. The State Board adopted a general NPDES permit (Order No. 2001-12-DWQ) on July 19, 2001, for public entities that discharge pollutants to waters of the U.S. associated with the application of aquatic pesticides for resource or pest management. Public entities that conduct such activities must seek coverage under the~~at~~ general permit.

~~4.~~3. The objective of this Order is to protect the beneficial uses of receiving waters in Los Angeles County. To meet this objective, this Order requires that the SQMP specify BMPs that will be implemented to ~~control~~ reduce the discharge of pollutants in storm water to the maximum extent practicable. Further, Permittees are to assure that storm water discharges from the MS4 shall neither cause nor contribute to the exceedance of water quality standards and objectives nor create conditions of nuisance in the receiving waters, and that the discharge of non-storm water to the MS4 has been effectively prohibited.

~~5.~~4. The SQMP required in this Order builds upon the programs established in Order Nos. 90-079, and ~~No.~~ 96-054, consists of the components recommended in the USEPA guidance manual, and was developed with the cooperation of representatives from the regulated community and environmental groups. The SQMP includes provisions that promote customized initiatives, both on a countywide and watershed basis, in developing and implementing cost-effective measures to minimize discharge of pollutants to the receiving water. The various components of the SQMP, taken as a whole rather than individually, are expected to reduce pollutants in storm water and urban runoff to the maximum extent practicable. Provisions of the SQMP are fully enforceable under provisions of this Order.

~~6.~~5. The emphasis of the SQMP is pollution prevention through education, public outreach, planning, and implementation as source control BMPs first and then structural and treatment control BMPs next. Successful implementation of the provisions of the SQMP will require cooperation and coordination of all public agencies in each Permittee's organization, among Permittees, and with the regulated community.

~~7.~~6. The implementation of a Public Information and Participation Program is a critical component of a storm water management program. An informed and knowledgeable community is critical to the success of a storm water management program since it helps insure the following: (i) greater support for the program as the public gains a greater understanding of the reasons why it is necessary and important, and (ii) greater compliance with the program as the public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters.

7. This Order includes a Monitoring Program that incorporates Minimum Levels (MLs) established under the ~~*Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays and Estuaries of California* SIP – 2000 (State Board Resolution No. 2000-15 as amended by Resolution No. 2000-30).~~ The SIP's MLs represent the lowest quantifiable concentration for priority toxic pollutants that is measurable with the use of proper method-based analytical procedures and factoring out matrix interferences. The SIP's MLs, therefore represent the best available science for determining MLs and are appropriate for a storm water monitoring program. The use of MLs allows the detection of toxic

priority pollutants at concentrations of concern using recent advances in chemical analytical methods.

8. This Order provides flexibility for Permittees to petition the Regional Board Executive Officer to substitute a BMP or requirement under the SQMP with an alternative BMP, if they can provide information and documentation on the effectiveness of the alternative, equal to or greater than the prescribed BMP in meeting the objectives of this Order.

9. This Order contemplates that the Permittees are responsible for considering potential storm water impacts when making planning decisions in order to fulfill the Permittees' CWA requirement to reduce the discharge of pollutants in municipal storm water to the maximum extent practicable from new development and redevelopment activities. However, the Permittees retain authority to make the final land-use decisions and retain full statutory authority for deciding what land uses are appropriate at specific locations within each Permittee's jurisdiction. This Order and~~or any of~~ its requirements are not intended to restrict or control local land use decision-making authority.

10. This Order is not intended to prohibit the inspection for or abatement of vectors by the State Department of Health Services or local vector agencies in accordance with Cal. Health and Safety Code § 2270 *et seq.* and §116110 *et seq.* Certain treatment control BMPs if not properly designed, operated or maintained may create habitats for vectors (e.g. mosquito and rodents). This Order contemplates that the Permittees will closely cooperate and collaborate with local vector control agencies and the State Department of Health Services for the implementation, operation, and maintenance of treatment control BMPs in order to minimize the risk to public health from vector borne diseases.

G. Public Process

1. The Regional Board has notified the Permittees and interested agencies and persons of its intent to issue waste discharge requirements for this discharge, and has provided them with an opportunity to submit their written view and recommendations.

2. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

3. The Regional Board has conducted public workshops to discuss ~~the~~ drafts of the permit. On April 24, 2001, Regional Board staff conducted a workshop outlining the reasoning behind the changes proposed for the new permit and received input from the Permittees and the public regarding those proposed changes. On July 26, 2001, a second public workshop was held at a special Regional Board meeting. The Permittees and the public had another opportunity to express their opinions regarding the proposed changes to the permit in front of the Regional Board members. A significant number of working meetings with the Permittees and other interested parties have occurred throughout the period from the

submittal of the ROWD and completion of the tentative draft, in an attempt to incorporate and address all the comments presented.

4. The Los Angeles County Flood Control District, the County of Los Angeles and the other municipalities are ~~C~~co-permittees as defined in 40 CFR 122.26 (b)(1). Los Angeles County Flood Control District will coordinate with the other municipalities and facilitate program implementation. Each Permittee is ~~only~~ responsible only for a discharge for which it is the operator.

5. This Order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit, pursuant to Section 402 of the ~~Federal Clean Water Act~~CWA, or amendments thereto, and shall take effect 50 days from Order adoption provided the Regional Administrator of the USEPA has no objections.

6. The action to adopt an NPDES permit is exempt from the provisions of Chapter 3 of CEQA (Cal Pub. Resources Code Section 21100 *et seq.*), in accordance with ~~California Water Code~~ CWC ~~Section~~§ 13389.

7. Pursuant to ~~California Water Code Section~~ CWC §13320, any aggrieved party may seek review of this Order by filing a petition with the State Board. A petition must be sent to the State Water Resources Control Board, P.O. Box 100, Sacramento, California, 95812, within 30 days of adoption of the Order by the Regional Board.

8. This Order may be modified or alternatively revoked or reissued prior to its expiration date, in accordance with the procedural requirements of the ~~federal~~ NPDES program, and the CW~~California Water Code~~ for the issuance of waste discharge requirements.

IT IS HEREBY ORDERED that the Los Angeles County Flood Control District, Los Angeles County, and the Cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Cañada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier, in order to meet the provisions contained in Division 7 of the CW~~California Water Code~~ and regulations adopted thereunder, and the provisions of the CW~~lean Water Act~~, as amended, and regulations and guidelines adopted thereunder, shall comply with the following:

Part 1. DISCHARGE PROHIBITIONS

~~Each~~The Permittees shall effectively prohibit non-storm water discharges into the MS4 and watercourses, except where such discharges are:

1. covered by a separate individual or general NPDES permit for non-storm water discharges; or

2. fall within one of the categories below, and meet all conditions when specified by the Regional Board Executive Officer:

   a) Category A - Natural flow:

      (1) Natural springs and rising ground water;

      (2) Flows from riparian habitats or wetlands;

      (3) Stream diversions, permitted by the State Board; and

      (4) Uncontaminated ground water infiltration [as defined by 40 CFR 35.2005(20)].

   b) Category B - Flows from emergency fire fighting activity.

   c) Category C - Flows incidental to urban activities~~, all of which are subject to conditions that shall be approved by the Regional Board Executive Officer~~:

      (1) Reclaimed and potable landscape irrigation runoff;

~~(2)Water line flushing of potable water distribution systems;~~

      (2) Potable drinking water supply and distribution system releases (~~once a Pollution Prevention Plan is adopted by the Southern California Chapter of the~~ consistent with American Water Works Association guidelines~~and approved by the Regional Board Executive Officer~~ for dechlorination/debromination and suspended solids reduction practices);

      ~~(2)~~(3) Drains for foundations, footings, and crawl spaces;

      ~~(3)~~(4) Air conditioning condensate;

      ~~(4)~~(5) Dechlorinated swimming pool discharges;

      ~~(5)~~(6) Dewatering of lakes and decorative fountains;

      ~~(6)~~(7) Non-commercial car washing by residents or by non-profit organizations; and

      ~~(7)~~(8) Sidewalk rinsing.

The Regional Board Executive Officer may add or remove categories of non-storm water discharges above. Furthermore, in the event that any of

the above categories of non-storm water discharges are determined to be a source of pollutants by the Regional Board Executive Officer, the discharge will no longer be exempt from this prohibition unless the Permittee implements conditions approved by the Regional Board Executive Officer to ensure that the discharge is not a source of pollutants. Notwithstanding the above, the Regional Board Executive Officer may impose additional prohibitions of non-storm water discharges in consideration of anti-degradation policies and TMDLs.

Part 2. RECEIVING WATER LIMITATIONS

1. Discharges from the MS4 that cause or contribute to the violation of water quality standards or water quality objectives are prohibited.

2. Discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible for, shall not cause or contribute to a condition of nuisance.

3. The Permittees shall comply with Part 2.1. and 2.2. through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the SQMP and its components and other requirements of this Order including any modifications. The SQMP and its components shall be designed to achieve compliance with receiving water limitations. If exceedances of water quality objectives or water quality standards (collectively, water quality standards) persist, notwithstanding implementation of the SQMP and its components and other requirements of this permit, the Permittee shall assure compliance with discharge prohibitions and receiving water limitations by complying with the following procedure:

   a) Upon a determination by either the Permittee or the Regional Board that discharges are causing or contributing to an exceedance of an applicable water quality standard, the Permittee shall promptly notify and thereafter submit a report to the Regional Board that describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedances of water quality standards. This report may be incorporated in the annual Storm Water Report and Assessment ~~update of the SQMP and its components~~ unless the Regional Board directs an earlier submittal. The report shall include an implementation schedule. The Regional Board may require modifications to the Report.

   b) Submit any modifications to the report required by the Regional Board within 30 days of notification.

   c) Within 30 days following the approval of the report, the Permittee shall revise the SQMP and its components and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, implementation schedule, and any additional monitoring required.

d) Implement the revised SQMP and its components and monitoring program according to the approved schedule.

4. So long as the Permittee has complied with the procedures set forth above and is implementing the revised SQMP and its components, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Board to develop additional BMPs.

Part 3. STORM WATER QUALITY MANAGEMENT ~~PLAN~~ROGRAM (SQMP) IMPLEMENTATION

A. General Requirements

1. Each Permittee shall, at a minimum, implement the SQMP. The SQMP is an enforceable element of this Order.

2. The SQMP shall, at a minimum, comply with the applicable storm water program requirements of 40 CFR 122.26(d)(2). The SQMP and its components shall be implemented so as to reduce the discharges of pollutants in storm water to the maximum extent practicable.

3. Each Permittee shall implement~~may develop a SQMP, incorporating the countywide SQMP, which identifies~~ additional controls~~provisions~~, where necessary, ~~intended~~ to reduce the discharges of pollutants in storm water to the maximum extent practicable.

B. Best Management Practice Implementation

The Permittees shall implement or require the implementation of the most effective combination of BMPs for storm water/urban runoff pollution controls ~~benefits~~. When implemented, BMPs are intended to~~shall~~ result in the reduction of pollutants in storm water to the maximum extent practicable.

C. ~~Modification~~ Revision of the Storm Water Quality Management Plan~~rogram~~

The Permittees shall ~~modify~~revise the SQMP, at the direction of the Regional Board Executive Officer, to incorporate program implementation amendments~~additional provisions~~. Such ~~provision~~amendments may include regional, watershed specific requirements, and/or waste load allocations developed and approved pursuant to the process for the designation and implementation of Total ~~Daily~~ Maximum Daily Loads (TMDLs) for impaired water bodies.

D. Designation and Responsibilities of the Principal Permittee

The Los Angeles County Flood Control District is hereby designated as the Principal Permittee. As such, The Principal Permittee shall:

1. Coordinate and facilitate activities necessary to comply with the requirements of this Order, but is not responsible for ensuring compliance of any individual Permittee;~~.~~

2. ~~1.~~ Coordinate permit activities among Permittees and act as liaison between Permittees and the Regional Board on permitting issues;~~.~~

3. ~~2.~~ Provide personnel and fiscal resources ~~for compilation, evaluation and submittal of all reports required under this Order and~~ for the necessary updates of the SQMP and its components;

R0006844

4. ~~3.~~ Provide technical and administrative support for committees that will be organized to implement the SQMP and its components;

~~4.~~5. Convene the Watershed Management Committees (WMCs) constituted pursuant to Part F, below, upon designation of representatives;

~~5.~~6. Implement the Countywide Monitoring Program required under this Order and evaluate, assess and synthesize the results of the monitoring program;

~~6.~~7. Provide personnel and fiscal resources for the ~~preparation~~collection, processing and submittal to the Regional Board of annual reports and summaries of other reports required under the SQMP; and

~~7.~~8. Comply with the "Responsibilities of the Permittees" in Part 3.E., below.

E. Responsibilities of the Permittees

Each Permittee is required to comply with the requirements of this Order applicable to discharges within its boundaries, (see~~subject to provisions identified in~~ Findings B.2. and D.2.) and not for the implementation of the provisions applicable to the Principal Permittee or other Permittees. Each Permittee shall, within its geographic jurisdiction:

1. Comply with the requirements of the SQMP and any modifications thereto;

2. Coordinate among its internal departments and agencies, as appropriate, to facilitate the implementation of the requirements of the SQMP applicable to such Permittee in an efficient and cost-effective manner;

3. Designate a technically knowledgeable representative to the appropriate WMC; and

4. Participate in intra-agency coordination (e.g. Fire Department, Building and Safety, Code Enforcement, Public Health, etc.) necessary to successfully implement the provisions of this Order and SQMP.

5. Prepare an annual summary of expenditures applied to the storm water management program. This summary of budget expenditures shall identify the storm water budget for the following year, using estimated percentages and written explanations where necessary, for the specific categories noted below:

   a) Program management

      ~~(1)~~• Administrative costs

      ~~(2)Capital costs~~

   b) Illicit connection/illicit discharge

   c) Development planning

   d) Development construction

- Construction inspection activities

e) Industrial/Commercial inspection/site visit activities

~~f)Construction inspection activities~~

~~g)~~f) Public Agency Activities

(1) Maintenance of structural BMPs and treatment control BMPs

(2) Municipal Street Sweeping

(3) Catch basin clean-up

(4) Trash collection

(5) Capital costs

~~h)~~g) Public Information and Participation

~~i)~~h) Monitoring Program

~~j)~~i) Miscellaneous Expenditures

6. Each Permittee, in addition to the budget summary, shall report any supplemental dedicated budgets~~, if any,~~ for the same categories.

F. Watershed Management Committees (WMCs)

1. Each WMC shall be comprised of a voting representative from each Permittee in the Watershed Management Area (WMA).

2. The WMC's chair and secretary shall be chosen by the WMC upon Order adoption and on an annual basis, thereafter. In the absence of volunteer Permittee(s) for the positions, the Principal Permittee shall assume those roles until the WMC chooses members of the committee for the positions.

3. Each WMC shall:

a) Facilitate cooperation and exchange of information among Permittees;

b) Establish additional goals and objectives and associated deadlines for the WMA, as the program implementation progresses;

c) Prioritize pollution control efforts based on beneficial use impairment(s), watershed characteristics and analysis of results from studies and the monitoring program;

d) Develop and/or update and monitor the adequate implementation, on an annual basis, of the tasks identified for the WMA;

e) Assess the effectiveness of, prepare revisions for, and recommend appropriate changes to the SQMP and its components;

f) Continue to prioritize the Industrial/Commercial critical sources for investigation, outreach and follow-up~~.~~; and

g) Conduct joint WMC meetings four times per year and, as necessary.

~~**G.Executive Advisory Committee (EAC)**~~

~~1.The EAC shall be composed of one representative from the Malibu Creek WMA, two representatives from each of the other WMAs, one representative from the City of Los Angeles, and one representative from the Los Angeles County Flood Control District.~~

~~2.The EAC shall facilitate program compliance in each watershed and enhance consistency among Permittees.~~

~~3.The EAC shall conduct its meetings in compliance with the Cal. Gov. Code § 54950 et seq.~~

G. Legal Authority

1. Permittees shall possess the necessary legal authority to prohibit non-storm water discharges~~, to the maximum extent practicable~~, to the storm drain system, including, but not limited to:

   a) Prohibit illicit discharges and illicit connections and a require~~ment for~~ removal of illicit connections;

   b) Prohibit the discharge of wash waters to the MS4 from the cleaning of gas stations, auto repair garages, or other types of automotive service facilities;

   c) Prohibit the discharge of runoff to the MS4 from mobile auto washing, steam cleaning, mobile carpet cleaning, and other such mobile commercial and industrial operations;

   d) Prohibit the discharge of runoff to the MS4 from areas where repair of machinery and equipment which are visibly leaking oil, fluid or antifreeze, is undertaken;

   e) Prohibit the discharge of runoff to the MS4 from storage areas of materials containing grease, oil, or other hazardous substances, and uncovered receptacles containing hazardous materials;

   f) Prohibit the discharge of chlorinated/ brominated swimming pool water and filter backwash to the MS4;

   g) Prohibit the discharge of runoff from the washing of toxic materials from paved or unpaved areas to the MS4;

   h) Prohibit washing impervious surfaces in industrial/commercial areas that results in a discharge of runoff to the MS4; ~~and~~

   i) Prohibit the discharge of concrete or concrete laden wash water from concrete trucks, pumps, tools, and equipment to the MS4.

   j) Prohibit ~~spills~~, dumping, or disposal of materials into the MS4, other than storm water, such as:

      (1) Litter, landscape debris and construction debris;

      (2) Any state or federally banned or unregistered pesticides, ~~fungicide or herbicide~~;

      (3) Food and food processing wastes; and

      (4) Fuel and chemical wastes, animal wastes, garbage, batteries, and other materials that have potential adverse impacts on water quality.

2. The Permittees shall possess adequate legal authority to:

~~k)~~a) Require persons within their jurisdiction c~~C~~omply with conditions in Permittees ordinances, permits, contracts, model programs, or orders (i.e. hold dischargers to its MS4 accountable for their contributions of pollutants and flows);

~~l)~~b) Utilize enforcement mechanisms to require compliance with Permittees ordinances, permits, contracts, or orders;

~~m)~~c) Control ~~of~~ pollutants, ~~(~~including potential contribution~~)~~, in discharges of storm water runoff associated with industrial activities (including construction activities) to its MS4 and control the quality of storm water runoff from industrial sites (including construction sites). This requirement applies to source control, and treatment control, ~~and structural control~~ BMPs; ~~and,~~

~~n)~~d) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and non-compliance with permit conditions, including the prohibition of illicit discharges to the MS4. Permittees must possess authority to enter, sample, inspect, review and copy records, and require regular reports from industrial facilities (including construction sites) discharging polluted or with the potential~~ly~~ to discharge polluted storm water runoff into its MS4 ~~(including construction sites)~~.

~~o)~~e) Require the use of best management practices (BMPs) to prevent or reduce the discharge of pollutants to MS4s to the maximum extent practicable.

f) Require~~Ensure~~ that treatment control BMPs ~~are~~be properly ~~designed~~ operated and maintained to prevent the breeding of vectors.

~~p)~~3. Each Permittee shall, no later than~~On or before July 1, 2002~~ [9 months from permit effective date]~~, if necessary,~~ amend and adopt, (if necessary), a Permittee-specific storm water and urban runoff ordinance to enforce all requirements of this permit.

~~2.The Principal Permittee shall, on or before July 1, 2002, amend the Los Angeles County Public Health Code to require inspections at restaurants that will address:~~

~~a)Oil and Grease residue to verify that it is not poured onto a parking lot, street or adjacent catch basin.~~

~~b)Dumpster areas to verify that the dumpster area is clean, dumpster lid closed, not filled with liquid or washed out.~~

R0006849

~~c)Parking lot, alley, sidewalk and street areas to verify that floormats, filters and garbage containers are not washed in those areas and that no washwater is poured in those areas.~~

~~d)Parking lot area to verify that it is cleaned by sweeping and not by hosing down and that the facility operator uses dry methods for spill cleanup.~~

~~3.~~4. Each Permittee shall submit no later than ~~July 31, 2002~~[10 months from permit effective date], a new or updated statement by ~~the~~ its legal counsel that the Permittee has obtained all necessary legal authority to comply with this Order through adoption of ordinances and/or municipal code modifications.

Part 4. SPECIAL PROVISIONS

Maximum Extent Practicable Standard

This permit, and the provisions herein, are intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water to the MEP from the permitted areas in the County of Los Angeles to the waters of the State.

A. General Requirements

A.1. Best Management Practice Substitution

The Regional Board Executive Officer may approve any site-specific Best Management Practice (BMP) substitution upon petition by ~~the~~a Permittee(s), if the Permittee can document that:

~~1.~~a) The proposed alternative BMP or program will meet or exceed the objective of the original BMP or program in the reduction of storm water pollutants; or

~~2.~~b) The fiscal burden of the original BMP or program is substantially greater than the proposed alternative and does not achieve a substantially greater improvement in storm water quality; and,

~~3.~~c) The proposed alternative BMP or program will be implemented within a similar period of time.

2. Customized SQMP

Each Permittee shall have available a local SQMP, which:

a) Is customized and reflects the conditions in the area under its jurisdiction; and

b) Specifies activities being implemented under the appropriate elements described in the countywide SQMP.

B. Public Information and Participation Program (PIPP)

The Principal Permittee shall implement a Public Information and Participation Program (PIPP) that includes, but is not limited to, the requirements listed in this section. The Principal Permittee shall be responsible for developing and implementing the Public Education Program, as described in the SQMP, and shall coordinate with Permittees to implement specific requirements. ~~PIPP that incorporates the components of the five-year education plan and the provisions of this section.~~

~~Permittees shall work collaboratively to implement a comprehensive education/outreach program with the following objectives~~The objectives of the PIPP are as follows:

a) To measurably increase the knowledge of the target audiences regarding the MS4, the impacts of storm water pollution on receiving waters, and potential solutions to mitigate the problems caused;

b) To measurably change the waste disposal and runoff pollution generation behavior of target audiences by encouraging implementation of appropriate solutions;

c) To involve and engage all socio-economic groups and ethnic ~~groups~~communities in Los Angeles County to participate in mitigating the impacts of storm water pollution (such as African American, Latino, East Asian, South Asian, and Middle Eastern).

The Principal Permittee shall convene a panel to review the PIPP and the effectiveness of each of its components. Panel members shall possess the expertise to assess public information and outreach programs, strategies, and materials. Comments and recommendations on the PIPP shall be submitted to the Regional Board Executive Officer for consideration no later than December 31, annually. The PIPP will become effective upon approval.~~The Principal Permittee shall submit the PIPP to the Regional Board Executive Officer for review and approval on or before December 31, 2001, and annually thereafter.~~

1. PIPP - Residential Program

~~a)~~The Principal Permittee shall implement the Public Education Program as outlined in the SQMP, including the continuation of the following activities:

~~Advertising~~
~~Media Relations~~
~~Public Service Announcements~~
~~"How-To" Instructional Material Distributed in a Targeted and Activity-Related Manner~~
~~Corporate, Community Association, Environmental Organization and Entertainment Industry Tie-Ins~~
~~1-888-CLEAN-LA and 888CleanLA.com~~
~~Events Targeted to Specific Activities and Population Sub-groups~~

~~b)~~a) "No Dumping" Message

Each Permittee shall mark all storm drain inlets that they own with a legible "no dumping" message. In addition, signs with prohibitive language discouraging illegal dumping must be posted at designated public access points to creeks, other relevant water bodies, and channels no later than (2 years after the effective date of this Order)~~by October 25, 2003~~. S~~Legible s~~ignage and storm drain messages shall be legible and maintained as necessary during the term of the permit.

~~c~~b) Countywide Hotline

The 888-CLEAN-LA hotline will serve as the general public reporting contact for reporting clogged catch basin inlets and illicit discharges/dumping, faded or lack of catch basin stencils, and general storm water management information. Each Permittee may establish its own hotline if preferred. Permittees shall include this information, updated when necessary, in public information, and the government pages of the telephone book, as they are developed/published. The Principal Permittee shall compile a list of the general public reporting contacts from all Permittees and make this information available on the web site (888CleanLA.com) and upon request. Permittees shall provide the Principal Permittee with their reporting contacts within 30 days of the date this order becomes effective.

~~d~~c) Outreach and Education

(1) The Principal Permittee shall continue to implement the following activities that were components of the first five-year Public Education Program:~~implement the second Five-Year Education Plan as detailed in the SQMP.~~

(i) Advertising;
(ii) Media relations;
(iii) Public service announcements;
(iv) "How To" instructional material distributed in a targeted and activity-related manner;
(v) Corporate, community association, environmental organization and entertainment industry tie-ins;
(vi) Events targeted to specific activities and population subgroups.

(2) The Principal Permittee shall develop a strategy to educate ethnic communities and businesses through culturally effective methods. Details of this strategy should be incorporated into the Public Education Program, and implemented, no later than (365 days from the effective date of this Order).

(3) The Principal Permittee shall implement an outreach program to educate on proper disposal of cigarette butts.

~~(2)~~(4) Each Permittee shall conduct educational activities within its jurisdiction and participate in countywide events.

~~(3)~~(5) The Principal Permittee shall organize Public Outreach Strategy meetings for ~~with all~~ Permittees on a quarterly basis, beginning (within 3 months of the effective date of this Order). The Principal Permittee shall provide guidance for Permittees to augment the countywide outreach and education program. Permittees shall coordinate regional and local outreach and education to reduce duplication of efforts. Permittees are encouraged to include other

interested parties in the outreach strategy to strengthen and coordinate educational efforts.

~~(4)~~(6) The Principal Permittee shall ensure that a minimum of 35 million impressions per year are made on the general public about storm water quality via print, local TV access, local radio, or other appropriate media.

~~(5)~~(7) The Principal Permittee, in cooperation with the Permittees, shall provide ~~all~~schools within each School Districts ~~within its jurisdiction~~ in the County with materials, including, but not limited to, videos, live presentations, ~~brochures,~~ and other ~~media~~ information necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution.

(8) The Permittees shall provide the contact information for their appropriate storm water staff to the Principal Permittee no later than (60 days from the effective date of this Order)~~on November 25, 2001~~. Cooperative efforts with other agencies may also be used to accomplish this requirement.

(9) The Principal Permittee shall develop a strategy to measure the effectiveness of in-school educational programs. The protocol shall include assessment of students' knowledge of storm water pollution problems and solutions before and after educational efforts are conducted. The protocol shall be developed and submitted to the Regional Board Executive Officer for approval no later than (90 days from the effective date of this Order). It shall be implemented on approval.

(10) In order to ensure that the PIPP is demonstrably effective in changing the behavior of the public, the Principal Permittee shall develop a behavioral change assessment strategy no later than (90 days from the effective date of this Order). The strategy shall be developed based on sociological data and studies (such as the County Segmentation Study). The Principal Permittee shall submit the assessment strategy to the Regional Board Executive Office for approval. It shall be implemented on approval.

~~e)~~d) Pollutant-Specific Outreach

The Principal Permittee, in cooperation with Permittees, shall coordinate to develop outreach programs that focus on~~target~~ the watershed-specific pollutants listed in Table 1 no later than (365 days from the effective date of this Order)~~on or before October 25, 2002~~. Metals may be appropriately addressed through the Industrial/Commercial Facilities Program ~~businesses program described in the next section~~ (e.g. distribute education materials on appropriate BMPs for metal waste management ~~reduction~~ to

facilities that have been identified as a potential source, such as metal fabricatingers facilities). Region-wide pollutants may be included in the Principal Permittee's mass media outreach efforts. ~~Programs shall focus on the anthropogenic sources of each pollutant.~~

Table 1.	
Watershed	***Target Pollutants for Outreach***
Ballona Creek	Trash, Indicator Bacteria, Metals, PAHs
Malibu Creek	Trash, Nutrients (Nitrogen), Indicator Bacteria, Sediments
Los Angeles River	Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals, Pesticides, PAHs
San Gabriel River	Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals
Santa Clara River	~~Reserved~~Nutrients (Nitrogen), Coliform
Dominguez Channel	Trash, Indicator Bacteria, PAHs

Each Permittee shall make outreach materials available to the general public and target audiences, such as schools, community groups, contractors and developers, and at appropriate public counters and events. Outreach material shall include information on pollutants, sources of concern, and source abatement measures.

2. Businesses Program

a) Corporate Outreach

The Principal Permittee shall develop and implement a Corporate Outreach program to educate and inform corporate ~~environmental~~ managersment about storm water regulations. The program shall target retail gasoline outlets and restaurant chains. At a minimum, this program shall include:

(1) Conferring with corporate ~~environmental~~ management to explain storm water regulations;

(2) Distribution and discussion of educational material regarding storm water pollution and BMPs, and provide ~~environmental~~ managers with suggestions to facilitate employee compliance with storm water regulations.

Corporate Outreach for all retail gasoline outlet and restaurant chain corporations shall be conducted ~~occur once every 2 years, but~~ not less than twice during the permit term~~.~~, with the first outreach contact to begin no later than (365 days from effective date of this Order).

b) Business Assistance Program

~~(1)~~The Principal Permittee and Permittees ~~with the available resources, including but not limited to the City of Los Angeles,~~ may implement a Business Assistance Program to provide ~~confidential,~~ technical resource assistance to small businesses to advise them on BMPs implementation to reduce the discharge of pollutants in storm water runoff. ~~At a minimum, p~~Programs may include:

~~(i)~~(1) On-site technical assistance or consultation via telephone to identify and implement storm water pollution prevention methods and best management practices; and

~~(ii)~~(2) Making ~~A~~available~~ility~~, distributing~~on~~, and discussing~~on~~ of applicable BMP and educational materials.

R0006856

C. Industrial/Commercial Facilities Program [Version A]

Each Permittee shall implement an Industrial and Commercial Facilities Program. The objective is to reduce pollutants in storm water runoff to the maximum extent practicable by requiring the implementation of pollutant reduction and control measures at industrial and commercial facilities. At a minimum, the Program shall include the following requirements.

1. Inventory of Facilities

a) Database for Critical Sources Identification

Each Permittee, within its jurisdiction, shall update annually (individually or in partnership) a watershed-based inventory of all facilities identified as priority through the Permittees critical sources identification program. The database inventory of facilities may be augmented or reduced as new data becomes available. The update of the database may be accomplished through the collection of new information obtained through field activities or through other readily available intra-agency informational databases (e.g. business licenses, pretreatment permits, sanitary sewer hook-up permits). The inventory shall include the following minimum fields of information for each industrial and commercial facility:

(1) Name of facility and name of owner/operator;

(2) address;

(3) coverage under the GIASP or other individual or general NPDES permits; and

(4) a narrative description including SIC codes that best reflects the principal products or activities performed by each facility.

The use of an automated database system, such as Geographical Information System (GIS) or Internet-based system is highly recommended, but not required. The Permittees may add other fields of information, as necessary (e.g. to point out discrepancies between SIC Code designation and type of activities actually performed on-site, exposure of activities and/or materials to storm water, etc.) Facilities determined at no risk of exposure will be so identified in the inventory database. At a minimum, the type of facilities considered for the inventory, will include:

b) High Priority Categories

(1) Municipal Landfills

R0006857

(2) Hazardous Waste Treatment, Disposal and Recovery Facilities

(3) Facilities Subject to SARA Title III (also known as EPCRA)

(4) Restaurants

(5) Wholesale trade (scrap, auto dismantling)

(6) Automotive service facilities

(7) Fabricated metal products

(8) Motor freight

(9) Chemical/allied products

(10) Automotive Dealers/Gas Stations

(11) Primary Metals Products

c) Lower Priority Categories

Facilities which are listed in Attachment B of the permit.

2. Municipal Landfills, Hazardous Waste Treatment, Disposal and Recovery Facilities, Facilities Subject to SARA Title III (also known as EPCRA)

a) The Permittees shall inspect

(1) Municipal landfills;

(2) Hazardous waste treatment, disposal and recovery facilities; and,

(3) Facilities subject to SARA Title III

once every 24 months.

b) Level of inspection: The Permittees shall confirm that

(1) BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP; and,

(2) Each owner/operator has a current Waste Discharge Identification (WDID) number, and that a Storm Water Pollution Prevention Plan is available on-site.

3. Restaurants

The Permittees, in cooperation with their appropriate departments (such as health, public works, etc.), or using an equivalent approach, shall inspect all restaurants to determine that storm water BMPs are being implemented effectively.

a) Frequency: The Permittees shall inspect each restaurant once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) Restaurants shall be inspected to verify that:

(1) Oil and Grease residue is not poured onto a parking lot, street or adjacent catch basin;

(2) The trash bin area is clean, trash bin lid closed, not filled with liquid or washed out;

(3) Parking lot, alley, sidewalk and street areas (in the immediate vicinity of the establishment), floormats, filters and garbage containers are not washed and that no washwater is poured in those areas;

(4) Removal of food waste, rubbish or other materials from the parking lot area is not performed in an unsanitary manner or creating a nuisance through hosing down the area.

d) Inspectors shall distribute educational materials to facility operator on storm water pollution prevention practices.

4. Retail Gasoline Outlets

The Permittees shall communicate appropriate BMPs to each RGO (in accordance with the SQMP and Regional Board Resolution 98-08, and the Stormwater Quality Task Force Best Management Practice Guide for RGOs.)

a) Frequency: The Permittees shall inspect each RGO and Automotive Service facility once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) RGOs shall be inspected to verify that:

(1) Fuel-dispensing areas are routinely swept for removal of litter and debris, and that rags and absorbents are ready for use in case of leaks and spills;

(2) Operator is aware that wash down of RGO area to the storm drain is prohibited;

(3) Employees are trained in management of waste materials;

(4) Drains and flow patterns are labeled at the facility;

(5) Inspection and cleans up of storm drain inlets and catch basins within the facility's boundaries are performed before October 1 each year;

(6) Posting signs are close to the fuel dispenser that warn vehicle owners/operators against "topping off" of vehicle fuel tanks and installation of automatic shutoff fuel dispensing nozzles;

(7) Outdoor waste receptacle and air/water supply area is routinely cleaned-up of leaks and drips, that only watertight waste receptacles are used and lids are closed. Check if grading is done in such a way to prevent run-on of storm water, segregation of flow, and if a roof cover or a low containment berm was built; and,

(8) Employees are trained to implement storm water pollution prevention practices.

d) A follow-up inspection shall be performed within one business day when a complaint related to non-storm water or contaminated storm water discharge is made against a previously inspected RGO.

5. Automotive Service Facilities

The Permittees shall communicate appropriate BMPs to each Automotive Service facility (in accordance with the SQMP and Regional Board Resolution 98-08.)

a) Frequency: The Permittees shall inspect each Automotive Service facility once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) Automotive Service facilities shall be inspected to verify that:

(1) The facility area is clean and dry without evident stains;

(2) Measures are implemented to prevent spills and leaks;

(3) The facility operator properly manages wastewaters;

(4) The facility operator is aware of the prohibition on discharge of non-storm water to the storm drain;

R0006860

(5) The facility operator properly manages raw and waste materials including proper disposal of hazardous waste;

(6) Outdoor work and storage areas are protected to prevent potential pollution;

(7) Storm drain inlets situated on the property are labeled, inspected and routinely cleaned out; and,

(8) Employees are trained to implement storm water pollution prevention practices.

6. Site Visits to Lower Priority Categories

a) Based on the inventory developed under paragraph 1. above, each Permittee shall visit facilities identified as lower priority as specified below.

(1) Frequency: Each Permittee shall visit all industrial/commercial facilities (except those subject to the inspection program) no later than (24 months from the permit effective date).

(2) Level of visit: Each Permittee shall confirm that each owner/operator:

(i) has a current Waste Discharge Identification (WDID) number (for facilities discharging storm water associated with industrial activity), and that a Storm Water Pollution Prevention Plan is available on-site, and

(ii) is implementing BMPs consistent with model programs for industrial and commercial facilities, and local storm water/urban runoff ordinances.

(3) Enforcement Referral: For any facility not complying with requirements for facilities discharging storm water associated with industrial activity (i.e. a non-filer), Permittees shall advise the owner/operator of such facility of its obligation to obtain coverage under the GIASP, and shall document this action. On a quarterly basis, Permittees shall provide the Regional Board an updated electronic record of non-filers identified during site visits.

b) Each Permittee shall develop and implement a program to conduct spot checks of lower priority facilities subject to site visits (excluding those previously determined to pose no risk of exposure). After the completion of the first site visit cycle (i.e., first 24 months) twenty percent of the total number of facilities will be visited per year. Spot check visits will be performed as described in paragraph a.2. and a.3. of section 6.

7. BMPs Implementation

In the event that particular minimum BMPs are infeasible at any site, Permittees shall require implementation of other BMPs that will achieve the equivalent reduction of pollutants in the storm water discharges. Furthermore, Permittees may require additional site-specific controls (BMPs) as necessary to comply with this Order, including BMPs that are more stringent than those required under the statewide GIASP.

a) For industrial and specified commercial facilities, identified as critical sources, tributary to CWA § 303(d) impaired water bodies, Permittees shall consider requiring operators to implement additional controls as necessary.

b) For industrial and specified commercial facilities, identified as critical sources, within or directly adjacent to or discharging directly to ESAs, Permittees shall consider requiring operators to implement additional controls as necessary.

8. Complaint Response

In response to any complaint related to storm water or unauthorized non-storm water discharges or a specific request by the Regional Board Executive Officer, a Permittee shall visit any facility, to determine if the facility is effectively complying with the SQMP and municipal storm water/urban runoff ordinances.

9. Interagency Coordination

The Permittees shall provide compliance assistance to the Regional Board through supporting activities, including but not limited to: referrals of complaints, assisting in identification of current owners, operators, and leasees in conjunction with activities performed at any facility within municipal jurisdiction, appearing as witnesses in Regional Board enforcement hearings, and participating in joint inspections when requested by Regional Board staff.

Copies of the inspection/site visit report and any follow-up documentation shall be provided to the Regional Board Executive Officer upon request.

10. Regional Board Inspected Facilities

To the extent that the Regional Board has conducted an inspection of a facility during a particular year, or the inspection has been performed through an authorized agent on behalf of the Regional Board, the Permittee need not inspect the facility during the same 24 month inspection period.

11. Facilities Not Addressed

The Permittees need not inspect State or Federal facilities that are not under their jurisdiction.

C. Industrial/Commercial Facilities Program [Version B]

Each Permittee shall implement an Industrial and Commercial Facilities Program. The objective is to reduce pollutants in storm water runoff to the maximum extent practicable by requiring the implementation of pollutant reduction and control measures at industrial and commercial facilities. At a minimum, the Program shall include the following requirements.

1. Inventory of Facilities

a) Database for Critical Sources Identification

Each Permittee, within its jurisdiction, shall update annually (individually or in partnership) a watershed-based inventory of all facilities identified as priority through the Permittees critical sources identification program. The database inventory of facilities may be augmented or reduced as new data becomes available. The update of the database may be accomplished through the collection of new information obtained through field activities or through other readily available intra-agency informational databases (e.g. business licenses, pretreatment permits, sanitary sewer hook-up permits). The inventory shall include the following minimum fields of information for each industrial and commercial facility:

(1) Name of facility and name of owner/operator;

(2) address;

(3) coverage under the GIASP or other individual or general NPDES permits; and

(4) a narrative description including SIC codes that best reflects the principal products or activities performed by each facility.

The use of an automated database system, such as Geographical Information System (GIS) or Internet-based system is highly recommended, but not required. The Permittees may add other fields of information, as necessary (e.g. to point out discrepancies between SIC Code designation and type of activities actually performed on-site, exposure of activities and/or materials to storm water, etc.) Facilities determined at no risk of exposure will be so identified in the inventory database. At a minimum, the type of facilities considered for the inventory, will include:

b) High Priority Categories

(1) Municipal Landfills

(2) Hazardous Waste Treatment, Disposal and Recovery Facilities

(3) Facilities Subject to SARA Title III (also known as EPCRA)

(4) Restaurants

(5) Wholesale trade (scrap, auto dismantling)

(6) Automotive service facilities

(7) Fabricated metal products

(8) Motor freight

(9) Chemical/allied products

(10) Automotive Dealers/Gas Stations

(11) Primary Metals Products

c) Lower Priority Categories

Facilities which are listed in Attachment B of the permit.

2. Municipal Landfills, Hazardous Waste Treatment, Disposal and Recovery Facilities, Facilities Subject to SARA Title III (also known as EPCRA)

a) The Permittees shall inspect

(1) Municipal landfills;

(2) Hazardous waste treatment, disposal and recovery facilities; and,

(3) Facilities subject to SARA Title III

once every 24 months.

b) Level of inspection: The Permittees shall confirm that

(1) BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP; and,

(2) Each owner/operator has a current Waste Discharge Identification (WDID) number, and that a Storm Water Pollution Prevention Plan is available on-site.

R0006865

3. Restaurants

The Permittees, in cooperation with their appropriate departments (such as health, public works, etc.), or using an equivalent approach, shall inspect all restaurants to determine that storm water BMPs are being implemented effectively.

a) Frequency: The Permittees shall inspect each restaurant once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) Restaurants shall be inspected to verify that:

(1) Oil and Grease residue is not poured onto a parking lot, street or adjacent catch basin;

(2) The trash bin area is clean, trash bin lid closed, not filled with liquid or washed out;

(3) Parking lot, alley, sidewalk and street areas (in the immediate vicinity of the establishment), floormats, filters and garbage containers are not washed and that no washwater is poured in those areas;

(4) Removal of food waste, rubbish or other materials from the parking lot area is not performed in an unsanitary manner or creating a nuisance through hosing down the area.

d) Inspectors shall distribute educational materials to facility operator on storm water pollution prevention practices.

4. Retail Gasoline Outlets

The Permittees shall communicate appropriate BMPs to each RGO (in accordance with the SQMP and Regional Board Resolution 98-08, and the Stormwater Quality Task Force Best Management Practice Guide for RGOs.)

a) Frequency: The Permittees shall inspect each RGO and Automotive Service facility once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) RGOs shall be inspected to verify that:

(1) Fuel-dispensing areas are routinely swept for removal of litter and debris, and that rags and absorbents are ready for use in case of leaks and spills;

(2) Operator is aware that wash down of RGO area to the storm drain is prohibited;

(3) Employees are trained in management of waste materials;

(4) Drains and flow patterns are labeled at the facility;

(5) Inspection and cleans up of storm drain inlets and catch basins within the facility's boundaries are performed before October 1 each year;

(6) Posting signs are close to the fuel dispenser that warn vehicle owners/operators against "topping off" of vehicle fuel tanks and installation of automatic shutoff fuel dispensing nozzles;

(7) Outdoor waste receptacle and air/water supply area is routinely cleaned-up of leaks and drips, that only watertight waste receptacles are used and lids are closed. Check if grading is done in such a way to prevent run-on of storm water, segregation of flow, and if a roof cover or a low containment berm was built; and,

(8) Employees are trained to implement storm water pollution prevention practices.

d) A follow-up inspection shall be performed within one business day when a complaint related to non-storm water or contaminated storm water discharge is made against a previously inspected RGO.

5. Wholesale Trade (scrap, auto dismantling), Fabricated Metal Products, Motor Freight, Chemical/Allied Products, Primary Metal Products Facilities

a) The Permittees shall inspect

(1) Wholesale trade (scrap, auto dismantling);

(2) Fabricated metal products;

(3) Motor freight;

(4) Chemical/Allied products; and

(5) Primary metal products

facilities once every 24 months.

b) Level of inspection: The Permittees shall confirm that

(1) BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP; and,

(2) Each owner/operator has a current Waste Discharge Identification (WDID) number, and that a Storm Water Pollution Prevention Plan is available on-site.

6. Automotive Service Facilities

The Permittees shall communicate appropriate BMPs to each Automotive Service facility (in accordance with the SQMP and Regional Board Resolution 98-08.)

a) Frequency: The Permittees shall inspect each Automotive Service facility once every 24 months.

b) Level of inspection: The Permittees shall confirm that BMPs are effectively implemented in compliance with County and Municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) Automotive Service facilities shall be inspected to verify that:

(1) The facility area is clean and dry without evident stains;

(2) Measures are implemented to prevent spills and leaks;

(3) The facility operator properly manages wastewaters;

(4) The facility operator is aware of the prohibition on discharge of non-storm water to the storm drain;

(5) The facility operator properly manages raw and waste materials including proper disposal of hazardous waste;

(6) Outdoor work and storage areas are protected to prevent potential pollution;

(7) Storm drain inlets situated on the property are labeled, inspected and routinely cleaned out; and,

(8) Employees are trained to implement storm water pollution prevention practices.

7. Site Visits to Lower Priority Categories

a) Based on the inventory developed under paragraph 1. above, each Permittee shall visit facilities identified as lower priority as specified below.

(1) Frequency: Each Permittee shall visit all industrial/commercial facilities (except those subject to the inspection program) no later than (24 months from the permit effective date).

(2) Level of visit: Each Permittee shall confirm that each owner/operator:

(i) has a current Waste Discharge Identification (WDID) number (for facilities discharging storm water associated with industrial activity), and that a Storm Water Pollution Prevention Plan is available on-site, and

(ii) is implementing BMPs consistent with model programs for industrial and commercial facilities, and local storm water/urban runoff ordinances.

(3) Enforcement Referral: For any facility not complying with requirements for facilities discharging storm water associated with industrial activity (i.e. a non-filer), Permittees shall advise the owner/operator of such facility of its obligation to obtain coverage under the GIASP, and shall document this action. On a quarterly basis, Permittees shall provide the Regional Board an updated electronic record of non-filers identified during site visits.

b) Each Permittee shall develop and implement a program to conduct spot checks of lower priority facilities subject to site visits (excluding those previously determined to pose no risk of exposure). After the completion of the first site visit cycle (i.e., first 24 months) twenty percent of the total number of facilities will be visited per year. Spot check visits will be performed as described in paragraph a.2. and a.3. of section 6.

8. BMPs Implementation

In the event that particular minimum BMPs are infeasible at any site, Permittees shall require implementation of other BMPs that will achieve the equivalent reduction of pollutants in the storm water discharges. Furthermore, Permittees may require additional site-specific controls (BMPs) as necessary to comply with this Order, including BMPs that are more stringent than those required under the statewide GIASP.

a) For industrial and specified commercial facilities, identified as critical sources, tributary to CWA § 303(d) impaired water bodies, Permittees shall consider requiring operators to implement additional controls as necessary.

b) For industrial and specified commercial facilities, identified as critical sources, within or directly adjacent to or discharging directly to ESAs, Permittees shall consider requiring operators to implement additional controls as necessary.

9. Complaint Response

In response to any complaint related to storm water or unauthorized non-storm water discharges or a specific request by the Regional Board Executive Officer, a Permittee shall visit any facility, to determine if the

facility is effectively complying with the SQMP and municipal storm water/urban runoff ordinances.

10. Interagency Coordination

The Permittees shall provide compliance assistance to the Regional Board through supporting activities, including but not limited to: referrals of complaints, assisting in identification of current owners, operators, and leasees in conjunction with activities performed at any facility within municipal jurisdiction, appearing as witnesses in Regional Board enforcement hearings, and participating in joint inspections when requested by Regional Board staff.

Copies of the inspection/site visit report and any follow-up documentation shall be provided to the Regional Board Executive Officer upon request.

11. Regional Board Inspected Facilities

To the extent that the Regional Board has conducted an inspection of a facility during a particular year, or the inspection has been performed through an authorized agent on behalf of the Regional Board, the Permittee need not inspect the facility during the same 24 month inspection period.

12. Facilities Not Addressed

The Permittees need not inspect State or Federal facilities that are not under their jurisdiction.

C. Industrial/Commercial Educational Program [Version C]

Each Permittee shall implement an industrial/commercial site visit program. The purpose of such site visits will be solely educational and to provide industrial/commercial facilities with information regarding the Permittee's storm water program, and to provide advice when requested in understanding and complying with the Permittee's storm water regulations. To minimize cost, each Permittee is encouraged to coordinate its site visit program with existing fire, health, industrial wastes and/or other inspection type programs so that the Permittee need not institute new and separate site visit programs. The program shall contain the following components:

1. Identification of Sources

   a. The Principal Permittee in consultation with the Permittees shall maintain and update a database for listing industrial/commercial facilities by four digit SIC Industry Numbers. This database will serve as a reference resource for the public, business, industry, local government, the Regional Board, and other public agencies on storm water program participation. The initial accuracy of the database will be dependent on the accuracy of electronic and information sources used to establish the database, but the accuracy is expected to improve after Permittees begin to implement the industrial/commercial site visit program. No legal import is to be attributed to the database developed by the Permittees. The database format shall include at a minimum:

      i. Facility name;
      ii. Site address;
      iii. Watershed Management Area;
      iv. Applicable SIC code(s); and
      v. NPDES storm water permit coverage status, if applicable.

   b. Each Permittee shall update the information using the format developed by the Principal Permittee for industrial/commercial facilities within its jurisdiction and submit the information to the Principal Permittee. The list of facilities shall include, at a minimum:

      i. All industrial groups regulated under Phase I of the Federal storm water program (40 CFR 122.26; Phase I Facilities);

      ii. Motor vehicle repair shops, motor vehicle body shops, motor vehicle parts and accessories facilities, gas stations, and restaurants; and

      iii. Additional SIC industrial/commercial groups identified as priorities by each WMC pursuant to this Order.

   c. The Principal Permittee shall maintain and update the information submitted by each Permittee into a database of industrial/commercial facilities. This database shall include:

i. For each four-digit SIC Industry Number, primary activities that might impact runoff discharges (from national or commercial database sources); and

ii. For each four-digit SIC Industry Number, primary materials that might impact runoff discharges (from national or commercial database).

2. Source Control Measures

The Permittees, shall require the implementation of specific storm water BMPs for each industrial/commercial SIC group of facilities requiring educational site. The BMPs shall:

a. Address multiple pollutants;

b. Initially focus on pollutant source minimization, education, good housekeeping, and site design alternatives; and

c. Target source areas and activities with the highest potential to generate substantial pollutant loads.

The Principal Permittees shall distribute the BMP lists to the Permittees to be incorporated in each Permittee's outreach measures conducted during industrial/commercial site visits.

3. Educational Site Visits

a. Each Permittee shall implement an industrial/commercial educational site visit program according to the following schedule in Table 7:

Table 7
Schedule of Educational Site Visits

FACILITIES	SITE VISIT FREQUENCY (No. of Contacts / Time period)
i) Phase I*, [i]-[ix] and [xi] with waste discharge or pretreatment permit	1 / 24 months **
ii) Phase I, [i]-[ix] and [xi] with no waste discharge or pretreatment permit but with GIASP	1 / 24 months**
iii) Phase I, [i]- [ix] with no waste discharge or pretreatment permit, and no GIASP	1 / 24 months**
iv) Phase I [xi] with no GIASP	1 / 5 years***
v) Vehicle repair shops, vehicle body shops, vehicle parts and accessories facilities	1 / 24 months**
vi) Gas stations	1 / 24 months**
vii) Restaurants	1 / 24 months**
viii) Facilities selected by WMCs	1 / 36 months

* See Glossary of Terms for definition
** Once in 24 months with a minimum of two site visits during the five-year term of this Order
*** See exception in text below

i. Phase 1 facilities in categories [i] through [ix] and [xi] which have an industrial waste discharge permit or a pretreatment permit, once every twenty-four months;

ii. Phase 1 facilities in categories [i] through [ix] and [xi], which do not have an industrial waste discharge permit or a pretreatment permit but have obtained coverage under the GIASP, once every twenty-four months;

iii. Phase 1 facilities in categories [i] through [ix], which do not have an industrial waste discharge permit, a pretreatment permit or GIASP coverage, once every twenty-four months;

iv. Phase 1 facilities in category [xi] without an industrial waste discharge permit, a pretreatment permit, or GIASP coverage. In lieu of a site visit, contact by phone, mail-out of questionnaire and educational materials, or other similar method to inform the facilities of notice of intent (NOI) requirements and encourage good storm water quality control measures (non-responders to be identified in annual report), once in five years;

v. Vehicle repair shops, vehicle body shops, vehicle parts and accessories (SIC Industry Major Group 75); once every twenty-four months;

vi. Gasoline stations (SIC Industry Number 5541); once every twenty-four months;

vii. Restaurants (SIC Industry Number 5812), once every twenty-four months; and,

viii. Additional SIC industrial/commercial groups identified by the WMC for the watershed in which the Permittee is located, once in thirty-six months, with a maximum limit of 3,000 additional site visits per Permittee during the term of this Order.

b. During the educational site visit, the Permittee shall:

i. Consult with a representative of the facility to explain applicable storm water regulations;

ii. Distribute and discuss applicable BMP and educational materials, including information regarding the codes, regulations, ordinances, and permits applicable to the category of the facility. In the case of Phase I facilities, notify the facility of specific requirements under the GIASP including that such facilities must file an NOI with the State Water Resources Control Board and that SWPPP must be available on the site; and

iii. Follow-up with facilities, as deemed necessary and appropriate by the Permittee, to provide advice in complying with the Permittee's storm water ordinances, prohibitions, and other legal instruments.

c. Each Permittee shall submit to the Principal Permittee, on a quarterly basis, the lists of visited facilities identified by category. The Principal Permittee shall compile the submitted lists and submit them to the Executive Officer on a quarterly basis.

4. Alternative Programs

A Permittee may petition the Executive Officer to substitute the industrial/commercial educational program with an alternative industrial/commercial educational program that will achieve greater or substantially similar educational goals and which will be implemented within a similar period of time.

D. Development Planning Program

1. The Permittees shall implement a development-planning program that will require all planning priority development and redevelopment projects to:

   a) Minimize impacts from storm water and urban runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA (Cal. Pub. Resources Code § 21100), CW~~Cal Water Code~~ § 13369, CWA § 319, CWA § 402(p)~~Section~~CWA § 404 ~~of the CWA,~~, CZARA § 6217(g), ESA § 7, and local government ordinances~~, and other legal authorities~~;

   b) Maximize the percentage of permeable surfaces to allow ~~more~~ percolation of storm water into the ground;

   c) Minimize the quantity of storm water directed to impermeable surfaces and the MS4;

   d) Minimize pollution emanating from parking lots through the use of appropriate treatment control BMPs and good housekeeping practices;

   e) Ensure that treatment control BMPs are properly designed and maintained in a manner that does not promote the breeding of vectors; and

   ~~e)~~f) Provide for appropriate permanent measures to reduce storm water pollutant loads in storm water from the development site.

2. Peak Flow Control

   The Permittees shall control post-development peak storm water runoff discharge rates, velocities, and duration (peak flow control) in natural drainage systems (i.e., mimic pre-development hydrology) to prevent accelerated stream erosion and to protect stream habitat. ~~The Permittees shall develop and implement numerical criteria on or before October 31, 2002, to control the post-development peak storm runoff discharge rates in natural drainage systems to maintain or reduce pre-development peak discharge rates to prevent down-stream erosion, and to protect stream habitat.~~ Natural drainage systems ~~include~~ are located in the following areas:

   a) Malibu Creek

   b) Topanga Canyon Creek

   c) Upper Los Angeles River

   d) Upper San Gabriel River

   e) Santa Clara River

f) ~~Named and unnamed coastal drainages~~ Los Angeles County Coastal ~~S~~streams (see Basin Plan Table 2-1)

The Principal Permittee in consultation with Permittees shall develop numerical criteria for peak flow control, based on the results of the Peak Discharge Impact Study (see Monitoring Program Section I).

Each Permittee shall no later than (540 days from the permit effective date) implement numerical criteria for peak flow control.

A Permittee or group of Permittees may substitute for the peak flow control criteria with a Hydromodification Control Plan, on approval by the Regional Board, in the following circumstances:

(1) Stream or watershed-specific conditions indicate the need for a different peak flow control criteria, and the alternative numerical criteria is developed through the application of hydrologic modeling and supporting field observations; or

(2) Watershed wide plan has been developed for implementation of control measures to reduce erosion and stabilize drainage systems on a watershed basis.

3. Standard Urban Storm Water Mitigation Plans

a) Each Permittee shall require that a single-family hillside home developments:

(1) Conserve natural areas

(2) Protect slopes and channels

(3) Provide storm drain system stenciling and signage

(4) Divert roof runoff to vegetated areas before discharge unless the diversion would result in slope instability

(5) Direct surface flow to vegetated areas before discharge unless the diversion would result in slope instability

b) Each Permittee shall require that a Standard Urban Storm Water Mitigation Plan as approved by the Regional Board in Board Resolution No. R 00-02 be implemented for the following categories of developments ~~with immediate effect~~:

(1) Ten or more unit homes (includes single family homes, multifamily homes, condominiums, and apartments)

(2) A 100,000 or more square feet of impervious surface area industrial/ commercial development

(3) Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534, and 7536-7539)

(4) Retail gasoline outlets

(5) Restaurants (SIC 5812)

(6) Parking lots 5,000 square feet or more of surface area or with 25 or more parking spaces

(7) Redevelopment projects in subject categories that meet redevelopment thresholds

Each Permittee shall submit an Environmentally Sensitive Area (ESA) Delineation Map for its jurisdictional boundary, based on the Regional Board's ESA Definition, no later than (120 days from permit effective date) for approval by the Regional Board Executive Officer in consultation with the California Department of Fish and Game, and the California Coastal Commission.

c) ~~The~~Each Permittees shall require the implementation of SUSMP provisions no later than (180 days from permit effective date), for all projects located in or directly adjacent to or discharging directly to an ESA~~environmentally sensitive area~~, where, the development will:

(1) discharge storm water and urban runoff that is likely to impact a sensitive biological species or habitat; and

~~(1)~~(2) create 2,500 square feet or more of impervious surface area, ~~or~~

~~(2)alter the area of imperviousness of the site to ten or more percent of the naturally occurring condition, and~~

~~(3)discharge storm water and urban runoff that is likely to impact a sensitive biological species or habitat~~

4. Numerical Design Criteria

The Permittees shall require that post-construction treatment control BMPs incorporate, at a minimum, either a volumetric or flow based treatment control design standard, or both, as identified below ~~the following design criteria~~ to mitigate (infiltrate, filter or treat) storm water runoff:

a) Volumetric ~~Structural or~~ Treatment Control BMP

(1) the 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality*

Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998), or

(2) the volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial,* (1993), or

(3) the volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or

(4) the volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event, ~~and/or~~

b) Flow Based ~~Structural or~~ Treatment Control BMP

(1) the flow of runoff produced from a rain event equal to at least 0.2 inches per hour intensity, or

(2) the flow of runoff produced from a rain event equal to at least two times the 85th percentile hourly rainfall intensity for Los Angeles County, or

(3) the flow of runoff produced from a rain event that will result in treatment of the same portion of runoff as treated using volumetric standards above.

5. Applicability of Numerical Design Criteria

The Permittees shall require the following categories of planning priority projects to design and implement post-construction treatment ~~and structural~~ controls to mitigate storm water pollution:

a) Single-family hillside residential developments of one acre or more of surface area

b) Housing developments (includes single family homes, multifamily homes, condominiums, and apartments) of ten units ~~one acre~~ or more.

c) A 100,000 square feet or more impervious surface area industrial/ commercial development

d) Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534 and 7536-7539) [5,000 square feet or more of surface area]

e) Retail gasoline outlets [5,000 square feet or more and with projected Average Daily Traffic (ADT) of 100 or more vehicles]

f) Restaurants (SIC 5812) [5,000 square feet or more of surface area]

g) Parking lots 5,000 square feet or more of surface area or with 25 or more parking spaces

h) Projects located in, adjacent to or discharging directly to an ESA ~~environmentally sensitive areas~~ that meet threshold conditions identified above in 3.c.

i) Redevelopment projects in subject categories that meet redevelopment thresholds

6. Not later than March 9, 2003, each Permittee shall require the implementation of SUSMP and post-construction control requirements for the industrial/commercial category to projects that disturb one acre or more of surface area. ~~and greater to conform to USEPA Phase II storm water regulations.~~

7. Site Specific Mitigation

Each Permittee shall no later than (180 days from permit effective date) require the implementation of a site-specific plan to mitigate post-development storm water for new developments and redevelopment not requiring a SUSMP but which may potentially have adverse impacts on post-development storm water quality, where one or more of the following project characteristics exist:

~~(1)~~a) Vehicle or equipment fueling areas~~;~~

~~(2)~~b) Vehicle or equipment maintenance areas, including washing and repair

~~(3)~~c) Commercial or industrial waste handling or storage

~~(4)~~d) Outdoor handling or storage of hazardous materials~~;~~

~~(5)~~e) Outdoor manufacturing areas

~~(6)~~f) Outdoor food handling or processing

~~(7)~~g) Outdoor animal care, confinement, or slaughter

~~(8)~~h) Outdoor horticulture activities

8. Redevelopment Projects

~~a)~~The Permittees shall apply the SUSMP, or site specific requirements including post-construction storm water mitigation to all planning priority projects that undergo significant redevelopment in their respective categories.

a) Significant redevelopment means land-disturbing activity that results in the creation or addition or replacement of 5,000 square

R0006879

feet or more of impervious surface area on an already developed site.

Where -redevelopment results in an alteration to more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, the entire project must be mitigated. Where redevelopment results in an alteration to less than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, only the change must be mitigated, and not the entire development.

b) Redevelopment does not include activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety.

c) Existing Single Family Structures are exempt from the redevelopment requirements.

9. Maintenance Agreement and Transfer

Each Permittee shall require that all developments subject to SUSMP and site specific plan requirements provide verification of maintenance provisions for structural and treatment control BMPs, including but not limited to legal agreements, covenants, CEQA mitigation requirements, and or conditional use permits. Verification at a minimum shall include:

a) The developers signed statement accepting responsibility for maintenance until the responsibility is legally transferred, and either

b) A signed statement from the public entity assuming responsibility for structural or treatment control BMP maintenance and that it meets all local agency design standards, or

c) Written conditions in the sales or lease agreement, which requires the recipient to assume responsibility for maintenance and conduct a maintenance inspection at least once a year, or

d) Written text in project conditions, covenants and restrictions (CCRs) for residential properties assigning maintenance responsibilities to the Home Owners Association for maintenance of the structural and treatment control BMPs; or

e) Any other legally enforceable agreement that assigns responsibility for the maintenance of post-construction structural or treatment control BMPs

R0006880

10. Regional Storm Water Mitigation Program

~~2.~~A Permittee or Permittee group may apply to the Regional Board for approval of a regional or sub-regional storm water mitigation program to substitute in part or wholly SUSMP requirements ~~for new development~~. Upon review and a determination by the Regional Board Executive Officer that the proposal is technically valid and appropriate, the Regional Board may consider for approval such a program if its implementation will ~~result in~~

a) result in equivalent or improved storm water quality;

b) protect stream habitat;

c) promote cooperative problem solving by diverse interests;

d) be fiscally sustainable and has secure funding; and~~.~~

e) be completed in five years including the construction and start-up of treatment facilities.

Nothing in this provision shall be construed as to delay the implementation of SUSMP requirements, as approved in this Order.

11. Mitigation Funding

The Permittees may propose a management framework, for endorsement by the Regional Board Executive Officer, to support regional or sub-regional solutions to storm water pollution, where the following situations occur:

a) A waiver for impracticability is granted

b) Legislative funds become available

c) Off-site mitigation is required because of loss of environmental habitat

d) An approved watershed management plan or a regional storm water mitigation plan exists that incorporates an equivalent or improved strategy for storm water mitigation ~~for new development~~

12. California Environmental Quality Act (CEQA) Document Update

Each Permittee shall incorporate into its CEQA process, with immediate effect,~~modify planning~~ procedures for considering potential storm water quality impacts and providing for appropriate mitigation when preparing and reviewing CEQA documents ~~to consider potential storm water quality impacts and provide for appropriate mitigation, with immediate effect~~. The procedures~~CEQA guidelines~~ shall require consideration of the following:

a) Potential Impact of project construction on storm water runoff

b) Potential Impact of projects post-construction activity on storm water runoff.

c) Potential for discharge of storm water from areas from material storage, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas or loading docks, or other outdoor work areas.

d) Potential for discharge of storm water to impair the beneficial uses of the receiving waters or areas that provide water quality benefit

e) Potential for the discharge of storm water to cause significant harm on the biological integrity of the waterways and water bodies

f) Potential for significant changes in the flow velocity or volume of storm water runoff that can cause environmental harm

g) Potential for significant increases in erosion of the project site or surrounding areas

13. General Plan Update

a) Each Permittee shall amend, revise or update its General Plans to include watershed and storm water quality and quantity management considerations and policies when the following General Plans elements are updated or amended: (i) Land Use, (ii) Housing, (iii) Conservation, (iv) Open Space.

b) Each Permittee shall provide the Regional Board with the draft amendment or revision when a listed General Plan element or the General Plan is noticed for comment in accordance with Cal. Govt. Code § 65350 et seq.

14. Targeted Employee Training

Each Permittee shall train its employees in targeted positions (whose jobs or activities are engaged in development planning) regarding the requirements of the development planning on an annual basis beginning no later than (six months from the effective date of this Order)~~March 31, 2002~~, and more frequently if necessary. For Permittees with a population of 250,000 or more, training shall be completed no later than (one year from the effective date of this Order).

15. Developer Technical Guidance and Information

a) Each Permittee shall develop and make available to the developer community SUSMP (development planning) guidelines immediately.

b) The Principal Permittee in partnership with Permittees shall issue no later than (ten months from the effective date of this Order)~~March 31, 2003~~, a technical manual for the siting and design of BMPs for the development community in Los Angeles County. The technical manual may be adapted from the revised California Storm Water Quality Task Force Best Management Practices Handbooks scheduled for publication in September 2002. The technical manual shall at a minimum include:

(1) ~~Specifications for t~~treatment control BMPs based on flow-based and volumetric water quality design criteria for the purposes of countywide consistency~~;~~;

(2) Peak Flow Control ~~C~~criteria ~~for~~to control ~~of~~ peak discharge rates, velocities and duration~~;~~;

(3) ~~E~~expected pollutant removal performance ranges obtained from national databases, technical reports and the scientific literature;

(4) ~~M~~maintenance considerations; and

(5) ~~C~~cost considerations.

E. Development Construction Program

1. Each Permittee shall implement a program to control runoff from construction activity at all construction sites within its jurisdiction. The program shall ensure the following minimum requirements are effectively implemented at all construction sites:

a) ~~Sediments shall not be discharged to the MS4 or receiving waters.~~ Sediments generated on the project site shall be retained using adequate treatment control or structural ~~drainage~~ controls;

b) ~~No c~~Construction-related materials, wastes, spills, or residues shall be retained at the ~~discharged from the~~ project site to avoid discharge to streets, drainage facilities, receiving waters, or adjacent properties by wind or runoff;

c) Non-storm water runoff from equipment and vehicle washing and any other activity shall be contained at the project site; and

d) Erosion from slopes and channels shall be controlled by implementing an effective combination of BMPs (as approved in Regional Board Resolution No. 99-03), such as the limiting of grading scheduled during the wet season; inspecting graded areas during rain events; planting and maintenance of vegetation on slopes; and covering erosion susceptible slopes;

e) ~~Discourage grading during the wet season. Proper justification for the need to grade during the wet season shall be provided to the Permittee. All erosion susceptible slopes shall be covered, netted,~~

~~planted, or protected in any way that prevents sediment discharge from the site.~~

2. ~~In addition, f~~For construction sites one acre and greater, each Permittee shall ~~require~~ compl~~y~~iance with all conditions in section E.1. above and shall:

a) Require the preparation and submittal of a Local Storm Water Pollution Prevention Plan (Local SWPPP), for approval prior to issuance of a grading permit for construction projects~~, that meets one or more of the following criteria~~:

~~(1)Will result in soil disturbance of one acre or more in size;~~

~~(2)Is within, directly adjacent to, or is discharging directly to an environmentally sensitive area; or~~

~~(3)Is located in a hillside area.~~

The Local SWPPP shall include appropriate construction site BMPs and maintenance schedules. (A Local SWPPP may substitute for the State SWPPP if the Local SWPPP is at least as inclusive in controls and BMPs as the State SWPPP). The Local SWPPP must include the rationale used for selecting or rejecting BMPs. The project architect, or engineer of record, or authorized qualified designee, must sign a statement on the Local SWPPP to the effect:

"As the architect/engineer of record, I have selected appropriate BMPs to effectively minimize the negative impacts of this project's construction activities on storm water quality. The project owner and contractor are aware that the selected BMPs must be installed, monitored, and maintained to ensure their effectiveness. The BMPs not selected for implementation are redundant or deemed not applicable to the proposed construction activity."

The landowner or the landowner's agent shall sign a statement to the effect:

"I certify that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is true, accurate, and complete. I am aware that submitting false and/or inaccurate information, failing to update the Local SWPPP to reflect current conditions, or failing to properly and/or adequately implement the Local SWPPP may result in revocation of grading and/or other permits or other sanctions provided by law."

The Local SWPPP certification shall be signed by the landowner as follows, for a corporation: by a responsible corporate officer which means (a) a president, secretary, treasurer, or vice president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or (b) the manager of the construction activity if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures; for a partnership or sole proprietorship: by a general partner or the proprietor; or for a municipality or other public agency: by an elected official, a ranking management official (e.g., County Administrative Officer, City Manager, Director of Public Works, City Engineer, District Manager), or the manager of the construction activity if authority to sign Local SWPPPs has been assigned or delegated to the manager in accordance with established agency policy.

b) ~~Shall i~~Inspect all construction sites for storm water quality requirements during routine inspections a minimum of once during the wet season. The Local SWPPP shall be reviewed for compliance with local codes, ordinances, and permits. For inspected sites that have not adequately implemented their Local SWPPP, a follow-up inspection to ensure compliance will take place within 2 weeks. If compliance has not been attained, the Permittee will take additional actions to achieve compliance (as specified in municipal codes). If compliance has not been achieved, and the site is also covered under a statewide general construction storm water permit, each Permittee shall enforce their local ordinance requirements, and if non-compliance continues the Regional Board shall be notified for further joint enforcement actions.

c) ~~Shall r~~Require, commencing March 10, 2003, prior to issuing a grading permit for all projects less than five acres requiring coverage under a statewide general construction storm water permit, proof of a Waste Discharger Identification (WDID) Number for filing a Notice of Intent (NOI) for permit coverage and a certification that a SWPPP has been prepared by the project developer. A Local SWPPP may substitute for the State SWPPP if the Local SWPPP is at least as inclusive in controls and BMPs as the State SWPPP.

3. ~~In addition, f~~For sites five acres and greater, each Permittee shall comply with all conditions in Sections E.1 and E.2.and shall:

a) Require, prior to issuing a grading permit for all projects requiring coverage under the state general permit, proof of a Waste Discharger Identification (WDID) Number for filing a Notice of Intent (NOI) for coverage under the GCASP~~State General Construction Activity Storm Water Permit~~ and a certification that a SWPPP has been prepared by the project developer. A Local SWPPP may substitute for the State SWPPP if the Local SWPPP

R0006885

is at least as inclusive in controls and BMPs as the State SWPPP~~The prepared SWPPP may satisfy the requirement under E.1. (in lieu of Local SWPPP)~~.

b) ~~Each Permittee shall r~~Require proof of an NOI and a copy of the SWPPP at any time a transfer of ownership takes place for the entire development or portions of the common plan of development where construction activities are still on-going.

c) ~~Each Permittee shall u~~Use an effective system to track grading permits issued by each Permittee. To satisfy this requirement, the use of ~~A~~a database or GIS system is encouraged, but not required~~, to be used to satisfy this requirement~~.

4. Each Permittee shall train employees in targeted positions (whose jobs or activities are engaged in construction activities including construction inspection staff) regarding the requirements of the storm water management program no later than (six months from the effective date of this Order)~~March 31, 2002~~, and annually thereafter. For Permittees with a population of 250,000 or more, initial training shall be completed no later than (one year from the effective date of this Order). A list of trained employees shall be maintained by each Permittee.

F. Public Agency Activities Program

~~1.~~Each Permittee shall implement a Public Agency program to minimize storm water pollution impacts from public agency activities. Public Agency requirements consist of:

Sewage Systems ~~Operations~~Maintenance, Overflow, and Spill Prevention
Public Construction Activities Management
Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management
Landscape and Recreational Facilities Management
Storm Drain Operation and Management
Streets and Roads Maintenance
Parking Facilities Management
Public Industrial Activities Management
Emergency Procedures
Treatment~~Dry Weather Diversions~~ Feasibility Study

~~Each Permittee shall conduct an assessment of measures that can be implemented to reduce and/or prevent trash from entering the MS4 system. The Assessment and a schedule for implementation shall be submitted to the Regional Board Executive Officer for review by July 1, 2003.~~

~~3.~~1. Sewage System ~~Operations~~ Maintenance, Overflow, and Spill Prevention

a) Each Permittee shall implement a response plan for overflows of the sanitary sewer system within their respective jurisdictions ~~which~~, which shall consist at a minimum of the following:

(1) Investigation of any complaints received;

~~b)~~(2) Upon notification, ~~i~~immediate response to overflows for~~by~~ containment; and

~~c)~~(3) Notification to appropriate sewer and public health agencies when a sewer overflows to the MS4.

b) In addition to 3.a.1, 3.~~b~~a.2, and 3.~~c~~a.3 above, for those Permittees, which own and/or operate a sanitary sewer system, the~~each~~ Permittee shall also implement the following requirements ~~(until such time that the proposed Capacity, Management, Operation and Maintenance Regulations (CMOM) are promulgated by the USEPA. After which, the CMOM regulations shall be enforceable under this Order until such time they are added into an individual NPDES permit)~~:

~~d)~~(1) Procedures~~A program~~ to prevent sewage spills or leaks from sewage facilities from entering the MS4; and

e)(2) Identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers to the MS4.

4.2. Public Construction Activities Management

a) Each Permittee shall implement the Development Planning Program requirements (Permit Section D) at public construction projects.

b) Each Permittee shall implement the Development Construction Program requirements (Permit Section E) at Permittee owned construction sites.

a)Each Permittee shall implement a program to control runoff from construction activity at all construction sites. To accomplish this, the Permittees shall revise their Development Construction Program in the SQMP no later than March 31, 2002. The revisions shall specify a schedule for implementation by each Permittee, and must contain the following minimum elements, including performance measures, schedules for implementation, and shall include the following categories of construction:

(1)Less than one acre;

(2)Between one and five acres; and

(3)Five or more acres.

b)Each Permittee shall comply with requirements in section E. and with the following conditions, at all public construction sites:

(1)Design and construction of public facilities shall be consistent with the requirements and dates specified for private development in Part 4.D.;

(2)Prepare and retain site-specific SWPPPs for municipal construction sites;

(3)Implement construction and post-construction storm water controls as required of private construction projects, including numerical mitigation criteria for post-construction BMPs;

(4)Implement a program to ensure that SWPPPs and BMPs implemented are effective;

(5)Inspect public construction sites and implement changes as necessary to maintain or replace ineffective BMPs in order to protect water quality; and

(1)c) Each Permittee shall obtain coverage under the GCASPState of California General Construction Activities Storm Water Discharge Permit coverage for public construction sites for sites 5

R0006888

acres or greater (or part of a larger area of development~~, etc...~~) except that a municipality under 100,000 in population need not obtain coverage under a separate permit until March 10, 2003.

d) Each Permittee, ~~N~~no later than March 9, 2003, ~~each Permittee~~ shall obtain coverage under a statewide general construction storm water permit ~~the State of California General Construction Activities Storm Water Discharge Permit coverage~~ for public construction sites for projects~~sites~~ between one ~~acre~~and five acres ~~or greater~~.

3. ~~5.~~ Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management

a) Each Permittee, consistent with the SQMP, shall implement pollution prevention plans for public vehicle maintenance facilities, ~~and~~ material storage facilities, and corporation yards which have the potential to discharge pollutants into storm water.

b) Each Permittee shall implement BMPs to minimize pollutant discharges in storm water including but not be limited to:

(1) Good housekeeping practices;

(2) Material storage control;

(3) Vehicle leaks and spill control; and

(4) Illicit discharge control.

c) Each Permittee shall require:

(1) For existing facilities, that all vehicle/equipment wash areas are self-contained or covered, or equipped with a clarifier, or other pretreatment device.

(2) For new facilities or during redevelopment of existing sites to be equipped with a clarifier, or other pretreatment device, and properly connected to the sanitary sewer to prevent the discharge of pollutants to the MS4.

This provision does not apply to fire fighting vehicles.

4. ~~6.~~ Landscape and Recreational Facilities Management

Each Permittee shall implement the following requirements:

a) A standardized protocol for the routine and non-routine application of pesticides, herbicides (including pre-emergents), and fertilizers;

b) Consistency with State Board's guidelines and monitoring requirements for application of aquatic pesticides to surface waters (WQ Order No. 2001-12 DWQ).

~~b)~~c) Ensure no application of pesticides or fertilizers immediately before, during, or immediately after a rain event or when water is flowing off the area to be applied;

~~c)~~d) Ensure that no banned or unregistered pesticides~~, herbicides, fungicides, or rodenticides~~ are stored or applied;

~~d)~~e) Ensure that staff applying pesticides are certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator;

~~e)~~f) Implement procedures to encourage retention and planting of native vegetation and to reduce water, fertilizer, and pesticide needs;

~~f)~~g) Store fertilizers and pesticides indoors or under cover on paved surfaces or use secondary containment;

~~g)~~h) Reduce the use, storage, and handling of hazardous materials to reduce the potential for spills; and

~~h)~~i) Regularly inspect storage areas.

~~7.~~5. Storm Drain Operation and Management

Each Permittee shall:

a) Ddesignate catch basin inlets within its jurisdiction as one of the following:

Priority A – catch basins that are designated as consistently generating the highest volumes ~~and~~ of trash and/or litter.

Priority B - catch basins that are designated as consistently generating moderate volumes ~~and~~ of trash and/or litter

Priority C – catch basins that are designated as generating low volumes of trash and/or litter.

b) Clean catch basins according to the following schedule:

Priority A –Aat least once during the dry season and once per month during the wet season.

Priority B – At least 2 times per year and once during the wet season. Between the effective date of this Order and July 1, 2003, each Permittee shall ensure that each catch basin is cleaned whenever the catch basin reaches 40% full during the wet season. From July 1, 2003 to the date this Order is renewed, each Permittee shall ensure that each catch basin is cleaned whenever the catch basin reaches 25% full during the wet season.

Priority C – as necessary but at least once per year.

c) For any special event that can be reasonably expected to generate substantial quantities of trash and litter, ~~the Permittee shall,~~ include provisions that require for the proper management of trash and litter generated, as a condition of the special use permit issued for that event~~, include provisions that provide for the proper management of trash and litter generated from the event~~. At a minimum, the Permittee shall arrange for either temporary screens to be placed on catch basins or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain.

d) Place trash receptacles at all transit stops within its jurisdiction and maintain them.

~~d)~~e) ~~For each Permittee subject to a trash TMDL, t~~The Permittees shall~~may~~ implement a program which achieves the waste load allocations ~~maximizes trash removal~~ in conformance with a TMDL schedule of implementation by using an effective combination of BMPs which may include a combination of street sweeping, catch basin clean outs, installation of treatment devices, ~~and/or implementation of any~~ or other BMPs ~~that achieve waste load allocations~~).

~~e)~~f) Each Permittee shall~~:~~ inspect the legibility of the catch basin stencil or label nearest the inlet. Catch basins with illegible stencils shall be recorded and re-stenciled or re-labeled within 180 days of inspection.

~~(1)Keep a record of catch basins cleaned;~~

~~(2)Record the quantity of catch basin waste collected [The data shall be reported in a single unit of measure that is reproducible and measures the amount of trash, irrespective of water content (e.g., compacted volume based on a standardized compaction rate, dry weight, etc.). The Permittees may select the unit, but all Permittees shall use the same unit of measure.];~~

~~(3)Inspect the legibility of the catch basin stencil or label nearest the inlet. Illegible stencils shall be recorded and re-stenciled or re-labeled within 180 days of inspection.; and~~

~~(4)Submit a record (preferably but not required, as a GIS layer) of all catch basins in a municipality and identify which are city-owned/county-owned, and which to note priority for more frequent cleaning.~~

~~f)~~g) Each Permittee shall implement BMPs for Storm Drain Maintenance that ~~shall~~ include:

(1) A program to visually monitor Permittee-owned open channel storm drains and other drainage structures for

debris at least annually and identify and prioritize problem areas of illicit discharge for regular inspection;

(2) A review of current maintenance activities to assure that appropriate storm water BMPs are being utilized to protect water quality;

(3) Removal of trash and debris from open channel storm drains shall occur a minimum of once per year before the storm season;

(4) Minimize the discharge of contaminants during MS4 maintenance and clean outs; and

~~(5)Record the quantity of open channel waste collected by stream or channel segment in tons from Permittee-owned open channels or other drainage structures [The data shall be reported in a single unit of measure that is reproducible and measures the amount of trash, irrespective of water content (e.g., compacted volume based on a standardized compaction rate, dry weight, etc.). The Permittees may select the unit, but all Permittees shall use the same unit of measure.]; and~~

~~(6)~~(5) Proper disposal of material removed.

~~8.~~6. Streets and Roads Maintenance

a) Each Permittee shall designate streets and/or street segments within its jurisdiction as one of the following:

Priority A – streets and/or street segments that are designated as consistently generating the highest volumes ~~and~~ of trash and/or litter.

Priority B - streets and/or street segments that are designated as consistently generating moderate volumes ~~and~~ of trash and/or litter.

Priority C – streets and/or street segments that are designated as generating low volumes of trash and/or litter.

b) Each Permittee shall perform street sweeping ~~cleaning~~ according to the following schedule:

Priority A – These streets and/or street segments shall be swept at least two times per month.

Priority B - ~~Between the effective date of this Order and July 1, 2003, e~~ Each Permittee shall ensure that each streets and/or street segments is swept~~cleaned~~ at least once per month.

Priority C – These streets and/or street segments shall be swept~~cleaned~~ as necessary but in no case less than once per year.

R0006892

c) Each Permittee shall require that:

(1) Sawcutting wastes be recovered and disposed of properly and that in no case shall waste be left on a roadway or allowed to enter the storm drain.

~~d)~~(2) Concrete and other street and road maintenance materials and wastes shall be managed to prevent ~~pollutant~~ discharges to the MS4; and

~~e)~~(3) The washout of concrete trucks and chutes shall only occur in designated areas and never discharged ~~in~~to storm drains, open ditches, streets, or catch ~~basins leading to the storm drain system~~.

~~f)Each Permittee shall implement a program which maximizes trash removal by using an effective combination of street sweeping, catch basin clean outs, installation of treatment devices, and/or implementation of any other BMPs that achieve TMDL waste load allocations.~~

~~g)~~d) Each Permittee shall, no later than (six months from effective date of this Order), train their employees in targeted positions (whose interactions, jobs, and activities affect storm water quality) regarding the requirements of the storm water management program to:

(1) Promote a clear understanding of the potential for maintenance activities to pollute storm water; and

(2) Identify and select appropriate BMPs.

For Permittees with a population of 250,000 or more training shall be completed no later than (one year from the effective date of this Order.)

~~9.~~7. Parking Facilities Management

Permittee-owned parking lots exposed to storm water shall be kept clear of debris and excessive oil buildup and cleaned no less than 2 times per month and/or inspected no less than 2 times per month to determine if cleaning is necessary. In no case shall a Permittee-owned parking lot be cleaned less than once a month.

~~10.~~8. Public Industrial Activities Management

Each Permittee shall, for any municipal activity considered a~~n~~ discharge of storm water associated with industrial activity ~~covered under USEPA Phase I storm water regulations~~, obtain separate coverage under the GIASP~~State of California General Industrial Activities Storm Water Discharge Permit no later than November 25, 2001,~~ except that a municipality under 100,000 in (1990 Census) population need not file the

Notice Of Intent to be covered by said permit until March 10, 2003 (with the exception of power plants, airports, and uncontrolled sanitary landfills).

~~11.~~9. Emergency Procedures

Each Permittee shall ~~continue to~~ repair essential public services and infrastructure in a manner to minimize environmental damage in emergency situations such as: earthquakes; fires; floods; landslides; or windstorms. BMPs shall be implemented to the extent that measures do not compromise public health and safety. After initial emergency response or emergency repair activities have been completed, each Permittee shall implement BMPs and programs as required under this Order.

~~12.~~10. Treatment Feasibility Study ~~Dry Weather Diversions~~

a)~~Each~~ The Permittees in cooperation with the County Sanitation Districts of Los Angeles County shall conduct a study to investigate the ~~prioritize drains for~~ possible diversion of dry weather ~~flows~~discharges or the use of alternative treatment control BMPs to treat flows from ~~areas within~~ their jurisdiction ~~that flow to areas where the public~~ which may ~~be~~ impacted ~~(for~~ public health and safety and/or the environmental ~~reasons)~~. The Permittees shall collectively review their individual prioritized lists and create a watershed based priority list of ~~possible~~ drains for potential diversion or treatment ~~no later than March 31, 2002~~ and submit a the ~~listing of~~ priority listing ~~diversions~~ to the Regional Board Executive Officer, no later than July 1,2002. ~~The Permittees shall immediately begin a feasibility study and discussions with the appropriate sewer agency for diversion of selected dry weather flows to the sanitary sewer for treatment, subject to approvals of the Regional Board and the appropriate sewer agency.~~

~~The Permittees shall investigate and determine the location of potential dry weather urban runoff treatment devices for strategic placements in areas of the watersheds where most appropriate. This information shall be submitted to the Regional Board Executive Officer no later than March 31, 2002.~~

G. Illicit Connections and Illicit Discharges Elimination Program

Permittees shall eliminate all illicit connections and illicit discharges to the storm drain system, and shall document, track, and report all such cases in accordance with the elements and performance measures specified in the following subsections.

1. General

a) Implementation: Each Permittee must develop an Implementation Program which specifies how each Permittee is implementing revisions to the IC/ID Program of the SQMP. This Implementation Program must be documented, and available for review and approval by the Regional Board Executive Officer, upon request.

b) Tracking: All Permittees shall, no later than [365 days from the effective date of this Order] develop and maintain a ~~baseline map~~ listing of all permitted connections ~~of~~ to their storm drain system.~~,~~ ~~showing all storm drain connections permitted by the Permittee, at a scale and in a format specified by the Lead Permittee. On an annual basis,~~ aAll Permittees shall map at a scale and in a format specified by the Principal Permittee all illicit connections and discharges on their baseline maps, and shall transmit this information to~~, and in a format specified by,~~ the Principal Permittee. No later than ~~October 25, 2002,~~[365 days from the effective date of this Order] the Principal Permittee shall use this information as well as results of baseline and priority screening for illicit connections (as set forth in subsection 2 below) to start an annual evaluation of patterns and trends of illicit connections and illicit discharges, with the objectives of identifying priority areas for elimination of illicit connections and illicit discharges.~~,~~ ~~and making recommendations for corrective action.~~

c) Training: All Permittees shall train all targeted employees who are responsible for identification, investigation, termination, cleanup, and reporting of illicit connections and discharges. For Permittees with a population of less than 250,000, training shall be completed no later than ~~March 31, 2002.~~ [six months from the effective date of this Order]. For Permittees with a population of 250,000 or more, training shall be completed no later than ~~October 25, 2002.~~[365 days from the effective date of this Order]. Furthermore, all Permittees shall conduct refresher training on an annual basis thereafter.

~~d) Documentation and Reporting: Document and report all illicit connections, illicit discharges, and hazardous substances that enter the storm drain, within times specified in subsections 2 and 3 below.~~

2. Illicit Connections

a) Screening for Illicit Connections

(1) ~~Baseline~~Field Screening: All Permittees shall ~~continue to~~field screen the storm drain system for illicit connections ~~during scheduled infrastructure maintenance. On an annual basis,~~ in accordance with the following schedule:

(i) Open channels: [365 days from the effective date of this Order];

~~a)~~(ii) Underground pipes in priority areas: [three years from the effective date of this Order]; and

(iii) Underground pipes with a diameter of 36 inches or greater: [five years from the effective date of this Order].

Permittees shall report, to the ~~Lead~~ Principal Permittee, on the location and length of open channels or ~~closed storm drains~~underground pipes that have been screened vis a vis the entire storm drain network, and on the status of suspected, confirmed, and terminated illicit connections. Permittees shall maintain a list containing all permitted connections and the status of connections under investigation for possible illicit connection.

~~b)~~(2) ~~Priority Screening: In addition to the baseline screening that will occur during regularly scheduled maintenance, Permittees shall design and implement a plan on or before October 31, 2002, subject to Regional Board Executive Officer approval, for proactive storm drain screening of priority areas that are, or are suspected to be a source of non-storm water discharges.~~Permit Screening: [five years from the effective date of this Order], Permittees shall complete a review of all permitted connections to the storm drain system, to confirm compliance with Part 1 (Discharge Prohibition).

~~c)~~b) Response to Illicit Connections

(1) Investigation: Upon discovery~~through either baseline or priority screening,~~ or upon receiving a report of a suspected illicit connection, Permittees shall initiate an investigation within 21 days, to determine the source of the connection, the nature and volume of discharge through the connection, and the responsible party for the connection.

~~d)~~(2) Termination: Upon confirmation of the illicit nature of a storm drain connection, Permittees shall ensure termination of the connection within 180 days, using enforcement authority as ~~needed. For those cases of illicit connections that require more than 180 days to eliminate due to lengthy court proceedings, the Regional Board Executive Officer may grant time extensions on a case by case basis.~~needed.

3. Illicit Discharges

a) Abatement and Cleanup:~~ Respond, within 72 hours~~Permittees shall respond, within one business day of discovery or a report of a suspected illicit discharge, with activities to abate, contain, and clean up all illicit discharges, including hazardous substances.

b) Investigation: ~~As soon as practicable, during~~Permittees shall investigate illicit discharges as soon as practicable (during or immediately following containment and cleanup ~~activities,~~activities), and shall take enforcement action as appropriate.

Part 5. DEFINITIONS

The following are definitions for terms applicable to this Order:

"Adverse Impact" -means a detrimental effect upon water quality or beneficial uses caused by a discharge or loading of a pollutant or pollutants.

"Anti-degradation policies" means the *Statement of Policy with Respect to Maintaining High Quality Water in California* (State Board Resolution No. 68-16) which protects surface and ground waters from degradation. In particular, this policy protects waterbodies where existing quality is higher than that necessary for the protection of beneficial uses including the protection of fish and wildlife propagation and recreation on and in the water.

"Applicable Standards and Limitations" means all State, interstate, and federal standards and limitations to which a "discharge" or a related activity is subject under the CWA, including "effluent limitations, "water quality standards, standards of performance, toxic effluent standards or prohibitions, "best management practices," and pretreatment standards under sections 301, 302, 303, 304, 306, 307, 308, 403 and 404 of CWA.

"**Areas of Special Biological Significance (ASBS)**" means all those areas of this state as ASBS, listed specifically within the California Ocean Plan or so designated by the State Board which, among other areas, includes the area from Mugu Lagoon to Latigo Point: Oceanwater within a line originating from Laguna Point at 34° 5' 40" north, 119° 6'30" west, thence southeasterly following the mean high tideline to a point at Latigo Point defined by the intersection of the meanhigh tide line and a line extending due south of Benchmark 24; thence due south to a distance of 1000 feet offshore or to the 100 foot isobath, whichever distance is greater; thence northwesterly following the 100 foot isobath or maintaining a 1,000-foot distance from shore, whichever maintains the greater distance from shore, to a point lying due south of Laguna Point, thence due north to Laguna Point.

"Authorized Discharge" means any discharge that is authorized pursuant to an NPDES permit or meets the conditions set forth in this Order.

"Automotive Service Facilities" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 5511, 7532-7534, or 7536-7539.

~~**"BAT/BCT Criteria"** means treatment-based standards for reducing the discharge of pollutants, as defined in 40 CFR subchapter N, for specific categories of industrial facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards. Effluent limitations have been defined in 40 CFR for the reduction of toxic pollutants using Best Available Technology Economically Achievable (BAT) and for the reduction of conventional pollutants using Best Conventional Pollutant Control Technology (BCT).~~

"Basin Plan" means the Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties, adopted by the Regional Board on June 13, 1994 and subsequent amendments.

"Beneficial Uses" means the existing or potential uses of receiving waters in the permit area as designated by the Regional Board in the Basin Plan.

"Best Management Practices (BMPs)" ~~are~~means methods, measures, or practices designed and selected to reduce or eliminate the discharge of pollutants to surface waters from point and nonpoint source discharges including storm water. BMPs include structural and nonstructural controls, and operation and maintenance procedures, which can be applied before, during, and/or after pollution producing activities.

"Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, ~~multi-apartment buildings,~~ car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

"Construction" means constructing, clearing, grading, or excavation that results in soil disturbance. Construction includes structure teardown. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"Control" means to minimize, reduce, eliminate, or prohibit by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

"Dechlorinated/Debrominated Swimming Pool Discharge" means swimming pool discharges which have no measurable chlorine or bromine and do not contain any detergents, wastes, or additional chemicals not typically found in swimming pool water. The term does not include swimming pool filter backwash.

"Development" ~~shall mean~~means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction.

"Directly Adjacent" means situated within 200 feet of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area.

"Director" ~~shall mean~~means the Director of a municipality~~Public Works of the County~~ and Person(s) designated by and under the Director's instruction and supervision.

"Discharge" means when used without qualification ~~means~~ the "discharge of a pollutant."

"~~Directly~~ **Discharging Directly**" means outflow from a drainage conveyance system that is composed entirely or predominantly of flows from the subject, property, development, subdivision, or industrial facility, and not commingled with the flows from adjacent lands.

"Discharge of a Pollutant" means: Any addition of any "pollutant" or combination of pollutants to "waters of the United States" from any "point source" or, Aany addition of any pollutant or combination of pollutants to the waters of the "contiguous zone" or the ocean from any point source other than a vessel or other floating craft which is being used as a means of transportation. The term discharge includes additions of pollutants into waters of the United

R0006899

States from: surface runoff which is collected or channeled by man; discharges through pipes, sewers, or other conveyances owned by a State, municipality, or other person which do not lead to a treatment works; and discharges through pipes, sewers, or other conveyances, leading into privately owned treatment works. ~~This term does not include an addition of pollutants by any "indirect Discharger."~~

"Disturbed Area" means an area that is altered as a result of clearing, grading, and/or excavation.

~~**"Effluent limitation"** means any restriction imposed by the Regional Board on quantities, discharge rates, and concentrations of "pollutants" which are "discharged" from "point sources" into "waters of the United States," the waters of the "contiguous zone," or the ocean.~~

"Environmentally Sensitive Areas" means an area "in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which would be easily disturbed or degraded by human activities and developments" (California Public Resources Code § 30107.5). Areas subject to storm water mitigation requirements are: areas designated as Significant Ecological Areas by the County of Los Angeles (*Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976)* and amendments); an area designated as a Significant Natural Area by the California Department of Fish and Game's~~,~~ Significant Natural Areas Program; an area listed in the ~~Regional Board~~ Basin Plan as supporting the "Rare, Threatened, or Endangered Species (RARE)" beneficial use; or an area identified by ~~a~~the Permittees as environmentally sensitive~~ for water quality purposes[1]. See Attachment B for details of each listing.~~

~~**"Executive Advisory Committee"** means the committee composed of representatives of the Los Angeles County Flood Control District, the City of Los Angeles, and the five six Watershed Management Areas.~~

"Full Capture Device" means any device or system that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow resulting from a one-year, one-hour, storm.

"General Construction Activities Storm Water Permit (GCASP)" means the general NPDES permit adopted by the State ~~Water Resources Control~~ Board which authorizes the discharge of storm water from construction activities under certain conditions.

"General Industrial Activities Storm Water Permit (GIASP)" means the general NPDES permit adopted by the State ~~Water Resources Control~~ Board which authorizes the discharge of storm water from certain industrial activities under certain conditions.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is 25% or greater and where grading contemplates cut or fill slopes.

"Illicit Connection" ~~shall~~ means any man-made conveyance that is connected to the storm drain system without a permit, excluding roof drains and other similar type connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

~~[1] Regional Board is currently working with the City of Rancho Palos Verdes to recognize their identified local conservation areas~~

"Illicit Discharge" means any discharge to the storm drain system that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term illicit discharge includes all non storm-water discharges except discharges pursuant to an NPDES permit, discharges that are identified in Part 1, "Discharge Prohibitions" of this order, and discharges authorized by the Regional Board Executive Officer.

"Illicit Disposal" means any disposal, either intentionally or unintentionally, of material(s) or waste(s) that can pollute storm water.

"Industrial/Commercial Facility" means any facility involved and/or used in either the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by the Standard Industrial Classifications (SIC). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

"Infiltration" means the downward entry of water into the surface of the soil.

"Inspection" means entry and the conduct of an on-site review of a facility and its operations, at reasonable times, to determine compliance with specific municipal or other legal requirements. The steps involved in performing an inspection, include, but are not limited to: 1. Pre-inspection documentation research.; 2. Request for entry; 3. Interview of facility personnel; 4. Facility walk-through. 5. Visual observation of the condition of facility premises; 6. Examination and copying of records as required; 7. Sample collection (if necessary or required); 7. Exit conference (to discuss preliminary evaluation); and, 8. Report preparation, and if appropriate, recommendations for coming into compliance.

"Large Municipal Separate Storm Sewer System (MS4)" means all MS4s that serve a population greater than 250,000 (1990 Census). as ~~The complete~~ defined~~ition is contained~~ in 40 CFR §~~Section~~ 122.26 (b)(4). The Regional Board designated Los Angeles County as a large MS4 in 1990, based on: (i) the U.S. Census Bureau 1990 population estimate of 8.9 million, and (ii) the interconnectivity of the MS4s in the incorporated and unincorporated areas within the County.

"Local SWPPP" means the Storm Water Pollution Prevention Plan required by the local agency for~~if~~ a~~the~~ project that~~is~~ disturbs one or more acres of land. ~~not subject to the Statewide Construction Activities General Permit.~~

"Maximum Extent Practicable (MEP)" means the standard for implementation of storm water management programs to reduce pollutants in storm water. ~~It is the maximum extent possible taking into account equitable consideration and competing facts, including, but not limited to: the gravity of the problem, public health risk, societal concern, environmental benefits, pollutant removal effectiveness, regulatory compliance, public acceptance, implementability, cost and technical feasibility.~~ CWA's §~~Section~~ 402(p)(3)(B)(iii) ~~of the CWA~~ requires that municipal permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. Specifically, municipalities must choose effective BMPs, and reject applicable BMPs only where other effective BMPs will serve the same purpose. See the legal memorandum (Feb 11, 1993) from State Board OCC to DWQ.

"Method Detection Limit (MDL)" means the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in 40 CFR 136, Appendix B.

"Minimum Level (ML)" means the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

"Municipal Separate Storm Sewer System (MS4)" means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, alleys, catch basins, curbs, gutters, ditches, manmade channels, or storm drains) owned by a State, city, county, town or other public body, that is designed or used for collecting or conveying storm water, which is not a combined sewer, and which is not part of a publicly owned treatment works, and which discharges to Waters of the United States.

"National Pollutant Discharge Elimination System (NPDES)" means the national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under CWA §~~sections~~ 307, 402, 318, and 405 ~~of CWA~~. The term includes an "approved program."

"Natural Drainage Systems" means unlined or unimproved (not engineered) creeks, streams, rivers or similar waterways.

"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

"Non-Storm Water Discharge" means any discharge to a storm drain that is not composed entirely of storm water.

"Nuisance" means anything that meets all of the following requirements: (1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; (2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal; (3) occurs during, or as a result of, the treatment or disposal of wastes.

"Parking Lot" means land area or facility for the parking or storage of motor vehicles used personally, for businesses or for commerce with a lot size of 5,000 square feet or more of surface area, or with 25 or more parking spaces.

~~**"Permit"** means an authorization, license, or equivalent control document issued by USEPA or an "approve State" to implement the requirements of 40 CFR Parts 122, 123, and 124. "Permit" includes an NPDES "general permit" (§ 122.28). Permit does not include any permit which has not yet been the subject of final agency action, such as a "draft permit" or a "proposed permit."~~

"Permittee(s)" means Co-Permittees and any agency named in this Order as being responsible for permit conditions within its jurisdiction. Permittees to this Order include the Los Angeles County Flood Control District, Los Angeles County, and the cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Canada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier.

"Planning Priority Projects" means those projects that are required to incorporate appropriate storm water mitigation measures into the design plan for their respective project. These types of projects include:

i. Ten or more unit homes (includes single family homes, multifamily homes, condominiums, and apartments)

ii. A 100,000 or more square feet of impervious surface area industrial/ commercial development

iii. Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534, and 7536-7539)

iv. Retail gasoline outlets

v. Restaurants (SIC 5812)

vi. Parking lots 5,000 square feet or more of surface area or with 25 or more parking spaces

vii. Redevelopment projects in subject categories that meet redevelopment thresholds

viii. Additionally, for all projects located in or directly adjacent to or discharging directly to an ESA, which meet thresholds; and

ix. Those projects that require the implementation of a site-specific plan to mitigate post-development storm water for new development not requiring a SUSMP but which may potentially have adverse impacts on post-development storm water quality, where the following project characteristics exist:

(1) Vehicle or equipment fueling areas;

(2) Vehicle or equipment maintenance areas, including washing and repair;

(3) Commercial or industrial waste handling or storage;

(4) Outdoor handling or storage of hazardous materials;

(5) Outdoor manufacturing areas;

(6) Outdoor food handling or processing;

(7) Outdoor animal care, confinement, or slaughter; or

(8) Outdoor horticulture activities.

"Pollutants" means those "pollutants" defined in CWA §Section 502(6) of the federal Clean Water Act (33.U.S.C.§1362(6)), and/or incorporated by reference into California Water Code §13373. Examples of pollutants include, but are not limited to the following:

- Commercial and industrial waste (such as fuels, solvents, detergents, plastic pellets, hazardous substances, fertilizers, pesticides, slag, ash, and sludge);
- Metals such as cadmium, lead, zinc, copper, silver, nickel, chromium, and non-metals such as phosphorus and arsenic;
- Petroleum hydrocarbons (such as fuels, lubricants, surfactants, waste oils, solvents, coolants, and grease)
- Excessive eroded soils, sediment, and particulate materials in amounts which may adversely affect the beneficial use of the receiving waters, flora or fauna of the State;
- Animal wastes (such as discharge from confinement facilities, kennels, pens, recreational facilities, stables, and show facilities);
- Substances having characteristics such as pH less than 6 or greater than 9, or unusual coloration or turbidity, or excessive levels of fecal coliform, or fecal streptococcus, or enterococcus;

The term "pollutant" shall not include uncontaminated storm water, potable water or reclaimed water generated by a lawfully permitted water treatment facility.

The term "pollutant" also shall not include any substance identified in this definition, if through compliance with the best management practices available, the discharge of such substance has been eliminated to the maximum extent practicable. In an enforcement action, the burden shall be on the person who is the subject of such action to establish the elimination of the discharge to the maximum extent practicable through compliance with the best management practices available.

"Potable Water Distribution Systems" means sources of flows from drinking water storage, supply and distribution systems including flows from system failures, pressure releases, system maintenance, well development, pump testing fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults, and wells.

"Priority Pollutants" are those constituents referred to in 40 CFR 401.15 and listed in the USEPA NPDES Application Form 2C, pp. V-3 through V-9.

"Project" means all development, redevelopment, and land disturbing activities. The term is not limited to "Project" as defined under CEQAalifornia Environmental Quality Act (Pub. Resources Code §Section 21065).

"Rain Event" means any rain event greater than 0.1 inch in 24 hours except where specifically stated otherwise.

"Rare, Threatened, or Endangered Species (RARE)" means a beneficial use for waterbodies in the Los Angeles Region, as designated in the Basin Plan (Table 2-1), that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered.

"Receiving Waters" means all surface water bodies in the Los Angeles Region ~~within the permit area~~ that are identified in the Basin Plan.

"Redevelopment" means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; ~~structural development including an increase in gross floor area and/or exterior construction or remodeling~~; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to ~~with~~ structural or impervious surfaces. ~~Where redevelopment results in an increase of more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, the entire project must be mitigated. Where redevelopment results in an increase in less than fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, only the addition must be mitigated, and not the entire development.~~

"Regional Administrator" means the Regional Administrator of the Regional Office of the USEPA ~~Environmental Protection Agency~~ or the authorized representative of the Regional Administrator.

"Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC Code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils.

"Runoff" means any runoff including storm water and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of ~~many~~ base flow ~~components~~ either contaminated with pollutants or uncontaminated, and nuisance flows.

"Sidew~~-~~Walk Rinsing" means pressure washing of paved pedestrian walkways with average water usage of 0.006 gallons per square foot, with no cleaning agents, and properly disposing of all debris collected, as authorized under Regional Board Resolution No. 98-08.

"Significant Ecological Area (SEA)" means an area that is determined to possess an example of biotic resources that cumulatively represent biological diversity, for the purposes of protecting biotic diversity, as part of the Los Angeles County General Plan.[2]
Areas are designated as SEAs, if they possess one or more of the following criteria:

[2] The 61 existing SEAs represent the findings of a study that was completed in 1976 by England and Nelson, Environmental Consultants, as amended through the adoption of a revised Los Angeles County General Plan in 1980. The results of an update study to evaluate existing SEAs within unincorporated Los Angeles County is currently being proposed to the Los Angeles County Planning Commission (*Los Angeles County Significant Ecological Area Update Study 2000, Background Report*, PCR Services Corporation). The *Update Study 2000*, which contains existing and proposed SEA boundaries, can be downloaded from the Los Angeles County Department of Planning website at http://planning.co.la.ca.us/drp_revw.html#SEA

1. The habitat of rare, endangered, and threatened plant and animal species.
2. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind, or are restricted in distribution on a regional basis.
3. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind or are restricted in distribution in Los Angeles County.
4. Habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, migrating grounds and is limited in availability either regionally or within Los Angeles County.
5. Biotic resources that are of scientific interest because they are either an extreme in physical/geographical limitations, or represent an unusual variation in a population or community.
6. Areas important as game species habitat or as fisheries.
7. Areas that would provide for the preservation of relatively undisturbed examples of natural biotic communities in Los Angeles County.
8. Special areas.[3]

"Significant Natural Area (SNA)" means an area defined by the California Department of Fish and Game (DFG), Significant Natural Areas Program, as an area that contains an important example of California's biological diversity. The most current SNA maps, reports, and descriptions can be downloaded from the DFG website at ftp://maphost.dfg.ca.gov/outgoing/whdab/sna/. These areas are identified using the following biological criteria only, irrespective of any administrative or jurisdictional considerations:

1. Areas supporting extremely rare species or habitats.
2. Areas supporting associations or concentrations of rare species or habitats.
3. Areas exhibiting the best examples of rare species and habitats in the state.

"Site" means the land or water area where any "facility or activity" is physically located or conducted, including adjacent land used in connection with the facility or activity.

"Source Control BMP" means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

"SQMP" ~~shall mean~~means the Los Angeles Countywide Stormwater Quality Management Program.

"State Storm Water Pollution Prevention Plan (State SWPPP)" ~~shall mean~~means a plan, as required by a State General Permit, identifying potential pollutant sources and describing the design, placement and implementation of BMPs, to effectively prevent non-stormwater Discharges and reduce Pollutants in Stormwater Discharges during activities covered by the General Permit.

"Storm Water" ~~shall mean~~means storm water runoff, snow melt runoff, and surface runoff and drainage.

[3] These criteria from the 1976 study have been modified in the *Update Study 2000.*

"Storm Water Discharge Associated with Industrial Activity" means industrial discharge as defined in 40 CFR 122.26(b)(14)

"Stormwater Quality Management Program" ~~shall mean~~means the Los Angeles Countywide Stormwater Quality Management Program, which includes descriptions of programs, collectively developed by the Permittees in accordance with provisions of the NPDES Permit, to comply with applicable federal and state law, as the same is amended from time to time.

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both treatment control BMPs and source control BMPs.

"SUSMP" means the Los Angeles Countywide Standard Urban Stormwater Mitigation Plan. The SUSMP shall address conditions and requirements of new development.

"Total Maximum Daily Load (TMDL)" means the sum of the individual waste load allocations for point sources and load allocations for nonpoint sources and natural background.

"Toxicity Identification Evaluation" means a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

"Toxicity Reduction Evaluation" meanis a study conducted in a step-wise process to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity.

"Treatment" means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media absorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment Control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

"USEPA Phase I Facilities" ~~are~~means facilities in specified industrial categories that are required to obtain an NPDES permit for storm water discharges, as required by 40 CFR 122.26(c). These categories include:

i. facilities subject to storm water effluent limitation guidelines, new source performance standards, or toxic pollutant effluent standards (40 CFR N)
ii. manufacturing facilities
iii. oil and gas/mining facilities
iv. hazardous waste treatment, storage, or disposal facilities
v. landfills, land application sites, and open dumps
vi. recycling facilities
vii. steam electric power generating facilities
viii. transportation facilities
ix. sewage of wastewater treatment works
x. light manufacturing facilities

"Vehicle Maintenance/Material Storage Facilities/Corporation Yards" means any Permittee owned or operated facility or portion thereof that:

i. Conducts industrial activity, operates equipment, handlesmaterials, and provides services similar to Federal Phase I facilities;
ii. Performs fleet vehicle on ten or more vehicles per day including repair, maintenance, washing, and fueling;
iii. Performs maintenance and/or repair of heavy industrial machinery/equipment ; and
iv. Stores chemicals, raw materials, or waste materials in quantities that require a hazardous materials business plan or a Spill Prevention, Control , and Counter-measures (SPCC) plan.

"Water Column Toxicity" means a 70 percent survival rate for a single test or an average of 90 percent survival for three consecutive tests.

"Water Quality Standards and Water Quality Objectives" means water quality criteria ~~applicable to the Permittee include those~~ contained in the ~~Los Angeles Regional Water Quality Control Plan (~~Basin Plan~~)~~, the California Ocean Plan, the National Toxics Rule, the California Toxics Rule, and other state or federally approved surface water quality plans. Such plans are used by the Regional Board to regulate all discharges, including storm water discharges.

"Waters of the State" means any surface water or groundwater, including saline waters, within boundaries of the state.

"Waters of the United States" or "Waters of the U.S." means:

a. All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
b. All interstate waters, including interstate "wetlands";
c. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:
    1. Which are or could be used by interstate or foreign travelers for recreational or other purposes;
    2. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
    3. Which are used or could be used for industrial purposes by industries in interstate commerce;
d. All impoundments of waters otherwise defined as waters of the United States under this definition;
e. Tributaries of waters identified in paragraphs (a) through (d) of this definition;
f. The territorial sea; and
g. "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraph (a) through (f) of this definition.

Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.22(m), which

also meet the criteria of this definition) are not waters of the United States. This exclusion applies only to man-made bodies of water, which neither were originally created in waters of the United States (such as disposal area in wetlands) nor resulted from the impoundment of waters of the United States. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the CWA~~lean Water Act~~, the final authority regarding CWA~~lean Water Act~~ jurisdiction remains with US EPA.

"Wet Season" means the calendar period beginning October 1 through April 15.

~~**"Whole Effluent Toxicity"** means the aggregate toxic effect of an effluent measured directly by a toxicity test.~~

Part 6. STANDARD PROVISIONS

A. Standard Requirements

1. ~~The~~ Each Permittees shall comply with all provisions and requirements of this permit.

2. Should ~~the~~ a Permittees discover a failure to submit any relevant facts or that it submitted incorrect information in a report, it shall promptly submit the missing or correct information.

3. ~~The~~Each Permittees shall report all instances of non-compliance not otherwise reported at the time monitoring reports are submitted.

4. This Order includes the attached Monitoring and Reporting Program, and SUSMP~~tandard Urban Storm Water Mitigation Plan~~(Regional Board Resolution No. R00-02), which are a part of the permit and must be complied with in the same manner as with the rest of the requirements in the permit.

B. Regional Board Review

~~1.~~Any formal determination or approval made by the Regional Board Executive Officer pursuant to the provisions of this Order may be reviewed by the Regional Board. Such review may be requested upon petition by a Permittee(s) or a member of the public within 30 days of the effective date of the notification of such decision to the Permittee(s) and interested parties on file at the Regional Board.

C. Public Review

1. All documents submitted to the Regional Board in compliance with the terms and conditions of this Order shall be made available to members of the public pursuant to the Freedom of Information Act (5 U.S.C. §~~Section~~ 552 (as amended) and the Public Records Act (Cali~~fornia~~ Government Code Section 6250 *et seq.*).

2. All documents submitted to the Regional Board Executive Officer for approval shall be made available to the public for a 30-day period to allow for public comment.

D. Duty to Comply

1. ~~The Principal~~ Each Permittee must comply with all of the terms, requirements, and conditions of this Order. Any violation of this order constitutes a violation of the Clean Water Act, its regulations and the California Water Code, and is grounds for enforcement action, Order termination, Order revocation and reissuance, denial of an application for reissuance; or a combination thereof [40 CFR 122.41(a), CWC Section 13261, 13263, 13265, 13268, 13300, 13301, 13304, 13340, 13350].

2. A copy of these waste discharge specifications shall be maintained by each Permittee so as to be available during normal business hours to Permittee employees and members of the public.

3. Any discharge of wastes at any point(s) other than specifically described in this Order is prohibited, and constitutes a violation of the Order.

E. Duty to Mitigate [40 CFR 122.41 (d)]

~~The~~ Each Permittees shall take all reasonable steps to minimize or prevent any discharge that has a reasonable likelihood of adversely affecting human health or the environment.

F. Inspection and Entry [40 CFR 122.41(i), CWC Section 13267]

The Regional Board, USEPA, and other authorized representatives shall be allowed:

1. Entry upon premises where a regulated facility is located or conducted, or where records are kept under conditions of this Order;

2. Access to copy any records, at reasonable times, that are kept under the conditions of this Order;

3. To inspect at reasonable times any facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; and,

4. To photograph, sample, and monitor at reasonable times for the purpose of assuring compliance with this Order, or as otherwise authorized by the Clean Water Act and the California Water Code.

G. Proper Operation and Maintenance [40 CFR 122.41 (e), CWC Section 13263(f)]

The Permittees shall at all times properly operate and maintain all facilities and systems of treatment ~~and~~ (and related appurtenances) that are installed or used by the Permittees to achieve compliance with this Order. Proper operation and maintenance includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar system that are installed by a Permittee only when necessary to achieve compliance with the conditions of this Order.

H. Signatory Requirements [40 CFR 122.41(k) & 122.22]

Except as otherwise provided in this Order, all applications, reports, or information submitted to the Regional Board shall be signed by the Director of Public Works, City Engineer, or authorized designee ~~under penalty of perjury~~ and certified as set forth in 40 CFR 122.22.

I. Reopener and Modification [40 CFR 122.41(f) & 122.62]

1. This Order may only be modified, revoked, or reissued, prior to the expiration date, by the Regional Board, in accordance with the procedural requirements of the Water Code and Title 23 of the California Code of Regulations for the issuance of waste discharge requirements, 40 CFR 122.62, and upon prior notice and hearing, to:

   a) Address changed conditions identified in the required reports or other sources deemed significant by the Regional Board;

   b) Incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;

   c) Comply with any applicable requirements, guidelines, and/or regulations issued or approved pursuant to CWA Section 402(p); and/or,

   d) Consider any other federal, or state laws or regulations that became effective after adoption of this Order.

2. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:

   a) Violation of any term or condition contained in this Order;

   b) Obtaining this Order by misrepresentation, or failure to disclose all relevant facts; or,

   c) A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.

3. This Order may be modified, revoked and reissued, or terminated for cause.

4. The filing of a request by the Principal Permittee or Permittees for a modification, revocation and re-issuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any condition of this Order.

5. This Order may be modified to make corrections or allowances for changes in the permitted activity listed in this section, following the procedures at 40 CFR Part 122.63, if processed as a minor modification. Minor modifications may only:

   a) Correct typographical errors, or

   b) Require more frequent monitoring or reporting by the Permittee.

J. Severability

The provisions of this permit are severable; and if any provision of this permit or the application of any provision of this permit to any circumstance is held invalid,

the application of such provision to other circumstances and the remainder of this permit shall not be affected.

K. Duty to Provide Information [40 CFR 122.41(h)]

The Permittees shall furnish, within a reasonable time, any information the Regional Board or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order. The Permittees shall also furnish to the Regional Board, upon request, copies of records required to be kept by this Order.

L. Twenty-four Hour Reporting [40 CFR 122.41(l)(6)][1]

1. The Permittees shall report to the Regional Board any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time any Permittee becomes aware of the circumstances. A written submission shall also be provided within five days of the time the Permittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times and, if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

2. The Regional Board may waive the required written report on a case-by-case basis.

M. Bypass [40 CFR 122.41(m)][2]

Bypass (the intentional diversion of waste streams from any portion of a treatment facility) is prohibited. The Regional Board may take enforcement action against Permittees for bypass unless:

1. Bypass was unavoidable to prevent loss of life, personal injury or severe property damage. (Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.);

2. There were no feasible alternatives to bypass, such as the use of auxiliary treatment facilities, retention of untreated waste, or maintenance during normal periods of equipment down time. This condition is not satisfied if adequate back-up equipment should have been installed in the

[1] This provision applies to incidents where effluent limitations (numerical or narrative) as provided in this Order or in the Los Angeles County SQMP are exceeded, and which endanger public health or the environment.

[2] This provision applies to the operation and maintenance of storm water controls and BMPs as provided in this Order or in the SQMP.

R0006913

exercise of reasonable engineering judgment to prevent a bypass that could occur during normal periods of equipment downtime or preventive maintenance;

3. The Permittee submitted a notice at least ten days in advance of the need for a bypass to the Regional Board; or,

4. Permittees may allow a bypass to occur that does not cause effluent limitations to be exceeded, but only if it is for essential maintenance to assure efficient operation. In such a case, the above bypass conditions are not applicable. The Permittee shall submit notice of an unanticipated bypass as required.

N. Upset [40 CFR 122.41(n)][3]

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.

1. A Permittee that wishes to establish the affirmative defense of an upset in an action brought for non compliance shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:

   a) An upset occurred and that the Permittee can identify the cause(s) of the upset;

   b) The permitted facility was being properly operated by the time of the upset;

   c) The Permittee submitted notice of the upset as required; and,

   d) The Permittee complied with any remedial measures required.

2. No determination made before an action for noncompliance, such as during administrative review of claims that non-compliance was caused by an upset, is final administrative action subject to judicial review.

3. In any enforcement proceeding, the Permittee seeking to establish the occurrence of an upset has the burden of proof.

O. Property Rights [40 CFR 122.41(g)]

This Order does not convey any property rights of any sort, or any exclusive privilege.

[3] *Supra*. See footnote number 2.

P. Enforcement

1. Violation of any of the provisions of the NPDES permit or any of the provisions of this Order may subject the violator to any of the penalties described herein, or any combination thereof, at the discretion of the prosecuting authority; except that only one kind of penalties may be applied for each kind of violation. The Clean Water Act provides the following:

   a) Criminal Penalties for:

      (1) Negligent Violations:

      The CWA provides that any person who negligently violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $2,500 nor more than $25,000 per day ~~of~~for each violation, or by imprisonment for not more than 1 year, or both.

      (2) Knowing Violations:

      The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

      (3) Knowing Endangerment:

      The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than $250,000, or by imprisonment for not more than 15 years, or both.

      (4) False Statement:

      The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than two years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than four years, or by both. (See section 309(c)(4) of the Clean Water Act.)

   b) Civil Penalties

The CWA provides that any person who violates a permit condition implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed $27,500 per day for each violation.

2. The CWCalifornia Water Code provides that any person who violates a waste discharge requirement provision of the CWCalifornia Water Code is subject to civil penalties of up to $5,000 per day, $10,000 per day, or $25,000 per day of violation; or when the violation involves the discharge of pollutants, is subject to civil penalties of up to $10 per gallon per day or $25 per gallon per day of violation; or some combination thereof, depending on the violation or combination violations.

Q. Need to Halt or Reduce Activity not a Defense [40 CFR 122.41(c)]

It shall not be a defense for a Permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order.

~~**R.Modifications to this Order**~~

~~This Order may be modified, revoked, or reissued, prior to the expiration date as follows:~~

~~1.To address changed conditions identified in the required technical reports or other sources deemed significant by the Regional Board;~~

~~2.To incorporate applicable requirements or statewide water quality control plans adopted by the State Board, or amendments to the Basin Plan;~~

~~3.To comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain any other requirements of the CWA then applicable; or,~~

~~4.Any amendments under the Clean Water Act.~~

~~S.~~R. **Rescission**

Regional Board Order No. 96-054 is hereby rescinded.

~~T.~~S. **Expiration**

This Order expires on ~~[October 25, 2006]~~ November 29, 2006. The Principal Permittee must submit a Report of Waste Discharges and a proposed Storm Water Quality Management Plan~~r~~ogram in accordance with Title 23, California Code of Regulation, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

I, Dennis A. Dickerson, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on ~~October 25,~~November 29, 2001.

Definitions

"Automotive Service Facilities" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 5511, 7532-7534, or 7536-7539. For inspection purposes, Permittees need not inspect facilities with industrial activities falling under SIC codes 5013, 5014, 5541, 5511, provided that these facilities have not outside activities or materials that may be exposed to storm water.

"Inspection" means entry and the conduct of an on-site review of a facility and its operations, at reasonable times, to determine compliance with specific municipal or other legal requirements. The steps involved in performing an inspection include, but are not limited to:

1. Pre-inspection documentation research;
2. Request for entry;
3. Interview of facility personnel;
4. Facility walk-through;
5. Visual observation of the condition of facility premises;
6. Examination and copying of records as required;
7. Sample collection (if necessary or required);
8. Exit conference (to discuss preliminary evaluation); and
9. Report preparation, and if appropriate, recommendations for coming into compliance.

In the case of restaurants, a Permittee may conduct an inspection from the curbside, provided that such a "curbside" inspection provides the Permittee with adequate information to determine an operator's compliance with BMPs that must be implemented per requirements of this Order, Regional Board Resolution 98-08, County and municipal ordinances, and the SQMP.

MONITORING AND REPORTING PROGRAM - CI 6948

FOR

MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES, AND THE INCORPORATED CITIES, EXCEPT THE CITY OF LONG BEACH

(NPDES PERMIT NO. CAS004001)

I. Program Reporting Requirements

The Principal Permittee shall submit, no later than October 15 of each year beginning in the year 2002, a unified Annual Storm Water Report (unified Annual Report) documenting the progress of Permittee implementation of the SQMP and the requirements of this Order. The unified Annual Report shall contain a section covering common activities conducted collectively by the Permittees, and an integrated summary of the Monitoring Program results. Each Permittee shall submit an individual Annual Report to the Principal Permittee, by the date determined by the Principal Permittee, to be included in the unified Annual Report. The unified Annual Reports shall cover each fiscal year from July 1 through June 30. The first unified Annual Report, to be submitted on October 15, 2002, shall include the period from July 1, 2001 through June 30, 2002. Specific requirements that must be addressed in the Annual Reports are listed below.

A. Unified Annual Report

The Principal Permittee shall include the following in the unified Annual Report:

1. A compilation of Permittee Individual Annual Reports.

2. Proposed changes to the SQMP, as recommended by the WMCs.

3. An assessment of the effectiveness of SQMP requirements to reduce storm water pollution. This assessment will be based upon the specific record-keeping information requirement in each major section of the permit, monitoring data, summaries of program effectiveness from each Permittee, and any other information related to program effectiveness. The program assessment shall include summaries of the following:

   a) Summary of common activities conducted by all Permittees;

   b) County-wide BMP implementation;

   c) Identification of management measures proven to be effective and/or ineffective at reducing urban runoff pollutants and flow;

   d) Permittee level of effort;

   e) Integrated summary of Monitoring Program results, including the identification of water quality improvements or degradation, and

recommendations for improvements to the SQMP (including proposed BMPs) based on the results from the monitoring program. When exceedances of applicable water quality standards have been identified, a discussion of how Permittees will comply with the requirements in Part 2 of this Order (Receiving Water Limitations) shall be included.

4. A Receiving Water Limitations (RWL) Compliance Report shall be attached to the unified Annual Report every alternate year, beginning in 2003. The RWL Compliance Report shall include the following:

   a) A plan to comply with the RWL (Order 01-XXX, Part 2);

   b) Changes to the SQMP to eliminate water quality exceedances;

   c) Enhanced monitoring to demonstrate compliance; and

   d) Results of implementation.

   If all water quality exceedances have been abated, a RWL Compliance Report is not required.

B. Individual Annual Reports

Each individual Annual Report shall document and describe all activities conducted by a Permittee to meet all requirements of this Order, during the past annual reporting period. Individual Annual Reports shall use the attached form (Attachment U-5), or create another reporting format that includes all items on the attached form. Each Permittee shall complete the form in its entirety, except for those requirements applicable only to the Principal Permittee, as indicated on the form. Status of compliance with permit requirements including implementation dates for all time-specific deadlines should be included for each program area. If permit deadlines are not met, Permittees shall report the reasons why the requirement was not met and how the requirements will be met in the future, including projected implementation dates. A comparison of program implementation results to performance standards established in this Order and in the SQMP shall be included for each program area.

C. Monitoring Program Management

The Principal Permittee shall submit a Storm Water Monitoring Report (Monitoring Report) on August 15, 2002, and annually on August 15, thereafter. The Monitoring Report to be submitted on August 15, 2002 shall include the results of monitoring from July 1, 2001 through June 30, 2002. Each Monitoring Report shall include:

1. Status of implementation of the monitoring program.

2. Data, results, methods of evaluating the data, graphical summaries of the data, and an explanation/discussion of the data for each component of the monitoring program, including any specific reporting requirements included in Section II. Monitoring Program. All data shall be compared to applicable water quality standards in the Ocean Plan, the Basin Plan, the California Toxics Rule (CTR), and California Title 22 (Title 22).

3. An analysis of the findings of each monitoring program component. The analysis shall identify and prioritize water quality problems. Based on the identification and prioritization of water quality problems, the analysis shall identify potential sources of the problems, and recommend future monitoring and BMP implementation measures for identifying and addressing the sources. The analysis shall also include an evaluation of the effectiveness of existing control measures.

4. Identification and analysis of any long-term trends in storm water or receiving water quality.

5. An estimation of total pollutant loads due to storm water/urban runoff for each mass emission station.

6. An assessment of compliance with applicable water quality standards for each component of the monitoring program. The lowest applicable standard from the Basin Plan, the Ocean Plan, the CTR, or Title 22 shall be used as a comparison. When data indicate that discharges are causing or contributing to exceedances of applicable water quality standards, a discussion of how Permittees plan to comply with the requirements of Part 2 of this Order (RWL) shall be included.

7. Recommendations for improvements to the SQMP and to the monitoring program to address water quality exceedances and potential pollutant sources.

8. For each monitoring component, maps of all monitoring station locations and descriptions of each location.

9. All monitoring reports shall be submitted in both electronic and paper formats.

D. The Principal Permittee shall, not later than December 15, 2005, prepare and submit an Integrated Receiving Water Impacts Report. The report shall include, but not be limited to, a comprehensive analysis of the results of the data from each component of the monitoring program, and other pertinent studies available, and feasible environmental indicators. It should also include a budget summary for each monitoring requirement and recommendations on future monitoring requirements. This report will be an integral part of the ROWD.

E. All applications, reports, or information submitted to the Regional Board shall be signed and certified pursuant to US EPA regulations at 40 CFR 122.41 (k). Each report shall contain the following completed declaration:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true,

R0006926

accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility, of a fine and imprisonment for knowing violations.

Executed on the ___ day of _____ , 20_,

at _____.

(Signature)_____(Title)_____";

Permittee submittals to the Principal Permittee shall also be signed and certified pursuant to EPA regulations 40 CFR 122.41 (k).

The Principal Permittee shall mail the original of each annual report to:

INFORMATION TECHNOLOGY
CALIFORNIA REGIONAL WATER QUALITY
CONTROL BOARD - LOS ANGELES REGION
320 W. 4TH STREET, SUITE 200
LOS ANGELES, CA 90013

A copy of the annual report shall also be mailed to:

REGIONAL ADMINISTRATOR
ENVIRONMENTAL PROTECTION AGENCY
REGION 9
75 Hawthorne Street
San Francisco, CA 94105

II. Monitoring Program

The primary objectives of the Monitoring Program include, but are not limited to: 1) assessing compliance with this Order; 2) measuring and improving the effectiveness of the SQMPs; 3) assessing the chemical, physical, and biological impacts of receiving waters resulting from urban runoff; 4) characterization of storm water discharges; 5) identifying sources of pollutants; and 6) assessing the overall health and evaluating long-term trends in receiving water quality. Ultimately, the results of the monitoring requirements outlined below should be used to refine the SQMP for the reduction of pollutant loadings and the protection and enhancement of the beneficial uses of the receiving waters in Los Angeles County.

The Principal Permittee and Permittees shall implement the Monitoring Program as follows:

CORE MONITORING

A. Mass Emissions

The Principal Permittee shall monitor mass emissions to accomplish the following objectives: 1) estimate the mass emissions from the MS4; 2) assess trends in the mass emissions over time; and 3) determine if the MS4 is contributing to exceedances of water quality objectives by comparing results to objectives in the

R0006927

Basin Plan, the Ocean Plan, the CTR, Title 22, and with emissions from other dischargers.

1. The Principal Permittee shall monitor mass emissions from the following seven mass emission stations: Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, Coyote Creek, Dominguez Channel, and the Santa Clara River[1]. The Principal Permittee shall monitor the first storm event and a minimum of 2 additional storm events for each season. A minimum of two dry weather samples per year at each mass emission station shall also be analyzed. Sampling at all stations shall begin no later than (the effective date of this Order), except for sampling in the Santa Clara River, which will begin no later than (the following wet season).

2. All storms events, in addition to those required above, that result in at least 0.25 inches of rainfall shall be sampled and analyzed for TSS. Results shall be used to assess the variability of storm water constituents and provide a more accurate estimate of mass emissions (pollutant correlation with TSS). This requirement does not apply to manual sampling stations.

3. Samples for mass emission monitoring may be taken with the same type of automatic sampler used under Order 96-054. Grab samples shall be taken for pathogen indicators and oil and grease. The samplers shall be set to monitor storms that produce 0.25 inches or greater of rainfall. Samples taken at mass emission stations during the first storm event of the wet season shall be analyzed for all constituents listed in Attachment U-1.

4. Manual samples shall be collected from mass emission stations where it is not feasible to install an automatic sampler (Santa Clara River). Manual samples shall be flow-weighted composites, collected during the first 3 hours, or for the duration of the storm if it is less than 3 hours. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge[2], unless the Regional Board Executive Officer approves an alternate protocol.

5. Samples from mass emission stations shall be analyzed for all constituents listed in Attachment U-1. If a constituent is not detected at the method detection limit for its respective test method listed in Attachment U-1 in more than 75 percent of the first 48 sampling events, it need not be further analyzed unless the observed occurrences show concentrations greater than state water quality standards. The Principal Permittee will also conduct annual confirmation sampling for non-detected constituents during the first storm of the wet season every year at each station.

6. The Principal Permittee shall perform an annual analysis, to be included in the Monitoring Report, of the correlation between pollutants of concern

[1] Regional Board staff will work with the Principal Permittee to determine an appropriate location for the Santa Clara River station.

[2] Required in 40 CFR 122.21(g)(7)(ii), and described in NPDES Storm Water Sampling Guidance Document EPA 833-B-92-001. Time-weighted samples may be appropriate if flow is measured during sampling.

(including but not limited to metals and PAHs) and TSS loadings for the sampling events that are analyzed for the full suite of constituents.

B. Water Column Toxicity Monitoring

The Principal Permittee shall analyze mass emission samples for toxicity to evaluate the extent and causes of toxicity in receiving waters and to modify and utilize the SQMP to implement practices that eliminate or reduce sources of toxicity in storm water.

1. The Principal Permittee shall analyze samples from two storm events (including the first storm of each year) and two dry weather events from each mass emission station for toxicity every year. A minimum of one freshwater and one marine species shall be used for toxicity testing. Specifically, *Ceriodaphnia dubia* (water flea) survival and *Strongylocentrotus purpuratus* (sea urchin) fertilization shall be used.

2. Toxicity Identification Evaluations (TIE)

   The Principal Permittee shall begin a Phase I TIE immediately on all samples that are substantially toxic to either test species. If a sample is substantially toxic to both species, a TIE shall be performed for both species. Substantial toxicity means the amount of toxicity necessary to successfully conduct a Phase I TIE. For example, *Ceriodaphnia* TIEs require at least 50% mortality in undiluted sample at any time during the 7-day duration of the initial chronic bioassay.[3]

3. Toxicity Reduction Evaluations (TRE)

   a) If a discharge from the MS4 is identified to cause or contribute to toxicity in a receiving water body, a TRE shall be performed. TRE development shall be performed by a neutral third party (retained by the Principal Permittee), with input from Permittees and Regional Board staff. The TRE shall include all reasonable steps to identify the source(s) of toxicity and discuss appropriate BMPs to eliminate the causes of toxicity. Once the source of toxicity and appropriate BMPs are identified, the Principal Permittee shall submit the TRE to the Regional Board Executive Officer for approval. At a minimum, it shall include a discussion of the following items:

      (1) The potential sources of pollutant(s) causing toxicity;

      (2) A list of municipalities that may have jurisdiction over sources of pollutant(s) causing toxicity;

      (3) Recommended BMPs to reduce the pollutant(s) causing toxicity;

      (4) Proposed changes to the SQMP to reduce the pollutant(s) causing toxicity; and

[3] SCCRWP

(5) Suggested follow-up monitoring to demonstrate that toxicity has been removed.

b) If TRE implementation for a specific pollutant coincides with TMDL implementation for that pollutant, the efforts may be coordinated.

c) Upon approval by the Regional Board Executive Officer, the Permittee(s) having jurisdiction over sources causing or contributing to toxicity shall implement the recommended BMPs and take all reasonable steps necessary to eliminate toxicity.

d) The Principal Permittee shall be responsible for the development of a maximum of two TREs per year. If applicable, the Principal Permittee may use the same TRE for the same toxic pollutant or pollutant class in different watersheds. The TRE process shall be coordinated with TMDL development and implementation (ie. If a TMDL for zinc is being implemented when a TRE for zinc is required, the efforts shall be coordinated to avoid overlap).

e) The Principal Permittee shall report on the development, implementation, and results for each TRE in the annual Monitoring Reports, beginning the year following the identification of each pollutant or pollutant class causing toxicity.

C. Tributary Monitoring

The Principal Permittee shall monitor tributaries to identify sub-watersheds where storm water discharges are causing or contributing to exceedances of water quality standards, and to prioritize drainage and sub-drainage areas that need management actions.

1. The Principal Permittee shall develop and implement a watershed-based tributary monitoring program, in which a minimum of six tributaries per WMA will be monitored, based on the schedule described below:

a) Monitoring station locations will be rotated so that a minimum total of six tributaries will be monitored per year. Each tributary shall be monitored for a minimum period of one year. If no exceedances of applicable water quality standards occur during one year of monitoring at a single tributary station, the Principal Permittee may move that monitoring station to another tributary, subject to the approval of the Regional Board Executive Officer. When an applicable water quality standard is exceeded in three out of four sampling events in a given monitoring year, the Permittees shall initiate a focused effort to identify sources of pollutants within that subwatershed.

b) Tributary monitoring shall begin in the Los Angeles River WMA, and shall be rotated to locations in other watersheds as monitoring at each station is complete, as approved by the Regional Board Executive Officer. The Principal Permittee shall include a description and explanation of each proposed station location and

a summary of the prior year's results of the tributary monitoring program in the annual Monitoring Report.

c) Monitoring shall begin at the following tributaries:

(1) Aliso Creek
(2) Bull Creek
(3) Compton Creek
(4) Rio Hondo Channel
(5) Burbank West
(6) Verdigo Wash

2. Tributary monitoring shall begin (no later than the effective date of this Order).

3. The Principal Permittee shall monitor the first storm event and at least 3 additional storm events during each storm season. At least one dry weather event per year will also be sampled at each station.

4. Samples shall be flow-weighted composites, collected during the first 3 hours or for the duration of the storm if it is less than 3 hours. Samples may be collected manually or automatically. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge[4], unless the Regional Board Executive Officer approves an alternate protocol. Samples shall be taken just upstream of the tributary's confluence with the mainstem. Constituents to be analyzed for each location shall include the following:

a) pH, dissolved oxygen, temperature, conductivity, and total suspended solids;

b) Indicator bacteria;

c) All priority pollutants (Attachment U-1) for the first storm of the year;

d) All constituents for which the water body is impaired downstream of the monitoring station[5];

e) All constituents that caused toxicity or exceeded any applicable water quality criteria at the associated mass emission station the previous year. These constituents shall be listed in each Monitoring Report.

f) Flow (flow may be estimated using EPA methods[6] at sites where flow measurement devices are not in place).

[4] Required in 40 CFR 122.21(g)(7)(ii), and described in NPDES Storm Water Sampling Guidance Document EPA 833-B-92-001. Time-weighted samples may be appropriate if flow is measured during sampling.

[5] The 1998 California 303(d) List and TMDL Priority Schedule lists pollutants for which each water body is impaired, www.swrcb.ca.gov/tmdl/docs/303d98.pdf#reg4

[6] NPDES Storm Water Sampling Guidance Document, EPA 833-B-92-001, July 1992

D. Shoreline Monitoring

The City of Los Angeles shall monitor shoreline stations to evaluate the impacts to coastal receiving waters and the loss of recreational beneficial uses resulting from storm water/urban runoff. This component shall be integrated and coordinated with similar monitoring programs in the region.

1. The City of Los Angeles shall monitor eighteen water quality sampling stations along the shoreline of the Pacific Ocean within the Santa Monica Bay to determine compliance with the California's bathing water standards for public beaches and ocean water-contact sport areas[7], and the related impacts of discharges from storm drains and piers. The shoreline monitoring program shall be implemented as follows:

   a) The eighteen established shoreline water quality stations listed in Attachment U-3 shall be monitored. Station locations may be modified based on recommendations from the Santa Monica Bay Restoration Project (SMBRP) and approval from the Regional Board Executive Officer;

   b) Three indicator groups shall be tested for using either membrane filtration, multiple tube fermentation, or chromogenic substrate test kits. Monitoring shall include the following types and frequencies of sampling:

Parameter	Units	Sample Frequency
Total coliforms	CFU or MPN/100 ml	6/week (Mon-Sat)[8]
Fecal coliform[9]	CFU or MPN/100 ml	6/week (Mon-Sat)[5]
Enterococcus	CFU or MPN/100 ml	6/week (Mon-Sat)[5]

   c) Shoreline monitoring shall occur during daylight hours. Samples may be omitted in the event of hazardous weather;

   d) Shoreline monitoring frequencies at certain stations may be modified based on the use of the adjacent beaches and their proximity to storm drains, as recommended by the SMBRP's Technical Advisory Committee and the Los Angeles County Department of Health Services (LA County DHS).

   e) Data collected shall be transmitted daily to the LA County DHS. The City of Los Angeles will annually assess the data and submit it to the Principal Permittee for inclusion in the Monitoring Report;

   f) When exceedances of public health standards for bacteria occur, the LA County DHS shall take the appropriate action, as described in the Regulations for Public Beaches and Ocean Water-Contact Sports Areas[10].

[7] California Department of Health Services, Health and Safety Code §115880 (Assembly Bill 411, Statutes of 1997, Chapter 765

[8] Samples will be collected on Sundays preceding Monday holidays

[9] *Escherichia Coli (E. Coli)* may be substituted for Fecal Coliform if chromogenic substrate test kits are used

[10] Regulations for Public Beaches and Ocean Water-Contact Sports Areas, Title 17 CCR Group 10, developed in response to Health and Safety Code §115880

R0006932

g) The City of Los Angeles will continue to conduct all monitoring, testing, and data transferring actions as part of the SMBRP regional program for the Santa Monica Bay.

E. Trash Monitoring

Permittees shall conduct trash monitoring to assess likely sources and to identify areas impaired for trash. The Principal Permittee and the Permittees in the Los Angeles River and Ballona Creek WMAs (listed in Attachment A) shall develop and implement a trash monitoring program for the Los Angeles River and Ballona Creek watersheds no later than October 15, 2002. The monitoring program and schedule shall be consistent with and pursuant to the CWC §13267 Request for Trash Monitoring, issued by the Regional Board on [date letter issued]. All other Permittees shall begin implementation of the trash monitoring program in watersheds that are not presently listed on the CWA §303(d) list for impairment for trash no later than October 15, 2003.

1. Either of the following formats for monitoring plans may be used:

a) For each watershed, the group of Permittees in that watershed will capture and quantify trash from an area no less than 10% of the total land area over which they have jurisdiction. The monitoring areas shall represent 10% of every land use the group of Permittees has jurisdiction over. If storm drain configuration versus land use make the representation of 10% of a land use infeasible, the Permittees can choose areas that represent their land uses as accurately as possible, as long as the extent of the surface being monitored represents 10%. This monitoring shall use full capture devices. During wet weather, all sampling devices will be emptied within 72 hours of every rain event of 0.25 inch or greater. During dry weather, sampling devices will be emptied and analyzed every three months in the absence of precipitation.

b) For each watershed, the group of Permittees in that watershed will sample a minimum of ten representative sites for each land use monitored. For each sampling site, a minimum of five catch basins will be fitted with inserts, for a total of not less than 50 catch basin inserts per land use monitored. The existing litter removal practices that the cities implement will remain in place, so that monitoring will evaluate how much trash is washed into the system under current practices. A structural, full capture device shall be installed downstream of at least one sampling site for each land use monitored. For this sampling site, all of the catch basins that are upstream of the full capture-monitoring device must be fitted with inserts. This configuration will provide information on the relative effectiveness of the catch basin inserts as opposed to the full capture systems in varying land uses and under varying weather conditions. During wet weather, all sampling devices will be emptied within 72 hours of every rain event of 0.25 inch or greater. During dry weather, sampling devices will be emptied and analyzed every three months in the absence of precipitation.

2. Permittees shall report data in a single unit of measure that is reproducible and measures the amount of trash, irrespective of water

content (e.g. compacted volume based on a standardized compaction rate, or dry weight). Permittees may select the unit, but all Permittees must use the same unit of measure.

3. Following the first two years of data collection, Permittees shall calculate trash loading as a running three-year average (estimated total load discharged from 2003-2006, divided by three).

4. All trash collected shall be disposed of in compliance with all applicable regulations.

REGIONAL MONITORING

The Principal Permittee shall participate on regional monitoring committees to help establish on-going regional programs that address public health concerns, monitor trends in natural resources and nearshore habitats, and assess regional impacts from all pollutant sources. Regional Monitoring participation shall include, but not necessarily be limited to, the efforts described below.

F. Estuary Sampling

The Southern California Coastal Waters Research Project (SCCWRP), in conjunction with the USEPA, the State Board, three Regional Boards, and participating dischargers, has organized an effort to implement a regional monitoring program for the southern California bight. Previous studies (in 1994 and 1998) included microbiology, water quality, sediment chemistry, sediment toxicity testing, benthic infauna, demersal fish, and bioaccumulation. A similar bight-wide monitoring effort is planned to be conducted in 2003. The Principal Permittee shall participate on the Steering Committee for this bight-wide monitoring project, and should complete the estuary sampling requirement described below in parallel with this effort.

In addition to participation in the Bight-wide study, the goal of this requirement is to sample estuaries for sediment chemistry, sediment toxicity, and benthic macroinvertibrate community to determine the spatial extent of sediment fate from storm water, and the magnitude of its effects. A map of each estuary which depicts the impacted areas shall be produced. The maps shall provide the information necessary to conduct effective sediment monitoring to determine trends and accumulation, as a future permit requirement.

1. The Principal Permittee shall sample a maximum of 25 sites in each estuary/mouth (Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, and Dominguez Channel) once during the permit cycle. Sediment samples shall be taken at each station by means of a $0.1m^2$ ($1.1 ft^2$) modified Van Veen sediment grab sampler.

2. The Principal Permittee shall also sample a total of 25 sites outside of the direct outfalls to assess cumulative effects.

3. All samples shall be analyzed for the following:
   a) Sediment Chemistry (priority pollutants)
   b) Totai Organic Carbon (TOC)
   c) Grain size

d) Sediment Toxicity

(1) Amphipod survival bioassays shall be conducted on each sediment sample. Toxicity shall be indicated by an amphipod survival rate of 70% or less in a single test.

(2) Phase I TIEs of interstitial water, using Ceriodaphnia dubia and Strongylocentrotus purpuratus (sea urchin) fertilization, shall be conducted for samples from stations identified to be toxic in a single amphipod survival bioassay.

e) Benthic Macroinvertibrates

(1) All sediment samples shall be passed through a 1.0mm (0.039 in) screen to retrieve the benthic organisms. Benthic epifauna and infauna shall be analyzed to determine the structure of the benthic community.

(2) The Principal Permittee shall identify all organisms to lowest possible taxon.

(3) The Principal Permittee shall determine the Total Biomass of:

(i) Mollusks
(ii) Echinoderms
(iii) Annelids/polychaetes
(iv) Crustaceans
(v) All other macroinvertebrates

(4) The Principal Permittee shall determine the community structure analysis, including wet weight of each taxonomic group (listed above), number of species, number of individuals per species, total numerical abundance, species abundance per grab, species richness, species diversity, species evenness and dominance, similarity analysis, cluster analyses, or other appropriate multivariate statistical techniques approved by the Regional Board Executive Officer, and the Infaunal Index[11].

4. The Principal Permittee shall create a map of each estuary depicting degraded areas and the spatial distribution of sediment from storm water. In the Integrated Monitoring Report, the Principal Permittee shall suggest appropriate locations for regular sediment monitoring, based on the results of this study.

G. Bioassessment

The Principal Permittee shall continue participation on the Stormwater Monitoring Coalition (SMC), as well as coordinate with the Surface Water Ambient

[11] Benthic Response Index for Assessing Infaunal Communities on the Mainland Shelf of Southern California, the SCCWRP

Monitoring Program (SWAMP) being developed the State Board to complete this requirement. The Regional Board anticipates that the SMC will organize an effort to evaluate the biological index approach for southern California and to design a research project for developing an Index of Biological Integrity (IBI) for this region. The SWAMP has begun work on a statewide effort to determine how to identify reference sites with the goal of IBI development.

The purpose of this requirement is to detect biological trends in receiving waters and to collect data for the development of an IBI for southern California. The ultimate goals of bioassessment are to assess the biological integrity of receiving waters, to detect biological responses to pollution, and to identify probable causes of impairment not detected by chemical and physical water quality analysis.

1. The Principal Permittee shall coordinate with the SMC and SWAMP to identify the most appropriate locations for bioassessment stations within Los Angeles County.

2. Station selection shall be complete within one year from the date this Order is adopted, and sampling shall begin no later than October of 2003.

3. The Principal Permittee shall monitor a minimum of 20 bioassessment stations in October of each year, beginning in 2003. A minimum of three replicate samples shall be collected at each station during each sampling event.

4. A professional environmental laboratory shall perform all laboratory, quality assurance, and analytical procedures. The Principal Permittee may collect samples when properly trained in CSBP methods. The Principal Permittee shall develop Standard Operation Procedures (SOPs) for the Bioassessment Monitoring Program that describes all procedures and responsible parties. The SOPs must contain step-by-step field, laboratory and data entry procedures, as well as, related QA/QC procedures. There must also be specific information about the bioassessment program including: assessment program description, its organization and the responsibilities of all its personnel; assessment project description and objectives; qualifications of all personnel; and the type of training each member has received. A copy of the SOPs shall be available to the Regional Boar Executive Officer upon request.

5. Field sampling must conform to the SOP established for the California Stream Bioassessment Procedure (CSBP) when appropriate. For sampling of aquatic environments where the CSBP is not appropriate (i.e., an estuary or unwadable stream), California Department of Fish and Game and the Regional Board Executive Officer shall be consulted in order to determine the most appropriate protocol to be implemented. Field crews shall be trained on aspects of the protocol and appropriate safety issues. All field data and sample Chain of Custody (COC) forms must be examined for completion and gross errors by the field crews, the receiving laboratory, and the Principal Permittee. These forms shall be available to California Department of Fish and Game or the Regional Board Executive Officer upon request. Field inspections should be planned with random visits and should be performed by the Principal

R0006936

Permittee, if properly trained in CSBP methods, or an independent auditor. These visits should report on all aspects of the field procedure with corrective action occurring immediately.

6. Taxonomic identification laboratories process the biological samples that usually consist of subsampling organisms, enumerating and identifying taxonomic groups and entering the information into an electronic format. There should be intra-laboratory QA/QC results for subsampling, taxonomic validation and corrective actions. Biological laboratories should also maintain reference collections, vouchered specimens (the Principal Permittee can request return of their sample voucher collections) and remnant collections. Biological laboratories shall participate in an inter-laboratory (external) taxonomic validation program at a recommended level of 20% for the first two years of the program. If there are no substantial QA/QC problems, the level of external validation may be decreased to 10% in year three upon approval from the Regional Board. External QA/QC should be arranged through the California Department of Fish and Game's Aquatic Bioassessment Laboratory in Rancho Cordova.

7. Sampling, laboratory, quality assurance, and analysis procedures shall follow the standardized "Non-point Source Bioassessment Sampling Procedures" for professional bioassessment as set forth in the California Department of Fish and Game California Stream Bioassessment Procedure (CSBP)[12]. The following results and information shall be included in the annual Monitoring Report:

   a) All physical, chemical and biological data collected in the assessment;

   b) Photographs and GPS locations of all stations;

   c) Documentation of quality assurance and control procedures;

   d) Analysis that shall include calculation of the metrics used in the CSBP;

   e) Comparison of mean biological and habitat assessment metric values between stations and year-to-year trends;

   f) Electronic data formatted to the California Department of Fish and Game Aquatic Bioassessment Laboratory for inclusion in the Statewide Access Bioassessment Database; and

   g) Copies of all QA/AC documents from laboratories.

SPECIAL STUDIES

H. New Development Impacts Study in the Santa Clara Watershed

The Principal Permittee, with support from the City of Santa Clarita, shall monitor tributaries in the Santa Clara watershed to determine impacts from new development and to compare storm water quality between subwatersheds with and without SUSMPs.

1. The Principal Permittee, in cooperation with the City of Santa Clarita, shall select one station that is representative of a subwatershed in which the majority of development has occurred without SUSMP implementation, and one station (SUSMP station) in a subwatershed in which the majority of the development has/will include SUSMP implementation. Other inputs to runoff, such as septic systems, in the two subwatersheds should be similar.

2. The Principal Permittee shall coordinate with the City of Santa Clarita and the Regional Board to develop a proposed study design, including a description of the drainage areas to be monitored and sampling locations, no later than 180 days from the date this Order is adopted. If appropriate, this study may be conducted in conjunction with the Peak Discharge Impact Study, described below.

3. The Principal Permittee shall monitor the first storm event and at least 2 additional storm events during each storm season. At least one dry weather event per year will also be sampled at each station.

4. Samples shall be flow-weighted composites, collected during the first 3 hours, or for the duration of the storm if it is less than 3 hours. Samples may be collected manually or automatically. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge[13], unless the Regional Board Executive Officer approves alternate protocol. Constituents to be analyzed for each location shall include the following:

a) pH, dissolved oxygen, temperature, conductivity, chloride, nitrogen, and TSS

b) Metals: aluminum, arsenic, beryllium, cadmium, chromium, copper, iron, lead, mercury, nickel, selenium, silver, and zinc.

c) Pathogen Indicators (Coliform)

d) PAHs

e) Flow (flow may be estimated using EPA methods at sites where flow measurement devices are not in place)

[13] Required in 40 CFR 122.21(g)(7)(ii), and described in NPDES Storm Water Sampling Guidance Document EPA 833-B-92-001. Time-weighted samples may be appropriate if flow is measured during sampling.

5. The Principal Permittee shall submit an analysis of the data, including a description of each subwatershed, year-to-year changes compared to the amount of development that occurred in each, comparisons between stations, and an analysis of SUSMP effectiveness, with the fourth year Monitoring Report.

I. Peak Discharge Impact Study

The Principal Permittee shall conduct a study to evaluate peak flow control and to determine numeric criteria to prevent or minimize erosion of natural stream channels and banks caused by urbanization.[14] The Principal Permittee may partner with the Ventura County Flood Control District to expand the stream erosion study to the Santa Clara River watershed. The study shall begin no later than (180 days from the effective date this Order).

J. BMP Effectiveness Study

The Principal Permittee shall conduct or participate in studies to evaluate the effectiveness of structural and treatment control BMPs. The objective of this study shall include the following:

1. Monitor the reduction of pollutants of concern in storm water (including, but not limited to: trash, suspended sediment, pathogen indicators, nutrients, heavy metals, and oil and grease) from five or more different types of BMPs that have been properly installed within the year preceding monitoring. Monitoring shall be continued until the effectiveness of the BMP can be determined.

2. Evaluate the requirements, feasibility and cost of maintenance for each BMP.

3. Develop recommendations for appropriate BMPs for the reduction of pollutants of concern in storm water in Los Angeles County.

The Principal Permittee may participate in the SMBRP's, "Performance Evaluation of Structural BMPs for Storm Water Pollution Control in the Santa Monica Bay Watershed" study to meet this requirement. Participation includes collaboration and fund contribution to cover the scope of the proposed study.

K. Standard Monitoring Provisions

All monitoring activities shall meet the following requirements:

1. Monitoring and Records [40 CFR 122.41(j)(1)]

Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

[14] Permit, Part 4.D.2 (Development Planning Program) requires the development of numerical criteria for peak flow control in natural drainage systems.

2. Monitoring and Records [40 CFR 122.41(j)(2)] [California Water Code §13383(a)]

   The Principal Permittee and Permittees shall retain records of all monitoring information, including all calibration and maintenance of monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the Report of Waste Discharge and application for this Order, for a period of at least five (5) years from the date of the sample, measurement, report, or application. This period may be extended by request of the Regional Board or EPA at any time and shall be extended during the course of any unresolved litigation regarding this discharge.

3. Monitoring and Records [40 CFR 122.21(j)(3)]

   Records of monitoring information shall include:

   a) The date, exact place, and time of sampling or measurements;

   b) The individual(s) who performed the sampling or measurements;

   c) The date(s) analyses were performed;

   d) The individual(s) who performed the analyses;

   e) The analytical techniques or methods used; and,

   f) The results of such analyses.

4. Monitoring and Records [40 CFR 122.21(j)(4)]

   All sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this Order.

5. Monitoring and Records [40 CFR 122.21(j)(5)]

   The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this Order shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than two years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by both.

6. All chemical, bacteriological, and toxicity analyses shall be conducted at a laboratory certified for such analyses by an appropriate governmental regulatory agency.

7. For priority toxic pollutants that are identified in the CTR (65 *Fed. Reg.* 31682), the MLs published in Appendix 4 of the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California - 2000* (SIP) shall be used for all analyses, unless otherwise specified. Appendix 4 of the SIP is included as Attachment U-2. For pollutants not contained in Appendix 4 of the SIP, the test method and method detection limit (MDL) listed in Appendix U-1 shall be used for all analyses, and the ML for these parameters shall be lower than or

R0006940

equal to the lowest applicable water quality criteria from the Basin Plan and/or the Ocean Plan.

8. The Monitoring Report shall specify the analytical method used, the MDL and the ML for each pollutant. For the purpose of reporting compliance with numerical limitations, performance goals, and receiving water limitations, analytical data shall be reported with one of the following methods, as appropriate:

   a) An actual numerical value for sample results greater than or equal to the ML;

   b) "Not-detected (ND)" for sample results less than the laboratory's MDL with the MDL indicated for the analytical method used; or

   c) "Detected, but Not Quantified (DNQ)" if results are greater than or equal to the laboratory's MDL but less than the ML. The estimated chemical concentration of the sample shall also be reported. This is the concentration that results from the confirmed detection of the substance by the analytical method below the ML value.

9. For priority toxic pollutants, if the Principal Permittee or Permittee can demonstrate that a particular ML is not attainable, in accordance with procedures set forth in 40 CFR 136, the lowest quantifiable concentration of the lowest calibration standard analyzed by a specific analytical procedure (assuming that all the method specified sample weights, volumes, and processing steps have been followed) may be used instead of the ML listed in Appendix 4 of the SIP. The Principal Permittee must submit documentation from the laboratory to the Regional Board Executive Officer for approval prior to raising the ML for any constituent.

10. Monitoring Reports [40 CFR 122.41(l)(4)(ii)]

    If the Principal Permittee monitors any pollutant more frequently than required by the permit using test procedures approved under 40 CFR part 136, unless otherwise specified in the Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the annual Monitoring Reports.

11. Monitoring Reports [40 CFR 122.41(l)(4)(iii)]

    Calculations for all limitations which require averaging of measurements shall utilize an arithmetic mean unless otherwise specified in this Order.

12. If no flow occurred during the reporting period, the Monitoring Report shall so state.

13. The Regional Board Executive Officer or the Regional Board, consistent with 40 CFR 122.41, may approve changes to the Monitoring Program, after providing the opportunity for public comment, either:

a) By petition of the Principal Permittee or by petition of interested parties after the submittal of the annual Monitoring Report. Such petition shall be filed not later than 60 days after the Monitoring Report submittal date, or

b) As deemed necessary by the Regional Board Executive Officer following notice to the Principal Permittee.
