> No surface water management license shall be issued in the absence of reasonable assurances by the applicant that the surface water management system... is consistent with the state water policy, Chapter 62-40, F.A.C.

Provide a copy of the municipality's adopted "Comprehensive Plan" required in accordance with Chapter 163 of the Florida Statutes, which states that the Comprehensive Plan should set forth goals, objectives and policies for water quality, master planning and flood protection.

Copies of the pertinent portions of the co-permittee municipal comprehensive plans were submitted along with the First Annual Report.

Strength and Weakness :

The regulation ensures that all construction projects obtain the license. The presumption that the water quality regulation standards will result in discharges that will meet state water policy.

The strength of this element is in FDOT's linkage of permit requirements and state regulations. As described in the Part 1 and 2 permit applications, within the state of Florida, stormwater facilities built since about 1985 are required to provide for stormwater runoff treatment. This state regulation (Chapter 62-25, Florida Administrative Code) is required for new facilities as well as significantly modified ones. Therefore, the construction or modification of FDOT District Four Stormwater facilities must meet state regulatory requirements to obtain a permit. No weaknesses have been identified thus far.

Assessment of Controls:

The current controls are adequate for complying with the permit requirements.

Revisions:

No revisions are required or requested for this element.

Compliance Status:

Compliance achieved.

5. ***Identification, Monitoring, and Control of Discharges from Municipal Waste Treatment, Storage, or Disposal (TSD) Facilities not covered by an NPDES Storm Water Permit***

Objective: Identify measures to monitor and reduce pollutants in storm water discharges from municipal waste TSD facilities

Activities Completed:

There were 32 Broward County municipal waste handling and landfill sites identified which were not

covered by NPDES storm water permit. Monitoring and control of discharges from these facilities are regulated by county and state regulations.

General Discussion:

Provide a description of the program employed to evaluate, for each co-permittee, through inspections and monitoring, municipal waste treatment, storage and disposal (TSD) facilities which are not covered by NPDES permit(s). This requirement may be satisfied through cooperative efforts with other co-permittees. Implement the program designed to reduce pollutants in storm water discharges from municipal waste treatment, storage and disposal facilities which are not covered by NPDES permits.

State permitting and county licensing programs ensure that municipal waste handling facilities and landfills comply with storm water programs. Surface water at the 32 Broward County municipal waste handling facilities and landfills are regulated through Florida Department of Environmental Protection (FDEP) rules in Chapter 62, F.A.C. and Broward County Code, Chapter 27. Please see the table below.

Broward County Solid Waste Facilities	Address	City
Airport Recycling Specialists	3551 SW 2nd Ave.	Ft. Lauderdale
Broward County (BC) Interim Contingency Sanitary LF	7101 SW 205 Ave.	Pembroke Pines

Surface water licenses are either issued separately, such as the Broward County Department of Planing and Environmental Protection (DPEP) Surface Water Management License, or together with licenses for other programs, such as DPEP County Resource Recovery and Management License. Presented below are descriptions of the Stormwater stipulations of various licenses and permits required of solid waste management facilities.

$ DPEP Resource Recovery and Management License: Issued by the Solid Waste section of DPEP, the license applies to all Broward County landfills, compost facilities, transfer stations, yard trash and wood incinerators, and material recovery facilities. A license requirement is that "sanitary landfills shall provide for the collection, control and treatment of surface runoff from the site to meet established water quality standards of receiving waters." (Broward County Code 27-215(f)(3)) The County has been designated by the State to license all solid waste management facilities accept landfills, which are licensed by both the DPEP and Florida Department of Environmental Protection (FLDEP). In addition, DPEP Solid Waste Section follows the FLDEP Solid Waste Management regulations in issuing the license to landfills and other solid waste facilities.

$ FLDEP Solid Waste Management Facility Permit: Issued by the Solid Waste Section of the FLDEP, the permit is issued to Broward County landfills. Permit requirements for solid waste management facilities that incorporate surface water issues include the following: 1) Landfill surface water monitoring points installed at locations to yield semi-annual samples[1] of surface water -standing water, flowing water bodies, discharges from detention ponds - that may be affected by the landfill. (Florida Administrative Code (FAC) Chapter 62-701.510); 2) Landfill surface water management systems shall be properly designed, constructed, and maintained.[2] (FAC Chapter 62-701.700); and 3) stormwater management systems for all solid

[1] The samples shall be analyzed for specific conductivity, unionized ammonia, pH, total hardness, dissolved oxygen, biochemical oxygen demand, turbidity, copper, temperature, iron, colors, sheens, mercury, nitrate, zinc, total dissolved solids, and total organic carbon.

[2] Surface water management systems.

(a) A Stormwater management system shall be designed, constructed and maintained which, at a minimum, prevents Stormwater from the peak discharge of the 25 year storm event from running onto those portions of the landfill which have not been closed.

(b) A Stormwater management system shall be designed, constructed and maintained which collects and controls, at a

waste management facilities shall be operated and maintained as necessary to meet applicable standards of FAC Chapter 62-302 (Surface Water Quality Standards), FAC 62-330 (Regulation of Stormwater Discharge) and FAC 62-25 (Environmental Resource Permitting).

In addition to surface water stipulation imbedded in solid waste regulations, municipal waste facilities also are subject to the following surface water programs:

- $ FLDEP Surface Water Discharge Permit: The permit ensures surface water management units,except those already permitted by the South Florida Management District, comply with the technical requirements of (FAC Chapter 62-25).
- $ DPEP Surface Water Management License: Issued by the Surface Water Management Section of the DPEP, the license ensures that all surface water management units outside the independent drainage districts comply with the technical requirements of Broward County Code 27-200 (b).
- $ South Florida Water Management District (SFWMD) Surface Water Management License. The license applies to solid waste facilities that are greater than ten acres or have more than two acres of impervious surface.

Provide a description of the program to monitor pollutants in runoff from the City of Tamrac Sewer Treatment Plant and Sludge Farm which was closed in 1987.

This description was provided in the First Annual Report.

Strengths and Weakness:

The Broward County had similar policies, programs and regulations for a number of years before the MS4 permit was issued. It consistent throughout the Broward County. The Broward County Code prohibits discharges from these types of facilities.

Assessment of Control:

The Broward County Code adequately meets compliance in this area.

Revisions:

No revisions are required or requested for this element.

Compliance Status:

---

minimum, the volume of runoff from a 25 year, 24 hour storm event.

(c) Stormwater controls shall include retention or detention ponds, and drainage ways specifically designed and sized according to local drainage patterns, soil permeability, annual precipitation, area land use, and other characteristics of the contributing watershed.

(d) Stormwater management systems shall be designed to avoid mixing of Stormwater with leachate. Stormwater or other surface water which comes into contact with the landfilled solid waste or mixes with leachate shall be considered leachate and is subject to the requirements of Rules 62-701.500(8) and 62-701.510(5), F.A.C.

Broward County has achieved compliance.

6. Control of Pollutants Related to Application of Pesticides, Herbicides, and Fertilizers

Objective: Implement controls to reduce, to the MEP, the discharge of pollutants related to the storage and application of pesticides, herbicides, and fertilizers applied by employees or contractors, to public rights-of-way, parks, and other municipal property.

Activities completed:

Applicators are trained and certified in county. Broward County has provided training to the pesticides applicators.

General Discussion:

Implement the program, as described within the SWMP in the Part 2 permit application, to reduce pollutant loads associated with the application of pesticides and herbicides.

Broward County and Florida Department of Transportation (FDOT) continue to implement the program as described within the SWMP in the Part 2 permit application related to pesticides, herbicides, and fertilizers. The application of pesticides, herbicides, and fertilizers is regulated under Broward County Department of Planing and Environmental Protection (DPEP) Article XIII wellfield protection Chapter 27-380(d) and 27-380(e).

Require evidence of proper certification for all applicators contracted by the municipality to apply pesticides and herbicides on municipal and FDOT property.

Co-permittees have submitted copies pesticide applicator licenses issued by the Florida Department of Agriculture and Consumer Services. (Copies are available in Attachment 3.)

Provide a description, for incorporation into the permit, of the existing public education program(s), employed within jurisdictional areas,. to encourage the public to reduce their use of pesticides, herbicides, and fertilizers. This requirement may be satisfied through cooperative efforts with other permittees, public agencies, or private entities.

It was provided in the first year report as per the requirement.

Provide a description of the program and procedures implemented by municipal staff, within each jurisdictional area, to minimize the use of pesticides, herbicides and fertilizers and to properly apply, store and mix these products. Where no comprehensive program of this nature exists, the permittee(s) shall develop and implement a program to include proper training and/or on-the-job supervision for municipal employees who apply, store or mix these products. In a summary of the program developed in the subsequent ANNUAL REPORT.

This element has been completed in the second year of the permit. Please see the second year permit

for detail. No changes have been made.

Implement the program, described in the FDOT Statewide SWMP, to minimize the use of pesticides, herbicides, and fertilizers and to properly apply, store, and mix these products.

FDOT District Four minimizes the use of pesticides, herbicides and fertilizers as well as properly trains and certifies FDOT applicators. Certification is required of any applicator with which FDOT contracts. FDOT requires that all applicators obtain Florida Department of Agriculture Public Applicator certification for use of Restricted Pesticides before applying any pesticides in accordance with Chapter 5E-9, F.A.C. The District 4 is developing procedures to improve the documentation of pesticide, herbicide and fertilizer application in Stormwater pond areas to in conjunction with the MMS more efficiently track the use of such chemicals in sensitive areas. The FDOT encourages the use of manual vegetation removal and track driven roller wiper application methods over spraying to minimize the potential for environmental degradation.

The Turnpike District contracts out these services when required. As a contract requirement, the contractor must be certified to apply chemicals in order to be considered for the job. Limited use of herbicides is used for nuisance control around concrete structures or hard-to-reach places. Minimal use of herbicides is also used in some mitigation sites to control regrowth of nuisance species, such as cattails.

Strengths and Weakness:

This SWMP is good for safety, health of the public and the environment. There was no comprehensive plan of this type before this permit was issued.

Assessment of Control:

Current controls are adequate for complying with the permit requirements.

Revisions:

No revisions are required or requested for this element.

Compliance Status:

Compliance achieved by all co-permittees.

7. a.) Illicit Discharges and Improper Disposal: Inspections, Ordinances, and Enforcement Measures

Objective: Effectively prohibit non-storm water discharges to the MS4 by the permittees through the use of inspections, ordinances, and enforcement

Activities Completed:

Two golf courses were investigated as part of the requirement to implement DPEP's random inspection program for illicit connections and illegal dumping into the MS4.

FDOT District Four and Turnpike have developed programs to achieve compliance with this requirement of the MS4 permit. The inspection and illicit connection inspection programs are shown in Appendix I-2 and Appendix I-3 respectively in District 4 report and Appendix H of Turnpike report.

General Discussion:

Identify those of the non-storm water discharges listed under Part II.7.a. on page 16 of the permit which will be allowed to be discharged to the MS4. Describe conditions, if any, to be placed on allowable non-storm water discharges. Provide a copy of this identification.

This element has been discussed in the First Annual Report.

Continue to Implement the Broward County DPEP random inspection program to identify potential illicit connections and illegal dumping into the MS4. Maintain a log documenting inspections.

This year's study aims at determining whether there is any excessive nutrients and pesticides in golf course runoffs. Two golf courses in Broward County were selected for this purpose. They are Palm Air Country Club located at the central part of the Broward County and Deer Creek Golf Club which is located in the northern part of the Broward County. The report "Pesticides and Nutrients Occurrence at Golf Courses" is in Attachment 5. The report concludes that the phosphorous levels are high in surface water at both the golf courses. There is no increase in total Nitrogen level. That shows there is no effect of nutrients that were used at golf courses on surface water quality. Diazinon, Atrazine and Ethion were detected in the surface water. However, the levels are below the Broward County standards for fresh water.

Develop a program to inspect drainage connections to the FDOT MS4 after project completion to ensure continued compliance with drainage connection permit requirements and to ensure that no illicit or non-permitted connections have been made. In cases where another regulatory agency requires a periodic certification of compliance, the program developed may allow FDOT to accept this certification of compliance in lieu of further inspections by FDOT. After development, include a description of the inspection program in the subsequent ANNUAL REPORT for incorporation into the permit.

FDOT Districts have developed programs to achieve compliance with this requirement of the MS4 permit. The inspection and illicit connection inspection programs are shown in Appendix I-2 in Attachment 23 and Appendix I-3 in the Attachment 23 respectively.

The procedures developed are consistent with the protocol documented in the Statewide SWMP for investigation of potential illicit connections. The three-fold procedure is: determine if the discharge is definitely an illicit discharge; determine the source of the discharge through the use of the Drainage Connection Permit; and notify EPA, FDEP and co-permittees, as appropriate.

Implement developed program to inspect drainage connections to the FDOT MS4 after project completion. Maintain an internal log documenting inspections and enforcement actions performed and provide a summary of these records in each subsequent ANNUAL REPORT.

Final inspection of the completed drainage connection is already in place for FDOT. Drainage Connection Permits are rarely issued in District four. Only two drainage connection permits were issued in 1998. They are Golden Bear Golf centers Inc., 5601 West Mcnab Road, North Lauderdale and Broward County School Board at I-595 and Nobhill Road in Davie. These drainage connection were inspected after the constructions. The Turnpike district conducted inspections and found 36 drainage connections. Some of them were not permitted by Turnpike as they were connected before the permit requirement. Log of the inspections are in Appendix N of attachment 23 of Turnpike.

Strengths and Weakness:

This SWMP allowed us to develop a random inspection program for airports, seaport and golf course facilities. There is a duplication of resources between Broward County, Hollywood and Fort Lauderdale because each has a MS4 Permit.

Assessment of Controls:

Controls are adequate for complying with the permit requirements.

Revision:

FDOT request that the permit be modified to exclude FDOT from enforcement procedures beyond its jurisdiction and limit its responsibilities in these instances to that of notification to the appropriate agency or municipality.

Compliance Status:

Compliance Achieved by all co-permittees.

7. b.) Illicit Discharges and Improper Disposal - Field Screening

Objective: Continue ongoing efforts to detect the presence of illicit connections and improper discharges to the MS4

Activities Completed:

Dry field screening has been completed successfully for the 50 sites in the third year of the permit. has been completed successfully. The FDOT Turnpike District has developed a program to field screen all major outfalls.

General Discussion:

Perform on-going field screening, as described in the SWMP within the Part 2 application, to detect the presence of improper disposal and illicit connections to the MS4s throughout the term of the permit. Provide, in the first ANNUAL REPORT, a schedule of the on-going field screening to be performed throughout the term of the permit. Perform field screening, as described on page 17 of the Permit, to detect the presence of improper disposal and illicit connections to the FDOT MS4. Collect inventory information on outfall and on portions of the MS4 not mapped and update municipal mapping data on an ongoing basis.

Field screening was undertaken to detect the presence of improper disposal and illicit connections to the MS4 throughout the year. Fifty major outfall dry field screening sites were selected in 1998-99. Dry field screening consisted of inspecting these major outfalls for illicit discharges. All fifty locations were inspected by April 1999. Attachment 6 contains a table describing the results of those inspections.

A positive result of the dry field screening was that no evidence of illicit connections or improper disposal (as evidenced by discharges during the dry season) was discovered during the dry field screening. Hence, no enforcement activity was required. However, dry field screening often revealed that the locations of the major outfalls as indicated in the inventory were inaccurate.

Strengths and Weakness:

This program helps to identify illicit discharges. The dry field screening revealed that some of the major outfall locations had been shown incorrectly. Upon locating the major outfalls during dry field screening, major outfall locations were updated. A large percentage of outfalls are under water and their inspection will not assist dry field screening.

Assessment of Controls:

Current controls are adequate for complying with the permit requirements.

Revisions:

No revisions are required or requested for this element.

Compliance Status:

Compliance achieved.

7. c.) Illicit Discharges and Improper Disposal - Investigation of Suspected Illicits and/or Improper Disposal

Objective: Develop and implement standard procedures to be followed to investigate portions of the MS4 that, based on the results of the field screen or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water

Activities Completed:

A log of violation reported to DPEP were maintained and inspections were carried out. If there were any violation found, enforcement actions were taken. The FDOT Turnpike District has developed a pamphlet titled "Don't Pollute Our Florida Waterways" which informs the general public on the importance of reporting illicit discharges and directs the general public to call the Turnpike's Public Information offices to report spills and/or illicit discharges.

General Discussion:

Report all suspect conditions and violations (regarding illicit connections and improper disposal to the MS4s) to Broward County Department of Planing and Environmental Protection for investigation and elimination. Continue to implement the investigative procedure, as described in the SWMP in the Part 2 application, to identify and terminate any source(s) of illicit connections or discharges to the MS4. Based on the results from the field screening or citizen reports, establish a schedule to begin inspections. Maintain a log of violations reported to DPEP along with the enforcement action taken.

Broward County Department of Planing and Environmental Protection (DPEP), Enforcement Administration receives complaints from other governmental agencies and the public for possible violations to the Broward County Code. DPEP has over 70 Natural Resource Environmental Officers (NREO) from six divisions to respond and investigate any Code violations and issue citations, warning notices or a notice of violation to enforce ordinances/regulations regarding illicit discharges to the MS4. The DPEP Enforcement Administration maintains a file describing the complaint, source location, findings and enforcement action taken.

Once a complaint is received by DPEP, Natural Resources Enforcement officer (NREO) is dispatched from one of DPEP's Divisions to conduct a complete investigation of a possible contamination or degradation of the environment. During the course of the investigation or inspection, inspectors may make observations, conduct interviews, obtain statements review and copy records, take physical samples, take photographs, and write notes describing the incident. The final report is submitted to the Enforcement Administration for closure or enforcement action.

Attachment 23 Appendix TK1 describes the Turnpike District's Hazardous Materials Emergency Response Procedures.

The table entitled "Log of Violations Reported to DPEP and Enforcement Action Taken," located in Attachment 7, illustrates the following about DPEP notification, reporting, investigation and enforcement actions applicable to the MS4:

$ From December 1998 to December 1999, fifty-three storm drainage related complaints were received by DPEP.

$ As indicated in the "Division Code" column of the table, either the Water Resources Division's Surface Water Section (abbreviated WR-SW in the table), Water Resources Division's Non-domestic Wastewater Section (WR-IW), Water Resources Division's Domestic Wastewater Section (WR-DW), Biological Resource's Dredge and Fill Section (BR-DF) or Pollution Prevention and Remediation Division's Hazardous Materials Section (PP-HM) responded to MS4 complaints based upon the type of complaint.

$ Five out of the fifty-three complaints resulted in Warning Notices being issued to the facility out of compliance.

Develop investigative procedures to identify the source(s) of illicit connections or discharges to the FDOT MS4. These procedures shall include notification to FDEP and EPA of illicit connections. After development, include a summary of the investigative procedures in the subsequent ANNUAL REPORT.

The Statewide Storm Water Management Plan describes methods and procedures to reduce the discharge of pollutants to the maximum extent practical (MEP) using management practices, control techniques and system, design and engineering methods.

As described in the previous page that the final report is submitted to Enforcement Administration for closure or enforcement action after the inspection is done by NREO. Broward County Chapter 27-193(4)Surface water management :

a. Use of storm sewers and sanitary sewers: No domestic wastewater, non-domestic wastewater, or other wastewater shall be discharged into any sewer designated to carry stormwater, unless the discharger has an NPDES permit and existing county license, nor shall stormwater be discharged into a sewer designated to carry domestic wastewater.

b. Construction without a license: Where a surface water management license is required, no water management works within Broward County shall be excavated, created, constructed, altered, or abandoned unless a surface water management license has been obtained.

Broward County Department of Planing and Environmental Protection (DPEP) performs ongoing field screening to detect the presence of improper disposal and illicit connections to the FDOT MS4. When there is the presence of an improper disposal from an illicit connection, DPEP will investigate the source and proceed with corrective and/or enforcement action. DPEP will notify FDOT for notification to FDEP and EPA of illicit connections.

Implement the investigative procedures developed to identify the source(s) of illicit connections or discharges to the MS4.

From December 1998-November 1999 about sixty FDOT outfall inspections were performed. The areas around the outfalls were checked for natural habitat, head wall repair, pipe size and waterway conditions. The objective of the field investigation was to determine if there was any type of illicit discharging. At the time of inspection, conditions of the outfalls and head walls appeared to be in good repair. Vegetation was growing on the banks of the canals, fish were visible and we did not witness any discoloration of the water. Attachment 18 documents the inspection reports.

The Turnpike's HAZMAT Emergency Response Procedures indicates emergency contact information by Mile Post location. Broward County is in between Mile Post 48 and 72. Usually, the general public contacts the Florida Highway Patrol (FHP) Troop "K" for any spills or illicit discharges along the roadways. Zone managers are notified to coordinate an appropriate response with the responsible party, cleanup contractor, and environmental agencies. A list of spills reported in Broward County during permit year three (1999) is included in Appendix L of Turnpike District report.

Strengths and Weakness:

The Broward County DPEP had citizen complaint hotline prior to the issuance of the NPDES MS4 Permit. This program is very labor intensive. The co-permittees may be reluctant to report a discharge from their own facility.

Assessment of Control:

Current controls are adequate for complying with the permit requirements.

Revisions:

No revisions are required or requested for this element.

Compliance status:

Compliance achieved.

7. d.) Illicit Discharges and Improper Disposal - Spill Prevention and Response

Objective: Implement procedures to prevent, contain, and respond to spills that may discharge into the MS4

Activities Completed:

Spill prevention procedures were followed within jurisdiction of Broward County municipalities and FDOT. Continue to maintain the Broward County DPEP's 24-hour emergency response hotline. FDOT District Four has contracted with WRS & Infrastructure and Handex of Florida, Inc., to respond to any spill response emergency assigned to them. The contract with WRS & Infrastructure and Handex of Florida, Inc., is handled through the Ft. Lauderdale Operations facility using the protocols defined in the FDOT District 4 On-Call Supervisors Procedure for Haz-Mat or Petroleum

Spills. Turnpike District has developed its own emergency procedures to respond to spill along the Turnpike Roadways network (please see Appendix J of Attachment 23 Turnpike report).

General Discussion:

Implement the various municipal procedures for handling and disposing of chemical spills within each permittee's jurisdictional area. Include notifying the Broward County DPEP Response Team to provide technical support or remediation assistance for hazardous materials or chemical spills. If no procedures of this type exist, the permittee(s) shall develop spill prevention and spill response procedures to effectively mitigate pollutant discharges from spills to surface waters and the MS4. Include training personnel to recognize and quickly assess the nature of spills and to promptly report all hazardous material spills and chemical spills to the Broward County DPEP. Provide a description of the existing or developed spill prevention and response programs or procedures to mitigate pollutant discharges from spills to the MS4 and surface waters.

If a spill has occurred in Broward County, the notifying party -- a citizen, other government agency, or local Police or Fire Department -- contacts Broward County Central Dispatch (BCCD) at (954) 765-5124. (In most cases of spills the local Fire Department is the notifying party.) BCCD then routes the call to the DPEP Hotline which is housed within the DPEP's Enforcement Administration. Enforcement Administration then notifies the appropriate divisions within DPEP. For instance, for a pollutant discharge to the MS4 the Pollution Prevention and Remediation Program Division's Environmental Response Section (ERS) and the Water Resource Divisions's Non-Domestic Discharge Licensing Section would be notified. (After hours, BCCD would contact an on-call ERS site investigator if any emergencies occurred.) ERS will send a site investigator depending on the "Zone" that the spill occurred. Please see the table below.

Emergency Response Section Zones	
Zone 1 (north)	Area between Oakland Park Blvd. To West Palm Beach County Line
Zone 2 (central)	Area between Griffin Rd. and Oakland Park Blvd.
Zone 3 (south)	Area between Griffin Rd. And Dade County Line

During the site check, the site investigator will provide the local authority (police or fire department) with technical support, take samples if necessary, and complete an investigator's report that details the case specifics. Depending on the circumstances of the case, ERS issues a Warning Notice, Notice of Violation, or Citation or refers the case to another Division.

Continue to maintain the Broward County DPEP's 24-hour emergency response hotline to provide assistance in cases of hazardous waste clean-up and emergency chemical spills.

Broward County DPEP's 24-hour emergency response hotline is directed to the Environmental Response Team (ERT) or appropriate Divisions for suspected discharges to the MS4. After hours calls are directed to the DPEP ERT on-call Coordinator. On-call personnel respond to all complaints for investigation on a 24 hours a day, 7 days a week. The ERT investigates and provides technical

assistance for all hazardous waste cleanup and emergency chemical spills.

Implement the FDOT's Emergency Operations Procedures which effectively mitigate potential pollutant discharges to surface waters.

Spill prevention procedures were followed within FDOT jurisdiction in Broward County.
FDOT District Four has continued to implement FDOT District four On-Call Supervisors Procedure for Haz-Mat or Petroleum Spills. This protocol is provided in Appendix D of FDOT District 4 report in Attachment 23.
FDOT District Four has contracted with WRS & Infrastructure and Handex of Florida Inc. to respond to any spill response emergency assigned to them. The contract with WRS & Infrastructure and Handex of Florida, Inc., is handled through the Ft. Lauderdale Operations facility using the protocols defined in the FDOT District 4 On-Call Supervisors Procedure for Haz-Mat or Petroleum Spills.
FDOT District Four responds to emergencies according to specific, documented protocols. This protocol is provided in Appendix D. In addition, FDOT uses WRS & Infrastructure and Handex of Florida, Inc., to handle spill responses in the event that the party responsible for the spill does not take action to clean up the spill. WRS & Infrastructure and Handex of Florida, Inc., are qualified contractors that will cleanup or direct the cleanup of spills in a timely manner.

The Turnpike's Hazardous Materials Emergency Response Procedures, included as Appendix K of Turnpike District, was developed as a guide for Turnpike personnel to respond to HAZMAT spills within the Turnpike's right-of-way. A list of spills that were reported in Broward County during permit year three is included as Appendix L of Turnpike District Report in Attachment 23

Strengths and Weakness:

This is a cooperative effort throughout Broward County. Sometimes it is very difficult to identify responsible party for cleanup.

Assessment of Control:

Current controls are adequate for complying with the permit requirements.

Compliance Status:

Compliance achieved.

7. e.) Illicit Discharges and Improper Disposal - Public Notification

Objective: Develop and implement a program to promote, publicize, and facilitate public reporting of illicit discharges of water quality impacts associated with discharges to the MS4.

Activities Completed:

Continue to make available literature informing public about problems associated with illicit discharges

to the MS4.Continue to maintain DPEP 24 - hour hotline for the public to report of illicit discharges and improper disposal. The FDOT maintains complaint lines at the local maintenance yard located in the Ft. Lauderdale Operations facility. FDOT maintains a database on illicit connections and responsible parties.

General Discussion:

Provide Broward County co-permittees with a copy of the Broward County DPEP's brochure describing the proper disposal of toxic materials and phone numbers to report the presence of illicit discharges and improper disposal of materials into the MS4. The brochure shall include information on the problems associated with illicit connections or discharges, what to look for and how to report incidents. Continue to maintain the Broward County DPEP 24-hour hotline for the public to report the presence of unpermitted discharges to the MS4. Continue to make available literature informing the public about problems associated with illicit connections or discharges to the MS4, how to spot them, how to report incidents, and the 24-hour Broward County DPEP pollution complaint hotline.

Efforts made by the Broward County DPEP to describe the proper disposal of toxic materials is described in the Attachment 9. The 24-hour hotline has been maintained throughout the year . Literature regarding the illicit discharges or improper disposal to the MS4 is contained in the DPEP brochure entitled "Where Should the Water Go?" (Please see Attachment 8.) In simple language, the brochure describes how to go about disposing of wastewater from outdoor cleaning operations as well as a providing stern warning regarding polluting water bodies. Some of the co-permittees have also distributed some flyers to the public regarding surface water protection (Please see Attachment 8).

DPEP also has a volunteer program which encourages people to inform DPEP about any illicit discharges throughout the Broward County. Volunteers are called Earth Keepers. The brochure about this program is included in Attachment 8.

There is Broward Urban River Trails (BURT) program for Broward County residents. This is a new volunteer program started by DPEP's Water Resources Division. Mr. Kevin Carter of DPEP is a key contact in the program. At present 5 Broward County citizens have volunteered for this program. Their job is to report any contamination observed in a outfall located in their neighborhood after any storm. A brochure has been included in the Attachment 8 about this program.

As part of public outreach program, a presentation was given to the Painting and Decorating Contractors of America. The presentation was about pollution prevention due to paint chemicals. The details of the presentation are in Attachment 19. About thirty people from painting industries around the county attended the presentation.

DPEP is co-sponsor of the waterways cleanup program. Every year on the third weekend of March about 80-100 volunteer work at the DPEP sponsored site to cleanup debris from New River at Delevoe Park. This way people get educated about not throwing trash into water ways.

Maintain a citizen complaint log for FDOT documenting all reports of illicit discharges and what actions were taken to investigate and resolve the problem. Include a summary of this log in each

ANNUAL REPORT.

The District four maintains complaint lines at the local maintenance yard located in the Ft. Lauderdale Operations Facility. FDOT District Four maintains a database on illicit connection reported through citizen complaint lines in place at the local District Four Ft. Lauderdale Operations Facility. Reporting of illicit connections is made through the local maintenance yard to standardize on phone lines which citizens can file all FDOT related complaints within Broward County.

Establish a direct dial local telephone number at the District Office to be used for the reporting of illicit connections, accidental spills, illegal dumping, or other water quality violations to the FDOT District NPDES Coordinator for investigation and action as needed. This requirement may be satisfied through cooperative efforts with other permittees.

FDOT District Four currently has direct phone lines in place at local maintenance yards for complaints and reporting of illicit connections, spills, illegal dumping, or any other water quality violations needing reporting to FDOT by the public. Hence, FDOT District Four request to remove the requirement of the establishment of a direct dial local telephone number within 36 months at the District Office.

FDOT Turnpike District has a direct line 1-800-749-7453 for illicit discharge reporting at the Public Information office. Also, spills and illicit discharges are currently reported to Turnpike zone managers, as indicated in the Turnpike's HAZMAT Emergency Response Procedure in Appendix J of Turnpike report in Attachment 23.

Strengths and Weakness:

The public outreach for educational purposes already existed before this permit. This program is very expensive to implement.

Assessment of Controls:

Current controls are adequate for complying with the permit requirements.

Revisions:

FDOT District Four currently has direct phone lines in place at local maintenance yards for complaints and reporting of illicit connections, spills, illegal dumping, or any other water quality violations needing reporting to FDOT by the public. Hence, FDOT District Four requests to remove the requirement of the establishment of a direct dial local telephone number within 36 months at the District Office.

Compliance Status:

Compliance achieved.

7. f.) ***Illicit Discharges and Improper Disposal - Oils, Toxic, and Household Hazardous Waste Control.***

Objective: Effectively prohibit the discharge or disposal of used motor vehicle fluids, household hazardous wastes, grass clippings, leaf litter, and animal wastes into the MS4

Activities Completed:

Literatures were distributed to the general public about the proper disposal of used motor oil, left over hazardous house hold products, used vehicle tires and lead acid batteries. Continue to implement the Broward County Used oil Recovery program. FDOT distributes information on hazardous waste disposal, used oil recycling, and spill reporting in every Drainage Connection Permit (Appendix F of FDOT report).

General Discussion:

Continue to make available to the public information (by means of literature, lectures, television ads, radio announcements, etc.) on the proper disposal of used motor oil, leftover hazardous household products, used vehicle tires and lead acid batteries. Include information informing the public of the locations of the Broward County recycling facilities, and collection sites for used motor oil, hazardous household products, used vehicle tires, and lead acid batteries and the hours of operation. Continue to implement the Broward County Household Hazardous Waste program which instructs the public on responsible environmental management and proper handling and disposal of household hazardous material. Continue to implement the Broward County Used Oil Recovery program.

Broward County's Office of Integrated Waste Management (IWM) has developed a Household Hazardous Waste Program which allows Broward County residents to bring house hold hazardous waste (for example: paints, thinners/strippers, used oil, automotive fluids, gasoline, solvents, pesticides, insecticides, fertilizers, pool chemicals, spot removers, oven drain cleaners, furniture and metal polish, mercury, batteries and tires) to waste transfer stations. Brochures describing collection site locations and schedules were distributed to Broward County municipalities at the Technical Advisory Committee meetings. IWM has also developed a Used Oil Recycling Recovery Program brochure which describes how and where to drop off your used oil for recycling. In September 1997 approximately 13,000 brochures were mailed to the municipalities of Broward County. This program is advertised in local news papers like Miami Herald and Sun Sentinel. In addition to brochures, television, radio and newspaper ads, the two programs have made available information through the Internet at "www.broward.org" and at a IWM hotline number (954) 765-4999. Please see Attachment 9.

With each FDOT Drainage Connection Permit, include information on used oil recycling, proper hazardous waste disposal, storm water regulations, and spill reporting.

FDOT distributes information on hazardous waste disposal, used oil recycling, and spill reporting with every Drainage Connection Permit (Appendix F Attachment 23).

Strengths and Weakness:

Broward County and co-permittees continue to have pro-active programs of public information. The program is costly to administer and the county assumes the financial responsibility for disposal of the hazardous wastes.

Assessment of Control:

Current controls are adequate for complying with the permit requirements.

Revisions:

No revisions are required or requested for this element.

Compliance Status:

Compliance achieved.

7. g.) ***Illicit Discharges and Improper Disposal - Limitation of Sanitary Sewer Seepage***

Objective: Minimize un-permitted discharges of dry and wet weather overflows from sanitary sewers into the MS4.

Activities Completed:

Utility owners are required to report DPEP any spill occurred in the Broward County effective November 24, 1998.

Advise appropriate utility owners, municipality, and/or State Agency of violation if constituents common to wastewater contamination are discovered in the MS4 during field screening, routine inspections, regular maintenance or public reporting.

No constituents common to wastewater were discovered during field screening, routine inspection, or regular maintenance. If they were discovered during inspection or by any other means then it was reported to the appropriate utility owner for correction. On November 24, 1999, the wastewater program of DPEP sent a letter to all owners & operators of domestic wastewater treatment plants and collection/transmission facilities about discharge reporting and immediate cleanup activity. The letter is in attachment 10. There were twenty nine sanitary sewer spills reported in the year 1999 which is listed in attachment 10.

Continue to implement the programs conducted by the Broward County Office of Environmental Services Water Supply Division, as described in the SWMP within the Part 2 Permit Application, for limiting infiltration of seepage from sanitary sewers to the MS4s.

Broward County Office of Environmental Services (OES) has embarked on a Sewer System

Rehabilitation Program. This program will rehabilitate the sewer collection systems owned and operated by the twelve Large Users party to the North East Regional Wastewater Treatment Plant User Agreements. The goal of the program is reduce sewer system overflows, exfiltration, infiltration, and inflow while efficiently transporting raw wastewater through the local and regional pumping transmission systems. The program will identify repairs to collection systems to reduce infiltration and inflow, assess the impact of exfiltration during line repairs, and study the impacts of local and regional pumping and transmission modifications. For a complete listing of the Scope of Services for the project, please see Attachment 10 of the First Annual Report.

Advise appropriate utility owners, municipality, and/or State Agency of violation if constituents common to wastewater contamination are discovered in the MS4 during field screening, routine inspections, regular maintenance or public reporting.

On November 24, 1999 the domestic wastewater program of DPEP sent a letter to all owners & operators of Domestic Wastewater treatment plants and collection/transmission facilities about discharge reporting and immediate cleanup activity. The letter is in Attachment 10.

No constituents common to wastewater were discovered during field screening, routine inspection, regular maintenance. If they were discovered during inspection or by any other means then it will be reported to appropriate utility owners for correction. On November 24, 1999 the wastewater section of DPEP sent a letter to all owners & operators of domestic wastewater treatment plants and collection/transmission facilities about discharge reporting and immediate cleanup activity. The letter is in Attachment 10. There were twenty-nine sanitary sewer spills reported in the year 1999 which is listed in Attachment 10. Out of twenty-nine incident only three spills went to storm drains. The storm drains were vacuumed and disinfected immediately so that spill had no affect on nearby surface water bodies.

Include plan of action and schedule, to be detailed in the subsequent Annual Report, to correct the deficiencies.

As per Broward County Code 27B58(b)(3), verbal notification is requir within eight hours of the event ed by calling DPEP (954) 519-1490. Voice mail services are provided. A Fax notification is also acceptable. If there is or has been a discharge to the surface waters (inclusive of storm drain) or abnormal event with a waste water facility outside the weekly hours of 8:00 a.m. to 4:30 p.m. then notification shall also be made to County's emergency dispatch by calling (954) 765-5124. Within three working days of the event, a written report is required that describes the incident, its cause, the measures taken to correct the problem and measures taken to prevent its reoccurrence and the owner's intention toward repair, replacement or reconstruction of affected facilities and a schedule of events leading toward operation within the license conditions and compliance with all provisions of the current version of the Chapter 27 of the Code of Ordinances, Broward County.

Strengths and Weakness:

This program enable the utilities to evaluate the condition of their systems. The high groundwater table limits the seepage of waste water into the water table. Force main breaks underwater are difficult to detect.

Assessment of Controls:

Current controls are adequate for complying with the permit requirements.

Revisions:

No revisions are required or requested for this element.

Compliance Status:

Compliance achieved.

8. a.) Industrial and High Risk Runoff - Identification of Priorities and Procedures for Inspections

Objective: Identify all targeted facilities and determine priority sites in accordance with the schedule provided in Part III.A.8.a. on of the permit.

Activities Completed:

The high risk facilities in Broward County have been prioritized as per the permit requirement. High Risk facilities are inspected for permit requirements. A procedure for inspection of highrisk facilities has been developed. No drainage connection permits have been issued by the FDOT Districts to any high-risk facilities in Borward County.

General Discussion:

Inventory and prioritize all existing high risk facilities discharging into the MS4 within each permittee's jurisdictional area. High risk facilities shall include municipal landfills, hazardous waste treatment, storage, disposal and recovery facilities, facilities that have reported under the requirements of EPCRA Title III, Section 313, private and municipal waste handling facilities and any other industrial or commercial discharge which the permittee determines is contributing a substantial pollutant loading to the MS4. This inventory shall identify the outfall and surface water body into which each high risk facility drains.

Please see the table entitled "Log of Broward County Industrial High Risk Facility Inspections" in Attachment 17. The table lists the name and location of the industrial facility, the name of the MS4 operator, the receiving water body, the facility SIC code and the results of the latest inspections performed.

Implement procedures, within each permittee's jurisdictional area, to determine if the identified high risk facilities are in compliance with all appropriate aspects of the storm water program (e.g. no illicit connections; compliance with local storm water regulation requirements; and if the facility is required to have NPDES permit coverage, a copy of the NPDES storm water pollution prevention plan on site).

Maintain a list of all industrial storm water sources discharging to the MS4 and include an update in each ANNUAL REPORT of any additionally identified industrial facilities not previously listed. Maintain a log documenting the results of the inspections performed.

Develop procedures for the inspection of high risk facilities which hold FDOT drainage connection permits to verify compliance with FDOT Drainage permit requirements. In cases where another regulatory agency requires a periodic certification of compliance, the program developed may allow FDOT to accept this certification of compliance in lieu of further inspections by FDOT.

FDOT District Four will notify Broward County should a contaminant be discovered during field screening in a FDOT outfall or structure that is near to a identified high risk facility. FDOT District Four is currently working on a database system that will identify drainage areas for FDOT's MS4 and flag high risk facilities in the vicinity of these drainage areas. Under the Emergency Planning and Community Right-to-Know Act (EPCRA) of 1986, provision of detailed information concerning hazardous substances substantially stored in the permit area was made mandatory. EPCRA increases the public's knowledge of hazardous substances contained in the permit area and allows for quicker and more informed responses in cases of spills.

Broward County Department of Planing and Environmental Protection is the regulatory agency for Broward County including FDOT and regulates many of the high risk runoff sites - municipal landfills, hazardous waste treatment, storage and disposal and recovery facilities, and private and municipal waste handling facilities - directly in the Pollution Prevention and Remediation Programs (PPRP) Division's Solid Waste and Hazardous Materials Sections. In addition to DPEP involvement, other agencies are involved in the regulation of high risk facilities.

Hazardous Materials

Covering over 5,000 sites in Broward County, the DPEP Hazardous Materials Section regulates generation, use, storage, handling, processing, manufacturing, and disposal of hazardous materials. Per Broward County Code 27-354 (f), hazardous material disposal sites cannot be permitted or licensed in Broward County. Therefore, the high-risk hazardous material facilities in Broward County are transfer stations, small quantity generators, solid waste and oil recycling facilities. In addition to the County regulations, Florida Department of Environmental Protection (FLDEP), delegated authority by the EPA, implements a Hazardous Waste Program as well. Although the programs generally overlap, the FLDEP program is not as stringent as the County Program. DPEP issues three different types of facility licenses through the Hazardous Material Section.

$ A hazardous material facility operating license is required for an existing, new or proposed facility

that generates, stores, uses, handles, or manufactures hazardous materials in quantities of twenty-five (25) gallons or more within any one (1) month period of time.

$ A Hazardous Material Transfer Station License is issued to any facility whose primary purpose is to store, hold, or process hazardous material prior to or during transport to a processing or disposal facility.

$ Public Used Oil Collection Facility Registration is required for facilities that store or transfer used oil.

All three of these licenses are monitored once every two years and require that secondary containment shall be "provided with a roof to prevent rainwater from entering the area or, as an alternative, be equipped with a lockable valve to enable the controlled release of any accumulation of clean rainwater." (Broward County Code 27-356 (b)(4)b.3.b) Additionally, any floor drains leading to the Stormwater system in the hazardous material handling area must be sealed. (Broward County Code 27-356 (b)(4)b.4.)

Storage Tank

Storage tank facilities that contain or will contain solid and liquid hazardous materials are regulated by the county to prevent discharge to the ground and surface waters of the county; and to provide specifications for facility design, early detection of a discharge, to provide for containment of discharge, to provide for recovery of discharge, and to provide for maintenance, replacement, and closure. Storage tank facilities are monitored and inspected once a year for compliance with all County, State and Federal regulations.

Solid Waste

State permitting and county licensing programs ensure that municipal waste handling facilities and landfills comply with storm water programs. Surface water at the 32 Broward County municipal waste handling facilities and landfills is regulated through Florida Department of Environment Protection (FDEP) rules in Chapter 62, F.A.C. and Broward County Code, Chapter 27. Please see the table below for the solid waste facilities, and inspection / monitoring schedule.

Broward County Solid Waste Facilities	Address	City	Inspections/Year
Airport Recycling Specialists	3551 SW 2nd Ave.	Ft. Lauderdale	Four times per year
Broward County (BC) Interim Contingency Sanitary LF	7101 SW 205 Ave.	Pembroke Pines	Four times per year
BC Residential Transfer Unit - Central	5490 Reese Rd.	Davie	Once per year
BC Residential Transfer Unit -North	2780 Powerline Rd.	Pompano Beach	Once per year
BC Residential Transfer Unit - South	5601 W. Hallandale Rd	Hollywood	Once per year
Central Sanitary Landfill - Ash Monofill	3000 NW 48th St.	Pompano Beach	Four times per year

Broward County Solid Waste Facilities	Address	City	Inspections/Year
Central Sanitary Landfill and Recycling Center	3000 NW 48th St.	Pompano Beach	Four times per year
Central Sanitary Landfill - Material Rec. Fac.	3000 NW 48th St.	Pompano Beach	Four times per year
Central Sanitary Landfill - Trash Transfer St.	3000 NW 48th St.	Pompano Beach	Four times per year
Central Sanitary Landfill - Yard Trash Compost	3000 NW 48th St.	Pompano Beach	Four times per year
Chambers Waste Systems of Florida	SW Pembroke Rd & 208 Ave.	Pembroke Pines	Once per year
Coral Springs Trash Transfer Station	NW 121 st Ave & Wiles Rd	Coral Springs	Once per year
Deerfield Beach Trash Transfer Station	360 SW 4th St.	Deerfield Beach	Once per year
Fort Lauderdale Trash Transfer Station A	2101 NW 6th St.	Ft. Lauderdale	Once per year
Fort Lauderdale Public Service Trash Transfer	201 SW 12th Ave.	Ft. Lauderdale	Once per year
Fort Lauderdale Snyder Park Trash Transfer Station	3299 SW 4th Ave.	Ft. Lauderdale	Once per year
Hallandale Residential Trash Transfer	NW 8th Ave. & 2nd St.	Hallandale	Once per year
Hollywood 56th Ave. Mulch Processing	3400 NW 56th Ave.	Hollywood	Once per year
Hollywood Residential Trash Transfer	3400 NW 56th Ave.	Hollywood	Once per year
Plantation Residential Trash Transfer	750 NW 91st Ave.	Plantation	Once per year
Envirocycle, Inc.	849 SW 21st Terrace	Ft. Lauderdale	Four times per year
J & A Transfer, Inc.	2241 NW 15th Ct.	Pompano Beach	Four times per year
Pompano Silica and Sand	1951 N. Powerline Rd.	Pompano Beach	Four times per year
Recycle America of Broward County	810 NW 13th Ave.	Pompano Beach	Four times per year
Reuter Recycling of Florida	20701 Pembroke Rd.	Pembroke Pines	Four times per year
Rocklake, Inc..	3300 NW 27th Ave.	Pompano Beach	Four times per year
Tire Recycling of Florida	6116 NW 2nd Ave.	Ft. Lauderdale	Four times per year
Transfer/ Recycling Services	7061 SW 22nd Ct.	Davie	Four times per year
UHEL Polly Hauling, Inc.	2201 NW 16th St.	Pompano Beach	Four times per year
Waste Magic Recyclers Central, Inc.	1501 NW 12th Ave.	Pompano Beach	Four times per year

Surface water regulation can come under licenses dedicated to surface water exclusively, such as the Broward County Department of Planing and Environmental Protection (DPEP) Surface Water Management License, or licenses that have surface water requirements as part of the overall permit, such as DPEP County Resource Recovery and Management License. Presented below are descriptions of the Stormwater stipulations of various licenses and permits required of solid waste management facilities.

$ DPEP Resource Recovery and Management License: Issued by the Solid Waste section of DPEP, the license applies to all Broward County landfills, compost facilities, transfer stations, yard trash and wood incinerators, and material recovery facilities. A license requirement is that "sanitary landfills shall provide for the collection, control and treatment of surface runoff from the site to meet established water quality standards of receiving waters." (Broward County Code 27-

215(f)(3)) The County has been designated by the State to license all solid waste management facilities accept landfills, which are licensed by both the DPEP and Florida Department of Environmental Protection (FLDEP). In addition, DPEP Solid Waste Section follows the FLDEP Solid Waste Management regulations in issuing the license to landfills and other solid waste facilities.

$ FLDEP Solid Waste Management Facility Permit: Issued by the Solid Waste Section of the FLDEP, the permit is issued to Broward County landfills. Permit requirements for solid waste management facilities that incorporate surface water issues include the following: 1) Landfill surface water monitoring points installed at locations to yield semi-annual samples[3] of surface water -standing water, flowing water bodies, discharges from detention ponds - that may be affected by the landfill. (Florida Administrative Code (FAC) Chapter 62-701.510); 2) Landfill surface water management systems shall be properly designed, constructed, and maintained.[4] (FAC Chapter 62-701.700); and 3) Stormwater management systems for all solid waste management facilities shall be operated and maintained as necessary to meet applicable standards of FAC Chapter 62-302 (Surface Water Quality Standards), FAC 62-330 (Regulation of Stormwater Discharge) and FAC 62-25 (Environmental Resource Permitting).

In addition to surface water stipulation imbedded in solid waste regulations, municipal waste facilities also are subject to the following surface water programs:

$ FLDEP Surface Water Discharge Permit: The permit ensures surface water management units. accept those already permitted by the South Florida Management District, comply with the technical requirements of (FAC Chapter 62-25).

$ DPEP Surface Water Management License: Issued by the Surface Water Management Section of the DPEP, the license ensures that all surface water management units outside the independent drainage districts comply with the technical requirements of (Broward County Code 27-200 (b)).

$ South Florida Water Management District (SFWMD) Surface Water Management License. The

---

[3]The samples shall be analyzed for specific conductivity, unionized ammonia, pH, total hardness, dissolved oxygen, biochemical oxygen demand, turbidity, copper, temperature, iron, colors, sheens, mercury, nitrate, zinc, total dissolved solids, and total organic carbon.

[4] Surface water management systems.

(a) A Stormwater management system shall be designed, constructed and maintained which, at a minimum, prevents Stormwater from the peak discharge of the 25 year storm event from running onto those portions of the landfill which have not been closed.

(b) A Stormwater management system shall be designed, constructed and maintained which collects and controls, at a minimum, the volume of runoff from a 25 year, 24 hour storm event.

(c) Stormwater controls shall include retention or detention ponds, and drainage ways specifically designed and sized according to local drainage patterns, soil permeability, annual precipitation, area land use, and other characteristics of the contributing watershed.

(d) Stormwater management systems shall be designed to avoid mixing of Stormwater with leachate. Stormwater or other surface water which comes into contact with the landfilled solid waste or mixes with leachate shall be considered leachate and is subject to the requirements of Rules 62-701.500(8) and 62-701.510(5), F.A.C.

license applies to solid waste facilities that are greater than ten acres or have more than two acres impervious surface.

Resource Recovery Management Facility Licenses for the above facilities require sampling semi-annually in the event of an emergency and/or discharge. The regular surface water sampling event may be omitted if no discharge has occurred. During the passed year there has not been a reported discharge at the Resource Recovery Management Facilities.

Strengths and Weakness:

This program facilitates the development of a list of high risk facilities. This program is very labor intensive. A large percentage of the high risk facilities are located in the City of Fort Lauderdale and the City of Hollywood and this an overlap of resources.

Assessment of Controls:

Current controls are adequate for complying with the permit requirements.

Revisions:

FDOT does not have the authority to conduct monitoring of high risk facilities suspected of contaminating the MS4 and thus request to remove the requirement for the development of a monitoring program. FDOT request that its responsibility be limited to notification of the appropriate agency with authority to conduct such a monitoring program.

Compliance Status:

Compliance Achieved.

8. b.) Industrial and High Risk Runoff - Monitoring for High Risk Industries

Objective: Implement the monitoring program for facilities identified under this section in accordance with the schedule provided in Part III.A.8.b. of the permit.

Activities Completed:

Identified high risk facilities were inspected as per the permit requirement.

General Discussion:

Begin implementing Broward County's DPEP monitoring program for identified high risk industrial facilities. Initiate enforcement action on those facilities having storm water discharges to the MS4 which violate water quality standards. Send to EPA a copy of each Notice of Violation at the address shown in Part V.E.2., page 55 of the permit.

The table entitled "Log of Violations Reported to DPEP and Enforcement Action Taken", located in Attachment 7 and "Log of Broward County Industrial High Risk Facility Inspections" located in Attachment 17, illustrates the following about DPEP notification, reporting, investigation and enforcement actions applicable to the MS4:

Non-domestic wastewater program (WR-IW), Water Resources Division's domestic wastewater program (WR-DW), Biological Resource's dredge and fill Section (BR-DF) or Pollution Prevention and Remediation Division's hazardous materials section (PP-HM) responded to MS4 complaints based upon the type of complaint.

The procedures to inspect high risk facilities are part of the hazardous material and the storage tank program facility license requirements of DPEP. The facilities are inspected for compliance with the Broward County Code Chapter 27-356.

$ From December 1998 to December 1999, 53 related complaints were received by DPEP.

$ As indicated in the "Division Code" column of the table, either the Water Resources Division's surface water program (abbreviated WR-SW in Table), Water Resources Division's Non-domestic Wastewater program (WR-IW), Water Resources Division's domestic wastewater Section (WR-DW), Biological Resource's dredge and fill program (BR-DF) or Pollution Prevention and Remediation Division's hazardous materials section (PP-HM) responded to MS4 complaints based upon the type of complaint.

Initiate enforcement action on those facilities having storm water discharges to the MS4 which violate water quality standards.

$ Seven out of the 53 complaints resulted in warning notices being issued to the facility in question.

$ None of the warning notices resulted in a notice of violation (NOV).

Develop a monitoring program which addresses the water quality criteria included in the FDOT permitting process for those high risk industrial facilities which hold FDOT drainage connection permits. Include a description of the specific enforcement steps to be taken to require compliance with permit conditions if violations are identified. After development, include a summary of the monitoring program in the subsequent ANNUAL REPORT for incorporation into the permit. Implement the monitoring program for high risk industrial facilities.

The monitoring procedures of FDOT roads and highways are described in the Florida Department of Transportation Statewide Storm Water Management Plan Attachment 23. It specifically describes requirements of sampling and record keeping. FDOT will notify Broward County DPEP when it is determined that high risk industrial facility is discharging to a FDOT-MS4 facility. Corrective and/or enforcement actions will be coordinated between the discharging facility and Broward County DPEP.

FDOT is not aware of any high risk facilities with Drainage Connection Permits or that are located in FDOT area of control. FDOT Districts have an inter-local agreement with Broward County to perform both the inspection and monitoring of high risk facilities.

Strengths and Weakness:

Broward County has an enforcement program which existed prior to this permit. A large percentage of the high risk facilities are located in the City of Fort Lauderdale and the City of Hollywood and this is an overlap of resources.

Assessment of Control:

Current controls are adequate for complying with the permit requirements.

Revisions:

No revisions are required or requested for this element.

Compliance Status:

Compliance achieved.

9. a.) Construction Site Runoff - Site Planning & Structural and Non-structural Controls

Objective: Require the use and maintenance of appropriate structural and non-structural best management practices to reduce pollutants discharged to the MS4 during the time of construction.

Activities Completed:

Broward County controls construction site runoff through the requirements of stormwater management construction/operation license. FDOT controls construction site runoff through the requirements of the Drainage Connection permit (see Appendix B) which complies with state water policy. FDOT Districts have an inter-local agreement for NPDES construction inspection services with Broward County in order to meet compliance with this component of the NPDES MS4 permit.

General Discussion:

New storm water management systems owned or operated by permittee(s) shall adhere to the treatment performance standards set forth in the State Water Policy. In addition, new land development and construction projects shall incorporate Broward County DPEP's BMP guidelines for erosion, sediment, and runoff control and surface stabilization as described in the Part 2 application.

Areas of new development, significant redevelopment, and new flood control projects must receive a Stormwater management construction/operation license. These licenses must comply with State Water Policy, as stated in Broward County Code, Section 27-200 (b)(1)h, *"No surface water management license shall be issued in the absence of reasonable assurances by the applicant that the surface water management system... is consistent with the state water policy, Chapter 62-40, F.A.C."* Therefore, new storm water management systems owned or operated by permittees adhere to treatment

performance standards set forth in the State Water Policy.

Broward County DPEP has developed a document entitled "Stormwater Control Best Management Practices for Broward County Construction Sites". The document provides the reader with detailed information on techniques to control construction site Stormwater pollution. The controls selected are by no means all inclusive but instead are a subset of controls suitable for the conditions of Broward County. Most of the information was taken from *Stormwater Pollution Management for Construction Activities* (EPA- 832-R-92-005). The report divides best management practices (BMPs) into three categories - erosion and sedimentation stabilization controls, erosion and sedimentation structural controls, and other pollution controls - and provides detailed information on specific techniques.

As per the FDOT Statewide SWMP, employ new FDOT Drainage Connection Permit conditions which require connecting entities subject to the NPDES storm water regulations to submit a copy of their NPDES Storm Water Pollution Prevention Plan to FDOT.

FDOT SWMP has been modified concerning the requirement for a Storm Water Pollution Prevention Plan (SWPPP). A Notification of Intent (NOI) is now required of an applicant wishing to connect to FDOT drainage. FDOT does not require a copy of the SWPPP at the time of application. Submittal of an NOI by an applicant is satisfactory proof that the applicant is knowledgeable of the NPDES regulations. Should FDOT have concerns about the storm water quality during construction that would be the appropriate time to request to see the SWPPP.

Through a requirement of the BCDPEP and as stated in the Broward County Code, Section 27-200(b)(1)h, surface water must be consistent with State Water Policy. Therefore, all projects must receive a Stormwater management construction/operational license through BCDPEP. Currently, FDOT construction projects are built according to the Florida Development Manual : A Sound Guide to Land and Water Management (FDER 1988). EPA refers to it in the Federal Register for the NPDES Industrial Permit. They also refer to erosion control and sedimentation techniques and Best Management Practices that are listed in this manual. FDOT Construction concurs that these are the current guidelines used for all work. EPA should have the complete manual, but should extra copies be needed, applicable parts of the guide will be sent upon request.

Strengths and Weakness:

This program already exists in Broward County.

Assessment of Control:

Current controls are adequate for complying with the permit requirements.

Revisions:

No revisions are required or requested for this element.

Compliance Status:

Compliance achieved.

9. b.) Construction Site Runoff - Inspection and Enforcement

Objective: Implement a program for inspecting construction sites with runoff to the MS4s and for enforcing the requirement for control measures for runoff from construction sites to the MS4s.

Activities Completed:

Continue to inspect and enforce construction site runoff. Surface water management licenses were issued.

General Discussion:

Continue to implement the inspection program, as described in the SWMP within the Part 2 application, at construction sites where runoff discharges to the Broward County MS4, to maintain compliance with local storm water ordinances and codes. Include verification that construction site(s), subject to the NPDES Storm Water Regulations, within Unincorporated Broward County's jurisdictional limits, have a Storm Water Pollution Prevention Plan on site. Maintain a log documenting the inspections conducted.

Through the surface water management program, Broward County continues to issue surface water management licenses that authorize the construction, alteration or abandonment of a water management systems in accordance with license conditions. As outlined in Broward County Code 27-200(b), the license assures that the system will meet general criteria (i.e., provide adequate flood protection, do not adverse impact to surface and/or groundwater, etc.) as well as specific design criteria (i.e., one inch of runoff detention, one half inch of dry runoff retention, etc). A log of the construction projects investigated and issued is included in the table entitled "Construction Site Inspections Performed by DPEP Surface Water Management Licensing" in Attachment 13. In 1999, 158 construction projects have been issued surface water management licenses.

Additionally, a list of construction sites in Broward County subject to NPDES Storm Water Regulations was obtained from EPA. (Please see Attachment 14.) Only one of these sites, Griffin Road. in between SR7 and University Drive in the Town of Davie is in the area covered by this MS4 permit. The site was inspected on August 19, 1999. A Stormwater Pollution Prevention Plan was found on site. The best management practices for erosion and sediment control were applied.

There were some construction sites inspected in the county where permits were issued by drainage districts but no Notice of Intent was sent to EPA. The sites were inspected for construction sites runoff. Construction supervisors were educated about erosion and sedimentation control best management practices and other EPA requirements like NOI.

Provide a copy of the municipal program for inspecting construction projects for compliance with their licensing conditions and which provides for enforcement action against those in violation of their municipal permit stipulations. If none exist, develop and implement an inspection program for construction sites where runoff discharges to the MS4, to verify compliance with local storm water

ordinances and codes. The program shall include systematic inspection procedures, and proper enforcement mechanisms.

In the first year of the report it was mentioned that this program does not exist on the municipal level. An inspection and enforcement program for construction sites were developed and distributed to the municipalities. The program was also discussed at the training for construction site operators and inspectors DPEP on October 15, 1999. The program discusses in detail the role of the inspector, preparation for an inspection, causes of noncompliance and effectiveness of erosion and sedimentation control best management practices.

Develop and implement a program to inspect construction projects that propose to directly discharge storm water to the FDOT MS4 and have been granted an FDOT drainage connection permit for compliance with FDOT permit conditions. Require connection entities, who are found or suspected of discharging storm water of unacceptable quality during or following construction, to sample and test the discharge to prove compliance with FDOT permit conditions.

An inspection program has been developed and implemented. The details of the programs are in Attachment 12.

Strengths and Weakness:

This licensing program already existed in Broward County. High growth and development makes this program labor intensive.

Assessment of Control:

Current controls are adequate for complying with the permit requirements.

Revisions:

No revisions are required or requested for this element.

Compliance Status:

Compliance achieved.

9. c.) Construction Site Runoff - Site Operator Training

Objective: Conduct appropriate education and training measures for permittee's employees involved in either construction, site operations, inspections, or regulations of construction sites which discharge to the permittee's MS4.

Activities Completed:

Municipal construction site operators were given training for erosion and sediment control. Applicants

for DPEP surface water management licenses will be sent information concerning the NOI process if the construction site is more than five acres.

General Discussion:

Provide a description of any currently implemented curriculum and/or certification programs(s) for construction site operators.

On October 15, 1999 Broward County DPEP gave training to construction site operators and inspectors concerning erosion and sedimentation control. Sixty-five people from different municipalities and contractors registered for the course but only thirty five people were able to attend the training because of Hurricane Irene. A best management practices manual for sedimentation and erosion control were given to all attendees. The training was conducted by four certified trainers. Two weeks after the training an examination was conducted to certify the attendees. Lists of the people registered for the class and the people who took the examination are in the Attachment 4. The Florida Department of Environmental Protection (DEP), Tallahassee, has a similar training and the certification program. Every year they give the training to construction inspectors and operators in south Florida area.

Develop and implement a procedure to notify building permit applicants, in developments subject to the storm water regulations, of their application responsibilities under the NPDES permitting program for construction site runoff. After development, include a summary of procedures in the subsequent ANNUAL REPORT. This requirement may be satisfied through cooperative efforts with other permittees, public agencies or contracted entities.

Building permit applicants go through the surface-water program of the DPEP for an approval process. At the time of approval the applicants are notified about their responsibility for construction site runoff. The applicant will be required to submit best management practices for sedimentation and erosion control along with their construction drawing if the site is more than 5 acres. Applicant will be provided with the best management practices manual. At the time of construction, sites will be inspected for erosion and sedimentation control practices.

Strengths and Weakness:

This program improves the quality of inspection. It is very difficult to co-ordinate training for all inspectors at the same time.

Assessment of Controls:

Current controls are adequate for complying with the permit requirements.

Revisions:

No revisions are required or requested for this element.

Compliance Status:

Compliance achieved.

E. MONITORING

1. Surface Water Ambient Monitoring Program (SWAMP)

Objective : SWAMP is a collaborative effort between various agencies monitoring water quality and provides information to the public, elected officials and ecosystem managers. The SWAMP program has the following specific goals:

- $ Identifying and documenting the existing conditions of surface waters
- $ Support state water-quality criteria
- $ Identifying water quality changes over time in significant water bodies
- $ Documenting potential problem areas
- $ Establishing relatively pristine eco-region reference sites for comparison with affected waters
- $ Collecting biological data at the reference sites to establish preliminary techniques for measuring biological integrity and establishing bio-criteria
- $ Establishing a network of stations to monitor trends and water chemistry
- $ Providing information for managers, legislators, other agencies, and the public

In 1995, through a cooperative effort between Florida DEP, EPA, US Fish and Wildlife, US National Marine Fisheries Service, and DPEP, the following four quarterly monitoring sites were selected for inclusion in the SWAMP Trend Site Monitoring Network. The following five sites were chosen for inclusion in the network:

Monitoring Station Number	Location
3	Hillsboro Canal at 441
8/109	Pompano Canal at 441
27	South New River Canal at the Salinity Control Structure
32	Snake Creek Canal at US 27
43	Miami Canal-Conservation Area 3A

The five sites were sampled on a quarterly basis for Chlorophyll A, Conductivity, pH, Turbidity, Organic Nitrogen, Total Phosphorous, Total Nitrogen, Organic Phosphate, Flow Direction, Fecal Coliform, Fecal Streptoccoccus, Pheophytin A, Salinity, Temperature, Ammonia, Total Kjeldahl Nitrogen, Nitrite, Nitrate, Dissolved Oxygen, Total Organic Carbon, Flow Velocity, and Total Coliform.

Summary chart of the data: SWAMP monitoring data from December 1, 1996 to December 1, 1999 has been tabulated in attachment 21. The site Number 43 at Miami Canal-Conservation Area 3A is monitored by Florida Department of Environmental Protection and the other sites are monitored by Broward County DPEP. Station #8 has been moved to east of the original location and renamed station #109.

Discussion of the monitoring results:

		Monitoring Sites				
		#3	**#8/ #109**	**#27**	**#32**	**#43**
Samples		7	7	7	7	7
Miles		4.76	3.35	4.14	6.05	Not available
1996 to 1997	WQI_TSI	41	50	56	41	54
	Water Quality	Good	Good	Poor	Good	Fair
1997 to 1998	WQI_TSI	50	39	48	44	58
	Water Quality	Fair	Good	Fair	Good	Poor
1998 to 1999	WQI_TSI	43	49	49	35	59
	Water Quality	Good	Fair	Fair	Good	Poor

The water quality index (WQI) was developed to assess the quality of water relative to the overall Florida water quality. For the computation of the WQI, Florida DEP used data from 2,000 streams throughout the state (DEP 1994). A WQI= 50 represents the average stream in Florida from a water quality standard point of view. Lower indexes identify the best water quality conditions, while WQI's higher than 50 identify poorer water quality conditions.

Status of Monitoring: Compliance schedule in Part V.B.1 of the permit achieved.

Revisions: No revisions are required or requested for this element.

2. Outfall Monitoring

(A) The table entitled "Major NPDES Outfalls" in Attachment 15 contains an inventory of all the MS4[5] major outfalls[6] in Broward County. This table will be updated in the upcoming years of the permit.

(B) The NPDES Site #5, Site #6 and Site #7 were investigated for organic pollutants as described in the Table V.A.2.

TABLE V.A.2.

PARAMETERS	SITE	PERMITTEE(S)
Arsenic Chromium	NPDES Site #5	City of Margate
Benzo(b)fluoranthene Thallium Chrysene	NPDES Site #6	City of Lauderdale Lakes
Total Recoverable Phenolic Arsenic	NPDES Site #7	City of North Lauderdale (MCNAB Industrial)

Each site was sampled at least twice a year for the past three years and the organic pollutants were detected below the standard of violation limit in the samples. The sampling results are in the Attachment 22.

---

[5] "Municipal Separate Storm Sewer" means a conveyance, or system of conveyances (including roads with drainage systems, municipal street made channels, and storm drains):

(i) owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursua disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State Law such as a sewer distri district, or similar entity, or an Indian Tribe or an authorized Indian tribal organization, or a designated and approved managemer that discharges to waters of the United States;

(ii) designed or used for collecting or conveying storm water;

(iii) which is not a combined sewer; and

(iv) which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

[6] An outfall is defined as a "point source" as defined y 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include any open conveyances connecting two municipal separate storm sewers, or pipes, tunnels, or other conveyances which are in the middle of a stream or other waters of the United States and are used to convey waters of the United States. From EPA "Guidance Manual for the Preparation of Part 1 of the NPDES Permit Applications for Discharges from MS4"

F. SUMMARY OF SWMP AND MONITORING MODIFICATIONS

1. The Broward County NPDES MS4 Permit co-permittees currently includes 24 municipalities, FDOT, and Broward County. A new city, Weston, has been created from a portion of the unincorporated area of the County formerly the responsibility of Broward County. The corporate boundaries of the city of the Weston include the Indian Trace Development District (Indian Trace) and the West Lauderdale Water Control District (Bonaventure). Broward County will no longer be responsible for the storm water management program implementation for the streets and highways in Weston. Weston, rather than Indian Trace (which is not presently one of the co-permittees), is now responsible for the planing and regulation of storm water management activities within their corporate boundaries. We request that the City of Weston be added as a co-permittee for the Broward County NPDES-MS4 permit.

2. NPDES Site #5, Site #6 and Site #7 were sampled for organic pollutant as shown in the TABLE V.A.2 of this report on the page 62. The parameters were detected below the standard of violation in the last three years samples. Based upon sampling results, DPEP requests to eliminate the parameters from sampling for Site #5, Site #6 and Site #7.

3. The FDOT does not have any legal jurisdiction to enforce findings of illicit connections; therefore it is requested that the permit be modified to read " the requirement may be satisfied through cooperative efforts with other permittees".

4. The FDOT does not have legal jurisdiction to inspect or monitor high risk facilities. This requirement is satisfied through cooperative efforts of the lead permittee. Therefore, the FDOT request the permit be modified.

G. FISCAL ANALYSIS

Attachment 16 contains the fiscal analysis submitted by each of the co-permittees. The co-permittees have indicated budgets and funding sources for the year, FY99 and the upcoming FY00.

Permittee	1998-99	1999-00	Funding Sources
Broward County	$641,274.23	$641,274.23	Operating Funds
Coconut Creek	$1,281,810.00	$1,137,233.00	General Funnd
Cooper city	$176,585.00	$139,072.00	Stormwater Utility
Coral Springs	$910,000.00	$910,000.00	General and Water & Sewer
Dania	$661,707.00	$772,937.00	Utility and Public Works
Davie	$262,000.00	$256,000.00	General Fund
Deerfield Beach	$215,000.00	$225,750.00	General Fund
Hallandale	$282,779.00	$378,729.00	Stormwater drainage Fee
Lauderdale By the Sea	$12,600.00	$13,230.00	General Fund
Lauderdale Lakes	$109,000.00	$1,407,780.00	Stormwater Fund
Lauderhill	$965,000.00	$4,533,058.00	Utilities
Lighthouse Point	$100,000.00	$117,000.00	Public Works
Margate	$660,000.00	$688,000.00	Stormwater Utility
Miramar	$382,200.00	$417,593.00	General Fund
North Lauderdale	$55,000.00	$50,000.00	Capital and General
Oakland Park	$1,759,856.00	$2,426,498.00	Stormwater
Parkland	$20,000.00	$17,300.00	General Fund
Pembroke Park	$52,700.00	$52,700.00	Stormwater
Pembroke Pines	$1,945,950.00	$2,055,500.00	General Fund
Plantation	$128,500.00	$134,000.00	Gas Tax
Pompano Beach	$2,069,216.00	$2,173,265.00	General Fund
Sea Ranch lakes	$40,069.48	$101,000.00	General Fund
Sunrise	$1,531,047.00	$1,530,441.00	Stormwater Utility Fund
Tamrac	$1,483,895.00	$6,508,500.00	Storm Water Utility Fund
Wilton Manors	$579,575.00	$536,659.00	Stormwater Fund
Florida DOT	$858,634.00	$588,140.00	General Fund
Total	$13,903,906.76	$16,857,801.48	

H. FDOT STATEWIDE MANAGEMENT PROGRAM

Table **V.C.8.a.** - Table for FDOT Statewide Storm Water Management Program Element Status

FDOT STATEWIDE STORM WATER MANAGEMENT PROGRAM ELEMENT (To Be Conducted at State Office)	ACTIVITY ACCOMPLISHED DURING THE PERMIT YEAR?	DESCRIPTION OF RESULTING PROGRAM MODIFICATIONS	PROGRAM POLICY INCORPORATED AT DISTRICT OFFICE?
Evaluate the feasibility of the FDOT drainage connection permit becoming an operating permit requiring long-term storm water facility management by the connecting entity.	YES / NO (If no, list anticipated completion date)	State NPDES team evaluated drainage connection permit and agreed not to make it an operating permit.	NO
Add information specific to storm water runoff protection and reduction of chemical usage to the FDOT's *Turf Management Manual* and *Chemical Weed and Grass Control Manual.*	YES / NO (If no, list anticipated completion date)	No change will be made. Turf management manual is only a reference. SWAMP has been modified to reflect this.	YES
Evaluate, on an ongoing basis, innovative structural and non-structural BMPs and new technologies as they evolve to determine their efficiency and cost effectiveness in the field. Comment on those which are found suitable & adopted for use in FDOT projects in the District.	ONGOING ACTIVITY	No new technologies reviewed during permit year 3.	None

R0013067

Identify those of the non-storm water discharges listed under Part II.A.7.a. on page 16 of the permit, as well as any other non-storm water discharges, which will be allowed to be discharged into the FDOT MS4.	YES / NO (If no, list anticipated completion date)	Landscape irrigation from Turnpike maintenance activities, and unavoidable rising ground water due to shallow water table.	YES / NO

R0013068

Comments on Table V.C.8.a.

Evaluate the feasibility of the FDOT drainage connection permit becoming an operating permit requiring long-term storm water facility management by the connecting entity.

Comments: FDOT feels drainage connection permits should not be made into operating permits because: (1) FDOT does not have the regulatory authority to enforce environmental laws outside our right-of-way limits, and (2) District 4 does not issue drainage permits for actual connections. For district 4 , most sites are self-contained and not designed to flow onto state roadways. Since there is no true connection, there is no need for a long-term operating drainage permit. Most drainage permits on file already serve a purpose as a record of references for business along highways (should the need arise to know who is in the area of suspected illicit). No program policy will be incorporated at this district office for this element.

Add information specific to storm water runoff protection and reduction of chemical usage to the FDOT's Turf Management Manual and Chemical Weed and Grass Control Manual.

Comments: No change will be made to these manuals as they are for reference only. This element has been dropped from FDOT's Statewide Storm Water Management Program. No program policy will be incorporated at this district office for this element; it no longer exists in the SWMP.

Evaluate, on an ongoing basis, innovative structural and non-structural BMPs and new technologies as they evolve to determine their efficiency and cost effectiveness...

Comments: To review Best Management Practices in this district, please see the attached submittals on pay item 104-15 Soil Tracking Prevention Device and Rock bagging. Also, sumps are being used within manholes to keep them free of debris. This is being done in the field without a standard design or procedure on an as needed basis in order to alleviate any problems that might affect storm flow. These BMPs have been found to be effective for erosion control and help to keep storm water clean. New technologies that prove to be useful in the field are adopted and incorporated into program policy here at District 4.

Identify those of the non-storm water discharges listed under part II.A.7.a on page 16 of the permit, as well as any other non-storm water discharges, which may be allowed to be discharged into the FDOT MS4.

Comments: There are few non-storm water discharges that are actually allowed to flow into FDOT MS4. The ones we in Permits are aware of are air conditioning condensate from a beach condominium along A-1-A in Pompano Beach and a few city's irrigation water from medians on state roads.

Table **V.C.8.b.** - Table for FDOT Statewide Storm Water Management Program Training Status

FDOT STATEWIDE STORM WATER MANAGEMENT PROGRAM TRAINING (Conducted through State Office)	TRAINING CONDUCTED DURING THE PERMIT YEAR?	DESCRIPTION OF TRAINING COURSE	NO. OF DISTRICT EMPLOYEES COMPLETING TRAINING COURSE?
Conduct training for FDOT maintenance and construction inspectors in the identification and detection of potential storm water related problems, signs of illegal dumping and illicit connections, proper containment methods, and reporting procedures.	YES / NO (If no, give anticipated schedule.)	FDEP's certified erosion & sedimentation control	24 construction maintenance inspectors
Conduct training for the FDOT Emergency Coordinator assigned to each FDOT maintenance facility. Training shall not only educate the FDOT Emergency Coordinator in the proper containment of spills and spill reporting procedures, but shall include storm water remediation activities, storm water regulations, and storm water retrofitting necessary to eliminate polluted storm water discharges from FDOT maintenance facilities.	YES / NO (If no, give anticipated schedule.)	Hazardous Materials Emergency Response, 40hours training.	7 Emergency Coordinators
Conduct training for all FDOT personnel involved in the chemical weed and grass control program to ensure a safe and effective program. Incorporate into the training of these applicators an emphasis on storm water implications of the use of pesticides, herbicides, and fertilizers.	YES / NO (If no, give anticipated schedule.)	Herbicides / Pesticides Certification Refresher	7
Conduct training for all FDOT personnel involved in hazardous waste handling. Incorporate into the training a segment on the identification, detection, and reporting of illicit storm water connections and potential storm water related problems such as visible water quality degradation and signs of illegal dumping.	YES / NO (If no, give anticipated schedule.)	Hazardous Materials Emergency Response, 40 hours training, and implementation of the Turnpike's Hazardous Materials Emergency Response Procedures.	112 Emergency Coordinators

STORMWATER MANAGEMENT PROGRAM:
8.a.) Industrial and High-Risk Runoff - Identification of priorities and procedures for inspections.

PERMITTEE(S)	ACTIVITY	DATE DUE/ FREQUENCY	COMPLETED	COMMENTS
City of Boynton Beach, City of Delray Beach, City of Lake Worth, Village of Palm Springs, City of Riviera Beach, Village of Royal Palm Beach, City of West Palm Beach and NPBCID	88) Inventory and prioritize all existing high-risk facilities discharging into the MS4. High-risk facilities shall include municipal landfills, hazardous waste treatment, storage, disposal and recovery facilities, facilities that have reported under the requirements of EPCRA Title III, Section 313, private and municipal waste handling facilities and any other industrial or commercial discharge which the permittee determines is contributing a substantial pollutant loading to the MS4. This inventory shall identify the outfall and surface water body into which each high-risk facility drains.	Within 24 Months of the Effective Date of the Permit	YES	Inventory completed; priority ranking established. No high-risk facilities identified for Boynton, Palm Springs
	89) For the high-risk facilities identified, develop procedures for inspections. Provide a description of the procedures developed in the subsequent ANNUAL REPORT	Within 36 Months of the Effective Date of the Permit	YES	
FDOT	90) Develop procedures for the inspection of high-risk facilities which hold FDOT drainage connection permits to verify compliance with FDOT Drainage permit requirements. In cases where another regulatory agency requires a periodic certification of compliance, the program developed may allow FDOT to accept this certification of compliance in lieu of further inspections by FDOT. After development, include a summary of the procedures & inspection schedule in the subsequent ANNUAL REPORT for incorporation into the permit.	Within 24 Months of the Effective Date of the Permit	NOT APPLICABLE	This requirement has been eliminated.

R0013077

STORMWATER MANAGEMENT PROGRAM:
8.a.) Industrial and High-Risk Runoff - Identification of priorities and procedures for inspections.

PERMITTEE(S)	ACTIVITY	DATE DUE/ FREQUENCY	COMPLETED	COMMENTS
City of Boynton Beach, City of Delray Beach, City of Lake Worth, Village of Palm Springs, City of Riviera Beach, Village of Royal Palm Beach, City of West Palm Beach, NPBCID and FDOT	91) Begin performing inspections of identified high-risk facilities, implementing procedures to determine if they are in compliance with all appropriate aspects of the stormwater program (e.g. no illicit connections; compliance with local stormwater regulation requirements; and if the facility is required to have NPDES permit coverage, a copy of the NPDES stormwater pollution prevention plan on site). Maintain a list of all industrial stormwater sources discharging to the MS4 and include an update in each ANNUAL REPORT of any additionally identified industrial facilities not previously listed. Maintain a log documenting the results of the inspections performed.	Within 36 Months of the Effective Date of the Permit	YES	High-risk facilities inventory updated annually by co-permittees. No high-risk facilities noted by Boynton Beach, FDOT or Palm Springs. No high-priority, high-risk facilities noted by NPBCID, Riviera Beach, or Royal Palm Beach. Inspection programs in place for all permittees.

STORMWATER MANAGEMENT PROGRAM:
8.b.) Industrial and High-Risk Runoff - Monitoring for High-Risk Industries.

PERMITTEE(S)	ACTIVITY	DATE DUE/ FREQUENCY	COMPLETED	COMMENTS
City of Boynton Beach and City of Delray Beach	92) Develop and Implement a monitoring program for high-risk industrial facilities. Provide, in the subsequent ANNUAL REPORT, a summary of the municipal stormwater monitoring program developed for high-risk industrial facilities which discharge into the MS4.	Within 24 Months of the Effective Date of the Permit	NOT APPLICABLE	No high-priority, high-risk facilities discharging into MS4.
City of Lake Worth, Village of Palm Springs, Village of Royal Palm Beach, and NPBCID	93) Provide a summary of the municipal stormwater monitoring program for high-risk industrial facilities which discharge into the MS4.	Provide in second ANNUAL REPORT	YES	
NPBCID	94) Provide a summary of the surface water monitoring study of the closed landfill.	Provide in first ANNUAL REPORT	YES	

R0013078

STORMWATER MANAGEMENT PROGRAM:
8.b.) Industrial and High-Risk Runoff - Monitoring for High-Risk Industries.

PERMITTEE(S)	ACTIVITY	DATE DUE/ FREQUENCY	COMPLETED	COMMENTS
FDOT	95) Develop a monitoring program which addresses the water quality standards included in the FDOT permitting process for those high-risk industrial facilities which hold FDOT drainage connection permits. Include a description of the specific enforcement steps to be taken to require compliance with permit conditions if violations are identified.	Within 24 Months of the Effective Date of the Permit	NOT APPLICABLE	This requirement has been eliminated.
	After development, Include a summary of the monitoring program in the subsequent ANNUAL REPORT for incorporation Into the permit.	Within 36 Months of the Effective Date of the Permit		
	Begin implementing the monitoring program for high-risk industrial facilities.			

R0013079

television advertisements, tours and the hazardous waste hotline. Additionally, the SWA participates in or hosts various special events within the community to increase public awareness of hazardous waste. The co-permittees are informed about SWA activities and are provided literature about the programs through a number of avenues such as the NPDES Steering Committee, Palm Beach County Municipal League and the SWA itself.

The SWA also offers disposal services for eligible small businesses or Conditionally Exempt Small Quantity Generators (CESQG), for a fee. CESQGs often have difficulty obtaining cost-effective disposal services due to the relatively small amount of waste they generate.

4.12 Sanitary Sewage Seepage

The co-permittees have instituted programs to minimize discharges of dry and wet weather overflows from sanitary sewers into the MS4. During the dry weather field-screening program, the MS4 system is evaluated for any signs of wastewater contamination. If wastewater contamination is suspected, the appropriate utility authority is notified so that corrective actions can be taken. All co-permittees with operation and maintenance responsibilities for sanitary sewer systems indicated they have ongoing sanitary sewer evaluations for investigation of leaks. These programs include monitoring lift station pumping rates to detect greater than normal flow rates, televising sewer systems to detect leaks and scheduling corrective maintenance. Additionally, utilities have established procedures, including containment, reporting and cleanup, to handle sewage spills.

4.13 High-Risk Industrial Facilities

The NPDES permit requires the co-permittees to maintain an inventory, establish a priority ranking, and develop procedures for the inspection of high-risk facilities discharging into the co-permittee's MS4. A high-risk facility, as defined by the NPDES permit, is any one of the following:

- Operating and closed municipal landfills
- Hazardous waste treatment, storage, disposal and recovery facilities
- Facilities that have reported under the Emergency Planning and Community Right-to-Know Act (EPCRA).
- Private and municipal waste handling facilities
- Any industrial or commercial facility that a co-permittee determines is contributing a substantial pollutant loading to the MS4.

R0013080

The NPDES permit identified nine co-permittees, the City of Boynton Beach, the City of Delray Beach, the City of Lake Worth, the Village of Palm Springs, the City of Riviera Beach, the Village of Royal Palm Beach, the City of West Palm Beach, Northern Palm Beach County Improvement District and the Florida Department of Transportation as entities having the potential of high-risk facilities discharging into their MS4s. However, both the Village of Palm Springs and the FDOT have stated in their annual reports that high-risk facilities do not exist within their outfall drainage areas. To assist the municipalities in further clarification of the high-risk facility inventory, the above-referenced process (EPA and Palm Beach County databases) was provided to the co-permittees in Year 2 of the permit. In subsequent years the co-permittees conducted their own independent evaluation to develop their inventory of potential high-risk facilities. The inventory for these co-permittees may be found in the individual annual reports. The attached Table 4-4 identifies 20 co-permittees with high-risk facilities and the number of facilities identified during the fourth year of the permit. The high-risk facility inventory provides the co-permittees with information on potential pollutant sources for use when conducting investigations of the MS4 to identify and eliminate illicit discharges.

Inventory

In order to develop an inventory of high-risk facilities, databases developed by the Environmental Protection Agency (EPA) and Palm Beach County were searched by the Steering Committee staff. The Environmental Protection Agency's electronic databases include the Industrial NPDES permits, the Toxic Release Inventory, the Superfund List and the Resource Conservation and Recovery Information System. Palm Beach County hardcopy databases included the operating and closed landfill list; EPCRA Section 3.02 Facilities; and a list of businesses, commercial and industrial facilities located within wellfield protection zones.

The Steering Committee staff sorted the Palm Beach lists by municipality and provided this information to each co-permittee. The co-permittees were then charged with determining if each of the facilities were in fact located within their jurisdiction and would discharge to their MS4.

One approach used by some of the co-permittees is to map the location of each facility in a Geographic Information System. This data is then overlaid with the location of the drainage area associated with each of the co-permittee's MS4 outfalls. The facilities located within a co-permittee's drainage area can then be associated with the correct NPDES outfall and the receiving water body. For the fourth year inventory update, the co-permittees conducted their own research of available databases and developed their list of potential high-risk facilities discharging into their

R0013081

MS4. Databases used to develop the high-risk facility inventory have been organized into the following categories:

Municipal Landfills: A list of operating and closed landfills in the County may be obtained from the Palm Beach County Solid Waste Authority. This list was provided to the Environmental Protection Agency in the Part 2 MS4 Permit Application, General Volume, Section 6. For updated information on landfills within Palm Beach County, contact the Solid Waste Authority at (561) 930-2727 or www.swa.org.

Hazardous Waste Generation, Transportation, Treatment, Storage, Disposal and Recovery Facilities: These facilities are required to report to the appropriate State agency under the Resource Conservation and Recovery Act. Reported information is collected, validated and maintained by EPA regional offices in an information system (RCRIS) that can be accessed through the Environmental Protection Agency Internet site (www.epa.gov/enviro/index_java.html). This site allows queries of the database for all facilities located within Palm Beach County or a specific municipality. Adjacent municipalities should also be checked to ensure all contributors to the MS4 are accounted for.

Facilities reporting under the Emergency Planning and Community Right-to-Know Act (EPCRA): The Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) mandates that certain facilities report information on various substances stored or used at that facility. Section 3.02 of EPCRA requires reporting from any facility that has present a quantity that meets or exceeds the threshold planning quantity of any Extremely Hazardous Substance. A list of these facilities within Palm Beach County is available from the Palm Beach County Emergency Response Commission (Emergency Management Coordinator at (561) 712-6400). Section 3.13 of EPCRA requires that certain businesses submit annual Toxic Chemical Release Forms for each toxic chemical above the threshold amount. Reporting must be made to both the EPA and the respective State Emergency Response Commission. A list of the Section 3.13 facilities is found in the Toxic Release Inventory, accessible through the EPA Internet site (www.epa.gov/enviro/index_java.html).

The EPA site also maintains a list of abandoned and/or inactive or uncontrolled Superfund sites. The CERCLA Information System may be searched for these sites.

R0013082

Private and Municipal Waste Handling Facilities: A list of these facilities can be obtained from the EPA's database of industrial NPDES permits, available at the EPA Internet site (www.epa.gov/enviro/html/pcs/pcs_query_java.html).

Any Industrial Commercial Facility that the Co-Permittee Determines is Contributing a Substantial Pollutant Loading into Its MS4: Each co-permittee may add facilities to its inventory based on experience. Palm Beach County's wellfield operating permit database is an example of an inventory of facilities that co-permittees may review in developing their potential high-risk facility inventory. A list of the County's wellfield operating permit database is available only in hardcopy from the Palm Beach County Department of Environmental Resource Management at (561) 233-2400. Information on Palm Beach County Wellfield Protection Program including the Wellfield Protection Maps can be obtained by accessing the Internet site (www.co.palm-beach.fl.us/erm/divisions/protection/wellfield/index.htm).

Inspections

Co-permittees are required to develop and perform inspections of high-risk facilities to determine if these facilities are in compliance with all appropriate aspects of the stormwater management program (e.g. no illicit connections, compliance with local stormwater regulation requirements, and, if the facility is required to have NPDES permit coverage, a copy of the NPDES stormwater pollution prevention plan onsite). Additionally, a log documenting the results of the inspections must be maintained and an annual update of the inventory must be provided. Existing local inspection programs include the following: local fire departments inspect EPCRA Section 3.02 facilities; Palm Beach County Department of Environmental Resource Management (ERM) inspects businesses and industrial operations that are located within wellfield protection areas; Palm Beach County ERM also inspects pollutant storage tanks; Palm Beach County Health Department inspects facilities reported as small quantity generators. A copy of the Palm Beach County ERM Wellfield Protection Compliance Report form is attached to this report as Figure 4-3. This report form is completed by a Palm Beach County ERM representative while inspecting high-risk facilities within applicable wellfield protection zones. Also attached (as Figure 4-4) is a copy of the High-Risk Facility Inspection Checklist developed through coordination with the City of West Palm Beach Fire Rescue Department. This form is being reviewed by the Fire Rescue Department for incorporation into their existing inspection program and can be used by co-permittees during inspections.

The high-risk industrial facilities have been prioritized based on their potential to discharge pollutant loadings to the MS4. High-risk facilities identified as retail facilities and small quantity

R0013083

generators are considered to have a low-risk of contributing a pollutant loading to the MS4. Low-risk sites are facilities identified on the EPA's Resource Conservation and Recovery Information System (RCRIS) list; NPDES industrial permits list; municipal landfills; and Palm Beach County's inventories for Section 3.02 facilities. Priority high-risk facilities are those with a higher risk of contributing a substantial pollutant loading to the MS4s, such as those identified on the EPA's Toxic Release Inventory (TRI) or the Superfund List. Additionally, Palm Beach County's co-permittees can add any other facilities to the high-risk inventory as necessary. Palm Beach County co-permittees will conduct inspections on those facilities identified as priority/high-risk facilities. Options for conducting inspections include separate co-permittee inspections or utilization of existing programs conducted by local fire departments, Palm Beach County and/or other governmental entities. Table 4-4 provides a list of the number of low risk and priority high risk facilities with potential to discharge into the co-permittees MS4s.

During the current year, co-permittees reviewed and updated their high-risk inventory as necessary. The updated inventory identified 438 low-risk facilities and four priority high-risk facilities. Three co-permittees with priority high-risk facilities within their MS4 (Lake Worth - 1, Palm Beach Gardens - 1, and West Palm Beach – 2). Please refer to the individual annual reports for inspection and monitoring activities for these priority facilities.

4.14 Monitoring Activities

Palm Beach County co-permittees have identified seven main elements of the monitoring from the nine stormwater management programs. These elements include:

- Stormwater Collection Systems
- Sanitary Sewer Systems
- Dry Weather Field Screening of Outfalls
- High-Risk Facilities
- Illicit Investigations
- Water Quality Monitoring
- Construction Inspections

The inventory, inspection and monitoring associated with these elements provides a means to evaluate, synthesize and integrate the monitoring results within the required nine stormwater management programs to identify strengths, weaknesses, and revisions. Strengths associated with the above elements include an increase in the frequency of inspections, maintenance activities,

MEMORANDUM

SUBJECT: Final Report No. 2001-P-00013
State Enforcement of Clean Water Act Dischargers Can Be More Effective

FROM: Charles McCollum /s/
Divisional Inspector General for Audit
Western Division

TO: Sylvia Lowrance
Acting Assistant Administrator for
Enforcement and Compliance Assurance

Attached is our final report, "*State Enforcement of Clean Water Act Dischargers Can Be More Effective.*" The purpose of the audit was to determine whether EPA-authorized state enforcement programs protect the environment and human health. Our audit included your office, three regions, and one state within each region. We also took into account the results from a National State Auditors' Association joint review of state water programs.

This audit report contains findings that describe problems we have identified and corrective actions we recommend. This report represents the opinion of the OIG; the findings in this report do not necessarily represent the final EPA position. Final determinations on matters in this report will be made by EPA managers according to EPA audit resolution procedures.

ACTION REQUIRED

According to EPA Order 2750, you (as the action official) are required to provide this office with a written response to this report within 90 days of its issuance. For corrective actions planned but not completed by the response date, please provide the specific milestone dates for completing these actions.

If you or your staff have any questions, please contact me at (415) 744-2445, or Katherine Thompson, Team Leader, at (916) 498-6535. Additional copies of this report may be obtained from us or our website, www.epa.gov/oigearth/.

Executive Summary

Objective

The objective of the audit was to determine whether state enforcement of Clean Water Act discharge programs protect human health and the environment. This audit resulted from concerns over the effectiveness of state enforcement programs.

Forty-four states play a major role in implementing the Clean Water Act's National Pollutant Discharge Elimination System program. These states have EPA approval to issue and enforce permits that set limits on pollutants that can be discharged into our nation's surface waters. We evaluated state enforcement of discharge programs in three regions; within each region, we evaluated one EPA-approved state program. We also took into account information from five state audits.

Results in Brief

We believe that state enforcement programs could be much more effective in deterring noncompliance with discharge permits and, ultimately, improving the quality of the nation's water. EPA and the states have been successful in reducing point source pollution since the Clean Water Act passed in 1972. However, despite tremendous progress, nearly 40 percent of the nation's assessed waters are not meeting the standards states have set for them.

Strategies Need Reconsideration

The state enforcement strategies we evaluated needed to be modified to better address environmental risks, including contaminated runoff. Contaminated runoff, including agricultural and urban runoff, was widely accepted as causing the majority of the nation's remaining water quality problems. Although many sources of contaminated runoff were regulated, some were not.

EPA's Office of Enforcement and Compliance Assurance had set national enforcement priorities for urban and agricultural runoff, including storm water dischargers, sewer overflows, and concentrated animal feeding operations. However, its core program and monitoring systems have emphasized major industrial facilities and larger sewage treatment plants. State strategies were also inhibited by:

- Inadequate water quality data.
- Incomplete permit data.
- EPA-state relationships.
- State concerns over regulating small and economically vital businesses and industries.

R0013090

Compliance and Enforcement Systems Deficient

The states we evaluated did not have sufficient information on dischargers to effectively implement their programs. A major barrier to state program management was the lack of information about hundreds of thousands of dischargers that contributed to water quality problems.

One critical missing component of the Permit Compliance System was electronic transmission of self-monitoring reports. Without electronic reporting by dischargers, it was virtually impossible for states to monitor compliance with all permits.

EPA's Permit Compliance System—its national permitting and enforcement system—was incomplete, inaccurate and obsolete. The growth, variety and complexity of the regulated community had greatly outstripped the system capabilities. Hundreds of thousands of dischargers were not monitored by the system. Although many states were developing their own systems, they did not fill the information void.

State Enforcement Program Deficiencies

- Compliance systems lacked data for hundreds of thousands of smaller dischargers
- Serious toxicity violations and other violations were not reported
- Strategies for identifying unpermitted storm water dischargers were incomplete
- Enforcement actions were issued a year or more after violation
- Penalties failed to recover economic benefit of noncompliance
- Proactive strategies to avoid serious violations needed further development

States also had weaknesses in their compliance monitoring and enforcement systems, including not reporting serious, significant violations. The states we evaluated did not implement effective storm water compliance monitoring programs to detect and correct noncompliance in higher risk areas. Moreover, states needed to improve their enforcement response to significant violations to prevent further violations. Most of the enforcement actions we reviewed did not meet EPA's criteria for timeliness and often did not recover the economic benefit gained by violators.

Finally, to ensure fair and effective enforcement of the Clean Water Act, EPA regions need to improve their in-depth program evaluations and annual performance evaluations of state performance. These evaluations need to be consistent, continue toward a goal of measuring the effectiveness of performance, and be made easily accessible to the public.

Other Matters

In determining the status of EPA's plan to modernize its Permit Compliance System, we found that the Office of Enforcement and Compliance Assurance had not successfully collaborated with the Office of Water and the states in the design of the new system requirements.

R0013091

Recommendations

> *"A modernized [Permit Compliance] system should fulfill many programmatic needs and contribute to the demonstration of environmental outcomes and results."*
> -EPA Office of Water

We are recommending that the Office of Enforcement and Compliance Assurance, in partnership with the Office of Water and EPA regions, collaborate with states to develop risk-based enforcement priorities. EPA also should make modernizing its Permit Compliance System a high priority. Teaming with EPA's Office of Water and the states, the Office of Enforcement and Compliance Assurance should ensure that the new system will meet both federal and state needs.

We are also recommending that the Office of Enforcement and Compliance Assurance revise its enforcement guidance to better define significant violations for toxicity test failures, minor facilities, and storm water dischargers.

Lastly, the Office of Enforcement and Compliance Assurance should routinely determine whether states are fulfilling their obligations to monitor and enforce discharge programs. To do so, the Office should develop consistent criteria for in-depth program evaluations of state programs. These evaluations, along with state performance measures, should be accessible to the public.

Agency Comments

The Office of Enforcement and Compliance Assurance agreed with several of the conclusions in the report, including that states need to implement risk-based approaches to water enforcement and that it would be useful to have a process for periodic evaluation of the Clean Water Act program in each state. It agreed that modernizing the Permit Compliance System should be a high priority.

However, the Office expressed concern about the way some of the issues, as well as EPA's role, were characterized in the report, and claimed that many of the findings were based on "anecdotal information." The Office stated the draft report did not recognize that (1) it had an exhaustive process for setting national enforcement priorities, (2) states should be responsible for setting watershed-specific enforcement priorities, and (3) permit program requirements had flexibility that supported state enforcement strategies. The Office also believed the issues related to the Permit Compliance System were oversimplified.

The Office of Enforcement and Compliance Assurance believed that existing national enforcement guidance had the necessary flexibility to address toxicity, minors, and storm water violations. It agreed to work with EPA regions to ensure that the states were aware of the guidance. The Office agreed to consider the OIG's specific recommendations

R0013092

when guidance is updated in the future. The Office also agreed that elements of state compliance and enforcement programs need to be periodically evaluated.

OIG Position

The Office of Enforcement and Compliance Assurance either specifically agreed with the vast majority of our conclusions or did not dispute them. However, in many cases it did not agree to a specific course of action to correct the problem. Instead, the Office defended existing guidance, processes, and systems. It agreed to reassess some of its guidance, but did not state when. It proposed alternative recommendations, but did not agree to take them.

In short, the Office was reluctant to change its current way of conducting business. However, the current way of conducting business was marginally effective.

We agree that states have helped develop national priorities and that they are responsible for developing risk-based strategies. However, states cannot be fully effective until the Office of Enforcement and Compliance Assurance allows states more latitude in the redirection of their resources.

Also, EPA had taken too long to modernize the Permit Compliance System, leaving huge information gaps for minor and storm water dischargers that rendered the system inadequate. Further, the existing guidance and processes for ensuring the prevention or correction of significant toxicity, minor discharger, and storm water violations were not working – thousands of toxicity violations occurred nationally and numerous facilities had recurring violations. The guidance needs updating.

Although the Office of Enforcement and Compliance Assurance asserted our conclusions in this report were based on "anecdotal" evidence, we disagree. Anecdotal information was only used to provide examples. As discussed with the Office, our audit was based on extensive data analysis, document reviews, interviews, surveys, and observations. Details on our scope and methodology are in Exhibit 1, page 65.

Part I
Introduction

Chapter 1
Objective, Background, and Scope and Methodology

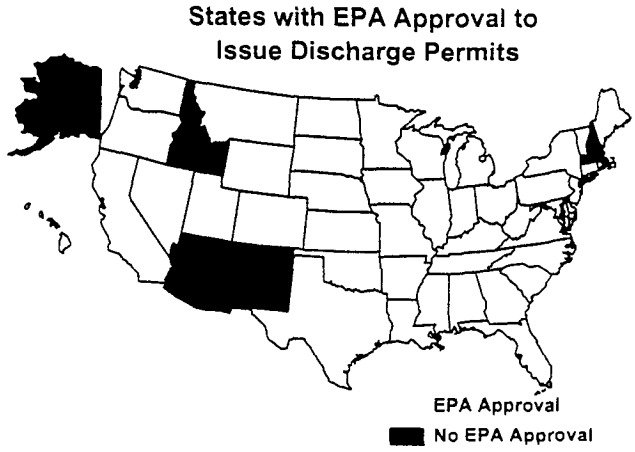
Objective

The objective of the audit was to determine whether state enforcement of Clean Water Act discharge programs protects human health and the environment.

Background

The purpose of the Clean Water Act's discharge permit program is to protect human health and the environment by setting limits on pollutants that can be discharged into our nation's surface waters. The goal of the Clean Water Act is for all rivers, lakes, and estuaries to be swimmable and fishable.

Citizens, industries, states, local governments, and the federal government have done much to improve the quality of our nation's waters in the last 30 years:



- More than a trillion dollars, much of it authorized under the Clean Water Act, was spent to build, upgrade, and expand wastewater treatment facilities.
- EPA and the states have written and enforced over 70,000 permits to limit pollutants.

Controlling point sources has removed billions of pounds of pollutants from our waters and doubled the number of waters safe for drinking and swimming. Much of this success can be credited to the Clean Water Act, which was enacted in 1972.

Despite the successes of the Act, EPA reports that a majority of Americans live within 10 miles of a polluted river, lake, stream or coastal area. Although there is not an accurate portrayal of water quality conditions nationwide, the 1998 National Water Quality Inventory found that nearly 40 percent of the nation's assessed waters were not meeting the standards states have set for them.

R0013095

Discharge System

Much of the Clean Water Act's improvements can be attributed to the National Pollutant Discharge Elimination System, a program to control discharges from "point sources" of pollution. Point sources are discrete conveyances, such as pipes or man-made ditches.

Forty-four states play a major role in implementing the Clean Water Act's discharge program. These states have EPA approval to issue and enforce permits that set limits on pollutants that can be discharged into our nation's surface waters. EPA regions issue permits in the remaining states.

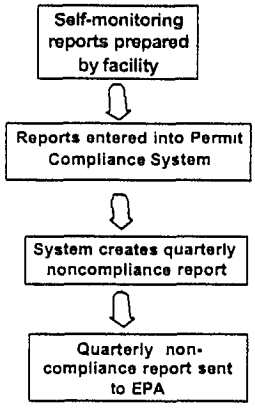
Several categories of discharges are covered under the permit program, including municipal waste water and industrial process waste water. These facilities are generally classified as major or minor, depending on size and nature of the discharges. For example, a major municipal treatment plant typically discharges one million gallons or more per day.

Runoff Permits

In 1987, Congress added provisions to the Clean Water Act that called attention to another source of problems that was believed to be responsible for continuing water quality problems: contaminated runoff from agriculture, airborne pollution, forestry, and urban development.

Idaho animal feeding operation runoff drains into a Snake River tributary

Amendments to the Clean Water Act and subsequent regulations require permits for storm water runoff from industrial activity, large and medium municipal storm water systems, and construction activities. Also, certain concentrated animal feeding operations, primarily those with over 1,000 animals and those discharging into waters,



R0013096

are subject to permit requirements. By law, most irrigated agricultural discharges have been excluded from permit requirements.

State Enforcement Systems

In order for states to have effective enforcement systems, they need sound enforcement strategies and compliance monitoring systems. They also need to take prompt and appropriate enforcement actions that deter future noncompliance not only at the facility, but at other facilities. EPA has developed an enforcement management system which sets criteria for identifying and reporting significant violations. In addition to enforcement guidance, the Office of Enforcement and Compliance Assurance issues the *Memorandum of Agreement Guidance* that establishes national priorities for enforcement programs.

Self-Monitoring Reports

States monitor facility compliance through inspections and self-monitoring reports. EPA recommends that states inspect major facilities annually. Also, facilities are required to regularly analyze their discharge and report the results on self-monitoring reports. States compare self-monitoring reports to permit limits to determine compliance. In addition, major dischargers are required to report significant violations to states within 24 hours.

States report significant violations to EPA in a quarterly noncompliance report. This report identifies major dischargers with significant violations, the nature of the violation, and the type of enforcement actions taken in response to those violations. EPA has defined violations of a sufficient magnitude or duration as "significant" in order to target those violations for a high enforcement priority.

EPA has established standards for taking enforcement actions on significant violations. Generally, if a major facility has two significant violations in two consecutive quarters, a state is expected to take a formal enforcement action before the end of the following quarter. EPA also recommends assessing penalties that recover the economic benefit of noncompliance gained by the violator.

Issues Impacting Enforcement Effectiveness

Nationally, there are two important issues that impact the effectiveness of permit enforcement in protecting human health and the environment.

- The backlog of expired discharge permits.
- The implementation of the Total Maximum Daily Load Program.

• Expired Permits

A backlog of expired permits is an ongoing, national problem that impairs enforcement. In fiscal 2000, about 25 percent of discharger permits for major facilities nationwide were expired. Federal law requires permits to be updated every five years. Permits are updated and reissued in order to

R0013097

conform with changing state and federal laws, pollution control technology, and water quality conditions. Outdated permits may not reflect new technology or water quality objectives, thereby impairing enforcement effectiveness.

- **Total Maximum Daily Load Program**

In the future, permit compliance will take on more importance in meeting water quality standards because of the Clean Water Act's Total Maximum Daily Load Program. A total maximum daily load is a calculation of the maximum amount of a pollutant that a water body can receive and still meet water quality standards, and an allocation of that amount to the pollutant's sources.

Total maximum daily load = sum of non-point sources + sum of point sources + margin of safety

States are required to:

- Identify water bodies not meeting water quality standards;
- Set priorities for calculating total maximum daily load;
- Develop a total maximum daily load for each pollutant in each listed waterway; and,
- Allocate loadings to both permitted dischargers and to non-point sources.

States have just begun to implement this program for water bodies identified as impaired. It is likely that permit limits for some pollutants will be more stringent after total maximum daily load calculations are completed. And, if limits are exceeded, it may prevent the water body from meeting water quality standards.

Scope and Methodology

This audit resulted from concerns over the effectiveness of state enforcement programs. We focused on the Clean Water Act discharge program because of a lack of recent audit coverage in this area.

In addition to evaluating national data, we evaluated three EPA regions: 4, 8, and 9. In each region, we evaluated one state with EPA approval to issue discharge permits: California (Region 9), North Carolina (Region 4), and Utah (Region 8). We also took into account recent audit reports from the following states: Arkansas, Colorado, Louisiana, Maryland, and Oregon. Our scope and methodology are further discussed in Exhibit 1, page 65.

R0013098

Part II
Strategies Need Reconsideration

Chapter 2
State Enforcement Strategies Need to Be Modified

"...nearly 40 percent of the nation's assessed waters are not meeting the standards states have set for them."
-Office of Water, May 2000

State enforcement strategies and systems needed to be modified to meet the goals of the Clean Water Act and to better protect human health and the environment. In the three states we reviewed, there were opportunities to better align enforcement strategies and resources with water quality impairments.

EPA and the states have been successful in reducing point source pollution since the Clean Water Act passed in 1972. However, despite tremendous progress, nearly 40 percent of the nation's assessed waters are not meeting the standards states have set for them. Contaminated runoff, both regulated and unregulated, is widely accepted as causing the majority of the nation's remaining water quality problems.

In the past, EPA and the states have focused their efforts on major dischargers because they were relatively few in number but discharged large quantities of pollutants. We believe enforcement strategies should be environmentally risk-based and better address:

- The relative risks presented by contaminated runoff, such as storm water and concentrated animal feeding operations.
- A rapidly growing number of smaller dischargers.
- Unique problems causing impairments in individual watersheds.

EPA's Office of Enforcement and Compliance Assurance had set national enforcement priorities and developed strategies for addressing runoff, including storm water dischargers, sewer overflows, and concentrated animal feeding operations. However, its core program and monitoring systems emphasized major industrial facilities and larger sewage treatment plants. State strategies were also inhibited by:

- Inadequate water quality data.
- Incomplete permit data.
- EPA-state relationships.

R0013099

- State concerns over regulating small and economically vital businesses and industries.

EPA's Strategic Plan

EPA's Strategic Plan lays out the Agency's 10 long-term goals for protecting human health and safeguarding the environment. In addition to long-term goals for achieving clean air, clean water, and safe food, one of EPA's 10 goals is to ensure full compliance with laws intended to protect human health and the environment.

EPA cannot achieve its goals without partnerships with states. States play a major role in implementing the Clean Water Act's discharge program. Forty-four states have EPA approval to issue and enforce Clean Water Act discharge permits. EPA regions issue discharge permits in the remaining states. States write more than 90 percent of all federal environmental permits and take over 75 percent of enforcement actions.

Need for New Strategies

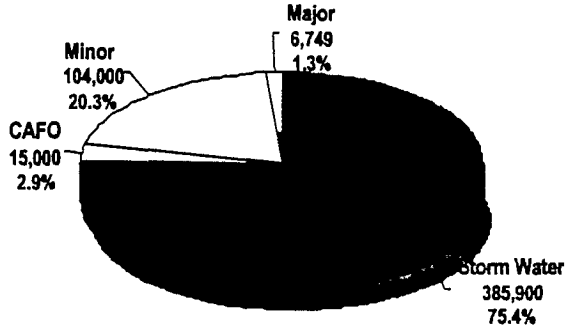
In the past, EPA and the states have focused their efforts on major dischargers because they were relatively few in number but discharged large quantities of pollutants. We believe enforcement strategies should be environmentally risk-based and better address:

- Changing sources of pollution;
- An increasing universe of permit holders; and
- Watershed approaches to improving water quality.

Changing Sources of Pollution

Contaminated runoff, such as agricultural and urban runoff, was widely accepted as causing the majority of the nation's remaining water quality problems. Agricultural runoff (crops and animal husbandry) was ranked as the number one cause of impaired rivers, streams, and lakes. Some of these sources have been regulated; others, such as irrigation runoff, have not.

Swimmers frolic in Southern California waters often posted as unsafe due to urban runoff. (Photograph by Chas Mativier, Orange County Register.)



EPA issued regulations in 1976 to permit discharges from concentrated animal feeding operations; since that time, the livestock industry substantially increased both the number and size of these large animal feeding operations. Combined releases of more than 30 million gallons of animal waste to surface

R0013100

water in a number of states have highlighted the adverse environmental impacts of concentrated animal feeding operations. By law, agricultural storm water discharges and return flows from irrigated agriculture have been excluded from permit requirements.

In order to address urban runoff, the Clean Water Act was amended in 1987 to regulate municipal and industrial storm water discharges. Phase II of these regulations was added in 1999, thereby regulating a large number of smaller facilities. Storm water is a continuing concern; it was the largest source of water pollution in urban areas, such as Los Angeles.

Clean Water Act Permits
(Includes Phase II Storm Water Permits)

CAFO is concentrated animal feeding operation
Source: EPA Office of Water

In response to changing regulations and sources of water impairments, the Office of Enforcement and Compliance Assurance has suggested enforcement strategies for storm water dischargers and concentrated animal feeding operations. These strategies are accessible by states.

Increasing Permit Universe

The addition of storm water regulations more than tripled the regulated universe. The ballooning regulated universe, along with other issues, such as the backlog of out-of-date permits and the lack of data systems, has made it virtually impossible for states to fully permit, monitor, and enforce the regulated universe.

Watershed Strategies

The watershed approach to solving water quality problems calls for individual strategies tailored to each watershed rather than a focus on major dischargers or types of agricultural or urban runoff.

"To achieve the nation's clean and safe water goals, EPA will implement the watershed approach...."
-EPA's Fiscal 2001 Annual Plan

R0013101

EPA's annual plan calls for a watershed approach to fulfill the goal of the Clean Water Act. EPA regions have partnered with states, local governments, private industry, and environmental organizations to create some effective watershed strategies.

States Can Improve Effectiveness

The states we reviewed continued to emphasize inspecting and monitoring major dischargers, although contaminated runoff, including storm water runoff, was widely accepted as causing the majority of the nation's remaining water quality problems. EPA and the states could improve the effectiveness of state enforcement programs by developing risk-based enforcement strategies. EPA has a role in evaluating the effectiveness of state strategies and supplementing them, when necessary and feasible.

> Contaminated runoff is widely accepted as causing the majority of the nation's water quality problems.

In the three states we reviewed, there were opportunities to better align enforcement strategies and resources with water quality impairments.

California

> *"The polluted runoff problem is the number one water pollution problem in California."*
> -California Resources Secretary

California identified storm water as its most serious water quality problem. However, it had invested relatively little resources in inspecting and monitoring storm water. Meanwhile, storm water runoff continued to cause water impairments and beach closures. At the same time, the state had a relatively significant investment in monitoring and enforcing its major dischargers, although the state reported a relatively high compliance rate. In fiscal 2000, the state increased its storm water staffing; however, it needed to further evaluate whether its enforcement resources would yield a better return by monitoring other sources.

North Carolina

North Carolina had not developed a strategy for monitoring compliance with storm water permits, although storm water was a significant contributor to its water quality impairments. As discussed in Chapter 6 (page 53), North Carolina was taking actions to better measure the effectiveness of its enforcement strategies.

Utah

We found indicators that Utah could more effectively use its enforcement resources to address the risks that agricultural and urban runoff presented to Utah's water quality. Specifically, agricultural practices, land development, and urban runoff were listed as sources of impairments of surface waters or ground water. However, we found that monitoring strategies were not fully

R0013102

developed for either its storm water or concentrated animal feeding operation dischargers.

Reasons for Emphasis on Major Dischargers

We believe the emphasis on major dischargers was typical of many states because EPA's implementation of the Clean Water Act focused on major dischargers. Due to limited resources, EPA and the states had decided many years ago to focus on major dischargers because they were relatively few in number but discharged large quantities of waste water. Subsequently, EPA and state management systems were well developed for major dischargers but not for other sources, such as storm water, which had new types of permit limits.

States needed more latitude in the redirection of their resources. The state programs we reviewed did not have the resources and systems to permit, monitor, and fully regulate smaller dischargers, such as storm water. States did not have mechanisms to evaluate tradeoffs in different enforcement strategies. Also, states were not encouraged to divest in major dischargers.

Implementation Focuses on Major Dischargers

Much of the Clean Water Act's implementation over the last quarter of a century focused on addressing point sources, particularly major dischargers:

- EPA and many of the EPA regions emphasized inspecting, monitoring, and enforcing major discharger permits in program guidance, performance measures, and oversight reviews.

- The Code of Federal Regulations required states to have the capability to inspect all major dischargers annually. EPA and its regions stressed and monitored the annual inspection of all major dischargers. Utah cited EPA's 100 percent inspection requirement of major dischargers as one reason it was difficult to shift to other priorities.

- EPA's Permit Compliance System included little data for nonmajor dischargers. Because of states' concerns over the cost of data entry requirements, EPA policy did not require data from other dischargers to be entered into the system.

- National standards were set for taking action on significant violations by major dischargers but standards were unclear for other dischargers.

Contaminated Runoff Not Easily Regulated

The state programs we reviewed did not have the resources and information systems to permit, monitor, and fully enforce regulated runoff, such as storm water. As discussed more fully in Chapter 4 (page 35), the states we

R0013103

reviewed had minimal coverage of storm water dischargers. The addition of storm water regulations greatly increased the size of the regulated universe without a commensurate increase in resources or information systems. Thus, states were limited in their ability to implement, monitor, and enforce storm water regulations. Further, as one EPA region noted, states were expected to fully implement the "core" program before moving onto programs to regulate contaminated runoff.

Mechanisms for Evaluating Tradeoffs Not in Place

The states we evaluated did not have mechanisms in place to weigh the relative merits of divesting in major discharger enforcement in order to more heavily invest enforcement resources in minor dischargers, agricultural feeding operations, storm water dischargers, industrial sectors, or watersheds. Although the Office of Enforcement and Compliance Assurance's program guidance allowed states to change their enforcement priorities, it did not encourage divesting in major dischargers.

Best Practice: Strategy Evaluation Process

One notable "best practice" we found was in Region 10's process for evaluating the impacts of different state enforcement strategies. Region 10 issued the Clean Water Act discharge permits for Idaho and Alaska.

Region 10 Best Practice: Strategy Evaluation Process

- Evaluated shifting resources between monitoring different types of permits.
- Changed enforcement priorities.
- Quantified improvements to water quality resulting from shifting resources.

The Region had established a process to evaluate the effectiveness of investing resources in monitoring and enforcement of all categories of permit holders, including minor facilities and concentrated animal feeding operations.

As a result of its evaluation, the Region changed its enforcement priorities and ultimately caused improvements in water quality. The Region moved some of its resources from monitoring major dischargers to other sources, such as storm water. It also created a cost-effective system to monitor minor dischargers. As a result, the Region:

- Realized substantial reductions of pollutant loadings.
- Significantly increased compliance rates.
- Provided an impetus for municipality infrastructure investments that were necessary for long-term improvements in water quality.

R0013104

State Enforcement Priorities Need Development

EPA, its regions and the states need to jointly develop priorities that address each state's risks to water quality and maximize the effectiveness of enforcement resources.

> *"Section 106 grants continue to support the compliance and enforcement efforts undertaken at the State level to protect surface water quality."*
>
> -EPA Office of Water

EPA impacts state enforcement priorities in several ways. First, EPA must approve state enforcement programs before they can operate. EPA also provides states with Clean Water Act water pollution control grants and negotiates related grant agreements. For fiscal 2001, Congress appropriated about $170 million for states, territories, and Indian tribes for administering water pollution control programs. Further, the Office of Enforcement and Compliance Assurance sets national priorities in its program guidance; regions use this guidance to develop enforcement priorities with states.

In its program guidance, the Office of Enforcement and Compliance Assurance set national priorities for enforcing "wet weather" dischargers, including sewer overflows, concentrated animal feeding operations, and storm water. It also identified two industrial sectors as priorities: petroleum refineries and metal electroplating.

EPA's Wet Weather Enforcement Priorities

- Combined sewer overflow policy
- Sanitary sewer overflow enforcement system
- Concentrated animal feeding operations sector strategy
- Storm water regulations

-Fiscal 2000/2001 guidance

The Office of Enforcement and Compliance Assurance consulted with states (and EPA regions and Office of Water) in setting these priorities. It also considered public health and environmental risk as reported by states and the Office of Water. As a result of its process, wet weather issues, such as sewer overflows and contaminated urban and agricultural runoff, along with storm water, were identified as national enforcement priorities for fiscal years 2000 and 2001.

However, these enforcement priorities did not necessarily reflect a state's or region's watershed-specific impairment problems. For example, some watersheds were impacted by surface mining. Also, wet weather priorities encompassed a large universe of dischargers that could not be easily

R0013105

addressed by states without finding new resources or divesting in other areas. Divesting in major dischargers was somewhat difficult because EPA grant work plans continued to contain requirements for inspecting major dischargers, a resource-intensive requirement.

Finally, agreed-upon state enforcement priorities were not necessarily followed. For example, for fiscal 1999, Utah agreed that three industrial sectors would be given priority: refineries, mineral mining, and steel making. We were unable to substantiate that the state took any priority actions for these sectors, which included some minor permit holders. The state's year-end report stated that the mineral mining and steel making sectors ended the year with zero and 50 percent compliance rates, respectively.

Barriers to Strategy Development

EPA and the states have been hampered by a number of significant barriers to developing and evaluating the effectiveness of enforcement strategies. They include:

- **Water Quality Data Gaps.** The General Accounting Office's (GAO) survey of all 50 states found that their abilities to identify and set priorities among water quality problems were impacted by (1) a lack of water quality assessments and (2) data limitations on causes and sources of water impairments. These data gaps were particularly serious in the case of diffuse non-point sources, which were widely accepted as contributing to the majority of the nation's water quality problems.

> *"Only six states reported that they have a majority of the data they need to assess whether their waters meet water quality standards."*
>
> -GAO, March 2000

- **Incomplete Compliance Data.** Due to limited resources, EPA's Permit Compliance System and state systems had incomplete data on smaller dischargers, concentrated animal feeding operations, and storm water dischargers. There were serious data gaps on the amounts and types of pollutant discharges, the number of facilities without required permits, and compliance rates. These gaps hampered the development of risk-based strategies. (This issue is discussed further in Chapter 3, page 19.)

- **Compliance Standards Not Established.** EPA and the states we reviewed had not set compliance standards for types of

R0013106

dischargers, sectors, watersheds, or other specific categories. Without some standard, there was no objective basis for making decisions to invest or divest in certain sectors, areas, or programs.

- **Environmental Outcomes Difficult to Measure**. GAO found environmental outcomes were inherently difficult to measure for a number of reasons: the absence of baseline data, the inherent difficulty and expense involved in quantifying the outcomes, and the difficulty in establishing causal links that isolate the effect of a particular strategy.

- **Reluctance to Address Certain Sectors**. EPA enforcement officials told us some states were reluctant to address small businesses and economically vital industries.

We recognize these impediments impact EPA's and the states' abilities to set priorities and improve the effectiveness of enforcement investments. Nonetheless, as evidenced by the actions taken by Region 10, there is much that can be done to improve the effectiveness of enforcement with some relatively minor system changes and resource realignments. Further, the establishment of compliance standards would greatly aid the decision-making process.

State Partnerships Need Strengthening

EPA, its regions, and states needed to forge strong partnerships in order to improve the effectiveness of enforcement and help solve environmental problems. State enforcement priorities were sometimes not made in a partnership fashion.

"It is of great importance to the states and to the nation that our partnership [with EPA] be strengthened."
-Environmental Council of the States

As pointed out by the National Academy of Public Administration, there are many impediments to a performance-based EPA-state relationship. Certainly, the lack of data is a major impediment. The Academy concluded that other impediments were EPA's state oversight role and a concern that states will weaken environmental protection.

However, actions by Region 10 and some states show that enforcement effectiveness can be greatly improved. We believe EPA-state collaboration is essential to maximize the effectiveness of limited enforcement resources, to

R0013107

reach EPA's goal of compliance with environmental laws, and to improve our nation's waters.

Recommendations

We recommend that the Assistant Administrator for Enforcement and Compliance Assurance:

3- 1. In partnership with the Office of Water and EPA regions, collaborate with states to develop risk-based enforcement priorities. Encourage states to develop mechanisms to evaluate tradeoffs in enforcement investments.

3- 2. Provide states more latitude in the redirection of their resources. In this respect, eliminate the goal to inspect all major dischargers annually.

Agency Response and OIG Position

*2-1. **Risk-Based Priorities**. The Office of Enforcement and Compliance Assurance explained that it already has a consultation process in place in which EPA regions, states, EPA's Office of Water, and other stakeholders are extensively consulted in determining the national water enforcement priorities for each 2-year cycle. A major factor in identifying the candidates for priorities is the element of risk. This consultation process was being used to shape the 2002/2003 Memorandum of Agreement guidance. The Office believed the OIG should recognize state involvement in identifying national priorities and recommend that the Office of Enforcement and Compliance Assurance develop a process to ensure states are implementing its risk-based strategies.*

The Office of Enforcement and Compliance Assurance asserted that its actions are not keeping the states from implementing a risk-based approach or from addressing watershed priorities. Its guidance and strategies provide states with the flexible framework they need to implement a risk-based program. While EPA regions can and do recommend that states participate in national water priorities, suggest where states might focus their resources, and meet with states to conduct joint work planning, the Office stated that, ultimately, it is a state's decision as to the priorities it will set. The Office stated that a "constructive" recommendation would be that EPA should place more emphasis on program reviews and improve its efforts to share best practices with the states.

R0013108

The Office disagreed with the finding that the "core" permit program inhibits the development of state strategies. The Office's guidance allows regions and states flexibility in shifting a portion of their total inspection resources from major to minor facilities, particularly in priority watersheds, where those minor facilities represent a significant risk. The Office also defended the Agency goal to inspect 100 percent of all major point sources annually because:

- *Major point sources generate the majority of effluent flow and toxic pollutant loadings which can significantly affect water quality in receiving waters.*
- *Significant environmental benefits associated with higher levels of compliance among majors would be lost if "we were to allow a total shift to minors."*

OIG Position: The Office's response partially addresses our recommendations. We recognize that states have been involved in setting national priorities. We agree that EPA should evaluate state enforcement strategies and share best practices. However, the Office of Enforcement and Compliance Assurance needs to further collaborate with EPA's Office of Water, regions, and states so that each state has an effective, risk-based enforcement strategy that addresses its unique risks to water quality. Further, the Office should foster the development of tools that states can use to evaluate tradeoffs in enforcement investments.

States have not been allowed total flexibility in deciding how to best invest their enforcement resources. EPA does, to some extent, control state enforcement programs. It authorizes states to operate these programs and sets rules, regulations, and goals for permitting, inspecting, monitoring, and enforcing discharge permits, especially those for major facilities. EPA state grants were typically contingent upon work plans which required states to perform a certain number of inspections of major and minor dischargers and perform other actions.

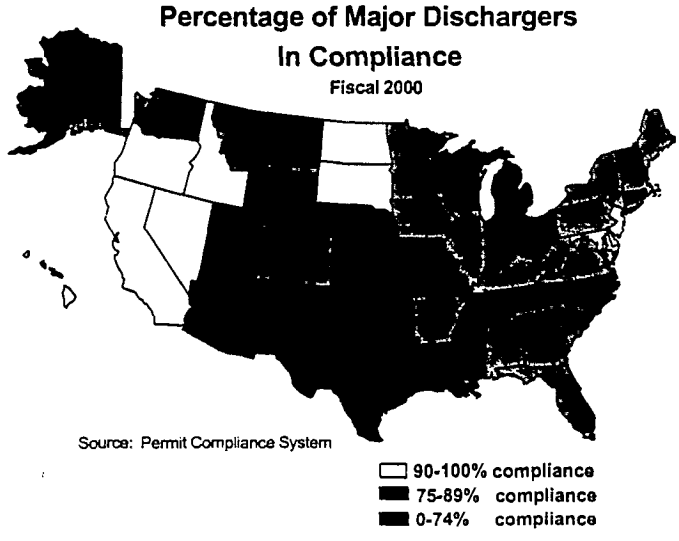
2-2. ***Inspections.*** *The Office of Enforcement and Compliance Assurance believed that state programs needed to have the ability to inspect all major dischargers annually. It cited several reasons, including:*

- *States should have minimum, quantifiable standards for procedures and resources.*
- *Major dischargers were high risk because they generate the majority of the effluent flow and toxic pollutant loadings.*

R0013109

- *Numerous noncompliance problems existed with major dischargers.*

The Office of Enforcement and Compliance Assurance also pointed out that it has issued guidance that allows minor facility inspections to be traded for major facilities at a 2:1 ratio, using risk-based rationale. The Office believed an appropriate alternative recommendation would be to ensure that any state that does not commit to inspect 100 percent of its major facilities develops and implements an inspection plan that targets an appropriate mixture of high risk dischargers (i.e., majors and minors) in priority areas such as impaired watersheds.



OIG Position: The Office of Enforcement and Compliance Assurance's response illustrates its reluctance to commit to a risk-based approach. We believe it is the impact state resources have on compliance and, ultimately, water quality, that should be used to determine the adequacy of a state's resource investment in major inspections and other activities.

R0013110

Part III
Compliance Monitoring and Enforcement Systems Deficient

The states we evaluated did not have sufficient information on dischargers to effectively implement their enforcement programs. One reason was that EPA's Permit Compliance System was incomplete, inaccurate and obsolete. The growth, variety and complexity of the regulated community had greatly outstripped the system capabilities. Compliance data for hundreds of thousands of dischargers were not monitored by the system because it was too costly to enter the data. Although many states were developing their own systems, they did not fill the information void.

States had other weaknesses in their compliance monitoring and enforcement systems, including not reporting serious, significant violations. The states we evaluated had not implemented effective storm water compliance monitoring programs to detect and correct noncompliance in higher risk areas.

Moreover, states needed to improve their enforcement response to significant violations to prevent further violations. Although EPA's goal was full compliance, only 10 states reported a compliance rate of 90 percent or better during fiscal 2000. Twenty states reported that less than 75 percent of their major dischargers were in compliance during the year. A discharger was defined as out of compliance with its permit when it had two significant, repeated violations of its permit within two consecutive quarters.

We recognize the compliance rate was not completely accurate because of deficiencies in EPA's Permit Compliance System. However, it provided an

R0013111

indicator of the states' compliance status. National compliance rates were not available for other sources such as minor facilities and storm water dischargers. As detailed later in this section, EPA and the states estimated a very large number of storm water dischargers were not in compliance because they had not obtained permits.

R0013112

Chapter 3
Permit and Other Information Systems Inadequate

The states we evaluated did not have sufficient information on regulated dischargers to determine the effectiveness of their enforcement programs.

A major barrier in state program management was the lack of information about hundreds of thousands of smaller dischargers that contributed to water quality problems. EPA's Permit Compliance System—its national permitting and enforcement system—was incomplete, inaccurate and obsolete. The system lacked data from these smaller dischargers. Although many states were developing their own systems, they did not fill the information void. As a result, states could not effectively implement the discharge program.

Without electronic reporting by dischargers, it will be virtually impossible for states to monitor compliance with permits.

One critical missing component of the Permit Compliance System was electronic transmission of self-monitoring reports. Without electronic reporting by dischargers, it will be virtually impossible for states to monitor compliance with all permits.

Further, serious toxicity violations were not classified as "significant," thereby overstating the national compliance rate. The states we evaluated had other weaknesses in their procedures for identifying significant violations.

Without sound compliance monitoring systems, significant permit violations that adversely impact water quality went uncorrected. At two of the three states, toxic discharges were released into impaired water bodies.

Permit Compliance System Had Serious Problems

EPA's Permit Compliance System Data

- Pollutant discharges
- Permit limits
- Permit violations
- Enforcement actions

EPA's permitting and enforcement information system— the Permit Compliance System—was incomplete, inaccurate and difficult to use. Compliance data from hundreds of thousands of smaller dischargers was not captured by the system and information in the system had serious limitations. Some states had created their own systems and, to some extent, duplicated the Agency's system. EPA was aware of these problems and, in 1999, identified the system as an Agency weakness. Until the system is upgraded, expanded, and reasonably accurate, its usefulness as a management and program evaluation tool will be seriously limited. As

R0013113

such, the system should continue to be reported as an Agency weakness until these problems are corrected.

EPA and state permitting and enforcement programs rely on EPA's compliance system; of the 44 states approved to issue permits, 39 states enter data into the system. EPA uses the system for program management and oversight purposes, including assisting in targeting enforcement activity to the areas experiencing compliance and environmental problems. The data are analyzed to help determine the quality of the nation's water bodies and will serve as the source of data for reporting purposes on EPA's progress in reducing pollutant loadings.

State Enforcement Program Deficiencies

- Compliance system excluded data for smaller dischargers
- Serious toxicity violations and other violations not reported
- Strategies for identifying unpermitted storm water dischargers needed development
- Many enforcement actions issued a year or more after violations
- Penalties failed to recover economic benefit of noncompliance
- Proactive strategies needed to avoid serious violations

System Capabilities Exclude Many Dischargers

The growth, variety, and complexity of the regulated community had greatly outstripped the system's capabilities. Dischargers not monitored by the system included:

- Storm water,
- Concentrated animal feeding operations, and
- Sewer overflows.

- *Permits Have Different Requirements*

The system was not designed for these type of permits, which had different permit requirements than the more traditional major and minor discharger permits. Generally, states were not entering discharge information on minor and storm water dischargers, concentrated animal feeding operations, and sewer overflows because EPA did not require it.

The lack of a sound monitoring system was particularly evident for storm water dischargers. The system was not designed to track storm water compliance data, and states did not maintain their own complete and

Number of Permits in EPA's Permit Compliance System

Type of Permit	Estimated Number of Permits	Number in System
Storm water	400,000	16,417
Concentrated animal feeding operations	15,000	5,608

R0013114

consistent data systems
for tracking and monitoring storm water compliance activities.

- *Thousands of Permits Need Data Entry*

Another reason data was excluded for smaller permits was because data entry was time-consuming. The Office of Water estimated there were about 400,000 storm water and 100,000 minor discharger permits. Compared to 7,000 major discharger permits, these permits represented a substantial workload. As such, EPA and the states had agreed that data only for major dischargers was required to be in the system.

In order for states to effectively monitor the myriad of smaller dischargers and others, electronic self-monitoring reports are critical. As noted later in this report, storm water and minor permit violations went undetected and uncorrected largely due to a lack of monitoring. Also, EPA had not yet been successful in its efforts to introduce electronic self-reporting. To effectively monitor all sources, EPA should set a high priority for implementing electronic reporting for all dischargers nationwide.

Best Practice: Electronic Reporting

California was testing electronic submission of self-monitoring reports and reported successful results. In addition to providing necessary environmental decision-making information, electronic self-reporting eliminates costs associated with preparing paper reports and repeat data entry by states and EPA. It also helps eliminate the failure of facilities and states to accurately report and categorize violations.

Best Practice: Electronic Self-Reporting

- Eliminates costs associated with preparing and reviewing paper reports
- Minimizes repeat data entry by EPA and the states
- Helps eliminate inaccurate reporting by facilities and states
- Facilitates the prompt review of discharge reports
- Allows large volumes of discharge data to be included in state and national data bases efficiently

System Inaccurate for Major Dischargers

In addition to excluding a large number of dischargers, the Permit Compliance System was inaccurate for a number of other reasons. For example:

- **California Data Not Entered** Beginning in fiscal 2000, the Office of Enforcement and Compliance Assurance had agreed to allow only about 30 percent of California's major facility compliance data to be entered into the system. These facilities represented the greatest amount of municipal flow and the industries of greatest concern.

R0013115

- **Utah's Noncompliance Rate Overstated.** A compliance system report showed that 65 percent of Utah's major facilities were in significant noncompliance for fiscal 1999. This rate was substantially overstated because the state had not entered self-monitoring reports into the system on time. The system did not have the capability to correct this error.

- **Report Unusable in Maryland.** A recent Maryland state audit report found the system generated many violations that did not represent actual violations.

- **Toxicity Violations Excluded** As detailed later in this chapter, whole effluent toxicity violations were not classified as significant violations and, in many cases, overstated the compliance rate.

As shown, it was questionable whether the compliance system fairly represented the compliance status of major facilities nationwide. It did not reflect the national compliance rate of other facilities. Without complete and accurate information, it was difficult to evaluate the effectiveness of permitting, compliance, and enforcement strategies.

System Obsolete

EPA readily acknowledged its compliance system was obsolete, resource intensive, and difficult to use. In spite of these factors, the system had not had any major redesigns in nearly 20 years.

The Permit Compliance System was first developed in 1974 and its last modernization effort was in 1982, nearly 20 years ago. Further, the system was:

- **Hard to use.** Due to the age and inflexibility of the system, it was not user friendly. The system was dependent on user coding and some users only saw the large quantity of data that was entered.

- **Resource Intensive**. The system required the manual entry of all data including facility self-monitoring reports. As a result, data entry was very labor intensive. For example, the state of Colorado estimated the cost to enter data was about $70,000 per year. Further, the system was costly for EPA to

State Data Systems

	California	North Carolina	Utah
Uses its own system	•	•	
Enters data into Permit Compliance System		•	•

• = Condition occurs

R0013116

maintain.

States Create Their Own Systems

The lack of an effective compliance system resulted in the development of unique state systems. Unique systems have created problems for EPA and the states. Some state systems did not interface with the Permit Compliance System. As a result, either states or regions had to reenter state data into the Permit Compliance System. To remedy this problem of duplicate data entry, EPA has proposed an Interim Data Exchange Format to overcome the data transfer difficulties. However, this system has not been fielded.

Further, the Office of Enforcement and Compliance Assurance had not addressed the risk that new state systems would not include the data elements required by the modernized Permit Compliance System. To illustrate, California was designing a new enforcement system to meet its own needs; however, Region 9 was not involved with the development to ensure all data elements needed for the new Permit Compliance System were included. In order to do this, the Office of Enforcement and Compliance Assurance and Office of Water need to complete the policy statement for mandatory data elements.

Compliance System Modernization Project

The Office of Enforcement and Compliance Assurance had three major initiatives underway for its Permit Compliance System which were intended to address system problems and improve its usefulness as a management tool:

1. System modernization,
2. State interim data exchange format, and
3. Electronic reporting.

In determining the status of EPA's plan to modernize its Permit Compliance System, we found that the Office of Enforcement and Compliance Assurance had not successfully collaborated with EPA's Office of Water and the states in the design of the new system requirements. This issue is discussed in more detail in Exhibit 2, *Other Matters*, found on page 69.

A wastewater treatment plant in North Carolina failed 27 out of 36 toxicity tests since 1996. None of these violations were designated as significant and, therefore, the state did not include them on quarterly non-compliance reports to EPA.

Other Aspects of Compliance Systems Need Improvement

We found other fundamental weaknesses in EPA and state compliance monitoring systems for major and minor facilities. Our review of three states, along with results from recent state audits, found:

R0013117

- Many serious toxicity violations were not classified as "significant" and thus were not subject to corrective or enforcement actions.
- Numerous other major and minor facility violations went unreported.
- State inspection procedures for major facilities needed some improvements.

Without sound compliance monitoring systems, significant permit violations that adversely impact water quality go undetected. For example, we found serious toxicity violations in two states that went uncorrected; they were not reported to EPA as significant violations. In at least one case, the toxic discharge was released into an impaired water body. Further, when violations are not identified, enforcement actions that penalize noncompliance cannot be taken.

Serious Toxicity Violations Not Identified as Significant

Serious toxicity violations, found through whole effluent toxicity tests, were not categorized as significant violations. The states we evaluated told us they were not aware toxicity test failures met EPA's criteria for a "significant" violation. Also, Office of Enforcement and Compliance Assurance guidance (a 1995 memorandum) did not clearly identify toxicity text violations as significant violations. As a result, facilities continued to discharge toxic waste water into water bodies.

"In addition, the [toxicity] test itself is intended to measure the direct potential for impairment of fish and aquatic life communities related to substances present in effluents at toxic concentrations. Thus, any failure of the effluent limitation should be considered class I [serious] and appropriate action taken."

-Wisconsin Department of Natural Resources

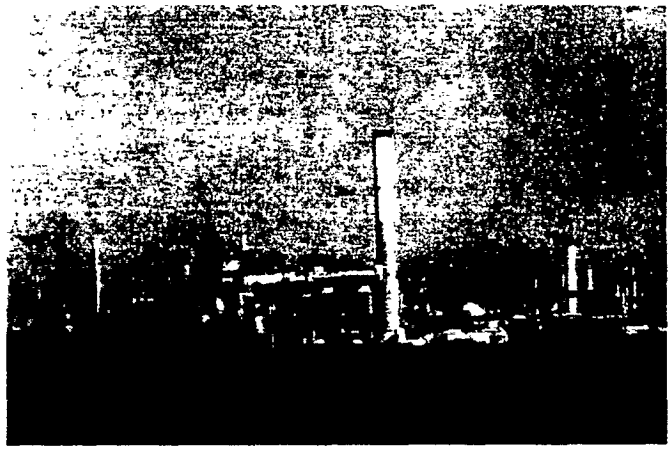
Whole effluent toxicity tests are one of the most important measures of assessing the impact of wastewater discharges. Toxicity tests expose aquatic organisms and fish to discharges for a specific time period, in order to predict at what levels the discharges may cause harm to the organisms. When a toxicity violation occurs, it shows the discharge is toxic enough to harm or kill fish and organisms.

Our sample of nine facilities in California and our review of North Carolina's data base identified three facilities in California and four facilities in North Carolina that had toxicity violations. The seven California and North Carolina facilities did not categorize their toxicity violations as significant. If EPA had been aware of the toxicity violations, it could have worked with state officials, obtained enforcement orders, and resolved the toxic problems.

Utah did not report any toxicity violations in the sample of facilities we reviewed. Region 8 told us that Utah had a policy in place to take actions on whole effluent toxicity test violations.

Best Practice:
Utah's Toxicity Violation Policy

- Violations must be reported within 24 hours
- Accelerated testing is required
- Investigation of the cause of toxicity is required for patterns of toxicity



R0013118

There was a large number of toxic violations nationwide that went unreported as significant violations. EPA's Permit Compliance System reported 6,552 toxicity violations nationwide between October 1, 1998 and December 31, 1999. We estimate that less than 10 percent of these violations were designated as significant and, thus, were not subject to the requirements for taking enforcement actions.

Although EPA guidance categorized effluent violations that may cause environmental harm as significant, it did not specifically designate whole effluent toxicity violations as significant. EPA officials told us this stemmed from industry opposition years earlier based on concerns over the reliability of toxicity tests. However, EPA officials confirmed that toxicity tests were very reliable. Also, they noted that toxicity tests allowed dischargers to eliminate other tests of specific chemicals. As such, EPA needs to require dischargers to categorize toxicity test failures as significant violations.

Violations by Major Dischargers Not Identified

Significant violations by major dischargers were not always identified and reported. In California, the state's manual reviews of monitoring reports missed significant violations at three of the nine facilities we reviewed. As a result, none of these violations were identified and reported. Many of these problems could be eliminated by having dischargers submit monitoring reports electronically.

Refinery in Northern California, a major discharger

A 1999 California study also found that violations were not identified and reported. The study found many self-monitoring reports were not received, and many that were received were not reviewed in sufficient detail to identify violations.

Because it did not identify daily and weekly violations, North Carolina delayed 15 months in issuing an enforcement action for mercury violations. The violator, a town's waste water treatment plant, was the cause of pollution of an environmentally-impaired stream with designated poor water quality, non-supporting of its intended uses.

R0013119

In North Carolina, permits contained daily or weekly limits which were sometimes violated but not identified or reported. In at least one case we reviewed, the violations of mercury limits were directly attributable to impairing a stream. As a result of our audit, North Carolina developed a separate software system to detect violations of daily maximum limits in permits.

State audit reports identified problems with the accurate identification of violations. For example, Arkansas's Legislative Auditor found discrepancies between the violations reported on the self-monitoring reports and those reported on in-house summary reports.

Significant Violations Not Identified for Minor Facilities

Significant violations were not identified for minor facilities. There were two main reasons for this condition:

- States were not tracking compliance at minor facilities and entering information into EPA's system.
- EPA had not explicitly defined a "significant" violation for minor dischargers.

Minor dischargers have been implicated as causes of water impairments in some water bodies. A recent Region 10 initiative to monitor compliance at minor facilities found high noncompliance rates. After the region developed an oversight system and began enforcing permit limits, pollutant discharges dropped dramatically.

Region 10 Best Practice
Minor Permit Compliance System

- Created oversight system for minor facility dischargers
- Identified violations with minimal effort
- Identified when an enforcement action should be taken

EPA's Permit Compliance System identifies violations based on data entered from permits and discharger self-monitoring reports. As discussed previously, generally states only enter data for major facilities. Even this limited data entry process is time-consuming and expensive; however, the system calculates discharge violations.

Generally, states were not reporting information on minor facility compliance to EPA. Although North Carolina was reviewing minor facility violations, we found:

- **Data Not Entered into EPA System.** None of the three states we evaluated were consistently entering minor facility data into the Agency's compliance system. Thus, minor discharger violations weren't reported to EPA.

R0013120

- **Annual Reports Missing**. Many states did not submit annual reports describing compliance and enforcement activities at minor facilities, as required by federal regulation. None of the states we reviewed submitted this report and only two of the ten states in Regions 8 and 9 submitted this report.

- **States Were Not Evaluating Compliance.** Two of the three states we evaluated did not have a state system for evaluating minor facility compliance.

- **Conditions Noted in Other Reports**. These conditions were noted in state audit reports. For example, Louisiana auditors found 21 percent of the required self-monitoring reports for minor facilities in their sample had not been submitted. Also, the state was not reviewing the monitoring reports that were submitted.

Without these annual reports on the compliance status of minor dischargers, EPA was unaware of compliance problems and was unable to take unilateral action or assist the states in helping permit-violating facilities come back into compliance.

Further, EPA had not established criteria for significant violations at minor facilities or significant minor facilities. EPA guidance stated that the inventory data for "significant minors" should be entered directly into the Permit Compliance System, but significant minors was not defined. At a minimum, minors that adversely impact impaired watersheds should be identified as significant. Also, nonsubmission of discharge monitoring reports should be identified as a significant violation. If this criteria were established, states, regions and EPA would have better data to evaluate compliance by minor facilities.

Inspections of Major Facilities Need Improvements

States needed to improve the quality of their inspections to ensure facilities were accurately reporting monitoring data. Self-monitoring reports are the backbone of the Clean Water Act's compliance monitoring system; major facilities must submit them monthly. States rely on facilities to promptly and accurately report their violations to regulators. Facilities are required to report significant violations to states within 24 hours.

Changes Needed to State Inspection Procedures

- Inspections need to be unannounced
- Inspections need to evaluate the accuracy and reliability of self-monitoring reports

R0013121

California performed cursory inspections of a sugar refinery, missing violations of chlorine limits. When the state analyzed reporting documentation in August 1999, it found several years of unreported violations of chlorine limits. The chlorine was discharged into an impaired waterway.

Two of the three states we reviewed needed to improve their inspection procedures. For the sites we reviewed, neither California nor Utah performed unannounced inspections and California did not uniformly verify the accuracy and reliability of self-monitoring reports during site visits. As a result, California missed unreported significant violations by at least one facility. This facility discharged chlorine into an impaired waterway.

Other reports found inspection quality issues in state programs. For example, the Environmental Working Group reported in July 2000 that 42 percent of all Clean Water Act inspections were a brief visual inspection of a facility. Visual inspections typically do not evaluate the accuracy of self-monitoring reports. Although most state audit reports did not evaluate the quality of inspections, a recent Oregon audit report found that the Department of Environmental Quality was not ensuring self-monitoring reports were accurate.

Oregon Department of Environmental Quality *"...was unaware of numerous instances of falsified reporting occurring over a 5-year period at one permitted facility..."*
-Oregon Audits Division

In California, inspections were not thorough because inspections were deemed lower priority than issuing permits and taking enforcement actions. The goal of inspecting all major facilities annually took precedence over a thorough inspection. States did not perform unannounced inspections because staff were concerned no one would be available at the facility and time would be wasted.

Conclusion

EPA's Permit Compliance System was obsolete and insufficient to evaluate the effectiveness of state enforcement programs. The system lacked data from thousands of smaller dischargers. Although many states were developing their own systems, these systems did not fill the information void.

One critical missing component of the Permit Compliance System was electronic transmission of self-monitoring reports. Without electronic reporting by dischargers, it will be virtually impossible for states to monitor compliance with all permits.

We also found many states were not classifying thousands of serious toxicity violations as "significant." Without this designation, states were not subject to EPA requirements for taking enforcement and corrective actions. Moreover, in some states, toxic effluent continued to be discharged into impaired waterways.

R0013122

Other aspects of discharge compliance were not being addressed by states. Two of the three states we reviewed were not evaluating compliance by minor dischargers. We also found procedures for conducting inspections and reviewing self-monitoring data was insufficient at two states. Since self-monitoring reports are the cornerstone of the discharge system, these procedural weaknesses are serious.

Recommendations

We recommend that the Assistant Administrator for Enforcement and Compliance Assurance:

3- 1. Make modernizing the Permit Compliance System a high priority. Further, ensure that future systems:
   - Require electronic submission and evaluation of self-monitoring reports for all dischargers, including minor facilities and storm water.
   - Track storm water permits, inspections, compliance rates, and enforcement actions.

3- 2. Accelerate the development of the Interim Data Exchange Format for the Permit Compliance System. Also, before proceeding further into design and development, work with the Office of Water to ensure there is an up-to-date policy statement for water system criteria.

3- 3. Have regions work with states to help ensure data elements needed for the new Permit Compliance System are included in state systems being developed.

3- 4. Continue to report the Permit Compliance System as an Agency-level weakness until the modernization project is implemented and the system data is reasonably accurate and complete.

3- 5. Revise guidance to specify that whole effluent toxicity violations are significant violations. Revise regulations to require whole effluent toxicity violations to be reported on quarterly noncompliance reports.

3- 6. Establish a definition of significant violations for minor facilities, including storm water dischargers. At a minimum, include nonsubmission of self-monitoring reports in this definition. Also, define "significant" minor facilities. Include facilities impacting impaired waterways in this definition.

Additional suggestions for modernizing the Permit Compliance System can be found at Exhibit 2, page 69.

R0013123

Agency Response and OIG Position

3-1. ***System Modernization.*** *The Office of Enforcement and Compliance Assurance stated that modernizing the Permit Compliance System was, and will continue to be, a high priority. The modernized system will allow for entry of data element fields needed to track all dischargers, including minor facilities and storm water facilities. Information tracked for those dischargers will include permit limits, inspections, compliance and enforcement action data. System modernization is scheduled for implementation by the end of 2003.*

OIG Position: While the Office asserted that the Permit Compliance System was a high priority, the system has been obsolete for over 10 years and the new system schedule has continually slipped. Further, the Office has not yet identified the data elements the system will include. These facts indicate that the system has not been a high priority.

3-2. ***State Data Transfer System.*** *The Office of Enforcement and Compliance Assurance said it and the EPA Office of Environmental Information had worked closely with their state partners in implementing the Interim Data Exchange Format over the last year.*

The EPA Office of Environmental Information is the lead for implementing the Exchange Format project, has developed the schedule for project implementation, and must address acceleration. Currently, the Exchange Format is scheduled for full implementation by March 2002.

While Office of Enforcement and Compliance Assurance agreed that there was a need to update the Policy Statement to address new data requirements, it did not agree that this must occur before design and software development. Broad capacity will be built into the system as indicated in the response to 3-1. Only a subset of that capacity is likely to be federally required. Therefore, the Policy Statement can be updated during system design and development.

OIG Position: The Agency's response does not fully address our conclusions and recommendations. According to the Office of Enforcement and Compliance Assurance's Fiscal 2000 Integrity Act Annual Assurance Letter, the Exchange Format was scheduled to be implemented in the third quarter of fiscal 2001. Thus, the Exchange Format system has been delayed nearly a year since the letter was prepared in October 2000. Further, the Office needs to work with the Office of Environmental Information to accelerate the Exchange

R0013124

Format system, since the Office of Enforcement and Compliance Assurance is responsible for the system.

The Policy Statement is obsolete and needs to be updated immediately. This critical Agency document excludes federal information requirements for storm water permits, which now compromise the largest number of permits. Further, changes to the Policy Statement should be completed before software design, so that the changes can be incorporated into the modernized system. Data entry requirements are essential for determining system requirements.

3-3. ***State Systems.*** *The Office of Enforcement and Compliance Assurance explained that it was finalizing the overall data requirements for the modernized Permit Compliance System. It stated it will continue to work closely with the states in developing detailed data requirements. Until those requirements are finalized, those states modernizing their systems should include in their modernized system the data entry requirements specified in the current Policy Statement.*

For the most part, states do not coordinate or consult with the Office of Enforcement and Compliance Assurance when modernizing their systems, as these systems are built primarily to accommodate state needs. However, the Office agreed to request of regions that they make a special effort to discuss state modernization plans during their program status meetings. Additionally, it hoped that extensive involvement of state representatives in the modernization process will have a spill over effect in getting states to include the necessary data elements in their systems.

OIG Position: We do not agree an updated policy statement is unnecessary at this time. EPA regions need an updated policy statement to engage in constructive discussions with states about which state data is needed at the national level. Existing data requirements are insufficient.

3-4. ***Agency Control Weakness.*** *The Office of Enforcement and Compliance Assurance agreed to continue to report the Permit Compliance System as an Agency-level weakness until all milestones were met. One of the milestones was the completion of modernization which is scheduled to occur by the end of 2003.*

OIG Position: The response only partially addresses our recommendation. The system should continue to be reported as an Agency weakness until the data is reasonably accurate and complete.

R0013125

3-5. ***Toxicity Violations.*** *The Office of Enforcement and Compliance Assurance pointed out that, in many ways, whole effluent toxicity is treated like any other parameter in the permit program; i.e., the permittee reports self-monitoring data on its discharge report, results are entered into the permit compliance system and tracked, and violations should be reviewed and are subject to a range of enforcement responses. The major exception is that toxicity violations are not automatically flagged as significant noncompliance. Because of the variability in permit requirements and in the frequency of compliance monitoring required, toxicity violations do not neatly fit under existing "significant noncompliance" criteria.*

However, EPA's existing regulations and guidance provide EPA regions and states with the flexibility to identify toxicity violations as significant:

- *40 CFR Part 123.45(a) provides states with the flexibility to report any violation of substantial concern on quarterly noncompliance reports.*
- *EPA's "Whole Effluent Toxicity Permitting Principles and Enforcement Strategy" prescribes review of toxicity limit violations.*
- *EPA's enforcement response guide recommends responses to toxicity violations.*

The Office of Enforcement and Compliance Assurance agreed to reconsider the applicability of significant noncompliance to whole effluent toxicity violations when it revises the definition of significant noncompliance.

OIG Position: There is no reason to delay categorizing whole effluent toxicity violations as significant violations. The current process is not working. While states have had the flexibility to identify whole effluent toxicity violations as "significant" violations, they generally have not. According to the Permit Compliance System, only 5.6 percent of the fiscal 2000 toxicity violations were identified as significant violations. Facilities nationwide had large numbers of recurring toxicity violations that were not designated as significant. For example:

- One facility in Massachusetts had 16 toxicity violations; none were categorized as significant.
- One facility in New Jersey had nine toxicity violations; none were categorized as significant.
- One facility in Florida had 19 toxicity violations; none were labeled as significant.

By not labeling toxic violations as "significant," states obfuscate EPA oversight of the appropriateness and effectiveness of state enforcement actions.

R0013126

*3-6. **Other Significant Violations**. The Office of Enforcement and Compliance Assurance noted that a state has the discretion to designate any facility with violations of concern as a "major" discharger thereby subjecting the facility to "significant" noncompliance criteria. 40 CFR Part 123.45(a) provides a state with the discretion to report any violation of "substantial concern" on a quarterly noncompliance report.*

The Office of Enforcement and Compliance Assurance committed to consider developing guidance on when a minor discharger should be designated as a major discharger and to include factors such as non-submission of discharge monitoring reports and impact of the discharge on impaired waterways.

OIG Position: The Office's response does not address our recommendation to establish a definition of significant violations for minor facilities, including storm water dischargers, and to define "significant" minor facilities. We are recommending that EPA establish a uniform definition for significant violations at all minor dischargers, including storm water. Designating minor dischargers as major dischargers does not address our recommendation or the problems that exist.

R0013127

R0013128

Chapter 4
Storm Water Compliance Systems Have Deficiencies

"Urban runoff from seven south Orange County [California] cities is so noxious that it exceeds safe-swimming water standards at all but three of 35 sites–and by 100-fold at four..."
-Orange County Register

Storm water pollution posed significant water quality problems and health risks—in 1999, more than 6,000 beaches were closed or had health advisories issued due to polluted waters caused mainly by storm water runoff.

The states we evaluated were not effectively monitoring compliance by storm water dischargers, resulting in violations going undetected and unaddressed. We found:

California estimated there could be as many as 19,000 facilities operating without proper storm water permits.

- **State strategies were needed for identifying storm water non-filers**. States estimated thousands of facilities had not obtained storm water permits.
- **Risk-based inspection programs were lacking**. The thousands of relatively small dischargers in this program dictated a risk-based approach that had not been well developed.
- **Processes were needed to monitor discharge reports**. States did not maintain adequate processes or systems for reviewing self-monitoring reports, identifying major violations, and taking appropriate action.
- **Tracking systems for citizen complaints were insufficient**. Although citizen complaints were a primary means of identifying violations, complaint tracking systems were not implemented.

The main impediments to effective storm water monitoring systems were a lack of resources and information. Although the storm water program involved nearly 400,000 dischargers nationwide, state resources were not significantly increased to implement this program. Further, EPA's Permit Compliance System and state systems did not track storm water permit compliance data, resulting in significant data gaps. As a result, the states we reviewed did not have effective storm water compliance monitoring programs to detect and correct noncompliance in higher risk areas.

Numerous Storm Water Non-filers

The states we evaluated did not have adequate strategies for identifying storm water dischargers that had failed to file for a proper permit. Although some "non-filers" were identified through citizen complaints, states did not have systematic processes to search for and identify non-filers because of inadequate resources and data.

R0013129

The number of unpermitted dischargers was substantial. For example, Utah estimated it had about 500 unpermitted facilities subject to storm water regulations. California estimated that at least 19,000 facilities might be subject to storm water regulations, but had yet to apply for a permit. Because the identification of non-filers continued to be a challenge in the state, the state was investigating the feasibility of accessing other state agency databases to assist in identifying non-filers.

Inadequate Inspection Programs

The states we evaluated were not employing sound, risk-based inspection programs of storm water dischargers:

Storm Water Inspection Programs

	California (Los Angeles)	Utah	North Carolina
Number of permitted facilities	16,641 (3,304)	690	6,227
Estimated annual rate of facilities inspected	12 %	2 % *	Construction-100%; others unknown
Risk-based inspection schedule developed	No	No	No
Inspections documented	Yes	Sometimes	Yes
Inspection results tracked and violations followed up	No	No	No, except construction sites

** Number of inspections performed could not be substantiated.*

Inspection Statistics Unreliable

State-reported inspection statistics were generally overstated or unsubstantiated at the states we reviewed. For example, California's Los Angeles region included searches for non-filers in its tally. Fortunately, the Los Angeles region had recently increased its inspection field presence from previous years. Utah's reported inspections could not be fully substantiated; the state did not consistently document or track inspection results.

Although most state audit reports did not evaluate storm water inspections, the Louisiana Legislative Auditor reported in January 2001 that most of the uninspected facilities were storm water dischargers.

States Need Strategies

We recognize that it is not realistic to inspect hundreds or thousands of storm water dischargers every year with limited resources. Therefore, states should develop risk-based strategies to target inspections that provide maximum benefit to improving total water quality.

R0013130

Best Practice: Risk-Based Inspection Strategy

California was developing a risk-based inspection plan: the Los Angeles region's work plan for fiscal year 2000/2001 showed that it intended to start targeting industrial and construction inspections at the highest risk dischargers using specific criteria, such as administrative or technical non-compliance, high-risk industries, large construction sites, and complaints. Other criteria states could use to focus inspection resources are impaired waters or high priority watersheds, and repeat violators.

California Best Practice: Risk-Based Inspection Plan

- Focuses limited resources on highest risk dischargers
- Uses criteria to identify highest risk dischargers

States Need to Follow Up on Inspection Results

The states we evaluated were not consistently tracking or following up on inspection results. Four of eleven inspection reports reviewed in California and Utah detected violations that were not tracked or acted upon. Therefore, facilities with major violations, such as failure to prepare a storm water pollution prevention plan or implement storm water best management practices, did not come into compliance promptly, if at all. And there was no evidence to determine if or when compliance was achieved.

"The heart of a general permit is the pollution prevention plan..."
- EPA Region 9

Self-Monitoring System Not Identifying Major Violations

The states we evaluated were not reviewing self-monitoring reports for compliance with permits and regulations. In California, one of four monitoring reports we reviewed did not meet regulatory requirements. The Los Angeles region acknowledged that in the past they have had to focus limited resources on requiring dischargers to submit reports, as opposed to addressing noncompliance items in reports.

Utah did not track which facilities were required to submit self-monitoring reports; thus, the state could not ensure all required reports were received.

Significant Storm Water Violations Found: California

- Missing sampling analysis during the required test period
- Missing descriptions of best management practices implemented at the facility
- Reporting results which were not based on storm events
- Not submitting monitoring reports

R0013131

EPA and state systems did not facilitate a review of self-monitoring reports. The Permit Compliance System was not designed to track storm water compliance data. State data systems did not fill this gap, either. However, storm water data was critical, not only for determining compliance, but for evaluating the effectiveness of the storm water program.

Control of sediment into storm drain

Due to the large volume of storm water self-monitoring reports, states need an electronic scoring process that cost-effectively identifies significant violations and other important information. Several low-cost viable options need to be seriously considered including scan sheets (commonly used for electronic scoring of tests) and web-based reporting. This would make efficient use of limited resources, as well as provide assurance that required reports are submitted and noncompliance is detected.

Complaint Tracking Systems Lacking

The states we reviewed did not maintain adequate or consistent tracking systems for citizen complaints. Complaints were an important source of violation information. Without consistently tracking when and how citizen complaints were resolved, there was no evidence that the states addressed the complaints or provided a formal or informal response addressing citizen concerns.

Barriers

Deficiencies in the state storm water programs occurred primarily because of incomplete and inconsistent data systems for tracking storm water activities and inadequate resources. Also, states were reluctant to place additional burdens on small and economically vital business.

Fed by urban runoff, Munger Creek in Orange County, California, had an increased fecal-coliform count. (Photo by Orange County Register.)

R0013132

Inadequate Data Systems

As previously discussed in Chapter 3, one major impediment to storm water self-monitoring systems was data systems. Storm water data was critical, not only for determining compliance, but for evaluating the effectiveness of the storm water program. We found EPA's Permit Compliance System:

- Included only about 16,500 of an estimated 400,000 storm water permits.
- Did not require states to enter storm water permit data. This was due to concerns over the increased state and federal data entry workload.
- Was not designed to track storm water compliance data.

State data systems did not fill this gap, either. The states we evaluated did not maintain their own complete and consistent data systems for tracking and monitoring storm water compliance activities. All three state data systems were not tracking one or more pieces of critical storm water data.

For example, Utah did not track critical compliance data and could not support an internal report citing 100 percent compliance. Utah also did not maintain an information system on its current construction site permits. Our sample included an instance where a construction facility was operating with an expired permit until a complaint was lodged.

Inadequate Resources

The promulgation of the Phase I storm water regulations in November 1990 substantially increased the universe of permit holders under the Clean Water Act. Implementation of the Phase II regulations beginning in 2000 further increases the universe. However, minimum resources have been dedicated to carry out storm water activities. In addition, permit fees were generally inadequate to help fund storm water programs.

Staff Years Dedicated to Storm Water
Fiscal 1999

State	Storm Water Permits	Staff Years
California (Los Angeles Region)	3,304	2.5
North Carolina	6,227	7
Utah	690	1+

For example, at the time of our audit, California's Los Angeles region only had 2.5 staff years to monitor more than 3,300 storm water permit holders and conduct searches for as many as 10,000 unpermitted facilities that were subject to regulation. The program was grossly underfunded and as a result, was identified as not meeting federal standards for controlling pollution caused by storm water runoff. This was a serious concern because storm water runoff was the largest single source

> "...the Los Angeles Regional Board inexplicably devotes the least amount of resources to its worst water quality problem: polluted runoff."
> - Natural Resources Defense Council

R0013133

of water pollution in this region. To help address this concern, the Los Angeles region requested and received a substantial increase in its 2000/2001 storm water budget, which enabled it to hire additional storm water staff.

Risk-Based Strategies

Because of limited resources and the large number of storm water dischargers, states should engage in risk-based strategies to focus their resources on the most significant water quality issues. Urban runoff, including storm sewers, is one of the top three sources of pollutants in rivers, lakes, and estuaries. Storm water dischargers now make up about 75 percent of the number of discharge permits. However, as further discussed in Chapter 2, state water programs have generally given higher priority to major "point source" dischargers, such as municipal waste water treatment plants and industrial facilities.

States Taking Enforcement Actions

The three states in our review took some substantial storm water enforcement actions. The three states assessed penalties of over $500,000. North Carolina took one enforcement action for $50,975.

Storm Water Enforcement Actions
Fiscal Year 1999

	Number of Enforcement Actions	Penalties
California (Los Angeles Region)	28	$256,100
North Carolina	12	$248,741
Utah	2	$ 86,609

Recommendations

We recommend that the Assistant Administrator for Enforcement and Compliance Assurance:

4-1. Work with EPA regions in assisting states to:
- Develop mechanisms to better balance their limited resources between all categories of dischargers, as indicated by the states' analysis of risks to water quality.
- Create effective strategies for identifying storm water non-filers.
- Develop sound storm water inspection programs which include risk-based inspection schedules and tracking and follow-up of inspection results.
- Establish tracking systems for citizen complaints.

4-2. Facilitate the development of a system which allows self-monitoring reports to be electronically scored for compliance. Consider low-cost options such as scan sheets (commonly used for electronic scoring of tests) and web-based reporting.

R0013134

Agency Response and OIG Position

*4-1. **State Strategies and Systems.** The Office of Enforcement and Compliance Assurance agreed to continue to work with the EPA regions and states to implement risk-based approaches to water enforcement. It noted that the Office's Memorandum guidance and national strategies provide flexibility to address majors as well as minors. The 2000 Storm Water Enforcement Strategy outlines a recommended "sweep" approach of targeting a priority watershed or geographic area, then focusing storm water inspections and enforcement actions on a category of non-filers (e.g., a priority industrial sector or large construction sites) in that area.*

The Office noted that while EPA can assist the states by providing direction, guidance, training, and work-sharing, states must take responsibility to develop appropriate planning mechanisms to develop and implement risk-based strategies (which should include a sound inspection program and a system to track citizen complaints), and balance their limited resources.

OIG Position: The Office's Memorandum Guidance does not address our recommendation. While the guidance allowed "trading" major inspections for minor inspections at a 2:1 ratio, the guidance did not address trading major inspections for storm water inspections. Nor did it address the other aspects of our recommendation. Moreover the storm water enforcement strategy was developed for EPA regions, not states.

We agree that states are responsible for their enforcement strategies. However, we do not agree there is sufficient flexibility in the existing system. EPA-driven requirements for major facility inspections, oversight, and enforcement actions focus state programs on major dischargers. Instead of setting rules for divesting in major facility oversight, it would be more useful if EPA used its national perspective and expertise to help states develop and fine-tune risk-based enforcement strategies, including those for monitoring storm water permits.

*4-2. **Electronic Submission of Storm Water Reports.** The current Permit Compliance System already determines compliance based on electronic review of the discharge monitoring reports, though some improvements are needed in the system. The modernized system will certainly have this capability. Additionally, the modernized system will provide the capability for facilities and states to electronically report information using the Agency's Central Data Exchange portal and the National Environmental Information Exchange Network for the transfer of permit data.*

OIG Position: The Permit Compliance System does not determine compliance for storm water permits because it does not have the capability to accept storm

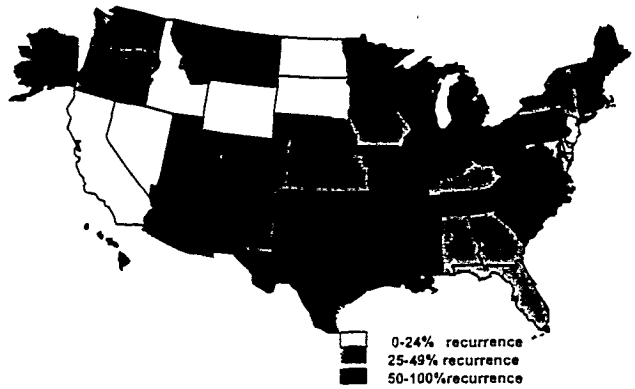
R0013135

water compliance data. Further, for various reasons, the system does not accept compliance data electronically. As a result, states must enter compliance data manually. Manual data entry is a huge obstacle, especially for the hundreds of thousands of storm water and minor permits.

One obvious solution to the data entry problem is to have permit holders submit their reports electronically. Low-cost, common platform options are electronic score sheets (used for testing) and web-based reporting. We have no evidence the new system will address these issues; however, in meetings with the Office, it indicated it would explore these options.

R0013136

Chapter 5



Enforcement Actions Late and Penalties Insufficient

"Regulations are not self-implementing; they have impact only when regulated parties decide to comply or agencies force them to do so."
-National Academy of Public Administration

Although the states we evaluated generally took enforcement actions on significant violations, we found these actions were often taken a year or more after the violation occurred. Further, penalties were sometimes insufficient to prevent further violations and were not always collected. This may have contributed to a large number of recurring violations. Over one-third of the states reported that over half of their major facilities with significant violations in 1999 also had recurring significant violations in fiscal 2000. (Data was not available for non-major facilities.)

Major Facilities with Recurring Violations

Facilities With Significant Violations Recurring in 2000

Source: Permit Compliance System

Some states were taking actions to improve the effectiveness of their enforcement programs by:

- Requiring penalties to include recovery of the economic benefit of noncompliance.
- Using minimum penalties.
- Publicizing violations and responses.

States could further improve the effectiveness of enforcement actions by taking actions promptly and improving proactive strategies that help avoid violations.

Delayed Enforcement Actions

The three states we evaluated were oftentimes taking a year or more to respond to significant violations at major facilities:

R0013137

Enforcement Actions Delayed Over 1 Year

State	Percentage of Late Actions	Months Late (Violation to Action)
California (San Francisco Region)	50%	15
North Carolina	100%	26 to 41
Utah	100%	12 to 41

[We evaluated 15% and 67% of the formal enforcement actions taken on major dischargers in North Carolina and Utah, respectively. In California, we evaluated 67% of the actions on major dischargers taken by the San Francisco Region.]

There was evidence this problem extended to other states. For example, the Louisiana Legislative Auditor found the state took over a year to issue nearly 40 percent of its actions.

Discharge from a Northern California facility

Not taking prompt enforcement action increases water pollution as violations go unchecked. States must take swift action not only to bring violators into compliance quickly, but also to establish credible enforcement programs. For example, a California municipality failed to meet its deadline to replace its obsolete treatment plant by 1997. Although the state issued a cease and desist order in 1993, at the time of our audit, no penalties were assessed. Delays continued and the plant continued to pollute the Pacific coast until the new plant demonstrated full compliance in January 2001.

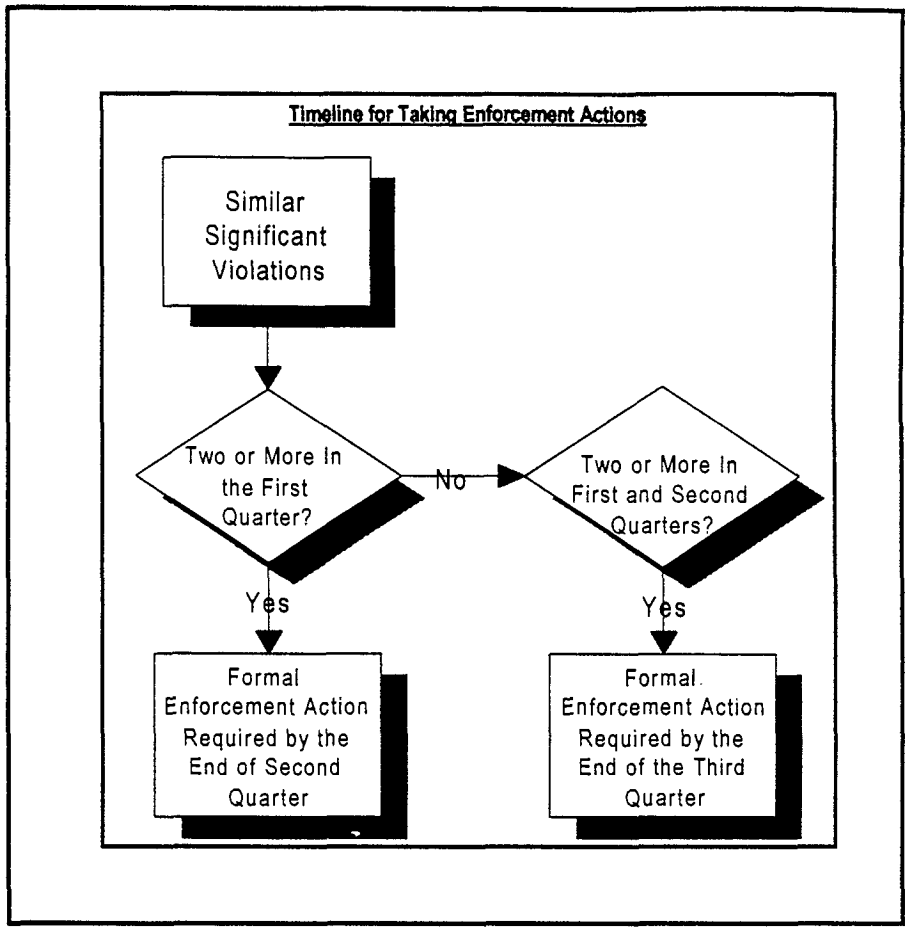
R0013138

There were a number of reasons states enforcement actions were delayed:

- **Enforcement Process**. Enforcement actions generally had to be approved by higher management levels and, in California, Governor-appointed boards. These approval processes delayed actions. Also, states negotiated enforcement orders or penalty amounts with dischargers, which was a time-consuming process. Further, in order to compute penalties, states needed to obtain cost data from the discharger, further delaying actions.

- **Reluctance.** States were reluctant to take immediate action on violations, especially when violators were making efforts to comply. Staff tended to work closely with the discharger, developing a working relationship they believed would be threatened by a formal enforcement action. Also, North Carolina and Utah negotiated formal orders or penalty amounts due to concerns over litigation; negotiations caused further time delays.

- **Consequences**. There were limited adverse consequences associated with delayed enforcement actions. The Office of Enforcement and Compliance Assurance told us that states not taking actions on repeat violators received phone calls from EPA; generally, EPA took no other actions. The most obvious adverse consequence of delay enforcement was the continued discharge of pollutants in excess of permit limits. However, this consequence usually had no immediate impact on a state.



Another factor may have been the lack of time standards for taking enforcement actions. The states we evaluated had not set standards for taking enforcement actions. EPA's standard was variable and not embraced by the states we evaluated.

> *"The Enforcement Response Guide... addresses timely responses to... violations...Even though some of the language can be seen as ambiguous..."*
>
> - EPA Office of Enforcement and Compliance Assurance

EPA's Enforcement Response Guide set a variable time standard for taking enforcement actions. It required a formal enforcement action when there was a repeated, significant violation in the same or a consecutive quarter. A state was expected to complete a formal action before the end of the quarter following the second violation. Thus, the timing of the second violation determined how long a state had to take a "timely response." For example, if the repeat violation occurred April 1, the state had

R0013139

6 months to complete the action; if it occurred on June 30, the state had only 3 months to complete the action. Three months may not be enough time to issue an enforcement action. We recommend that EPA set a clear and consistent time standard for taking enforcement actions.

Penalties Did Not Recover Economic Benefit

Two of the three states were not calculating or recovering the economic benefit of noncompliance, although both states had recently instituted changes to do so. The failure of states (and EPA) to recover the economic benefit of noncompliance has been a long-standing problem. EPA oversight should continue to evaluate the effectiveness of penalties, including the recovery of economic benefit.

Adverse Impacts of Insufficient Penalties

- Financial gain realized when economic benefit of violation not recovered
- Violator implicitly rewarded for each violation
- Violator gains an economic advantage over compliers

R0013140

"EPA expects states to make a reasonable effort to calculate economic benefit and encourages states to recover this amount in negotiations and litigation."

-EPA's 1986 Oversight Framework

Frequently, violators have economic gains from postponing compliance actions. These savings can come from:

- Delaying or avoiding purchase of equipment.
- Delaying the construction of new facilities.
- Avoiding annually recurring costs of operating and maintaining equipment over the period of noncompliance.

To ensure everyone is thus treated fairly and consistently, economic benefit should be recovered for all significant violations.

At the time of our review, neither California nor North Carolina required or prescribed the recovery of economic benefit. Also, they had not developed procedures for calculating economic benefit:

Recovery of Economic Benefit

	California	North Carolina	Utah
State law requires recovery of economic benefit?	No*	No	No
Policy requires recovery of economic benefit?	Yes	Yes	Yes
Policy prescribes methods to compute economic benefit?	No	No	Yes
Economic benefit recovered?	No	No	Yes

**California passed a law effective January 1, 2000 requiring the recovery of economic benefit. It did not impact the actions we reviewed.*

Although recent state audit reports did not address recovery of economic benefit, EPA Region 9's evaluation of Nevada's program and a 1997 Virginia audit found that these states were not recovering economic benefit.

When states did not recover economic benefit, violators could realize substantial financial gains and be implicitly rewarded for noncompliance. To illustrate, a California municipality's waste water treatment plant was not completed by the deadline required by the state's cease-and-desist order. However, a penalty was not assessed. The municipality saved at least $1.5 million by delaying construction of the $50 million plant.

R0013141

Besides the lack of a requirement and methodology, there were other reasons states did not recover economic benefit. One of the main reasons economic benefit was not calculated was because obtaining necessary cost data was cumbersome and time consuming. Minimum penalties also sometimes prevented the recovery of economic benefit. For example, a North Carolina treatment plant was fined repeatedly for failing to meet its permit limits. The state's environmental specialist concluded paying minimum penalties was less costly than complying with permit requirements.

Reasons States Did Not Recover Economic Benefit in Penalties

- Lack of methodology
- Difficult and time-consuming to obtain cost data
- Time-consuming to compute penalties
- Penalties generally higher; states reluctant to assess higher penalties
- Not required to by state law or policy
- Minimum penalties used instead

Economic Benefit Recognized As Deterrent

Recently, both California and North Carolina had recognized the importance of recovering economic benefit in improving compliance. California passed a law requiring the recovery of economic benefit. North Carolina issued its *Principles of Enforcement* which call for the cost of noncompliance to be greater than the cost of compliance. North Carolina stated that it was committed to incorporate economic benefit into penalties for serious violations and chronic repeat violations.

Lack of Consistent Penalties

Penalties were not consistent nationwide or within states. In order to maintain a level playing field, penalties should recoup the economic benefit the violator gained through noncompliance. As GAO concluded, a key difference among state enforcement authorities is the recovery of economic benefit. Economic benefit tends to be a large portion of computed penalties. When it is not computed, it can lead to smaller penalties and an unfair economic advantage to the violator. To make enforcement consistent nationally, economic benefit should be recovered in state penalties.

Internal studies by California and Arkansas had found problems with the consistency of penalties. In 1999, California reported that there were inconsistencies in enforcement actions amongst its regional boards. In 2000, Arkansas reported that "the current formal enforcement structure allows for inconsistencies in the initiation of formal enforcement actions and the levying of fines."

R0013142

To ensure the regulated community is treated fairly, states should have uniform penalty structures that have specific guidelines and equitable formulas.

Uncollected Penalties

Penalties must be collected to establish credibility. We found some penalties for storm water permit violations were not collected in California. There was evidence penalty collection was problematic in other states. Louisiana's Legislative Audit report showed the state had not collected $441,188 in penalties for the years 1998 and 1999. A Maryland audit found the state did not assess or collect penalties of $100 per day for not meeting consent order milestones. In this last case, the discharger continued to violate its permit 13 times between October 1997 and March 2000 without paying assessed penalties.

Proactive Actions Could Prevent Significant Violations

The states we evaluated needed to improve strategies to prevent violations from occurring at overused facilities. Many significant violations occurred because waste water treatment facilities were obsolete, worn out, or exceeding capacity. Further, an expanding population taxed existing systems beyond capacity.

> *"If you ignore the (sewage) systems for 20 or 30 years, it's going to come back and haunt you."*
>
> -Orange County CoastKeeper, environmental advocate

We found states had vehicles available to address future discharges that would violate permits. For example, California could issue a time schedule order for threatened discharges of waste in violation of requirements.

We found numerous violations due to plant obsolescence and capacity limits. For example:

- In North Carolina, one small city's waste water treatment plant capacity had not kept pace with population growth, leading to pollution violations. The treatment plant discharged pollutants into a stream which ran through a residential area.

- In Northern California, one small city's population growth outstripped the capacity of its sewage collection system. Sewage spills occurred because the collection system lacked necessary capacity. Some of these spills ended up in drinking water sources.

R0013143

Many of these violations could not be prevented without major capital investments, including new plants, that required months or years to finance and construct.

EPA should continue to work with states to establish proactive strategies, such as time schedule orders, to hold dischargers accountable for compliance. As one North Carolina official observed, when discharge rates reach 80 percent of the limit, consideration should be given to expanding the plant. When discharges approach 90 percent, plant expansion should have begun.

Best Practices: Deterring Noncompliance

Best Practices: Deterrence

- Minimum penalties
- Publicity of enforcement actions
- Compliance report card

States had several best management practices that were effective in improving compliance. These practices included:

- **Minimum Penalties.** Both California and North Carolina had instituted minimum penalties for certain violations. They followed the lead of New Jersey, which reported improvements in water quality by using minimum penalties for large sewage spills and other water quality violations. However, as found by North Carolina, minimum penalties may not be effective for more severe violations if they are too low.

Minimum Penalties: Pros and Cons

+ Penalties assessed for normally unaddressed minor violations

+Relatively quick consequence to violations

+Ensures consistent, dependable response from regulators

-Serious violations may receive the same penalties as minor violations

-Minimum penalty may be substantially less than recovering economic benefit

- **Publicity of Enforcement Actions.** EPA's sector facility indexing project and North Carolina's website provided some measure of public accountability over violators and regulator responses. By accessing these Internet sites, the public can identify violators, locations, and penalties assessed. States can gain an additional deterrent effect by publicizing their enforcement responses widely, using vehicles such as state websites and press releases.

- **Compliance Report Card.** California planned to publicize the results of its enforcement program to keep managers, policy makers, and the public informed about violations and actions taken. Its planned compliance report card would be produced annually, showing compliance rates, enforcement actions taken, the use of penalty funds and supplemental

R0013144

environmental projects. Ongoing compliance rates of dischargers and the report card would be placed on the Internet.

Recommendations

We recommend that the Assistant Administrator for Enforcement and Compliance Assurance:

5- 1. Establish a clear and consistent standard for measuring the promptness of enforcement actions.

5- 2. Continue to work with the regions to assist states in establishing proactive enforcement strategies to help facilities avoid long-term serious violations due to plant or system obsolescence or capacity limits.

Chapter 6 also contains a recommendation for setting standards for enforcement actions. See page 60.

Agency Response and OIG Position

*5-1. **Time Standard.** The Office of Enforcement and Compliance Assurance explained that the permit program already had a "timely and appropriate" standard described in the Enforcement Management System. It believed that a more appropriate recommendation would be for the Office to review the consistency of its standard and ensure that the regions and states are aware of it.*

OIG Position: We agree with the Office's alternative recommendation and ask it to address the recommendation's implementation.

*5-2. **Proactive Strategies.** The Office of Enforcement and Compliance Assurance stated that it, in conjunction with the EPA Office of Water, had developed guidance documents and training workshops to assist the regulated community in avoiding noncompliance due to plant or system obsolescence or capacity problems. Some specific examples were guidance for implementation of nine minimum controls and a long-term control plan for combined sewer overflows, as well as guidance documents and training workshops for municipal officials, system operators, and consultants on procedures to eliminate and prevent combined and sanitary sewer overflows.*

The Office of Enforcement and Compliance Assurance said it was involved in the development of the Guide for Evaluating Capacity Management, Operation and Maintenance Programs at Sanitary Sewer Collection Systems which describes management practices and operation and maintenance techniques that have served municipalities best in the

R0013145

reduction and elimination of sanitary sewer overflows from their systems. The audience for this guidance is state and EPA personnel who are assisting municipalities to comply with sanitary sewer overflow requirements. The guidance will also help municipalities make decisions on the rehabilitation and repair of their collection systems and ways to better operate those systems. The guidance was scheduled for release as an interim-final document early in fiscal 2002, and was planned to be finalized following the final publication of the Sanitary Sewer Overflow Rule.

The Guide for Evaluating Capacity Management, Operation and Maintenance Programs at Wastewater Treatment Plants will assist inspectors in determining whether a capacity management, operation and maintenance program was adequate for a particular wastewater treatment plant. The guidance will also be useful to municipalities for determining whether their plants were following accepted practices and for addressing any discrepancies as needed in order to improve or maintain compliance. The guidance was scheduled for release as an interim-final document early in fiscal 2002.

OIG Position: The Office's reply partially addresses the issue and recommendation. The guides are excellent references and will provide some measure of compliance assistance to EPA regions and states. However, the guides in and of themselves are not proactive enforcement strategies.

R0013146

Chapter 6

Improved Performance Evaluation and Measurement Needed

To ensure fair and effective enforcement of the Clean Water Act, EPA regions need to continue performing both periodic, in-depth program evaluations and annual performance evaluations of states' performance. These evaluations need to be consistent, continue toward a goal of measuring the effectiveness of performance, and be made easily accessible to the public.

> *"EPA must balance the new expectations raised by the Government Performance and Results Act, the [National Environmental Performance] partnership approach suggesting more flexibility in state oversight, and the more traditional measures used to assess performance of state enforcement programs."*
>
> -EPA Office of Regulatory Enforcement

Oversight Tools

EPA had developed several tools to evaluate state enforcement performance:

- **Quarterly Non-Compliance Reports.** States are required to report on major facilities that have significant violations of their permits on a quarterly basis, along with the enforcement actions the state has taken. Further, the Office of Enforcement and Compliance Assurance has developed an automated system called "SNC [Significant Noncompliance] Tracker" which allows both states and regions to evaluate compliance records of major facilities at any time.

- **Policy Framework.** In 1986, EPA established a framework for evaluating enforcement programs. In addition, Clean Water Act-specific guidance provides additional criteria.

- **Core Performance Measures.** Under the National Environmental Performance Partnership System, EPA and the Environmental Council

EPA's Oversight Criteria and Measures

- Clear identification of and priorities for the regulated community
- Clear and enforceable requirements
- Accurate and reliable compliance monitoring
- High or improving rates of continuing compliance
- Timely and appropriate enforcement response
- Appropriate use of civil, judicial, and administrative penalty authorities

-EPA 1986 Policy Framework

R0013147

of the States have agreed upon seven "core" performance measures for evaluating state enforcement and compliance performance.

Regions Performed Valuable Evaluations

"While states and local government have primary responsibility for compliance and enforcement actions... EPA retains the responsibility for ensuring fair and effective enforcement of federal requirements, and a credible national deterrence to noncompliance."

-EPA's 1986 Policy Framework for EPA-State Enforcement Agreements

We found that at least eight regions were performing in-depth evaluations of state programs. (We were unable to obtain information from two regions.) The three regions we audited were performing in-depth evaluations that had important findings that were used, or should have been used, to improve state programs. To illustrate:

- In February 2000, Region 9 presented its findings on California's Clean Water Act discharge program to a California joint legislative committee hearing on water quality issues. Its findings included the lack of storm water inspections and inadequate recovery of economic benefit in penalties. Both of these issues were being addressed by revisions in California's enforcement strategy and policy.

- In June 1999, Region 4's issued its findings from a review of North Carolina's Clean Water Act discharge program. These findings included the lack of an effective storm water program and weaknesses in the state's enforcement policy concerning identifying toxicity test failures as permit violations.

Although regional evaluations found significant weaknesses with state programs, they were inconsistent. The regions that responded to our survey had developed their own evaluation programs; these programs evaluated many of the same program elements but did not evaluate others.

The frequency of in-depth evaluations also varied substantially. Region 4 performed in-depth evaluations every 8 years or so because of the large number of states in the region. Region 6 told us it performed a detailed program review on a semiannual basis.

EPA should develop and use consistent criteria and measures for in-depth program evaluations. At a minimum, all of the oversight criteria and measures in EPA's 1986 Policy Framework should be included along with additional elements

Best Practice: Region 8's Scoring System

- Performance measured objectively and consistently
- Clear expectations set for performance
- States challenged to improve scores
- Areas needing improvement specifically identified
- Region could focus resources on areas where state needed assistance

R0013148

included in the Clean Water Act discharge guidance, such as the adequacy of pretreatment programs.

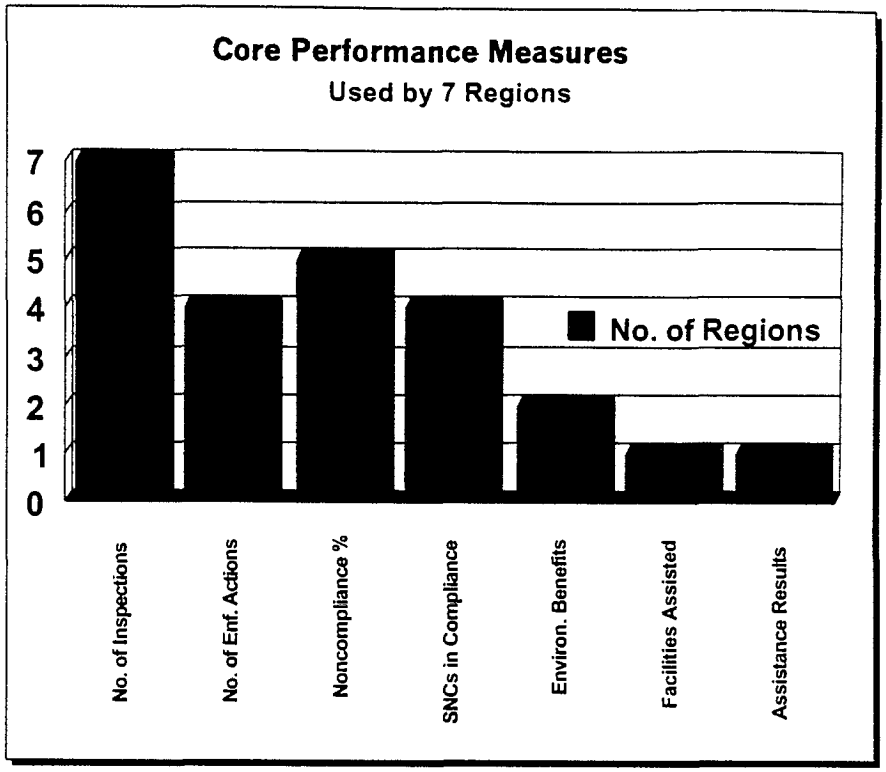
Further, to ensure consistent oversight, there should be a uniform, objective scoring mechanism. In this regard, Region 8 used an objective scoring system in 1999 for measuring state performance.

We also believe regional evaluations should be made easily accessible to the public. Publicity apparently caused North Carolina to improve its storm water program. Although EPA Region 4's evaluation of North Carolina's enforcement program in 1999 found serious deficiencies in management of the storm water program, the state did not agree to make investments in the program until we reported these same problems a year later.

Performance Measures Need Focus on Effectiveness

EPA regions needed to use core performance measures to consistently measure the effectiveness of state enforcement programs. Under the National Environmental Performance Partnership System, EPA and the Environmental Council of the States had agreed upon seven "core" performance measures for evaluating enforcement programs.

Core Performance Measures



- Number of major inspections and percentage in priority areas
- Number of enforcement actions
- Number of facilities reached through compliance assistance*
- Rates of significant noncompliance*
- Percentage of significant noncompliers returned to compliance
- Environmental or health benefits achieved by enforcement activities*
- Results of using alternative compliance approaches*

**Optional*

While there was state resistence to collecting and reporting state data, EPA should continue to press its state partners, including the Environmental Council of the States, to use core performance measures that address the effectiveness of enforcement programs. Further, these measures should be reported annually and be easily accessible to the public.

Core performance measures were not consistently used by regions or states to evaluate performance. Core performance measures are a limited set of measures designed to help gauge progress toward protection of the environment and public health. Only part of one core measure, the number of major facility inspections, was used to evaluate state performance by all seven regions that responded to our survey.

R0013149

SNC=Major Facilities in Significant Noncompliance

We believe the core performance measures needed further evolution in order to achieve their national objective of "managing for environmental results" for a number of reasons:

- **Bean Counts.** Three of the measures counted activities, such as the number of major facilities inspected. These "bean counts" would be more meaningful if they were converted into rates, such as the percentage of the targeted universe inspected.

- **Measuring Success.** Rates, such as compliance rates, were not evaluated against benchmarks, standards, industry averages or geographic norms. It was unclear what a successful, average, or unsuccessful rate was.

- **Environmental Outcomes.** The states we reviewed were not measuring environmental outcomes from enforcement activities or assistance activities.

- **Correlation Analysis.** Except for North Carolina, the states we evaluated had not attempted to analyze correlations between monitoring activities, enforcement actions and compliance rates. Analyzing such correlations

"What is the relationship between enforcement and compliance, and how can we use this information to improve compliance and meet other [North Carolina] objectives?"

-North Carolina's Enforcement Assessment 2000

R0013150

would be useful in evaluating the effectiveness of inspections, monitoring, notices of violations, and penalties.

> *"Many [states] were not enthusiastic about the prospect of an EPA report with comparable performance measures for all 50 states...."*
>
> -National Academy of Public Administration, November 2000

As found by the National Academy of Public Administration, there were several reasons that the core performance measures did not fully shift the focus from "bean counting" to environmental results. Four of the most important core performance measures were optional, such as environmental benefits achieved through concluded enforcement activities. Further, states refused to collect and report on many measures. They claimed the measures did not always address their problems and added to their reporting burden.

EPA had its problems with core performance measures as well, the Academy reported. EPA was unwilling to abandon its traditional practice of negotiating agreements on activities states will conduct. Further, the core measures were developed separately from the Agency's own goals and measures under the Government Performance and Results Act. States believed there was a significant disconnect between the Agency's own goals and core performance measures.

> *"All states should compile core performance measures; EPA should gather them and make them publicly available."*
>
> -National Academy of Public Administration, November 2000

In spite of these weaknesses, core performance measures can provide an important measure of success and public accountability. By reporting on compliance rates and environmental benefits, the core performance measures provide indicators of state program accomplishments and success. The National Academy of Public Administration has recommended that all states compile core performance measures and EPA consolidate them and make them publicly available. We agree. As California observed, state officials "must be regularly informed as to how their actions, policies, and staff are affecting the rate of compliance." States (and EPA) should be held accountable for their results.

Developing core outcome performance measures will be more difficult. GAO recently concluded that enforcement outcome measures have been difficult to create because of:

R0013151

- The frequent absence of baseline data needed to determine whether compliance rates or environmental quality have improved under new strategies.
- The inherent greater difficulty and expense in quantifying outcomes as compared to counting and reporting enforcement activities.
- Difficulty in establishing causal links between enforcement strategies and compliance rates or environmental quality.

States' Efforts to Develop Performance Measures

While core performance measures may not have addressed each state's problems, the states we evaluated had not made much progress in developing more appropriate measures.

Best Practice: Using Outcome Measures

"Florida was one of the few states to have attempted to quantify outcomes, noting that calculating accurate industrywide compliance rates was an important part of the state's effort to focus programs on results."

-GAO Testimony, June 1998

Utah and North Carolina were tracking their compliance rates, although there were some serious limitations. California was not routinely evaluating its compliance rates state wide. However, states were making efforts to develop better measures.

North Carolina had formed a work group to develop performance measures to assess the effectiveness of its enforcement programs, including water quality. The three performance measures developed for enforcement were the (1) number of repeat violators, (2) compliance rate per number of regulated facilities, and (3) compliance rate per inspections.

Utah and Region 8 had also partnered in an attempt to develop better enforcement performance measures, including environmental improvement measures. After much effort, the project came to a halt. The Region and state decided not to proceed because the effort would not reduce reporting; instead, it would increase data gathering.

California was in the midst of a major initiative to improve its compliance rates for water dischargers. It recognized the serious limits of its monitoring and data systems and was in the process of implementing new systems.

"... The attractiveness of performance measures is exceeded only by the difficulty of their design and implementation."

-National Academy of Public Administration

R0013152

Only one of the seven regions that responded to our survey was aware of a state that used outcome-based performance measures. As previously noted, developing outcome-based measures was inherently difficult. The Office of Enforcement and Compliance Assurance had issued grants to states to develop better performance measures. The results of these studies should be used to further refine the core performance measures.

Lack of Goals and Standards

Although it was EPA's goal to increase compliance, this goal had not been articulated into specific measures of success by EPA or the states we reviewed. Both Utah and California had set some compliance goals; however, there were not specific goals or standards for most aspects of the program. For example, compliance goals were not established for watersheds, priority programs, high-risk sources, or priority industrial sectors. None of the states we reviewed had specific goals or objectives for increasing compliance, reducing recidivism, or improving water quality by specific amounts or percentages.

The lack of standards and goals made it difficult for decision-makers to make decisions on whether to invest or divest in certain strategies, target areas, sectors, watersheds, or sources. Also, without goals or standards, it was difficult to evaluate the relative success of programs.

Recommendations

We recommend that the Assistant Administrator for Enforcement and Compliance Assurance routinely determine whether states are fulfilling their obligations to monitor and enforce discharge programs. Specifically:

6- 1. Develop consistent criteria and measures for in-depth program evaluations of state programs:
   a. At a minimum, all of the oversight criteria and measures in the 1986 Policy Framework should be included along with additional elements included in the Clean Water Act discharge guidance. Include the accuracy and completeness of data systems, the quality of inspections, and the reliability of self-monitoring reports.
   b. Evaluate all significant discharge programs including storm water, minor dischargers, and concentrated animal feeding operations.
   c. Use a uniform, objective scoring mechanism.

6- 2. Have regions perform in-depth evaluations of state enforcement programs every two to three years. Make these evaluations available to the public through publicity releases or the EPA website.

R0013153

6- 3. Continue to remind state partners, including the Environmental Council of the States, of their obligation to use core performance measures that address the effectiveness of enforcement programs.

6- 4. Have regions collect and use all core performance measures to consistently measure the effectiveness of state enforcement programs on an annual basis. Consolidate these measures nationwide and make them public.

6- 5. Work with regions to assist states in setting specific goals and standards for compliance, recidivism, the timeliness of enforcement actions and other important measures.

Agency Response and OIG Position

*6-1. **Consistent Criteria and Measures**. The Office of Enforcement and Compliance Assurance agreed that a process for periodic evaluation of the Clean Water Act discharge program in each state would be useful. It stated that most regions conducted assessments of state water enforcement programs, either annually or bi-annually, though the nature of the assessment varied. Some variability in the assessment process was necessary since priorities varied by state, as did work sharing with EPA regions. The Office asserted that the review content of state performance for any program, not just the Clean Water Act discharge program, must be governed principally by the authorization agreements, grant work plans and agreements and the performance partnership agreement between a region and a state. Those policies and agreements should define priorities, describe work sharing arrangements between a region and a state, and define the evaluation process to be used, among other things.*

The Office of Enforcement and Compliance Assurance stated it had a national evaluation process which focused on "program element reviews" among programs. These reviews examine policy and implementation of a particular program element in all EPA regions and a sample of states. The Office noted it was responsible for working with EPA regions and states to evaluate a wide scope of statutory programs, and while resources did not permit a commitment to ensure a top to bottom evaluation of the enforcement of the discharge program in every state, the Office agreed to consider how best to concentrate on key concerns of the program.

The Office of Enforcement and Compliance Assurance noted that since the program element reviews will each address a different program or problem, there will not be a standing uniform scoring mechanism. However, within each review, the questions used and the weight assigned

R0013154

to the answers will be the same. The Office agreed to continue to develop a consistent set of criteria and measures as part of its design for each program element review. All applicable policy is considered in designing each review. For discharge permits, this will include criteria from the 1986 Policy Framework. However, the Office was not yet in a position to identify what reviews will be undertaken in the future.

OIG Position: We laud the Office of Enforcement and Compliance Assurance's efforts to develop a consistent set of criteria and measures for "key concerns" of state enforcement programs. However, the plan to evaluate a single element of a state enforcement program is less than optimal and merits serious reconsideration. EPA should be aware of significant weaknesses in the state programs it has authorized. A single program element review will not evaluate all of the state's significant discharge programs. Morever, single program element reviews fail to consider how resource constraints drive program management.

As the Office noted, it has uniform criteria to evaluate state enforcement programs: (1) EPA 1986 Policy Framework, and (2) core performance measures developed by EPA and the Environmental Council of the States. These criteria provide a sound foundation for consistently evaluating state performance nationally.

Further, as detailed in this report, all of the regions that responded to our survey indicated they were performing comprehensive state evaluations. Thus, lack of resources does not seem to be a major issue.

6-2. ***In-Depth Evaluations.*** *The Office of Enforcement and Compliance Assurance pointed out that many regions performed in-depth evaluations of state enforcement programs on a rotating basis, using the Performance Partnership Agreement, grant agreement, and existing policy as a basis. The Office agreed that it would be ideal to have these evaluations of enforcement programs in all states every 2 or 3 years; however, resources simply would not allow that in some EPA regions. The Office also agreed that publicity can be an effective factor to ensure competent program operations; however, active publication of all evaluations on a website may exacerbate federal-state tensions and inhibit a frank, open review process. The Office reserved to use the website as conditions dictate.*

OIG Position: It appears EPA regions have adequate resources for evaluating state programs; all of the regions that responded to our survey indicated they were performing comprehensive evaluations of state programs. Further, the Office of Enforcement and Compliance Assurance could team with the Office

R0013155

of Water to better leverage federal resources directed at evaluating state performance.

One weakness in the existing state evaluation process was the lack of consistent criteria and measures. For evaluations to be equitable, comparable, and valuable, they need to be consistent, objective, continue toward a goal of measuring the effectiveness of performance, and easily accessible to the public.

The public should be aware of serious deficiencies in a state's ability to protect human health and the environment. While public information about state performance may exacerbate federal-state tensions, it would provide an important means for holding states accountable for their environmental performance.

6-3. ***State Use of Core Performance Measures.*** *The Office of Enforcement and Compliance Assurance agreed to continue to remind states of their obligation to use core performance measures, and suggested that OIG encourage the states directly where possible to do so as well. In fiscal 1999, $1.8 million was awarded to 11 states to develop outcome measures, and, in fiscal 2000, another $1.2 million was awarded to 10 states to develop outcome measures specifically for compliance assistance. The Office was also discussing with states possibilities for funding performance measurement work within the National Environmental Performance Partnership System framework.*

6-4. ***EPA Use of Core Performance Measures.*** *The Office of Enforcement and Compliance Assurance advised that states report on the required core measures through national data systems. It is the optional measures which the states have opted not to use. The Office agreed to continue to promote the use of the optional measures through all means available, including grants. The Office consolidates information on required core measures of outputs nationally, and this information is used by EPA regions in their performance discussions with their states and is available to the public on request.*

6-5. ***Compliance Measures.*** *The Office of Enforcement and Compliance Assurance noted that while measures for compliance, recidivism, and the timeliness of enforcement actions were not "core measures" for states, it had established performance standards for the timeliness of enforcement actions which, for the most part, were derived directly from the 1986 Policy Framework. Regions have worked with states to have them adopt these standards. In fact, the Office included state performance on this standard in some of its program management reports.*

R0013156

Since the measure for recidivism is new, the Office of Enforcement and Compliance Assurance wanted to get some experience with the measure before establishing performance goals. Likewise, it has not set performance goals for compliance rates, recognizing that compliance rates are the product of many factors, not just EPA activities. The Office planned to work with the states through a grant to the Environmental Council of the States to assist in developing a consistent approach to determining compliance rates.

The Office of Enforcement and Compliance Assurance stated it monitored and reported on recidivism and timeliness on a national basis. It was considering setting a national target for recidivism for all programs, as well as a national target for improving compliance.

OIG Position: The Office's response partially addressed recommendation 6-5. The Office's efforts to set goals and standards for compliance, recidivism, and timeliness are critical to evaluating the effectiveness of state (and EPA) performance and should be continued. We are recommending, however, that regions work with states to establish specific performance goals in these areas. We look forward to the Agency's response to this recommendation in its reply to this report.

R0013157

R0013158

Exhibit 1

Details on Scope and Methodology

Scope

This audit resulted from concerns over the effectiveness of state enforcement programs. We focused on the Clean Water Act discharge program because of a lack of recent audit coverage in this area.

Forty-four states have EPA approval to issue, monitor, and enforce permits under the Clean Water Act's National Pollutant Discharge Elimination System program. EPA regions issue permits in the remaining states. The purpose of the discharge program is to protect human health and the environment by preventing the discharge of pollutants.

In addition to evaluating national data, we evaluated three EPA regions: 4, 8, and 9. In each region, we evaluated one state authorized to issue discharge permits. We selected states with a range of population, economy and sources of water pollution: California, North Carolina, and Utah. These states represent about 16 percent of the U.S. population.

We issued a separate report on North Carolina entitled *"North Carolina's NPDES Enforcement and EPA Region 4 Oversight"* in September 2000. This report addressed matters not included in this report, such as water testing methodology. Issues pertaining to this audit are included in this report. Additional details on the scope and methodology of our North Carolina evaluation are discussed in the North Carolina report.

We considered the results from a National State Auditors' Association-coordinated audit that included enforcement of the Clean Water Act. As of April 1, 2001, five state audit reports had been issued that addressed Clean Water Act enforcement to some degree: Arkansas, Colorado, Louisiana, Oregon, and Maryland. We considered the results of these audits in this report.

We performed our audit according to Government Auditing Standards issued by the Comptroller General. Our field work was conducted from February 2000 to October 2000. The audit included management procedures in effect as of fiscal 1999. We evaluated strategies, compliance monitoring systems, and enforcement actions taken from October 1, 1998 to December 31, 1999.

R0013159

Methodology

As part of our evaluation of management controls, we performed a risk assessment. This risk assessment identified the potential threats to state water enforcement and the management controls to address these threats. Based on this risk assessment and interviews with EPA officials, we identified critical management controls.

Management Controls

In assessing management controls, we also considered the Agency's own assessment. EPA's Permit Compliance System was identified in 1999 as an Agency weakness during EPA's annual self-assessment process. In EPA's fiscal 2000 Integrity Act Report to the Office of Management and Budget, EPA reported it had three major initiatives underway, in conjunction with the states, which were intended to address the issues involved with the Permit Compliance System and improve the usefulness of the system as a management tool: (1) system modernization; (2) interim data exchange format; and (3) electronic reporting. The status of these initiatives is discussed in Exhibit 2, page 69.

The management control weaknesses we found are described in this report, along with recommendations for corrective action. These weaknesses were a significant contributing cause to enforcement effectiveness problems.

Management Controls Over State Water Enforcement Programs

- Clean Water Act and amendments
- EPA approval process for state programs
- 40 CFR 122 and 123
- State laws, policies and guidance
- EPA's Permit Compliance System and state data systems
- 1986 Policy Framework for State/EPA enforcement agreements
- EPA Memorandum Of Agreement Guidance
- EPA's Enforcement Management System, Enforcement Response Guide, and enforcement policies
- Regional performance partnership grant agreements, work plans, and evaluations
- Regional audits and evaluations of state programs
- Regional memorandum of agreements
- EPA Inspection Manual
- Inspections
- Self-monitoring reports
- Quarterly noncompliance reports

Analysis Techniques

In evaluating state strategies, we considered compliance monitoring activities performed in high-risk areas.

To evaluate compliance monitoring and enforcement systems, we evaluated a judgmental sample of facilities to see if violations were properly identified and enforcement actions were appropriately taken. In California, we selected a judgmental sample of nine major facilities in the San Francisco Bay Regional

R0013160

Water Quality Control Board. We also evaluated the storm water compliance monitoring systems of the Los Angeles Regional Water Quality Control Board. Both boards are part of California's State Water Resources Control Board. Moreover, we considered Region 9's audits of Clean Water programs that had been performed in California's three other regional water boards. In evaluating compliance monitoring and enforcement systems in Utah, we selected a judgmental sample of six major facilities.

We also evaluated a sample of 34 major facility inspections in California and Utah; California's were selected from the San Francisco region. We evaluated four storm water inspections in the Los Angeles region and seven from Utah. These were judgmental samples; however, we believe they were representative.

To evaluate regional oversight of state programs and performance measures, we conducted a survey of 10 regions; seven regions responded. We also obtained information on oversight procedures for another region. In evaluating oversight, we compared annual and in-depth state evaluation criteria to EPA's 1986 Policy Framework and the National Environmental Performance Partnership System's core performance measures.

Evidence Considered

In analyzing state strategies, we considered the National Water Quality Inventory; EPA's Strategic Plan and annual plans; state plans, strategies, and grant agreements; EPA's 2000/2001 Memorandum of Agreement Guidance; Office of Water's report, *"Liquid Assets 2000";* regional memoranda of agreement, strategies and plans; and GAO reports. We interviewed responsible EPA headquarters, regional, and state personnel.

We considered the following evidence in evaluating compliance monitoring and enforcement:

- State compliance monitoring activities, including receipt and review of discharge monitoring reports, discharger inspections, and handling of complaints.
- State enforcement actions, including timeliness and appropriateness of the response, appropriateness of the penalty, and penalty collection.

We reviewed inspection procedures and examined state inspection reports. We also considered state and regional board policies and practices, management reports and interviews with responsible officials.

For the three regions we reviewed, we obtained regional evaluations of state performance.

R0013161

Data Limitations

There were serious limitations in the scope of the management information available to evaluate state enforcement programs. EPA's permit compliance system was inaccurate and incomplete. (This problem is described in Chapter 3, page 19.) Thousands of smaller discharge permits were not required to be included in the system. Further, state systems were limited, especially for storm water program compliance status and activities. These issues are also further discussed in Chapter 3, page 19 and Chapter 4, page 35.

Prior Audit Coverage

Neither EPA Office of Inspector General nor GAO have conducted any recent national audits of state enforcement of Clean Water Act dischargers.

The National Academy of Public Administration issued a report in November 2000 which included evaluations of EPA's water and enforcement programs.

R0013162

Exhibit 2: Other Matters

Key Management Decisions Needed for the Permit Compliance System

During the audit we attempted to determine if the plans for the modernized Permit Compliance System would remedy data gaps in EPA and state water enforcement information. These data gaps are discussed in Chapter 3 of this report (page 19). We were unable to ascertain whether the modernized system and its components would remedy these data gaps. We also identified management decisions the Office of Enforcement and Compliance Assurance should address promptly to ensure the system will meet both EPA and state needs.

Permit Compliance System Modernization Projects

EPA is redesigning the Permit Compliance System to better address current requirements of discharge permitting and enforcement programs and to meet new Office of Water initiatives, such as tracking reduced pollutant loadings, capturing information on storm water sources, and assessing the health of individual watersheds. EPA estimates that the cost for modernizing the system is between $12 and $14 million.

The Office of Enforcement and Compliance Assurance has three major initiatives currently underway for its Permit Compliance System, in conjunction with the states, which are intended to address system problems and improve its usefulness as a management tool:

- System modernization,
- State interim data exchange format, and
- Electronic reporting.

Permit Compliance System Initiatives

Initiative	Target Date (Fiscal)	New Functions
System Modernization	2003	Tracks reduced pollutant loadings, captures information on storm water sources, assesses health of watersheds
Interim Data Exchange Format	2001	Eases entry of state data into system; simplifies transition to modernized system
Electronic Self Reporting	2002	Discharger self-monitoring reports submitted electronically

Efforts to modernize the system have been frustrated over the years by a lack of funding and other Agency priorities. In addition, there have been regulatory hurdles to overcome. For example, to enable electronic reporting, the Agency had to modify federal discharge regulations to allow the regulated community to use electronic reporting to submit discharge information to EPA.

Concerns

In evaluating whether the modernized system would remedy problems with data gaps, we identified several concerns that we believe should be promptly addressed:

- **Data Entry Requirements Were Not Updated**. The Agency policy that identifies data that EPA and states are required to enter into the national information system had not been updated for over a decade and excluded storm water data. Meanwhile, the functional requirements documents for the new system had been completed and the project had started the detailed design phase. Data entry requirements are critical for determining system requirements, identifying system costs and benefits, and developing electronic reporting regulations.

- **Requirements Documents Were Incomplete**. The requirements documents for the new system were incomplete. We were told that new data elements had been established for storm water and concentrated animal feeding operation permits and, potentially, new data elements will be needed for certain minor facility operation permits. However, this will not be fully known until the data entry policy is updated. Also, the Office of Enforcement and Compliance Assurance had not determined how the compliance status would be determined for storm water, concentrated animal feeding operations, and other new permits.

- **Formal Consensus Was Not Reached**. The Office had not successfully collaborated with the Office of Water in the design of the system requirements. Further, the states had not formally bought into system requirements. Although the Office of Water and states had been included in workshops to determine system requirements, they had not reached a formal consensus on the modernized system requirements to ensure the new system will meet the users' needs.

- **Cost-Benefit Analysis Was Incomplete**. System modernization for the Permit Compliance System had begun the detailed design phase without completing the required life cycle cost-benefit analysis. Office of Management and Budget Circular No. A-11, Part 3 - *Planning, Budgeting, and Acquisition of Capital Assets* (July 2000), and OMB

R0013164

Circular No. A-130, *Management of Federal Information Resources* (November 2000), require agencies to prepare and update cost benefit analyses for information systems. An accurate cost-benefit analysis is necessary to identify the most cost-effective solution for the new system. Also, the expected benefits of the new system need to be quantified for evaluating the return on investment.

- **Key Decision Documents Were Needed.** Although the modernized system was estimated to cost more than $10 million in life cycle costs, the required system charter and system management plan decision papers had not been prepared or approved by appropriate levels of management. According to EPA's Information Resources Management Policy, the system charter should have been developed during project initiation, included an estimate of life cycle costs, and identified appropriate management levels for approval of decision papers. Further, the decision paper for the system management plan should have been produced at the conclusion of the analysis stage and updated as the project progressed.

Suggestions

We suggest that the Office of Enforcement and Compliance Assurance collaborate with the Office of Water to create an updated data entry policy. Upon completion of this policy, we suggest that the Assistant Administrator for Enforcement and Compliance Assurance:

- Complete the system requirements document.
- Execute memoranda of agreements with the Office of Water and state participants to help ensure (1) that the baseline requirements for the new system design are formally agreed to and (2) that both federal and state needs are addressed in the design of the new system.
- Perform a cost-benefit analysis of the new system that addresses the electronic reporting and data entry requirements, the system development costs, and the projected operational and maintenance costs over the life of the system.
- Establish and approve a system charter and system management plan.

Agency Response and OIG Position

The Office of Enforcement and Compliance Assurance agreed with the suggestions, except for the suggestion to execute memoranda of agreements with the Office of Water and the states on the system requirements and design. It explained that the schedule below addresses the tasks it will perform, with the involvement of EPA regions and states:

R0013165

Update system management plan	*5/01-12/01*
Complete system design specification document	*7/01-3/02*
Update federally required data element list	*4/02-9/02*
Update system policy statement	*Ongoing-9/02*

- ***System Requirements Document.*** *The Office of Enforcement and Compliance Assurance informed us that data requirements were collected from EPA (the Office of Water and the Office of Enforcement and Compliance Assurance) and states to determine the scope of the modernized Permit Compliance System. The next phase of system modernization is the design phase. One of the major products from that phase will be a design specification document. This document will be developed with very intense participation by EPA and states (both direct users and interface states). The design specification includes data elements to be collected in the system, data entry screens, report formats, and specific functionality to be supported, including electronic reporting efforts being managed elsewhere in the Agency. This effort will begin in July 2001 with the national Permit Compliance System meeting and will be completed by March of 2002.*

OIG Position: The finalization of the data requirements has the potential to affect the design phase and the cost benefits of system modernization. Accordingly, we suggest that extensive work on the design phase not be initiated until after the finalization of the data and functional requirements.

- ***Memoranda of agreements with the Office of Water and state participants.*** *The Office of Enforcement and Compliance Assurance agreed that full consultation and coordination with the Office of Water and the states was necessary; however it did not agree that the development of agreements with these parties was necessary or desirable. The Office believed that such a process would be extremely time consuming and resource intensive, and the goals of such a process can be achieved in other ways. Coordination had already occurred (and will continue) with Association of State and Interstate Water Pollution Control Administrators and the Environmental Council of the States.*

  Decisions on policy and system issues will be handled at a senior level between the Office of Water and the Office of Enforcement and Compliance Assurance with recommendations coming from the Permit Compliance System Steering Committee (representing EPA headquarters, regions, and states). One of the tasks before the Steering Committee and senior water managers is the updating of the

R0013166

system Policy Statement and the identification of federally-required data elements.

The Office of Enforcement and Compliance Assurance stated it had worked extensively with the Office of Water to identify data requirements. It intended to continue to work with the Office of Water and the states to finalize data requirements, both for existing programs and for new regulatory activities which were not well handled in the Permit Compliance System. In the next several months, system modernization managers will be working with the Office of Water to verify that requirements are still accurate and complete. Additionally, a data requirements team with representatives from the Office of Enforcement and Compliance Assurance, Office of Water, and state will be established at the Permit Compliance System national users meeting in July to review, validate, and finalize the identified requirements.

Once the data requirements are established, a workgroup, including EPA headquarters and regional representatives, as well as states, will be formed to identify the subset of data requirements which will be federally mandated for entry into the Permit Compliance System. The Policy Statement will then be modified to incorporate the data elements which states and regions are required to enter into the system as well as the universe to which those requirements will apply.

OIG Position: We believe it is critically important that the data and functional requirements for the modernized system be formally agreed to by the Office of Water and states to help ensure the system contains the agreed upon data, data definitions, data formats, and pertinent technical information needed to foster data quality and data integration. Without such agreements, there is an increased risk that the modernized system will not (1) meet the users' needs and (2) lower the costs to exchange data.

Formal agreements are also called for by the Exchange Network, an EPA project to improve environmental decision-making, improve data-quality and accuracy, and reduce data redundancy. The Exchange Network's Blueprint calls for EPA and the states to have "trading partner agreements" that contain the agreed upon data, formats, and related technical information. The Blueprint specifically cites Permit Compliance System data as an exchange of data to be governed by trading partner agreements.

- ***Cost-Benefit Analysis.*** *The Office of Enforcement and Compliance Assurance agreed to complete a cost-benefit analysis by September 2001.*

R0013167

OIG Position: Because the finalization of the data requirements has the potential to affect the design phase and the costs and benefits of the Permit Compliance System modernization, we suggest that the cost-benefit analysis be completed after the finalization of the data and functional requirements.

- ***System charter and system management plan.*** *The Office of Enforcement and Compliance Assurance agreed to establish and approve a system charter and management plan by December 2001. However, the Office stated that a system management plan was done early in the planning phases of system modernization. It was replaced with the Information Technology Management Reform Act submission, which contained all of the information required in the system management plan and was approved by Deputy Assistant Administrator. This submission was provided to the Office of Management and Budget. As this document was updated each year, the Office believed that it served the purpose of the system management plan; however, it agreed to update the plan by December 2001.*

OIG Position: We concur with the decision to update the system management plan by December 2001. However, we were unable to substantiate that a system management plan was previously prepared. Further, a system management plan must be approved by the Assistant Administrator, rather than the Deputy Assistant Administrator. Also, a system management plan also must be linked with Agency and organizational information resource management strategic and multi-year implementation plans, and be updated to reflect actual and planned changes as new system decision papers are approved.

OFFICE OF
ENFORCEMENT AND
COMPLIANCE ASSURANCE

MEMORANDUM

SUBJECT: OECA Comments on the Draft Audit Report, "State Enforcement of Clean Water Act Dischargers Can Be More Effective"

FROM: Sylvia K. Lowrance
Acting Assistant Administrator

TO: Charles McCollum
Divisional Inspector General for Audit
Western Audit Division
Office of the Inspector General

Thank you for the opportunity to review and comment on the April 25, 2001 version of the Draft Audit Report, "State Enforcement of Clean Water Act Dischargers Can Be More Effective." We agree with several of the conclusions in the report, including that States need to implement risk-based approaches to water enforcement and that it would be useful to have a process for periodic evaluation of the Clean Water Act program in each State. We also agree that modernization of the Permit Compliance System (PCS) should be a high priority; in fact, the modernization of the Permit Compliance System (PCS) has been an OECA priority for the last four years. As we have informed you on at least two previous occasions, part of the justification for this work was to improve the quality of information in PCS. OECA has funded modernization efforts during this 4 year period and Agency funds have been provided since FY 2000. OECA's commitment to modernizing PCS is further demonstrated through our recommendations as early as 1999 that PCS be added as an Agency-level FMFIA weakness.

However, we remain very concerned about the way some of the issues, as well as EPA's role, are characterized in the report and that many of the findings are based on anecdotal information. In brief, the draft report does not recognize that: 1) the Office of Enforcement and Compliance Assurance (OECA) has an exhaustive process for setting national enforcement priorities, including stakeholder meetings and a Federal Register notice and comment period (p. ii), 2) States should be responsible for setting "watershed-specific enforcement priorities"(p. 13), and 3) flexibility in NPDES program requirements

(e.g., tradeoffs of major and minor inspections are allowed) supports State enforcement strategies (p. 7). We are also concerned that the issues related to PCS have been oversimplified in the report.

OECA's national enforcement priority setting process includes consultation with the Regions, States, Tribes, and the national program managers. In addition, the views of the public are solicited through the publication of a Federal Register notice identifying proposed priorities. Public health and environmental risk is a major criterion used in identifying possible priorities, and documents coming from States, such as the 305(b) report, are used in determining which environmental problems pose the greatest risks. Wet weather issues, such as sewer overflows and contaminated urban and agricultural runoff, were identified as major sources of water quality impairment in the 305(b) reports and were identified as an OECA priority for FY 2000-2001. Storm water was added at the request of EPA's Office of Water. A stakeholder meeting held in the fall of 2000, which included State representation, verified that "wet weather" should be a priority again for FY 2002-2003. The audit report fails to recognize the involvement of States in the OECA national priority setting process, as well as the significance given to environmental issues identified by the States. A chronology of OECA's stakeholder process is included in response 2-1 of the attachment.

OECA believes it has been sending a consistent and strong message to the Regions and the States that enforcement resources should be concentrated on the most significant pollution sources. OECA has developed national risk-based strategies for addressing sewer overflows, concentrated animal feedlot operations, and storm water; each of these emphasize the importance of focusing on impaired watersheds. We agree more needs to be done, but we question whether additional guidance documents and further rounds of consultation would help, or whether they would drain scarce resources in redundant and time consuming bureaucratic processes with little environmental result. We believe that the real issue is not OECA's priority setting process but whether risk-based strategies are being implemented in the field by the States. The draft report reveals that several States have no risk-based planning at all. States need to assume a greater share of responsibility in addressing significant pollution problems. For example, they are often in the best position to identify watershed-specific priorities and develop field level implementation plans. A constructive recommendation would be that EPA should place more emphasis on program reviews and improve its efforts to share information (e.g., on "best practices") with the States.

OECA disagrees with the finding that the core NPDES program inhibits the development of State strategies. In its FY 2000/2001 OECA Memorandum of Agreement (MOA) Guidance ("the MOA Guidance"), OECA's focus was not on major point sources, but on the same "wet weather" risks to water quality cited by OIG in its report, including CAFOs and storm water. The MOA Guidance does state that it is an Agency goal to inspect 100% of all major point sources annually because major point sources generate the majority of effluent flow and toxic pollutant loadings which can significantly affect water quality in receiving waters. OECA believes that implementing a risk-based approach means evaluating all dischargers contributing to water quality impairment and an important component of that is maintaining a field presence at major facilities. Consistently inspecting major facilities in the past may be responsible for the relatively high levels of compliance among majors. We need to recognize that we would lose significant environmental benefits associated with higher levels of compliance among majors if we were to allow a total shift to minors. OECA's MOA Guidance allows Regions/States flexibility in shifting a portion of their total inspection resources from major to minor facilities, particularly in priority watersheds, where those minor facilities represent a significant risk. OECA's guidance makes clear that minor inspections can be traded for major inspections at a 2:1 ratio, using a risk-based rationale, if the Region/State is willing to

OECA Responses to Recommendations in Draft OIG Report,
"State Enforcement of Clean Water Act Dischargers Can Be More Effective"

I. Executive Summary

OIG is recommending that the Office of Enforcement and Compliance Assurance, in partnership with the Office of Water and EPA regions, collaborate with states to develop risk-based enforcement priorities. EPA also should make modernization of its Permit Compliance System a high priority. Teaming with the Office of Water and the states, the Office of Enforcement and Compliance Assurance should ensure that the new system will meet both federal and state needs.

OIG is also recommending that the Office of Enforcement and Compliance Assurance revise its enforcement guidance to better define significant violations for toxicity test failures, minor facilities, and storm water dischargers.

Lastly, the Office of Enforcement and Compliance Assurance should routinely determine whether states are fulfilling their obligations to monitor and enforce discharge programs. To do so, it should develop consistent criteria for in-depth program evaluations of state programs. These evaluations, along with state performance measures, should be accessible to the public.

EPA Response: The Office of Enforcement and Compliance Assurance (OECA) has an exhaustive stakeholder process in place to determine what the national enforcement priorities are; it includes consultation with the Regions, States, and the Office of Water (OW). OECA has developed national risk-based strategies for the wet weather priorities and will continue to assist the Regions in working with the States to implement them. Modernization of the Permit Compliance System (PCS) is and will continue to be a high priority for OECA. OW and the States have been involved in workshops to help identify the data requirements needed for management of the NPDES program. Additionally, an OECA/OW/State data requirements team will be established at the PCS national users meeting in July 2001 to review, validate, and finalize the identified requirements. The final data requirements as identified by OECA, OW, and the States will be incorporated in the modernized PCS system.

Existing national enforcement guidance has flexibility to address toxicity, minors, and storm water violations. OECA will work with the Regions to ensure that the States are aware of the guidance and will consider OIG's specific recommendations when guidance is updated in the future.

OECA agrees that State compliance and enforcement programs need to be periodically evaluated. EPA Regions do assess State programs on a rotating basis and OECA now has a national evaluation process which focuses on "program element reviews."

Chapter 2: State Enforcement Strategies Need to Be Modified

OIG recommends that the Acting Assistant Administrator for Enforcement and Compliance Assurance:

*3- 1. **In partnership with the Office of Water and EPA regions, collaborate with states to develop risk-based enforcement priorities. Encourage states to develop mechanisms to evaluate tradeoffs in enforcement investments.***

EPA Response: OECA already has a consultation process in place, in which Regions, States, EPA's Office of Water, and other stakeholders are extensively consulted in determining what the national water enforcement priorities should be for each 2-year cycle. A major factor in identifying the candidates for priorities is the element of risk. To start the FY 2002/2003 process, in the Spring of 2000, Regions were asked to begin by engaging States and Tribes in a discussion of national priorities. We received comments, suggested changes for existing priorities, and recommendations for new

R0013176

priorities from 16 individual States and their environmental agencies, as well as receiving collective State comments from 3 EPA Regional offices. Based on feedback received and combined with an analysis conducted at Headquarters, a Federal Register (FR) notice was published on September 28, 2000 soliciting public comment on a list of 15 potential priorities and encouraging suggestions for additional nominations. The comments received from the FR notice helped set the stage for OECA's "National Priorities Meeting" held on November 14, 2000. State, Tribal, Regional and Headquarters managers attended the meeting. Fifteen priority candidates were described and discussed and attendees were then requested to recommend their top choices for OECA's FY 2002/2003 MOA priorities. Six State representatives and 12 representatives from State associations attended the meeting and they all contributed to the outcome. The 6 recommended priorities are all current priorities, sending a clear signal that stakeholders and our regulatory partners want OECA to continue working on those national priorities in FY 2002/2003.

While Regions can and do recommend that States participate in national water priorities, suggest where States might focus their resources, and meet with States to conduct joint work planning, ultimately it is the State's decision as to the priorities it will set. We believe OIG should recognize State involvement in identifying national priorities and that a more appropriate recommendation would be for OECA to develop a process to ensure States are implementing the risk-based strategies we have.

*3- 2. **Initiate action to eliminate the regulatory requirement to inspect all major dischargers annually.***

EPA Response: Our regulations at 40 CFR Part 123.26(e)(5) require that State programs have the "procedures and ability" to inspect all majors annually. We believe that it is important to retain this regulatory requirement because not all States are authorized to implement the NPDES program yet and this requirement sets a minimum, quantifiable standard for States to be held to (i.e., a State applying for approval to implement the NPDES program must have procedures and resources in place to at least inspect all of its largest dischargers annually). Major facilities are considered high risk facilities because they generate the majority of effluent flow and toxic pollutant loadings. As shown in the maps included in this audit report (p. 17 and 39), there still are numerous noncompliance problems with major dischargers indicating that it is important that we maintain a field presence at these facilities.

OECA recognizes that a risk-based approach, such as addressing impaired watersheds, requires addressing majors *and* minors which is why we issued the September 11, 1995 memorandum to the Regions entitled "Revision to Inspection Coverage and Frequency Criteria of Clean Water Act Permittees." This memorandum, as well as OECA's Memorandum of Agreement (MOA) Guidance, provides EPA Regions and States flexibility in shifting some inspection resources from lower risk majors to higher risk minors. OECA's guidance makes clear that minor inspections can be traded for major inspections at a 2:1 ratio, using a risk-based rationale, if the Region/State is willing to report the minor inspection results in PCS. Resistance sometimes arises from a lack of rationale (e.g., no risk-based strategy), unwillingness to commit to the tradeoff ratio, and/or unwillingness to report minor data in PCS. Reporting and tracking outcomes from these inspections is critical to addressing OIG's concerns regarding the lack of data on minors and for EPA to document results under the Government Performance and Results Act (GPRA).

We believe an appropriate alternative recommendation would be for OECA to ensure that any State that does not commit to inspect 100% of its majors develops and implements an inspection plan that targets an appropriate mixture of high risk dischargers (i.e., majors and minors) in priority areas such as impaired watersheds.

Chapter 3: Permit and Other Information Systems Inadequate

OIG recommends that the Acting Assistant Administrator for the Office of Enforcement and Compliance Assurance:

*3-1. **Make modernization of the Permit Compliance System a high priority. Further, ensure that future systems:***
- ***Allows for submission and evaluation of self-monitoring reports for all dischargers, including minor facilities and storm water.***
- ***Tracks storm water permits, inspections, compliance rates, and enforcement actions.***

EPA Response: Modernization of PCS is, and will continue to be, a high priority for OECA. The modernized system will build in the capacity to allow for entry of all data element fields needed to track all dischargers, including minor facilities and storm water facilities. Information tracked for those dischargers will include permit limits, inspections, compliance and enforcement action data. PCS modernization is scheduled for implementation by the end of 2003.

R0013177

3-2. Accelerate the development of the state data transfer system for the Permit Compliance System. Also, before proceeding further into design and development, work with the Office of Water to ensure there is an up-to-date policy statement for water system criteria.

EPA Response: Over the last year, OECA and the Office of Environmental Information (OEI) have been working closely with our State partners in implementing the PCS Interim Data Exchange Format (IDEF). IDEF will ease the States' entry of required information from their modernized State systems into legacy PCS, and will simplify the transition of that information entry into the modernized PCS. OEI is the lead for implementing the IDEF project and has developed the schedule for implementation of the project. Acceleration of that implementation schedule needs to be addressed by OEI. Currently IDEF is scheduled for full implementation in February/March 2002.

While OECA agrees that there is a need to update the PCS Policy Statement to address new data requirements, we do not agree that this must occur before design and software development. Broad capacity will be built into the system as indicated in the response to 3-1. Only a subset of that capacity is likely to be Federally required. Therefore, the Policy Statement can be updated during system design and development.

3-3. Have regions work with states to help ensure data elements needed for the new Permit Compliance System are included in state systems being developed.

EPA Response: OECA is in the process of finalizing the overall data requirements for the modernized PCS system. We will continue to work closely with the States in developing those detailed data requirements. Until those requirements are finalized, those States modernizing their systems should include in their modernized system the current PCS data entry requirements as referenced in the current PCS Policy Statement.

For the most part, States do not coordinate or consult with OECA when modernizing their State systems as they are built primarily to accommodate State needs. We will, however, request of Regions that they make a special effort to discuss State modernization plans during their EPA/State program status meetings. Additionally, we hope that extensive involvement of State representatives in the PCS modernization process will have a spill over effect in getting States to include the necessary data elements in their systems.

3-4. Continue to report the Permit Compliance System as an Agency-level weakness until the modernization project is implemented and the system data is reasonably accurate and complete.

EPA Response: OECA will continue to report PCS as an Agency-level weakness until all milestones have been met. One of the milestones is the completion of PCS modernization which is scheduled to occur by the end of 2003.

3-5. Revise guidance to specify that whole effluent toxicity violations are significant violations. Revise regulations to require whole effluent toxicity violations to be reported on quarterly noncompliance reports.

EPA Response: In many ways, whole effluent toxicity (WET) is treated like any other parameter in the NPDES program, i.e., the permittee reports self-monitoring data on its discharge monitoring report, WET results are entered into PCS and tracked, and violations should be reviewed and are subject to a range of enforcement responses. The major exception is that WET violations are not automatically flagged as significant noncompliance or "SNC." Because of the variability in permit requirements (e.g., many permits just require monitoring with a trigger for follow-up study instead of a numeric limit) and the variation in frequency of compliance monitoring required (e.g., quarterly or annually),WET violations do not neatly fit under our existing SNC criteria. However, EPA's existing regulations and guidance provide Regions and States flexibility to identify WET violations as significant. The regulations at 40 CFR Part 123.45(a)(2)(G) currently provide the Director with flexibility to report any violation of "substantial concern" on the QNCR. EPA's 1989 "Whole Effluent Toxicity Permitting Principles and Enforcement Strategy" states that any violation of a WET limit is of concern and should be reviewed. EPA's "Enforcement Management System" enforcement response guide was last revised in 1989 and recommended responses to WET violations were added.

When OECA revises the NPDES definition of SNC, we will re-consider the applicability of SNC criteria to WET.

R0013178

3-6. Establish a definition of significant violations for minor facilities, including storm water dischargers. At a minimum, include nonsubmission of self-monitoring reports in this definition. Also, define "significant" minor facilities. Include facilities impacting impaired waterways in this definition.

EPA Response: The Director has discretion to designate any facility with violations of concern as a "major" thereby subjecting the facility to SNC criteria, and 40 CFR Part 123.45(a)(2)(G) currently provides the Director with discretion to report any violation of "substantial concern" on the QNCR. OECA will commit to consider developing guidance on when a minor should be designated as a major and to include factors such as non-submission of discharge monitoring reports and impact of the discharge on impaired waterways.

Chapter 4: Storm Water Compliance Systems Have Deficiencies

OIG recommends that the Acting Assistant Administrator for Enforcement and Compliance Assurance:

4-1. Work with EPA regions in assisting states to:

- *Develop mechanisms to better balance their limited resources between all categories of dischargers, as is indicated by the states' analysis of risks to water quality.*
- *Create effective strategies for identifying storm water nonfilers.*
- *Develop sound storm water inspection programs which include risk-based inspection schedules and tracking and follow-up of inspection results.*
- *Establish tracking systems for citizen complaints.*

EPA Response: OECA will continue to work with the Regions and States to implement risk-based approaches to water enforcement; OECA's MOA guidance and national strategies provide flexibility to address majors as well as minors. OECA's 2000 Storm Water Enforcement Strategy outlines a recommended "sweep" approach of targeting a priority watershed/geographic area, then focusing storm water inspections and enforcement actions on a category of non-filers (e.g., a priority industrial sector or large construction sites) in that area. While EPA can assist the States by providing direction, guidance, training, and work-sharing, States must take responsibility to develop appropriate planning mechanisms to develop and implement risk-based strategies (which should include a sound inspection program and a system to track citizen complaints), and balance their limited resources.

4-2. Facilitate the development of a system which allows self-monitoring reports to be electronically scored for compliance. Consider low- cost options such as scan sheets (commonly used for electronic scoring of tests) and web-based reporting.

EPA Response: The current PCS system already determines compliance based on the electronic review of the discharge monitoring reports, though some improvements are needed in the system. Modernized PCS will certainly have this capability. Additionally, modernized PCS will provide the capability for facilities and States to electronically report information utilizing the Agency's Central Data Exchange portal and the National Environmental Information Exchange Network for the transfer of NPDES data.

Chapter 5: Enforcement Actions Late and Penalties Insufficient

OIG recommends that the Acting Assistant Administrator for Enforcement and Compliance Assurance:

5-1. Establish a clear and consistent standard for measuring the promptness of enforcement actions.

EPA Response: The NPDES program already has a "timely and appropriate" standard described in the NPDES "Enforcement Management System." We believe that a more appropriate recommendation would be for OECA to review the consistency of its standard and ensure that the Regions and States are aware of it.

5-2. Continue to work with the regions to assist states in establishing proactive enforcement strategies to help facilities avoid long-term serious violations due to plant or system obsolescence or capacity limits.

EPA Response: OECA, in conjunction with OW, has developed guidance documents and training workshops to assist the regulated community in avoiding noncompliance due to plant or system obsolescence or capacity problems. Some

R0013179

specific examples are guidance with regard to implementation of nine minimum controls and a long-term control plan for combined sewer overflows (CSOs) as well as guidance documents and training workshops for municipal officials and their system operators and consultants on procedures to eliminate and prevent sanitary sewer overflows (SSOs) and CSOs.

OECA is involved in the development of a *Guide for Evaluating Capacity Management, Operation and Maintenance (CMOM) Programs at Sanitary Sewer Collection Systems* which describes the management practices and operation and maintenance techniques that have served municipalities best in the reduction and elimination of SSOs from their systems. The audience for this guidance is State and EPA personnel who are assisting municipalities to comply with SSO requirements. The guidance will also help municipalities make decisions on the rehabilitation and repair of their collection systems and ways to better operate those systems. The guidance is scheduled for release as an interim-final document early in fiscal 2002, and is planned to be finalized following the final publication of the SSO Rule.

Guide for Evaluating Capacity Management, Operation and Maintenance Programs (CMOM) at Wastewater Treatment Plants will provide guidance to assist compliance monitoring inspectors in determining whether a CMOM program is adequate for a particular wastewater treatment plant. The guidance will also be useful to municipalities for determining whether their plants are following accepted practices and for addressing any discrepancies as needed in order to improve or maintain compliance. The guidance is scheduled for release as an interim-final document early in FY 2002, and is planned to be finalized following the final publication of the SSO Rule.

Chapter 6: Improved Performance Evaluation and Measurement Needed

OIG recommends that the Acting Assistant Administrator for Enforcement and Compliance Assurance routinely determine whether states are fulfilling their obligations to monitor and enforce discharge programs. Specifically:

6- 1. Develop consistent criteria and measures for in-depth program evaluation of state programs:

- *a. At a minimum, all of the oversight criteria and measures in the 1986 Policy Framework should be included along with additional elements included in the Clean Water Act discharge guidance. Include the accuracy and completeness of data systems, the quality of inspections, and the reliability of self-monitoring reports.*
- *b. Evaluate all significant discharge programs including storm water, minor dischargers, and concentrated animal feeding operations.*
- *c. Use a uniform, objective scoring mechanism.*

EPA Response: OECA agrees that a process for periodic evaluation of the Clean Water Act (CWA) discharge program in each State would be useful. In fact, most Regions do conduct an assessment of State water enforcement programs, either annually or bi-annually, though the nature of the assessment varies. Some variability in the assessment process is necessary since priorities vary by State, as does work sharing with the Region. For your information, the content of the review of State performance for any program, not just the CWA discharge program, must be governed principally by the authorization agreements, grant work plans and agreements and the Performance Partnership agreement between the Region and State. Those policies and agreements should define priorities, describe work sharing arrangements between the Region and State, and define the evaluation process to be used, among other things.

OECA now has a national evaluation process which focuses on "program element reviews" among programs. These reviews focus on examining policy and implementation of a particular program element in all Regions and a sample of States. OECA is responsible for working with the Regions and States to evaluate a wide scope of statutory programs, and while resources do not permit a commitment to ensure a top to bottom evaluation of the enforcement of the CWA discharge program in every State, OECA will consider how best to concentrate on key concerns of the program.

Since the OECA program element reviews will each address a different program or problem, there will not be a standing uniform scoring mechanism. However, within each review, the questions used and the weight assigned to the answers will be the same. OECA agrees to continue to develop for each of its program element

R0013180

reviews a consistent set of criteria and measures as part of its design for each review. All applicable policy is considered in designing each review. For NPDES, this will include criteria from the 1986 Policy Framework. However, we are not yet in a position to identify what reviews will be undertaken in the future.

6- 2. ***Have regions perform in-depth evaluations of state enforcement programs every two to three years. Make these evaluations available to the public through publicity releases or the EPA website.***

EPA Response: Many Regions do perform in-depth evaluations of State enforcement programs on a rotating basis, using the Performance Partnership Agreement, grant agreements, and existing policy as a basis for those evaluations. Again, OECA agrees that it would be ideal to have these evaluations of enforcement programs in all States every 2 or 3 years; however, resources simply would not allow that in some Regions. OECA also agrees that publicity can be an effective factor to ensure competent program operations; however, active publication of all evaluations on a website may exacerbate Federal/State tensions and inhibit a frank, open review process. OECA reserves use of the website as conditions dictate.

6- 3. ***Continue to remind state partners, including the Environmental Council of the States, of their obligation to use core performance measures that address the effectiveness of enforcement programs.***

EPA Response: OECA agrees to continue to do so, and suggests that OIG encourage the States directly where possible to do so as well. In FY 1999, $1.8 million was awarded to eleven States to develop outcome measures, and in FY 2000, another $1.2 million was awarded to 10 States to develop outcome measures specifically for compliance assistance. OECA is also discussing with States possibilities for funding performance measurement work within the NEPPS framework.

6- 4. ***Have regions collect and use all core performance measures to consistently measure the effectiveness of state enforcement programs on an annual basis. Consolidate these measures nationwide and make them public.***

EPA Response: States currently report on the required core measures through national data systems. It is the optional measures which the States have opted not to use. OECA will continue to promote the use of the optional measures through all means available to us, including grants. OECA does consolidate information on required core measures of outputs nationally, and this information is used by the Regions in their performance discussions with their States and is available to the public on request.

6- 5. ***Work with regions to assist states in setting specific goals and standards for compliance, recidivism, the timeliness of enforcement actions and other important measures.***

EPA Response: While the above measures are not "core measures" for States, OECA has established performance standards for the timeliness of enforcement actions which, for the most part, derive directly from the 1986 Policy Framework. Regions have worked with States to have them adopt these standards. In fact, OECA includes State performance on this standard in some of its program management reports. Since the measure for recidivism is new, OECA has wanted to get some experience with the measure before establishing performance goals. Likewise, we have not set performance goals for compliance rates, recognizing that compliance rates are the product of many factors, not just our OECA activities. OECA does plan to work with the States through an ECOS grant to assist in developing a consistent approach to determining compliance rates. OECA does monitor and report on recidivism and timeliness on a national basis and is considering setting a national target for recidivism for all programs as well as a national target for improving compliance.

Exhibit 2: Other Matters, Key Management Decisions Needed for PCS

In evaluating whether the modernized system and components would remedy problems with data gaps, OIG identified several concerns that they believe should be promptly addressed:

- ***Data Entry Requirements Not Updated.***
- ***Incomplete Requirements Document.***

R0013181

EPA's Response: OECA has already worked extensively with OW, particularly the Permits Division, to identify data requirements. A number of special sessions were held with OW personnel when they were unable to attend the established sessions. We intend to continue to work with OW and the states to finalize data requirements, both for existing programs and for new regulatory activities which are not currently well handled in PCS. In the next several months, PCS modernization managers will be working with OW to verify that requirements provided previously by them are still accurate and complete. Additionally, an OECA/OW/State data requirements team will be established at the PCS national users meeting in July to review, validate, and finalize the identified requirements.

Once the data requirements are finally established, a workgroup, including EPA Headquarters and Regional representatives, as well as States, will be formed to identify the subset of data requirements which will be federally mandated for entry into PCS and, which currently required data elements can be eliminated. The PCS Policy Statement will then be modified to incorporate the data elements which States/Regions are required to enter into PCS as well as the universe to which those requirements will apply.

- ***Key Decision Documents Are Needed.***

EPA Response: The System Management Plan (SMP) is a document which contains information on why the system is needed, what contract will be used, who is the project manager, what is the estimated cost, etc. While such a plan was done very early in the planning phases of PCS modernization, it was replaced with the OECA ITMRA submission. This submission contains all of the information required in the SMP, is reviewed by all management levels and is approved by OECA's Deputy Assistant Administrator. It is then reviewed by peer review teams within the Agency and annually provided to OMB as part of the Agency's overall response to IT investment reporting requirements of the Clinger-Cohen Act. As this document is updated each year, we believe that it serves the purpose of the SMP; however, we will update the SMP by December 2001.

OIG suggests that the Office of Enforcement and Compliance Assurance collaborate with the Office of Water to create an updated data entry policy. Upon completion of this policy, OIG suggests that the Acting Assistant Administrator for Enforcement and Compliance Assurance:

- ***Complete the systems requirements document.***

EPA Response: Data requirements were collected from EPA (OW and OECA) and States to determine the scope of the modernized PCS system. The next phase of PCS modernization is the design phase. One of the major products from that phase is a design specification document. This document will be developed with very intense participation by EPA and States (both direct users and interface States). The design specification includes data elements to be collected in PCS, data entry screens, report formats, and specific functionality to be supported, including electronic reporting efforts being managed elsewhere in the Agency. This effort will begin in July of this year with the National PCS meeting and will be completed by March of 2002.

- ***Execute memoranda of agreements with the Office of Water and state participants to help ensure (1) that the baseline requirements for the new system design are formally agreed to and (2) that both federal and state needs are addressed in the design of the new system.***

EPA Response: While we agree that full consultation and coordination with the Office of Water and the States is necessary, we do not agree that the development of MOAs with these parties is necessary or desirable. Such a process would be extremely time consuming and resource intensive, and the goals of such a process can be achieved in other ways. Coordination has already occurred (and will continue) with ASWIPCA and the Water Subcommittee of ECOS. Decisions on policy and system issues will be handled at a senior level between OW and OECA with recommendations coming from the PCS Steering Committee (representing EPA Headquarters, Regions, and States). One of the tasks before the PCS Steering Committee and senior water managers is the updating of the PCS Policy Statement and the identification of Federally required data elements. The schedule below addresses this task. Again, Regions and States will be involved in regular formulation and decision on these issues.

R0013182

Update System Management Plan	05/01-12/01
System Design Specification Document	07/01-03/02
Update Federally Required Data Element List	04/02-09/02
Update PCS Policy Statement	Ongoing-09/02

- ***Perform a cost-benefit analysis of the new system that addresses the electronic reporting and data entry requirements, the system development costs, and the projected operational and maintenance costs over the life of the system.***

EPA Response: This analysis is underway and should be completed by September 2001.

- ***Establish and approve a system charter and system management plan.***

EPA Response: We agree and will complete them by December 2001.

R0013183

(Slip Opinion)

NOTICE: This opinion is subject to formal revision before publication in the Environmental Administrative Decisions (E.A.D.). Readers are requested to notify the Environmental Appeals Board, U.S. Environmental Protection Agency, Washington, D.C. 20460, of any typographical or other formal errors, in order that corrections may be made before publication.

In re:	)	
City of Irving, Texas Municipal Separate Storm Sewer System	)	NPDES Appeal No. 00-18
Permit No. TXS001301	)	

[Decided July 16, 2001]

ORDER DENYING REVIEW

Before Environmental Appeals Judges Scott C. Fulton, Ronald L. McCallum, and Kathie A. Stein.

CITY OF IRVING, TEXAS
MUNICIPAL SEPARATE STORM
SEWER SYSTEM

NPDES Appeal No. 00-18

ORDER DENYING REVIEW OF PETITION

Decided July 16, 2001

Syllabus

Petitioner, City of Irving ("Irving"), filed a Petition for Review of a National Pollutant Discharge Elimination System ("NPDES") permit issued to it by U.S. Environmental Protection Agency, Region VI ("Region"), for operation of Irving's municipal separate storm sewer system ("MS4"). Irving's appeal seeks review of several permit conditions on the basis that they require Irving to regulate, legislate, and use its enforcement powers in violation of the principles of federalism contained in the Tenth Amendment, which Irving contends prohibits Congress or federal agencies from compelling states to enact or enforce a federal regulatory program. Irving also objects to permit conditions requiring it to develop training and education programs targeted to reduce storm water pollution, on the basis that such provisions compel it to speak to its citizens and to deliver a message chosen by the Region in violation of its First Amendment right to free speech.

In addition to its constitutional objections to the permit, Irving contends that other permit conditions evidence error, abuse of discretion, or other unlawful action by the Region that warrants review by the Board, including: (1) the permit's failure to authorize all forms of discharge from its MS4; (2) inclusion of permit language requiring Irving to develop a storm water management plan ("SWMP"); (3) inclusion of provisions making Irving jointly liable for failure of co-permittees to fulfill their permit obligations; (4) the establishment of a permit compliance certification date that precedes the effective date of the permit; (5) the requirement that Irving submit annual reports; and (6) the requirement that Irving seek approval prior to implementing certain changes to its SWMP, in that it places no time limit on the Region when processing such a request.

Held: The Board finds that while Irving attempts to present its constitutional arguments as a challenge to specific permit conditions established by the Region, the permit provisions in question fall within the immediate contemplation of both the Clean Water Act ("CWA") and its implementing regulations at 40 C.F.R. § 122.26(d). Thus, Irving is in reality challenging the validity of the statutory and regulatory provisions themselves, rather than the manner in which they were applied by the Region when it

wrote Irving's permit. The Board denies review of Irving's constitutional arguments on the basis that the proper forum for Irving's challenge lies with the federal courts, finding, *inter alia*, that nothing in Irving's Petition or in the administrative record in this case presents circumstances sufficiently compelling to overcome the presumption of non-reviewability of Agency rules in the context of Board proceedings.

With regard to the balance of Irving's objections, we find nothing clearly erroneous in the Region's approach nor any other circumstances warranting review. Accordingly, the Petition for Review is denied in its entirety.

Before Environmental Appeals Judges Scott C. Fulton, Ronald L. McCallum, and Kathie A. Stein.

Opinion of the Board by Judge Fulton:

The City of Irving ("Irving") has filed a Petition for Review ("Petition") dated August 14, 2000, seeking review of several conditions set forth in a National Pollutant Discharge Elimination System ("NPDES")[1] permit issued to Irving, Dallas County Utility and Reclamation District, Dallas County Flood Control District No. 1, and Irving Flood Control Districts Sections I and III by the U.S. Environmental Protection Agency, Region VI ("Region") on February 8, 1997. The permit would authorize storm water discharges from Irving's municipal separate storm sewer system ("MS4").[2] The Petition argues that several conditions violate Irving's constitutional rights under

[1]Under the Clean Water Act ("CWA"), persons who discharge pollutants from point sources (discrete conveyances, such as pipes) into waters of the United States must have a permit in order for the discharge to be lawful. CWA § 301, 33 U.S.C. § 1311. The National Pollutant Discharge Elimination System is the principal permitting program under the CWA. CWA § 402, 33 U.S.C. § 1342.

[2]Under CWA § 402(p) and 40 C.F.R. § 122.26, an NPDES permit is required for MS4s serving populations of 250,000 or more (large systems), and those serving populations of more than 100,000 but less than 250,000 (medium systems). It is undisputed that Irving satisfies the requirement of a medium system.

the First and Tenth Amendments and that the Region clearly erred or abused its discretion in setting several other permit conditions.

In its Response to Petition for Review ("Response"), the Region contends that its actions were a lawful exercise of its discretion and that the conditions objected to by Irving are required under the Clean Water Act ("CWA") and in no way violate Irving's constitutional rights. Response at 8-13. The Region further argues that, as a general matter, the Board does not review arguments challenging the constitutionality of statutes administered by EPA. *Id.* at 6.

Because we decline to assume jurisdiction over Irving's constitutional claims and Irving has failed otherwise to explain why the Board should review such a challenge or demonstrate how the Region's findings were clearly erroneous, an abuse of discretion, or otherwise unlawful, review is denied.

I. BACKGROUND

A. *Factual Background*

Irving owns and operates an MS4 that discharges storm water into a system of rivers and creeks in Texas. Administrative Record Exhibit ("AR Ex.") 1 at 4-4. Pursuant to the requirements for system-wide MS4 permitting set forth in CWA § 402(p)(4) ("Permit application requirements") and the implementing regulations at 40 C.F.R. § 122.26(d) ("Application requirements for large and medium municipal separate storm sewer discharges"), Irving joined with its co-permittees to submit Part 1 of the required NPDES permit application in 1992 and the Part 2 application in 1993.[3] AR Exs. 1, 3. From 1993 through 1997,

[3]As explained more fully *infra*, section I.B, the permitting process for an MS4 consists of a two-part application. Part 1 of the application requires an applicant to provide general owner information, describe its legal authority to implement permit (continued...)

Irving, its co-permittees, and the Region worked to revise the Part 2 application, resulting in the Region's issuance of a draft permit on February 8, 1997. Irving filed its Comments on Draft NPDES Permit No. TXS001301 ("Comments") on March 20, 1997, during an extension of the public comment period. Petitioner's Exhibit ("P Ex") 2. The Region continued negotiations with Irving and its co-permittees and, after having received certification from the Texas Natural Resource Conservation Commission,[4] issued its Response to Comments on Draft Permit ("RTC") (AR Ex. 33) and the final permit at issue here on September 11, 1998. R Ex 34 (NPDES Permit No. TXS001301, hereinafter "Permit"). On November 2, 1998, Irving filed a Request for Evidentiary Hearing pursuant to regulations governing the NPDES program at that time. P Ex 4. On July 14, 2000, the Region returned Irving's Request for Evidentiary Hearing without prejudice to Irving's filing an appeal with the Board under changes made to the NPDES

---

[3](...continued)
requirements, identify sources of discharge to the MS4 and characterize the water quality of such discharges, describe existing pollutant management programs, commence identification of sources of illicit discharges that contribute to storm water pollution, and describe financial resources available for storm water programs. 40 C.F.R. § 122.26(d)(1). Part 2 of the application expands on the requirements of Part 1, and also requires permittees to develop a storm water management program that must include:

> a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate.

Id. § 122.26(d)(2)(iv).

[4]Under CWA § 401(a)(1), 33 U.S.C. § 1341(a)(1), the Region may not issue a permit until the state in which a facility is located (in this case Texas) either certifies that the permit complies with the state's water quality standards or waives certification. *See* 40 C.F.R. § 124.53.

permit appeals process effective June 14, 2000.[5] Respondent's Exhibit ("R Ex") 3. Irving filed its Petition with the Board on August 14, 2000. Irving's co-permittees have not challenged the permit.

In its Petition, Irving makes several challenges to the permit on constitutional grounds. The first is that several provisions of the permit[6] violate the constitutional principles cited in cases such as *Koog v. United States*, 79 F.3d 452 (5th Cir. 1996), *New York v. United States*, 505 U.S. 144 (1992), and *Printz v. United States*, 521 U.S. 898 (1997), that Congress (and thus federal agencies by association) cannot, under the principles of federalism contained in the Tenth Amendment, compel states to enact or enforce a federal regulatory program. *See* Petition at 2-5, 15. Irving argues that the permit is structured in a way that requires Irving to regulate, legislate, and use its enforcement powers according to requirements set by EPA rather than in a manner chosen by Irving itself. *Id.* at 4. Irving suggests that the Region could have avoided these constitutional violations had it accepted Irving's proposed language to structure the permit so that permit compliance would be based on

---

[5]Procedures for issuing, modifying, revoking, or terminating permits are governed generally by 40 C.F.R. pt. 124. Prior to June 14, 2000, subpart E of part 124 established an evidentiary hearing process for NPDES permits. Section 124.74 required that any person challenging a final NPDES permit decision submit a request to the Regional Administrator for an evidentiary hearing within 30 days of service of the notice. 40 C.F.R. § 124.74(a) (1998). Only a decision after an evidentiary hearing or a denial of the request for an evidentiary hearing could be appealed to the Board. *Id.* § 124.91. On May 15, 2000, EPA promulgated substantial changes to the permit review process. *See* Amendments to Streamline the National Pollutant Discharge Elimination System Program Regulations, 65 Fed. Reg. 30,886 (May 15, 2000) (codified at 40 C.F.R. § 124.19). Included in these changes was the elimination of the evidentiary hearing procedures for NPDES permits. *Id.* at 30,896. Under current procedures, persons appealing an NPDES permit condition may now file a petition directly with the Board within 30 days after the issuance of a final NPDES permit decision. 40 C.F.R. § 124.19(a).

[6]Irving's Petition cites Pts. I.B, II (Introductory Provisions), II.A, II.E-G, and V.C. Petition at 4-5, 10, 16-17, 20.

compliance with Irving's storm water management program ("SWMP") as outlined in Part 2 of its NPDES permit application. *Id.* at 9, 17; *see also* Comments at 5; P Ex 5 (Letter from M. Walter of Irving, to J. Ferguson of EPA Region 6 (Apr. 17, 1998)). For the same reasons, Irving argues that permit conditions requiring it to ensure legal authority to control discharges to and from its MS4 also go beyond the constitutional restrictions mentioned above.[7] Petition at 12. It is also Irving's contention that because, in its view, EPA does not have the constitutional authority to set many of the requirements of the SWMP, Irving should be able to make changes to the SWMP at any time without prior approval by the Region.[8] Petition at 20.

Irving's second set of constitutional arguments challenges permit conditions[9] that require it to develop training and education programs designed to help reduce various sources of storm water pollution. Petition at 10-12. Irving argues that these provisions infringe upon its First Amendment right to free speech "by compelling Irving to 'speak' to its citizens and by compelling Irving to deliver a message chosen by EPA." *Id.* at 10.

---

[7]Irving also objects to this provision on the basis of its First Amendment right to petition the government. While Irving asserts that the permit requires that Irving work with higher sovereign powers to ensure legal authority is maintained, it makes no argument as to why or how this violates Irving's First Amendment rights, nor cites any authority to support its claim. Petition at 12-13. Given Irving's failure to substantiate its First Amendment objection, we will not entertain it further. *See* 40 C.F.R. § 124.19(a) (petition shall include a statement of the reasons supporting that review); *City of Port St. Joe & Fla. Coast Paper Co.*, 7 E.A.D. 275, 283 n.17 (EAB 1997) (legal arguments presented in summary fashion without arguments or documentation do not meet regulatory requirements that petition shall include a statement of reasons supporting review).

[8]Irving acknowledges, however, that if changes made by it to the SWMP so decrease the effectiveness of the MS4 program that it no longer attains the goals of the permit, the Region would then have the authority to modify the permit. Petition at 20.

[9]These include Pts. II.A.9.c, II.A.10, and III of the permit.

Besides its constitutional claims, Irving argues that other permit conditions set by the Region evidence error or abuse of discretion, or are otherwise unlawful. First, Irving alleges that the Region violated CWA § 402(p) and its supporting regulations by failing to authorize all forms of discharges from Irving's MS4, and limiting its lawful discharge under the permit to municipal storm water discharges only. *Id.* at 13-16. Irving maintains that accidental spills, sanitary sewer overflow discharges, and storm water associated with industrial activity that enter the MS4 despite Irving's efforts to prevent their entry should be legally authorized under its NPDES permit. *Id.* at 13-14. It argues that the current structure of the permit would make Irving liable for every form of discharge that passes through the MS4 regardless of whether Irving has control over it. This structure, according to Irving, is contrary to EPA's stated approach to regulating storm water discharges from MS4s. *Id.* at 15-16.

Irving also argues that permit language requiring it to develop an SWMP is unnecessary and ambiguous.[10] *Id.* at 16-17. In particular, it argues that the language in the permit requiring development of an SWMP strongly suggests that the Region did not determine whether the SWMP incorporated in the permit already satisfies the statutory standards for MS4s under the CWA. *Id.* at 17. Irving argues that the inclusion of language that anticipates development of an SWMP thus creates a conflict in the operative provisions of the permit and is arbitrary and capricious.[11] *Id.*

Irving further alleges that the Region erred when it included permit provisions in Part I.C holding Irving jointly responsible for permit compliance where MS4 operational authority is shared. *Id.* at 18. Irving argues that such a provision would make it liable for failures of co-

---

[10]Irving specifically references the introductory paragraphs in Pt. II and all of Pts. II.A, D-F.

[11]Irving also states that such language "could raise constitutional issues if wrongly interpreted" but fails to explain how this is so. Petition at 16.

permittees to perform their obligations under the permit, the SWMP, or under agreements between the co-permittees on management and operation of the MS4 system, and that Irving has never consented to such liability. *Id.*

Irving also states that the Region erred by setting a compliance certification date that is prior to the effective date of the permit. *Id.* at 19. In addition, Irving argues that the requirement that Irving submit annual reports instead of adhering to the biannual reporting provision of its SWMP, is an abuse of the Region's discretion. *Id.* at 19-20. Finally, apart from its constitutional objection to the permit's requirement that Irving seek approval from the Region prior to implementing certain changes to its SWMP, Irving argues that such a provision is unreasonable because it places no time limit on the Region when processing such a request. *Id.* at 20.

The Region argues in response that Irving fails to meet its burden of showing that the Region committed any clear error of law or fact or abuse of discretion when it set the permit conditions. Response at 5-6. The Region cites CWA § 402(p)(3)(B)(ii) and (iii), 33 U.S.C. § 1342(p)(B)(ii) and (iii), as requiring NPDES permits for MS4s to "effectively prohibit" non-storm water discharges into storm sewers and to require controls to reduce discharges of pollutants from an MS4 to the "maximum extent practicable." *Id.* at 2. The Region states that the storm water program is incidental to the general prohibition of all unpermitted discharges under CWA § 301(a), 33 U.S.C. § 1311(a). *Id.* at 9. The Region also points to the permitting process for MS4s set forth in 40 C.F.R. § 122.26(d) as allowing EPA to work with municipalities in designing site-specific permits containing SWMPs and emphasizing the use of best management practices to meet the CWA § 402(p)(3)(B)(ii) and (iii) requirements. *Id.* at 2. The Region maintains that it properly issued Irving's permit in accordance with the CWA, implementing regulations, and EPA guidance, and that the permit provisions were supported by the administrative record in this case. *Id.* at 8, 12-13.

The Region argues that while the constitutional principles raised by Irving may involve an important policy decision, the Board, as a general matter, does not adjudicate arguments challenging the constitutionality of a statute, and "a permit appeal proceeding is not the appropriate forum in which to challenge either the validity of Agency regulations or the policy judgments that underlie them." *Id.* at 6-7. Furthermore, the Region argues that the MS4 program does not violate the Constitution as asserted by Irving, because the Supreme Court has held that federal statutes of general applicability, such as the CWA, can be applied to states and municipalities so long as their application "does not excessively interfere with the functioning of those separate sovereign governments." *Id.* at 10 (citing *Reno v. Condon*, 120 S. Ct. 666, 672 (2000); *South Carolina v. Baker*, 485 U.S. 505, 514-15 (1988); *Printz v. United States*, 521 U.S. 898, 932 (1997)). The Region concludes that since Irving's objections do not allege such an interference, the Board should deny review of Irving's Petition. *Id.*

B. *Statutory and Regulatory Background*[12]

In 1972, Congress amended the Federal Water Pollution Control Act (what is now commonly referred to as the CWA) to prohibit the discharge of any pollutant to waters of the United States from a point source unless authorized by an NPDES permit. 33 U.S.C. §§ 301, 402. As originally structured, the NPDES program focused its attention primarily upon the reduction of pollutants coming from the discharge of industrial processing wastewater and municipal sewage by requiring pollution control mechanisms and tracking point sources primarily on an "end-of-pipe" basis. *See, e.g.,* National Pollutant Discharge Elimination System – Regulations for Revision of the Water Pollution Control Program Addressing Storm Water Discharges, 64 Fed. Reg. 68,722,

[12]For additional discussion of the background of the storm water program, see *In re Arizona Municipal Storm Water NPDES Permits*, 7 E.A.D., 646, 654-57 (EAB 1998), *petition for review denied sub nom Defenders of Wildlife v. EPA*, 191 F.3d 1159 (9th Cir. 1999).

68,723 (Dec. 8, 1999). Although covered under the definition of a point source, storm water from conveyances such as separate storm sewers was not specifically addressed by the CWA and EPA initially attempted to provide exemptions for MS4s until the U.S. Court of Appeals for the District of Columbia ruled that EPA could not exempt such discharges under the CWA. *Id.; NRDC v. Costle*, 568 F.2d 1369, 1377 (D.C. Cir. 1977); *see also* 132 Cong. Rec. S16,424 (Oct. 16, 1986), *reprinted in* 2 Environment and Natural Resources Policy Division, Library of Congress, *A Legislative History of the Water Quality Act of 1987* 646 (1988) (hereinafter "*Leg. Hist.*").

Moreover, in the wake of several major studies indicating that the leading cause of water quality impairment was pollution from diffuse sources such as storm water drainage from urban areas and construction sites, Congress passed the Water Quality Act of 1987 ("WQA"), which amended the CWA to specifically cover storm water discharges. *See* National Pollutant Discharge Elimination System Permit Application Regulations for Storm Water Discharges, 55 Fed. Reg. 47,990, 47,991-92 (Nov. 16, 1990); *Legis. Hist.* at 646. Among other amendments, the WQA added § 402(p) to the CWA, which required permits to be obtained by October 1992 for four types of storm water discharges, namely: discharges associated with industrial activity; discharges from municipal storm sewer systems serving populations over 100,000; discharges with respect to which a permit had been issued prior to 1987; and any discharge determined by the permitting authority to be contributing to a violation of water quality standards or a significant source of pollutants to waters of the United States. 55 Fed. Reg. at 48,992. The WQA also required EPA to conduct studies on storm water discharges not already covered by CWA § 402, the purpose of which was to identify any other sources contributing to the degradation of water quality and to provide a basis for establishing a comprehensive program to regulate such sources. *Id.* at 47,993. Thus, the WQA set up a schedule for the gradual regulation of all storm water discharges deemed harmful to water quality, as currently embodied in CWA § 402(p). *See* 33 U.S.C. § 402(p).

Under CWA § 402(p), the requirements for an MS4 permit differ considerably from the technology-based treatment standards and numeric effluent criteria required of other end-of-pipe dischargers. CWA § 403(p)(3)(B) states that permits for MS4 discharges:

> (i) may be issued on a system- or jurisdiction-wide basis;
> (ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and
> (iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.

33 U.S.C. § 1342(p)(3)(B)(i)-(iii). The rationale for the difference in treatment standards can be found in the legislative history to the WQA, which stresses Congress' concern that the variability of MS4 discharges - due to the fact that the type and extent of the pollutants in such discharges will depend on the activities occurring in the drainage area - would make regulation of MS4s based solely on the technical and numeric effluent standards under CWA § 301 inappropriate.[13] *Legis. Hist.* at 617. Congress therefore created the "maximum extent practicable" ("MEP") standard and the requirement to "effectively prohibit non-storm water discharges" into the MS4 in an effort to allow

[13]As explained by EPA in its 1996 guidance on storm water regulations, the difficulty of applying numeric effluent limits to storm water discharge stems from the fact that such limits are derived from methodologies designed primarily to calculate water quality impacts from "process wastewater discharges which occur at predictable rates with predictable pollutant loadings under low flow conditions in receiving waters." Questions and Answers Regarding Implementation of an Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, 61 Fed. Reg. 57,425, 57,426 (Nov. 6, 1996). By contrast, storm water discharge is highly variable both as to flow and pollutant type and concentration, and storm water permits are issued on a system-wide basis, thus rendering it largely incompatible with numeric effluent calculation methodologies. *Id.*

permit writers the flexibility necessary to tailor permits to the site-specific nature of MS4 discharges. *Legis. Hist.* at 646; House Committee on Public Works and Transportation, Section-by-Section Analysis (100th Sess. 1987), *reprinted in* 1987 U.S.C.C.A.N. (101 Stat. 7) 5, 38-39; *see also* 55 Fed. Reg. at 48,038. Included in that flexibility was the capacity to direct permit requirements at the *sources* of pollution in the MS4 rather than solely at the end of the pipe. 55 Fed. Reg. at 48,038. Thus, the MS4 permit requirements set forth under CWA § 402(p)(3)(iii) were designed to allow permit writers to use a combination of pollution controls that, as Congress noted, "may be different in different permits;" not all of the types of controls listed in § 402(p)(3)(iii) are required to be incorporated into each MS4 permit. 1987 U.S.C.C.A.N. at 39.

In 1990, EPA promulgated its first set of regulations implementing CWA § 402(p) as it pertained to permit requirements for storm water discharges associated with industrial activity and discharges from large and medium municipal separate storm sewer systems (commonly referred to as "Phase I" regulations). 55 Fed. Reg. at 47,990; 40 C.F.R. pt. 122. In the preamble to the final rule, EPA noted that while the MS4 program required a substantial amount of flexibility, it should not be "to such an extent that all municipalities do not face essentially the same responsibilities and commitment for achieving the goals of the CWA" and that the regulations being promulgated would "build in substantial flexibility in designing programs that meet particular needs, without abandoning a nationally consistent structure * * *." 55 Fed. Reg. at 48,038. To achieve these ends, the permit application requirements established in 40 C.F.R. Part 122 centered on the development of site-specific SWMPs to be issued primarily on a system-wide basis. *Id.* at 48,043. Such an approach would, as appropriate, allow several municipal entities responsible for different parts of a single MS4 system to be co-permittees on a single permit. This would in turn facilitate coordination and consolidation of MS4 activities, as well as spread the resource burden for monitoring, analysis, and development

and implementation of water pollution controls.[14] *Id.* Additionally, EPA established a two-part permit application for the development of MS4 permits that would assist permittees in developing SWMPs capable of meeting statutory and regulatory requirements. *Id.* This application process also provides information to the permit-writers for use in setting permit conditions; it was anticipated that if a municipality submitted a satisfactory application all or part of its proposed SWMP would likely become an integrated part of its final permit. Office of Water, U.S. EPA, EPA 833-B-92-002, *Guidance Manual for the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems* 1-9 (1992) (hereinafter "*Part 2 Guidance Manual*"). The two parts of the permit application cover the six general elements necessary for an MS4 permit: adequate legal authority, source identification, discharge characterization, proposed SWMP, assessment of controls, and fiscal analysis. *Id.* at 2-1 to 2-4. Details of these elements of the permit application process for medium and large MS4s are set forth at 40 C.F.R. § 122.26(d). Because, as discussed below, several of the issues presented depend on an understanding of the regulatory framework for MS4 permits, we will briefly review several of the key elements of that framework.

1. *Adequate Legal Authority*

Municipalities applying for an MS4 permit must demonstrate adequate legal authority to control and prohibit certain discharges to the MS4; to carry out all inspection, surveillance, and monitoring procedures necessary to determine compliance and noncompliance with permit conditions; and to require dischargers to the MS4 to comply with permit or other conditions. 40 C.F.R. § 122.26(d)(2)(i). This is because the municipality, as the permittee, "is responsible for compliance with its permit and must have the authority to implement the conditions in its

[14]Where a permit has more than one legal entity as permittee, applications require a description of the roles and responsibilities of each legal entity and procedures in place to ensure effective coordination. 40 C.F.R. § 122.26(d)(2)(vii).

permit." *Part 2 Guidance Manual* at 3-1. Compliance with the MEP and "effective prohibition" standards set forth in CWA § 402(p)(3) requires a permittee to do more than plan for pollution controls during the term of its permit; it must also make a "strong effort to have the necessary police powers and controls" necessary to meet statutory standards prior to issuance of the permit. 55 Fed. Reg. at 48,044. In order to meet this requirement, applicants must cite to and describe how specific state and/or local ordinances currently in effect meet the federal requirements set forth in 40 C.F.R. § 122.36(d)(2)(i). *Part 2 Guidance Manual* at 3-4. Should existing authority be insufficient to meet such requirements, applicants must describe what changes are needed and provide a schedule for implementation of such changes. *Id.*

2. *Proposed Storm Water Management Program*

The proposed SWMP is generally considered to be the most important part of the permit application and the lynchpin of the program. *Part 2 Guidance Manual* at 6-1. Part 1 of the application requires submission of a description of existing management programs to control pollutants from the MS4 and a description of existing programs to identify and prevent illicit discharges to the system. 40 C.F.R. § 122.26(d)(1)(v). Part 2 requires the permittee to propose control measures meeting the MEP standard for the most expected types of discharge to an MS4, namely: (1) runoff from commercial and residential areas; (2) storm water runoff associated with industrial activity; (3) storm water runoff from construction sites; and (4) non-storm water discharges (e.g., illicit discharges and improper disposal). 55 Fed. Reg. at 48,052. While the SWMP provisions are designed to allow for flexibility and tailoring to the needs of each particular MS4, all SWMPs must meet certain minimum requirements, including establishing a comprehensive planning process that provides for public participation and any necessary intergovernmental coordination concerning management practices, control techniques, system design, and engineering or other methods to reduce the discharge of the above-listed types of pollutants to the maximum extent practicable, as well as a

description of staff and equipment available to implement the SWMP. 40 C.F.R. § 122.26(d)(2)(iv). Other specific SWMP provisions require the municipality to submit a description of programs for public education and outreach, implementation and enforcement of ordinances preventing illicit discharges to the MS4, investigation and monitoring of discharge sources to the MS4, and implementation and maintenance of site planning and best management practices ("BMPs") for construction sites. *Id.* § 122.26(d)(2)(iv)(B)-(D). Because a permitting authority is likely to incorporate all or part of an SWMP meeting regulatory requirements into the NPDES permit and utilize the SWMP to develop effluent limits, these provisions provide a municipality with an opportunity to have substantial input into permit conditions. *Part 2 Guidance Manual* at 6-1.

3. *Assessment of Controls*

In order for an SWMP to be successful, assessing its effectiveness is imperative; in this way, successful parts of the program may be enhanced and unsuccessful control measures can be changed. As the first step of this process, Part 2 applications require MS4s to submit an estimate of anticipated pollutant reduction once the SWMP is in place. 40 C.F.R. § 122.26(d)(2)(v). Subsequently, in order to determine whether an SWMP is achieving its anticipated effectiveness, MS4 permittees are required to provide annual reports on the progress of their SWMPs covering, among other things, the status of SWMP implementation, any proposed SWMP revisions, a summary of any monitoring data, projected annual expenditures, a summary of any enforcement actions, inspections, or educational programs, and any changes to water quality. 40 C.F.R. § 122.42(c). EPA guidance encourages permittees to provide both direct evidence of SWMP effectiveness (such as reductions in pollutant loads) as well as indirect evidence (such as measurements demonstrating increased public awareness of storm water issues) to assist the permittee and permit-writer in:

> [d]etermining whether the most cost-effective best management practices (BMPs) are included in the [SWMP]; [e]nsuring that the [SWMP] includes adequate public participation programs and intergovernmental coordination; [e]stablishing on-going monitoring inspection and surveillance programs that help refine estimates of program effectiveness; and [d]eveloping a strategy to evaluate progress toward achieving water quality goals.

Part 2 Guidance Manual at 7-1.

II. *DISCUSSION*

A. *Standard of Review*

In appeals under 40 C.F.R. § 124.19(a), the Board will not grant review unless it appears from the petition that the condition in question is based on a clearly erroneous finding of fact or conclusion of law, or involves an exercise of discretion or an important policy consideration that warrants review.[15] 40 C.F.R. § 124.19(a). The Board exercises its authority to review permits sparingly, in recognition of Agency policy favoring resolution of most permit disputes at the Regional level. *In re New England Plating Co.*, NPDES Appeal No. 00-7, slip op. at 7 (EAB, Mar. 29, 2001), 9 E.A.D. __; *In re Town of Ashland Wastewater Treatment Facility*, NPDES Appeal No. 00-15, slip op. at 9-10 (EAB,

---

[15]As noted *supra*, note 5, prior to the Amendments to Streamline the NPDES Program Regulations, 65 Fed. Reg. 30,886 (May 15, 2000), the rules governing petitions for review of NPDES permitting decisions were set out in 40 C.F.R. § 124.91 (1998). Even though these amendments have eliminated the evidentiary hearing requirement in favor of direct appeal to the Board, the standard of review under 40 C.F.R. § 124.91 is essentially identical to that of 40 C.F.R. § 124.19. *See, e.g., In re New England Plating Co.*, NPDES Appeal No. 00-7, slip op. at 6 n.10 (EAB, Mar. 29, 2001), 9 E.A.D. __; *In re Town of Ashland Wastewater Treatment Facility*, NPDES Appeal No. 00-15, slip op. at 9 n.11 (EAB, Feb. 26, 2001), 9 E.A.D. __.

Feb. 26, 2001), 9 E.A.D. __; *In re Town of Hopedale, Bd. of Water & Sewer Comm'rs*, NPDES Appeal No. 00-4, slip op. at 8-9 n.13 (EAB, Feb. 13, 2001). The burden of establishing grounds for review rests upon the petitioner. 40 C.F.R. § 124.19(a)(1)-(2).

Irving's arguments are considered in light of this framework. For the reasons set forth below, the petition for review is denied.

B. *Issues Pertaining to Irving's Constitutional Rights*

Irving argues that several permit conditions require it to legislate and regulate in a manner that violates its constitutional rights under the Tenth Amendment, and sets forth a list of specific provisions Irving finds to be beyond EPA's constitutional power to impose. Petition at 4-5. Upon closer scrutiny, however, the provisions cited by Irving in its Petition come directly from provisions set forth in the CWA and EPA's implementing regulations.[16] When viewed in this light, it

[16]For example, Irving objects to Part I.B, Part H (Introductory Provisions) and Part II.E of the permit which requires it to effectively prohibit discharge of non-storm water into the MS4, but this requirement comes verbatim from CWA § 402(p)(3)(B)(ii). Furthermore, the implementing regulations at 40 C.F.R. § 122.26(d)(2)(iv) require an MS4 permit applicant to provide an SWMP that "reduce[s] the discharge of pollutants to the maximum extent practicable * * *." Under § 122.43, the Region is required to establish permit conditions that "provide for and assure compliance with all applicable requirements of CWA and regulations." 40 C.F.R. § 122.43(a).

Irving also argues that Parts II.A.9 and 10 and Part III of the permit, which require it to develop public education programs, compels Irving to speak in violation of its First Amendment rights. Petition at 10-12. As discussed in section I.B above, these requirements come directly from the statutory scheme established by Congress and detailed by EPA in the implementing regulations at 40 C.F.R. § 122.26(d)(2)(iv)(B)(*5*) and (*6*).

Similarly, Irving objects to Part II.A.2 and III.A, which require Irving to "implement changes to its ordinances to minimize the discharge of pollutants from areas of new development and significant redevelopment," including revisions to its (continued...)

appears that Irving's real complaint is with the statute itself and its implementing regulations.

To the extent that Irving objects to the substance of the storm water regulations, CWA § 509(b)(1) contemplates that challenges to administrative regulations be brought in a federal circuit court of appeals within 120 days from the date of promulgation of such regulations.

---

[16](...continued)
landscaping ordinance. Petition at 4. As the Region correctly points out, these requirements are taken directly from the permit application requirements at 40 C.F.R. § 122.26(d)(2)(iv)(A)(*2*).

Irving objects to Part II.A.5 of its permit, which requires reduction of the discharge of pollutants related to the application and distribution of pesticides, herbicides, and fertilizers. Petition at 4. Again, this requirement comes directly from 40 C.F.R. § 122.26(d)(2)(iv)(*6*). Irving also objects to provisions in Part II.A.6 requiring it to effectively prohibit certain sources of illicit discharge and improper disposal to the MS4, but again, such requirements are found at 40 C.F.R. § 122.26(d)(2)(iv)(B)(*1*)-(*7*). Part II.A.8 of the permit, which requires implementation of an industrial and high risk inspection program, and is also objectionable to Irving, is a nearly-verbatim copy of language found at 40 C.F.R. § 122.26(d)(2)(iv)(C). Likewise with Part II.A.8 of the permit, which requires implementation and maintenance of BMPs to reduce pollution from construction sites to the MS4; this provision also comes nearly verbatim from 40 C.F.R. § 122.26(d)(2)(iv)(C). Part II.A.10, requiring Irving to implement a public education program targeting illicit discharges, improper disposal, and the proper use, application, and disposal of pesticides, herbicides, and fertilizers - also on Irving's list - comes from language found at 40 C.F.R. § 122.26(d)(2)(iv)(A)(*6*) and (B)(*5*), (*6*). The Part II.E requirements for ensuring legal authority to control discharges to and from the MS4 to which Irving objects can be found in nearly identical form at 40 C.F.R. § 122.26(d)(1)(ii) and (2)(i). The objected-to SWMP resource requirements set forth in Part II.F are reflected in and driven by 40 C.F.R. § 122.26(d)(1)(vi) and (2)(vi). Finally, Irving objects to the requirement that it provide evidence that its governing body has reviewed or been appraised of its annual report, but the provisions to which it cites make no such reference. Assuming Irving intended to refer to Part V.D, it appears that the Region is following the signatory requirements for all NPDES permit applications and reports as required by 40 C.F.R. § 122.22(a)(3). While those provisions do not specifically require a statement or resolution that the permittees' governing body has been appraised of a report, we do not see how this is any different in essence from the signatory requirement, nor how inclusion of it can be said to violate Irving's Tenth Amendment rights.

CWA § 509(b)(1), 33 U.S.C. § 1369(b)(1). As a consequence, the Board does not ordinarily allow a permit appeal to be used as a vehicle for collateral challenge of regulatory provisions when the time for such challenge has long since passed. *See In re Woodkiln, Inc.*, 7 E.A.D. 254, 269-70 (EAB 1997) (refusing to review final Agency regulations attacked on substantive content or alleged invalidity, either in exercise of Board's permit review authority and in an enforcement context); *In re City of Hollywood*, 5 E.A.D. 157, 176 (EAB 1994). Indeed, we have observed that the presumption of nonreviewability in the administrative arena is a rule of practicality and is especially appropriate in the context of a provision like CWA § 509(b), which sets limits on the availability of a judicial forum for challenging particular kinds of regulations:

> [O]rdinarily, the only way for a regulation that is subject to a preclusive review provision to be invalidated is by a court in accordance with the terms of the preclusive review provision. * * * Once the rule is no longer subject to court challenge by reason of the statutory preclusive review provision, the Agency is entitled to close the book on the rule insofar as its validity is concerned.

In re Echevarria, 5 E.A.D. 626, 634-35 (EAB 1994).[17]

Moreover, we have repeatedly recognized that the regulations authorizing appeals to the Board contemplate review of *conditions* of permits, not review of the statutes and regulations which are predicates

---

[17]The Board will review the vitality of an Agency regulation only in "an exceptional case," such as where a challenged regulation has been effectively invalidated by a court but has yet to be formally repealed by the Agency. *Echevarria*, 5 E.A.D. at 635 n.13; *see also In re B.J. Carney Indus.*, 7 E.A.D. 171, 194 (EAB 1997) (holding that the Board will entertain a challenge to an Agency regulation only in "the most compelling circumstances"). Nothing in Irving's brief or in the administrative record persuades us that this case presents any compelling circumstances warranting a departure from our practice of not reviewing final Agency regulations in the context of Board cases.

for such conditions. *See, e.g., In re City of Port St. Joe & Fla. Coast Paper Co.*, 7 E.A.D. 275, 286-87 (EAB 1997) (rejecting challenge to validity of regulations or policy judgments underlying them in permit appeal proceeding); *In re Suckla Farms, Inc.*, 4 E.A.D. 686, 696 (EAB 1993); *In re Ford Motor Co.*, 3 E.A.D. 677, 682 n.2 (Adm'r 1991).

In any case, as a general rule, constitutional questions of the kind argued by Irving here are reserved to the federal courts. *In re Britton Constr. Co.*, CWA Appeal Nos. 97-5 & 97-8, slip op. at 24 n.6 (EAB, Mar. 30, 1999), 9 E.A.D. __ (citing *Johnson v. Robinson*, 415 U.S. 361, 368 (1974)). While the Board has entertained matters that question whether a statute or regulation is being *applied* in a manner which passes constitutional muster (*see, e.g., In re Ocean State Asbestos Removal, Inc.* 7 E.A.D. 522, 558 (EAB 1998); *In re Gen. Elec. Co.*, 4 E.A.D. 615, 627-36 (EAB 1993)), we have also repeatedly refused to entertain challenges to the constitutionality of statutes and Agency regulations themselves. *See Britton*, slip op. at 24 n.6; *City of Port St. Joe*, 7 E.A.D. at 317 n.58 (EAB 1997); *In re Echevarria*, 5 E.A.D. 626, 634 (EAB 1994). *See also In re Pontiki Coal Corp.*, 3 E.A.D. 572, 578 (Adm'r, 1991) (holding that the scope of review under 40 C.F.R. § 124.19 only contemplates challenges to specific permit decisions, not to constitutional validity of regulations themselves).

As we have discussed, while Irving attempts to present its constitutional arguments as a challenge to specific permit decisions made by the Region, it is fairly plain that the permit provisions in question fall within the immediate contemplation of both the CWA and the implementing regulations at 40 C.F.R. § 122.26(d). Thus, Irving's "as applied" challenge is, as we see it, in actuality a challenge to the constitutionality of the CWA and EPA's implementing regulations.

For all of the foregoing reasons, we decline to review Irving's constitutional claims.

C. *Whether the Region Erred in Failing to Authorize All Discharges from Irving's MS4*

Irving objects to the Region's failure to permit all discharges from its MS4, arguing that CWA § 402(p) and its implementing regulations require the Region to permit all discharges from its MS4, including non-storm water discharges and storm water associated with industrial activities. Petition at 13-16. Irving argues that by refusing to authorize such discharges under its permit, liability for them transfers to Irving, a position which forces it to use its police powers to stop such discharges and violates the scheme established by the storm water regulations, which places responsibility for controlling and obtaining legal authorization for storm water discharges on the discharger rather than the municipality. *Id.* This, according to Irving, runs counter to the thrust of EPA's regulations and constitutional principles.

Upon review, Irving's regulatory arguments misrepresent the structure of the storm water program. While Irving is correct that the "storm water permitting rules expressly require permits for '*all discharges* from large and medium municipal separate storm sewer systems,'" *id.* at 14, neither this phrase nor any other regulatory text supports Irving's conclusion that a single permit must address all such discharges. Indeed, the opposite appears to be contemplated. With respect to non-storm water discharges that find their way into the MS4, the statute itself requires storm water permits issued to an MS4 to effectively *prohibit all such discharges*. CWA § 402(p)(3)(B), 33 U.S.C. § 1342(p)(3)(B). Thus, the Region would appear to lack the authority to authorize within the context of a storm water permit non-storm water discharges such as those listed by Irving in its Petition.

Similarly, with respect to storm water associated with industrial activity, the permit appears to comport both with the regulations and the Federal Register preamble cited by Irving in its Petition. *See* Petition at 16; National Pollutant Discharge Elimination System Permit

Application Regulations for Storm Water Discharges, 55 Fed. Reg. 47,990, 47,997-98 (Nov. 16, 1990). The regulations contemplate that storm water associated with industrial activity is to be permitted separately from municipal storm water.[18] 40 C.F.R. § 122.26(c). Because, as the Region points out, Irving did not apply for a permit for storm water associated with industrial activity, this particular permit does not authorize such discharges. Rather, such discharges will, consistent with the preambular discussion of the program, be addressed in permits to be subsequently issued, presumably to sources of such storm water. The language of the final permit expressly stating that liability for unauthorized discharges through the MS4 does not transfer from the discharger to the permittee would appear to ameliorate Irving's concern about incurring liability for such discharges. Permit, Pt. I.B.2.

As touched on earlier in section I.B, the language of Part I.B.2 of the permit was taken directly from CWA § 402(p)(3)(B) as well as implementing regulations at 40 C.F.R. § 122.26(d)(2)(iv) requiring MS4s to eliminate the type of discharges Irving argues should be permitted. Irving's constitutional objection to this permit provision, because it takes issue with the substance of the regulation itself, is, for the reasons we have already stated, an argument the Board will not entertain. In sum, we do not see any clear error by the Region on this point and therefore deny review.

D. *Whether Language Requiring Irving to Submit an SWMP is Arbitrary and Capricious.*

Irving objects to language in its permit it states requires it "to develop, prospectively, an SWMP that will be assessed, also prospectively, for compliance with the 'effective prohibition' and 'MEP' standards." Petition at 17. Irving argues that this language either raises

---

[18]Additionally, all industrial storm water permittees are required to provide information regarding such discharges to the MS4 owner/operator under 40 C.F.R. § 122.26(a)(4).

questions regarding whether the Region in fact accepted Irving's SWMP. If the SWMP has been accepted by the Region, then, according to Irving, the language creates a conflict within the operative provisions within the permit. *Id.*

We do not see the ambiguity or the conflict alleged by Irving. The SWMP is intended to be a dynamic document, changing over time to reflect changing conditions and improved practices. 55 Fed. Reg. at 48,052-54. The permit, in boilerplate fashion, sets out the general requirements of an SWMP, including a requirement that it be updated, as necessary; provision for how modifications are to be made; and a statement that compliance with Irving's SWMP and any approved updates "shall be deemed compliance with Parts II.A,B, and F" and that all approved updates made in accordance with the permit "are hereby incorporated by reference." Permit, Pt. II. Accordingly, by its terms, the permit serves as the rule by which the SWMP, over time, will be measured. The prospective language is thus not without purpose - it anticipates likely changes to a dynamic document. For these reasons, we deny review of this issue.

E. *Whether EPA Erred in Making Irving Jointly Liable for Compliance by Other Co-permittees*

Irving argues that Part I.C.1.e and Part I.C.2 of its permit might together be read to hold Irving responsible for, or force it to assume, permit obligations of one or more co-permittees should a co-permittee fail to meet its permit obligations, creating liabilities beyond those contemplated by the operative regulations and Irving's intra-system agreements. Petition at 18. In particular, Irving appears to be concerned that it would incur liabilities for parts of the broader system beyond Irving's operational control. For its part, the Region argues that Irving is overstating the impact of these provisions and that they were added to ensure that, "regardless of any private contractual or inter-governmental agreements the co-permittees may enter into to perform their responsibilities," Response at 33, Irving continues to "comply with the

terms of the final Permit for which [it is] responsible." *Id.* In terms of the scope of that responsibility, the Region states that "Petitioner is responsible only for permit compliance and SWMP implementation for those portions of the MS4 that the Petitioner operates." *Id.* at 32. Although not as clear as the Region's Response, the RTC appears to be consistent with the idea that these provisions were intended not to enlarge Irving's liability but rather to ensure that Irving could not transfer away its responsibilities under its permit. RTC at 3. In particular, the RTC observes, "It is not EPA's intent or purpose to redistribute the roles and responsibilities of the permittees." *Id.*

In examining the issue, our starting point is, of course, the text of the permit itself. The provisions of the permit with which Irving is concerned read as follows:

> 1. Each permittee is responsible for:
>
> * * * *
>
> e. A plan of action to assume responsibility for implementation of storm water management and monitoring programs on their portions of the Municipal Separate Storm Sewer System should interjurisdictional agreements allocating responsibility between permittees be dissolved or in default.
>
> * * * *
>
> 2. Permittees are jointly responsible for permit compliance on portions of the Municipal Separate Storm Sewer System where operational or Storm Water Management Program implementation authority over portions of the Municipal Separate Storm Sewer System is shared or has been transferred from one permittee to another in accordance with legally binding instruments.

Permit, Pt. I.C.1.e and 2.

We agree with the Region that, as to Part I.C.1.e, Irving's concern is overstated. First, the only liability produced by this provision is liability for preparing a contingency plan. Second, and more importantly, the fact that the provision contemplates ultimate responsibility only for each participant's *portion* of the MS4 belies any notion that Irving would ultimately be subject to liability under the plan for matters beyond its operational control.

Part I.C.2 presents a more difficult question, as the language of the provision is not tightly drafted and is open to more than one interpretation. We are not without assistance on this question, however, as the regulations upon which these provisions were predicated provide additional grist for consideration. In anticipation of intra-system, multiple-permit approaches to storm water management, the rules provide:

> Co-permittees need only comply with permit conditions relating to discharges from the muncipal separate storm sewers *for which they are operators.*

40 C.F.R. § 122.26(a)(iv) (emphasis added). We conclude that the better interpretation here is one that reconciles the text of the permit with the rule upon which it is based, and thus interpret Part I.C.2 to mean that, irrespective of any agreements into which Irving might enter related to storm water management, Irving remains ultimately responsible for those portions - and only those portions - of the MS4 within its operational

control.[19] Interpreting the provision thusly, we deny review of the issue.[20]

F. *The Permit's Compliance Certification Date*

Irving has objected to the date in its permit for certification of its compliance with the floatable monitoring program as being incorrect. Petition at 19. In its Response, the Region recognizes that the date is incorrect and states that it will make all necessary schedule adjustments pending final disposition of this appeal. Based on this representation, we deny review of this issue, and direct the Region to make the necessary changes.

G. *Whether the Region Erred in its Inclusion of Annual Reporting and Prior Approval Requirements*

Irving objects that the annual reporting requirements set forth in Part V.D of its permit represent an abuse of discretion because they conflict with the biannual reporting requirements set forth in Irving's SWMP. Petition at 19-20. Irving stated in its Petition that it knew of no requirements calling an annual report. *Id.* at 19. However, as pointed out *supra* in section I.B, 40 C.F.R. § 122.42(c) requires an MS4

---

[19]This does not mean that Irving cannot enter into legally binding agreements which themselves enlarge Irving's liability beyond its operational control. If Irving chooses to assume additional liabilities by virtue of intra-system agreements, it of course may do so, but the resulting liabilities would arise from those agreements and not from Part I.C.1.e and 2 of Irving's permit.

[20]While it appears that the Region's interpretation of this permit condition is similar or identical to ours, we note that because we serve as the final decision maker for the Agency in this matter, our interpretation will be binding on the Region in its implementation of the permit. *See, e.g., In re Ocean State Asbestos Removal, Inc.*, 7 E.A.D. 522, 542-43 n. 22 (EAB 1998); *In re Austin Powder Co.*, 6 E.A.D. 713, 717 (EAB 1997); *In re Mobil Oil Corp.*, 5 E.A.D. 490, 590 n.30 (EAB 1994). It should thus address Irving's concern in appealing this issue.

permittee to submit annual reports. Accordingly, the Region's decision to include this condition was not erroneous.[21]

Irving also argues that permit conditions requiring Regional approval before certain changes to its SWMP may be implemented is unreasonable because it places no time limit on the Region's response to the request. Petition at 20. This is not entirely true, however. Under Parts II.G.2.b and c of the permit, which cover most possible changes to the SWMP, changes to the SWMP covered by the provision are deemed approved and may be implemented unless the Region denies the proposed change within 60 days. The only changes to the SWMP which are not subject to this sixty-day default and which must receive formal approval by the Region prior to inclusion into the SWMP are those which propose deletion of a BMP without substitution of another BMP. *See* Response at 36.

As pointed out by the Region in its RTC, Part II.G was modified in response to Irving's comments to clarify what changes to its SWMP would not be considered to be minor modifications to its permit. RTC at 13. In its Petition, Irving merely reiterates the comments that gave rise to these changes. As we have observed in the past, something more is required to sustain a petition for review - namely, a petitioner must demonstrate with specificity why the Region's response to the petitioner's comments was clearly erroneous. *See, e.g., In re Town of Ashland Wastewater Treatment Plant*, NPDES Appeal No. 00-15, slip op. at 11 (EAB, Feb. 26, 2001), 9 E.A.D.__ (A petitioner in an NPDES appeal must demonstrate with specificity why the Region's response to its comments is clearly erroneous or otherwise merits review). Moreover, in view of the fact that Irving's SWMP was an important part of Irving's application for an MS4 permit and a predicate for the Region's granting the permit, it does not strike us as unreasonable that the Region reserve a review and approval function with respect to

[21]As we have already observed, to the extent that Irving is challenging the underlying rule, this is the wrong forum for such a challenge.

significant changes to the SWMP as a means of ensuring that the SWMP continues over time to comport with the SWMP framework set forth in the permit. Furthermore, because deletion of a BMP may raise particular concerns regarding the integrity of the SWMP, it is not obvious to us that the decision by the Region not to limit itself to a sixty-day review period for review of BMP deletions is erroneous. Any failure by the Region to act is remediable through an unreasonable delay suit under section 706 of the Administrative Procedures Act, 5 U.S.C. § 706(1).

III. *CONCLUSION*

For the foregoing reasons, review of NPDES Permit No. TXS001301 is denied in all respects. Consistent with the discussion in section II.F, *supra*, we direct the Region to make all necessary corrections to erroneous compliance dates listed in the permit.

So ordered.

1.0 SUMMARY OF FINDINGS

This Retail Gasoline Outlet Storm Water Runoff Study identifies and quantifies chemical constituents detected in simulated storm water runoff from concrete and asphalt pavement at five preselected retail gasoline outlets (RGOs). The RGOs were selected to represent geographical areas, varying population densities, and different types of RGOs operating in California. Rainfall typical for California was simulated at each of the five RGOs. Runoff generated during the tests was collected and analyzed to identify and quantify chemical constituents that may have been present.

Metals.

The study analyzed metals in the first 15-minute sample (first flush) of runoff from the RGO pump island area. The concentrations reported in the data are below minimum analytical detection limits with the exceptions of barium, copper, and zinc. The GTEL Environmental Laboratory, Inc. (GTEL) analytical data sheets indicate that the maximum detection limit was increased for some samples due to a foaming effect noted in these samples.

The analytical results for metals demonstrate that the maximum concentrations of most constituents detected in the runoff water samples are lower than current United States Environmental Protection Agency (EPA) primary and secondary drinking water maximum contaminant levels (MCLs). The exceptions are antimony, arsenic, beryllium, cadmium, and lead, where the concentration cannot be compared to the drinking water MCLs because the minimum analytical detection limits are higher than the drinking water MCLs.

Volatile Organic Compounds.

The data collected during this study indicate that all VOC concentrations found in the storm water runoff from the pavement at RGOs are below the EPA MCLs. The concentrations of metals and VOCs detected during this study represent normal conditions at RGOs where the RGOs maintain effective housekeeping practices and cleanup of incidental spills.

At each RGO, nine samples of runoff water were obtained to be analyzed for the volatile organic compounds benzene, toluene, ethylbenzene and total xylenes (BTEX). Forty-five samples were collected from the five RGOs for analysis of volatile organic compound (VOC) content. Of 45 samples, 27 of the samples were below analytical detection limits (reported as ND, not detected). In the remaining 18 samples, VOCs were detected in the

runoff water at concentrations below the respective EPA MCLs. Out of the 45 samples, all were below the EPA MCLs.

2.0 PROJECT PROCEDURES

The simulated storm water runoff tests were conducted to identify and quantify chemical constituents in runoff at the five selected RGOs. The findings presented in this report identify the levels of chemicals commonly present in the runoff from typical RGOs in California. The data are presented as a comparison between each RGO and EPA primary and secondary drinking water MCLs.

Representatives of the Western States Petroleum Association (WSPA) selected RGO categories to represent the various geographical areas, varying population densities and types of RGOs located in California. The storm water runoff sampling was conducted at the five Southern California RGOs selected by the WSPA representatives.

Rainfall was simulated in the same manner at both the pump island (automotive refueling areas) and the driveway approach areas at each RGO (See Figure 1); samples were collected in the same manner at each RGO; sampling equipment was properly cleaned between each round of sampling. The only notable difference in the testing methodologies at the five RGOs occurred at the Category 5 RGO. One quart of gasoline was "spilled" at the pump island of the Category 5 RGO and cleaned up with absorbent material prior to the rainfall simulation. The "spill" was simulated at the pump island area only.

Tables 1 through 5 identify the sample source, collection time, date, weather conditions, and the specified analyses for each of the samples collected at the five RGOs.

The rainfall simulation was designed to represent the light, medium, and heavy rainfall regions of California. This report compares and documents the analytical data obtained from these tests. The test data quantify the concentrations of storm water constituents in runoff at the RGO pump islands and in driveway approaches to the RGO and pump islands. The analytical data for the samples collected at the five selected RGOs are summarized in Tables 6 through 9. The GTEL analytical data sheets are presented in Appendix A.

A comparison of average RGO runoff concentrations with water quality criteria and typical urban runoff are presented in Tables 10 through 14.

3.0 LITERATURE SEARCH

Initially a computerized literature file search was conducted to assess whether other similar studies had been performed which contained scientific information that may contribute to this storm water runoff project. The computerized literature file search did not disclose a previous RGO storm water study. Key literature abstracts relating to storm water runoff or other related information is included in Appendix B.

The computerized literature file search was conducted using the Dialog Information Database. The search was conducted of the following files:

NTIS (National Technical Information) - File 6;
COMPENDEX (Engineering Information Inc., NY, NY) - File 8;
APILIT (American Petroleum Institute) - File 354;
Pollution Abstracts/Cambridge Scientific Abstracts - File 41;
Water Resources Abstracts - File 117;
WATERNET (American Water Works Association,) - File 245; and
CA SEARCH (Chemical Abstracts , Columbus, OH) - File 399.

4.0 TECHNICAL APPROACH

The technical approach for this project included:

Developing site selection criteria and selecting representative RGOs;
Conducting preliminary field testing to establish test procedures; and
Determining sampling and analytical procedures.

These topics are described in detail in the following sections.

4.1 Selection of Retail Gasoline Outlets

The selection of the RGOs for this study was based on a cross section of the various populated and geographic areas in California and used the following criteria:

Anticipated refueling frequencies and anticipated ages of vehicles expected to frequent the RGOs.

Anticipated commercial use, based on the RGO's location.

The RGO's age and general appearance.

The construction class of the RGO including fuel islands, mechanics' bays, car washes and convenience stores.

The topography around the RGO including the drainage pattern and adjacent property use.

The WSPA members provided RGOs to represent differing examples of the above-listed categories. The RGOs selected for each category are located in the following cities in California:

Trabuco Canyon
Apple Valley
San Diego
Rancho Cucamonga
Los Angeles

Using the criteria previously mentioned, the RGOs which were selected had the following characteristics:

Category 1

Throughput greater than 250,000 gallons per month
Urban location, little or no commercial use
New facility, clean appearance
Covered fuel islands; carwash; no mechanics' bays
Hilly area, runoff to the east and west; facility is bermed[1]; shopping center adjacent to RGO

The Category One RGO was observed to have minimal staining on the ground surface around the pump islands. The pump island and driveway approach areas are concrete. The driveway approach area was observed to be relatively clean and free of oil and grease stains.

Category 2

Throughput greater than 250,000 gallons per month
Urban location, little or no commercial use
New facility, clean appearance
Covered fuel islands; carwash; convenience store; no mechanic's bays
Flat area, runoff to the west; facility is bermed; fast food adjacent to RGO

The Category Two RGO was observed to have minimal staining on the ground surface around the pump islands. The pump island and driveway approach areas are concrete. The driveway approach area is concrete and was observed to have oil and grease stains.

(1) - refers to concrete curbs (present at the category 1 and 2 RGOs) which direct the flow of storm water to on-site surface storm drains. At the RGOs without berming, rainfall on the RGO lot flows into surface storm drains on-site or off of the RGO into the street adjacent the RGO.

Category 3

Throughput of 150,000 to 250,000 gallons per month
Inner city, light commercial use
Older facility, stained and degraded concrete and asphalt
Covered fuel islands; mechanic's bays
Flat area, runoff to the south; facility is not bermed; residential and retail adjacent to RGO

The Category Three RGO was observed to have dark oil and grease stains on the ground surface around the pump islands and in the driveway approach areas. The pump island areas are concrete. The asphalt in the driveway approach areas was observed to be in poor condition, or degraded.

Category 4

Throughput of 150,000 to 250,000 gallons per month
Urban location, light commercial use
Older facility, stained and degraded concrete and asphalt
Covered fuel islands; mechanic's bays
Area sloped to the south; runoff to the south; facility is not bermed; shopping center adjacent to RGO

The Category Four RGO was observed to have oil and grease stains on the ground surface around the pump islands. The pump island areas are concrete. The asphalt in the driveway approach areas was observed to be in good condition.

Category 5

Throughput less than 150,000 gallons per month
Inner city, high commercial use
Older facility, stained and degraded concrete and asphalt
Covered fuel islands with mechanic's bays
Flat area, runoff to the north and south; facility is not bermed; industrial and retail adjacent to RGO

The Category Five RGO was observed to have oil and grease stains on the ground surface around the pump islands. The pump island areas are concrete. The asphalt in the driveway approach areas was observed to be degraded.

4.2 Preliminary Field Testing

Two days of preliminary field testing were conducted prior to initiating the on-site RGO storm water evaluation (discussed in further detail in Appendix C - Preliminary Field Testing). The preliminary field testing was performed at an abandoned RGO in Westminster, California.

The preliminary field testing was conducted to achieve the following objectives:

Develop the simulated rainfall distribution system;

Determine the minimum rainfall rate necessary to create sheet flow;

Test the containment berms and collection apparatus for performance and effectiveness;

Determine a method to contain water generated during rainfall simulation; and

Develop safety protocol to ensure that RGO personnel and customers were not exposed to hazards during the testing period.

4.3 *Water Application*

The test was designed to simulate a significant storm as defined by the National Oceanic and Atmospheric Administration (NOAA). A significant storm is defined as a continuous discharge of storm water for a minimum of one hour, or intermittent discharges of storm water for a minimum of three hours, in a 12-hour period.

During the test, potable water was distributed over the pump island and the driveway approach areas at a rate sufficient to provide adequate coverage of the test zone and develop sheet flow.

The test area evaluated at each RGO was approximately 400 square feet. The volume of water required to attain adequate sheet flow across each test area was determined to occur at a flow rate of about 2.0 gallons per minute (gpm). Based on this flow rate, the test was designed to run for a duration of 45 minutes. The 45-minute test was divided into three, 15-minute periods.

A flow rate of 2.0 gpm was dispensed over the 400 square-foot test area (See Figure 1) for a total of 45 minutes. This flow rate was determined to be appropriate for the test area size and functional operation of the water dispensing equipment. The flow rate of 2.0 gpm was sufficient to generate sheetflow within the test area.

Water distributed at the constant flow rate of 2.0 gpm distributed approximately 0.125 inches of "rain" over the test area in the first 15-minute period (33 gallons over 400 square feet). After 30 minutes, 0.250 inches of "rain" was distributed over the test area (66 gallons over 400 square feet). After 45 minutes, 0.375 inches of "rain" was distributed over the test area (100 gallons over 400 square feet).

4.4 *Water Dispensing System*

The water dispensing system was comprised of a supply line (a flexible hose), a flow meter with an on/off valve and 1 inch diameter, schedule 80 polyvinyl chloride (PVC) pipe. One end of the supply line was attached to the source water (the RGO hose bib). The other end of the supply line was attached to the flow meter. The flow meter was attached to the network of PVC pipes. The PVC pipes were perforated at 8 to 12 inch intervals with 3/64 inch holes (See Figure 2).

At each RGO, the network of pipes was set up so that the water would cover an area approximately 20 feet x 20 feet. The location of the water

dispensing equipment was positioned at each RGO depending on the physical layout and the slope of the RGO. The volume of water was regulated by a shut-off valve and monitored by the flow meter. The water was dispensed through the network of PVC pipe.

4.5 Water Collection Apparatus

The containment berms consisted of sand-filled polyethylene tubing. The berms were constructed of 5-foot-long tubes and placed into position around the test area. The containment berms were used to channel the runoff water to the collection point. A stainless steel collection trough was placed at the lowest point of the test area and incorporated into the containment berms (See Figures 2 and 3).

At the end of each 15 minute period, an electric pump was used to pump the collected water into a 55-gallon steel drum. The 55-gallon drum was lined with a polypropylene liner. A new liner was used for each test to ensure the composite samples were representative of the test area being sampled. The electric water pump and sampling scoop were properly cleaned between sampling rounds using a solution of deionized water and alconox and then rinsed with deionized water.

4.6 Staged Spill and Cleanup Sampling Event

A staged spill was conducted at the Category 5 RGO. The RGO was randomly picked from the five categories. The spill was conducted to simulate the type of spill that would occur at the pump island if a motorist were to drop the pump nozzle while in the process of fueling an automobile. No cleanup or sweeping was performed prior to conducting the spill.

To simulate the spill the pump nozzle was used to dispense one quart of regular unleaded gasoline onto the ground. The gasoline was allowed to spread out naturally. After one minute, absorbent material was applied to the spill area and allowed to soak up the gasoline. When the absorbent material appeared saturated and the gasoline appeared to be completely soaked up, the absorbent was swept up.

After sweeping up the absorbent, the water dispensing equipment was set up and the storm water runoff test begun. The spill was conducted at the pump island area only.

5.0 SAMPLE COLLECTION

A total of 28 samples were collected at each RGO. Tables 1 through 5 identify the site-specific conditions for each round of samples collected at the five RGOs. The sample source, collection time, date, weather conditions, and the specified analyses for the samples are listed in the tables.

Appendix E lists rainfall dates and amounts prior to the simulated rainfall runoff testing. Appendix F contains volume calculations of the simulated runoff at each RGO.

5.1 Sampling Procedures

Sampling procedures followed strict sampling protocol established by SW846, "Test Methods for Evaluating Solid Waste" (including surface and groundwater). Samples were obtained using cleaned sampling equipment and placed into laboratory supplied and certified "clean" sample containers. The samples were kept at or below 4 degrees Celsius.

Prior to starting each test, a background sample was collected from the RGO's potable water at the end of the supply line used to deliver water to the network of PVC pipes, this sample was the Round 1 sample. After the simulation started, the predetermined flow rate was adjusted and three successive samples were collected from the collection trough at 15-minute intervals.

Trip blanks are sent along with field samples as a measure of quality assurance. Trip blanks are used to ensure that the field samples represent the material sampled and not material or chemicals introduced during transport. The trip blanks were analyzed to verify that contamination was not introduced to the samples while they are in transit between point of collection and the laboratory.

For the RGO runoff sampling the same type of vials were used for the trip blanks as were used to collect the water samples at the RGOs. The vials were filled with purified water and handled in the same manner as the other samples, which were analyzed for VOCs and TPH. One trip blank was stored in each cooler together with the field samples. See Appendix D - Sampling Procedures for detailed sampling procedures followed for this study.

5.2 *Sample Time and Location*

At each RGO the following samples were obtained:

One background sample from the RGO potable water source;

Three discrete grab samples of runoff from the pump island area collected at 15-minute intervals;

One composite sample of total runoff from the 55-gallon drum collected from the pump island area over the 45-minute test duration;

Three discrete grab samples of runoff from the driveway approach area collected at 15-minute intervals;

One composite sample of total runoff from the 55-gallon drum collected from the driveway approach area over the 45-minute test duration; and

One trip blank sample for quality assurance was filled with deionized water prior to arriving at the RGO for the sampling event.

See Figure 2 for sample time, location and sample round numbers.

5.3 *Sample Analytical Methods*

The samples were analyzed by the methods listed below.

Volatile Organic Compounds -	EPA method 8020
Total Petroleum Hydrocarbons -	EPA method 8015
Total Suspended Solids -	EPA method 160.2
Total Recoverable Oil and Grease -	EPA method 413.2
Title 26 Metals -	EPA method 6010 and EPA method 7470

6.0 RESULTS AND DISCUSSION

6.1 Physical Condition of Retail Gasoline Outlets

The laboratory test results indicate that the physical condition of the RGO did not influence the concentrations of chemicals detected in the storm water at the pump island areas and the driveway approach areas. This was for both asphalt and concrete ground surfaces.

The analytical data for the samples collected at the five selected RGOs are summarized in Tables 6 through 9. The GTEL analytical data sheets are presented in Appendix A.

6.2 Volatile Organic Compounds and Total Petroleum Hydrocarbons

All samples were determined to be below the EPA MCLs for the VOCs (benzene, toluene, ethylbenzene and total xylenes). Data presented in Table 6 indicates that most concentrations of VOCs in the runoff samples are below analytical detection limits. Some samples had detectable concentrations of VOCs, but the concentrations were below the EPA MCLs. The only clear pattern emerging from the data is that total xylenes are the most prevalent VOC to be detected; this pattern is logical due to total xylenes having a lower vapor pressure (i.e., lesser tendency to volatilize) compared to benzene, toluene, and ethylbenzene.

The EPA MCLs for the BTEX compounds are as follows:

Compound	EPA MCLs
benzene	5 μg/L
toluene	1,000 μg/L
ethylbenzene	700 μg/L
total xylenes	10,000 μg/L

At the Category 1 RGO, concentrations of VOCs were detected in each sample of runoff from the pump island area. Toluene was detected at a maximum of 0.8 micrograms per liter (μg/L) and total xylenes were detected at a maximum of 1.4 μg/L. The VOCs were not detected in the runoff samples from the driveway approach area.

R0013227

At the Category 2 RGO, VOCs were not detected in the samples from the pump island area. VOCs were detected in the samples from the driveway approach area. Benzene was detected at 1.5 μg/L in the 15-minute sample (the first flush) from the driveway approach area and at 0.4 μg/L in the composite sample from the driveway approach area. Toluene was detected in the trip blank that was sent along with the samples from this RGO at 0.5 μg/L. (See Trip Blank section)

At the Category 3 RGO, the highest concentrations of VOCs were detected in the 15-minute sample from the pump island area and the 45-minute runoff sample from the driveway approach area. Toluene was detected at 7.9 μg/L and total xylenes were detected at 20 μg/L in runoff from the pump island area. Benzene was detected at 0.5 μg/L, toluene at 4.5 μg/L, ethylbenzene at 1.1 μg/L and total xylenes at 12 μg/L in the runoff from the driveway approach area.

At the Category 4 RGO, the highest concentrations of VOCs were detected in the source water and in the last runoff sample from the pump island. The application water was determined to have toluene at 0.3 μg/L and total xylenes at 7.1 μg/L. Toluene was detected at 0.4 μg/L and total xylenes were detected at 1.5 μg/L in the last runoff sample. Toluene was detected in the trip blank that was sent along with the samples from this RGO at 0.7 μg/L. (See Trip Blank section)

At the Category 5 RGO, VOCs were detected in the runoff from the pump island following the spill and cleanup of one quart of gasoline. The highest concentrations of VOCs detected at this RGO were benzene at 1.0 μg/L, toluene at 14 μg/L, ethylbenzene at 6.3 μg/L and total xylenes at 41 μg/L. VOC concentrations were below detection limits in the runoff samples from the driveway approach area.

6.3 Suspended Solids

The analytical results for total suspended solids are presented in Table 7. Most of the results are below analytical detection limits. Total Suspended Solids were not detected at the Category 1 and 2 RGOs. Total Suspended Solids were detected in the application water at the Category 3 and 4 RGOs at 11 and 14 mg/L, respectively. These results were slightly above the detection limit of 10 mg/L. These levels were reflected in the runoff data. At the Category 5 RGO, the 45-minute sample from the driveway approach

area had 13 milligrams per liter of total suspended solids, slightly above the detection limit of 10 mg/L.

6.4 Metals

The analytical results for the metals are presented in Table 8. The data represent the metal concentrations in the 15-minute sample from the pump island area at each of the RGOs. Subsequent samples were not analyzed for metals. All of the concentrations reported in the data are below analytical detection limits with the exceptions of barium, copper and zinc.

The EPA MCLs and detection limits for barium, copper and zinc are listed below:

element	EPA MCL	Detection Limit
barium	1,000 μg/L	20 μg/L
copper	1,000 μg/L	200 μg/L
zinc	5,000 μg/L	100 μg/L

At the Category 1 RGO, barium was detected at 130 μg/L.

At the Category 2 RGO, all metals analyzed for were ND, not detected.

At the Category 3 RGO, barium was detected at 60 μg/L and zinc at 200 μg/L.

At the Category 4 RGO, barium was detected at 60 μg/L and zinc at 200 μg/L.

At the Category 5 RGO, barium was detected at 80 μg/L, copper at 200 μg/L and zinc at 600 μg/L.

6.5 *Recoverable Oil and Grease*

The analytical results for total recoverable oil and grease are listed in Table 9. The detection limit for the oil and grease test was 1 mg/L. The highest detected concentration of oil and grease was 34 mg/L.

At the Category 1 RGO, total recoverable oil and grease was at the detection limit in the 15-minute sample and the 45-minute sample from the pump island area. In the driveway approach area, the 15-minute sample and the 45-minute sample had oil and grease concentrations of 2 mg/L.

At the Category 2 RGO, total recoverable oil and grease was at the detection limit in the 15-minute sample from the driveway approach area and composite sample from the driveway approach area.

At the Category 3 RGO, the highest total recoverable oil and grease was detected at 8 mg/L in the 15-minute sample from the pump island area. The subsequent samples in the pump island area for the 30, 45-minute and composite samples were 3, 2 and 3 mg/L, respectively.

At the Category 4 RGO, an unexpected result in the analytical data is reported. A 15 mg/L concentration of total recoverable oil and grease is reported in the source water. The 15 mg/L concentration in the background sample is higher than the 4, 2, and 8 mg/L concentrations reported in the 15, 30, and 45-minute runoff water samples collected.

At the Category 5 RGO, the total recoverable oil and grease concentrations detected were the highest among the RGOs. The composite sample at the pump island area had a concentration of 34 mg/L, The composite sample at the driveway approach area had a concentration of 29 mg/L.

6.6 *Trip Blanks*

Toluene was detected in the quality control trip blanks that were sent with the runoff samples from the Category 2 and 4 RGOs at concentrations of 0.5 μg/L and 0.7 μg/L, respectively. These concentrations are slightly above the analytical detection limit of 0.3 μg/L. The laboratory did not provide the trip blanks used for this test. The trip blanks were filled with bottled water prior to arriving at each RGO from different bottles of purified water. In the two trip blanks with detectable levels of toluene, the concentrations of toluene were higher than the levels detected in the runoff

water. Contamination was not introduced through sample handling or transportation because toluene was not detected in the other samples from this site.

The GTEL laboratory director, Ms. Joan Greenwood, indicated that GTEL has detected toluene in batches of purified bottled water. At our request, Ms. Greenwood prepared a letter to explain their findings. The letter is included in Appendix H. The letter states that GTEL has detected toluene in bottles of "pure" water from commercial bottled water companies. Water in glass containers has frequently contained toluene in concentrations up to 2 $\mu g/L$. GTEL found plastic containers to contain toluene in even higher concentrations.

7.0 WATER QUALITY COMPARISON

The average concentrations for the chemical compounds studied during the runoff test are compared to water quality criteria and typical urban runoff in Tables 10 through 14.

7.1 EPA MCLs

The data indicate that the average concentrations observed at the five RGOs are lower than the current EPA primary and secondary drinking water MCLs with a few exceptions. The exceptions are antimony, arsenic, beryllium, cadmium, and lead. These exceptions exist because laboratory analytical detection limits are higher than the drinking water MCLs.

We note here that this study illustrates a problem typical of many water quality studies; the analyses employed in the study were performed using standard methods approved by regulatory agencies. However, the detection limits inherent to the standard methods are higher than current and proposed water quality criteria identified in the CA Draft Freshwater and Saltwater Aquatic Life Water Quality Objectives. Achieving lower detection limits requires specialized and expensive analytical techniques sometimes by non-standard research-oriented methods.

7.2 Federal Freshwater and Marine Aquatic Life

The EPA has published chronic exposure water quality criteria for freshwater and marine aquatic life. Concentrations from the RGO runoff which exceed these criteria are copper and zinc. Many of the EPA freshwater and marine aquatic life criteria are below the analytical detection

limits attainable by laboratory methods employed for sample analysis in this study.

7.3 Draft California Freshwater/Saltwater Aquatic Life Water Quality

The State of California is proposing water quality objectives for freshwater and saltwater aquatic life. Comparisons of the RGO runoff with the proposed four-day exposure freshwater aquatic life objectives are difficult because many of the objectives must be calculated by use of the hardness concentrations in the aquatic environment. With respect to the proposed four-day exposure marine chronic objectives, the standards are set below the analytical detection limits attainable by the laboratory methods employed for this study except for chromium and selenium; neither of which were detected in the runoff in concentrations above the proposed objectives.

7.4 Range of Concentrations Typical in Urban Runoff

Tables 10 through 14 also list ranges of chemical concentrations typical of urban runoff as reported in the EPA's Nationwide Urban Runoff Program (NURP). Comparison of the analytical data obtained from the runoff at the five RGOs represented by this study show the chemical concentrations from runoff water are similar to the ranges reported by NURP. The data from this study showed slightly higher concentrations of toluene and copper. The data produced by this study are in the lower ranges of many of the concentrations reported in the NURP, for example, benzene and total suspended solids.

8.0 CONCLUSION

All volatile organic compound concentrations detected in the samples of runoff water were below EPA MCLs. More testing will be necessary to determine the levels of gasoline constituents present in stormwater.

The results of the incidental spill performed at the Category 5 RGO indicate that good housekeeping practices minimize the amount of gasoline constituents present on the RGO ground surface. By minimizing the gasoline constituents present on the ground surface, minimal gasoline constituents will be available to be washed away with the runoff water from the RGO surface during a storm event.

Report Issue Date: July 1, 1993

Mr. John Netherwood
Hart Crowser
1 World Trade Center
Long Beach, CA 90831

Dear Mr. Netherwood,

This report replaces the original report, dated September 22, 1992, which is being reissued due to GTEL's inadvertant ommission of information pertaining to this project. Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 9/4/92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #1123.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

for JG

Joan Greenwood
Laboratory Director

Mr. John Netherwood
Hart Crowser
1 World Trade Center
Long Beach, CA 90831

Dear Mr. Netherwood,

Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 9-11-92

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

Minsoon Song
Laboratory Director

cc: Allison Fong

GTEL Client Number: WSP01.WSP01

Mr. John Netherwood
Hart Crowser
1 World Trade Center
Long Beach, CA 90831

Dear Mr. Netherwood,

Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 9/4/92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

Minsoon Song
Laboratory Director

Mr. John Netherwood
Hart Crowser
1 World Trade Center
Long Beach, CA 90831

Dear Mr. Netherwood,

Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 9-10-92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

Minsoon Song
Laboratory Director

cc: Allison Fong

Mr. John Netherwood
Hart Crowser
1 World Trade Center
Long Beach, CA 90831-2300

Dear Mr. Netherwood,

This report replaces the previous report issued on 10-2-92 due to a typographical error in the dilution multiplier on page 2. Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 9-18-92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

Minsoon Song
Laboratory Director

cc: Allison Fong

Dilution Multiplier[b]		25	25	1	
TFT surrogate[c], % recovery		97.7	97.8	99.8	

a. Test Methods for Evaluating Solid Waste, SW-846, Third Edition, Revision 0, US EPA November 1986. Modification for TPH as gasoline as per California State Water Resources Board LUFT Manual procedures.

b. Indicates the adjustments made for sample dilution.

c. TFT surrogate recovery acceptability limits of 72.8-123% are derived from the 99% confidence interval of all samples during the previous quarter. Expected surrogate value is 100 ug/L.

* Detection limit increased due to matrix effect (foaming)

KEY LITERATURE SEARCH ABSTRACTS

Item 62

Accession Number	100143
Main Title	Contributions of Urban Roadway Usage to Water Pollution
Personal Author	Shaheen., Donald G.;
Corporate Author	Biospherics, Inc., Rockville, Md.;Environmental Protection Agency. Washington, D.C. Office of Research an Development.
Year Published	1975
Call Number	PB-245 854
Report Number	EPA-68-01-0197; EPA-ROAP-21ASY-005; EPA/600/2-75-004;
Abstract	Street surface contaminants are deposited on roadways from many sources within an urban area. Industrial operations, land use activities, fallout of air pollutants, roadway usage and other activities contribute to the loading of particulates on urban roadways. These materials are then carried into receiving waters by storm runoff where they constitute a substantial portion of the overall water pollution problems of cities. Metropolitan Washington, D.C., with its low background of industrial emissions, was the area chosen for study of contributions of motor vehicle usage to urban roadway loading factors. Specific roadway study sites within this area were selected so as to provide minimal interference from nontraffic-related land use activities and thus isolate, as much as possible, the traffic-related depositions.

Item 108

Accession Number	116665
Main Title	Toxicants in Urban Runoff: Metro Toxicant Program Report Number 2.
Personal Author	Galvin, D.V.; Moore, R.K.;
Corporate Author	Municipality of Metropolitan Seattle-METRO,WA. Water Quality Div.
Year Published	1982
Call Number	PB84-104124
Report Number	MMS/WOR-8210; EPA-P-000161-01:
Abstract	As part of the U.S. Environmental Protection Agency's Nationwide Urban Runoff Program, the Municipality of Metropolitan Seattle (METRO) studied the sources and presence of toxic substances in urban stormwater runoff, as well as their potential adverse effects on local freshwater receiving environments. Sampling and analysis were designed to provide concentration data for the Clean Water Act's priority pollutant metals and organics. Sampling of potential sources to stormwater runoff included airborne particles, street dust, and catchbasin sediments. Both urban control environmental samples were taken from interstitial streamwaters, stream sediments, and Lake Washington bottom sediments. Evaluations of toxicant control measures focuses on currently available removal techniques, such as street sweeping, detention basins, and oil separators. The report incorporates a thorough literature review and includes an extensive bibliography.

Item 119

Accession Number	118337
Main Title	Nationwide Urban Runoff Program, Bellevue Urban Runoff Program, Washington: Summary Report.
Personal Author	Pitt, R.; Bissonnette, P.;
Corporate Author	Bellevue Storm and Surface Utility, WA.; Environmental Protection Agency, Washington, D.C. Office of Water Program Operations.
Year Published	1984
Call Number	PB84-237213
Report Number	EPA-R-805929;
Abstract	This summary report consolidates the major findings and conclusions of several individual studies, which included: Tests conducted to contrast the biological and chemical conditions in an urban creek with a rural creek; Monitoring urban runoff quality and quantity from 3 urban areas; Analysis of many source area, urban runoff, and creek samples for metallic and organic priority pollutants; Sampling of urban stormwater and base flows rom 2 residential areas. Collection of street dirt samples and evaluation of effects of street cleaning and catchbasin cleaning on improvement of urban runoff quality.

Title:	Sources of petroleum hydrocarbons in urban runoff.
Author:	Latimer, James S.; Hoffman, Eva J.; Hoffman, Gerald; Fasching, James L.; Quinn, James G.
Corporate Source:	Univ of Rhode Island, Narragansett, RI, USA
Source:	Water, Air and Soil Pollution v 52 n 1-2 Jul 1990 p 1-21
Publication Year:	1990
CODEN:	WAPLAC
ISSN:	0049-6979
Language:	English
Document Type:	JA; (Journal Article) Treatment: X; (Experimental); G; (General Review)
Journal Announcement:	9103
Abstract:	In an effort to provide a better understanding of the sources of petroleum hydrocarbons in urban runoff, petroleum products as well as probable source materials were analyzed for hydrocarbons and trace metals and then compared to urban runoff samples from four different land use areas. The petroleum products considered were No.2 and No.6 fuel oil, used and virgin crankcase oils, and gasoline. Source materials included street dust, roadside soil, roadside vegetation, and atmospheric fallout; and the land use categories were commercial, residential, interstate highway, and industrial areas. The samples were compared on the basis of hydrocarbon (saturated and aromatic) and trace metal (Cd, Pb, Mn, Cu, Fe, Zn) loadings and distributions. Results indicated that the hydrocarbon content in runoff at all four land use sites originated primarily from used crankcase oil, with a small amount of No. 2 fuel oil detected at the industrial site. Only a small portion of the crankcase oil component came from the sources surveyed, and the majority of this oil probably came from: (1) oil drops within the driving lanes on the road surfaces or deposits in parking areas, and/or (2) direct dumping of waste crankcase oil down storm drains. Abstract:	Waste-to-energy resource recovery facilities fall into two major categories: mass burn and RDF (refuse-derived fuel). Site design considerations presented here are applicable to both categories; however, layout and system description used is for mass-burn facilities. The project site is identified through a complex screening process that includes issues such as environmental compatibility and public sentiment. This paper considers the design within the selected site. Site layout and aesthetics of the facility are of utmost importance to win public support. Traffic congestion is an issue which may be of particular concern to residents in the area of the project; therefore, it is essential that sufficient on-site truck queuing space is provided to avoid traffic spillover onto public streets. Storm-water drainage system must be designed to prevent water pollution during the construction, and in many instances it must be designed to maintain predevelopment runoff rate from the site. Last is the economic consideration: Site must be designed to minimize the capital cost and cost of maintenance. (Edited author abstract)

Pollution of Street Run-off by Traffic and Local Conditions
Muschack, W.
Umweltbundesamt, Berlin (Germany, F.R.).
The Science of the Total Environment STENDL, Vol. 93, p 419-431, April 1990. 6 tab, 12 ref.,
Journal Announcement: SWRA2402
Investigations were performed in the Federal Republic of Germany to determine pollutant concentrations in rainwater in order to obtain a comprehensive picture of the pollution caused by precipitation runoff. Influencing parameters included: exhaust gases, tire abrasion particles, brake lining abrasion dust, leakage of hydrocarbons, and winter street cleaning activities. The analysis of these factors was complemented by the determination of detection limits. After an assessment of all possibilities, 30 substances remained, and 22 were analyzed. Lead, chromium, copper, nickel, and zinc are the elements commonly found in the emissions/particles of the aforementioned parameters. (Stoehr-PTT)

USGS Open-File Report 84-718, 1987. 139 p., 8 fig., 16 tab, 8 ref.,
Journal Announcement: SWRA2204
Data were collected as part of the National Urban Runoff Program to characterize urban runoff in Fresno, California. Rainfall-runoff quantity and quality data are included along with atmospheric dry-deposition and street-surface particulate quality data. The data are presented in figures, and tables that reflect four land uses: industrial, single-dwelling residential, multiple-dwelling residential, and commercial. A Total of 255 storms were monitored for rainfall and runoff quantity. Runoff samples from 112 of these storms were analyzed for physical, organic, inorganic, and biological constituents. The majority of the remaining storms have pH and specific conductance data only. Ninety-two composite rain samples were collected. Of these, 63 were analyzed for physical, inorganic and (or) organic constituents. The remaining rainfall samples have pH and specific conductance data only. Nineteen atmospheric deposition and 21 street-particulate samples were collected and analyzed for inorganic and organic constituents. The report also details equipment utilization and operation, and discusses data collection methods. (USGS)

Oil and Grease in Stormwater Runoff
Stenstrom, M. K.; Silverman, G.; Bursztynsky, T.A.; Zarzana, A.L.; Salarz, S.E.
California Univ., Los Angeles, Dept. of Engineering Systems Report, February 1982. Association of Bay Area Governments, Berkeley, California. 241 p., 41 Fig., 44 Tab., 158 Ref., 3 Append.,
Journal Announcement: SWRA1511
The objective of this project was to determine the environmental effects of oil and grease in urban stormwater on marine environments in San Francisco Bay and to recommend suitable control measures. Studies show that there are significant effects of low level oil/grease pollution and that continuous pollution from urban stormwater can change the ecology of a marine environment. Five field sampling stations were selected in a stormwater basis in Richmond, CA to determine oil/grease pollution by land-use type. Samples were taken from the mouth of the watershed, a parking lot, a commercial street, a residential area, and from a light industrial facility. Land-use strongly affects oil/grease in stormwater. The major contributing factor is motor vehicles. Areas with the most auto traffic had the highest concentration of oil/grease in stormwater and the highest hydrocarbon load factor. Mean oil/grease concentration in runoff flow ranged from 4.13 mg/1 in an upstream residential area to 15.25 mg/1 in a parking lot. A strong correlation exists between total rainfall and total mass of oil/grease pollution--contamination is higher at the beginning of a storm than at the end. Nine control techniques showed promise. Three non-structural techniques were to recycle used crankcase oil, reduce auto emissions through better inspections, and improve standards. Six structural techniques were to improve street/parking lot cleaning, sorption systems for manhole and gutter intakes, porous pavement, greenbelts around parking lots, dispersion devices, and wetlands or marshes to trap pollutants. These are site-specific techniques but it was recommended they be developed further. (Atkins-Omniplan)

Constituents of Highway Runoff: Volume I, State-of-the-Art Report
Gupta, M.K.; Agnew, R.W.; Kobriger, N.P.
Envirex Inc., Milwaukee, WI.
Available from the National Technical Information Service, Springfield, VA 22161 as PB881-241895, Price codes: A06 in paper copy, A01 in microfiche. Federal Highway Administration Report No. FHWA/RD-81/042, February, 1981. 121 p., 16 Fig., 37 Tab., 169 Ref., DOT-FH-11-8600.
Journal Announcement: SWRA1510
The factors which most affect quantity and quality of highway runoff are traffic volume, rainfall intensity and pattern, highway drainage characteristics, operation and maintenance characteristics and degree of imperviousness of the drainage area. Maintenance of adequate drainage is one of the most important aspects of highway design. Highway runoff characteristics are similar to those of urban runoff and may exert significant shock pollutional loads on receiving waters. The weighted average of total solids accumulations between successive street cleanings, a period of 2 to 12 days, for eight cities was found to be 1400 lb/curb mile. A high percentage of street surface pollutants are associated with very fine dust and dirt particles. Substantial quantities of toxic materials, such as heavy metals and pesticides, are present in street surface contaminants with the amounts varying considerably from site to site. Because of the consistent presence of heavy metals in amounts large enough to interfere with BOD5 measurements, COD is considered to be a better parameter for measuring the oxygen demand potential of highway runoff. Highway salting rates usually range from 400 to 1200 lbs per two-lane mile. Over the winter season, a typical multiple lane highway may use 100 tons or more of salt per mile. Significant amounts of vehicle released airborne matter are settled out and washed off the road surface during rainstorms. (Moore-SRC)

Water Quality Patterns During A Storm On a Mall Parking Lot
Black, P.E.
State Univ. of New York at Syracuse, Coll. of Environmental Science and Forestry.
Water Resources Bulletin, Vol 16, No. 4, p. 615-620, August, 1980, 6 Fig. 2 Tab., 13 Ref.
Journal Announcement: SWRA1510
Rainfall, surface runoff, and subsurface drainage plus streamflow upstream and downstream of a suburban New York mall parking lot were intensively sampled during and after a thunderstorm on June 18, 1978. Prior to the 11.4mm which fell within less than 1.5 hours, no rain had fallen for 4 days. Ammonia-N concentrations were high (up to 2.5mg per liter) in parking lot runoff, a result of precipitation which contained up to 2.0mg per liter ammonia-N. Surface runoff had a peak in conductivity during the rainfall and returned to prestorm levels by the end of the study period. Initial runoff appeared gray and nearly opaque. Nine constituents (K, Mn, Fe, P, Pb, Zn, Mg, Ca, and Na) showed a peak in surface runoff between 45 and 60 min after the rain started, declined to a low at 75 min, and returned to prestorm values by 105 min. Drainage from subsurface drains was brown in color and had a strong odor. In the receiving stream, water temperature increased and conductivity decreased during the beginning of the storm and returned to prestorm levels after 5 hours. (Cassar-FRC)

The Distribution of Heavy Metals and Petroleum Residues in the Soil from Urban Surface Runoff
Owe, M.
State Univ. of New York at Syracuse. Coll. of Environmental Science and Forestry.
PhD Thesis, January, 1981, 197 p., 56 Fig., 22 Tab., 100 Ref., University Microfilms International, Ann Arbor, MI; Order No. GAX81-18121.,
Journal Announcement: SWRA1509
The soil is thought to possess an enormous capacity for immobilizing environmental contaminants, especially those typically contained in urban surface runoff. The profiles of two common area soil, a sandy, porous Arkport and a dense clayey Dunkirk, were reconstructed in 14 cm by 80cm columns in the laboratory. The design was intended to simulate a collection basin, one fourth the surface area of the test basin. Surface runoff was sampled and collected from a heavy used shopping center parking lot. Treatments simulated actual precipitation-runoff event frequency and volume occurring during the study period. The profiles were subsequently analyzed at predetermined increments for zinc, lead, cadmium, copper and petroleum residues. An overall increase in total cation and petroleum concentration was noticed with an increase in treatment concentration. A positive relationship between contaminant concentration in the soil and treatment level, exchange capacity, final soil pH and percent organic matter was realized. A negative correlation was noticed between contaminant concentration and bulk density. Treatment level and final soil pH recovered totals far below the input amounts, consistently lower hydrocarbon totals were recovered from the Arkport. This indicates the possibility of a higher rate of petroleum residue decomposition in the more porous, better aerated Arkport soil. (Sinha-OEIS)

APPENDIX C
PRELIMINARY FIELD TESTING PROCEDURES AND FINDINGS

Preliminary Field Testing Procedures and Findings

The preliminary field testing was successful in determining that a constant flow rate was needed to achieve uniform distribution of the application water over the selected area. The preliminary field testing of various distribution systems identified that a cascading flow of potable water dispersed through perforated Polyvinyl Chloride (PVC) pipe and measured by an accumulating water meter achieved the desired results. The flow rate was measured by a Rotameter with a scale of 0 through 10 gallons per minute. A stainless steel water collection trough was designed and constructed (Figure C-1) to function as a sampling point and accumulation sump to capture the applied water. It was determined that the leading edge of the stainless steel trough needed a flexible edge to conform to the irregular surface of the concrete and asphalt. A length of polypropylene tubing was cut and slipped over the leading edge of the trough for this purpose.

The captured water was pumped from the collection sump into a plastic-lined metal 55-gallon drum. Four-foot-long containment berms were used to contain the water flow. The berms were constructed from 6 millimeter clear polypropylene tubing, 4 inches in diameter, and filled with clean sand. The non-porous polypropylene and sand filled berms contained the water flow and diverted it to a preselected collection point at the lowest area of the sampling site.

Safety precautions included placing cones around the active test area and meeting with the station attendant to discuss the activities that were going to be conducted.

APPENDIX D
SAMPLING PROCEDURES

SAMPLING PROCEDURES

The water dispensing equipment was set up at each location using the PVC pipe apparatus to cover an area approximately 20 feet x 20 feet. The location of the equipment was determined at each station depending on the physical layout and the slope of the station island. The containment equipment was then placed into position around the area. The containment berms were used to channel the runoff water to the collection point. A stainless steel collection trough was placed at the lowest point of the test area and incorporated into the network berms.

Tables 1 through 5 list each sample round, the sample point or time and the analyses run on the samples collected during that round:

The first round of samples was collected from the source water. The source water sample was submitted for testing with the site samples. The predetermined flow rate was adjusted when the water flow was started. The second round of samples was taken 15 minutes into the water dispensing. A plastic scoop was used to fill the sample bottles from water in the collection trough.

After the second round of samples the water in the collection basin was pumped into a 55-gallon drum using an electric pump. The 55-gallon drum was lined with polypropylene that was changed between the pump island test location and the driveway approach test location at each station. The electric water pump and scoop were decontaminated between sample rounds using a solution of deionized water and alconox, followed by two rinses with deionized water.

For quality control one trip blank was filled with deionized water and stored in each cooler together with the field samples. The trip blank insures that the data obtained from the site testing represents the pollutants collected from the site surface and does not represent contaminates introduced during transport.

A background sample was collected from the service station's potable water at the end of the supply line that was used to produce the simulated rain. The sampling and analysis keys used for this project list the sample identification, station category, location, time interval and weather for each sampling event. The keys are presented in Tables 1 through 5.

At the Category 5 station an incidental spill evaluation was conducted at the pump island prior to conducting the runoff test. The incidental spill test was conducted using one-quart of gasoline. The staged spill of fuel was collected in absorbent that was applied to the spill and picked up prior to the application of the test water.

Grab samples were drawn from the collected water and caution was used to insure that the 40 ml vials for BTEX did not contain any head space. The samples were transported to GTEL Environmental Laboratories, Inc. in an ice chest maintained at 4 degrees Celcius where the samples were analyzed for the specified chemical compounds in the sampling protocol. The analytical data are intended to represent an estimate of the water quality from a storm event equivalent to the flow represented.

SAMPLING PROCEDURES (Continued)

(Round 2 at 15 minutes, Round 3 at 30 minutes, and Round 4 at 45 minutes in the pump island area and Round 6 at 15 minutes, Round 7 at 30 minutes, and Round 8 at 45 minutes in the driveway approach area). At the end of each 15-minute interval, the water in the collection trough was pumped into a 55-gallon drum using an electric pump. Upon completion of the simulation, a composite sample was collected from the 55-gallon drum (Round 5 for the pump island area and Round 9 for the driveway approach area).

Trip blanks were used to ensure that the sample obtained from a site represented the material sampled and its constituents not material or chemicals introduced during transport. Trip blanks are sent along with field samples as a measure of quality assurance. The trip blanks are analyzed to verify that contamination is not introduced to the samples while they are in transit between the point of collection and the laboratory.

APPENDIX E
ACCEPTABILITY LIMITS AND STATISTICAL ACCURACY OF LABORATORY ANALYTICAL METHODS

The Acceptability Limits for the Analytical Methods

Compound	Acceptability Limit
Benzene	81.1 to 118.0 percent of actual concentration
Toluene	79.9 to 123.0 percent of actual concentration
Ethylbenzene	81.1 to 123.0 percent of actual concentration
Total Xylenes	82.9 to 123.0 percent of actual concentration
Oil and Grease	80.0 to 120.0 percent of actual concentration
Metals	80.0 to 120.0 percent of actual concentration

The Statistical Accuracy of the Analyitcal Methods

Compound	Category One	Category Two	Category Three	Category Four	Category Five
Benzene	92.0 percent	117.0 percent	99.3 percent	117.0 percent	110.0 percent
Toluene	94.0 percent	119.0 percent	111.0 percent	119.0 percent	109.0 percent
Ethylbenzene	97.3	115.0 percent	107.0 percent	115.0 percent	102.0 percnet
Total Xylenes	95.8 percent	121. 0 percent	119.0 percent	121.0 percent	112.0 percent
Oil and Grease	87.7 percent	103.0 percent	102.0 percent	88.9 percent	101.0 percent
Metals	97.0 to 107.0 percent	97.0 to 107.0 percent	97.0 to 107.0 percent	97.0 to 107.0 percent	96.0 to 109 percent

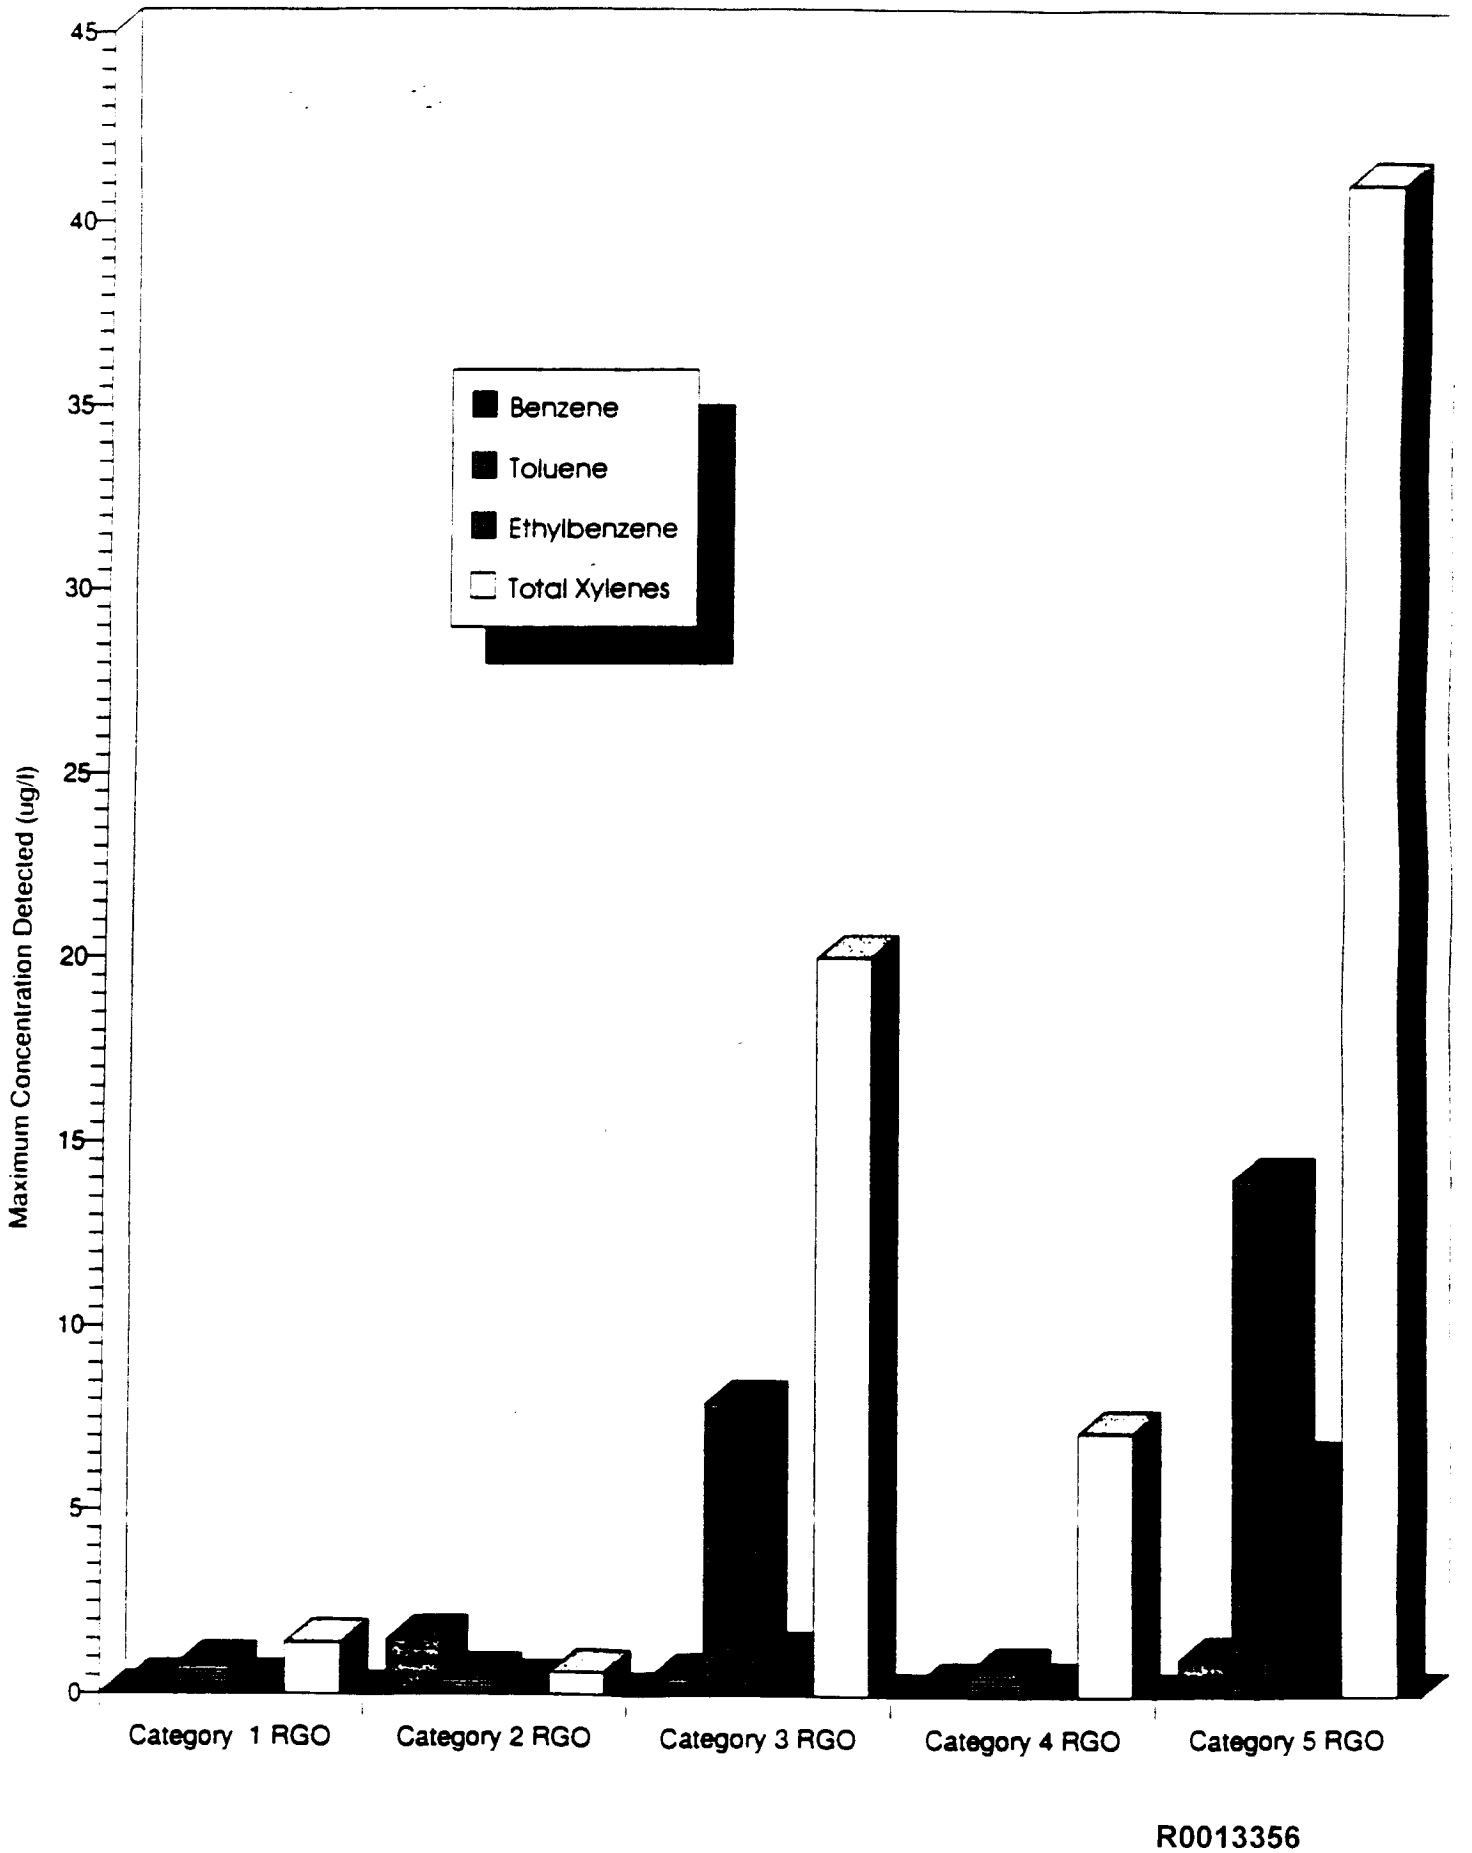
RE: Toluene in Trip Blank

Dear Mr. Darrow:

Recently, GTEL's Torrance Laboratory investigated several commercial sources of "pure" water for use as trip blanks. It was our experience that water sold in glass containers frequently contained up to 2 parts per billion (ppb) Toluene. Water from plastic containers tended to have even higher concentrations of Toluene due to leaching. As a result of our study, we now verify purity of every trip blank prior to sending it out to Clients.

Another source of Toluene contamination in Trip Blanks is the sample container. As part of GTEL's Total Quality Management Program, evaluation of several vendors' products were conducted. One supplier's glass VOA vials consistently showed several ppb Toluene. GTEL's now purchases sample containers from a single source and receives a Certificate of Analysis with each shipment to ensure that the containers meet our specifications.

I strongly recommend that in the future, Trip Blanks be ordered directly from the Laboratory at the time the project is scheduled. It is very difficult for a consultant to make his/her own Toluene-free Trip Blanks.



If I can be of further assistance, please do not hesitate to contact me.

Very truly yours,
GTEL Environmental Laboratories, Inc.

Joan V. Greenwood
Laboratory Director

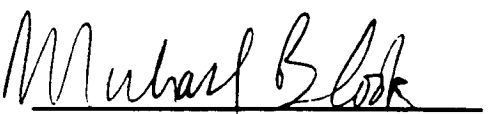
NPDES Storm Water Sampling Guidance Document

Printed on Recycled Paper

DISCLAIMER

This document was issued in support of EPA regulations and policy initiatives involving the development and implementation of a national storm water program. This document is agency guidance only. It does not establish or affect legal rights or obligations. Agency decisions in any particular case will be made applying the laws and regulations on the basis of specific facts when permits are issued or regulations promulgated. Mention of trade names or commercial products does not constitute endorsement or recommendation for use.

FOREWORD



Pollutants in storm water discharges from many sources are largely uncontrolled. The National Water Quality Inventory, 1990 Report to Congress provides a general assessment of water quality based on biennial reports submitted by the States under Section 305(b) of the Clean Water Act. The report indicates that roughly 30% of identified cases of water quality impairment reported by the States are attributable to storm water discharges.

Sampling data from storm water discharges is an important tool which provides information on the types and amounts of pollutants present. This data can then be used to identify pollutant sources and to develop storm water pollution prevention plans and best management practices priorities to control these sources.

This manual is for operators of facilities that discharge storm water associated with industrial activity and operators of large and medium municipal separate storm sewer systems. This manual describes the basic sampling requirements for NPDES storm water discharge permit applications and provides procedural guidance on how to conduct sampling. Many of the concepts in this guidance may also be applicable to sampling requirements contained in NPDES storm water permits.

This document was issued in support of EPA regulations and policy initiatives involving the development and implementation of a national storm water program. This document is agency guidance only. It does not establish or affect legal rights or obligations. Agency decisions in any particular case will be made applying the laws and regulations on the basis of specific facts when permits are issued or regulations promulgated.

This document is expected to be revised periodically to reflect advances in this rapidly evolving area. Comments from users are welcomed. Send comments to the U.S. Environmental Protection Agency, Office of Wastewater Enforcement and Compliance, 401 M Street, SW, Mailcode EN-336, Washington, DC 20460.

Michael Cook,
Director
Office of Wastewater Enforcement
and Compliance

NPDES STORM WATER SAMPLING GUIDANCE DOCUMENT

1. INTRODUCTION

The 1972 Federal Water Pollution Control Act [(FWPCA), also referred to as the Clean Water Act (CWA)] prohibits the discharge of any pollutant to waters of the U.S. from a point source unless the discharge is authorized by a National Pollutant Discharge Elimination System (NPDES) permit. Efforts to improve water quality under the NPDES program have focused traditionally on reducing pollutants in industrial process wastewater discharges and from municipal sewage treatment plants. Past efforts to address storm water discharges, in particular through the NPDES program, have generally been limited to certain industrial categories, using effluent limitations for storm water as a permit condition.

Recognizing the need for more comprehensive control of storm waters discharges, Congress amended the CWA in 1987 and established a two-phase program. In Phase I, Congress required the U.S. Environmental Protection Agency (EPA) to establish NPDES requirements for certain classes of storm water discharges.

- A storm water discharge for which a permit has been issued prior to February 4, 1987
- A storm water discharge associated with industrial activity
- A storm water discharge from a municipal separate storm sewer system serving a population of 250,000 or more (large system)
- A storm water discharge from a municipal separate storm sewer system serving a population of 100,000 or more, but less than 250,000 (medium system)
- A discharge for which the Administrator or the State determines that the storm water discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to the waters of the United States.

To implement these requirements, EPA published on November 16, 1990 (55 Fed. Reg. 47990), permit application requirements that include storm water sampling. EPA and the States will subsequently issue NPDES storm water permits based on these applications, and many of these

R0013369

permits will require storm water sampling. Congress intended for EPA to address all other point source discharges of storm water in Phase II of the program.

1.1 PURPOSE OF THIS MANUAL

This manual is for operators of facilities that discharge storm water associated with industrial activity and operators of large and medium municipal separate storm sewer systems. Storm water sampling is sometimes difficult due to the unpredictability of storm events and the variable nature of storm water discharges. This manual is primarily designed to assist operators/owners in planning for and fulfilling the NPDES storm water discharge sampling requirements for permit applications as well as for other storm water sampling needs.

It is assumed that applicants already have a basic understanding of the storm water permit application requirements. This document is designed to supplement existing storm water application guidance by focusing on the technical aspects of sampling. Since many industrial storm water permits and all municipal storm water permits will require regular storm water sampling, many of the concepts in this guidance may be applicable to sampling requirements contained in NPDES storm water permits.

The information in this manual pertains specifically to individual industrial storm water applications, group storm water applications (Part 2), and municipal Part 2 storm water permit applications for storm water discharges. For information on other storm water application requirements for industrial facilities and large and medium municipal separate storm sewer systems, see EPA's Guidance Manual for the Preparation of NPDES Permit Applications for Storm Water Discharges Associated with Industrial Activity (EPA-505/8-91-002, April 1991), and EPA's Guidance Manual for the Preparation of Part 1 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems (EPA-505/8-91-003A, April 1991), respectively. These manuals can be requested by calling the Storm Water Hotline [(703) 821-4823] or the National Technical Information Service (NTIS) [(703) 487-4650]. Additional background documents for further information are listed in Technical Appendix D.

1.2 ORGANIZATION OF THIS MANUAL

This manual explains the basic requirements of storm water sampling and provides procedural guidance on sampling for permit applications. Chapter 2 discusses background information (i.e., a

R0013370

summary of permit application requirements, who must sample, when and where to sample, and staffing considerations). Chapter 3 presents the fundamentals of sampling (i.e., types of sampling, obtaining flow data, handling samples, and sending them to the laboratory). Chapter 4 presents analytical considerations, including the storm water pollutants that must be analyzed under the regulations. Chapter 5 discusses regulatory flexibility with respect to storm water sampling, and Chapter 6 includes health and safety considerations.

Technical Appendices provide information as follows:

- Technical Appendix A—Forms 2F and 1
- Technical Appendix B—NOAA Weather Radio Information
- Technical Appendix C—Required Containers, Preservation Techniques, Holding Times and 40 Code of Federal Regulations (CFR) Part 136
- Technical Appendix D—References
- Technical Appendix E—Glossary
- Technical Appendix F—Acronyms.

R0013371

R0013372

2. BACKGROUND FOR STORM WATER SAMPLING

This chapter presents background information, definitions, and a description of the fundamentals of sampling. Specifically, it covers the following areas:

- The benefits of sampling
- A summary of storm water application regulations
- Who must sample
- When sampling is required
- Where to sample
- Staffing considerations

In response to the 1987 Water Quality Act amendments to the CWA, EPA published the storm water final rule on November 16, 1990. In this rule, EPA established the initial scope of the storm water program by defining the phrase "storm water discharge associated with industrial activity" in terms of 11 categories of industrial activity and the phrase "large and medium municipal separate storm sewer systems" to include municipal systems serving a population greater than 100,000. These terms are discussed in greater detail in Section 2.6, "Who Must Sample."

In addition to defining the initial scope of the storm water program, the final rule established permit application requirements, including requirements for storm water sampling. Sampling data gathered for the application will be used to characterize storm water discharges, and will serve as a basis for establishing requirements in NPDES storm water permits. It is important to note that the applicant must report data that are representative of the storm water discharge, and that the intentional misrepresentation of discharge characteristics is unlawful.

2.1 BENEFITS OF SAMPLING

Data that characterize storm water discharges are valuable to permitting authorities and permittees for several reasons. First, storm water sampling provides a means for evaluating the environmental risk of the storm water discharge by identifying the types and amounts of pollutants present. Evaluating these data helps to determine the relative potential for the storm water discharge to contribute to water quality impacts or water quality standard violations. And, storm water sampling

R0013373

data can be used to identify potential sources of pollutants. These sources can then be either eliminated or controlled more specifically by the permit.

2.2 INDUSTRIAL FACILITY APPLICATION REQUIREMENTS

The storm water permit application regulations provide operators of facilities (including those owned by the government) that have storm water discharges associated with industrial activity with three application options: (1) submit an individual application; (2) participate in a group application (a two-part application); or (3) submit a Notice of Intent (NOI) to be covered by a general permit where general permits are available. This guidance focuses on sampling requirements for individual applications and Part 2 of group applications. Sampling data generally will not be required for an NOI, however, the general permit may require sampling during the term of the permit. State permitting authorities may also require sampling information for an NOI at their discretion, and should, therefore, be consulted prior to submittal.

Industrial facilities submitting individual applications must submit sampling data on a completed application Form 2F (entitled "Application for Permit to Discharge Storm Water Discharges Associated with Industrial Activity"). Facilities selected to be part of the sampling subgroup for a group application must submit sampling data with Part 2 of the application. Members of the sampling subgroup must complete only the quantitative data portions of Form 2F, including Sections VII, VIII, IX, and the certification in Section X. Exhibit 2-1 details the types of information required for each section of Form 2F. Exhibit 2-2 describes what sampling information must be provided in Part 2 of the group application. It should be noted that States may require the use of different forms and submittal of additional documentation.

Form 1 must also be submitted with Form 2F by applicants submitting individual permit applications. General information about the facility is provided on Form 1 (i.e., addresses, operators, etc.); it does not request sampling data. Forms 1 and 2F are reproduced in Technical Appendix A.

Facilities with unpermitted combined discharges of storm water and process or nonprocess wastewater must submit Form 2C or 2E, respectively, in addition to Forms 1 and 2F. Facilities with storm water discharges combined with new sources or new discharges of process wastewater must submit Form 2D as well as Forms 1 and 2F.

R0013374

EXHIBIT 2-1. FORM 2F APPLICATION REQUIREMENTS	
Section	**Requirement**
2F-I	Outfall location(s), including longitude and latitude and receiving water(s)
2F-II	Facility improvements which may affect the discharges described in the application
2F-III	Site drainage map
2F-IVA	Estimates of impervious area within each outfall drainage area
2F-IVB	A narrative description of pollutant sources (i.e., onsite materials which may come in contact with storm water runoff)
2F-IVC	Location and description of existing structural and nonstructural pollutant control measures
2F-VA	Certification that outfalls have been tested or evaluated for non-storm water discharges
2F-VB	Description of method used for testing/evaluating presence of non-storm water discharges
2F-VI	History of significant leaks or spills of toxic or hazardous pollutants at the facility within the last 3 years
2F-VII	Discharge characterization for all required pollutants
2F-VIII	Statement of whether biological testing for acute or chronic toxicity was performed and list of pollutants it was performed for
2F-IX	Information on contract laboratories or consulting firms
2F-X	Certification that information supplied is accurate and complete
Note: See Form 2F and the instructions for more detail on application requirements.	

2.3 MUNICIPALITIES' APPLICATION REQUIREMENTS

Operators of large and medium municipal separate storm sewer systems are required to submit a two-part application. Both parts contain sampling requirements: Part 1 requires information characterizing discharges from the separate storm sewer system, including field screening sample data for identifying illicit/illegal connections; Part 2 requires sampling at representative locations and estimates of pollutant loadings for those sites. These sampling data are to be used to design a long-term storm water monitoring plan that will be implemented during the term of the permit. The sampling data that must be submitted in Parts 1 and 2 of municipal applications are listed in Exhibit 2-3. There is no standard application form for municipalities.

R0013375

EXHIBIT 2-2. PART 2 GROUP APPLICATION SAMPLING REQUIREMENTS

Quantitative Testing Data

- For groups with 4 to 20 members, 50 percent of the facilities must submit data; for groups with 21 to 99 members, a minimum of 10 dischargers must submit quantitative data; for groups with 100 to 1,000 members, a minimum of 10 percent of the facilities must submit data; for groups with greater than 1,000 members, no more than 100 facilities must submit data; there must be 2 dischargers from each precipitation zone in which 10 or more members of the group are located, or 1 discharger from each precipitation zone in which 9 or fewer members are located.
- Sampling and analysis requirements are described in 40 Code of Federal Regulations (CFR) 122.26(c)(1)(i)(E) and 40 CFR 122.21(g)(7). Pollutants to be analyzed depend on the type(s) of industries applying as a group.
- Sampling subgroup must provide all quantitative discharge information required in Form 2F Sections VII-IX plus the certification in Section X.
- The group application sampling subgroup must collect grab samples during the first 30 minutes of the storm event and flow-weighted composite samples as required in 40 CFR 122.21(g)(7).

2.4 APPLICATION SUBMITTAL DEADLINES

Deadlines for submitting permit applications and associated sampling requirements are presented in Exhibit 2-4 for individual and group industrial applications and for municipal applications.

2.5 WHERE TO SUBMIT APPLICATIONS

Storm water discharge permit applications are generally submitted directly to the permit-issuing authority. The appropriate authority is the State, where the State has been granted the authority to issue NPDES permits, or the EPA Regional office, where the State does not have NPDES authorization. Exhibit 2-5 indicates which States have approved NPDES permitting programs. It also provides contact names and addresses where applications should be submitted for each State or EPA Regional Office (depending on who the permitting authority is in each case). It should be noted, however, that both parts of a group application must instead be submitted to EPA Headquarters. Group applications must be sent to: Director, Office of Wastewater Enforcement and Compliance, Attention Mr. William Swietlik, U.S. EPA, EN-336, 401 M Street, SW, Washington, DC 20640.

R0013376

EXHIBIT 2-3. MUNICIPAL APPLICATION SAMPLING REQUIREMENTS

Part 1

- Monthly mean rainfall and snowfall estimates
- Existing quantitative data on the depth and quality of storm water discharges
- A list of receiving water bodies and existing information concerning known water quality impacts
- Field screening analysis for illicit connections and illegal dumping
- Identification of representative outfalls for further sampling in Part 2

Part 2

- Quantitative data from 5 to 10 representative locations in approved sampling plans
- Estimates of the annual pollutant load and event mean concentration (EMC) of system discharges
- Proposed schedule to provide estimates of seasonal pollutant loads and the EMC for certain detected constituents in a representative storm event during the term of the permit
- Proposed monitoring program for representative data collection during the term of the permit

Applications submitted by industrial facilities must be certified by a responsible corporate officer as described in 40 CFR 122.22 (e.g., president, secretary, treasurer, vice president of the corporation in charge of a principal business function). Applications submitted by municipalities must be certified by a principal executive officer or ranking elected official as described in 40 CFR 122.22.

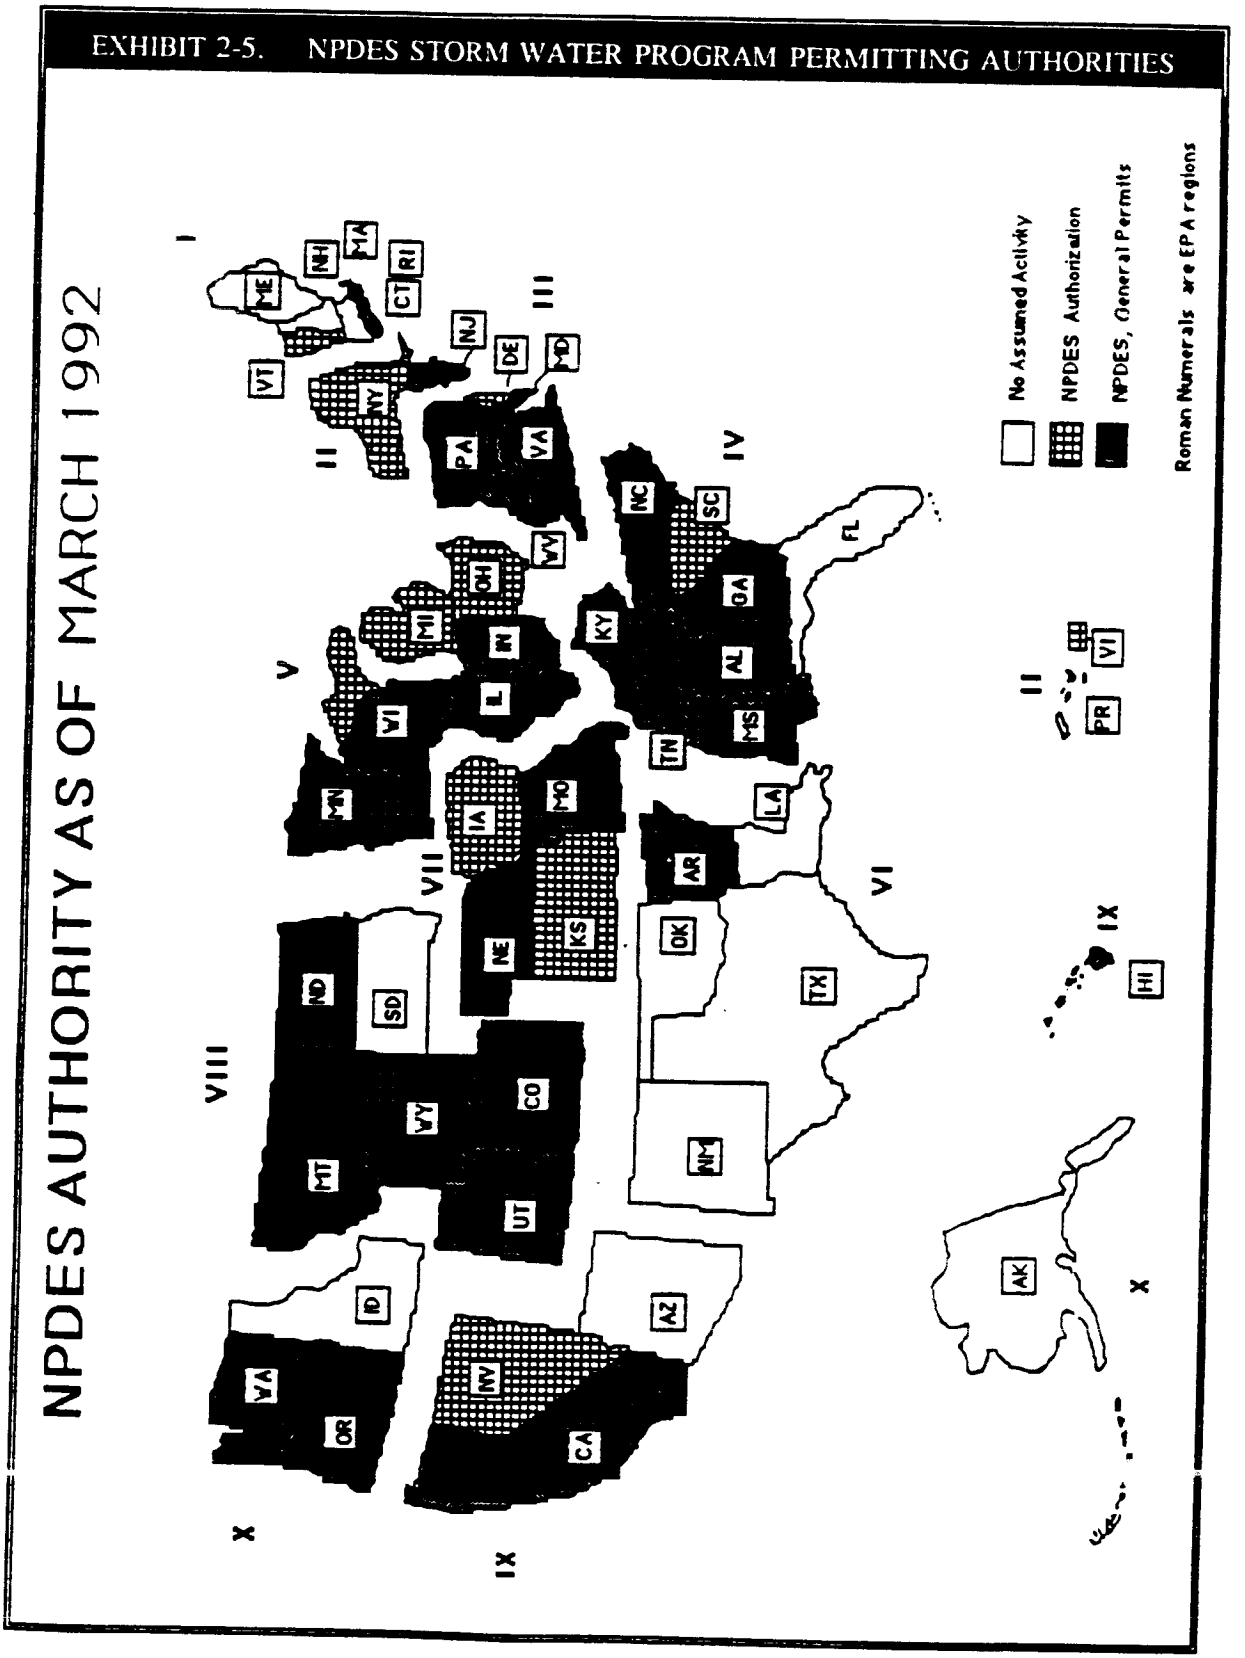
2.6 WHO MUST SAMPLE

Operators of facilities that have storm water discharges associated with industrial activity and operators of large and medium municipalities are required to conduct storm water sampling as part of their NPDES permit applications. Specifically, the following types of industries and municipalities must sample storm water discharges:

R0013377

EXHIBIT 2-4. PERMIT APPLICATION SUBMISSION DEADLINES

	Date	Sampling Requirement
Industrial		
Individual	October 1, 1992	Sampling data due
Group		
• Part 1	September 30, 1991	Sampling subgroup identified
• Part 2	October 1, 1992	Sampling data due
Municipal		
Large Municipalities		
• Part 1	November 18, 1991	Illicit connection screening due and identification of sampling points
• Part 2	November 16, 1992	Effluent characterization due Monitoring management program identified
Medium Municipalities		
• Part 1	May 18, 1992	Illicit connection screening due and identification of sampling points
• Part 2	May 17, 1993	Effluent characterization due Monitoring management program identified



*NOI under a general permit is due on October 1, 1992 or the date specified in the permit, whichever comes first.

- Storm Water Discharges Associated With Industrial Activities - Under Phase I, the storm water permit application regulations identify, by Standard Industrial Classification (SIC) code and narrative description, 11 categories of facilities considered to be "engaging in industrial activity" for the purposes of storm water permit application requirements. Those facilities included in 40 CFR 122.26(b)(14)(i) through (xi) of the storm water permit application regulations with storm water point source discharges to waters of the U.S. or separate storm sewers and those designated under Section 402(p)(2)(E) of the CWA are required to apply for storm water permit coverage by October 1, 1992. Industrial facilities include those that are Federally, State, or municipally owned or operated. Exhibit 2-6 lists these industrial facilities. The Transportation Act of 1991 provides an exemption from storm water permitting requirements for certain industrial activities owned or operated by municipalities with a population of less than 100,000. Such municipalities must submit storm water discharge permit applications for only airports, power plants, and uncontrolled sanitary landfills that they own or operate, unless a permit is otherwise required by the permitting authority

- Municipal Separate Storm Sewer Systems - Under Phase I, those municipalities with separate storm sewer systems serving 100,000 people or more are required to submit an application for discharges from the system. (Only the part of the population served by municipal separate storm sewers is to be included in the 100,000 count, not the part served by combined sewers.) Regulated municipalities are listed in Appendices F through I in the November 16, 1990, final rule or have been designated by their permitting authority.

2.7 WHEN SAMPLING IS REQUIRED

Industrial individual and group applicants must include sampling data from at least one representative storm event. Operators of large or medium municipal separate storm sewer systems must submit sampling data from three different representative storm events. How to determine "representativeness" and other considerations for when to sample are presented below.

2.7.1 STORM EVENT CRITERIA

Storm water discharge permit application requirements establish specific criteria for the type of storm event that must be sampled:

- The depth of the storm must be greater than 0.1 inch accumulation
- The storm must be preceded by at least 72 hours of dry weather
- Where feasible, the depth of rain and duration of the event should not vary by more than 50 percent from the average depth and duration.

R0013383

EXHIBIT 2-6. INDUSTRIAL FACILITIES WHICH MUST SUBMIT APPLICATIONS FOR STORM WATER PERMITS

40 CFR 122.26(b)(14) Subpart	Description
(i)	Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutants effluent standards under 40 CFR, Subchapter N [except facilities which are exempt under category (xi)].
(ii)	Facilities classified as: SIC 24 (except 2434) . . . . . Lumber and Wood Products SIC 26 (except 265 and 267) . Paper and Allied Products SIC 28 (except 283 and 285) . Chemicals and Allied Products SIC 29 . . . . . Petroleum and Coal Products SIC 311 . . . . . Leather Tanning and Finishing SIC 32 (except 323) . . . . . Stone, Clay and Glass Products SIC 33 . . . . . Primary Metal Industries SIC 3441 . . . . . Fabricated Structural Metal SIC 373 . . . . . Ship and Boat Building and Repairing
(iii)	Facilities classified as SIC 10 through 14, including active or inactive mining operations and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with, or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts, or waste products located on the site of such operations. SIC 10 . . . . . Metal Mining SIC 11 . . . . . Anthracite Mining SIC 12 . . . . . Coal Mining SIC 13 . . . . . Oil and Gas Extraction SIC 14 . . . . . Nonmetallic Minerals, except Fuels
(iv)	Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under Subtitle C of the Resource Conservation and Recovery Act (RCRA).
(v)	Landfills, land application sites, and open dumps that receive or have received any industrial wastes including those that are subject to regulation under subtitle D or RCRA.
(vi)	Facilities involved in the recycling of material, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as: SIC 5015 . . . . . Motor Vehicle Parts, Used SIC 5093 . . . . . Scrap and Waste Materials
(vii)	Steam electric power generating facilities, including coal handling sites.
(viii)	Transportation facilities which have vehicle maintenance shops, equipment cleaning operations, or airport de-icing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fuelling, and lubrication), equipment cleaning operations, or airport de-icing operations, or which are otherwise listed in another category, are included. SIC 40 . . . . . Railroad Transportation SIC 41 . . . . . Local and Suburban Transit SIC 42 (except 4221-25) . . . . Motor Freight and Warehousing SIC 43 . . . . . U.S. Postal Service SIC 44 . . . . . Water Transportation SIC 45 . . . . . Transportation by Air SIC 5171 . . . . . Petroleum Bulk Stations and Terminals

R0013384

EXHIBIT 2-6. INDUSTRIAL FACILITIES WHICH MUST SUBMIT APPLICATIONS FOR STORM WATER PERMITS (Continued)

40 CFR 122.26(b)(14) Subpart	Description
(ix)	Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage, treatment, recycling, and reclamation of municipal or domestic sewage, including lands dedicated to the disposal of the sewage sludge that are located within the confines of the facility, with a design flow of 1.0 million gallons per day or more, or required to have an approved pretreatment program under 40 CFR Part 403. Not included are farm lands, domestic gardens, or lands used for sludge management where sludge is beneficially reused and which are not physically located in the confines of the facility, or areas that are in compliance with Section 405 of the CWA.
(x)	Construction activity including clearing, grading, and excavation activities except operations that result in the disturbance of less than 5 acres of total land area and those that are not part of a larger common plan of development or sale.*
(xi)	Facilities under the following SICs [which are not otherwise included in categories (ii)-(x)], including only storm water discharges where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, byproducts, or industrial machinery are exposed to storm water.* SIC 20 . . . . . Food and Kindred Products SIC 21 . . . . . Tobacco Products SIC 22 . . . . . Textile Mill Products SIC 23 . . . . . Apparel and Other Textile Products SIC 2434 . . . . . Wood Kitchen Cabinets SIC 25 . . . . . Furniture and Fixtures SIC 265 . . . . . Paperboard Containers and Boxes SIC 267 . . . . . Converted Paper and Paper Board Products (except containers and boxes) SIC 27 . . . . . Printing and Publishing SIC 283 . . . . . Drugs SIC 285 . . . . . Paints, Varnishes, Lacquer, Enamels SIC 30 . . . . . Rubber and Misc. Plastics Products SIC 31 (except 311) . . . . . Leather and Leather Products SIC 323 . . . . . Products of Purchased Glass SIC 34 (except 3441) . . . . . Fabricated Metal Products SIC 35 . . . . . Industrial Machinery and Equipment, except Electrical SIC 36 . . . . . Electronic and Other Electric Equipment SIC 37 (except 373) . . . . . Transportation Equipment SIC 38 . . . . . Instruments and Related Products SIC 39 . . . . . *On June 11, 1992, the U.S. Court of Appeals for the Ninth Circuit remanded the exemption for construction sites of less than five acres in category (x) and for manufacturing facilities in category (xi) which do not have materials or activities exposed to storm water to the EPA for further rulemaking. (Nos. 90-70671 & 91-70200).

R0013385

These criteria were established to: (1) ensure that adequate flow would be discharged; (2) allow some build-up of pollutants during the dry weather intervals; and (3) ensure that the storm would be "representative," (i.e., typical for the area in terms of intensity, depth, and duration).

Collection of samples during a storm event meeting these criteria ensures that the resulting data will accurately portray the most common conditions for each site. However, the permitting authority is authorized to approve modifications of this definition (especially for applicants in arid areas where there are few representative events). Section 5.1 of Chapter 5 discusses general protocol for requesting modifications to application requirements, including the definition of "representative storm."

In determining whether a storm is representative, there are two important steps to take. First, data on local weather patterns should be collected and analyzed to determine the range of representative storms for a particular area. Second, these results should be compared to measurements of duration, intensity, and depth to ensure that the storm to be sampled fits the representativeness criteria.

2.7.2 OBTAINING RAINFALL DATA

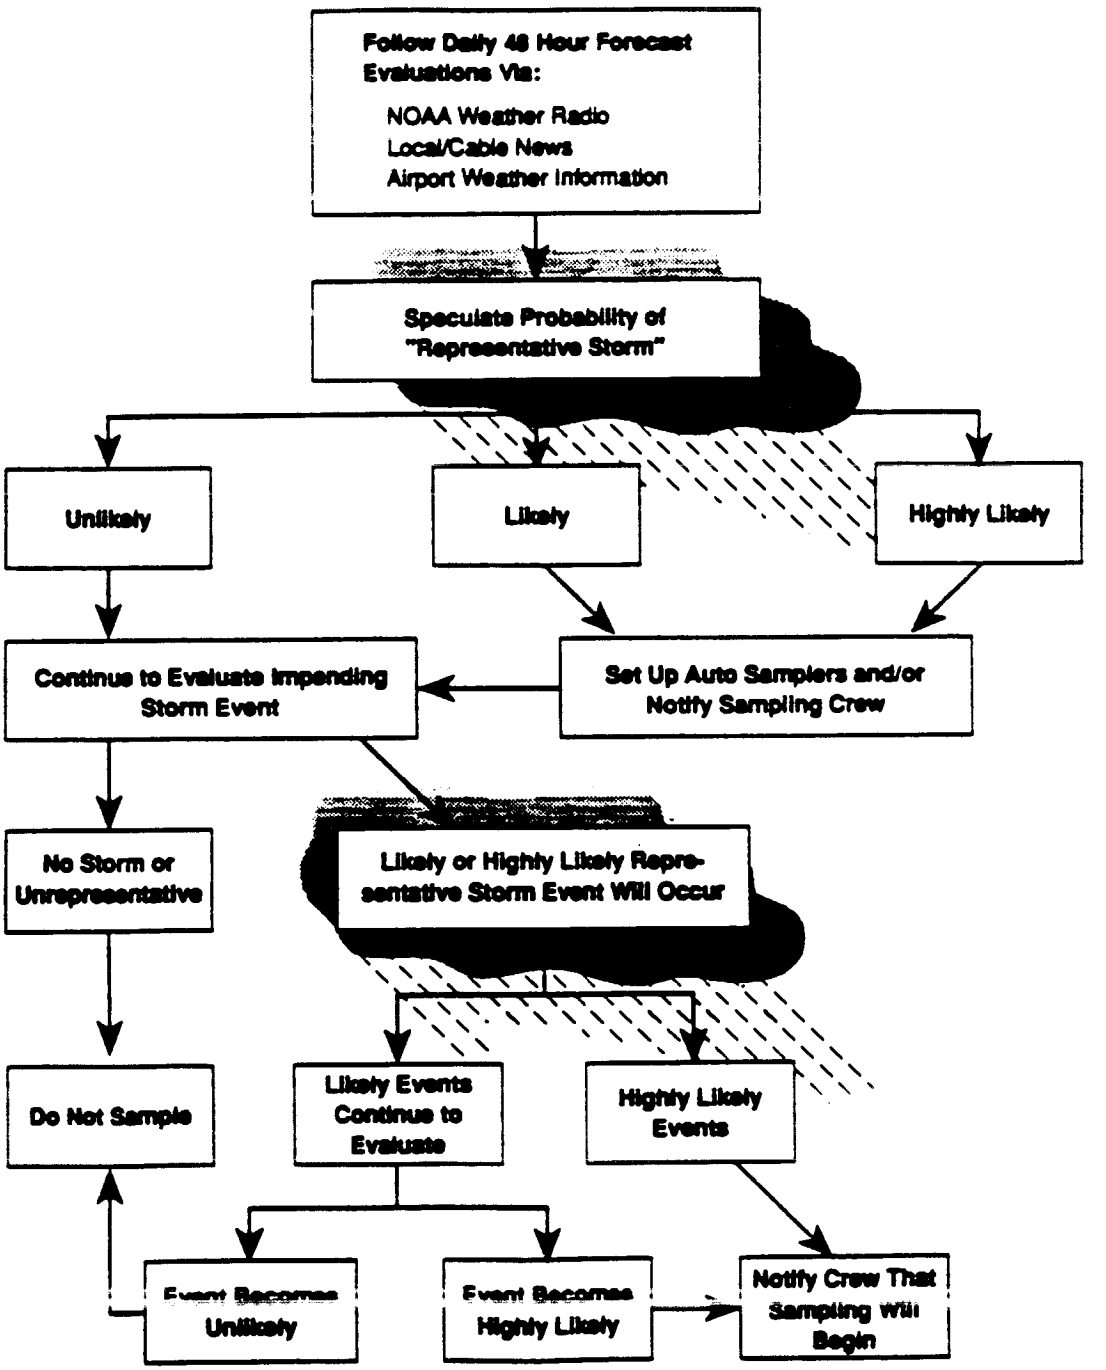
Several sources provide accurate local weather information for both: (1) determining what a representative storm event is for a particular area; and (2) assessing expected storm events to determine whether a predicted rainfall will be "representative," and thus, meet the requirements for storm water sampling. The National Oceanic and Atmospheric Administration (NOAA) National Climatic Data Center's (NCDC's) Climate Services Branch is responsible for collecting precipitation data. Data on hourly, daily, and monthly precipitation for each measuring station (with latitude and longitude) are available to the public on computer diskette, microfiche, or hard copy. Orders can be placed by calling **(704) 259-0682**, by fax at **(704) 259-0876**, or by writing to NCDC, Climate Services Branch, The Federal Building, Asheville, North Carolina 28071-2733.

The National Weather Service (NWS) of NOAA can also provide information on historic, current, and future weather conditions. Local NWS telephone numbers can be obtained from the NWS Public Affairs Office at **(301) 713-0622**. Telephone numbers are also usually in local phone directory listings under "National Weather Service" or "Weather." In addition, NOAA runs the NOAA NWS

R0013386

Weather Radio, which provides continuous broadcasts of the most current weather information. This broadcast can be accessed with a radio that has a weather band feature. Approximately 90 percent of the United States population is within listening range of the 380 NWS stations. Technical Appendix B presents additional information on NOAA Weather Radio, including radio frequencies for specific locations and a listing of weather band radio manufacturers. Telephone recordings of weather conditions are also provided by most NWS offices.

Cable TV weather stations and local airports can also provide weather information. Weather information provided by the local newspaper or TV stations should be used only if more accurate data (as described above) are unavailable, since weather forecasts can change drastically within several hours.



Someone should be designated at the facility to follow current weather conditions by listening to NOAA Weather Radio, calling the local NWS offices, and watching cable TV weather news. Exhibit 2-7 presents a storm water sampling decision chart for mobilizing field personnel for a probable storm event.

Annual rainfall statistics can also be used to evaluate representativeness of storm events. For example, Exhibit 2-8 presents fifteen rain zones in the United States and related storm event statistics. (These rain zones are not those shown in 40 CFR Part 122 Appendix E.) To determine typical values of annual storm events for a particular facility, identify the zone in which the facility is located. The tabulated information lists the annual average number of storms and precipitation as well as the average duration, intensity, and depth of independent storm events for each zone. Care must be taken, however, in using annual rainfall statistics for determining representativeness of storm events, since the annual rainfall statistic may not be representative of seasonal rainfall events. If rainfall data is available at or close to a particular facility, it is preferable to use this data for determining average storm event statistics.

Rainfall data tabulated from NOAA precipitation data indicate for Alaska (not shown in Exhibit 2-8) that average storm events last from 14 to 24 hours in duration and are 0.6 to 1.05 inches in depth. Average storm event data for Hawaii are 9 to 11 hours in duration and from 0.6 to 1.6 inches in depth.

R0013389

The NWS should be consulted for proper procedures for collecting and interpolating rainfall data if the applicant elects to collect the data rather than use existing data.

2.7.3 DETERMINING REPRESENTATIVENESS

An example of how to determine whether a rainfall event varies by more than 50 percent (i.e., is not representative) is shown in Exhibit 2-9.

EXHIBIT 2-9. EXAMPLE OF 50 PERCENT VARIANCE FROM AVERAGE RAINFALL

Event Type	Duration (hrs.)	Depth (in.)
Average event	5.2	0.43
50 percent average event	2.6	0.22
150 percent average event	7.8	0.65

Once the information on an average duration and depth storm event is obtained for a specific location, multiply these numbers by 0.5 to get the 50 percent average event numbers and multiply by 1.5 to get the 150 percent average event numbers.

A representative storm in both duration and depth for a specific area will fall between the shaded numbers above (i.e., between 2.6 and 7.8 hours in duration and 0.22 and 0.65 inches in depth).

Snowmelt creates runoff which may result in point source discharges very similar to that from other storm events. Pollutants accumulate in snow, and when a thaw occurs, the pollutants will be discharged to receiving waters much like during a rain storm event. Snowmelt may be sampled as long as the applicant works closely with the permitting authority to determine the proper sampling strategy, i.e., sampling procedures, techniques, and pollutant analyses.

For snowmelt, the sampling strategy should be developed depending on the drainage area being monitored for storm flow. The strategy should consider (1) snow removal or clearing practices, e.g., direct dumping into water bodies, plowing, and the creation of snow mounds (whether in a line along a roadway or in piles on parking lots, etc.), and (2) the melting process.

It is also important to consider what happens to snowmounds as they melt and evaporate, which can alter the pollutant concentration in the resulting runoff. In addition, pollutants from the surrounding

R0013390

air and pavement can build up on snow mound surfaces in a crust or cake-like manner eventually leaving a residue (including previously dissolved solids that become a remaining solids residue) which is later left to be washed off by rainfall, manual flushing or other mechanisms.

The sampling of snow mounds, undisturbed snow itself, and hard pack requires a carefully thought out strategy. Given the complexities associated with snowmelt sampling, applicants should have proposed sampling strategies reviewed by the permitting authority before attempting to conduct sampling.

2.7.4 LOGISTICAL PROBLEMS WITH WHEN TO SAMPLE

Applicants may encounter weather conditions that may not meet minimum "representative" storm criteria; these conditions may prevent adequate collection of storm water samples prior to application submission deadlines. For instance, sampling may be problematic in parts of the country that experience drought or near-drought conditions or areas that are under adverse weather conditions such as freezing and flooding. Events with false starts and events with stop/start rains can also cause problems. Solutions for sampling under these circumstances are discussed below.

Where the timing of storm event sampling poses a problem, it may be appropriate for the applicant to petition the permitting authority for a sampling protocol/procedure modification either prior to sampling or after sampling is conducted (if the storm event is not acceptable). When the applicant requests a sampling protocol/procedure modification, a narrative justification should be attached. This justification should be certified by a corporate official (for industrial facilities) or the principle executive officer or ranking official (for municipalities), as per 40 CFR 122.22. Section 5.1 of Chapter 5 discusses protocol/procedure modifications.

Arid Areas

For arid or drought-stricken areas where a storm event does not occur prior to the time the applicant must sample and submit data with the application form the applicant should submit the application, complete to the extent possible, with a detailed explanation of why sampling data are not provided and an appraisal of when sampling will be conducted. This explanation must be certified by the appropriate party (as described above). The applicant should also contact the permitting authority

R0013391

for further direction. Where the applicant can anticipate such problems, approval for an extension to submit sampling data should be acquired prior to the deadline.

Adverse Weather Conditions

The applicant should never conduct storm water sampling during unsafe conditions. It is likely that, in areas that experience flooding, lightening storms, high winds, etc., another representative storm event will occur for which sampling conditions will be much safer. (For further information on safety issues, see Chapter 6.) If no other storm event occurs, the applicant should submit a justification as to why the event was not sampled. This information should be certified by the appropriate official.

False Starts and Stop/Start Rains

False start and stop/start rains can also cause problems. False starts may occur when weather conditions are unpredictable and it appears that a storm event may be representative, collection begins, and then the rain stops before an adequate sample volume is obtained. (Necessary sample volumes are discussed in Section 3.6.) Some latitude may be given for the 0.1-inch rainfall requirement as long as the sample volume is adequate; the permitting authority may accept the results with applicant justification and certification. Again, see Chapter 5 for information on requesting protocol/procedure modifications to storm water sampling requirements.

During stop/start rains (those in which rainfall is intermittent), samples should be taken until an adequate sample volume is obtained. Exhibit 2-10 summarizes logistical problems of storm water sampling and presents solutions to the problems identified.

2.7.5 WHEN INDUSTRIAL FACILITIES MUST SAMPLE

Industrial applicants must generally collect two types of storm water samples: (1) grab samples collected during the first 30 minutes of discharge; and (2) flow-weighted composite samples collected during the first 3 hours of discharge (or the entire discharge, if it is less than 3 hours). Information from both types of samples is critical to fully evaluate the types and concentrations of pollutants present in the storm water discharge.

R0013392

EXHIBIT 2-10. LOGISTICAL PROBLEMS OF STORM WATER SAMPLING	
Problem:	**Arid/drought areas**
Solution:	Submit a petition requesting a modification to the protocol if problems are anticipated and, if it is approved, submit the application without sampling data by the application due date with a certified explanation. Provide sampling data to the permitting authority as soon as possible.
Problem:	**Adverse weather conditions such as freezing, flooding, winds, tornadoes, electrical storms, and gully washes**
Solution:	Sample another, less hazardous event or submit a certified justification of why the event was not sampled. Provide sampling data to the permitting authority as soon as possible.
Problem:	**False starts**
Solution:	Discard the sample if the volume is inadequate. If the volume is adequate, submit the sampling data with a certified explanation that the sample is from a non-representative event. Continue to monitor weather conditions and attempt to resample as soon as possible.
Problem:	**Stop/start rains**
Solution:	Continue to sample in case the storm event turns out to be representative and adequate sample volumes are obtained. If sample volumes are inadequate, continue to monitor weather conditions and attempt to resample as soon as possible.

The grab samples taken during the first 30 minutes of a storm event will generally contain higher concentrations of pollutants, since they pick up pollutants that have accumulated on drainage surfaces since the last storm event.

Composite samples characterize the average quality of the entire storm water discharge. Flow-weighted composite samples provide for the most accurate determination of mass load. The flow-weighted composite sample must be taken for either the first 3 hours or for the entire discharge (if the event is less than 3 hours long). Additional information on how to collect grab and composite samples is presented in Sections 3.3 and 3.4, respectively.

Industrial applicants are required at a minimum to sample only one storm event. However, if samples from more than one storm are analyzed and the results are representative of the discharge, the data representing each event must be reported. The facility must provide a description of each storm event tested. The average of all values within the last year must be determined and the

R0013393

concentration, mass, and total number of storm events sampled must be reported on Form 2F. Furthermore, sampling should be conducted during normal operating procedures (day or night), and, not when the facility has been closed for a period of time.

Industrial applicants must certify, as a separate requirement, that all outfalls have been tested or evaluated to determine whether non-storm water discharges are present (e.g., process wastewater, sanitary wastes, cooling water, or rinse water) or whether illegal/illicit connections are occurring in the system. This testing should be conducted during dry weather to avoid any flows of storm water through the conveyance.

A checklist that can be used to conduct dry weather evaluations is provided in Exhibit 2-11. A narrative description of the method used to conduct dry weather evaluations and the date and the drainage points must be included in Section V.A of Form 2F. This statement must be certified by the appropriate party as described in Section 2.7.4.

A dry weather visual inspection is the simplest way to screen for illicit discharges. If one or more of the items on the checklist in Exhibit 2-11 are answered affirmatively, or if there are other reasons to believe that illicit connections exist, more detailed investigations (such as dye tests, smoke tests, evaluation of piping designs, and TV line monitoring) may be necessary. Dye testing involves releasing fluorescent, nontoxic dye into the suspected source of non-storm water, (e.g., a drain, sink, toilet, or pipe) and checking to see whether the dye shows up in the storm water outfall. Smoke testing involves pumping smoke into a storm sewer and viewing the facility to see if smoke escapes through unknown openings or storm sewer inlets. The presence of smoke indicates that storm water may enter the sewer through these openings or inlets. However, smoke testing may prove ineffective at finding non-storm water discharges to separate storm sewers. Smoke passage may be blocked due to line traps that are intended to block sewer gas.

TV line monitoring is a technique whereby a small video camera is placed in the storm sewer and a video image of the sewer is viewed on a monitor at the surface to identify illicit connections. The camera can be moved through the sewer by remote control. For more information on smoke and dye testing and TV line monitoring, consult EPA's Guidance Manual for the Preparation of NPDES

R0013394

EXHIBIT 2-11. CHECKLIST FOR CONDUCTING DRY WEATHER EVALUATIONS

1. Date of inspection:_____
2. Facility name and address:_____
3. Date of last rain event:_____
4. Inspector name:_____
5. Type of outfall

☐ Concrete ☐ Pipe ☐ Grassed ☐ Rock ☐ Other _____

6. Is there visible flow from the pipe? ☐ Yes ☐ No
If yes, check all that apply. If no, go to number 7.

☐ Colored water (describe)_____ ☐ Oily sheen
☐ Odor* (describe)_____ ☐ Sludge present
☐ Murky ☐ Clear water
☐ Floating objects (describe)_____ ☐ Stains on conveyance
☐ Absence of plant life surrounding conveyance ☐ Notable difference in plant life surrounding conveyance
☐ Scum ☐ Suds ☐ Other:_____

*e.g., rotten eggs, earthy, chemical, chlorine, soap, putrescence, gasoline, musty, etc.

Estimate the flow either visually or by describing the width, height, and shape of the conveyance and the approximate percentage of the conveyance where flow is present or the approximate depth of the flow. Describe your estimate.

7. Is there standing water present? ☐ Yes ☐ No
If yes, check all that apply. If no, go to number 8.

☐ Colored water (describe)_____ ☐ Oily sheen
☐ Odor* (describe)_____ ☐ Sludge present
☐ Murky ☐ Clear water
☐ Floating objects (describe)_____ ☐ Stains on conveyance
☐ Absence of plant life surrounding conveyance ☐ Notable difference in plant life surrounding conveyance
☐ Suds ☐ Scum ☐ Other:_____
☐ Absence of plant life surrounding conveyance

*e.g., rotten eggs, earthy, chemical, chlorine, soap, putrescence, gasoline, musty, etc.

8. From the inspection locations, can you see any unusual piping or ditches that drain to the storm water conveyance? ☐ Yes ☐ No

9. Is there any overland flow visible from the discharge location? ☐ Yes ☐ No

10. Are there dead animals present? ☐ Yes ☐ No

Permit Applications for Storm Water Discharges Associated with Industrial Activity (EPA-505/8-91-002, April 1991).

A problem with the dry weather evaluation process is that the presence of a dry weather/non-storm water discharge may be caused by infiltration of ground or surface waters through cracks in the storm water drainage system. In this situation, all other possible sources of the non-storm water discharge should be examined and ruled out. If no sources are found, the physical structure of the conveyance system should be inspected for deterioration.

The applicant should make every attempt to halt non-storm water discharges to the storm sewer system unless the discharge is covered by an NPDES permit. If it is not feasible to halt the discharge of non-storm water to the storm sewer system, and the discharge is not authorized by a process wastewater or storm water permit, the applicant must submit either Form 2C (for a process water discharge) or Form 2E (for a nonprocess water discharge), and check with state officials to see if alternate forms are required.

2.7.6 WHEN MUNICIPAL FACILITIES MUST SAMPLE

Municipal applicants are required to conduct sampling for both Parts 1 and 2 of their applications. In Part 1, municipalities must conduct a field screening analysis to detect illicit connections and illegal dumping into their storm sewer system. Where flow is observed during dry weather, two grab samples must be collected during a 24-hour period with a minimum of 4 hours between samples. These samples must be analyzed for pH, total chlorine, total copper, total phenol, and detergents (surfactants). Note that these are dry weather samples, rather than storm water samples. EPA's Guidance Manual for the Preparation of Part 1 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems presents a description of conducting field screening sampling and provides a data sheet.

For Part 2 of the application, municipalities must submit grab (for certain pollutants) and flow-weighted sampling data from selected sites (5 to 10 outfalls) for 3 representative storm events at least 1 month apart. The flow-weighted composite sample must be taken for either the entire discharge or the first 3 hours (if the event lasts longer than 3 hours). Municipal facilities are not required to collect grab samples within the first 30 minutes of a storm event.

R0013396

In addition to submitting quantitative data for the application, municipalities must also develop programs for future sampling activities that specify sampling locations, frequency, pollutants to be analyzed, and sampling equipment. Where necessary (as determined by the municipality or if required by the permitting authority), responsibilities may also include monitoring industries connected to the municipality's storm sewers for compliance with their facility-specific NPDES permits. Refer to EPA's Guidance Manual for the Preparation of Part 1 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems for information on how to develop municipal sampling programs.

2.7.7 USE OF HISTORICAL DATA

Data from storm water samples analyzed in the past can be submitted with applications in lieu of new sampling data if:

- All data requirements in Form 2F are met
- Sampling was performed no longer than 3 years prior to submission of the permit application
- All water quality data are representative of the present discharge.

The historical data may be unacceptable if there have been significant changes since the time of that storm event in production level, raw materials, processes, or final products. Significant changes which may also impact storm water runoff include construction or installation of treatment or sedimentation/erosion control devices, buildings, roadways, or parking lots. Applicants should assess any such changes to determine whether they altered storm water runoff since the time of the storm event chosen for use in the permit application. Historical data can be used only in applications. Historical data cannot be used for fulfilling permit requirements.

2.8 WHERE TO SAMPLE STORM WATER DISCHARGES

Storm water samples should be taken at a storm water point source. A "point source" is defined as any discernible, confined, and discrete conveyance, including (but not limited to) any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel, or other floating craft from which pollutants are or may be discharged (as per 40 CFR 122.2). Included in the definition of storm water "point

R0013397

sources" is storm water from an industrial facility that enters, and is discharged through, a municipal separate storm sewer. In short, most storm water discharges can be defined as "point source" discharges, since they ultimately flow into some kind of conveyance (e.g., a channel or swale).

2.8.1 INDUSTRIAL FACILITIES

Industrial applicants submitting individual applications must collect and analyze a grab sample taken within the first 30 minutes of the storm event and flow-weighted composite samples from each of the industrial storm water "point source" outfalls identified on the site drainage map submitted for Section III of Form 2F. Applicants submitting quantitative data for Part 2 of the group application must also collect samples for each outfall discharging storm water associated with industrial activity. All outfalls should be sampled during the same representative storm event if possible. If this is not feasible, outfalls may be sampled during different representative storm events upon approval by the permitting authority. Descriptions of each storm event and which outfalls were sampled during each event must be included in the application. Storm water runoff from employee parking lots, administration buildings, and landscaped areas that is not mixed with storm water associated with industrial activity, or storm water discharges to municipal sanitary sewers, do not need to be sampled.

Outfalls With Substantially Identical Effluents—Industrial Facilities

If an applicant has two or more outfalls with "substantially identical effluents," the facility may petition the permitting authority to sample and analyze only one of the identical outfalls and submit the results as representative of the other. "Substantially identical effluents" are defined as discharges from drainage areas undergoing similar activities where the discharges are expected to be of similar quantity and quality, and indistinguishable in expected composition. Chapter 5 presents an example of a petition for substantially identical effluents and discusses this process in more detail.

2.8.2 MUNICIPALITIES

Large and medium municipalities are required to sample storm water discharges from 5 to 10 outfalls or field screening points that were proposed in Part 1 of the application. The final decision on the number and location of sampling points will be determined by the permitting authority and will

R0013398

depend on site-specific conditions such as land use or drainage area and results of data collected during the field screening analysis process for Part 1 of the application

2.8.3 LOGISTICS OF WHERE TO SAMPLE

The ideal sampling location would be the lowest point in the drainage area where a conveyance discharges storm water to waters of the U.S. or to a municipal separate storm sewer system. A sample point also should be easily accessible on foot in a location that will not cause hazardous sampling conditions. Ideally, the sampling site should be on the applicant's property or within the municipality's easement; if not, the field personnel should obtain permission from the owner of the property where the discharge outfall is located. Typical sampling locations may include the discharge at the end of a pipe, a ditch, or a channel.

However, logistical problems with sample locations may arise (e.g., nonpoint discharges, inaccessibility of discharge point, etc.). Logistical problems with sample locations and suggested solutions are described in Exhibit 2-12. In many cases, it may be necessary to locate a sampling point further upstream of the discharge point (e.g., in a manhole or inlet). If the storm water at a selected location is not representative of a facility's total runoff, the facility may have to sample at several locations to best characterize the total runoff from the site. In situations where discharge points are difficult to sample for various reasons, the applicant should take the best sample possible and explain the conditions in the application. A discussion on sampling at retention ponds appears in Section 3.1.2.

2.9 STAFFING CONSIDERATIONS

Staffing needs for sampling must be determined by the applicant. Factors in making the determination include the number of sample locations, the size of the area to be sampled, how far apart the locations are, the type of sampling required, the technique to be used, the number of samples to be taken (depending on how many parameters must be analyzed), and safety considerations.

Training sampling personnel is important to the success of storm water discharge characterization. Training can be done using this manual. Sampling conducted by untrained personnel may result in

R0013399

EXHIBIT 2-12. SOLUTIONS TO SAMPLE LOCATION PROBLEMS	
Problem:	**Sampling where storm water commingles with process or non-process water**
Solution:	Attempt to sample the storm water discharge before it mixes with the non-storm water discharge. If this is impossible, sample the discharge both during dry and wet weather and present both sets of data to the permitting authority. This will provide an indication of the contribution of pollutants from each source.
Problem:	**Numerous small point discharges**
Solution:	Impound channel or join together flow by building a weir or digging a ditch to collect discharge at a low point for sampling purposes. This artificial collection point should be lined with plastic to prevent infiltration and/or high levels of sediment. Or, sample at several locations to represent total site runoff.
Problem:	**Inaccessible discharge point [examples include underwater discharges or unreachable discharges (e.g., out of a cliff)]**
Solution:	Go up the pipe to sample (i.e., to the nearest manhole or inspection point). If these are not available, tap into the pipe or sample at several locations to best represent total site runoff.
Problem:	**Managing multiple sampling sites to collect grab samples during the first 30 minutes (industrial facilities only)**
Solution:	Have a sampling crew ready for mobilization when forecasts indicate that a representative storm will occur or sample several different representative events. Also, for most parameters, automatic samplers may be used to collect samples within the first 30 minutes triggered by the amount of rainfall, the depth of flow, flow volume or time.
Problem:	**Commingling of parking lot runoff with discharge associated with industrial activity**
Solution:	The combined runoff must be sampled at the discharge point as near as possible to the receiving water or the parking lot drain inlet if there is one.
Problem:	**Sampling in manholes**
Solution:	Sample in manholes only when necessary. See Chapter 6 for safety information. Sampling in manholes requires training on confined space entry.
Problem:	**Runon from other property**
Solution:	If possible, estimate the volume of offsite runon contributions and offsite runon sources of pollutants to perform a mass balance calculation. Include this information in the permit application. If this estimation is not possible, provide a narrative discussion of the upstream site (e.g., is it developed, if so the type of facility, the types of pollutants that may be present on the site, etc.).

R0013400

data that is unrepresentative of the facility's storm water discharge. This data might be rejected by the permitting authority, who would then require another sampling effort.

R0013401

R0013402

3. FUNDAMENTALS OF SAMPLING

Because of the variable nature of storm water flows during a rainfall event and different analytical considerations for certain pollutants, the storm water regulations establish specific requirements for sample collection techniques. The quality of storm water discharges and logistical needs for sampling will be different for industrial applicants and municipal applicants. Therefore, specific sampling requirements vary. After a brief review of sampling fundamentals and special sampling requirements for storm water permit applications, the following sections are intended to teach applicants how to sample to meet these requirements.

The applicant should carefully plan his/her sampling strategy prior to the actual sampling event, e.g., walk the site to determine appropriate sampling locations, become familiarized with local rainfall patterns, train sampling staff in procedures and safety, consult with laboratory, and collect supplies.

3.1 TYPES AND TECHNIQUES OF SAMPLING

There are three basic aspects of sampling:

- Sample type (i.e., grab versus composite)
- Sample technique (i.e., manual versus automatic)
- Flow measurement methods.

These topics will be discussed in relation to requirements of an NPDES storm water discharge permit application. Once these aspects are addressed, step-by-step instructions on sampling procedures are presented. The sections below define and describe the types of storm water samples that must be collected and methods or techniques for collecting them. In addition, special sampling requirements for certain pollutants are discussed.

R0013403

3.1.1 SAMPLE TYPE VERSUS SAMPLE TECHNIQUE

It is important to understand the difference between sample type and technique. "Sample type" refers to the kind of sample that must be collected -- either a grab or a composite. "Sample technique" refers to the method by which a grab or composite sample is actually collected -- either manually or by automatic sampler. A generalized relationship between sample type and sample technique is presented in Exhibit 3-1. Sections 3.1.2 and 3.1.3 further explain the significance of these terms as they relate to storm water sampling requirements.

EXHIBIT 3-1. SAMPLE TYPE vs. SAMPLE TECHNIQUE

Sample Type	Sample Technique
Grab	Manual Automatic sampling system
Composite	Manual with manual compositing Automatic system or automatic sampling with manual compositing

3.1.2 SAMPLE TYPE: GRAB AND COMPOSITE SAMPLES

To comply with storm water application requirements, the sample type (grab or composite) must be collected in accordance with 40 CFR 122.21(g)(7) and 40 CFR Part 136. The storm water application requirements clearly specify which pollutants must be analyzed by grab sample, and which by composite sample. Although the requirements in 40 CFR 122.21(g)(7) do not explicitly specify either manual or automatic sampling techniques, the approved analytical methods contained in 40 CFR Part 136 direct that grab samples must be collected manually for certain pollutants. Sections 3.3 and 3.4 clarify which pollutants must be grabbed, which ones must be grabbed manually, and which ones must be flow-weighted composites.

The two types of storm water samples required by the regulations, grab and composite samples, are described below.

R0013404

Grab Samples

A grab sample is a discrete individual sample taken within a short period of time (usually less than 15 minutes). Analysis of grab samples characterizes the quality of a storm water discharge at a given time of the discharge.

Composite Samples

A composite sample is a mixed or combined sample that is formed by combining a series of individual and discrete samples of specific volumes at specified intervals. Although these intervals can be time-weighted or flow-weighted, the storm water regulations require the collection of flow-weighted composite samples. This means that discrete aliquots, or samples, are collected and combined in proportion to flow rather than time. Composite samples characterize the quality of a storm water discharge over a longer period of time, such as the duration of a storm event.

Application Requirements

Both types of samples must be collected and analyzed for storm water discharge permit applications. Grab samples must be collected for the following conditions:

- For storm water discharges associated with industrial activity, a grab sample must be obtained during the first 30 minutes of a discharge. This requirement is in addition to the composite sampling requirements. These samples are intended to characterize the maximum concentration of a pollutant that may occur in the discharge and/or may indicate intermingling of non-storm water discharges.

- For storm water discharges from large and medium municipal separate storm sewers, grab samples are required for Part 1 of the application if a discharge is noted during dry weather field screening. Two grab samples must be collected during a 24-hour period with a minimum of 4 hours between samples. These samples are intended to assist in the identification of illicit connections or illegal dumping. In Part 2, grab samples may be required for the analysis of certain pollutants for which municipalities are required to sample.

Flow-weighted composite samples must be collected during the first 3 hours of discharge or the entire discharge (if it is less than 3 hours) for both industrial and municipal applicants.

R0013405

Pollutant-specific Requirements

The regulations at 40 CFR 122.21(g)(7) identify certain pollutants for which grab sampling is required:

- Monitoring by grab sample must be conducted for pH, temperature, cyanide, total phenols, residual chlorine, oil and grease (O&G), fecal coliform, and fecal streptococcus. Composite samples are not appropriate for these parameters due to their tendency to transform to different substances or change in concentration after a short period of time. Such transformations may be particularly likely in the presence of other reactive pollutants.

Sampling At Retention Ponds

Retention ponds with greater than a 24-hour holding time for a representative storm event may be sampled by grab sample. Composite sampling is not necessary. The rationale for this is that, because the water is held for at least 24 hours, a thorough mixing occurs within the pond. Therefore, a single grab sample of the effluent from the discharge point of the pond accurately represents a composite of the storm water contained in the pond. If the pond does not thoroughly mix the discharge, thereby compositing the sample, then a regular grab and composite sample should be taken at the inflow to the pond. Since each pond may vary in its capability to "composite" a sample, applicants must carefully evaluate whether the pond is thoroughly mixing the discharge. Such factors as pond design and maintenance are important in making this evaluation. Poor pond design, for example, where the outfall and inflow points are too closely situated, may cause short-circuiting and inadequate mixing. In addition, poor maintenance may lead to excessive re-suspension of any deposited silt and sediment during heavy inflows. Because of factors such as these, the applicant should determine the best location to sample the pond (e.g., at the outfall, at the outfall structure, in the pond) to ensure that a representative composite sample is taken. If adequate compositing is not occurring within the pond, the applicant should conduct routine grab and flow-weighted composite sampling.

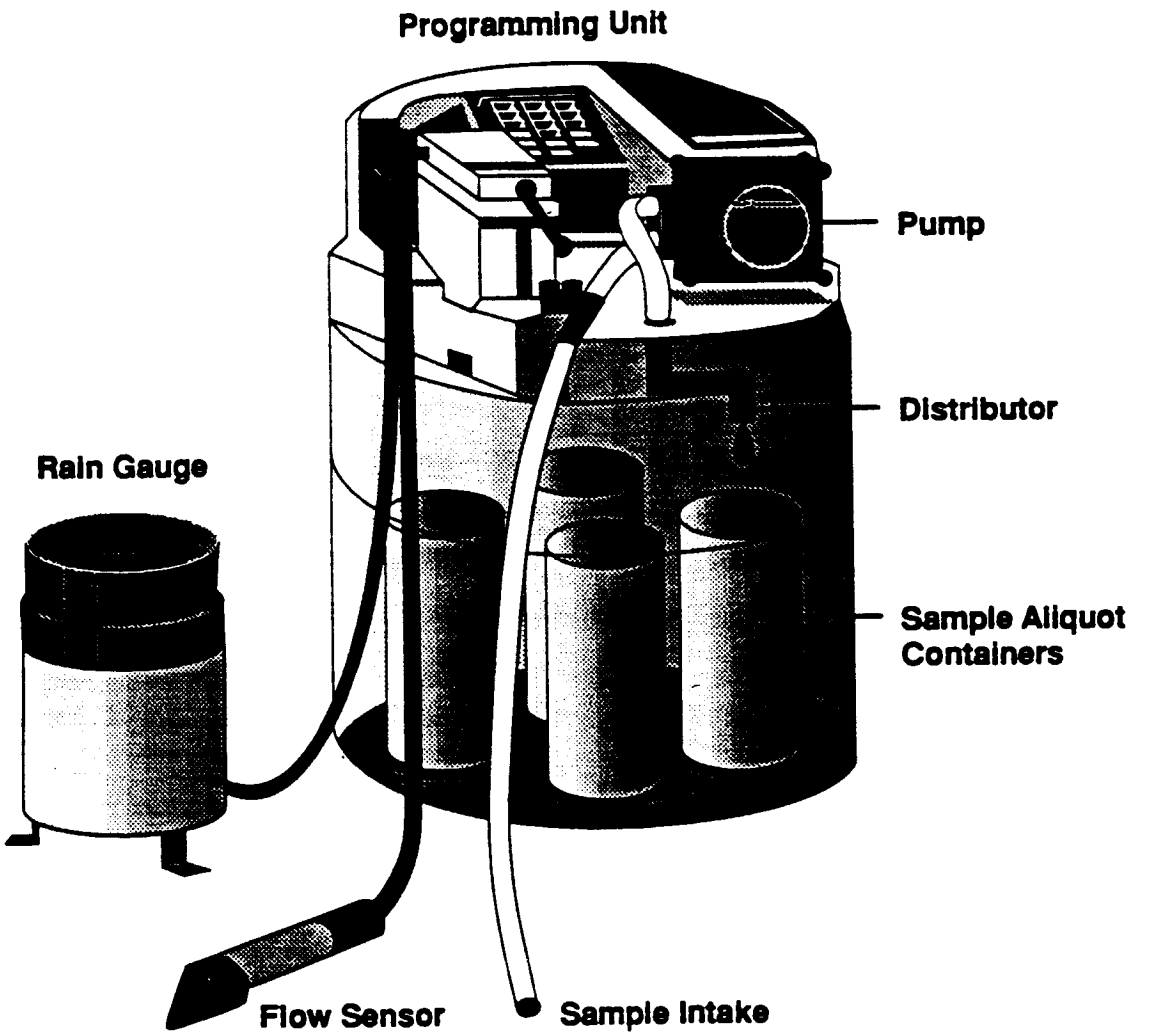
A grab sample and a flow-weighted sample must be taken for storm water discharges collected in holding ponds with less than a 24-hour retention period. The applicant must sample the discharge in the same manner as for any storm water discharge [as described in 40 CFR 122.21(g)(7)]. In

R0013406

effect, the applicant must take one grab sample within the first 30 minutes of discharge, or as soon as possible. The applicant must also collect a flow-weighted composite sample for at least the first 3 hours of the discharge, or for the event's entire duration (if it is less than 3 hours). The flow-weighted composite sample may be taken using a continuous sampler or as a combination of at least three sample aliquots taken during each hour of the discharge, with a minimum of 15 minutes between each aliquot. If the applicant does not know what retention period the pond is designed for, the design engineer of the pond should be consulted.

3.1.3 SAMPLE TECHNIQUE: MANUAL VERSUS AUTOMATIC SAMPLING

As previously discussed, manual and automatic sampling techniques are methods by which both grab and composite samples can be collected. Manual samples are simply samples collected by hand. Automatic samplers are powered devices that collect samples according to preprogrammed criteria. A typical automatic sampler configuration is shown in Exhibit 3-2.



For most pollutants, either manual or automatic sample collection will conform with 40 CFR Part 136. However, one case in which automatic samplers cannot be used is for the collection of volatile organic compound (VOC) samples because VOCs will likely volatilize as a result of agitation during automatic sampler collection. Samples collected for VOC analysis should be filled until a reverse meniscus is found over the top of the collection bottle and capped immediately to leave no air space. Automatic samplers do not perform this function. Special requirements for VOC sampling are discussed in Section 3.5.2.

Although both collection techniques are available, several other pollutants may not be amenable to collection by an automatic sampler, for example fecal streptococcus, fecal coliform and chlorine have very short holding times (i.e., 6 hours), pH and temperature need to be analyzed immediately and oil and grease requires teflon coated equipment to prevent adherence to the sampling equipment.

Other restrictions on sample collection techniques (such as container type and preservation) should be determined by consulting the approved analytical methods listed in 40 CFR Part 136. Section 3.5 and Technical Appendix C provide additional information on sample handling, holding times, and preservation methods.

R0013407

EXHIBIT 3-2. AUTOMATIC SAMPLER

R0013408

Manual and automatic techniques have advantages and disadvantages that the applicant should consider in relation to the sampling program. The main advantage of manual sampling is that it can be less costly than purchasing or renting automatic samplers. Automatic samplers, however, can be often more convenient. Exhibit 3-3 presents a matrix of advantages and disadvantages associated with each technique. Ultimately, the best technique to use will depend on each applicant's situation.

3.2 OBTAINING FLOW DATA

In addition to collecting samples of storm water discharges, applicants must collect data characterizing the flow rate and flow volume for each storm water discharge sampled. Flow rate is the quantity of storm water discharged from an outfall per unit of time. Total flow is a measure of the total volume of storm water runoff discharged during a rain event. Flow rates and volumes can either be measured specifically or can be estimated (based on rainfall measurements, velocities, and depth of flows). To collect flow-weighted composite samples, flow rate data is necessary to combine proportional volumes of individually collected aliquots. Applicants must also report the mass of pollutants contained in storm water discharges (see Section 3.2.5). To determine mass loadings of pollutants, applicants must measure both discharge flow rate and pollutant concentration. This section presents methods for obtaining flow data.

3.2.1 MEASURING FLOW RATES

Flow rates for storm water discharges are most accurately measured using either primary or secondary flow measurement devices. Facilities should use these devices to characterize their discharge as precisely as possible. Where flow measurement devices are not already installed, portable devices should be considered. There are many permanent and portable types of flow measurement devices available. This discussion is limited to the most common flow measurement devices. To purchase flow measurement devices and rain gauges, pertinent engineering journals can be consulted for equipment vendor listings. Proper analysis of site discharge conditions must be conducted prior to purchase and installment of flow measurement devices.

Primary Flow Measurement Devices

A primary flow measurement device is a man-made flow control structure which, when inserted into an open channel, creates a geometric relationship between the depth of the flow and the rate of the

R0013409

EXHIBIT 3-3. COMPARISON OF MANUAL AND AUTOMATIC SAMPLING TECHNIQUES

Sample Method	Advantages	Disadvantages
Manual Grabs	• Appropriate for all pollutants • Minimum equipment required	• Labor-intensive • Environment possibly dangerous to field personnel • May be difficult to get personnel and equipment to the storm water outfall within the 30 minute requirement • Possible human error
Manual Flow-Weighted Composites (multiple grabs)	• Appropriate for all pollutants • Minimum equipment required	• Labor-intensive • Environment possibly dangerous to field personnel • Human error may have significant impact on sample representativeness • Requires flow measurements taken during sampling
Automatic Grabs	• Minimizes labor requirements • Low risk of human error • Reduced personnel exposure to unsafe conditions • Sampling may be triggered remotely or initiated according to present conditions	• Samples collected for O&G may not be representative • Automatic samplers cannot properly collect samples for VOCs analysis • Costly if numerous sampling sites require the purchase of equipment • Requires equipment installation and maintenance • Requires operator training • May not be appropriate for pH and temperature • May not be appropriate for parameters with short holding times (e.g., fecal streptococcus, fecal coliform, chlorine) • Cross-contamination of aliquot if tubing/bottles not washed
Automatic Flow-Weighted Composites	• Minimizes labor requirements • Low risk of human error • Reduced personnel exposure to unsafe conditions • May eliminate the need for manual compositing of aliquots • Sampling may be triggered remotely or initiated according to on-site conditions	• Not acceptable for VOCs sampling • Costly if numerous sampling sites require the purchase of equipment • Requires equipment installation and maintenance, may malfunction • Requires initial operator training • Requires accurate flow measurement equipment tied to sampler • Cross-contamination of aliquot if tubing/bottles not washed

R0013410

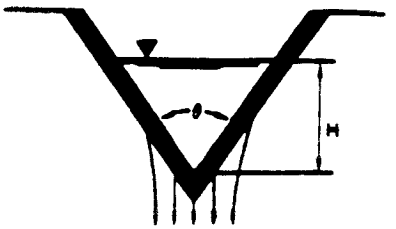
flow. The depth of the flow, referred to as the head (H), can then be measured at the respective reference point/area with a ruler or other staff gauge. When substituted into a formula, which mathematically describes the relationship between depth and discharge for the primary devices, the head measurement can be used to calculate a flow rate (Q). The most common primary flow measurement devices are weirs and flumes. Weirs and flumes are flow structures designed to provide a known, repeatable relationship between flow and depth.

Weirs

Weirs consist of a crest located across the width of an open channel (at a right angle to the direction of the flow). The flow of water is impeded, causing water to overflow the crest. Diagrams and formulas of some typically found weirs are provided in Exhibit 3-4. Weirs are inexpensive and particularly valuable in measuring flow in natural or man-made swales because they are easily installed in irregularly shaped channels.

Weirs can only provide accurate flow measurements when head measurements are appropriately taken. When flow exceeds the capacity of the weir and water overtops the weir crest, flow depth actually diminishes as the water approaches the weir, as shown in Exhibit 3-5. Therefore, measuring the depth at the weir crest will result in an inaccurate measurement of the actual head. Under these circumstances, the head should be measured upstream, at a point determined by the type of weir and the estimated amount of flow. A staff gauge can be installed at a nonturbulent point upstream of the weir crest to provide accurate and convenient measurements.

Flumes



Flumes are structures which force water through a narrow channel. They consist of a converging section, a throat, and a diverging section. Exhibit 3-6 portrays the most common type of flume, the Parshall flume, and also provides formulas for calculating appropriate flow rates.

Parshall flumes have fixed specifications relating to geometric shape. They vary only in throat width. Due to these geometric constraints, Parshall flumes may be expensive to install. They are typically used in permanent flow measurement points and are most commonly placed in concrete-lined channels. However, Parshall flumes can also be used in temporary points. Parshall flumes provide accurate measurements for a relatively wide range of flow rates. The flow rate through the Parshall flume (see Exhibit 3-6) is calculated from the depth (H_a) of flow measured in the converging

section of the flume. The exact location of the depth measurement depends on the specific design of the Parshall flume. Exhibit 3-6 indicates the equations used to calculate flow rate through a typical Parshall flume. These equations are accurate only when the submergence ratio (H_b/H_a) is greater than 0.7. The manufacturers' information should be consulted for the flow rate equation and measuring points for a specific Parshall flume.

Palmer-Bowlus flumes, shown in Exhibit 3-7, are also used at some facilities. Palmer-Bowlus flumes are designed to be installed in an existing circular channel (such as a manhole channel) and are available as portable measurement devices. While Palmer-Bowlus flumes are inexpensive, self cleaning, and easy to install, they can only measure flow rates accurately over a narrow range of flow.

The flow from a Palmer-Bowlus flume is calculated using the height between the floor of the flume portion and the water level, not the total head of the water level. Head measurements are taken at

a distance from the throat equal to one half the width of the flume. The dimensions of a Palmer-Bowlus flume have been standardized in a generic sense, but the flume shape may vary. Therefore, there are no formulas that can be applied to all Palmer-Bowlus flumes. Device-specific head-flow relationships for each device should be obtained from the manufacturer.

There are a number of other, less common, flow measurement devices available which will not be discussed (see Appendix D for additional references).

R0013415

Secondary Flow Measurement Devices

Secondary flow measurement devices are automated forms of flow rate and volume measurement Typically, a secondary device is used in conjunction with a primary device to automatically measure the flow depth or head. This value is then processed, using established mathematical relationships to relate the depth measurement to a corresponding flow rate. The device also may have the capacity to convert this flow rate to a volume. Secondary flow measurement devices include floats, ultrasonic transducers, pressure transducers, and bubblers. The output of the secondary device is transmitted to a display, recorder, and/or totalizer to provide flow rate and volume information. The user manuals for these devices should be consulted for proper usage.

Evaluation of Flow Measurement Devices

To ensure accurate results, facilities should evaluate, via visual observation and routine checks, the design, installation, and operation of flow measurement devices. When evaluating design, select a device which:

- Is accurate over the entire range of expected flow rates
- Can be installed in the channel to be monitored
- Is appropriate to the sampling location (i.e., power setup, submersible, etc.).

When evaluating the installation of flow measurement devices, ensure that:

- There are no leaks and/or bypasses of flow around the measuring device
- The primary device is level and squarely installed
- The secondary device is calibrated.

When evaluating the operation of flow measurement devices, look for:

- Excessive flows which submerge the measuring device
- Flows outside the accuracy range of the device
- Leaks and/or bypasses around the measuring device

R0013416

- Turbulent flow through the measuring device
- Corrosion, scaling, or solids accumulation within the measuring device
- Obstructions to the measuring device
- Use of the correct factor or formula to convert head readings to actual flow rate.

Other than ensuring appropriate design and installation, accuracy checks are difficult to accomplish for primary flow measurement devices. Secondary flow measurement devices, on the other hand, may require evaluation of design, installation, and calibration. Applicants should examine the secondary recording devices and their readouts after installation to ensure that they are operating properly. Unusual fluctuations or breaks in flow indicate operational or design flaws.

3.2.2 ESTIMATING FLOW RATES

There are a variety of techniques for estimating flow rates. These methods are not as accurate as the methods described in Section 3.2.1 above, but are suitable for those discharges where primary or secondary devices are not practical or economically feasible. Each of the following methods is suitable for certain types of flow situations, as indicated. For each, the procedure for collecting flow rate data will be given along with a sample calculation.

Float Methods

Float methods can be used for any discharge where the flow is exposed and/or easily accessible. It is particularly useful for overland flows, gutter flows, and open drain or channel flows. The flow rate is calculated in each of the float methods by estimating the velocity of the flow and the cross-sectional area of the discharge and using the standard flow rate equation:

$$\textit{Flow Rate } (cfm) = \textit{Velocity } (ft/min) \times \textit{Area } (ft^2)$$

R0013417

The velocity is estimated by measuring the time it takes a float to travel between two points (point A and point B) along the flow path. For most accurate results, the two points should be at least 5 feet apart. The cross-sectional area is estimated by measuring the depth of the water and the width of the flow, and multiplying the depth by the width. This assumes a uniform cross-section in the flow path and a geometric cross-section shape. The float method can also be used for any accessible pipe or ditch where the movement of the float can be traced downstream for at least 5 feet. Subsurface storm water flows can be measured with the float method where there are two accessible manholes.

If the flow is overland, the water will need to be directed into a narrow channel or ditch so that the measurements can be taken. The initial preparation for this method requires that a shallow channel or ditch be dug that is 6 feet long or longer and 4 to 12 inches wide. The channel or ditch should be shallow enough to easily obtain flow depths but should be deep enough to carry the flow that will be diverted to it. Boards or other barriers should be placed on the ground above the channel (so that the flow is diverted into the channel) and along the edges of the channel or ditch (flush with the ground surface so that flow does not seep under them).

The procedure for measuring the flow rate by the float method involves measuring the length of the channel between chosen points A and B (which must be 5 feet apart or more). The depth of the water at point B, in the middle of the channel, must be determined, and the width of the water flow must be measured at point B. A float is then placed in the water and timed as it moves from point A to point B. Exhibit 3-8 provides an example of estimating the flow rate using the float method.

For runoff flows from many directions into a drain in a low or flat area where ponding is evident, the float method can also be used. The total flow rate is calculated by measuring flow rates for several points into the drain and adding these values together. Exhibit 3-9 provides an example of estimating the flow rate using the float method in this situation.

Bucket and Stopwatch Method

The bucket and stopwatch method of estimating flow rate is the easiest of all the flow rate estimation procedures. However, it can only be used under certain conditions. The flow or discharge to be measured must be flowing from a small pipe or ditch, and it must be free-flowing. In other words,

R0013418

EXHIBIT 3-8. EXAMPLE CALCULATION OF FLOAT METHOD FOR UNIMPEDED OPEN CHANNEL FLOW

Step 1: When each sample or aliquot is taken, record the data for the time the sample was taken and the length between points A and B (at least 5 feet apart). See columns A, B, and C.

EXAMPLE DATA:

A	B	C	D	E	F	G
Sample Number	Time in Minutes	Distance Between Points A & B (feet)	Time of Travel (A to B) (min)	Depth of Water at Point B (feet)	Width of Flow at Point B (feet)	Calculated Flow Rate (cfm)
1	0	5.0	0.17	0.12	0.5	1.8
2	20	5.0	0.18	0.25	0.5	3.5
3	40	5.0	0.20	0.29	0.5	3.6
4	60	5.0	0.21	0.33	0.5	3.9
5	80	5.0	0.18	0.29	0.5	4.0
6	100	5.0	0.17	0.25	0.5	3.7
7	120	5.0	0.17	0.12	0.5	1.8
8	140	5.0	0.16	0.12	0.5	1.9
9	160	5.0	0.18	0.12	0.5	1.7

Step 2: Place a float in the water flow at point A and time it as it moves from point A to point B. Record the time in minutes. See column D.

Step 3: Measure the depth of the water and the width of the flow at point B. See columns E and F.

Step 4: Calculate the flow rate for each sample time using the common flow rate formula. See column G.

Formulas:

$$Velocity\ (V) = \frac{Length\ from\ A\ to\ B}{Time\ of\ Travel}$$

$$Area\ (A) = Water\ Depth \times Width\ of\ Flow$$

$$Flow\ Rate\ (Q) = (V) \times (A)$$

Example: For Sample 1

$$V = \frac{5.0\ ft}{0.17\ min} = 29.4\ ft/min$$

$$A = 0.12\ ft \times 0.5\ ft = 0.06\ ft^2$$

$$Q = 29.4\ ft/min \times 0.06\ ft^2 = 1.8\ cfm$$

R0013419

EXHIBIT 3-9. EXAMPLE CALCULATION OF FLOAT METHOD FOR ESTIMATING DRAIN FLOW RATES

Step 1: When each sample or aliquot is taken, record the data for the time the sample was taken. Measure the outer perimeter or edge of the drain where the water flows in. See columns B and C.

Step 2: Designate three evenly spaced points surrounding the drain approximately 3 to 5 feet from the drain. These points will be referred to as points A, B, and C. Record the distance from each point to the edge of the drain. See column D.

EXAMPLE DATA: Assume the drain dimensions are 1 ft x 1 ft square, and flow surrounds drain.

A	B	C	D			E			F			G
Sample Number	Sample Time (min)	Drainage Perimeter (feet)	Distance of Point to Drain (feet)			Time of Travel to Drain (min)			Depth of Water (feet)			Calculated Flow Rate (cfm)
			Pt. A	Pt. B	Pt. C	Pt. A	Pt. B	Pt. C	Pt. A	Pt. B	Pt. C	
1	0	4	3	4	5	0.2	0.3	0.5	0.08	0.08	0.08	4 cfm
2	20	4	3	4	5	0.3	0.4	0.5	0.11	0.12	0.14	5 cfm
3	40	4	3	4	5	0.3	0.4	0.5	0.11	0.12	0.14	5 cfm
4	60	4	3	4	5	0.4	0.5	0.6	0.16	0.17	0.20	6 cfm
5	80	4	3	4	5	0.3	0.4	0.5	0.11	0.12	0.14	5 cfm
6	100	4	3	4	5	0.3	0.4	0.5	0.11	0.12	0.14	5 cfm
7	120	4	3	4	5	0.3	0.4	0.5	0.11	0.12	0.14	5 cfm
8	140	4	3	4	5	0.3	0.4	0.5	0.11	0.12	0.14	5 cfm
9	160	4	3	4	5	0.2	0.3	0.5	0.08	0.08	0.08	4 cfm

Step 3: Place a float at each of the three points and measure the time it takes to reach the drain. Record the times in minutes. See column E.

Step 4: Determine the depth of flow at each place where the float enters the drain from points A, B, and C. Record the depth in feet. See column F.

Step 5: Calculate the flow rate by adding the individual flow rates for points A, B, and C. Record the data in column G.

Formulas:

$$Velocity\ (V) = \frac{Distance\ of\ Point\ from\ Drain}{Time\ of\ Travel}$$

$$Area\ (A) = Water\ Depth \times Drainage\ Perimeter$$

$$Flow\ Rate\ (Q) = 1/n\Sigma A_n V_n,\ where\ n\ equals\ points\ A,\ B,\ and\ C$$

Example: For Sample 1

$$V_A = \frac{3\ Feet}{0.2\ Min} = 15\ ft/min$$

$$A_A = 0.08\ ft \times 4\ ft = 0.32\ ft^2$$

R0013420

EXHIBIT 3-9. EXAMPLE CALCULATION OF FLOAT METHOD FOR ESTIMATING DRAIN FLOW RATES (Continued)

$$Q_{(TOTAL)} = \tfrac{1}{3}(V_A A_A + V_B A_B + V_C A_C)$$

$$= \tfrac{1}{3}[(15\ ft/min)(0.32\ ft^2) + (13\ ft/min)(0.32\ ft^2) + (10\ ft/min)(0.32\ ft^2)]$$

$$= 4\ cfm$$

the pipe or ditch must be raised above the ground. Also, the flow must be small enough to be captured by a bucket or other suitable container without overflowing. If these conditions are not present, another method must be used. The procedure involves recording the time that each sample is taken, the time it takes for the container to be filled, and the volume of discharge collected. The flow rate is then calculated in gallons per minute (gpm) or in cubic feet per minute (cfm). The basis for the bucket and stopwatch method is the collection of a measured amount of flow over a measured amount of time to determine flow per unit of time (or flow rate) as per the formula below.

$$Flow\ Rate\ Q\ (gpm) = \frac{Volume\ of\ Bucket\ (gal)}{Time\ to\ Fill\ (sec)} \times \frac{60\ sec}{1\ min}$$

Exhibit 3-10 provides an example of estimating flow rates with the bucket and stopwatch method.

Slope and Depth Method

The slope and depth method is also a relatively easy method for estimating flow rates in pipes and ditches. This procedure requires that the slope of the pipe or ditch be known. A survey or engineering design data such as sewer or grading plans may provide the slope or grade of the pipe or ditch. In addition, the flow or effluent to be measured should not fully fill the pipe or ditch from which it is flowing. To measure the depth of the flow at the center of the pipe or ditch at the outfall, the outfall should be accessible. If these conditions are not present, another method should be used. The procedure involves recording the time that each sample is taken and measuring the depth of the flow in the middle of the pipe or ditch. If the flow is coming from a pipe, the inside diameter of the pipe should be recorded. If the effluent is coming from a ditch, the width of the flow in the ditch should be measured. Also, the modified slope of the ditch should be calculated. The flow rate is calculated in cfm using the same formulas for both pipes and ditches. Exhibit 3-11 provides an example of estimating the flow rate with the slope and depth method.

R0013421

EXHIBIT 3-10. EXAMPLE CALCULATION OF BUCKET AND STOPWATCH METHOD FOR ESTIMATING FLOWS

Step 1: When each sample or aliquot is taken, record the data for the time the sample was taken. See column B.

EXAMPLE DATA:

A	B	C	D	E	F
Sample Number	Time (minutes)	Time to Fill Bucket (seconds)	Volume of Bucket (gallons)	Calculated Flow Rate (gpm)	Calculated Flow Rate in (cfm)
1	0	40.0	2.0	3.0	0.4
2	20	26.0	2.0	4.6	0.6
3	40	24.0	2.0	5.0	0.7
4	60	32.0	2.0	3.7	0.5
5	80	45.0	2.0	2.7	0.4
6	100	31.0	2.0	3.9	0.5
7	120	50.0	2.0	2.4	0.3
8	140	21.0	2.0	5.7	0.8
9	160	28.0	2.0	4.3	0.6

Step 2: Put a bucket beneath the flow, while measuring with a stopwatch the time it takes to fill the bucket to a certain level. If the water spills over the sides, the process must be redone. Record the time it took to fill the volume of water. See columns C and D.

Step 3: Calculate the flow rate in gpm and cfm.

Formulas:

$$Flow\ Rate,\ Q(gpm) = \frac{Volume\ of\ bucket\ (gal)}{Time\ to\ fill\ (sec)} \times \frac{60\ sec}{1\ min}$$

$$Q(cfm) = Q(gpm) \times 0.1337\ ft^3/gal$$

Example: For Sample 1

$$Q\ (gpm) = \frac{2\ gal}{40.0\ sec} \times \frac{60\ sec}{1\ min} = 3.0\ gpm$$

$$Q\ (cfm) = 3.0\ gpm \times 0.1337\ ft^3/gal = 0.4\ cfm$$

R0013422

EXHIBIT 3-11. EXAMPLE CALCULATION OF SLOPE AND DEPTH METHOD FOR ESTIMATING FLOW RATES

Step 1: Obtain the pipe or ditch channel percent slope from engineering data. Determine the inside diameter if the flow is from a pipe.

EXAMPLE DATA: For purposes of this example, a ditch with a 2 percent slope is assumed.

Step 2: When each sample or aliquot is taken, record the data for the time the sample was taken. See column B.

EXAMPLE DATA:

A	B	C	D	E	F	G
Sample Number	Time (minutes)	Depth of Water (in)	Width of Flow (ditch only) (feet)	"M" Modified Slope (ditch only)	Calculated Flow Rate (cfm Pipe only)	Calculated Flow Rate (cfm ditch only)
1	0	3.6	2.2	3.7	-	246.1
2	20	6.0	3.2	3.2	-	713.6
3	40	7.2	4.0	3.3	-	1,237.3
4	60	8.4	4.2	3.0	-	1,532.9
5	80	7.2	4.0	3.3	-	1,237.3
6	100	6.0	3.2	3.2	-	713.6
7	120	6.0	3.0	3.0	-	624.2
8	140	6.0	2.9	2.9	-	581.8
9	160	4.6	2.5	3.3	-	374.1

Step 3: Measure the depth of the water in the center of the pipe or ditch. Record the data in feet. See column C.

Step 4: Measure the width of the flow only if the flow is in a ditch. Record the data in feet. See column D.

Step 5: Calculate the modified side slope only if the flow is in a ditch (leave column E blank if the flow is in a pipe).

Formula:
$$\textit{Modified slope } (M) = \frac{12.0 \text{ in/ft} \times \textit{flow width (ft)}}{2.0 \times \textit{water depth (in)}}$$

Example: Sample 1:
$$M = \frac{12.0 \text{ in/ft} \times 2.2 \text{ ft}}{2.0 \times 3.6 \text{ in}} = 3.7$$

Step 6: For pipes, calculate the flow rate and record the data in column F.

$$\textit{Flow Rate } (Q) = 0.004 \times (I.D.)^{2.67} \times D \times \sqrt{S}$$

where Q = flow rate in pipe (cfm), I.D. = inside diameter of pipe (in), D = water depth (in), S = pipe slope (%)

Step 7: For ditches or channels, calculate the flow rate in cfm. Record the flow rate in column G.

Formula:
$$\textit{Flow Rate } (Q) = \frac{0.42M \times (M)^{1.67} \times (D)^{2.67} \times \sqrt{S}}{(M^2 + 1)^{0.33}}$$

where Q = flow rate in ditch (cfm), M = modified slope, D = water depth (in), S = ditch slope (%)

Example: For sample 1:
$$Q_1 = \frac{0.42\,(3.7) \times (3.7)^{1.67} \times (3.6)^{2.67} \times \sqrt{2}}{[(3.7)^2+1]^{0.33}}$$

$$Q = 246.1 \text{ cfm}$$

R0013423

Runoff Coefficient Methods

Runoff coefficient methods are the least accurate of all the flow rate estimation methods. These methods should only be used for composite flow-weighted samples if all of the other methods are inappropriate for the site. Although the least accurate, runoff coefficients are the simplest method of estimating runoff rates.

Runoff coefficients represent the fraction of total rainfall that will be transmitted as runoff from the drainage area that flows into the facility outfall. Runoff coefficients consider the ground surface or cover material and determine the amount of storm water flow which may infiltrate or runoff as a discharge. A simple estimate of runoff volume assumes that paved areas and other impervious structures such as roofs have a runoff coefficient of 0.90 (i.e., 90 percent of the rainfall leaves the area as runoff). For unpaved surfaces, a runoff coefficient of 0.50 is normally assumed. A more accurate estimate can be made by using more specific runoff coefficients for different areas of the facility, based on the specific type of ground cover. Commonly used runoff coefficients are listed in Exhibit 3-12.

The average runoff coefficient can be estimated for drainage areas that have both paved and unpaved areas by weighting the coefficients based on their proportion of the total area. An equation for this would be:

$$\textit{Estimated Average Runoff Coef.} = \frac{(\textit{Area A})(\textit{Runoff Coef. A}) + (\textit{Area B})(\textit{Runoff Coef. B})}{\textit{Area A} + \textit{Area B}}$$

The area of the drainage basin can generally be obtained from land surveys conducted at the time of facility purchase or site surveys taken from design documents developed as part of construction planning. If these are not available, the applicant may estimate the drainage areas from a topographic map of the area. The areas used in this calculation should include only those areas drained by the sampled outfall. When determining the basin area that drains through the outfall, some special considerations should be noted: (1) storm water from sources outside an industrial facility's property boundary may contribute to the discharge; and (2) storm water not associated with industrial activity may contribute to the flow volume. Where these conditions occur, the facility should accurately quantify and appropriately address these contributions.

R0013424

EXHIBIT 3-12. TYPICAL "c" COEFFICIENTS FOR 5- TO 10-YEAR FREQUENCY DESIGN STORMS

Description of Area	Runoff Coefficients
Business	
• Downtown areas	0.70-0.95
• Neighborhood areas	0.50-0.70
Residential	
• Single-family areas	0.30-0.50
• Multiunits (detached)	0.40-0.60
• Multiunits (attached)	0.60-0.75
Residential (suburban)	0.25-0.40
Apartment dwelling areas	0.50-0.70
Industrial	
• Light areas	0.50-0.80
• Heavy areas	0.60-0.90
Parks and cemeteries	0.10-0.25
Playgrounds	0.20-0.35
Railroad yard areas	0.20-0.40
Unimproved areas	0.10-0.30
Streets	
• Asphalt	0.70-0.95
• Concrete	0.80-0.95
• Brick	0.70-0.85

R0013425

There are two specific methods to estimate flow rate using runoff coefficients. The first method uses depth of flow in a pipe or ditch and an average runoff rate to estimate each of the sample flow rates where the slope/pitch of the pipe or ditch is unknown. Exhibit 3-13 provides an example calculation of estimating flow rates based on depth and runoff coefficients. The second method uses only rainfall accumulation and runoff coefficients to estimate a flow associated with the time the sample was taken. No actual flows or flow depths are measured. Exhibit 3-14 provides an example of estimating the flow rate based on rainfall depth and runoff coefficients.

3.2.3 MEASURING TOTAL FLOW VOLUMES FOR THE SAMPLED RAIN EVENT

Similar to measuring flow rates, flow volumes may be measured using automatic flowmeters or primary/secondary devices as discussed in Section 3.2.1. Measurement of flow volume with these devices provides a reasonably accurate determination of the total flow volume for the entire storm water discharge. In many cases, however, primary or secondary devices have not been installed for storm water flow measurement. Portable flow measurement devices are often expensive. Many of the automatic samplers that are currently on the market can measure flow volumes as well as perform sampling. Where available and when economically feasible, measuring devices should be used to generate data for calculating flow.

3.2.4 ESTIMATING TOTAL FLOW VOLUMES FOR THE SAMPLED RAIN EVENT

Since accurate measurement of total flow volumes is often impracticable due to lack of equipment, total flow volumes are more commonly estimated. The two methods provided in this section require only simple estimated measurements. The first method is based on rainfall depths and runoff coefficients and the second is based on flow rates that can be either measured or estimated.

Runoff Coefficients Methods

Discharge volumes are most easily estimated using the area of the drainage basin contributing to the outfall, the rainfall accumulation, and a runoff coefficient. The total volume of discharge can be estimated using a simple equation that relates the amount of rainfall to the volume of discharge that will leave the site as runoff. The equation is as follows:

R0013426

EXHIBIT 3-13. EXAMPLE CALCULATION OF RUNOFF COEFFICIENT/FLOW DEPTH METHOD FOR ESTIMATING FLOW RATES

Step 1: Estimate the runoff coefficient for the drainage area that contributes flow to the sampled outfall (see Section 3.2.2).

EXAMPLE: Assume the drainage area to the outfall is 3 acres. Two of those acres are paved with a runoff coefficient of .90, and 1 is unpaved with a runoff coefficient of .50. Using the equation for estimated runoff coefficient from the text in Section 2.2.2.2:

$$\textit{Est. Run. Coef.} = \frac{(2\ Ac)\ (0.90) + (1\ Ac)\ (0.50)}{2\ Ac + 1\ Ac} = 0.77$$

The runoff coefficient for the entire drainage area is 0.77.

Step 2: Measure the rainfall depth. Record the total rainfall of the storm or the rainfall that occurred in the first 3 hours (if it lasted more than 3 hours). Also record the duration of the rain event.

EXAMPLE: Assume the rainfall depth to be 1.0 inches in 3 hours.

Step 3: Calculate an average runoff rate.

Formula:

$$\textit{Average Runoff Rate} = \frac{\textit{Drainage Area} \times \textit{Runoff Coef.} \times \textit{Rainfall Depth}}{\textit{Rainfall Duration}}$$

Example:

$$\textit{Average Runoff Rate} = \frac{3\ Ac \times .77 \times 1\ in}{3\ hrs} \times \frac{43{,}560\ ft^2}{Ac} \times \frac{ft}{12\ in} \times \frac{hr}{60\ min} = 47\ cfm$$

When each sample or aliquot is taken, record the data for the time the samples were taken and the depth of the water in the center of the ditch or pipe. Record the data in columns B and C.

EXAMPLE DATA:

A	B	C	D	E
Sample Numbers	Time (minutes)	Channel or Ditch Water Depth (feet)	Calculated Depth-Weighted Flow Factor	Flow Rate (cfm)
1	0	1.0	0.82	39
2	20	1.1	0.90	42
3	40	1.2	0.98	46
4	60	1.25	1.02	48
5	80	1.3	1.06	50
6	100	1.25	1.02	48
7	120	1.2	0.98	46
8	140	1.7	1.39	65
9	160	1.0	0.82	39

Step 4: Sum up all the water depths for each sample taken as indicated above in column C.

Sum = 11.0 feet

R0013427

EXHIBIT 3-13. EXAMPLE CALCULATION OF RUNOFF COEFFICIENT/FLOW DEPTH METHOD FOR ESTIMATING FLOW RATES (Continued)

Step 5: Calculate a depth-weight flow factor and record the data in column D.

Formula:

$$Factor = \frac{Measured\ Water\ Depth \times Number\ of\ Flow\ Measurements}{Sum\ of\ all\ Water\ Depths}$$

Example: For Sample 1

$$Factor = \frac{(1\ ft) \times 9}{11.0} = 0.82$$

Step 6: Calculate the flow rate. Record the data in column E.

Formula:

$$Flow\ Rate,\ Q\ (cfm) = Average\ Runoff\ Rate \times Depth\ Factor$$

Example: For Sample 1

$$Q = 47\ cfm \times 0.82 = 39\ cfm$$

$$V_t = R_t \times [(A_{paved} \times C_{runoff}) + (A_{unpaved} \times C_{runoff})]$$

where: V_t = the total runoff volume in cubic feet
R_t = the total rainfall measured in feet
A_{paved} = the area (sq ft) within the drainage basin that is paved or roofed
$A_{unpaved}$ = the area (sq ft) within the drainage basin that is unpaved
C_{runoff} = a specific runoff coefficient (no units) for the drainage area ground cover

Exhibit 3-15 provides an example calculation of total runoff volume from rainfall data.

Discharge Volumes Estimated Based on Measured Flow Rates

Another method of estimating the total volume of a discharge uses a series of measured or estimated flow rates. The total volume of discharge can be estimated by first multiplying each of the flow rates by the time interval in between flow measurements. This time period represents the portion of the total storm duration that can be associated with the flow rate measurement. Adding all such partial volumes results in a total flow volume. A procedure for calculating the total runoff volume from a set of discrete measurements of flow depth and velocity in a ditch during a storm runoff event is presented in Exhibit 3-16.

R0013428

EXHIBIT 3-14. EXAMPLE CALCULATION OF RUNOFF COEFFICIENT RAINFALL DEPTH METHOD FOR ESTIMATING FLOW RATES

Step 1: Estimate the runoff coefficient for the drainage area that contributes flows to the sampled outfall.

EXAMPLE: See Step 1 in Exhibit 3-14. The site for this example will be similar so a coefficient of .77 will be used for the same 3-acre drainage area.

Step 2: When each sample or aliquot is taken, record the data for the time the sample was taken. Record the data in column B.

EXAMPLE DATA:

A	B	C	D	E	F
Sample Number	Time (minutes)	Total Rainfall Depth (inches)	Time Since Last Sample	Incremental Rainfall (inches) per 20 minutes	Calculated Flow Rate (cfm)
1	0	0.0	0	0.0	–
2	20	0.2	20	0.2	84
3	40	0.3	20	0.1	42
4	60	0.5	20	0.2	84
5	80	0.6	20	0.1	42
6	100	0.8	20	0.2	84
7	120	0.9	20	0.1	42
8	140	1.0	20	0.1	42
9	160	1.1	20	0.1	42

Step 3: Using a rainfall gauge, measure the total rainfall depth (in inches) and record the data in column C.

EXAMPLE: See sample data above.

Step 4: Calculate the incremental time since the last flow measurement and record the data in column D.

EXAMPLE: Samples were taken 20 minutes apart so this increment will be 20 minutes for every sample.

Step 5: Calculate the additional or incremental rainfall that has occurred since the last measurement. Record the data in column E.

Formula:

$$\textit{Incremental Rainfall} = \textit{Total Rainfall Sample 2} - \textit{Total Rainfall Sample 1}$$

Example: For Sample 2

$$\textit{Incremental Rainfall} = .2 - 0 = .2 \textit{ inches}$$

Step 6: Calculate the flow rate. Record the data in column F.

Formula:

$$\textit{Flow Rate (cfm)} = \frac{(\textit{Drainage area})(\textit{Runoff coefficient})(\textit{Incremental rainfall})}{(\textit{Incremental time})}$$

Example:

$$\textit{Flow Rate} = \frac{(3\ \text{Ac})(0.77)(0.2\ \text{in})}{20\ \text{min}} \times \frac{(43{,}560\ \text{ft}^2)}{\text{Ac}} \times \frac{1\ \text{ft}}{12\ \text{in}} = 84\ \text{cfm}$$

R0013429

EXHIBIT 3-15. EXAMPLE CALCULATION OF TOTAL RUNOFF VOLUME FROM RAINFALL DATA

Step 1: Determine the area of drainage contributing to the runoff volume at the outfall and convert it to square feet.

Example: Using a land survey, a facility has determined its site encompasses 0.3 acres (13,068 square feet). The entire site is used for industrial activities, and therefore, any storm water discharges from the site will be associated with industrial activity. A berm surrounds the entire site limiting the drainage area to the site itself and preventing any dilution or contamination from other discharges. (Note: To convert acres to square feet, multiply the number of acres by 43,560, which is the conversion factor).

Step 2: Determine the rainfall depth during the event that was sampled to the nearest one-hundredth of an inch and convert it to feet.

Example: From the rain gauge, the rainfall accumulation is measured at 0.6 inches or 0.05 feet (ft). (Note: To convert inches to feet, divide the inches by 12, which is the conversion factor).

Step 3: Determine the runoff coefficients for each area.

Example: The facility has estimated that ⅛ of the site, or 4,356 square feet, is covered by impervious surfaces (i.e., roofs or paved roadways) and ⅞ of the site, or 8,712 square feet, is unpaved.

Step 4: Calculate the volume of flow using the following formula and convert the volume to liters.

Formula: ***Total runoff volume in cubic feet (cu ft) = total rainfall (ft) x [facility paved area (sq ft) x 0.90 + facility unpaved area (sq ft) x 0.50]***

Example: ***Total runoff volume (cu ft) = 0.05 x [4,356 x 0.90 + 8,712 x 0.50]***

Total runoff volume = 413.8 cu ft or 11,720 liters

(Note: To convert cubic feet to liters, multiply cubic feet by 28.32, which is the conversion factor).

R0013430

EXHIBIT 3-16. EXAMPLE CALCULATION OF TOTAL RUNOFF VOLUME FROM FLOW RATE DATA

Step 1: Measure and tabulate flow depths and velocities every 20 minutes (at the same time that the sample is collected) during at least the first 3 hours of the runoff event.

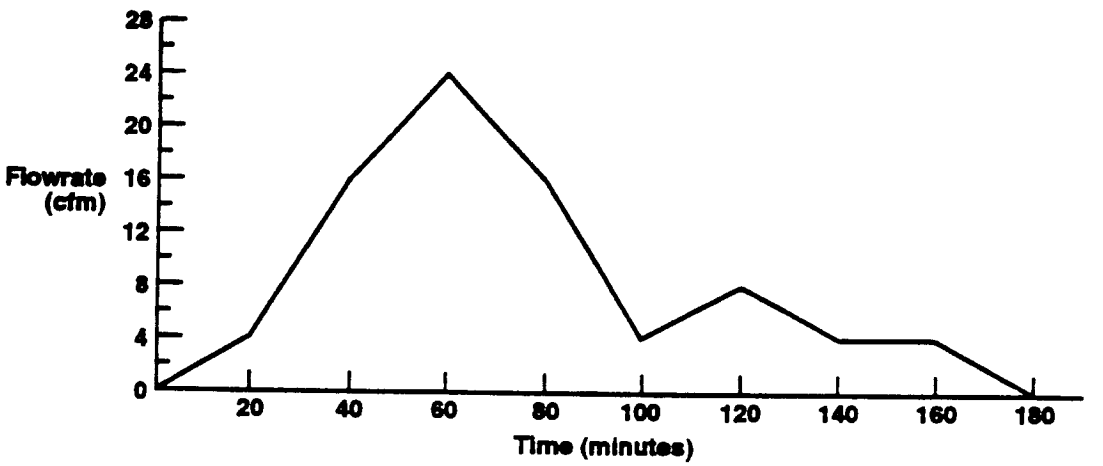
EXAMPLE DATA:

A	B	C	D	E	F
Sample Number	**Time (minutes)**	**Flow Velocity (feet per minute)**	**Flow Depth (feet)**	**Width (feet)**	**Calculated Flow Rate (cfm)**
1	0	-	-	-	-
2	20	4	0.2	5	4
3	40	8	0.4	5	16
4	60	12	0.4	5	24
5	80	8	0.4	5	16
6	100	4	0.2	5	4
7	120	8	0.2	5	8
8	140	4	0.2	5	4
9	160	4	0.2	5	4

R0013431

EXHIBIT 3-16. EXAMPLE CALCULATION OF TOTAL RUNOFF VOLUME FROM FLOW RATE DATA (Continued)

Step 2: Calculate and tabulate the cross-sectional area of flow for each of the flow depths measured. Calculate the flow rate for each discrete set of measurements.



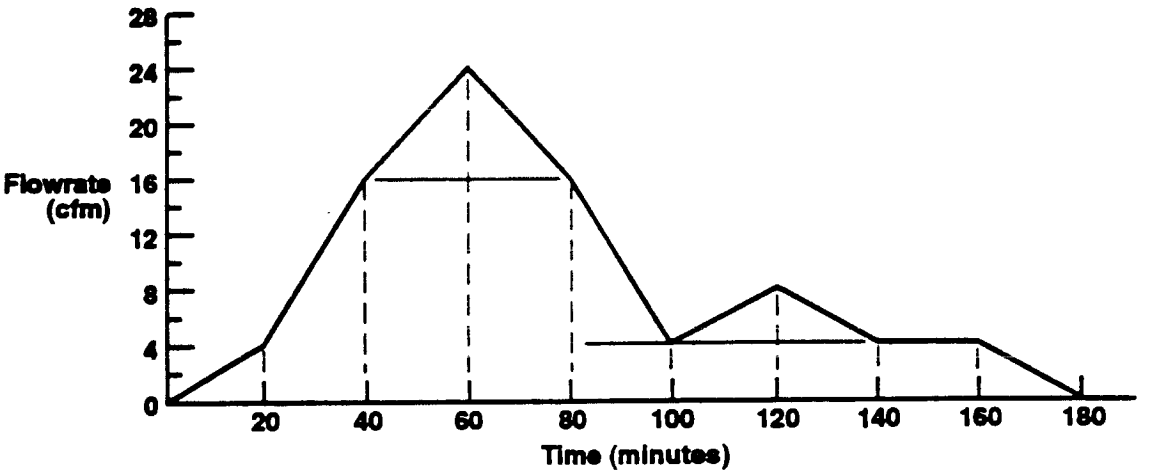
Formula: $$\textit{Flow Rate } Q \textit{ (cfm)} = \textit{Velocity (ft/min)} \times \textit{Area (sq ft)}$$
$$\textit{Area} = \textit{Depth} \times \textit{Width}$$

Example. For Sample 1

$$\textit{Area} = 0.2\ \textit{ft} \times 5\ \textit{ft} = 1\ \textit{sq ft}$$
$$\textit{Flow Rate} = 4\ \textit{ft/min} \times 1\ \textit{sq ft} = 4\ \textit{cfm}$$

Step 3: Plot the flow rate, Q, versus time. Also, assume that flow drops uniformly from the last calculated flow rate (Q_9) to zero at the time when Q_{10} would have been taken.

Example: The flow rates calculated in Step 3 are plotted against the time between samples.



R0013432

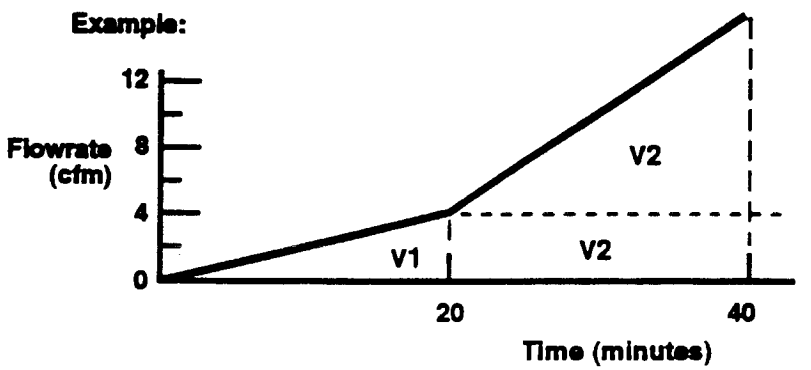


EXHIBIT 3-16. EXAMPLE CALCULATION OF TOTAL RUNOFF VOLUME FROM FLOW RATE DATA (Continued)

Step 4: The total flow volume (V_t) can be calculated by geometrically determining the area under the curve. The summation of the individual volumes per increment of time (V_1 through V_9) is the total flow volume of the event.

Example:

Step 5: Compute the flow volume associated with each observation (V_1, V_2, ..., V_9) by multiplying the measured flow rate by the duration (in this case, 20 minutes). Be sure the units are consistent. For example, if durations are in minutes and flow velocities are in cubic feet per second (cfs), convert the durations to seconds or the velocities to feet per minute.

R0013433

EXHIBIT 3-16. EXAMPLE CALCULATION OF TOTAL RUNOFF VOLUME FROM FLOW RATE DATA (Continued)

Formula: ***Volume (V) = Flow Rate (cfm) x Duration (minutes)***

Example:

$$V_1 = \frac{1}{2}(Q_1 - Q_0)(t_1 - t_0) = \frac{1}{2}(4-0)(20-0) = 40\ ft^3$$

$$V_2 = \frac{1}{2}(Q_2 - Q_1)(t_2 - t_1) + Q_1(t_2 - t_1)$$

$$= \frac{1}{2}(16-4)(40-20) + 4(20)$$

$$= 120 + 80 = 200\ ft^3$$

$V_1 = 40\ ft^3$
$V_2 = 200\ ft^3$
$V_3 = 400\ ft^3$
$V_4 = 400\ ft^3$
$V_5 = 200\ ft^3$
$V_6 = 120\ ft^3$
$V_7 = 120\ ft^3$
$V_8 = 80\ ft^3$
$V_9 = 40\ ft^3$

Step 6: Total the individual volumes calculated in Step 5 to obtain the total runoff volume.

Example:

Total Storm Runoff = 1,600 ft³

R0013434

3.2.5 REPORTING STORM WATER DISCHARGE FLOW RATES AND VOLUMES

Form 2F requires applicants to provide quantitative data (reported both as concentration and as total mass) based on flow-weighted samples collected during storm events. In addition, applicants are required to provide flow estimates or flow measurements, as well as an estimate of the total volume of the discharge. The method of flow estimation or measurement must be described in the application. Although EPA only requires flow estimates in Form 2F, accurate flow measurement is necessary for collecting representative flow-weighted composite samples and reporting pollutant mass loadings.

3.2.6 MEASURING RAINFALL

Many types of instruments have been developed to measure the amount and intensity of precipitation. All forms of precipitation are measured on the basis of the depth of the water that would accumulate on a level surface if precipitation remained where it fell. There are two types of rain gauges - standard and recording gauges. A standard rain gauge collects the rainfall so that the amount of rain can be easily measured. The standard gauge for the NWS has a collector which is 8 inches in diameter. Rain flows from the collector into a cylindrical measuring tube inside the overflow can. The measuring tube has a cross-sectional area one tenth the size of the collector so that 0.1 inch of rainfall will fill 1 inch of the measuring tube. While this standard gauge is both accurate and easy to use, any open receptacle with vertical sides can be an effective rain gauge. Standard rain gauges are simple and inexpensive; however, with a standard gauge, there is no way to record changes in the intensity of the rainfall without making frequent observations of the gauge during the storm.

The second type of gauge is the recording rain gauge, which provides a permanent record of the amount of rainfall which accumulates over time. Three common types of recording gauges are:

- Tipping Bucket Gauge - Water caught in a collector is funneled into a two-compartment bucket; a known quantity of rain fills one compartment, overbalancing the bucket and emptying it into a reservoir. This moves the second bucket into place beneath the funnel. The tipping of the bucket engages an electric circuit, which records the event.
- Weighing Type Gauge - Water is weighed when it falls into a bucket placed on the platform of a spring or lever balance. The weight of the contents is recorded on a chart, showing the accumulation of precipitation.
- Float Recording Gauge - Water is measured by the rise of a float that is placed in the receiver. These gauges may be self-siphoning, or may need to be emptied periodically by hand.

R0013435

Recording rain gauges provide a permanent record of rainfall, and they can be used to determine variations in rainfall intensity over time without making frequent observations during the storm. But recording gauges are more complicated mechanically than standard gauges, making them more costly, less durable, and more difficult to operate.

Although all gauges are subject to error, most errors can be minimized. To minimize errors, the gauge should be placed on a level surface that is not windswept and is away from trees or buildings that might interfere with the path of rainfall. When taking measurements, other factors contributing to error should also be considered: mistakes in reading the scale, dents in the collector rim (which changes the receiving area), measuring sticks that may retain some of the water, and water lost to evaporation. In the case of tipping bucket gauges, water may not be collected while the bucket is still tipping. The most common source of inaccuracy is changes in data that are attributable to wind. It is possible to assess wind errors by comparing measurements of gauges that are protected from the wind with those that are not.

3.3 GRAB SAMPLE COLLECTION

Section 3.1.2 discussed both the parameters that must be monitored by grab sample and the conditions under which grab sampling is required. This section explains how to collect grab samples. The entire sample is collected at an uninterrupted interval (i.e., grabbed at one time). A grab sample provides information on the characterization of storm water at a given time and may be collected either manually or automatically as discussed below.

3.3.1 HOW TO MANUALLY COLLECT GRAB SAMPLES

A manual grab is collected by inserting a container under or downcurrent of a discharge with the container opening facing upstream. Generally, simplified equipment and procedures can be used. In most cases, the sample container itself may be used to collect the sample. Less accessible outfalls may require the use of poles and buckets to collect grab samples. To ensure that manual grab samples are representative of the storm water discharged, the procedures set forth in Exhibit 3-17 should be followed.

R0013436

EXHIBIT 3-17. RECOMMENDED OPERATING PROCEDURES FOR TAKING GRAB SAMPLES

- Label sample containers before sampling event
- Take a cooler with ice to the sampling point
- Take the grab from the horizontal and vertical center of the channel
- Avoid stirring up bottom sediments in the channel
- Hold the container so the opening faces upstream
- Avoid touching the inside of the container to prevent contamination
- Keep the sample free from uncharacteristic floating debris
- Transfer samples into proper containers (e.g., from bucket to sample container), however, fecal coliform, fecal streptococcus, phenols and O&G should remain in original containers
- If taking numerous grabs, keep the samples separate and labelled clearly
- Use safety precautions (see Chapter 6)

Specialized equipment and procedures may be needed, particularly in situations where storm water discharges are inaccessible or where certain parameters are monitored. For example:

- When sampling for O&G and VOCs, equipment that safely and securely houses O&G bottles or VOC vials should be used. This may be necessary because: (1) O&G will adhere to containers and thus should not be transferred from one container to another; and (2) excessive aeration during sampling may result in the partial escape of VOCs.
- Since facilities sometimes use sample bottles that already contain preservatives (as provided by contract laboratories), extreme care should be taken when filling them to avoid spills, splatters, or washout of the preservatives.

All equipment and containers that come into contact with the sample must be clean to avoid contamination. Additionally, sample collection equipment and container materials should be totally unreactive to prevent leaching of pollutants. Cleaning procedures are discussed in detail in Section 3.5.

R0013437

3.3.2 HOW TO COLLECT GRAB SAMPLES BY AUTOMATIC SAMPLER

Grab samples can also be collected using programmed automatic samplers. Automatic samplers come equipped with computers that can be programmed to collect grab samples. Programming for grabs is specific to the type of automatic sampler. Some samplers are portable and have been developed specifically to sample for storm water discharges. These samplers are frequently attached to a rain gauge and/or a flow sensor. Such samplers can be programmed to initiate sample collection by one or more of the following conditions: (1) depth of flow in a channel; (2) rainfall in inches; (3) flow rate; (4) time; (5) external signal; and (6) combinations of the first three conditions. For example, an automatic sampler could be used to collect a sample at 15-minute intervals after its sensors indicate that rainfall has begun.

When using an automatic sampler, planning is very important. First, all equipment must be properly cleaned, particularly the tubing and the sample containers. There are several different types of tubing available, including rubber and Tygon tubing. Tygon tubing is commonly used since it generally does not leach contaminants. Deionized water should be drawn through the sampler to remove any remaining pollutant residuals prior to taking samples. Tubing should also be replaced periodically to avoid algae or bacterial growth.

Sampling personnel should also use adequate and appropriate containers and ensure they are properly cleaned. Section 3.5 contains information on cleaning procedures which should be followed for all equipment. Additionally, the utilization of blanks (a control used to verify the accuracy of analytical results) is recommended to determine if cross-contamination of sampling equipment has occurred. Samplers should also be programmed, set up, and supplied with a source of power. Properly charged batteries should be readily available for portable samplers in advance of a storm event and, as a backup power supply in case of power failure. Finally, although automatic samplers may be useful in some situations, several parameters are not amenable to collection by automatic sampler. These pollutants include fecal streptococcus, fecal coliforms, oil and grease and VOCs which should be collected manually, not automatically, as discussed in Section 3.1.2.

3.4 FLOW-WEIGHTED COMPOSITE SAMPLE COLLECTION

Composite samples are samples simply comprised of a series of individual sample aliquots that have been combined to reflect average pollutant concentrations of the storm water discharge during the

R0013438

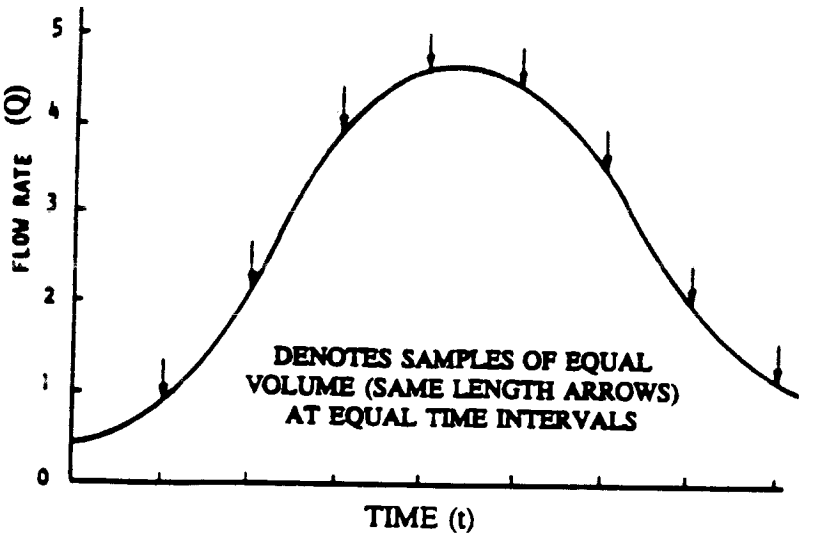
sampling period. Composite samples can be developed based on time or flow rate. There are four different types of composite samples, as follows:

- Constant Time - Constant Volume - Samples of equal volume are taken at equal increments of time and composited to make an average sample (similar to Exhibit 3-18). This method is not acceptable for samples taken for compliance with the storm water permit application regulations.

- Constant Time - Volume Proportional to Flow Increment - Samples are taken at equal increments of time and are composited proportional to the volume of flow since the last sample was taken (see Exhibit 3-19).

- Constant Time - Volume Proportional to Flow Rate - Samples are taken at equal increments of time and are composited proportional to the flow rate at the time each sample was taken (see Exhibit 3-20).

- Constant Volume - Time Proportional to Flow Volume Increment - Samples of equal volume are taken at equal increments of flow volume and composited (see Exhibit 3-21).



Generally, flow-weighted composite samples must be collected for most parameters. The methods for generating flow-weighted composite samples are discussed in the following sections.

For storm water discharge permit applications, the aliquots for flow-weighted composite samples must be collected during a representative storm for the first 3 hours, or for the duration of the storm event if it is less than 3 hours long. The storm water application regulations allow for flow-weighted composite samples to be collected manually or automatically. For both methods, equal volume aliquots may be collected at the time of sampling and then flow-proportioned and composited in the laboratory, or the aliquot may be collected based on the flow rate at the time of sample collection and composited in the field. When composite samples are collected, the regulations require that each aliquot collection be separated by a minimum of 15 minutes and that a minimum of three sample aliquots be taken within each hour of the discharge. See Exhibit 3-22 for an example of how this requirement may be fulfilled.

The provisions set forth in 40 CFR 122.21(g)(7) for collecting flow-weighted composite samples establish specific requirements for minimum time duration between sample aliquots. Where these conditions cannot be met, the permitting authority may allow alternate protocols with respect to the time duration between sample aliquots (see Chapter 5). However, permission from the permitting

R0013441

EXHIBIT 3-22. EXAMPLE OF SAMPLING INTERVALS

Suppose that a storm water discharge began at 2:15 p.m. and lasted until 5:15 p.m. on a Friday. The field staff person wants to collect the samples at regular intervals, so s/he plans to collect an aliquot with a volume that is proportional to the flow every 20 minutes. After the third hour of collection, the field staff person must deliver the samples to the laboratory (which is 10 minutes away). The laboratory closes at 5:00 p.m. So, s/he should take the last sample at 4:45 p.m. One way of doing this would be to collect samples (in hour three) at 4:15, 4:30, and 4:45 p.m. This would comply with the three-sample minimum in hour three (4:15-5:15 p.m.) and the required 15-minute minimum interval between collections. It would also allow the field staff person to get the samples to the lab before it closes for the weekend. On the other hand, if s/he missed the sample collection at 4:15 p.m. and instead, collected the sample at 4:20 p.m., then s/he would have to collect the next sample at 4:35 p.m. and the last sample at 4:50 p.m., and the field staff person would not be able to deliver the sample until Monday (by which time the required maximum holding time would be exceeded), and the sampling would need to be repeated.

R0013442

authority must be obtained before changes are initiated. Considerations applicable to the collection of flow-weighted composites by automatic and manual techniques are discussed in the following sections.

3.4.1 HOW TO MANUALLY COLLECT FLOW-WEIGHTED COMPOSITE SAMPLES

Manually collected, flow-weighted composite samples may be appropriate for a facility that prefers not to invest in automatic equipment. This technique is cost-effective for short-term monitoring programs and for facilities where few outfalls are being sampled. The fundamental requirement for facilities that use these methodologies is that they should have personnel available to perform the sampling when needed. Those facilities where VOCs analysis of storm water discharges are required should manually collect composite samples since these parameters may not be amenable to sampling by automatic samplers. Compositing of VOC samples should be conducted in the laboratory as discussed in Section 3.5.2.

The manual collection of a flow-weighted sample is performed in the same manner as taking manual grab samples (see Section 3.3.1). The only difference is that a series of samples (or aliquots) will be collected. As discussed in the previous section, there are two ways to manually collect and combine the aliquots for a flow-weighted sample:

- Collect sample aliquot volumes based on the flow at the time of sampling which can immediately be combined to make the composite sample in the field (see Exhibit 3-23)
- Collect equal volume sample aliquots at the time of sampling and then flow-proportion and composite the aliquots in the laboratory (see Exhibit 3-24).

When uniform time intervals are used between the collection of the sample aliquots, the volumes of each aliquot used in the composite sample can be determined based on either volumes of flow or the flow rate, as they will result in similar proportions. However, when there are different time intervals between the sample aliquots, the individual sample aliquot volumes should be based on the runoff volume (calculated from the individual flow rates and durations) associated with each sample aliquot.
Generally, 1,000 ml for each aliquot collected should provide enough sample volume, when composited, for pollutant analyses of the required parameters contained in Section VII.A of Form 2F (see Section 3.6). More aliquot volume may be required if sampling is conducted for additional parameters. The laboratory conducting the analyses should always be contacted prior to a sampling event to determine how much sample volume they will require.

R0013443

EXHIBIT 3.23 EXAMPLE OF HOW TO COLLECT SAMPLE ALIQUOT VOLUMES BASED ON FLOW, AND PROPORTION AND COMPOSITE IN THE FIELD

Step 1: Determine the necessary volume for compositing purposes.

Example: To fulfill analyses for all parameters in Section VII.A of Form 2F for which composite samples are required [Biochemical Oxygen Demand (BOD_5), Chemical Oxygen Demand (COD), Total Suspended Solids (TSS), Total Kjeldahl Nitrogen (TKN), nitrate plus nitrite, and phosphorous] a total composite sample volume of 5,000 ml is needed by the contract laboratory.

Step 2: Determine an appropriate interval for collection of samples.

Example: Manually collected flow-weighted composite samples must consist of at least three sample aliquots collected per hour and must be gathered at least 15 minutes apart. For this example, sample aliquots will be collected exactly 20 minutes apart.

Step 3: Estimate or measure the volume of discharge for each sampling event.

Example: A discharge flow volume of 4.8 cubic feet will be used here.

Step 4: Convert the discharge flow volume to liters.

Example: To convert cubic feet to liters, use the conversion factor of 28.32 liters per 1 cubic foot as set forth in the following formula:

$$\textit{Volume (liters)} = \textit{Volume (cubic feet)} \times \frac{\textit{28.32 liters}}{\textit{1 cubic foot}}$$

$$\textit{Volume} = \textit{4.8 cubic feet} \times \frac{\textit{28.32 liters}}{\textit{1 cubic foot}} = \textit{136 liters}$$

Step 5: Using Steps 3 and 4, volumes that have been discharged between the collection of each aliquot can be calculated.

(Note that the discharge volumes provided for aliquot numbers 2-9 have already been given for the purposes of this exhibit.)

Example: The procedures set forth in Section 3.2 may be used to calculate discharge volumes. The following table presents aliquot numbers, time of aliquot collection, and discharge volumes.

Aliquot Number	Time of Aliquot Collection	Discharged Volume
1	2:15 p.m.	136 liters
2	2:35 p.m.	200 liters
3	2:55 p.m.	122 liters
4	3:15 p.m.	178 liters
5	3:35 p.m.	156 liters
6	3:55 p.m.	117 liters
7	4:15 p.m.	94 liters
8	4:30 p.m.	21 liters
9	4:45 p.m.	12 liters

R0013444

EXHIBIT 3-23. EXAMPLE OF HOW TO COLLECT SAMPLE ALIQUOT VOLUMES BASED ON FLOW, AND PROPORTION AND COMPOSITE IN THE FIELD (Continued)

Step 6: Determine the appropriate minimum aliquot volume as the basis for collecting other aliquot samples which together will provide adequate volume to fulfill the analytic requirements.

Example: In Step 1, it was determined that at least 5,000 ml of sample were required for flow-weighted composite sample analytical testing. As discussed in Section 3.4.1, basing the sample collection on a minimum aliquot volume of 1,000 ml gathered every interval (i.e., every 15 minutes) should result in adequate sample volume.

Step 7: Calculate the volume of the sample aliquot which must be collected during each aliquot sample period using the following formula:

$$\textit{Aliquot volume (ml)} = \textit{Minimum aliquot volume (ml)} \times \frac{\textit{Aliquot's discharge volume (liters)}}{\textit{Initial discharge volume (liters)}}$$

Step 6 shows that the minimum aliquot volume is 1,000 ml.

$$\textit{Aliquot \#1 volume (ml)} = 1{,}000 \text{ ml} \times \frac{136 \text{ liters}}{136 \text{ liters}} = 1{,}000 \text{ ml}$$

$$\textit{Aliquot \#2 volume (ml)} = 1{,}000 \text{ ml} \times \frac{200 \text{ liters}}{136 \text{ liters}} = 1471 \text{ ml}$$

$$\textit{Aliquot \#3 volume (ml)} = 1{,}000 \text{ ml} \times \frac{122 \text{ liters}}{136 \text{ liters}} = 897 \text{ ml}$$

$$\textit{Aliquot \#4 volume (ml)} = 1{,}000 \text{ ml} \times \frac{178 \text{ liters}}{136 \text{ liters}} = 1{,}309 \text{ ml}$$

$$\textit{Aliquot \#5 volume (ml)} = 1{,}000 \text{ ml} \times \frac{156 \text{ liters}}{136 \text{ liters}} = 1{,}147 \text{ ml}$$

$$\textit{Aliquot \#6 volume (ml)} = 1{,}000 \text{ ml} \times \frac{117 \text{ liters}}{136 \text{ liters}} = 860 \text{ ml}$$

$$\textit{Aliquot \#7 volume (ml)} = 1{,}000 \text{ ml} \times \frac{94 \text{ liters}}{136 \text{ liters}} = 691 \text{ ml}$$

$$\textit{Aliquot \#8 volume (ml)} = 1{,}000 \text{ ml} \times \frac{21 \text{ liters}}{136 \text{ liters}} = 154 \text{ ml}$$

$$\textit{Aliquot \#9 volume (ml)} = 1{,}000 \text{ ml} \times \frac{12 \text{ liters}}{136 \text{ liters}} = 88 \text{ ml}$$

A table of these calculations follows:

Aliquot Number	Discharged Volume	Aliquot Volume
1	136 liters	1,000 ml
2	200 liters	1,471 ml
3	122 liters	897 ml
4	178 liters	1,309 ml
5	156 liters	1,147 ml
6	117 liters	860 ml
7	94 liters	691 ml
8	21 liters	154 ml
9	12 liters	88 ml

In conclusion, a combination of the above sample aliquots result in a composite of 7,617 ml.

R0013445

EXHIBIT 3-24 EXAMPLE OF HOW TO MANUALLY COLLECT EQUAL SAMPLE ALIQUOTS WHICH ARE LATER FLOW PROPORTIONED AND COMPOSITED IN THE LABORATORY

Step 1: Determine the necessary volume for compositing purposes.

Example: To fulfill analyses for all parameters in Section VII.A of Form 2F for which composite samples are required (BOD_5, COD, TSS, TKN, nitrate plus nitrite, and phosphorous) a total composite sample volume of 5,000 ml is needed by the contract laboratory.

Step 2: Determine an appropriate interval for collection of samples.

Example: Manually collected flow-weighted composite samples must consist of at least nine sample aliquots and must be gathered at least 15 minutes apart; only three or four samples per hour may be taken. For convenience, the minimum number of three is chosen. Sample aliquots will be collected every 20 minutes.

Step 3: Determine the aliquot which should be taken during each sampling event.

Example: At least 5,000 ml of sample is required for flow-weighted composite sample analytical testing. As discussed in Section 3.4.1, a minimum aliquot volume of 1,000 ml gathered every interval (i.e., every 15 minutes) should result in adequate sample volume to be used for later flow-weighted compositing.

Step 4: Estimate or measure the volume of discharge for each sampling event while collecting a discrete 1,000-ml aliquot, as discussed in Step 3, for later compositing.

Example: Section 3.2 discusses methods to calculate total discharge volumes. A discharge flow volume of 4.8 cubic feet will be used here.

Step 5: Convert the discharge flow volume to liters.

Example: To convert cubic feet to liters, use the conversion factor of 28.32 liters per 1 cubic foot as set forth in the following formula:

$$\textit{Volume (liters)} = \textit{Volume (cubic feet)} \times \frac{\textit{28.32 liters}}{\textit{1 cubic foot}}$$

$$\textit{Volume} = \textit{4.8 cubic feet} \times \frac{\textit{28.32 liters}}{\textit{1 cubic foot}} = \textit{136 liters}$$

R0013446

EXHIBIT 3-24. EXAMPLE OF HOW TO MANUALLY COLLECT EQUAL SAMPLE ALIQUOTS WHICH ARE LATER FLOW-PROPORTIONED AND COMPOSITED IN THE LABORATORY (Continued)

Step 6: Using Steps 3 and 4, calculate the volumes that have been discharged between the collection of each aliquot.

Example: The procedures set forth in Section 3.2 may be used to calculate discharge volumes. The following table presents aliquot numbers, time of aliquot collection, and discharge volumes (note that the discharge volumes provided for aliquot numbers 2-9 were chosen for purposes of this exhibit).

Aliquot Number	Time of Aliquot Collection	Discharged Volume
1	2:15 p.m.	136 liters
2	2:35 p.m.	200 liters
3	2:55 p.m.	122 liters
4	3:15 p.m.	178 liters
5	3:35 p.m.	156 liters
6	3:55 p.m.	117 liters
7	4:15 p.m.	94 liters
8	4:30 p.m.	21 liters
9	4:45 p.m.	12 liters

Step 7: Determine the aliquot sample which is associated with the greatest discharge volume.

Example: Aliquot number 2 was taken when the volume was 200 liters. This is the largest discharge volume.

Step 8: Calculate the volume of sample aliquot which must be used subsequent to the sample event to comprise a flow-weighted composite sample. The following formula should be used:

$$\textit{Aliquot volume (ml)} = \textit{Minimum aliquot volume (ml)} \times \frac{\textit{Aliquot's discharge volume (liters)}}{\textit{Largest discharge volume (liters)}}$$

Step 3 shows that the minimum aliquot volume is 1,000 ml. Using this value and the data determined as part of Steps 6 and 7, the following can be calculated:

$$\textit{Aliquot \#1 volume (ml)} = 1{,}000 \text{ ml} \times \frac{136 \text{ liters}}{200 \text{ liters}} = 680 \text{ ml}$$

$$\textit{Aliquot \#2 volume (ml)} = 1{,}000 \text{ ml} \times \frac{200 \text{ liters}}{200 \text{ liters}} = 1{,}000 \text{ ml}$$

$$\textit{Aliquot \#3 volume (ml)} = 1{,}000 \text{ ml} \times \frac{122 \text{ liters}}{200 \text{ liters}} = 610 \text{ ml}$$

$$\textit{Aliquot \#4 volume (ml)} = 1{,}000 \text{ ml} \times \frac{178 \text{ liters}}{200 \text{ liters}} = 890 \text{ ml}$$

$$\textit{Aliquot \#5 volume (ml)} = 1{,}000 \text{ ml} \times \frac{156 \text{ liters}}{200 \text{ liters}} = 780 \text{ ml}$$

$$\textit{Aliquot \#6 volume (ml)} = 1{,}000 \text{ ml} \times \frac{117 \text{ liters}}{200 \text{ liters}} = 585 \text{ ml}$$

R0013447

EXHIBIT 3-24. EXAMPLE OF HOW TO MANUALLY COLLECT EQUAL SAMPLE ALIQUOTS WHICH ARE LATER FLOW-PROPORTIONED AND COMPOSITED IN THE LABORATORY (Continued)

Aliquot #7 volume (ml) = 1,000 ml x $\frac{94 \text{ liters}}{200 \text{ liters}}$ = 470 ml

Aliquot #8 volume (ml) = 1,000 ml x $\frac{21 \text{ liters}}{200 \text{ liters}}$ = 105 ml

Aliquot #9 volume (ml) = 1,000 ml x $\frac{12 \text{ liters}}{200 \text{ liters}}$ = 60 ml

A table of these calculations follows

Aliquot Number	Discharged Volume	Aliquot Volume
1	136 liters	680 ml
2	200 liters	1,000 ml
3	122 liters	610 ml
4	178 liters	890 ml
5	156 liters	780 ml
6	117 liters	585 ml
7	94 liters	470 ml
8	21 liters	105 ml
9	12 liters	60 ml

In conclusion, a combination of the above sample aliquots results in a composite sample of 5,100 ml.

Manually collected flow-weighted composite samples can also be prepared by collecting sample aliquots of equal volume where the collection times are related to the volume of discharge which has passed since the last sample aliquot collection. However, this method is subject to fluctuating flow rates and volumes which may dictate that samples be taken prior to the 15-minute interval required by the regulations. In that case, the alternative sampling protocol would have to be approved by the permitting authority.

3.4.2 HOW TO COLLECT FLOW-WEIGHTED COMPOSITE SAMPLES BY AUTOMATIC SAMPLER

The typical automatic sampler collects sample aliquots after a specific interval. These aliquots can be flow-weight composited by the automatic sampler; or by hand in the laboratory. The automatic

R0013448

sampler may be programmed in one of three ways: (1) to collect a sample at equal time intervals and varying aliquot volumes commensurate with the flow (either rate or volume) that has passed; (2) to collect equal volume aliquots at varying time intervals commensurate with the flow volume that has passed; or (3) to collect equal volume aliquots of sample at equal time intervals.

The first two methods automatically composite the sample but require that the sampler be connected to a flow meter such that the sampler determines either the flow rate or the amount of volume that passes. Since these methods automatically composite samples, one main sample container may be used to receive all aliquots. The third method automatically collects the sample aliquots but does not automatically flow-weight composite the sample. As such, discrete sample containers must be used, and manual flow-weighted compositing must be conducted after the aliquots are collected. Exhibits 3-23 and 3-24 in Section 3.4.1 describe the manual compositing procedures that should be followed.

Manufacturers' instructions for the use of an automatic sampler provide the best explanation of programming options and should be consulted for information on programming samplers for storm water collection. Some of the points regarding automatic samplers discussed in Section 3.3.2 should also be considered.

3.5 SAMPLE HANDLING AND PRESERVATION

Samples must be handled and preserved in accordance with 40 CFR Part 136. This section describes acceptable analytical methods, including requirements regarding sample holding times, containers, sizes, and preservation requirements. For each pollutant or parameter that may have to be analyzed, 40 CFR Part 136 includes information on:

- Container types to be used to store the samples after collection
- Procedures to correctly preserve the samples
- The maximum holding time allowed for each parameter.

The following sections present a detailed discussion of preservation techniques and sample handling procedures. Technical Appendix C presents a matrix of required containers, preservation techniques,

R0013449

and holding times for each parameter. Most laboratories can provide clean sample containers, preservatives, sealing, chain-of-custody forms and can advise further on sample handling and preservation.

3.5.1 DECONTAMINATION OF SAMPLE EQUIPMENT CONTAINERS

Storm water sample containers should be cleaned and prepared for field use according to the procedures set forth in 40 CFR Part 136. A summary of the procedures is presented below for plastic containers, any or all of which may be performed by the laboratory or container distributor:

- Nonphosphate detergent and tap water wash
- Tap water rinse
- 10 percent nitric acid rinse (only if the sample is to be analyzed for metals)
- Distilled/deionized water rinse
- Total air dry.

To clean glass containers, the same steps should be taken; but, after the distilled/deionized water rinse, the containers should be rinsed with solvent if appropriate prior to total air drying. After the decontamination procedures have been accomplished, the sample containers should be capped or sealed with foil, and the sampling device should be protected and kept clean. It is a good idea to label sample containers after cleaning. The laboratory should keep a record of the technician performing the cleaning procedure as well as the date and time. This begins the required chain-of-custody procedure for legal custody (see Section 3.10 for more information). A chain-of-custody record accompanies each sample to track all personnel handling the sample. This record is essential to trace the sample integrity in the event that quality control checks reveal problems. For this reason, as well as to avoid problems if contamination issues arise, it is suggested that the laboratory performing the analysis perform the cleaning.

R0013450

3.5.2 SAMPLE PRESERVATION AND HOLDING TIMES

Preservation techniques ensure that the sample remains representative of the storm water discharge at the time of collection. Since many pollutants in the samples collected are unstable (at least to some extent), the sample should be analyzed immediately or preserved or fixed to minimize changes between the time of collection and analysis. Because immediate analysis is not always possible, most samples are preserved regardless of the time of analysis.

Problems may be encountered when flow-weighted composite samples are collected. Since sample deterioration can take place during the compositing process, it is necessary to preserve or stabilize the samples during compositing in addition to preserving aggregate samples before shipment to the laboratory. Preservation techniques vary depending on the pollutant parameter to be measured; therefore, familiarity with 40 CFR Part 136 (see Technical Appendix C) is essential to ensure effective preservation. It is important to verify that the preservation techniques for one parameter do not affect the analytical results of another in the same sample. If this is the case, two discrete samples should be collected and preserved accordingly.

Sample preservation techniques consist of refrigeration, pH adjustment, and chemical fixation. pH adjustment is necessary to stabilize the target analyte (e.g., addition of NaOH stabilizes cyanide); acidification of total metal samples ensures that metal salts do not precipitate. Refrigeration is the most widely used technique because it has no detrimental effect on the sample composition (i.e., it does not alter the chemistry of the sample), and it does not interfere with most analytical methods. Refrigeration requires the sample to be quickly chilled to a temperature of 4°C. This technique is used at the beginning of sample collection in the field, and is continued during sample shipment, and while the sample is in the laboratory. Even though samples taken for compositing purposes are taken over time each individual sample must be refrigerated. If taken manually, the samples can be placed in an ice box. If taken by a automatic sampler, the sampler unit should have refrigeration capabilities. The analytical laboratory may provide chemicals necessary for fixation, or may tell sampling personnel where they can be purchased.

In addition to preservation techniques, 40 CFR Part 136 indicates maximum holding times. A detailed list of holding times appears in Technical Appendix C. The holding time is the maximum

R0013451

amount of time that samples may be held before analysis and still be considered valid. Samples exceeding these holding times are considered suspect and sample collection may have to be repeated.

Although Technical Appendix C provides required sample containers, preservation techniques, and holding times, some of the more commonly monitored parameters warrant additional discussion. The following provides a more detailed discussion of considerations pertaining to cyanide, VOCs, organics and pesticides, O&G, pH, total residual chlorine, fecal coliform, fecal streptococcus, and 5-day Biochemical Oxygen Demand (BOD_5).

Cyanide

Cyanide is very reactive and unstable. If the sample cannot be analyzed immediately, it must be preserved by pH adjustment after collection. However, prior to pH adjustment, procedures to eliminate residual chlorine and sulfides must be followed immediately.

Where chlorine has the possibility of being present, the sample should be tested for residual chlorine by using potassium iodide-starch test paper previously moistened with acetate buffer. If the sample contains residual chlorine (a blue color indicates the need for treatment), ascorbic acid must be added 0.6 gram (g) at a time until the tests produce a negative result; then, an additional 0.6 g of ascorbic acid should be added to the sample.

Samples containing sulfides may be removed, in which case the holding time is extended to 14 days. Sulfides must be removed as follows:

- Use lead acetate paper moistened with an acetic acid buffer solution to test for the presence of sulfide. Darkening of the lead acetate paper indicates sulfide is present in the sample.
- Add cadmium nitrate to be added to the sample in a manner similar to the ascorbic acid until the test is negative.
- Filter with a 0.45 micrometer (μm) filter and prefilter combination immediately after.

After chlorine and sulfide residuals have been eliminated, the pH must be adjusted to greater than 12.0 standard units (s.u.) and chilled to 4°C.

R0013452

If cyanide is suspected to be present, the sampling personnel should bring all materials mentioned above to the sampling location.

VOCs

Sampling for VOCs requires the use of a glass vial. The vial should contain a teflon-coated septum seal. Volatiles will escape from the water to the air if any air is entrapped in the container. Therefore, the sample should be collected so that there are no air bubbles in the container after the screw cap and septum seal are applied. To ensure that air bubbles are not trapped in the vial, the following procedures should be followed:

- Fill the vial until a reverse meniscus forms above the top of the vial
- Screw on the cap (the excess sample will overflow)
- Invert the vial to check for the presence of air bubbles
- If air bubbles are observed, the vial should be opened, emptied, then completely refilled, and the first three actions should be repeated.

VOC samples should not be composited in the field. To composite a sample, the sampling personnel would have to mix it thoroughly. This mixing action would aerate the sample and cause volatiles to be lost. Therefore, VOC samples should be sent to the laboratory where they can be immediately, and carefully, composited and analyzed with minimal volatilization as per method Nos. 502.1, 502.2, 524.1, and 524.2 as described at 40 CFR 141.24(f)(14)(iv) and (v). There are two ways flow-weighted compositing of VOCs can be accomplished—mathematical compositing or procedural compositing as discussed below.

Mathematical Compositing

In this method, the grab samples are analyzed separately. The sampling personnel collect the requisite number of samples and send them to the laboratory. The laboratory performs the individual analyses on each sample. Five ml (or 25 ml if greater sensitivity is required) of each grab sample are placed into the purge vessel of the GC or GC/MS for analysis. Special precautions must be made to maintain zero headspace in the syringe used to transfer the VOC sample into the purge vessel of the GC or GC/MS. These analytical results are mathematically flow-weight composited

R0013453

using the calculation in Exhibit 3-24. The concentrations (C) should be adjusted by using the following formula:

$$Adjusted\ Concentration = \frac{Individual\ Aliquot\ Volume}{Total\ Composite\ Sample} \times C$$

Each sample concentration should be adjusted, and all adjusted concentrations added, to obtain the flow-weighted VOC composite using this method

Procedural Compositing

For the second method, sampling personnel collect the requisite number of samples and provide the laboratory with flow-weighted values for each sample using the calculation in Exhibit 3-24. The laboratory technician then draws the necessary volume from each aliquot into an adequately sized syringe, physically combining the samples to result in a flow-weighted composite sample for VOC analysis. Necessary volumes are drawn into the syringe with a volume control fitting. The samples are thus composited directly in the syringe and then placed in the purge vessel of the GC or GC/MS. The advantage of this procedure is that only one analysis on the GC or GC/MS has to be performed.

Although the applicant is required to report only flow-weighted composite concentrations, the mathematical compositing method may provide more information, as it will indicate the concentrations of each separate grab sample. For example, if the procedural compositing method is employed and one of the samples has a high concentration and the other three have non-detectable concentrations, the result will be an average which does not represent the concentration in any of the separate grab samples. In certain cases it may be important to know the concentration of each grab as well as the composite concentration. The mathematical compositing method would be the most appropriate compositing method in these cases.

Organics and Pesticides

The procedures affecting organics and pesticides [base/neutral/acids and pesticide polychlorinated biphenyls (PCBs)] are less complex than VOC procedures. Glass containers must be used for sample collection purposes, amber glass should be used to eliminate the potential for reactivity caused by light. These samples should be maintained at 4°C during storage and shipment. A preservative in

R0013454

the form of 0.008 percent sodium thiosulfate ($Na_2S_2O_3$) must be added to organic samples if residual chlorine is present. To determine if chlorine is present, a small color indicator test kit can be used. Eighty ml of $Na_2S_2O_3$ per liter of sample must then be added and mixed well until chlorine tests indicate a negative result as per methods 604 and 625 of 40 CFR Part 136 Appendix A. The pH of pesticide samples must be adjusted to between 5 and 9 s.u.

Oil and Grease

O&G tends to adhere to the surfaces that it contacts. Therefore, it should not be transferred from one container to another; rather, a 1-liter container should be used to take the sample. The container used for O&G must be made of glass. A teflon insert should be included in the glass container's lid. However, if teflon is not available, aluminum foil extending out from under the lid may be used. Samples for O&G must be preserved by adding sulfuric acid (H_2SO_4) or hydrochloric acid (HCl) to a pH of less than 2 s.u. and then stored at 4°C.

Additional Considerations

Some pollutants have specific analysis requirements due to short holding times that the applicant must consider. For example:

- Requirements to analyze immediately (pH, total residual chlorine, temperature, sulfite, and dissolved oxygen)
- Requirements to preserve immediately and analyze within 6 hours (fecal coliform and fecal streptococcus)
- Requirements to analyze within 48 hours (BOD_5).

Because of these requirements, field testing equipment may need to be purchased, borrowed, or rented for those parameters that may require field analysis. If the laboratory is located nearby, analysis in the field may not be required.

Laboratories do not always operate in the evenings or on weekends. As a result, holding times for samples taken in the late afternoon or on a Friday may be exceeded. To prevent this from occurring, close coordination with laboratories is necessary. The latest date and time of delivery should be

R0013455

established to avoid taking samples, only to discover they cannot be accepted by the laboratory and analyzed in accordance with 40 CFR Part 136 requirements.

3.6 SAMPLE VOLUMES

Exhibit 3-25 presents minimal suggested sample volumes for specific parameters. This exhibit should be consulted so that the proper volume is collected for analysis of each pollutant of concern. This exhibit may not include all parameters; if a particular parameter is not listed, refer to 40 CFR Part 136.

3.7 SAMPLE DOCUMENTATION

Information should be submitted to the laboratory with the sample to ensure proper handling by the laboratory. Exhibit 3-26 is an example form which can be used to document the following information.

- Unique Sample or Log Number - All samples should be assigned a unique identification number. If there is a serial number on the transportation case, the sampling personnel should add this number to the field records.
- Date and Time of Sample Collection - Date and time of sample collection (including notation of a.m. or p.m.) must be recorded. In the case of composite samples, the sequence of times and aliquot size should be noted.
- Source of Sample, Including Facility Name and Address - Use the outfall identification number from the site map with a narrative description; a diagram referring to the particular site where the sample was taken should be included.
- Name of Sampling Personnel - The names and initials of the persons taking the sample must be indicated. For a composite sample, the names of the persons installing the sampler and the names of the persons retrieving the sample should be included.
- Sample Type - Each sample should indicate whether it is a grab or composite sample. If the sample is a composite, the volume and frequency of individual aliquots should be noted.
- Preservation Used - Any preservatives (and the amount) added to the sample should be recorded. The method of preservation (e.g., refrigeration at 4°C) should be indicated.
- Analysis Required - All parameters for which the sample must be analyzed at the laboratory should be specified.

3.8 SAMPLE IDENTIFICATION AND LABELING

Prior to collection of the sample, a waterproof, gummed sample identification label or tag should be attached to the sample container. This label should contain relevant information for sample analysis, such as:

- Facility name
- Name of the sample collector
- Sample identification number
- Date and time of sample collection
- Type of analysis required
- Location of sample collection
- Preservatives used
- Type of sample (grab or composite).

Sample lids should be used to protect the sample's integrity from the time it is collected to the time it is opened in the laboratory. The lid should contain the collector's name, the date and time the sample was collected, and a sample identification number. Information on the seal must be identical to the information on the label. In addition, the lid should be taped shut so that the seal must be broken to open the sample container. Caution should be taken to ensure that glue from tape and label tag wires do not contaminate samples, particularly those containing volatile organics and metals. Also, waterproof ink should be used to avoid smearing on the label from melted ice used for cooling.

3.9 SAMPLE PACKAGING AND SHIPPING

If the samples are not hand-delivered to the laboratory or analyzed in an onsite laboratory, they should be placed in a transportation case (e.g., a cooler) along with the chain-of-custody record form, pertinent field records, and analysis request forms and shipped to the laboratory. Glass bottles should be wrapped in foam rubber, plastic bubble wrap, or other material to prevent breakage during shipment. The wrapping can be secured around the bottle with tape. The container lid should also be sealed with tape. Samples should be placed in ice or a synthetic ice substitute that

R0013461

will maintain the sample temperature at 4°C throughout shipment. Ice should be placed in double-wrapped watertight bags so the water will not leak from the shipping case. Metal or heavy plastic ice chests make good sample transportation cases. Filament tape wrapped around each end of the ice chest ensures that it will not open during transport. Sampling records (preferably laminated or waterproof) can be placed in a waterproof envelope and taped to the inside of the transportation case to avoid getting them wet in case a sample container or an ice bag leaks. Shipping containers should also be sealed to prevent tampering. A copy of all sampling records should be kept onsite in case they are requested by the permitting authority

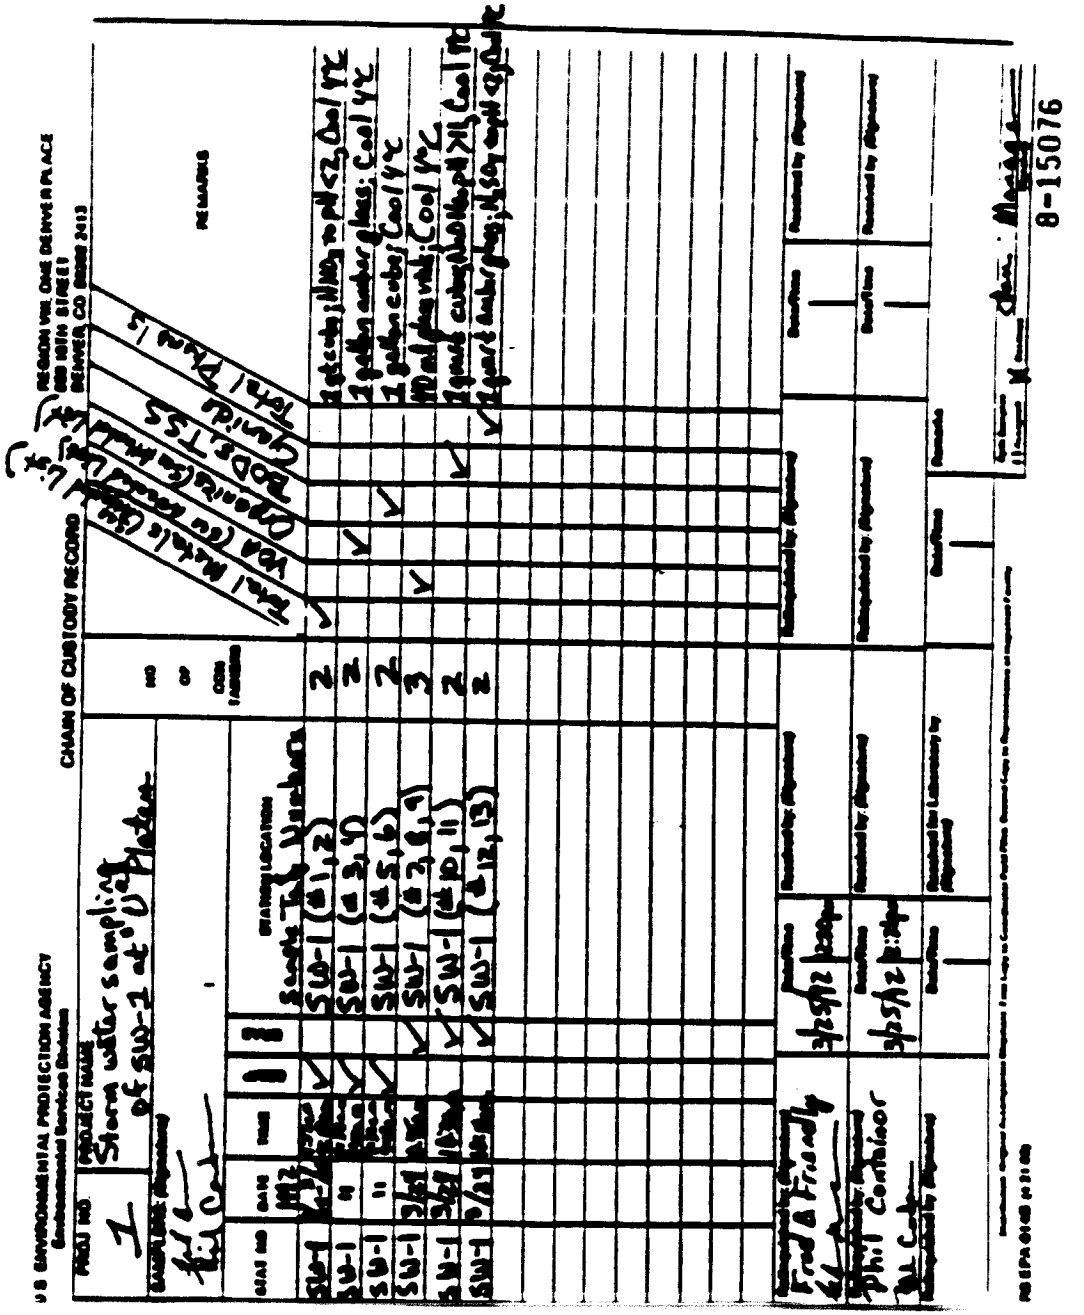
Most samples will not require any special transportation precautions except careful packaging to prevent breakage and/or spillage. If the sample is shipped by common carrier or sent through the U.S. mail, it must comply with Department of Transportation Hazardous Materials Regulations (49 CFR Parts 171-177). Air shipment of hazardous materials samples may also be covered by requirements of the International Air Transport Association (IATA). Before shipping a sample, the facility should be aware of, and follow, any special shipping requirements. Special packing and shipping rules apply to substances considered hazardous materials as defined by IATA rules. Storm water samples are not generally considered hazardous materials, but in the event of a spill, leakage, etc., at the collection site hazardous materials may be present in the samples. Be aware, before sampling, of what hazardous materials may be in the discharge drainage area. If the presence of hazardous materials is suspected, do not sample unless properly trained.

3.10 CHAIN-OF-CUSTODY PROCEDURES

Once samples have been obtained and collection procedures are properly documented, a written record of the chain of custody of that sample should be made. This is recommended so the applicant can be confident that the samples have not been tampered with and that the sample once analyzed is representative of the storm water discharge. "Chain-of-custody" refers to the documented account of changes in possession that occur for a particular sample or set of samples. The chain-of-custody record allows an accurate step-by-step recreation of the sampling path, from origin through analysis. Information necessary in chain-of-custody is:

- Name of the persons collecting the sample
- Sample ID numbers

R0013462



- Date and time of sample collection
- Location of sample collection
- Names and signatures of all persons handling the samples in the field and in the laboratory.

To ensure that all necessary information is documented, a chain-of-custody form should be developed. An example of such a form is found in Exhibit 3-27. Chain-of-custody forms should be printed on carbonless, multipart paper so all personnel handling the sample receive a copy. All sample shipments should be accompanied by the chain-of-custody record and a copy of these forms should be retained by the originator. In addition, all receipts associated with the shipment should be retained. Carriers typically will not sign for samples; therefore, seals must be used to verify that tampering has not occurred during shipment.

When transferring possession of samples, the transferee should sign and record the date and time on the chain-of-custody record. In general, custody transfers are made for each sample, although samples may be transferred as a group. Each person who takes custody should fill in the appropriate section of the chain-of-custody record.

4. ANALYTICAL CONSIDERATIONS

All storm water discharges must be sampled and analyzed in accordance with the test procedures provided in 40 CFR Part 136. This section discusses pollutant parameters which must be analyzed by storm water permit applicants. If the applicant wants to use an alternative test method, the facility must apply for approval (by submitting a description of the method to the permitting authority for approval) prior to application submission [see 40 CFR 136.4(d)(3)]. Section 5.4 elaborates on how to obtain approval for an analytical method for a parameter that is not included in 40 CFR Part 136. EPA-approved analytical methods at 40 CFR 136.3, Tables IB and IC are shown in Appendix C of this document.

When choosing the appropriate 40 CFR Part 136 analytical method, the applicant should consider sample interferences and potential field sampling error. Most method detection levels are established under ideal sample conditions (e.g., with little or no sample matrix interferences or sampling error). Thus, for storm water samples, the method chosen should account for sampling error and interferences.

4.1 INDUSTRIAL REQUIREMENTS

Industrial dischargers must provide information on the following parameters, as required in 40 CFR 122.26(c)(1)(i)(E):

- Any pollutant limited in an effluent guideline to which the facility is subject
- Any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility has an existing NPDES permit)
- O&G, pH, BOD_5, COD, TSS, total phosphorus, TKN, and nitrate plus nitrite nitrogen
- Any pollutant known or believed to be present [as required in 40 CFR 122.21(g)(7)]
- Flow measurements or estimates of the flow rate, the total amount of discharge for the storm events sampled, and the method of flow measurement or estimation
- The date and duration (in hours) of the storm events sampled, rainfall measurements or estimates of the storm event (in inches) which generated the sampled runoff, and the time between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event (in hours).

R0013465

4.1.1 INDIVIDUAL APPLICANTS

Industrial facilities submitting an individual permit application must provide sampling data in three parts of the Form 2F application form as discussed below. (Form 2F restates requirements listed in 40 CFR 122.21 and 122.26).

Section VII.A Parameters

Section VII.A of Form 2F requires the facility to sample (grab and flow-weighted samples) for O&G, BOD_5, COD, TSS, TKN, nitrate plus nitrite nitrogen, total phosphorus, and pH. These parameters are to be monitored by every facility applying for a storm water discharge permit, regardless of the type of operations that exist at the site. Sampling for additional parameters may be required, depending on the type of facility applying for the permit or the pollutants expected to be present in the discharge. These additional requirements are discussed in detail below.

Section VII.B Parameters

Section VII-B of Form 2F requires the applicant to identify all pollutants that are limited in an effluent guideline to which the facility is subject, as well as other toxic and nonconventional pollutants listed in the facility's NPDES permit for its process wastewater. EPA interprets that for pollutants listed in NPDES process wastewater permits, at a minimum, facilities must sample their storm water discharge for those pollutants specifically limited in their process wastewater permit. States can be more stringent, however, and may interpret this requirement to mean all pollutants listed in the permit. Once these parameters are identified, the applicant will be required to sample for these parameters by both grab and flow-weighted composite samples, except for the specified pollutants which must be grab sampled only. Form 2F requires the applicant to submit maximum values. The average values column is not compulsory, but should be completed if data are available. Applicable effluent guidelines appear in 40 CFR Parts 405-471. A listing of the Subchapter N—Effluent Guidelines and Standards by which the applicant may be regulated appears in Exhibit 4-1. The applicant must refer to the effluent guidelines and standards for the particular industry, and should determine which guidelines apply and which parameters should be listed in Section VII.B of Form 2F.

R0013466

R0013467

Section VII.C Parameters

Section VII.C requires the applicant to list, for each outfall, each pollutant described in 40 CFR Part 122, Appendix D, Tables II, III, IV, and V (Tables 2F-2, 2F-3, and 2F-4 of application Form 2F) that it knows, or has reason to believe, may be present in the storm water discharge. These pollutants consist of conventional and nonconventional pollutants, toxic pollutants and total phenol, Gas Chromatography/Mass Spectrometry (GC/MS) fraction volatile compounds, acid compounds, base/neutral compounds, pesticides, and hazardous substances. These tables are also provided on the back of Form 2F. Tables II and III of 40 CFR Part 122 Appendix D have been combined in Table 2F-3 of application Form 2F. Table IV of 40 CFR Part 122 Appendix D is listed as Table 2F-2 of application Form 2F and Table V of 40 CFR Part 122 Appendix D is listed as Table 2F-4 of application Form 2F. There are specific requirements associated with each table. If pollutants in Table IV of 40 CFR Part 122 Appendix D (Table 2F-2 of application Form 2F), are directly or indirectly limited by an effluent guideline limitation, the applicant must analyze for it and report the data. For other pollutants listed in Table IV of 40 CFR Part 122 Appendix D (Table 2F-2 of the application form), the applicant must either report quantitative data, if available, or briefly describe the reasons the pollutant is expected to be in the discharge.

For every pollutant in Tables II and III of 40 CFR Part 122 Appendix D (Table 2F-3 of application Form 2F) expected to be discharged in concentrations of 10 parts per billion (ppb) or greater, the applicant must submit quantitative data. For acrolein, acrylonitrile, 2,4-dinitrophenol, and 2-methyl-4,6-dinitrophenol, the applicant must submit quantitative data if any of these four pollutants is expected to be discharged in concentrations of 100 ppb or greater. For every pollutant expected to be discharged with a concentration less than 10 ppb (or 100 ppb for the four parameters mentioned above), the applicant must either submit quantitative data or briefly explain why the pollutant is expected to be discharged.

For the parameters identified in Table V of 40 CFR Part 122 Appendix D (Table 2F-4 of application Form 2F) that the applicant believes to be present in the discharge, no sampling is required. If previous analyses of these parameters were conducted, the results must be reported. Otherwise, the applicant is required to explain why these pollutants are believed to be present.

R0013468

Small Business Exemption

Small businesses are exempted from the reporting requirements for the organic toxic pollutants presented in 40 CFR Part 122, Table II of Appendix D. Applicants can claim a small business exemption if:

- The facility is a coal mine and the probable annual production is less than 100,000 tons per year. The applicant may submit past production data or estimate future production data instead of conducting analyses for the organic toxic pollutants listed in Table 2F-3 of application Form 2F.
- The facility is not a coal mine, and the gross total annual sales for the most recent 3 years is, on average, less than $100,000 per year (reflected in second quarter 1980 dollars). The applicant may submit sales data for those years instead of conducting analyses for the organic toxic pollutants listed in Table 2F-3 of application Form 2F.

Section VIII

Section VIII of Form 2F requires the applicant to provide biological toxicity testing data for storm water discharges associated with industrial activity. Applicants are required to perform biological toxicity testing for the storm water application if the facility's NPDES permit for its process wastewater lists biological toxicity (EPA interprets "listed" as limited). For example, if a facility's NPDES process wastewater permit has an acute toxicity limit of a lethal concentration (LC_{50}), equal to 75 percent effluent using ceriodaphnia, then that facility must also test its storm water discharges associated with industrial activity and report the results of the tests in Section VIII of Form 2F.

Until whole effluent toxicity methods are promulgated by EPA in 40 CFR Part 136, toxicity testing should be conducted using the most appropriate methods and species as determined by the permitting authority. In the absence of State acute toxicity testing protocols, EPA recommends using the methods described in Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Fresh Water and Marine Organisms. EPA/600/4-90-027 (Rev. September 1991)

4.1.2 GROUP APPLICANTS

Industrial facilities submitting a group application must also provide sampling data (from the sampling subgroup) which is required to be submitted in Sections VII, VIII, and IX along with the certification in Section X of Form 2F. At a minimum, these parameters include O&G, BOD_5, COD,

R0013469

TSS, TKN, nitrate plus nitrite nitrogen, total phosphorous, and pH. Furthermore, all pollutants listed in an effluent guideline or limited in an NPDES permit applicable to the sampling facilities within the group must be sampled, as well as pollutants suspected of being present based on significant materials and industrial activities present onsite.

4.2 MUNICIPAL REQUIREMENTS

For Part 1 of the municipal permit application, municipalities must submit samples from the field screening effort for pH, total chlorine, total copper, phenol, and detergents (or surfactants). A narrative description of the color, odor, turbidity, and presence of oil sheen and surface scum must be included. For Part 2 of the permit application, municipalities must provide quantitative data for the organic pollutants listed in Table II of 40 CFR Part 122 Appendix D, and the pollutants listed in 40 CFR Part 122, Appendix D, Table III, as well as some additional pollutants. These pollutants are listed in Exhibit 4-2.

Furthermore, 40 CFR 122.26(d)(2)(iii)(A)(5) requires that estimates be provided of the annual pollutant load of the cumulative discharges to waters of the U.S. from all identified municipal outfalls, and the event mean concentration of the cumulative discharges to waters of the U.S. from all identified municipal outfalls during storm events for the parameters listed in Exhibit 4-2. Estimates of the parameters must be accompanied by a description of the procedures for estimating constituent loads and concentrations, including any modelling, data analysis, and calculation methods.

R0013470

EXHIBIT 4-2. PARAMETERS WHICH MUST BE ANALYZED BY MUNICIPAL APPLICANTS

Pollutants Contained in Table III of 40 CFR Part 122, Appendix D				
Total antimony	Total cadmium	Total lead	Total selenium	Total zinc
Total arsenic	Total chromium	Total mercury	Total silver	Total cyanide
Total beryllium	Total copper	Total nickel	Total thallium	Total phenols

Pollutants Contained in Table II of 40 CFR Part 122, Appendix D				
Acrolein	Toluene	Benzo(a)pyrene	2,6-dinitrotoluene	Gamma-BHC
Acrylonitrile	1,2-trans-dichloroethylene	3,4-benzofluoranthene	Di-n-octyl phthalate	Delta-BHC
Benzene	1,1,1-trichloroethane	Benzo(ghi)perylene	1,2-diphenylhydrazine	Chlordane
Bromoform	1,1,2-trichloroethane	Benzo(k)fluoranthene	Fluoranthene	4,4'-DDT
Carbon Tetrachloride	Trichloroethylene	Bis(2-chloroethoxy)methane	Fluorene	4,4'-DDE
Chlorobenzene	Vinyl chloride	Bis(2-chloroethyl)ether	Hexachlorobenzene	4,4'-DDD
Chlorodibromo-methane	2-chlorophenol	Bis(2-chloroisopropyl)ether	Hexachlorobutadiene	Dieldrin
Chloroethane	2,4-dichlorophenol	Bis(2-ethylhexyl)phthalate	Hexachlorocyclopen-tadiene	Alpha-endosulfan
2-Chloroethylvinyl ether	2,4-dimethylphenol	4-bromophenyl phenyl ether	Hexachloroethane	Beta-endosulfan
Chloroform	4,6-dinitro-o-cresol	Butylbenzyl phthalate	Indeno(1,2,3-cd)pyrene	Endosulfan sulfate
Dichlorobromo-methane	2,4-dinitrophenol	2-chloronaphthalene	Isophorone	Endrin
1,1-dichloroethane	2-nitrophenol	4-chlorophenyl phenyl ether	Naphthalene	Endrin aldehyde
1,2-dichloroethane	4-nitrophenol	Chrysene	Nitrobenzene	Heptachlor
1,1-dichloroethylene	p-chloro-m-cresol	Dibenzo(a,h)anthracene	N-nitrosodimethylamine	Heptachlor epoxide
1,2-dichloropropane	Pentachlorophenol	1,2-dichlorobenzene	N-nitrosodi-n-propylamine	PCB-1242
1,3-dichloropropylene	Phenol	1,3-dichlorobenzene	N-nitrosodiphenylamine	PCB-1254
Ethylbenzene	2,4,6-trichlorophenol	1,4-dichlorobenzene	Phenanthrene	PCB-1221
Methyl bromide	Acenaphthene	3,3-dichlorobenzidine	Pyrene	PCB-1232
Methyl chloride	Acenaphthylene	Diethyl phthalate	1,2,4-trichlorobenzene	PCB-1248
Methylene chloride	Anthracene	Dimethyl phthalate	Aldrin	PCB-1260
1,1,2,2-tetrachloroethane	Benzidine	Di-n-butyl phthalate	Alpha-BHC	PCB-1016
Tetrachloroethylene	Benzo(a)anthracene	2,4-dinitrotoluene	Beta-BHC	Toxaphene

Additional Pollutants Which Must be Analyzed		
TSS	O&G	TKN
TDS	Fecal coliform	Nitrate plus nitrite nitrogen
COD	Fecal streptococcus	Total and dissolved phosphorus
BOD_5	pH	
	Total residual chlorine

R0013472

5. FLEXIBILITY IN SAMPLING

The requirements for storm water sampling for permit applications offer some flexibility by the permitting authority. The areas of flexibility are discussed below.

5.1 PROTOCOL MODIFICATIONS

The permitting authority may allow sampling protocol modifications for specific requirements on a case-by-case basis. For example, the permitting authority may accept application forms with incomplete sampling data if there was no rainfall at the applicant's facility prior to the submission deadline. However, the permitting authority will require that sampling data be submitted as soon as possible. The reason for not submitting data must be certified by a corporate official (for industrial facilities) or the principal executive officer or ranking official (for municipalities).

Another area where permitting authorities may allow flexibility in storm water sampling is acceptance of quantitative data from a storm event that does not meet the representative rainfall criteria of within 50 percent of the volume and duration for the average storm event for the area. The permitting authority may decide that the discharge data provided is better than no data at all.

In addition, the permitting authority may establish appropriate site-specific sampling procedures or requirements, including sampling locations; the season in which the sampling takes place; the minimum duration between the previous measurable storm event and the storm event sampled; the minimum or maximum level of precipitation required for an appropriate storm event; the form of precipitation sampled (snow melt or rainfall); protocols for collecting samples under 40 CFR Part 136; and additional time for submitting data on a case-by-case basis. The permitting authority should be contacted for preapproval of any necessary protocol modifications. In the case of group applications, EPA Headquarters should be contacted.

5.2 PETITION FOR SUBSTITUTING SUBSTANTIALLY IDENTICAL EFFLUENTS

As described at 40 CFR 122.21(g)(7), when an industrial applicant has two or more outfalls with substantially identical effluents, the permitting authority may allow the applicant to test only one outfall and to report that the quantitative data also apply to the substantially identical outfalls. In the case of group applications, the petition must be submitted to EPA Headquarters.

R0013473

For facilities seeking to demonstrate that storm water outfalls are substantially identical, a variety of methods can be used as determined by the permitting authority. Three possible petition options are discussed here: (1) submission of a narrative description and a site map; (2) submission of matrices; or (3) submission of model matrices. Detailed guidance on each of the three options for demonstrating substantially identical outfalls is provided below. An owner/operator certification should be submitted with each option. See Section 5.2.3 for an example of this certification.

5.2.1 OPTION ONE: NARRATIVE DESCRIPTION/SITE MAP

Facilities demonstrating that storm water outfalls are substantially identical may submit a narrative description of the facility and a site map to the permitting authority . The narrative portion must include a description of why the outfalls are substantially identical. Petitioners may demonstrate that these outfalls contain storm water discharges associated with:

- Substantially identical industrial activities and processes;
- Substantially identical significant materials that may be exposed to storm water [including, but not limited to, raw materials, fuels, materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under Section 101(14) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA); any chemical the facility is required to report pursuant to Section 313 of Title III of the Superfund Amendments and Reauthorization Act (SARA); fertilizers; pesticides; and waste products such as ashes, slag, and sludge that have the potential to be released with storm water discharges as per 40 CFR 122.26(b)(12)];
- Substantially identical storm water management practices (such as retention ponds, enclosed areas, diversion dikes, gutters, and swales) and material management practices (such as protective coverings and secondary containment); and
- Substantially identical flows, as determined by the estimated runoff coefficient and approximate drainage area at each outfall.

The site map should include an indication of the facility's topography; each of the drainage and discharge structures; the drainage area of each storm water outfall; paved areas and buildings within the drainage area for each storm water outfall; all past or present areas used for outdoor storage or disposal of significant materials; identification of the significant materials in each drainage area; and identification of each existing structural control measures used to reduce pollutants in storm water

R0013474

runoff, materials loading and access areas, and areas where pesticides, herbicides, soil conditioners, and fertilizers are applied.

Exhibit 5-1 offers an example of a narrative description/site map petition that sufficiently demonstrates identical outfalls. A demonstration of how to determine runoff coefficient estimates was presented in Section 3.2.2. Exhibit 5-2 presents an example of a site map to be included with the narrative description.

5.2.2 OPTION TWO: USE OF MATRICES TO INDICATE IDENTICAL OUTFALLS

Facilities attempting to demonstrate that storm water outfalls are substantially identical may submit matrices and an owner/operator certification describing specific information associated with each outfall to the permitting authority. Matrix information is required only for those outfalls that the permit applicant is attempting to demonstrate are identical, not for all outfalls. Petitioners must demonstrate, using the matrices, that the outfalls have storm water discharges that meet the criteria listed in Section 5.2.1. Refer to Exhibit 5-3 for examples of matrices that demonstrate substantially identical outfalls and Section 3.2.2 for guidance on determining runoff coefficient estimates.

5.2.3 OPTION THREE: MODEL MATRICES

Facilities attempting to demonstrate that storm water outfalls are substantially identical may submit model matrices and an owner/operator certification to the permitting authority. This option is particularly appropriate for facilities with a large number of storm water outfalls and the potential for numerous groupings of identical outfalls. In addition, this option may be useful in group applications that have a large sampling subgroup.

Model matrices should contain information for one grouping of substantially identical outfalls. For example, if a facility has 150 outfalls and several groupings of identical outfalls, the facility would choose one of the groupings of identical outfalls to provide information in the model matrices. The petitioner must demonstrate, using these matrices, that all outfalls within this grouping have storm water discharges that meet the criteria listed in Section 5.2.1.

The facility should provide an owner certification that all other groupings of outfalls have been examined and certified as substantially identical outfalls according to the criteria established in the

R0013475

EXHIBIT 5-1. PETITION TO SAMPLE SUBSTANTIALLY IDENTICAL OUTFALLS (NARRATIVE DESCRIPTION/SITE MAP)

Examples

I. The Pepper Company of Philadelphia, Pennsylvania, is primarily engaged in manufacturing paperboard, including paperboard coated on the paperboard machine (from wood pulp and other fiber pulp). This establishment is classified under SIC code 2631. Pursuant to the November 16, 1990, NPDES storm water permit application regulations, this facility is considered to be "engaging in industrial activity" for the purposes of storm water permit application requirements in 40 CFR 122.26(b)(14)(i) and (ii).

II. "When an applicant has two or more outfalls with substantially identical effluents, the Director may allow the applicant to test only one outfall and report that the quantitative data also apply to the substantially identical outfalls." [40 CFR 122.21(g)(7)]

In accordance with 40 CFR 122.21(g)(7) of the NPDES regulations, The Pepper Company hereby petitions the State of Pennsylvania (the permitting authority) for approval to sample certain representative storm water outfalls in groupings of storm water outfalls that are substantially identical. The Pepper Company will demonstrate that of the ten (10) outfalls discharging storm water from our paperboard manufacturing plant, there are two pairs of substantially identical outfalls. Outfalls 3 and 4 are substantially identical and should be grouped together. Outfalls 8 and 9 are substantially identical and should be grouped together. Outfalls 1, 2, 5, 6, 7, and 10 have distinct characteristics and, therefore, will not be grouped together with other outfalls for the purposes of storm water discharge sampling.

III. The Pepper Company will demonstrate that the substantially identical outfalls that have been grouped together contain storm water discharges associated with: (1) substantially identical industrial activities and processes that are occurring outdoors; (2) substantially identical significant materials (including raw materials, fuels, finished materials, waste products, and material handling equipment) that may be exposed to storm water; (3) substantially identical material management practices (such as runoff diversions, gutters and swales, protective coverings, and structural enclosures); and (4) substantially identical flows, as determined by the estimated runoff coefficient and approximate drainage area at each outfall.

R0013476

EXHIBIT 5-1. PETITION TO SAMPLE SUBSTANTIALLY IDENTICAL OUTFALLS (NARRATIVE DESCRIPTION/SITE MAP) (Continued)

1. Industrial Activities

A. Description of Industrial Activities at the Pepper Company

The Pepper Company receives wastepaper in bales. This baled wastepaper is sent through a hydropulper and converted to pulp. The fiber material is concentrated, stored, and then drawn through refiners to the paper machines. Wires, plastics, and miscellaneous material are removed during the pulping.

Three systems are used to produce top liner, back paper, and filler. The highest quality fiber is used for the top liner, the medium quality is used for the back paper, and the poorest quality is used for the filler paper. Wireforming or conventional boxboard processes are employed to produce clay-coated boxboard, using a water-based clay-coating material. Additional materials may be used as binders. These are stored indoors and are not exposed to precipitation. Ammonia is used in the clay-coating process. Off-grade fiber and trim material are ground up and returned to the liquid process stream. Slime control agents, consisting of bactericides, are used in association with this process. These agents are organic materials used to prevent souring of mill operations. They are received in drums and stored indoors. Empty drums are returned to the supplier to reuse. In addition, the Pepper Company operates an onsite landfill for the disposal of miscellaneous waste materials removed during pulping and paper cuttings operations.

B. Demonstration of Why Outfalls Are Substantially Identical in Terms of Industrial Activities Conducted Outdoors.

Outfalls 3 and 4

Outfalls 3 and 4 are substantially identical in terms of industrial activities conducted outdoors. Both outfalls contain storm water discharges associated with the outdoor storage of baled wastepaper. The wastepaper, which consists of old corrugated containers, mixed paper, and other types of wastepaper, is received weekly and stored for up to 3 weeks in Storage Areas #1 and #2. These uncovered storage areas are enclosed by chain-link fencing.

Outfalls 8 and 9

Outfalls 8 and 9 drain storm water runoff from areas where all industrial activities occur indoors. The industrial activities occurring under roof cover at these two outfalls include hydropulping, storage of concentrated fiber material, refining, and paperboard production. These industrial processes have no potential for contact with precipitation.

R0013477

EXHIBIT 5-1. PETITION TO SAMPLE SUBSTANTIALLY IDENTICAL OUTFALLS (NARRATIVE DESCRIPTION/SITE MAP) (Continued)

2. Significant Materials

A. Description of Significant Materials at the Pepper Company

The significant materials listed below are used by the Pepper Company to manufacture paperboard. These materials are stored indoors, unless otherwise indicated.

(i) Raw materials, including baled wastepaper (off-spec damaged paper stock or recycled paper) [wastepaper is stored outdoors at Storage Areas #1 and #2]; clays, ammonias, sizings, and slime control agents (chlorine dioxide); caustic; ammonia, which is stored in two tanks. [See Storage Area #3].

(ii) Waste Materials, including miscellaneous materials removed during pulping and paper cuttings (such as staples, rubber bands, styrofoam, etc.). These waste materials are stored indoors in open dumpsters. However, prior to disposing of the waste in the onsite landfill, these dumpsters are moved outdoors where they are potentially exposed to precipitation for 12 hours or less. [See Storage Area #3].

(iii) Finished Products, including paperboard and molded fiber products. These are always stored indoors.

(iv) Others, including wood pallets (which are used to transport and haul raw materials, waste materials, and finished products) are stored both indoors and outdoors. [See Storage Area #3]. The Pepper Company has an above-ground fuel tank with a pump. [See Storage Area #3].

B. Demonstration of Why Outfalls are Substantially Identical in Terms of Significant Materials that Potentially May be Exposed to Storm Water

Outfalls 3 and 4

Outfalls 3 and 4 are substantially identical in terms of significant materials that may be exposed to storm water. Both outfalls contain storm water discharges associated with the outdoor storage of baled wastepaper. The wastepaper, which consists of old corrugated containers, mixed paper, and other types of wastepaper, is received weekly and stored for up to 3 weeks in Storage Areas #1 and #2. These uncovered storage areas are enclosed by chain-link fencing.

Outfalls 8 and 9

Outfalls 8 and 9 are substantially identical in terms of significant materials. Both outfalls contain storm water runoff from areas that have no significant materials potentially exposed to storm water. All industrial activities occurring in the areas drained by Outfalls 8 and 9 occur completely indoors.

R0013478

EXHIBIT 5-1 PETITION TO SAMPLE SUBSTANTIALLY IDENTICAL OUTFALLS (NARRATIVE DESCRIPTION/SITE MAP) (Continued)

3. Material Management Practices

A. Description of Material Management Practices at the Pepper Company

The Pepper Company uses a wide range of storm water management practices and material management practices to limit the contact of significant materials with precipitation. Non-structural storm water management practices include employee training, spill reporting and clean-up, and spill prevention techniques. Structural storm water management practices include:

(i) Diversion Devices (both above-ground trenches and subterranean drains) are used to divert surface water from entering a potentially contaminated area.

(ii) Gutters/Swales (constructed of concrete or grass) channel storm water runoff to drainage systems leading to separate storm sewers.

(iv) Overland Flow (which is the flow of storm water over vegetative areas prior to entrance into a storm water conveyance) allows much of the storm water to infiltrate into the ground. The remainder is naturally filtered prior to reaching the storm water conveyance. This is not considered sheet flow since natural drainage channels may be carved out during a heavy storm event.

B. Demonstration of Why Outfalls Are Substantially Identical in Terms of Storm Water Management Practices Used

Outfalls 3 and 4

Outfalls 3 and 4 are substantially identical in terms of storm water management practices used. Both outfalls contain storm water discharges associated with the outdoor storage of baled wastepaper, located in Storage Areas #1 and #2. Concrete gutters at both sites channel storm water away from the storage areas down to the respective outfalls.

Outfalls 8 and 9

Outfalls 8 and 9 are substantially identical in terms of storm water management practices used. Both outfalls contain storm water runoff from areas that have no significant materials potentially exposed to storm water. All industrial activities occurring in the areas drained by Outfalls 8 and 9 occur completely indoors. Both outfalls receive overland flow storm water. From roof drains, the storm water in both drainage areas is then conveyed over similarly graded vegetative areas prior to entrance into the respective outfalls.

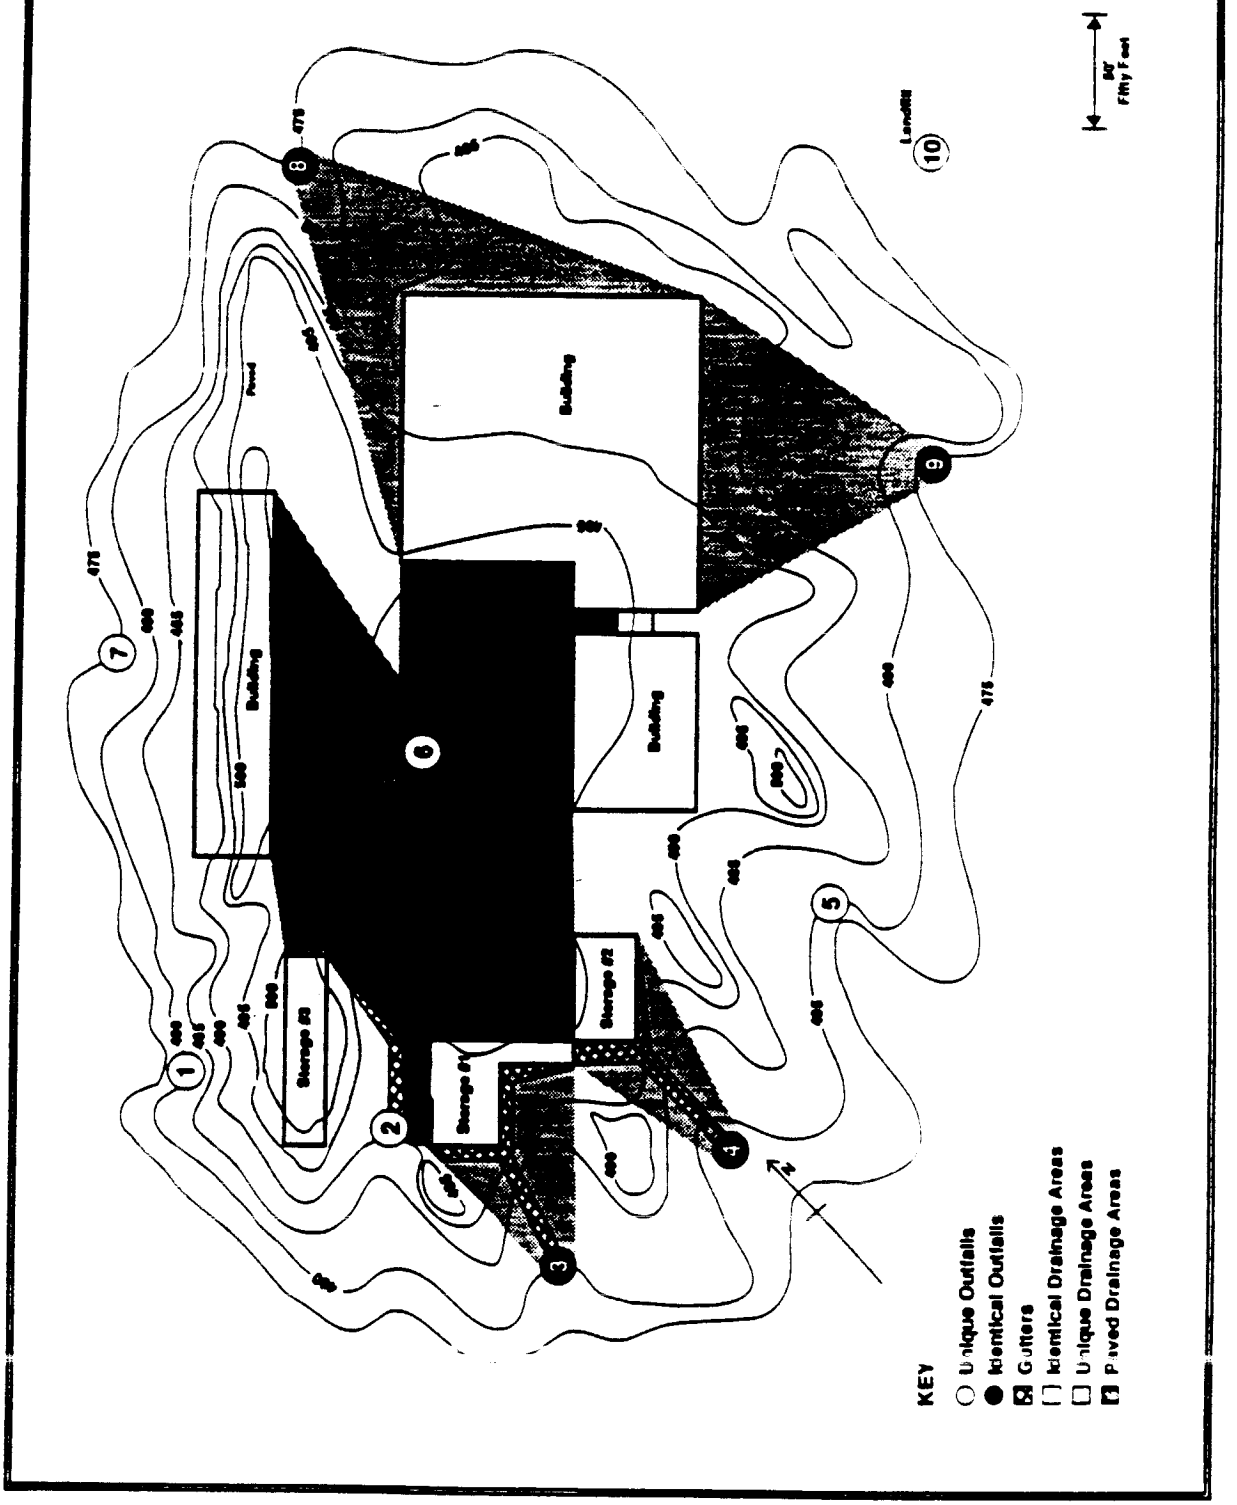
R0013479

EXHIBIT 5-1. PETITION TO SAMPLE SUBSTANTIALLY IDENTICAL OUTFALLS (NARRATIVE DESCRIPTION/SITE MAP) (Continued)

4. **Flow Characteristics**

A. Demonstration of Why Outfalls Are Substantially Identical in Terms of Flow, as Determined by The Estimated Runoff Coefficient and Approximate Drainage Area at Each Outfall

Outfalls 3 and 4



Outfalls 3 and 4 are substantially identical in terms of flow. Both drainage areas have a 2 to 7 percent grade and contain fine textured soil (greater than 40 percent clay) with a vegetative cover. The estimated runoff coefficient for both outfalls is .2. The approximate drainage area for each outfall is similar. Outfall 3 has an approximate drainage area of 3,500 square feet. Outfall 4 has an approximate drainage area of 2,900 square feet.

Outfalls 8 and 9

Outfalls 8 and 9 are substantially identical in terms of flow. Both drainage areas have a 2 to 7 percent grade and contain fine textured soil (greater than 40 percent clay) with a vegetative cover. The estimated runoff coefficient for both outfalls is .2. The approximate drainage area for each outfall is similar. Outfall 8 has an approximate drainage area of 7,600 square feet. Outfall 9 has an approximate drainage area of 8,700 square feet.

model matrices described in Exhibit 5-3. The owner/operator who signs documents in this section should include the following certification:

> "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations" [as per 40 CFR 122.22(d)].

5.3 ALTERNATE 40 CFR PART 136 METHOD

As required in 40 CFR 136.4, the applicant must request the approval of an alternate test procedure in writing (in triplicate) prior to testing. The request must be submitted to the Regional Administrator through the Director of the State agency responsible for issuing NPDES permits. The applicant must:

- Provide the name and address of the responsible person or firm making the discharge (if not the applicant), the applicable identification number of the existing or pending permit, the issuing agency, the type of permit for which the alternate test procedure is requested, and the discharge serial number;
- Identify the pollutant or parameter for which approval of an alternate testing procedure is being requested;
- Provide justification for using testing procedures other than those specified in 40 CFR Part 136;
- Provide a detailed description of the proposed alternate test procedure, together with references to published studies of the applicability of the alternate test procedure to the effluents in question;
- Provide comparability data (for applicants applying for nation wide approval of an alternative test procedures).

The permitting authority will notify the applicant within 90 days regarding the approval of the alternate method.

R0013484

5.4 LACK OF METHOD IN 40 CFR PART 136

If a specific pollutant that must be tested does not have a corresponding analytical method listed in 40 CFR Part 136, the applicant must submit information on an appropriate method to be used. The permitting authority must approve its use prior to collection and analysis of sampling data. The laboratory should be consulted for suggestions and information about analytical methods that can be used. All information justifying the alternative method should be sent to the permitting authority prior to use.

R0013485

R0013486

6. HEALTH AND SAFETY

Storm water sampling activities may occur when the sampling environment and/or storm water discharges create hazardous conditions. Hazardous conditions associated with sampling include:

- Hazardous weather conditions (e.g., wind, lightning, flooding, etc.)
- Sampling in confined spaces (e.g., manholes)
- Hazards associated with chemicals
- Biological hazards (e.g., rodents and snakes)
- Physical hazards (e.g., traffic, falling objects, sharp edges, slippery footing, and the potential for lifting injuries from opening or removing access panels and manhole covers, etc.)

It is essential that sampling personnel be aware of these hazards. Sampling personnel should be trained to evaluate potentially hazardous situations and develop ways for handling them. Since sampling hazards can be life threatening, safety must be the highest priority for all personnel. This chapter outlines general health and safety issues and concerns. Additional references discussed below should be consulted for more specific guidance to avoid adverse health and safety situations.

6.1 GENERAL TRAINING REQUIREMENTS

Preparation and training of all sampling personnel should be completed before beginning any sampling task. Extreme care should be taken to allow for safety precautions including proper equipment and appropriate operational techniques, sufficient time to accomplish the task, training on potential hazards, and emergency procedures. EPA's Order 1440.2 sets out the policy, responsibilities, and mandatory requirements for the safety of personnel who are involved in sampling activities. This order, which is found within the EPA NPDES Compliance Monitoring Inspector Training: Sampling manual, provides further guidance to applicants' storm water sampling personnel. Basic emergency precautions include having access to both local emergency phone numbers and communication equipment (i.e., phones or radios), and ensuring that personnel are trained in first aid and carry first aid equipment.

R0013487

6.2 NECESSARY SAFETY EQUIPMENT

Exhibit 6-1 contains a list of safety equipment that may be appropriate depending on the characteristics of the sampling site.

EXHIBIT 6-1. LIST OF SAFETY EQUIPMENT	
Flashlight	18-inch traffic cones
Meters (for oxygen, explosivity, toxic gases)	Insect/rodent repellant
Ladder	Ventilation equipment
Safety harness	50 feet of 1/2-inch nylon rope
Hard hat	Safety shoes
Safety goggles	Rain wear
Coveralls	Gloves (rubber)
Respirator	First aid kit
Reflective vests	Self-contained breathing apparatus
Source: Adapted from NPDES Compliance Monitoring Inspector Training: Sampling, U.S. EPA, August 1990.	

6.3 HAZARDOUS WEATHER CONDITIONS

Common sense should dictate whether sampling be conducted during adverse weather conditions. No sampling personnel should place themselves in danger during high winds, lightning storms, or flooding conditions which might be unsafe. Under extreme conditions, a less hazardous storm event should be sampled.

6.4 SAMPLING IN CONFINED SPACES

Confined spaces encountered by storm water sampling personnel typically include manholes and deep, unventilated ditches. A confined space is generally defined as a space that is somewhat enclosed with limited access and inadequate ventilation.

R0013488

The National Institute of Occupational Safety and Health (NIOSH) has developed a manual entitled "Working in Confined Spaces" which should be consulted prior to confined space entry. Also, several States have developed specific procedures which should also be consulted. Unless they have been trained for confined space entry, sampling personnel should avoid entry under all circumstances.

6.4.1 HAZARDOUS CONDITIONS IN CONFINED SPACES

Confined spaces pose a safety threat to sampling personnel because of low oxygen, explosivity, and toxic gases. When entering a confined space, a qualified person should ensure that the atmosphere is safe by sampling to test for oxygen levels, potential flammable hazards, and toxic materials known or suspected to be present. If atmospheric conditions are detected, the confined space should be ventilated or sampling personnel should use a self-contained air supply and wear a life line. At least one person should remain outside of the confined space in the event that problems arise. If atmospheric testing has not been properly conducted, the confined space should not be entered. Manholes can also pose a threat to safety because of the small confined area, slippery surfaces, sharp objects, unsafe ladders, etc.

6.4.2 SPECIAL TRAINING REQUIREMENTS

Personnel should not enter into a confined space unless trained in confined space entry techniques. Such training covers hazard recognition, the use of respiratory equipment and atmospheric testing devices, use of special equipment and tools, and emergency and rescue procedures. In addition, at least one member of the sampling crew should be certified in basic first aid and Cardiopulmonary Resuscitation (CPR). Sampling personnel should, on an annual basis, practice confined space rescues.

6.4.3 PERMIT SYSTEM

If entry into a confined space is necessary, an entry permit system should be developed which includes a written procedure. This permit should include, at a minimum:

- Description of type of work to be done
- Hazards that may be encountered

R0013489

- Location and description of the confined space
- Information on atmospheric conditions at confined space
- Personnel training and emergency procedures
- Names of sampling personnel.

The manual developed by NIOSH discusses this permit system in more detail. Furthermore, the Occupational Safety and Health Administration (OSHA) proposed a rule on June 5, 1989 (54 FR 24080) that would implement a permit system. The rule is expected to be finalized and published late in 1992.

6.5 CHEMICAL HAZARDS

Sampling personnel can also be at risk of exposure to hazardous chemicals—either chemicals in the actual storm water discharge or the chemicals that have been placed in the sample collection containers for sample preservation. Therefore, direct contact with the preservatives and the storm water (if hazardous chemicals are suspected to be present) should be avoided. Sampling personnel should wear gloves and safety glasses to avoid skin and eye exposure to harmful chemicals. Sampling personnel should be trained to avoid exposure and instructed as to what to do if exposure occurs (e.g., flush the eyes, rinse the skin, ventilate the area, etc.).

6.6 BIOLOGICAL HAZARDS

Storm water sampling personnel may also encounter biological hazards such as rodents, snakes, and insects. The sampling crew should remain alert to these hazards. As mentioned in Section 6.2, necessary sampling equipment, for certain locations, should include insect/rodent repellant and a first aid kit.

6.7 PHYSICAL HAZARDS

The sampling crew should be aware of a number of physical hazards that could cause accidents at the sampling site. These hazards include traffic hazards, sharp edges, falling objects, slippery footing, and lifting injuries from removing manhole covers. Sampling personnel should pay close attention in order to prevent these safety hazards at all times.

R0013490

If the sample point is in a manhole, a street gutter, or ditch near the street, particular attention must be given to marking off the work area to warn oncoming traffic of the presence of the sampling crew. Traffic cones, warning signs, and barricades should be placed in appropriate places around the sampling point.

R0013491

TECHNICAL APPENDIX A

FORMS 2F AND 1

Please print or type in the unshaded areas only

EPA ID Number *(copy from item I of Form 1)*

Form Approved. OMB No. 2040-0086
Approval expires 5-31-92

Form 2F NPDES

EPA

United States Environmental Protection Agency
Washington, DC 20460

Application for Permit to Discharge Storm Water Discharges Associated with Industrial Activity

Paperwork Reduction Act Notice

Public reporting burden for this application is estimated to average 28.6 hours per application, including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding the burden estimate, any other aspect of this collection of information, or suggestions for improving this form, including suggestions which may increase or reduce this burden to: Chief, Information Policy Branch, PM-223, U.S. Environmental Protection Agency, 401 M St., SW, Washington, DC 20460, or Director, Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503.

I. Outfall Location

For each outfall, list the latitude and longitude of its location to the nearest 15 seconds and the name of the receiving water.

A. Outfall Number *(list)*	B. Latitude	C. Longitude	D. Receiving Water *(name)*

II. Improvements

A. Are you now required by any Federal, State, or local authority to meet any implementation schedule for the construction, upgrading or operation of wastewater treatment equipment or practices or any other environmental programs which may affect the discharges described in this application? This includes, but is not limited to, permit conditions, administrative or enforcement orders, enforcement compliance schedule letters, stipulations, court orders, and grant or loan conditions.

1. Identification of Conditions, Agreements, Etc.	2. Affected Outfalls		3. Brief Description of Project	4. Final Compliance Date	
	number	source of discharge		a. req.	b. proj.

B. You may attach additional sheets describing any additional water pollution (or other environmental projects which may affect your discharges) you now have under way or which you plan. Indicate whether each program is now under way or planned, and indicate your actual or planned schedules for construction.

III. Site Drainage Map

Attach a site map showing topography (or indicating the outline of drainage areas served by the outfall(s) covered in the application if a topographic map is unavailable) depicting the facility including: each of its intake and discharge structures; the drainage area of each storm water outfall; paved areas and buildings within the drainage area of each storm water outfall, each known past or present areas used for outdoor storage or disposal of significant materials, each existing structural control measure to reduce pollutants in storm water runoff, materials loading and access areas, areas where pesticides, herbicides, soil conditioners and fertilizers are applied; each of its hazardous waste treatment, storage or disposal units (including each area not required to have a RCRA permit which is used for accumulating hazardous waste under 40 CFR 262.34); each well where fluids from the facility are injected underground; springs, and other surface water bodies which receive storm water discharges from the facility.

Continued from the Front

IV. Narrative Description of Pollutant Sources

A. For each outfall, provide an estimate of the area (include units) of impervious surfaces (including paved areas and building roofs) drained to the outfall, and an estimate of the total surface area drained by the outfall.

Outfall Number	Area of Impervious Surface (provide units)	Total Area Drained (provide units)	Outfall Number	Area of Impervious Surface (provide units)	Total Area Drained (provide units)

B. Provide a narrative description of significant materials that are currently or in the past three years have been treated, stored or disposed in a manner to allow exposure to storm water; method of treatment, storage, or disposal; past and present materials management practices employed to minimize contact by these materials with storm water runoff; materials loading and access areas; and the location, manner, and frequency in which pesticides, herbicides, soil conditioners, and fertilizers are applied.

C. For each outfall, provide the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of the treatment the storm water receives, including the schedule and type of maintenance for control and treatment measures and the ultimate disposal of any solid or fluid wastes other than by discharge.

Outfall Number	Treatment	List Codes from Table 2F-1

V. Nonstormwater Discharges

A. I certify under penalty of law that the outfall(s) covered by this application have been tested or evaluated for the presence of nonstormwater discharges, and that all nonstormwater discharges from these outfall(s) are identified in either an accompanying Form 2C or Form 2E application for the outfall.

Name and Official Title (type or print)	Signature	Date Signed

B. Provide a description of the method used, the date of any testing, and the onsite drainage points that were directly observed during a test.

VI. Significant Leaks or Spills

Provide existing information regarding the history of significant leaks or spills of toxic or hazardous pollutants at the facility in the last three years, including the approximate date and location of the spill or leak, and the type and amount of material released.

EPA ID Number (copy from item I of Form 1)

Continued from Page 2

VII. Discharge Information

A,B,C, & D: See instructions before proceeding. Complete one set of tables for each outfall. Annotate the outfall number in the space provided. Tables VII-A, VII-B, and VII-C are included on separate sheets numbered VII-1 and VII-2.

E. Potential discharges not covered by analyses - is any toxic pollutant listed in table 2F-2, 2F-3 or 2F-4, a substance or a component of a substance which you currently use or manufacture as an intermediate or final product or byproduct?

☐ Yes (list all such pollutants below) ☐ No (go to Section G)

VIII. Biological Toxicity Testing Data

Do you have any knowledge or reason to believe that any biological test for acute or chronic toxicity has been made on any of your discharges or on a receiving water in relation to your discharge within the last 3 years?

☐ Yes (list all such pollutants below) ☐ No (go to Section IX)

IX. Contract Analysis Information

Were any of the analyses reported in item VII performed by a contract laboratory or consulting firm?

☐ Yes (list the name, address, and telephone number of, and pollutants analyzed by, each such laboratory or firm below) ☐ No (go to Section X)

A. Name	B. Address	C. Area Code & Phone No.	D. Pollutants Analyzed

X. Certification

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

A. Name & Official Title (type or print)	B. Area Code and Phone No.
C. Signature	D. Date Signed

EPA Form 3510-2F (Rev. 1-92) Page 3 of 3

EPA ID number (copy from item 1 of Form 1) Form Approved OMB No. 2040-0086
Approval expires 5-31-92

VII. Discharge Information *(Continued from page 3 of Form 2F)*

Part A - You must provide the results of at least one analysis for every pollutant in this table. Complete one table for each outfall. See instructions for additional details.

Pollutant and CAS Number (if available)	Maximum Values (include units)		Average Values (include units)		Number of Storm Events Sampled	Sources of Pollutants
	Grab Samples Taken During First 30 Minutes	Flow-weighted Composite	Grab Samples Taken During First 30 Minutes	Flow-weighted Composite		
Oil and Grease						
Biological Oxygen Demand (BOD5)						
Chemical Oxygen Demand (COD)						
Total Suspended Solids (TSS)						
Total Kjeldahl Nitrogen						
Nitrate plus Nitrite Nitrogen						
Total Phosphorus						
pH	Minimum	Maximum	Minimum	Maximum		

Part B - List each pollutant that is limited in an effluent guideline which the facility is subject to or any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit). Complete one table for each outfall. See the instructions for additional details and requirements.

Pollutant and CAS Number (if available)	Maximum Values (include units)		Average Values (include units)		Number of Storm Events Sampled	Sources of Pollutants
	Grab Samples Taken During First 30 Minutes	Flow-weighted Composite	Grab Samples Taken During First 30 Minutes	Flow-weighted Composite		

Continued from the Front

Part C - List each pollutant shown in Tables 2F-2, 2F-3, and 2F-4 that you know or have reason to believe is present. See the instructions for additional details and requirements. Complete one table for each outfall.

Pollutant and CAS Number (if available)	Maximum Values (include units)		Average Values (include units)		Number of Storm Events Sampled	Sources of Pollutants
	Grab Sample Taken During First 30 Minutes	Flow-weighted Composite	Grab Sample Taken During First 30 Minutes	Flow-weighted Composite		

Part D - Provide data for the storm event(s) which resulted in the maximum values for the flow weighted composite sample.

1. Date of Storm Event	2. Duration of Storm Event (in minutes)	3. Total rainfall during storm event (in inches)	4. Number of hours between beginning of storm measured and end of previous measurable rain event	5. Maximum flow rate during rain event (gallons/minute or specify units	6. Total flow from rain event (gallons or specify units)

7. Provide a description of the method of flow measurement or estimate.

R0013497

Instructions - Form 2F
Application for Permit to Discharge Storm Water Associated with Industrial Activity

Who Must File Form 2F

Form 2F must be completed by operators of facilities which discharge storm water associated with industrial activity or by operators of storm water discharges that EPA is evaluating for designation as a significant contributor of pollutants to waters of the United States, or as contributing to a violation of a water quality standard.

Operators of discharges which are composed entirely of storm water must complete Form 2F (EPA Form 3510-2F) in conjunction with Form 1 (EPA Form 3510-1).

Operators of discharges of storm water which are combined with process wastewater (process wastewater is water that comes into direct contact with or results from the production or use of any raw material, intermediate product, finished product, byproduct, waste product, or wastewater) must complete and submit Form 2F, Form 1, and Form 2C (EPA Form 3510-2C).

Operators of discharges of storm water which are combined with nonprocess wastewater (nonprocess wastewater includes noncontact cooling water and sanitary wastes which are not regulated by effluent guidelines or a new source performance standard, except discharges by educational, medical, or commercial chemical laboratories) must complete Form 1, Form 2F, and Form 2E (EPA Form 3510-2E).

Operators of new sources or new discharges of storm water associated with industrial activity which will be combined with other nonstormwater new sources or new discharges must submit Form 1, Form 2F, and Form 2D (EPA Form 3510-2D).

Where to File Applications

The application forms should be sent to the EPA Regional Office which covers the State in which the facility is located. Form 2F must be used only when applying for permits in States where the NPDES permits program is administered by EPA. For facilities located in States which are approved to administer the NPDES permits program, the State environmental agency should be contacted for proper permit application forms and instructions.

Information on whether a particular program is administered by EPA or by a State agency can be obtained from your EPA Regional Office. Form 1, Table 1 of the "General Instructions" lists the addresses of EPA Regional Offices and the States within the jurisdiction of each Office.

Completeness

Your application will not be considered complete unless you answer every question on this form and on Form 1. If an item does not apply to you, enter "NA" (for not applicable) to show that you considered the question.

Public Availability of Submitted Information

You may not claim as confidential any information required by this form or Form 1, whether the information is reported on the forms or in an attachment. Section 402(j) of the Clean Water Act requires that all permit applications will be available to the public. This information will be made available to the public upon request.

Any information you submit to EPA which goes beyond that required by this form, Form 1, or Form 2C you may claim as confidential, but claims for information which are effluent data will be denied.

If you do not assert a claim of confidentiality at the time of submitting the information, EPA may make the information public without further notice to you. Claims of confidentiality will be handled in accordance with EPA's business confidentiality regulations at 40 CFR Part 2.

Definitions

All significant terms used in these instructions and in the form are defined in the glossary found in the General Instructions which accompany Form 1.

EPA ID Number

Fill in your EPA Identification Number at the top of each odd-numbered page of Form 2F. You may copy this number directly from item I of Form 1.

Item I

You may use the map you provided for item XI of Form 1 to determine the latitude and longitude of each of your outfalls and the name of the receiving water.

Item II-A

If you check "yes" to this question, complete all parts of the chart, or attach a copy of any previous submission you have made to EPA containing the same information.

Item II-B

You are not required to submit a description of future pollution control projects if you do not wish to or if none is planned.

Item III

Attach a site map showing topography (or indicating the outline of drainage areas served by the outfall(s) covered in the application if a topographic map is unavailable) depicting the facility including:

each of its drainage and discharge structures;

the drainage area of each storm water outfall;

paved areas and building within the drainage area of each storm water outfall, each known past or present areas used for outdoor storage or disposal of significant materials, each existing structural control measure to reduce pollutants in storm water runoff, materials loading and access areas, areas where pesticides, herbicides, soil conditioners and fertilizers are applied;

each of its hazardous waste treatment, storage or disposal facilities (including each area not required to have a RCRA permit which is used for accumulating hazardous waste for less than 90 days under 40 CFR 262.34);

each well where fluids from the facility are injected underground; and

springs, and other surface water bodies which receive storm water discharges from the facility;

Item IV-A

For each outfall, provide an estimate of the area drained by the outfall which is covered by impervious surfaces. For the purpose of this application, impervious surfaces are surfaces where storm water runs off at rates that are significantly higher than background rates (e.g., predevelopment levels) and include paved areas, building roofs, parking lots, and roadways. Include an estimate of the total area (including all impervious and pervious areas) drained by each outfall. The site map required under item III can be used to estimate the total area drained by each outfall.

Item IV-B

Provide a narrative description of significant materials that are currently or in the past three years have been treated, stored, or disposed in a manner to allow exposure to storm water; method of treatment, storage or disposal of these materials; past and present materials management practices employed, in the last three years, to minimize contact by these materials with storm water runoff; materials loading and access areas; and the location, manner, and frequency in which pesticides, herbicides, soil conditioners, and fertilizers are applied. Significant materials should be identified by chemical name, form (e.g., powder, liquid, etc.), and type of container or treatment unit. Indicate any materials treated, stored, or disposed of together. "Significant materials" includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under Section 101(14) of CERCLA; any chemical the facility is required to report pursuant to Section 313 of Title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag and sludge that have the potential to be released with storm water discharges.

Item IV-C

For each outfall, structural controls include structures which enclose material handling or storage areas, covering materials, berms, dikes, or diversion ditches around manufacturing, production, storage or treatment units, retention ponds, etc. Nonstructural controls include practices such as spill prevention plans, employee training, visual inspections, preventive maintenance, and housekeeping measures that are used to prevent or minimize the potential for releases of pollutants.

R0013499

Item V

Provide a certification that all outfalls that should contain storm water discharges associated with industrial activity have been tested or evaluated for the presence of non-storm water discharges which are not covered by an NPDES permit. Tests for such non-storm water discharges may include smoke tests, fluorometric dye tests, analysis of accurate schematics, as well as other appropriate tests. Part B must include a description of the method used, the date of any testing, and the onsite drainage points that were directly observed during a test. All non-storm water discharges must be identified in a Form 2C or Form 2E which must accompany this application (see beginning of instructions under section titled "Who Must File Form 2F" for a description of when Form 2C and Form 2E must be submitted).

Item VI

Provide a description of existing information regarding the history of significant leaks or spills of toxic or hazardous pollutants at the facility in the last three years.

Item VII-A, B, and C

These items require you to collect and report data on the pollutants discharged for each of your outfalls. Each part of this item addresses a different set of pollutants and must be completed in accordance with the specific instructions for that part. The following general instructions apply to the entire item.

General Instructions

Part A requires you to report at least one analysis for each pollutant listed. Parts B and C require you to report analytical data in two ways. For some pollutants addressed in Parts B and C, if you know or have reason to know that the pollutant is present in your discharge, you may be required to list the pollutant and test (sample and analyze) and report the levels of the pollutants in your discharge. For all other pollutants addressed in Parts B and C, you must list the pollutant if you know or have reason to know that the pollutant is present in the discharge, and either report quantitative data for the pollutant or briefly describe the reasons the pollutant is expected to be discharged. (See specific instructions on the form and below for Parts A through C.) Base your determination that a pollutant is present in or absent from your discharge on your knowledge of your raw materials, material management practices, maintenance chemicals, history of spills and releases, intermediate and final products and byproducts, and any previous analyses known to you of your effluent or similar effluent.

A. **Sampling:** The collection of the samples for the reported analyses should be supervised by a person experienced in performing sampling of industrial wastewater or storm water discharges. You may contact EPA or your State permitting authority for detailed guidance on sampling techniques and for answers to specific questions. Any specific requirements contained in the applicable analytical methods should be followed for sample containers, sample preservation, holding times, the collection of duplicate samples, etc. The time when you sample should be representative, to the extent feasible, of your treatment system operating properly with no system upsets. Samples should be collected from the center of the flow channel, where turbulence is at a maximum, at a site specified in your present permit, or at any site adequate for the collection of a representative sample.

   For pH, temperature, cyanide, total phenols, residual chlorine, oil and grease, and fecal coliform, grab samples taken during the first 30 minutes (or as soon thereafter as practicable) of the discharge must be used (you are not required to analyze a flow-weighted composite for these parameters). For all other pollutants both a grab sample collected during the first 30 minutes (or as soon thereafter as practicable) of the discharge and a flow-weighted composite sample must be analyzed. However, a minimum of one grab sample may be taken for effluents from holding ponds or other impoundments with a retention period of greater than 24 hours.

   All samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches and at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where feasible, the variance in the duration of the event and the total rainfall of the event should not exceed 50 percent from the average or median rainfall event in that area.

   A grab sample shall be taken during the first thirty minutes of the discharge (or as soon thereafter as practicable), and a flow-weighted composite shall be taken for the entire event or for the first three hours of the event.

   Grab and composite samples are defined as follows:

Grab sample: An individual sample of at least 100 milliliters collected during the first thirty minutes (or as soon thereafter as practicable) of the discharge. This sample is to be analyzed separately from the composite sample.

Flow-Weighted Composite sample: A flow-weighted composite sample may be taken with a continuous sampler that proportions the amount of sample collected with the flow rate or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire event or for the first three hours of the event, with each aliquot being at least 100 milliliters and collected with a minimum period of fifteen minutes between aliquot collections. The composite must be flow proportional; either the time interval between each aliquot or the volume of each aliquot must be proportional to either the stream flow at the time of sampling or the total stream flow since the collection of the previous aliquot. Aliquots may be collected manually or automatically. Where GC/MS Volatile Organic Analysis (VOA) is required, aliquots must be combined in the laboratory immediately before analysis. Only one analysis for the composite sample is required.

Data from samples taken in the past may be used, provided that:

All data requirements are met;

Sampling was done no more than three years before submission; and

All data are representative of the present discharge.

Among the factors which would cause the data to be unrepresentative are significant changes in production level, changes in raw materials, processes, or final products, and changes in storm water treatment. When the Agency promulgates new analytical methods in 40 CFR Part 136, EPA will provide information as to when you should use the new methods to generate data on your discharges. Of course, the Director may request additional information, including current quantitative data, if they determine it to be necessary to assess your discharges. The Director may allow or establish appropriate site-specific sampling procedures or requirements, including sampling locations, the season in which the sampling takes place, the minimum duration between the previous measurable storm event and the storm event sampled, the minimum or maximum level of precipitation required for an appropriate storm event, the form of precipitation sampled (snow melt or rainfall), protocols for collecting samples under 40 CFR Part 136, and additional time for submitting data on a case-by-case basis.

B. **Reporting:** All levels must be reported as concentration and mass (note: grab samples are reported in terms of concentration). You may report some or all of the required data by attaching separate sheets of paper instead of filling out pages VII-1 and VII-2 if the separate sheets contain all the required information in a format which is constant with pages VII-1 and VII-2 in spacing and identification of pollutants and columns. Use the following abbreviations in the columns headed "Units."

Concentration		Mass	
ppm	parts per million	lbs	pounds
mg/1	milligrams per liter	ton	tons (English tons)
ppb	parts per billion	mg	milligrams
ug/1	micrograms per liter	g	grams
kg	kilograms	T	tonnes (metric tons)

All reporting of values for metals must be in terms of "total recoverable metal," unless:

(1) An applicable, promulgated effluent limitation or standard specifies the limitation for the metal in dissolved, valent, or total form; or

(2) All approved analytical methods for the metal inherently measure only its dissolved form (e.g., hexavalent chromium); or

(3) The permitting authority has determined that in establishing case-by-case limitations it is necessary to express the limitations on the metal in dissolved, valent, or total form to carry out the provisions of the CWA. If you measure only one grab sample and one flow-weighted composite sample for a given outfall, complete only the "Maximum Values" columns and insert "1" into the "Number of Storm Events Sampled" column. The permitting authority may require you to conduct additional analyses to further characterize your discharges.

If you measure more than one value for a grab sample or a flow-weighted composite sample for a given outfall and those values are representative of your discharge, you must report them. You must describe your method of testing and data analysis. You also must determine the average of all values within the last year and report the concentration and mass under the "Average Values" columns, and the total number of storm events sampled under the "Number of Storm Events Sampled " columns.

C. **Analysis:** You must use test methods promulgated in 40 CFR Part 136; however, if none has been promulgated for a particular pollutant, you may use any suitable method for measuring the level of the pollutant in your discharge provided that you submit a description of the method or a reference to a published method. Your description should include the sample holding time, preservation techniques, and the quality control measures which you used. If you have two or more substantially identical outfalls, you may request permission from your permitting authority to sample and analyze only one outfall and submit the results of the analysis for other substantially identical outfalls. If your request is granted by the permitting authority, on a separate sheet attached to the application form, identify which outfall you did test, and describe why the outfalls which you did not test are substantially identical to the outfall which you did test.

Part VII-A

Part VII-A must be completed by all applicants for all outfalls who must complete Form 2F.

Analyze a grab sample collected during the first thirty minutes (or as soon thereafter as practicable) of the discharge and flow-weighted composite samples for all pollutants in this Part, and report the results except use only grab samples for pH and oil and grease. See discussion in General Instructions to Item VII for definitions of grab sample collected during the first thirty minutes of discharge and flow-weighted composite sample. The "Average Values" column is not compulsory but should be filled out if data are available.

Part VII-B

List all pollutants that are limited in an effluent guideline which the facility is subject to (see 40 CFR Subchapter N to determine which pollutants are limited in effluent guidelines) or any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit). Complete one table for each outfall. See discussion in General instructions to item VII for definitions of grab sample collected during the first thirty minutes (or as soon thereafter as practicable) of discharge and flow-weighted composite sample. The "Average Values" column is not compulsory but should be filled out if data are available.

Analyze a grab sample collected during the first thirty minutes of the discharge and flow-weighted composite samples for all pollutants in this Part, and report the results, except as provided in the General Instructions.

Part VII-C

Part VII-C must be completed by all applicants for all outfalls which discharge storm water associated with industrial activity, or that EPA is evaluating for designation as a significant contributor of pollutants to waters of the United States, or as contributing to a violation of a water quality standard. Use both a grab sample and a composite sample for all pollutants you analyze for in this part except use grab samples for residual chlorine and fecal coliform. The "Average Values" column is not compulsory but should be filled out if data are available. Part C requires you to address the pollutants in Table 2F-2, 2F-3, and 2F-4 for each outfall. Pollutants in each of these Tables are addressed differently.

Table 2F-2: For each outfall, list all pollutants in Table 2F-2 that you know or have reason to believe are discharged (except pollutants previously listed in Part VII-B). If a pollutant is limited in an effluent guideline limitation which the facility is subject to, the pollutant must be analyzed and reported in Part VII-B. If a pollutant in Table 2F-2 is indirectly limited by an effluent guideline limitation through an indicator (e.g., use of TSS as an indicator to control the discharge of iron and aluminum), you must analyze for it and report the data in Part VII-B. For other pollutants listed in Table 2F-2 (those not limited directly or indirectly by an effluent limitation guideline), that you know or have reason to believe are discharged, you must either report quantitative data or briefly describe the reasons the pollutant is expected to be discharged.

Table 2F-3: For each outfall, list all pollutants in Table 2F-3 that you know or have reason to believe are discharged. For every pollutant in Table 2F-3 expected to be discharged in concentrations of 10 ppb or greater, you must submit quantitative data. For acrolein, acrylonitrile, 2,4 dinitrophenol, and 2-methyl-4,6 dinitrophenol, you must submit quantitative data if any of these four pollutants is expected to be discharged

in concentrations of 100 ppb or greater. For every pollutant expected to be discharged in concentrations less than 10 ppb (or 100 ppb for the four pollutants listed above), then you must either submit quantitative data or briefly describe the reasons the pollutant is expected to be discharged.

Small Business Exemption - If you are a "small business," you are exempt from the reporting requirements for the organic toxic pollutants listed in Table 2F-3. There are two ways in which you can qualify as a "small business". If your facility is a coal mine, and if your probable total annual production is less than 100,000 tons per year, you may submit past production data or estimated future production (such as a schedule of estimated total production under 30 CFR 795.14(c)) instead of conducting analyses for the organic toxic pollutants. If your facility is not a coal mine, and if your gross total annual sales for the most recent three years average less than $100,000 per year (in second quarter 1980 dollars), you may submit sales data for those years instead of conducting analyses for the organic toxic pollutants. The production or sales data must be for the facility which is the source of the discharge. The data should not be limited to production or sales for the process or processes which contribute to the discharge, unless those are the only processes at your facility. For sales data, in situations involving intracorporate transfer of goods and services, the transfer price per unit should approximate market prices for those goods and services as closely as possible. Sales figures for years after 1980 should be indexed to the second quarter of 1980 by using the gross national product price deflator (second quarter of 1980 = 100). This index is available in National Income and Product Accounts of the United States (Department of Commerce, Bureau of Economic Analysis).

Table 2F-4: For each outfall, list any pollutant in Table 2F-4 that you know or believe to be present in the discharge and explain why you believe it to be present. No analysis is required, but if you have analytical data, you must report them. **Note:** Under 40 CFR 117.12(a)(2), certain discharges of hazardous substances (listed at 40 CFR 177.21 or 40 CFR 302.4) may be exempted from the requirements of section 311 of CWA, which establishes reporting requirements, civil penalties, and liability for cleanup costs for spills of oil and hazardous substances. A discharge of a particular substance may be exempted if the origin, source, and amount of the discharged substances are identified in the NPDES permit application or in the permit, if the permit contains a requirement for treatment of the discharge, and if the treatment is in place. To apply for an exclusion of the discharge of any hazardous substance from the requirements of section 311, attach additional sheets of paper to your form, setting forth the following information:

1. The substance and the amount of each substance which may be discharged.
2. The origin and source of the discharge of the substance.
3. The treatment which is to be provided for the discharge by:
    a. An onsite treatment system separate from any treatment system treating your normal discharge;
    b. A treatment system designed to treat your normal discharge and which is additionally capable of treating the amount of the substance identified under paragraph 1 above; or
    c. Any combination of the above.

See 40 CFR 117.12(a)(2) and (c), published on August 29, 1979, in 44 FR 50766, or contact your Regional Office (Table 1 on Form 1, Instructions), for further information on exclusions from section 311.

Part VII-D

If sampling is conducted during more than one storm event, you only need to report the information requested in Part VII-D for the storm event(s) which resulted in any maximum pollutant concentration reported in Part VII-A, VII-B, or VII-C.

Provide flow measurements or estimates of the flow rate, and the total amount of discharge for the storm event(s) sampled, the method of flow measurement, or estimation. Provide the data and duration of the storm event(s) sampled, rainfall measurements, or estimates of the storm event which generated the sampled runoff and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event.

Part VII-E

List any toxic pollutant listed in Tables 2F-2, 2F-3, or 2F-4 which you currently use or manufacture as an intermediate or final product or byproduct. In addition, if you know or have reason to believe that 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) is discharged or if you use or manufacture 2,4,5-trichlorophenoxy acetic

R0013503

acid (2,4,5,-T); 2-(2,4,5-trichlorophenoxy) propanoic acid (Silvex, 2,4,5,-TP); 2-(2,4,5-trichlorophenoxy) ethyl 2,2-dichloropropionate (Erbon); O,O-dimethyl O-(2,4,5-trichlorphenyl) phosphorothioate (Ronnel); 2,4,5-trichlorophenol (TCP); or hexachlorophene (HCP); then list TCDD. The Director may waive or modify the requirement if you demonstrate that it would be unduly burdensome to identify each toxic pollutant and the Director has adequate information to issue your permit. You may not claim this information as confidential; however, you do not have to distinguish between use or production of the pollutants or list the amounts.

Item VIII

Self explanatory. The permitting authority may ask you to provide additional details after your application is received.

Item X

The Clean Water Act provides for severe penalties for submitting false information on this application form.

Section 309(c)(4) of the Clean Water Act provides that "Any person who knowingly makes any false material statement, representation, or certification in any application, . . . shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than 2 years, or by both. If a conviction of such person is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or by both." 40 CFR Part 122.22 requires the certification to be signed as follows:

> (A) **For a corporation:** by a responsible corporate official. For purposes of this section, a responsible corporate official means (i) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities employing more than 250 persons or having gross annual sales or expenditures exceeding $25,000,000 (in second-quarter 1980 dollars), if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures.
>
> **Note:** EPA does not require specific assignments or delegation of authority to responsible corporate officers identified in 122.22(a)(1)(i). The Agency will presume that these responsible corporate officers have the requisite authority to sign permit applications unless the corporation has notified the Director to the contrary. Corporate procedures governing authority to sign permit applications may provide for assignment or delegation to applicable corporate position under 122.22(a)(1)(ii) rather than to specific individuals.
>
> (B) **For a partnership or sole proprietorship:** by a general partner or the proprietor, respectively; or
>
> (C) **For a municipality, State, Federal, or other public agency:** by either a principal executive officer or ranking elected official. For purposes of this section, a principal executive officer of a Federal agency includes (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of EPA).

LABEL ITEMS

I. EPA I.D. NUMBER

III. FACILITY NAME

V. FACILITY MAILING ADDRESS

VI. FACILITY LOCATION

PLEASE PLACE LABEL IN THIS SPACE

GENERAL INSTRUCTIONS

If a preprinted label has been provided, affix it in the designated space. Review the information carefully; if any of it is incorrect, cross through it and enter the correct data in the appropriate fill-in area below. Also, if any of the preprinted data is absent (the area to the left of the label space lists the information that should appear), please provide it in the proper fill-in area(s) below. If the label is complete and correct, you need not complete items I, III, V, and VI (except VI-B which must be completed regardless). Complete all items if no label has been provided. Refer to the instructions for detailed item descriptions and for the legal authorizations under which this data is collected.

II. POLLUTANT CHARACTERISTICS

INSTRUCTIONS: Complete A through J to determine whether you need to submit any permit application forms to the EPA. If you answer "yes" to any questions, you must submit this form and the supplemental form listed in the parenthesis following the question. Mark "X" in the box in the third column if the supplemental form is attached. If you answer "no" to each question, you need not submit any of these forms. You may answer "no" if your activity is excluded from permit requirements; see Section C of the instructions. See also, Section B of the instructions for definitions of bold-faced terms.

SPECIFIC QUESTIONS	MARK 'X' YES	NO	FORM ATTACHED	SPECIFIC QUESTIONS	MARK 'X' YES	NO	FORM ATTACHED
A. Is this facility a publicly owned treatment works which results in a discharge to waters of the U.S.? (FORM 2A)				B. Does or will this facility (either existing or proposed) include a concentrated animal feeding operation or aquatic animal production facility which results in a discharge to waters of the U.S.? (FORM 2B)			
C. Is this a facility which currently results in discharges to waters of the U.S. other than those described in A or B above? (FORM 2C)				D. Is this a proposed facility (other than those described in A or B above) which will result in a discharge to waters of the U.S.? (FORM 2D)			
E. Does or will this facility treat, store, or dispose of hazardous wastes? (FORM 3)				F. Do you or will you inject at this facility industrial or municipal effluent below the lowermost stratum containing, within one quarter mile of the well bore, underground sources of drinking water? (FORM 4)			
G. Do you or will you inject at this facility any produced water or other fluids which are brought to the surface in connection with conventional oil or natural gas production, inject fluids used for enhanced recovery of oil or natural gas, or inject fluids for storage of liquid hydrocarbons? (FORM 4)				H. Do you or will you inject at this facility fluids for special processes such as mining of sulfur by the Frasch process, solution mining of minerals, in situ combustion of fossil fuel, or recovery of geothermal energy? (FORM 4)			
I. Is this facility a proposed stationary source which is one of the 28 industrial categories listed in the instructions and which will potentially emit 100 tons per year of any air pollutant regulated under the Clean Air Act and may affect or be located in an attainment area? (FORM 5)				J. Is this facility a proposed stationary source which is NOT one of the 28 industrial categories listed in the instructions and which will potentially emit 250 tons per year of any air pollutant regulated under the Clean Air Act and may affect or be located in an attainment area? (FORM 5)

XI. MAP

Attach to this application a topographic map of the area extending to at least one mile beyond property boundaries. The map must show the outline of the facility, the location of each of its existing and proposed intake and discharge structures, each of its hazardous waste treatment, storage, or disposal facilities, and each well where it injects fluids underground. Include all springs, rivers and other surface water bodies in the map area. See instructions for precise requirements.

XII. NATURE OF BUSINESS (provide a brief description)

XIII. CERTIFICATION (see instructions)

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this application and all attachments and that, based on my inquiry of those persons immediately responsible for obtaining the information contained in the application, I believe that the information is true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

R0013512

NOAA WEATHER RADIO

The Voice of the National Weather Service

NOAA/PA 76015
Rev. July 1986

NOAA WEATHER RADIO IS A SERVICE...

...of the National Oceanic and Atmospheric Administration (NOAA) of the U.S. Department of Commerce. As the "Voice of the National Weather Service," it provides continuous broadcasts of the latest weather information directly from National Weather Service offices. Taped weather messages are repeated every four to six minutes and are routinely revised every one to three hours, or more frequently if needed. Most of the stations operate 24 hours daily.

During severe weather, National Weather Service forecasters can interrupt the routine weather broadcasts and substitute special warning messages. The forecasters can also activate specially designed warning receivers. Such receivers either sound an alarm indicating that an emergency exists, alerting the listener to turn the receiver up to an audible volume; or, when operated in a muted mode, are automatically turned on so that the warning message is heard. "Warning alarm" receivers are especially valuable for schools, hospitals, public-safety agencies, and news media offices.

Under a January 1978 White House policy statement, NOAA Weather Radio was designated the sole Government-operated radio system to provide direct warnings into private homes for both natural disasters and nuclear attack. This capability is to supplement warnings by sirens and by commercial radio and TV.

The broadcasts are tailored to weather information needs of people within the receiving area. For example, stations along the sea coasts and Great Lakes provide weather information for boaters, fishers, and others engaged in marine activities as well as general weather information.

NOAA Weather Radio broadcasts are made on one of seven high-band FM frequencies ranging from 162.40 to 162.55 megahertz (MHz). These frequencies are not found on the average home radio now in use. However, a number of radio manufacturers offer special weather radios to operate on these frequencies, with or without the emergency warning alarm. Also, there are now many radios on the market which offer standard AM/FM frequencies plus the so-called "weather band" as an added feature.

NOAA Weather Radio broadcasts can usually be heard as far as 40 miles from the antenna site, sometimes more. The effective range depends on many factors, particularly the height of the broadcasting antenna, terrain, quality of the receiver, and type of receiving antenna. As a general rule, listeners close to or perhaps beyond the 40 mile range should have a good quality receiver system if they expect reliable reception. Also, an outside antenna may be required in these fringe areas. If practicable, a receiver should be tried at its place of intended use before making a final purchase.

The National Weather Service operates about 380 stations. Approximately 90 percent of the Nation's population is within listening range of a NOAA Weather Radio broadcast.

A similar network of about 15 stations using the same frequencies broadcasts continuous weather information across much of southern Canada.

If you have a question concerning NOAA Weather Radio or wish to receive a listing of NOAA Weather Radio receiver manufacturers, please contact your nearest National Weather Service Office, or write to National Weather Service (Attn: W/OM11), National Oceanic and Atmospheric Administration, Silver Spring, MD. 20910.

REQUIRED CONTAINERS, PRESERVATION TECHNIQUES, AND HOLDING TIMES			
Parameter	**Container(1)**	**Preservative (2), (3)**	**Maximum Holding Time (4)**
Organic Tests (8)			
Purgeable halocarbons	G, Teflon-lined septum	Cool, 4°C 0.008% $Na_2S_2O_3$ (5)	14 days
Purgeable aromatics	G, Teflon-lined septum	Cool, 4°C 0.008% $Na_2S_2O_3$ (5) HCl to pH<2 (9)	14 days
Acrolein and acrylonitrile	G, Teflon-lined septum	Cool, 4°C 0.008% $Na_2S_2O_3$ (5) Adjust pH to 4-5 (10)	14 days
Phenols (11)	G, Teflon-lined cap	Cool, 4°C 0.008% $Na_2S_2O_3$ (5)	7 days until extraction, 40 days after extraction
Benzidines (11)	G, Teflon-lined cap	Cool, 4°C 0.008% $Na_2S_2O_3$ (5)	7 days until extraction (13)
Phthalate esters (11)	G, Teflon-lined cap	Cool, 4°C	7 days until extraction, 40 days after extraction
Nitrosamines (11), (14)	G, Teflon-lined cap	Cool, 4°C store in dark 0.008% $Na_2S_2O_3$	7 days until extraction, 40 days after extraction
PCBs (11) acrylonitrite	G, Teflon-lined cap	Cool, 4°C	7 days until extraction, 40 days after extraction
Nitroaromatics and isophorone (11)	G, Teflon-lined cap	Cool, 4°C store in dark 0.008% $NA_2S_2O_3$ (5)	7 days until extraction, 40 days after extraction
Polynuclear aromatic hydrocarbons (11)	G, Teflon-lined cap	Cool, 4°C store in dark 0.008% $Na_2S_2O_3$ (5)	7 days until extraction, 40 days after extraction
Haloethers (11)	G, Teflon-lined cap	Cool, 4°C 0.008% $Na_2S_2O_3$ (5)	7 days until extraction, 40 days after extraction
Chlorinated hydrocarbons (11)	G, Teflon-lined cap	Cool, 4°C	7 days until extraction, 40 days after extraction
TCDD (11)	G, Teflon-lined cap	Cool, 4°C 0.008% $Na_2S_2O_3$ (5)	7 days until extraction, 40 days after extraction
Pesticides Tests			
Pesticides (11)	G, Teflon-lined cap	Cool, 4°C pH 5-9 (15)	7 days until extraction, 40 days after extraction
Radiological Tests			
Alpha, beta, and radium	P, G	HNO_3 to pH<2	6 months

R0013518

40 CFR 136.3 TABLE II NOTES

(1) Polyethylene (P) or Glass (G).

(2) Sample preservation should be performed immediately upon sample collection. For composite chemical samples each aliquot should be preserved at the time of collection. When use of an automated sampler makes it impossible to preserve each aliquot, then chemical samples may be preserved by maintaining at 4°C until compositing and sample splitting is completed.

(3) When any sample is to be shipped by common carrier or sent through the United States Mails, it must comply with the Department of Transportation Hazardous Materials Regulations (49 CFR Part 172). The person offering such material for transportation is responsible for ensuring such compliance. For the preservation requirements of Table II, the Office of Hazardous Materials, Materials Transportation Bureau, Department of Transportation has determined that the Hazardous Materials Regulations do not apply to the following materials: Hydrochloric acid (HCl) in water solutions at concentrations of 0.04% by weight or less (pH about 1.96 or greater); Nitric acid (HNO_3) in water solutions at concentrations of 0.15% by weight or less (pH about 1.62 or greater); Sulfuric acid (H_2SO_4) in water solutions at concentrations of 0.35% by weight or less (pH about 1.15 or greater); and Sodium hydroxide (NaOH) in water solutions at concentrations of 0.080% by weights or less (pH about 12.30 or less).

(4) Samples should be analyzed as soon as possible after collection. The times listed are the maximum times that samples may be held before analysis and still be considered valid. Samples may be held for longer periods only if the permittee, or monitoring laboratory, has data on file to show that the specific types of samples under study are stable for the longer time, and has received a variance from the Regional Administrator under § 136.3(e). Some samples may not be stable for the maximum time period given in the table. A permittee, or monitoring laboratory, is obligated to hold the sample for a shorter time if knowledge exists to show that this is necessary to maintain sample stability. See § 136.3(e) for details.

(5) Should only be used in the presence of residual chlorine.

(6) Maximum holding time is 24 hours when sulfide is present. Optionally all samples may be tested with lead acetate paper before pH adjustments in order to determine if sulfide is present. If sulfide is present, it can be removed by the addition of cadmium nitrate powder until a negative spot test is obtained. The sample is filtered and then NaOH is added to pH 12.

(7) Samples should be filtered immediately on-site before adding preservative for dissolved metals.

(8) Guidance applies to samples to be analyzed by GC, LC, or GC/MS for specific compounds.

(9) Sample receiving no pH adjustment must be analyzed within seven days of sampling.

(10) The pH adjustment is not required if acrolein will not be measured. Samples for acrolein receiving no pH adjustment must be analyzed within 3 days of sampling.

R0013519

40 CFR 136.3 TABLE II NOTES

(11) When the extractable analytes of concern fall within a single chemical category, the specified preservative and maximum holding times should be observed for optimum safeguard of sample integrity. When the analytes of concern fall within two or more chemical categories, the sample may be preserved by cooling to 4°C, reducing residual chlorine with 0.008% sodium thiosulfate, storing in the dark,and adjusting the pH to 6-9; samples preserved in this manner may be held for seven days before extraction and for forty days after extraction. Exceptions to this optional preservation and holding time procedure are noted in footnote 5 (re the requirement for thiosulfate reduction of residual chlorine), and footnotes 12, 13 (re the analysis of benzidine).

(12) If 1,2-diphenylhydrazine is likely to be present, adjust the pH of the sample to 4.0 $\pm$ 0.2 to prevent rearrangement to benzidine.

(13) Extracts may be stored up to 7 days before analysis if storage is conducted under an inert (oxidant-free) atmosphere.

(14) For the analysis of diphenylnitrosamine, add 0.008% $Na_2S_2O_3$ and adjust pH to 7-10 with NaOH within 24 hours of sampling.

(15) The pH adjustment may be performed upon receipt at the laboratory and may be omitted if the samples are extracted within 72 hours of collection. For the analysis of aldrin, add 0.008% $Na_2S_2O^3$.

TABLE IA—LIST OF APPROVED BIOLOGICAL TEST PROCEDURES

Parameter and units	Method [1]	EPA [2]	Reference (Method Number or Page)		
			Standard Methods 18th Ed.	ASTM	USGS
Bacteria:					
1. Coliform (fecal) number per 100 ml.	MPN, 5 tubes, 3 dilution; or, membrane filter (MF)[3]; single step.	Page 132.	908C		
2. Coliform (fecal) in presence of chlorine number per 100 ml.	MPN, 5 tubes, 3 dilution; or, MF [3]; single step.[4a]	p. 124	908		B-0050-77
3. Coliform (total), number per 100 ml.	MPN, 5 tubes, 3 dilution; or, MF [3] single step or two step.	p. 114	908A		
		p. 108	908A		B-0055-77.
4. Coliform (total) in presence of chlorine, number per 100 ml.	MPN, 5 tubes, dilution; or MF [3] with enrichment.	p. 114	908A		
		p. 111	909 (A+A.8c)		
5. Fecal streptococci, number per 100 ml.	MPN, 5 tubes, 3 dilution; MF [3]; or, plate count.	p. 139	910A		
		p. 135	910B		B0055-77.[5]
		p. 143	910C		

Table IA Notes

[1] The method used must be specified when results are reported.

[2] "Microbiological Methods for Monitoring the Environment, Water and Wastes, 1978", EPA-600/8-78-017, U.S. Environmental Protection Agency.

[3] Brenner, P.E., *et al.*, "Methods for Collection and Analysis of Aquatic Biological and Microbiological Samples," U.S. Geological Survey, Techniques of Water-Resources Investigations, Book 5, Chapter A4, Laboratory Analysis, 1977.

[4] 0.45 µm membrane filter or other pore size certified by the manufacturer to fully retain organisms to be cultivated, and free of extractables which could interfere with their growth and development.

[4a] Since the membrane filter technique usually yields low and variable recovery from chlorinated wastewaters, the MPN method will be required to resolve any controversies.

[5] Approved only if dissolution of the KF Streptococcus Agar (Section 5.1, USGS Method B-0055-77) is made in a boiling water bath to avoid scorching of the medium.

TABLE IB—LIST OF APPROVED INORGANIC TEST PROCEDURES—Continued

[1] "Methods for Analysis of Inorganic Substances in Water and Fluvial Sediments," U.S. Department of the Interior, U.S. Geological Survey, Open-File Report 85-495, 1985, unless otherwise stated.
[2] "Official Methods of Analysis of the Association of Official Analytical Chemists," methods manual, 14th ed. (1984).
[3] For the determination of total metals the sample is not filtered before processing. A digestion procedure is required to solubilize suspended material and to destroy possible organic-metal complexes. Two digestion procedures are given in "Methods for Chemical Analysis of Water and Wastes, 1979." One (section 4.1.3), is a vigorous digestion using nitric acid. A less vigorous digestion using nitric and hydrochloric acids (section 4.1.4) is preferred; however, the analyst should be cautioned that this mild digestion may not suffice for all sample types. Particularly, if a colorimetric procedure is to be employed, it is necessary to ensure that all organo-metallic bonds be broken so that the metal is in a reactive state. In those situations, the vigorous digestion is to be preferred making certain that at no time does the sample go to dryness. Samples containing large amounts of organic materials would also benefit by this vigorous digestion. Use of the graphite furnace technique, inductively coupled plasma, as well as determinations for certain elements such as arsenic, the noble metals, mercury, selenium, and titanium require a modified digestion and in all cases the method write-up should be consulted for specific instruction and/or cautions.

NOTE: If the digestion included in one of the other approved references is different than the above, the EPA procedure must be used.

Dissolved metals are defined as those constituents which will pass through a 0.45 micron membrane filter. Following filtration of the sample, the referenced procedure for total metals must be followed. Sample digestion for dissolved metals may be omitted for AA (direct aspiration or graphite furnace) and ICP analyses provided the sample solution to be analyzed meets the following criteria:
a. has a low COD (<20)
b. is visibly transparent with a turbidity measurement of 1 NTU or less.
c. is colorless with no perceptable color, and
d. is of one liquid phase and free of particulate or suspended matter following acidification.

[4] The full text of Method 200.7, "Inductively Coupled Plasma Atomic Emission Spectrometric Method for Trace Element Analysis of Water and Wastes," is given at Appendix C of this Part 136.
[5] Manual distillation is not required if comparability data on representative effluent samples are on company file to show that this preliminary distillation step is not necessary; however, manual distillation will be required to resolve any controversies.
[6] Ammonia, Automated Electrode Method, Industrial Method Number 379-75 WE, dated February 19, 1976, Technicon AutoAnalyzer II, Technicon Industrial Systems, Tarrytown, NY 10591.
[7] The approved method is that cited in "Methods for Determination of Inorganic Substances in Water and Fluvial Sediments", USGS TWRI, Book 5, Chapter A1 (1979).

[10] The use of manual and differential pulse voltage ramps to increase sensitivity and resolution is acceptable.
[11] Carbonaceous biochemical oxygen demand (CBOD$_5$) must not be confused with the traditional BOD$_5$ test which measures "total BOD." The addition of the nitrification inhibitor is not a procedural option, but must be included to report the CBOD$_5$ parameter. A discharger whose permit requires reporting the traditional BOD$_5$ may not use a nitrification inhibitor in the procedure for reporting the results. Only when a discharger's permit specifically states CBOD$_5$ is required, can the permittee report data using the nitrification inhibitor.

[25] Just prior to distillation, adjust the sulfuric-acid-preserved sample to pH 4 with 1 + 9 NaOH.
[26] The approved method is that cited in *Standard Methods for the Examination of Water and Wastewater*, 14th Edition. The colorimetric reaction is conducted at a pH of 10.0±0.2. The approved methods are given on pp. 579-81 of the 14th Edition: Method 510A for distillation, Method 510B for the manual colorimetric procedure, or Method 510C for the manual spectrophotometric procedure.
[27] R. F. Addison and R. G. Ackman, "Direct Determination of Elemental Phosphorus by Gas-Liquid Chromatography," *Journal of Chromatography*, vol. 47, No. 3, pp. 421-426, 1970.
[28] Approved methods for the analysis of silver in industrial wastewaters at concentrations of 1 mg/L and above are inadequate where silver exists as an inorganic halide. Silver halides such as the bromide and chloride are relatively insoluble in reagents such as nitric acid but are readily soluble in an aqueous buffer of sodium thiosulfate and sodium hydroxide to a pH of 12. Therefore, for levels of silver above 1 mg/L, 20 mL of sample should be diluted to 100 mL by adding 40 mL each of 2 M $Na_2S_2O_3$ and 2M NaOH. Standards should be prepared in the same manner. For levels of silver below 1 mg/L the approved method is satisfactory.
[29] The approved method is that cited in *Standard Methods for the Examination of Water and Wastewater*, 16th Edition.
[30] The approved method is that cited in *Standard Methods for the Examination of Water and Wastewater*, 13th Edition.

Table IC Notes

[1] All parameters are expressed in micrograms per liter (µg/L).

[2] The full text of Methods 601–613, 624, 625, 1624, and 1625, are given at Appendix A, "Test Procedures for Analysis of Organic Pollutants," of this Part 136. The standardized test procedure to be used to determine the method detection limit (MDL) for these test procedures is given at Appendix B, "Definition and Procedure for the Determination of the Method Detection Limit," of this Part 136.

[3] "Methods for Benzidine, Chlorinated Organic Compounds, Pentachlorophenol and Pesticides in Water and Wastewater," U.S. Environmental Protection Agency, September, 1978.

[4] Method 624 may be extended to screen samples for Acrolein and Acrylonitrile. However, when they are known to be present, the preferred method for these two compounds is Method 603 or Method 1624.

[5] Method 625 may be extended to include benzidine, hexachlorocyclopentadiene, N-nitrosodimethylamine, and N-nitrosodiphenylamine. However, when they are known to be present, Methods 605, 607, and 612, or Method 1625, are preferred methods for these compounds.

[6] 625, Screening only.

[7] "Selected Analytical Methods Approved and Cited by the United States Environmental Protection Agency," Supplement to the Fifteenth Edition of *Standard Methods for the Examination of Water and Wastewater* (1981).

[8] Each analyst must make an initial, one-time, demonstration of their ability to generate acceptable precision and accuracy with Methods 601–613, 624, 625, 1624, and 1625 (See Appendix A of this Part 136) in accordance with procedures each in section 8.2 of each of these Methods. Additionally, each laboratory, on an on-going bases must spike and analyze 10% (5% for Methods 624 and 625 and 100% for methods 1624, and 1625) of all samples to monitor and evaluate laboratory data quality in accordance with sections 8.3 and 8.4 of these Methods. When the recovery of any parameter falls outside the warning limits, the analytical results for that parameter in the unspiked sample are suspect and cannot be reported to demonstrate regulatory compliance.

NOTE: These warning limits are promulgated as an "interim final action with a request for comments."

TABLE ID—LIST OF APPROVED TEST PROCEDURES FOR PESTICIDES [1]

Parameter µg/L)	Method	EPA [2, 7]	Standard Methods 18th Ed	ASTM	Other
1. Aldrin	GC	608	509A	D3086	Note 3, p. 7; Note 4, p. 30.

Table ID Notes

[1] Pesticides are listed in this table by common name for the convenience of the reader. Additional pesticides may be found under Table IC, where entries are listed by chemical name.

[2] The full text of methods 608 and 625 are given at Appendix A, "Test Procedures for Analysis of Organic Pollutants," of this Part 136. The standardized test procedure to be used to determine the method detection limit (MDL) for these test procedures is given at Appendix B, "Definition and Procedure for the Determination of the Method Detection Limit", of this Part 136.

[3] "Methods for Benzidine, Chlorinated Organic Compounds, Pentachlorophenol and Pesticides in Water and Wastewater," U.S. Environmental Protection Agency, September, 1978. This EPA publication includes thin-layer chromatography (TLC) methods.

[4] "Methods for Analysis of Organic Substances in Water," U.S. Geological Survey, Techniques of Water-Resources Investigations, Book 5, Chapter A3 (1972).

[5] This method may be extended to include α-BHC, β-BHC, endosulfan I, endosulfan II, and endrin. However, when they are known to exist, Method 608 is the preferred method.

[6] "Selected Analytical Methods Approved and Cited by the United States Environmental Protection Agency," Supplement to the Fifteenth Edition of *Standard Methods for the Examination of Water and Wastewater* (1981).

[7] Each analyst must make an initial, one-time, demonstration of their ability to generate acceptable precision and accuracy with Methods 608 and 625 (See Appendix A of this Part 136) in accordance with procedures given in section 8.2 of each of these methods. Additionally, each laboratory, on an on-going basis, must spike and analyze 10% of all samples analyzed with Method 608 or 5% of all samples analyzed with Method 625 to monitor and evaluate laboratory data quality in accordance with Sections 8.3 and 8.4 of these methods. When the recovery of any parameter falls outside the warning limits, the analytical results for that parameter in the unspiked sample are suspect and should be reported to demonstrate regulatory compliance.

NOTE: These warning limits are promulgated as an "interim final action with a request for comments."

TECHNICAL APPENDIX E

GLOSSARY

GLOSSARY

Aliquot: A discrete sample used for analysis.

Biochemical Oxygen Demand (BOD): The quantity of oxygen consumed during the biochemical oxidation of matter over a specified period of time, usually 5 days (BOD_5).

Chain-of-Custody: Procedures used to minimize the possibility of tampering with samples.

Chemical Oxygen Demand (COD): Measurement of all the oxidizable matter found in a runoff sample, a portion of which could deplete dissolved oxygen in receiving waters.

Composite Sample: Used to determine "average" loadings or concentrations of pollutants, such samples are collected at regular time intervals, and pooled into one large sample, can be developed on time or flow rate.

Confined Space: Enclosed space that an employee can bodily enter and perform assigned work, that has limited means of exit and entry, that is not designed for continuous employee occupancy, and has one of the following characteristics:

- Contains or has a known potential to contain a hazardous atmosphere
- Contains a material with the potential for engulfment of an entrant
- Has an internal configuration such that an entrant could be trapped or asphyxiated by inwardly converging walls or a floor that slopes downward and tapers to a smaller cross section
- Contains any other recognized serious safety or health hazard.

Conveyance: A channel or passage which conducts or carries water including any pipe, ditch, channel, tunnel, conduit, well, or container.

Detention Ponds: A surface water impoundment constructed to hold and manage storm water runoff.

Discharge: Any addition of any pollutant to waters of the U.S. from any conveyance.

Effluent: Any discharge flowing from a conveyance.

Flumes: A specially shaped open channel flow section providing a change in the channel area and/or slope which results in an increased velocity and change in the level of the liquid flowing through the flume. A flume normally consists of three sections: (1) a converging section; (2) a throat section; and (3) a diverging section. The flow rate through the flume is a function of the liquid level at some point in the flume.

Flow-Weighted Composite Sample: Means a composite sample consisting of a mixture of aliquots collected at a constant time interval, where the volume of each aliquot is proportional to the flow rate of the discharge.

R0013535

Flow-Proportional Composite Sample: Combines discrete aliquots of a sample collected over time, based on the flow of the wastestream being sampled. There are two methods used to collect this type of sample. One collects a constant sample volume at time intervals which vary based on stream flow. The other collects aliquots at varying volumes based on stream flow, at constant time intervals.

First Flush: Individual sample taken during the first 30 minutes of a storm event. The pollutants in this sample can often be used as a screen for non-storm water discharges since such pollutants are flushed out of the system during the initial portion of the discharge.

Grab Sample: A discrete sample which is taken from a wastestream on a one-time basis with no regard to flow or time; instantaneous sample that is analyzed separately.

Head of Liquid: Depth of flow

Illicit Discharge: Any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to an NPDES permit and discharges from fire fighting activities.

Materials Management Practices: Practices used to limit the contact between significant materials and precipitation. These may include structural or nonstructural controls such as dikes, berms, sedimentation ponds, vegetation strips, spill response plans, etc.

Municipal Separate Storm Sewer Systems: A conveyance or system of conveyances including roads with drainage systems, storm drains, gutters, ditches under the jurisdiction of a city, town, borough, county, parish, or other public body.

Outfall: Point source where an effluent is discharged into receiving waters.

Point Source: Any discernible, confined, and discrete conveyance from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff (see 40 CFR 122.3).

Reverse Meniscus: The curved upper surface of a liquid in a container.

Runoff Coefficient: Means the fraction of total rainfall that will appear at the conveyance as runoff.

Significant Materials: Include, but are not limited to, raw materials, fuels, solvents, detergents, metallic products, CERCLA hazardous substances, fertilizers, pesticides, and wastes such as ashes, slag, and sludge that have potential for release with storm water discharges [see 40 CFR 122.26(b)(12)].

Storm Water: Storm water runoff, snow melt runoff, and surface runoff, and drainage.

Storm Water Discharge Associated with Industrial Activity: Discharge from any conveyance which is used for collecting and conveying storm water which is directly related to manufacturing processing or raw materials storage areas at an industrial plant [see 40 CFR 122.26(b)(14)].

R0013536

Time Composite Sample: Prepared by collecting fixed volume aliquots at specified time intervals and combining into a single sample for analysis.

Turbidity: Describes the capability of light to pass through water.

Weir: A device used to gauge the flow rate of liquid through a channel; is essentially a dam built across an open channel over which the liquid flows, usually through some type of notch.

TECHNICAL APPENDIX F

ACRONYMS

ACRONYMS

BOD_5	Biochemical Oxygen Demand (5-day)
CERCLA	Comprehensive Environmental Response Compensation and Liability Act
cfm	cubic feet per minute
CFR	Code of Federal Regulations
cfs	cubic feet per second
COD	Chemical Oxygen Demand
COV	Coefficient of Variation
CPR	Cardiopulmonary Resuscitation
CWA	Clean Water Act
DOT	Department of Transportation
ECD	Electron Capture Detector
EMC	Event Mean Concentration
EPA	Environmental Protection Agency
ESE	Environmental Science & Engineering, Inc.
FWPCA	Federal Water Pollution Control Act
FID	Flame Ionization Detector
FR	Federal Register
GC/MS	Gas Chromatography/Mass Spectometry
gpm	gallons per minute
H	Head
HCl	Hydrochloric Acid
HNO_3	Nitric Acid
HPLC	High Pressure Liquid Chromatography
H_2SO_4	Sulfuric Acid
IATA	International Air Transport Association
LC_{50}	Lethal Concentration
NaOH	Sodium Hydroxide
$Na_2S_2O_3$	Sodium Thiosulfate
NCDC	National Climate Data Center
NIOSH	National Institute of Occupational Safety and Health
NOAA	National Oceanic and Atmospheric Agency
NOI	Notice of Intent
NPDES	National Pollutant Discharge Elimination System
NWS	National Weather Service
O&G	Oil and Grease
OSHA	Occupational Safety and Health Administration
PCB	Polychlorinated Biphenyl
PE	Professional Engineer
ppb	parts per billion
Q	Flow Rate
RCRA	Resource Conservation and Recovery Act
SARA	Superfund Amendments and Reauthorization Act
SIC	Standard Industrial Classification
s.u.	standard units
TKN	Total Kjeldahl Nitrogen
TSS	Total Suspended Solids
VOC	Volatile Organic Compound

THE POWER OF WATER... OURS FOR 100 YEARS

We've always met that challenge...

From Sumatra to Senegal to Seattle...

From when we first got our feet wet in the 1880's to current projects scheduled for completion after 2000...

From hydropower facilities to canal projects to irrigation systems to intake and outfall structures, from supply of gates, locks, penstocks, valves and turbines to entire systems and turnkey plants...

No one matches our experience...our commitment to advance the technology through continuous research and application of new principles and materials.

From your initial feasability studies 'till final acceptance tests, you'll be glad NOELL is there working with you. Contact NOELL for more information.

CATERPILLAR® 375 EXCAVATOR

A New Direction On A Proven Path

The Path to Higher Performance Leads to the New Cat® 375 Excavator

As the industry standard in its class, the 245D was a tough act to follow. So, instead of following, we set out in a new direction to design the all-new Cat 375 Excavator.

More than simply the next step, this ground-breaking machine takes excavator performance to new heights. Compared to the 245D, the 375 offers:

- 11% more horsepower.
- 22% better fuel efficiency from a high-performance Cat 3406 ATAAC Engine and an advanced hydraulic system that utilizes up to 98% of available engine power.
- Electronic Power Control (EPC) for power management of engine, hydraulic and electronic systems.
- Three boom options and more stick and bucket choices to help tailor your machines for your applications.
- An innovative design that improves digging depth, reach, lift capacity and breakout force:
  - 3"/76 mm more digging depth and 1"/25 mm more reach than the 245D Deep Trencher.
  - 6,960 lb/3160 kg (9%) more breakout force than the 245D Mass Excavator.
- A Proportional Priority Pressure Compensated control valve, featuring:
  - Automatic Flow Proportioning to compensate for pressure differentials between hydraulic circuits, ensuring smooth, predictable response to control lever movements.
  - Pump Flow On Demand which automatically adjusts pumps to minimum flow levels under no-load conditions for reduced noise and improved fuel efficiency.
- Undercarriage with larger components, designed specifically for excavator applications.
- Improved visibility, low noise levels, better ventilation and well-placed, easy-effort controls for high operator productivity.
- Up to 30% larger boom cross sections...up to 44% larger stick cross sections... stress-relieved plates...deep-hardened, chrome-plated pins for extra front linkage durability.
- "H"-shaped carbody, adjustable for easy transport... 5"/127 mm (1%) more ground clearance...thicker track roller frames, reinforced side doors and extra-sturdy fabricated counterweight for extended wear life.

The unparalleled service and extensive parts inventory you've come to expect from your Caterpillar Dealer.

Stop in today at your Cat Dealer and take A New Direction On A Proven Path with the Cat 375 Excavator.

Dutch firm courts Geraghty & Miller

Geraghty & Miller Inc., the Plainview, N.Y., environmental consultant, announced Sept. 10 that it is "negotiating a possible business combination" with Heidemij Holding NV, and could become the Dutch engineering firm's subsidiary. G&M Chief Financial Officer John McCusker declined to elaborate on the strategy behind the combination, nor confirm where the two firms are in their talks. Arnhem-based Heidemij and G&M already have a joint venture company now running an innovative soil-washing technology at a New Jersey Superfund site (ENR 7/19 p. 27). One analyst says this would be the first "cross-border transaction" involving environmental firms in several years, slowed by a dragging European economy. And another source says a stock swap could give G&M more access to global cleanup markets and financial capital.

U.S. opens only one new road to Vietnam

President Clinton disappointed businesses that want to work in Vietnam by lifting the trade embargo against that country only slightly. Clinton decided to permit U.S. firms to take part in "development projects" in Vietnam that are financed by international lending institutions. The White House acknowledged "recent steps taken by the Vietnamese government" on U.S. prisoners of war and those missing in action. But the U.S. didn't end the embargo "to make clear to the Vietnamese that more needs to be done."

ChemWaste kills incinerator plans

Chemical Waste Management Inc., has canceled plans to build a 50-million-Btu-per-hour hazardous waste incinerator at its Kettleman Hills, Calif., landfill. The the decision is a result of a 30% drop in the volume of incinerable hazardous wastes in California, which continues to decline about 10% a year. The plant had been on hold since 1991 because of legal challenges to its environmental impact review. The company declined to reveal the plant's dollar value and capacity.

Sweden to build seventh longest span

The Swedish National Road Administration is evaluating 20 bids for three contracts to build the country's biggest suspension bridge, with the seventh longest span in the world. Bids for the substructure and towers, steel superstructure and cables are below the project's $140-million budget, says a project source. The Høga Kusten Bridge will cross the Ångerman River near the Town of Härnösand. The bridge will be 5,905 ft long and include a 3,937-ft main span. The bridge is designed by Stockholm-based Kjessler Mannerstrale AB, with COWIconsult AS, Virum, Denmark.

Taiwan offers big power market

In a major liberalization of its power sector, Taiwan is inviting the private sector to build about half the powerplants it needs over the next 10 years. In addition, the government is encouraging industries to invest in cogeneration projects. The state-owned Taiwan Power Co. forecasts that installed capacity must increase by about 12,000 Mw to at least 31,000 Mw by 2002 to meet soaring demand. That total will include at least one new nuclear generating unit of no less than 2,000 Mw. Most of the new capacity will be in fossil-fuel plants, but some 2,000 Mw is to be hydropower. Total development cost is estimated at $22 billion.

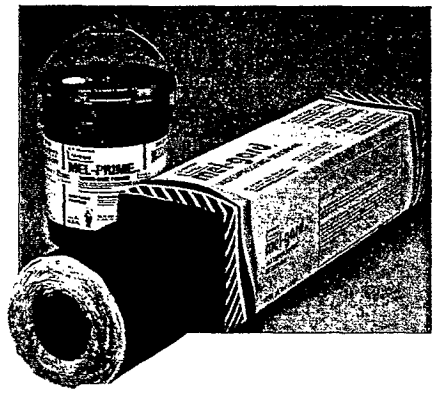
mel-gard™

Protected Waterproofing Membrane

"Thanks to MEL-GARD Protected Waterproofing Membrane, we'll spend less time down in the hole and use less material to complete the job."



"Mel-Gard is a revolutionary time saver. It cuts installation time by 20% to 30% over competitive products. It's also flexible, easy-to-handle and apply. A few quick steps are all that's required. There's no need for adhesives, separate protection course or drain boards. No costly callbacks are required to replace lost or damaged foam boards blown off by the wind, because backfilling wasn't done on schedule."

W. R. MEADOWS
SEALTIGHT.

MEL-GARD™ Protected Waterproofing Membrane

Unique MEL-GARD does three jobs in one. It waterproofs, vaporproofs and provides its own protection course. Everything's built-into a single product. In fact, MEL-GARD is the only semi-rigid, protected waterproofing membrane available in roll form. At 88 mils thick, it's thicker than any competitor's product and flexible enough to eliminate "fish mouthing" air pockets. MEL-GARD's 4' x 50' roll provides nearly 30% more material per roll. And it's WVT rating is 50% better than other "peel-and-stick" products. Exterior vertical surfaces, interior and exterior horizontal surfaces, above and below grade for foundation walls, plaza and parking decks, between slab waterproofing and similar projects are ideal MEL-GARD waterproofing membrane and protection course applications.

SEALTIGHT MEL-PRIME™ Water-Base Primer, used to prepare the concrete surfaces for MEL-GARD application, is special too. It arrives on the job site ready-to-use, requires no additional mixing vessel, emits no unpleasant odors and works with any SEALTIGHT self-adhering waterproofing membrane. Applies easily with our recommended sprayer. MEL-PRIME is one of the SEALTIGHT "Green Line" of environmentally responsible products which means it's VOC Compliant too.

MEL-GARD is another of W.R. Meadows' high quality vaporproofing, waterproofing and protection course products and systems offered from the broadest line available in the industry. For complete information and catalog in a hurry:

Weigh options to levees

As Midwesterners plan to rebuild flood-damaged levees, the Clinton administration wants them to consider other options besides reconstruction. In an Aug. 23 memo to federal agencies, T.J. Glauthier, an associate director of the Office of Management and Budget, and Katie McGinty, director of the White House Office of Environmental Policy, state that as officials weigh applications for repairing levees, they "shall consider, to the extent practical, nonstructural alternatives and design modifications that could provide greater local benefits of flood control, reduction of future flood damages...lower long-term cost to the federal government and natural resource protection." But they don't want to "force alternatives...on unwilling participants."

Longer-range, Laurence W. Zensinger, Federal Emergency Management Agency public assistance division chief, told an American Consulting Engineers Council meeting Sept. 10 that the administration is looking at the possibility of setting up a commission or an interagency group to look at river system management.

GAO finds some Superfund gains, but there's still a long way to go

The Superfund program has cleaned up lots of waste at the sites where work has been completed, but there's plenty of work yet to do, according to a study from the General Accounting Office. Senate Superfund subcommittee Chairman Frank R. Lautenberg (D-N.J.) says the "good news" in the GAO report is that "the Superfund program has been successful in ending the health threats at many sites across the country" on the National Priorities List (NPL). But, he adds, "The bad news is that there are more than 1,000 other NPL sites that still need to be cleaned up. And many of these [are] the most expensive and difficult sites." GAO states that as of Sept. 30, 1992, the Environmental Protection Agency had deleted 40 of the 1,275 NPL sites and completed construction at another 109.

At a Sept. 9 hearing of his panel, Lautenberg said he plans to introduce a comprehensive new Superfund bill "later in this Congress." Lautenberg previewed some of the questions he wants to address, such as whether partial cleanups at sites should be acceptable. He suggests that permanent cleanups "may be too expensive." Another subcommittee member, Sen. David Durenberger (R-Minn.), says it may not be technically possible to achieve required cleanup levels, particularly when there is groundwater contamination.

Federal public works spending down as percentage from 1970s

In percentage terms, the federal government is spending less on infrastructure than it did 20 years ago, according to a new report from the Congressional Budget Office. The study, released Sept. 9, estimates 1993 federal infrastructure capital spending at $30.3 billion, up from $27.7 billion the year before. The 1993 capital spending total equals 0.5% of gross domestic product, compared with 0.48% in 1992. The recent high was 0.83% in 1980. The 1970s average was 0.7%.

"What is most disturbing is that within the last year, almost nothing has changed," says House Public Works and Transportation Committee Chairman Norman Y. Mineta (D-Calif.), who requested the study. "This nation has to do better than we did in 1992," he declares, "when as a percentage of gross domestic product there was virtually no increase in federal infrastructure spending. When you have Japan spending $3 trillion to improve its infrastructure over 10 years, and Germany spending nearly $2 trillion, we have to do more than merely run in place."

Senate panel cuts wastewater aid

The Senate Appropriations Committee voted to slash fiscal year 1994 wastewater treatment spending and reduce Superfund spending 5%. In approving appropriations for the Environmental Protection Agency, Dept. of Veterans Affairs and other agencies on Sept. 9, the panel recommended $2.5 billion for "water infrastructure." That includes $599 million for the new drinking water state revolving fund the Clinton administration has proposed (see p. 19), assuming Congress authorizes the program. Also included in the water infrastructure area was $1.7 billion for wastewater treatment aid, with $500 million of that available for grants to "cities with special needs," including those with high sewer rates and Mexican border projects. This year, EPA has $1.9 billion for wastewater revolving funds.

For Superfund, the committee approved slightly less than $1.5 billion for fiscal 1994, 5% below this year's level, but 6% higher than the House recommended.

The panel also trimmed VA major construction spending by 25%, to a total of $369 million, but that mark is 14% more than in the House-passed version. In addition, the Senate committee continued spending for the space station, providing $1.9 billion. That's $176.5 million less than 1993 and $154 million less than in the House version.

SAFETY

Fall protection rules up in the air

While the Occupational Safety and Health Administration drags out rulemaking on fall protection for steel erection, some regional OSHA officials are going their own way in enforcing standards and are doing so aggressively, say many contractors. Confusion and inconsistency are growing, they claim.

OSHA officials in Denver started the trend last year, prompted by fatalities during construction of the the Denver International Airport and a rash of fall-related fatalities in homebuilding. Some of the regional offices are refusing to exempt any jobsite duties and are using a 6 ft, 8 ft or 10 ft standard for requiring fall protection, depending on the region and type of work. The current OSHA standard calls for employers to provide protection above 25 ft for exterior work and 30 ft for interior work.

Region II Administrator James W. Stanley says the New York-New Jersey office enforces a tougher standard "when there is a recognizable hazard." The situation is acute in OSHA's Region V, which covers Illinois, Ohio, Wisconsin, Michigan, Indiana and Minnesota, although the first three, as federal plan states, are the most active. Ohio area OSHA officials changed their fall protection policy earlier this year. This summer, Illinois regional officials followed suit, setting as their ultimate goal "100% fall protection."

Some regional OSHA officials believe the current OSHA standard is too lenient and are getting around it by having their compliance officers use OSHA's "general duty" clause to enforce their new policies. OSHA officials justify this decision with a recent internal study of 3,496 deaths over five years, which found that 60% of the deaths by falls were from heights of less than 30 ft. "OSHA believes and recommends that 100% fall protection is feasible and preferable," says the Region V policy.

Steel erection is being hit hard by inconsistent OSHA enforcement.

OSHA considers the new policies to be a local emphasis program. As a result, inspections are not bound by normal scheduling criteria and can occur at any time.

Regional officials have held numerous meetings with local contractors and union representatives. They feel that they have gotten the message out and have started issuing citations. However, the first step usually is a notification letter with abatement information.

The contracting community feels that the situation still is "very confusing," says Thomas A. Broderick, executive director of the Chicagoland Construction Safety Council, a labor-management group. With only a one-page policy to go by, "it's just real squishy," he claims.

Broderick says contractors are particularly upset because it is difficult for them to go back to owners and ask for the additional cost of the extra fall protection. They also are having trouble finding fall-protection technology that can be adapted for the different stages of construction that now are covered.

Contractors working in multiple OSHA regions say the agency's inconsistent policies and applications are giving them headaches. Inconsistency "is one of the main issues confronting our industry," says Noel Borck, executive vice president of the National Erectors Association. The biggest impact has been in steel erection, particularly when ironworkers making connections need to move from point to point, he explains.

OSHA officials say they recognize the difficulty of adapting to multiple policies. They plan to address the inconsistencies once they receive recommendations from their construction advisory committee on September 30. The issue has united labor and management in many cases. They want a better national fall protection standard promulgated through negotiated rulemaking.

"We're beginning to see signs that

R0013548

OSHA is willing to reach workable solutions," says Jim Patterson, vice president of Talbert Corp., Denver, and a member of Associated General Contractors' safety and health committee. While he doesn't agree with the inconsistent policies, he notes that the agency is working with individual contractors to address their situations.

Still, many industry safety experts say they will fight until OSHA takes a more formal rulemaking approach with documentation and comes up with one clear standard to follow. ▣

By Hazel Bradford

HEALTH INSURANCE

One Clinton proposal would dent designers

Details of the Clinton administration's plans for overhauling the nation's health care system are leaking out and one analysis shows design firms taking a big hit in new costs.

According to a review by *Professional Services Management Journal,* the administration's proposal will cause average overhead for an architectural-engineering firm to rise "a little over 4%," says PSMJ Research Director William J. Fanning in Atlanta. The 500,000 persons employed nationwide by such firms would pay up to $450 million more annually in health insurance premiums, he claims. The estimates are based on a draft of the Clinton plan circulated in recent weeks, says Fanning. The review is being studied by the American Consulting Engineers Council.

The Clinton proposal would calculate employers' premiums as a percentage of payroll, rather than the current flat rate charge per employee under private insurance, says Fanning. It proposes a premium of 7.9% of annual pay. Employees would be enrolled in large insurance pools administered by states.

A-E firms currently pay an average of $2,200 annually per employee for health insurance, says Fanning. Based on the national average annual A-E salary of $39,000, the average premium would increase to about $3,100. Insurance for employees earning $75,000 per year would cost $5,925.

"The [Clinton] philosophy is those who make more will pay more for health coverage," says Fanning. "If A-E firms have to absorb that cost, 60% of their pre-tax profits will evaporate," he claims. Passing costs through in a soft market will be a tough proposition, he claims. ▣

INTERNATIONAL WORK

Mideast peace dividend?

Israel's Rabin (left), and PLO's Arafat shake on peace agreement that could boost construction.

The historic peace accord between Israel and the Palestine Liberation Organization signed in Washington, D.C., last week will likely stimulate unprecedented construction in the West Bank and Gaza Strip. The extent and timing of building will depend on funding levels for aid to the authority that implements Palestinian self-rule. Palestinian experts foresee abundant near-term foreign involvement in West Bank and Gaza Strip projects.

Officials say that the largest project under consideration is the deepening of an existing small Mediterranean port in Gaza to handle large vessels. The French government says it would help fund the job. "The cost of such a project would run up to $500 million and take several years," says Simcha Bahiri, a leading Israeli construction industry consultant who has studied building in the occupied territories.

Housing is another area with big investment potential. Hundreds of millions of dollars are expected to go into housing for refugees. Samir Houlele, a leading Palestinian economist, estimates that at least 20,000 units annually are needed in the Gaza Strip and the West Bank for the next five years.

In addition, large infrastructure investments are planned. A World Bank proposal seeks $1.35 billion in investments over the next five years for water and sewer works, transportation and powerplants. Israeli and Palestinian officials stress that the pace of construction will largely be dictated by the level of outside assistance.

The World Bank will play an important role, predicts Nicholas H. Ludlow, managing director of Washington, D.C.-based Development Bank Associates. The lending agency looks at the Middle East-North Africa area as a whole, ranking it as an aid candidate just behind eastern Europe and the former Soviet states, Southeast Asia and southern Africa. Projects stretching from Egypt to Syria worth some $5 billion are in the bank's planning pipeline, says Ludlow. Commitments are likely to increase in the next few years, he predicts, "provided peace can be sustained."

The European Community so far has committed some $600 million for the next five years, with Nordic countries chipping in about $120 million. The U.S., Japan, the wealthy Gulf states and organizations like the World Bank are also expected to provide capital. ▣

BUILDINGS

Aspiring to new heights

If completed in 1996 as now planned, the twin PETRONAS Towers in Kuala Lumpur would, at 1,476 ft, beat the Sears Tower height record by 22 ft. But the recent decision to increase their height seems almost an afterthought, considering that Kuala Lumpur City Centre already stands out as the most ambitious commercial development under way in the world.

Towers, at 1,476 ft, would exceed height of Sears Tower.

Foundations are 50% complete for the first phase of work, to encompass more than 10 million sq ft (ENR 1/25 p. 56). KLCC overall is proposed as a 17-million-sq-ft-plus project on a 97-acre site in the Malaysian city's commercial district.

Described by its local developer Kuala Lumpur City Centre Berhad (KLCCB) as a city-within-a-city, the first phase, called Northwest Development, will alone accommodate more than 50,000 people daily. To help strengthen or create the required city infrastructure, KLCC is working on a comprehensive area-road improvement program. KLCC traffic consultants, including the Singapore office of Wilbur Smith Associates and the local Dewan Bandaraya Kuala Lumpur, are recommending road widenings, underpasses and intersection upgrades. A KLCC people mover will help as will proximity to a city light-rail system, proposed but not yet built.

Relocation. Northwest Development, designed by Cesar Pelli & Associates, New Haven, Conn., with KLCCB's architectural division, Toronto-based Adamson Associates and a long list of other consultants, is challenging from bottom to top. For example, the current location of the metal and glass-clad towers is 150 ft from the original one planned. The move was made during design after subsurface investigation revealed that within the tower footprints, bedrock elevation varied from the level of the lowest basement to more than 600 ft below grade, raising the potential for major differential settlement, says the owner.

KLCCB is a wholly owned subsidiary of KLCC (Holdings) Sdn. Bhd., which is 51% owned by the national petroleum company, PETRONAS, and 49% owned by MAI Holdings, Pacific States Investment Ltd. and the Selangor Turf Club. PETRONAS will be the main tenant of the towers.

In addition to the twin towers, Northwest Development includes two office buildings, a 50-acre public park, a 630-room hotel and a 1.5-million-sq-ft shopping and entertainment center. There will be parking for 7,000 cars.

According to the owner, which is handling all press inquiries, DBF, a consortium led by Dragages Et Travaux Publics, a construction subsidiary of the Paris-based Bouygues Group, is excavating 14 acres for a five-level, below-grade foundation structure to support a six-level podium and the towers. The foundation contract alone is valued at about

R0013550

$55 million. Lehrer McGovern Malaysia leads KLCCB's project management team.

As designed by structural engineer Thornton Tomasetti/Engineers, New York City, with the local firm Ran Hill Bersekutu Sdn. Bhd., both nearly 2-million-sq-ft supertall towers will be framed by a roughly 152-ft-dia concrete perimeter tube connected by floor diaphragms consisting of composite metal deck on 18-in.-deep rolled steel beams to a 74.8 x 75.4-ft, high-strength, reinforced concrete core. Four reinforced concrete outrigger Vierendeel trusses in a 38th floor double-height mechanical room link the core corners to the perimeter tube. A two-level bridge connects the towers at the 40th floor.

Beyond the tube. Each tower, with 88 occupied floors and several setbacks, extends beyond the main structural tube. In plan, there is basically a series of eight circle segments that alternate with eight triangles encircling the perimeter tube. Each segment or triangular section is supported by steel trusses that cantilever from the perimeter tube. Each tower top is a pinnacle.

Tower foundations consist of a raft and 4 x 9-ft rectangular friction piles, called barrette piles, that range in length from 130 to 340 ft. The piles do not reach bedrock.

The goal is to wrap up foundation work by the beginning of January. Construction of the tower frames will follow. Cladding should be complete by the end of 1995 or early in January 1996. First occupancy is set for the following August or September.

Though total project costs are not available, core and shell construction in the region is about $100 per sq ft, according to knowledgeable sources.

CLEAN AIR

Emission credit trades hot

The Clinton administration is boosting its support of market-based approaches to meet Clean Air Act requirements, U.S. Environmental Protection Agency officials said earlier this month at an industry conference in Washington, D.C. But local authorities are already doing fine in pushing their own programs.

EPA is proposing a rule that would allow companies other than utilities to trade sulfur dioxide emission allowances, agency Administrator Carol M. Browner told attendees of the Clean Air Act Marketplace conference. That approach now allows 110 utilities to trade credits gained from reducing SO_2 emissions below the required 10 million tons per year, beginning in 1995. The so-called "opt-in" rule, set for publication soon in the *Federal Register*, will "create new market opportunities for companies in a variety of industries, not just utilities," said Browner.

Robert Brenner, acting deputy assistant administrator of EPA's office of air and radiation, conceded that such public/private ventures have been hindered by existing regulatory barriers and scrutiny by agency inspectors general and the Office of Management and Budget.

"I think we're going to do a lot better," said Brenner. He also admitted that EPA funding for trading efforts remains a problem, "but we're hoping there will be a snowballing effect as people see the benefit" of such programs.

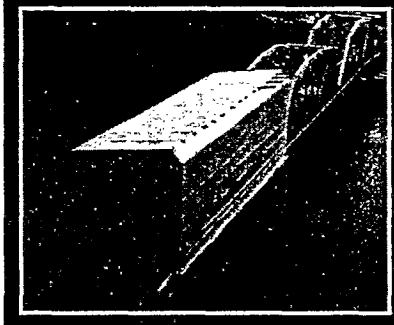
Interest is already growing. On Sept. 9, southern California's South Coast Air Quality Management District (AQMD) heard testimony on its new Regional Clean Air Incentives Market proposal. It would set emission levels for SO_2 and oxides of nitrogen for about 400 large facilities, beginning in 1994. These would be lowered each succeeding year through 2003. Emitters that exceed their annual reduction targets could sell credits on the open market. However, facilities could not "bank" credits for future years, and would face penalties for not meeting emission reduction levels.

The program has already garnered support from some of southern California's largest industrial firms, according to AQMD. But others voiced opposition at the hearing, citing severe economic impacts. AQMD is set to vote on the proposal on Oct. 15, although an agency spokesman says that could be delayed if the final proposal needs extensive changes based on testimony.

Meanwhile, a similar regional trading effort is being considered by the Northeast States for Coordinated Air Use Management, said Michael Bradley, executive director. He added that Massachusetts is about to launch its own trading program, which he termed "the most innovative."

Monarflex®
PROTECTION SYSTEM

MONARFLEX PROTECTION SYSTEM provides TOTAL CONTAINMENT, *simply* and *effectively* from SSPC Class 1 to Class 5.



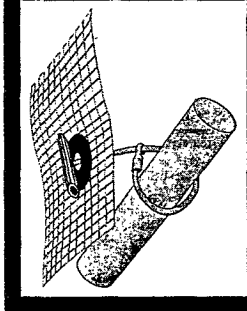


Photo of Class 3 Containment on Historic Connecticut River Bridge.

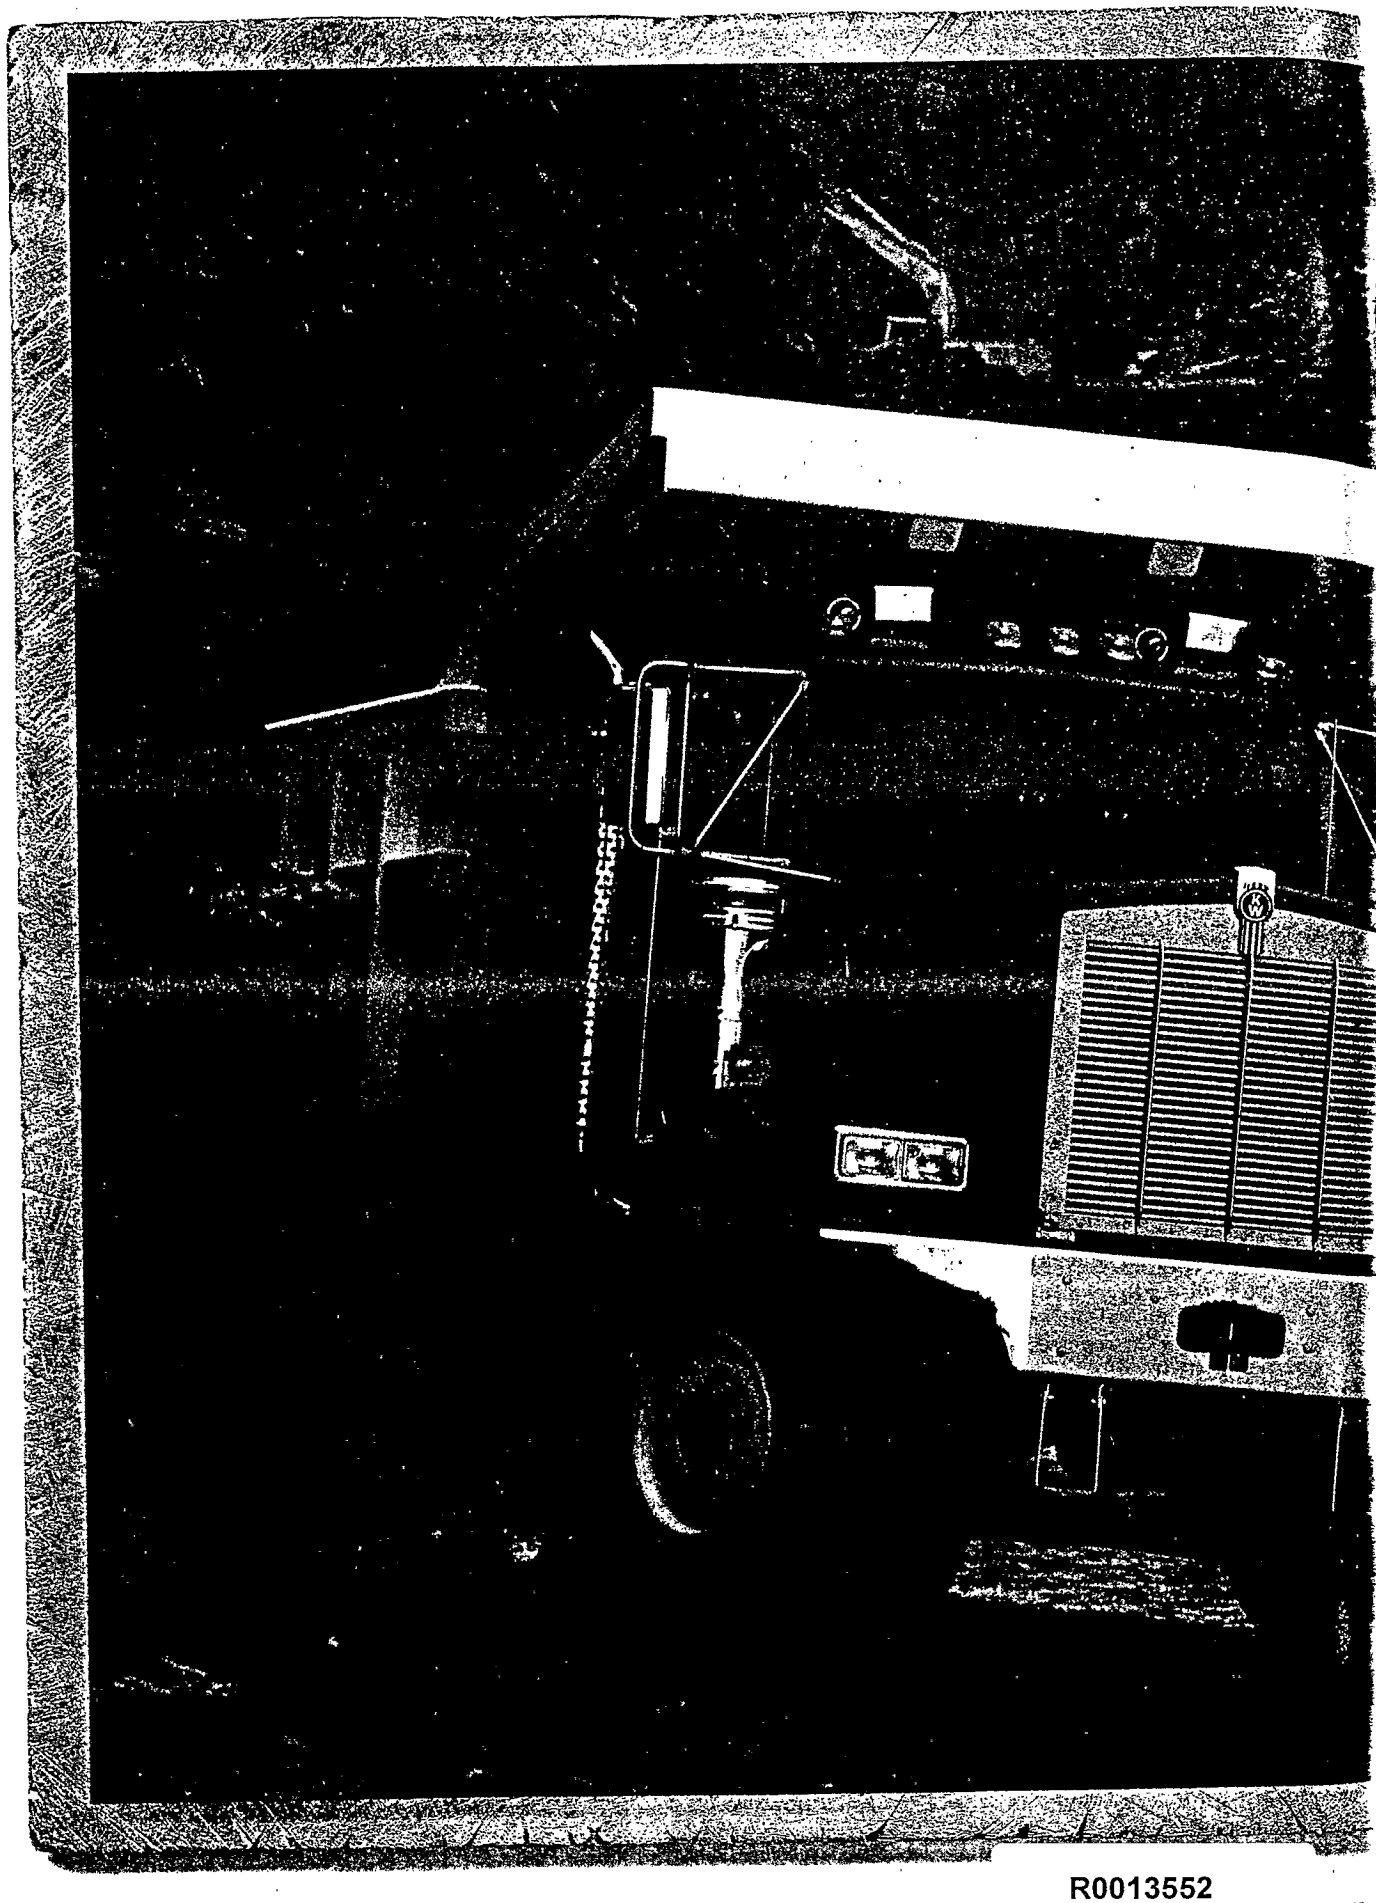
The #1 Environmental Choice for *any* lead paint removal job. Fast, highly economical and absolutely secure, Monarflex *delivers* what others can only talk about!

- ✔ Tough 10 mil thick reinforced poly
- ✔ Fast and easy to use fastening system
- ✔ Designed to withstand winds up to 77mph
- ✔ 100% weather resistant
- ✔ Highly economical and reusable
- ✔ Usable in temperatures from -40F to +140F
- ✔ 100% UV resistant



World patented fastening system secures sheeting to any scaffolding.

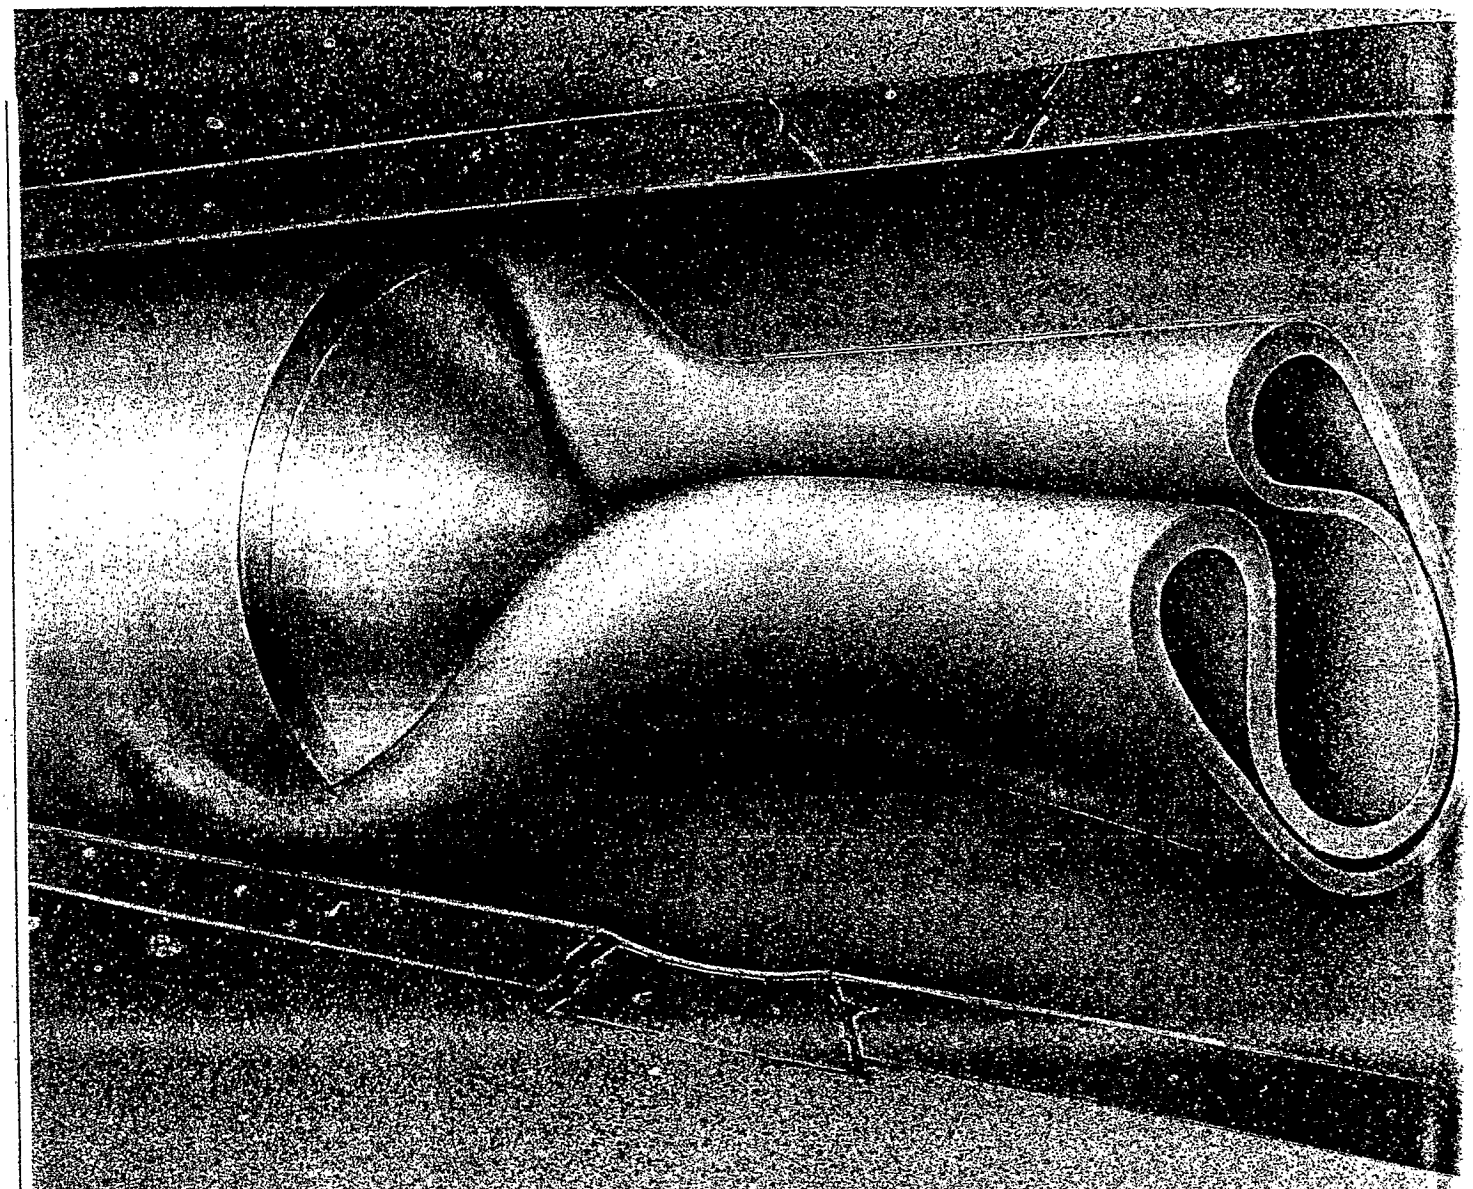
IF A PERSON WORKED THIS HARD FOR YOU, YOU'D MAKE THEM A VICE PRESIDENT.

If you were going to build a truck to be your business partner, how would you go about it?

You'd start with a full-length frame of steel for strength. You'd add a corrosion-resistant cab of fiberglass and aluminum, then Huckbolt it, for durability. You'd fit it with rugged taperleaf springs, and an ergonomically designed cab to help the truck and driver endure even the most grueling conditions.

The result: a truck engineered to minimize downtime. A truck that lasts longer. Nothing less than a truck to help you move mountains. In fewer trips, we might add, due to computer-aided analysis, utilized to help achieve the lowest possible tare weight.



So, like your other top employees, a Kenworth will work hard to exceed your expectations, year in, year out, for a long, long time to come.

KENWORTH. THE WORLD'S BEST.

Discover the NuPipe Difference

When it comes to trenchless pipe reconstruction, one fold-and-formed pipe stands above the rest.

NuPipe.

The Material of Choice

NuPipe offers PVC, the sewer industry standard for new pipeline construction.

It's also the smartest choice for pipeline reconstruction, offering a tight fit that stops infiltration and restores structural integrity.

Fast, Safe, Trenchless Installations

NuPipe installations are designed to last!

A unique heat containment tube provides a controlled environment for installing the folded NuPipe.

Applying heat softens the PVC, making it flexible enough to be pulled through the host pipe from a manhole. Then a specially designed rounding device expands the new pipe tight against the existing pipe, leaving a smooth inner surface that increases flow capacity.

And it's all done in a matter of hours, safely, without the hassles of digging!

Choose the Industry Standard

Call us today for a brochure and the name of your nearest licensed installer.

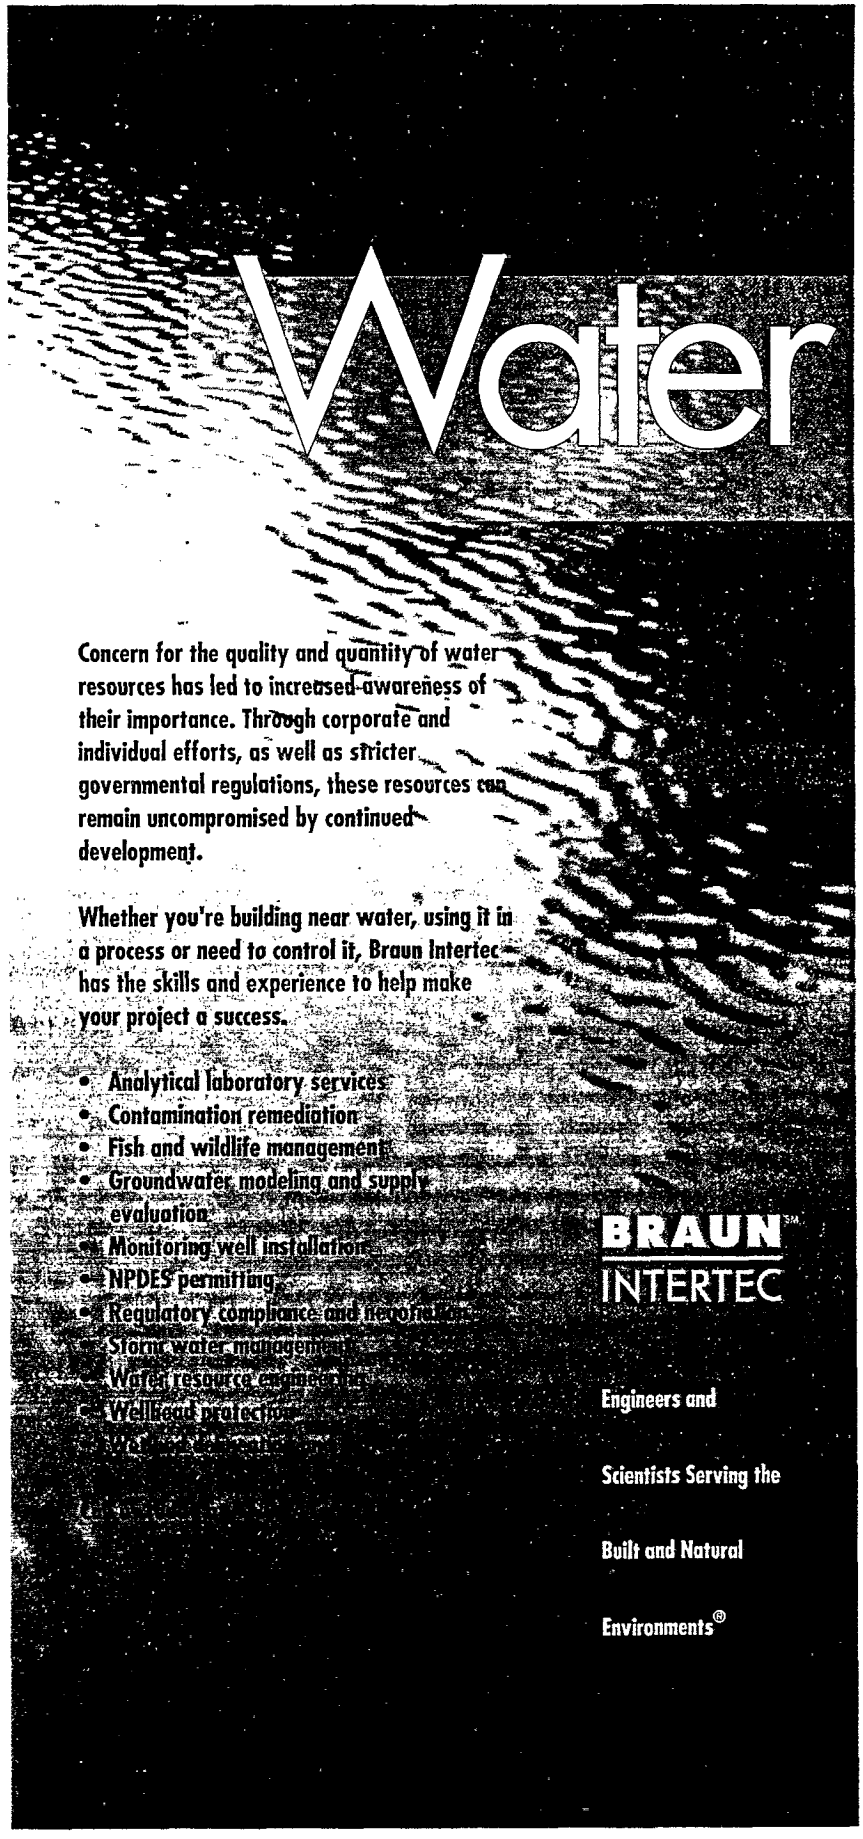
WASTEWATER

Florida county agrees to replace sewer pipe

Florida's Dade County and the Miami-Dade Water and Sewer Authority have agreed to replace a 5.3-mile-long, 72-in.-dia sewer force main beneath Biscayne Bay, under a consent decree filed Sept. 9 in U.S. District Court in Miami.

The agreement settles one of five claims against the entities, all brought in June by the U.S. Environmental Protection Agency for violations of the federal Clean Water Act. EPA says the action is the first use of the act's Section 504 provisions as a response to "imminent and substantial endangerment."



Officials in EPA's Atlanta-based region say they are concerned about the integrity of the existing concrete pipe, built in 1956. They say a Miami area land-based line of similar construction and age ruptured from corrosion in 1989. "We wanted to get this replacement under a construction schedule before we have raw sewage in the bay," says David Olson, chief of the regional office's data management unit.

The existing pipeline is in bay sediment and carries about 100 million gal per day of wastewater from Miami, Coral Gables, South Miami and Miami Springs to the county wastewater treatment plant on Virginia Key. The bay is a national sanctuary.

Construction of a new 102-in.-dia pipe is set to begin by the end of the month and has a scheduled November 1994 completion date. Six construction awards to five firms were made earlier this month for the project, estimated to cost about $60 million. The new pipe will be of reinforced concrete with an impervious plastic lining, says Robert A. Cuevas, the utility's chief engineer. Pipelaying will also involve special precautions because of delicate seagrasses.

The consent decree also requires the county to suspend new sewer hookups in areas where adequate treatment capacity cannot be provided. An authority spokeswoman says those restrictions are county wide. "We have not suspended permits, but they are being delayed until the capacity is available," she says. Officials say the new pipeline and improvements to two treatment plants will provide the needed capacity.

An emergency contingency plan is due by early October and a second consent decree resolving illegal discharges and overflows is under negotiation, say EPA officials. ▣

BONDING

Jury awards hefty sum over surety dispute

A state court jury in Contra Costa County, Calif., has ordered a surety to pay $116.5 million to a general contractor because the jurors believed the surety breached its contract and "interfered" with the contractor's business by refusing to continue to provide bonds. The surety cut off the firm's bonding after disagreeing with it over who was at fault on a troubled project.

The jury ordered St. Paul Fire & Marine Insurance Co., St. Paul, Minn., to pay $100 million in punitive damages and $16.5 million in compensatory damages to Arntz Contracting Co., a general building contractor in Novato, Calif. The jury supported the claim that St. Paul prevented the company from bidding and winning projects during the 1980s. "We asked the jury to send a message to the boardrooms throughout the country that surety companies cannot act with impunity," says R.W. Miller, a Kansas City, Mo.-based attorney who represented Arntz.

Appeal. St. Paul Fire and Marine pledges to "vigorously appeal" the decision. "The verdict is not supported by the evidence" and "the award is grossly excessive," says a company spokesman.

Dennis Wine, vice president of the Surety Association of America, Iselin, N.J., says the surety industry is facing a growing problem of lawsuits based on claims of broken promises for future projects. "I can conceive of sureties trying to cope [by including] something stronger in applications for bonds or in indemnification agreements that would make it abundantly clear to contractors that we are not making a lifetime agreement to bond you."

The dispute began in 1982, when St. Paul provided bid, payment and performance bonds to Arntz for construction of a $4.7-million housing project in Richmond, Calif. In 1984, with most of the project completed, the Richmond Housing Authority terminated Arntz for refusing to redo the buildings' stucco walls. St. Paul informed Arntz that it was stepping in to complete the project, but Arntz claimed it was not at fault in the matter.

In December 1984, Arntz agreed to provide St. Paul with an additional $1.2 million in collateral that Arntz claimed would entitle it to future bonds. But about 8 months later, St. Paul refused to provide any more bonds, Arntz claimed. ▣

ACCIDENTS

Scotland investigates recent fatal 'implosion'

Investigations are under way into the death of a spectator at the demolition of two large concrete buildings in Glasgow, Scotland, on Sept. 12. Flying debris from what was called Europe's largest building implosion escaped into the spectator exclusion zone, causing the fatality and some injuries.

The demolition contractor initially suspects that the buildings' great size and structural form helped eject debris more than 394 ft from the explosions. "The buildings are so heavy that the stresses could have caused concrete to burst," says Michael Higginbothan, a director of Ladkarn Demolition Ltd., Crook, Durham. "This has never happened before in Britain," he says.

"The exclusion zone was created in accordance with [the government's] Health and Safety Executive guidelines," says an HSE spokeswoman. HSE, which requires exclusion zones to be no less than twice a building's height, is leading investigations.

The 190-ft-tall apartment buildings were built in the mid-1960s to replace slums in the once-notorious Gorbals district. Because of decay and social problems, the buildings were condemned by the city council, which awarded a $1.3-million demolition contract to a joint venture of Ladkarn and Wreckers Ltd., an international explosives expert with operations in South Africa and the U.S., according to Higginbothan. The joint venture appointed structural engineer Bullen & Partners, Glasgow, to advise on weakening the buildings in advance of demolition by mechanically cutting redundant structural elements.

"We surveyed the buildings before and...during the pre-weakening...and we were quite happy with the work," says Ian Paterson, a principal engineer with Bullen. Paterson says that the width of both buildings was 41 ft. One building was 213 ft long and the other 476 ft.

The structures consist of cast-in-place concrete slabs and walls. The contractor used 2.5 tons of explosives aiming to reduce the buildings to rubble. However, even discounting the fatality, the demolition was not entirely successful. "There is one section which did not fully collapse, but this is not seen as a problem," says Paterson. "The object was to bring down these very large buildings to ground level where they could be broken up." ▣

SHRINES

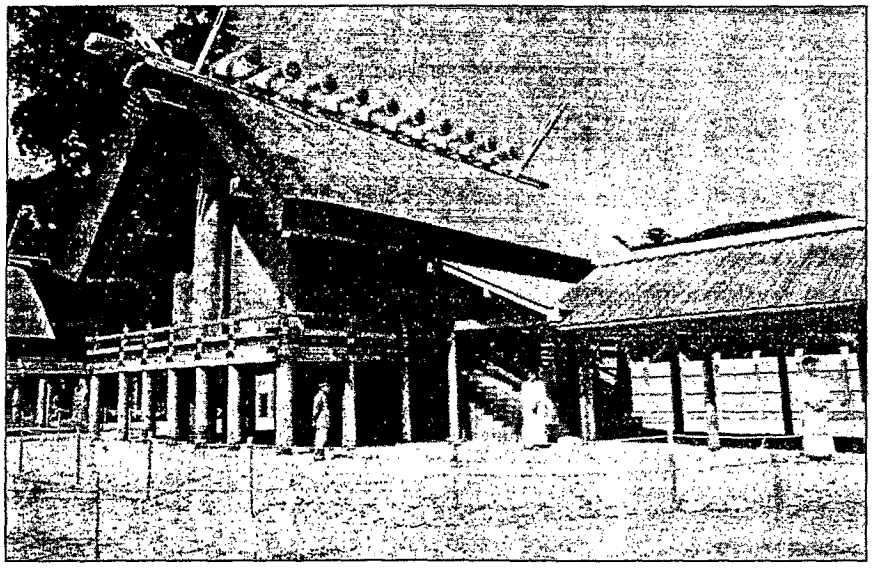
Japan's 61st reconstruction

Early next month, Shinto priests will carry the symbols of Japan's most important deity from a 20-year-old wooden building to a just-completed reproduction a stone's throw away. Then the old building will be razed. In a tradition that began in 690, the process will be repeated in another 20 years.

The tradition is unique to the Grand Shrine of Ise, founded in about 4 B.C. and believed to be Japan's oldest. "In Shinto, the ideal of eternity and longevity is made possible by periodic renewal," says Kunio Kobori, a shrine official.

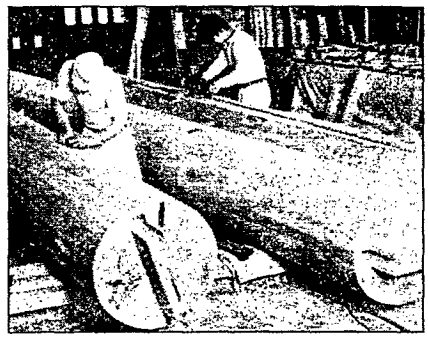
The renewal "has a central role in perpetuating traditional craftsmanship," says Yutaka Ishikawa, an official with the United Association of Shinto Shrines. Though some power tools are used, all joints are notched, fitted and wedged, as they were 1,300 years ago.

Located in Mie Prefecture, about 200 miles west of Tokyo, the Grand Shrine is a complex of more than 125 buildings in various locales. Though all are rebuilt periodically, the most significant is the main "Naiku" shrine and 13 auxiliary ones. The Naiku is a single-story building just 17.9 x 7.2 ft and on pillars.



The $297 million for the 61st rebuilding, which also includes reproduction of 1,600 ceremonial items, comes from shrine reserves and public donations. Construction is executed by the shrine's master carpenter, who directs a permanent staff of 20 carpenters and other crafts specialists plus a seasonal work force that peaks at 170.

Kobori says the architecture was adapted from rice storehouses common at the time. The buildings' stark simplicity still characterizes Japanese architecture.



The buildings are unfinished hinoki cypress with steep roofs of miscanthus thatch. Main columns are set directly in the ground. Though a few bolts are used, nails or other fasteners are not.

Work began in May 1985 with the felling of trees from the shrine's own forests. The shrine also owns its own miscanthus fields and saw mill. The reason for the 20-year interval is unclear, though a generation's time makes sense and parallels material life, says Kobori.

Every stage is marked by ceremony. Carpenters must ritually bathe each morning and don white work outfits. As the main shrine is done, workers move to other buildings. "The construction process never ends," adds Kobori. ▣

Sacred wooden buildings that make up Japan's oldest shrine are reproduced every 20 years.

Workers pass along traditional techniques.

TUNNELS

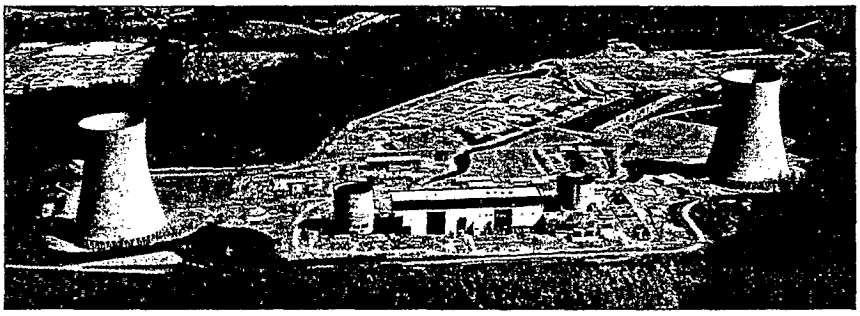
Norway floats tube concept

Norwegian engineers are waiting for a government decision by year's end that would pave the way for the world's first floating tunnel. Parliamentary approval is needed for some $5 million in design research. Although the tunnel across an 820-ft-deep fjord near Stavanger is mentioned in Norway's 1994-97 road plan, no budget has been allocated for the work.

"We think the tunnel is possible," says Kaare Flaate, director of the Norwegian Road Research Laboratory (NRRL), in Oslo. "To convince ourselves that it is possible to cast such a structure, we have to make a full-scale section," he adds. The agency is looking at three concrete designs and one in steel, each conceived by a different design team.

The 33-ft-dia tunnel, with two traffic lanes, would be tethered to float beneath the surface of the 3,900-ft-wide Høgsfjord. Steel construction is relatively easy, but contractors familiar with the project say horizontally slip-formed concrete would be cheaper, says Flaate.

To exploit the latest technology for a watertight concrete tube, NRRL wants to stage full-scale trials no more than two years before construction, he adds.



A floating tunnel would suit the road network in western Norway, which is punctuated by numerous fjords. Some are shallow and narrow enough for conventional tunnels and bridges, but others are too deep, says Flaate.

Høgsfjord is shallow for a fjord, Flaate says, but rock suitable for tunneling is too deep. A floating bridge is being built across the wide Salhusfjord north of Bergen, but a tethered tunnel would be cheaper, he says. ▣

R0013558

POWER

Plan offered to revive nukes

Inactive plant site includes mothballed Unit 3 (right) and Unit 5, which was abandoned 10 years ago.

A new plan would allow work to resume on two uncompleted nuclear power units in Washington state at a cost of $3.3 billion under an agreement with the federal government. If approved, the Dept. of Energy would fabricate plutonium from U.S. and former Soviet Union weapons into fuel.

Despite power shortages in the Pacific Northwest, the 1,240-Mw units were headed for termination, 10 years after being shut down during construction for economic reasons. (ENR 4/19 p. 14). Washington Public Power Supply System owns the projects—Unit 1 at Hanford and Unit 3 at Satsop.

The current proposal is part of a complex financing arrangement that involves raising more than $7 billion. A joint venture called Columbia Nuclear Corp., Kennewick, Wash., made the proposal to DOE. Gary Peterson, a consortium spokesman, says it will present details this week to WPPSS.

The consortium includes Science Applications International (SAI), San Diego, Calif., which specializes in defense and energy projects; a subsidiary of Newport News Shipbuilding of Virginia; and Battelle Memorial Institute, Columbus, Ohio, a research firm that has long been involved at Hanford.

Columbia Nuclear proposes to raise $3.3 billion by issuing revenue bonds to complete construction. Peterson says the company has talked to the units' original engineers, constructors and reactor suppliers about participating.

Columbia Nuclear would deed the nuclear steam supply portions of the units to DOE because a federal law prevents commercial plants from using weapon materials. WPPSS would retain ownership of the turbine-generator islands and buy steam from DOE to produce electricity. The federal Bonneville Power Administration would market the power, as originally planned.

After construction is completed,

How to treat wastewater without creating needless waste.

We're talking about wasted time. And wasted money.

Some firms look at wastewater problems strictly as an end-of-pipe matter.

Which doesn't exactly get to the root of things.

At ERM, we take a more integrated approach.

Sure, we solve the problem. But first we make certain that we really have it defined. You can spend a lot of time and money looking for the solution to the wrong problem.

Next, end-of-pipe is not end-of-story. Because what comes out as waste starts out as something else, providing opportunities for source reduction and savings.

And don't forget sludges. Minimization is key, because disposal is one of the largest problems in the process.

We do it all—investigation to feasibility study to engineering design to construction. Even startup and operation.

ERM is a global environmental engineering organization with more than 75 locations worldwide. We offer one-stop shopping: a full range of wastewater treatment services, including a unique, cost-effective method of evaluation and design based on our PROACT℠ services approach.

ERM

ERM is one of the fastest-growing environmental engineering organizations in the world. If you call, we'll show you why.

Making the world better for everyone. Including business.

For the location nearest you, call 1-800-544-3117

Columbia Nuclear plans to raise $4 billion more on the bond market. Half would be paid to BPA to pare its debt. The rest would go to former Soviet republics for plutonium, says Peterson.

Columbia Nuclear would be contractually guaranteed revenue from DOE's steam sales to WPPSS to service the developer's first bond issue, and revenue from WPPSS electricity sales to BPA to retire the second financing. ▣

MATERIALS

Virginia embankment: where the rubber really meets the road

Virginia disposed of nearly one-tenth of its stockpile of 25 million waste tires by shredding 2.2 million for use this summer as highway embankment fill near Williamsburg. State officials claim it is the most ambitious use of the approach to date in the U.S.

James C. Cleveland, construction engineer for the Virginia Dept. of Transportation's southeastern district, says the 100,000-cu-yd-plus embankment project evenly mixed shredded tires and sandy soil.

The Virginia Dept. of Environmental Quality, which runs the state's waste-tire program, says the project is the largest ever use of waste rubber and tire steel as structural fill, surpassing jobs in Minnesota, North Carolina, Oregon and Vermont.

The $750,000 job just finished by Barnhill Contracting Co., Tarboro, N.C., specified two 600-ft-long ramp embankments up to 20-ft high for part of a future interchange on Virginia Route 199. DOT supported the project because the state's largest tire-shredding operation is only 20 miles from the site, the embankments will settle for two years before roadway construction, and the lighter fill exerts less pressure on unstable, swampy soil beneath the site.

The waste tire program agreed to pay the extra $147,000 the DOT spent to use the shredded tires, says Allan Lassiter, program director. That works out to less than 15 cents per tire, or one-fifth to one-sixth the cost of landfill disposal.

E.J. Poindexter, Barnhill vice president, says his firm spread alternate 6-in. layers of shredded tires and soil, mixing them with a grader and rolling the mix. Thick layers of straight soil cover the top and sides of the embankments.

DOT plans to monitor the site to compare settlement there with settlement at conventional embankments. ▣

R0013560

DRINKING WATER

EPA would boost funds and reduce regulations

The Environmental Protection Agency released recommendations to revamp the nation's drinking water program, including a new state revolving fund to close an estimated $9-billion infrastructure gap. EPA also is stressing pollution prevention, wants to give local agencies more flexibility and proposes to let local authorities levy fees to pay program administration costs.

The federal agency hopes its recommendations, sent to Congress Sept. 8, will become part of a revised Safe Drinking Water Act. EPA Administrator Carol M. Browner contends that the current program is "broken in some

Browner wants to fix the broken water program.

instances and...needs to be fixed." She says many communities cannot keep up with the growing regulatory burden.

Under the drinking water fund proposed by President Clinton in February, the federal government would contribute $599 million in the first year, and $1 billion in each of the next four years. Aid would be funneled to states based on a formula including such factors as the number of water systems, population and geographic area, says James R. Elder, director of EPA's office of groundwater and drinking water. States would have to pay a 20% share.

Brian P. Deery, director of the Associated General Contractors' municipal utilities division, says the present act "sets stringent standards for local water companies to meet. Many are just not

Our politicians should have approval ratings this good!

At MPC, secondary containment doesn't stop at the dike. We provide a *total solution* to the threat of soil and water contamination... for both horizontal and vertical tank layouts.

On the dikes. Around pipes. Under vertical tanks. We're the specialists in above ground tank double-bottom retrofit liners.

Patented, leak-proof MPC Petrogard® liners are pre-engineered for quick, problem-free installation. And because they're heat-seamable, it's easy to make modifications on-site.

Let MPC design a retrofit or new liner system that really does the job by meeting applicable codes and reducing pollution insurance. Send for our free engineering package, or call toll-free **1-800-621-0146**.

Circle 21 on Reader Service Card

going to be able to meet those standards without some kind of federal assistance." AGC thinks state revolving funds (SRFs) for wastewater treatment have a good record and will "work just as well in the drinking water area," says Deery.

Browner says EPA would let financially pressed small systems use "less expensive technologies" than big systems. And some systems could have up to 60 months to comply with new rules compared with 18 months now.

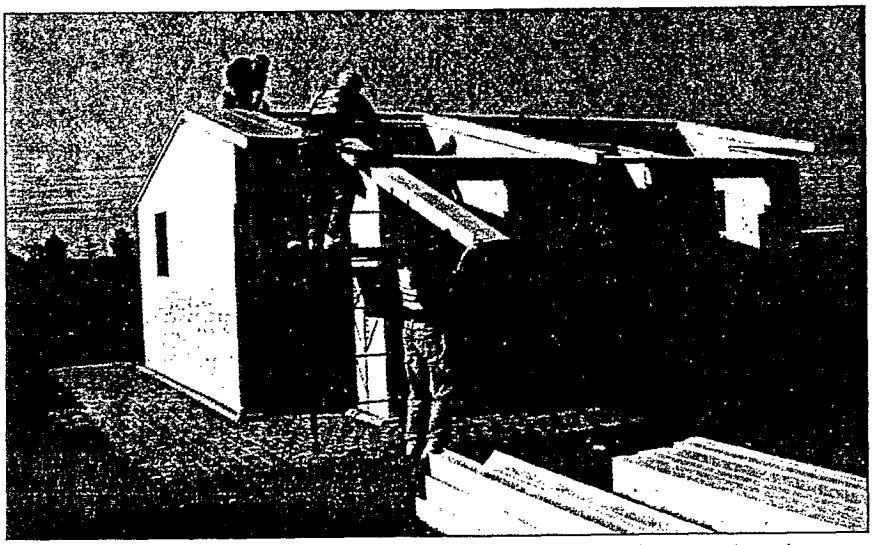
EPA wants to do away with the present legislative requirement to set new limits for 25 more contaminants every three years. Instead, it calls for splitting contaminants into two groups: those needing regulation and those requiring "further study," says Browner.

Two House committees passed drinking water SRF bills in April, but neither is a comprehensive measure. Senate Environment and Public Works Committee Chairman Max Baucus (D-Mont.) and the panel's ranking Republican, John H. Chafee of Rhode Island, are drafting drinking water legislation that may be introduced this month. ▣

CASINOS

Winner, loser join up, weigh grander plan

A month after selecting a developer to build and operate what would be the state's only land-based casino, the Louisiana Economic Development and Gaming Corp. is still not sure what it will get. Though the losing contender, who controls the site, joined the winner, both parties now say they need more time to hammer out a deal.



When Gov. Edwin Edwards threatened to call a special legislative session, Harrah's Jazz Co., a partnership of Promus Cos.' Harrah's Hotel Casinos and 10 New Orleans investors, agreed to give one third of the deal to loser Christopher Hemmeter in exchange for access to the New Orleans site, which he controls under a long-term lease with the city (ENR 9/6 p. 20).

Harrah's proposed to renovate the site's vacant New Orleans Rivergate Convention Center into a 120,000-sq-ft casino. But the city, which has to approve the project, wants a 300,000-sq-ft facility instead, as promised in Hemmeter's lease. Tom Morgan, Promus vice president of development, told the commission the partners have not decided whether to demolish or renovate. A decision is expected soon. ▣

HOUSING

Modular low-cost homes give plastic new dimension

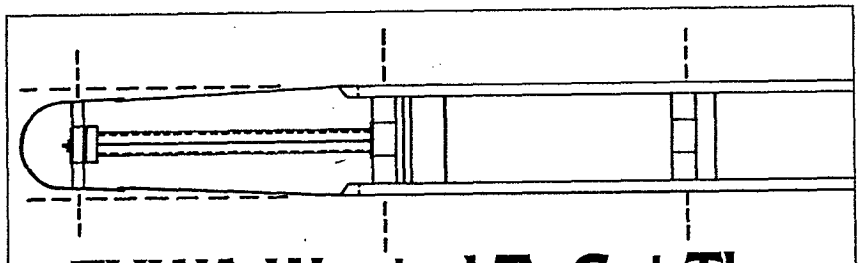
Composite panels, assembled on site, resist cracking, rust, rot and high winds, says the maker.

A Canadian modular homebuilder is starting production of affordable houses from a polymer composite that the maker says also has commercial, institutional and industrial applications. The resin belongs to a family of plastics used in a number of products from tennis rackets to the Stealth bomber.

The basic building block or panel is a hollow, extruded reinforced polymer composite based on polyvinyl chloride. Royal Plastics Group, the parent company of the modular homebuilder Royal Building Systems (Cdn) Ltd., Toronto, developed the material.

According to recent independent laboratory tests, the houses are able to resist 175 mph winds when hollow wall panels are filled on site with concrete. And the maker claims the material won't fade, crack, split, rust or rot, and is impervious to insect infestations.

It is the first PVC modular house to be tested for residential building code purposes by the Canadian Construction Materials Centre, a division of the National Research Council, says Brian Burton, technical specialist at Trow Consulting Engineers Ltd., Toronto, retained by Royal for testing. "That meant new criteria had to be written."



The houses range from 300 to more than 3,000 sq ft. They can be configured as single or multiple-story dwellings. Nearly everything is plastic.

Housing kits range from $17 to $38 per sq ft, including kitchen and bathroom fixtures, but not transportation to the site, the foundation pad, concrete fill, insulation and hookups. A stick-built house costs about $55 per sq ft, according to the National Association of Home Builders of the U.S.

After the concrete pad sets, three workers using hand tools can assemble a house in less than three days, according to John M. Garbin, Royal Building's general manager. The crew connects wall panels to reinforcing steel embedded in the concrete pad and attaches the roof using connector studs.

Royal Building recently sealed its first order—5,500 units for a public project in Buenos Aires. Royal is now turning its sights to Canada and the U.S. Garbin estimates that total demand for the units could hit 50,000 next year.

"I'm satisfied the house has technical substance, and it if costs a fraction of conventional technology, then it has enormous upside potential, particularly in developing countries," says Fred Hallahan, engineer-principal of a housing technology firm in Baltimore that bears his name. "The question is: Will it sell in the U.S.?" ▣

FHWA Wanted To Cut The Cost Of Energy-Absorbing Crash Cushions In Half

In 1982 FHWA ran a design competition to cut the cost of energy-absorbing crash cushions. C-A-T® won. Originally developed by a former D.O.T. professional, C-A-T turned standard guardrail components into an energy-absorbing life saver. All the components are familiar to guardrail installers so it's easy to install and maintain. Today, after over seventy hits with no fatalities, C-A-T shows what happens when people who understand cost/benefit ratios set out to improve safety. It's one more way Syro is teaming up with America's best highway safety minds to help you cut the cost of saving lives. Call for free details, today. Girard, Ohio 44420, 1-800-321-2755. Centerville, Utah 84014, 1-800-772-7976.

"This French process quickly reduces 65 tons of organic waste to 33 tons of compost clean enough for farming."

Jerald Niebuhr
Prarieland Board Chairman

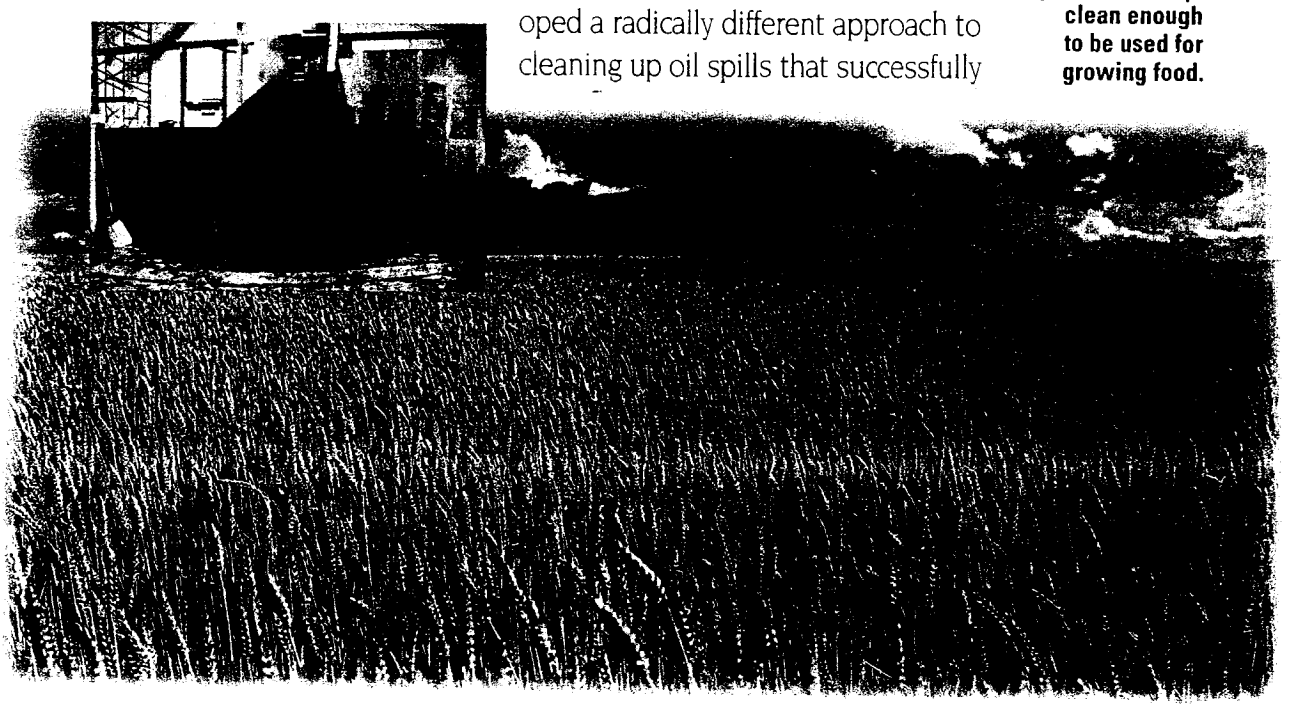
The French have a way with perfume, champagne and...garbage.

At least, that's what they're finding out at the Prarieland Solid Waste Board in Truman, Minnesota. Municipal authorities there turned to OTVD, owned by France's Compagnie Generale des Eaux, for an innovative solution to the county's garbage disposal problem.

Communities were already doing all they could to recycle, but 100 tons a day of solid waste were still loading up landfills. The bright spot was that some 65 tons were compostable, if only the technology could be found to do it on such a huge scale.

OTVD introduced Prarieland to French Siloda technology, never before used in the United States. A patented paddle wheel speeds up the composting. In just 28 days, the compost is ready for curing. After that, the clean compost can either be used for municipal projects or sold to farmers and nurseries.

Instead of going to landfills, 65% of the town's solid waste can be composted.



"We checked out just about every solid waste management system used in Europe or the U.S., and concluded that this one was best for large-scale composting," said Jerald Niebuhr, Chairman of the Prarieland Board. "This process will be a model for other communities that want to use composting in the future."

Perhaps it is the French eye for beauty that has led French companies to become so active in the environmental field.

Montenay, also owned by Compagnie Generale des Eaux, operates five ultra-modern incinerating plants in the U.S. and a medical waste incineration facility in the Bronx, New York.

Lyonnaise des Eaux-Dumez is helping water companies in 31 U.S. communities improve the quality of their drinking water to meet today's and tomorrow's higher standards. One example is a new ultra-filtration membrane process, marketed in the U.S. by Infilco-Degremont, Inc., that is being used by the New Rochelle, N.Y. Water Company.

And Société Nationale Elf Aquitaine has developed a radically different approach to cleaning up oil spills that successfully helped clean up the Alaskan coastline after the Prince William Sound oil spill.

The Siloda process produces compost clean enough to be used for growing food.

It's time you took a closer look at doing business with France–through trade, partnerships, joint ventures and strategic alliances.

NO PROBLEMS!

Self-Priming Heavy-Duty Trash Pumps

Hydraulically-Driven Submersible Trash Pumps

Rotary Wellpoint Pumps

Multipurpose Dry-Prime Pumps

Whether you purchase, lease, or rent a Thompson pump, you know you have the most reliable equipment on the market... today and for the future!

Thompson pumps have earned their reputation for being rugged, dependable and efficient...day after day, month after month, and year after year...after *year*! Furthermore, Thompson pumps are easy to maintain, continually delivering top performance with very little attention...which means more profits in your pocket with a lot less problems than with other pumps.

Sure, our competitors have occasionally matched our prices by using lighter, less durable materials; but they have *never* matched the long-term value of a Thompson pump. Whatever the application, Thompson has a pump for every job. Give us a call and ask for our free brochure featuring the complete product line of Thompson pumps and detailed specifications.

Banks agree to bailout plan for Canary Wharf that creditors must ok

A consortium of banks has agreed to a $1.7-billion rescue package for Olympia & York's failed Canary Wharf office development in London. If the development's 1,400 unsecured creditors vote for the plan on September 30, the project will be taken out of Administration, the British equivalent of Chapter 11.

Unsecured creditors, claiming up to $224 million, will receive a maximum of 15 cents on the dollar. Of these, 130 construction companies owed $120 million will get an additional 25 cents on the dollar if they agree to warranty their work, says Administrator Nigel Hamilton, a director of accountant Ernst & Young, London.

The creditors' agreement to the package also would trigger construction of a $2.7-billion extension of London Underground's Jubilee Line to Canary Wharf. The banks have agreed to honor O&Y's pledge to partly fund the project, which is considered essential for the commercial development's success.

Canary Wharf failed with Toronto, Canada-based O&Y owing the banks $850 million. The project ultimately was to have contained about 10.5 million sq ft of leasable space in more than 20 major buildings (ENR 3/18/91 p. 22). When the court appointed Ernst & Young to take control of the project in May 1992, O&Y had built 4.4 million sq ft of office and retail space, representing about a third of the total plan. Construction halted, leaving one 472,500-sq-ft building, B3, without curtain walls. About 40% of the constructed space now is rented and that will rise to 49% if the rescue package succeeds, says Hamilton.

The package involves the banks deferring their $850 million worth of debt for 17 years, when interest will start accruing. Banks also will provide an additional $417 million, including $40.5 million for unsecured creditors and $230 million for long-term support of the project. Those additional funds will include a $147-million immediate payment toward the Jubilee Line extension. Another $450 million will be paid to the London Underground over a 25-year period after the subway line is completed.

Hamilton says that he knows of no immediate plans for further construc-

R0013566

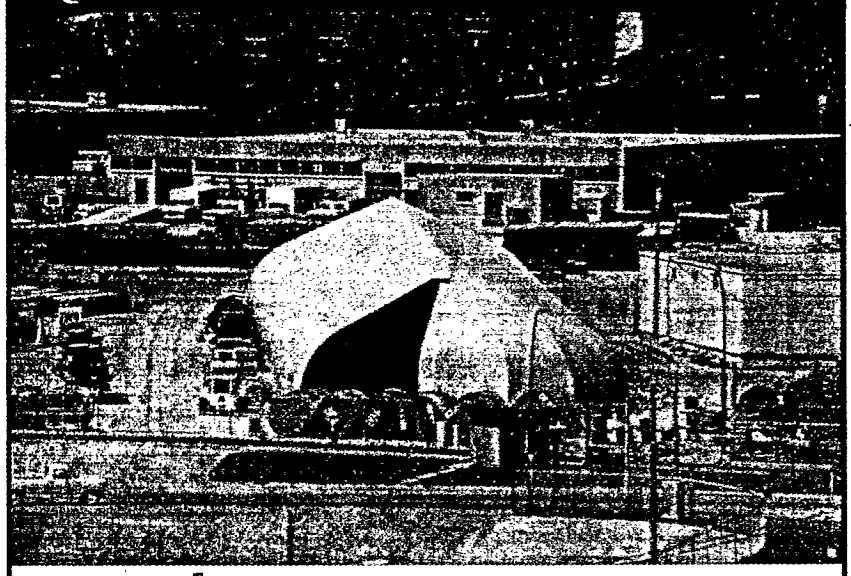
tion at Canary Wharf, except for the completion of the B3 building's curtain walls.

O&Y's original owners in the Reichmann family will have no involvement in the revived project, says Hamilton. Skidmore, Owings & Merrill, Chicago, was the master planner for the Canary Wharf project and designed four of the major buildings. ▣

CONTRACTING

Design-build contracts spreading in industry

Design-build is continuing to gain momentum at the expense of other project delivery systems and the trend will continue, according to speakers at a recent conference on the future of project delivery systems sponsored by the Associated General Contractors. AGC also is nearing completion of model contract documents for design-build.



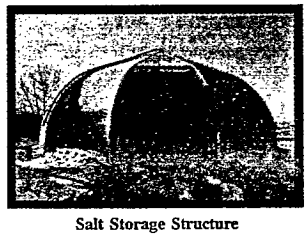
"I see it as the new project delivery system for the '90s and on into the next century," said speaker J. William Ernstorm, a Rochester, N.Y., attorney and member of the AGC task force working on the documents. However, other speakers at the Atlanta conference cautioned that design-build still has several unresolved hurdles, including design liability, bonding and selection process problems in the public sector.

Speakers called for shortlisting teams in advance of the costly process of producing detailed proposals for public owners. "The wanton use of [architects', engineers'] and contractors' time in developing proposals is our main objection," says John Busby, a partner with Atlanta-based architect Jova-Daniels-Busby. "It's absolutely downright damned disgusting. I'm disappointed that we're putting up with it."

The AGC documents should be available by November if the association's directors approve them at their mid-year meeting later this month, says task force chairman Paul J. Hoffman, who also is president of Hoffman Corp., Appleton Wisc., a design-build oriented general contractor.

AIA currently produces the industry's most widely used design-build contract documents. The Engineers' Joint Contract Documents Committee is working on another set. It may be ready by the end of the year, says Steven Polk, deputy executive director of business affairs of the American Consulting Engineers Council. ▣

SPRUNG INSTANT STRUCTURES
QUALITY SHELTER SYSTEMS...WORLDWIDE



Public Works Storage Facility

Regardless of size, conditions, or purpose, quickly installed Sprung Instant Structures have proven themselves time and time again. This is because of their wind load & snow shedding capabilities, patented skylight system, modular construction, freespan widths from 30 ft. - 180 ft., limited or no foundation requirements and ease of relocation.

Sprung's dedication to quality and service is backed by the industry's longest guarantee program. We challenge anyone to meet the quality of the Sprung Instant Structure and to match our record of service and prompt delivery. Offices are located worldwide to help you solve your shelter needs.

Installations of Sprung Instant Structures are supervised by professional Technical Consultants supplied by the company.

INFRASTRUCTURE

Small town takes high road

Rush hour starts before noon in Branson, Mo.—population 3,700—and lasts until around midnight. Talk about a traffic jam! The 5 million visitors a year to the five-mile-long "strip" of more than 25 country music theaters can end up sitting in the parking lot for an hour after the show waiting to get onto the town's three-lane artery, Route 76, known as Country Music Blvd. The bumper-to-bumper crawl out of town can take another hour.

Branson, Taney County, the Missouri Highway and Transportation Dept. (MHTD) and the Federal Highway Administration (FHWA) all are coordinating efforts. A new 18-mile-long loop around the city, known as the Ozark Mountain High Road, is on the drawing board, as are several local roads. But there will be no instant relief. Ground was broken earlier this month on an $8.4-million connector road that may be open in about a year, but even on a very fast track, the Ozark highway won't be operational for at least four years.

Country Music Blvd carries about 30,000 cars per day and is "notorious" for "wall-to-wall cars," says Willis Graven, MHTD district engineer for the Springfield area. Widening the road to five lanes was not an option because buildings and hotel swimming pools tend to be on the right-of-way line. To take out another 8 to 10 ft along the strip would be "devastating to the existing properties," adds Graven.

The Ozark Mountain road will ease the load somewhat. It will have seven interchanges with connector roads that will lead into Rt. 76 in a wheel-and-spoke configuration. "It doesn't solve the problem by itself," says Scott M. Smith, transportation group director for HNTB Architects Engineers Planners, Kansas City, designer of the road.

The most remarkable part of the project is the environmental aspect. Branson is in a beautiful and environmentally sensitive area, and "we did not want to skip any of those issues," says Graven. The FHWA and MHTD developed a model of procedures that speeded things up. All the agencies involved assigned people to the effort. As many as 50 people attended meetings and consequently, it took just under eight months to get a notice to proceed, down from the usual two to three years. "It shows what they can do when they work together," says Smith.

The road will have "a lot of curvilinear alignment" to follow the area's natural curves, says Smith. Variable median widths and variable grades will make it "blend in with the area," adds Graven.

In the water and sewer areas, a 20-year plan has been squashed into four years, says David H. Miller, Branson city engineer. "We've kept up with [the growth], but it's been difficult," he says.

The city has built two new sewage treatment plants, done preliminary engineering on a third and is starting on a fourth. Because of the hilly landscape, the the city's eight lift stations in 1990 have soared now to 29.

Funding for these city-built projects should be no problem. If a tourism tax passes this November, $40 million of

Finance Your Cat® Equipment With Cat Financial

What's your best source for financing or leasing Cat equipment? Caterpillar Financial Services Corporation. We offer attractive financing packages for Caterpillar® construction and earthmoving machines, lift trucks, and engines – both new and used.

bonds for water, sewer and roads will be issued and another $40 million in two years. "In 10 years that tax will generate $15 million in income if the growth keeps up," says Miller. It will. The city is issuing building permits for $40 million worth of commercial construction each month. Projects have included 38 motels and numerous new theaters. ▣

By Judy Schriener

TRANSIT

L.A. County takes first step to fund Blue Line

Months of uncertainty over the proposed Los Angeles to Pasadena leg of the Metro Blue Line ended recently when the Los Angeles County Metropolitan Transportation Authority voted to allocate $97 million to the project in its $3.3-billion, 1993 budget.

Though it represents only a fraction of the 13.6-mile line's estimated $841-million cost, the allocation includes $40 million of the $48.5 million necessary to complete final design, says Laurence Weldon, vice president and project manager for Rail Construction Corp. (RCC), MTA's construction subsidiary. In the next fiscal year, there are also funds for relocating utilities, hiring a construction manager and a contingency for removing hazardous waste.

The drawn-out funding—brought on by MTA's budget squeeze—will push back the line's opening date an undetermined period from its original target of November 1997, Weldon says. Agency staff will prepare a revised construction schedule and cost projection.

Next month, Blue Line officials will advertise the line's first construction contract: replacing a bridge across the Los Angeles River. With cast-in-place concrete abutments and segmental spans, the bridge will be similar to a bridge completed in 1992 for the Metro Green Line light-rail project.

To comply with Corps of Engineer requirements to stay out of the river channel during the rainy season, contractors will work between April 15 and Oct. 15, 1994.

Design consultant for all RCC projects is Engineering Management Consultant, a team led by Parsons Brinckerhoff Quade & Douglas Inc., and Daniel Mann Johnson & Mendenhall.

The team did the preliminary design, and RCC engaged local firms for final design, which is about 45% complete, says Robert Ball, facilities engineering manager for the light rail. ▣

R0013570

MEDICAL CONSTRUCTION

Market slumped long before Clinton's reform proposal

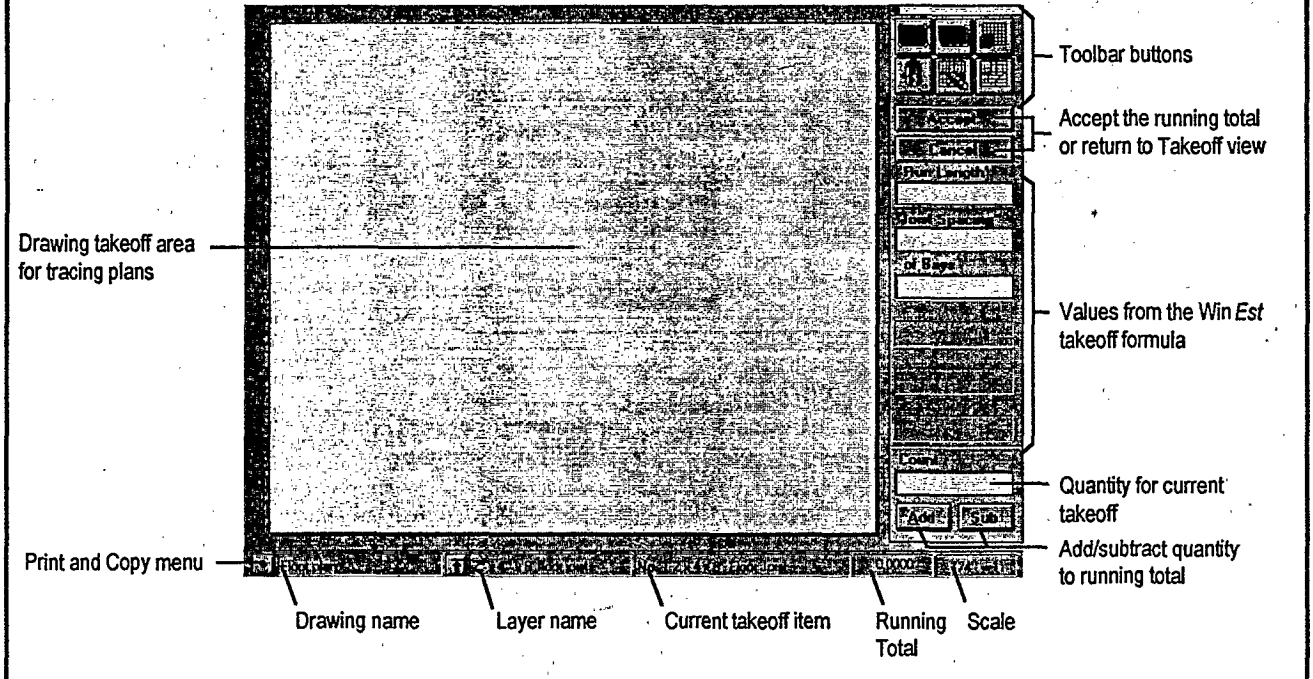
Details of the Clinton Administration's plan for health care reform finally landed on desks in Washington, D.C., last week, but the market for medical construction already had spent months in an unfamiliar funk. The President's initiative is actually just another sign of new market-dictated limits for a segment of the economy that was once thought to be recession-proof.

The pace of new medical construction this year is off 10% compared to 1992, when the market reached a peak of $10.9 billion in new contract awards, according to the F.W. Dodge Division of McGraw-Hill Inc. The decline, the first since 1984, is even greater for hospital construction, which is down 35% to $3.1 billion.

The seeds of the decline had been planted long before the President took office. Competition among health care providers had spawned cost-cutting moves and restructurings that already had put the brakes on some capital spending plans. Uncertainty over the planned reforms tipped the scales in favor of conservatism.

Pause. "We have seen a lot of our clients go on pause," says Jennifer Altenhoff, director of marketing for Stone, Marraccini, Patterson, a San Francisco-based architect. The market "is the weakest I've ever seen it," adds John Currie, senior vice president of Ellerbe Becket Co., Minneapolis. The downturn has hit Massachusetts particularly hard. Eight of Boston's major hospitals have $920 million worth of work either under way or on the drawing boards. But the intended uses of these buildings—either as clinics or laboratories—is in doubt.

For example, Massachusetts General Hospital recently decided to leave 10 floors of its new 14-story tower without completed interiors. The hospital has no specific plans for using the space.



"It was a wrenching decision," says a spokesman. "But we are facing a very rapid revolution in the way health care is provided in this country. And what was historically valid only a few short years ago, no longer holds true today."

Children's Hospital had planned to build an ambulatory care facility but dropped the project. And Beth Israel shelved all expansion plans for the near future.

Health maintenance organizations and managed care providers have cut deeply into the demand for hospital in-patient care. The presence of HMOs drove hospitals to compete for patients, says Alan Sager, a health policy analyst and professor at Boston University's School of Public Health.

Efforts to control medical costs have prompted physicians and hospitals to limit in-patient care and shorten hospital stays. Over a four-year period between 1987 and 1991, the number of hospital beds for in-patient care in Massachusetts shrank by 2,000, according to

DRILLED SHAFT FOUNDATIONS

It's another advantage from Bauer of America. Advanced shaft drilling and caisson systems that offer technical, time-saving and economic benefits over projects that might otherwise require conventional piled foundations.

Bauer's techniques provide:

- deep foundations
- large diameter caissons
- post-grouted caissons
- bored minipiles
- front-of-wall minipiles
- earth retention systems
- contiguous caisson walls
- secant caisson walls
- minipile walls

Bauer BG 30 rotary drill constructing 40 in diameter caissons for a bridge abutment.

Bauer is one of the worlds leading specialty foundation contractors... experts in cutter excavated diaphragm and cut-off wall construction and in ground improvement projects such as vibroflotation, vibro-replacement, dynamic compaction and high pressure injection grouting. Bauer's expertise extends to the design and manufacture of equipment used in all types of geotechnical projects worldwide.

For additional information on our full range of specialty foundation capabilities, call us at (813) 536-4748 or fax (813) 530-1571.

the Massachusetts Hospital Association. The rest of the country is undergoing a similar downsizing, adds a spokesman for the American Hospital Association.

All of the rapid adjustments could have been avoided if hospitals hadn't made the error of believing health care was recession-proof, claims Sager. He says strong statistical evidence exists that cutbacks in health care spending start four years after a recession sets in.

Robert Murray, chief economist for F.W. Dodge, believes the downturn may be temporary as the industry pauses to catch its breath and assimilate the changes contained in the Clinton proposals. Others agree. "They're still trying to calculate how much impact it will have," says Altenhoff. "Then we see the potential for another boom."

Exceptions. Despite the drop-off in health care construction this year, industry experts note that the market remains segmented and some areas still are strong, if not booming. "Health care has always been strong relative to the overall construction market," says Ellerbe Becket's Currie. Despite the weakness in some health care sectors, "there are enormous exceptions" and large construction projects are under way in most major cities, he says.

Los Angeles County, for example, is two years into a five-year, $3-billion program to build county-run health facilities with state funds. But California has its own fiscal woes and a design contract held by Ellerbe Becket has "been put on hold, I think for a very long time," says Currie. In New York City, work is moving forward on the $600-million, multiphase expansion of Kings County Medical Center in Brooklyn.

And new projects still are being planned, although some of them are no longer driven by anticipated patient-generated revenue. One of them is a new $106-million research building recently announced by the Dana-Farber Cancer Institute. It is part of the Longwood medical complex, which includes Harvard Medical School and several affiliated teaching hospitals. The new research building will be financed by tax-exempt bonds issued by the Massachusetts Health and Educational Facilities Authority and will be paid off through rent from the research grants of the autonomous researchers for whose use the building has been planned.

Even a research building such as Dana-Farber's is not immune to change, suggests Sager. "Massachusetts receives a disproportionately large share of federal research dollars but that could change very easily," he concludes. ▣

The hands of a surgeon

Steady. Precise. Accurate.

ICI Explosives' field staff prepares for every blasting procedure with surgical precision. Every move is planned. Field conditions are studied and analyzed. Each minute detail relating to the project is studied and factored in.

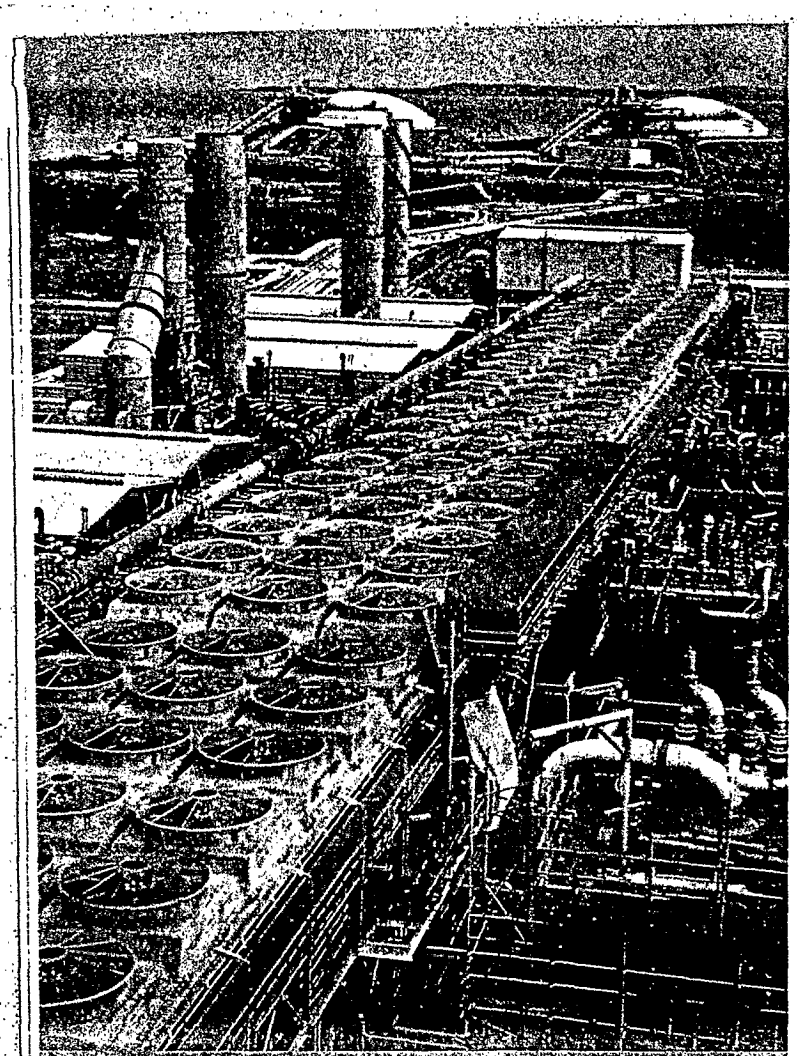
Prior to the actual blast, ICI Explosives' unique Sabrex™ computer model assesses options regarding blast-hole configuration, explosive type, quantity and initiation sequence, all without the need for field trials. Every blast is custom-made to fit the unique configurations which apply to that project.

Environmental trauma – noise and vibration – is minimal.

Even optimal rock fragmentation is determined in advance.

This whole procedure is carried out by ICI Explosives' field staff, with all the precision and delicacy of a surgeon.

As a result of this research, the moment of the actual blast involves no worry. No surprises. And no guesswork. A well planned operation, well executed. This totally integrated approach ensures that the whole procedure is consistently cost efficient.



Exciting, innovative procedures and full service approach make ICI Explosives a world leader.

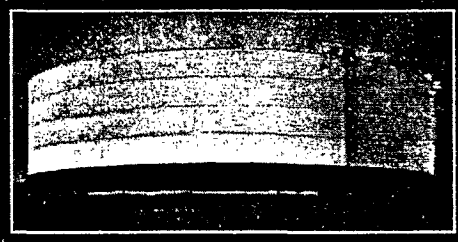
Major refinery work planned

As oil refineries in California race to comply with federal and state clean air laws that require production of cleaner-burning vehicle fuels soon, Shell Oil Co. earlier this month overcame local opposition to its plans for a $1-billion expansion of its sole refinery in the state. Other refiners in California have ambitious plans as well.

Faced with threats of a lawsuit and delays by its neighbors east of San Francisco, Shell agreed to reduce emissions of volatile organic compounds by 326 tons annually at that Martinez facility, in exchange for permission to generate an equal amount of VOCs at the adjacent expansion. Although the company plans no increase of its current crude oil throughput of 150,000 barrels per day, in addition to producing cleaner-burning fuels, it plans to build new units for producing lighter fuels from heavier ones, and for making coke for steel production.

Environmentalists hailed Shell's concessions, including a pledge to meet quarterly with them if so requested during the design phase. Shell also agreed to install more sophisticated emissions sensors at the plant. "It was very important to us and people in the community that clean fuels didn't turn out to be a dirty deal for them," says Denny A. Larson, a spokesman for Citizens for a Better Environment, San Francisco.

Satisfied as well, the Contra Costa County Planning Commission plans to grant Shell a permit this week. And with approval from the regional air quality management district also expected shortly, Shell plans to select a general contractor soon. "We have a very tight time line to comply with the Clean Air Act," says Diane Kalas, a spokeswoman at Shell's Martinez refinery.



By federal law, refineries must produce reformulated gasoline by January 1995; California law gives them until March 1996 to produce even cleaner-burning fuels. According to a study released late last month by the National Petroleum Council, investments in this decade by U.S. refineries on reformulated gasoline facilities will reach $37 billion—or $6 billion more than the refineries' current book value.

Earlier this month, San Francisco-based Chevron Corp. announced plans to produce reformulated gas in California by upgrading its refinery near San Francisco for $370 million, and its refinery near Los Angeles for $580 million. Los Angeles-based Unocal Corp. plans to spend about $400 million on redoing its four California refineries: one in Santa Maria, one near San Francisco and two near Los Angeles. At its refinery in Martinez, Tosco Refining Co. plans to spend more than $300 million on producing chemical components for making cleaner gasoline.

Houston-based Exxon Co. declines to disclose plans for its refinery in Benicia east of San Francisco. And financially ailing Pacific Refining Co. plans to decide by Oct. 31 whether to spend more than $500 million to upgrade its refinery in Hercules east of San Francisco, or shut it down. ▣

THE SAFER, EASIER WAY
TO REMOVE 38,000 SQ. FT. OF LEAD PAINT
FROM A 5 MILLION GALLON WATER TANK.

Peel Away Lead Paint Case #27

In Nacagdoches, Texas, the Peel Away system helped a local Water Authority remove lead based paint from a large storage tank without severely impacting the budget, while maintaining all environmental guidelines. The contractor was able to achieve removal rates of 5,000 square feet a day, requiring only ground cover containment. Worker safety was maximized, and lead waste was minimized and easily disposed of in accordance with regulations. This is but one of many Peel Away success stories. To learn how Peel Away can work for you, call one of our experienced representatives. They will conduct tests and/or help you generate specifications to meet your application needs so that the Peel Away experience can safely and profitably solve your lead paint problems. For more information write or call Dumond Chemicals.

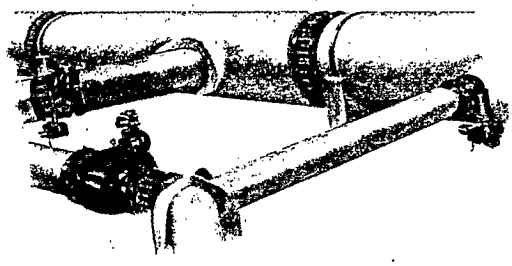
NEW AWWA STANDARDS INTRODUCED FOR PCCP DESIGN AND MANUFACTURE



New Generation of Standards for Prestressed Concrete Pipe

Introducing AWWA C301-92 and C304-92

AWWA C301-92 is the new manufacturing standard that squarely addresses the questions raised by owners, engineers and the public about quality and reliability of Prestressed Concrete Cylinder Pipe (PCCP). It mandates stringent testing that had previously been optional and significantly tightens all component material specifications.

AWWA C304-92 is the entirely new design standard based on limit states analysis and advanced computer modeling. Developed over an eight-year period at a cost of over $1 million, C-304 replaces the former C301-84 Appendix A and B design methods. The end result is a new design procedure that is able to provide analysis unsurpassed by other pipe materials. The new design standard provides pipeline owners and engineers the knowledge that Prestressed Concrete Cylinder Pipe is conservatively designed by the most current technology available.

Both new standards were exhaustively reviewed and approved by the AWWA Concrete Pressure Pipe Standards Committee, AWWA Standards Council and AWWA Board of Directors. Those groups include many of the largest users of PCCP and some of the most prominent consulting engineers in the water supply industry.

New standards are just the beginning

As good as these new standards are, they're only a foundation for the future of PCCP. The companies that comprise the ACPPA are committed to continued product improvement and total quality management to ensure that PCCP will continue to provide the best performance record in the water works industry.

We invite you to examine the new AWWA standards in detail. To obtain your copies, please contact the AWWA or call the ACPPA for more information.

The Solution to your Stormwater Problems... The INFILTRATOR™ Chamber System

"My original design was to use a concrete vault to provide the required storage of 16,117 cubic feet. After seeing another installation, I redesigned the stormwater management system using the INFILTRATOR™ as a storage unit and a conveyance pipe that interconnected the twenty-one catch basins. Use of the INFILTRATOR™ as a conveyance pipe worked so well, increasing the area that the surface water can percolate into the soil. I never plan to use regular pipe again."

Geoffrey G. Purse, PE
President, Purse Associates, Inc.
Naples, Florida

- Most cost-effective underground alternative to traditional stormwater methods.
- Ideal for use under parking lots.
- 32,000 lbs/axle load rating (H-20) with 18" of cover.
- Design for retention or detention.
- Flexible design for shallow or deep installations.
- 16.3 ft³ of storage per chamber.
- Constructed of high-density polyethylene — lightweight for easy installation, impervious to chemicals.
- Hundreds of installations nationwide.

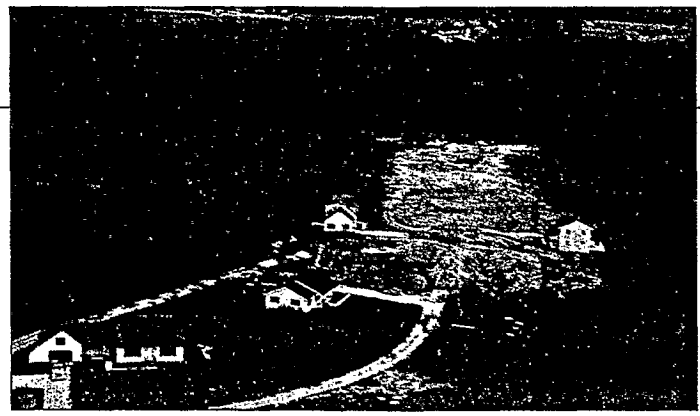
A 'whole' lot of planning going on

Watershed management reemerges as the nation's water quality strategy for the 21st Century

Two decades into America's water quality crusade, practitioners are realizing that the whole is greater than the sum of its parts. Cleanup strategies that targeted separate pollution dischargers and bowed to political boundaries are giving way to a more "holistic" approach—watershed management. The philosophy is nothing new to many water quality experts, but it's gaining renewed acceptance in states and in Washington.



"We're seeing new life in an old idea," says Ann Powers, general counsel of the Chesapeake Bay Foundation. "There is an interconnectedness at the watershed level." Even so, making that link is proving no easy task for the diverse array of watershed stakeholders.

Managing water quality by ecosystem is as old as the 1972 Clean Water Act itself, which authorized "area-wide" efforts. Multistate programs to protect high-profile, high-risk waters such as the Great Lakes, the Chesapeake Bay and the Gulf of Mexico are much touted.

But for the most part, water quality managers and regulators targeted pollution problems that were easiest to see, to fix and to fund. With federal monies then abundant and "end-of-pipe" problems persistent, the national strategy targeted individual municipal and industrial "point" sources of pollution.

The approach has fixed the worst pollution night-

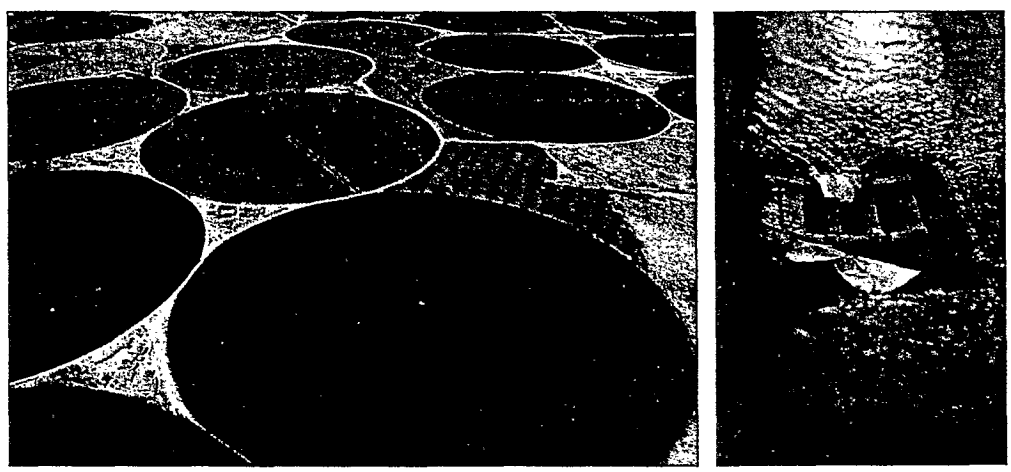
R0013580

Development has created erosion in this Chesapeake Bay watershed community (right).

Farming and urbanization are key sources of nonpoint water pollution in the U.S. (below, left).

mares, but critics say it has neglected the less obvious but potentially more egregious impact of "nonpoint" pollution such as farm and stormwater runoffs and air emissions. "Unfortunately, efforts under these programs have been largely fragmented and piecemeal," said Tudor T. Davies, EPA's acting deputy assistant water administrator, in congressional testimony last month. "As a result, there are significant gaps in our efforts to protect ecosystems from the cumulative impacts of a multitude of activities that stress our waterbodies."

Value. With time, experience, and new sophistication, water quality managers have come to appreciate the value of a watershed-wide approach. It is the cornerstone of the much-praised *Water Quality 2000* report, a blueprint for 21st Century water quality management issued last year by a coalition of 75 industry groups. "We believe the nation is now ready, and indeed must, embrace this approach," says Paul Woodruff, coalition chairman and president of Environmental Resources Management Inc., an Exton, Pa., consultant.



Already, local governments and their citizens are taking watershed matters into their own hands. "Our experience repeatedly shows that people are most likely to protect what they know," says EPA's Davies. "The watershed provides a logical area within which to build on this local commitment."

Cleanup of the nutrient-loaded Chesapeake Bay is a sterling example of a watershed approach that has successfully crossed state lines and linked point and nonpoint dischargers. With a goal of reducing bay nutrients by 40% by 2000 under a 1987 agreement, Maryland has already cut nitrogen levels by 13% and phosphorus 18%, says Cecily Majerus, Gov. William Donald Schaefer's Chesapeake Bay coordinator.

A key part of that effort now is implementing a "nesting" approach that targets smaller, localized watersheds that feed into the bay. Under a 1992 pact, bay-area states agreed to place nutrient caps on the Chesapeake's 10 main tributaries. "We've struggled a lot to bring the broader message to states like Pennsylvania that don't even have bay frontage," says Powers. The state, nevertheless, accounts for 70% of bay water. This past June, Pennsylvania enacted a law mandating new controls on farm-generated nutrient loadings and discharge planning.

Meanwhile, Majerus says Maryland is using a watershed approach even within its own boundaries in crafting plans to reduce nutrients in 10 state tributaries to the bay. Drafts will be sent by month's end to affected jurisdictions to thrash out whether steps are equitable and cost-effective. "We're doing this by watershed, not by county," she notes.

Other states are following suit. North Carolina has adopted what many consider the most far-reaching approach, dividing the entire state into 17 watersheds. The effort has allowed officials to synchronize discharge permits in each

Wastewater treatment plants (above) and other stationary dischargers have long been targets for water pollution regulators, but stormwater runoff impacts (right) can be better tracked in a watershed management approach.

R0013581

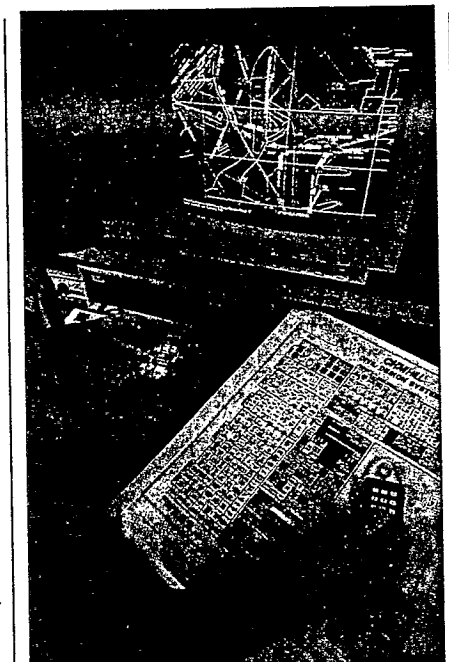
basin simultaneously, boosting management efficiency, says Steve Tedder, state water quality chief. "It's a way of doing business," he says.

Likewise, Oregon formally adopted a new watershed management strategy last year, which includes statewide assessment of conditions and voluntary "councils" to develop specific goals and action plans, says Lorna Stickel, chairwoman of the Oregon Water Resources Commission. She notes that state members of the Western Governors Association and the Western States Water Council will meet for the first time in November to share watershed management strategies.

And in another precedent-setting union, 23 representatives of state and federal agencies, environmental groups, developers and agribusiness met last week to begin charting a new environmental approach for the floodplain of the 100-mile-long Santa Clara River in southern California. "They're trying to make some multi-million-dollar decisions that are going to affect the river and all the stakeholders," says Michael T. Savage, senior water resources engineer for CH2M Hill Inc., the effort's engineering consultant. "Very seldom have we brought them together in a systems approach. But there's a growing understanding that you can't treat just one piece of it."

Woodstock. The watershed groundswell was apparent when EPA's first big watershed management conference in Washington last spring drew a standing room only crowd. "It's being called the Woodstock of water quality protection," says Robert H. Wayland III, director of the agency's new office of wetlands, oceans and watersheds, formed in 1991.

That was a watershed event for EPA itself. "There's an institutional change going on," says Wayland. Regional EPA water officials are meeting this week on watershed issues, "the largest block of time we will have spent on this," he notes. An EPA source says the agency will seek dedicated funds for watershed management efforts in its fiscal 1995 budget request. In past years, it has had to crib from other water program areas because budget overseers couldn't understand what watershed management was, says one agency source.



The agency's Seattle-based region, which includes the Pacific Northwest and Alaska, has already adjusted to management by watershed. In a restructuring begun last year, the region divided its domain into 22 key watersheds and assigned a staff member to each "to understand everything going on there," says Tom Wilson, senior policy advisor in its water division. "Before we were running programs. Now we're targeting those programs to solve problems, and we're getting the states to do likewise."

Wilson says this has worked in handling eutrophication problems in Idaho's Snake River basin. "We found the problem was caused by a multitude of small sources, so we changed our priorities and the state's to put needed resources there," he notes. "Before, we would not have recognized this."

Wilson says the regional refocus will come in handy as EPA and other federal agencies tackle the Clinton Administration's mandate for change in government management of Pacific Northwest forests. The effort, expected to set national precedent, will be based on a watershed approach, he notes.

Water quality monitoring has improved, key to an effective watershed strategy.

Computer mapping can analyze watersheds.

Transfixed. But nothing has created more of a stir in watershed management circles than pending legislation that references the approach for the first time. In particular, all eyes are on the Water Pollution Prevention and Control Act of 1993, introduced in the Senate last June by Max Baucus (D-Mont.) and John H. Chafee (R-R.I.), ranking members of the Committee on Environment and Public Works, as the vehicle for Clean Water Act reauthorization. What's important about the approach "is the integration," says Baucus. "Otherwise you address one part of the problem in a watershed, and neglect another."

The bill, S.1114, authorizes single or multiple states to voluntarily designate "watershed management units" and to identify impaired waters within them. It requires EPA to approve such designations and requires states to manage the units.The bill also asks states to submit watershed management plans for EPA approval; authorizes more attention to nonpoint source pollutant reductions in a watershed; and allows incentives such as state revolving fund (SRF) use and longer-term discharge permits in approved watersheds.

The bill's watershed approach is generally applauded in water quality management circles, but interest groups voice concern over certain provisions and are furiously lobbying to get their agendas addressed.

States in particular fear that their traditional primacy in water quality management could be undercut by federal watershed mandates. "The whole virtue of watershed management is that it bubbles up," says Robert J. Zimmerman, administrator of the surface water management section in Delaware's Dept. of Natural Resources and Environmental Control. "But this legislation is top down and will impair this."

State officials say the provisions would force states to adopt uniform solutions for very unique problems. "We don't want a one-size-fits-all process," says North Carolina's Tedder, a particularly outspoken critic for the Association of State and Interstate

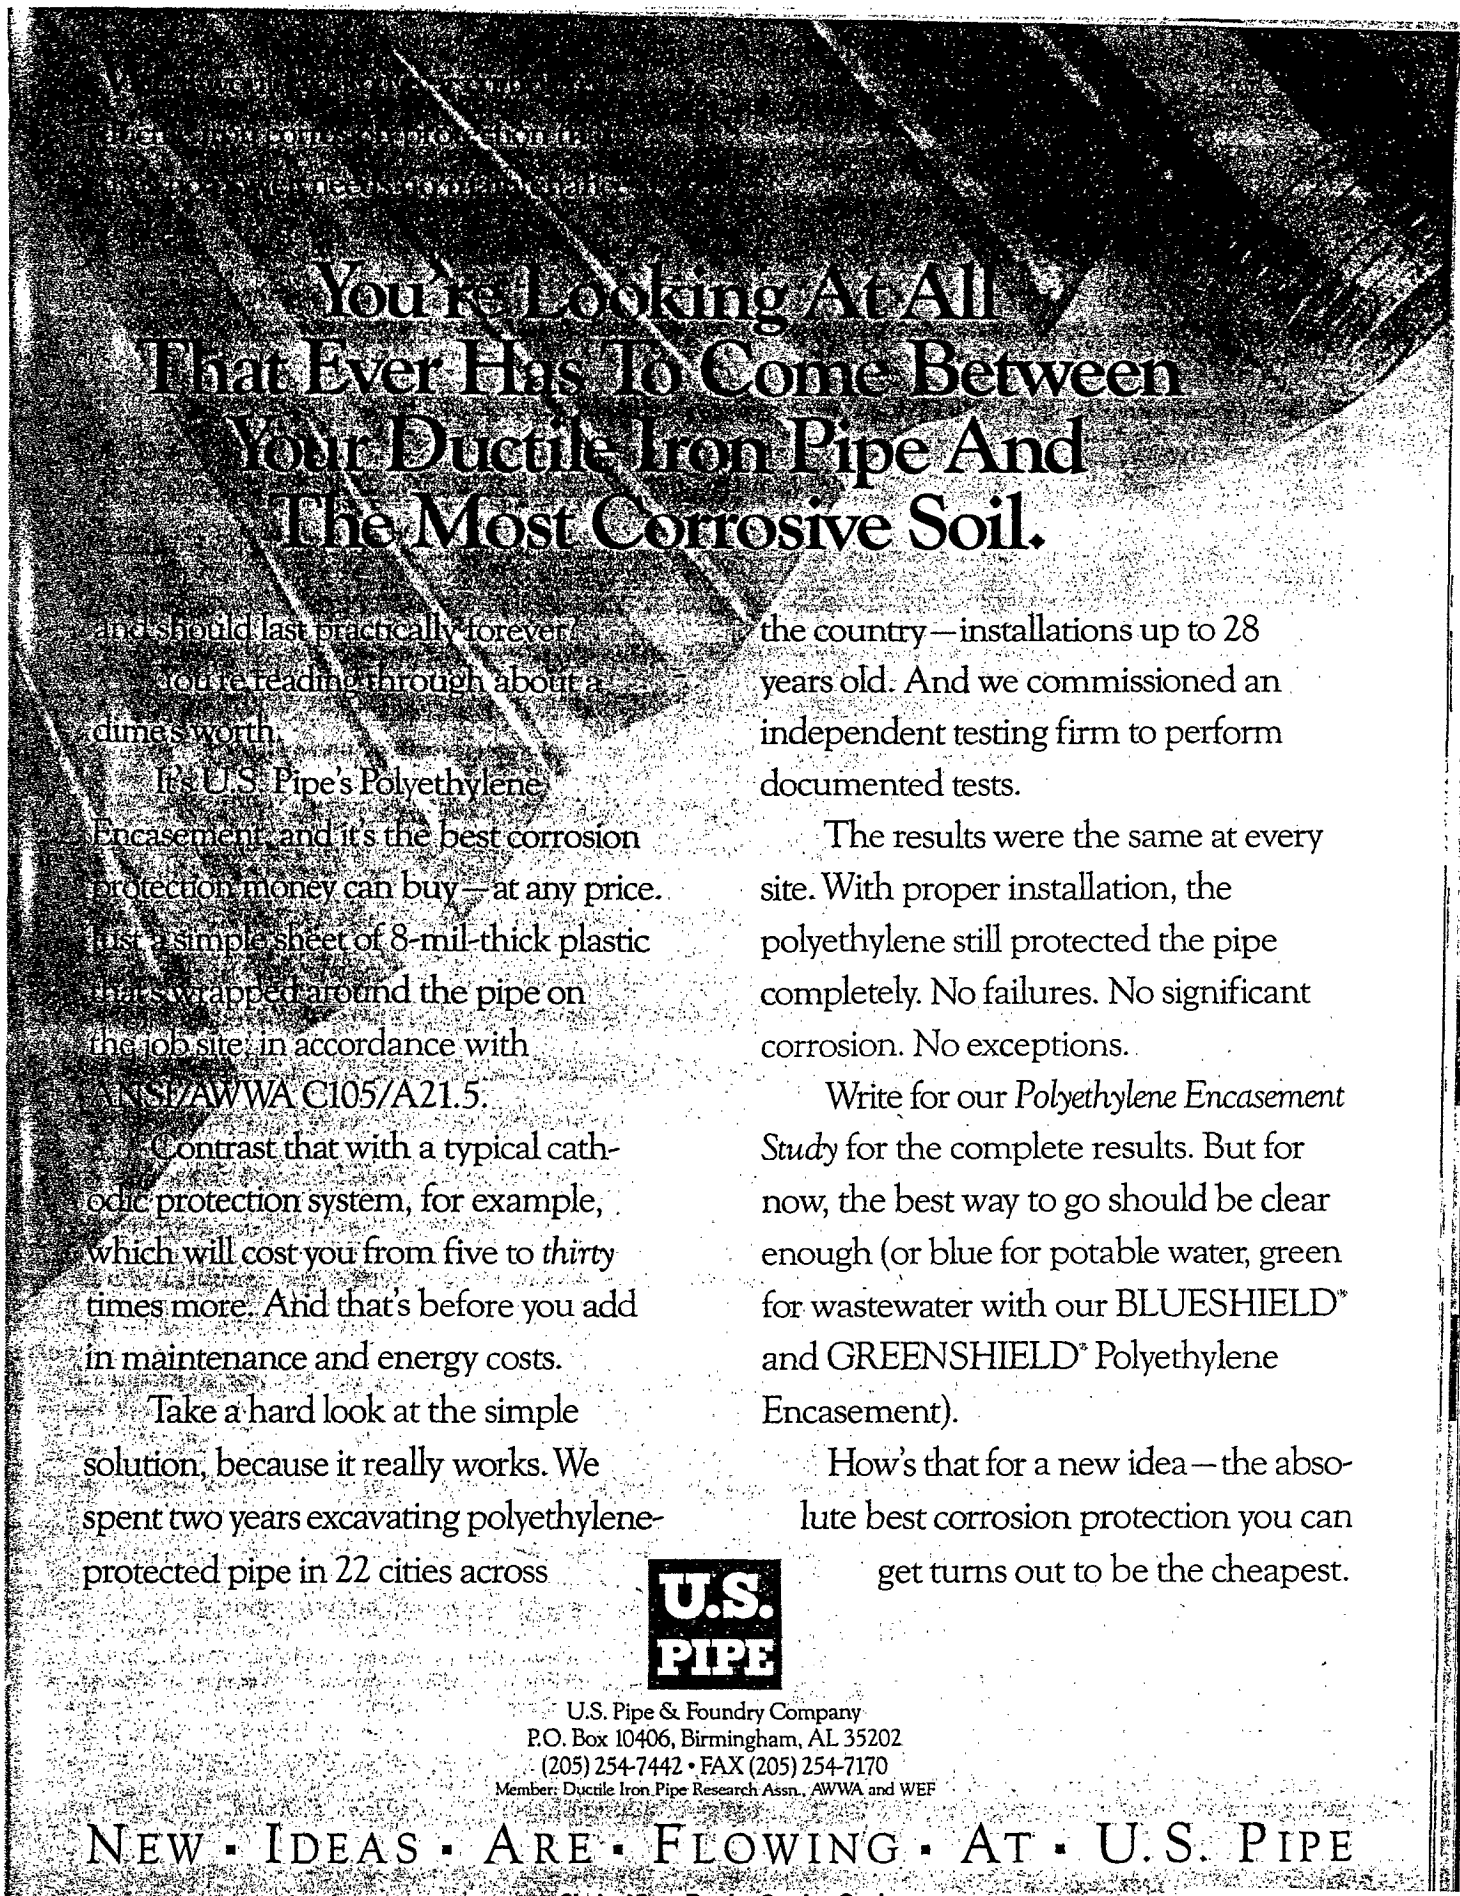
R0013583

Water Pollution Control Administrators (ASIWPCA). "If they all start looking alike, we've defeated the concept." States hope for a sympathetic ear from EPA's newly named assistant water administrator, Robert Perciasepe, who formerly headed Maryland's Dept. of the Environment. "Having him is a reality check for the feds," says ASIWPCA Executive Director Roberta Savage.

States also worry about having to contend with too many outside interests in drafting and managing plans, particularly where watershed efforts are still very premature. Even Baucus admits that one pitfall of the approach is "you get too many cooks in the kitchen."

ASIWPCA is particularly unhappy with a proposal by the Association of Metropolitan Sewerage Districts (AMSA) to create formal "commissions" that would make watershed management decisions. AMSA contends such entities, staffed by relevant local stakeholders, would act as "bureaucracy busters," forcing agencies to coordinate efforts.

Meanwhile. AMSA and environmental groups make unlikely bedfellows in both calling for S.1114's provisions to be mandatory, not voluntary. "Making the program voluntary means that it is likely to fail," said Charles F. Gauvin, president of Trout Unlimited, a Virginia-based conservation group, in Senate testimony in July. Environmentalists also insist on strong EPA oversight of watershed programs, and are suspicious that the approach will allow states to ease up on point source dischargers. "The watershed planning provisions in S.1114 may represent an irresistible temptation to local governments to delay upgrading sewage treatment plants," testified Curt Spalding, executive director of Save the Bay, a Providence, R.I., group.



Santa Clara River will get a watershed focus.

And, advocates for farmers and other landowners worry about their liability for curbing nonpoint pollution in a watershed scenario. Farmers are adopting practices such as reduced tillage and contour planting to curb runoff, "but these changes are not without cost," says Gerald Talbert, director of policy for the National Association of Conservation Districts. While some industry spokesmen say farmers could benefit from a watershed approach, others want no part of it. "They see watershed planning as the first step toward a permit program for agriculture," says John H. Thorne, director of water quality programs for the National Agricultural Chemicals Association.

Senate Environment and Public Works Committee staff decline to elaborate on possible changes to S.1114, but a spokeswoman says these will be made when the bill heads for markup, possibly early next month.

Meanwhile, the House is targeting to introduce companion legislation within the next two months. Rep. James Oberstar (D-Minn.) introduced a bill several months ago that would tighten nonpoint source restrictions and pushes a watershed approach, but it has seen little activity lately, sources say. Most Washington observers don't expect a

R0013584

You're Looking At All That Ever Has To Come Between Your Ductile Iron Pipe And The Most Corrosive Soil.

and should last practically forever.

You're reading through about a dime's worth.

It's U.S. Pipe's Polyethylene Encasement, and it's the best corrosion protection money can buy—at any price. Just a simple sheet of 8-mil-thick plastic that's wrapped around the pipe on the job site, in accordance with ANSI/AWWA C105/A21.5.

Contrast that with a typical cathodic protection system, for example, which will cost you from five to *thirty* times more. And that's before you add in maintenance and energy costs.

Take a hard look at the simple solution, because it really works. We spent two years excavating polyethylene-protected pipe in 22 cities across the country—installations up to 28 years old. And we commissioned an independent testing firm to perform documented tests.

The results were the same at every site. With proper installation, the polyethylene still protected the pipe completely. No failures. No significant corrosion. No exceptions.

Write for our *Polyethylene Encasement Study* for the complete results. But for now, the best way to go should be clear enough (or blue for potable water, green for wastewater with our BLUESHIELD® and GREENSHIELD® Polyethylene Encasement).

How's that for a new idea—the absolute best corrosion protection you can get turns out to be the cheapest.

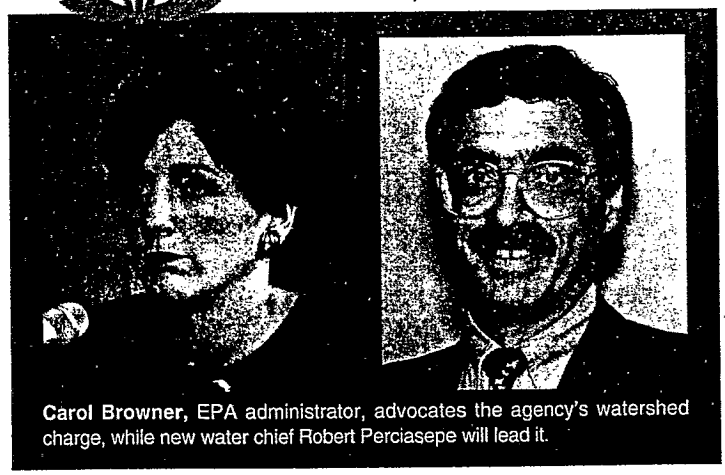
Sens. Max Baucus and John Chafee, (above, left and center) are championing legislation that promotes watershed management. Rep. James Oberstar (right) has introduced a bill in the House also stressing the approach.



reauthorized Clean Water Act to come out this year.

In the meantime, practitioners wonder whether Congress will provide more financial and regulatory incentives to make watershed programs more politically palatable in economically hard-hit states. Confusion still reigns over how existing protocols for using SRF and federal grant monies will work in a watershed structure.

In particular, the bill is silent on the issue of trading water pollutant "credits," either between point sources in a particular area or between point sources and non-point sources. "As of now, [S.1114] doesn't include anything at all about trading or any other market-based approaches," says Mark Luttner, director of policy and resources management in EPA's water office. Environmental groups have been fighting such strategies "tooth and nail," he notes.

But government and private-sector experts say trading still has great potential. Trading consultant Kenneth I. Rubin, president of Apogee Research Inc., Bethesda, Md., says that several conditions appear necessary for trading to work. They include the presence of a definable watershed; a combination of point sources and controllable non-point sources that each contribute a significant portion of the total pollutant load; and a water-quality goal for the watershed that forces action.

Also, he says, point sources must be facing the need to either upgrade their facilities or trade for nonpoint reductions to meet water-quality goals; and significant non-point reductions must be possible at a lower marginal cost than reductions from point-source improvements. All told, there are more than 900 U.S. watersheds with water-quality problems that could potentially benefit from trading, says Rubin, and that number will grow. Among those eyeing trading are New York and Connecticut jurisdictions near Long Island Sound, the Tampa Bay region in Florida, the Chehalis River watershed in Washington State, and the Neuse River basin in North Carolina.

Carol Browner, EPA administrator, advocates the agency's watershed charge, while new water chief Robert Perciasepe will lead it.

Perhaps the first actual water-pollutant trade already is under way in North Carolina's Tar and Pamlico river basin. There, a state-administered fund has contributed $900,000 to help about 20 farmers and livestock managers on Chicod Creek institute best-management practices to reduce nutrient runoff.

This entitles them to credits of 15,000 kg per year of nutrients, about equal to the amount released by a 1 million-gal-per-day wastewater treatment plant.

Malcolm Green, general manager of the Greenville, N.C., Utilities Commission and chairman of the Tar-Pamlico Basin Association, a group of wastewater treatment plant owners, says it will use credits for those reductions to help members meet new, stricter limits on area-wide nutrient releases (ENR 12/21/92 p. 33).

Mark Tedesco, director of EPA's Long Island Sound office in Stamford, Conn., says 11 local management zones that have been established in New York and Connecticut to reduce nutrient release into the sound. "What we'd like to do is allow trading for nutrient reduction within the zones and possibly between the zones," he says.

Meanwhile, farther out on the horizon are calls for the watershed approach to reach beyond the Clean Water Act and to synchronize other environmental laws. *Water Quality 2000* has recommended a new national water policy that should be implemented through watershed planning and management.

Others want more attention to watershed management as a profession. "There are no watershed professionals, per se," says Harvey Olem, executive director of The Center for Watershed Protection, a nonprofit group based in Herndon, Va., which was formed last year to promote the approach. It soon plans to issue a quarterly newsletter and a variety of other technical guidance documents.

Even as water quality experts struggle to understand and implement watershed management, it is clear the philosophy is here to stay. EPA's Davies cites a 1911 quote by the famous naturalist John Muir that Davies says remains the essence of watershed management 82 years later: "When we try to pick anything out by itself, we find it hitched to everything else in the universe." ▣

CONFRONTING THE INFRASTRUCTURE CRISIS

Eyewitnessed examples show how funding falls far short of the money needed to repair and replace the nation's aging water and sewer works

By Gerry Dorfman, president, National Utility Contractors Association and a water/sewer contractor based in Woodland Hills, Calif.

Recently I visited a rural, northern California community and walked through families' backyards to determine the location of a new septic tank system. To my dismay, I found myself walking on saturated ground — saturated not with water, but with wastewater — raw sewage that had overflowed from failed leaching systems. The entire neighborhood was a public health hazard; children could not play in their backyards.

Happily, a grant from the Rural Development Administration's Water and Waste Disposal Program has since helped finance a new septic system, and families again have free use of their backyards.

Here's another: in Pawtucket, Rhode Island, a contaminated water system forced residents to boil their drinking water or buy bottled water for more than two months. My colleague Ted Bragger, of A.E. Bragger Construction, worked on the pipe replacement job.

"We replaced dangerously old and decaying water lines," he notes. "Some of the six-inch pipes had been in service for more than a century and were so encrusted that you could scarcely fit a ping-pong ball through the center.

"In May I took a section of the pipe to a congressional hearing, and the Senators were sufficiently disgusted. But restricted flow is more than disgusting," Bragger explains. "Water pressure in the pipes must be increased to transport the same volume of water to the user — which means that pumping stations effectively waste huge quantities of electricity.

"Plus, restricted flow throws a serious public safety hazard into the mix, because water volume and pressure available through fire hydrants is much lower."

The situation is menacing, as such examples prove. Every day, utility contractors expose decaying sewer lines and tuberculated drinking water systems. Sewer lines can rupture, and have done so, pouring sewage into a river or bay.

Fortunately, the United States possesses the resources — the contractors, suppliers, workers and engineers in the utility construction industry — and the essential programs to address the problems. Federal programs are in place, but they are seriously underfunded.

Based on recent needs surveys, the National Utility Contractors Association (NUCA) estimates a shortfall of more than $100 billion for wastewater and drinking water capital between the years 1993 and 2000. EPA estimates that the total 20-year design needs for publicly-owned wastewater treatment facilities will reach $111.5 billion.

Moreover, spending means jobs. The 1992 NUCA jobs study reveals that each $1 billion invested in water and sewer projects generates up to 57,400 jobs. What's more, the study found that water and sewer construction generates more jobs than other types of public works investment.

Funding Hurdles

Despite such documented needs and benefits, federal clean water investment has dwindled since the late 1970's, when EPA construction grants were funded at $5 billion-plus amounts annually. In June, the House approved just $1.25 billion for EPA's wastewater construction State Revolving Loan Fund (SRF) in fiscal 1994; that's $650 million less than fiscal 1993 spending.

NUCA recommends funding the SRF program at $5 billion per year, but in acknowledging current budget realities, requested a minimum appropriation of $2.4 billion for fiscal 1994. As the appropriations battle went to the Senate, we sought to replenish these vital funds, but instead are fighting to maintain depleted House figures.

There is some good news. President Clinton proposed a new Drinking Water State Revolving Loan Fund and asked for $599 million for fiscal 1994 and $1 billion per year thereafter to help communities comply with the Safe Drinking Water Act. The House approved the spending request, but significant hurdles remain.

Authorizing legislation must clear both Houses of Congress, and at this writing two House committees are squabbling over jurisdiction. Meanwhile the Senate is mulling it over. The idea may not develop this year, but NUCA will continue to push its persuasive case.

Also on the upside, Rural Development Administration (RDA) clean water construction programs apparently have managed to capture the only federal construction dollars in the fiscal 1993 supplemental spending package.

Before its August recess, Congress approved $1.4 billion for the RDA Water and Waste Disposal Grant and Loan Programs in fiscal 1994, a slight increase from current spending. These programs, which serve communities with fewer than 10,000 residents, netted $70 million in the final, watered-down "economic stimulus" package. Of that, $35 million will be grants, and $35 million will be used to service $250 million in loans.

Digging America Safely

Underground contractors, especially NUCA members, generally give safety an ever-higher priority these days. Underground construction groups have created safety agendas and promoted them to help contractors prevent injuries and comply with safety regulations. Our priority areas include training for "competent persons" (see following article), safety technologists and confined-space construction, and the development of widely accessible technical assistance and safety references.

By necessity, underground construction is linked to trenching and safety measures; trenching is one of OSHA's high-emphasis inspection programs. OSHA inspectors are required to inspect every open trench or excavation they en-

R0013589

counter, and OSHA rules call for qualified competent persons to oversee all trench and excavation sites.

With increased competent person training and an emphasis on safety, organizations such as NUCA have met this new demand. In fact NUCA has trained 31 competent person instructors, who in turn have trained more than 15,000 individuals nationwide.

In April, OSHA implemented a new confined-space standard for general industry, focusing on permit-required confined spaces that pose immediate safety threats. Though the new rule does not apply to the construction industry, which must adhere to a separate standard, OSHA inspectors will be more cognizant of confined-space safety. NUCA safety director George Kennedy expects the agency to use the new rule as a guide to enforcing confined-space entry in all industries.

To strengthen job site safety and compliance, construction and general industry employers have turned to various confined space training programs. NUCA has trained 23 instructors to teach the association's Confined-Space Entry Program, which incorporates the new standard.

The need for trained safety personnel in construction continues to grow. OSHA has reported that it cannot keep pace with the demand for training at the OSHA Institute, and other organizations have come forward to fill the gap. This fall NUCA will introduce a construction safety technologist program that will provide managers, safety directors and other personnel with a thorough understanding of OSHA regulations and safety. NUCA has also launched a safety subscription series that provides video and classroom safety training materials and maintains training records for employers.

NUCA also provides technical assistance and a full library of safety reference materials to the underground construction industry. The library includes ten safety training videos with topics ranging from confined space entry to heavy equipment operation to pipe handling; a 410-page safety manual, a pocket safety manual for employees, and up-to-date coverage of emerging safety issues in NUCA's many publications.

Even so, many on Capitol Hill disregard the industry's clear commitment to job site safety. They are calling for increased government intervention, greater workplace scrutiny and stronger penalties for violators. The Comprehensive Occupational Safety and Health Reform Act (COSHRA) has been introduced in both houses of Congress, and hearings are under way.

WHY TRENCHLESS TECHNOLOGY KEEPS GROWING

A variety of systems offer ways to pierce under congested areas

From New York City to Florida, and from Atlanta to California, in just nine years microtunneling has become an established method to place underground pipe. And it's growing rapidly in popularity, especially for sites where buildings, railroad tracks and the like make open-cut tunneling difficult if not impossible.

Nationally, more than 125,000 ft. of microtunnels have been bored. In Houston alone, more than 67,000 ft. of pipe with diameters from 18 to 30 in. have been placed with microtunneling systems at depths of 25 ft. or more.

Simply put, microtunneling is a sophisticated form of pipe jacking. Using remote controls and laser guidance, pipe sections are inserted into a jack, which pushes sections forward and retracts to receive the next section. Seeking a better way to dig ditches, the Japanese first developed it in the mid-1970s. Further advances came from German firms, namely Soltau Vortriebstechnik and Herrenknecht GmbH, which now offer machines in the U.S.

First used in the U.S. by subcontractor Salgado Eastern Corp. (SEC), of Columbia, Md. in 1984, microtunneling systems are offered in two varieties. One removes the spoil from the face of the tunnel using small augers in a dedicated casing; the other removes spoil from the tunnel as slurry. Pumps take the material to the surface, where excavated material can settle while the water is being reused.

Microtunneling is one type of "trenchless technology." Horizontal earth boring, including directional drilling, wet boring, and pipe jacking are others. Several methods of earth boring are available, including augers, wet boring machines, pipe ramming systems and directional ground-piercing tools. Ground-piercing tools can be powered with either hydraulics or compressed air; typically, pnematic piercing tools range from 2 to 10.5 in. in diameter.

Still, for most contractors, the hydraulic excavator remains the tool of choice for most pipelaying jobs. Excavators gain extra value in a contractor's fleet because they're so versatile. Not just for digging trenches, excavators can team with trucks or articulated haulers to make quick work of mass excavations, especially in wet, mucky sites that would prove tough going for scrapers.

Big player in future

"Right now, for most of our sewer, storm drain and water main projects, we are using open-cut equipment and using subcontractors for our microtunneling," says Gerry Dorfman, president of the National Utility Contractors Association and owner of Dorfman Construction Co., Woodland Hills, Calif. "We use trenchless technology for about 4 percent of our jobs and conventional methods for the other 96 percent. But I see trenchless technology as becoming a big player in the future of underground construction technology."

The cost of microtunneling? Currently it exceeds that of conventional cut-and-cover methods. But because trenchless excavation methods minimize surface damage, contracting agencies avoid the cost of traffic disruptions, rerouting, environmental disruptions — and can often bore under obstacles that would stop an excavator outright.

Because many of the nation's aging pipe systems serve highly congested areas — yet must be replaced in the next several years — trenchless technologies surely will play an ever-more important role in rebuilding the nation's underground water, sewer and electrical power systems.

Moreover, several leading construc-

Hook up with the new SK150LC MARK III

You'll get street-legal transport, more power, more lift capacity, and more reach. Best of all, it's a Kobelco.

Kobelco quality throughout: Built especially for the U.S. market, the new SK150LC MARK III provides the performance, quality, and reliability you've come to expect from Kobelco.

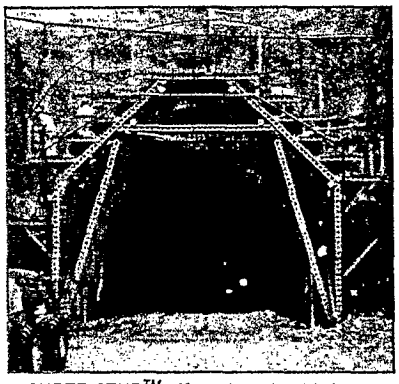
Street legal: The SK150LC MARK III is only 8'6" wide and weighs 34,500 pounds, enabling legal transport in most states at any time of day or night without permits.

Highest digging forces: The SK150LC MARK III delivers higher breakout forces than any machine in its class; Bucket: 21,380 lbs, Arm: 15,430 lbs.

Highest lifting capacities: With an extra-long undercarriage for added stability, the SK150LC MARK III's lifting capacities are tops in its class.

Working range second to none: The SK150LC MARK III extends your ground level reach to 30'1", dumping clearance to 21', and digging depth to 21'5".

Exceptional maneuverability: A 3.7 mph propel speed and 28,200 lb drawbar pull combine to give the SK150LC MARK III the ability to handle the toughest job site conditions.



At your Kobelco dealer now: For more information, visit your nearby Kobelco dealer or contact Kobelco America Inc., 10515 Harwin Drive, Houston, Texas 77036, 713-981-4050, Fax: 713-981-0150.

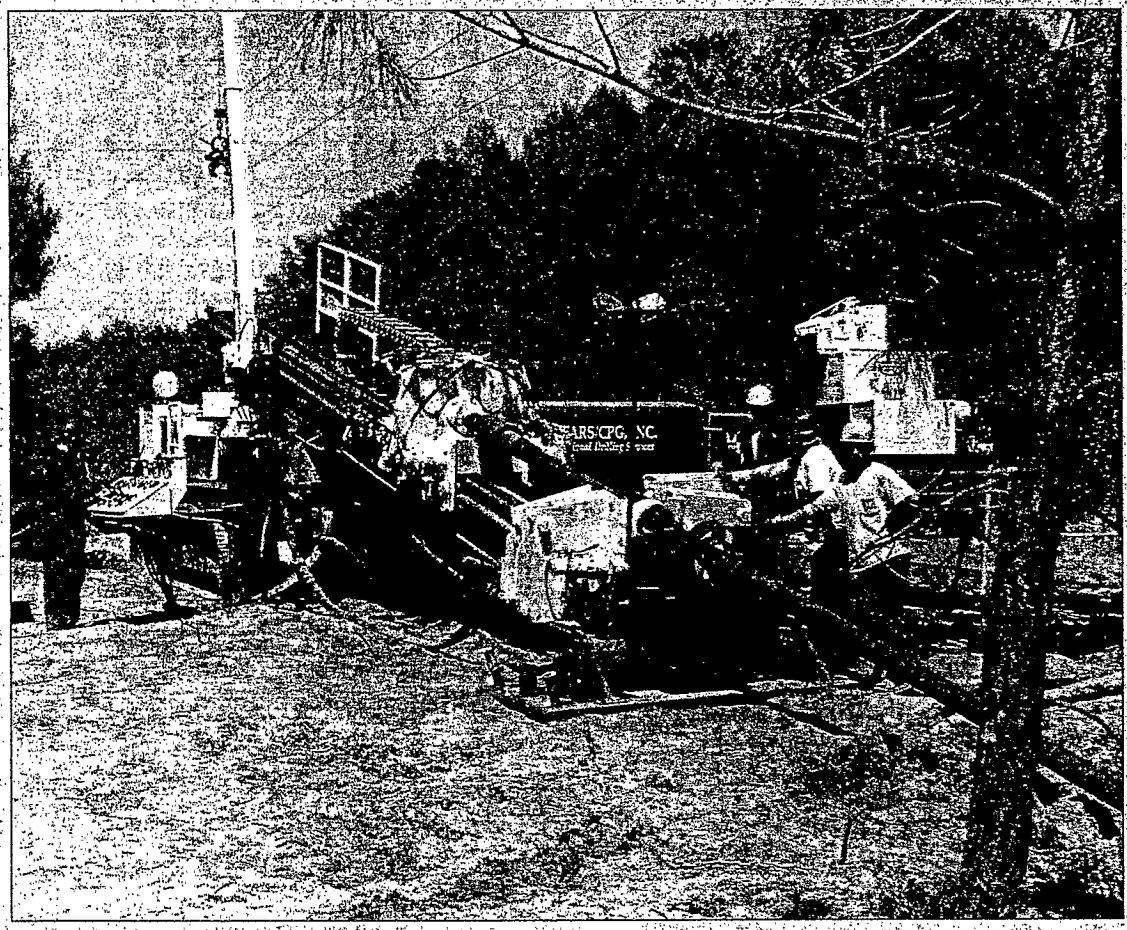
tion-related associations promise progress on the trenchless front. Earlier this year nine groups entered into a memorandum of understanding that provides a forum for the organizations to pool their resources to advance trenchless construction. The nine: The American Society of Civil Engineers, American Underground Space Association, American Waterworks Association, Associated General Contractors of America, National Association of Sewer Service Companies, National Utility Contractors Association, Trenchless Technology Center, Water Environment Federation, and North American Society for Trenchless Technology.

Safety: a prime concern



Unless proper safety precautions are taken, trench collapses can occur, and can injure or kill workers. Some 100 persons are killed each year in trenching and excavation accidents, according to the Occupational Safety and Health Administration. In recent years OSHA has worked diligently to enforce trench safety regulations and at the same time, to gain the cooperation of underground contractors in an effort to improve trench safety.

Stiff penalties await those who fail to comply with OSHA regulations: fines run up to $7,000 for serious violations and can hit $70,000 for willful violations. A serious violation, says NUCA safety director George Kennedy, is defined as one that could result in serious injury, loss of life or limbs. While OSHA rarely fines a contractor $70,000, such a fine would be imposed for intentional violations of OSHA rules.

Basic OSHA rules require that all trenches more than 5 ft. deep must be protected, either with shoring, shielding or sloping sides. OSHA standards include a system for classifying soils to determine which protection system best fits the application. And, the standard demands that a competent person do the soils analysis in that process.

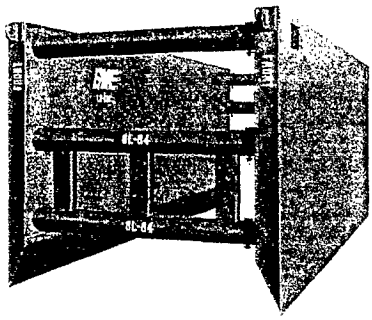
Mears Directional Drilling Services Group

Equipment.
Our drilling rigs have been designed to work in tight situations, are completely self-contained, and are highly mobile. This allows for quick move-in and setup with minimal impact to the surrounding environment.

Personnel.
Mears has experienced personnel from both the pipeline construction and oil and gas drilling industries working together as a team. This enables us to provide sound, workable solutions to utility crossings.

Experience.
Having worked in the construction industry for over 20 years, Mears has the expertise necessary to assist the customer in all aspects of environmentally sound utility installations including design, permitting and the right-of-way acquisition as well as directional drilling.

Small rig size, big rig capability.
Combining our equipment, personnel, and extensive experience provides our customers with professional, cost-effective solutions to their mid-size utility crossings.



For your next environmentally sound utility crossing project, contact the specialists at Mears. Call us at 1-800-632-7727, or fax (517) 433-5433.

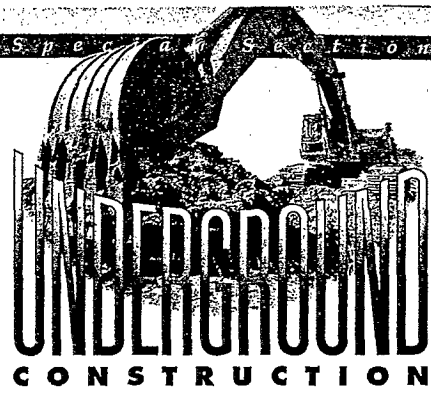
Circle 61 on Reader Service Card

If sloping sides are the chosen method, Kennedy says the typical OSHA specification is 1.5:1 — for every foot of depth, the trench edge must be set back 1.5 ft.

Shoring consists of bracing that usually is hydraulically forced against trench sides to support them and prevent the movement of soil in or around the trench. Such systems rely on soils' natural cohesion to prevent its movement. In very unstable soils hydraulic waler shores are used with solid sheeting that supports trench walls completely.

Shielding systems, in contrast, do not support trench walls; they simply protect workers in a box-like structure. Trench shields with upper-half cross braces provide clearance in the trench bottom for the pipe.

Trench boxes, a form of shielding, typically have walls relatively longer than their height, fit down inside the trench and protect workers who adjust and join the pipe sections. They range in size from 4 ft. high by 6 ft. long to 12 or 14 ft. high by about 30 ft. long. A new twist: trench boxes are now offered in aluminum, says Kennedy.



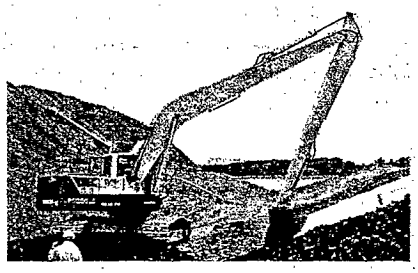
"Contractors should ask themselves if they can afford to be without safety equipment — not if they can afford it," says Rory R. McLean, marketing director for Kundel Industries, a NUCA member. "If I could only get contractors to do one thing, it would for them to plan every detail of their job before they start digging," he adds.

McLean offers the following safety tips:

- Make sure a competent person attends to the safety of the job at all times. OSHA defines a competent person as one capable of identifying existing and predictable hazards in and around trenching and excavation jobsites. Such a person can be a foreman or superintendent, and should be trained in soil evaluations, trench safety systems and OSHA and state regulations.
- Use adequate safety systems that meet applicable regulations.
- Assure that all laws and regulations are followed.

Naturally, site conditions should be considered when planning the project. Each project requires close attention to traffic patterns, nearness of structures and their condition, surface and groundwater and the weather.

R0013594



Case Histories

LONG BOOMS, BIG BUCKETS HELP EXCAVATE NEW CANAL

O & F Construction, Idaho Falls, Idaho, was recently faced with the challenge of building a canal to feed water to a newly constructed hydroelectric plant eight miles east of Ashton, Idaho. This new canal, named the Marysville Canal, would run parallel to the turbulent Falls River and would power the turbines of a 9.7 megawatt generating station, while also providing irrigation water for area seed potato farmers.

The Marysville Canal was a joint effort between five contracting companies. O & F excavated over one million yards of earth to dig the canal, which is approximately 85 ft wide at the top.

To excavate the canal, O & F used a fleet of Komatsu machines, which included six PC200LC-5 hydraulic excavators, two PC300LC-5 hydraulic excavators, one PC400LC-5 hydraulic excavator, one WA380-1 wheel loader and one WA450-2 wheel loader. Due to the width of the canal, three of the PC200 excavators were equipped with 50-foot Pierce Pacific long booms and 60-in. buckets.

"We needed the reach of the long booms to grade the banks of the canal, and they were indispensable," said La Vern Fowler, president of O & F.

After the cuts were made to build the canal, the soil was compacted, then a protective liner was placed by a California-based company specializing in that type of work. Fowler explained that the PVC liner has a protective coating underneath to help make the canal watertight. And, once it was in place, a 1 ft layer of 5-1/2-in. rock was spread over the liner—over 100,000 tons of crushed rock were used on the project.

Coordination and scheduling of the Marysville Canal made the project a challenge. According to Fowler, one of the biggest challenges involved orchestrating the work of all the company's equipment along a 12-14 ft wide road on the south side of the canal. "We had 38 major pieces of equipment moving in and out of that road's right of way while also having to move materials in and out from the road," Fowler said.

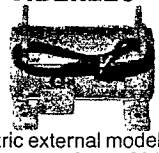
The project began in mid February, 1993 and was completed on July 15, 1993. Factors that contributed to O & F meeting a stringent completion date was the 97% uptime rate of Komatsu excavators.

VIBER
RELIABLE AND DEPENDABLE PRODUCTS SOLVING VIBRATION PROBLEMS FOR OVER 55 YEARS

EXTERNAL VIBRATORS

TURBOVIBER®
Massive force, high speed, low amplitude. Perfect for tunnels, precast yards, and cast in place operations. TV7 develops 5000 lbs of force.

TurboVibers require no lubrication, making them ideal in confined areas. Operate in any position. The only moving part—a single rotating assembly.

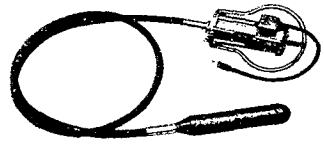


RENTALS AVAILABLE

AIROVIBER®

Ball type vibrators for a wide range of applications. No lubrication required.

VIBERLEC®



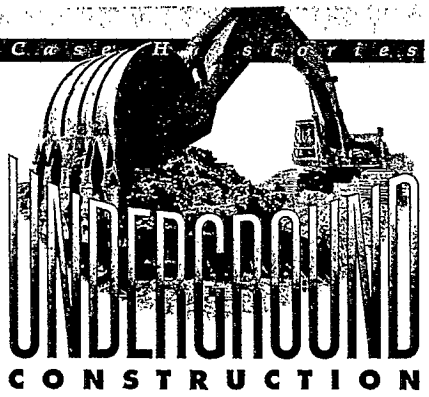
Electric external models in force ranges from 160 lbs–3500 lbs.

INTERNAL VIBRATORS

VIBERMITE® SERIES
Complete interchangeability of power units, flexible drives, and heads.

Choose from electric, pneumatic or gas engine power units. Six head sizes.

VIBERAIR® MOTOR-IN-HEAD SERIES
Beringless head is designed for easy maintenance. The four head sizes have a range from 515 to 3000 lbs of force.



UNIVIBER® SERIES
Electric Motor-in-Head High Cycle vibrators. Built to handle the really "tough" jobs. Seven models to fit any demanding application.

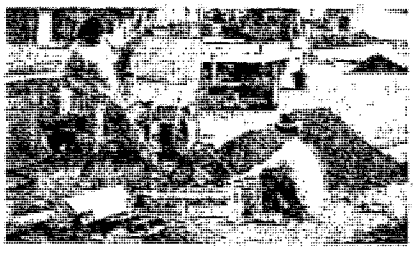
R0013595



TRENCHLESS TECHNOLOGY USED FOR WATER LINE REPLACEMENT

Riverside-Highland Water Company, Colton, Calif., serves the municipal water supply needs for the community of Grand Terrace, California. Native soils are extremely corrosive to steel and galvanized water supply lines because of the hot chemical reaction. This reaction greatly reduces the lifetime of the supply lines and speeds their need for replacement. The ground conditions in the area can vary widely from sandy loam to gravel and very hard, dry, decomposed granite.

Kingdon and Sons, Inc., of Chino, California specializing in water, sewer, and storm drain construction, is under contract to Riverside-Highland Water Company to replace 4600 ft of steel main and 98 house service connections in Grand Terrace. Plans called for the old steel main to be replaced with new 6-in. and 8-in. certainteed A.C. pipe. New 1-in. poly tube, which seems to greatly outlast steel or copper in these soils, was used for the 98 new service connections.

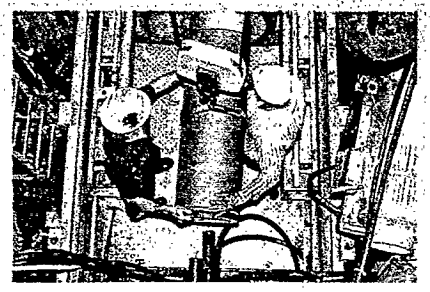
In a search for a more cost effective way to replace the service crossings, Bill Kingdon, president of Kingdon and Sons, Inc., began looking for a better way.

Open cutting the trench was necessary for the installation of the new main line. However, a fast, efficient way of installing the service crossings without trenching would save not only pavement costs, but the problem of compacting ditches back to necessary standards. Kingdon discovered the POW-R Mole Model PD-4 hydraulic pusher/puller, and contacted Petersen Underground Equipment, Inc., of Murray, Utah.

12-volt hoist was used to lower and raise PD-4.

The PD-4 is a top loading machine which uses 1-5/8-in. solid steel rods in 2-1/2 ft lengths to push under the roadway. Solid steel rods are better suited to push through adverse soil conditions and yet maintain accuracy. The operating trench required is only 48-in. long, 20-in. wide and the PD-4 will operate from most hydraulic sources.

The main concern when Kingdon purchased the PD-4 and Power Stinger hydraulic power supply was the ability of the system to complete at least 10 service line crossings per day. After purchase of the POW-R Mole System, Kingdon set about designing a special trailer to transport the machine and streamline the operation.



The trailer was 4 ft by 8 ft, equipped with mounts for the Power Stinger, tool box for accessories, POW-R MOLE PD-4, And a Venturo 12 volt crane. This crane allows the PD-4 to be lifted in and out of the operating trench without tying up an additional piece of equipment or unnecessary labor from the pipe crew.

A 410C John Deere backhoe prepares the operating trenches and target pits ahead of the pipe crew. Mike Colvin, foremen on the project, stated that from the beginning of the project, the PD-4 allowed the required 10 pushes to made under the average 30 ft of pavement between 7 a.m.. and 10:30 a.m. The only thing that prevented more pushes being made was the fact that the three man pipe crew is also responsible for the service hookups, backfill and cleanup. With more personnel, Kingdon believes the average number of crossings completed per day could have risen to 20 per work day on this project.

MICROTUNNELLING EQUIPMENT RESCUES SUSPENDED SEWER PROJECT

Microtunnelling was rapidly deployed to complete an open cut wastewater sewer installation which had been discontinued due to difficult geologic conditions within a populous California residential area.

Fremont is a typical California suburban community near downtown San Francisco. As part of an expansion of the wastewater collection system, Union

Sanitary District (USD), which serves the area, appropriated a project to relocate and upsize existing sewers to make way for planned improvements to adjacent Interstate 880, a major commuter route into the city.

Original attempts to construct the sewers by conventional open cut methods proved to be impossible due to the inability to dewater soils present in the area. The attempts at excavation were suspended after the contractor proved to the authorities that the dewatering methods specified for the project could not provide adequate soils stabilization.

To circumvent the risk of severe property damage and possible long term maintenance costs, USD discontinued the open-cut concept, and undertook a bold move to implement trenchless construction. The project was swiftly redesigned to accommodate microtunnelling, which would enable the installation of the utility without any dewatering requirements.

EMSCO Contracting of Oakland, Calif., was awarded the redesigned project in September, 1992. They subcontracted the microtunnelling work to Western Utility Contractors, Inc. (Westcon) of Pleasant Grove, Utah. A Herrenknecht AVN 300 microtunnelling machine and jacking frame were expedited by air, from Germany, to be used with Westcon's support package.

Residents in the neighborhood were consulted and advised by USD of the proposed method of construction in an effort to ease their concerns about possible damage to the area. Social awareness played a key role in the introduction of the new methodology. Noise abatement during extended working hours was a critical concern of this bedroom community.

The equipment was positioned into small 12 ft diameter steel caisson jacking shafts, which were constructed in welded sections, and lowered to an elevation below the existing groundwater. Reception shafts, 8 ft-in diameter, were constructed to make way for the first installation of jacked-in-place vitrified clay pipe in California.

R0013596

WIDEST SELECTION OF THE MOST ADVANCED TRENCH SHIELD AND SHORING EQUIPMENT ON EARTH

Whatever you need in **Trench Shields**, Efficiency has a size, type, shape and weight to fit your specific job needs: 4- to 10-in. wall thicknesses, in steel or aluminum including Manhole Shields, Boring Boxes, and Big Mo spreader systems.

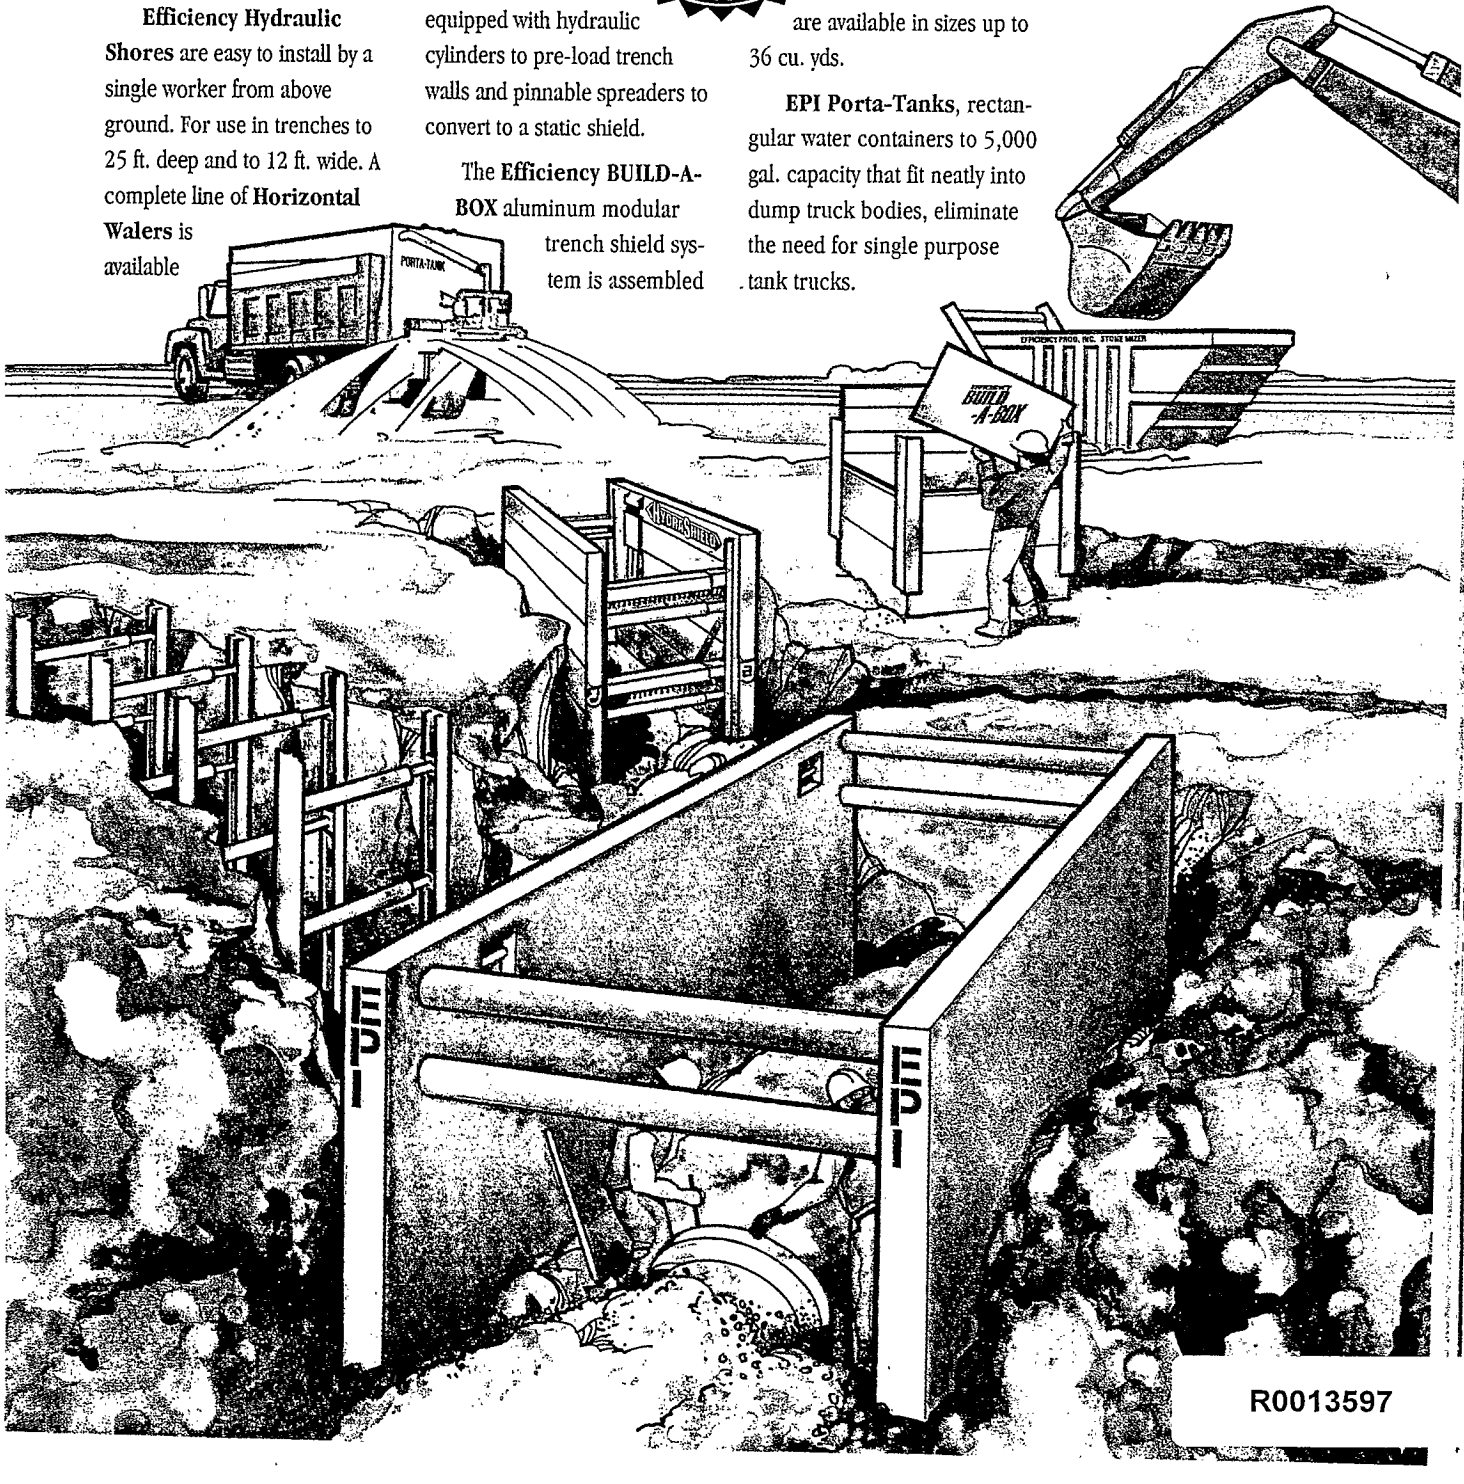
Efficiency Hydraulic Shores are easy to install by a single worker from above ground. For use in trenches to 25 ft. deep and to 12 ft. wide. A complete line of **Horizontal Walers** is available using the same cylinders.

Efficiency HydraShield is a lightweight shielding system available in sizes up to 8-ft. high by 12-ft. long, equipped with hydraulic cylinders to pre-load trench walls and pinnable spreaders to convert to a static shield.

The **Efficiency BUILD-A-BOX** aluminum modular trench shield system is assembled by hand, transports in a pick-up truck, converts from 2- to 3- or 4-sided shield in minutes.

EPI Stone Mizers, specially designed bedding material containers, are available in sizes up to 36 cu. yds.

EPI Porta-Tanks, rectangular water containers to 5,000 gal. capacity that fit neatly into dump truck bodies, eliminate the need for single purpose tank trucks.



Contact your nearby Efficiency distributor for details or call 1-800-552-8800.

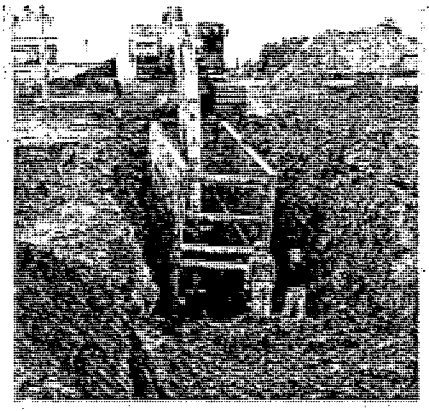
EFFICIENCY PRODUCTION, INC.™

Circle 63 on Reader Service Card



R0013597

Mission Clay Products of Pittsburg, Kan., supplied the newly designed 12 inch i.d. pipe sections in 4 ft lengths, which were inspected and tested prior to each individual installation. Because microtunnelling is quieter and less disruptive than open-trench construction methods, Westcon was able to work 18 hours per day without major disturbance to the neighborhood. Microtunnelling progressed from shaft to shaft through the neighborhood at a maximum production rate of 130 ft per day. All of the 1,000 ft comprising the four pipe drives were completed within a four week schedule.

Advantages and savings in the social sector continue to require individual assessment per project. In this case, the quick response and bold decisions proved that seemingly impossible conditions can be surmounted with technologically advanced methods.

ELABORATE TRENCH SHIELDING USED TO TUNNEL FOR SEWER PIPE

It took a whole lot of trench shield equipment to prepare entry and exit points for a tunnel constructed to insert 36" diameter cast iron sewer pipe under Washington Street in West Chicago, Illinois.

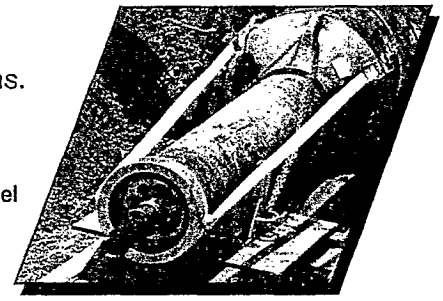
View from the east side of Washington Street shows 34-foot deep excavation opened to accommodate pipe emerging from tunnel.

The contractor, Harry Kuhn, Inc. of West Chicago, handled the $2 million contract to install 9,600 feet of the pipe in a time efficient, safety conscious fashion. The job is part of the overall expansion of the DuPage County Airport.

To tunnel under heavy traffic laden Washington Street from the West, the Kuhn firm constructed an elaborate tunnel machine entry point. Working with local Efficiency Production trench shield distributor, Lee Jensen Sales, Inc., Crystal Lake, Illinois, the contractor built a trench shield system to fit into a work site 39 feet long, 24 feet deep, and 10 feet wide. An additional 10 feet of trench was sloped back at the top in one-to-one ration, so that the total depth ended up being 34 feet.

The trench shielding equipment used was substantial. It consisted of three 8 ft. high trench shields stacked one on top of the other to form a 24 ft high wall of steel 27 feet long. Each section had 8-in. wide steel double walls.

A 12 ft. long section, also 8 ft high, in three sections was stacked behind the 27 ft. long sections to total 39 feet in length. Spreader bars for each section were 10 feet wide. So the entire enclosed entry work site ended up with a trench shield system that measured 14 feet high, 39 feet long and 10 feet wide. A boring machine capable of cutting a 48 in. tunnel was placed into the work site to cut under Washington Street.

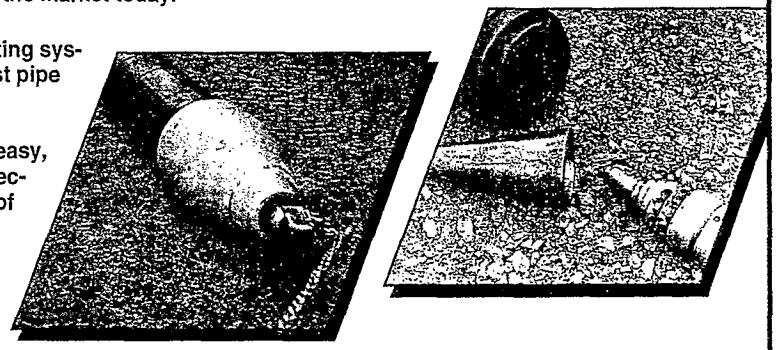


At the exit point on the eastern side of Washington Street, a 33 ft. deep work site was excavated and three sections of 827HT Efficiency trench shields were placed in the pit stacked one on top of the other. This combination measured 24 feet high, 27 feet long and 10 feet wide.

The job was completed without major incident, without disturbing traffic, and with extra attention to worker safety.

Over 30 Years of Solutions

. . . for every Trenchless Application



Make sure your trenchless experiences are solutions, not problems. Put 30 years of TT Technologies experience on your side. It's the difference you need for success in every trenchless situation.

GRUNDORAM — Accurate, economical pipe ramming for installation of steel casings from 4" to 80" in diameter. Nothing else like it!

GRUNDOMAT — The professional's preferred piercing tool. The most accurate and durable on the market today.

GRUNDOCRACK — A full-featured pipe bursting system that delivers low-cost pipe system rehabilitation.

GRUNDOHIT — Directional boring made easy, dependable, and cost-effective. TT offers a full line of dry bore and fluid assist systems for all your directional needs.

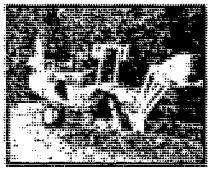
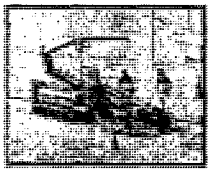
EQUIPMENT REVIEWS



The Ditch Witch model 7610 is a mechanical drive trencher and vibratory plow which accepts a wide range of modules for a variety of underground construction jobs. The mechanical trenching and vibratory plow drive incorporates an enclosed gear box which protects components and eliminates daily maintenance. Available modules include trenchers; vibratory plow; combination trencher and plow, earth saw disc-type trencher, and front-mounted utility backhoe.

Circle # 101 on Reader Service Card



Parsons Trenchers has introduced a new 80 HP multi-purpose trencher. The Parsons T-750 can be equipped for trenching, cable plowing, back filling, backhoeing, boring and offset trenching.

The T-750's design incorporates an articulated frame and hydraulically powered automotive-type steering for maneuverability. Its special design provides optimum digging rates for soil and other materials. It includes a single master foot clutch to disengage both systems simultaneously in case of emergency. Other features: Hydraulic steering and transmission, centrally-located operator's station, offset or center mount trencher module, and rotary carbide teeth on a solid slide boom.

Circle # 102 on Reader Service Card

Ditch Witch has introduced the new 8/60 Jet Trac® long-range directional boring system. The 8/60, powered by an 85-HP diesel fluid system, can make horizontal bores to distances of 600 feet and pull back material as large as eight inches in diameter. The 8/60 drill unit drives its own anchoring stakes, has hydraulic drill pipe make up and breakout, has smooth operating capabilities due to its electric controls, and includes the Jet Trac electrical strike system.

SUPERLINER™

"SUPERLINER WAS THE MOST COST EFFECTIVE PRODUCT AND APPROXIMATELY THREE TIMES STRONGER THAN THE COMPETITION"

—Edward Catone Jr., Superintendent Division of Sewers and Sanitation, City of Pawtucket, R.I.

Why **SUPERLINER™** is the best choice for your next pipe rehabilitation project:

- The unique reinforced **SUPERLINER™** matting structurally restores pipe to a strength which exceeds the original pipe specifications
- Improves hydraulic flow
- Significantly reduces infiltration
- Polyethylene Film System insures uniform wall thickness
- Less expensive than other lining processes & requires absolutely no excavation
- Resists chemical degradation
- Complete turnkey operations in less than 8 hours
- Unique Filtration System protects the environment & homeowners

SUPERLINERS USA's FILTRATION SYSTEM (patent pending) filters all air used and any condensate to zero levels of toxicity. The **SUPERLINER™** system is the only cured-in-place process to responsibly filter Occupational Safety and Health Administration (OSHA) restricted chemical by-products present in all cured-in-place methods.

Kundel Industries has introduced their Shorlite Shield, designed with a ultra narrow 2 1/2-in. wall trench shield. Constructed from durable steel with the lightness and flexibility of aluminum, the Shorlite is designed to work as a system box that can be stacked, hooked-in-tandem and leap frogged. Its center is built with aluminum panels, and its outer wall is wrapped in a steel barrier. All steel end tubes are part of the trench shield barrier, and give extra strong support to the ends of the box where most of the driving force will be applied. These end tubes protect the aluminum panels while increasing the depth rating. And, its all steel cutting edge protects the aluminum panels from boulders and other objects that are encountered during excavation. An all steel cutting bar protects the bottom of the box for long wear.

Alitec's model CP30BH excavator cold planer is designed for use with excavators in the 50,000 to 150,000 lb. class and requires a minimum flow of 60 gpm at 3,000 psi. It features a planetary drum drive; a manual or hydraulic depth control from cab; and up to 120 hydraulic horsepower with 10,000 lbs. torque. The model CP30BH is compatible with most coupling systems; its planetary drum drive provides higher torque to cutting teeth and it has a lower initial cost vs. current methods, says Alitec.

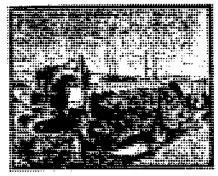
UNDERGROUND CONSTRUCTION

The 75-metric-ton-class Caterpillar® Cat 375 excavator features a new design with increased performance capabilities, new electronic controls and versatility through a wide range of options. Its electronic power control (EPC) system manages the engine and hydraulic system, putting power where and when it's needed most. The EPC balances engine speed and hydraulic pump output and utilizes up to 98% of available engine power to drive the pumps. A micro computer controls engine underspeed to prevent lugging under load and controls a back-up system with machine diagnostics to minimize downtime. Two pilot-operated, adjustable joysticks control all front end and swing functions. Low sound levels, smooth low-effort controls, and excellent all-around visibility minimize operator fatigue. And, a nearly infinite range of seat and control adjustments on either of two seat options allow operators of any size to work in their most desirable position.

Circle # 110 on Reader Service Card

The Gradall Co.'s new XL4000 series excavators are equipped with high pressure hydraulics which increase productivity with faster cycle times and higher digging forces. Plus, they can greatly reduce fuel costs by making full, efficient use of horsepower with twin load sensing piston pumps which automatically adjust to meet changing job requirements, while a third piston pump powers the fully independent closed loop swing circuit. Reach and range extend to a full 30 ft 6-in. at grade, or to over 45 ft with a Telestick attachment. Its versatility is improved with Gradall's famed boom which can increase attachment productivity as it telescopes, raises, lowers, digs, swings and tilts up to 360 degrees. And, all boom movements and tilt speed are easily controlled with convenient joysticks built into a new operator compartment.



Circle # 111 on Reader Service Card

The Vangaurd drive panel system manufactured by Kundel Industries is a shoring system that is designed for use in unstable soil when excavating along side existing utilities, underground and above ground structures. The waler system that is used in connection with the Vanguard panel system has a modular design, and it can be pre-assembled before starting an excavation. This guide pocket box system is designed to hold and guide drive panels. When using this guide pocket system, trenches can be excavated up to 5 ft deep; then the guide box can be inserted in the trench.

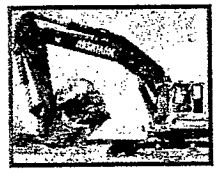
Kubota Tractor Corporation has added the new KX-Series excavators to its expanding line of compact construction equipment. Ranging from 22.2 to 42.7 horsepower, the new KX-41, KX-71, KX-101 and KX-151 models deliver powerful performance for a variety of digging applications. Each of the KX-Series models feature a commanding, power-up hydraulic system; walk-through design on four-post models for increased operator mobility and auxiliary hydraulic lines extending to the end of the dipper arm to provide a wider range of uses and enhance attachment applications.



Circle # 113 on Reader Service Card

The HS 40 D Walking Excavator by Schaeff Inc. is a problem solver for all operations which are not possible with any conventional wheel-and track-type excavator. Its areas of operations include rough terrain; embankments; slopes; mountainous terrain; roads with heavy traffic; river courses; terrace construction and more. This excavator is powered by a water-cooled 38kW (52 HP) supercharged diesel engine for mountain operation with altitudes up to 6500 ft without a drop in output. The HS 40 D's working hydraulic system is an energy saving, but powerful and fast hydraulic circuit with Schaeff specific horsepower summation control via a dual-axial piston pump. A variety of tools and optional attachments make the HS 40 D's operating spectrum wider, e.g. buckets from 140 to 340l contents and 350-900 mm width, ditch-cleaning bucket, tilt bucket, and profile buckets. Optional attachments range from hydraulic hammer to swamp attachment, ripping tooth and towbar.

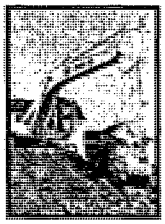
SIMPLY MORE EFFICIENT

With the simple touch of the work mode button, you're automatically in one of four programmed performance settings.

For one of four engine speeds, simply touch one of these buttons. The two buttons directly above allow further refinement.

With its new E-Series Excavators, John Deere can make your operation more efficient. QUADTRONICS, a microprocessor engine/hydraulic management system, lets the operator set up the machine's engine and hydraulic system by simply touching a button. You get optimum production, better fuel efficiency, plus performance tailored to the job. You're in total control, and more efficient too, at the touch of a button. It's as simple as that.

JOHN DEERE



RUN WITH THE BEST®

Circle 71 on Reader Service Card

production-oriented features. Its digging depth is 21 ft 8-in. with a lifting capacity of 14,300 lbs. An optional arm digs at 19 ft 4-in. The Quadtronics system by John Deere allows the operator to select the machine performance he wants by choosing combinations of four hydraulic work modes and four engine power modes. The system consists of the main hydraulic pump, the controller or microprocessor, an engine throttle proportional solenoid and a pump displacement proportional solenoid. The microprocessor/controller is located behind the operator's seat and responds to easy-to-use keypad commands from the operator for hydraulic work modes and engine power levels. Work modes include precision, economy, general and heavy duty.

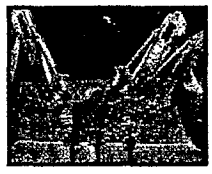
A new hydraulic hammer product line by **Link-Belt Construction Equipment Co.** has recently been introduced. Designated the "RP Series," 13 models are offered ranging in size from 250 to 11,000 ft /lb. impact energy class. These high performance hammers feature a nitrogen cushion chamber that not only absorbs shock from the hammering action, but also stores the piston recoil energy and applies it to the next blow for increased productivity. The elongated piston and dual retainer pin design provide alignment of the piston and tool for maximum energy per blow and ease of tool placement.



Circle # 117 on Reader Service Card

Shieldco Trench Safety Systems has added their new "R-Series" shields to their line of Trench Shielding systems. Designed and certified by their staff of registered professional engineers, "R-Series" shields optimize strength, while minimizing weight and sidewall thickness. Shieldco special features include: replaceable hardwood pounding blocks to protect the integrity of the structure; steel wear plates for added strength and puncture resistance in the critical spreader socket areas; and a variety of industry options that are Shieldco standard features.

Circle # 118 on Reader Service Card

JCB Inc. has introduced a range of new hydraulic breakers, the HammerMaster 60 Series. Three different breakers in the 400 ft lb. to 1000 ft lb. size classes comprise the range, which was developed to perfectly complement the weight distribution and hydraulic systems of JCB's 200 series of backhoe loaders. The breakers can be directly mounted to the dipper or picked up by JCB's backhoe bucket quick coupler. JCB offers a three breaker range that offers sizes for applications in road building, demolition, quarrying, metallurgy and utility work. They have been engineered with constant blow energy to ensure maximum breaking power, while supply pressure damping is used for smooth reliable operation.

Circle # 119 on Reader Service Card

Kubota Tractor Corporation has introduced three new KXB hydraulic breakers for its KX-Series excavator line—the KXB400, KXB500 and the KXB600. These hydraulic breakers have an integral pressure adjusting valve that guarantees constant blow energy by utilizing 100% of available power. Ultra-high blow rates are achieved by the high-volume distributor valve and all blows are at full power and maximum

Building Roads and Bridges Takes More Than Sweat, It Takes StreetSmarts®.

You and your employees work hard. It takes a lot of manpower and toil to construct the avenues for the people of the nation to get from "here to there," but does your computer system work as hard as you do?

For over a decade, BGIS has been the nationwide leader in providing integrated management information systems to contractors and material producers in the **Highway/Heavy/Utility** construction industry. Combining our unmatched expertise in this field with the most modern software tools available, BGIS offers StreetSmarts™ as a unique advantage for your business.

StreetSmarts
Your Road to Success

By integrating estimating, project management, accounting, equipment management, materials production and remote communications, your people work smarter and more efficiently. And with the full color graphical displays with help windows, StreetSmarts™ is easily accessible for people who have never before used computers.

If you think that a computer system should conform to the way you do business, StreetSmarts is the system for you. Give us a call, and we'll put your company on the road to success.

NASTT, founded in 1990, is a multiple disciplinary society of individuals and organizations with professional, utilitarian or environmental interests in Trenchless Technology. NASTT's mission is to advance the science and practice of Trenchless Technology for the public benefit; to develop standards; to promote education, training, research, development and information; and to promulgate through public forms the improvements and status of Trenchless Technology. NASTT is affiliated with the International society for Trenchless Technology and shares the same basic concerns for the environmental and social costs of utilities trenching. An NASTT member is automatically affiliated with ISTT. Membership in NASTT is available to a broad spectrum of those individuals, agencies and companies involved or concerned with providing gas, water, sewerage, communications and electrical services. Members include contractors, engineers, consultants, researchers, manufacturers and developers interested in underground systems and the application of Trenchless Technology. *Circle # 167 on Reader Service Card*

The National Utility Contractors Association
4301 North Fairfax Drive, Suite 360
Arlington, VA 22203
Phone (703) 358-9300

The National Utility Contractors Association (NUCA), based in Arlington, VA., comprises 40 local groups of underground utility construction contractors and suppliers throughout the United States. Its nearly 2,000 members provide the materials and necessary manpower to build and maintain our nation's network of sewer, water, gas, and other underground utility systems. Founded in 1964, NUCA is the industry's voice in Washington, D.C., vigorously promoting a stronger federal commitment to water and wastewater infrastructure. NUCA strives to enhance jobsite safety with comprehensive safety programs and services, while also working to ease the regulatory burden on construction businesses. NUCA disseminates information throughout the underground construction industry via The National Utility Contractor magazine, legislative and safety newsletters, and an annual convention and exhibition, which will be held march 2-6, 1994, in Reno, Nevada.

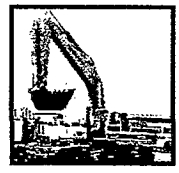
ous multi-function cycles with no swing circuit interference. Regenerative swing braking adds power availability to other functions when applied. *Circle # 129 on Reader Service Card*

Komatsu Dresser Company's PC300LC-5 hydraulic excavator uses microprocessors with a revolutionary design and performance, says the company. By utilizing microprocessors in hydraulic excavators, an operator can tailor the machine's performance to the job. Microprocessors serve as mechanical "nerve centers," using computerized "brains" to optimize efficiency and ultimately, increase profit for equipment owners. Equipped with a Komatsu SA6D108 six-cylinder engine, the PC300LC-5 delivers a flywheel horsepower of 207 h.p. at 1,950 rpm. And, it has a bucket digging force of 41,450 lbs., a bucket capacity of 1.0-2.5 cu. yd. and an arm crowd force of 31,080 lbs. *Circle # 130 on Reader Service Card*



Liebherr-America, Inc. has introduced the new 107,000 lb. R 954 HD Litronic hydraulic excavator. To make "Litronic" perform to its fullest potential on the R 954, all key components were redesigned to fully match each other. "Litronic" not only improves the machine's efficiency, but also protects the power train from overloads, thereby extending the life expectancy of all machine components. This excavator is powered by the turbo-charged and after-cooled Liebherr D 926 Ti diesel engine, with an output of 282 SAE net horsepower. The engine operates at a low 200 RPM in the "High" mode setting, for extended life, improved fuel consumption and lower emission and noise levels.

Circle # 131 on Reader Service Card

The new **DH320 hydraulic excavator** by Daewoo Machinery Corporation has an operating weight of 68,800 lbs. With a digging force of up to 42,500 lbs., the DH320 has the highest available force per horsepower available for the 70,000-lb. weight class, claims the manufacturer. A 217-horsepower, turbo-charged Daewoo diesel engine drives two variable-displacement axial piston pumps to power both propulsion and digging systems. Daewoo's unique Electronic Power Optimizing System monitors and controls engine and hydraulic power for optimum output and operating efficiencies over a wide range of digging and lifting applications. A 9-spool monoblock design allows for both independent and combined operations of all functions.

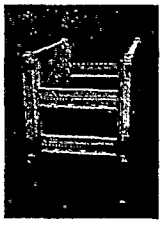
Earthline Coporation's SUPERLINER™ trenchless relining system requires no excavation, structurally restores pipe to a strength which meets or excees original pipe specifications, is three times stronger than standard felt cured-in-place liners, improves hydaulic flow, significantly reduces infiltration, and provides excellent strain corrosion properties. There is zero annular space in the final product. Less expensive than other lining processes, the final product fits all shapes sizes and navigates bends. The SUPERLINER™ product is available in all 50 states.

Circle # 133 on Reader Service Card

Westar Manufacturing Company's Quick-Shor vertical hydraulic shores are available in 2 ft, 3-1/2 ft, 5 ft, 7ft, 9 ft, 12 ft and 16 ft rails. These vertical hydraulic shores are used for type A, B, and C soils and are equipped with finger guards and oversleeves as standard equipment. Westar offers contractors the option of heavy duty or standard duty rails. The Quick-Shor cylinders and rails are all interchangeable—extension kits to enlarge cylinder length are available in sizes ranging



R0013608

from 9-in to 63-in. Other advantages 4f the Quick-Shor vertical hydraulic shore is its capability of one-man installation and removal, and safe above-ground installation and removal.
Circle # 134 on Reader Service Card

A new aluminum shoring shield system, the HydraShield from Efficiency Production, Inc. consists of aluminum sidewalls with hydraulic cylinders to accommodate varying trench widths. Other features include: telescoping steel pinnable spreaders to convert it to a static shield and an economical hand pump with 5-gal.can, hose, and pressure gauge. It is available in eight sidewall sizes ranging from 6 ft high by 6 ft long, to 8 ft high by 12 ft long. Spreader sets, which include hydraulic cylinders, telescoping steel spreaders, return springs, and locking pins. Exclusive smooth wall design prevents dirt build-up, reduces friction when pulling the shield forward in the trench, and makes it easier to handle in and out of excavations. Double wall aluminum cavities are filled with foam to prevent dirt and moisture build-up, and its double-wall construction adds strength without increasing weight.

Circle # 135 on Reader Service Card

"Felco Industries, Ltd. bedding conveyor delivers bedding materials in the trench fast, safely and economically," says the manufacturer. Felco's bedding conveyors can be placed on any type of crawler excavator. Other bedding conveyor benefits include a standard bedding conveyor which will fill a two cu. yd. bucket in 10 to 20 seconds; standard components are readily available and require little maintenance; operator visibility remains unchanged due to the hopper's slant profile and pinned mounting connection on backhoe permits 15 minute removal and installation. By using Felco's bedding conveyor, bedding material waste is reduced by almost 10%. Less equipment is needed on the job site, and fewer employees are needed on the project.

Circle # 136 on Reader Service Card

The new models 15, 21, 25, & 40 trenching attachments from Lowe Manufacturing Co., Inc. are designed to add capability to skid loaders. The trenching attachments feature quick and easy mounting, side shift capability, and only two hydraulic connections to the loader. Models 21, 25, and 40 are available in three to five foot digging depths, and six to 12-in. trench widths. Included with the trenching attachments are a 50,000 lb. anti back flex digging chain; removable spoil auger; greaseable tapered roller bearings and a 3,000 psi continuous operating pressure capability.

Circle # 137 on Reader Service Card

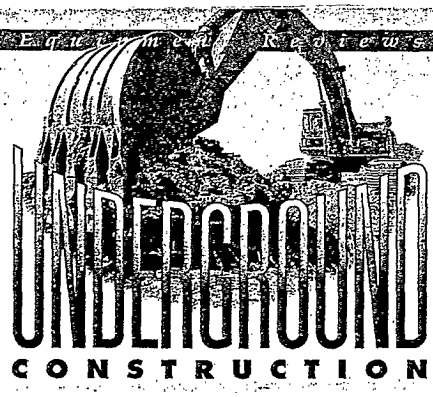
Iseki, Inc., San Diego, California, announces the development of new rock excavation disc cutter systems. While the disc cutter has proven its worth on large diameter rock excavators of all types, due to the high thrust forces necessary to break hard rock, its use has been restricted to only large diameter equipment. Their physical size prevents standard disc cutters from being used on small diameter cutter heads. After nearly two years of development, a small 5.0 inch disc cutter was produces, capable of withstanding a sustained thrust load of up to 30,000 lbs. These mini-cutters are cantilever mounted and can be serviced with simple hand tools. The mounting methods developed permit their use in closely spaced patterns and on cutterheads as small as approximately 12.75 inches. A full scale cutterhead, 32 inches in diameter mounted with 12 of the mini cutters performed well on both 9,000 psi and 24,000 psi UCS rocks. Iseki no offers the new high production, long distance hard rock tunnel machines, in the range of outside diameters from 18 inches to 84 inches, complimenting its existing range of tunnel systems.

Circle # 138 on Reader Service Card

Takeuchi Manufacturing, Ltd.'s model TB015 compact excavators feature synchronized bucket and arm cylinder speeds to make flat bottom trenching easier; two-speed travel for increased mobility; and simultaneous digging functions for faster cycle times. A wrap around counterweight helps to protect the engine compartment from

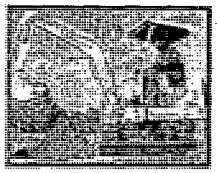
"The east wall moved 0.25 mm last night"

You know it's moving. You need to know how much and how fast. You need Electrolytic Beam Sensors from Slope Indicator.



Ask the engineers at Arley Tunnel, where real-time monitoring of 432 beam sensors provides early warning of collapse, allowing preventative measures to be taken and ensuring the safety of workers.

For details, contact:



Slope Indicator Co.

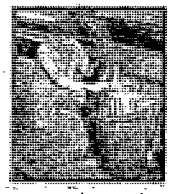
R0013609

damage when slewing. The excavator's track frame can be expanded or contracted hydraulically in a range from 51-in. to 38-in. And, the narrower width lets the TB015 negotiate small openings or operate in very tight job conditions. The expanded track frame provides greater stability for heavy digging and working on uneven terrain. The TB015 weighs only 3,418 lbs., making it easily transportable. A 16HP engine delivers 2,415 lbs. of bucket digging force. Maximum digging depth is 7 ft 3-in. with a maximum reach at ground level of 12 ft and 1-in.

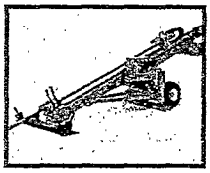
Circle # 139 on Reader Service Card

Barnes Pumps, Inc. offers a complete line of Prosser® submersible dewatering pumps that are constructed of hard-anodized aluminum for durable performance and lightweight portability. They feature a slim-line design—operates in any position; 3/4 to 50 horsepower; ability to handle a 2-in. to 6-in. discharge; in-line suction and a discharge capability and electric or hydraulic power source options.



Circle # 140 on Reader Service Card

The compaction bucket from Felco Industries, Ltd. allows an excavator operator to backfill, position and control the depth of lifts. This advantage eliminates one man and machine from backfilling spoil. The compacting bucket allows a compacting excavator to follow closely behind pipelaying activities. This reduces the possibility of cave-in when a trench box is relocated. Felco's compaction buckets also increase safety by keeping unprotected men out of the trench and a majority of the trench closed. With optional bolt on teeth, compaction buckets can be used to excavate without changing attachments.



Circle # 141 on Reader Service Card

ITT Fluid Technology Corporation's model BS-2400 is a 140 HP high head/high volume submersible pump. It features high head pumping for open pit mines and can be completed in a single (two stage) pump unit. The Poly-Life version is equipped with polyurethane lined wear parts for prolonged life, especially when pumping highly abrasive liquids. Its main applications include mines or open pit mines.

Circle # 142 on Reader Service Card

StraightLine Manufacturing, Inc. has introduced Directline™, an extended-range directional boring system for trenchless drilling for landscaping, freeways, rivers and other obstacles without site damage or restoration expenses. It features a PowerWrench™ break-out system to change drill stem faster, easier, and safer; an easy-to-use master control panel; a variable solution pressure control and a unique priority-flow control valve to maintain optimum drill rack performance. It is designed with a TaperLok™ drill stem which is available in 1 and 1/2-in. and 1 and 7/8-in. sizes. It also delivers fast trouble-free operation in rigorous drilling and backreaming operations.

Circle # 143 on Reader Service Card

AGL Corporation has announced a new remote alignment system for its GradeLight pipelaser. Called AutoLine, the system uses an enhanced infrared signal to align a laser beam up to 600 ft away from the laser instrument when used through-the-pipe. It makes setting up much faster and safer as trips into the ditch to align the laser could be reduced. Other GradeLight features include compact size for easy setup inside a pipe or

Helping You Get the Most Out of Trenchless!

Why NASTT? Because it's the only society in North America dedicated to advancing the science and practice of Trenchless Technology for the public benefit.

Whether you're new to the industry or an experienced veteran in the field, you need NASTT and NASTT needs you.

Membership in NASTT is open to a broad spectrum of individuals, agencies and companies involved or concerned with Trenchless Technology.

You will benefit from direct involvement and participation in a vital and active organization right here in North America.

We invite you to call us at 312/644-0828 to talk about membership or to write NASTT, 435 N. Michigan Ave., Suite 1717, Chicago, IL 60611-4067 for an application.

NASTT membership provides:

- an automatic affiliation with the International Society for Trenchless Technology
- information exchange at conferences and exhibitions, such as the upcoming NO-DIG '94 in Dallas this April
- opportunities to network
- technological information
- industry recognition
- subscriptions to various industry publications

When it's time to replace old pipelines, it's time for...

TRENCHLESS WARFARE!

Used to be that the only way to replace old pipelines was to dig huge trenches smack in the middle of major roads. It was noisy, inconvenient for commuters and local residents, and expensive.

Now there's a new technology available—the TRS trenchless replacement system — that makes it a cinch to win the war against the spiralling costs and environmental damage of conventional pipeline replacement methods.

Steel, ductile and cast iron, concrete and clay pipelines, even semi-collapsed sewers, can be replaced with new *standard specification* PVC, PE, steel, and other pipes. Use the TRS system to replace with full same size or LARGER than original pipe, while reducing road traffic by only one lane!

Better still, our powerful system works with a smooth, non-impact, hydraulic force minimizing hazard to adjacent structures.

Find out more about TRS; call us today! Contractors' inquiries welcomed.

The Power Mole model PD-6 hydraulic pusher/puller from Petersen Underground Equipment, Inc. is designed for under-road crossings that require additional driving force. Its features include a shoring box to provide blocking and operator safety in unstable soil conditions and a steerable system which provides depth, position and the ability to change direction upon demand. Its jaw system is positive locking, non-slip, and hydraulically actuated. The PD-6's solid steel push rods are top loaded which allow operation from excavations less than 5 ft long. With a maximum driving force of over 84,000 lbs. per sq. in., the PD-6 is used for the installation of pipe or cable from 1/2-in. to 8-in. with an outside diameter, and double pipes up to two 4-in. pipes on the pull-back operation in most compressible soils.

Circle # 145 on Reader Service Card

The 42316 hydraulic backfill tamper by Greenlee Textron, Inc. delivers 1200 blows per minute with a 3-in. stroke to a large 6-in. diameter foot. It can also be driven by an open center hydraulic system capable of delivering a flow of 7-9 gpm. Its actuator valve is mounted on the end of the tamper tube, and it is 53-in long and weighs only 39 lbs. The 42316 hydraulic tamper's light weight and blow power, give it efficiency when setting poles and compacting asphalt patch or backfill. It features a choice of in-handle or hose-end valve location and replaceable kidney-shaped (for around poles), rectangular or round tamping feet (for general backfill).

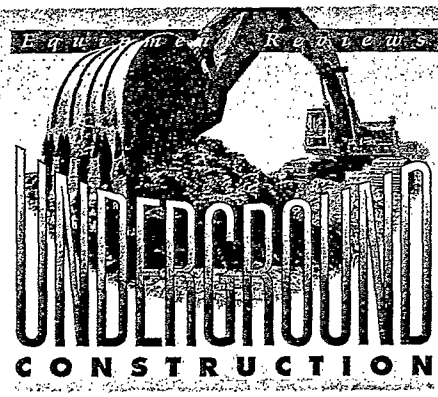
AM-LINER®
PATENTED

the cost effective system for sewer rehabilitation without excavation

Folded AM-Liner is inserted through the existing pipeline.

AM-Liner is expanded to form a tight molded fit against the walls of the existing pipe.

AM-Liner,® a strong, seamless, jointless PVC pipe, allows you to repair broken and leaking underground sewer lines without costly and time-consuming excavation. A sewer line 300-400 feet long can be installed and back in service in less than 2 hrs.



- No excavation
- Faster installation
- More economical
- Jointless interior
- Stronger than original pipe
- Resistant to sewer gases and chemicals
- Resistant to corrosion and abrasion
- Increases liquid flow

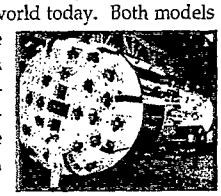
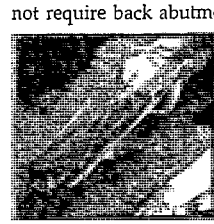
The new Ken-Jet Industries Still Worker hydraulic piling system is utilized for the installation and extraction of sheet piles and h-piles and is an environmentally-responsible alternative to conventional piling systems. The Still Worker eliminates vibration and minimizes the risk of damage to nearby structures, equipment and sensitive soil formations. With its compact size and the ability to self travel, the Still Worker excels in limited access situations. Unlike auger-cast systems, the Still Worker does not require the removal of soils. So there are no voids to fill with concrete and no mess to clean up.



Circle # 148 on Reader Service Card

The Borpak Model 1200 blind hole drilling system developed by the Robbins Company is a remote operated, self propelled drilling machine mounted on a crawler for high mobility and launched out of a starting tube for quick collaring. The BorPak is capable of boring raises at angles from 30o to 90o from horizontal in sizes ranging from 1.2m-2m diameter without the use of a drill pipe. Some of its applications include use for drilling shafts in mines and transfer shafts in a hydro power plant. The BorPak features a crawler undercarriage for adding higher mobility and more efficient collaring; a launching tube anchoring system is used for mine drilling for more efficient setup and an electric drive system achieves easier hose and cable-handling and a more power-efficient drive system.



Circle # 149 on Reader Service Card

The Robbins Company's Model 167-266/267 open gripper tunnel boring machine consists of three major components, the cutterhead\cutterhead support, gripper and main beam assemblies. The cutterhead is the front end of the machine which excavates rock. The cutterhead support houses the main bearing and the cutterhead drive systems. These are electrical motors, gear reducers and hydraulic clutches. The main beam assembly involves the main beam and rear support. The main beam can move up, down or sideways relative to the tunnel axis throughout the full working stroke. The main beam is also involved in the machine's steering. Currently, the Robbins models 167-266/267 are being used for the Lesotho Highlands Water Project, one of the largest ventures in the world today. Both models are working on separate sections of the 45 km transfer tunnel stretching between Katse intake and 'Muela in the Republic of South Africa.

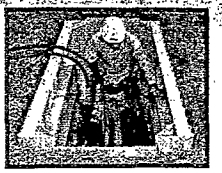
McLaughlin Manufacturing Company and Markham & Company Ltd. of Chesterfield England have entered into an agreement to introduce Markham Technology's microtunneling equipment to North America.

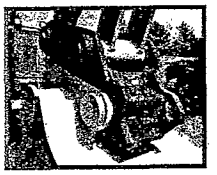
Innovations that place Markham Technology in a class above other microtunneling machines include the use of temporary pipes on the initial drive for improved steering accuracy, greater thrust loading in difficult soil, reduced joint makeup time and the ability to retrieve the machine in the event of an emergency. A patented reamer is available for use with the temporary pipes, enabling a wide range of sizes from a single machine. Other microtunneling equipment from Markham Technology and McLaughlin include road headers, excavator shields, and earth pressure balanced (EPB) machines with computer-aided steering and rock crushing capabilities.

Circle # 154 on Reader Service Card



TT Technologies has introduced a 2-in. piercing tool to the Grundomat line. The new Grundomat piercing tool incorporates a number of significant design and operational features including TT Technologies patented reciprocating head and replaceable stepped cone that contributes to its accuracy. Plus, it's easy to operate with the ability to reverse the tool with just a quarter turn of the air hose. Applications include uses for pulling steel or plastic pipe as well as driving steel castings. Ten sizes of Grundomat piercing tools are available, ranging from 1-3/4-in to 7-in.

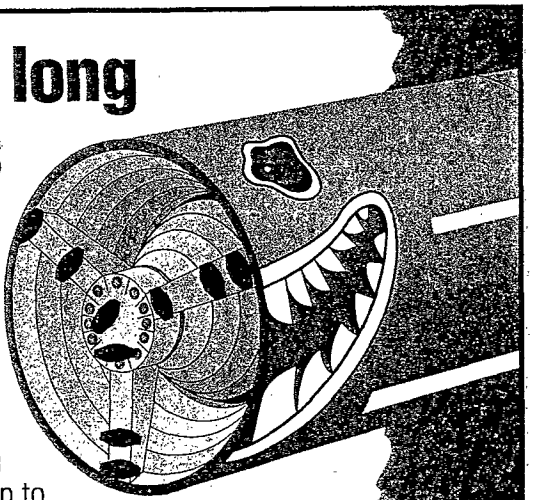
Circle # 155 on Reader Service Card



The 5000 series pipe jacking system by Akkerman Equipment, Inc. is unique because its main jacking cylinders and the hydraulic system are both housed in the pump unit. This system is one of the most versatile, since it easily adapts for any jacking pipe (RCP, steel, or composite) in any length. The pump unit has two distinct hydraulic systems powered by electric motors. A high pressure system supplies oil for the two main jacking cylinders, which have 400 tons of thrust, and any intermediate jacking stations.
Circle # 156 on Reader Service Card

Poweram Corporation's Model 2020 Power Ram hydraulic pipe pusher/puller offers 98,000 lbs. of push power, its own optional safety shoring box and special connector tools which expedite the smooth return of attached utility pipe. The Power Ram generates exceptional power from twin hydraulic cylinders, and a patented jaw system which permits full hydraulic force to be applied to the drive rod.

Other Poweram pipe pusher/pullers are the Mini-Ram II with 62,000 lbs. of pushing force and the Mini-Ram I, with 35,000 lbs. of pushing force.
Circle # 157 on Reader Service Card



The new piggyback style coupler by Wain-Roy®, Inc. is unlike other couplers since it does not require the use of bars, ratchets, springs, or any tools to engage and disengage. A simple rear hand lever is all that is required, and is adjustable. Its capability allows contractors to use OEM buckets, and is available at this time on most late model excavators.

Circle # 158 on Reader Service Card

A new model of the DDU-10 directional drill from Augers Unlimited has just been introduced. Named Model DDU-10T, the drill carriage is now offered on a track carriage. Its tracks are powered by independent hydraulic drive motors for accurate maneuvering. The hydraulics are driven by a carriage mounted engine for completely independent mobility. Featuring special pad designs, the tracks also minimize ground disturbance while positioning. The DDU-10T's hydraulic drilling

Profit By Association!

My name is Gerry Dorfman, and I am an underground utility contractor from California. My company has been a member of NUCA for many years, and if you have any involvement in the underground utility construction industry, you should be a member as well.

The National Utility Contractors Association (NUCA) is our voice in Washington, working to represent our industry. Issues, such as OSHA reform, Clean Water Act reauthorization, and striker replacement, top this year's priority list. These issues affect contractors and suppliers every day. NUCA also provides safety training information and seminars. We keep our members abreast of new and emerging construction methods and technologies through *The National Utility Contractor*, our monthly newsletter, and monthly safety newsletter. By joining with your peers from across the country, you can become part of a force that empowers you as a business person. By increasing our membership, we increase our strength.

Experience membership at the 1994 NUCA convention in Reno, Nevada, March 2-6. The show will include the largest–ever heavy equipment exhibition exclusively for the underground utility construction industry—over 150,000 square feet of exhibit space, including the latest innovations in equipment, supplies, and services available to our industry.

To learn more about NUCA and the benefits of belonging, I recommend that you talk to a NUCA contractor or supplier member. There's no one better to tell you about the benefits of membership than one of your peers. It is the best investment you will ever make for your business. Experience belonging. Join the NUCA team.

Sincerely,
Gerry Dorfman
NUCA President

For further details on NUCA membership or Convention and Heavy Equipment Show, call (703) 358-9300, fax (703) 358-9307, or write NUCA at 4301 N. Farifax Dr., Suite 360, Arlington, VA 22203-1627.

ENR WORLD PROJECTS FEATURE

Odebrecht: Brazil's giant beats adversity

Brazilian contractor takes philosophical approach to business and political crises at home and abroad

Norberto Odebrecht (left) has passed on the torch to his son Emílio.

If U. S. contractors think the 1990s have been rough, they should hear what Brazilian construction giant Odebrecht S.A. has had to contend with.

In 1992 alone the international conglomerate had to orchestrate an emergency airlift to get 5,500 of its workers out of war-torn Angola just months after moving its Florida contracting subsidiary out of the path of Hurricane Andrew. It also had to maneuver through political chaos caused by a coup in Peru and an attempted overthrow of the Venezuelan government.

And things were no better at home where political scandals last fall toppled Brazil's president and implicated many in the construction industry. Meanwhile, domestic building markets wallowed in a deep slump as the nation's runaway inflation continued to soar.

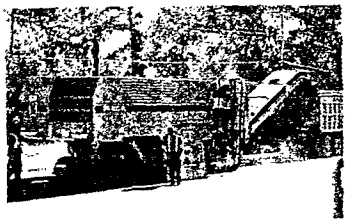
"All told, the organization has probably never experienced so many devastating events," says Renato Baiardi, chief operating officer of general contracting subsidiary Construtora Norberto Odebrecht S.A. (CNO).

Fortunately, the Odebrecht group succeeded in facing down the adversities. It emerged from last year's crucible with $1.9 billion in contract awards and $51 million in profits. Though down considerably from 1991, $612 million in foreign work was good enough to place Odebrecht 57th on ENR's top international contractors list (ENR 8/23 p. 34).

Odebrecht workers are treated as partners and delegated much authority in the field.

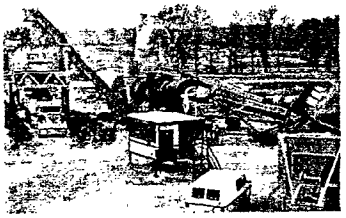
"Our goal is to increase turnover by 50% in the next two years to $3 billion," says Emílio Odebrecht, president and chief executive officer of parent company Odebrecht S.A.

Roots. Based in the port city of Salvador, in the northern state of Bahia, Odebrecht oversees operations in 18 countries and employs nearly 42,000 worldwide. Despite its mammoth size, the entire organization still lives by the weighty management philosophies espoused by its founder, Norberto Odebrecht.



He has written five books on the subject, enough to make him a veritable business guru in Brazil. Calling his concepts "entrepreneurial technology," he preaches decentralization and planned delegation of decision-making authority to workers who are entrusted to be partners and invited to participate in corporate profits.

At 72, he still chairs the holding company's board of directors, while his 48-year-old son, Emílio, serves as president. The first Odebrechts came to Brazil from Germany in the mid-1800s. In 1919, Norberto's father started a concrete contracting business that was later forced into bankruptcy during World War II, a victim of inflation and materials shortages.



Inheriting no assets other than his father's employees, a young Norberto made a pact with them to start a new company of partner-entrepreneurs. Together, they founded CNO in 1945 and slowly began mapping a strategy for growth within Brazil. From those humble beginnings, an international action plan for expansion has evolved, picking up steam in the last 15 years.

"We realized a long time ago that we

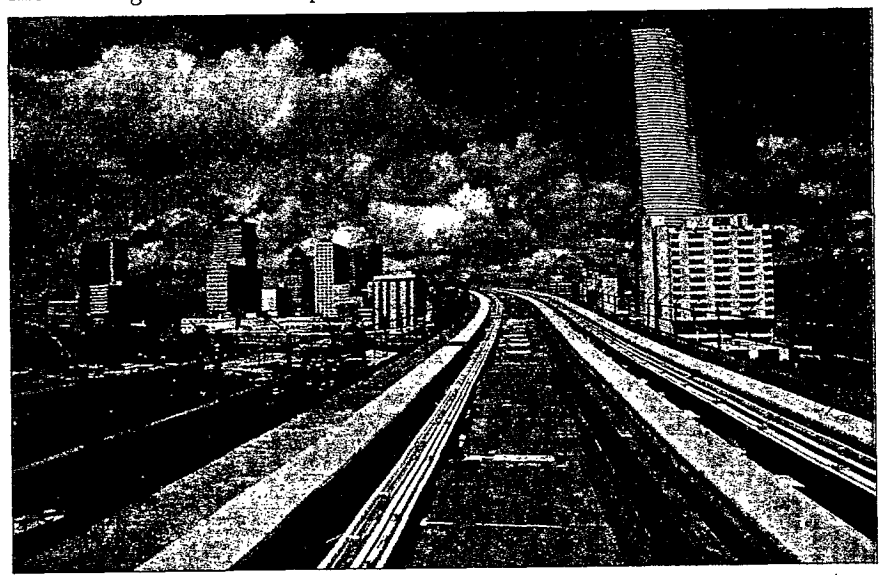
R0013620

must learn how to operate worldwide, if only to know how to fend off our international competition in Brazil," says Sergio Foguel, vice president of corporate planning and development. "By the 1990s, we wanted to have half our work abroad and by the end of the decade, we also want to have half our net worth (currently $1.1 billion) outside of construction." So far, the firm is on schedule to meet its goals, he notes.

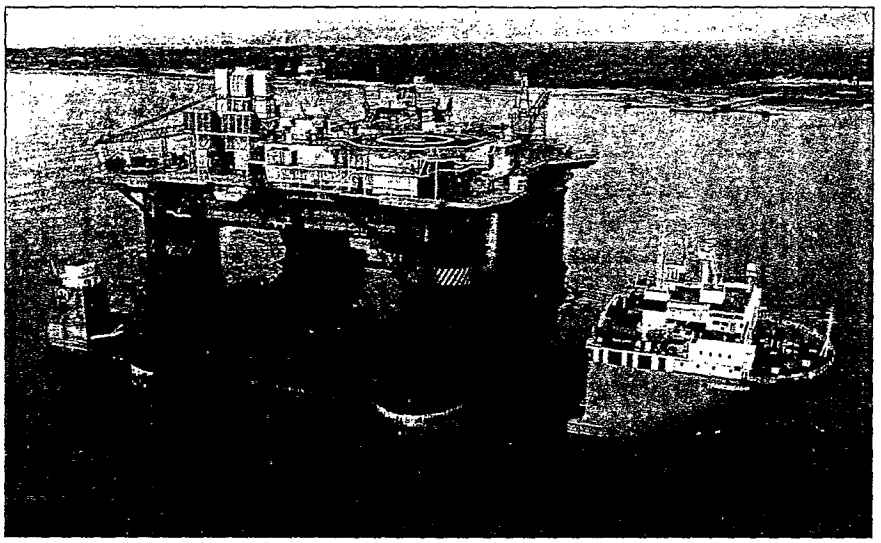
Diversity. Today, Odebrecht's capabilities are widely varied. Although highways, subways and dams have accounted for some of its biggest contracts, the company also has been very active in general building, petrochemical and other industrial work, electronics and telecommunications. Non-construction investments include chemicals manufacturing, offshore oil drilling and pulp and paper production.



Along the way, Odebrecht has made benchmark acquisitions to propel it from one goal to the next. By far the biggest was the 1980 purchase of Companhia Brasileira de Projetos e Obras (CBPO) for $100 million. Founded in 1931, the São Paulo-based heavy contractor immediately gave Odebrecht access and clout in the markets of southern Brazil. This paid off immediately with work on the world's largest hydroelectric project at Itaipú. One of CBPO's biggest domestic projects is the Red Line, a $225-million expressway currently under construction in Rio de Janeiro.

In 1988, CBPO acquired Portugal's Bento Pedroso Construções S.A., a heavy contractor now working on a new Lisbon subway project. Odebrecht's other most significant acquisition was industrial contractor Técnica Nacional de Engenharia S.A. (Tenenge), which joined the group in 1986. The firm is joint-venturing with a Singapore contractor on a $270-million deepwater offshore oil rig. Construction passed the midway point in May when the rig was transported from Singapore to Brazil for its final phase.

To establish a presence in Europe, Odebrecht two years ago teamed Tenenge with British petrochemical contractor SLP Engineering Ltd., which had been acquired earlier by Odebrecht.



Aiming for North America in the late 1980s, Odebrecht set up Odebrecht Contractors of Florida Inc. in Miami. It has a $25-million contract to extend the city's people mover and a $32-million contract for an interchange.

The Metro-Dade Transit Agency says the people mover project is ahead of schedule and under budget. Ronald Steiner, the Florida Dept. of Transportation's district construction engineer in Miami, says the interchange is also on schedule. He adds that the agency has had an excellent relationship with Odebrecht and says it was "extremely cooperative" a year ago

Miami Metromover was Odebrecht's first major U.S. job. It is under budget and ahead of schedule.

R0013621

Offshore oil rig arrived in Brazil from Singapore last May. Tenenge will finish building it in 1994.

when he asked the firm to help clear state roads after Hurricane Andrew struck.

But in California, a cloud is hanging over Odebrecht's subsidiary, CBPO of America Inc. in Sherman Oaks. In July, it was apparent low bidder for a $168-million earthfill dam project being let by the Corps of Engineers (ENR 7/19 p. 16). As CBPO's bid was $29 million under the next bid, the Corps is deciding whether to accept CBPO's rationale for the low-ball bid. Last month, the second-low bidder alerted the Corps to Odebrecht's alleged involvement in Brazil's recent political scandals.

But the firm has been, "very responsive to the charges and it looks like they're going to be okay on this bid," concedes David Coon, a spokesman for the Corps' Los Angeles district office. "We feel fairly positive about our relationship with [CBPO]."

Damage control. The political situation at home has been a nagging problem for Odebrecht since last summer. Indeed, there still are repercussions all over Brazil from last fall's spectacular collapse of President Fernando Collor de Mello's short-lived "reform government."

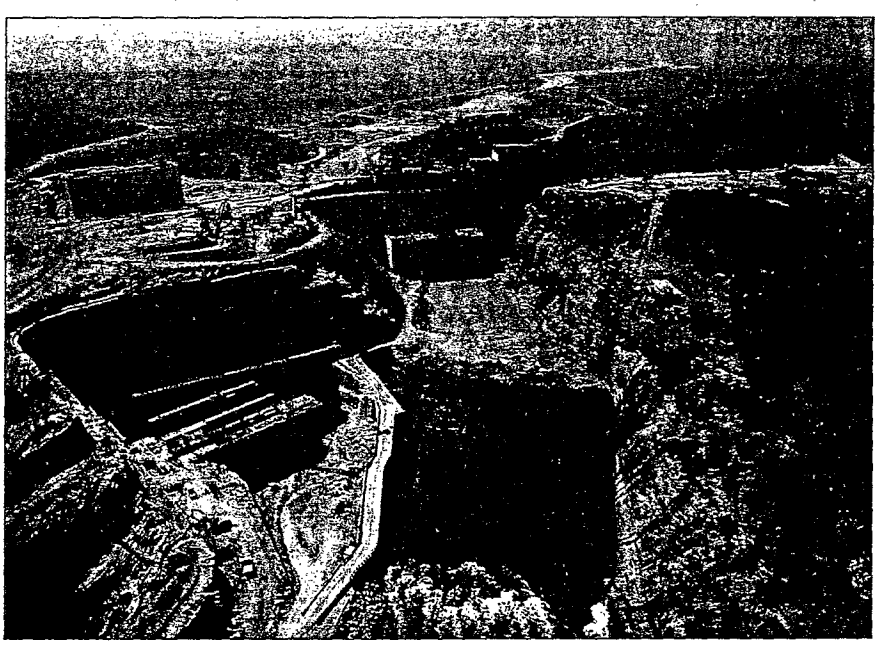
Now renowned as perhaps the most corrupt administration in Brazil's tattered political history, the Collor presidency featured a consulting firm established by a presidential aide for the sole purpose of collecting bribes from construction companies. The firm collected about $55 million.

Such embarrassing revelations cast aspersions on virtually every major construction company in Brazil. Odebrecht initially declined comment on the matter and got hammered in the national press. It responded by beefing up its public relations department and hiring one of Brazil's foremost business journalists to run it.

"In spite of all the noise being made by the press, we have never been indicted nor have any allegations against us ever been supported by proof," says Emílio Odebrecht.

Reform. Although Odebrecht's record is clean, few truly believe that it was able to remain totally unsullied while operating in such a grossly corrupt environment. For a time during Collor's regime, it was a commonly held belief that the only way to get public work was to buy it.

"Of course we paid," confides one Odebrecht executive. "Here, either you pay or you get out of the market. And sometimes, you have to pay twice—once to get the contract and then again to get paid."



To put an end to such perversion and ensure it never returns to public contracting in Brazil, Odebrecht and other major firms lobbied the Brazilian Congress hard earlier this year to pass new federal legislation requiring government contracts to be awarded to the lowest bonded bidder.

"That is the most significant step we can take to end corruption," says João Baptista M. de Paiva Chaves, director of Odebrecht's corporate relations.

In June, the lobbying effort paid off with federal enactment of a new law mandating a low-bidder contracting system. However, citing concern for smaller firms, President Itamar Franco used his line-item veto to kill the measure's performance bond requirement. That element of the bill was "the key," laments Paiva.

Efforts are now under way to renegotiate the law and restore the bonding provision. Beyond that, Odebrecht also has put political campaign finance reform high on its lobbying agenda, hoping to force changes before Brazil's pivotal elections in October 1994. ■

ENR WORLD PROJECTS NEWS

Hong Kong contracts will total $10.5 billion

Chek Lap Kok Airport and new highway and railroad require massive reclamation projects.

During the next 48 months a French-Japanese consortium will reclaim 50 acres of harbor fronting Hong Kong Island to expand the colony's Wanchai district and provide 15 acres for the terminal of a rail line to the new airport now under construction.

The Dragages/Penta/BSG consortium, comprises Dragages et Travaux Publics and Bachy Soletanche Group, France, with Japan's Penta-Ocean Construction Co. The group has to dredge 1.3 million cu yd of marine sediment and place 3.9 million cu yd of sand.

The $222-million Wanchai reclamation is the 25th contract awarded by the Hong Kong government in the Airport Core Program (ACP) to build an airport on Chek Lap Kok Island. Publicly funded contracts now total $3.6 billion, about 68% of the government commitment to ACP.

Another significant ACP contract signed this month is for an immersed tube vehicle tunnel between Hong Kong Island and Kowloon. But that contract differs from other airport-related projects because Western Harbour Tunnel Co. (WHTC) signed the first build-operate-transfer agreement under the airport-related program. WHTC awarded a $740-million, 48-month construction contract to Nishimatsu Kumagai, a Japanese joint venture.

Meanwhile, the Provisional Airport Authority (PAA) has separately awarded four contracts worth $1.3 billion. This brings the total of airport-related construction to $5.7 billion and there is another $4.8 billion yet to be awarded.

Chek Lap Kok Airport, the reason for all the construction activity, is currently at the center of a dredging and earthmoving operation to create a 3,100-acre platform.

PAA awarded a $1.2-billion contract to a six-company consortium comprising a marine group and an earthmoving group. The marine group, led by Jan de Nul N.V., Belgium, completed 21% of its platform last month. The civil group, including Morrison Knudsen Corp., Boise, leveled 126 acres of the 766-acre onshore platform. ▣

First tower up on Tsing Ma Bridge

Linked slipformers will finish casting the first twin-legged 659.5-ft-high tower of Hong Kong's Tsing Ma suspension bridge later this month. At the end of last month, another set of equipment started casting legs of the second tower at a rate of 10 ft a day.

The double deck bridge is a major component of a new highway and railroad extending from Chek Lap Kok Airport to the mainland. Designed by the Hong Kong office of Mott MacDonald Group, the 7,119-ft-long bridge will include a 4,518-ft main span.

A joint venture of Mitsui & Co. Ltd., Tokyo, and Costain Civil Engineering Ltd, London, is building the towers. The companies are members of Anglo Japanese Construction, the consortium constructing the $936-million bridge (ENR 8/17/92 p. 17).

The towers' oval-section legs, linked at four levels by beams, are a constant 19.7 ft wide and taper in the other direction from 59 ft to 33 ft. Slipformers will place 80% of the towers' concrete leaving the top 36 ft to be cast conventionally. Each twin tower contains over 30,000 cu yd of concrete, incorporating blast furnace slag, micro silica, retarding admixtures and ice.

To cast the towers' deep cross beams, the contractor combines steel trusses with post-tensioned concrete. Crews install steel trusses, 23 to 39.4 ft deep and up to 118 ft long after the slipformers pass. The trusses are prefabricated with bottom forms, rebar and post-tensioning ducts. When they are in place, the contractor erects side forms and encases the trusses in concrete before prestressing the beams. ▣

Oval tower legs are slipformed at 10 ft a day.

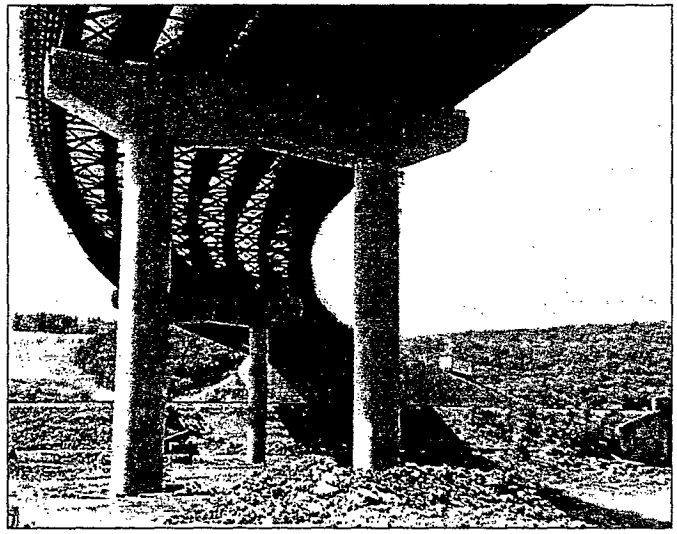
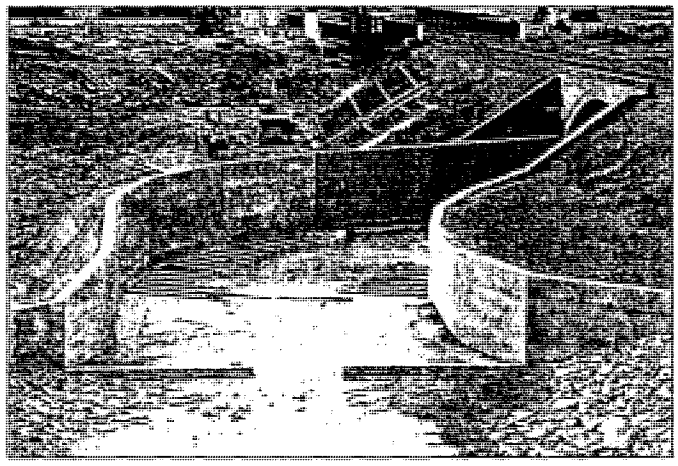
INFRASTRUCTURE



State builds road to last 50 years

New York State builds highway with 48-in. roadbed based on European design



By the year 2045, engineers will know whether New York State's investment in a 50-year design life for a 2.8-mile segment of highway paid off. Based on the so-called European design, the roadway is 48 in. deep instead of the conventional 21 in. and incorporates an open-graded subbase under 11 in. of unreinforced concrete paving. The additional cost is modest, compared to the overall cost of the $56-million project.

The state Dept. of Transportation's chief engineer, Michael Cuddy, was on last year's field trip sponsored by the Federal Highway Administration to find out why roads lasted so much longer in western Europe. Cuddy was impressed enough to try the European method in the Corning Bypass, designed by Bergmann Associates, Rochester, N.Y.

New York is one of the first states to try long-life road construction and is currently building a segment with a bituminous concrete surface in Saranac Lake. And Cuddy says all state road reconstruction projects over one mile long will now be built for a 50-year life.

Corning Bypass includes 11 major structures in the 2.8-mile-long highway.

New flume redirects creek flowing through old tunnel under railroad.

Departing from normal construction, the bypass roadway beneath the concrete paving is 4 in. of open subgrade to drain water, 12 in. of stone subgrade and 21 in. of select subgrade comprising excavated materials, says Brian Dougherty, Bergmann's project designer.

The cost is higher than a conventional 21-in. roadway since the contractor has to excavate deeper and lay much thicker subbases. Dougherty says the 48-in.-deep roadway added $2.5 million to the cost of the project.

Ray Gemme, associate soils engineer at NYSDOT, says the superior drainage under the pavement will help to eliminate joint faulting. The agency specified 20-ft-long pavement slabs and called for some 15-ft test slabs for wear comparison.

And following the European pattern, the agency specified shoulder slabs to be 8 ft wide and the adjacent lanes to be 14 ft wide. However, the striping demarcates a 10-ft shoulder, reducing the wear on longitudinal shoulder joints

For the elevated sections of the route, Bergmann followed NYSDOT specifications to space bridge girders to suit the span of an 8.5-in.-deep reinforced concrete deck. The agency subsequently increased the specified depth to 9.5 in. but the change doesn't affect the Corning contract.

Split package. NYSDOT split the bypass construction into two contracts so that a complicated interchange and realignment of another state route could get under way, leaving a clear run at the major length of roadway. Cold Springs Construction Co., Akron, N.Y., started the first part in June 1992 under a $26-million contract. This month it laid the first section of its 850 ft of highway pavement. Lane Construction Corp., Meriden, Conn., is building the rest of the bypass under a $30-million contract.

Between the two jobs, the contractors will build 11 structures, two pedestrian tunnels and several flood control facilities. The bypass skirts the edges of two floodplains so segments of it have to be built on embankments varying between 35 ft and 60 ft high. ▣

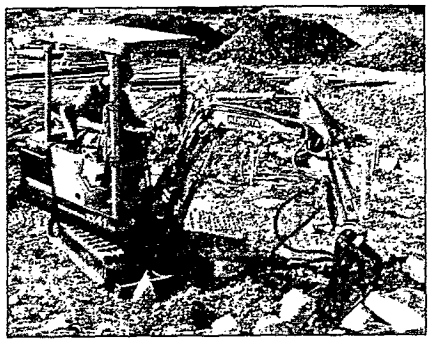
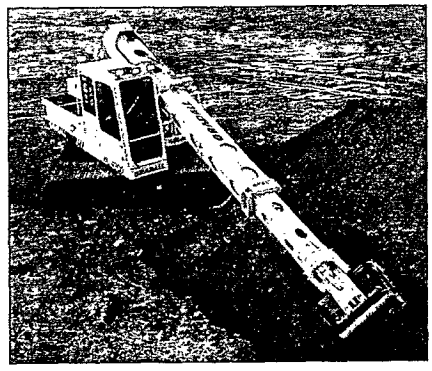
Excavator line expansion
Company has added two new hydraulic excavators to its E-Series line. The 190E is a 16,300-lb, 55-hp unit. The 67,450-lb, 220-hp 892E-LC is a heavy-duty production excavator. Both feature an operator-oriented cab and quadtronics, a microprocessor-based engine and hydraulic control system providing ease of control to make the excavators strong performers in close-quarter foundation work, lifting and placing pipe and trenching. DEERE & CO. 169



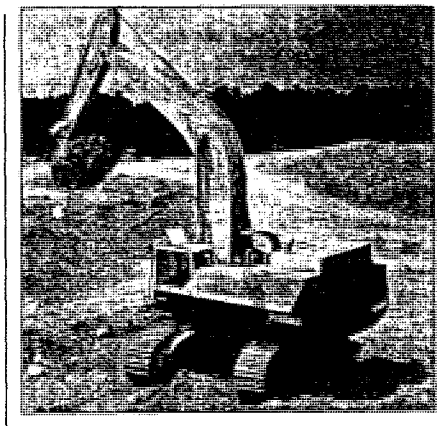
Mass excavator attachment
These excavators have a bucket range of 3.75 to 5.5 cu yd and an engine output of 300 hp/2,000 rpm for high-production jobs. Features include the independent travel mode that separates the travel and attachment circuits to ensure steady travel speed. KOBELCO AMERICA INC. 170

Excavator series leader
The newly designed Cat 375 excavator enters the 75-metric-ton-class with increased performance capabilities, new electronic controls and versatility through a wide range of options. Digging depths range from 24 ft 7 in. to 37 ft 7 in. CATERPILLAR INC. 171



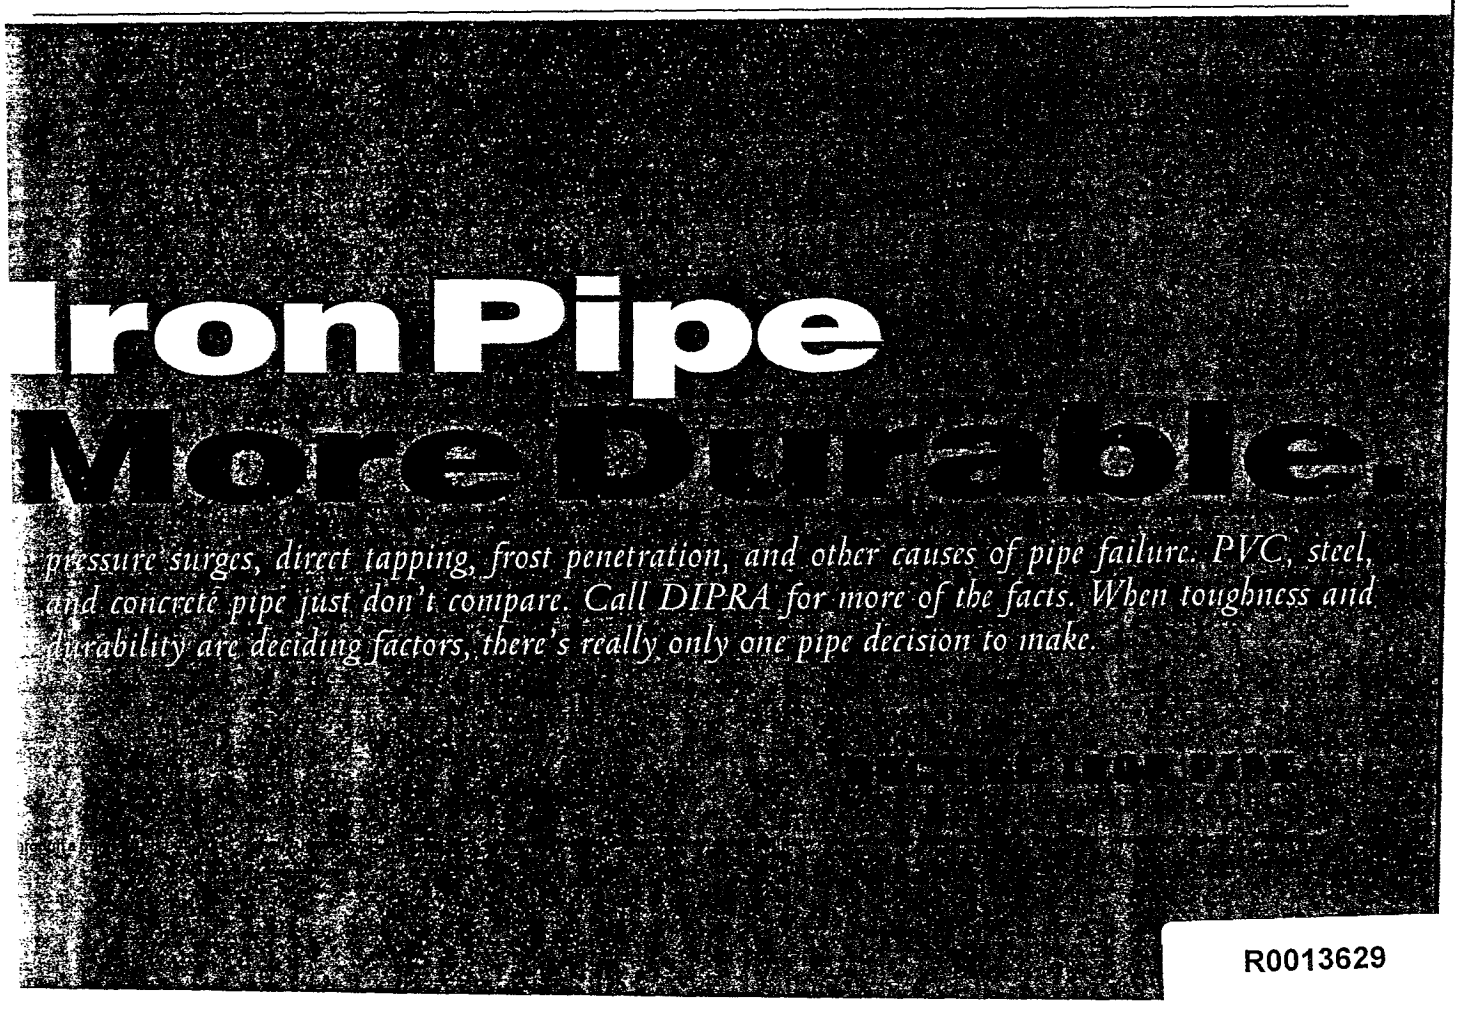
Hydraulic breakers
Three different breakers in the 400 to 1,000 ft-lb size classes have been designed for use in road building, demolition, quarrying, metallurgy and utility works. The breakers can be directly mounted to the dipper or picked up by the company's backhoe bucket quick coupler. They are engineered with constant blow energy to ensure maximum breaking power. JCB INC. 172

Ductile
IsTougherAnd
For nearly 40 years, we've proven the facts about Ductile Iron pipe. When you want a "tough" pipe with the longest possible trouble-free life, Ductile Iron gives you the decided advantage. Ductile Iron holds up under the worst conditions. Under expansive soil,
R0013628



Breakers
Equipped with a range of special performance features, the KXB400, 500 and 600 hydraulic breakers have been designed for a variety of construction applications. The KXB400 has an impact energy classification of 200 ft lb and operates at 1,100 blows per minute.The KXB500 is included in the 500-ft-lb impact energy class. The KXB600 is included in the 750-ft-lb impact energy class and offers a powerful breaking force with a frequency of 875 blows per minute. KUBOTA TRACTOR CORP. 173

On-grade processor
This excavator attachment is for use in a wide range of on-grade applications such as road and bridge reconstruction projects in which on-grade slab removal and processing is needed. It features a lower jaw design that allows the attachment to slip under slabs or decks, raise them and easily guide material to the throat of the attachment for processing. LABOUNTY MANUFACTURING 174



XL 4000 series excavator
A line of hydraulic excavators, known as the XL 4000 series, increases productivity with faster cycle times and higher digging forces, says the manufacturer. Reach and range of the models extend to a full 30 ft, 6 in. at grade, or to over 45 ft with a telestick attachment. The boom tilts up to 220° with a 360° option. All boom movements are easily controlled with joysticks. THE GRADALL CO. 175

Hydraulic excavator improvements
The PC650-5 hydraulic excavator features improved hydraulics for better work capabilities such as three operating modes for heavy, standard and light duty; a soft-dig system that allows the operator to select either a smooth or power mode; and 404 hp at 1,800 rpm for high-production digging and loading operations such as cross-country pipeline jobs. KOMATSU DRESSER CO. 176

Road ramp rebuild required

The New York State Dept. of Transportation had the power to require a developer to relocate a highway ramp, even after the local municipality removed that requirement from its site plan approval, according to a state appeals court.

In 1985, Westage Business Center Associates sought permission to build a commercial development at the intersection of Interstate 84 and state Route 9 in the Town of Fishkill, N.Y. An environmental impact statement was prepared as required by the New York State Environmental Quality Review Act. Among the concerns listed was the increased traffic at the intersection of I-84 and Rt. 9. The Fishkill Planning Board issued its final site plan approval, conditioned on Westage relocating the existing westbound access ramp from Rt. 9 to I-84, if required by the New York State Dept. of Transportation.

In September 1987, after Westage began construction, DOT issued a highway work permit. The permit is required by state law before anyone can construct or improve an entrance to or connection with any state highway within the right-of-way. It is required "notwithstanding any consent or franchise granted by any town or county superintendent or other municipal authority." The permit required Westage to realign the ramp.

Westage sued the state, challenging this requirement, but the suit was dismissed because it was filed too late. Nevertheless, the Fishkill Planning Board deleted the ramp-moving requirement from its final site plan approval.

As a result, Westage did not build the access ramp. DOT then sued to enforce the terms of its permit. Westage argued that it did not have to relocate the ramp because the requirement was deleted from Fishkill's site plan approval.

The New York trial court ruled for Westage, but the appellate division of the state Supreme Court reversed. It held that DOT could condition its permit on Westage relocating the ramp.

Under state law, DOT had the power to require an owner to perform work needed to "facilitate safe and unimpeded traffic flow," noted the court. "The DOT's authority to impose such conditions in [Westage's] highway work permit was in no way affected by the planning board's addendum removing such conditions." *White v. Westage Development Group Inc., 595 N.Y.S.2d 507 (N.Y. App. Div. 1993).*

Supplier sues over missing bond

A public benefit corporation and the developer of a cogeneration plant were liable to an unpaid supplier because they failed to obtain a payment bond as required by New York State law, a state trial court ruled.

In the late 1980's, Indeck Energy Services of Silver Springs Inc. was developing an energy cogeneration plant in Silver Springs, N.Y. In order to obtain financing at low tax-exempt rates, Indeck signed an agreement with the Wyoming County Industrial Development Agency, a public benefit corporation. Under the agreement, Indeck would transfer title to WCIDA at the beginning of construction and WCIDA would transfer it back at the end of the project. This arrangement allowed WCIDA to sell industrial development revenue bonds to finance the project.

Indeck hired National Energy Production Co. as the general contractor and it subcontracted steel work to Fels Co. Inc. Fels bought $137,000 worth of steel from Davidson Pipe Supply Co. Inc. When Davidson was not paid, it sued WCIDA and Indeck.

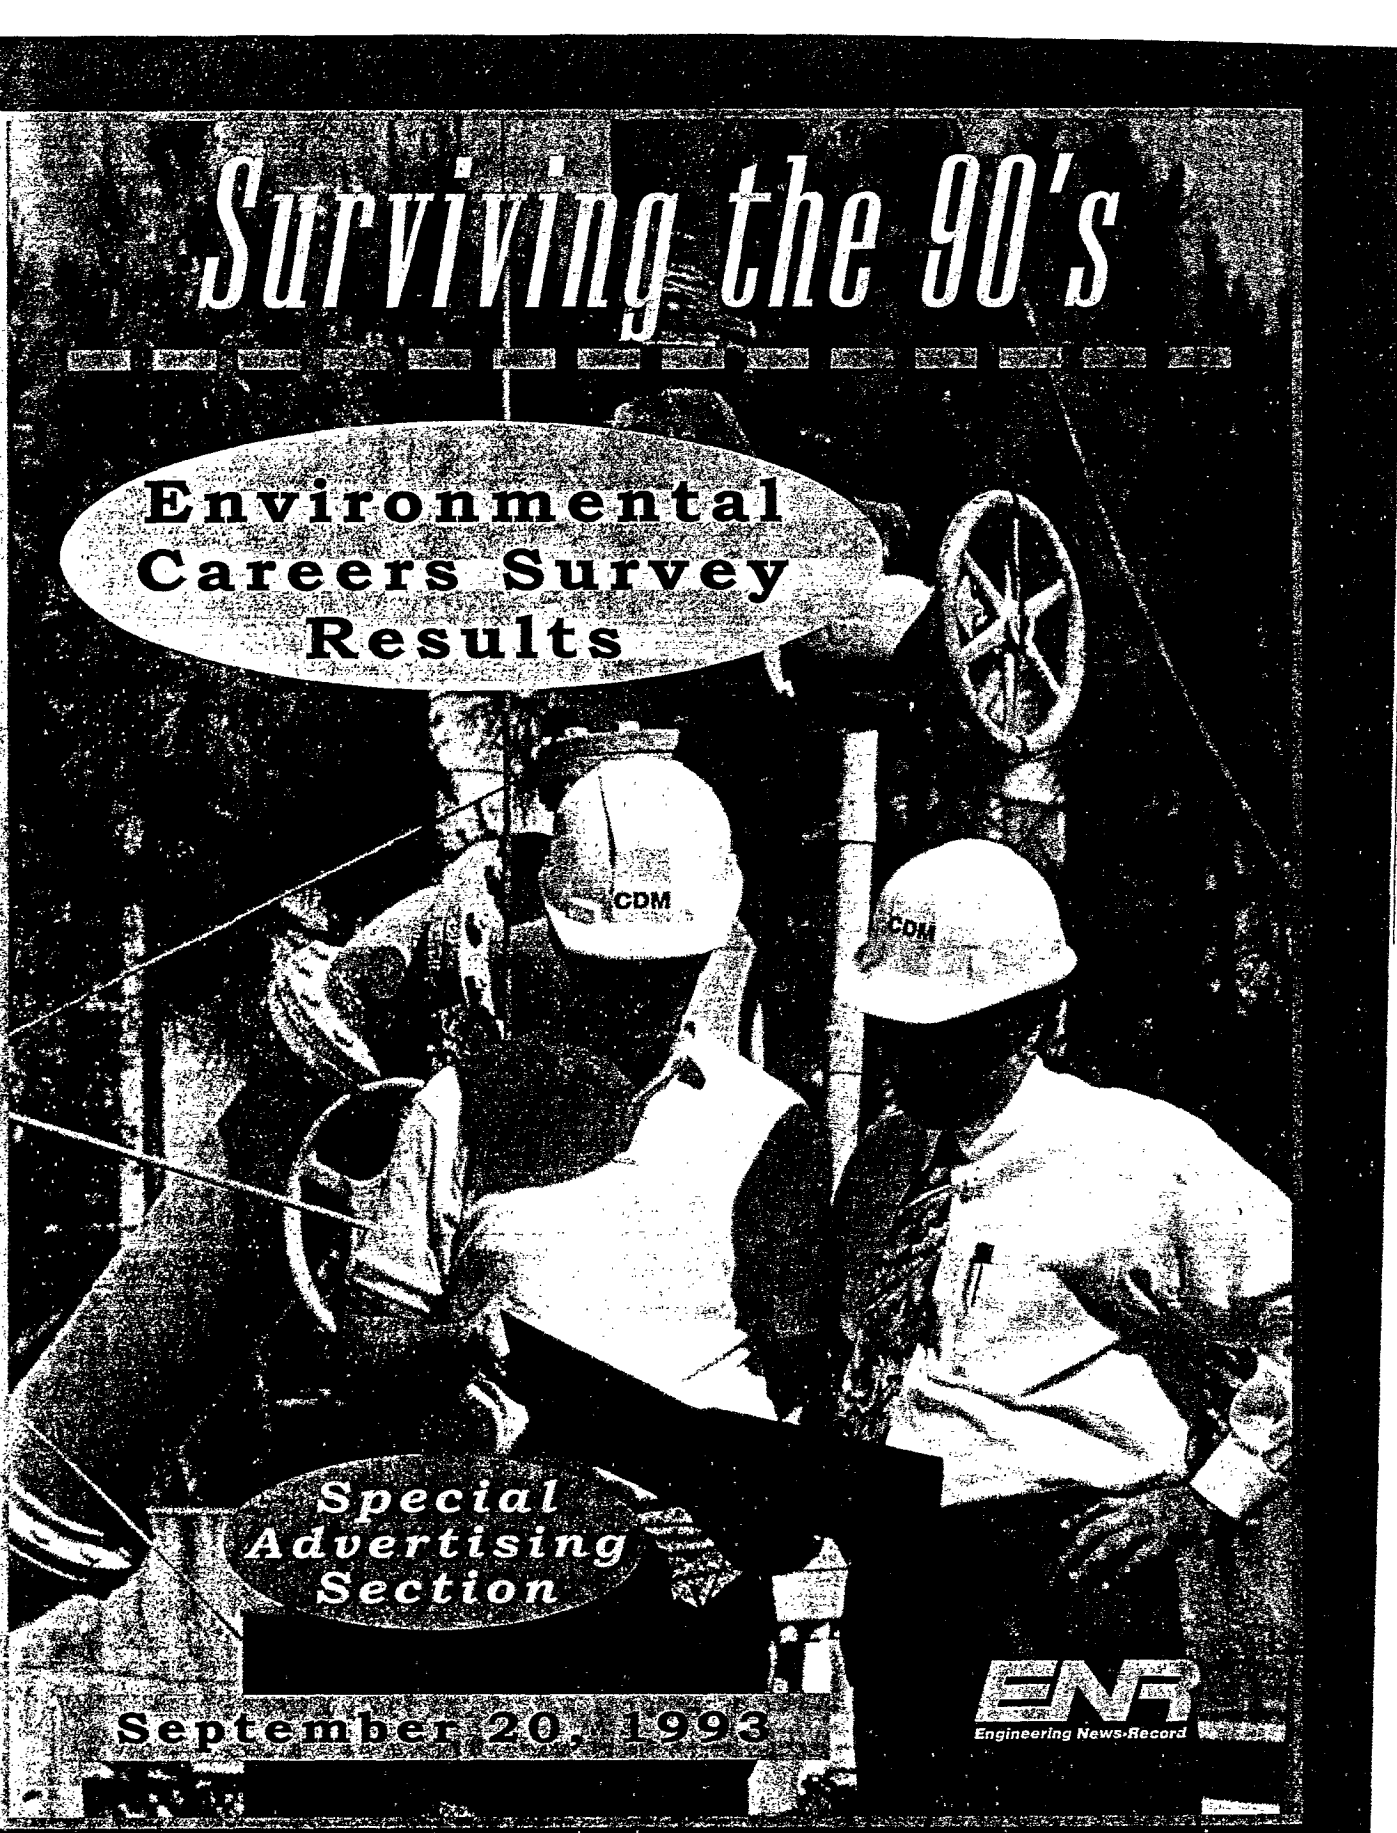
Under New York State's Finance Law, a public benefit corporation involved in construction of a public improvement must require a bond guaranteeing payment to all persons furnishing labor or materials on the job. The trial court, the New York State Supreme Court, ruled for Davidson because WCIDA and Indeck were responsible for obtaining a payment bond. Although the statute does not state what remedies are available if a required bond is not obtained, the court held that Davidson had a direct claim against WCIDA and Indeck for their breach of the law. *Davidson Pipe Supply Co. v. Wyoming County Industrial Development Agency, 595 N.Y.S.2d 898 (N.Y. Sup. Ct. 1993).*

Owner can't stiff sub over alleged mob ties

A concrete contractor's alleged membership in a Mafia "club" was not suitable grounds for an owner's refusal to pay the contractor for services on a project, a New York appellate court has ruled.

In 1983, X.L.O. Concrete Corp. contracted to do the concrete work on a Manhattan high-rise apartment building called Rivergate. The price was $16.5 million. X.L.O. performed the work under its contract. In May 1991, it sued Rivergate Corp., seeking payment of $844,135 that it claimed was due on its contract.

Rivergate argued that the contract was unenforceable, asserting that X.L.O. was a member of a Mafia-run "club" of concrete contractors that dominated the concrete trade in New York City. According to Rivergate, its contract with X.L.O. violated state and federal antitrust laws.



The New York trial court dismissed X.L.O.'s lawsuit. However, the Appellate Division of the state Supreme Court reinstated it, holding that X.L.O. had a right to sue for payment. The court noted that the antitrust laws invalidate contracts and combinations in restraint of trade, but do not void "every contract for services or goods entered into by a person or entity which is a member of such illegal arrangement or combination."

"We conclude that X.L.O.'s membership in the club was collateral to the contract it negotiated and entered into with Rivergate and that the contract and its performance can be proved without reference to the illegal arrangement known as the club; i.e. that the contract constitutes an intelligible economic transaction in itself," said the appeals court. *X.L.O. Concrete Corp. v. Rivergate Corp., 597 N.Y.S.2d 302 (N.Y. App. Div. 1993).*

Innovative by Nature.

At Camp Dresser & McKee—one of the world's leading environmental consulting engineering firms—we have solved the most challenging environmental problems for industry and government for nearly half a century. CDM integrates proven experience with the creativity of today's sharpest minds to meet the country's environmental needs and to preserve the world's natural resources.

From conducting individual site assessments, to managing overall facility construction programs; from helping drought-ridden California get the most out of its water supply, to providing engineering studies for the Boston Harbor cleanup; CDM can manage your environmental challenge.

CDM's environmental work in drinking water, wastewater, solid waste, hazardous waste, air quality, and stormwater is innovative by—*and for*—nature.

How Environmental Employers and Employees Are Adapting

Employees are seeking more autonomy, independence, and a greater say in how they do their work. The days of rapid growth, a job for life and limitless career opportunities are today a distant memory for employees in many environmental firms. Although some firms are still growing, many have had to resort to downsizing, relocation of staff, and streamlining of operations to maintain their profit levels. The results of the 3rd Annual Environmental Career and Employer Preference Survey provide insight into how employees are surviving this difficult period and how their employers are helping them adapt by empowering them.

About the Survey

The Environmental Career and Employer Preference Survey was conducted to gain a better understanding of why employees entered the environmental field, what they like and dislike about working in the field, and how satisfied they are with various aspects of their work life. Respondents were also asked to rank their most preferred employers in the field.

The survey appeared in this year's May 10 issue of Engineering News-Record. Additional copies of the questionnaire were mailed separately to 4,000 subscribers in the environmental field. The results were tabulated by The Discovery Group, a Sharon, Massachusetts-based firm specializing in conducting employee and customer opinion surveys.

About the Respondents

A total of 1,076 completed surveys were received, up from 800 in last year's study. The majority of the respondents work in the private sector (72%) and over half have been with their present employer for at least 3 years. Approximately 50% work for companies whose primary business is environmental engineering while another are 30% are with firms involved in environmental engineering to some extent. Eighty-five percent of the respondents are males. The median age is 39 and the median annual salary is $50,000 to $60,000. The largest segment of the group is employed as either Project Engineers, Directors or Managers (44%). Administrative Managers (13%), Environmental Engineers (14%) and Civil Engineers (13%) comprise the balance of the sample.

The Results

For the third straight year, CH2MHill, Denver, CO, was ranked as the most preferred employer in the environmental field. Twenty-three percent of the respondents ranked CH2MHill as either their first, second or third choice. (See Table 1). It should be noted that CH2MHill employees comprise only 2% of the eligible votes.

Once again Camp, Dresser & McKee Inc., Cambridge, MA, drew runner-up honors with 14% of the vote, followed by a newcomer to the top three, the U.S. Environmental Protection Agency, with 5%.

CH2MHill has adopted a number of on-going programs to bolster employee morale and commitment. As a result, turnover among professionals has only been 5% over the past several years. The company is highly committed to their employee opinion survey process. They conducted a survey last year and do so periodically. Darell Nepil, Corporate Staffing Manager, says that employees have embraced their quality improvement program. "Even the skeptical ones have become believers. Most have received training and are now beginning to work on quality improvement projects."

Two U.S. Environmental Protection Agency wetland scientists working together at Sapelo Island, GA. Photo: S.C. Delaney/U.S. EPA.

Bob Card, Director of Business Development and Planning at CH2MHill, attributes the favorable ratings received by the firm to several factors. "Our matrix organization enables us to communicate effectively throughout the organization. The growth of employees is limited only by their skills and flexibility, not by the organization. I can also count on only one hand the number of our 5,700 employees where people won't talk to each other."

Assigning the right people to the right assignment has helped buoy employee attitudes at Camp, Dresser & McKee. According to Charlene Allen, Corporate Human Resources Manager, "We restructured a few years ago to move away from traditional home room type project teams. This has enabled us to provide more career growth for our employees. All employees are assigned to Resource Pools which enables us to match their skills, experiences and track record to the appropriate new project. As a result, although employees must travel more between our different offices, they are able to develop their skills more rapidly."

A number of factors may have contributed to the positive ratings of the U.S. Environmental Protection Agency.

Cover photo: Camp Dresser & McKee is implementing a mentoring program, designed to pair senior and junior engineers.

R0013633

Environmental Careers Survey Results

"Our employees have not been impacted by the concern for job security found in many public sector firms," says Maureen Delaney, Director of Human Resources for the U.S. E.P.A.'s Office of Air and Radiation, Washington, D.C.. "Many of our employees choose to work for the E.P.A. over private sector firms because they are interested in public service and feel they can have more of a direct impact on the environment."

What Do Employees Want Most From Their Job?

For many engineering professionals, the environmental field represented an oasis in the drying engineering employment market. Although employees entered the field for a variety of reasons, the majority were attracted to the abundant opportunities for personal and career growth.

As shown in Tables 2 and 3, personal growth is the leading reason why employees entered the environmental field and is also what they like best about their current job. Thirty-two percent say they were seeking a feeling of personal pride and accomplishment from their work. Employees like the autonomy and independence their current jobs provide. They also like the actual type of work they are conducting as well as the level of responsibility their jobs require. In addition, they are happy with the high degree of variety and challenge their jobs provide.

In addition to the intangible of personal growth, employees seek tangible career advancement (See Table 2). Approximately 4 out of 10 survey respondents say they entered the field for career growth opportunities (22% sought more alternative career paths and 17% were attracted to the better chances for advancement).

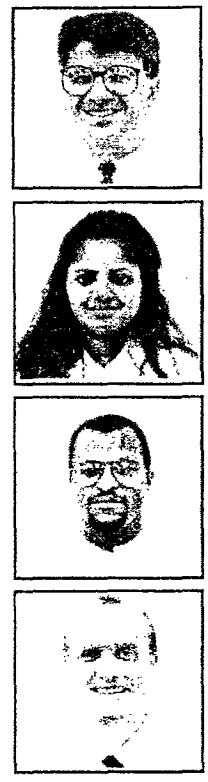
**Note - Only non-photocopied completed surveys were included in the analysis of the 1993 responses. A small number of firms had sent in a significant number of photocopied surveys. If the photocopies had come from a diverse number of firms, we could have comfortably attributed this to our pass-a-long readership. However, since this was not the case, and the photocopies dramatically affected the rankings, it was felt the fair and statistically reliable decision was to eliminate the photocopies for this specific question.*

Are Employees Getting What They Want?



In the face of restructuring, downsizing, and a shrinking job market, career advancement opportunities in the industry have declined. Not surprisingly, employee satisfaction with career opportunities has suffered. As shown in Table 4, only 27% are very satisfied with their advancement opportunities and only 23% are very satisfied with the alternative career paths offered by their company.

Although concerned about their advancement, the overwhelming majority of employees have no immediate plans to leave their job. Seventy-four percent plan to stay with their current employer. (See Table 5) However, lack of career

Talented Professionals Seek Same

advancement is the leading reason why employees might consider leaving. (See Table 6) Thirty-three percent say lack of career advancement might lead them to leave.

Job security is another major concern of employees today. Most firms, even those still growing, have had layoffs. As shown in Table 4, only 33% are very satisfied with their job security.

Instead of wondering about the next promotion, many employees are now wondering about what they can do to expand their job skills and maintain their job security. Jim Krug, Manager of Training and Development at Woodward-Clyde, Denver, CO, recommends a strategy many have been adopting to survive the 90's, "when you get up in the morning to go to work, you should view yourself as an independent con-

sultant. If you look at your job that way, it can help you deal with the uncertainties of the economy and the lack of job security."

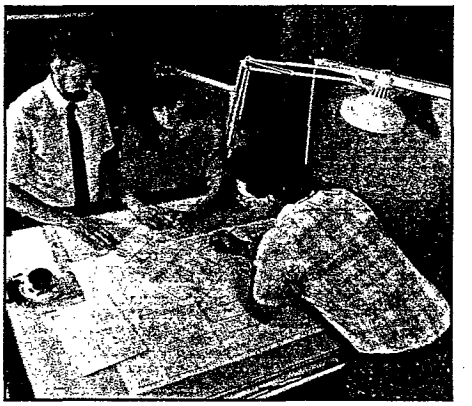
How Employers Are Responding

In today's challenging economic environment, employers have had to ask employees to work more independently, do more varied type of work and assume more decision-making authority. Fortunately, as the survey reveals, this is precisely why employees entered the field in the first place and what they are looking for from their jobs today.

The key has been for environmental firms to increase employee empowerment. A variety of strategies have been used to empower employees. They range from abandoning traditional hierarchical management structures to providing employees with more personal responsibility for their own careers. "The environmental consulting type of business lends itself quite well to empowerment," says Audrey Hausmann, Regional Human Resources Manager at McLaren-Hart, Philadelphia, PA. "The way work groups are structured into project teams allows employees a good deal of independence and responsibility to develop solutions to meet clients' needs."

TABLE 4
LEVEL OF SATISFACTION WITH KEY JOB FACTORS (N = 1,076)

Changing the Corporate Structure



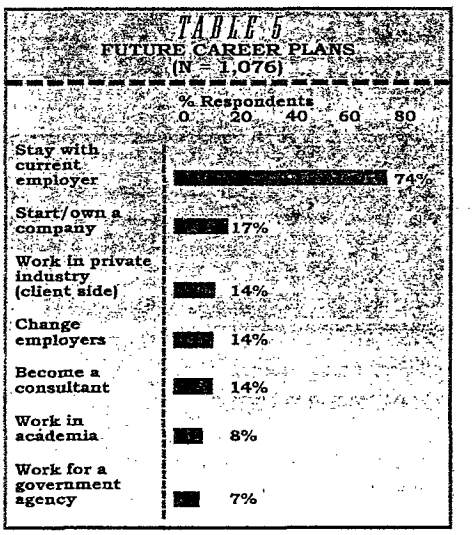
In an effort to empower employees and move decision-making authority lower in the organization, many environmental firms have restructured in the past few years. Their efforts have been complicated by the fact that many of the firms are very large, offer a wide diversity of services, and are spread throughout the country.

Not unlike many other environmental firms, CH2MHill continues to make changes to simplify its organizational structure. According to Darell Nepil, "The key to our structural changes has been to make certain we are best serving our customers."

Empowering employees to best serve their customers is the guiding principle for restructuring at Science Applications International Corporation (SAIC), San Diego, CA, as well. "We want our customers and employees to have easy access to each other," says Howard Pratt, Group Senior Vice President of Environmental Services. "For example, since many of our customers are in Washington, D.C., we have eight offices there."

Once they are appropriately staffed and given the proper tools, firms have been empowering their local offices. "We have tried to keep the organization relatively flat to facilitate decision-making, says Jim Krug at Woodward-Clyde. Our 45 local offices are fairly independent so they don't have to refer many questions to corporate headquarters."

Reducing layers of management has also helped empower employees at Dames & Moore, Los Angeles, CA. "We have tried to flatten the organization to give employees better access to significant decision makers," says Ann Toepker, Chief



Teaming approach at O'Brien & Gere Engineers facilitates input from multiple disciplines to best serve clients and employees. Photo courtesy: O'Brien & Gere Engineers, Inc.

Human Resources and Communications Officer.

"At ABB Environmental Portland, ME, we flattened our structure to three levels of management: team leaders, service center managers and senior managers," explains Bob Sansone, Vice President of Human Resources. "We also increased signature authority so that people don't have to chase four other people for signatures. The person signing is the person who has the responsibility."

"A rigid hierarchical approach doesn't work in our industry," says Nick Masucci, Senior Vice President of U.S. Environmental Services for Louis Berger, East Orange, NJ. "We want people to be creative and contribute to the solution. We try to break up projects into sub tasks so that instead of just collecting data, employees have a sense of accomplishment when they complete a task."

ENGINEERING-SCIENCE, INC.

Professional Opportunities

At Engineering-Science, people are our most valuable resource. Our professionals are part of one of the world's largest and most diversified environmental engineering firms providing consulting, design, construction, and O&M services. To continue our leadership in the environmental consulting and engineering market, we are seeking experienced professionals with imagination and initiative to join our team. There are many advancement opportunities available due to substantial growth in our business. We are involved in challenging projects in hazardous and toxic substance handling and disposal; wastewater collection, treatment and disposal; air quality control; water resources development; water treatment and distribution; and facilities design.

Engineering-Science provides complete environmental consulting engineering services.

We have outstanding professional growth opportunities in the following positions:

- **Air Quality Engineers/Scientists**
- **Aquatic Biologists**
- **Chemical Engineers**
- **Civil Engineers**
- **Environmental Engineers**
- **Environmental Planners/Scientists**
- **Geologists**
- **Geotechnical Engineers**
- **Hazardous Waste Engineers**
- **Health and Safety Specialists**
- **Hydrogeologists**
- **Landfill Design/Solid Waste Engineers**
- **Project and Program Managers**
- **Radioactive/Mixed Waste Engineers**

These opportunities may be available in one or more of the following locations:

Alameda, CA
Atlanta, GA
Austin, TX
Baton Rouge, LA
Boston, MA
Chicago, IL
Cincinnati, OH
Cleveland, OH
Dayton, OH
Denver, CO
Detroit, MI
Fairfax, VA

Redefining the Job of Supervisor

Some companies have realized that empowering employees requires managers with greater people skills. At ABB Environmental, "Employees helped us develop a competency based model of the job of manager," says Bob Sansone. "We then removed all of our managers from their positions and refilled the positions with the more people-oriented managers and reassigned others to senior technical positions. We also coached the new managers to continually ask employees how they can help them to do their jobs better."

Many firms have also made empowering employees an important part of the supervisor's responsibilities. In fact, some organizations evaluate supervisors based on how well they empower others.

Reducing Paperwork

A major concern of many employees is the huge amount of paperwork and bureaucracy with which they must contend. What firms have been trying to do is provide employees with the autonomy and independence they need to maintain their entrepreneurial spirit while still maintaining some degree of control. "A certain amount of bureaucracy is inevitable," says Audrey Hausmann of McLaren-Hart.

The many forms and signatures required by both their own companies and regulatory agencies often paralyze rather than empower employees. "After you've completed the paperwork, there is often no time left at the end of the day," says Crystal Cruise, Human Resource Supervisor at Canonie Environmental, Porter, IN.

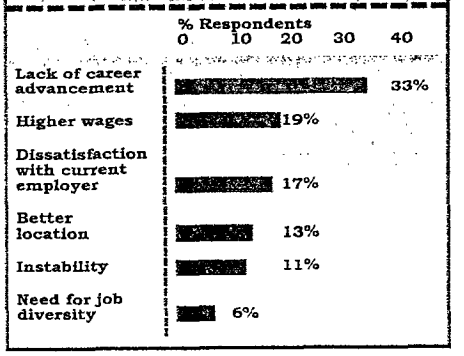
In an attempt to untie the hands of their employees, some environmental firms have automated while others have conducted extensive internal analyses of the paperwork trail.

"We've tried to reduce paperwork by conducting an internal systematic analysis of who receives what reports and memos and who really uses them," says Martin Reynolds, of the Marketing and Public Relations group at Stone and Webster, Boston, MA. Woodward-Clyde through their TQM program, called Leadership Through Client Satisfaction, is also looking at their internal procedures and asking if they really need all of their existing forms.

Several firms including TRC Environmental, Lowell, MA and McLaren-Hart are moving toward

NOT JUST ANOTHER

Corporate Climber



At Woodward-Clyde, theres no such thing as just another employee, which is why we're not just another engineering firm. We have worked hard for over 40 years to create a solid reputation for innovation and effectiveness, attracting some of the best minds and best projects in the business. As a global force in the engineering industry we know our reputation depends on ambitious people like you. Our engineers and scientists have a wide range of backgrounds, but once they get here, only one thing matters: quality of work. Our Professional Development Institute ensures that your skills are kept current, and our ownership options offer interest in a company with sustained growth. If you're considering a job in engineering or the sciences, consider Woodward-Clyde.
You'll find a career, not just another job, and opportunity instead of just another ladder to climb.

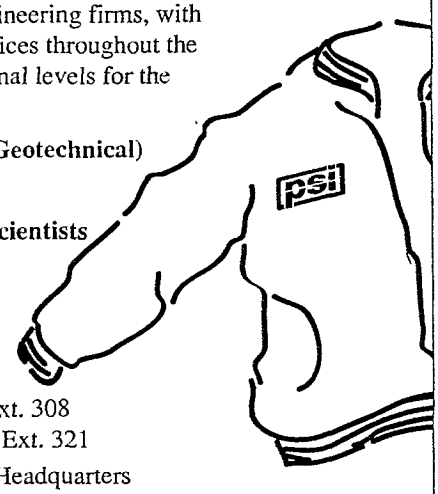
real time project management systems that allow employees to know the status of projects at any point in time. Others are computerizing commonly used internal documents. "We have aggressively reduced internal paperwork by computerizing our client report and cost reports," says Marge Adler, VP of Organization Development at Roy F. Weston.



Empowerment Through Quality Improvement

Many environmental firms have initiated quality improvement programs. The goal of these programs is to continuously improve the ability of the firm to meet the expectations of their customers. One major by-product of these efforts, however, is increased employee empowerment. Front line employees are major contributors to identifying problem areas, developing solutions and then implementing the improved processes.

Join the Team!

PSI, one of the nation's largest engineering firms, with 3,500 employees located in 200 offices throughout the U.S., is recruiting at all organizational levels for the following positions:

R0013639

As part of these quality initiatives, many firms have instituted customer satisfaction assessment programs. "We ask our clients directly how we are doing through individual interviews and surveys," reports Howard Pratt of SAIC. "That's been very helpful to us."

A similar client survey at ABB Environmental showed that their clients were concerned about their billing process. "With less work internally, we were able to cut our receivables by half and greatly reduce our billings over 60 days old," says Bob Sansone.

As part of their Continuous Performance Improvement program (CPI), Fluor Daniel, Irvine, CA, has instituted a policy called "The Alignment Process" which has empowered employees to better serve their clients. Mike Burnett, Director of Communications in their Greenville office, says, "All new projects must have an alignment process. It begins before the actual meeting and requires looking at the culture of our client and our own culture. We then jointly develop a common vision of a successful project and then assign responsibility for each key result area."

Are Employees Satisfied?

The survey indicates that for the most part, efforts to empower employees are working. Despite reduced career opportunities, the overwhelming majority (74%) of employees plan to stay with their current employer, up from 60% last year. Also, this year only 14% plan to switch employers which is down from 19% last year. (See Table 5)

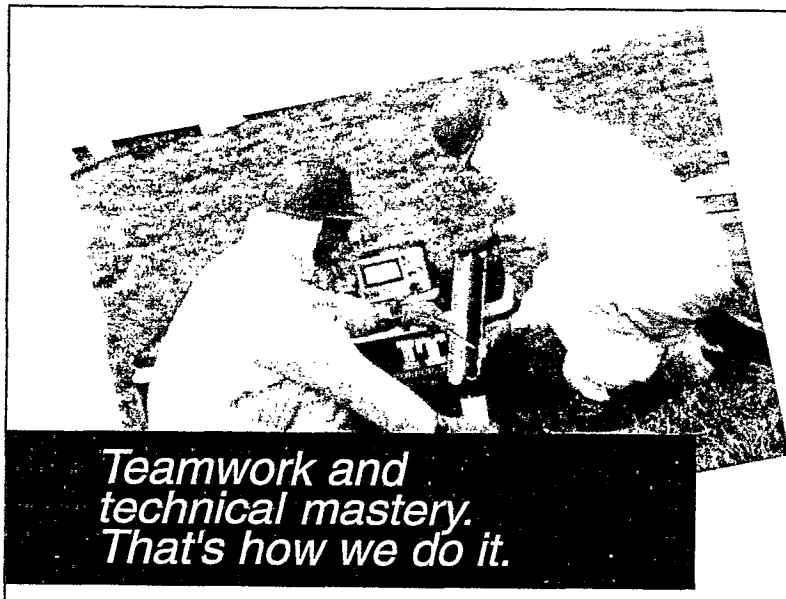

Table 4 shows that employees are generally very satisfied with their jobs' challenge, autonomy and independence. However, far fewer are very satisfied with the corporate culture, job security, and advancement opportunities.

Many workers are seeking even more autonomy and independence than their current employers are able to provide them. Seventeen percent desire the freedom of starting or owning their own company, 14% would like to become an independent consultant and 8% would like to work in an academic setting.

Continuing to provide opportunities for engineers to broaden their skills is one of the our major employee relations challenges facing environmental firms. In addition to empowerment strategies, a number of career management approaches have been used to help employees

TRC Environmental Corporation has instituted a project management training program which emphasizes quality, completion schedule, cost management and effective client communication. Photo courtesy: TRC Environmental.

Teamwork and technical mastery. That's how we do it.

International Technology Corporation (IT) is one of the fastest growing, most innovative companies in the environmental industry. And the environment we work in is second to none — professional, challenging, advancement-oriented.

The reason we're a success is clear: IT employs the most advanced techniques — and the finest talent — in the industry. Come share the pride. Openings exist for:

Hydrogeologists/Geologists (5+ years experience)
Construction Project Managers — Lump Sum
Sr. Project Managers — Remediation
Industrial Hygienists & Certified Industrial Hygienists
Site Safety Managers
Quality Assurance Managers
Civil, Chemical & Process Engineers
General Project Managers
Risk Assessment Professionals

As the industry's leading firm, we offer opportunities throughout the United States, plus competitive salaries and attractive flexible benefits. For consideration, please send resume indicating GEOGRAPHIC PREFERENCE and salary history to ***Professional Staffing, Dept. attain their career goals. Audrey Hausmann, however cautions that "Career management is the responsibility of both employee and manager. Employees must begin to develop short and long term career goals and actively plan actions to achieve these goals as early in their career as possible."

One approach used by a number of firms is the use of dual-career paths. "We have a two-tiered approach," says Nick Valkenburg, Vice President at Geraghty and Miller, Plainview, NY. "You don't have to get stuck doing one thing. You can move in and out of administrative and technical jobs so that you can pursue your own specific interests."

The Future

Human resource professionals are poised for a flurry of activity in the upcoming year, which may ease employee concern about job security and open up new advancement opportunities. This activity will require continuing to move employees into areas of the firm where they may be needed as well as additional hiring.

"The government and the public have begun to lose patience with studying the problems and want to move on with the clean-up," says Glenn Zimmerman, Regional Human Resource Manager at ABB Environmental. "Remedial design and engineering have started to grow already."

Others also foresee big growth in waste minimization, air quality management, municipal infrastructure, process changes in industrial facilities, reduction of emissions before they are produced, and environmental management and program design.

In addition to experienced personnel in these areas, many firms are also looking for "people-oriented" project managers. "Project managers are needed that can communicate how and why decisions are made," says Crystal Cruise of Canonie Environmental. "You don't find them walking the streets. A good project manager might interview with as many as 6-8 firms".

"People with strong project management skills are worth their weight in gold," agrees Bob Sansone. "We're looking for people with good people skills, technical knowledge, and financial awareness."

Why are "people-oriented" managers so critically important? The answer is empowerment. It takes a special type of manager to be able to continually empower others. Empowerment is vital for the growth of environmental firms and their employees.

Solutions that Work.

R0013641

At CH2M HILL, award-winning performances come naturally thanks to people like J.P. Martin.

From left: J.P. Martin, CH2M HILL; John Foster, President of ACEC; and Frank Koncewicz, USS.

When CH2M HILL Project Manager J.P. Martin recently accepted an ACEC National Honor Award for our work on an innovative pollution abatement project with U.S. Steel, everyone here was exceedingly proud. But not at all surprised.

That's because even though their award-winning solution to a client's water treatment problem created a new performance benchmark for imaginative, cost-effective design, it was also typical of the kind of outstanding work CH2M HILL employees like J.P. Martin provide hundreds of clients every day.

Named ENR's #1 Environmental Engineering Employer for the third year in a row, CH2M HILL has challenging opportunities for engineers experienced in transportation; hazardous and solid waste; water and wastewater; air quality; and environmental planning. To learn more about our employee-owned company or current professional openings, send your resume in confidence to: Manager of Recruiting, ENR;993, CH2M HILL, Box 221111, Denver, CO 80222-9998. An Equal Opportunity Employer M/F/D/V.

CH2M HILL

PLANS

Florida—Nix Mann Yiehman Architects Inc., Atlanta, has been selected architect by Walker Memorial Hospital for **addition and alterations to hospital** located on U.S. Highway 27 N. in Avon Park. Estimated cost, $15 million.

Georgia—Diedrich Architects & Associates Inc., Atlanta, is negotiating a design-construction management contract with an unnamed owner for Stone Mountain **incline railroad** located at Stone Mountain Park. The project will consist of cable-driven electric rail cars, computer systems, and replacement of buildings on top of the mountain. Estimated project cost, $13 million. Construction start hopeful for late 1994. Completion targeted for September 1995.

Hawaii—GMP Associates, Honolulu, is preparing working drawings for **secondary wastewater treatment plant facility** located at Honouliuli Wastewater Treatment Plant in Honolulu. Planned by City and County of Honolulu. Estimated cost, $40 million.

Illinois—Hammond Beeby & Babka, Chicago, has been selected architect by Fourth Presbyterian Church for **renovation and restoration of church** at 126 E. Chestnut St. in Chicago. Estimated cost, $12 million.

Maine—Symmes Maini & Mckee Associates Inc., Cambridge, Mass., is preparing plans for a four-story, 240,000-sq-ft **office building** located at 2211 Congress St. in Portland. Planned by UNUM Life Insurance Co. of America, Portland. Estimated cost, $19 million. Further progress pending Dept. of Environmental Protection approvals.

Massachusetts—Joint venture of Hoskins Scott & Partners Inc., Boston, and Hammel Green & Abrahamson Inc., Minneapolis, Minn., has been selected architectural team to design the **Medical City Complex**, which will include a nine-story, 379-bed hospital, Fallon Clinic offices, an atrium and medical office building, retail space and adjacent parking structure, to be built on a 22-acre site in downtown Worcester. Planned by an unnamed owner. Plans scheduled to start soon. The facility is targeted to be operational by late 1998.

Massachusetts—Homart Development Co., Chicago, has selected ADD Inc., Cambridge, to provide architectural services for the proposed rebuilding of Shoppers World **retail mall** located on Rte. 9 in Framingham. The project will consist of demolition of existing 760,000-sq-ft shopping center and construction of new shopping center to house 15 value-oriented retailers and approximately 50,000 sq ft of specialty space. Further action pending August 1994 completion of the Natick Mall project.

Missouri—Promus Cos. Inc., Memphis, Tenn., is planning to build the Harrah's St. Louis **casino and entertainment complex** located at southwest quadrant of I-70 and Earth City Expressway in the Maryland Heights section of St. Louis. The estimated $82-million project will include a 43,000-sq-ft riverboat casino-entertainment complex with dining areas, retail space and lodging. Further progress pending license approval.

Missouri—Arnhold & Associates, Hermann, is in early planning stage for the proposed Bavarian Hills **shopping mall**, which will include eight to ten stores and parking facilities for 1,000 cars, located at Highways H, 19 and I00 in Hermann. Estimated cost, $25 million. Further action pending results of market analysis.

New York—Greenman-Pedersen Inc., Babylon, is architect for 175,000-sq-ft **retail shopping center** to be built on a 108-acre site at southeast corner of Commack Rd. and Grand Blvd. in Deer Park. Planned by R.G. Partners, Great Neck. Estimated cost, $13 million to $14 million. Feasibility studies are in progress.

Ohio—Deaconess Society/Hospital/Family Home, Cleveland, is preparing preliminary plans for a $14-million outpatient **medical center**, which will include indoor swimming pool at Northcliffe Rd. in Brooklyn.

Texas—Southwest Properties, Dallas, is planning to build a 200-unit **apartment complex**, the old Santa Fe Building located at 1122 Jackson St. in Dallas. Estimated cost, $17 million. Further information within 30 days.

Virginia—Gary Weaver Inc., Indianapolis, Ind., is completing plans for the nine-building, 264-unit Deer Cross **apartment complex**, including swimming pool, clubhouse, health spa, and racquetball and tennis courts, located on Colonia Ave. at Ogden Rd. in Roanoke. Planned by Occidental Development Ltd., Indianapolis, Ind. Project to be advertised for sub-bidding late 1993. Construction start scheduled for spring 1994.

Wisconsin—HSR Associates Inc., La Crosse, is preparing design. Toltz, King, Duvall, Anderson & Associates Inc., St. Paul, Minn., is structural engineer for a **combined support and military vehicle maintenance shop** to be built on a 13-acre site at Volk Field, Camp Douglas. Planned by U.S. Property and Fiscal Office, Camp Douglas. Estimated cost, $11 million.

CONTRACTS AND LOW BIDS

Alabama—The results of a recent bid opening by Jefferson County Commission, Birmingham, shows Brasfield & Gorrie Inc., Birmingham, as the lowest bidder at $13,021,000 for a **wastewater treatment facility** located on Ala. Highway 119 in Leeds.

California—The University of California at Berkeley, Planning Design and Construction Dept., is reviewing bids received at a recent bid opening where McCarthy, Sacramento, was the apparent low bidder at $24,333,720 for **chemistry unit III and service access improvements** located west of Latimer Hall and north of Gilman Hall in Berkeley.

Circle 51 on Reader Service Card

California—Hensel Phelps Construction Co., Santa Clara, was the apparent low bidder when the Sacramento Municipal Utility District opened bids for a new four-building **customer service center**, which will include a 163,800-sq-ft multistory office building, a 4,300-sq-ft fitness center, 2,100-sq-ft food service building and a 14,200-sq-ft HVAC central plant located at 6251 S St. in Sacramento. Estimated project cost, $37.5 million. Contract award pending results of Board of Directors meeting.

California—The U.S. Dept. of Veterans Affairs, Central Office of Acquisition and Material Management, Washington, D.C., has awarded a general contract to Dillingham Construction, Long Beach, for **VA hospital**, Bid Pkg. A, building #126, located at 5901 E. Seventh St. in Long Beach. Work will consist of fabricating, testing and installing seismic base isolation system that will support a 12-story reinforced concrete shear wall building. Estimated project cost, $17.5 million.

California—Clean-Up Technology, Santa Monica, has been awarded a contract by Chevron USA Products Co., El Segundo, for a **bioremediation facility**, including support areas, located at the former Todd Shipyard in San Pedro. The project will include five bioremediation cells, offices, lunch and lab trailers, low temperature thermal oxidizer, a decontamination area, and truck scale and storage area. Coastal permit has been granted. Construction and set up of cells expected within three months.

California—Morley Construction Co., Burbank, has begun construction on a $12.5-million six-story **parking structure** in vicinity of Olive Ave. and the Los Angeles River in Burbank. Contract was awarded by Warner Brothers Inc., Burbank.

California—Brutoco Engineering & Construction Inc., Fontana, has been awarded a general contract by the City of Irvine for **Culver Dr. improvements**, including underpass and pedestrian overcrossing and water and sewer facilities in Irvine. Estimated project cost, $10.3 million. Work scheduled to start within 30 days.

California—California Corridor Constructors, Irvine, has awarded a contract to FCI Constructors, San Diego, for Moulton Parkway Toll Highway **bridge** located in Lake Forest. Estimated cost, $10 million.

Connecticut—A contract to build the 37-building, 302-unit Prentice Place **apartment complex** was awarded to Great West Contractors, Denver, by Simpson Housing Corp., Denver, Colo. The estimated $21-million project, including parking garages, outdoor swimming pool and clubhouse is located near Prentice Place and S. Ulster St. in Greenwood Village.

R0013644

Florida—The City of Homestead has awarded a general contract to Gilbert Southern, Miami, for Homestead **motorsports complex** located east of the Homestead Sports Complex. Estimated project cost, $37 million. Project completion scheduled for February 1994.

Florida—A low bid of $33,890,000 was made by Andrade Gutierrez Construction, Miami, when the Dade County School Board, Miami, opened bids for **state school,** Barbara Goleman Senior High School, at N.W. 89th Ave. and 142nd St.

Florida—Greenhut Construction Co., Pensacola, has been awarded a general contract by Sacred Heart Hospital, Pensacola, for **addition to hospital** located at Ninth Ave. and Bayou Blvd. in Pensacola. Estimated project cost, $15 million.

Florida—The Metro-Dade County Dept. of Aviation, Miami, has released results of a recent bid opening which show State Paving Corp., Fort Lauderdale, as submitting a low bid of $12,452,417 for **improvements to runway 12-30 and extension of runway 9R/27L,** Bid Pkg. 2, at Opa Locka Airport. Contract award expected within 60 to 90 days.

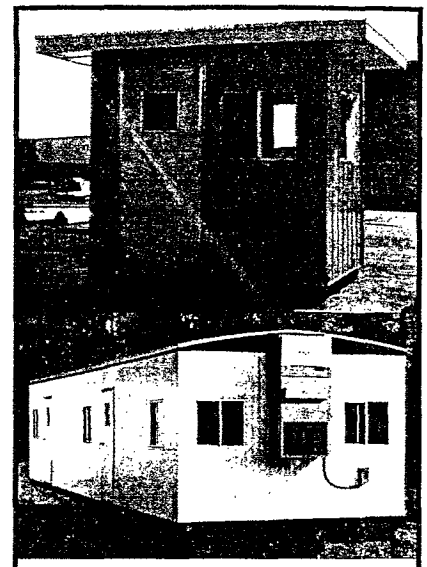
Florida—The results of a recent bid opening by the Miami-Dade Community College shows DCC Constructors Inc., with corporate offices in Orlando and Plantation, as the low responsive bidder on a $9.2-million, five-story, 580-car **parking garage and central utilities plant** located on the south campus of Miami-Dade Community College. Groundbreaking is scheduled for October 1993, and construction is expected to take 14 months.

Hawaii—A low bid of $16,248,000 was made by G.W. Murphy Construction Co. Inc., Honolulu, when University of Hawaii, Honolulu, opened bids for UH Manoa **faculty housing,** phase 2, 173 units, including parking for 325 cars, located on Kalawaa at Woodlawn and Lowry in Manoa Valley. Contract award possible by end of September and completion targeted for January 1995.

Massachusetts—The Massachusetts Highway Dept., Boston, is reviewing bids received at a recent bid opening where M. Dematteo Construction Co., North Quincy, submitted the lowest bid at $19,165,637 for **ventilation building #7** located at Boston Harbor and Logan Airport through Bird Island Flats.

Massachusetts—A contract for the 126,800-sq-ft Massachusetts state **track facility** was awarded to a joint venture of Suffolk Construction Co. Inc., Boston, and J.B. Cruz Construction Corp., Roxbury, by the State of Massachusetts Division of Capital Planning & Operations. The new state-of-the-art facility with a total seating capacity of 3,000, constructed under the design-build method, will serve high school track athletes, Roxbury Community College students, faculty and staff, and the local community. The estimated $14-million project, is located on the campus of Roxbury Community College at the corner of Tremont and new Dudley Sts. in the Roxbury section of Boston. Construction start scheduled for October 1993.

Minnesota—HBE Corp., St. Louis, Mo., has been selected general contractor for **addition and alterations to Cambridge Medical Center** located at 725 S. Delwood St. in Cambridge. Estimated project cost, $11 million. Construction start targeted for September 1993.



Mississippi—Roy Anderson Corp., Gulfport, has been selected general contractor by Maritime Corp., Biloxi, for the Palace **casino** to be built on an existing barge at Howard Ave. and Cadet St. in Biloxi.

Nevada—McCarran Constructors, Las Vegas, has submitted a low bid of $17,329,000 when Clark County Dept. of General Services, Las Vegas, opened bids for **extension of runway 7L/25R,** including construction of new taxiway, drainage improvements, removal and replacement of taxiway lighting, McCarran 2000 phase 3 project located at McCarran International Airport in Las Vegas. Contract award expected by end of September 1993.

Nevada—Clark County Dept. of General Services, Las Vegas, has released results of a recent bid opening which lists Meadow Valley Contracting, Moapa, as submitting the lowest bid at $14,062,581 for McCarran International Airport north portal **roadways and guardhouse,** McCarran 2000 phase 3 project located in Las Vegas. Estimated project cost, $14 million. Contract award expected by end of September 1993.

Nevada—The Nye County Board of Commissioners, Tonopah, is reviewing bids received at a recent bid opening where Steed Brothers Construction Co., Las Vegas, was listed as the apparent low combined base bidder at $10,792,791 for a **criminal justice complex,** phased construction, which will consist of a 78,000-sq-ft, 48-bed jail facility including sheriff's department, court facilities and district attorney's office at Radar and Globemallow in Tonopah; and an 8,500-sq-ft sheriff's department with eight holding cells and court facilities, located at Second and Third St. in Beatty. Further action within 30 days.

IMPORTANT INFORMATION... WE MAKE IT SIMPLE TO GET!

For reliable, hands-on information, successful engineers turn to the Civil Engineers' Book Club. Every 3-4 weeks members receive the Club Bulletin offering the best, newest, most important books from all publishers.

DEPENDABLE SERVICE...

Whether you want information about a book or have a question about your membership, just drop us a line. If you want the Main Selection, do nothing—it will be sent to you automatically. If you want another selection, or no book at all, just indicate your choice on the Reply Form and return it by the date specified. A shipping and handling charge and tax is added to each shipment.

CLUB CONVENIENCE...

You get a wide choice of books that simply cannot be matched by any bookstore. And all your books are conveniently delivered right to your door. You also get a full 10 days to decide whether you want the Main Selection. (If the Club Bulletin ever comes late and you receive a Main Selection you don't want, return it for credit at our expense.)

SUBSTANTIAL SAVINGS... AND A BONUS PROGRAM TOO!

You enjoy substantial discounts—up to 50%—on every Club book you buy. Plus, you're automatically eligible for our Bonus Book Plan which allows you to get FREE BOOKS.

GREAT MEMBERSHIP TERMS...

Your only obligation is to purchase 2 more books—at handsome discounts—during the next 12 months, after which you enjoy the benefits of membership with no further obligation. You or the Club may cancel membership anytime thereafter.

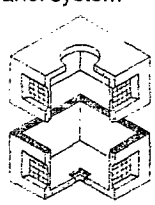
Specify Perfect Precast Concrete Products

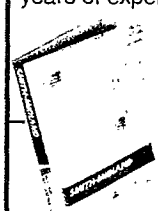
Use the SMITH-MIDLAND catalog of EASI-SET products to specify the perfect precast concrete products.



- ***SIERRA WALL*** - Sound wall, privacy fence, structural wall

- **Safety Barrier** - J-J Hooks™, tongue-and-groove, transition & special designs, double-face and single-face parapet

- ***SLENDERWALL*** - Permanent, lightweight, building panel system
- **Utility/Telephone Vaults** - standard electrical, mechanical and telephone vaults, super size vaults, specialty items, junction boxes



- **Precast Buildings** - Standard and expandable sizes from 10' x 12' to 30' x 100', custom options easily incorporated

Almost any need imaginable can be satisfied by the wide variety of products available.

When you want excellence in precast concrete products, backed by over thirty years of experience, there's only one place to look, the SMITH-MIDLAND Catalog of EASI-SET Precast Products.

To qualify for your free copy of the SMITH-MIDLAND Catalog, more than 75 pages packed full of pictures, drawings and specifications, return this coupon with your letterhead.

New Hampshire—McCarthy, St. Louis, has been awarded contracts to build three projects at Exeter Hospital in Exeter. The projects include a $6-million, one-story, 61,000-sq-ft **skilled nursing facility** to house 125 beds, dining and laundry rooms; a $5.5-million, three-story, 57,000-sq-ft **physical rehabilitation and exercise facility**; and a $2.4-million, 308-car, three-level **parking structure**. Construction is under way for the skilled nursing facility and is scheduled to be completed by October 1994. Construction will begin September 1993 on the Exeter Life Center physical rehabilitation and health club facility, and be completed by November 1994. Construction on the third project, a design-build parking facility, will also start in September and is scheduled for an August 1994 completion.

New Jersey—The Iselin office of Morse Diesel International was the apparent low base bidder on a general contract at $187,887,000 when the New Jersey Sports and Exposition Authority, Atlantic City, opened bids for a four-story, 2-million-sq-ft **convention center**, Contr. #7, which will include parking for 1,576 cars and a sports complex located on Beach Thoroughfare at Atlantic City Expressway and Kirkman Blvd. in Atlantic City.

New Jersey—The Bristol Myers Squibb Co., Syracuse, N.Y., has awarded a general contract to Binsky & Snyder Inc., Plainfield, for **expansion of pilot plant**, building #53, located on Rte. 1 in New Brunswick. Estimated project cost, $40 million.

New Jersey—Torcon Inc., Westfield, has been selected general contractor on a design-and-construct basis by the New Jersey Building Authority, Trenton, for the statehouse **underground parking garage** located on E. State St. in Trenton. Estimated project cost, $28.6 million. Construction start targeted for November 1993.

New Jersey—The New Jersey Transit Corp., Newark, is reviewing bids received at a recent bid opening where Prismatic Development Corp., Parsippany, submitted the lowest bid at $23,132,500 for a 210,000-sq-ft **bus maintenance garage** located in vicinity of Rte. 80 W. and Rte. 23 N., lot 1, block 402 in Wayne.

New Jersey—Arthur J. Ogren Inc., Vineland, has been awarded a general contract by Cumberland County Purchasing Dept., Bridgeton, for 77,000-sq-ft **addition and renovation of courthouse**, which will include four additional courtrooms and associated judges' chambers on Broad St., next to county jail in Bridgeton. Estimated project cost, $10.5 million.

New York—The New York State University Construction Fund, Albany, is reviewing bids received at a recent bid opening where Merritt-Meridian Construction Corp., Beacon, submitted the lowest bid at $19,487,000 for two new **academic buildings and a research greenhouse** located at SUNY Binghamton campus. Contract award is expected within two months. Construction start is scheduled for October 1993 and completion is targeted for February 1997.

Oklahoma—Smith & Pickel Construction, Oklahoma City, has begun construction on phase 2 **addition to hospital** located at 1011 14th Ave. N.W. in Ardmore. Contract was awarded by Memorial Hospital of Southern Oklahoma, Ardmore. Estimated project cost, $16 million.

Oregon—The results of a recent bid opening by the City of McMinnville show Contractors Inc., Tualatin, as submitting a low bid of $25,577,700 for a **wastewater treatment project**, which will include a new wastewater plant, a new pump station at existing site and pipelines between new and existing plants, located at end of Colvin Court in McMinnville. Project completion is targeted for October 1995.

Oregon—A contract to build the new two-story, 180,000-sq-ft Nordstrom **department store** at Washington Square Mall in Tigard, was awarded to R.E. Bayley Construction Co., Seattle, by Nordstrom, Seattle. Estimated project cost, $15 million to $18 million.

Oregon—An apparent low bid of $14,694,000 was made by a joint venture of S.D. Deacon and J.R. Roberts Corp., Portland, when the West Linn School District, West Linn, opened bids for a two-story, 140,000-sq-ft **high school** located on Wilsonville Rd. in Wilsonville. Construction scheduled to start soon.

Pennsylvania—Thomas P. Carney Inc., Langhorne, was the apparent low bidder on general contract, design-and-construct basis, at $48,800,168 when the Southeastern Pennsylvania Transportation Authority (SEPTA), Philadelphia, opened bids for the new Midvale **bus maintenance facility**, Luzerne replacement facility, located at 4301 Wissahickon Ave. in Philadelphia. Contract award expected by late September and construction start possible by November.

Utah—Jacobsen Construction Co. of Salt Lake City has been selected by the Salt Lake City School District as construction manager for the $22-million **addition and remodeling of East High School** located at 800 South 130 East. The project includes the construction of a new sports stadium, 200,000 sq ft of new laboratory and classrooms, and the demolition of existing classroom buildings. Construction is scheduled to start in early 1994.

R0013648

Washington—The results of a recent bid opening by the U.S. Navy Contracting, Pacific Northwest Borough, Silverdale, list PCL Construction Services Inc., Bellevue, as the lowest bidder, design-and-construct basis, at $14,234,000 for **commissary/exchange building, and auto hobby shop** located at the Navy Support Complex on I-5 and 116th St. N.E. in Everett.

BID DATES

Arizona, Oct. 12—Rock Point Community School, Navajo Reservation, Rock Point, **junior/senior high school** on Navajo Indian Reservation at Highways 191 and 35 in Rock Point. $7 million to $7.3 million. Wyatt & Rhodes Architects, architect, Phoenix.

Arizona, Oct. 12 (tentative)—U.S. Army Corps of Engineers, Phoenix, **direct fire, and artillery and mortar ranges** located at Yuma Proving Grounds. $1 million to $5 million. Mason & Hanger Engineering Co., architect, Lexington, Ky.

Ohio, Oct. 12—City of Centerville, Yankee Trace golf academy **clubhouse** at 1000 Yankee St. in Centerville. Architects Associated, Dayton, is architect.

California, Oct. 13 (tentative)—U.S. Army Corps of Engineers, Sacramento, **addition to support equipment shop, and new covered storage facility** located at March Air Force Base. Grillias Pirc Rosier Alves, architect, Irvine.

Nebraska, Oct. 13—U.S. Property and Fiscal Office, Lincoln, **fuel system maintenance facility** located at Lincoln Air National Guard Base. $5 million to $10 million. Dana Larson Roubal & Associates, architect, Omaha.

Ohio, Oct. 13—U.S. General Services Administration, Chicago, **alterations to U.S. Post Office and Courthouse** located at Main and Walnut Sts. in Cincinnati.

South Dakota, Oct. 13—Rapid City Area School District 51-4, **addition and renovation of North Middle School** on Maple Ave. in Rapid City. $4 million to $5 million. Galyardt Associates, architect, Rapid City.

Texas, Oct. 13 (tentative)—U.S. Army Corps of Engineers, Albuquerque, N.M., Bluff **channel**, phase 2, located in southeast part of El Paso. $10 million. The project consists of 13,000 ft of trapezoidal and rectangular flood control channel along with four drop structures, 1,000 ft of concrete box culverts and eight overflow weirs.

Information for Pulse is derived primarily from Dodge Reports prepared by the F.W. Dodge Div. of McGraw-Hill Inc. For more details on these and other construction projects or to learn more about Dodge Reports, call (800) 541-9913.

THE T. L. JAMES MARINE GROUP provides the entire spectrum of dredging technology with its 19-vessel fleet of cutterheads, hopper dredges, bucket dredges, and new-to-America water injection dredges.

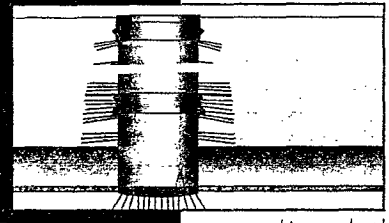
For Accuracy of 1 in 10,000,000 On The Superconducting Super Collider, Control Was Best Left To Chance.



When the Parsons Brinckerhoff/Morrison Knudsen Team was looking for a firm to provide precise horizontal and vertical control for boring the tunnel for the Superconducting Super Collider, nothing was left to chance.

PB/MK selected John E. Chance & Associates(JECA) to be a member of its design team to establish a highly stable horizontal and vertical control network covering a 322-square-mile area.

Using dual frequency GPS satellite receivers, JECA surveyors achieved a positional accuracy of 1:10,000,000 for the horizontal network. More than 750 miles of precise differential leveling was run to establish the vertical network.

The high precision surface networks, shaft transfers and tunnel traverses have enabled tunnel excavation breakthroughs of 1.8 inches in the horizontal and vertical planes in 2 1/2 miles of tunneling. The tunnel survey control was surveyed to 1/2" for the horizontal and 1/4" for the vertical.

For basic control networks, mapping control, cadastral, geophysical surveys, marine surveys or precise engineering surveys, things are best left to Chance.

A special congratulations to

Laurie Rodriguez,

Staff Scientist/Geologist of Geraghty & Miller

whose name was chosen in the drawing.

She will receive $500!

Official Proposals

City of New York Department of Environmental Protection Bureau of Water Supply and Wastewater Collection

Notice to Engineering Consultant firms to submit a Statement of Qualifications for Engineering Services.

The New York City Department of Environmental Protection, Bureau of Water Supply and Wastewater Collection, hereby invites Engineering Consultant firms to submit a Statement of Qualifications to perform Resident Engineering Inspection (REI) services for the reconstruction of twelve East of Hudson dams, three controlled lakes and two pumping stations located in the Croton Watershed.

The estimated construction costs of the contracts are in the range of $6,000,000 to $50,000,000.00. The Department intends to award seven (7) or more separate REI contracts each having a period of performance of 24 to 30 months.

Interested Engineering Consultants, who wish to be considered for these projects, are invited to submit Federal Standard Forms 254 and 255, and a New York City Vendex Questionnaire. These submittals will be used to formulate a Pre-qualified List of candidates.

The completed forms (10 copies of each Federal Form and 1 copy of the Vendex form) must be received no later than 4:00 p.m. on October 20, 1993 by:

Joseph W. Iannuzzi, P.E.
Acting Chief, Planning and Programs
Department of Environmental Protection
Bureau of Water Supply &
Wastewater Collection
59-17 Junction Boulevard
3rd Floor (Low Rise)
Corona, New York 11368

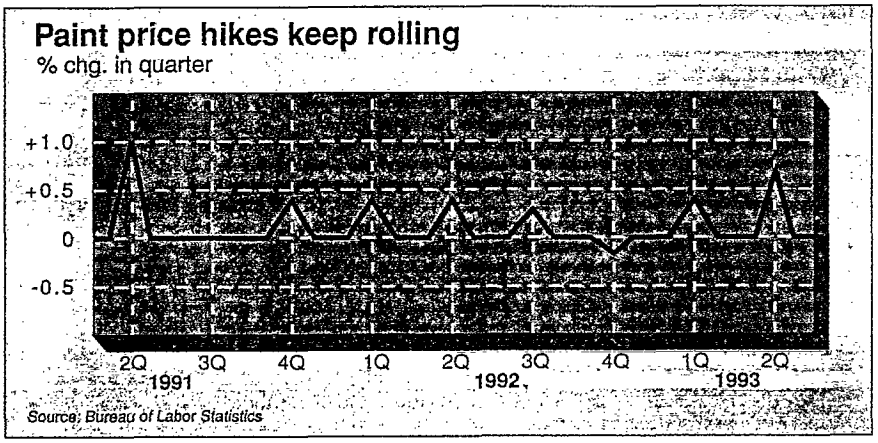
Copies of the Vendex Questionnaire may be obtained at the above address from 10:00 A.M. to 4:00 P.M., Monday-Friday, except holidays. Requests may be made in writing, in person or by telephone. Telephone requests should be made to Ms. Ingrid Weseman at (718) 595-5472.

The services to be provided under each contract shall include, but not be limited to:

1. Resident Engineering Inspection of the reconstruction of one or more dams, controlled lakes and/or pumping stations.
2. Evaluation of contract changes and the preparation of change orders.
3. Checking of record drawings.

A minimum of 8 randomly selected firms from the Pre-qualified List shall be asked to submit a technical and separate cost proposal for each contract based on a detailed scope of work prepared by the Bureau. It is anticipated that the seven contracts will be awarded within a 24 month period beginning in 1994.

The Contracts to be awarded under this Request for Qualifications (RFQ) are expected to be funded 100% by the City of New York. The Federal Standard Forms requested are to facilitate the establishment of a Pre-qualified List only.



Final selection for the contracts shall be based on a combination or the best Technical and Cost Proposals.

The REI Contracts will be subject to the utilization requirements for participation of certified Minority and Women Business Enterprises (M/WBE).

The City of New York's Department of Environmental Protection is not responsible for costs incurred in the preparation of any documents relative to this advertisement.

For Additional Official Proposal Advertising, See Pages 89-90

Monthly market quotations by ENR field reports Aug.16, 1993. All prices are spot prices quoted from a single source. Common lumber prices are those quoted for the most popular species in the area. Quotes are delivered prices. Some prices may include taxes or discounts for prompt payment, etc. Product specification may vary, depending on what is most commonly used or most accessible in a city. All quantities are truckloads unless noted. Quotes for Montreal and Toronto are in Canadian dollars and metric units. The above prices are not intended to represent the prevailing or average price in a city but are designed to track price movement from a single source for a given quantity and specification over time.

St. Lucie County Utility Services Director. This is a management and technical position responsible for planning, organizing, directing, budgeting, and coordinating water and wastewater activities. duties include the coordination of water and wastewater projects and activities with other utilities functions and the public. Minimum qualifications: A Bachelor's degree in Civil or Sanitary Engineering or Business Administration. Ten (10) years of progressive experience, of which at least five (5) years of supervisory experience, including responsibility in the engineering field with part of it in the wastewater and water treatment field. Send resume or apply in person to St. Lucie County Personnel Coordinator, 2300 Virginia Avenue, Ft. Pierce, FL 34982 EOE.

Associate Engineer; 40 hrs./wk.; 8 am-5 pm; $37,334/yr.; Job requires: Master of Science in Civil Engineering or Master of Science in Mechanical Engineering degree, with a major field of study in Structural Engineering. Job also reqs.: 1) thesis or 2 published papers in the field of dynamics of structures; 2) 1 graduate course in finite element methods; 3) 1 grad. crse. in structural analysis; & 4) 1 grad. crse. in structural dynamics. Job duties: Develop finite element models of vehicle structures using finite element softwares such as NASTRAN. Perform analysis of automotive components using finite element analysis software such as DYNA3D and PAMCRASH. Qualified applicants should send resume & verification of reqs. to: 7310 Woodward, Rm. 415, Detroit, MI 48202. Ref. #69493. Employer Paid Ad.

Bridge Design Engineer, Lexington, MA: 40 hrs/wk, 8:00 a.m. - 5:00 p.m.; $38,100 per year. Design computations and preparation of details for structural steel and concrete bridge design including post-tensioned structural steel and post-tensioned segmental concrete bridge design; computer modeling of structural systems; dynamic analysis of bridges and the behavior and design of bridge substructure including soil/structure interaction; layout and analysis of pre-tensioned and post-tensioned systems including temperature and time dependent influences. Develop innovate solutions for structure bridge rehabilitation using post-tensioning and other state-of-the-art procedures. Ph.D. in Civil Engineering/ Structural Engineering req'd. 2 yrs. research experience in high performance cementitious material behavior & its applications to bridge repairs and rehabilitation req'd. Ability to work with all facets of concrete design and detailing; i.e., precast cast in place, post-tensioned, pre-tensioned, and reinforced req'd. Familiarity with the latest AASHTO/ACI Code req'd. Experience in computer analysis programs such as SAP90. ABAQUS. STRUDL, & LPILE req'd. Mail resume to: Dept. of Employment and Training, P.O. Box 8968, Boston, MA 02114. Case No. 30753.

MEXICO STAFFING

Sundtcorp de Mexico, SA. de C.V., a subsidiary of Sundt Corp., plans soon to be performing both construction management and self-performed contract work in Mexico. Candidates are required for the following positions:

PROJECT MANAGER. Minimum of 10 years experience as a Project Manager on commercial building projects having a value of over $20 million. Working knowledge of Primavera scheduling system and B.S. in Civil Engineering required.

PROJECT ENGINEER. Must have at least five years experience as a Project Engineer on multi-million dollar commercial building projects. Good computer skills, strong capability in Primavera scheduling system, and B.S. Civil Engineering required. P.E. credentials a plus.

FIELD SUPERINTENDENTS (4). Requires a minimum of 10 years experience on multi-story commercial building projects as the superintendent-in-charge.

All positions require fluency in English and Spanish (speaking and writing). These job assignment are in Mexico.

Send Resume to: Sundt Corp, Corporate Employment Office

Environmentally Conscious Manufacturing Engineer

The Industrial Technology Institute (ITI) is a unique inter-disciplinary organization dedicated to improving the competitive position of U.S. manufacturers.

The senior staff member ITI seeks will: lead institute-wide technical and programmatic activities related to environmentally-conscious manufacturing, particularly aimed at smaller durable and plastic manufacturing companies, develop an implement programs of technical assistance, training, information exchange and technology transfer as they pertain to plant-level environmental issues, and participate in strategic and operational planning.

Qualifications: thorough knowledge of manufacturing, particularly a production process-level understanding of environmental issues, including emissions and solid, liquid and hazardous waste reduction. The ideal candidate would also have experience in policy and regulatory aspects of environmentally-conscious manufacturing. A master's degree (or an equivalent combination of education and experience) and a minimum of 10 years of experience in manufacturing, 5 years in the environmental field is required.

ITI offers a challenging environment and an opportunity to have an impact on U.S. manufacturing. Mail your resume, and salary requirements to: HR - #9321 Industrial Technology Institute P.O. Box 1485 Ann Arbor, MI 48106. An EEO/AA Employer M/F/D/V.

CORPORATE DEVELOPMENT DIRECTOR

A highly responsible, quality directed Midwestern Engineering Consulting Firm is seeking a growth oriented person to provide leadership in the company's development.

Do these questions describe you?

- Are you an activator? Do you make things happen?
- Do you think strategically? Can you select and anticipate events which lead to growth and profit?
- Are you a visionary? Can you create images of excellence and growth for an organization?

If so, we want to talk with you. We are a Lincoln, Nebraska based Engineering Consulting Firm founded in 1944. We are searching for a talented individual to take responsibility for the growth efforts of this firm. The ideal candidate will have an engineering or science education background, consulting experience in the design profession and strong persuasive and organizational talents.

We offer:

- Excellent base salary plus performance incentives.
- An established firm focused on quality and growth.
- Equity ownership for the future.
- A chance to join a company with integrity and a mission to serve people.

Call today to investigate this unique and exciting opportunity to work with top management to energize corporate development.

Jim Sorenson
Selection Consultant working with the Company
1-800-793-0450 or 1-800-793-0451
Monday - Friday 8am-5pm CDT

Senior Software Analyst - Plant Design Systems. Responsible for the design, development and implementation of computer graphics software for plant design applications, for use by engineers in advanced CAD/CAM applications. Works under limited supervision. Programs in C or C++ languages in a UNIX operating system environment. Uses CAD system to perform 2D and 3D graphics design. Develops new, modified, enhanced or tailored software, utilizing knowledge of mechanical, structural or chemical engineering. Designs piping and instrumentation software, temperature and control valve software, and other computer software used in plant design applications. Assists others in area of expertise. Must have BS in Mechanical, Structural or Chemical or related engineering field and 2 years of experience in job above or 2 years experience in computer software development. A Master's or higher degree may be substituted for 2 years of experience, if advanced degree work involved computer software development. Requires UNIX or Windows NT operating system, programming in C or C++ languages, knowledge of CAD systems, knowledge of mechanical, structural or chemical engineering or related area. Salary $700 per week, 40 hrs/wk, 7:30am-4:15pm. Resume to M. Thomas, Alabama State Employment Service, P.O. Box 428, Huntsville, AL 35804-0428. Job Order No. AL 4096486. An Affirmative Action/Equal Opportunity Employer.

Official Proposals

New York City Transit Authority Notice of Solicitation

Contract #A-35724-1,2,3,4.

Bid Opening: Monday, October 18, 1993 at 2 PM local time.

Title: Rehabilitation of Canal Street Complex.

A site tour has been scheduled on September 21, 1993, at 10:00 A.M., at Canal Street Station, Lexington Avenue Line, South bound mezzanine Token Booth R-214. There will be a Pre-bid Conference Scheduled on September 22, 1993, 10:00 A.M., at 386 Park Avenue South, Room 308, New York, N.Y. Prospective bidders who desire to attend shall notify the Procurement Specialist no later than noon of the day prior to the scheduled event.

Procurement Specialist Yasmin M. Thomas
(718) 694-4111

Sealed bids will be received by the NYCTA at 130 Livingston Street, Brooklyn, New York 11201 at the Bid Solicitation Counter until the bid opening time and date. Bids will be publicly opened and read in Room 139 at said location. Bidders will be fully responsible for the delivery of their bids in a timely manner. Reliance upon the U.S. Mail or other carriers is at the bidders risk. Late bids will not be considered.

Bid solicitation documents may be obtained at the Solicitation Counter at the aforementioned address from 9:00 AM to 3:30 PM Mon-Fri except holidays. Requests can be made in writing, in person but not by telephone. There is a non-refundable charge of $75.00 for each set of documents.

Please be advised that all of the funding anticipated for this contract has not been secured. However, it is the intent of the Transit Authority to have necessary funds in place prior to award. Should funds not become available in a timely manner, bidders are hereby advised that this solicitation may be withdrawn.

"Locker Facility Addition" for William Paterson College 300 Pompton Road Wayne, New Jersey 07470 Job #A0272.00 Notice to Bidders

Notice is hereby given that sealed proposals will be received by The William Paterson College of New Jersey for "Locker Facility Addition," located in Wayne, New Jersey, completed and in accordance with bid documents, plans, specifications covering the work in connection therewith and incidental thereto.

Sealed bids for "Locker Facility Addition" will be received at the College of the Office of the Administration and Finance in the President's Conference Room located in Morrison Hall off Pompton Road at Entry #2, Wayne, New Jersey until 2:00 P.M. on October 5, 1993. A mandatory pre-bid meeting will be held in Morrison Hall at 10 A.M. on September 21, 1993. All prospective bidders must attend this meeting.

No bids shall be received by mail, facsimile transmission or overnight delivery service.

Bid Documents for the proposed work are on file at the College at the above office and at the Office of the Director of Facilities located in the College's Maintenance Building.

Bid documents can be obtained at the Office of The RBA Group, 1 Evergreen Place, P.O. Box 1927, Morristown, NJ 07962-1927, between the hours of 8:00 A.M. and 5:00 P.M., Monday through Thursday. Requests for mailing of contract documents will not be accepted. Deposit fees will be $50 per set and shall be refunded to only those bidders who return the bid documents in good condition within two weeks of the bid opening.

Bids must be made on the proposal forms furnished with the bid documents and must be enclosed in a sealed envelope. The bid envelope should be marked on the outside with the project #A0272.00 and titled: "Locker Facility Addition."

Bidders must be prequalified under N.J.S.A. 52:35 and must submit security as provided in the Instructions to Bidders. No bidder may withdraw his bid for 60 calendar days after the opening. The College may reject any and all bids.

Bidders are required to comply with the requirements of P.L. 1975, C. 127, N.J.S.A. 40A:11-1 et. seq. New Jersey Law Against Discrimination.

Peter S. Spiridon, V.P.
Office of Administration and Finance

New York City Transit Authority Notice of Solicitation

Contract #C-33467

Bid Opening: October 12, 1993 at 2:00 PM local time.

Synopsis: Construction of RTO Facilities at Westchester & Mosholu Yards (IRT), "A" Division Borough of The Bronx.

A site tour will be held on Sept. 23, 1993 9:00 AM at the Westchester Yard, Signal Tower at Westchester Ave & Water Place in The Bronx. A Pre Bid Conference will be held on Sept. 23, 1993 1:00 PM at Site Visit Place.

Sealed bids will be received by the NYCTA at 130 Livingston St., B'klyn, N.Y. 11201 at the Bid Solicitation Counter, Room 160, until the bid opening time and date. Bids will be publicly opened and read in Room 139 at 130 Livingston St., B'klyn, as specified above.

Bid documents may be obtained at the Bid Solicitation Counter, Room 160, New York City Transit Authority, 130 Livingston St., B'klyn, from 9:00 A.M. to 3:30 P.M. Mon.-Fri. excl. holidays. Requests can be made in writing, in person but not by telephone. Each request must be accompanied by a check or money order for $75.00 (Non refundable) for each set of specifications and drawings. Cash or personal checks are not accepted.

Minority and women-owned Business Enterprises are given full opportunity to submit bids and receive or participate in contract awards. Discrimination on the basis of race, religion, color, sex or national origin is prohibited. Compliance with all applicable Affirmative Action, Equal Opportunity, and Minority and women-owned Business Enterprise conditions is required. A full description of these and all other provisions is included in the bid documents.

Bidders will be fully responsible for the delivery of their bids in a timely manner. Reliance upon the U.S. Mail or other carriers is at the bidder's risk. Late bids will not be accepted.

It is anticipated that funds for this work will be provided in part (20%) by the MTA and in part (80%) by the U.S. Govt. Federal Transit Administration.

Please be advised that all of the funding anticipated for this contract has not been secured. However, it is the intent of the Transit Authority to have necessary funds in place prior to award. Should funds not become available in a timely manner, bidders are hereby advised that this solicitation may be withdrawn.

Request for Proposals The Port Authority of New York and New Jersey

Sealed proposals for the following contracts will be received by the Chief Engineer, Room 72S, One World Trade Center, New York, N.Y. 10048, until 2:30 p.m. on the date indicated and will then be opened and read in Room 72E. Official Proposals

New York City Transit Authority Notice of Solicitation

Contract #E-31259. Bid Opening: Wednesday, October 20, 1993 at 2:00 PM local time.

Synopsis: Rehabilitation of Five Pan Plants, Rutgers Street Tunnel "F" Line, "B" Division (IND), Boroughs of Manhattan and Brooklyn.

Prospective bidders are advised that a tour of inspection of the job sites will be held on Oct. 1, 1993 at 9:00 A.M. at the Token Booth N-530, York St. Station, "F" Line, Borough of Brooklyn. A Pre-bid Conference will be held on Oct. 5, 1993 at 10:00 A.M. in the 9th Floor Conference Room at 10 Columbus Circle, Borough of Manhattan. Prospective bidders who desire to attend shall notify the Procurement Specialist, Marsha Korotyk at (718) 694-4097. Prospective bidders are advised that this solicitation contains a new Master Legal, revising its standard Terms and Conditions with a view towards a more equitable sharing of risks and liberalizing other items. Prospective bidders should bear in mind that the revised contract will give rise to different assumptions used in costing the project especially with respect to contingencies and risks.

Sealed bids will be received by the NYCTA at 130 Livingston St, B'klyn, N.Y. 11201 at the Bid Solicitation Counter, Room 135, until the bid opening time and date. Bids will be publicly opened and read in Room 135 at said location.

Bidders will be fully responsible for the delivery of their bids in a timely manner. Reliance upon the U.S. Mail or other carriers is at the bidder's risk. Late bids will not be considered.

Bid documents may be obtained at the Solicitation Counter at the aforementioned address from 9:00 AM to 3:30 PM Mon-Fri except holidays. Requests can be made in writing, in person but not by telephone. Each request must be accompanied by a company or bank check for the following amount: $75.00 for each set of specifications and the associated drawings. Cash and personal checks are no longer accepted. This fee is non-refundable.

Disadvantaged Business Enterprises are given full opportunity to submit bids and receive or participate in contract awards. Discrimination on the basis of race, religion, color, sex or national origin is prohibited. Compliance with all applicable Affirmative Action, Equal Opportunity, and Disadvantaged Business Enterprise conditions is required. A full description of these and all other provisions is included in the bid documents.

Funds for this work are provided in part by the Metropolitan Transportation Authority and in part by the United States Government, Federal Transit Administration. Please be advised that all of the funding anticipated for this contract has not been secured. However, it is the intent of the Transit Authority to have necessary funds in place prior to award. Should funds not become available in a timely manner, bidders are hereby advised that this solicitation may be withdrawn.

California Department of Water Resources Division of Design and Construction Civil Design Branch Chemical Grouting Consultant Request for Qualifications

The Department requires the services of a consultant to advise design staff in the preparation of contract plans and specification to grout hydraulic piezometer tubing and concrete joints in earth and concrete dams owned by the Department. The consultant will also advise staff during the performance of the subject contract. Consultant must have extensive knowledge and experience in chemical grouting and possess current knowledge of applicable State and Federal environmental regulations.

Copies of the Request for Qualifications may be requested from the Department of Water Resources, Division of Design and Construction, Civil Design and Construction, Civil Design Branch, Room 533-6, Post Office 942836, Sacramento, California 94236-0001, Attention: Les Harder, (916) 653-8055, Responses must be submitted no later than October 20, 1993 at 10:00 a.m.

City of New York Department of Environmental Protection Bureau of Water Supply and Wastewater Collection

Notice to Engineering Consultant firms to submit a Statement of Qualifications for Engineering Services.

The New York City Department of Environmental Protection, Bureau of Water Supply and Wastewater Collection hereby invites Engineering Consultant firms to submit a Statement of Qualifications to perform resident engineering inspection services for the construction of sewage treatment plants located in the Catskill and Delaware Watersheds.

The estimated costs for the construction contracts are in the range of $10,000,000 to $20,000,000. The Department intends to award 5 separate Resident Engineering Inspection contracts each having a period of performance of 24 to 30 months.

Interested Engineering Consultants, who wish to be considered for these projects, are invited to submit Federal Standard Forms 254 and 255, and a New York City Vendex Questionnaire. These submittals will be used to formulate a Pre-qualified list of candidates.

The completed forms (10 copies of each Federal Form and 1 copy of the Vendex Form) must be received no later than 4:00 p.m. on October 20 1993 by:

Joseph W. Iannuzzi, P.E.
Acting Chief, Planning and Programs
Department of Environmental Protection
Bureau of Water Supply & Wastewater Collection
59-17 Junction Boulevard, 3rd Fl.
Corona, New York 11368

Copies of the Vendex Questionnaire may be obtained at the above address from 10:00 A.M. to 4:00 P.M., Monday-Friday, except holidays. Requests may be made in writing, in person or by telephone. Telephone requests should be made to Ms. Ingrid Weseman at (718) 595-5472.

The services to be provided under each contract shall include, but not be limited to:

1. Resident Engineering Inspection of the construction of one or more sewage treatment plants which will include advanced state-of-the-art treatment processes. There will be multiple construction contracts as required by the Wick's Law.
2. Evaluation of contract changes and the preparation of change orders.
3. Checking of record drawings.
4. Preparation of O & M manuals.

A minimum of 8 randomly selected firms from the pre-qualified list shall be asked to submit a technical and separate cost proposal for each contract based on a detailed scope of work prepared by the Bureau. It is anticipated that the five contracts will be awarded within a 24 month period beginning in 1994.

The contracts to be awarded under this Request-for-Qualifications are expected to be funded 100% by the City of New York. The Federal Standard Forms requested are to facilitate the establishment of a Pre-qualified List only.

Final selection for the contracts shall be based on a combination of the best Technical and Cost Proposals.

The Contracts will be subject to the utilization requirements for participation of certified Minority and Women Business Enterprises.

The City of New York's Department of Environmental Protection is not responsible for costs incurred in the preparation of any documents relative to this advertisement.

Contractors need clear direction on fall protection requirements

Some regional administrators of the Occupational Safety and Health Administration are grabbing the bull by the horns and addressing what they feel is a very serious safety problem in fall protection requirements for the construction industry.

They believe that the current construction standard protection thresholds of 25 ft for exterior work and 30 ft for interior work are too generous and are enforcing more strict limits based on the general duty imposed on employers to provide a safe work place (see p. 6). We don't disagree with the good intentions, but the agency must spell out a uniform national policy after soliciting input from the industry and then enforce it nationwide.

Its regional offices are enforcing thresholds far below the national standard—6, 8 and 10 ft, depending on the type of work and the region. OSHA's internal study showing that 60% of deaths from falls occur from less than 30 ft indicates that there are some real hazards that should be dealt with effectively. The agency should develop a new standard that protects workers from falls, even if they are from less than 10 ft. Such limits have long been kicked around, but politics and the glacial standard-making process have prevented adoption.

The confusion must be dealt with. Constitutional due process requires regulators to give clear direction before penalties can be imposed.

Despite protests to the contrary from some quarters, the industry continues to need a strong federal safety program enforced vigorously. Contractors could provide fall protection voluntarily to their workers when they are engaged in hazardous activities no matter what the height, but many choose to let the government make those decisions for them.

Basinwide is the way to go

Government officials and consulting firms finally seem to be getting a handle on managing overall watershed pollution problems, only 21 years after that approach was encouraged by federal legislation. It certainly is about time; there are some 900 river basins with serious water quality degradation.

Efforts to eliminate point sources have been quite successful. But pollution snoops have long known that amorphous nonpoint sources can be more damaging. Now they are finding ways to identify them and develop realistic, coordinated abatement strategies (see p. 38).

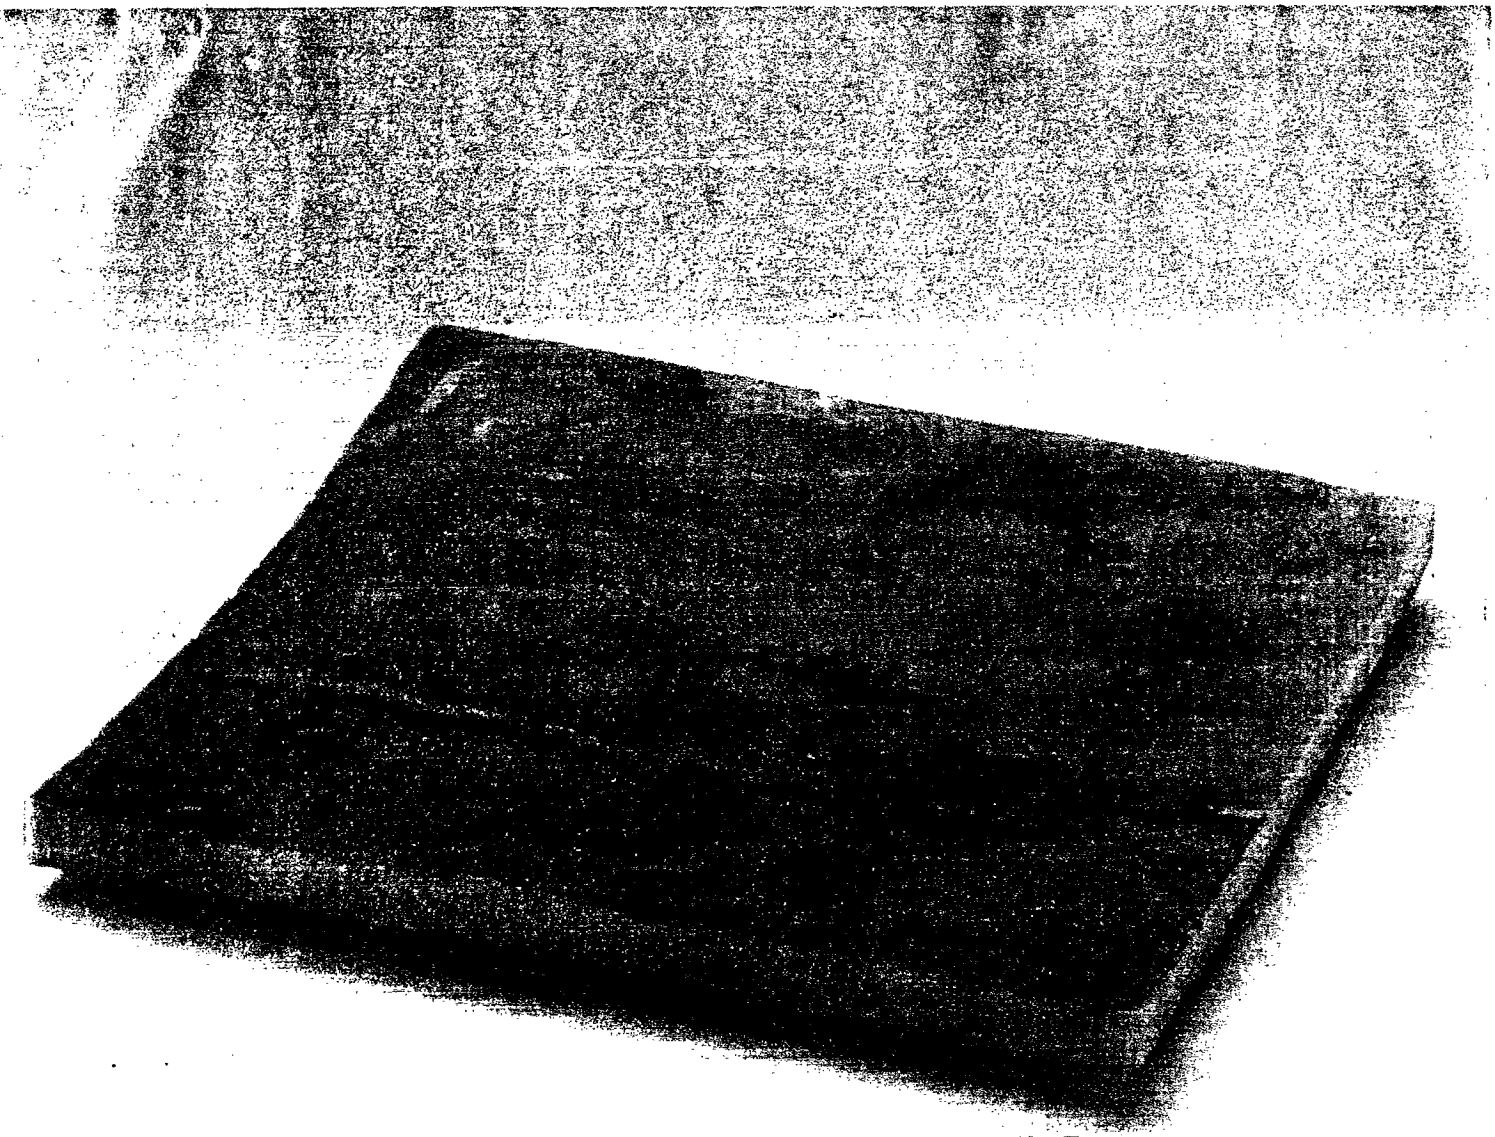
The new approaches should make our water pollution control programs far more efficient and contribute substantially to quality of life. Cleaning up the lower reaches of a river is to some extent a cosmetic exercise if vast amounts of pollutants from agriculture, stormwater runoff and other less obvious sources continue to pour into the watershed's tributaries.

Building in a longer highway life

Travelers returning from a trip to Europe usually bring back memories of good food, and perhaps something from a duty-free shop. But some U.S. highway engineers returned from a tour with something extra—realization that are better ways to build roads.

One member of the visiting group, Michael Cuddy, who is chief engineer of the New York State Dept. of Transportation, is putting the European technique to work on two highway projects. One with a concrete pavement in Corning (see p. 53) and another having an asphalt pavement in Saranac Lake. For not very much extra capital cost the state is getting roadways with a design life of 50 years, two and a half times longer than that to which we are accustomed.

The investment appears to be highly worthwhile. We now know that long-life roadway construction works in other countries, so it's time we caught up and paved the way for better use of our own highway funds.



Peace promotes business, and that can solidify peace

The historic agreement signed last week between Israel and the Palestine Liberation Organization already has launched proposals for construction projects costing billions of dollars. We expect that momentum will accelerate, and it will contribute to stabilizing the region.

The ink literally was not dry on the agreement when plans started to erupt for major projects in what will be PLO-administered areas (see p. 7). As confidence in the peace process transforms euphoria into reality, firm developments should take form in the previously Israeli-occupied territories. And with tensions in the region lessening, that may even spill over to impoverished parts of neighboring countries.

The Mideast has been a tinderbox for 45 years. Terrorism has flourished in areas of abject poverty. Bringing in jobs and promoting prosperity will help provide barren ground for terrorist groups. Construction can make the peace permanent. Our industry can build something worth living for.

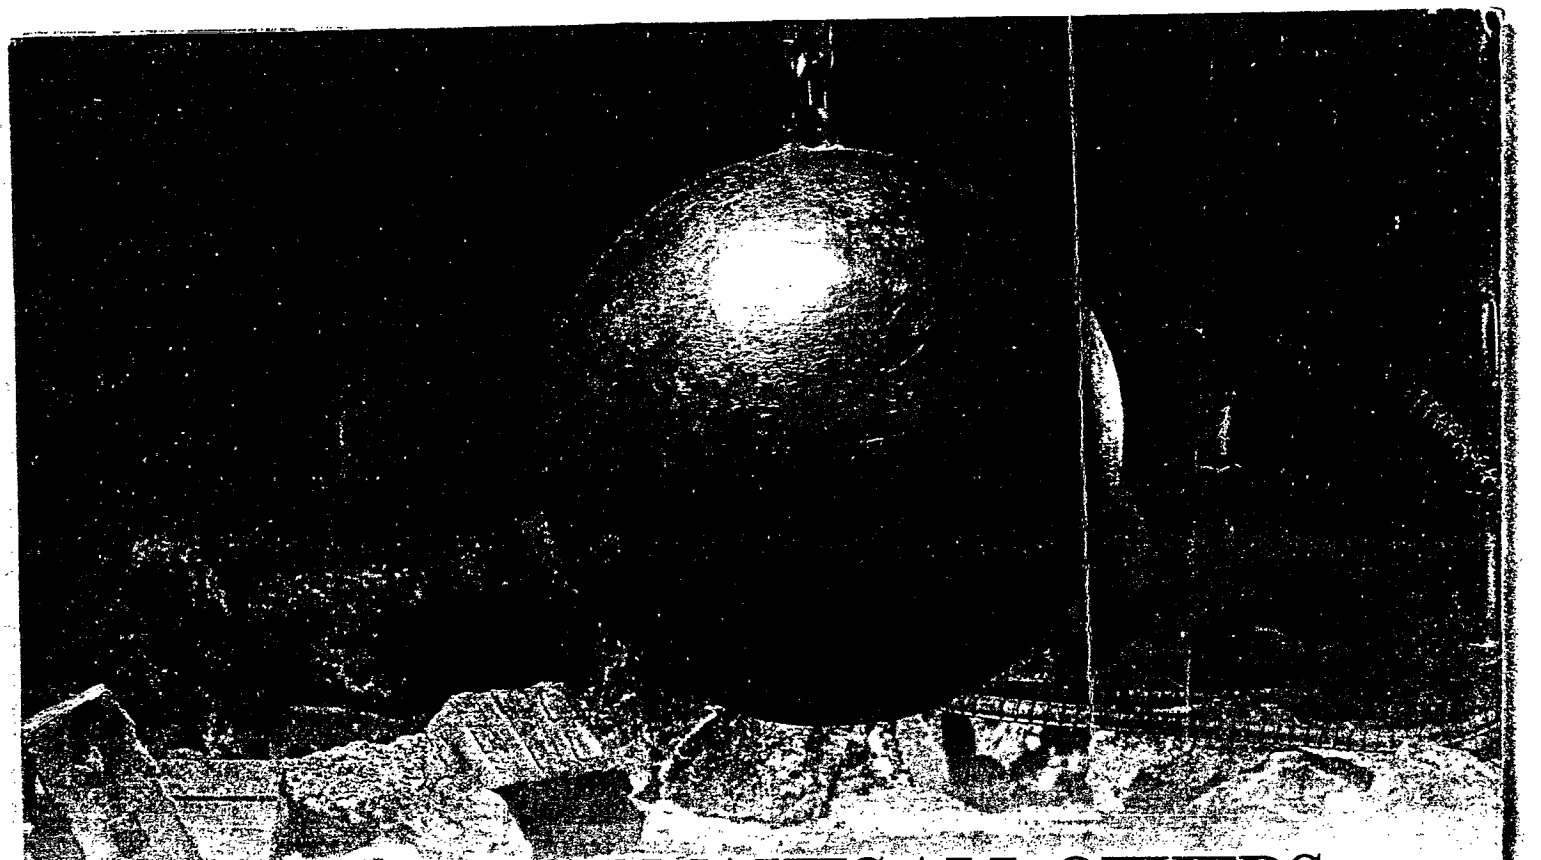
You should look so good after twenty years in a London sewer.

R0013665

This is a sample from the very first installation of Insituform. Extracted by MTS Pendar Ltd., they found that the Insituform pipe passed even today's stringent structural design guidelines. And this after two decades on the job. (For a copy of the test results, call 901-759-7473.)

Surprised? You shouldn't be, if you're at all familiar with Insituform's *own* extensive testing. Or our meticulous quality control. Or our advanced research and new products.



In fact, in light of all this, you should be even less surprised to learn that 40 different countries have used Insituform for no-dig pipe reconstruction.

To learn more about Insituform pipe reconstruction, call 901-759-7473.

Why settle for less?

Introducing the Krüger/Fuchs ATAD system. Your first choice for effective, efficient and economical sludge treatment.

Quality

Our Autothermal Thermophilic Aerobic Digestion (ATAD) process has provided excellent performance worldwide. It's recognized by the EPA as a process that can meet the new Part 503 sludge regulations for land application of municipal wastewater sludge, which includes PFRP and Class A requirements.

Speed

Our ATAD system features a sludge holding time of just six days in most cases. That's *up to 75% less* than with other aerobic or anaerobic methods, saving both space and time. And it's easy to operate, which reduces training time and operating personnel.

Price

Our autothermal process requires no additional heat, providing significant energy savings. The quick digestion cycle uses smaller tanks, further reducing capital costs. No added chemicals or expensive nitrification equipment are needed, either.

Dependable. Fast. Affordable. There's only one choice for sludge treatment: Krüger/Fuchs ATAD.

More than just ATAD bit better.

Water Mark.

Mark Weidman, Vice President and General Manager of Wheelabrator Clean Water's Thermal Operations Group, fishes in the Hudson River, downstream from WTI's Poughkeepsie EOS wastewater treatment facility and upstream from our New York Organic Fertilizer Company project in the Bronx, designed to turn two-thirds of New York City's sludge into an environmentally safe agricultural product.

"Water is probably our most precious resource. It affects every aspect of our environment and we have no more today than our ancestors had."

When Mark Weidman talks about water, you sense his urgency. An avid outdoorsman, he fears that unchecked growth and development threaten our finite water supply. As one of Wheelabrator Technologies' Clean Water Systems managers, he's also relieved to be able to recover some of that water. "We work in many areas. One is simply the purification of wastewater. We clean it so it can be returned to nature. In another, we convert wastewater biosolids into organic, pathogen-free pellets that are used as fertilizer and to restore damaged land. I consider it recycling in its purest form. Our pelletizing operations are not only a reliable, cost-effective way to help manage and recycle wastewater byproducts, but produce a marketable product as well. For my children to enjoy the kind of environment I had as a child, communities must manage waste effectively and organizations such as ours must continue to find better solutions. We're not going to change the world overnight. But anything we can do here today contributes to global solutions for tomorrow."

To find out how the committed people of Wheelabrator can help bring a balanced approach to your trash, air and water pollution problems, call us at 1-800-682-0026.

editorial viewpoint

Harrassment, Diversity, And Challenge

EARLIER this year, much national publicity was given to a claim of sexual harrassment made by a county public works employee—a male employee—against his female supervisor. Some women probably thought, "So what! We deal with it all the time. It's only *news* because a man's experienced it!" Some men may have felt vindicated: "See! Women can be just as guilty as men of crossing the line." Whatever the merits of the particular case, most of us, male and female, have witnessed or experienced incidents of discrimination, harrassment, glass ceilings, etc. The unfortunate fact is that they exist in every work environment and public works is no exception.

The field of public works is populated by many women and minorities of distinction and achievement. Many of our articles are authored by women and minorities. In the past year, PUBLIC WORKS has featured more women and members of minorities on its covers than in any previous year. And although we are proud of that fact, we admit it's not because we specifically set out to put women and minorities on the cover, but rather because women and minorities are, more than ever before, achieving positions of prominence in the public works field.

Which makes it all the more unfortunate that the harrassment issue has to rear its ugly head. Awareness and education are needed to alert us all to avoid situations that make others uncomfortable. It may be an idealistic goal, but if we treat our co-workers—superiors, peers, and subordinates—with consideration, respect, and understanding, provide opportunities for excellence and achievement, and recognize that diversity equals strength, harrassment will cease to be a divisive issue in the workplace.

Chicago Embraces 'Streetwise' Parking Meters

CHICAGO is replacing old mechanical parking meters in its business district with new high-tech models. Good news for the city, but maybe not so good news for parkers. As reported in the *Chicago Tribune*, the city expects to save substantially on maintenance costs and repairs, reduce vandalism damage, and increase revenues. The new digital meters have no moving parts, feature a one-piece iron casing, and are accurate down to the second.

Parkers, however, may not appreciate some of these improvements. Previously, parkers had been given an extra three to five minutes of parking time to compensate for any inaccuracy on the part of the old meters. Also, to raise the parking rates per minute on the old meters meant taking each one apart and installing new parts, discouraging the raising of rates. Now, the parking rate per minute on the new meters can be raised immediately using an infrared light to reprogram the unit.

The new VIP 95 meters are supplied by Duncan Industries, Harrison, Arkansas.

Good News for Rural Communities

RURAL communities in the future will be better able to stay on top of municipal solid waste management practices and issues, thanks to a grant awarded to the Solid Waste Association of North America (SWANA). The "Solid Waste Management Grant" was awarded to SWANA in cooperation with the National Association of Development Organizations, Research Foundation (NADORF) through the U.S. Department of Agriculture, Rural Development Administration. The grant funds will allow SWANA and NADORF to develop guidebooks and provide training geared to the needs of rural America.

The SWANA and NADORF guidebooks will focus on Integrated Solid Waste Management Systems, Decision Making in the Public Sector, Managing Financial Resources, and Regional Approaches to Municipal Solid Waste Management. They will be sent to 5000 rural solid waste management professionals during spring 1994.

The five workshops will be offered between May 1994 and July 1994 in South Carolina, Maine, Kansas, Mississippi, and Oregon. For more information, contact Lori Swain at SWANA 301-585-2898.

New Suburban Fund-Raiser—Golf

AN informative article in *Crain's Chicago Business* tells us that golf is now a "lucrative business venture" for local suburban park districts. Responding to the public's increased interest in the sport and to the need to preserve open space, municipalities are considering operating golf courses to generate revenue for local budgets.

In the Chicago area, the Hoffman Estates Park District, which acquired its golf course for $4 million in 1989, expects to earn $300,000 in profits on revenues of $1.7 million this year. After debt payments, the net income will be $70,000. In ten years, after the district has paid off its debt, net proceeds from the golf course are projected to reach $750,000.

The article admits that profits are not assured at municipally run courses—capital costs and substantial maintenance requirements must be considered. However, most municipally run courses are exempt from property taxes, allowing them to charge lower acccess fees than privately run courses.

WHEN THINGS ARE CRUMBLING AROUND YOU TURN TO FLYGT

For details circle No. A-7 on card

R0013674

Dependability. That's the reason you buy a pump. You want it to work when it's supposed to. Not sometimes, but all the time. And you don't want to spend a lot of money to keep it running.

If you're tired of pump down time and fed up with endless maintenance and expensive repair costs because of poor pump quality or misapplication, then it's time to retrofit with a Flygt submersible pump.

Flygt submersibles are available with motor efficiencies to 96.5% and hydraulic efficiencies to 87%, and are the most dependable solids handling pumps you can get. They're available with motors up to 1000 HP and capacities to 50,000 GPM. Stainless steel and explosion proof models will deliver unparalleled reliability for even the most demanding applications. And Flygt submersibles are easy to install.

When you buy a Flygt submersible, you'll have the assurance that wherever you are, Flygt's nationwide network of factory authorized repair and service centers stocked with genuine Flygt parts are only a phone call away. Try getting that from the other pump guys and their local motor shops.

With almost 50 years of on-line experience, Flygt stands alone with the ability to provide application and engineering support services for you or your consultant.

When it's time to retrofit, whether wet-pit or dry-pit, trade up to a Flygt where retrofitting is made simple, dependable and cost effective. Contact your local Flygt representative or ITT Flygt Corporation, Trumbull, CT 06611.

ITT Flygt

R0013675

washington report

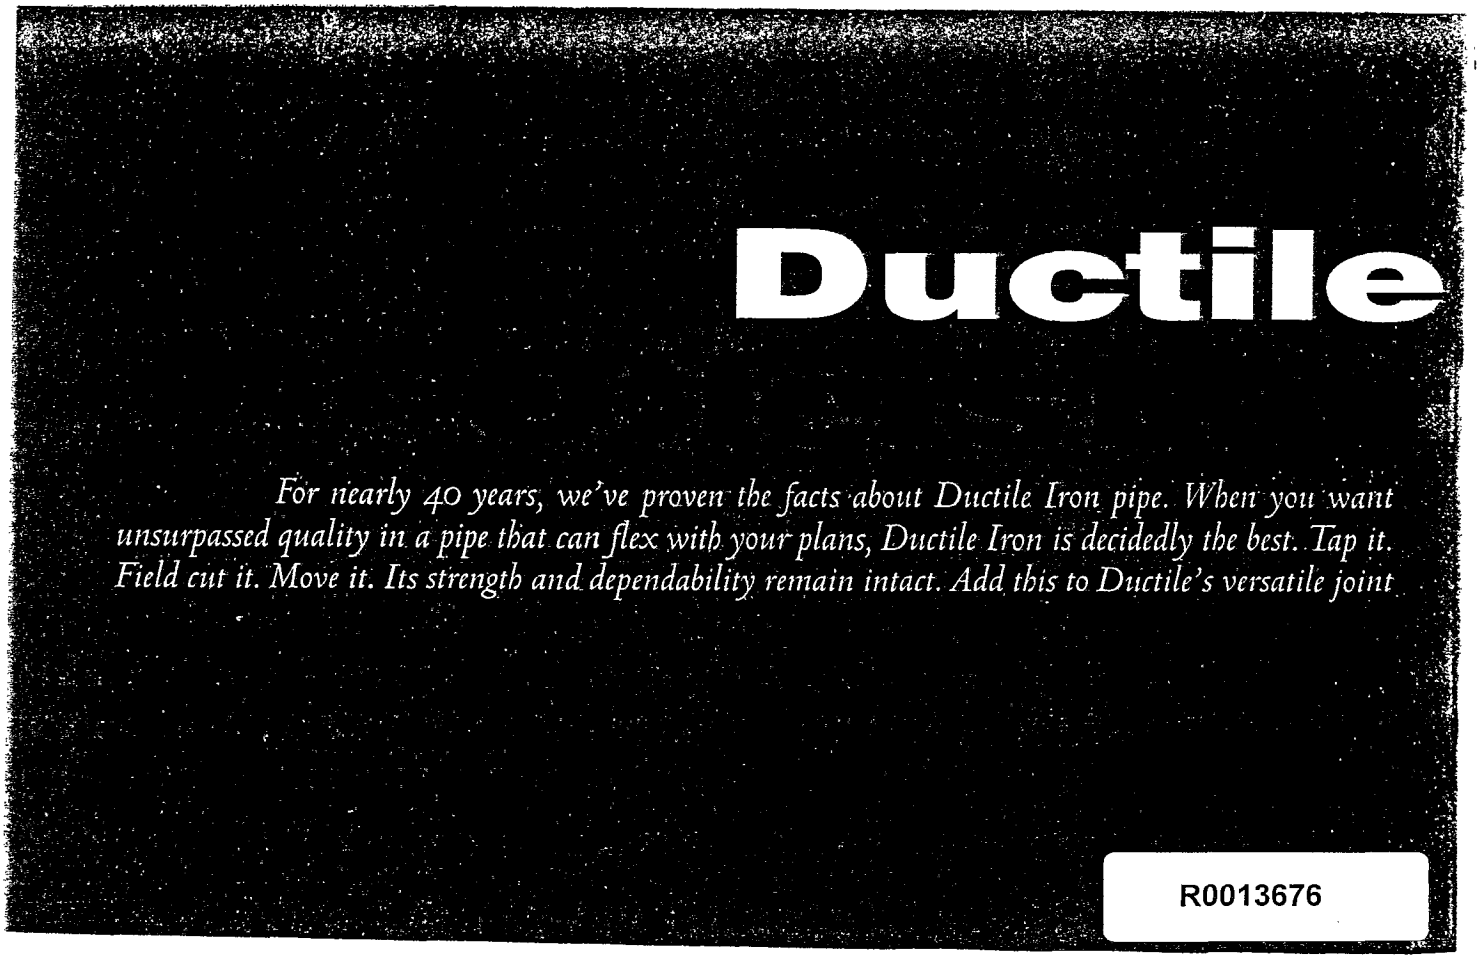
William F. Reynolds
Washington Correspondent

PRESIDENT Clinton's Omnibus Budget Reconciliation Act of 1993 was signed into law August 10, with October 1 this year as the date the federal excise tax on gasoline and most other transportation fuels will be increased by 4.3 cents per gallon. The legislation eked its way through the House by a vote of 218-216 and through the Senate by 51-50. Vice President Al Gore broke the tie.

The legislation was designed to reconcile the existing revenue and spending law with deficit-reduction targets set by the congressional budget resolution in March, which in turn, was designed to lower the projected growth in the deficit by $496 billion over the next five years. The 1990 Budget Reconciliation Act was intended to achieve $482 billion in savings over the following five years, but Congress failed to achieve much of that goal.

The new hike in the gasoline tax raises the federal tax by 30 percent to 18.4 cents per gallon. The tax on automotive diesel fuel will move to 24.4 cents per gallon. Since the increase also applies to marine fuels, diesel fuel used by inland waterway vessels will rise from 17 cents to 21.3 cents per gallon. Aviation fuel use by commercial airlines is exempt from the increase for two years, however, private aircraft and corporate jets will be subject to the increase beginning October 1.

Gasoline substitutes and additives also are affected under the new law. These substitutes and additives would include compressed natural gas, liquid propane, alcohol fuels (ethanol and methanol) and their octane-enhancing derivatives.



About $23.2 billion in revenues is expected to be generated from the fuel tax increases over the next five years, with about 70 percent of that total coming from gasoline increases. The Administration claims all those funds are earmarked for deficit reduction. President Clinton's original Btu tax was expected to raise about $72 billion over five years. It was dumped in favor of the gasoline tax increase.

Arguments for the gasoline tax hike noted that the average American family driving about 12,850 miles a year, at 20 miles per gallon, would only pay an extra $28 a year under the new law. But arguments against the increase pointed out that the average American household pays about $204 a year in federal motor fuel taxes, and the 30 percent increase, amounting to $62 a year, would move the total outlay for taxes to $266 a year. In some states, like Wyoming, with long range driving, the increase could jack tax outlays to well over $300 a year.

Other tax provisions relating to the existing tax on transportation fuels include:

1) extension of some of the existing federal gasoline tax, 2.5 cents per gallon, which was set to expire in 1995. Extension through 1998 means it will raise $7.82 billion, which is not earmarked for deficit reduction.

2) The tax will be collected on diesel fuel at terminal storage facilities, and no longer

from the wholesaler, a move designed to reduce evasion of payment of the fuel tax. Over five years, the increased revenue from the change is expected to top $1 billion.

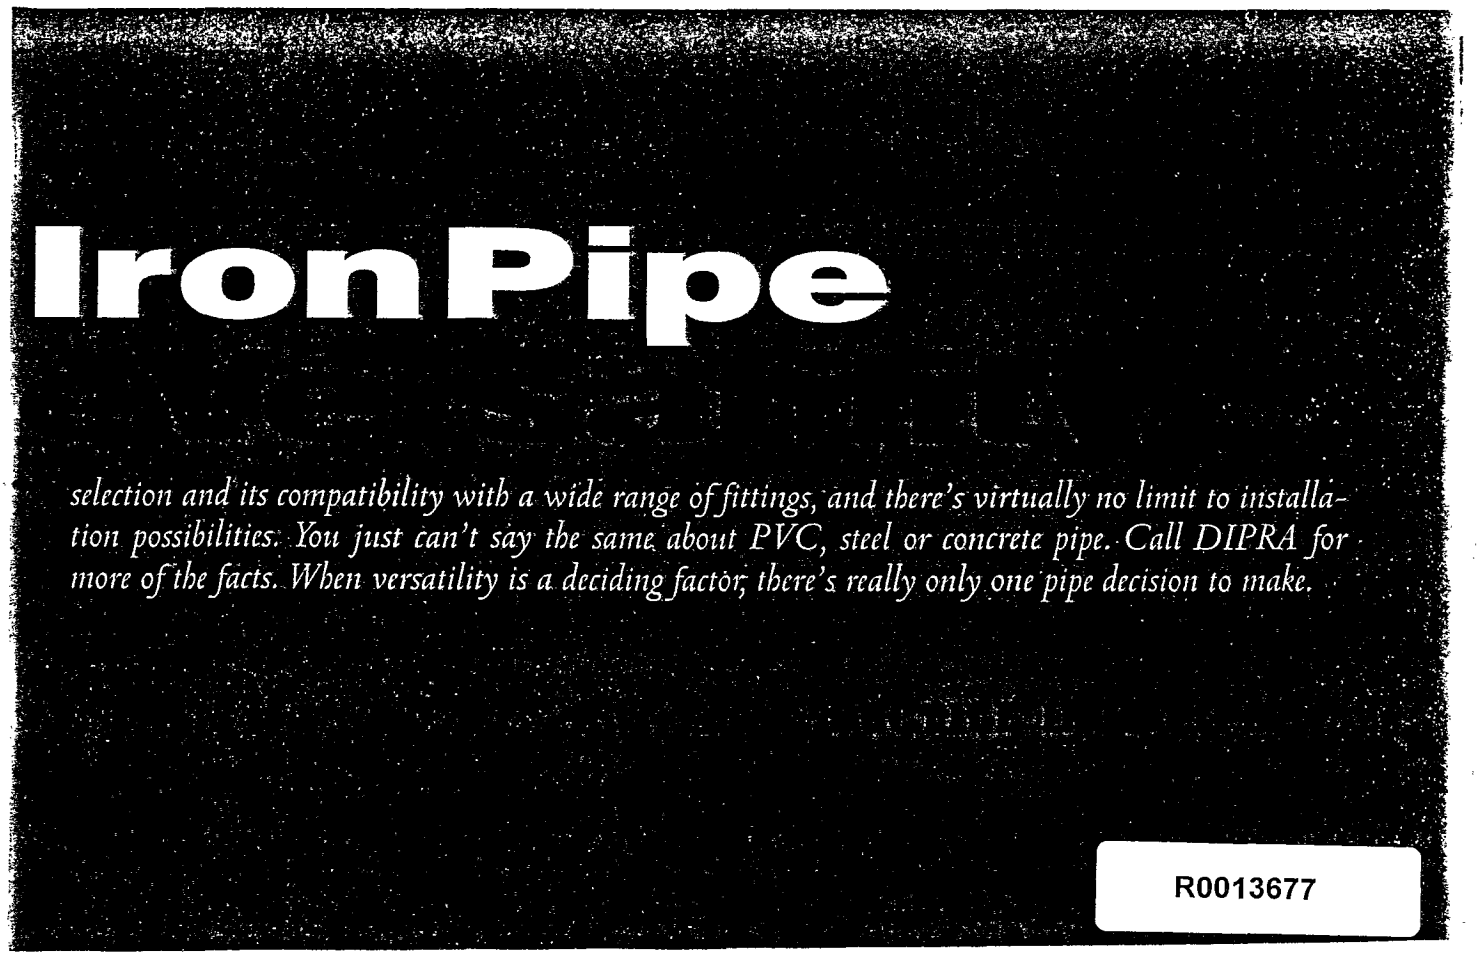
3) The passive-income tax credit on certain income derived from foreign shipping and from oil and gas extracted overseas would be removed, and additional revenues of $2.5 billion over five years are anticipated.

4) Eliminating the exemption for recreational boats from the existing 20.1 cents per gallon diesel fuel tax is seen bringing in an additional $148 million over five years. Recreational boats would also be subject to the 4.3 cents per gallon increase.

Congress is expected to place the reauthorization of the Clean Water Act on a fast track this month. In the Senate there have been seven hearings on the measure, and the Senate Environment subcommittee is planning to have it reported out to the full committee, headed by Senator Max Baucus, Montana, early this month. Senator Baucus has often said he will give it highest priority and wants to see it cleared for Senate floor action this session.

An additional seven hearings were held by the House Public Works subcommittee on water resources, headed by Representative Douglas Applegate, Ohio. The House Public Works Committee has not introduced its draft of the reauthorization legislation, but work on clearing it for House floor debate is seen matching the pact set by the Senate panels.

Major motivation for passage of the reauthorization is the federal fund assistance to states and localities for construction of wastewater treatment plants and other water pollution control projects. The Environmental Protection Agency claims it will need more than $100 billion for pollution control projects if it is to comply with existing Clean Water Act requirements.



The Senate's Baucus-Chafee bill would authorize $2.5 billion a year for the state revolving loan funds, starting in fiscal 1995. Grants to the funds would be authorized to go up by $500 million every year until FY 2000, but increases would be contingent on the federal government meeting certain deficit-reduction targets.

Champions for federal aid cheer the Senate bill's proposals, but the problem is there might be a big chunk of the revolving loan funds cut in FY 1994. The House passed a spending bill for EPA in June, to provide $1.25 billion for revolving loan funds next year, a big drop from the former $2 billion a year for the program. President Clinton wanted to take $845 million from the $2 billion slated for the program, and use it for supplemental spending to aid the economy, but the president's bill died in April. That defeat left the EPA with $1.2 billion for wastewater treatment program in FY 1994.

Two House committees have still not solved their differences over what should be done on drinking water legislation. The House Energy Committee, chaired by Representative John Dingell, Michigan, has offered a bill that would authorize $3.6 billion over four years to establish a new revolving loan program under the EPA that would help states keep contaminants out of drinking water. It was adopted by the committee in April. Outbreaks of intestinal disease from drinking water in several locations prompted fast action for the legislation.

The same day the Energy Committee approved its bill, Public Works Committee Chairman Norman Mineta, California, introduced a similar bill, and his full panel approved the bill the next day. It would authorize $2.6 billion over three years to set up a new program, but it would use the revolving loan fund structure already in place under the Clean Water Act to distribute the money to states.

The two panels have to compromise on jurisdictional authority; the Energy Committee does have jurisdiction over the Safe Drinking Water Act. However, the Public Works Committee, Chairman Mineta claims, has jurisdiction over the legislation because it deals with construction of water supply facilities. When a compromise has been reached, the legislation will move along.

MONUMENTAL FACTS

It took 1,600 men 14 years to build the Brooklyn Bridge.

Other monumental facts...

■ Eagle Point, formerly Engineering Data Systems Corporation (EDSC) has grown **1059%** over the last two years.

■ Eagle Point is one of the largest AutoDesk developers with over **200** employees!

CAT
WasteHandlers

Recycling Calls For New Efficiencies In Waste Handling

Caterpillar offers you machines to make your operation more productive, more profitable.

Versatile Caterpillar® waste handling machines offer you a better way to separate, transfer and stockpile recyclable materials.

It could be a single machine solution like the hydraulic excavator or integrated toolcarrier. Or maybe you can look to a combination of Cat® Wheel and Track-type Loaders, Lift Trucks... or Diesel Engines for OEM specification or repowering of existing equipment.

Whatever direction you are moving...the speed and maneuverability of Caterpillar equipment can often replace an older system or a group of single purpose machines.

And remember, besides material handling efficiencies you also benefit from the Caterpillar "job proven" record of dependable performance.

Call your Cat Dealer to learn more about Caterpillar's new efficiencies in waste handling. There's at least one best-suited to your application.

See your Cat Dealer to get all the details.

about our cover

Philip E. Gerwert, the President-Elect of the Water Environment Federation, is the Manager, Plant Environment-Compliance Consistency Section, General Motors Environmental and Energy Staff, Detroit, Michigan. He is responsible for coordination and oversight of compliance consistency programs at the company's manufacturing plants worldwide. For the three years before this assignment in 1992, his responsibilities included coordination, oversight, and regulatory interface of both solid and hazardous waste control programs worldwide and Superfund activities. In addition, his experience includes managing the Industrial Waste Activity, GM Environmental Activities Staff, with responsibilities for developing and coordinating solid and hazardous waste control programs worldwide. Other duties of that position included complying with the requirements of the Toxic Substances Control Act and the Department of Transportation Hazardous Materials Transportation Act conformance programs as well as the regulatory interface in these areas.

He was appointed Manager, Water Pollution Control, GM Environmental Activities Staff with responsibility for coordinating water pollution control programs worldwide. He began his career with the firm in 1958, with various assignments in production supervision, manufacturing process research and development, work standards and methods, advanced product planning, and environmental engineering at various plant locations.

Mr. Gerwert is a graduate of the University of Missouri-Rolla with a Bachelor of Science degree in Chemical Engineering. He attended the Pennsylvania State University Executive Management Program.

His professional affiliations include the Water Environment Federation of which he will become president at the organization's 66th annual conference in October. He has worked extensively for the WEF on both the local and national levels. He has served on the Executive Committee, the Board of Control as a Director-at-Large, the International Committee, and the Long Range Planning Committee. He is a past chairman of the Industrial Waste Committee and a member of the Government Affairs Committee. He is also a member of the Michigan Water Pollution Control Association, Air and Waste Management Association, New York Academy of Sciences, and American Water Works Association.

Mr. Gerwert also served on environmental quality committees of the Business Roundtable, Motor Vehicle Manufacturers Association, the Southeast Michigan Council of Governments, and the Michigan Chamber of Commerce Environmental Quality Committee. He was a member of the National Academy of Engineering Roundtable on Engineering Contributions to the Clean Water Act and the National Science Foundation Inter-Agency Task Group to develop regulations for pollution control in Antarctica.

Mr. Gerwert received the WEF Arthur Sidney Bedell Award in 1989 and is listed in *Who's Who in the Midwest* and *Who's Who Worldwide.*

Mr. Gerwert and his wife Pat reside in Rochester, Michigan and have a married daughter, Vicki, who is a civil engineer. He has been active in the local Kiwanis Club for 19 years, serving as President in 1983. Mr. Gerwert and his wife enjoy golf, cross-country skiing, and bridge.

ALAMO
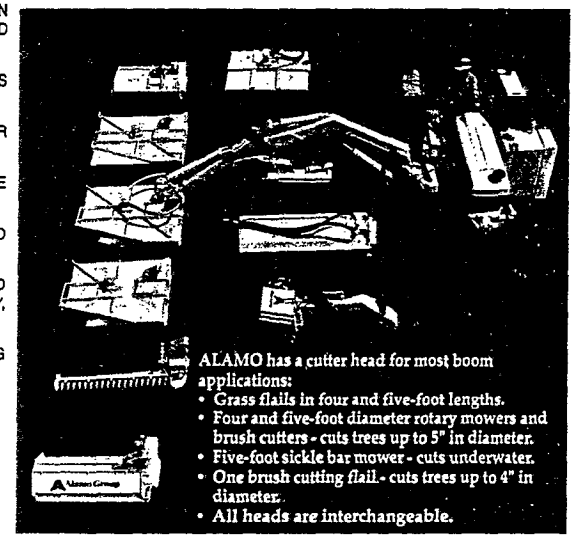
A 30-YEAR HISTORY OF LEADERSHIP & INNOVATION

ALAMO IS LARGER THAN THE NEXT THREE MANUFACTURERS COMBINED – WHEN COMPARING THE SIZE OF NORTH AMERICA MANUFACTURERS OF HYDRAULIC MOWING AND BRUSH CUTTING MACHINERY BUILT FOR THE GOVERNMENTAL MARKET!

ALAMO HAS THREE MANUFACTURING LOCATIONS AND OVER FOUR HUNDRED DEALERS LOCATED ACROSS THE NATION TO SERVE YOU.

ALAMO HAS ONE GOAL – TO PROVIDE THE BEST VALUE FOR EACH DOLLAR OF YOUR EQUIPMENT BUDGET.

WHEN YOU SPECIFY ALAMO EQUIPMENT YOU GET THE KNOWLEDGE AND EXPERIENCE GAINED THRU THIRTY YEARS OF SERVICE TO GOVERNMENTAL CUSTOMERS.



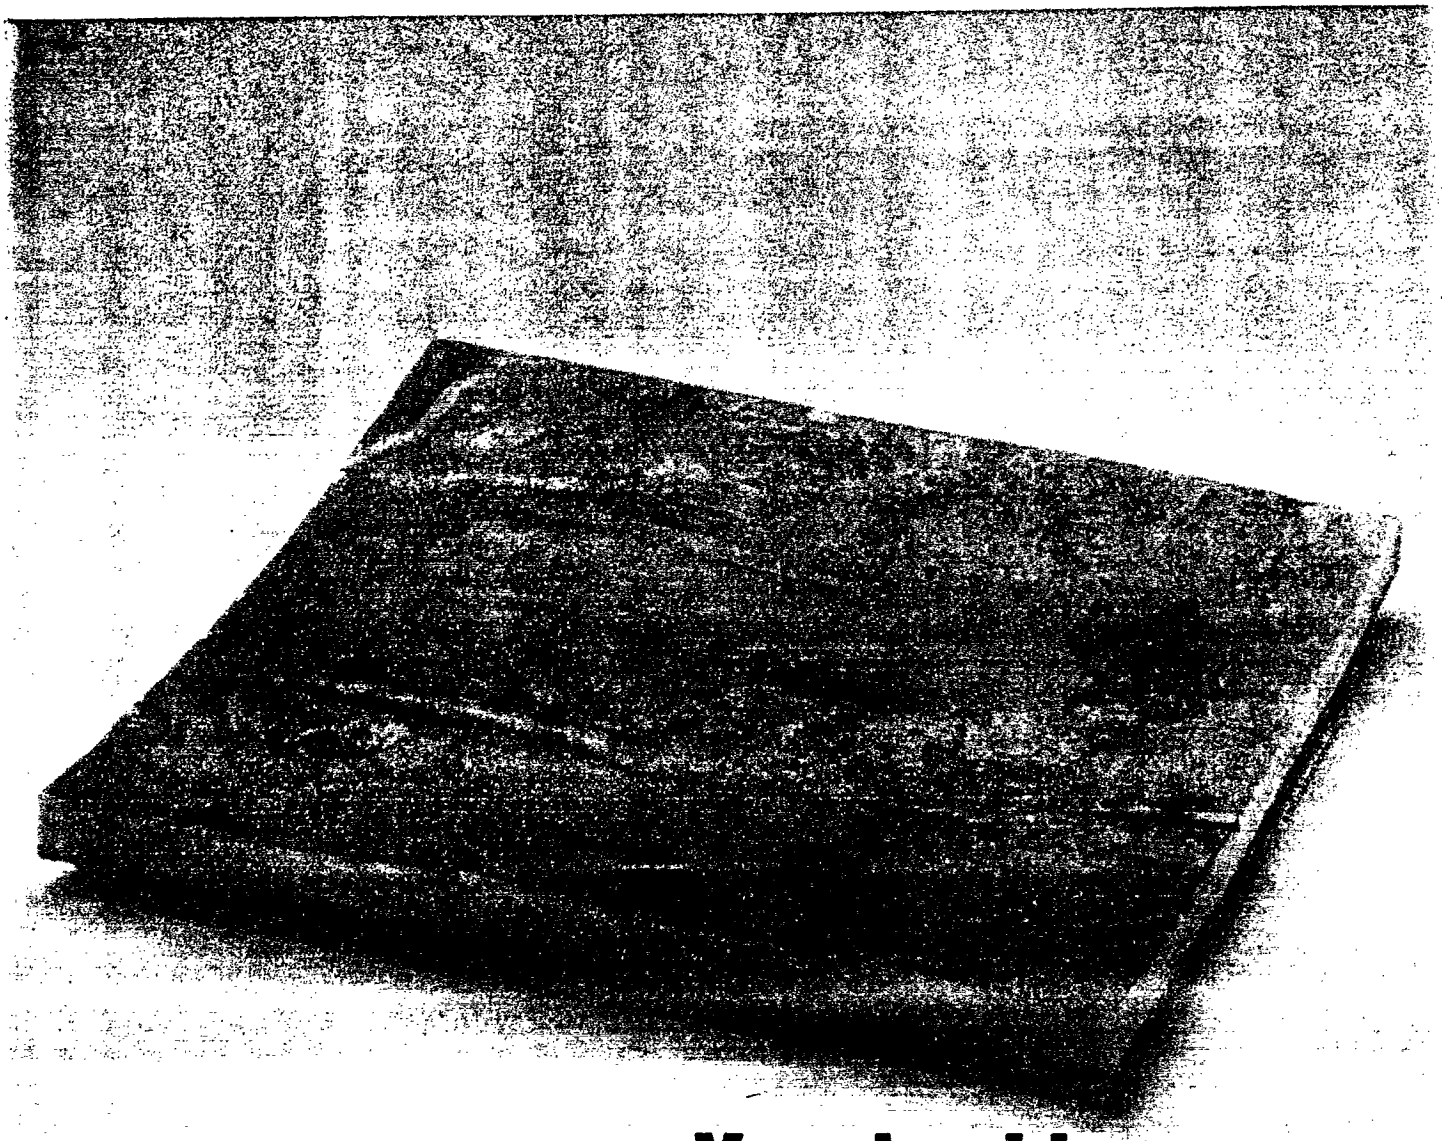
ALAMO HAS BEEN DOING MORE THAN JUST BUILDING EQUIPMENT. WE HAVE BEEN FIRST TO PROVIDE NEW PRODUCTS FOR YOU.

ALAMO BUILT THE FIRST EXTENDIBLE BOOM MOWER. WE NOW OFFER REAR MOUNT AND SIDE MOUNT MODELS WITH JUST ABOUT ANY CUTTING HEAD YOU COULD USE ROTARY, FLAIL, AND SICKLE BAR HEADS ARE AVAILABLE ON BOOMS TO ALMOST THIRTY FEET.

ALAMO HAS PROVIDED A NUMBER OF "FIRSTS" FOR THE MOWING AND BRUSH CUTTING INDUSTRY:

- FIRST FLAIL MOWER
- FIRST FLEXIBLE ROTARY MOWER
- FIRST EXTENDIBLE BOOM MOWER
- FIRST HYDRAULIC SICKLE BAR MOWER
- FIRST IN SERVICE TO GOVERNMENTAL CUSTOMERS FOR OVER THIRTY YEARS

ALAMO – A Name To Remember And Trust!



ALAMO has a cutter head for most boom applications:
- Grass flails in four and five-foot lengths.
- Four and five-foot diameter rotary mowers and brush cutters - cuts trees up to 5" in diameter.
- Five-foot sickle bar mower - cuts underwater.
- One brush cutting flail - cuts trees up to 4" in diameter.
- All heads are interchangeable.

FOR ADDITIONAL INFORMATION, PRODUCT DEMONSTRATION, AND THE NAME OF AN ALAMO DEALER IN YOUR AREA, CALL 210-372-3551, AND AN EXPERIENCED CUSTOMER SERVICE REPRESENTATIVE WILL HELP YOU.

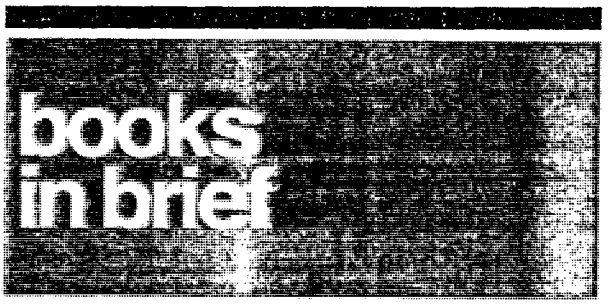
R0013680

You should look so good after twenty years in a London sewer.

R0013681

This is a sample from the very first installation of Insituform. Extracted by MTS Pendar Ltd., they found that the Insituform pipe passed even today's stringent structural design guidelines. And this after two decades on the job. (For a copy of the test results, call 800-234-2992.)

Surprised? You shouldn't be. Not if you're at all familiar with Insituform's *own* extensive testing. Or our meticulous quality control.



With these assurances, it's no wonder Insituform has reconstructed over 9 million feet of pipe without digging. All across the United States.

To learn more about Insituform pipe reconstruction, call 800-234-2992.

Insituform Technologies.

1770 Kirby Parkway, Suite 300, Memphis, TN 38138 FAX 901-759-7500

PUBLIC WORKS INSPECTORS' MANUAL

Silas B. Birch, Jr.; 680 pages; $34.95, add shipping and handling of $5.75 for the first item and $1.00 for every item over one; Building News, 77 Wexford Street, Needham Heights, MA 02194; 1-800-873-6397, fax-(617) 455-1493.

The fourth edition of the "blue book" is not only an indispensable handbook to inspection procedures, but gives an overview of the entire public works process. Main areas of the book cover general information; construction materials and materials control procedures; methods and inspection procedures; and preview, final inspection, and acceptance. The numerous and numbered subsections help locate particular information. There are suggestions on what to look for on specific projects, questions to consider, the proper equipment and techniques to be used, and other useful hints. There is information on the type and extent of records to be kept, sample forms, estimating, scheduling, grades marks, job site accidents, and so forth. The appendixes contain drawings, diagrams, sample records, and tables. A recommended guide for inspectors, designers, engineers, contractors, architects, consultants, and others involved in construction on the local, state, or federal level.

A GUIDE TO UNDERSTANDING LAND SURVEYS

Stephen V. Estopinal; 226 pages; $49.95; John Wiley & Sons, Inc. 1 Wiley Drive, Somerset, NJ 08875-1272, (908) 469-4400.

The second edition of this book features new drawings, updated information, and expanded explanations based on the reaction of readers from the first edition. Areas covered include real property, geometry, defining north, projection systems, measurement fundamentals, land record systems, boundaries, survey plats, legal descriptions, and deed descriptions. Useful as a basic reference, it is especially useful for those who are not surveyors, but whose work involves land surveying in some form (engineers, attorneys, site developers, and so forth). There are several useful appendixes including a section on the minimum requirements of the American Land Title Association and American Congress on Surveying & Mapping.

MILLER ON MANAGING

William H. Miller; 175 pages; $19.95 members, $24.95 nonmembers, catalog no. 10056; American Water Works Association, 6666 West Quincy Avenue, Denver, CO 80235; tel-1-800-926-7337, fax-(303) 795-1440.

Subtitled, *Straight talk on the ups and downs, do's and don'ts of managing a water utility,* this publication delivers just that—basic, practical advice. Replete with anecdotal stories and based on the author's 20 years at a large water utility (including 12 years as the head manager), it covers communication (with employees, the public, the managing board), the differing perceptions of managers and employees, mission statements, training, considering the future, regulations, and much more. Although based on a career at a water utility, the axioms and experienced-based knowledge found in this book are applicable to all management situations.

LANDMARK AMERICAN BRIDGES

Eric DeLony; 152 pages; $40.00; American Society of Civil Engineers, Publications Department, 345 East 47th Street, New York, NY 10017-2398.

Part of the "Historic American Engineering Record," this book shows the evolution of design, transportation, and engineering in American bridge building. With over 150 illustrations, it gives an interesting look at the types of innovation and ingenuity that occurred when a river or valley had to be crossed.

THE DESIGN OF WATER-RETAINING STRUCTURES

Ian Batty and Roger Westbrook; 202 pages; $89.95; John Wiley & Sons, Inc. 1 Wiley Drive, Somerset, NJ 08875-1272, (908) 469-4400.

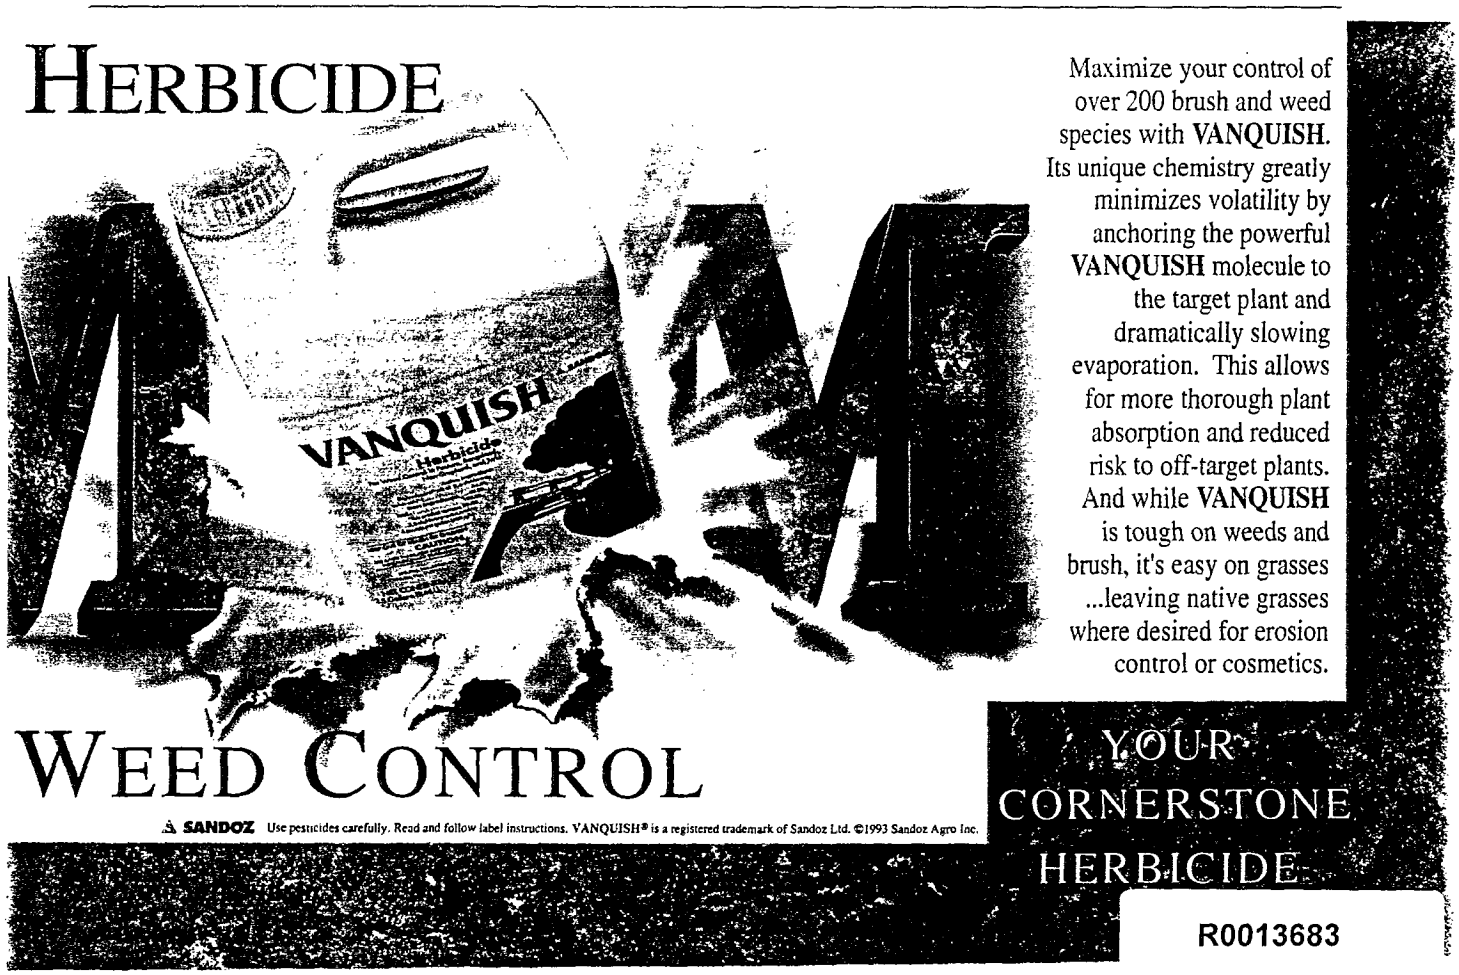
Applicable for water and wastewater structures, this book covers basic design parameters and provides design data on cantilevered walls, rectangular and circular tanks, prestressed concrete circular tanks, flat slab roofs, columns, and conical tanks. There is a sample analysis of a ground-supported structure and information on computer programs. It has numerous illustrations, diagrams, tables, and sample calculations.

CLIMATIC BUILDING DESIGN: ENERGY-EFFICIENT BUILDING PRINCIPLES AND PRACTICE

Donald Watson and Kenneth Labs; 288 pages; $29.95; McGraw-Hill Book Company, 11 West 19th Street. New York, NY 10011, 1-800-2-MCGRAW.

An intensive look at how design greatly affects a structure's ability to provide a suitable living environment and how to do so cost-effectively. Information is provided on minimizing and maximizing solar gain, strategies of climate control, heat flow, ventilation, and so forth. There are hundreds of drawings and diagrams as well as tables, charts, photographs, and other ancillary information. There is an extensive reference list and information on useful computer programs.

HYDRAULICS FIELD MANUAL



Robert O. Parmley, ed.; 334 pages; $42.40; McGraw-Hill Book Company, 11 West 19th Street, New York, NY 10011, 1-800-2-MCGRAW.

This book is designed to be a source of "quick" information in the field where a wide range of problems may be encountered. To aid in that task there are numerous charts, tables, diagrams, nomographs, drawings, and other illustrations. Main topics cover groundwater; pumps; weirs, flumes, and orifices; pipe flow; culverts and storm water; storage and fire protection; and estimating flows in the field. A supplemental section provides information on miscellaneous items as unit conversions, pipe curvature, infiltration rates, and much more.

Other Titles of Interest...

STATE ADMINISTRATIVE OFFICIALS CLASSIFIED BY FUNCTION; 331 pages; $30.00, order number D-003-91; Order Department, The Council of State Governments, P.O. Box 11910, Iron Works Pike, Lexington, KY 40578; tel-(800) 800-1910, fax-(606) 231-1858. Because job titles vary from state to state, this listing by function makes it much easier to find the right person; names, addresses, and telephone numbers of state officials in 147 areas.

DICTIONARY OF WATER AND WASTEWATER TREATMENT TRADEMARKS AND BRAND NAMES; Tom Pankratz; 139 pages; $39.95; Lewis Publishers, Inc., 2000 Corporate Blvd., N.W., Boca Raton, FL 33431. Arranged in alphabetical order with over 1,100 listings and cross-referenced; with current, obsolete, and dormant product names.

reviews of catalogs

Catalogs reviewed in this section have been selected for their helpful engineering and product information. New listings are designated by a star (☆). To order the catalogs you want just circle the numbers on the reply card and fill in your name, title, and address. This free Readers Service is restricted to persons actively engaged in public works.

Versatile Lifts Mean Better Servicing ☆

51. Literature describes parallelogram indoor/outdoor aboveground lifts that install easily and allow unrestricted access to the vehicle undercarriage. Standard safety features include automatic lock system, emergency stop bars, and an electronic logic control panel. Advantage Lift Systems, Inc., San Diego, CA.

Aerial Photography/ Photogrammetry Services ☆

52. This full-service company performs photogrammetric mapping, aerial photography, GIS services, and conventional and GPS surveying. Aerial Data Service, Inc., Tulsa, OK.

Rubberized Asphalt Kettle ☆

55. Literature features the Model KERA-130H diesel fueled rubberized asphalt kettle for crack sealing. Its Heated Hose System delivers heated fluid material to the application point through a heated discharge line that will maintain sealant temperatures, even during periods of non-use. Aeroil Products Co., Inc., South Hackensack, NJ.

Economy Lighting for Heavy Duty Trucks ☆

56. Catalog offers the full line of American-made strobe and halogen lights, rotating beacons, and warning lights. Shatter-resistant Lexan® lenses come in all five safety colors. Austin Electronics, a Div. of Whelen Engineering Co., Chester, CT.

All-Purpose Truck Covers ☆

60. Company offers an automatic cover for a roll-off truck that covers all height and length containers, and a dump truck cover powered by electricity, hydraulics, or hand crank. B & B Equpt. Sales Co., Inc., Miami, FL.

Suspension for Smoother Rides ☆

61. Product sheet describes the Chalmers 800 rubber spring tandem truck suspension—no leaf springs or air bags to replace. Soft ride increases mileage and stability and cuts maintenance needs. Chalmers Suspensions Int'l. Ltd., Brampton, Ontario, Canada.

Curvimeters & Precision Timing Instruments ☆

62. Catalog presents curvimeters for measuring distances in various scales, including the Comcurve-5 digital model, and stopwatches/time study watches. M. Ducommun Co., Inc., Warwick, NY.

Post-Emergence Vegetation Management ☆

511. Brochure outlines the chemistry and benefits of Vanquish® herbicide, provides problem vegetation information, and charts variations of tank mix options for broadleaf weed and brush control. Sandoz Agro, Inc., Des Plaines, IL.

Utility Castings, Hydrants, & Valves ☆

64. Catalog offers manhole frames and covers, catch basins, trench grating, tree grates, fire hydrants, gate valves, and much more, and includes flow capacity. East Jordan Iron Works, East Jordan, MI.

Tapping & Linestopping Equipment ☆

67. Perform pipe repairs without system shutdown—this company sells standard tapping and linestopping machines for 3/4- through 16-in. pipe diameters and performs contract services for 3/4- through 48-in. diameters. Hydra-Stop, Inc., Blue Island, IL.

Specialty Vehicles And Equipment ☆

68. Literature explains the custom design services this company offers for specialized multi-purpose and specific task vehicles, even with on-board power source. Masterack, Atlanta, GA.

Control Fueling Automatically ☆

71. Literature presents the RFC-2000™ automated fuel management system, which records vehicle ID, fuel dispensed, odometer reading, date, and time, unattended, and without cards, keys, or keypads. Tank Tech Corp., Congers, NY.

Measurement Gauges for Roadway Applications ☆

72. Electronic gauges to measure density, moisture, and asphalt content include the Model 4545 continuous density gauge to update compaction results while rolling and the Model 3241-C asphalt content gauge to measure asphalt cement content of pavement mixes. Troxler, Research Triangle Park, NC.

Clean Clogged Valve Boxes ☆

73. Literature highlights valve box cleanout systems to remove debris in minutes—including mud, rocks, water, clay, glass, etc. E.H. Wachs Co., Wheeling, IL.

Recycling: A Systems Approach ☆

76. Recycle America® programs focus on the three areas critical to program success: collection, processing, and marketing. Waste Management, Inc., Oak Brook, IL.

Large Document Copiers ☆

78. Literature introduces the model 516M mid-volume plain paper copier, which makes copies from any drawing and copies 36 in. wide by any length. Blu-Ray, Essex, CT.

Barrier System for On/Off Road Applications ☆

87. Literature covers this company's lightweight plastic channelizing device that can be water ballasted for positive protection in work zones, for flood protection, and against soil erosion. Yodock Barrier Systems, Bloomsburg, PA.

Replacement Blades ☆

99. Company offers replacement blades for snow plows, graders, dozers, loaders, and scrapers—available in high treated through hardened, high carbon, carbide edged, and surface hardened styles. Valley Blades Ltd., Waterloo, Ontario, Canada.

Eliminate Grease, Odor In Lift Stations ☆

209. Brochure presents Lineze™, an all-natural product of the citrus industry that floats on top of the wet well and prevents normal lift station odors from leaving the wet well, while also liquefying grease. Earth Chemical, Inc., Parrish, FL.

902 Pages of Safety Supplies ☆

211. Voluminous 1994 catalog displays thousands of personal, environmental, and industrial safety supplies, with an expanded section of ergonomics products. Lab Safety Supply, Janesville, WI.

Storm Alert/ Warning Service ☆

212. Company provides road and highway departments with accurate, timely storm warnings. DVM Weather Service, Florida, NY.

Solve Surface Seal Problems ☆

213. Literature describes how this durable, watertight fiberglass surface bonds to concrete or steel and seals swimming pools, fountains, tanks, zoos, aquariums, etc. Fibre Tech, Inc., Largo, FL.

Guide to Stormwater Runoff Monitoring ☆

217. New guide answers questions about the EPA monitoring guidelines, provides application information, and features product specifications on integrated monitoring systems. Isco, Inc., Environmental Div., Lincoln, NE.

Using PVC for Trenchless Pipeline Reconstruction ☆

223. Literature presents NuPipe, made from corrosion- and abrasion-resistant PVC. It is pre-manufactured in continuous folded lengths for long, jointless pipe runs and expands to its round shape during installation. NuPipe, Inc., a Subs. of Insituform Technologies, Inc., Memphis, TN.

Match the Truck To the Job ☆

224. Brochure (233-05919) profiles the Model FE and four-wheel drive PG439 line of Class 3, diesel-powered, light-duty trucks with tight-turning radius and tilt-forward cab for easy maintenance. Mitsubishi Fuso Truck of America, Inc., Bridgeport, NJ.

Prevent Pavement & Sidewalk Buckling ☆

225. Literature describes the Biobarrier® root control system, a geotextile fabric with controlled-release nodules containing trifluralin to control tree root encroachment. Reemay, Inc., Old Hickory, TN.

Reliable Wastewater Odor Control ☆

226. Brochure (Form B-60) explains how Odor-Master Systems control odors by chemically changing, not masking odorous compounds in contaminated air. The compact systems include scrubber tower, fan, brine tank, eletrolytic cells, rectifier, motor control center, and automatic control system. Pepcon Systems, Inc., Henderson, NV.

New Bucket Couplers ☆

227. Illustrated info sheet introduces the Remote Hydraulic Quick Coupler, the Quick Change JAW®, and the Piggy Back Swinger for coupler versatility. Wain-Roy,® Inc., Hubbardston, MA.

Think of the Price You Pay for a New Truck as Just a Downpayment.
TOTAL
SHOP SUPPLIES
TOTAL AMOUNT
R0013685

The most important factor in buying or leasing a new truck, is what happens after delivery. Will the truck perform the way you expect it to?

It's hard to find the answers to those questions before delivery. After all, the promises a salesman makes, are just that.

All too often, unexpected problems increase operating and maintenance costs beyond tolerable limits. Problems that simply do not exist with MITSUBISHI FUSO trucks.

What to expect after you buy or lease a MITSUBISHI FUSO truck.

1. Expect your MITSUBISHI FUSO truck to perform reliably. Without problems. MFTA and your MFTA dealer will work their hardest to make certain it does. Our warranty isn't just a piece of paper with disclaimers in barely legible type. It helps protect your investment.

2. Fully expect your MFTA dealer to do what's necessary to make certain your truck is an asset and not a liability. The common things most dealers do. And, the uncommon things few dealers do. While many dealerships offer a wide smile and a hearty handshake as you drive away—but forget you 5 minutes later—expect your MFTA dealer to remember your name and business whenever you call. Expect your MFTA dealer to act like a true "partner."

3. Expect your MFTA dealer to know how to keep your MITSUBISHI FUSO truck on the road. Working. We require every MFTA dealer to put sales, maintenance, and repair people through MITSUBISHI FUSO comprehensive training programs that have yet to be matched by anyone else in the industry. As a result, you

© 1993 MFTA

"My Mitsubishi Fuso trucks have saved me over 50% on my fuel cost, and even more in repair bills. They just don't break down. I appreciate a company that can engineer a truck that's exactly right for my business. Believe me, that's something no one else has done."

Richard Fulmer–AKCA, The Pavement Marking Company

"My Mitsubishi Fuso FH has 140,000 miles on it and neither the brakes nor clutch have had to be replaced. That savings alone in repair and down time cost, inspired me to buy another FH."

Terry Chapman–Chapman's Wrecker Service

"The complete dedication from my dealer for quick response is critical to my business, and our Mitsubishi Fuso FM trucks solve equipment problems traditional in my industry."

Mike Statt–Resurface Inc.

R0013686

"My 1987 FE has over 300,000 miles on it and it's never been taken apart."

Richard Brendle–Brendles Transfer

"Before I started in business two and a half years ago, I researched the truck situation thoroughly. I think I visited every truck dealership in New England and compared everything before I settled on Mitsubishi Fuso. My decision was based on the fact that the truck line offered more and had the best features."

Isaac Edry–Isaac's Moving and Storage

"After 107,000 miles, we've only added fuel, tires, and filters to keep our Mitsubishi Fuso FH running, and it gets the best fuel economy of any truck in our fleet."

Scott Hoover–Roaring Spring Bottling

can expect your truck to be in the hands of highly-trained, highly-skilled, dedicated people whose sole mission is to keep your truck profitable.

4. Expect replacement parts and component assemblies to be immediately available. Although parts availability may be a legitimate concern with other trucks it is not a concern with MITSUBISHI FUSO trucks. MFTA routinely fills all dealer parts orders within 48 hours. And, our parts fill rate remains consistent at 99% or above.

5. Expect your MITSUBISHI FUSO truck to perform durably, reliably, and economically for a long time. When you're ready to sell, or trade it in, remember that MITSUBISHI FUSO truck resale values have been traditionally high.*

What all this means, is that buying or leasing a MITSUBISHI FUSO Light/Medium™ or Medium Duty truck, is an extremely sound investment. One that also includes the best service, parts, and "value" for the life of the truck. From a company and dealers who know the difference between just "selling" and "superior customer service."

That is why the level of customer service you get, separates MITSUBISHI FUSO trucks and dealers from the rest of the crowd. And why MITSUBISHI FUSO trucks will provide an exceptional return for your investment, and profits for your business.

We invite you to discover that what you've read is not a paper promise, but a fact. Visit your nearest MITSUBISHI FUSO dealer as soon as possible.

***According to used truck valuation guides.**

Stop Pump Sealing Problems ☆

228. Literature describes S.B.S. stuffing box sealant and other mechanical seals, gaskets, O-rings, and lubricant products. Sterling Plastic & Rubber Products, Inc., South Amboy, NJ.

Pinpoint Leaks in Valves & Valve Systems ☆

231. Product sheet covers the AccuTrak™ Model VPX and Model VPX-WR (water resistant) ultrasonic leak detectors. Each kit includes detector/headset, sound generator, wave guide, horn restrictor, case, and charge adaptors. Superior Signal Co., Inc., Spotswood, NJ.

Valves for Hydraulic Power Control ☆

88. Literature presents mobile hydraulic control valves, integrated circuits, cartridge valves, electronic programmable controllers, and feedback devices. Gresen/Dana, Minneapolis, MN.

Suspension System for Demanding Refuse Operations ☆

89. Literature explains how the new maintenance free RS system's transverse rods reduce bushing wear and eliminate system maintenance. Hendrickson Suspension, Woodridge, IL.

Versatile Leaf Disposal Unit ☆

90. Product data features the Hi-Way AutumnMate 720, which handles wet and dry leaves with a brush, roller, conveyor, auger, and impeller/blower system. Highway Equpt. Co., Cedar Rapids, IA.

Comply With the OSHA Confined Space Rule ☆

600. Literature kit on respiratory equipment and gas detection instruments is designed to help employers meet the requirements of the new OSHA Confined Space Rule. Scott Aviation, A Figgie Int'l. Co., Lancaster, NY.

Boats for Debris Removal ☆

92. Company supplies boats for oil skimming, trash and debris removal, and aquatic plant harvesting. Hydraulic Boat Co., Inc., Port Byron, NY.

Advanced Cart Lifting Technology ☆

93. This company's rotary TuckAway cart lifter installs and stores compactly and lifts carts high and steep for complete dumping. Perkins Mfg. Co., Chicago, IL.

Permanent Asphalt Repair ☆

95. The 4TCR asphalt recycler and storage unit recycles new or old asphalt; the TR-48 heats asphalt in place with no burning or oxidation. Poweray Infrared Corp., Claremont, NH.

Pipe Joining System ☆

243. Literature explains the Victaulic system of joning pipe with only two bolts, making sludge clean-out, maintenance, expansion, etc. easier. Victaulic Co. of America, Easton, PA.

A Market for Waste Plastics ☆

613. Literature introduces Envirowood™, a synthetic lumber substitute made of 100 percent recycled plastic. The company is looking for sources of material and encourages communities with collection programs to investigate a mutually beneficial relationship. Envirowood, Mt. Prospect, IL.

Datalogging Open Channel Flow Measurement ☆

586. Product Data Sheet (US/275) features the MSPLOG data logging system, able to log daily totalized flow accumulated up to 32 days, plus a 2000 point flow measurement logging. The data storage rotates to provide continuous information. Magne-Sonics, Houston, TX.

Submersible Pumps ☆

244. Literature covers the wide range of horsepower, capacity, and heads offered in this company's line of submersible pumps. Flygt Corp., Norwalk, CT.

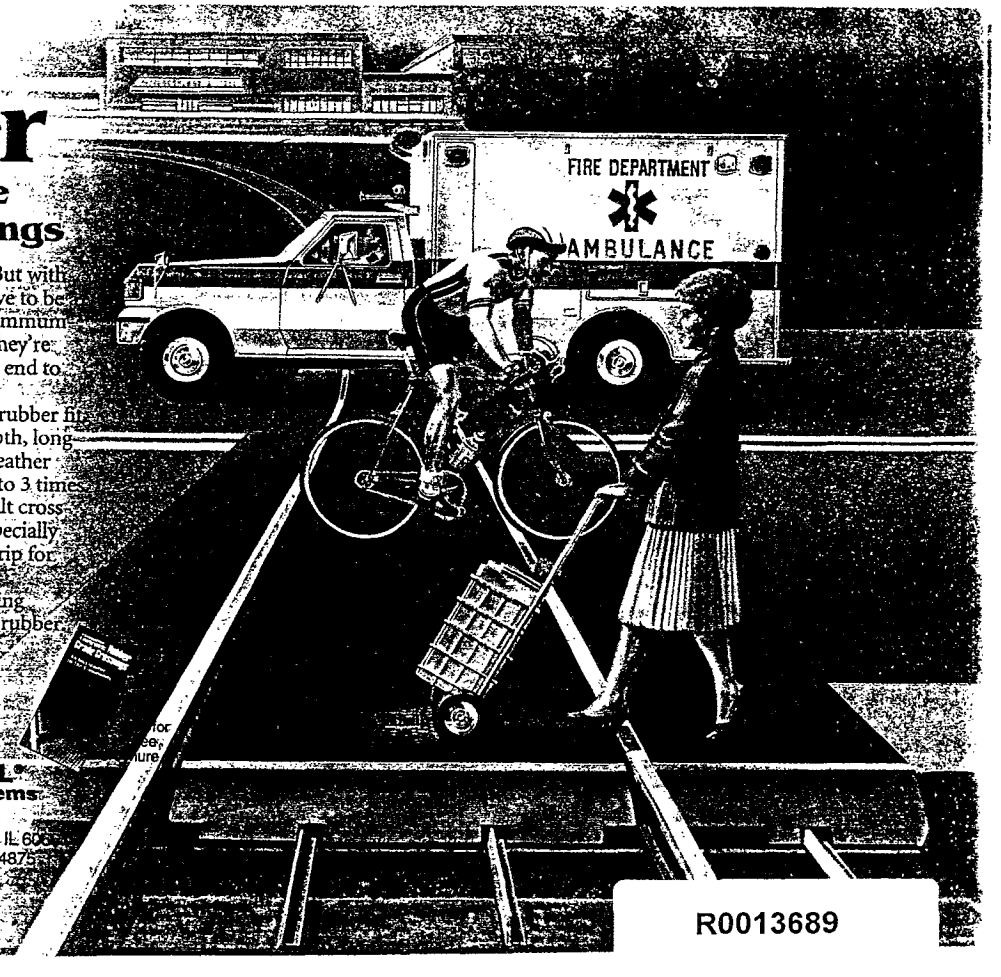
CCTV Sewer Inspection System ☆

245. The Port-A-Pac is a versatile CCTV system for both remote and mainline inspection. Available in four configurations. Cyclops Electronics, Inc., Boerne, TX.

Municipal Truck Leasing ☆

96. For information on the municipal leasing program for Ford vehicles, contact Southside Sales, Chicago, IL.

Plastic Covers Contain Odors & Vapor ☆



237. Fiberglass reinforced plastic covers are designed and manufactured for maximum strength at minimum weight, efficient on-site assembly, corrosion resistance, and minimal moisture collection points. SynTechnics Inc., Paducah, KY.

Alternative Hydraulics/ Hydrology Software ☆

238. Literature announces new releases to the STORM SEWERS and SANITARY SEWERS modules, operating inside AutoCAD®, for sewer analysis and/or design. Eagle Point, Dubuque, IA.

Tackifier Boosts Bonding Power ☆

404. Literature presents Silva-Tack™ concentrated formula tackifier to boost the bonding power of mulch, resulting in a web-like network of interlocking fibers that hold seed, fertilizer, and soil in place; stabilize soil and sand; and control dust. Weyerhaeuser, Engineered Fiber Products, Snoqualmie, WA.

Rubber

The Civil Response To Railroad Crossings

Road intersecting rail is a fact of life. But with today's technology, crossings don't have to be public nuisance. Across the nation, communities are insisting on rubber systems. They're attractive, affordable, and can spell the end to rough, even dangerous crossings.

Interlocking pads of 100% molded rubber fit securely against rails to provide a smooth, long lasting crossing surface. In fact, our weather resistant system is engineered to last 2 to 3 times longer than ordinary timber and asphalt crossings. For an extra measure of safety, specially designed grooves give vehicles added grip for superior traction.

Make your community's next crossing upgrade a true upgrade. Respond with rubber. Anything else is downright uncivil.

R0013689

Gentle Weed Control ☆

240. Technical guide tells how Surflan™ herbicide can stop over 50 weeds and grasses, protecting over 175 ornamentals. DowElanco, Indianapolis, IN.

Aerator for Wastewater Treatment ☆

493. Brochure details the TORNADO surface aspirating aerator. Design improvements include the replaceable seal module, which simplifies initial assembly and eases routine service inspections. AEROMIX Systems, Inc., Minneapolis, MN.

Towable Sewer Flushing Machine ☆

498. Product sheet (Bulletin 3030) covers the Model HV2060TR/L Hy-Velocity Sewer Flushing Machine, designed with high-pressure triplex pump and dual axle design for easy towing and positioning. Sreco Flexible®, Lima, OH.

Two-Function Rear Loader ☆

499. Specification sheet (PMRDG100-930501) introduces the RDG100 Load Liner II Series dual chamber rear loader to handle separated refuse collection and recycling. Pak-Mor®, San Antonio, TX.

New Microbiology Catalog ☆

502. A 48-page "Microbiology—Systems for Analysis" catalog (Lit. #3986) contains current information on testing for coliforms and other bacteria in water and wastewater and describes incubators and equipment, ready-to-use media, presterilized apparatus and labware, and much more. Hach Co., Loveland, CO.

Air Purifying Respirators ☆

503. Color brochure details the disposable Series 86--the low-maintenance air purifying respirator, the reusable Blue 2000 half-mask, and the full facepiece unit. Survivair®, Santa Ana, CA.

Effective Sludge Treatment ☆

241. Literature details the Kruger/Fuchs Autothermal Thermophillac Aerobic Digestion (ATAD) process for sludge treatment, which features a sludge holding time of six days. I. Kruger Inc., Cary, NC.

Diaphragm Valves for Fluid Handling Systems ☆

479. Literature (Bulletin 530) introduces the new Series 530 plastic diaphragm valves with high flow capability, new sizes, double shaft seal, and true union end connections. AquaMatic®, Inc., Rockford, IL.

Engineering Handbook for Bearing Users ☆

480. New 364-page handbook contains bearing specifications, engineering data, and rating life calculations for MRC bearings. A 20-page table provides data on vibration frequencies of widely used bearings. MRC Bearing Services, King of Prussia, PA.

New Tool Carriers— More Than Wheel Loaders ☆

489. Brochure (Form No. CE014053) presents the 621B and 721B XT Extra tool carriers with excellent engine efficiency, superior hydraulic capacities, maximum loader productivity, quick change tool capability, and a wide variety of application specific tools available. J I Case, Racine, WI.

Extending a Driver's Field of Vision ☆

492. Brochure explains how the Safety Vision SV55 Camera System helps drivers safely perform hazardous tasks such as backing up, making wide turns, and changing lanes. The United Group, Inc., Bannockburn, IL.

Plastic Products for Testing & Storage ☆

963. Catalog includes bottles, laboratory supplies, tubing and fittings, shipping supplies, etc. Consolidated Plastics Co., Inc., Twinsburg, OH.

Horizontal Pumping System ☆

424. Brochure covers a low-maintenance, cost-effective alternative for split casing and positive displacement pumps—a multistage centrifugal pump horizontally skid mounted for surface pumping applications. Reda, A Cameo Int'l. Inc. Co., Bartlesville, OK.

Scanning from Aerial Photos ☆

426. Literature (M-002-0390) discusses the VX3000 Image Scanner™, providing accurate, high resolution images from aerial photos for geographical surface modeling or landbase information capture and management. Vexcel Imaging Corp., Boulder, CO.

Spiral Technology for Dewatering Products ☆

786. Color brochure describes a new eight-product line of liquid/solid separation products based on spiral technology, including an all-in-one in-channel fine screening, conveying, and dewatering system, septage receiving system, dewatering press, grit separator, and more. Hycor Corp., Lake Bluff, IL.

Confined Space Entry Monitor ☆

789. Specification sheet (TR0293) details the Triple Plus multifunctional portable gas detector that simultaneously monitors up to four gases. The unit can be configured to provide instantaneous alarms, time weighted averages, or peak hold values. CEA Instruments, Inc., Emerson, NJ.

Handheld Meter Reading ☆

862. Brochure tells how the Route Management System (RMS) provides hardware and software to reduce data collection costs by improving accuracy, eliminating redundant data entry, and interfacing between field units and office PC. Radix Corp., Salt Lake City, UT.

Service.

"We take a personal approach to service so we can get to know our clients and help them meet the challenges that they face every day."

Gene Amlin, P.E., HNTB-Indianapolis

HNTB environmental engineers are committed to providing hands-on, personal service. We consider this approach critical to helping our clients meet the operational, financial and regulatory challenges that they face daily. This dedication to service, combined with technical expertise, is the hallmark of HNTB environmental engineering.

10' SWEEPING PATH • "SMART" CONTROLS • 11-1/2' HIGH DUMP • QUIET OPERATION

INTRODUCING

HIWIND

Vacuum Sweeping Power, High Dump Versatility

The all new Hiwind™ series vacuum sweeper from Elgin is more than a new product, it's a new concept in street sweeping productivity. With high dump capability, an extra-wide sweeping path and state of the art electronic controls, the Hiwind provides versatility and efficiency never before available in a full sized vacuum sweeper.

World's Widest Vacuum Sweeping Path. The Hiwind features two independently suspended vacuum nozzles that focus extraordinary cleaning power on the widest vacuum path you'll find–a full 60". A unique Hi-Flow™ design lets each nozzle adapt to changing surface contours for optimum cleaning efficiency. 42" side brooms extend the cleaning path to 10 feet and provide plenty of digging power to break-up heavy, compacted debris.

Lifts A 4½ Ton Payload 11½ Feet. Variable high dump capability lets you lift and empty the Hiwind's 6 cu. yd. hopper directly into a dump truck and quickly return to sweeping. Hiwind is the first full sized vacuum sweeper that gives you the option of unloading at ground level, 11½ feet, or any height in between.

Automated Sweeping Controls. Elgin's revolutionary new INTELLA-TOUCH II™ electronic control system lets operators handle all sweep system functions, including hopper dump, without leaving the cab. A unique "memory" function remembers all sweep settings for fast, easy conversion from transport to sweeping mode. Built-in self-diagnostics help service technicians check out the operating system and components in seconds. These innovative features and more make the Hiwind the most productive vacuum sweeper to hit the streets in years.

Ask your dealer for a free demonstration of the all new Hiwind. See for yourself the innovation and support which have made Elgin the most trusted name in street sweepers for nearly 80 years. The Hiwind is built with pride in the USA.

Tunnel & Underpass Lighting ☆

626. Illustrated brochure (Form TSLC 8-91) discusses tunnel and underpass lighting—the luminaires and lighting control systems available for correct, safe illumination of enclosed areas. Thomas/Schreder Lighting, Milan, IL.

Weight Data Management System ☆

630. Fold-out brochure details the Model 9000 Weight Data Management System, designed to quickly and efficiently collect data, display it graphically, and generate reports and tickets for documenting weighing transactions. Interface Logic Systems Inc., Weighing Div., Columbus, OH.

Durable & Corrosion-Resistant Hydraulic Cylinders ☆

634. Literature (DKPF104) presents the 120- and 180-Series Hydro-Max™ hydraulic cylinders with nickel-chrome plated hardened rods to extend seal life and improve corrosion resistance. John Deere Harvester Works, Moline, IL.

Versatile Waste Processing Unit ☆

779. Literature introduces "The Beast," a combination chipper/hammermill/hog with a 5-ft wide by 15-ft long feed conveyor to handle logs, brush, stumps, concrete blocks, demolition waste, etc. with knives, swinging hammers, and fixed hammers. Bandit Industries, Inc., Remus, MI.

Protection for Manhole Workers ☆

703. Literature discusses the new AMH Series of lightweight aluminum manhole shields for worker protection while setting or repairing manholes. The shields surround the manhole pit and provide an unobstructed inner span for excavating and placing the manhole. Griswold Machine & Engineering, Union City, MI.

Hydraulic Rough Terrain Cranes ☆

699. Product sheet (#SE/38/8030) covers the RTC Series of hydraulic rough terrain cranes with capacities from 25 to 30 tons. The exclusive Confined Area Lift Capacities system allows work in confined job areas where full outrigger extension is not possible. Link-Belt Construction Equpt. Co., Lexington, KY.

Combustible & Toxic Gas Detector ☆

704. Information sheet covers the LEAKATOR™ 10 battery-powered, hand-held, gas detection instrument, complete with carrying case, installed and tested gas sensor, flexible probe, earphone, and manual. Bacharach Inc., Pittsburgh, PA.

Video on Choosing Metal Detectors ☆

707. Free video kit includes, "Choosing the Right Metal Detector," an updated guide to various models that sense out ferrous and non-ferrous metals in conveyed materials. Eriez Magnetics, Metal Detector Div., Erie, PA.

128-Page Lighting Specification Manual ☆

811. Updated guide (SAG-100) allows users to evaluate various lighting options including fluorescent, compact fluorescent, high intensity discharge, incandescent, and halogen. It provides detailed information on the National Energy Policy Act of 1992 and the EPA Green Lights Program. Philips Lighting Co., Somerset, NJ.

CAD for Windows ☆

644. Literature explains MicroGDS 3.1, a Windows NT compatible CAD software program. It directly interfaces with the workstation-based Graphic Data System, a comprehensive GIS, CAD/CAE system. Electronic Data Systems Corp., Maryland Heights, MO.

Maintenance Lift for Utility Vehicles ☆

438. Product sheet features the Uni-Lift Model 390 maintenance repair lift for accessibility to the underside of riding mowers, grounds maintenance tractors, etc. G & H Products, Div. of Riburn Industries, Inc., St. Paris, OH.

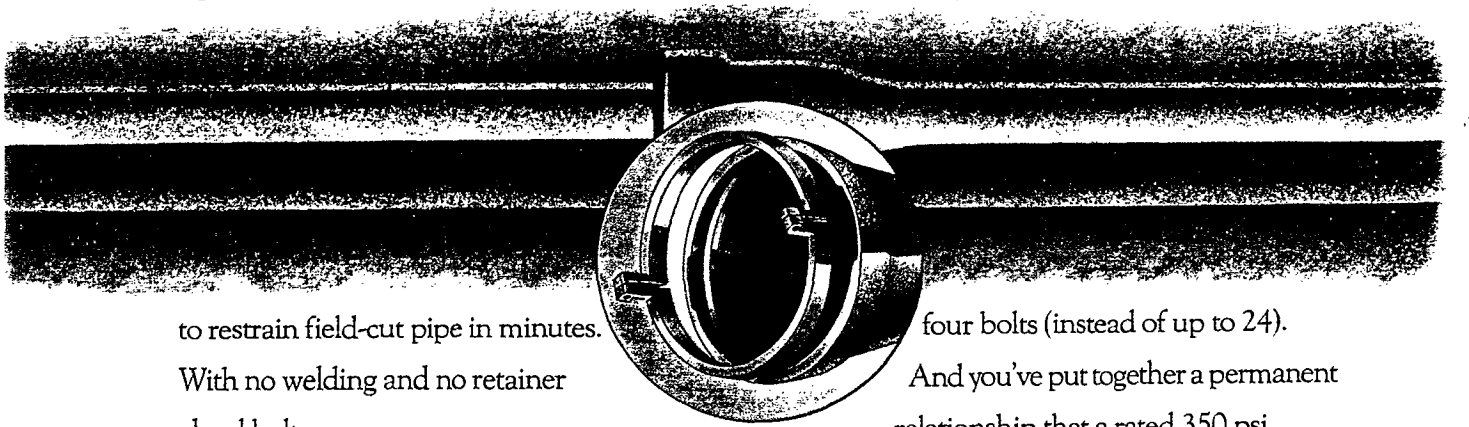
Electronic Control Unit ☆

440. Specification sheet (20-685) describes the Motionpac™ Controller, a single board, microprocessor-based unit to control bucket tilt, vibratory frequency, skid steer steering, mower reel speed, and more. Apitech, A Unit of Applied Power Inc., Butler, WI.

Odor Control for Compost Piles ☆

851. Literature describes the Windrow-Mate™ Odor Control System, an as-needed, air-operated chemical spray system, developed to control the odors associated with mechanical blending or turning of compost windrows and piles. NuTech Environmental Corp., Denver, CO.

Water & Wastewater Chemical Feed Equipment ☆



856. Product portfolio showcases the company's complete line: disinfection equipment, metering pumps, dry chemical feeders and systems for water and wastewater treatment applications, and flow measurement equipment. Wallace & Tiernan, Inc., Belleville, NJ.

Precision Surveying System ☆

750. Brochure describes the Geodetic Surveyor™ Series 4000 precision surveying system with advanced 6th Observable™ technology. It uses the GPSurvey software operating in the Windows™ environment. Trimble Navigation, Survey & Mapping Div., Sunnyvale, CA.

Jean La Duc is careful about which herbicides she recommends for maintaining 4,000 acres of parks.

After all, she not only works in them...she plays in them.

"I write or assist in writing all recommendations for chemicals used by the City of San Jose Department of Recreation, Parks and Community Services. And I have no second thoughts about taking my son here to play.

"People entering our parks have to trust us and the type of product we pick. We select Roundup® because we appreciate its favorable environmental traits, the fact that it dries quickly and has no residual activity in the soil.

"As professionals, we want to leave the environment in a better condition than we found it. That's easy when you select the right material for the job."

Ask for your FREE brochure telling how Roundup combines ecology and economy.
Call: 1-800-332-3111.

Roundup
Herbicide by Monsanto

ALWAYS READ AND FOLLOW LABEL DIRECTIONS FOR ROUNDUP HERBICIDE. Roundup® is a registered trademark of Monsanto Company. © Monsanto Company 1993 IND-30002 2/93

Salt/Sand Storage Lockers ☆

711. Product sheet details the new heavy-duty, 1000-lb capacity storage lockers, molded from industrial strength polyethylene and designed to safely store sand and salt year round. Go Plastics Inc., Waterloo, Ontario, Canada.

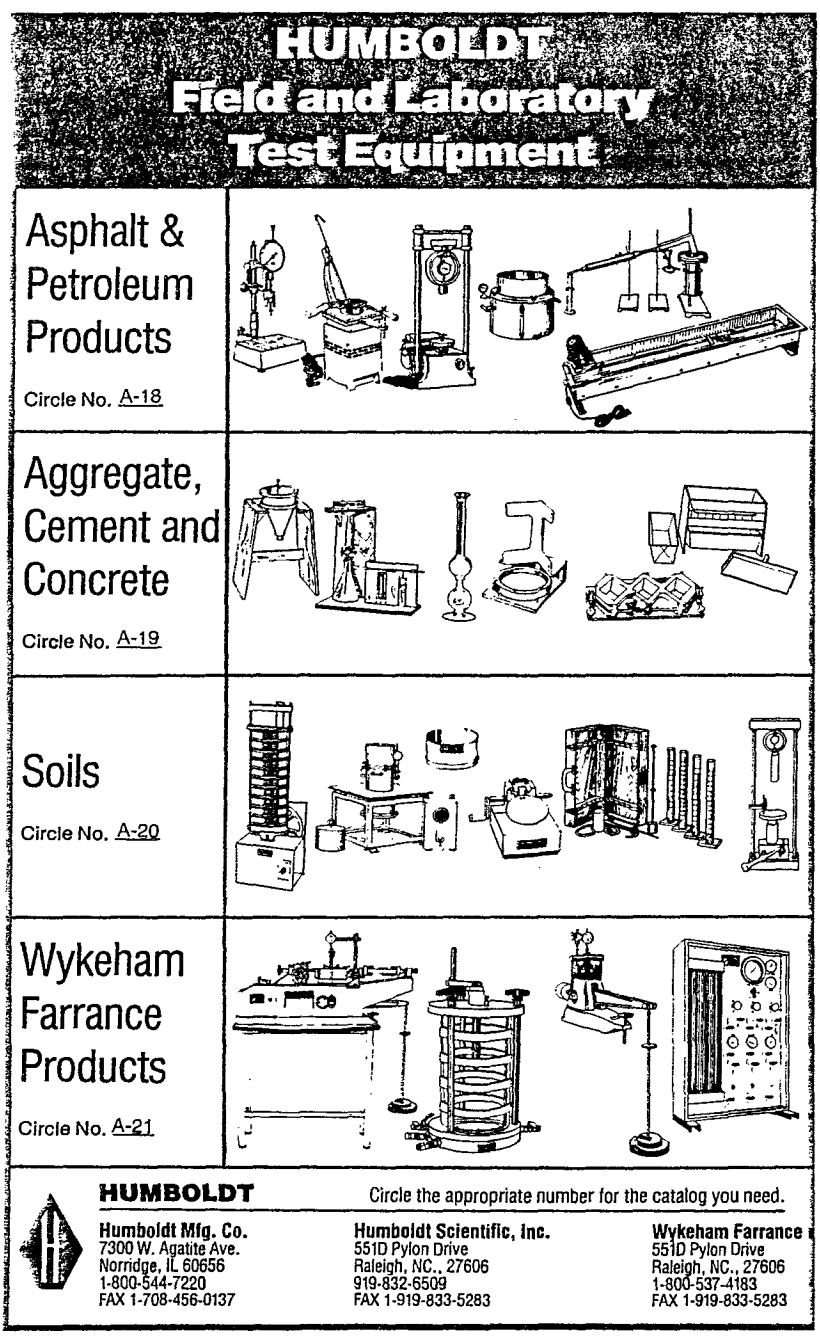
Storage for Standing Gas Cylinders ☆

855. Brochure features the Safe-T-Rack™ and Safe-T-Wall™ storage and containment systems for compressed gas cylinders. Safe-T-Rack Systems, Inc., Rocklin, CA.

Modernize Treatment Facilities ☆

622. Brochure (WWT-1.0) tells how this company's adjustable frequency AC drives and control systems can modernize fresh water pumping systems and wastewater treatment plants. Allen-Bradley Co., A Rockwell Int'l. Co., Milwaukee, WI.

Level the Load ☆



857. Brochure presents Add-On Air Springs to provide up to 5000 lb of load leveling support and improve ride, handling, stability, safety, steering, and comfort. Installed with no cutting or welding. Air Lift Co., Lansing, MI.

Erosion Control Mat ☆

858. New 8-page brochure discusses properties and performance of SuperGro® erosion control product, easily installed to provide quick vegetative establishment. Phillips Fibers Corp., Greenville, SC.

Water Analysis Products Reference Guide ☆

860. Catalog offers products for pH and electrode measurement, water testing, measuring dissolved oxygen, chemical testing, plus sections on technical applications, EPA methods, and technical literature. ATI Russell, Boston, MA.

SAFETY EQUIPMENT

Microprocessor-Based Gas Detector

153. Data sheet covers the OMNI-4000 gas detector that simultaneously detects up to four gases and is appropriate for use in confined spaces with diverse atmospheric hazards. It features interchangeable precalibrated toxic "smart block" sensors. Enmet Corp., Ann Arbor, MI.

Rear Vision Systems Promote Safety

370. New brochure (KG/6712/1-93) depicts rear vision system applications and presents the benefits and features of the TK-6712 camera, with 2.04 mm F/2.1 lens for panoramic view, and 6-in. monitor. KG Rear Vision, Arlington Heights, IL.

Tanks for Handling Hazardous Liquids

810. Brochure describes fully draining tanks that handle regulated and non-regulated chemicals. Available in 75- and 110-gal sizes. Poly Processing Co., Monroe, LA.

PAVEMENT REPAIR

Field & Laboratory Test Equipment

839. Catalogs offer testing equipment for asphalt and petroleum products, aggregate, cement and concrete, soils, and more. Humboldt Mfg. Co., Norridge, IL.

Rubber Grade Crossing Systems

942. Fold-out brochure promotes the advantages of Hi-Rail® interlocking tongue and groove pad rubber grade crossing systems for smooth grade crossing upgrades and water-tight design. Kraiburg® Corp., Chicago, IL.

Year-Round Patcher Versatility

185. Catalog introduces the UniBelt patcher with a 24-in. wide hot belt conveyor. It tackles pothole patching and utility cuts, and spreads salt, sand, or chippings. PB Loader Mfg. Co., Fresno, CA.

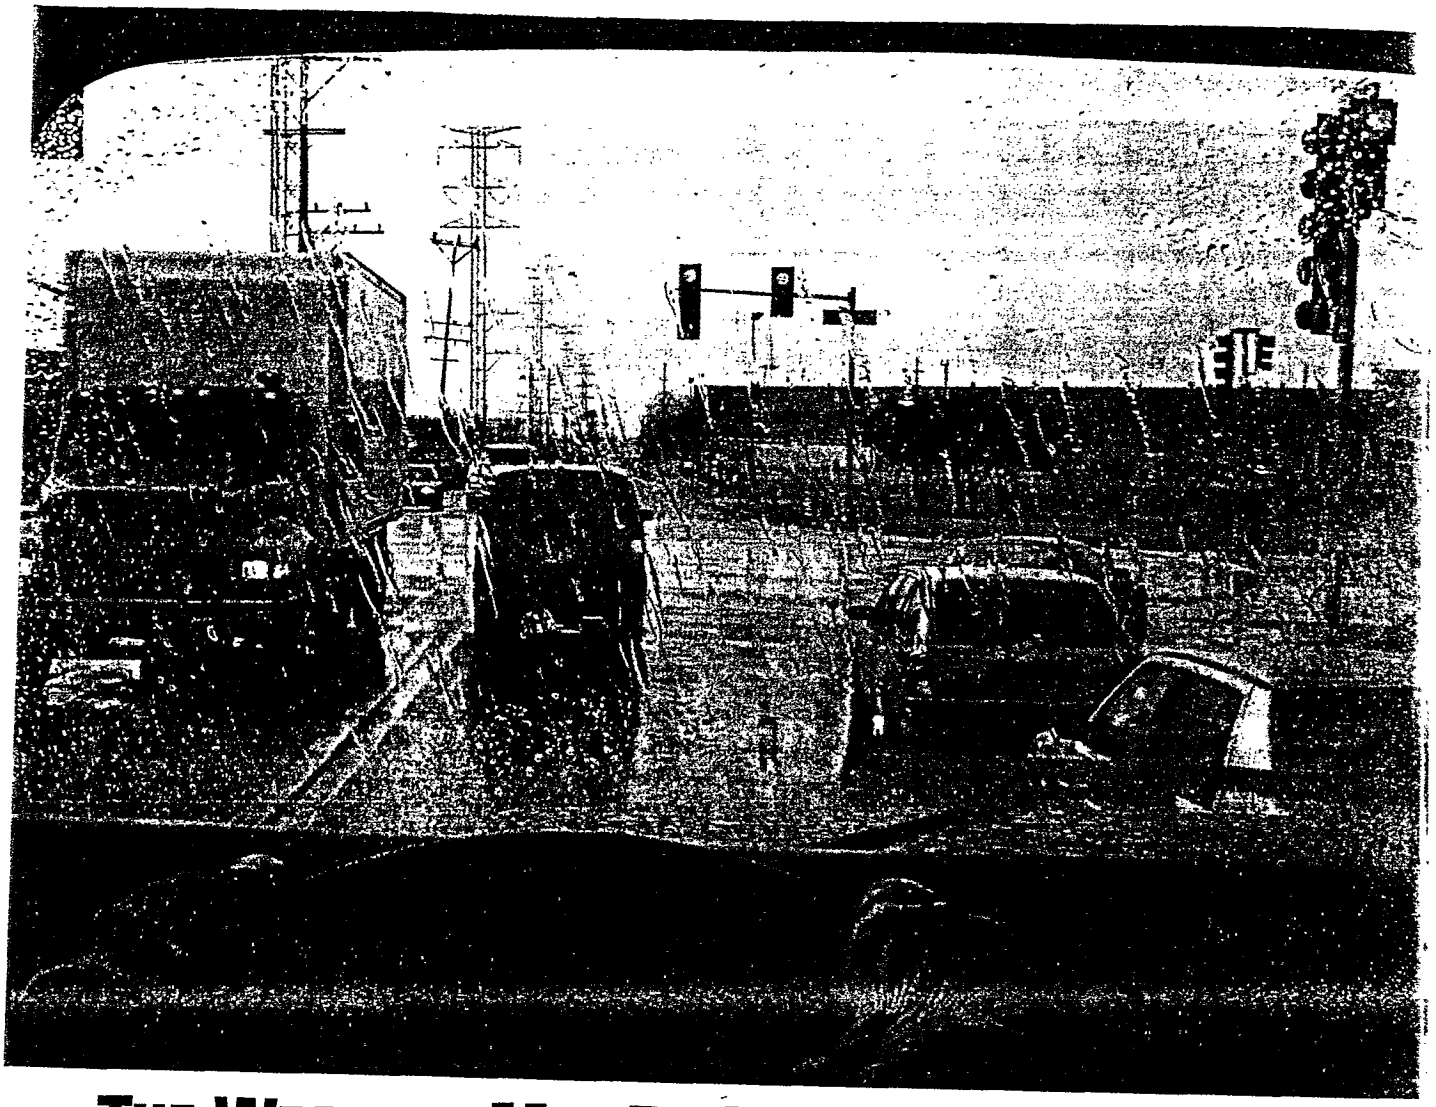
Road Marking Systems & Signage

854. Catalog offers extensive selection of regulatory signs, construction and warning signs, street name signs, hardware, etc. Super Precision Design, Inc., Fairfield, NJ.

SOLID WASTE COLLECTION & DISPOSAL

Rugged Truck Loaders

23. Literature describes this line of trailer-mounted and self-contained trailer dump model truck loaders with 3/4-in. impeller blades, 1/2-in. housing at wear point, and spring loaded boom. Giant-Vac Mfg., Inc., South Windham, CT.



Convert Waste Wood To Usable Products

485. The Series II "Tub Type Grinder" processes yard waste and leaves into mulch for landscaping or composting at a rate of over 15 tons per hour. The 12-ft diameter tub accepts 6-in. diameter limbs in any lengths, and up to 12-in. diameter limbs cut to 4-ft lengths. Fuel Harvesters Equpt., Grass Valley, CA.

Versatile Yard Waste Collector

522. Product bulletin (T/S-8/92) presents the TARCO® "Shuttle" Model TS-4 yard waste collector with front compartment for hand and bag loading, rear compartment for vacuum and brush chipper loading, and removable center panel for full capacity leaf collection. Tarrant Mfg. Co., Inc., Saratoga Springs, NY.

R0013694

THE WEATHER MAY BE OUT OF YOUR CONTROL, BUT AN INTERNATIONAL TRUCK WON'T BE.

International® is the first to offer 4-wheel anti-lock brakes on all medium duty trucks. Which means superior control and stopping power in all kinds of weather.

What's more, ABS brakes on your trucks could also reduce your insurance costs.

4-wheel ABS brakes are one more reason why International is the No. 1 selling line of medium and heavy duty trucks.

See your nearest International dealer for a test drive or call 1-800-962-0119, ext. 926. Preferably on a nice lousy day.

INTERNATIONAL®
BUILT FOR YOUR BUSINESS.

Federal Compliance Guide

342. Free guide gives rules for hazardous material storage and brochure describes this company's lockers, buildings, drums, etc. for cost-effective storage. Haz-Mat Containment Corp., Inc., Walnut Creek, CA.

STREET SANITATION

Street Sweeping & Stormwater

369. Valuable "What You Should Know" brochure (P/N 0705186) promotes understanding of the new stormwater provisions of the Clean Water Act and how they may impact street sweeping practices. Helpful list provides contacts for area EPA offices. Elgin Sweeper Co., Elgin, IL.

CONSULTING SERVICES

Environmentally Sound Solutions

345. Literature covers the options this company offers for material-handling: composting, landspreading, bioremediation, or landfilling. BFI®, Industrial Waste Services™, Houston, TX.

Drinking Water Technologies For the '90s

758. Brochure provides an overview of this consultant's engineering expertise and experience in the development, treatment, and delivery of safe drinking water supplies. Camp Dresser & McKee Inc., Cambridge, MA.

Environmental Engineering Services

871. Company helps clients meet their operational, financial, and regulatory challenges. HNTB Corp., Indianapolis, IN.

Stormwater Management Services

36. Literature packet presents this firm's comprehensive stormwater services, including master planning, combined sewer overflow studies, separate stormwater system permitting, water quality monitoring/modeling, utilities management, facilities design, and public education. Camp Dresser & McKee Inc., Cambridge, MA.

Water & Wastewater Management Services

197. Brochure describes and illustrates this company's water and wastewater services, including: contract operation and maintenance of treatment plants, plant evaluations and start-ups, operations training, sewer collection and water distribution system maintenance, and operations and maintenance manuals. Professional Services Group, Inc., Houston, TX.

Consider Environmental Quality

676. Literature tells how this company can bring a balanced approach to solid waste, air, and water pollution problems. Wheelabrator Technologies Inc., Hampton, NH.

Public Works Services

340. This company offers a complete scope of public works services, from vehicle maintenance to sanitation to meter reading/billing, and more. OMI, Operations Management Int'l., Inc., Kingwood, TX.

COMPUTERS & SOFTWARE

Enhanced Software Upgrades CAD Productivity

902. Brochure (100553) tells how AutoCAD® Release 12 delivers enhanced command options, more easily accessed pull-down menus, new dialogue boxes, faster zoom and pan operations—174 new features and changes. Autodesk Inc., Sausalito, CA.

BRIDGES

Pre-Engineered Modular Bridge System

373. Brochure describes the Mabey Universal Panel Bridge system with clear spans to 318 ft for one, two, or three lanes of AASHTO traffic loading. Mabey Bridge, Inc., Baltimore, MD.

ROADSIDE & PARK MAINTENANCE

Herbicide Combines Ecology & Economy

812. Brochure presents Roundup® herbicide, appropriate for use in municipal park areas because it dries quickly and has no residual activity in the soil. Monsanto Co., St. Louis, MO.

Mowing & Brush Cutting Equipment

846. Brochure (Form No. FL-1291-LG) covers flail, rotary, and sickle bar mowers, both mechanical and hydraulic. Numerous in-use photos demonstrate applications. The Alamo Group, Seguin, TX.

Disc Chippers for Brush & Tree Cleanup

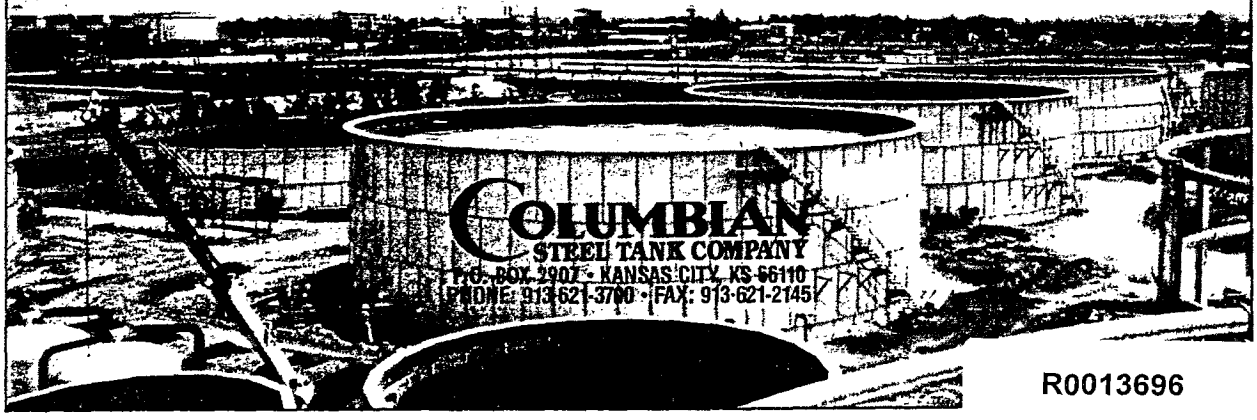
815. Literature lists feature for the complete line of disc style, hydraulic feed system chippers for both brush and whole trees. Bandit Industries, Inc., Remus, MI.

Pruning Tool for Safe Tree Trimming

869. Specification package highlights the lightweight Model D Power Pruner, powered by a 24cc, two-cycle gasoline engine. Technic Tool Corp., Lewiston, ID.

Not All Water And Wastewater Tanks Are The Same. The Columbian Difference Is...

COLUMBIAN COATING All interior and exterior components are coated in the factory creating a durable surface which fights corrosion. Our internal coating, "Trico-Bond 478" is completely covered with 2 coats of epoxy. For extra corrosion resistance we use "Z Bond 493" which is Columbian's exclusive coating for exteriors rich in zinc-based primer followed by 2 layers of thermally-cured epoxy, and a final layer of urethane which is electrostatically-applied.



COLUMBIAN DURABILITY Coatings are carefully applied on exteriors and interiors for complete coating to assure the longevity of the tank. Columbian tanks don't leak. GUARANTEED.

COLUMBIAN SAVINGS All tank components are shipped unassembled in compact kits, allowing economical shipping to any part of the world. You do not need skilled welders. Storage and handling are easy.

COLUMBIAN VERSATILITY Columbian tanks are easy to repair, enlarge or move, because they are made of pre-engineered components which are precision-designed, fabricated and packaged for shipment.

COLUMBIAN EXPERIENCE Since 1918 Columbian has served the liquid storage needs of thousands of clients. Columbian is the intelligent alternative over welded tanks because they last longer and are less expensive.

WHAT A DIFFERENCE! Call or write for FREE INFORMATION.

This CDM stormwater team really applied itself for Tulsa, Oklahoma.

CDM project engineers prepared an NPDES Part 1 permit application for the city of Tulsa that was one of the first in the region to earn approval. Backed by technical and regulatory expertise, CDM worked closely with the city and the regulatory agency throughout the project to meet all NPDES requirements. Using our own software, CDM developed a state-of-the-art database and computerized map of the city's stormwater system, contributing to a comprehensive—and comprehensible—document. This permit application added to Tulsa's reputation as a leader in stormwater management. And to ours. When it comes to stormwater management, CDM gets it done.

For more information on CDM's stormwater management services nationwide, call 904 281-0170.

Visit us at the WEF Conference, booth 2238.

WINTER MAINTENANCE

Storing Salt In-The-Round

906. Fold-out brochure explains the benefits of storing salt in spherically designed domes. Domes are designed with a 12 in. thick concrete retaining wall and a base wall from 6 to 12 ft high. A capacity chart relates tonnage to size. Bulk Storage Inc., Crete, IL.

LIQUID CONTAINMENT

Tank Design & Construction Process Summarized

496. Literature package (690) highlights wire wound prestressed concrete tanks for water storage, wastewater treatment, etc. Schematic drawings and photos explain each phase of the construction process. Preload Inc., Garden City, NY.

Creative Water Storage Solutions

693. Literature tells how this company helps solve specific water storage needs with prestressed concrete tanks. DYK Prestressed Tanks, El Cajon, CA.

Replace Conventional Septic Leachfields

754. Literature presents Infiltrator™ chambers for septic leachfields. The lightweight units require no gravel and are easily installed and inspected. Infiltrator Systems, Inc., Old Saybrook, CT.

How to Calculate Tank Painting Costs

993. This simple chart allows the user to calculate painting costs of steel tanks and how those costs are affected by rates of inflation. The chart is available from Natgun Corp., Wakefield, MA.

PIPELINE MAINTENANCE

Combination Cleaning/ Vacuuming Machines

80. New brochure shows the complete range of B-Series combo/vac units for municipal use, including the B3 (3.5 cu yd) and the B20 (20 cu yd). Aquatech, Inc., Cleveland, OH.

Underground Utility Locating

325. Brochure details the Vac-N-Dig system, a diesel-powered air compressor and a high powered vacuum that uses a jet of compressed air to break up dirt and the vacuum to remove the loosened material. The air stream uncovers buried utilities without damage. VACMASTERS of Denver, Inc., Arvada, CO.

A Pipe Replacement Breakthrough

434. Literature gives specifications, physical properties, and requirements for the XPANDIT® trenchless pipe replacement system, capable of upsizing. The installation process is quiet, non-destructive, and eliminates impact shock damage to adjacent utilities. Miller Pipeline Corp., Products & Services Div., Indianapolis, IN.

Combination Jetting/ Vacuum Truck

680. Product sheet describes the Vactor®2103 mid-size combination jetting and vacuum truck for heavy-duty cleaning of sewers and catch basins, providing 0 to 35 gpm and pressures from 0 to 3000 psi. Peabody Myers, Streator, IL.

Engineering Design Guide For Trenchless Pipeline Systems

59. New guide contains information and design data to assist engineers in using cured-in-place technology for trenchless pipeline reconstruction in specific design situations. It includes formulas and values based on tests and extensive field experience. Insituform Technologies, Inc., Memphis, TN.

Correct Inflow/ Infiltration Problems

37. No-dig technology uses a flooding system without liners, socks, or pipe inserts that may reduce flow. Sanipor North America, Cornelius, NC.

Speed Up Pipe & Cable Locations

759. The RD 333 Sonde Trace System saves time locating and tracing metallic and non-metallic drains and sewer systems and can be used with horizontal boring machines or pigs. Radiodetection Corp., Mahwah, NJ.

PIPE, VALVES & FITTINGS

Full Line of Valves for Public Works Applications

453. Company manufactures pressure reducing, altitude, relief, surge control, back pressure sustaining, pump control, and hydraulic valves and strainers for water and wastewater applications. Ross Valve Mfg. Co., Inc., Troy, NY.

Ductile Iron Pipe For Municipalities

684. Ductile iron pipe provides strength, corrosion resistance, and conservative design (ANSI/AWWA C150/A21.50). For complete information, contact American Ductile Iron Pipe, A Div. of American Cast Iron Pipe Co., Birmingham, AL.

New Ideas in Ductile Pipe & Fittings

715. The TR FLEX® Restrained Joint System delivers positive joint restraint with no bolts, rods, clamps, or thrust blocks. In unstable soil, use the TR Teleflex™ Flexible Expansion Assembly. For information on how the components of this system fit together, contact U.S. Pipe & Foundry Co., Birmingham, AL.

UNIBELT MAKES PATCHING A HOLE LOT EASIER

When it comes to pothole patching, Unibelt is the solution. Easy to operate and maintain, fully equipped so you can tackle patching jobs with just one machine. Unibelt features a belt conveyor that moves asphalt out of the container as you need it for continuous operation—it won't clog like auger patchers do. Plus, Unibelt is better insulated than other patchers, so asphalt stays hot, all day and night, even during winter months. Its radiant heater and adjustable thermostat range of

100° to 300° keeps hot asphalt hot and heats cold mix. Insulated container doors guard against heat loss and keep asphalt protected and useable. The LPG heat tube system eliminates hot oil leaks, potential fires and uses one third the BTU's required with hot oil systems—so you save operating costs. Take a serious look at the Unibelt Patcher... available in truck mounted, dump body slip-in and trailer models. It's easy, just call 800-350-8521, we'll cover the details.

WATER TREATMENT

Filter Sand & Gravel

107. All-color literature includes the company history along with specifications for supplying materials for all water filtering needs. Northern Gravel Co., Muscatine, IA.

The Bicarbonate Method For Corrosion Control

690. Literature explains how raising pH and alkalinity can virtually eliminate corrosivity of surface water, lowering lead levels in drinking water. Church & Dwight Co., Inc., Chemicals Div., Princeton, NJ.

WASTEWATER TREATMENT

Sludge Recycling & Land Application

649. Informative brochure on treated sludge supplies answers to questions on nutrient value, advantages and disadvantages, regulation, application, odor, etc., with helpful charts. Bio Gro Systems, Inc., Annapolis, MD.

68-Page Used Equipment Catalog

783. This company buys and sells centrifuges and filters of all manufacturers. Aaron Equpt. Co., Bensenville, IL.

Aluminum Pipe Railings & Ladders

823. Literature describes this company's ready-to-install, quality engineered aluminum pipe railings and ladders, available in specification finishes. Sterling Factories, Inc., Erie, PA.

Chlorination/Dechlorination Systems

612. The Sanuril® Chlorinator is a complete, one-piece system to treat wastewater from any sewage treatment plant without requiring controls, power pumps, instruments, or additional equipment by using Sanuril 115 chemical tablets. D-Chlor™ System dechlorinates wastewater using similar controlled release tablets. EES Corp., an ELTECH Systems Co., Sugar Land, TX.

VEHICLES & ACCESSORIES

Good-Looking Line of Work-Hungry Trucks

425. Brochure details the full line of International® trucks—the 4000, 4000LP, and 7000 Series medium trucks, the 2000 and 5000 Series sever service trucks, plus the network of supportive parts distribution centers. Navistar Int'l. Transportation Corp., Chicago, IL.

CONSTRUCTION & MAINTENANCE EQUIPMENT

Multi-Purpose Maintenance Machine

299. Literature features the versatile Model 1200 (116 hp) and Model 300 (177 hp). Attachments include: compost auger, grapple fork, bucket, broom, angle dozer, snow blower, and more. Brown Bear Corp., Corning, IA.

Analyze Equipment Costs

643. Booklet explains how "life cycle costing" helps determine the true cost of equipment, taking into account operating, maintenance, and repair costs. Caterpillar Inc., Peoria, IL.

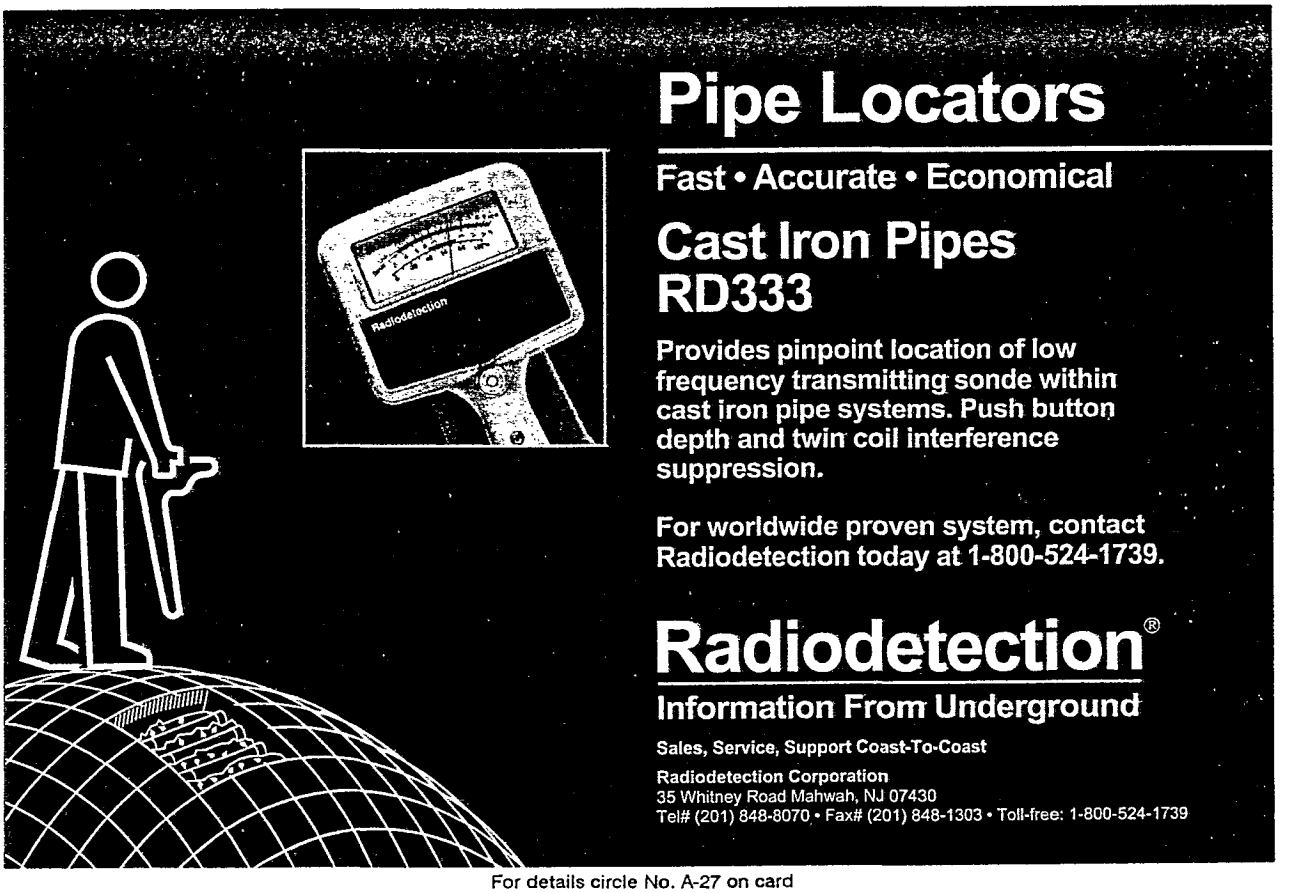
Backhoe, Grader, & Loader Attachments

576. Product literature packet covers fork lift attachments, asphalt cutters, backhoe mounted air hammer, bucket mounted ripper, sheepsfoot compactor, quick-attach sweeper, loader-mounted snow plows, and more. Guest Industries, Inc., Torrington, CT.

Equipment Financing Options

852. Literature (DKD1357, DKE5362) presents alternative financing programs for public agencies interested in construction equipment—short-term rental contracts, annual renewable governmental lease, municipal lease-purchase, the Life Cycle Bid, and the BEST BID™ program. John Deere, Moline, IL.

CONSTRUCTION & MAINTENANCE MATERIALS



How to Use Cement, Grout, & Mortar

798. Product reference guide covers RapidSet® cement, grout, mortar, and concrete. An easy-to-read chart gives technical data on compressive strength, flexural strength, and bond strength for each product. CTS Cement Mfg. Co., El Toro, CA.

SOIL STABILIZATION & EROSION CONTROL

Geotextiles for Drainage And Stabilization

85. Brochure (TRV-2000) covers HBC 100 percent polyester needlepunched nonwoven geotextiles, which can reduce soil migration and mixing, reduce localized shear failure, provide high permeability and permittivity, and reduce unwanted soil piping. Contech Construction Products Inc., Middletown, OH.

RETIRE BEFORE THE PIPE YOU SPECIFY DOES.

Pipe that takes early retirement could force you to do the same. That's why our attention to quality borders on the obsessive. Each length of American Ductile Iron® Pipe is hydrostatically tested and consistently exceeds AWWA standards. Each pipe is designed to have a high tolerance for stress so you don't have to. Water hammer, expansive soil and construction abuses are simply no match for ductile iron. So specify pipe that's going to be around a long time. From a company that's been around for nearly a century.

Recycling

It isn't often that a FORUM discussion subject is repeated two months in a row, but recycling is such a popular issue these days, a repeat seems in order. Last month we described Germany's plan to use "disassembly plants" to permit auto manufacturers to recycle car parts, i.e. old fenders melted down and used to produce new fenders, a procedure that is described as a "circulatory economy." The September 1992 *National Geographic* contains a discussion on the subject in the "Earth Almanac" section. As noted, about 75 percent of the total weight of automobiles is metal that has been "...recycled for decades," and the remaining 25 percent, called "fluff" ends up in landfills. Plastics are expected to constitute half of the fluff soon, and the industry is attempting to reduce the types of plastics used to simplify the task of recycling. According to the *National Geographic* article, there is "A crucial goal: finding markets for the coded plastic parts. 'This will complete the recycling loop,' says William Steinkuller of the Automotive Dismantlers & Recycling Association."

We recently received a news release from R. Frazier, Inc., of Salem, Virginia, which describes a recycling operation that appears to fit the "circulatory economy" definition. The release reports: "During 1992, R. Frazier processed 30 million pounds of electronic scrap and returned millions to clients such as IBM, AT&T, State Farm Insurance, General Electric, and BellSouth."

It is not clear whether the millions returned are dollars or pounds, but the release claims: "R. Frazier's recycling capabilities are 97 percent revitalization of assets, with less than 3 percent being diverted to landfills. R. Frazier's goal is 100 percent. To accomplish this, the company is participating in future equipment designs that will facilitate the total recyclability of newly manufactured equipment."

The release reports on a recent Carnegie-Mellon University study which predicts that 150 million used computers will have been discarded by the year 2005. "If measured, these old computers would fill a one-acre hole 3.5 miles deep with plastics, metals, and leaking batteries. Furthermore, it's a disturbing fact that old mainframe computers are being discarded at the rate of 10 million a year."

Randy Frazier approaches the recycling of computers by engaging in a "partnership" with the business that discards computers and either resells the discards to third world countries or dismantles the discards for reuse or recycling. Most of the components are expected to have many years of useful life left at the time of the initial discard.

"Frazier has developed world-wide markets for marketing the materials. Frazier's European market center opened in Dumfries, Scotland in April, a mirror-image of its Roanoke Valley operation. There is also a branch in China, a branch in Mexico, and two new locations planned for 1993."

Although the rapid growth of the computer industry may be an important factor in the apparent recyclability of computers, the aggressive pursuit of new markets for old equipment by recyclers like R. Frazier, Inc., may keep them out of the waste stream.

As for waste from more mundane sources, over a year ago an article about the New York City recycling program entitled "Recycling Minus the Myths" by John Schall of the Tellus Institute appeared in the *New York Times*. The article discussed the city's proposed solid waste management plan and addressed the issues of recycling cost, public participation, marketing of recyclables, and its "competition" with incineration. According to Mr. Schall, although costly, the proposed New York plan is cost-effective, and a uniform, properly designed recycling collection program coupled with a public education campaign and volunteer recycling coordinators should result in 65 to 80 percent public participation.

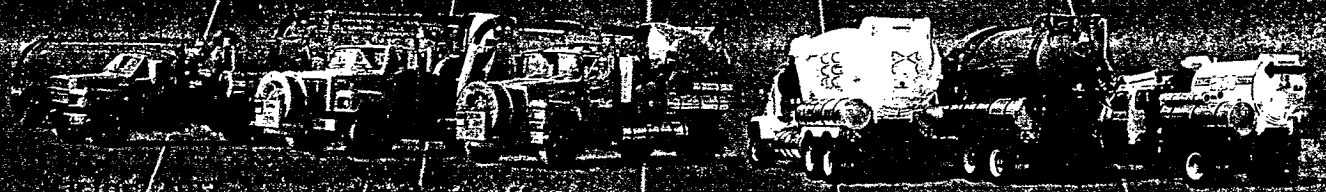
As for markets for recyclables: "Recycling makes economic and environmental sense. A study released in June by the Tellus Institute, a nonprofit research organization in Boston, reports that most industries have found using recycled materials technologically feasible, and that this has reduced toxic pollutant, green-house gases, and ozone-depleting emissions. According to the American Paper Institute, paper mills using recycled materials were five times more profitable last year than those using virgin fiber."

Regarding incineration, John Schall optimistically estimates that 50 percent to 65 percent of New York's municipal and commercial MSW would be recycled, which still would leave 9,800 to 14,000 tpd of MSW available for disposal. Recognizing the limited landfill space available in the metropolitan area, incineration, particularly if used for energy generation, would still make economic and environmental sense.

How successful New York City has been in implementing its new solid waste plan was briefly described in the August 1993 PUBLIC WORKS Magazine. The issue pictures Sanitation Commissioner Emily Lloyd on the cover standing next to a two compartment recycling collection truck, two curbside recycling storage containers, a blue bag, and two packages of wrapped paper. The "About Our Cover" write-up describes the status of the plan as follows: "The plan calls for city-wide recycling by September 1993, which will serve approximately 3 million households in 59 districts. In June, 13 community board districts in Brooklyn joined the recycling program and in September recycling will start borough-wide in Queens. By 1995, curbside collection will be expanded from eight to 26 materials. Over the past year, curbside collection of recyclable materials has increased by 37 percent city-wide and the overall percentage of material recycled has risen by 40 percent."

The write-up states that the recycling program is on schedule and by the year 2000, the city expects to recycle 42 percent of its MSW.

We received a copy of a report entitled "Integrated Environmental and Economic Policy Necessary in Argentina and Brazil" prepared by Frank J. Sudol, Manager, Division of Engineering, Newark, New Jersey, which was prepared for the U.S. Information Services. As the title indicates, Mr. Sudol, who actually visited nine cities in Argentina and Brazil to obtain first hand information, studied the impact of the economies of the two countries on the environment, including solid waste management. His findings revealed that, although disposal practices were well below standards experienced in this country due primarily to the poor state of their economies, in the two countries studied, recycling was an important practice in all of the cities visited. As reported:



"Poverty is driving the poor to pick through trash to recover marketable recyclables. These individuals, called

"catadores," recover materials such as metal, paper, and cardboard. The materials are collected in large wagons that are manually pushed and/or pulled. The materials are brought to market in exchange for cruzeiros (at the time this article was written, $1.00 U.S. was equivalent to approximately 40,000 cruzeiros), though this changes daily because of the high rate of inflation."

Frank Sudol reported that catadores also pick recyclables at the dump, and: "City officials in Porto Alegre have effectively organized many of the pickers by providing them with a level work-site near the landfill to sort though selectively collected trash, rather than allowing the catadores to pick at the active landfill dump area. This minimizes, to some extent, the risk of exposure to equipment which otherwise might injure or kill the pickers. This strategy also minimizes injury in climbing over mountains of trash, which in the past was responsible for causing numerous injuries due to tripping and infectious cuts from sharp objects."

Regular FORUM readers may recall reading of similar recycling descriptions in earlier columns. For the benefit of those of you who are new to solid waste management, scavenging at landfills (dumps) and from curb set-outs was fairly common practice in this country as recently as the 1960s. It wouldn't surprise me to learn that there are still signs up in some of our landfills warning that "Dump picking is prohibited."

Mr. Sudol advises that he discussed the value of landfill methane with some of the municipal officials he visited, and apparently they were unaware of this potential. This is surprising since over five years ago I reported in the FORUM that the COMLURB people in Rio De Janeiro took me to see the methane gas extraction and treatment facility at their Caju landfill. They then brought in a couple of trucks that were powered by the treated methane, filled their tanks, and sent them on their way.

The gas experience notwithstanding, Frank Sudol's assertion that the state of the economy has a significant impact on the environment generally and solid waste management particularly is valid in Latin America as well as North America. I wonder what the economic and environmental impacts would be if mixed recyclables from North America would be shipped to Latin America for sorting and reuse?

Finally, FORUM participant George Bergtholdt sent me an article from the January 12, 1993 *Wall Street Journal* headlined: "A New Market for Paper Shredders May Be Opening Up In Switzerland." The article discusses a new Zurich city ordinance that requires residents to sort their MSW for separated collection or pay higher collection fees. The program is described in the following:

"Now, homemakers here will have to put garbage in 'designer' bags marketed by the city, in sizes easily identified by abstract patterns in pink, yellow, blue, or red. Inspectors will track down people who don't use the spiffy new sacks and hit them with fines."

The article describes the "search and seizure" method used by the city, and the mixed public reaction to the new rule. What the Swiss are doing is not unlike some curbside separation techniques currently in use in this country. We learned one reaction to the extensive curbside separation set-outs from the comic strip Shoe several months ago, now let's hear what you readers think.

Incinerator Residue

Over a year ago, April 1992, we told you of the ASME/U.S. Bureau of Mines Investigative Program on Vitrification of Combustion Ash/Residue, and, thanks again to Herb Hollander who keeps us up to date on the status of this important program, we are pleased to tell you that a findings report of the project has been prepared and distributed to a select number of knowledgeable professionals for peer review. "The final results will not be made public until the peer review comments have been assimilated...and the

You are if you call BFI Industrial Waste Services. We can take virtually any non-hazardous special wastes, including industrial process wastes, contaminated soils, sludge, ash and asbestos, and help you through the maze of environmental regulations.

If you want quick turnaround, BFI is the place to call. We guarantee a response on approval requests in 24 hours for contaminated soils, 48 hours for other types of waste. And we help you with all the details, including paperwork, characterization, laboratory testing, hauling and final disposition.

We'll work with you to provide safe disposal or creative reuse programs for your materials. Depending on the types of waste you have, BFI offers several material-handling options: composting, landspreading, bioremediation or disposal in a secure, approved landfill.

Our commitment to your satisfaction, our single-minded insistence on environmental compliance, and our financial stability provide a solid resource for all your special waste needs.

Find out for yourself how BFI can help you manage your special wastes. Just call 1-800-289-4310 today.

Because when it comes to safe, environmentally sound solutions to your needs, we leave nothing to chance.

R0013705

report reviewed and finally approved by ASME, BuMines, NYSERDA, and EPRI."

The importance of further reducing the quantity of waste that ultimately is landfilled by converting residue to a useful product is indicated by the wide interest in the project described in Herb's letter: "This collaborative program provided the opportunity for modest contributions from many leveraged into a substantial investigative program which eventually included $1 million in funds and $250,000 in voluntary services."

Herb included a status report of the project which lists 15 government agencies and professional associations and 22 corporate sponsors from the U.S., Canada, France, and Norway. The report, which was prepared by Hollander, Plumley, and DeCesare, describes areas of study in the report abstract as follows: "This discussion covers some of the concerns which have prompted vitrification, the environmental implications, derived products, their potential uses, and the scope and expectations of the recently completed furnace operations of the $1.2 million ASME/BuMines Investigative Program conceived to demonstrate the effective vitrification of combustion residues from several diverse sources."

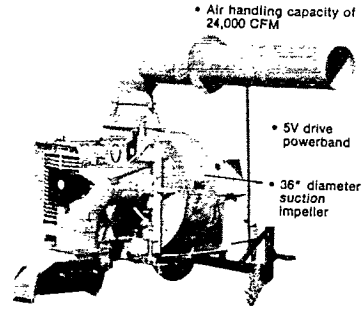
Of interest to readers is the environmental findings reported which reveal that the vitrified residue tested well below the EP-Tox standards for all metals. Even the cadmium, which in the ash residue condition tested above the EP-Tox limit, was well below in the Vitreous and Metal Products conditions.

The Hollander, et al, report concludes with the following note: "The objectives of this investigative program were to demonstrate on a commercial scale the technical, operational, and environmental feasibility of utilizing electrotechnology to consecutively vitrify combustor ash/residues from multiple sources to produce new, dense, benign materials having potential uses...in lieu of burial and potential future liability."

All indications from the Hollander letter and report are that the test process used to convert incinerator residue by vitrification to a useful product is successful. The reference in the final note that the demonstration is "...on a commercial scale..." alerts one to the need to introduce the cost factor into the project. Although cost, other than the program cost, is not mentioned in the interim report or letter, Herb advises that: "There are some 23 vitrification facilities of one type or another in operation or under construction in Japan. With their very limited land resources they have an urgent need for volume reduction and beneficial use."

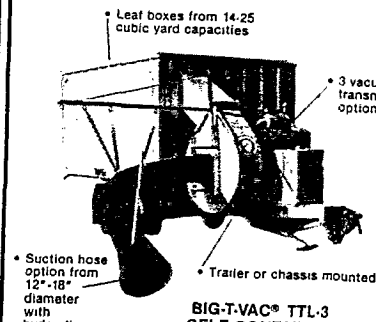
He also notes that there is a vitrification facility in the U.S. that processes sewage sludge to vitrified ash and "...there are several industrial and hazardous waste facilities, and coal burning power plants that do."

Herb Hollander, his associates, and the ASME should be congratulated for having shepherded this important project from conception to the present state of near successful conclusion. This gives us the opportunity to remind you that the ASME Solid Waste Processing Division is again seeking graduate and undergraduate candidates for their annual scholarship awards. The 1994 awards consist of three awards for graduate study totaling $9,000 and two awards for undergraduates totalling $5,000. If you are or know someone who may be interested in learning more about these scholarships, contact Junius Stephenson, P.E., 38 Sunset Road, Demarest, NJ 07627, or call (201) 767-1998.



We offer the rest of you the opportunity to participate in the educational experience which is the "Solid Waste Forum." The FORUM is yours to use to seek advise to help solve your problems or tell others of ideas or experiences you have had which may help them to solve their solid waste management problems. All you have to do is tell us about it by writing to me c/o PUBLIC WORKS Magazine or to Abraham Michaels, P.E., 872 Main Street, Osterville, MA 02655. If you want to talk about it, the telephone number is (508) 428-9282.

TARCO® BIG-T-VAC® LEAF LOADERS



Your first step to a successful composting program

The leaf collection experts with the widest range of models to fit your leaf loading needs. TARCO® BIG-T-VACS® are available in a variety of gas and diesel engines with leaf boxes ranging in size from 10½ to 30 cubic yards. Pick-up options include: Curb shrouds, hydraulic "Pavement Plucker," and suction hose assemblies with a hydraulic boom.

The How-To of Stormwater Sampling—Not Just a Drop in the Bucket

CHARLES T. SINCLAIR
Environmental Engineer
HDR Engineering, Inc.
Charlotte, North Carolina
and
JOHN A. RAY, P.E.
Stormwater Project Engineer
Street Department,
Winston-Salem, North Carolina

STORMWATER SAMPLING is probably one of the more interesting aspects of the relatively new pollution regulations. Whether that aspect remains interesting or becomes a frantic and frustrating experience depends a lot on how the sampling program is conducted.

The promulgation of EPA's National Pollutant Discharge Elimination System (NPDES) stormwater quality regulations triggered collecting stormwater samples nationwide. That explains the "why." The practical aspect—the necessity for hands-on work—requires the "how to" knowledge. Catching storms is like winning football games—it takes the proper equipment, a good playing field, a committed team, and a lot of luck. Even with everything in the right place at the right time, a "representative storm" may not occur. When the storm does happen, equipment preparation, personnel readiness, sampling techniques during the storm event, safety precautions, and sample handling and preservation are the prerequisites for a winning team. The sampling program conducted for the city of Winston-Salem, North Carolina, illustrates one possible "winning" strategy.

■ **SAMPLING platforms were built to be safe, accessible, and comfortable.**

Before deciding on specific details of the Winston-Salem sampling program, there were certain items to be addressed. The preferred sampling technique, personnel availability, and laboratory flexibility were all interdependent topics necessary to determine the sampling program's general direction. A "kickoff" meeting involving city officials and HDR representatives finalized the initial sampling program strategy. Flexibility to fine tune and refine the sampling work was recognized as a key to project success.

Sampling Technique. North Carolina regulations require that a grab sample be taken within the first 30 minutes of runoff for a representative storm event. In addition, the state allows time-based composite sample collection during the first 3 hours of runoff in lieu of flow-based composites. This composite sample could be collected by an automatic sampler; however, since volatile pollutants were parameters in the grab sample, these had to be collected manually and sealed immediately. Choosing either all manual or a combination of manual and automatic was an economic decision. Could it be cost-effective to leave sampling crews on site for an additional three hours to complete sampling and thereby avoid acquiring automatic samplers? The availability of sampling personnel and necessary laboratory services determined the answer.

Personnel Availability. A search began to find qualified personnel who would be available and willing to spend the summer "chasing" storms. Using city employees was investigated first and sign-up sheets were passed through the inspections and surveying departments. These were groups typically made up of engineering technicians whose normal duties were interrupted during rain events anyway. The response was excellent and arrangements were made to make the city staff volunteers available for sampling duty. The city agreed to excuse them from normal duties when necessary and the field crews would work under the direction of the consultant's on-site coordinators. Having the personnel available left open the first option, all manual collection.

Laboratory Flexibility. Due to the short holding time of the bacteriological pollutants, part of the grab sample had to be analyzed almost immediately. A nearby accredited laboratory was found that was willing to perform analysis at any time of the day with a 24-hour notice before the sampling event. This allowed the flexibility to collect a sample at any time.

Outline of the Program. In this instance, the first option, all manual collection, became the clear choice. Combining city personnel and an accredited laboratory allowed the Winston-Salem sampling program to be full-time and ongoing, capable of collecting samples at any site. Project costs would be minimized by using city staff and direct contract arrangements.

Like the Scouts—Being Prepared

Seven sampling locations across the city were chosen during part I of the permit application and approved by the state. The state prepared a list of pollutants to test for and also designated the limits of what would be considered a "representative storm event" for North Carolina. With the ground rules confirmed, preparation for sample collection began.

Equipment. To document specific storm events, semi-permanent recording rain gauges were placed at five of the sites and precipitation at all seven sites was calculated using the Thiessen Polygon Method. (This is a graphical technique to account for nonuniform distribution of recording stations within the drainage basin as each gauge is assumed to only measure the precipitation in the area around it.) Flow meters were installed in the discharge pipes at each site and then programmed and calibrated using a laptop computer. These rain gauges and flow meters were kept in continuous operation and routinely maintained; rain gauge data sheets had to be changed weekly and flow meter batteries had to be replaced every three to four weeks.

To facilitate sample collection at the seven sites, custom fabricated plywood boxes were constructed and outfitted with locks. Each box contained a plastic storage container (purchased at a local department store) for storing sample bottles and other useful items. These "utility packs" included:

Umbrella
480-ml plastic beaker
Flashlight
Funnel
Stopwatch/Clock
Gloves
Clipboard with laminated log sheet and grease pen
Collection bucket with handle
Telescoping pole with hook (paint roller handle assembly minus the roller)

Styrofoam blocks were cut out of packing materials and holes were drilled into them to match the diameter of the smaller

R0013708

sampling containers (those used for volatile organic chemicals [VOCs] and fecal coliform/fecal streptococcus [bacteriological] samples). This kept the smaller glass vials from sliding around and getting broken.

Sampling Stations. Before sampling started, some work had to be done to the sampling sites to make them safe, accessible, and somewhat comfortable (three hours of sitting in the pouring rain is bad enough). Each site was visited, pictures were taken, and sketches were developed by the consultant for building platforms, steps with landings, handrails, and even temporary gravel paths and roads. The sketches were forwarded to a city construction foreman and building materials were acquired. Right-of-entry permission was obtained for sites located on private property. Once the facilities were constructed, the sites were closely inspected (during a rain storm, if possible) to ensure safe conditions during the inclement weather. It was important not to cut any corners in this area. The cost of an accident could have far exceeded the cost to build these stations properly.

Communications. Realizing communication would be the key for successful mobilization and sampling, portable phones rugged enough to survive storm conditions were obtained for use by HDR coordinators. In addition, the city allowed the coordinators to go through the city dispatcher to contact sampling personnel on their city radios during regular working hours.

Laboratory. Final plans were made with a local laboratory to analyze for the bacteriological parameters with a six-hour holding time. A second laboratory was retained to perform the remaining analyses. Both laboratories, furnished with parameter lists, prepared the preserved sample bottles and shipped them to the consultant. Holding times were verified in advance to determine critical and allowable delivery times. Communication with key contact personnel at each laboratory was maintained to ensure full-time service and consultation. It is important that procedures be developed and checked before field sampling begins to provide complete quality assurance.

Personnel Training. With the sampling and laboratory procedures and details finalized, it was time to train the sampling technicians. All personnel were furnished with a manual explaining the history and purpose of stormwater regulations, detailed mobilization and sampling procedures, and special instructions and safety precautions. This manual was reviewed in the classroom and each technician was assigned a primary and secondary site that were typically two locations located closest to his or her home. After the classroom review the group re-assembled at one of the sites to practice sampling procedures.

Dry Run. To assure complete readiness and to resolve potential problems, a "dry run" was conducted. This involved everyone in the sampling program: the consultant's coordinators, the city liaison, and all potential sampling technicians. All personnel were called the night before and told of an "anticipated" time that the make-believe storm was going to start the following day. The next afternoon they were called again and told of a specific time to be at the site. The mobilization was phased so that two technicians were at their assigned sites at 45-minute intervals. This allowed time for the coordinators to meet them at the site, watch them set up and begin sampling, and answer any questions. The sampling personnel were dismissed and the coordinators went to the next site where another two-member sampling team assembled. The dry run was beneficial in resolving potential problems and assuring that everyone was aware of the proper procedures for mobilization and collection.

FIELD training exercise following classroom instruction taught sampling personnel correct sampling procedures.

The Sampling Experience

All the planning in the world cannot prepare everyone for what exactly will happen when an actual storm event comes. No two storms are the same, so creativity, communication, and good judgement must be used when things do not go as planned. The following items summarize the results of Winston-Salem's mobilization and sampling activities during the summer and fall of 1992.

Maintenance. During the days before an anticipated storm event, all elements of the sampling program had to be kept in a constant state of readiness. All utility packs were loaded with fresh sample bottles and other necessary equipment. Rain gauges and flow meters were checked weekly to assure proper working order. Each sampling platform was also visited regularly and inspected for safety and vandalism.

Weather Monitoring. A weather forecasting service was contracted to provide two weather forecasts a day, seven days a week. The forecasts were faxed to the consultant's office in Charlotte, North Carolina, a 1½-hour drive from Winston-Salem; also, unlimited telephone consultation was provided. A potential representative storm event would be identified at least two days before its anticipated start. Within 18 to 24 hours of its predicted arrival, a decision would be made about whether or not to attempt to sample. Early in the project, sampling was attempted at every potential representative event to increase the chance of capturing the required number of storms.

Alerting Personnel. When a decision was made to sample an event, sampling personnel were alerted. They were told the approximate times for the storm's arrival and their assigned station. Crew members were called on a rotation at first, however, later in the program, experience favored personnel who could be contacted the quickest and easiest. Crew members acknowledging availability for an event were required to keep the coordinators apprised of their whereabouts and approximate schedule up to the point of mobilization.

Notifying Laboratories. After sampling personnel were alerted, both laboratories were notified. This was especially crucial for the lab performing the bacteriological analysis. They not only had to be given sufficient time to set up the lab, but they also had to have someone available who could perform the analysis within the six-hour holding time. A single contact person with the laboratory was arranged and then alerted in the same manner as the sampling personnel. The second laboratory only needed to be notified of the potential number of samples being delivered.

Checking All Equipment. During the period between alerting personnel and actually dispatching them to the stations, there was time for the coordinators to do a final check of last minute items. All utility packs were checked and kept locked in the plywood boxes at each sampling station. All box locks were keyed the same and each crew member had a master key. This allowed the packs to be available to all personnel at all times, and without the coordinators having to be present. Final checks were made for rain gauges and flow meters to assure proper operation. During this time, periodic checks with the weather service kept coordinators informed of the upcoming storm event.

Dispatching Personnel. When the predicted storm arrival time was three or

R0013709

four hours away, the volunteers were contacted again. Actually dispatching them to the site was handled one of two ways, based on the confidence level of the forecast. If the event seemed likely to occur as forecasted and highly probable of producing the required quantity and duration of precipitation, then personnel were instructed to proceed to the site on their own as the rain was about to begin. If there were doubts about the duration and characteristics of the storm, they were instructed to stand by (ready to mobilize) until an official word was issued from the coordinators.

Sampling. As the storm began and personnel arrived on site, the actual sampling part of the program could finally begin. Regulations required that the first composite fraction, as well as the bulk grab sample, including VOCs and bacteriological samples, be collected within the first 30 minutes of runoff. For outfalls with a base flow, personnel had to decide when stormwater runoff was actually occurring. This could take from five minutes to over an hour, depending on the intensity of the rain and the characteristics of the watershed. During the sampling period, HDR coordinators, in two separate vehicles, visited each station checking the technicians' progress. At the first visit to each station, coordinators distributed ice packs and collected the bacteriological samples. After each station had been visited, coordinators met and one took all of the fecal samples to the laboratory for immediate analysis. Repeated visits checked on the progress of samplers as well as checking rain gauges and the storm's progress. In cases where rain exceeded the maximum allowable for a representative storm within the first three hours, sampling was aborted and personnel were released.

Demobilization. When the sampling period was over, sampling personnel placed the iced utility packs containing the filled sample bottles back into the wooden box, and locked them. After this was done, they were free to go. The coordinators then collected the utility packs as soon as possible, checked the total inches of rainfall to verify that the storm was representative, and brought the containers to a central location. The bulk samples, composite and grab, were then immediately broken down from the gallon jugs into the proper containers and taken with the VOC vials to the lab.

Cleanup. The final task was to clean everything up. The utility pack equipment was dried and fresh sample containers placed in them. Later, rain gauge data sheets were changed, flow meters were downloaded, and the refurbished utility packs were locked back in the boxes. Based on the time of day and elapsed time since collection, this was usually done before the coordinators left the Winston-Salem area and delivering the samples to the laboratory.

As noted, developing the final sampling program was a continuous process of refining specified field procedures based on experiences from previous mobilizations. No two sampling events could be managed exactly the same. After each storm, sample collection events were reviewed with respect to any special circumstances of that event, and procedural adjustments were made if necessary. This process of always striving to improve kept team members focused on developing appropriate solutions to specific situations and logistics issues. Coordinators and technicians alike were encouraged to attempt different approaches. The following lists some of the issues that typically arose while developing and implementing the sampling program. Suggestions on how to best address these issues are provided based on the successful efforts in Winston-Salem.

Everyone is here, where is the rain? For rain event mobilizations, all sampling personnel should stay near a phone or city radio to receive weather updates and mobilization instructions. This not only reduces the amount of time personnel must be on site, but it also keeps sampling coordinators from having to ask an even more serious question... "The rain is here, where is everyone?"

When are the sampling coordinators ever going to get here to pick up the samples? Plywood boxes can be built for each site and nailed to the platforms. The utility pack equipment can be locked in these boxes before the volunteers arrive and then placed back in the boxes to be picked up later by the coordinators. These boxes can also be big enough to house the flow meters at each station. Since the utility packs can be left safely in the boxes, this greatly reduces the amount of time that personnel spend on site after completing sampling activities.

Where are my keys? Multiple sets of spares should be available for plywood boxes, rain gauges, storage areas, and vehicles. A lost or misplaced key ring could ruin an entire sampling event.

Where is the ..... (fill in the blank)? It is very hard to remember everything needed when making a mad dash to catch a storm; and nothing is worse than trying to download flow data, or change a rain gauge sheet, or even collect a sample, when you suddenly realize the equipment you need is back at the office. Make a checklist for *everything!* It only takes a minute to look over, and will save a lot of time and frustration.

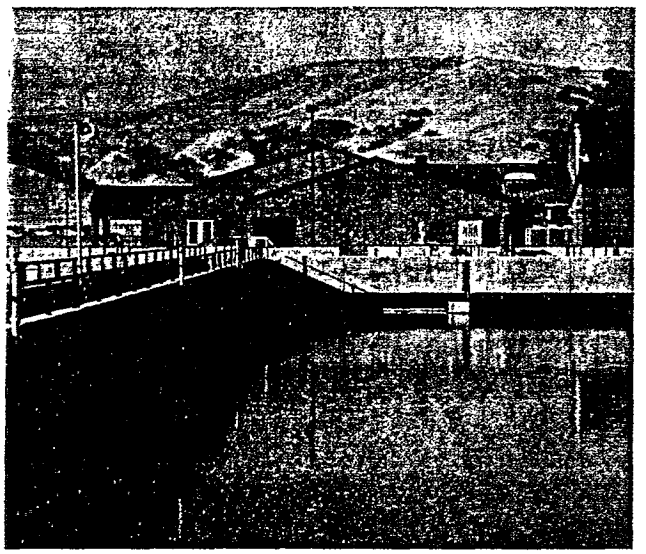
Why won't this work? Plywood warps, locks and latches rust, and equipment breaks down from the inclement weather. It is essential to have extra of everything; locks, latches, and hinges must be routinely lubricated; and the operation of all equipment needs to be checked and rechecked.

Should we try to catch a thunderstorm? Unfortunately, this was a question best answered after the event. Sometimes a sure representative event becomes a passing thunderstorm, and vice versa. Modern technology has not produced the luxury of hindsight. At the beginning of any storm sampling program, sampling should be attempted at every potential representative event. Later, after having captured a number of successful sampling events, sampling efforts can become more selective. This situation must be dealt with on a case by case basis, and is dependent on the confidence level of the sampling coordinators and the experience and successes of previous sampling efforts.

Where is he? Other related questions may be "Why did he do that?" or "Did I tell you to do it that way?" The only thing more unpredictable than the weather is trying to determine how people will act during the stressful times of sampling. The biggest challenge is to train personnel in understanding the purpose and intent of what they are doing rather than just giving procedures to follow. This allows everyone to make competent decisions on the appropriate actions to take, even when something unexpected may happen.

Is there any way to get in touch with him? Open lines of communication are a necessity, not just a luxury. Using portable telephones and hand-held radios allows sampling coordinators to be in constant contact with each other as well as with the sampling personnel.

It's 2:00 am, pouring down rain, and I am standing here in the dark holding a bucket waiting for water to come out of a pipe ..... What am I doing here? This is a question that everyone involved in the sampling program may ask themselves at least once. It is important to keep spirits up even when everything seems to be going wrong. A few donuts and a little coffee can do wonders for morale.



It is impossible to present a perfect sampling program with universal application. No two situations are exactly the same, and there is no single "right way." This particular approach was one that worked well for us.

The ultimate success of any sampling program is a function of the following:

- Capturing the required number of representative storm events.
- Completing sampling activities within budget and on schedule.
- Most importantly, completing field sampling activities without accident or personal injury.

The Winston-Salem sampling program was a success by all measures. Much of this success can be attributed to the team approach taken by the city and the consultant. Using available resources and effectively communicating the program's desires and goals were key factors. With a little hard work and flexibility, the success of any stormwater sampling program can be just three representative storms away. □ □ □

Walnut Creek, California

THE 40-mgd North Bay Regional Water Treatment Plant (NBR) was designed with maximum treatment and operating flexibility to respond to a number of unique circumstances. The $32.5-million plant, located in Solano County, California provides drinking water to the cities of Fairfield and Vacaville.

Both cities realized early in the planning process that creating one large plant at their border eliminated the need for two smaller treatment plants. Studies concluded that this joint venture would be economically feasible. Discussions successfully concluded with a joint powers agreement between the two cities, and plant construction was completed in 1990.

Two years of operating data show that the carefully designed and flexible process train has met and exceeded water quality standards.

Flexibility was paramount during planning and design because of the following conditions:

- Changing water supplies. The plant takes water from two different sources. The existing Putah South Canal brings generally good quality water south from Lake Berryessa. The new North Bay Aqueduct brings highly variable water—with total organic carbon from 3 to 20 mg/L and turbidities from 10 to 2500 Ntu—west through several interconnecting waterways from the Delta of the Sacramento and San Joaquin rivers.
- Changing blends. The variability of the influent water required a process train flexible enough to handle a wide range of water quality. To serve both cities' needs, the plant also had to operate over a wide range of flow rates—22.5:1—and changing blends—0 to 100 percent—for either source.
- Changing regulations. The plant was designed during a period of regulatory uncertainty following passage of the Safe Drinking Water Act (SDWA) Amendments of 1986. The plant had to be flexible enough to meet current regulations, as well as satisfy a range of potential regulatory outcomes under the SDWA. New regulations governing filtration, microbiological contaminants, synthetic organic contaminants, and disinfection by-products (DBPs) were in initial stages of development.
- Changing capacity. The plant was designed to meet the water supply needs of two rapidly growing communities. The plant has an ultimate capacity of 90 mgd and was designed to be readily expanded in 10-mgd increments, as needed. In fact, due to unforeseen growth, the plant was expanded from 30 mgd to 40 mgd during construction.

Water Quality Variables

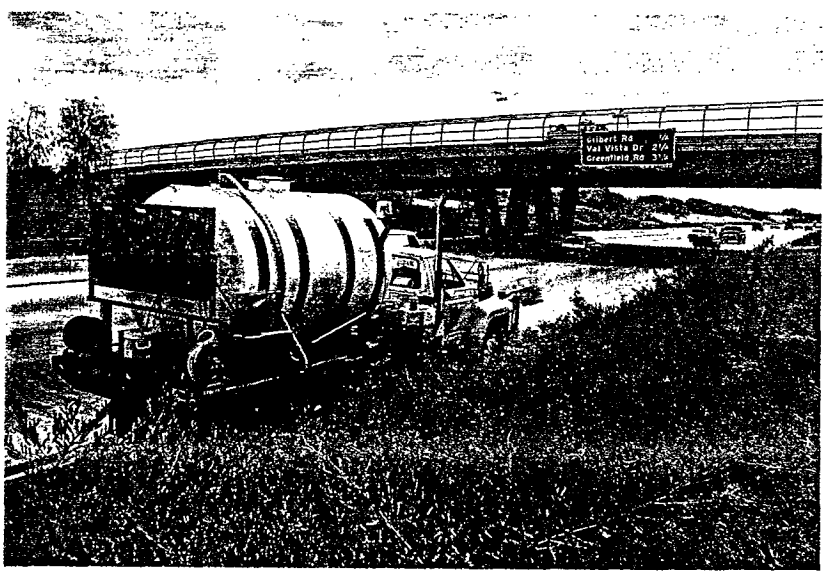
The NBR plant is located equidistant between its two water sources. The Putah South Canal brings water south from Lake Berryessa and the North Bay Aqueduct (NBA) carries water west from the Delta of the Sacramento and San Joaquin rivers. To reach the plant, NBA water travels from the Sacramento River Deep Water Ship Channel through several waterways. The combined effects of these interconnecting waterways, local hydrology, agricultural return flows, urban runoff, tidal influences, and export pumping rates result in considerable variations in water quality. Turbidities of up to 2500 Ntu have been reported along the route. Other recurring problems associated with this water source include algae, detectable tastes and odors, and chemical (synthetic and organic) pollutants. One significant problem has been occasional high levels of total organic carbon.

Data collected during the 24 months of operation show that the plant, in addition to meeting current drinking water standards, has exceeded these specially set treated water quality goals:

	Goal	Result
Turbidity	<0.1 NTU	0.06 NTU
THMs	<20 µ/L	8 µ/L
Coliform	<2.2 MPN	<2.2 MPN
HPC*	<10 CFU/ml	<1 CFU/ml
Odor	<2 TON	no odor

*HPC = heterotropic plate count
CFU = colony forming units

The plant was designed with preozonation, flash mixing, flocculation/sedimentation, deep-bed granular



R0013711

activated carbon filtration, post-ozonation, and chloramination. While none of these processes are unusual individually, the combination of processes, particularly ozonation with deep-bed granular activated carbon (GAC) filters distinguishes the NBR from a conventional plant. In addition, several conventional processes were fine-tuned to make them work more effectively under the NBR's unique conditions.

Pre-ozonation is used instead of chlorine to oxidize inorganic contaminants, color, and organic matter, and provide initial disinfection. Pre-ozonation replaces the pre-chlorination step used at most plants. Pre-chlorination is a major source of chlorinated organics. Pre-ozonation also promotes biodegradation of natural organics to remove DBP precursors biologically.

The plant also has the capability to add hydrogen peroxide. This is the first known large scale-installation of peroxide/ozone oxidation in a surface water plant. By adding hydrogen peroxide ahead of ozone, a reaction occurs that promotes a hydroxl radical, which is a faster and more powerful oxidant than ozone. Operating practice has been to add peroxide during the summer when taste and odor problems usually occur. Application of peroxide and ozone is an example of a new water treatment technology called "advanced oxidation processes" that allows the plant to control compounds (e.g. taste and odor) that previously could not be oxidized.

Without the use of chlorine, in-plant algae growth was a potentially significant problem. Montgomery Watson designed a number of changes into the basins to reduce algae growth. These included: replacing launders with end-of-basin weirs; orientation of basins and walkways to reduce the amount of sunlight on basin walls; and copper sheathing on the top four ft of basin walls to act as an algicide. These design changes have worked extremely well, resulting in almost complete in-plant algae control.

■ **THE Arizona Department of Transportation selects herbicides with the versatility to be applied in a variety of environments. Above, weed control along a busy roadside.**

Controlling Weeds Along Roadsides and Other Sensitive Sites

JAMES BREUNINGER, Ph.D.

Located in Sacramento, California, Dr. Breuninger is a Technical Service and Development Specialist for DowElanco, headquartered in Indianapolis, Indiana.

PUBLIC works professionals recognize that roadside vegetation must be controlled along highways and thoroughfares. If weed growth is not monitored, safety issues arise. For instance, due to visibility problems from uncontrolled weeds, stranded motorists, joggers, or other pedestrians could be in danger. Furthermore, uncontrolled weeds can be a fire hazard, possibly ignited by sparks from a vehicle's catalytic converter or muffler.

To reduce fire hazards and public safety risks, maintenance personnel should use an integrated approach to keep weeds at acceptable levels. Herbicides are often a necessary component of such a program.

In the past, products were selected solely because of efficacy and long residual. However, such products may no longer be tolerated in areas where drift can damage agricultural crops or in residential areas that border roads. These areas, called "sensitive sites," have changed the use patterns of many herbicides today.

Sensitive sites are a part of virtually every roadside maintenance program. The challenge for public works professionals is to effectively control troublesome weeds, yet consider environmental impact and public acceptance. The solution is choosing an herbicide program that can accomplish these goals.

In general, sensitive site describes how the use of herbicides on or near public areas will affect public reaction. Sites can be sensitive for different reasons. Sometimes sites are sensitive because members of the public are apprehensive about herbicide use. Sometimes they are sensitive because they are located in public areas such as parks where people are nearby. Sometimes they are sensitive because valued ornamentals are present.

Choose the Right Herbicide

Regardless of why a site is sensitive, public workers still need to deal gently, effectively, and economically with stubborn grassy and broadleaf weeds. And the key to controlling weeds in sensitive areas is executing an herbicide program that accommodates all needs and concerns. The ideal herbicide for sensitive sites should offer both versatility and public acceptance. In addition, the herbicide should continue to possess the features public works professionals depend on such as optimum length of control and minimal leaching—characteristics customarily expected—regardless of whether or not a sensitive site exists. For this reason, dinitroaniline herbicides have been the backbone of most roadside maintenance programs.

A versatile herbicide is one that can be used to treat numerous areas: turf, landscaping, and ornamentals. Kent Cairns, highway maintenance superintendent for the Arizona Department of Transportation (ADOT), has been successful with DowElanco's Surflan™ pre-emergence herbicide. This product does not require immediate incorporation and can be tank mixed with other products such as Roundup™. It is unique among dinitroaniline products because it does not photodegrade or volatilize readily. Therefore, incorporation through rainfall or irrigation can be delayed for up to 21 days.

Cairns' crews control weeds in sensitive sites along 150 miles of highway. In addi-

R0013712

The three objectives of the filtration process were turbidity removal, providing a barrier against chemical contamination, and taste and odor control. Pilot studies were used to investigate the right combination of media size and depth to respond to these objectives. The dual media filters are unusually deep, containing 6 ft of GAC over 2.5 ft of sand. The dual media provide effective filtration for turbidity removal. GAC adsorbs many taste and odor compounds. The deep bed of GAC provides a longer contact time, allowing the GAC to act as a better barrier against chemical contaminant spikes.

The GAC is used primarily as a filter media, not as an adsorbent. The GAC media has been in place for two years and will not be replaced for several years. Thus the adsorption capacity of the GAC for the commonly occurring compounds has probably been exhausted. Research has shown that even exhausted GAC provides an effective adsorption barrier for new compounds introduced to the media, especially when the contaminant is only present for a short time, such as would occur with a chemical spill.

One of the consequences of deep-bed GAC is high bacteria counts from the filters. Due to concern about DBP formation with chlorine and incomplete disinfection with chloramines, post-ozonation was provided. The three-stage post-ozonation process provided the strong disinfectant (ozone) required to kill bacteria. Chloramine or chlorine addition and a baffled contact basin were provided prior to the treated water pumps to ensure effective residual disinfection.

Operating results and tests show that the plant's design has produced the benefits it was designed to achieve, including control of taste and odor compounds; reduction in trihalomethane formation and other DBPs; algae control; improved coagulation; reduced sludge production; improved particulate removal; better disinfection; and increased barriers against organic contaminant spikes. □□□

---

tion, ADOT contracts with 40 landscape maintenance companies to provide sensitive site weed control in landscaping and roadside areas all around Phoenix. Cairns uses several herbicides year round for ADOT.

And like many public works professionals around the nation, Cairns and his crews manage landscaping and vegetation in addition to their general roadside maintenance.

"We apply herbicides that can be used in a variety of environments," Cairns says. ADOT treats so many different areas that it is unfeasible to use a different herbicide for every problem, he says. In landscape areas, ADOT works to control several troublesome weeds and grasses, including crabgrass, spurge, and purslane, just to name a few. Some of the ornamentals to be protected include oleanders, eucalyptus and palm trees, and several varieties of ground cover.

ADOT is not the only organization that relies on versatile products. For most professionals that control weeds in sensitive sites, it is their livelihood. Just ask Don Crook, construction maintenance superintendent for Modesto Irrigation District (MID).

MID is a public-owned agency that supplies irrigation water to farmers of Modesto, California, a city with a population of 160,000. Like many cities around the nation, Modesto began as a small farming community. But as the San Francisco Bay area, only 80 miles away, has grown so has Modesto. Subdivisions developed and schools and playgrounds were built, all alongside thousands of acres of farmland and 211 miles of irrigation canals.

Crook's job is to keep those irrigation canals free of weeds. The canals are surrounded by beautiful landscaping—and weeds, that if dispersed into the irrigation water, would end up in farmers' fields. And there lies the challenge: Crook and his crew must keep irrigation canals weed free, while accommodating adjacent residential areas. These canals often border school playgrounds and neighborhood backyards. Families enjoy nightly strolls on the neatly groomed paths along the canals.

Crook knew meeting this challenge would require careful study. He needed to find an herbicide that works on Johnsongrass, but can still be used in sensitive areas along those canal banks. With careful study, he too, found the right product. "It's not easy finding an herbicide that'll control the tough weeds and still give you confidence about using it in public areas. When we find such a product, we stick with it," Crook says.

It is important to use herbicides maintenance workers understand and the public accepts. Thorough knowledge of a product—including its label—is essential. Most public workers strive to use products with the lowest toxicity possible, and that have the "CAUTION" signal word.

Cairns from ADOT knows that his crews' success depends on public acceptance. "We need to make sure we understand our herbicides inside and out," Cairns says. "Besides making sure we're using effective and safe products, we must also adequately respond to customer questions."

ADOT will not use an herbicide without rigorously evaluating it. "When we decide to use an herbicide, it's not an overnight decision. We look at effectiveness, cost and, of course, safety," he says. In the past ten years, ADOT has applied more than $1 million worth of herbicides and has maintained a positive relationship with the public.

In their effort to select an herbicide compatible with sensitive sites, public works professionals should not disregard the other herbicide benefits crucial to their weed control program. Specifically, keep in mind the herbicide's length of control and leaching potential.

Savings in Hand Weeding Labor Costs

Selecting and using the right herbicide will save public agencies thousands of dollars in hand weeding labor costs, too. ADOT's Cairns says his crews hand weed, but not nearly as much as they would without herbicides.

For instance, a recent study from Auburn University for the nursery business shows the substantial hand weeding labor costs saved by using pre-emergence herbicides. In surveying state nurseries, the study's researchers found that weed control costs could be reduced by more than 50 percent by selecting and properly using pre-emergence herbicides.

When selecting an herbicide—and considering various factors such as sensitive site usage, leaching, and length of control—the end goal should be to use herbicides as efficiently as possible. Much has been written about Integrated Pest Management (IPM). But it is not just a catch phrase, it is an important concept that allows maintenance workers to use herbicides selectively.

The key to controlling weeds through an IPM program is properly identifying problem weeds. To achieve optimal results, apply the herbicides before problem weeds germinate. By accurately timing an application, public works professionals will save time and labor during their busy season. They will also reduce dependency on post-emergence herbicides, using less herbicide overall. Always remember to read the product label for specific use and application directions.

Public works professionals need to do their homework. Sensitive sites along roadsides can be controlled effectively and in a way that is acceptable to the public. The key is choosing herbicides that can accomplish this goal. Knowledge is the most powerful tool. Compare the different products available. Study their labels and manufacturers' recommendations. Consider sensitive site concerns, such as versatility and use in public areas. But remember other important factors, like length of control and leaching. By knowing which herbicides are best for roadside maintenance programs, weeds in sensitive sites can be controlled and substantial savings realized in hand weeding labor costs. □□□

R0013713

Wetland Mitigation and Stream Restoration

■ AS PART of an 11-acre Maryland wetland mitigation project, crew installs live willow branches in a stream bank to provide bank stabilization and enhance aquatic habitat.

SUSAN D. BITTER
and
KEITH J. BOWERS

Ms. Bitter is the Ecological Sciences and Field Services Team Leader for Biohabitats, Inc. Mr. Bowers is the founder and president of Biohabitats, Inc. and Ecological Restoration and Management, Inc., design/build ecological restoration companies based in Baltimore, Maryland.

MIXING concrete and steel with buttonbush and bulrush may be more common than one might think. All across the country, local, state, and federal agencies are increasing their regulations to protect, replace, and restore wetlands and streams that are filled and altered for road construction. These same regulations often require that impacts to these resources be mitigated to replace lost ecosystem values and functions. As a result, state highway and public works agencies are often charged with designing and constructing wetlands and streams along with their roads and bridges.

Over the past eight years, we have designed over 50 wetland and stream restoration/mitigation projects for various county, state, and federal agencies on the east coast. Much of our work stems from the need to mitigate and restore impacts resulting from public works projects including highways, utilities, and channel dredging.

The restoration challenge is straightforward: plan, design, and construct a mitigation project that complies with all permit conditions, satisfies neighborhood and community associations, meets budgetary and scheduling constraints, and replicates nature. Sound somewhat complex, if not formidable? Well, yes it is—especially the replication of nature. However, there are some important premises to respect and apply that will facilitate the design, construction, and maintenance of a successful mitigation project.

Art vs. Science. Wetland and stream restoration and creation is not an exact science, but an evolving art based on scientific theories and successful experiments. Current technology and knowledge do not afford us the opportunity to completely plan, design, construct, and manage all the biotic and abiotic resources that comprise a wetland or a stream. Furthermore, like all landscapes, wetland and stream systems evolve and change over time, and are subject to a host of changing land use activities throughout a watershed. At best, one can plan, design, and construct for the fundamental wetland components: hydrology, hydric soils, and hydrophytic plants; and basic stream morphology components: discharge, gradient, sinuosity, width/depth ratio, channel material and size, soil stability, channel entrenchment, and valley confinement. As form follows function, art follows science. The rule of thumb in restoration/mitigation is "Use what you do know and build upon that foundation through application," but be aware of the "dynamic equilibrium" inherent in all natural systems.

The Landscape is a Continuum. Streams and wetlands are complex ecosystems that we are still trying to understand and comprehend. To say we can "create" a wetland or a stream sounds a bit egotistical, and perhaps naive, but to give into the complexity of the undertaking and do nothing at all may be more of a disservice to our landscape than attempting to do something constructive. Wetland mitigation and stream restoration must be approached with caution and an affirmation that Mother Nature is the best instructor.

The restoration ecologist must look at the whole system and then analyze the parts. For example, if contemplating stream restoration, look at the top of the watershed and attempt to understand what makes the stream look and behave as it does. Travel downstream and learn what happens when that water leaves your site. Not only are these systems connected geographically, but are bridged by time as well. Your actions today will trigger events in the future, some predictable and some not. Everything that is done to manipulate and change a stream will have some effect on that system either down stream or up stream. Be sure to understand to the fullest extent possible the consequences of your actions and how they may affect the surrounding landscape.

Setting a Goal. Mitigation of wetlands and streams must begin with a goal. The goal must be achievable and at the same time meet the expectations of all project participants. Goals are often established based on the lost values and functions of the resource(s) being impacted. The goal may be as simple as reconstructing a stream bank to arrest erosion or as elaborate as recreating the exact habitat of a rare plant. Goals can also combine resource values and functions with cultural and economic factors. It may not be enough to just stabilize a stream bank, but to stabilize the stream bank while increasing trout habitat and enhancing water quality. Furthermore, the goal must be a result of a consensus between all interested parties. Once the goal is determined, a mitigation or restoration plan can be set into action. We have found it advantageous to meet with the client and regulatory agencies before beginning design concepts and develop a goal, or set of goals, that meets the expectations of all parties involved with the project.

It Takes a Team. Preparing and constructing a wetland or stream mitigation project is one of many steps in the regulatory process and often involves the expertise of a multi-disciplinary team of natural resource scientists, restoration ecologists, engineers, and collaboration with the regulatory agencies and the permit applicant. Very few successful projects are the result of individual efforts. Restoration ecologists are still learning a great deal about wetland and stream ecosystems and how they function, not to

R0013714

mention how to put them back together again, and the expertise of many people and disciplines are needed.

When team building, do not forget to include the input of concerned citizens and local neighborhood and environmental organizations. Often their insight into a particular site and their knowledge of local ecological processes and resources will provide valuable information for design and construction. Also consider including a wetland or stream restoration contractor on your team. Their expertise about construction techniques, plant availability, access considerations, and logistics can result in substantial cost savings not only during construction, but throughout the maintenance period.

Water, Water Everywhere. The long term success of any wetland mitigation and stream restoration project depends on restoring or creating the appropriate water budget (hydrology). Unfortunately, for nontidal wetland creation, this is one of the most difficult variables to manage. Groundwater levels must be monitored, surface runoff and flood flows must be modeled, precipitation and evapotranspiration must be calculated, and a water budget must be created. The water budget determines the amount and duration of water moving in, through, and out of the wetland. Water budgets govern the final elevations and grade of the wetland, dictate plant selections, and define specific wetland values and functions. Without reliable, long term monitoring data, accurate planning and design for specific water budgets is limited at best. Likewise with streams, water controls all other ecological processes. Whether it be sediment transport, stream bank erosion, or trout habitat, water is the key to defining stream values and functions.

Know your water budgets and hydrology. Know how water gets to the site and how it leaves the site. Apply field experiments and set up monitoring devices to record stream flows, groundwater levels, and surface runoff. Remember the three main principles of a successful wetland and stream restoration project: hydrology, hydrology, and hydrology.

Build a Stable Foundation. Wetland soils are the primary medium for many chemical transformations that support wetland plants, and are a reservoir for minerals and nutrients required by both plants and many other biotic resources. When designing and constructing a wetland or stream, soil properties must be considered in response to the anticipated hydrologic regime. Soil characteristics that must be contemplated include texture, organic matter, pore space, and chemical properties such as pH. In most cases, a soil's chemical and physical properties must be managed or altered to attain an optimum foundation for hydrophytic plant growth, chemical transformations, and mineral and nutrient cycles. Without a stable base from which to build, desired plant communities and wildlife habitat are a guess at best.

Like hydrology, know thy soils. Learn both the physical and chemical parameters of the site's soils and how these parameters will affect the desired plant community. Of equal importance is knowing everything about any soils imported onto the site too.

■ **FOUR months after installation, willows have leafed out. Roots growing into the stream bank prevent erosion and protect the bank from storm events.**

Green Side Goes Up. If the hydrology is predictable and the appropriate soils are in place, wetland and riparian plant selections can then be made. Wetland and riparian plants can grow in an environment that is typically inundated periodically throughout the growing season. The tolerance to inundation, which includes both the frequency and duration of water contact, varies depending on the physiology of each plant species. Some plants may require constant inundation of water to survive (e.g., cattails) where others may tolerate only short periodic inundations (e.g., ash). Plant survivability is not only dependent on hydrology and soils, but also on microclimate, topography, solar radiation, orientation, and biological interaction.

Native plant species found growing in environments similar to the created wetland provide a reliable source for plant design selection. Additionally, the use of *local* native species provides a genetic advantage for plant adaptation and survivability. Plant selection in mitigation and restoration projects must also take into consideration plant availability and costs, estimated mortality, reproduction rates, sizes and spacing requirements, pests and diseases, and biotic interactions.

Start Early and Stay Late. Successful wetland mitigation and stream restoration projects are often incorporated into the project early in the planning and design process and are a part of the project for up to five years after completion. By analyzing wetland and stream impacts early in the planning stages of a highway, it is possible to avoid impacts by altering alignments and minimize impacts by changing design details. Why do wetland mitigation and stream restoration when you do not have to?

If wetland mitigation or stream restoration is required, assign it a prominent role in the design process. Often mitigation and restoration requirements can be satisfied and incorporated into the design of a highway with minimal additional costs and time. Furthermore, integrating the design of wetland mitigation and stream restoration with the rest of the project will help ensure its long term success.

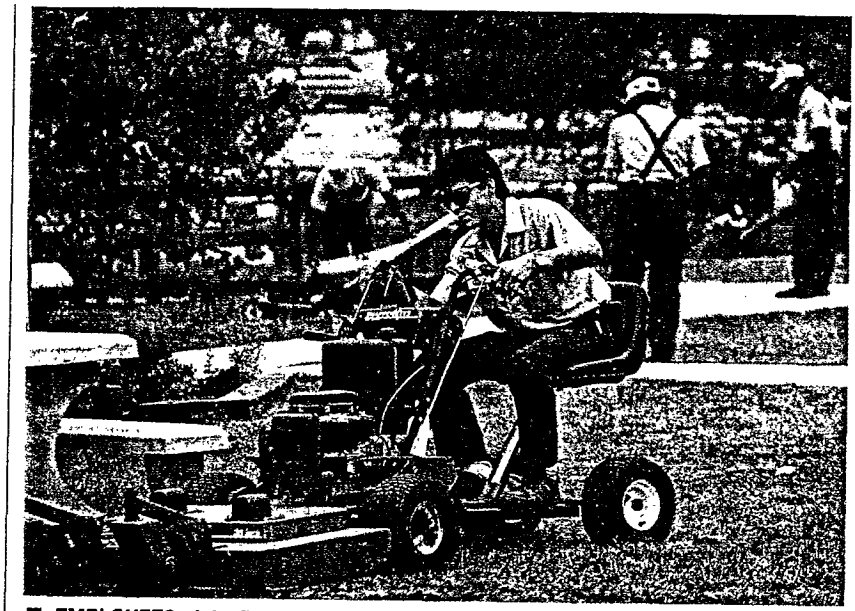
The other critical time often ignored by agencies and permit applicants is the post-construction period. No matter how well planned and executed, *all* mitigation and restoration projects *need* maintenance. Remember, ecological systems change over time and space, often in unpredictable ways. Federal and state agencies are now requiring maintenance and warranty of wetland mitigation and stream restoration projects for up to five years, and longer in some cases.

Maintenance must be incorporated into the project to reach and satisfy the goals of the project. Maintenance activities may include wildlife predation protection, dead and diseased plant removal and replacement, exotic plant eradication, trash and debris clean-up, soil supplements, and hydrologic modifications. Additionally, plant material often needs watering throughout the establishment period, primarily throughout arid regions of the country. A successful mitigation and restoration project has a contingency plan(s) to handle unexpected situations.

Landscaping vs. Ecological Restoration. The failure of many past projects can be directly attributed to the inexperience of the construction/landscape contractor combined with the lack of proper supervision. In mitigation and restoration projects it is impossible to

R0013715

design for all conditions at all times. Consequently, it is imperative that the contractor or a construction manager be able to make intelligent field changes to ensure the success of the project. This requires a thorough understanding of the project goal and thorough knowledge of project components including plant hydrologic regimes, plant material, soil conditions, and surrounding potential influences. Manipulating the final grade three inches or moving a specific plant three feet may mean the difference between a successful project and a failure.



Ecological restoration construction firms should possess the skills and experience to make sure the project is installed and maintained properly. If you contract with a standard landscape contracting firm that does not possess the required expertise, make sure you retain the design consultant or a construction manager with the right qualifications that can supervise the project.

Scruples. Ecological restoration is an attempt to reverse the trend of unsustainable development. Everything we do to the landscape affects the capacity of the landscape to sustain an environment suitable for life as we now know it. The use of exotic plant material, unnecessary fertilizers and pesticides, and other high maintenance "improvements" will ultimately limit the earth's capacity to support life. Ecological restoration represents a significant step in reversing this trend to restore and create sustainable landscapes.

William McDonough stated our ethical responsibility rather succinctly, "Nature doesn't have a design problem, after all; human beings have a design problem." A few sustainable design and construction points to follow include:

- Minimize the destruction of one habitat for the benefit of another. (Remember, peat moss is mined from wetlands. Specify alternatives if available.)
- Advocate the minimization of extremely invasive procedures to native landscapes including wholesale regrading, major changes in drainage patterns, and replacement of native plant material for non-indigenous plants.
- Emphasize landform and grading to create designs, rather than hard structures and surfaces. Balance cut and fill.
- Do not plant any species that may become invasive and decimate native habitats. A few plants that should not be planted include Norway maple, Russian olive, Amur and Tartarian honeysuckle, multiflora rose, kudzu, common reed, purple loosestrife, and red fescue.

Aldo Leopold, one of the great naturalists said, "Things are wrong, morally wrong, whenever our biotic community is degraded." Ecological restoration can be a powerful mechanism to reverse global ecological degradation. □□□

■ **EMPLOYEES of the Parks and Recreation Department take great pride in ensuring that Hinesville's many parks are kept beautifully manicured following the management change.**

Public-Private Partnership Works for Georgia City

ONETHA MINGLEDORFF
and
ADRIENNE MOCH

Ms. Mingledorff is Hinesville, Georgia's City Clerk/Treasurer. Ms. Moch is an Editor at Operations Management International, Inc., Kingwood, Texas.

LUSH green lawns and stately live oak trees, many with Spanish moss gracefully cascading through their branches, are indicative of the atmosphere that permeates the southeast Georgia city of Hinesville (population 21,603). Residents are proud of their community, which plays host to the 24th Infantry Division housed at Fort Stewart, and that pride is evident to even the most short-term visitor.

In early 1992, Hinesville's city council and staff made the difficult decision to contract out its entire public works department to a private firm, Operations Management International, Inc. (OMI). They knew that this public-private partnership would receive continual scrutiny from citizens of the community.

Now, more than a year after the private firm took responsibility for operating the public works department, Hinesville leaders are congratulating themselves on their foresight. Residents are pleased with the professionalism they see exhibited by company employees; the morale of the staff, most of whom are former city employees, is at an all-time high; and although cost figures have not yet been reconciled, it seems that the positive changes that have occurred in the department have resulted in a more cost-effective operation.

Good Track Record

The management company is no newcomer to Hinesville. The firm has operated the city's 7.2-mgd trickling filter/solids contact wastewater treatment facility since 1984. Because of the success of that arrangement, the addition of other public works functions to the company's scope of work was contemplated.

City administrator Billy Edwards believes that having a previous relationship with the company through which a trusting partnership was developed made the decision to expand its scope of work a little easier. He said it is difficult to design a contract that includes all potential public works issues, so trust must go both ways to ensure the partnership is successful.

One of the biggest early challenges that faced the management company was gaining the trust of the staff, many of whom were wary of their new employer. "We had to convince the employees that we were there to help them," said Larry Harper, project administrator. "A lot of people thought we would be 'the terminator' and were put in a sheer terror zone. One of the most exciting things we've seen is how the employees have adapted to being paid to think," Harper added, referring to the company's "Obsessed With

R0013716

Quality" process that stresses employee empowerment.

An indication of how well employees have adapted to new management came with the June 1993 publication of a special edition of *The Pride,* an in-house newsletter, that featured comments from several staff members about how they feel about their jobs since the management change was made. The publication's tone is overwhelmingly positive. In addition to winning over the employees, another big challenge for the company was gaining an understanding of the city's operations within the first 60 days, maintaining services while learning about current practices. It was only after that process was completed that improvements could be initiated.

Harper stresses that the talent core was always there, and it has been allowed to flourish through the successful partnership. In addition to continuing to manage the operation of the wastewater treatment facilities, OMI employees are charged with the overall administration of the public works department, water treatment and distribution, meter reading, streets and vehicle maintenance, parks and grounds maintenance, mosquito control, and sanitation.

Perhaps the most significant operational changes have occurred in the vehicle maintenance and sanitation areas. Organizational and scheduling alterations have increased employee morale and led to pride in exceeding their customers' expectations.

The vehicle maintenance department has become a 7-day-a-week operation, eliminating the backlog of work that occurred with the previous 5-day-a-week schedule. In addition to receiving excellent mechanical service, customers' vehicles are washed before being returned.

Computerized Routes

The sanitation department has computerized its routes, posted daily schedules, and streamlined the operation so that more work is completed with less equipment and personnel. Just recently, the entire solid waste pickup schedule was altered to plan for the city's future growth, and a recycling program is in the works.

Most important, however, is the change in the way sanitation employees view their jobs. Cross-training has improved employee morale and led to improved service, with all employees assisting as necessary to pick up both household refuse and dry trash. To commemorate employees' dedication to their work, the ROC(K) Award is presented quarterly to the sanitation department employee who best exemplifies pride in his job, and recipients' photos are featured in the local newspaper.

In addition to improving public works management, one of the goals of the city in hiring the management company was to save money. The books will not be closed on the initial period of OMI operation until the end of October 1993 (to coincide with the city's fiscal year), but both city and company officials are optimistic that the bottom line will be another reinforcement of the benefit of their partnership.

Harper said cross-training will definitely have a positive effect on the budget, especially in the sanitation and utilities areas, where staff consolidation has resulted in more cost-effective operations. For example, he pointed out that meter readers are being trained as operators and being encouraged to study for their Georgia certifications.

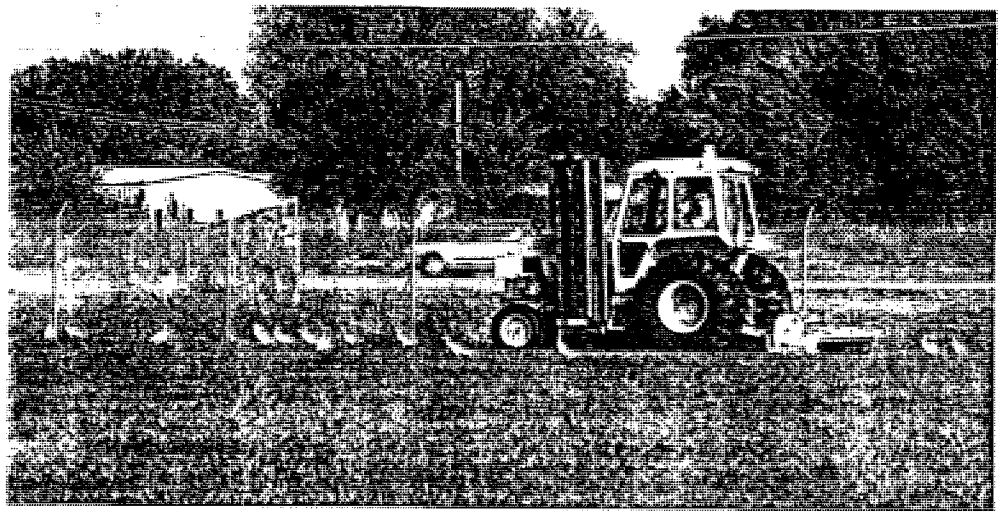
Mayor Allen Brown notes that he does not know if the city could have gotten through the aftermath of the unexpected severe winter storm in March without the management firm in place. With refuse pickups more than five times the norm, supervisors were out on trucks to assist with the cleanup, and those actions impressed city officials, residents, and employees alike.

The management company can see things that city employees did not see. Having the chance to take a fresh look at established procedures has benefitted residents to the point that even the city's mosquito population has declined. Instead of continuing the spraying program the city had in place, the company researched the situation and implemented a program based on specific data and able to be monitored for effectiveness.

Harper attends city staff meetings as a department head, so he is well aware of the pulse of thle community. He and all other company employees work hard to ensure that the public works department responds to both stated and unstated resident needs. For example, employees have gone to several areas around the city and cleaned them up, often on their own time, actions that serve to strengthen the bond between the city and its contract operator.

Synergistic Management Style

The company's synergistic management style has also afforded many Hinesville employees the opportunity to assist at the company's other Georgia projects. Being empowered to contribute in a global fashion to their employer's success is one of the main focuses of the quality process. This emphasis on quality has spilled over to Hinesville, as it is working with a quality consultant to implement its own Obsessed With Quality process.



Another sign of the benefit of the city-company alliance is that since turning over the operation of its public works department to the private company, Hinesville has been visited by officials from several communities that are curious about how its public-private partnership works. Edwards is pleased to see the city as a role model and even more pleased that the decision to contract out the public works department has resulted in significant benefits for Hinesville residents.

One benefit is the continued presence of Fort Stewart, which is the city's leading industry and employer. While many military bases across the country are being closed or scaled back, another brigade is being moved to Fort Stewart. Hinesville believes this shows the military's confidence in Hinesville's ability to serve its personnel. □□□

■ BIRDS attracted to insects stirred up by mowing activities may be hazardous to aircraft operations.

Airports Use Herbicides to Improve Safety, Lower Costs

USING herbicides to manage airport utility turf can offer substantial safety and economic advantages over conventional and repetitive mowing cycles, according to managers of several Florida airports and a leading southern agronomic consulting firm.

Several years of field trials and commercial use of herbicides on airport turf show that "chemical mowing" greatly reduces the safety hazards associated with mowers working in close proximity to runways and active aircraft.

Herbicide programs have also allowed airport operators to reduce the mowing cycles necessary. This reduction in mowing translates into lower equipment depreciation and overall operation costs.

"Use of herbicides is especially advantageous for maintaining turf in the south," said Ron Hill, an agronomic consultant with Weed Systems Equipment, Inc., a Keystone Heights, Florida firm that designs and builds precision spray equipment for research and commercial use. The company also conducts contract research and turfgrass consulting services.

Frequent Mowing Cycles

More frequent mowing cycles are necessary under southern conditions because of longer growing seasons, adequate rainfall, and the degree of vegetative competition, according to the consultant. "Nine-day mowing cycles are common in the south, and the number of mowings per season can range into the 20s," he stressed. "By using herbicides, the number of necessary mowings can be reduced by one-third or even one-half."

Hill also pointed out that many Florida airports apply herbicides along airport perimeter fence lines to keep weeds from encroaching on runways. It is difficult to mow along fence lines, damage to fences and equipment is common, and mowing along fence lines is very labor intensive.

Perhaps the biggest plus of chemical mowing is improved safety for aircraft and mower operators alike. At most airports, runways cannot be shut down during mowing operations. Consequently, mowing is often accomplished piecemeal between take-offs and landings, or during night or early morning when flight activity is minimal.

"Murphy's Law comes into play where airport mowing is concerned," said Murl Mitchell, maintenance supervisor for the Sarasota/Bradenton airport in Sarasota, Florida. "Anytime you mix airplanes with mowing equipment, the possibility for accidents is very high."

Considerable danger is also posed by birds feeding behind mowers, Mitchell commented. Mowing attracts large flocks of birds that congregate to feed on insects stirred up by mowing activity. By reducing the number of mowings, bird activity that can interfere with flight operations is greatly reduced. According to Hill, birds also gather and cluster in tall, unmowed grass. When airport maintenance crews get behind schedule with mowing, the number of birds attracted to the airport perimeter increases significantly.

The mowing season at Sarasota/Bradenton Airport runs from late April to early October. Two 15-ft mowers pulled by diesel tractors make between 18 and 21 cycles during that period of time every year. It takes nine working days to complete a single mowing cycle at an average of 152 man-hours per cycle.

Seventy-five percent of the 1100 acres within the airport perimeter is mowed. Since 1989, Mitchell and his crews have experimented with herbicide applications on several plots within the perimeter. Herbicides used include Campaign® (Monsanto Company, St. Louis, Missouri), Oust™, and Velpar™ (E.I. duPont de Nemours and Company, Wilmington, Delaware).

"In some areas where we've applied herbicide, we've been able to get by with two mowings—compared to a norm of five mowing cycles," Mitchell pointed out. "If we can reduce mowing by one-third, it will amount to a significant savings for us."

Reducing Foreign Object Damage

At Lakeland Linder Regional Airport in Lakeland, Florida, herbicides are also being evaluated as a means of reducing mowing costs and improving safety. Every spring, during the annual Sun 'n Fun Experimental Aircraft Association Fly-In, the airport will conduct over 30,000 flight operations in a single week. By comparison, the Atlanta airport—often billed as the world's busiest—conducts only 10,000 flight operations per week.

"During the week of the Fly-In, we become the busiest airport in the entire world," said Gary P. Quill, airport director. During the rest of the year, the airport will have an additional 120,000 operations. With such a high level of flight operations, safety concerns are first and foremost. Herbicides are used to eliminate weeds in runway cracks and the special dangers that these weeds pose.

"Weeds growing in runway and taxiway cracks pose a real safety hazard," Quill explained. "They contribute to the chipping away of pavement. These pieces of pavement—if sucked into aircraft engines—can threaten aviation safety. They can also do extensive damage to planes. We're trying to eliminate this type of foreign object damage."

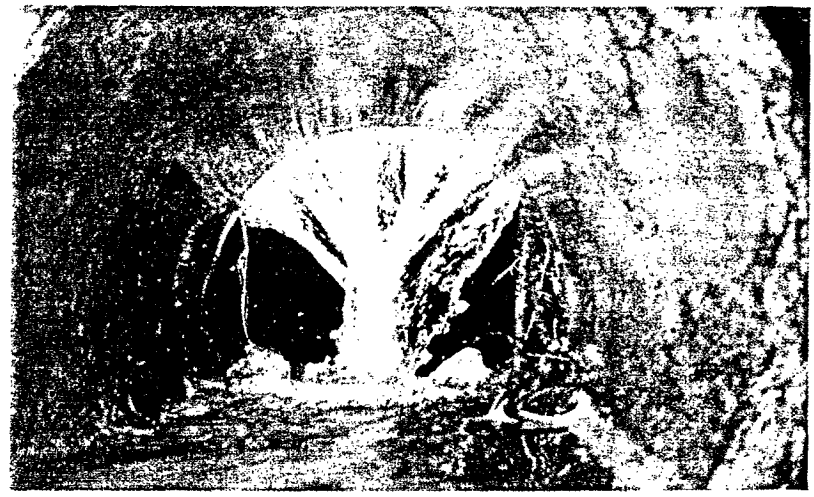
R0013718

Weeds growing in cracks also speed up the deterioration of runway and taxiway surfaces, especially when water gets into the cracks and freezes. Not surprisingly, damage to these surfaces is expensive to correct. Spraying weeds in cracks and crevices with herbicide eliminates this problem and decreases runway deterioration.

According to Bill Morton, Jr., maintenance supervisor at Lakeland Linder Regional Airport, herbicides have also proven useful for turf maintenance around runway lights. "Keeping grass mowed and trimmed around runway lights is very labor-intensive," Morton explained. "These lights are also delicate and easily damaged by mowers. Using a backpack sprayer for herbicide application, we can treat a circle around runway lights and avoid using the mowers for this job altogether."

Herbicides used at Lakeland include Campaign, Oust, and Roundup®. Along 15 miles of ditchline within the airport perimeter, Rodeo® herbicide is used. Rodeo is a specially-formulated herbicide for use in and around water. Rodeo and Roundup are Monsanto products.

"Keeping our drainage ditches clear of vegetation ensures fast, efficient drainage and minimizes potential dangerous sheet flow of water over runways," Morton said. "Poorly draining ditches that are clogged with vegetation increase the potential for increased sheet flow or ponding of water on pavement surfaces. We also reduce the environmental impact of the airport by keeping water moving through ditches that serve as mitigation areas, to improve the quality of runoff water."



Esthetics Are Important

The annual Sun 'n Fun Fly-In routinely draws almost 300,000 people to the Lakeland Airport grounds. Many of these visitors camp on the airport grounds, and media coverage of the event is constant.

"Because of the Fly-In, esthetics are more important for us than they are at most other airports," Morton explained. "We try to maintain our utility turf almost to golf-course standards."

Two employees spend all of their time on mowing chores. "We're trying to find ways to free up these people so they can concentrate on landscaping and other esthetic chores—especially in front of the terminal," Morton added. "Use of herbicides is helping us accomplish this."

Morton says that cattle egrets feeding behind mowers can also be a problem at times. "Birds can go through an aircraft windshield during take-offs and landings, causing serious injury to pilots. Also, birds can total an aircraft engine if one gets sucked in. Even the damage caused by a bird striking the a wing can be significant—both in terms of repair costs and the threat to safety." □□□

■ RAINFALL induced infiltration enters sheared pipe at the rate of 45,000 gpd.

Municipal Program Combines Rainfall Induced Infiltration

JAMES D. McGREGOR, P.E.
HAROLD M. KLEIN
and
JOHN LYONS

Mr. McGregor is a senior associate with Killam Associates, Millburn, New Jersey. Mr. Klein is the Township Administrator and Mr. Lyons is the Superintendent of Sewers, Piscataway, New Jersey.

THE Township of Piscataway, located in northern New Jersey, has a population of about 47,100. The township has a mixture of low density and condominium residential connections and significant commercial and industrial wastewater users.

The township owns and maintains a sanitary sewer system containing over 165 miles of municipal sanitary sewers. The sewer system also contains a network of building connection sewers of unknown length. Approximately 73 percent of the municipal sewers are 8-in. diameter pipes consisting of clay, asbestos cement, and plastic pipe.

Wastewater flow from the community is treated by the Middlesex County Utilities Authority (MCUA). The wastewater reaches the wastewater treatment plant through the MCUA interceptor sewer system. The MCUA meters Piscataway wastewater flows at eight metering chambers. The wastewater costs are partially apportioned on the basis of flow. These flow-related charges fluctuate significantly during dry and wet rainfall years because substantial rainfall-related extraneous flows enter the sanitary sewer collection system.

Although the extraneous flow problem has existed since the sanitary sewers were constructed, no concerted program was undertaken to control the extraneous flows until 1989 when the township retained Killam Associates to assist them with the extraneous flow problems.

The decision to retain a consultant was not solely prompted by high wastewater treatment costs. Within the township the sanitary sewer extraneous flows were causing additional problems. The problems were most critical during significant prolonged rainfalls when peak extraneous flow rates developed. The hydraulic loading imposed by the peak extraneous flows caused the following:

- sewage overflows from some manholes;
- sewage backups into some homes;
- bypass pumping into storm sewers at some sites to prevent backups into homes;
- activated high water alarms at pumping stations;
- increased pumping costs;
- required emergency responses by the department of public works (DPW);
- required responses to residents' complaints;
- restricted potential development in some small sewer drainage basins;
- made the township vulnerable to a future sewer ban or regulatory fines.

The predominant subsurface geology is soft red shale with sandstone beds. This geology provides ideal conditions for rainfall induced infiltration (RII), a type of groundwater infiltration prevalent in collection systems with subsurface rock.

A 1990 EPA report to Congress, *(Rainfall Induced Infiltration Into Sewer Sys-*

R0013719

tems, Report to Congress August, 1990, 430/09-90-005), indicates the characteristics and problems associated with RII include:

- rapid infiltration increase that mirrors the rainfall event followed by a somewhat similar decrease when the rain stops;
- frequently mistaken as surface water inflow, which results in poor achievements by some sewer rehabilitation programs;
- peak RII can cause dry weather wastewater flows to increase by 3.5 to 20 times;
- RII can represent 60 to 90 percent of wet weather extraneous flows;
- rainfall enters the sewer system by percolating through the soil of sewer trenches;
- sewer trenches channel the water to defects along the sewers;
- shallow sewer trenches (4-in. diameter building sewer connections) are more vulnerable to RII;
- deeper interceptor sewers are less susceptible to RII;
- subsurface rock maximizes the influence of RII because the groundwater cannot infiltrate into the ground below the sewer pipes;
- appreciable hydrostatic heads develop in rock sewer trenches, rapidly accelerating infiltration rates at sewer defects.

Killam Associates previously identified RII as a significant problem in northern New Jersey during sewer investigations in nearby communities with identical subsurface rock geology and extraneous flow problems. To accurately identify RII sources, the consultant modified its sanitary sewer investigation procedures. Traditional sewer system evaluation techniques were abandoned, and field investigations focused on identifying peak RII. This meant developing dry weather base flows, then mobilizing during RII periods to conduct metering, record instantaneous flow measurements, and identify manholes and specific sewer lines with RII. Most importantly, television inspection of the sewers was only scheduled when RII was active. These procedures ensure that major sources of RII are correctly identified and appropriate sewer rehabilitation work recommended.

The consultant initially investigated a small sanitary sewer basin designated as the Gramercy Park area. The basin contains about 38,000 ft of asbestos cement municipal sewers. The field investigations revealed the following:

- RII caused the extraneous flows;
- peak RII was 13 times the dry weather flow;
- 21 percent of the municipal sewers contained 90 percent of the RII;
- interceptor sewers partially blocked with grease and debris from vandalism were contributing to sewage backup problems;
- 4-in. diameter building connection sewers contributed 62 percent of the RII within television inspected sewers;
- some manholes contributed high RII flows (80,000 gpd maximum measured in one manhole);
- RII entering municipal sewers could be eliminated by spot repairs and grouting.

Engineering Recommendations

The consultant recommended that the township DPW become actively involved with the RII investigations and sanitary sewer rehabilitation because the DPW had a television inspection rig, sewer jet flushers, and the capability to excavate and repair damaged sanitary sewers. A cooperative venture between the DPW and the consultant would minimize contractor costs for television inspection; fully utilize DPW capabilities to investigate and rehabilitate the sanitary sewer; provide training to DPW personnel in television techniques needed to locate RII; train DPW personnel in flow measurement techniques to identify and quantify peak extraneous flows; train DPW personnel to make water tight sewer repairs; and demonstrate the need for high quality work during RII investigations and sewer rehabilitation work.

The township administrator and governing body evaluated the Gramercy Park sewer investigation findings and decided to adopt an aggressive program to reduce sanitary sewer system extraneous flows. They recognized that controlling extraneous flows would require reducing extraneous flows from the network of 4-in. diameter building sewers as well as the municipal sewer pipe. They also recognized that the field investigations were detecting significant maintenance problems. This added benefit enabled DPW to resolve some sewer backup problems and prevent future sewer backups.

Township officials made the important decision to adopt a policy of investigating and rehabilitating defects along building connection pipes. The DPW is viewed as a department with a responsibility for assisting the public with various problems. This is especially important where sanitary sewers are concerned because the sewers are underground and require specialized investigation techniques to evaluate problems. A mini-camera gave the DPW the ability to inspect 4-in. diameter pipes.

Existing records and television findings within the Gramercy Park sewer basin indicated that many building connection problems existed in the municipal right-of-way.

TV Inspection Equipment

The new television inspection equipment purchased by the township to improve its sanitary sewer inspection capabilities and permit inspections of the 4-in. diameter sewers included a 360-degree radial view color camera and a mini-camera for small diameter pipe (Cues Inc., Orlando, Florida). The equipment has proven valuable for identifying extraneous flow problems within accessible sewers. The radial view camera has determined that some building connection pipes are leaking within 1 ft of the municipal sewer. These leaks are the result of poor quality construction work or non-watertight connections by plumbers. The radial view camera has also identified some utility poles that damaged asbestos cement pipes.

The mini-camera locates extraneous flow problems and maintenance problems along building connections. Most identified problems along the 4-in. diameter pipes are related to structural damage caused during the original construction or caused by construction of nearby utilities after the pipe was installed.

Continuing Investigations

The township recognizes the benefits of the cooperative venture to identify sanitary sewer extraneous flows. The consultant's field procedures expedite the process of identifying major extraneous flows and minimize the costs for non-productive investigation tasks. For instance, the traditional tasks of smoke testing and dye water testing have hardly been used.

Investigations are ongoing in two additional drainage basins that also have severe extraneous flow problems. Similar sewer defects and building connection extraneous flow problems are being detected. Flow from both of these drainage basins is metered by the MCUA. Therefore it will be easy to monitor the extraneous flow reduction effects of proposed sewer rehabilitation work.

A successful flow reduction program is anticipated because some major extraneous flow sources have been pinpointed by the field investigation procedures. The most noteworthy finding has been the detection of a 1430-ft portion of 8-in. diameter municipal sewer not shown on the sanitary sewer map. The sewer alignment is in a right-of-way partially along a small brook. Smoke testing by the DPW identified five homes connected to the sewer. The dry weather average daily flow from the sewer is about 2000 gpd. During a 1.83-in. rainfall in November 1992, the peak RII flow from the sewer was 240,000 gpd, which is 120 times the dry weather flow. Even more astounding was the peak RII flow of 900,000 gpd, measured during a 4.29-in. rainfall in December 1992. The RII rate was 450 times the dry weather flow!

The planned rehabilitation of this sewer will have a dramatic impact in reducing extraneous flows from the sewer basin. Future wastewater treatment cost savings will be appreciable. □□□

Connecticut DOT Turns to Partnering

ARTHUR W. GRUHN, P.E.
Director of Construction,
Connecticut DOT,
Wethersfield, Connecticut

THE Connecticut Department of Transportation (ConnDOT) has instituted a voluntary "partnering agreement" as part of the project management strategy for a series of bridge rehabilitations along State Route 8 in the town of Seymour. The goal of this action is to foster carefully-coordinated teamwork necessary to overcome fast-track scheduling challenges, to avoid potentially high monetary penalties, and to minimize the number of claims associated with the $12-million contract. Work began in April 1993 and must be completed on or before November 30, 1994.

Like many other states, ConnDOT has battled a rising number of claims on projects in recent years. Currently, the state has more than 50 active claims on its books worth an aggregate total of about $50 million. The state began studying partnering in 1990-1991, but delayed implementing it until this year due to staff and other cutbacks. The Seymour project presents an ideal candidate to test the concept in this state.

The project has been awarded to O & G Industries, Inc., a Torrington, Connecticut general contractor with past experience in partnering on a U.S. Army Corps of Engineers project in Louisiana. The practice has gained favor after proving successful on hundreds of millions of dollars worth of Corps and Arizona Department of Transportation (ADOT) projects and others under the auspices of major public and private construction buyers.

How it Works

Construction buyers in the private sector were the first to accept partnering, especially on design/build projects. Other entities, including the Corps, ADOT, General Services Administration, Federal Highway Administration, state and local governments, and the Associated General Contractors of America (AGC), foresee the practice as the trend for the future and have encouraged it on hard bid programs, as well.

The implementation of partnering normally begins before construction begins, although it has also been used to rescue projects running behind schedule or over budget. The process starts with an orientation, or partnering conference, attended by representatives of the owner, major contractors, design consultants, and others likely to interact regularly throughout the work.

This initial meeting is normally run by an outside facilitator and often involves administration of behavioral/personality trait tests to provide participants with insight into their communication styles and other people skills. Following that step, the facilitator then has the group mutually develop the terms of a formal "charter," the accord that all participants sign.

This agreement corresponds to the project's business plan, outlining mutual goals and methods essential to the project's success. The other key elements normally include a team evaluation process by which the team can assess its progress or shortfalls, a process for identifying methods of improvement, and a protocol for instilling decision-making at the lowest level of authority possible, ideally with field supervision personnel to expedite the process. Follow-up workshops are also held to review the level of team commitment thereafter.

Partnering does not displace the obligations and protection of the legally-binding contracts, however. Partnering agreements are strictly voluntary so their success depends on the moral integrity and mutual trust achieved between all parties. The practice has been termed analogous to "restoring the handshake" that once characterized the industry. This level of mutual trust has been compromised in recent years by: the onerous nature of contemporary contracts; the practice of some contractors intentionally bidding a project low on the premise that an adequate profit can be salvaged later on through

Partnership Agreement Between State of Connecticut Department of Transportation, O & G Industries, Inc., Greiner, Inc., and The Maguire Group for the project 124-146 Reconstruction of Bridges 587, 588 and 1062, Route 8, Seymour, Connecticut

The general objective of this partnering agreement is to construct a quality project in a way that provides a well-designed, well-constructed bridge deck consistent with the construction time frame and safety for the general public and construction workers, so that the bridge will have a significant life span and minimal maintenance.

To do whatever is possible to keep a high degree of cooperation and to ensure the proper lines of communication remain open between all parties involved.

To create an atmosphere minimizing liquidated damages, claims, disputes, and litigation in a way that is consistent with the intent of the contract and the interests of all parties so that no party bears an unfair financial burden.

To minimize public inconvenience in a way that recognizes, plans for, and monitors disruptions to the normal operation of the roadway throughout and adjacent to the construction site so that the public can be informed as to the status of the project.

To institute a testing program that provides timely and on-site results, consistent with recognized testing standards so that on going quality of construction can be maintained and decision in regards to Monday morning openings can be made based on measured results.

To develop a chain of command that acts in a timely manner to resolve all design and construction problems with the express purpose of keeping the project flowing efficiently. Standard operating procedures will be modified where necessary.

To recognize the unique schedule requirements of the project and work cooperatively to reduce schedule impacts and complete the overall project on or ahead of schedule.

To resolve all conflicts at the lowest possible level by establishing an issue resolution and escalation procedure.

To recognize and respect the mutual financial goals of the participating organizations in the decision making process.

To institute an enjoyable work environment in a way that individuals maintain their professional perspective and meet their personal project goals so that the partners can be proud of the project.

To institute an enjoyable work environment in a way that individuals maintain their professional perspective and meet their personal project goals so that the partners can be proud of the project.

R0013721

change orders and claims; and by a general inclination to litigate rather than mitigate differences.

This has resulted in too much energy being devoted on many projects to "building a case" for resolution later than to focusing on expeditious correction of errors and to maintaining open lines of communications and trust at the field level. The ultimate outcome throughout the industry has been higher costs, lower profits, and compromises in productivity, schedules, and quality. Frankly, a judge or jury lacking the technical expertise to objectively assess construction claims seldom proves advantageous to anyone.

Where partnering agreements have been utilized, average schedule reductions of 11 percent have been reported (at no loss in quality) and with fewer unresolved claims. Using the practice, ADOT anticipates $7 million worth of savings on $415 million worth of infrastructure projects. ADOT expects an 18 percent average reduction in schedules, a 33 percent reduction in consulting engineer costs, and has identified $880,000 in value engineering savings, which are split 50/50 between ADOT and contractors. Twenty-one projects, worth $64 million, of the 97 subjected to partnering have been completed since 1991. This and Corps achievements caught the attention of ConnDOT.

Challenges of Route 8

Work on the Route 8 viaducts is restricted to continuous 59-hour periods on weekends. Potential penalties range in amounts from $5,000 for the first half-hour up to $9,900 for the third half-hour increment for missing the 6 a.m. deadline on Mondays to reopen the roadway to traffic. Liquidated damages in the amount of $10,000 per diem also apply for each day the contractor exceeds the total schedule of 508 days or for each day exceeding certain work packages therein. ConnDOT has subdivided the work into two phases and three sites.

Site 1 involves two northbound and two southbound lanes of Route 8 over Route 313 and the Naugatuck River. Site 2 addresses a four-lane Route 8 viaduct over Route 67 and the Metro-North Railroad. Site 3 is a four-lane bridge carrying Route 67 across the Naugatuck River.

The Route 8 viaducts are divided roadway structures with 7-in., reinforced-concrete decks composite with steel rolled beams and supported by hammerhead-type piers. The first has ten simple spans totalling 1,000 ft. in length and variable widths from 70 to 125 ft. The second has 24 simple spans that carry the two northbound and southbound roadways with a total length of 1,725 ft and each is 35 ft wide. A 1991 traffic census showed an ADT of 19,500 SB and 18,400 NB vehicles. The Route 67 bridge over the

(Continued on page 82)

Co-Composting Serves Tennessee County

As municipalities struggle to make their way through increasing disposal costs created by the litigation- and regulation-strewn landscape of modern waste management, they might do well to consider the experience of Sevier Solid Waste, Inc. (SSWI), a county-wide public authority whose waste management solution serves as a model of cost-effectiveness and environmental soundness.

In Sevier County, Tennessee, located to the southeast of Knoxville in eastern Tennessee, the solution has been to co-compost both solid waste and sludge in a state-of-the art facility, and sell the compost end product. Since the SSWI plant came on line in September 1992, the municipal waste stream in Sevier County has been cut by nearly 75 percent, far exceeding the current state waste diversion mandate of 25 percent.

The county's year-round resident population now stands at about 51,000, though tourists, drawn by the attractions of Great Smokies National Park, swell that number significantly in the summer months. While the population density does not place Sevier County in the same category as its counterparts in northern New Jersey, it is enough to have caused concern about diminishing landfill resources and escalating tipping costs.

The Search for Alternatives

In 1990, when SSWI began considering an alternative to its system of wholesale landfilling, awareness of co-composting as a technology was very low, among both Sevier County municipal officials and the general public. The same was true of Tennessee as a whole.

Municipal officials in Sevier County were keenly aware of the need for an alternative waste disposal method. SSWI had been formed two years earlier to deal with just this issue. The county's population had grown 23 percent from 1980 to 1990 while per-capita waste had grown 100 percent in the same period. The existing waste disposal resource—a ten-acre landfill—was expected to exhaust its capacity within a year.

Waste stream and population projections showed that replacing the landfill would require acquiring a new site of at least 100 acres. Moreover, that site would have to conform to the new Subtitle D federal landfill construction standards, involving considerable topology and hydrology analysis, design, and engineering—factors that would have substantially increased both development and management costs.

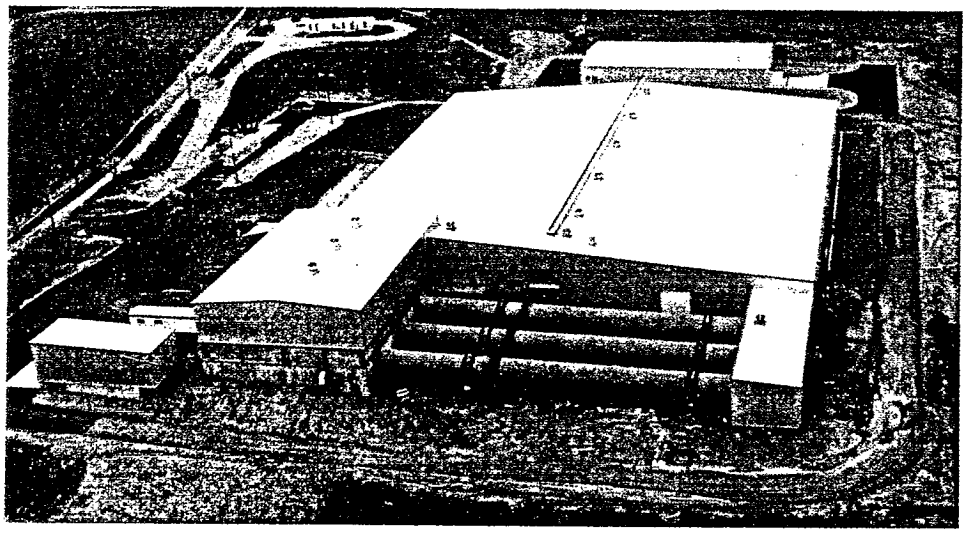
"We expected our tipping costs would rise to $30 a ton when everything was done," said John DeMoll, general manager of the Sevierville co-composting plant. "That would have been a 100 percent increase, with no slowing down on landfill consumption."

Incineration would slow landfill construction, but was ruled out because of the experience of nearby Knoxville, where objections from the National Park Service, based on the city's proximity to the Great Smokies National Park, had effectively scuttled plans for an incineration plant. Sevier County actually contains part of the park, making the odds of overcoming similar objections virtually impossible.

When members of the SSWI board began investigating recycling as an alternative, board members ruled out curbside separation recycling as unreliable and ineffective. Composting then emerged as a preferred alternative, particularly after members of SSWI made a number of trips to composting facilities around the country.

In Sevier County, the nature of the solid waste stream imposed certain conditions on prospective composters. The growing local economy, with its large tourism sector, produced wide fluctuations in waste stream volumes between summer and winter seasons. SSWI wanted the large amounts of restaurant waste grease produced by the county's many restaurants, at the time collected by a private carting service, included in a disposal solution.

The SSWI issued an RFP for a solid-waste composting plant, and ended up with four short-listed companies. Bedminster Bioconversion Corporation, a Cherry Hill, New Jersey firm, was chosen on the basis of its operational experience and patented technology.



Co-Composting: Nature's Own "Technology"

The core of the Bedminster system is the Eweson® (pronounced AY-ve-sun) digester, an enclosed rotary vessel, as large as 16½ ft across by 220 ft long, into which combinations of solid waste with sewage and septic sludge are introduced under perfect environmental conditions that support rapid microbial activity. The result is humus, the organic component of soil.

In an Eweson digester, where temperatures reach 160°F, the natural process of decomposition is accelerated dramatically. After three days, nearly 70 percent of the municipal solid waste (MSW) and 100 percent of the sludge emerges as compost. The balance is nonbiodegradable material that can be screened off, and either further processed for recyclable materials or landfilled.

Even this "reject" material is inert and sanitized, a major issue for those with landfill leachate or methane gas concerns. Unlike some composting systems whose

R0013722

■ CO-COMPOSTING facility in Sevier County, Tennessee. The three digesters are in the foreground.

end product resembles shredded paper in consistency, the end product of this composting process looks and feels like dirt.

That the chosen system can process sludge was an added plus for SSWI, because sludge in Sevier County had also been landfilled. Sited on 2½ acres, the 90,000-sq ft Sevierville plant uses three digesters, each with three compartments. The three digesters can process over 150 tpd of solid waste and at least 75 tpd of sludge. Unsorted solid waste arrives at the plant in packing trucks and is offloaded onto the tipping floor. There, oversized objects such as tires and rolls of carpet are pulled out of the mix before it is loaded onto the digester.

Sludge is then introduced to bring the moisture content up to 50 percent and the carbon:nitrogen ratio up to 30 to 1. The Bedminster system can successfully process sludges with solids content of two percent or higher.

Each digester contains three compartments, corresponding to a different stage of the composting process. In each compartment, a small percentage of the previous digester's load is left inside to act as a bacterial catalyst, much as "starter" dough is used to raise sourdough bread. The microbial activity causes the temperature to exceed 131° to condition the material and begin the process of killing pathogens.

At the end of the first day, the contents of the first compartment are batchloaded into the second compartment, with a small portion left behind to catalyze the next load. At the end of the second day the process continues, and the material in the second compartment is transferred to the third compartment, again leaving an inoculum for the incoming load. At the end of the third day, the batch is unloaded from the end of the digester. What emerges is a mixture of finely digested organic material and undigested inorganic material. It falls from the digester onto a conveyor belt and is moved onto a 1¼-in. trommel screen. Glass and ceramics emerge from the process in a sandy consistency, analyzing out as silica in the final product. Heavy plastics, metal cans, and other non-biodegradable materials emerge intact and are separated by a trommel screen for further processing. Metal and plastic can be removed for recycling, and the balance of the residuals can be landfilled.

The composting process in Sevierville is free of odors. All the composting takes place in a completely enclosed facility, equipped with an air treatment system that eliminates odor problems and creates no air, water, or soil pollution. Air from the plant is processed through 3-ft deep bio-filters where aerobic bacteria—working on the air through layers of stone, gravel, compost, and bark topped with plants—remove any remaining odor.

The compost is aerated for six to eight weeks to complete the curing process. It is then final-screened to meet specifications for the agricultural, landscaping, or nursery market. The batch system allows independent control of each day's waste flow.

The technology itself is only one piece of the "right fit" equation. Whether the technology was in fact turn-key, and whether it required extensive maintenance and retraining the work force were questions that faced the SSWI board. The potentially sensitive subject of effective privatization of this previously public function was solved by reassigning SSWI workers into the new plant (under a Bedminster manager) and by public ownership of the plant.

A false perception exists that co-compost made with sludge and solid waste must invariably contain high concentrations of either pathogens or heavy metals such as cadmium and mercury. In Sevierville, Bedminster used the compost standards of Florida, since Tennessee is still formulating co-composting standards. When measured for organic nutrient value, inert matter, and foreign matter against the three grades of Florida compost—agricultural, horticultural, and private home use (the finest)—SSWI's compost has registered only half the maximum parts-per-million permitted.

When SSWI solicited proposals for its plants, a major concern was the ability to find markets for the compost end product. In the case of the Sevierville plant, all the compost for the next year has already been sold to two soils dealers in Pigeon Forge and Knoxville.

The efficacy of Bedminster's plant design and the quality of the end product would be moot if they were not tailored to SSWI's cost considerations. SSWI financed the Sevierville plant through a $9-million public bond issue. The issue covered not only the costs of acquiring the new landfill site and constructing the plant, but also erecting a new recycling building adjacent to the plant, and purchasing additional machinery such as a tub grinder to pulverize large pieces of wood.

During the building of the plant, Bedminster provided turnkey construction services. SSWI owns the plant, and has contracted with Bedminster to operate it for five years under an operating agreement with five-year renewal periods, which includes an annual operating and maintenance fee. SSWI and Bedminster share compost sales revenues.

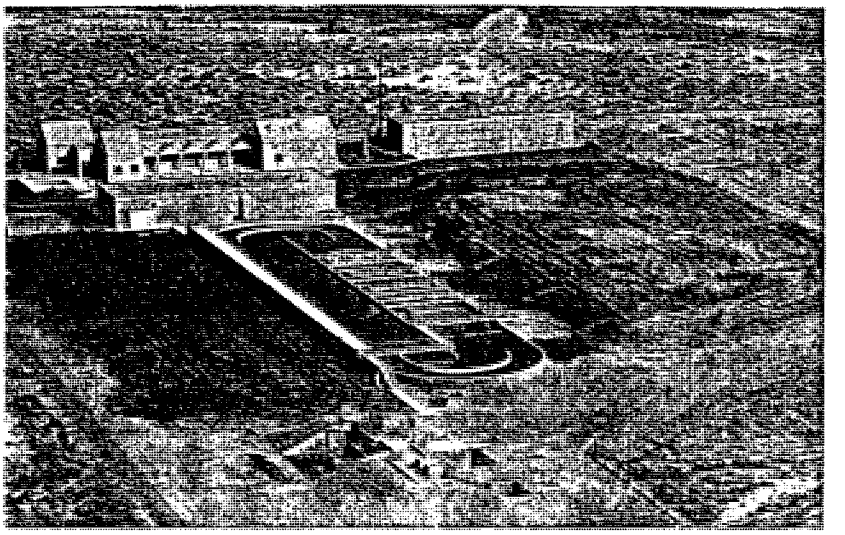
With its new co-composting waste stream system in place, SSWI has projected its current disposal costs to be approximately $30 per ton of total waste processed. In the meanwhile, landfill consumption in Sevier County has decreased from 4½ acres a year to ½ acre a year. □□□

R0013723

Washoe County Stakes Its Claim on Effluent Reuse

JOHN COLLINS, P.E.
Director, Utility Division
Washoe County, Nevada
and
FRANK APPELFELLER, P.E.
Project Engineer,
Black & Veatch
Cincinnati, Ohio

NEVADA earned the name the "Silver State" from the famous mining boom of the last century. Now Nevada is undergoing a modern day boom. Stimulated by gaming industry growth and its attractiveness as a retirement location, Nevada has recently led all states in population growth rate. The mushrooming of Las Vegas in southern Nevada has been well publicized. To the north, the city of Reno and surrounding Washoe County have seen their fortunes rise in similar fashion.



The heart of Washoe County is located in the Truckee Meadows between the Virginia and Carson mountain ranges, northeast of Lake Tahoe. Typical of much of the western U.S., the region is arid, receiving less than 10 in. of rainfall per year. Increasing demand has made water as precious as the silver ore that made Nevada famous in times past. The rights to own and manage water are often overriding concerns in the political arena. Practices that maximize the benefits of available water supply, such as wastewater reuse, are becoming an essential part of successful growth strategies.

Washoe County foresaw the current boom. In the early 1980s, three major developments were proposed for the Truckee Meadows area south of Reno. These developments were planned for a population equivalent of nearly 66,000 people. Until then, most utilities in the county were privately installed and operated. The county recognized the need to take a role in water management and created its utility division to provide water and sewer services.

In 1984, the county completed a water and wastewater facilities plan for the south Truckee Meadows area. To help conserve the available water supply, the plan recommended that wastewater be collected, treated, and reused within the drainage basin. A special sanitation assessment district was formed to finance the building and operation of the planned sub-regional wastewater facilities. Preliminary design of the South Truckee Meadows Wastewater Treatment Plant was initiated in 1987.

Implementing the project involved numerous challenges, including:

- A legally imposed construction start deadline.
- Site considerations relating to Native American cultural resources and wetlands.
- The need for treatment process flexibility to meet anticipated discharge limitations.
- Provision for storage of treated wastewater during the off-season when irrigation is not practiced.

■ RACETRACK-type oxidation ditch is designed to provide both biological treatment and secondary sedimentation at the South Truckee Meadows Wastewater Treatment plant.

Site Considerations

The plan called for the wastewater treatment plant to be located at the entrance to a draw in the Huffaker Hills south of Reno. With high ground on three sides, this draw was a natural enclosure for entrapping wild game by early Native Americans. It was expected that artifacts from these hunting activities would be found scattered throughout the area. To locate and preserve these artifacts, extensive cultural resource investigations were conducted, including some excavation. Based on the results of these investigations, treatment facilities were sited to avoid impacting these cultural resources.

The plant site is in a low area in the 100-year flood plain. The southeast corner of the property is adjacent to where Thomas Creek enters man-made Alexander Lake. A wetlands delineation performed by the Corps of Engineers classified about one-third of the site as wetlands. The county made an extensive effort to preserve these wetlands. The plant perimeter fencing was designed and installed to separate the wetlands from construction activities and future plant operations.

However, the relative locations of the plant and the collection system meant the 36-in. incoming sewer would pass through the wetlands. Although a Corps of Engineers nationwide general permit (under the Section 404 rule) allowed, with certain limitations, sewer construction through the wetlands, the county wanted to preserve wetlands in their existing state. Thus it was required that the sewer be designed and constructed on a less direct alignment that bypassed the wetlands.

Phased Construction

The plant's preliminary design was completed in May 1988. However, a fast construction start was necessary if the county was to build on the planned site. A legal arrangement set forth in the early 1980s gave Washoe County free use of the site, provided construction was initiated no later than October 1988. Failure to meet the deadline might have resulted in new and extensive site selection work, plan revisions, and significant project delays.

To meet this short time requirement, a phased construction plan was devised. Because extensive site development was necessary for access and flood protection, the site work was designated the initial fast-track construction project. Design work was completed and bidding soon followed. A notice to proceed with site development was issued in September 1988—enabling the county to meet the required deadline. This initial contract covered the plant access road construction, filling and grading the site to above the 100-year flood plain, and installing perimeter fencing to protect the wetlands and treatment plant site during and after plant construction.

R0013724

Construction was completed in early 1991. The plant's initial phase has an average flow capacity of 1.5 mgd; the planned ultimate capacity is 6.0 mgd. The treatment processes include preliminary treatment, biological treatment using an oxidation ditch activated sludge system, secondary sedimentation, and disinfection. The plant can operate in the extended aeration mode up to a capacity of about 0.75 mgd to achieve the required sludge age for solids stabilization. Once actual flow nears 0.75 mgd, the need for additional solids treatment capacity must be reviewed.

The discharge permit for the plant issued by the Nevada Division of Environmental Protection (NDEP) requires the treated wastewater to meet average limits of 30 mg/L biochemical oxygen demand (BOD) and 45 mg/L suspended solids; the fecal coliform limit is 200 coliform forming units (CFU) per 100 mL. The permit allows discharge to state groundwaters by means of spray irrigation.

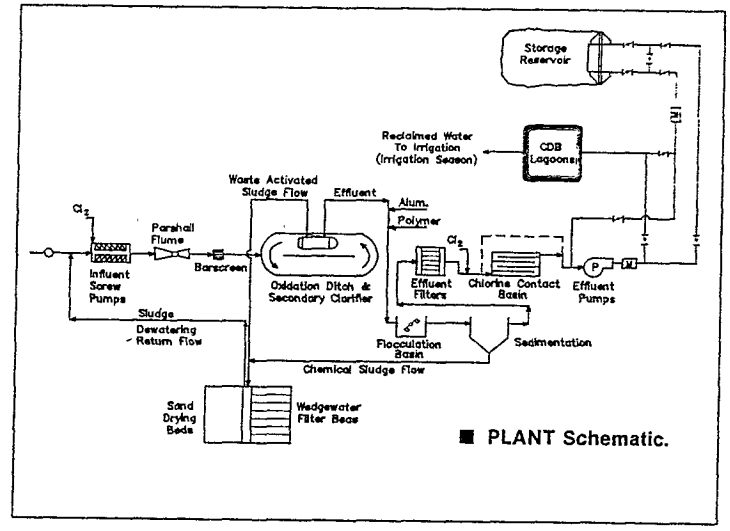
Before completing design work though, the project team coordinated its efforts with NDEP to identify two significant probable future discharge limitations. Because of concern for nitrate levels in potential groundwater supplies, NDEP indicated that future discharge permits were likely to include effluent limits for nitrogen. In addition, NDEP was then developing statewide guidelines governing wastewater effluent reuse. These guidelines have since been codified in Nevada state regulations.

Previous reuse guidelines as they applied to the county's spray irrigation operation generally required that the effluent meet secondary treatment standards. The new guidelines established requirements beyond these standards and set tiers of required disinfection efficiency based on the reuse method and the available buffer zone (to limit human contact). For example, under the new guidelines, a feed crop spray irrigation operation with no restriction to human access (i.e., no buffer zone) requires disinfection to an effluent fecal coliform limit of 2.2 CFU/100 mL. The same operation with a buffer zone of 800 ft or more requires no disinfection. Similar ranked limits are set for additional reuse methods, including other types of irrigation, industrial or commercial applications, and impoundments.

The county's initial reuse program consists of agricultural spray irrigation that requires a coliform limit of 200 CFU/100 mL. However, the county plans future reuse applications (for example, golf course irrigation) within the basin that will require the effluent to meet the 2.2 CFU/100 mL disinfection limit. Because advanced treatment processes are generally required to reliably achieve this lower limit, the plant was designed with flexibility for future installation of additional treatment processes.

To meet the anticipated future nitrogen limit, the biological treatment process was designed to reduce total nitrogen to less than 10 mg/L. The oxidation ditch is configured to achieve carbon oxidation, nitrification, and denitrification using a single-stage aeration system. The oxidation ditch is a "racetrack" type. Carbon oxidation and nitrification are achieved in an aerobic zone that spans one straight run of the 260-ft ditch. Aeration is accomplished using a coarse bubble diffuser system with air supplied by centrifugal blowers. Secondary clarification is also performed in the ditch through an intra-channel "boat" clarifier.

Denitrification occurs in an anoxic zone of zero dissolved oxygen ahead of the aerobic zone. This anoxic zone is produced by introducing the raw wastewater at an appropriate distance ahead of the aerated zone. In the absence of applied air, the raw wastewater exerts sufficient oxygen demand to bring the dissolved oxygen level to near zero, thereby creating conditions for denitrification.



To consistently achieve a coliform limit of 2.2 CFU/100 mL, flocculation, filtration, and second-stage sedimentation facilities will eventually be required. These processes will be located between the oxidation ditch and the chlorine contact basin (part of the initial facility). These additional facilities will be installed without intermediate pumping as the plant is designed with a hydraulic drop of about 8 ft between the boat clarifier and chlorine contact basin water surface elevations.

Off-Season Storage

The growing season in Washoe County generally runs from about May through October each year. During the rest of the year, conditions do not warrant irrigation and a means of storing treated effluent during this "off-season" is required. A rock-filled dam 120 ft high was built north of the treatment plant. The dam creates a reservoir capable of storing all plant effluent (at the ultimate average capacity of 6 mgd) for a full off-season period—3790 acre-feet.

The rock-filled design was selected because this dam type did not require an overflow spillway, thereby reducing the project cost. In the remote event of an overflow, the reservoir can overtop the dam crest without causing significant damage to the downstream rock face. The dam's upstream face is lined with reinforced concrete, and a grout curtain under the upstream toe minimizes leakage. The reservoir is also lined with a bentonite clay and soil mixture to reduce bottom leakage.

Two parallel force mains extend from the treatment plant effluent pump station to the reservoir. The pipes are encased underneath the dam embankment and connect to a multi-valve inlet/outlet structure at the upstream toe. This pipe network is designed with extensive flexibility. It allows flow in either direction in each pipe; it also permits several pumped and gravity flow options to convey effluent between the treatment plant, reservoir, and the reuse facility.

■ PLANT Schematic.

In the arid West, reusing treated effluent has become a key element of water management programs for communities like Washoe County. Cooperation and creativity minimized impacts on cultural and ecological resources. Good planning produced systems that can be conveniently adapted to changing regulatory demands. With the foresight shown in developing the South Truckee Meadows Wastewater Treatment Plant, Washoe County assured the community maximum utility from its scarce water resources. □□□

R0013725

Street Sweeping and Stormwater Regulations

WHETHER you are affected by the requirements of the new stormwater provisions of the national Clean Water Act, it is important to know that street sweeping has been shown to reduce stormwater pollution.

To achieve "fishable, swimmable standards," the Clean Water Act was amended in 1990 with provisions regulating the quality of stormwater discharged into public waters. Phase I of these regulations requires municipalities with populations greater than 100,000 and uncombined stormwater sewer systems to apply for NPDEs permits. For these municipalities, the NPDES permit requires that stormwater discharge pollution levels be monitored and managed, and that the volume of pollutants entering the system be reduced by the maximum extent possible.

Many industrial activities are also defined in the regulations and required to apply for stormwater permits. Examples include various manufacturing and mining industries and activities. Also, some municipal facilities may be engaged in industrial activities that are covered by the regulations. Examples would be hazardous waste treatment, storage and disposal facilities, landfill and land application sites that have received industrial wastes, facilities that recycle materials, portions of certain transportation facilities, treatment works treating 1 MG or more of sewage, and construction activities of clearing, grading, and excavating that disturb five or more acres.

Controlling pollution at its source has and continues to be the primary objective of the Clean Water Act. The provisions being implemented now require affected industries to document that rainfall will not flush contaminants from their site into an untreated stormwater system.

Methods proven to reduce the pollutant content of stormwater, or that prevent pollutants from entering stormwater systems, are Best Management Practices, or BMPs. For industry, frequent sweeping of site surfaces will be a prominent BMP in many compliance plans.

Affected municipalities will be required to reduce stormwater pollution both at its point of origin and at nonpoint sources including streets and byways. While these nonpoint surfaces are primarily just collectors of pollutants from other sources, they direct stormwater into public waterways. Activities that contribute to nonpoint source water pollution include agriculture, construction erosion, urban runoff, hydrologic modifications, and resource extraction activities.

Demonstration Data

Federal and state funded demonstrations conducted in several municipalities in the late 1970s and early 1980s showed that street sweeping removes important amounts of pollutants from streets and highways. Street sweepers also remove tons of debris and pollution that otherwise would be whisked into the air by passing vehicles or flushed into stormwater drains by rainfall.

Street sweepers fall into three basic operating categories: broom, vacuum, and recirculating air. Among EPA sanctioned studies thus far there appears to be no real evidence to conclude that one type of sweeper is better than another in the management of stormwater pollution. All appear to be as effective as part of a regular sweeping program. The best way to choose a street sweeper type is to evaluate your full range of sweeping needs. Choose the best overall balance of performance and features for the kind of sweeping applications you face most often.

Frequency and concentration of a sweeping program are by far the most important variables in reducing pollutant loads. The differences between monthly and weekly sweeping schedules can be measured in tons per curb mile per year. Plans for sweeping frequency should include consideration of variable such as traffic volume, condition of the road surface, and seasonal debris. Pre-determined route patterns and schedules are most likely to provide an optimum combination of efficiency and cost-effectiveness.

Street sweeping has always been recognized as an important and effective method of capturing construction debris before it can enter drainage systems. Currently, construction sites impacting five acres or more must apply for a stormwater permit. This application must include a description of the location and area of land to be disturbed, proposed erosion control measures, a runoff coefficient of the area, and the name of the receiving water.

The EPA has established a National Stormwater Hotline number: 703-821-4823 to help answer questions about stormwater management and to provide contacts for additional information. Note that this is not a toll free number. Further information can also be obtained from your state or regional EPA office, shown in Table 1. □□□

Boston Harbor Project $500 Million Under Budget

The Massachusetts Water Resources Authority (MWRA) has released a progress report on the Boston Harbor Project indicating that the project is $500 million under the budget initially projected in 1988. One-third of all construction needed to end pollution entering Boston Harbor has been successfully completed.

The report also indicates 3000 direct private sector construction, engineering, management, and support jobs have been created and that the overwhelming majority of contracts and jobs have gone to local firms and residents.

"The MWRA needs to report to the public on how, where, and why its money is being spent," said MWRA Executive Director Douglas B. MacDonald. He said rate relief remains his number one priority for residents living in the MWRA service area. According to the MWRA report, the first half of the new primary sewage treatment plant on Deer Island is 53 percent complete.

R0013726

■ CREWS assigned by the Ohio Department of Transportation planted 200,000 daffodil bulbs last fall. By April, roadside along Interstate 71 had blossomed in an eye-catching display.

Roadside Rainbow Beautifies District Highway

PIETER WYKOFF
Special Projects Coordinator, Ohio Department of Transportation, Columbus, Ohio

ROADSIDE space along the interstate highway system has to be one of the most neglected examples of landscaping in the nation's urban areas. Think of it. There are thousands of miles of interstate highways inside cities. The acres and acres of roadsides and medians are often the first and the last things a motorist sees when visiting a city. However, rarely does this vast area receive more than cursory care and attention.

"In our urban areas, the roadside interstate space is some of the most visible in the community," says Bill Sherman, a landscape architect with the Ohio Department of Transportation (ODOT). "Yet, we often ignore this space completely."

Sherman and his boss, Mike Flynn, an ODOT Deputy Director in charge of an eight-county district in Central Ohio, decided that space along their district's highways should no longer be wasted. Their solution was a program called Roadside Rainbow, a pilot project to beautify their district's highways by planting dozens of varieties of daffodils along the medians and shoulders. "I'm probably the only engineer in the world who grew up in a greenhouse," says Flynn. "My family has been in the florist industry for more than 100 years. Most people don't realize how much a part of their lives flowers are and what a difference they can make."

Flynn credits a private, non-profit organization called Colour Columbus with providing both the inspiration and the $20,000 worth of daffodil bulbs it took to get the project going. Last year, Colour Columbus President Cherie Lucks offered to donate the daffodil bulbs if Flynn would supply the labor to help plant them at 11 highway sites in the Columbus area. Additional labor and materials were supplied by the City of Columbus, and Colour Columbus volunteers and corporate sponsors.

"This is the state capital," says Lucks. "It's interstate highways are like the chamber of commerce for the City of Columbus and the State of Ohio. Millions of people see them. This project will have a visual impact on those people. It will make them feel good about the city and the state."

Attitudes Changed

Flynn says he "drafted" 15 project inspectors, three groundskeepers, and a few truck drivers as volunteers for the project. State and city workers took soil samples along the highways to determine the best sites to plant the daffodils. The workers then spent about two weeks last fall planting 200,000 bulbs, mostly along Interstates 71 and 70 in Columbus. Flynn says that while some of his employees were initially skeptical of the plan, most ended up becoming big supporters. Many have asked to be reassigned to the program this year.

ODOT Project Inspector Hugh Williams says "At first, we weren't happy about it. We normally inspect bridges and roadways. This wasn't really our line of work." However, Williams says, by the time the three-week planting assignment was over, he and his co-workers were convinced that Roadside Rainbow would be a success.

Colour Columbus President Lucks says planting daffodils is a subliminal way to educate people about the value of beautification. Flynn says there may also be an economic spin-off from the project. If Roadside Rainbow is successful, he says, the state may set up Roadside Rainbow Routes along all of Ohio's main interstate corridors. If people then route themselves through Ohio just to see the flowers, it may have a ripple effect on the economy.

Colour Columbus, with state and local assistance, hopes to plant one million daffodil bulbs in the Central Ohio area by 1995. The organization has already applied for grants from the state and the city to pay for the purchase of an additional 400,000 daffodil bulbs the group hopes to plant beginning this fall. The money would come primarily from federal funds that Congress has designated for road enhancement projects.

ODOT Director Jerry Wray says the Roadside Rainbow project is a good example of a successful public-private partnership. State and city officials worked together with a non-profit organization and its corporate sponsors to achieve a common goal.

The yellow and white daffodils should bloom each year for at least a month. As perennials, they will return for generations. □□□

County Integrates Scanned Raster Files Into GIS

TERRY E. BIEDERMAN, P.E.

Mr. Biederman is the Operation and Maintenance Engineer, County Drain Commissioners Division of Water and Waste Services, Flint, Michigan.

BY 1991 the Genesee County Drain Commissioners Division of Water and Waste Services had accumulated over 9000 as-built construction drawings detailing the entire water and sewer systems. Primarily high quality mylar, the drawings comprise the sole existing record of some 25 years of construction. These records are used daily to operate and maintain the system, to analyze existing problems and conditions, and to design and build new facilities. Due to the importance of these drawings, we began to investigate ways to integrate this information into an electronic environment.

I worked with Daniel J. Potter, Genesee County Chief of Operations and Maintenance, to develop a GIS to incorporate all our utility plans and a comprehensive database into an integrated system. Base maps were already being developed by a sister agency containing all property lines, legal descriptions, road right-of-ways, easements, tax information, property owners, road center lines, etc., for the entire area. Thus, we began to work closely with a consultant to build a customized, yet versatile and powerful GIS for water and waste services. The system runs under the SCO-UNIX Oracle environment to display the base maps and their sewer and water main locations.

During the initial development of the GIS, we were convinced that the archived construction drawings must also be placed on electronic media in a form that could be used in both the GIS and existing AutoCAD (Autodesk, Inc., Sausalito, California) systems.

Integrating Scanned Paper Drawings

There were four basic reasons we decided to integrate our mylar construction plans:

- As the sole existing record of 25 years of construction, a fire or other natural disaster could completely wipe out all our records.
- Our existing drafting package, AutoCAD, would become even more versatile if the drawings, in an electronic format, could be utilized directly by AutoCAD for revisions or new design work.
- To provide a fully functional GIS package, the as-built plans should be accessible from either the graphic environment or the text/database environment in a seamless fashion.
- With over 9000 construction plans, our operation staff had become disenchanted with the existing tub file system and the accompanying confusion every time a specific plan was needed. This was a particular problem in emergency situations, when the archive staff were not available. Often, unnecessary delays were caused in resolving emergencies.

As we investigated various ways to transfer the mylar plans to electronic media, it became clear that in-house scanning would be the most practical and cost-effective approach.

Direct digitizing (conversion to AutoCAD files) represented a huge time commitment, well beyond the capabilities and budget of our existing staff. Using a service bureau to scan and convert 9000 drawings at $10 to $25 per sheet was also out of the question.

At this point, we were fortunate to meet the Rassey Corporation and learn about raster technology. They convinced us that a low cost scanner combined with CAD Overlay ESP, ViewBase, and CAD Overlay GS from Image Systems Technology, Inc. (Troy, New York), could achieve our goal.

In early 1992, we purchased the hardware and software to develop the methodology to successfully convert the mylar plans into a useful electronic imaging system. We scanned the plans in IG4 format to maximize our storage on a 6.5-gigabyte optical disk jukebox. We chose to develop our database to let users search for an individual plan with minimal information. ViewBase was easily linked to the Paradox drawing database using a "hot key" configuration. Once we have done a query through the database, we hit our hot key to start ViewBase and load the requested scanned image automatically. This image can then be marked-up by a supervisor or engineer, plotted, and given to the appropriate personnel for repairs or information. An on-call supervisor can come in at any time, view the needed construction plans in ViewBase, and mark them to repair a water main or sanitary sewer problem without ever having to manually thumb through a tub file or even lift a pencil.

The marked raster files are sent over the network to an AutoCAD operator using CAD Overlay ESP to modify the scanned raster file and draw the revisions in vector format. The resulting hybrid raster/vector file is plotted out and/or sent back to be archived on the jukebox.

The remaining issue was providing the seamless link to our SCO-UNIX based GIS. This was resolved by DOS-merge, which allows us to run ViewBase from inside our GIS with no noticeable loss in speed. We are able to view construction plans in raster format associated with any of the base maps in our customized GIS.

The Future

We have scanned over 6000 drawings or roughly two-thirds of our total construction plans into our database. As we complete our archive, we will be investigating the integration of aerial photographs and other gray scale images into AutoCAD using CAD Overlay GS from ImageSystems.

Until a couple of years ago, we felt that scanning technology was not an operational solution. Today, with new scanners and software products we have found an economical way to store and utilize these scanned images without converting them to a vector based drawing. We often think that if we had undertaken this venture a few years earlier, we would have spent a lot more money to convert these drawings to vector files for use with AutoCAD or other packages. In this case, patience paid off.

The Genesee County Drain Commissioners Division of Water and Waste Services provides potable water, sanitary sewer collection and treatment, and solid waste services to the Genesee County, Michigan area, excluding the City of Flint. We provide these services to a customer base of 27,000 water connections and 61,000 sanitary sewer connections. □□□

Pennsylvania Borough Gets PMS System

Carlisle, Pennsylvania has chosen ArcCAD geographic information software from Environmental Systems Research Institute, Inc. (Redlands, California) and Earth Information Service's Roadway Inventory and Management System (RIMS) to manage the borough's road and highway system. Upon completing a comprehensive analysis, the borough determined that its primary need was to implement a computerized system that could meet Carlisle's road maintenance management needs, with easy access to information such as pavement history and repair, traffic flow, and report generation.

Borough officials have indicated that they are very pleased with the capabilities of the ArcCAD/RIMS package during its first six months of use. Borough staff members have begun adding other layers to the database, such as roads, bridges, building footprints, streams, ponds, catch basins, hydrants, manholes, utility poles, curbs, sidewalks, and fence layers.

R0013728

■ CROSS-SECTION of pavement core showing the asphalt supported matrix.

Stone Filled Asphalt Pavement

HARRY SCHMERL, P.E., P.P.
Port Authority of New York and New Jersey

As traffic loads and volumes increase, complaints about pavement performance are becoming more prevalent. This is especially true in a region like the New York and New Jersey Port District, an area within a 25-mile radius of the Statue of Liberty that includes some of the world's heaviest-trafficked facilities.

The Port Authority of New York and New Jersey (Port Authority) owns and operates some 30 facilities within the Port District including the six major tunnels and bridges that link New York and New Jersey, three major airports, and two major container ports. The Port Authority's jurisdiction includes 460 lane miles of roadway, 16 miles of runway, 60 miles of taxiway, and over 2700 acres of paved parking lot, marine terminal upland area, and aircraft apron area.

Flexible pavements are the most common type of pavement used within the Port District. Pavement thicknesses range from 6 inches in our parking lots to 38 in. in our aircraft areas. Structural deck wearing courses range between 2 to 4 in. thick. The value of pavements at the Port Authority alone exceeds $1 billion.

As these pavements are challenged to handle more frequent and heavier loads, pavement rutting and shoving has become more evident. As early as the 1970s, standard, high density, hot mixed, asphalt pavement could no longer resist the high surface stresses induced by commercial aircraft tires inflated to 200 psi (over 300 psi for some military aircraft), or the super compaction caused on a facility carrying an ADT count of 270,000 vehicles, 10 percent of which are heavy trucks, or the abuse heaped on pavements by solid-tire cargo handling equipment. High surface temperatures, which reach 140°F during the New York-New Jersey metropolitan area's "dog days," also exacerbate the problem.

While plastic deformation of pavements is common to both aviation and interstate roadways, the problem's magnitude is much greater on the aviation facilities. Thus, the Port Authority has focused its efforts primarily in this area.

A series of cores taken from various distressed pavements throughout the Port District during the early 1970s was analyzed. While the original construction records showed that the pavement materials met or exceeded specified Marshall design parameters—stabilities of 900 lb for roadway pavements and 1800 lb for aircraft pavements, examination of cores showed that almost all pavement deformation took place in the asphalt surface layers.

Research conducted as part of the investigation into ways of producing a more stable asphalt led us to try the Trinidad Lake Asphalt (TLA) modified binders being used by both English and German road authorities. In 1975, two test installations using TLA modified binders were installed. The first was on a short but steep ramp in Port Newark, New Jersey. The second was on the helical approach to the New Jersey entrance of the Lincoln Tunnel. The ADT for the Port Newark ramp was 10,400 with 42 percent trucks; the ADT for the Lincoln Tunnel approach was 45,900 with 10 percent trucks.

Standard AASHTO H-20-S-16-44 designated trucks braking on 5 percent and 8 percent down slopes, respectively, proved how tough the new pavement was, and the TLA modified binders became a Port Authority standard for use in highly-stressed highway and aviation pavement areas.

A series of extensive laboratory tests were also performed in 1984 to analyze further the viscoelastic properties of our standard binders. The study included binders composed of AC 20 [binder A], AC 40 [binder B], a 25/75 blend of TLA and AC 20 [binder C], a 40/60 blend of TLA and AC 20 [binder D], and a 95/5 blend of 25/75 TLA and AC 20 and latex additive [binder E]. The aggregate gradation of the tested mixes fell within the FAA's Mix-3 gradation band and was similar to the gradation used in our standard runway and taxiway top course mixes. Table 1 shows Port Authority specified Marshall parameters and the Marshall results for each mix.

Four specifications resulted from this study. Two specifications use a blended binder having by weight 95 percent TLA/AC 20 (25 percent/75 percent respectively) with 5 percent latex, and two use TLA/AC 20 (25 percent/75 percent, respectively) without latex. Material conforming to the former specification is used for pavement placed on structures and for aviation pavements that are subject to stop and go operations (hold bars and queuing traffic). Material conforming to the latter specification is used for aviation pavements subject to continuously moving operations (mainline taxiways and runways).

These pavements provided adequate service until the 1990s when plastic deformation of the heavy duty pavements became evident again.

Table 1—Specification and Marshall Result at 5.5 Percent A.C.

Items	P.A. Specification	Asphalt A	B	C	D	E
Stability, lb	1800 min.	1870	2185	2358	2770	3177
Flow, 0.01 in.	8 to 16	7.5	8.3	9.0	9.0	10.06
Air Void in Mixture (%)	2.0 to 5.0	3.04	2.88	3.49	3.7	4.2
Unit Weight, pcf	—	153.1	153.5	153.6	154.1	152.4
Void Filled with Bitumen (%)	74 to 84	81.2	82.1	79.03	76.31	74.5

R0013729

Cores taken through various, newly-distressed pavements such as those located at LaGuardia and Port Newark were analyzed and found to exhibit most, if not all, the following characteristics:

- All deformations occurred in the asphalt layers.
- In-place air voids were below 3 percent.
- The mix contained a large percentage of natural sand.
- Aggregate gradations were along the upper or finer edge of the specified gradation band.
- Asphalt viscosities were less than that of the original AC 20. (The asphalt appeared to be contaminated with fuel and hydraulic fluids.)
- 5 to 8 percent of the mix passed the 200 sieve.

Core cross-sections also show that there was an insignificant amount of stone-to-stone structure within the mix and that the asphalt binder floated the loads.

The approach taken to alleviate the rutting and shoving problems combined several elements as follows:

- Continuing the use of modified binders (AC 20 with Trinidad Lake Asphalt (TLA); AC 20 with TLA and latex; AC 20 with Styrelf, an asphalt modifier. Installations with other asphalt modifiers such as Vestoplast S, Kraton, Elvax, and Novaphalt are being evaluated.
- Adding a crater percentage of 1¼-through ¾-in. sized stone.
- Requiring manufactured (angular) sand in lieu of natural (rounded) sand.
- Narrowing the aggregate mix gradation band around the bottom of the original gradation band (provides more stone-to-stone contact).
- Reducing the percentage of less than 200 sieve size material.
- Increasing the Marshall voids.

The effectiveness of the new stone-filled asphalt mixes (SFAM) were verified both in the lab and on a taxiway.

A SFAM conforming to the FAA's 1¼-in. nominal size stone gradation was developed in the lab using standard Marshall design methods (with a 6-in. mold and 120 blows). The SFAM plug, using AC 20 as the binder, had a 4.6 percent asphalt content, 4 percent voids, and stabilities over 3000 lb. Adding blended binders to the Marshall specimens boosted stabilities approximately 20 percent. Cross-sections through the Marshall plugs showed a stone-to-stone supported matrix.

Test Sections

Two, 400-ft long test sections were placed on Taxiway "P" at John F. Kennedy International Airport in spring 1991. Both sections used blended binders with the new gradation. One section had the 95 percent Trinidad Lake Asphalt-AC 20 (25/75) with 5 percent latex as the binder; the other section had Styrelf as the binder. Both sections were constructed using two, 3-in. loose lifts over old concrete pavement. Thermocouples were placed in both sections below each lift. Using a Dynapac CC-50 vibratory compactor, 16 passes were required to achieve 98.6 percent compaction. This represents a two-fold increase over the compaction effort usually required to achieve the same level of compaction on our standard pavements.

Plate bearing tests, using 6-in. diameter plates, were performed on the pavements before they had a chance to cool. A maximum deflection of 0.11 in. was observed on the TLA/latex binder section after the vertical deformation reached its maximum value and the 300 psi stress sat for an additional one-half hour. The maximum deflection on the Styrelf section reached 0.20 inches. Pavement temperatures at the time of maximum deflection were approximately 135 °F. Six-in. diameter cores were extracted from areas adjacent to each plate bearing test and brought into the lab where they were subjected to a static creep test. To approximate the field deflections, chamber pressures had to be increased to 100 psi, while the 300 psi vertical stress was applied, and the 135 °F environment was maintained.

Table 2—Field Test Results

Marshall Data	In-Place Density
Voids-4.6 %	Voids-6%
Stability-3400	98% of Marshall Density
VMA-14.5	
Flow-17	
Voids Filled with AC-69%	
AC-20 Modified with Styrelf Grade D Binder-4.2%	

The following conclusions were drawn from the tests:

- The new, SFAM spec improves mix stability.
- The SFAM looks boney.
- Cohesion plays an active role in providing resistance to load-induced stresses.
- Once cohesive forces are known, the static creep test is a good predictor of pavement performance.
- Cohesion is dependent on mix gradation and binder.

Several projects were constructed in 1991 and 1992 using the SFAM pavement. Large areas of the mat appeared boney and segregated, especially at the joints and in those areas where hand work and raking took place. Several non-technical personnel also expressed concern about premature ravelling. Daily pavement sweeping dispelled that impression.

The remedies taken to reduce surface boniness require the contractor to eliminate all handwork and raking. The paving machine must start on blocks to compensate for compaction of the loose material and to eliminate the need for adding material to bring the joint up to grade (the height of the block is generally one quarter the height of the paving course). A full-course thickness transverse end joint must also be cut across the paving lane whenever work in that lane is completed or the paver runs out of material. Excess material may be broadcast back into the hopper when paving operations are expected to start up immediately, and the paver is elevated. The minimum thickness of each compacted paving course has been raised to 3 in. to permit proper seating of the stone under the rollers. The paver also must be set so that it overlaps the adjacent mat's longitudinal joint by approximately half the compacted course thickness to create a tight joint. Here too, excess material must be broadcast back into the hopper.

An inspection of the aviation pavements after they had been in service for only one year indicates that the surface had tightened up and no longer gives the impression of eminent ravelling.

Drainage Considerations

Because the voids in the new mix are greater than those of the original mix, special consideration must also be paid to drainage. For new construction, each successively lower layer must be designed with a relative permeability one order of magnitude greater than the layer it underlies. For overlay construction, the crown of the existing surface is retained and bleeder drains are added beneath the overlay to get the infiltrated water out of the pavement.

Based on our airfield experience, a new roadway mix was developed in 1992. The new mix, designated I-4A, added 1 in. stone to the Authority's standard nominal ¾ in. I-4 mix and narrowed the gradation curve around the I-4's lower band limit. The mix was placed along a major truck route at Port Elizabeth. Here again, while the surface looked boney, cores proved that stone-to-stone contact was achieved. In-place Marshall and field density data is shown in Table 2.

Work is also continuing, using the static creep test, to determine the effect that new modifiers have on pavement stability. Test installations are also being planned to demonstrate the value of any promising new additive. Installation of a Vestoplast-S test section was planned for spring 1993.

The information presented in this paper represents the Port Authority of New York and New Jersey's progress towards strengthening pavements to withstand the high stresses induced by both high-pressure aircraft and truck tires. Thus far, these efforts seem to be working. We have improved pavement resistance to deformation and a number of our improvements agree with conclusions reported by the National Center for Asphalt Technology, Auburn University. □□□

R0013730

Vegetation Control for Safety

DURING the growing season, grass, weeds, and brush often limit a driver's view of approaching vehicles. Likewise, lush vegetation can act as a screen that hides pedestrians and bicyclists from drivers and vice versa. Be alert for places where vegetation needs to be cut back.

The main safety goals for vegetation control include:

- Keep signs and vehicles visible to drivers as well as pedestrians and bike riders in cross walks, at street lights, at uncontrolled intersections, and on bike paths;
- Help pedestrians and bike riders see on-coming traffic more easily;
- Improve winter road maintenance in snow and ice areas.

Line of Sight Clearance

Drivers approaching an intersection need a clear line of sight along crossroads early enough to see any conflicting vehicles, pedestrians, and bicyclists and avoid a collision. Drivers also need an unobstructed line of sight to any roadside signs or hazards far enough in the distance to allow them to react safely to each situation.

Suggested maintenance steps to keep signs and traffic control devices visible include:

- Look for signs and other traffic control devices blocked by brush, trees, grass, or weeds when on routine maintenance patrol. Often a small branch near the sign is all that needs to be cut back. If vegetation along the ditch or shoulder blocks a driver's view of a sign, cut enough to allow the driver sufficient time to see the sign and respond to its message. If your agency has a policy on how far from a sign vegetation has to be cleared for a safe view, follow that policy. If there is no such policy, Table 1 is a suggested guideline to allow a driver 3 to 5 seconds to read and obey the sign.

Critical signs are STOP, YIELD, DO NOT ENTER, ONE WAY, WRONG WAY, and other regulatory signs. Noncritical signs are destination guide signs, parking regulations, advance warning signs, and similar warning or information signs.

- Pull the maintenance vehicle off the traveled lane and place traffic control warnings.
- Cut or trim trees, brush, weeds, or grass to clear a driver's line of sight to the sign or traffic control device. *Always wear protective leather gloves, safety glasses or goggles, orange safety vests, hard hats, and leather boots (not sneakers or soft shoes).*

Table 1—Clear Distance to See Sign

Speed Limit (MPH)	Noncritical Signs (feet)	Critical Signs (feet)
30	150	250
40	200	350
50	250	450
60	300	600

- Paint the stubs of brush or small trees with a weed killer solution to keep them from growing back.
- Collect limbs and large brush to haul away for disposal or run them through a chipper.
- Look for moving traffic when removing the temporary traffic control warnings and leaving the site. Drivers may not realize you are through working and probably will not expect you to pull onto the traffic lane.
- Watch for overhead power lines and electrified farm fences when cutting brush. Never touch a wire farm fence when an electrical storm is in the vicinity of your work.
- Take along the following equipment: leather gloves; hard hats; safety glasses or goggles; orange safety vests; chain saw, fuel, bar oil; gasoline powered "weed eater"; brush knife or machete; loppers (long handled side cutters); tree trimming saw with small branch lopper; tall step ladder; and axe.

Vegetation Control in Cities

In cities, you will often be cutting vegetation so drivers can see signs and other traffic control devices at intersections. When one of the streets is a minor street and you can work safely away from the traffic, try to park your vehicle on that street and carry your equipment to the major street. This will interfere with fewer drivers and create fewer hazards to you and other workers.

When an intersection has no STOP or YIELD signs to control who enters the intersection first, drivers must be able to see each other, pedestrians, and bicyclists soon enough to avoid a collision. The property line for a city corner lot will probably be a square corner that comes right up to the street corners. Usually you are not permitted to work outside the right-of-way lines. Some cities have an ordinance giving the city a sight distance easement. Such an ordinance authorizes the maintenance worker to ask the property owner to trim back any trees or shrubs that block the corner sight triangle; if the property owner does not comply, the ordinance authorizes the maintenance worker to trim the trees or shrubs as he sees fit. However, check with your supervisor before working outside the city's right-of-way. No shrubs or plants in such an area should be allowed to grow more than 3 ft high.

Table 2—Stopping Sight Distance

Speed Limit (MPH)	Stopping Sight Distance (feet)
20	125
30	215
40	330
50	470
60	650

At intersections with no stop signs (or with stop signs only at the cross street), drivers from all (both) directions need to be able to see oncoming traffic soon enough to be able to stop. Table 2 lists the stopping sight distance needed for different speed limits on a street.

Rural intersections also need to have clear intersection sight distances. In rural areas we expect higher speed limits and need the longer stopping sight distances listed in Table 2.

When vehicles are traveling along the inside of curves, drivers must be able to see ahead around the curve for the same stopping sight distance as at intersections. Cut brush, weeds, or trees growing in the roadside ditch that block the drivers' view on the inside of the curve to let them see a full stopping sight distance.

On divided roadways with median crossovers, drivers entering a median crossover must be able to see approaching vehicles for a clear distance at least as long as for an intersection. Vehicles using a median crossover will usually be entering the traffic lanes at slow speed. Providing good sight distance at median crossovers allows the higher-speed drivers on the through lane to avoid collisions with vehicles entering their lane from a median crossover.

R0013731

At-grade railroad crossings are special intersections. The most important thing to do in vegetation maintenance at railroad crossings is to make sure the crossing signs and signals can be clearly seen by drivers, bike riders, and others approaching the crossing.

- Clear vegetation to the railroad crossing signs and the advance warning signs to provide good sight distance.
- Clear vegetation to provide good sight distance of all flashing signals when a crossing has signals.

Do not enter the railroad right-of-way to cut vegetation unless you have been authorized to do so by your maintenance supervisor and are supervised by railroad employees. Cut the vegetation enough so that normal growth will not reach to a 3-ft height for at least one month.

Most private property owners are willing to cooperate in improving traffic safety. They should be required to keep all bushes and shrubs at a height of 3 ft or lower and to trim all trees and hanging branches to a minimum height of 7 ft. If notice of a violation is provided and a homeowner does not respond in a reasonable time, most public agencies have regulatory powers to remove the designated vegetation at the homeowner's expense.

Clearing Clear Zones

Trees growing in a clear zone are a special problem. Evergreen trees or trees in full leaf in the highway right-of-way block the driver's sight distance for signs and intersections. Trees with trunks larger than sign support posts (typically a 4-in. diameter) can be a hazard to any vehicle hitting them.

On highways we want to keep the roadside clear of trees and other obstructions for up to 30 ft if the right-of-way has that much room. A clear zone gives a driver who runs off the road a good chance to bring the vehicle under control without a crash. Cut trees close enough to the ground so that no stump remains to be a hazard. All trees within the clear zone should be cut while they are still small saplings rather than even small trees. At that time they are easy to cut off at ground level and cause no stump problems. Also, no one will be tempted to try to save a beautiful but hazardous tree in the highway clear zone.

Mowing for Safety

Road and street maintenance workers do three general types of mowing. In order of importance, these are: safety mowing, transition mowing, and selective mowing.

- Safety mowing ensures that signs, other traffic control devices, guardrails, and safety features can be seen and provides good sight distance for drivers approaching intersections, driving along curves, and approaching interchanges.
- Transition mowing makes a smooth change from a narrow mowed width to a wide mowed width when different widths of right-of-way are mowed.
- Contour or selective mowing makes a natural blending of the maintained roadside with native or planted growth and shows off landscaping or wildflower areas or dresses up an interchange entrance to an urban area.

DO NOT mow too often. This wastes money, exposes mowing crews to traffic hazards more than necessary, and can damage vegetation. DO NOT mow at the wrong time. Good timing reduces the frequency of mowing required by cutting the vegetation in the right stage of growth. DO NOT mow too short. Leaving the proper height helps maintain the stand of vegetation and keeps small litter objects hidden.

DO NOT mow steep slopes unless necessary. Steep slope operations increase the risk of mower accidents. DO NOT mow patterns inconsistently or mow a regular area incompletely. Drivers watch the pattern of a mowed area to help understand the safety of an area. Consistent mowing of similar areas helps drivers evaluate the safety of the roadway. DO NOT mow when wet; this is hard on equipment. DO NOT operate equipment carelessly and scar trees and shrubs. Mowing is tedious but care must be taken to avoid accidents and preserve valuable plantings.

DO avoid mowing slopes steeper than 2.5:1 with a regular mower unit. Mow steep slopes with a side-mounted mower on a boom if the tractor unit remains on flatter surfaces while mowing. DO operate side-mounted or boom mower units on the uphill side of the tractor to limit the possibility of overturning the tractor. DO replace broken or lost chain guards to deflect debris immediately. Using flail type mowers reduces the amount of debris thrown. DO cover all v-belts, drive chains, and power takeoff shafts. DO raise mowers when crossing driveways or roadways. DO shut off power before checking any mower unit. Block a mower before changing, sharpening, or replacing a blade. Any blade being reinstalled should be checked for cracks or damage that might lead to failure. DO use flashing signals and slow-moving-vehicle signs on all mower tractors. DO warn traffic with signs such as MOWING AHEAD, MOWING AREA, or ROAD WORK AHEAD. Signs saying MOWING NEXT (____) MILES may be used in advance of the operation, but the distance limits should not be shorter than two miles nor longer than five miles.

Traffic Control

Mowing is a moving operation taking place off the roadway. Therefore, it requires different traffic control from other maintenance operations. The most important thing to remember is to make the mower unit highly visible to drivers. That way drivers will be alert to you and will be able to avoid potential collisions.

- Operate rotating yellow beacons on mower tractors.
- Install slow-moving-vehicle signs on all mower tractors.
- Install yellow flasher lights on roll bars or the top of tractor cabs and operate these at all times.
- Install an orange flag or pennant on a whip to show the location of the tractor in high grass or over the edge of slopes.
- Operate the tractor with headlights on at all times.

Warning signs such as MOWING AHEAD, ROAD WORK AHEAD, and similar signs my be placed along the road. The MOWING AHEAD sign is preferred. The sign is to be used in advance of mowing operations on the right of way. Place it on the shoulder so the approaching driver can read the message easily.

As work progresses, move signs one to two miles from the actual mowing work. Mount signs on sturdy portable supports that will not be knocked over or blown down easily. Cover or remove signs during lunch breaks or other times when work is not in progress. Do not cover or remove signs if you have stopped mowing to repair or adjust equipment because the warning to drivers is important to safety operations. □□□

Information for the preceding article was taken from *Vegetation Control for Safety: A Guide for Street and Highway Maintenance Personnel,* Publication FHWA-RT-90-003, U.S. Department of Transportation, Federal Highway Administration Office of Highway Safety, and prepared under the Rural Transportation Assistance Program Project 70 by the Technology Transfer Center, Iowa State University, Ames, Iowa 50011.

Consultant Chosen for Data Conversion Services

The Calgary Waterworks Division, Alberta, Canada, has selected RJN Computer Services, Inc. (Wheaton, Illinois) to provide facilities management data conversion services associated with implementing a new Waterworks Division maintenance management system.

The goal of the project is to develop from existing records, an ORACLE database of the city's water valves, valve chambers, and water hydrants that can be used with the city's CASS WORKS® maintenance management system and the city's geographic information system. The consultant will develop a numbering scheme for all structures and physically identify and number valves and hydrants on the city's existing maps.

■ TREE grates quickly accumulate litter and weeds if not periodically cleaned and filled with new gravel.

Tree Grates and Guards—Scrapping the Heavy Metal

DAVID GAMSTETTER
Urban Forestry Specialist, Park Board Urban Forest Management Section, Cincinnati, Ohio

FOR nearly 100 years botanists have understood that iron, as a micronutrient, is necessary for tree survival. Iron contributes to chlorophyll formation and, when not readily available in the soil, may cause leaf discoloration (chlorosis) and mortality. However, when it is formed into tree grates and tree trunk guards that are not properly maintained, iron can severely injure or kill valuable street trees. In Cincinnati, improperly maintained tree grates and guards have killed or injured over 300 trees. These trees could cost $90,000 to replace. This figure does not include the actuai value of the trees based on "The Council of Landscape Appraisers Guide for Plant Appraisal," which takes into consideration tree size, species, location, and condition values before their premature death. The one-time cost to make corrective repairs to tree grates and guards citywide could approach an additional $60,000. Cincinnati now has a maintenance program in place to make certain that trees and "heavy metal" can coexist.

Iron tree guards and grates have been used in the United States since the late 1890s. As early as 1903, William F. Fox, Superintendent of the State Forests for the State of New York strongly recommended using tree trunk guards. Fox stated that "the necessity for some such protection is readily apparent on examining trees from the curbstone side, and observing the large number on which the bark has been gnawed by horses." (Fox, W. F., *Tree Planting on Streets and Highways*, Albany, J.B. Lyon Co., 1903.) While Mr. Fox's observations were very important in 1903, today most municipalities in the United States have relatively few equine problems but may experience occasional bumper damage caused by poor parallel parkers or inattentive drivers of large vehicles.

Tree grates have been popular streetscape amenities for the last 30 years because they are attractive and increase the amount of walkable sidewalk surface. Tree grates are perceived as being low maintenance because they supplant the need for mulch and, when properly backfilled with gravel, suppress weed growth.

A Grating Problem To Guard Against

As tree diameters increase, the aperture in the center of the grate must be enlarged to prevent it from girdling the tree. Depending on the size of the tree when planted and the aperture size, fast growing species such as London Planetrees and Callery Pears can be girdled in just a few growing seasons. This problem is greatly compounded if the tree is planted off center or develops surface roots or a buttress at a graft. Once the tree begins to grow into and around the grate, repairs are difficult and cause further injury to the tree. Grates must also be periodically reset in their frames to prevent a tripping hazard when they become unlevel or raised. Broken grates must be replaced when damaged by trucks or buses that use the sidewalk as a lane extension.

■ MOST tree grates are designed to be expandable so inner rings can be removed as the tree grows in diameter. If grate is not enlarged it will injure the tree.

Tree trunk guards, by their design, are temporary at best. Designed to protect the trunks of young trees, they can injure a tree when it moves in the wind or when the guard loosens from the grate and rubs the tree. A loose tree trunk guard can girdle a tree in just a few weeks. Dr. Roser C. Funk, vice president of human and technical resources with the Davey Tree

R0013733

Expert Company believes that "tree trunk guards and tree grates are a leading cause of mechanical damage to trees. They have no value other than they are helpful if you have a vandalism problem. Tree grates may be helpful to avoid soil compaction."

Now we get to the real problem. Trees and tree hardware can coexist if the hardware is properly maintained—if tree grates are periodically enlarged and tree trunk guards are repaired or removed to prevent tree injury. The problem is that many cities do not have a mechanism and sufficient funding to periodically inspect and maintain tree hardware. In the grand scheme of city infrastructure projects, it seems tree hardware maintenance falls somewhere between constructing a country club for city employees and upgrading the city fleet to Corvettes!

The Cincinnati Program

Over the past 20 years, tree grates and guards have been standard issue for all capital improvement streetscape projects constructed in Cincinnati's central and neighborhood business districts. In Cincinnati, as in most cities, capital improvement projects do not set aside funding for long term project maintenance. Streetscape installation usually includes new sidewalks, curbs, lights, street trees, tree grates, tree trunk guards, street furniture, and the occasional kiosk, with the intent that the abutting property owner will sign a maintenance agreement to maintain the new amenities.

On most streetscape projects the city enters into a signed maintenance agreement with either the owner of the abutting property or the business district association, a group of abutting property owners who share advertising and maintenance costs. In theory this approach makes excellent sense; proper facility maintenance attracts more customers to the business and increases property values. The fallacy of this is that in hard economic times maintenance of the city-owned streetscape becomes a luxury when compared to meeting payroll or paying suppliers. In some cases where the agreement is not transferrable, the property may change owners with the new owner not legally responsible for maintenance.

As an example, in the Cincinnati central business district there are 1040 streetscape trees; about 40 percent are covered by 27 maintenance agreements with abutting property owners. Of these 27 agreements, only 5 abutting owners actively maintain the streetscape trees and maintain tree grates and guards when asked to do so by the city.

In 1989, Cincinnati's Urban Forest Management Section met with all property owners in the city's central business district who own or manage property abutting a streetscape. A forester discussed each tree's specific maintenance needs and asked property managers to provide routine maintenance such as watering and weed control and to enlarge, reset, or replace problem tree grates and remove tree trunk guards as necessary. As a result, five property owners who hold maintenance agreements with the city and two who are not responsible for maintenance, repaired defective hardware.

When an abutting property owner fails to maintain the tree hardware, the city must assume the maintenance responsibility because broken or unlevel tree grates pose a tripping hazard and thus, a liability problem. When the city recognized the need to maintain tree grates and guards, no specific city agency wanted to assume the responsibility. The street tree program is funded by a small special street tree assessment authorized by the state of Ohio and restricted specifically to street tree planting and maintenance. The assessment cannot legally be used to maintain sidewalks or streetscape hardware.

In a legal opinion rendered by John Hanselman, assistant city solicitor, "Ohio Revised Code grants authority to municipal corporations to levy special assessments on property owners for various purposes including construction of sidewalks. Cincinnati Municipal Code Sections... provide for the responsibility of sidewalk repairs at the property owner's cost. If tree grates serve no purpose in the maintenance of street trees their placement is arbitrary, a decorative part of the sidewalk. As such the sidewalk maintenance provisions of the city code should apply to the repair of tree grates in the sidewalk."

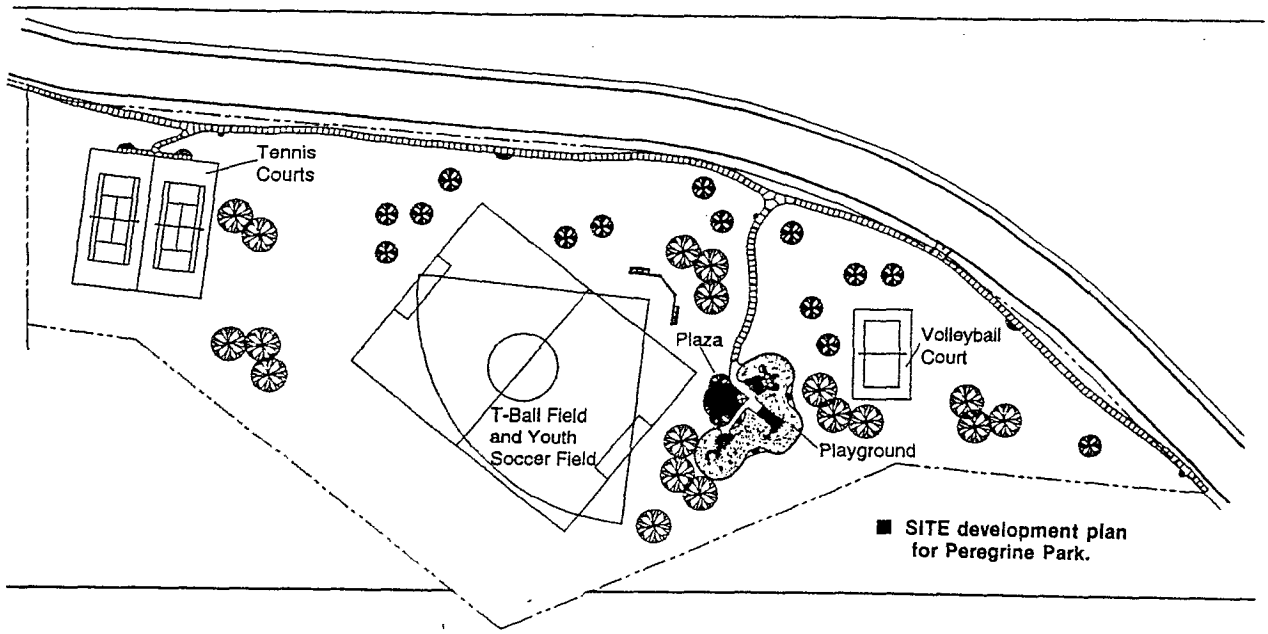
Clyde Hunt, urban forestry specialist with the U.S.D.A. Forest Service agrees with Mr. Hanselman's opinion, "tree grates do not provide any benefit to the tree, they are primarily ornamentation. I would rather put mulch around the trees."

Because Mr. Hanselman determined that tree grates are a part of the sidewalk, their maintenance falls under the jurisdiction of the city public works department's technical support section. When sidewalk problems occur, a sidewalk inspector from the technical support section inspects and marks defective or condemnable sidewalk blocks and orders the abutting property owner to make necessary repairs. If corrections are not made to the city's satisfaction, the city makes the necessary repairs and the property owner is billed for incurred costs. The city administration realized that using this same process with tree hardware repair could be a public relations nightmare—while some property owners signed agreements to maintain the streetscape hardware, many had no agreement and had no idea that they would be required to perform future maintenance on city property.

To avoid the potential public relations problem, the public works department agreed to divert infrastructure improvement funds to pay for a one-time citywide tree grate and guard repair project. Under this comprehensive project, 130 tree guards will be removed, 330 offset tree grates repaired, 260 enlarged, and 62 missing or broken grates will be replaced. All abutting property owners will be notified that the work that was performed and that the property owner will be legally responsible for streetscape hardware maintenance.

Maintenance Procedures

After the one-time repair project, the city's urban forest management section will inspect all streetscape trees every two years and process emergency complaints as they arise. Upon inspection, a forester will mark tree grate problems with paint and complete a form developed by the technical support section to document the problem, location, and corrections needed. The form will be sent to technical support, which issues legal orders to the property owner responsible for repairs. If repairs are not made within a specified time, a work order will be given to the city's sidewalk repair contractor to make the repairs, and the property owner will be billed for all incurred costs. A forester will perform a follow-up inspection to assure that the work was done properly and no harm caused to the tree.



The city uses the following criteria to mark tree grates for repair:

- Broken, cracked, or missing grates are replaced;
- Any grate offset more than ½ in. is reset to proper level;
- Broken light covers or lenses are replaced;
- Space between the grate and soil level greater than 1 in. is filled with gravel;
- Grates are enlarged if the distance between the aperture and tree is: 2½ in. for fast growing species or 1½ in. for slow growing species.

Trees can coexist with streetscape hardware only if the hardware is periodically maintained so it does not hamper tree growth. Some cities such as Cleveland, Ohio, simply remove problem tree grates and fill the opening with mulch. This solution is acceptable only if the remaining sidewalk area is wide enough to accommodate pedestrian traffic and wheelchairs per the Americans with Disabilities Act. In many cases, the tree grate must be considered as walkable sidewalk surface and remain in place.

If your city is considering installing streetscape hardware, designate the agency that will assume the maintenance responsibility and establish the funding source and process before installing the "heavy metal." Otherwise you may encounter problems similar to Cincinnati's. □□□

R0013734

■ SITE development plan for Peregrine Park.

Pencil and Computer Compared in Park Design Project

PHIL PUTERBAUGH
Parks and Recreation Department, Colorado Springs, Colorado

NESTLED in the eastern foothills of the Rocky Mountains, near the base of Pikes Peak, lies Peregrine Park, a 5.9-acre neighborhood park on the northwest side of Colorado Springs. Design of this park was one of the most exciting projects I have had during my 19-year stay at the Colorado Springs Parks and Recreation Department.

As a drafter/illustrator for the department, my usual mission on such a project is to prepare all the park development construction drawings on our CAD system. But my role this time was different. I had recently expressed to my superiors a desire to become more involved in design. I had experience in architectural and civil engineering design and had been exposed to the landscape designs of others in the department. So on this project I was granted a significant amount of the design responsibility; in fact, more than I had anticipated.

The first thing I had to design was the playground for the park, and I soon realized that I had a problem. Before I came to the parks and recreation department in 1973 I had never had a computer with a CAD system. All my previous work had been done using conventional pencil and paper techniques. Since I had been at the parks and recreation department, most of the design work was landscape design and was always done by our landscape architects. So even though I had been drafting on CAD for years, I had not yet had the experience of designing on CAD. So my dilemma was this: Should I design on paper first, as I had done in the past, and then draft my design on CAD, or should I go ahead and design directly on CAD?

Pencil First?

I have heard some designers say that they like drafting in CAD, but would rather design in pencil first. I have wondered if they were speaking from the position of a person who had tried it both ways and had made this decision on that basis, or if the decision was based more on resistance to change. I then wondered if I was considering doing the design on paper because I was resistant to change, or because I actually thought it would be easier.

On the Peregrine Park playground design I decided to put the comparison to a test and try it both ways. My first design was done in pencil on sketch tissue. I drew the design elements (the shelter, the individual pieces of playground equipment, and lines indicating necessary clearances around the equipment) on separate pieces of tissue and maneuvered them around until I had what looked like a meaningful layout. Then I refined the design by using layers of tissue to "pull through" good aspects of the design from lower layers, and then drew changes to each progressive layout on the top layer of tissue. This is pretty standard design practice and my usual style, but in the end the process would prove by comparison to be cumbersome and time consuming, and I was not particularly happy with the design.

Then I tried it again, this time drawing the design elements on CAD. The benefits were numerous.

- Everything was easily visible and I did not have to squint to see through layers of tissue.
- I did not have to discern between scribbled lines and decide which one to keep.
- Any element or group of elements could be rotated without shifting other elements that were to stay stationary.
- Everything stayed in place once it is moved.
- I did not have to deal with all those layers of tear-prone tracing tissue and drafting tape.

The process went quickly and easily, with all elements located with absolute accuracy. I felt I had a good design with no tearing tissue, no taping, and no graphite on my hands and shirt sleeves.

Since making the comparison, I decided that for my own preference, where simple drafting is concerned, of course, I would rather draft on CAD than in pencil whenever possible. Where design is concerned, it can depend. When developing a broad concept, pencil design can have its merits over CAD, but when it comes to the nitty-gritty of actually putting design elements that have dimension together, CAD is decidedly the way to go for me.

One factor that made this playground design particularly challenging was the Americans with Disabilities Act of 1990, which requires public facilities—playgrounds included—to be accessible to all disabled persons, including those in wheelchairs.

Quick Approval

The playground design had to be approved by all the neighbors of Peregrine

R0013735

Park before being finalized and made part of the construction plans. A neighborhood meeting was arranged at the elementary school next door to the park. I presented the plan and was pleased that there were no requests for changes to the design.

Next, I had to design the planting plan for the park. This was no special feat in terms of CAD design, especially with the LANDCADD software (LANDCADD International, Inc., Englewood, Colorado) we are using, because it has so many landscape architecture related commands and symbols. The challenge was in creating a meaningful planting plan using the principals and practices that landscape architects use: selecting trees appropriate for this climatic zone and considering their general hardiness, their water and soil needs, their shape, their spring and fall flower colors; spacing appropriate for easiest mowing; and the utilitarian purpose intended for each tree's specific location, such as shade, windscreen, visual effect, etc.

In the two shrub beds in the playground area, small ornamental trees were used to provide visual esthetics and shade in the playground area, evergreen shrubs were used for fall color, and thorny barberry shrubs were used as barrier plantings to discourage entry into the shrub beds.

There was a great deal of political pressure in our community during this project for us to complete the construction plans as soon as possible, so many processes had to be overlapped. While sometimes this helped things move faster, other times it caused problems.

One major problem we encountered was with the grading plan. Once the site development plan was complete, the project landscape architect prepared a grading plan and sent it to a consultant for cut and fill calculations. In the meantime, I was completing other plans in the set of drawings. Then the consultant returned the earthwork calculations, showing that we had an excessive amount of earth to be imported. This happened on a Friday and the plans were due at our city purchasing department for bidders at 8 a.m. on the following Monday morning, so we quickly had to find a way to balance the site.

If the project had been drafted manually, I would have been faced with the task of erasing and redrafting the location of these play fields, along with any related labels, notes, and dimensions on every plan in the set. Had that been the case, I do not believe I would have made my deadline. But on the CAD system I had all the plan sheets (as opposed to detail sheets) layered in a single drawing file. The file was structured so that any change I made on one plan would automatically be reflected on the other plans, in this case, the play field shift.

In the layering structure I like to use, all layer names end with a dash, followed by a suffix. The suffix identifies the sheet or sheets on which the layer will appear:

-A —All Sheets.
-D —Demolition Plan.
-E —Existing Site Plan.
-S —Site Development Plan.
-L —Layout (dimensioning) Plan.
-G —Grading Plan.
-I —Irrigation Plan.
-P —Planting Plan.
-DE—Demolition Plan and Existing Site Plan.
-SLGUIP—Site Development Plan, Layout Plan, Grading Plan, and Utilities Plan. This suffix is common for all proposed entities that will appear on those plans that reflect proposed conditions.

With this system, if I want to view the grading plan, I would first turn off all layers, using the asterisk wildcard to specify all layers. Then I would use the asterisk again to indicate the following layers to turn on: *-A, *-G, *-SLGUIP. With this layering system, the changes went quickly and were completed by deadline.

Under certain circumstances on some projects a degree of manual drawing will occasionally be necessary despite CAD, such as when you need to make minor changes to an already existing hard copy plan. But after experiencing CAD as the normal course for producing our construction plans for building parks, I would find it hard to ever go back entirely.

In utilizing our AutoCad (AutoDesk, Inc., Sacramento, California) and LANDCADD software to prepare our construction plans, we experienced better productivity, information organization, accuracy, and drawing neatness, all the while meeting tight deadlines.□□□

Consultant to Provide Services to Fort Myers

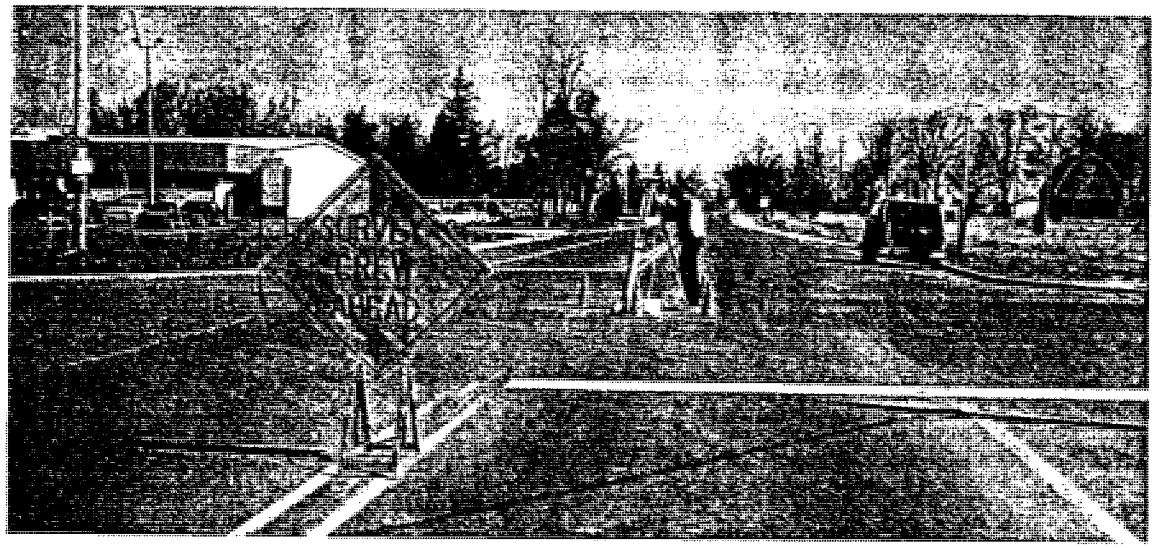
The city of Fort Myers, Florida has chosen Camp Dresser & McKee Inc., Cambridge, Massachusetts, to design wastewater residuals stabilization modifications to two of the city's 12-mgd advanced wastewater treatment plants. The modifications will allow the facilities to meet the Class B stabilization requirements for EPA's new Part 503 sludge management regulations. The project will be managed out of the consultant's local west coast Florida offices.

Based on recommendations contained in the Residuals Stabilization and Management Master Plan developed by the consultant, modifications to the facilities include constructing new aerobic sludge digesters, blower building, and appurtenances at the Fort Meyers Central wastewater treatment plant.

JAMES E. KOVAS, P.E., RLS
Wade-Trim, Inc.,
Plymouth, Michigan
and
GISELE GREEN-CZAJKA
GIS Coordinator,
Kalamazoo, Michigan

KALAMAZOO has developed a geographic information system (GIS) to better track, manage, and analyze the region's infrastructure, environment, and economic development. A program was developed that will eventually convert information on parcels, zoning, floodplain limits, annexation, historic districts, and storm, water, and sewer systems into a digital format. These data will provide input to applications for the departments of public works, planning, assessing, utilities, housing, public safety, management information services, and Kalamazoo's 77,000 residents.

The first layer to be created for the GIS was the base map, generated by digitizing the assessor's parcel maps. This layer was chosen for the initial conversion due to the current condition of the assessor's maps. Drafted on linen in the early 1920s, the maps were disintegrating from years of use and were difficult for the public to use. Sections of the city maps were also in different scales. These maps accurately represented parcel boundaries and dimensions of city property, but not streets surrounding the parcels.



Increasing Accuracy

The city hired Electronic Data Systems (EDS, St. Louis, Missouri) to convert the 1,016 assessor's maps into a digital format and renumber more than 27,000 parcels to coincide with the county parcel numbering system. We also decided to increase the map's level of positional accuracy with a global positioning system (GPS) control network. The GPS survey was conducted by Wade-Trim, Inc. in cooperation with Gove Associates Inc., the city's surveying consultant. The project consisted of surveying existing section corners, quarter section corners, centers of sections, and centerlines of major streets to determine the Michigan State Plane Coordinates of each corner. This allowed EDS to determine the true distance between street intersections and section corners for comparison with the assessor's recorded distances.

Gove personnel researched existing records. Old surveying maps, section corner witness records, and county and city deeds were used to verify the authenticity of monuments found in Kalamazoo streets. With all section corner locations for the assessment mapping, Wade-Trim

R0013736

GPS Supports Assessment Mapping Project

developed a plan for the GPS control survey. A GPS network was used in which GPS fast-static techniques were utilized to locate and tie together all the section corners included in the survey.

Using Trimble Navigation (Sunnyvale, California) *4000 SSE Fast-Static* equipment, the GPS technicians proceeded to occupy each section corner and quarter corner included in the network. The tree-lined streets, one of the charms of Kalamazoo, presented a problem in many areas of the city. Since GPS works by measuring signals sent down by numerous satellites in orbit, trees present the most common obstacle for this signal. These signals are received through an antennae mounted on a tripod or pole. Signal reception problems were resolved by scheduling observation sessions at times when the satellites were high in the sky and by elevating the antennae 12 to 15 ft above the ground.

Another concern of the GPS field technicians was the heavy traffic on Kalamazoo streets. Each operator worked by himself and was responsible for setting up necessary traffic cones and signs to alert drivers. Occasionally a flagman was needed to direct traffic around an antennae setup that blocked a traffic lane.

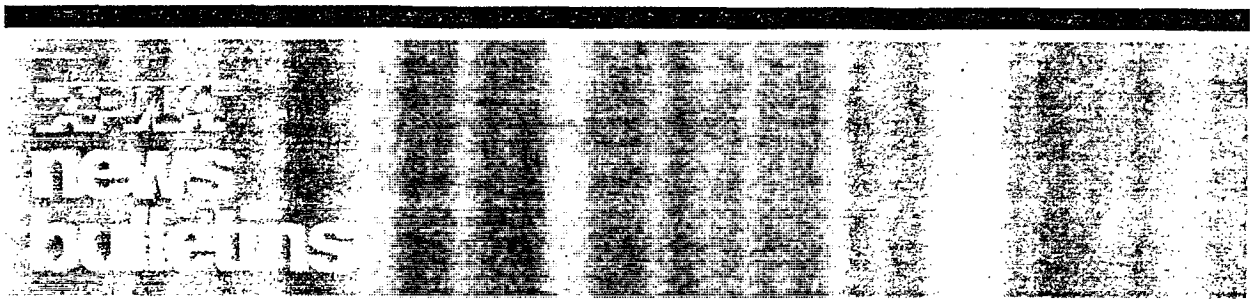
Operators were kept busy as their equipment collected satellite data at each section corner. They recorded the heights of the antennae above the ground, filled out log sheets, and answered many questions from curious children walking home from school. At the end of each 10-to 15-minute data collection session, the operators packed up their equipment and moved down the street to their next assigned section corner. During the seven-day collection period, about 60 sessions were completed during daylight hours. Most of the 76 section corners were iron pins protected by a cast iron box and lid. Three operators with GPS receivers collected satellite data during the same time interval for each session. These data were later processed to determine the distance between each section corner at an accuracy better than a quarter of an inch.

Using the section corner coordinates established by the GPS survey, the small parcel map features of the new computerized assessment maps are currently being repositioned. A digital representation of the converted parcel map is manipulated to match the coordinate locations specified for each section corner. This creates a template and permits repositioning of city block polygons, as well as the parcel making up the polygons.

The original parcels' dimensional shape and size are protected from the stretching process of rubber sheeting. Topological structures are then added to the parcel elements and other map features. This gives "intelligence" to the maps and provides a complete GIS interface with the city's VAX computer relational database.

Immediate Benefits

There were immediate benefits of this GPS/GIS project. More timely and accurate tax assessor related information is available to city staff and the public. The digital maps and database provide cost-effective maintenance, increased analytical capabilities, improved operational efficiency, and customer service. This will allow city staff to become more productive, while providing additional services at current staff levels.



Staff from the departments of the assessor's office, management information systems, public utilities, and public works were involved in planning all phases of this project. Assessing staff will maintain the parcel information; engineering users will catalog surveys conducted for local construction projects and enter new survey information into the GIS. This will increase the accuracy of the base map over time and tie all projects to common base coordinates.

Combining digitized assessor parcel maps with GPS surveying has been the most cost-effective way for the city to develop a GIS database. By surveying existing monuments rather than setting new monuments, the city produced an inventory of existing section and quarter corners that can be used by the county's re-monumentation program. Under a 1990 state law that created the program, all Michigan counties are required to re-establish their section corner monuments by the year 2010.

The city and county may establish an ordinance to densify established monumentation by requiring local surveys to be tied into the network. Such an ordinance will generate more accurate and less expensive property surveys, more accurately determine community utilities and roadway alignment, and facilitate a county-wide GIS system. The city has formed the Kalamazoo Area Geographical Information System Committee (KAGIS) to study the design and implementation of such a system.

Kalamazoo has committed itself to the GIS concept. The assessor's map conversion project is an important and integral part of the city's GIS development program. Upon this layer of information will rest the remainder of the city's infrastructure database and the applications that will evolve to benefit the citizens of Kalamazoo. □□□

American Public Works Association
106 West 11th Street, Suite 1800
Kansas City, Missouri 64105-1806
(816) 472-6100

Celebrating National Public Works Week

Public works officials throughout the United States and Canada celebrated National Public Works Week (NPWW), May 16 to 22, 1993. For the third consecutive year, "Quality of Life Through Public Works" was the theme of this week dedicated to recognizing public works engineers and administrators as resourceful, effective professionals.

Children's laughter and street sweeper "swooshes" came together in over 200 cities that week. The cities outdid themselves with proclamations declaring National Public Works Week, press releases to local media, radio and television talk show appearances, school presentations, flyers, equipment shows and demonstrations, parades, tours of public works facilities, and open houses at government offices or local shopping centers.

In Eugene, Oregon, Burger King distributed more than 15,000 informative tray liners, announcements about NPWW were printed on side panels of shopping bags, and children learned the "Adventures of a Raindrop" at the annual fair; in Gresham, Oregon, water treatment tours were given; in Thousand Oaks, California, there were paint striper and aerial lift demonstrations; and in San Francisco, the Ninja Turtles were spotted in a simulated sewer where children could learn what it is really like under the streets. Clark County, Las Vegas, Nevada, used a "guest" weatherprinter on the evening news the entire week; and in Yaughan, Ontario, the Committee of the Whole proclaimed May 16 to 22, 1993 "National Public Works Week."

The celebrations continued across the continent where in Jefferson City, Missouri, over 40 fourth graders participated in an equipment show; in St. Louis demonstrations took place in several area schools; in Bloomington, Indiana, demonstrations of the city's new geographic information system; in Covington, Tennessee, orientation on a natural gas vehicle; and in New Orleans, Louisiana, an equipment parade with a jazz band.

Also, in Concord, New Hampshire, an employee appreciation luncheon; in Harrisonburg, Virginia, the local newspaper carried the city's newsletter; in Norfolk, Virginia, a large sign was displayed across an elevated walkway and picnics were thrown to honor 3200 employees; and in Burlington, North Carolina, over 70 employees participated in a basketball shootout with proceeds going to a local charity.

"This is a great way to give the taxpayers a hands-on look at the workings of municipal professions and what their departments do, what tools they use, and the contributions they make," explained Steve Stewart, the city manager of Harrisonburg, Virginia.

As in Norfolk, Virginia, many cities recognized their staff by designating an Employee Appreciation Day. Captain Charles Fehlig of the Public Works Center at Norfolk, recognized the employees, saying, "You are part of the public works groups of the United States who really make a difference to the people who depend upon our services. You make a tremendous contribution out here."

National Public Works Week was established in 1960 with the objectives to increase citizen's understanding of public works; promote awareness of the need for public works professionals and the contributions they make to everyone's health, safety, and comfort; inspire excellence and dedication in public service by recognizing public works professionals and their achievements; and encourage talented young people to prepare for public works careers.

APWA Names New Executive Director

A nationwide search has culminated in the naming of William J. Bertera to succeed Richard H. Sullivan as executive director of the American Public Works Association. Bertera joined the Kansas city staff as executive director designate on August 9, and replaced Sullivan on October 1.

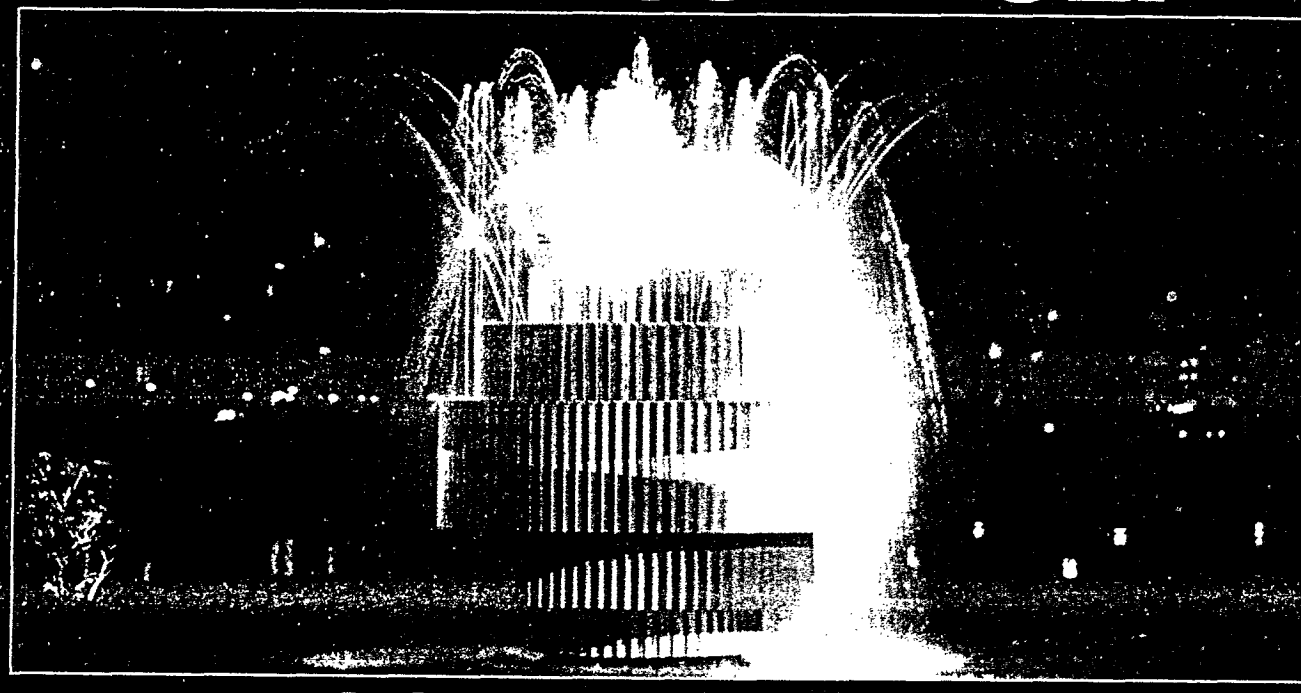
Bertera comes to APWA with 18 years experience in not-for-profit organizations representing both trade and professional entities in the public and private sector. He has a strong background in chapter development and service, membership sales and retention, state and federal government affairs, strategic planning, and fiscal management.

Most recently managing director of the private-sector National Solid Wastes Management Association, with a staff of 80 and a $90-million budget, Bertera headed the chapter relations, membership, public affairs, technical assistance, and state and federal advocacy programs. He was also responsible for 12 institutes and councils representing specialized constituencies.

Prior experience in the public sector includes service with the National Association of Counties as an associate director for federal affairs and as an administrative assistant to a member of Congress. He also served as a consultant to several federal agencies.

Bertera holds a B.S. degree in Business Administration and an M.P.A. in Urban Affairs. He is a member of the American Society of Association Executives and the American Society of Public Administration.

Congressman Receives APWA Service Award



The Honorable Norman Y. Mineta, chairman of the U.S. House of Representatives' Committee on Public Works and Transportation is the recipient of the APWA Distinguished Service Award. Mineta has a distinguished career in politics, and became the first Japanese American mayor of a major U.S. city, when he won election as mayor of San Jose, California, in 1971. In 1974 he won a seat in Congress and immediately established himself as a leader of the 75 new Democratic members in the 94th Congress. Fellow new members elected him chair of the New Members Caucus. Mineta has won every bid for reelection ever since, and is now serving in his tenth consecutive term.

As chair of the Committee on Public Works and Transportation, Mineta has leadership authority over much of the nation's public infrastructure investments—including roads, bridges, transit, safety, aviation, water resources, public buildings and grounds, and economic development assistance programs. As chair, he is a member of all six committee subcommittees: Surface Transportation, Aviation, Water Resources and Environment, Economic Development, Public Buildings and Grounds, and Investigations and Oversight.

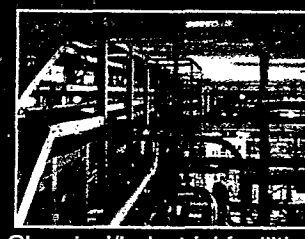
SOLVING THE TOUGHEST PROBLEMS ON THE SURFACE.



An Excellent Solution For:

Waterparks and slides

Commercial swimming pools

Chemical/Industrial facilities

Zoos and aquariums

A Fibre Tech surface provides a dependable chemical seal for swimming pools, fountains, petroleum tanks, aquariums, zoos - anything that holds liquid. From simple to complex industrial applications.

Fibre Tech is a durable, long-lasting, watertight surface that bonds easily to concrete or steel, yet remains flexible to structural movement. And with our 25-year guarantee against cracking*, we're sure you'll find that Fibre Tech can finish any facility's surface problems once and for all.

FIBRE TECH®

The Fiberglass Solution To Concrete Problems

You'd Have To Be Cracked Not To Call For More Information.

Oregon Commission to Review Six-Year Plan

Faced with a shortage of up to $400 million for transportation projects between 1995 and the end of the century, the Oregon Transportation Commission will re-evaluate all the projects in its Six-Year Transportation Improvement Program.

"We are going to have to make tough decisions on some important projects," said commission chairman Michael P. Hollern. "Given the magnitude of the shortfall," Hollern said, "we will have to look at every project on the six-year plan."

The shortfall is the result of several factors. Federal matching funds for transportation projects will be only 80 percent of the amounts originally authorized by Congress. State gasoline tax revenue also is lagging behind projections. A funding package presented to the state legislature to implement the Oregon Transportation Plan (OTP) was unsuccessful.

"We are committed to the philosophy of multi-modal transportation systems outlined in the Oregon Transportation Plan," said Hollern. "We need to begin that shift away from reliance on highways as the prime mode of transportation.

"Oregon's transportation system is the biggest single investment made by the citizens of this state. By doing all we can to preserve that investment, we will be able to divert funds from modernization or improvement projects to other projects that are more in line with the goals of the OTP."

Oregon Department of Transportation News, August 18, 1993.

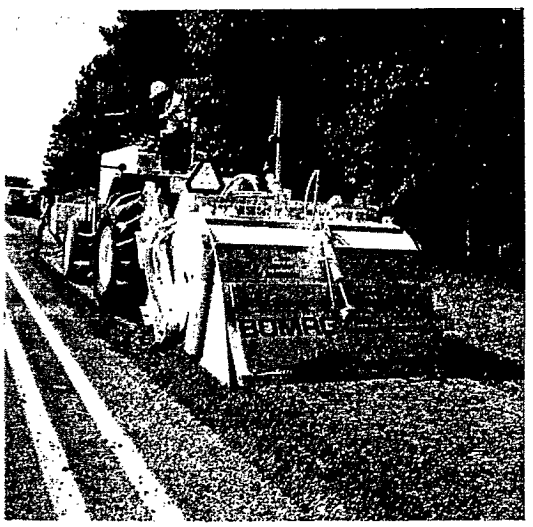
Hiker/Biker Trail To Be Extended

The Maryland Department of Transportation has announced an improvement to lengthen the Baltimore/Washington Airport hiker/biker trail under construc-

Modernizing Road Repair Operations

DISTRICT 20 of the Texas Department of Transportation (TxDOT) is using two recently purchased BOMAG MPH-100 Recyclers (Compaction America, A United Dominion Company, Kewanee, Illinois) to improve repairs and save time and money on hundreds of miles of secondary and tertiary roads and other highways through its eight-county area.

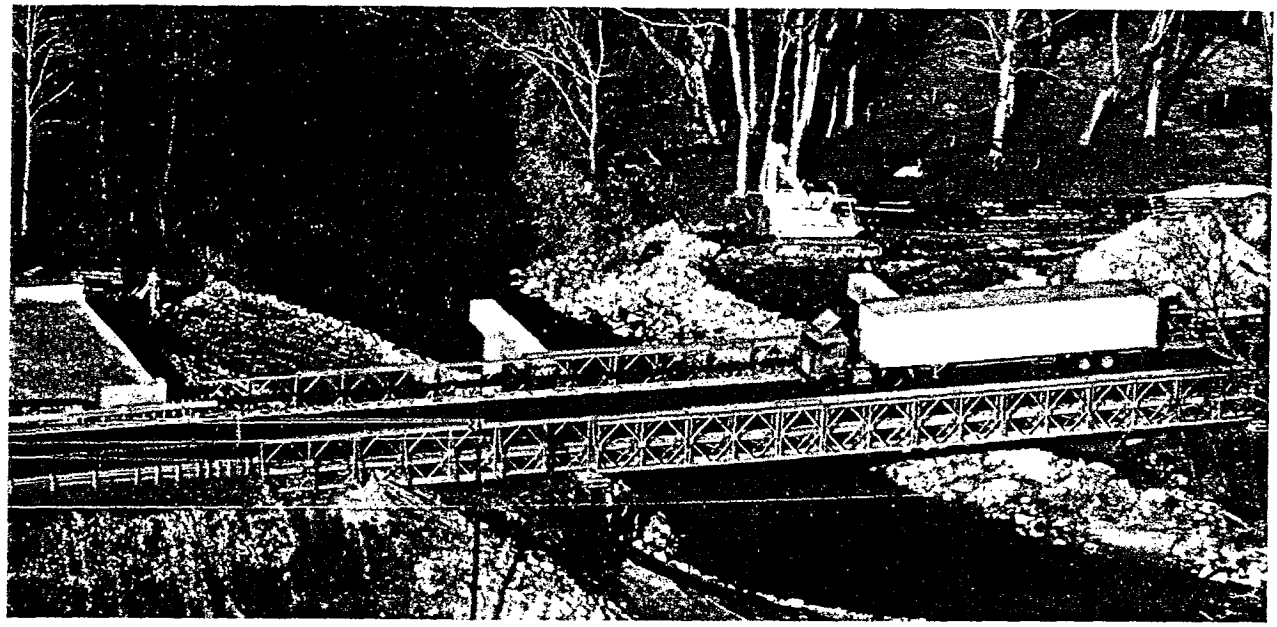
The recyclers cut into existing bituminous surface to a 12-in. depth, pulverizing it with the sub-grade, mixing cement into the soil, and providing a homogeneous material. The cutting rotor is held at selected depths by positive down pressure.



Tyler County Maintenance Supervisor Mark Hanks reported that his maintenance crew recently used one of the new recyclers to correct several base failures near the town of Woodville. Earlier the same crew had repaired five such roadbase failures with the same machine. Two reasons for base failures of the roads in Tyler County, according to Hanks, who has been with TxDOT for over 18 years, are weather and heavy logging operations. Most of the roads were not designed or built to carry the heavy loads they now do.

"In the old days, before we got the BOMAG MPH100, we repaired the base failures by using the scarifer teeth on a motor grader. An older farm tractor with disk was pulled behind it," said Hanks. "We used the tractor/disk to mix the cement with the soil after the grader operator broke up the asphalt and bladed the material out to where the failure was exposed. In the past it took five or six passes with the disk to get proper mixing. Now we can do the same thing with the BOMAG with only two passes. And we can go deeper a lot faster when need be," he added.

"I'm not sure how others do it, but we add cement to the soil simply by pacing off the distance of the failure area. We then add one bag of cement for each step or 3 ft of distance when we are repairing one half of a normal 20-ft wide road. If the repair goes across both travel lanes of the road, we use two bags of cement for each 3 ft," continued Hanks.



Hanks feels that the recycler mixes the material to a uniform consistency, avoiding the clods of soil that were common with the previous equipment. "We add cement and mix it to a uniform consistency. We add water to the correct proportion and then compact the material. Normally we use a pneumatic, rubber-tired roller to get the proper density. The next to last step is to reestablish the proper grade with our maintainer or motor grader. This is a very critical operation because the only thing we do after this is to come back after a few days and put down a coat of oil and stone.

"The initial difference in repairing base failures with the BOMAG MPH100 is going to be a better quality repair that will result in a longer lasting road. Long range, a savings in time and money," Hanks concluded.

■ **THE Recycler repairs damaged road by mixing existing bituminous pavement with subgrade material and cement. The mixture is then graded and compacted.**

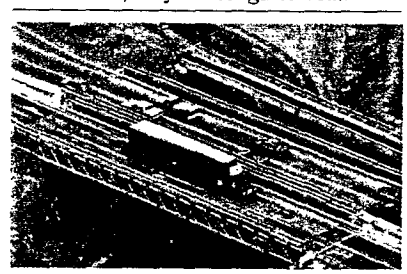
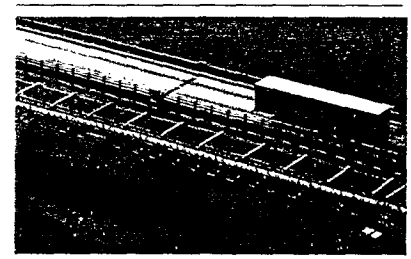
It's a Definite Mabey.

Mabey Bridge Of Course.



Twenty Four Hour Response

When an emergency arises, you can count on Mabey Bridge for a fast solution to your bridge problems. When flash floods in New Mexico washed out a highway bridge, Mabey responded in less than 24 hours and designed a replacement utilizing Mabey components already stocked by New Mexico DOT. The new 100 ft., two lane, clear span bridge was up within a week. The fast response earned a commendation from the governor for all involved, and, probably much gratitude from the highway travelers.



An Economical Solution

Baltimore County, Maryland, like many others, uses Mabey prefabricated panel bridges for economical bridge replacement. They go up fast. The initial cost is very competitive with other construction methods. And, on total lifetime overall cost, they are tough to beat.

Quality Design

The Mabey design team helps solve your bridge problems. When a utility bridge was needed in South Carolina to carry a 24" water main, Mabey designed it, delivered it and provided full on-site support. This 1000' structure is another example of the variety of bridge requirements handled by Mabey. Like all Mabey bridges, it uses fully galvanized high strength steel components for long life.

Make it a Mabey, Definitely

Mabey Bridge is a definite consideration for both temporary and permanent installations. A wide range of sizes and configurations can be rented or purchased to meet your needs quickly and economically. For your next bridge, definitely make it a Mabey. Call or write for more information.

tion in Anne Arundel County. The addition will extend the trail from North County High School to the new Linthicum Light Rail walk-up station, encouraging more people to use mass transit.

"With the opening of the light rail in Linthicum, extending the trail to improve pedestrian and cyclist access is ideal," said Maryland DOT Secretary O. James Lighthizer. "Local residents will be able to walk to the station along the new scenic path and employees from area businesses can travel by light rail and walk to work. The project is an excellent example of intermodalism in our department."

Construction of the 10.5-mile trail will be completed in four phases. Originally estimated at $225,000, the extension adds about $133,000 to the trail construction cost of which $66,750 are Federal Highway Administration enhancement funds. Averaging 10 to 12 ft wide, the asphalt and boardwalk trail will be built mainly on public property.

Maryland Department of Transportation News, July 16, 1993.

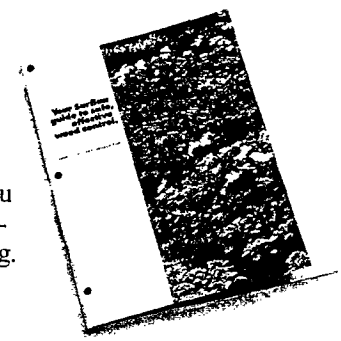
History of Urban Transportation Planning

The history of urban transportation planning in the United States is enlightening. Edward Weiner, in *Urban Transportation Planning in the United States: An Historical Overview*, presents the fourth edition of a work first published in 1983. The history focuses on key events in the evolution of urban transportation planning, including developments in technical procedures, philosophy, processes, and institutions. The current work brings the planning process history up to date and includes material on the Intermodal Surface Transportation Efficiency Act of 1991.

For more information contact Edward Weiner, Office of Economics, Office of the Assistant Secretary for Policy in International Affairs, Office of the Secretary of Transportation, Washington, D.C. 20590 (202-366-5403). The report (DOT-T-93-02) is distributed in cooperation with the Technology Sharing Program, U.S. Department of Transportation, Washington, D.C. 20590.

Newsline, July 1993, Transportation Research Board, National Research Council, Washington, D.C.

New Program Draws Many Applications



A new federal program that earmarks about $7.5 million a year for "enhancement" projects complementing Virginia's transportation systems has netted 219 applications requesting nearly $69 million. Requests range from landscaping and beautification along highways to developing hiking trails and bicycle paths to renovating railroad stations and creating

You make it a work of art. Surflan* herbicide keeps it a picture suitable for framing. Find out how in our free technical guide.

It describes how Surflan herbicide can stop more than 50 different weeds and grasses before they emerge to protect more than 175 different ornamentals. No other ornamental herbicide can top these numbers.

It also tells how Surflan is so gentle on your established shrubs and ornamentals you can spray it directly over the top, even over sensitive ornamentals like petunias. At recommended rates of 3 oz. per 1,000 square feet, Surflan keeps tough weeds out all season long. That makes your work a real work of art.

Ask for your free technical guide on Surflan today. Call toll-free: **1-800-729-3693, ext. 7613.**

"talking highways" that would allow motorists to hear on their car radios about the area they are driving through.

Virginia Department of Transportation (VDOT) officials were not surprised at the number of applications, three fourths of which poured in during the last three days before the deadline. Private and public sector groups and individuals applied for the funds.

"There's been a lot of interest in this program," said Commonwealth Transportation Commissioner Ray D. Pethtel, "and the quality of the project proposals is consistently high. It's a unique program that encourages recreational opportunities as well as historic preservation along our highways."

Pethtel said a 15-member Transportation Enhancement Advisory Committee would evaluate the proposals and recommend projects for funding no later than October.

Requests for funds have come from all over the state and range from $675 to $3 million. Federal funds provide 80 percent of the funding for projects under the federal Intermodal Surface Transportation Efficiency Act. The remaining 20 percent must come from localities or private sector applicants.

To ensure that the applicants can come up with the additional 20 percent, the local board of supervisors or city council must approve the projects before being submitted to VDOT.

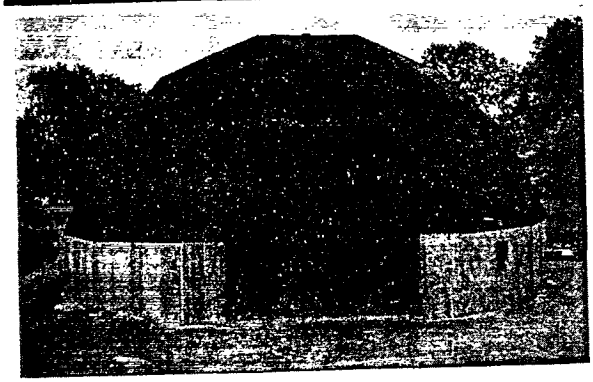
VDOT News, August 13, 1993.

Maryland Using Fly Ash In Interchange Construction

As part of its efforts to positively impact the environment, the Maryland State Highway Administration (SHA) is using fly ash in the construction of a new interchange and bridge at MD 213 and U.S. 301 in Queen Anne's County. Fly ash is the remaining residue from burning coal in electric generating power plants. About 50 million tons of fly ash were produced nationwide in 1990. In the past, fly ash was stored on the property of utility companies until it could be landfilled.

Research shows that fly ash is a successful borrow (soil and earth) replacement and it is being used increasingly for construction in several states such as Delaware, Alabama, Texas, and Pennsylvania. Twenty to thirty percent of fly ash produced each year is being used in highway construction.

Fly ash is replacing conventional borrow for embankments in the MD 213 and U.S. 301 interchange. The Delmarva Power Company, a coal burning plant at the Indian River Facility, is providing SHA and project contractor David A. Bramble Inc., Chestertown, Maryland, with over 60,000 cu yd of fly ash for the construction. The Southern Maryland Pepco Plant, Brandywine, Maryland, is also providing 140,000 cu yd of fly ash for the project. The fly ash is being surrounded with earth on the top, bottom, and sides of the embankment.



By using fly ash instead of standard borrow, SHA and Bramble Inc. will save 80 cents per cu yd in construction costs, or a combined anticipated savings of $160,00 for the project. The $4.8-million bridge and interchange project will improve traffic flow in the area. Construction began in February and should be completed by fall 1994.

Maryland Department of Transportation News, August 18, 1993.

New Rules Make The Going Scenic

New rules now allow county state-aid highways to be declared as Natural Preservation Routes to protect natural and historic resources, the Minnesota Department of Transportation has announced. Designation as a Natural Preservation Route allows designers greater flexibility in selecting design standards for new construction or rebuilding existing roadways. The relaxed standards reduce impact on the surrounding environment while ensuring that the roadway remains safe for

motorists and bicyclists. Revised standards include narrower widths for lanes, shoulders, and clearances and reduced design speeds.

"Our state is fortunate to possess many roadways that are rich in scenic or historic value. These rules allow counties to design roadways that preserve the natural beauty of the area while still maintaining a safe roadway," said Dennis Carlson, state aid engineer.

To be designated as a Natural Preservation Route, a roadway must possess sensitive or unique scenic, environmental, or historic characteristics. Examples may include roads near historic buildings, along lakes, rivers, and wetlands or through forests or hilly, rocky, or bluff terrain. Individuals who seek to designate a roadway as a Natural Preservation Route must make a written request to the county board having jurisdiction over the route.

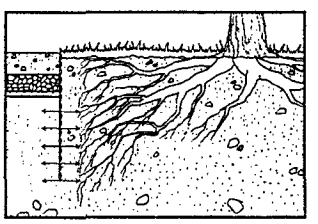
Partnering

(Continued from page 58)

Naugatuck River has 5-ft. wide cantilevered sidewalks on each side. This four-lane structure carried 17,500 ADT at last count.

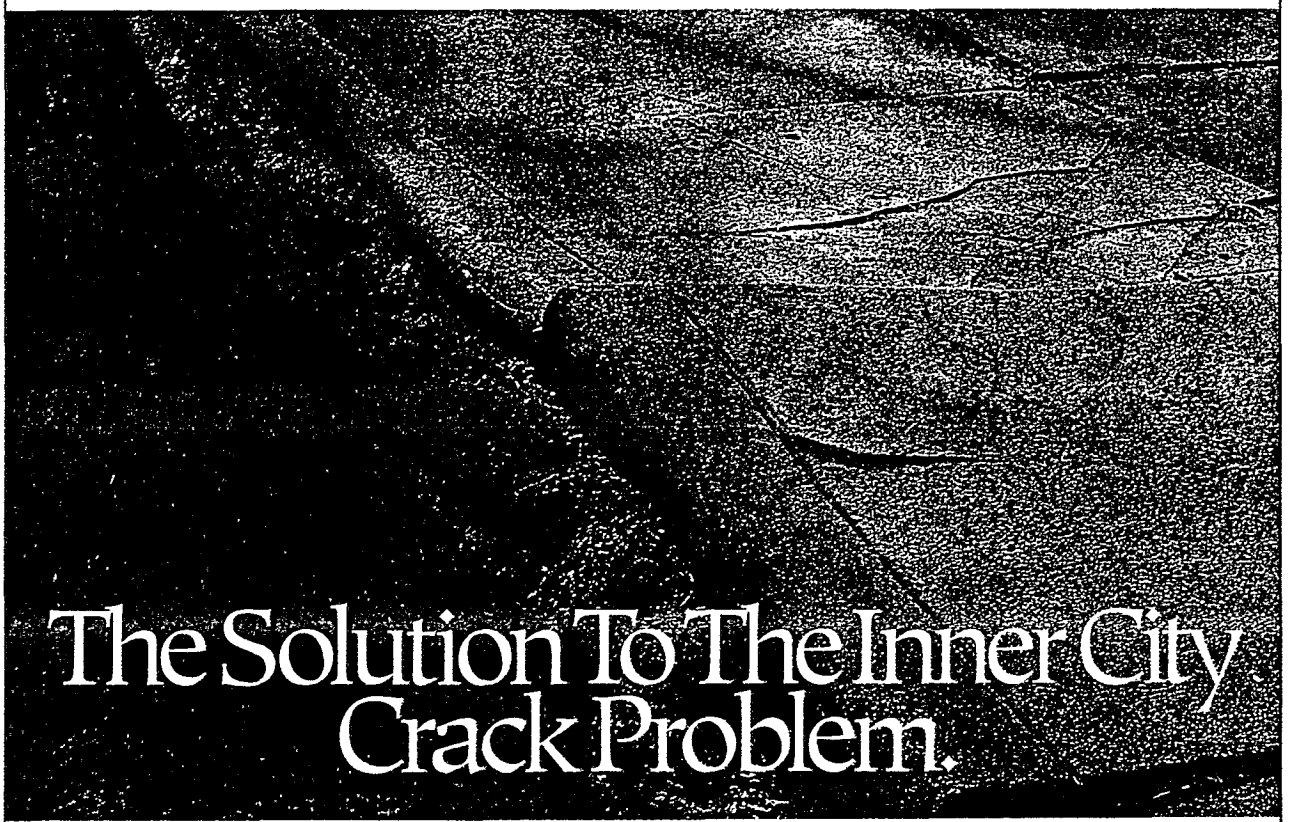


The scope of activities includes: replacing the original 7-in. reinforced concrete decks with precast concrete deck planks and a waterproof bituminous overlay; cast-in-place median barriers, bridge parapets, and deck joints; repairing fixed bearings and replacing expansion bearings with elastomeric bearings; and upgrading drainage and illumination systems. Greiner, Incorporated (Wallingford, Connecticut) has served as the state's design consultant for the overall project.

The unique design was completed in eight weeks to meet ConnDOT's deadline for advertising the project. Funding for the project derives from an 80/20 percent federal/state split. □□□

R0013746

It's a jungle out there. A concrete and asphalt jungle. And as roots from trees along sidewalks and city streets start to spread, pavement can buckle, crack and fall apart. Not only is this an unsightly problem, but a dangerous one, as well.



That's why there's Biobarrier®, the root control system that controls roots without damaging the tree over the long term. Biobarrier is a geotextile fabric that has controlled-release nodules containing trifluralin, which has been proven effective to control tree root encroachment for over 15 years. It's the strongest, most effective, yet the easiest way to divert roots away from sidewalks, curbs and street pavement.

And Biobarrier couldn't be easier to install, simply place it as a vertical barrier to deflect root growth. And unlike plastic barriers or other forms of root control, Biobarrier is installed completely underground. So your root control system is out of sight, and the roots are out of mind.

When you consider the long-term effectiveness, Biobarrier's value becomes quite apparent. Instead of replacing your root control system every few years, or worse yet, replacing concrete in sidewalks and curbs, Biobarrier provides over 15 years of effective root control so you can concentrate on more above-ground concerns.

The Biobarrier root control system. It guarantees there's one crack problem you can get rid of in your city, and keep it under control for years to come. For more information about Biobarrier, call 1-800-25-ROOTS.

Biobarrier®

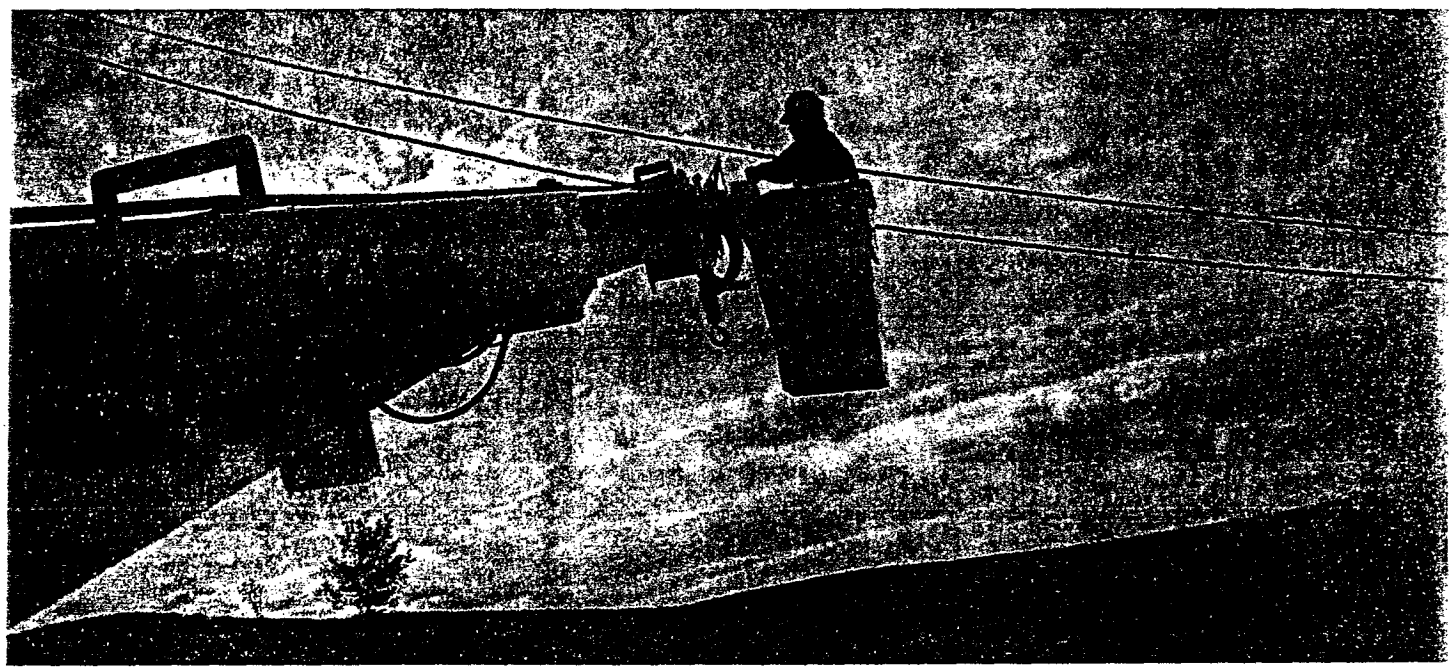
Storage Configuration And Water Quality

Several computer models have been developed that can simulate spatial and temporal changes in distribution water quality. An important application of water quality monitoring has been the significance of chlorine residuals. Several models have been developed to simulate the transport and decay of chlorine in water systems. Concentrations of chlorine along with many other water constituents are time-dependent. Thus the average age of water in a distribution system has a significant impact on water quality. In previous modeling efforts, storage reservoirs have been represented as compartmentalized completely-mixed vessels. However, neither the characteristics of mixing in distribution reservoirs nor the effects of reservoir design on mixing behavior have been investigated. From the moment water leaves the treatment plant, its age is increasing and its quality is changing as a result of time-dependent chemical and biochemical reactions. Constituents, such as free chlorine, are relatively unstable, and concentrations decrease with water age. Storage reservoirs can contribute to substantial increases in water age, depending on such factors as geometry, operation, and location. In modeling the effects of reservoirs on water age, complete mixing is usually assumed. The assumption of complete mixing may not be appropriate for all tank configurations. Elevated storage tanks and some ground storage tanks with spherical or elliptical shapes should have better mixing characteristics than standpipes. The potential plug-flow nature of standpipes during mixing and emptying may lead to behavior that can be characterized as "first in, last out." Three storage facilities from the Akron, Ohio distribution system, the Firestone, Crosier, and Tallmadge tanks, were selected for this study. The Tallmadge tank is an elevated, large diameter structure with a diameter-to-height ratio of 3.5:1. In contrast, the Firestone tank is a standpipe with a much smaller diameter-to-height ratio (0.4:1). The Crosier structure is an elevated tank with an intermediate diameter-to-height ratio of 1.4:1. The tanks were monitored for chlorine residual. Chlorine was also measured within the water column of each tank. Although chlorine profiles revealed some stratification in tanks with large diameter-to-height ratios, completely-mixed models were more accurate than plug-flow models in representing the behavior of all three tanks. If all distribution reservoirs behave as completely-mixed reactors as did those in this study, then storage reservoirs should be designed to ensure maximum volume change. Elevated tanks should be utilized rather than standpipes. Overdesign of storage facilities should be avoided because it leads to decreased volumetric change and increased water age. Consideration should also be given to taking storage tanks off line to improve the turnover rate. The use of fluoride as a conservative tracer was not possible in this study, because permission to suspend use of fluoride could not be obtained. The use of chlorine rather than fluoride made the tank mixing studies more difficult to conduct. Chlorine decay rates were deter-

Drinkable Water After Chemical Oxidation Process

A SUPERFUND Innovative Technology Evaluation (SITE) demonstration confirmed that chemical oxidation treatment technology will clean water contaminated by toxic organics. The SITE demonstration at California's Lawrence Livermore National Laboratory was conducted under stringent evaluation standards developed by the EPA for the SITE program.

During the three-week demonstration period a small perox-pure™ system (Peroxidation Systems, Inc., Tucson, Arizona) cleaned about 40,000 gal of groundwater contaminated with trichloroethene (TCE) and tetrachloroethene (PCE), which were present at concentrations of about 1,000 and 100 mg/L, respectively. The chemical oxidation process consistently destroyed the TCE and PCE to levels below detection limits of 0.5 μg/L.



According to Norma Lewis, project manager of the EPA's Risk Reduction Laboratory, once operating conditions were established, the perox-pure unit required little or no attention. "There were no operational problems that affected system performance," she reported. The treated water was drinkable by California standards and met Federal drinking water maximum contaminant levels at the 95 percent confidence level.

The advanced UV/oxidation process destroys the bonds between contaminant atoms and allows the atoms to recombine into simpler, nontoxic compounds, such as carbon dioxide, water, and various salts. During the process, contaminated water is combined with hydrogen peroxide, a chemical oxidant. The mixture is then exposed to ultraviolet light generated by medium pressure mercury vapor lamps. The ensuing photochemical reaction forms hydroxyl radicals, highly reactive molecules that break the chemical bonds of the pollutants. Clean water is the result. The treatment technology produces no air emissions and generates no residue, sludge, or spent media that require further processing, handling, or disposal.

During a second phase of testing, the process effectively destroyed compounds that are more difficult to oxidize and are not usually present in the contaminated water at high concentrations. Influent water containing TCE and PCE was spiked with chloroform, 1,1-dichloroethane (DCA), and 1,1,1-trichloroethane (TCA). The process destroyed over 93.1 percent of the chloroform, 98.3 percent of the DCA, and 81.8 percent of the TCA. Greater destruction efficiencies are achieved with additional oxidation time or larger perox-pure equipment.

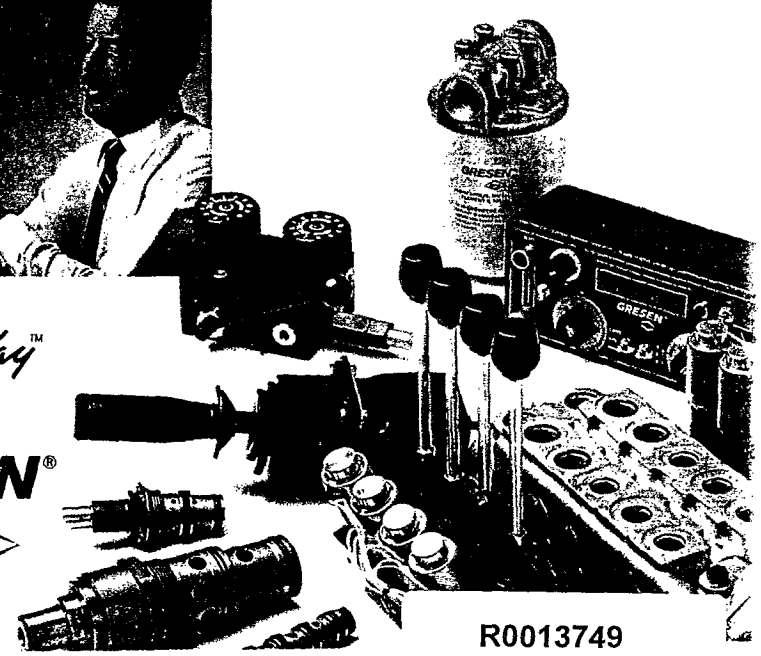
People Look Up To Gresen® Valves Because They Won't Unexpectedly Let You Down.

Whether front loader or back hoe, fork lift or man lift, Gresen® Valves are recognized as the standard wherever hydraulic power is used. And now controlling the strength in your mobile fluid power application is easier than ever.

Now Gresen gives you precise electronic control for our directional, pressure and flow control valves. Our comprehensive valve expertise includes mobile hydraulic control valves, integrated circuits, cartridge valves, electronic programmable controllers, and feedback devices.



And when you specify Gresen, you know you can count on:

- Efficiently-engineered, precisely manufactured components.
- A range of capabilities that are unmatched in the industry.
- A firm commitment to total customer satisfaction.

Harness your hydraulic power with the reliable control of Gresen Valves. For the distributor in your area, write Dana's Mobile Fluid Products Division, P.O. Box 1313, Minneapolis, Minnesota 55440 or call 1-800-862-9367.

CLEAN-O-VAC

VALVE BOX AND CATCH BASIN CLEANER

Large and bulky truck vacuums are not always justified because of their size, noise and traffic disruption; CLEAN-O-VAC offers the perfect solution. By combining a powerful vacuum in a compact, quiet, highly portable design,

CLEAN-O-VAC is capable of collecting over 5,000 pounds of wet or dry material per hour while remaining easy to move and operate.

This heavy-duty unit is factory trailer mounted, or may be carried in the bed of a small truck.

mined in this study. However, the use of a nonconservative tracer undoubtedly resulted in some tank modeling errors. These errors may have resulted from the assumption of first-order decay and applying lab decay data to storage tanks. The use of fluoride avoids many of the problems associated with chlorine analysis. The benefits of modeling research far outweigh any risk incurred from temporary cessation of fluoridation. State authorities need to be more accommodating in such matters.

"Assessing the Effects of Storage Tank Design on Water Quality." By Mark S. Kennedy, associate professor in civil engineering, South Dakota State University; Scott Moegling, engineer, Burgess & Niple Ltd., Akron, Ohio; Simsek Sarikelle, professor of civil engineering, University of Akron; and Khis Suravallop, engineer designer, Akron Public Utilities Bureau, Akron, Ohio. *Journal AWWA*, July 1993.

Pump Energy Savings

Utilities can save energy in water system operation in only a limited number of ways. By improving the operation of pumps, which are the biggest energy users in water treatment and distribution, utilities can realize significant energy cost savings. This article describes some methods for reducing energy costs and the kinds of tradeoffs that must be considered in making any energy cost savings. It is unlikely that any given pump station, although probably not extremely inefficient, is being operated at its lowest possible energy cost. The best approach to energy cost savings depends on the utility. It may be difficult for a small utility to spend a few thousand dollars studying pump operation or installing telemetry when the total cost of pumping energy is only a few thousand dollars per year. A large utility may be willing and able to spend considerable sums trying to squeeze one or two percent from its electric bill. Any proposed operating policy for a distribution system must be evaluated with regard to its impact on these competing objectives: 1) meeting everyday customer demands; 2) making sure emergency demands are met through proper provision of storage; 3) maintaining water quality; and 4) minimizing capital cost. Because there is no single reason why pumping systems are operated less than optimally, there is no single simple approach to minimizing energy costs. Instead there are myriad reasons why pumping systems operate at a higher-than-optimal cost, including: 1) pumps are incorrectly selected; 2) pumps have worn out or have clearances set incorrectly; 3) capacity in the distribution system is limited; 4) storage capacity is limited; 5) operational pressure tanks, such as hydropneumatic tanks, are inefficient; 6) telemetry equipment is inadequate or inaccurate; 7) pumps and

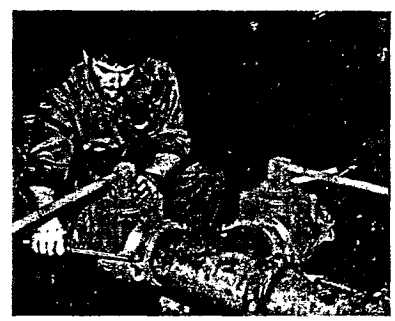
The Victaulic® system . . . the complete, fast, economical and reliable way to join pipe.

Saving money in municipal treatment plant piping since 1925.

The Victaulic system not only saves substantial time during initial installation, it also helps reduce operation and maintenance costs.

You work with only two bolts, compared with 8 to 12 for flanges. No bolt hole alignment problems. Easy field or shop pipe preparation.



Only Victaulic has a complete line of couplings, fittings, and valves for AWWA ductile and IPS steel, stainless, aluminum, or PVC pipe.

Sludge clean-out and maintenance are a snap. Each joint is a two-bolt union. Add-ons, changes, and expansion are easy. Products are available for AWWA ductile or IPS steel, stainless, aluminum and PVC—even a transition coupling from ductile to steel.

Grooved end plug, butterfly, ball and check valves are installed with two couplings. Fittings are grooved, ready for field installation. And products are available worldwide.

Next municipal waste treatment, water treatment, lift station or pump house, put the Victaulic system to work. We'll go the limit and beyond to save you time and reduce costs.

For more information, contact your Victaulic Distributor, or write Victaulic Company of America, P.O. Box 31, Easton, PA 18044-0031. Or phone 215-559-3300. FAX: 215-250-8817.

New Vic-Plug® valve provides exceptional flow, low maintenance, and fast, easy grooved coupling installation.

valves cannot be controlled automatically or remotely; 8) a penalty results from time-of-day or seasonal energy pricing; 9) demand or capacity charges are not understood; 10) operator error occurs; or 11) pump control strategies are less than optimal. Most of these problems will not be noticed unless the utility looks for energy waste. Energy consumption is directly proportional to the discharge and head and inversely proportional to the pumping efficiency. The problem is complicated, however, by the fact that efficiency itself is a function of the discharge. It can be shown mathematically, however, that energy usage can be reduced by reducing the amount of water pumped, the head against which it pumps, or the price of energy, and increasing the efficiency of the pumps. A utility does not have much control over the pumping volume. Water conservation and loss reduction are the only substantial ways to reduce the volume pumped. To the extent that water conservation and loss reduction reduce consumption, they also conserve energy. Where there are multiple pressure zones, savings can be realized by minimizing the amount of water that needs to be pumped to higher zones. Pressure zones can be rearranged so that customers are served from the lowest zone feasible. Reducing the total dynamic head against which the pump must work will reduce energy consumption. The easiest way to accomplish this is to keep distribution tanks less than full and suction storage tanks as full as possible. The heads produced by a pump are those either for lifting water or overcoming friction. If most of the energy goes toward lifting, the system head curve will be very flat. This is usually the case when the suction and discharge reservoirs are close to the pumping station and the pipes are large. Many electric utilities have a constant price for energy usage. Others use time-of-day pricing to discourage use during periods of peak electricity demand. Utilities can take advantage of this price structure by filling storage tanks during off-peak periods. Utilities need to check periodically to ensure that pumps are operating at their best efficiency point regardless of the appearance of satisfactory operation. Utilities are faced with several levels at which they can address improvement in the order of increasing cost. These range from field testing of pumps to an engineering-economic evaluation of energy consumption to the use of computer hardware-software. These costs for a large utility can vary from a few tens of thousands of dollars to millions. There is no substitute for actually measuring water-to-wire efficiency of pumps in the field. It is a standard practice and well-documented. If a utility has not undertaken pump testing in several years, it may be worthwhile. Efforts should be made to test the pumps over as wide a range of flows as feasible. There

Alkalinity First™

sodium bicarbonate

The natural choice for reducing lead and copper levels in drinking water

Join water suppliers across the country using sodium bicarbonate from the ARM & HAMMER® people to significantly lower lead and copper levels in drinking water. For water systems low in alkalinity or pH, Alkalinity First™ brand sodium bicarbonate can dramatically reduce corrosion of lead and copper pipes and fixtures when added at the distribution point. For water suppliers and their customers, this means end-of-tap water in compliance with EPA regulations.

Alkalinity First™ is NSF-certified*, free-flowing, non-irritating and safe to handle. It buffers pH, helping to minimize pH "spikes." And it's manufactured and backed by Church & Dwight Co., Inc., the world leader in sodium bicarbonate products, technology and applications.

Find out if **Alkalinity First™** is right for your facility. **Call us today at 1-800-221-0453 for more information.**

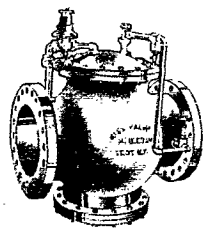
R0013753



is a limit to what can be accomplished with pump testing and engineering-economic evaluation. For utilities with sufficient energy cost and sound pumps, optimization may assure additional savings. In many cases, the existing rules for operating the system may prevent the utility from optimizing efficiency. Training operators to understand flexible rules can be difficult. At this point it may be necessary to shift to some form of computer-aided operation, in which the operator provides information to the computer to describe the state of the system. The computer would then supply the desired tank levels and which pumps should be running at any particular time. Each system is quite specific, so that there are no simple generic computer programs as there are for pipe networks, to optimize system operation. Enough development work has been done, however, that setting up optimum control is no longer a research effort. A pump optimization study usually consists of the following: 1) preliminary analysis of the system; 2) data collection; 3) optimization pfogramming; 4) verification of new equipment and procedures; and 5) operator training. There is probably not a pump station in existence that could not realize some cost savings. Before investing in sophisticated software or hardware to improve operation, the utility should first conduct pump testing and an overall evaluation of energy costs associated. It would then be possible to determine whether there is much room for improvement. Testing is the only way to determine whether pumps are wasting energy. Reviewing energy bills can give insights into the possibility for savings. Also, if a pump regularly operates to the left of its best efficiency point, the impeller or pump needs to be changed or the distribution capacity needs to be increased. If demand charges are significant, utilities need to determine when charges are effective and to operate during these times. Good communication between pump operators and management is important.

"Tips for Saving Energy in Pumping Operations." By Thomas M. Walski, associate professor of environmental engineering, Wilkes University, and engineer, Wyoming Valley Sanitary Authority, Wilkes-Barre, Pennsylvania. *Journal AWWA*, July 1993.

Reducing Radium By Ion Exchange

U.S. EPA's small system technology initiative was first developed in 1989 with the objective of building public-private partnerships to promote simpler drinking water technologies. The techniques were intended to apply to systems serving fewer than 3300, and designed to seek out and demonstrate cost-effective solutions for complying with federal and state regulations. To date, only systems serving fewer than 500 have been considered as possible demonstration sites. Sites were selected based on a variety of parameters, such as maximum contaminant levels, size, and financial status. Requests for proposals were solicited from water treatment suppliers to provide equipment and operational assistance for individual demonstrations. Demonstrations have been conducted under the supervision of EPA and appropriate regulatory personnel. EPA has completed evaluations and has issued a report on the first small systems technology initiative demonstration site—the Quail Creek water system near Spicewood, Texas. Two other projects are underway: one in Freestone, California, and another in Suffolk, Virginia. Several others are in the development stages. The Quail Creek water system supplies a privately owned mobile home development with about 15 connections and a total of 55 connections available for future expansion. An ion exchange system was provided by Kinetico, Inc. for the removal of radium present in a concentration of 7.5 pCi/L (picocuries per liter). The owner of the property decided to install a water system at a cost of $35,000 in 1983 to help sell tracts. The system consists of a well, storage tank,

R0013754

2.0 Million Gallon Buried Potable Water Storage Reservoir
Engineer: Daniel Boyle Engineering, Inc. Laguna Hills, California

Owners: South Coast County Water District, South Laguna, California
Moulton Niguel Water District, Laguna Niguel, California

Storing 2 million gallons of water is one thing. Camouflaging 2 million gallons of water is something else! When the water storage for a new development was being planned, several restrictions were mandated by the water districts, neighbors and the developer. It had to be buried, dependable, maintenance-free, aesthetically pleasing, have a multi-purpose use and enhance the local property values. The obvious choice was a buried, circular, externally machine-wrapped prestressed concrete tank. DYK Prestressed Tanks, Inc., was chosen to install the prestressing because of their impressive and dependable experience that encompasses more than one billion gallons of liquid storage. Galvanized vertical and circumferential prestressing assures a maintenance-free structure. A buried concrete roof, with tennis courts on top, fulfilled the requirement that the structure be aesthetically pleasing and multi-purpose. Whether your storage requirements are for water, sewage, lng, grain, nuclear, oil or if you just want to hide your tank, DYK will be glad to be of assistance.

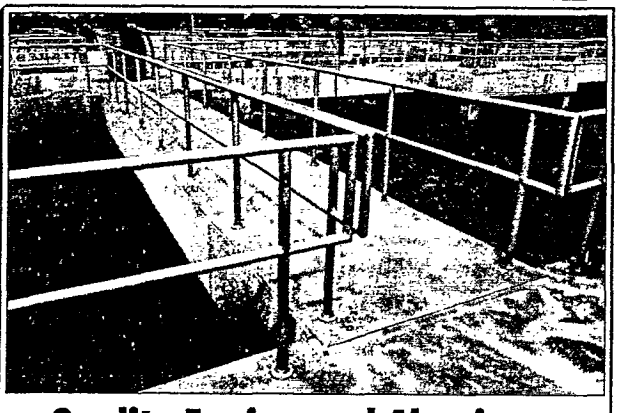
R0013755

pumps, hydropneumatic tank, and distribution piping. It has been recently expanded with ion exchange units, a French drain field, and pressure filters to provide radium removal. An 8 percent sodium chloride solution is furnished for regeneration and chlorine is used for disinfection. In addition to the high radium content, the fluoride level is 2.2 mg/L and total hardness, 471 mg/L as calcium carbonate. Pressure filters are provided to assure that particles capable of plugging an ion exchange resin are removed. The system uses a dual-tank cation softening unit to permit continuous operation. The tanks contain 1.5 cu ft of strong acid cation exchange resin. The system is nonelectric, being hydraulically powered. A water meter on top of the unit initiates the regeneration cycle after 1112 gal of water have been treated. After softening, the water is treated with 1.5 mg/L chlorine and then enters the storage tank for distribution. A French drain field, approved by the Texas Department of Health as part of the treatment plan, was installed for disposal of the brine waste. Because radium is one of the most highly preferred cations in ion exchange, the fundamental principles of cation exchange apply to its removal. Radium replaces sodium in the resin and will continue to do so until the resin becomes saturated. The treatment system was found to perform satisfactorily and was able to reduce radium levels in the Quail Creek water system to acceptable levels. The water system was readily accepted by the community and owner. Even though the costs are low, they still have an impact on a small water system. The current water rate of $17.50 for the first 4000 gal plus $2.50 for each additional 1000 gal provides an annual income for the system of $4500. The current income is approximately equal to the system's annual cost of $4687. By optimizing the resin usage, additional bed volumes can be treated between regenerations, improving cost recovery and reducing salt usage. Waste disposal does not appear to concern the water system owner. Long-term effects, however, could not be determined, and the drain field should continue to be monitored. Using ion exchange to remove radium from water systems appears to be an effective and viable alternative for meeting drinking water requirements.



"Ion Exchange: A Cost-effective Alternative for Reducing Radium." By Gregory A. McKelvey, manager, Kenetico, Inc., Community Water Systems Division, Newbury, Ohio; Mark A. Thompson, senior project engineer, Malcolm Pirnie Inc., Newport News, Virginia; and Marc J. Parrotta, environmental engineer, EPA Office of Ground Water and Drinking Water, Washington, DC. *Journal AWWA*, June 1993.

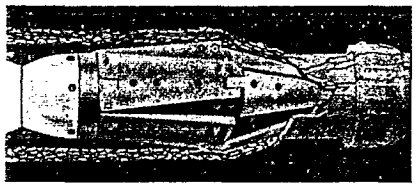
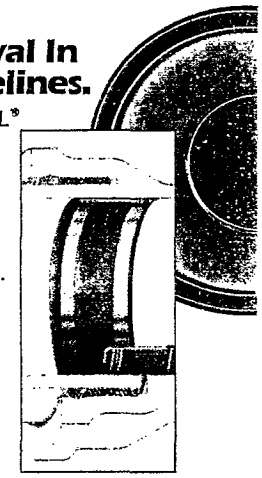
Are Your Pipeline Problems Eating Away At You?



Find Your Solutions In Trenchless Pipeline Rehabilitation.

A crumbling infrastructure is bad enough. Tearing up the streets is even worse. All that trenching eats away at your landscape, your traffic patterns, your budget and your patience. But Miller Pipeline, the leader in innovative pipeline rehabilitation and replacement, offers two trenchless solutions that will put you back on solid ground.



XPANDIT®
For Trenchless Replacement.

Miller's XPANDIT® system replaces deteriorated clay or cast iron pipelines with heavy-duty HDPE piping. XPANDIT can be installed with minimal excavation, or through existing manholes. It greatly reduces the digging, disruption and public inconvenience caused by conventional repair or replacement... usually for about the same cost as inversion lining, sliplining or other repair methods. But unlike those methods, which can actually decrease interior pipe diameter, XPANDIT allows you to install larger diameter pipe for increased flow capacity.

AMEX-10®/WEKO-SEAL®
For Internal Joint Renewal In Water & Wastewater Pipelines.

Miller's WEKO-SEAL® and AMEX-10-SEAL® systems are designed for cost-efficient repair of leaky joints in virtually all types of pipe, with diameters from 16" through 138" and larger. The seals are permanent, bottle tight, non-corrodible and flexible enough to accommodate pipe movement. And they're installed internally, virtually eliminating the cost and public inconvenience of excavation.

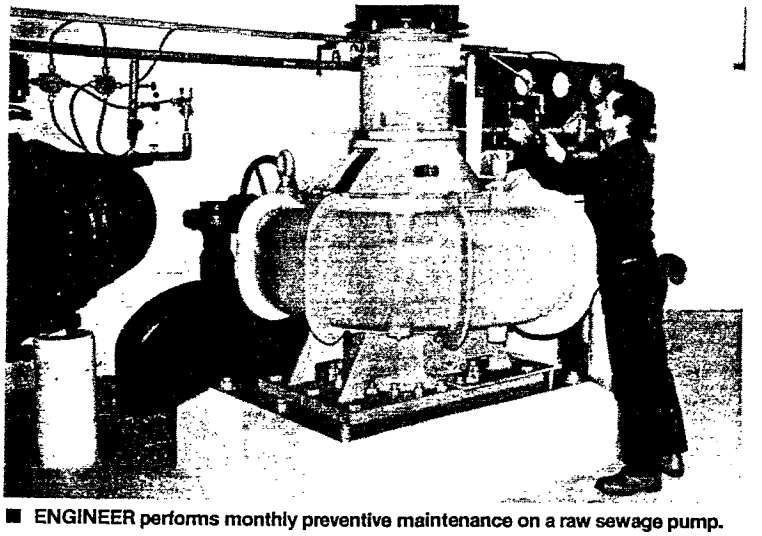
environmental wastes control digest

Prepared by Clayton H. Billings
Editorial Consultant

Laser-Induced Oxidation of Toxics

This report summarizes the results of a two-year bench-scale evaluation of laser-induced photochemical oxidative destruction (LIPOD), a process sponsored by the SITE Emerging Technologies Program. The LIPOD process is based on the photochemical destruction of toxic organic chemicals in dilute aqueous solution. Energy is supplied by an excimer laser and is absorbed by the organic molecule and hydrogen peroxide. This initiates the oxidation of the organic compound by hydrogen peroxide. The advantage of the process is that the narrow band of UV radiation is preferentially absorbed by the organic molecules and hydrogen peroxide. Also, little is absorbed by the surrounding water molecules, and the organic compounds are completely oxidized to inorganics and water. Unsaturated organics, particularly chlorinated ones, are major contaminants in groundwater at or near hazardous wastes sites. These species also rank high on EPA's list of priority pollutants, even at the parts per billion concentrations often found in wastewaters. Removal of the compounds is often difficult and expensive. Carbon adsorption and UV-hydrogen peroxide or ozonation are currently used to detoxify the wastes. The LIPOD process shows promise of excellent performance at a lower cost. The process has been under development for the past seven years, and

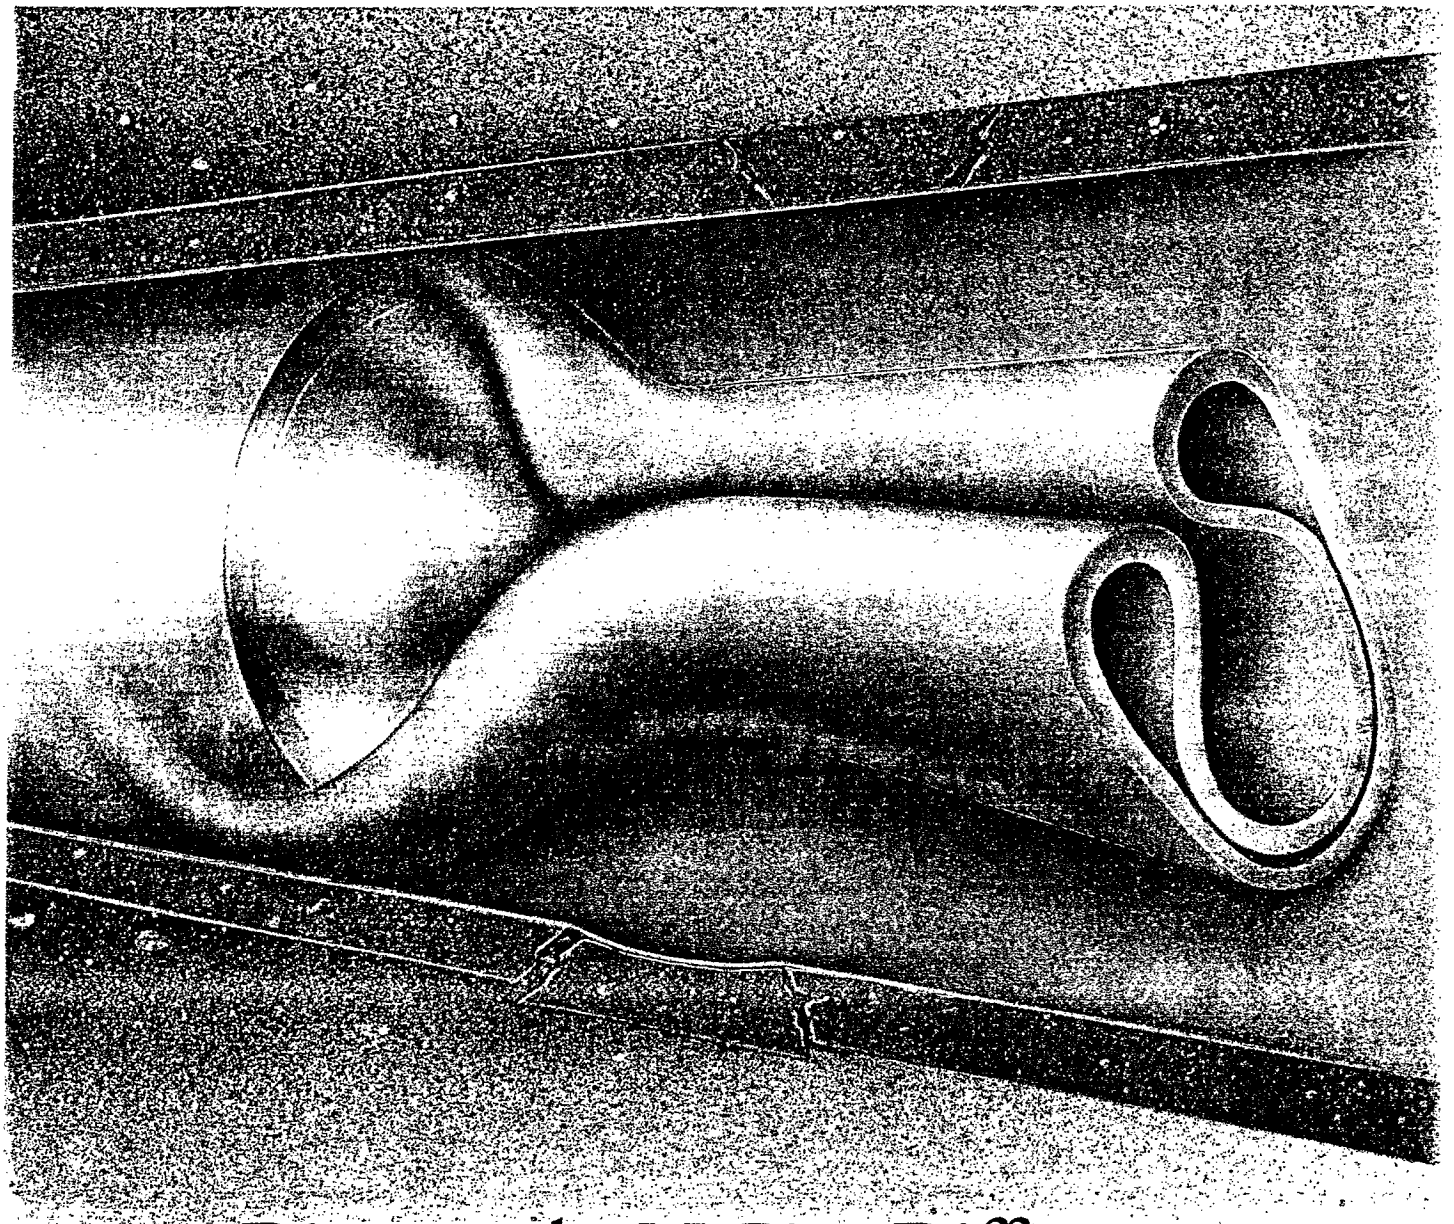
Treatment Facility Benefits from Preventive Maintenance



THE primary sewage treatment facility serving three New Brunswick, Canada municipalities known as Greater Moncton, with a combined population of about 85,000, is designed to treat an average of 20 mgd of sewage, with a peak of 45 mgd during heavy rainfall. In addition to operating a primary treatment facility, the Greater Moncton Sewerage Commission (GMSC) is constructing a sludge dewatering facility, an operations center, access tunnels, and a sludge shipping building—a $35-million system spanning 25 acres. An integral part of this new plant, which began operating in 1991, is the Dynastar computerized maintenance management system (DynaStar Systems Group, a division of Decision Dynamics, Inc., Lake Oswego, Oregon).

Roland Boudreau, maintenance coordinator for GMSC, wants to build equipment histories for all pieces of equipment, starting from the time equipment is purchased. Using Dynastar's comprehensive database and decision support capabilities, Boudreau asserts he will have a head start on an effective preventive maintenance program. Such a program will protect the commission's sizeable investment in the facility by assuring full-life expectancy from all equipment, better control of operating costs, and prevention of shut-downs due to equipment failure.

Before the commission implemented the system, the facility used a manual spreadsheet system to track job scheduling and maintenance of some 125 pieces of equipment with an estimated total value of over $10 million. Keeping the data in files was "almost impossible," according to Boudreau. Gathering information was a tremendous job that could take over two hours. Now it takes minutes, and Boudreau has confidence in the data's integrity.



Boudreau is still adding equipment to the history file, which he anticipates will be invaluable in years to come. Decisions about whether to repair or replace equipment will be easier to make. Boudreau said the equipment history module will be important for bringing order to the plant. For example, Boudreau has noticed that work orders are processed more quickly and accurately because records are complete for scheduling both preventive maintenance and corrective maintenance. So far, about 95 percent of the facility's equipment is on the maintenance management system.

The system's parts inventory component also allocates part costs to specific machinery at the end of the year. By looking at parts usage and maintenance hours, the plant's management will be able to thoroughly evaluate labor and work schedules and track costs of operations.

Discover the NuPipe Difference

When it comes to trenchless pipe reconstruction, one fold-and-formed pipe stands above the rest.

NuPipe.

The Material of Choice

NuPipe offers PVC, the sewer industry standard for new pipeline construction.

It's also the smartest choice for pipeline reconstruction, offering a tight fit that stops infiltration and restores structural integrity.

Fast, Safe, Trenchless Installations

NuPipe installations are designed to last!

A unique heat containment tube provides a controlled environment for installing the folded NuPipe.

Applying heat softens the PVC, making it flexible enough to be pulled through the host pipe from a manhole. Then a specially designed rounding device expands the new pipe tight against the existing pipe, leaving a smooth inner surface that increases flow capacity.

And it's all done in a matter of hours, safely, without the hassles of digging!

Choose the Industry Standard

Call us today for a brochure and the name of your nearest licensed installer.

its efficacy relies on the use of a coherent electromagnetic radiation source in the UV portion of the spectrum to activate an exothermic process in the presence of an oxidant so as to initiate a chain oxidation reaction. The UV source is an excimer laser. The oxidant is hydrogen peroxide. Hydroxyl radicals, which are very powerful oxidants, are produced when the laser beam impacts the hydrogen peroxide, and sufficient oxygen and/or hydroxyl radicals are formed to mineralize the organic compounds completely. The test compounds selected for this project are frequently found in wastewaters and have the ability to absorb the energy from the wavelength chosen for the laser. Laboratory scale testing of the process has shown that the method is capable of destroying 90 percent or more of a variety of toxics. The effects of concentration of the toxic, oxidant concentration, and irradiation dosage have been determined for a series of representative organic compounds. On the basis of these results, the cost of a commercial-scale process has been estimated and found to be very competitive with existing technologies now in use. Costs range from $30 to $70 per thousand gallons treated for the complete conversion of toxics, present initially at the 50 mg/L level. It is recommended that treatability studies using actual water samples from hazardous waste sites be undertaken to establish how the process performs on waste containing a variety of organics and inorganics. Successful completion of these treatability studies would lay the groundwork for commercialization of the process.

EPA's Metals Criteria

EPA's recent publication, *Interim Guidance on Interpretation and Implementation of Aquatic Life Criteria for Metals,* represents a significant advancement in metals regulation. Regulatory policy and science are more aligned. EPA has acknowledged in the interim guidelines that only toxic forms of bioavailable metals are intended to be regulated by EPA criteria. Some critics argue that the interim guidance does not reflect the latest scientific knowledge, and that the regulatory alternatives are overprotective. Since 1980, EPA has published aquatic life criteria for metals pursuant to Section 304(a) of the Clean Water Act. The criteria are not, by themselves, enforceable, but are available to states to assist in the development of water quality standards subject to state enforcement, from which water quality standards EPA or the state calculates the total maximum daily loads for receiving waters as well as the wasteload allocation for each discharge into the receiving waters establishes the permit effluent limitations. Many permit holders are concerned that metals criteria may be based on experiments whose objective was to determine the most toxic impact possible. The conditions under which these impacts occurred in the laboratory rarely, if ever, exist in ambient waters, and therefore the criteria may be unnecessarily stringent. The interim guidance is intended to present recommendations for approaches for implementing aquatic life criteria. A key recommendation is that of the water effect ratio (WER) method—a biological method comparing the bioavailability and toxicity in receiving waters downstream with the bioavailability and toxicity in laboratory test water. The WER provides a site-specific adjustment to the criteria to produce standards toxicologically equivalent to laboratory results. The interim guidance recognizes that, for most ambient waters, the measure of dissolved

WE WORK HARD SO YOU CAN BREATHE EASY.

PEPCON OdorMaster Odor Control Systems oxidize contaminants from an air stream using sodium hypochlorite (NaOCl) generated in electrolytic cells on-site, thus eliminating handling and storage of purchased oxidant.

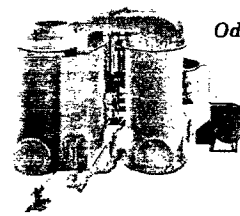
To eliminate more difficult odors, impurities absorbed in the scrubbing solution undergo additional oxidation in PEPCON's unique electrolytic cells – something systems using commercial NaOCl simply can't do.

Oxidant is recycled and regenerated, and only the amount required is produced in this extremely efficient, economical, "closed-loop" operation.

It automatically and continuously adjusts the scrubbing solution concentration to match the varying level of air stream contamination, preventing odor breakthrough.

OdorMaster Systems have become the standard against which all are measured by chemically changing, not masking, odorous compounds in contaminated air.

We're helping people around the world breathe easier. To find out how to join them, call your PEPCON sales representative.



Also from PEPCON: ChlorMaster on-site sodium hypochlorite generation systems, utilizing brine or seawater, and direct effluent treatment systems.

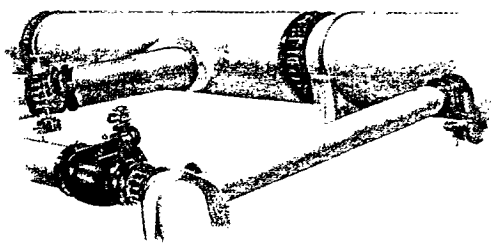
NEW AWWA STANDARDS INTRODUCED FOR PCCP DESIGN AND MANUFACTURE



New Generation of Standards for Prestressed Concrete Pipe

Introducing AWWA C301-92 and C304-92

AWWA C301-92 is the new manufacturing standard that squarely addresses the questions raised by owners, engineers and the public about quality and reliability of Prestressed Concrete Cylinder Pipe (PCCP). It mandates stringent testing that had previously been optional and significantly tightens all component material specifications.

AWWA C304-92 is the entirely new design standard based on limit states analysis and advanced computer modeling. Developed over an eight-year period at a cost of over $1 million, C-304 replaces the former C301-84 Appendix A and B design methods. The end result is a new design procedure that is able to provide analysis unsurpassed by other pipe materials. The new design standard provides pipeline owners and engineers the knowledge that Prestressed Concrete Cylinder Pipe is conservatively designed by the most current technology available.

Both new standards were exhaustively reviewed and approved by the AWWA Concrete Pressure Pipe Standards Committee, AWWA Standards Council and AWWA Board of Directors. Those groups include many of the largest users of PCCP and some of the most prominent consulting engineers in the water supply industry.

New standards are just the beginning

As good as these new standards are, they're only a foundation for the future of PCCP. The companies that comprise the ACPPA are committed to continued product improvement and total quality management to ensure that PCCP will continue to provide the best performance record in the water works industry.

We invite you to examine the new AWWA standards in detail. To obtain your copies, please contact the AWWA or call the ACPPA for more information.

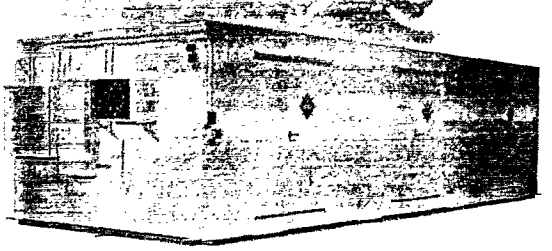
R0013761

metals provides an adequate indicator of toxicity and is a better indicator of toxicity than the measure of total recoverable metals. Although the Guidance states that the dissolved metals approach is a better indicator of bioavailable metals than the total recoverable approach, EPA raises several caveats about its use. The Guidance recommends that states using a dissolved approach reduce the EPA criteria to reflect the percentage of metal in the laboratory that was dissolved. This reduction is generally less than 10 percent and is essentially zero for several metals. The interim guidance states that the criteria and water quality standards refer to acceptable levels of bioavailable metals in ambient waters, which is vitally important to the regulated community. Before the interim guidance was issued, EPA assumed that the metal identified by the total recoverable metals method equated to the biologically available metal in ambient waters. Studies prove that this assumption is false. Updated and scientifically precise standards are essential for ensuring that pollution control resources are expended wisely. Because state agencies do not have resources to conduct independent scientific research, it is important for EPA to provide updated information on pollutant impacts. The interim guidance is a much needed improvement to the regulation of heavy metals. However, the Guidance needs to abandon outdated positions. In addition, the recommendation of the total recoverable method should be replaced by either WERs or the dissolved metals method.



"A Reflection on Metals Criteria." By John C. Hall, counsel, and Ronald L. Raider, associate, Kilpatrick & Cody, Washington, D.C. *Water Environment & Technology,* June 1993.

Great Lakes Pollution Abatement

The Great Lakes Initiative (GLI) is a landmark effort in controlling toxics in the Great Lakes basin. It is also the most far-reaching water quality regulation ever proposed by EPA. It is considered a major success story in both its technical content and its development process, but it is likely that many GLI concepts will be incorporated into future federal and state regulatory initiatives. In fact, Indiana has already adopted a regulation that identifies and controls bioaccumulative chemicals in the same manner as the GLI. The key questions are, is the GLI approach technically sound and fairly applied? Will it accomplish the goal of significantly improving the water quality of the Great Lakes? And finally, is the GLI an appropriate model for future water quality regulation in other parts of the country? The GLI has its roots in the Great Lakes water quality agreement, which was signed by the U.S. and Canada in 1972. When the agreement was updated by the two countries in 1978, language calling for the virtual elimination of the discharge of persistent toxic chemicals was included. In 1986, the governors of Indiana, Illinois, Michigan, Minnesota, New York, Ohio, Pennsylvania, and Wisconsin signed the Great Lakes Toxics Substances Control Agreement for uniform water quality standards for the Great Lakes. The goal was consistency for both environmental protection and economic competitiveness so that there would be no market-driven incentives to move facilities to a state with less stringent standards. A protocol was added to the Great Lakes Water Quality Agreement in 1987 that called for remedial action plans for 43 toxic hot spots around the lakes. Lakewide management plans were also required. The emphasis is on identifying the major sources of these pollutants and concentrating regulatory efforts where they will have the most impact. The 1987 Clean Water Act established EPA's Great Lakes National Program Office to design and carry out the GLI. Congress also passed the Great Lakes Critical Programs Act in 1990 to convert commitments made by the U.S. in the Great Lakes Water Quality Agreement into domestic law. Three committees were established to develop the GLI: a steering committee, comprised of the water program

This CDM wastewater team turned the tide on sludge management.

To meet a federally mandated deadline to cease ocean disposal of its sludge, the Passaic Valley Sewerage Commissioners (PVSC) teamed with CDM to develop an interim land-based sludge management strategy for its 330-million-gallons-per-day wastewater treatment plant in Newark, New Jersey. Meeting the ambitious 23-month schedule, CDM turned PVSC's plan into reality by fast-tracking design and construction of the facilities. The innovative design combined existing thermal sludge conditioning with the world's largest lime stabilization system. When it comes to wastewater management, CDM gets it done.

For more information on CDM's wastewater management services nationwide, call 407 660-2552.

directors of the eight Great Lakes states, with representatives from EPA Regions II, III, and V; a technical workgroup made up of scientific and technical staff from the Great Lakes states, EPA, and the U.S. Fish and Wildlife Service; and a public participation group, which includes representatives of the regulated community and environmental groups. At the end of 1991, the steering committee voted to approve the Great Lakes Water Quality Guidance drafted by the technical workgroup in 1990. This was done even though resolution had not been reached on many issues. Each of these states must amend its water quality standards to be consistent with the Guidance within two years following the publication, or EPA will promulgate the rule itself. The Guidance document contains detailed procedures for the calculation of water quality criteria for the protection of aquatic life, human health, and wildlife. One of the key concepts is the establishment of Tier 1 and Tier 2 criteria for all three. The procedures for calculating Tier 1, for example, for aquatic life are based on EPA's 1985 Guidelines. The procedures for calculating Tier 2 aquatic life criteria are based on a draft EPA procedure for calculating advisory levels. The procedure for calculating the Tier 2 values for toxicity data must be adopted by the states, however, the values themselves need not be. A total of 34 chemicals have at least one type of criterion. Bioaccumulation factors measure a chemical's potential to accumulate in fish tissue through exposure to both water and food. The emphasis on risk factors for criteria calculation in the guidelines goes beyond the current widespread use of bioconcentration factors, which only consider direct uptake from water. The factors can be measured only in the field on a site-specific basis. Because these are largely lacking, the Guidance depends on the application of controversial food-chain multipliers to convert laboratory-derived concentration factors to accumulation factors. Many of the accumulation factors generated thus far are higher than the concentration factors previously used by EPA and many states in the calculation of water-quality criteria. Many chemicals with high accumulation factors do not yet have criteria. A second issue regarding accumulation factors is the designation of all chemicals with a bioaccumulation factor greater than 1000 as bioaccumulative chemicals of concern to which extremely stringent implementation and antidegradation procedures would apply. Perhaps the topic of greatest debate concerning the GLI is the projected cost of compliance. EPA's preliminary cost estimates for compliance range from $80 million to $500 million. EPA is required to conduct a full impact analysis if the projected annualized costs are estimated to be $100 million or greater than beyond that required by existing regulations. Several groups within the regulated community have conducted their own studies. The American Iron and Steel Institute used site-specific background data for two locations of major existing facilities. The results indicate that for a single facility, the increase in necessary capital and operating expenses up to $102 million beyond that necessary to meet technology-based limits and state regulatory limits would be required to meet limits calculated with the Guidance.

How will you live up to all those biosolids management promises?

Call us. We understand the problems and frustrations you're facing.

We'll help you find common ground between new regulations, public expectations, and both technical and economic feasibility.

We bring to the table a range of experience unequalled by anyone in the wastewater biosolids management industry. Plus, we offer services and related technologies just right for today's needs.

For example, municipalities are using our BIO*FIX* stabilization processes (PSRP and PFRP) to decrease odors and recycle biosolids without costly new systems.

And our indirect biosolids dryer, the Pelletech* unit, reduces biosolids volume without emitting odors, while using about 30% less energy than direct systems.

So, whatever your needs, whatever promises you have to keep, we're ready and able to help. Just give us a call. (410) 224-0022.

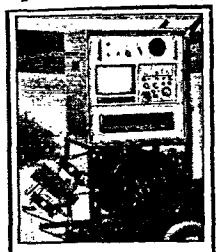
10 years of virus monitoring experience. One of the early concerns in developing water reuse was the fate of viruses in wastewater. These concerns were addressed in Title 22 of the California Administrative Code, the State Health Department's Wastewater Reclamation Criteria, which required a system consisting of coagulation, flocculation, sedimentation, filtration, and disinfection for recreational reuse. The specified system was costly and served as an incentive for evaluating alternatives. To satisfy that research need, the EPA, the State Water Resources Control Board, and CSDLAC jointly funded the Pomona Virus Study in 1975. This study showed that modified treatment trains, which could be constructed and operated on a less costly basis, achieved virus removal efficiencies equivalent to the full Title 22 requirements. The Pomona Study demonstrated equivalency of virus removal using high doses of vaccine polio viruses. Limited experiments conducted with naturally occurring viruses suggested that seed virus studies may not fully simulate the dynamics of natural virus removal and inactivation. It was still the consensus of the project advisors that the 5-log reduction of seed virus and system equivalency demonstrated during the Pomona Study was an adequate margin of safety for recreation. The Pomona Study also recommended that development of more sensitive virus detection procedures was warranted. As a result of the demonstrated virus removal capabilities of these alternative advance waste treatment trains and other findings of the study, a conservative approach was adopted and the requirements were changed to their present form. Based on the study findings, a construction program expanded the Districts' activated sludge secondary treatment plant to tertiary treatment to meet recreational standards. A health effects study was also proposed in anticipation of increasing the planned groundwater recharge with reclaimed water. Virus sampling of the tertiary treatment plants began in 1979 and continued through most of 1981. It was resumed in mid 1982. Results of that program are presented and discussed in the context of the reliability of the data and the California wastewater reclamation criteria. Six tertiary treatment water reclamation plants were monitored monthly for enteric viruses over a 10-year period. Secondary treatment removed 99.8 percent of detectable viruses. The virus concentrator and assay system detected low levels of native viruses in 74 out of 75 unchlorinated secondary effluent samples. Only one of 590 final effluent samples was positive for enteric viruses. The results have provided evidence that compliance with the California water reuse standard meets the desired objective of producing essentially virus free reclaimed water. This supports the observation that no detectable viral hazard has been found associated with current water reuse programs in California. These data also provide additional evidence that current water reuse programs in California can be expanded with reasonable assurances that viruses will not compromise public health.



"Analysis of 10 Years of Virus Monitoring Data from Los Angeles County Treatment Plants Meeting California Wastewater Reclamation Criteria." By William A. Yanko, laboratory supervisor, microbiology, County Sanitation Districts of Los Angeles County, Whittier, California. *Water Environment Research*, May/June 1993.

GIS System Planned for Midwest City and County

The Sidwell Company (West Chicago, Illinois) and M. J. Harden Associates, Inc. (Kansas City, Missouri) have joined forces to provide a comprehensive geographic information system (GIS) for Polk County and the city of Des Moines, Iowa. This award follows a successful pilot project designed to provide an accurate cost/benefit analysis for full implementation, which is planned as a four-year project.

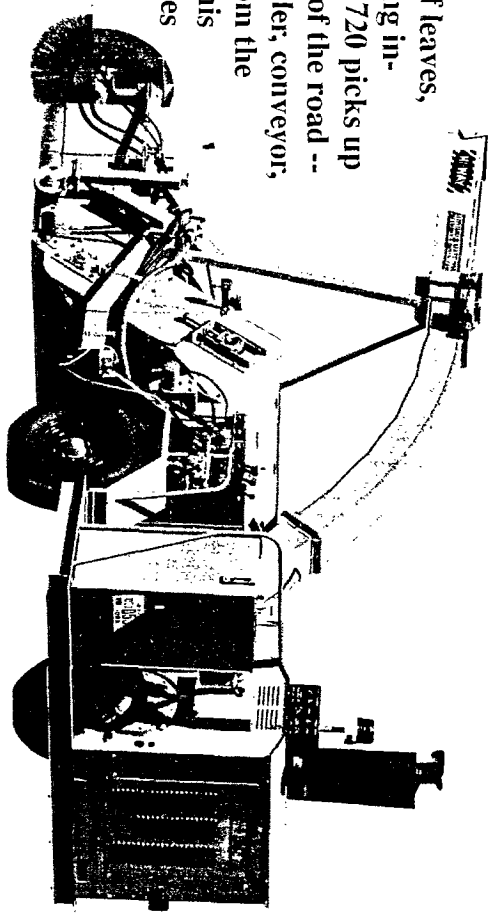
Services include conversion of cadastral data (property ownership mapping), sewer mapping of Des Moines, taxing and election district data conversion, boundary mapping (zoning, flood plain, etc.), planimetric compilation, aerial photography and orthophoto production, and other related geographic information services. All digital data will be developed and installed on Intergraph computer graphics equipment in the MGE environment. In addition to the conversion services, training and hardware development are also being provided.

Polk County and the city of Des Moines cover 582 square miles, comprising about 155,000 real estate parcels.

Consultant Awarded Bridge Repair Contract on Massachusetts Turnpike

The Massachusetts Turnpike Authority recently chose Maguire Group, Inc. (Foxborough, Massachusetts) to design the rehabilitation and renovation of ten bridges between exits 8 and 11-A, encompassing over 40 miles. The contract is part of a major project to repair 72 bridges on the turnpike between the New York state line and the terminus in downtown Boston. The rehabilitation designs will include complete deck replacement and other related structural repair on several of the bridges, all of which span the turnpike. Two of the bridges, Bancroft Street and Park Hill Avenue, need immediate repair. An accelerated design schedule has been set to repair these structures, with a design completion date of December 1993. Design work for the remaining bridges is slated for completion by 1996.

Interactive Software is Helping Cities Keep Water Clean



Twenty-four cities in the U.S. and Canada are using computer-based training to certify their wastewater system operators. The latest of three complementary training modules, the software features computer-guided text and high-resolution graphics to create an enjoyable, highly interactive exchange with the operator trainee. Operators are required to respond to questions and activities on environmentally sound wastewater operations. Each lesson ends with a 20-question quiz. Each volume also includes a 100-question certification-caliber examination that gives students a good feel for their test-passing ability. The training materials cross-reference California State University manuals, the generally-accepted standard for training information.

The software monitors and records a student's progress. A permanent record, including topic areas that require restudy, can be printed out. The Texas Water Commission has awarded each volume 20 hours of credit because of their documentation ability and the

The Ultimate Leaf Disposal Unit ...

That Is Turning The Industry On Its Side!

The Hi-Way AutumnMate 720 handles all kinds of leaves, from wet, hard packed to dry, fluffy, and everything in-between. The highly maneuverable AutumnMate 720 picks up leaves between parked vehicles and on either side of the road -- facing or moving with traffic. A unique brush, roller, conveyor, auger and impeller/blower system grabs leaves from the street and launches them into a towing vehicle. This system allows the AutumnMate 720 to mulch leaves into a compost pile-ready material -- a capability you'll want on your side!

course materials presented. The State of Georgia is also considering the software for training credit, says Austin, Texas-based Layton International, supplier of the software. A PC compatible computer with DOS 3.0 or later, hard disk, VGA monitor, and mouse are required to run the software. A demonstration disk is available from the company by calling (512) 251-0074.

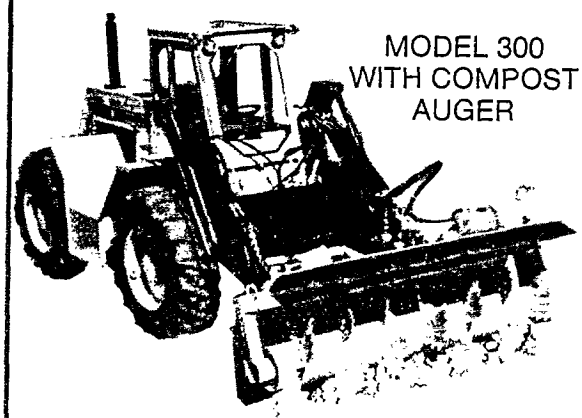
King County, Washington Implements County-Wide GIS System

King County, Washington is implementing a county-wide GIS system with ArcCAD software from Environmental Systems Research Institute, Inc., Redlands, California. The road maintenance and surface water divisions of the county's public works department are taking the lead in the project, which will be used to help the county meet the federally-mandated National Pollution Discharge System (NPDES) requirements. In addition to ArcCAD, the county will be using AutoCAD Release 12 and Trimble Navigation's Pathfinder Professional, a portable global positioning system. The system will include a Sun Sparcstation that will function as the server, networked together with high-powered 486-based PCs, linked with high speed dedicated data transmission lines. The GIS will support field investigation of water quality conditions and the artificial drainage network inventory data collection necessary to comply with NPDES permit requirements. The county-wide plan also includes the completion of a survey control densification project to provide a highly accurate control grid to support survey, road design, and capital improvement projects. As part of the NPDES permit requirements,

Major Metropolitan Transportation Commission Contract Awarded

The Metropolitan Transportation Commission, Oakland, California has chosen Colwell-Kirtland International (Sunnyvale, California) to undertake a major study to understand the issues affecting implmentation of automated vehicle location systems (AVLS) in the Bay Area. The study is a forerunner of the TravInfo project, a real-time traveler information system under consideration for the entire area. Colwell-Kirtland's study will include coordinating and interviewing all San Francisco Bay Area Transit organizations to determine each agency's experience with and acceptance of AVLS. The consultant will explore and review the future AVLS requirements of each transit organization to provide the Metropolitan Transportation Commission with a comprehensive analysis of AVLS needs and level of interagency cooperation.

Contract Operator Adds Four New Clients



Kingwood, Texas-based Operations Management International, Inc. (OMI) recently signed operations and maintenance contracts to operate facilities in Colorado, Texas, Hawaii, and Oregon.

- In Boulder, Colorado, OMI personnel have been onsite at the Marshall/Boulder Landfill since early April. The project's scope of services includes treating leachate from a closed landfill designated as a Superfund site. Among the challenges faced by the contract operator's three employees will be meeting strict discharge limitations and Resource Conservation and Recovery Act standards.
- In Lampasa, Texas, ten OMI employees are operating and maintaining the city's water and wastewater systems, including two wastewater treatment plants, five water storage facilities, and the collection and distribution systems. The project's scope of services also includes water and electric meter reading.
- Five OMI employees in Keauhou, Hawaii, are responsible for starting up and providing operations and maintenance services for a sequencing batch reactor wastewater treatment plant, five lift stations, and the collection system. The new facility is expected to come on line shortly and until that occurs, one employee is onsite performing "mothball" maintenance to ensure all equipment is in excellent condition upon startup.

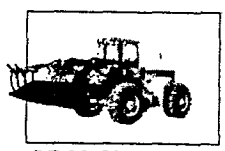
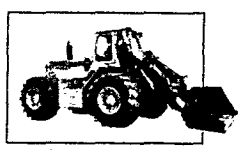
SIX MACHINES IN ONE

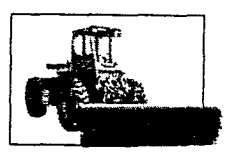


WITH THE BROWN BEAR PUBLIC WORKS MACHINE



MODEL 300 WITH COMPOST AUGER

Why buy a single purpose compost machine when the Brown Bear unit offers the versatility to stay busy 90% of the time for about the same money?



BROWN BEAR QUICK CHANGE ATTACHMENTS INCLUDE:

GRAPPLE FORK

BUCKET

BROOM

ANGLE DOZER

SNOWBLOWER AND MORE

MODEL 200 – 116 HP **MODEL 300 – 177 HP**

BROWN BEAR

Brown Bear Corp., Box 29, Corning, IA 50841 (515) 322-4220

POWER PRUNER

MODEL D

Call 1-800-243-9592 for a specification package/brochure and a free video introducing the insulated Power Pruner.

- **INSULATED**
- **GAS-POWERED**
- **PORTABLE**
- **PRODUCTIVE**
- **EASY-TO-USE**
- **SAFE**

Meets ANSI/OSHA Standards For Insulated Pruning Tools*

The insulated, portable Model D Power Pruner powered by a 24cc, two-cycle gasoline engine offers safety and productivity for utilities, municipalities, and tree care professionals trimming in and around high-voltage sources.

Pole saws and other manually/hydraulically driven trimming equipment can be eliminoted; productivity is increased; and safety is enhanced with the NEW insulated Power Pruner.

7 1/2-foot fiberglass shaft separates the 10-inch bar and chain (with automatic oiler) from the operator.

The lightweight, 15.9-pound unit provides hours of productive and safe tree trimming with a tough, low-maintenance power source.

ACCESSORIES AVAILABLE:

- CIRCLE SAW ACCESSORY
- EXTENSIONS — 5 feet and 2 1/2 feet
- HEDGER — hedge trimming attachment

Technic Tool Corporation
725 29th Street North • P.O. Box 1406
Lewiston, Idaho 83501
1-800-243-9592 • FAX: 208-746-0616

* Meets all test requirements: Technic Tool Corporation certifies that the housing and drive shaft of the Model D Power Pruner have been tested as a unit and found to withstand 100,000 volts per foot of length for five minutes. All new tools as shipped meet this standard. As long as any Model D Power Pruner is properly maintained and cleaned it will continue to meet this requirement.

R0013769

HOW MUCH ARE YOU REALLY PAYING FOR CHLORINE?

Denise Dolce
Chemical Manager

Q: Since chlorine chemical comes with differing percentages of available chlorine, how can you tell what you are actually paying for the chlorine you use for a wastewater disinfection?

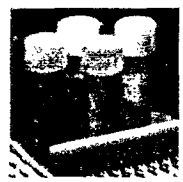
A: To compare accurately, you need to figure your cost per pound of chlorine. This can be achieved by dividing the cost per container by the percentage of available chlorine listed on the label.

Here's an example:

- Brand X Chlorine chemical contains 65% available chlorine (as most chlorine tablets do). For comparative purposes, suppose it costs $190 for a 100 pound drum, or $1.90 per pound.
- Sanuril 115 Chlorine tablets contain 70% minimum available chlorine. Suppose it costs $200 per 100 pound drum, or $2.00 per pound.

Although the Sanuril 115 costs more per pound, the question should be, "which one costs you less per pound of available chlorine?"

Brand X costs about $292 per hundred pounds of available chlorine ($190 ÷ .65).



SANURIL, with the higher concentration, would be only $285 per hundred pounds ($200 ÷ .70). In the above example, Brand X, which at first appears to cost less, actually ends up costing you about $7 more per one hundred pounds.

SANURIL 115 also contains two active ingredients for disinfection.

SANURIL provides greater strength, consistent delivery, longer regrowth control and less handling. SANURIL 115 is definitely a better value.

For more information, please call the Chemical Department at (713) 274-8444.

news of engineers

C. ADAM FISCHER was added to Shafer, Kline & Warren, P.A.'s staff for client development as a member of the market department.

STEVEN L. MARTIN was appointed hydrogeology group manager in Eder Associates Consulting Engineers, P.C.'s Madison, Wisconsin office.

Technomic Publishing Company, Program Division is offering six water quality and wastewater treatment courses November 16 to 18, 1993 in Washington, D.C. For more information write the company at 851 New Holland Avenue, Box 3535, Lancaster, Pennsylvania 17604, tel-(717) 291-5609, fax-(717) 295-4538.

Black & Veatch reorganized its environmental group into five divisions or strategic business units. Heading the groups are LEN RODMAN, managing partner, environmental division; JIM HIPPS, executive partner, environmental enterprises division; DR. JOHN R. STUKENBERG, senior partner, advanced environmental technologies division; ROLF STAMM, executive partner and president of BVI-Environmental, international activities; and PAUL MACROBERTS, executive partner and president of B&V Waste Science and Technology Corp., continues leading this unit.

Montgomery Watson named AGUSTIN E. MARISTANY manager of the firm's Water Resources Technology Center.

The American Society of Mechanical Engineers' Solid Waste Processing Division announced its 1994 scholarship program to encourage engineering students to enter careers in solid waste management. For more information or application forms contact Junius W. Stephenson, ASME Solid Waste Processing Division Scholarship Chairman, 38 Sunset Road, Demarest, New Jersey 07627, tel-(201) 767-1998.

SUSANNE M. BATCHELDER joined the King of Prussia, Pennsylvania office of Greiner, Inc. as a civil engineer. GEORGANNE K. SCOTT joined that office as an environmental specialist.

The Seventh Annual National Conference on Beach Preservation Technology will be held February 9 to 11, 1994 in Tampa, Florida. For information contact David Tait, Beach Technology '94, 864 E. Park Avenue, Tallahassee, Florida 32301; tel-(904) 222-7677, fax-(904) 561-1172.

CHARLES W. BALLINGER has opened the consulting engineering firm of Ballinger Consultants, P.C. The new firm is located at 19207 N. 33rd Drive, Phoenix, Arizona 85027, tel-(602) 516-0798, fax-(602) 516-8294.

WALTER B. SINNOTT was elected chairman of the board of Hazen and Sawyer Environmental Engineers and Scientists. Succeeding him as president is ROBERT E. HAGADORN. JERRY LASTIHENOS, senior vice president, was selected northeast regional manager.

The Engineering Foundation hosts numerous conferences on a variety of engineering subjects. For more information contact the Foundation at 345 East 47th Street, New York, New York 10017, tel-(212) 705-7836, fax-(212) 705-7441.

PETER L. PALMER, a senior engineer and vice president of Geraghty & Miller, Inc., has assumed the new position of vice president of engineering.

At the Wendel company, ANDREW C. REILLY, SCOTT F. SMITH, and TIMOTHY R. WOODBURY were promoted to associate principals.

The H2M Group—Holzmacher, McLendon and Murrell; H2M Associates, Inc.; H2M Labs, Inc.; and H2M Construction Management, Inc.—is celebrating its 60th anniversary this fall.

JOSEPH GLOWITZ, president, announced the formation of Point Services & Engineering, for engineering services, information systems, management consulting, mapping sciences, and geographic information systems. The firm is located at 649 Deer Lane, Point Roberts, Washington 98281, tel/fax-(206) 945-0950.

AWARDS: The Institute for the Advancement of Engineering accorded NICHOLAS L. PRESECAN, senior vice president of Engineering-Science, Inc., its Distinguished Engineering Achievement Award... The American Academy of Environmental Engineers awarded DR. PETER B. LEDERMAN, director, Center for Environmental Engineering & Science, New Jersey Institute of Technology, its Stanley E. Kappe Award; DR. CHARLES A. SORBER, Dean, School of Engineering, University of Pittsburgh, the Gordon Maskew Fair Award; and DUANE L. GEORGESON, assistant general manager, Metropolitan Water District of Southern California, the Edward J. Cleary Award.

The Geographic Resources Analysis Support System developed by the U.S. Army Construction Engineering Research Laboratories, received the 1993 Federal Laboratory Consortium Award for Excellence in Technology Transfer... ROBERT S. O'NEIL, president of Parsons De Leuw, Inc. was presented with the Guy Kelcey Award for career achievement in transportation planning and design from the American Road & Transportation Builders Association.

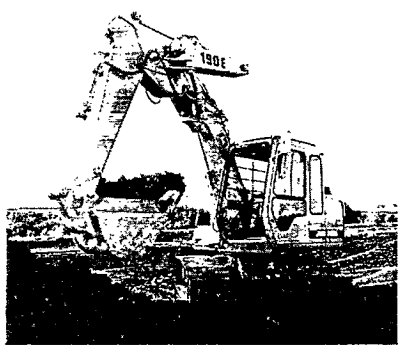
Fine Screens for Wastewater Grease Removal

Rotostrainer™ fine screens are designed to remove grease and scum at wastewater treatment plants, whether used before or after the clarifier. The Rotostrainer screen is a compact, automatic rotating wedgewire screen, available in a wide variety of screen openings. The rotating cylinder always presents a clean surface to the flow and prevents binding, even with heavy grease concentration. An automatic doctor blade scrapes the surface clean, and a spray bar cleans the surface when it is not in contact with the incoming flow. Solids and grease are captured on the screen's surface while water and other fine particles return to the process.

Hycor Corp., Lake Bluff, IL.

Circle No. **E-1** on the reply card.

Slip-In Distributor for Ice Control Liquids



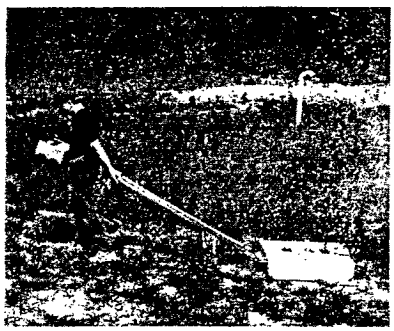
The Bear Cat "De-Icer" distributor for applying ice control liquids slips into a typical 5-cu yd end dump, using the truck's air system to pressurize the 1000-gal tank for spreading. A computerized rate control system regulates flow to maintain the desired spread rate (gallons per lane mile) at any travel speed from 2 to 20 mph. Spreading operations are controlled from the cab.

BearCat™ Mfg., Wickenburg, AZ.

Circle No. **E-2** on the reply card.

E-Series Excavator Line Is Expanded

Two new hydraulic excavators, the 190E and the 892E-LC, have been added to the E-Series excavator line. The 16,300-lb, 55-hp, 190E (pictured) replaces the 70D as the smallest excavator in this company's line. The 67,450-lb, 220-hp 892E-LC is a heavy-duty production excavator. Both feature operator-oriented cabs and Quadtronics, a special microprocessor-based engine and hydraulic control system. Seats are adjustable for operator weight and height, and seat-back inclination. The seat/console arrangement in the E-Series cab allows the operator to move farther forward in the cab, allowing excellent sight lines into trenches when working in close to the machine.

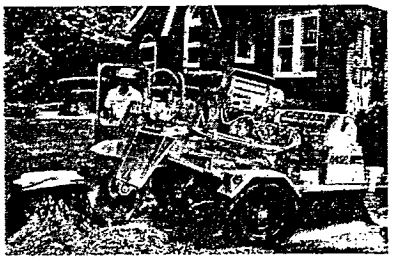


Deere & Co., Moline, IL.

Circle No. **E-3** on the reply card.

Ground-Penetrating Radar System is Portable

The new SIR® System 2 is a high-performance, portable, semi-automatic ground-penetrating radar system that makes subsurface surveys easier and less expensive. The system enables engineers, public works departments, utility crews, and contractors to:



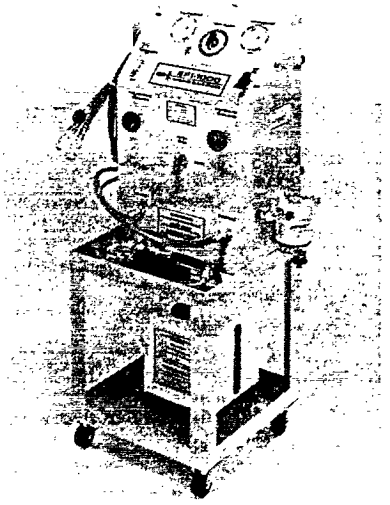
- Pinpoint conduit and wiring within walls when removing buildings.
- Test the integrity of structures ranging from bridges and buildings to buried gas mains and water pipes.
- Locate underground utilities, underground storage tanks, buried hazardous materials, and other subsurface natural phenomena and man-made objects without excavation.

The SIR System-2 can be carried by one person, is powered by a belt-pack battery, and requires less training and experience than previous SIR systems. Its control unit weighs less than 15 lb. Operation is semi-automatic. The operator must only search one parameter: range. The system comes with instructional videotape and a user's manual.

Geophysical Survey Systems, Inc., North Salem, NH.

Circle No. **E-4** on the reply card.

R0013777



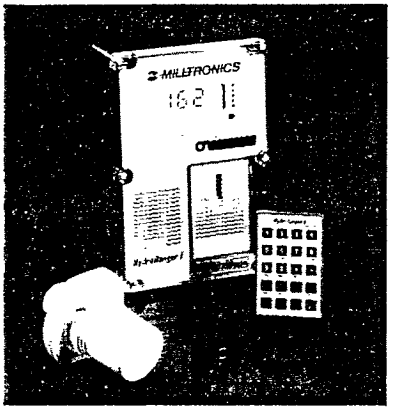
State-of-the-Art Stump Cutter

This stump cutter features a 68-hp diesel engine mounted on shock-absorbing rubber isolator pads for less vibration and a hydrostatic drive system to power the cutter wheel, enabling the operator to increase or decrease the cutting wheel rpm's, depending on soil conditions, independently of the engine rpm's. The RG 1665 AC Diesel stump cutter is compact for maneuvering into tight areas. With a working weight of just over 3000 lb, it tows safely behind a compact size truck.

Rayco® Mfg., Inc., Wooster, OH.

Circle No. E-5 on the reply card.

Powerful Fuel Injector Cleaning System



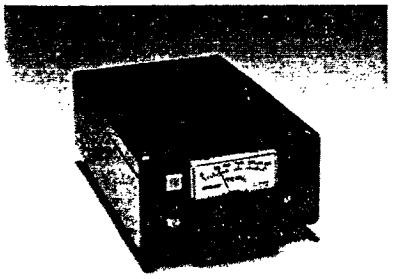
A significant cause of higher exhaust emissions and reduced fuel economy is dirty fuel injectors. The Model EFI-1000 cleaning machine cleans both EFI gasoline and diesel injectors while they are still in the engine by circulating a proprietary cleaning fluid, mixed with gasoline or diesel—as the case may be, through an engine operating at idle conditions for 15 to 25 minutes. The mixture removes carbon, gum, varnish, and other contaminants from the fuel injection system and related combustion surfaces. The system runs on compressed air, with a 12-volt compressor optionally available for use where compressed air is unobtainable.

Injector Clean Systems Inc., Baldwin Park, CA.

Circle No. E-6 on the reply card.

Ultrasonic Level and Flow Measurement System

The new HydroRanger I is a non-contacting, ultrasonic level and flow measurement system designed specifically for the wastewater industry. It is effective on applications from tank level measurement to complete lift station control. The HydroRanger I has an operating range of 30 ft and an accuracy of Ë0.25 percent. Built-in, multiple function relays can control up to five pumps.

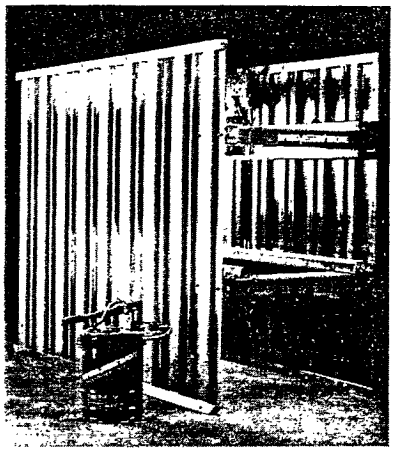


Milltronics Inc., Arlington, TX.

Circle No. E-7 on the reply card.

Portable Carbon Dioxide Detector

The Model CD-1300-P portable carbon dioxide detector uses an infrared sensor specific to CO_2. The instrument includes a built-in pump with detachable hose for remote sampling, dust filter, flow sensor, and 0-1 Vdc output. The analog meter has a standard range of 0 to 5000 ppm and option ranges available of 0 to 10, 0 to 20, and 0 to 100 percent by volume, with user adjustable high/low alarms.



ENMET Analytical Instruments, Ann Arbor, MI.

Circle No. E-8 on the reply card.

Trench Shield Line Gets New Feature

"Speed Struts" have been added to the popular Shoring Shield line. Speed Struts incorporate hydraulic cylinders and return springs within rectangular telescoping steel spreaders to allow for 3- and 4-sided trench support, while providing increased protection to critical components. Quick-connect fittings facilitate speedy hand assembly/disassembly and allow for transport in a light-duty truck. A special hydraulic manifold enables independent strut control to accommodate irregular, non-uniform excavations.

Speed Shore™ Corp., Houston, TX.

Circle No. E-9 on the reply card.

Decanter Centrifuge for Dewatering Sludge

The Noxon centrifuge dewaters municipal or industrial sludge to up to 40 percent dry solids. Its microprocessor-based control system continuously adjusts the differential speed between the bowl and scroll to maximize the dry solids content of the output sludge cake. This precise control is fully automated and minimizes polymer use. The compact system starts and stops automatically according to process requirements and in response to emergency situations.

Purac Engineering, Inc., Wilmington, DE.

Circle No. E-10 on the reply card.

Eccentric Plug Valves for Water/Wastewater Treatment

The 120 Series eccentric plug valves for water and wastewater applications are available in 11/2- to 60-in. diameters in screwed, flanged, and mechanical joint end configurations. The 120 Series features rectangular ports, 90 percent pure nickel raised seat, stainless steel bearings, and adjustable V-ring packing. A variety of actuators are offered.

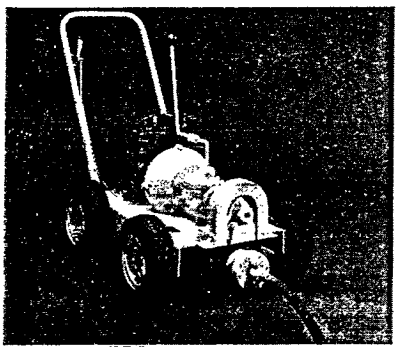
Homestead® Valve Co., Allentown, PA.

Circle No. E-11 on the reply card.

R0013778

Redesigned Wheel Loader, Integrated Toolcarrier

The improved 910F wheel loader (pictured) and the IT12F integrated toolcarrier replace the 910E wheel loader and the IT12B toolcarrier, respectively. Both machines are powered by a fuel injected, turbocharged 80-hp diesel engine. The transmission is electronically controlled with four forward and three reverse speeds and on-the-go shifting for greater operating efficiency and productivity. Autoshift transmission control with kickdown switch is offered on both machines. The units' oil-disc brakes are adjustment free, fully enclosed, and sealed from contaminants.

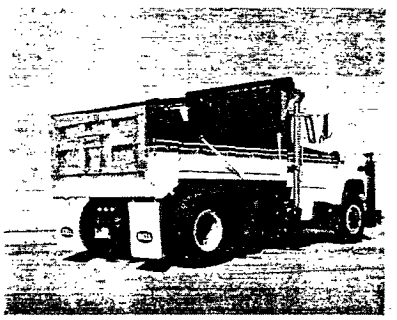


Caterpillar® Inc., Peoria, IL.

Circle No. E-12 on the reply card.

Sewer Cleaning Machine Only Needs Crew of One

The Model 325 sewer and industrial pipeline cleaner is engineered to thoroughly clean 4 to 14 in. diameter pipelines for distances up to 500 ft. It can be operated by one person and requires no handling of the rotating, heavy-duty dual cable. Features include 5-hp, 4-cycle gasoline engine; 3-speed forward and reverse transmission; and an automotive clutch to assure smooth and efficient transfer of power from the engine to the transmission. A trailer with tool box, loading ramps, and cable reel is optional.

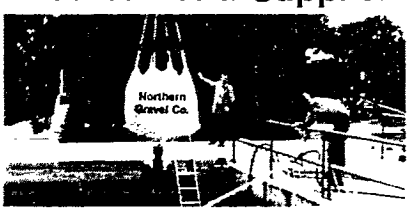


Electric Eel Mfg. Co., Inc., Springfield, OH.

Circle No. E-13 on the reply card.

New Dump Body Design Called Revolutionary

Described as a revolution in dump body design, the Sidewinder™ provides highly functional delivery at only 78 in. above the chassis frame in the side dump position. This allows the driver to spread or dump a wide variety of materials without having to pause for low-clearance obstacles such as bridges, trees, or power lines. Features include Cor-Ten® steel, heavy-duty box-braced tailgate, and continuous, 100 percent welding on the body. With the standard side-mount spinner, the Sidewinder throws sand, salt, etc., up to 25 ft with continuous feed from the dump body.



Heil® Co., Chattanooga, TN.

Circle No. E-14 on the reply card.

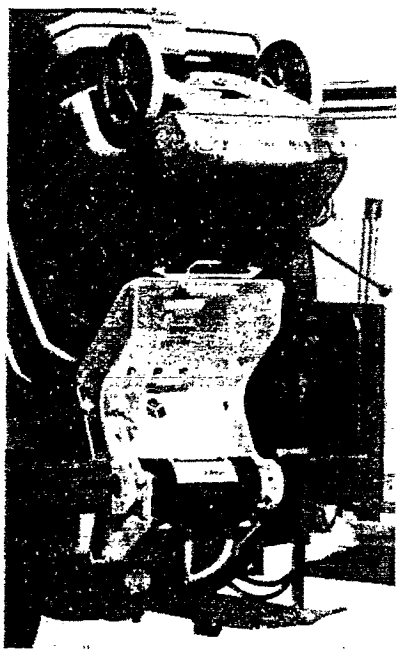
Manhole Lifting Device Promotes Back Safety



These casting pullers are back saving devices for removing or setting castings in place for new construction and structural maintenance. Lightweight and portable, they feature all-steel construction and tough powder coating in OSHA-approved safety yellow. They attach to backhoes, loaders, or truck cranes. Three models available to fit all circular and square castings.

Grappler™ Specialty Products, Eden Prairie, MN.

New Static Rollers Offer Innovative Design

The 700-Series line of static tandem rollers consists of the Model 708 (5 to 8 ton), Model 710 (8 to 10.5 ton), the Model 712 (8 to 12 ton), and the Model 714 (10 to 14 ton). The special design of these rollers gives the operator excellent visibility to the rolls from either side, allowing the operator to clearly see the position of the roll, especially when working near curbs or obstructions. The 700-Series machines also offer excellent visibility to the top of both rolls, including the spray nozzles. Because these rollers were designed with minimum frame overhang and smooth streamlined sides, they can work very close to walls or obstructions, reducing the need for hand tamping. Other features include 180-gal polyethylene water tank with automatic flow control, all-brass spray bars with quick-disconnect brass spray nozzles, and externally-mounted water pump for easy servicing.

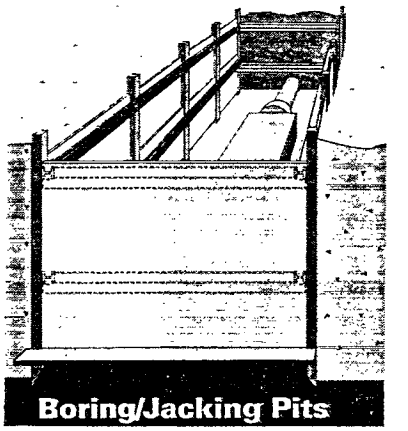
Interesting New Program For Water Utilities



Schlumberger Industries announces the Direct Utility Licensee Program, which offers the utility unlimited rights to acquire third-party reading equipment to read Schlumberger ARB® V and ProRead™ ARB® encoder meters. The company says it recognizes and supports the utility's need to have multiple vendor options for reading systems. The license is issued to requesting utilities at no cost. Technical information or assistance is available for a fee to utility designated vendors. The company says its product development strategy ensures that its systems are open and flexible. For more information on the Direct Utility Licensee Program contact Tim Jeffcoat at 1-800-633-8754 or circle the appropriate reply number on the reader service card.

Schlumberger Industries, Tallassee, AL.

Shoring System Boasts Double Slide Rails

The SBH double slide rail system is a close lining system in which the lining plates are driven by force. The system is installed by the excavator during the excavation work

using the cut and lower method. This means that excavation and support are one operation, the excavator will be fully utilized, and time and labor needs will be reduced. The SBH double slide rail system offers the advantage of greater safe working loads together with ease of installation.

Protective Coating for Treatment Plants

Interthane 990 H.S. is a polyurethane, low VOC, high-solids protective coating for use in aggressive environments such as water treatment plants and storage tank exteriors. It exhibits excellent single-coat hiding and appearance in most colors. Other characteristics of high-gloss Interthane 990 H.S. include high abrasion and impact resistance and strong adhesion. Application by brush, roller, or spray.

Lease-Purchase Plan For Street Sweepers

With today's tight budgets and cash flow demands, municipalities everywhere are looking for creative and more flexible ways to acquire needed capital equipment. One way is this firm's flexible lease-purchase plan, which allows participants to acquire efficient new street sweeping equipment on convenient payment terms. This arrangement combines the debt-free financing benefits of leasing with an innovative lease-to-own concept. As with a lease, the needed new street sweeping equipment is acquired with little or no money down. Payments are structured monthly, quarterly, semi-annually, or annually to best suit cash flow schedules. Unlike a lease, however, equity is accumulated with each payment. Customers own the equipment free and clear upon final payment with no buy-back or other special requirements.

Elgin Sweeper Co., Elgin, IL.

Circle No. E-24 on the reply card.

Fiberglass Grating for Treatment Facilities

The Corvex line of economical fiberglass grating is especially suited for water and wastewater treatment facilities. Durable and corrosion resistant to both acids and caustics, Corvex provides a slip-free surface, low flame spread, and non-conductivity for worker safety. It is available in various panel sizes and thicknesses.

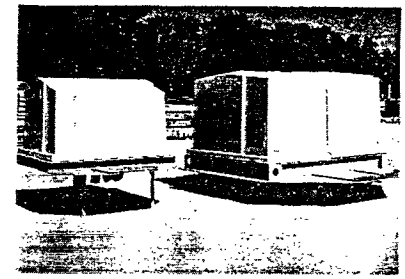
High Performance Notebook PC



The NP933 Notebook PC provides long battery life and various plug-in options such as Fax/modem, scanner pack, Ethernet pack, IBM 3270 emulation pack, extra serial port, voice-mail pack, SCSI interface pack, and 12-volt car battery adapter. Optional packs are added by removing one of the dual battery packs, and operating off a single battery. The high-contrast 10-in. black-on-white LCD screen has a 640 x 480 pixel resolution and can display 64 levels of gray scale. System RAM is expandable to either 4, 6, or 8 megabytes using ZIP memory modules. In addition to the 1.44-MB 3 /12-in. floppy disk drive and the standard 80-MB hard disk, an optional 120-MB hard disk drive is offered. Special ports are included for an external VGA monitor and an external floppy disk drive.

Micro Express, Santa Ana, CA.

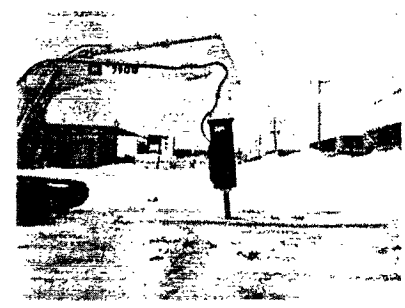
New Wet Well Mounted Pump Station



The wet well mounted pump station shown on the right is the new Model 8D4D, and doubles the flow capacity of the standard model pictured on the left. With an 8-in. pump, the Model 8D4D can accommodate over 2400 gpm. The station successfully pumps wastewater by drawing liquid up through a suction pipe to a centrifugal pump, pumping out through the discharge pipe, check valve, and plug valve into the force main. The new model's main distinctions are its special ability to double past flow rate capacities without affecting its high efficiency and low horsepower requirements.

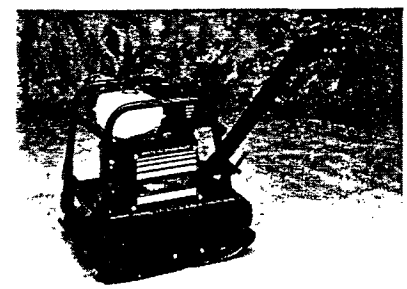
New Low Oil Sensor For Engines



The ED0505 oil level sensor accurately measures lube oil levels in engine crankcases. It can be used both on main power units and auxiliary equipment engines such as heater, compressor, or refrigeration engines. Used as standard equipment by some truck and bus manufacturers, it can be retrofitted to most engines. The sensor has a built-in 0.5-amp switch that can trigger a warning light or alarm. It can also be used as an ignition lockout in the event of low oil level before engine start-up. Sensors with variable output to indicate level range are available for use with gauges, monitors, or computer control systems.

Power Plus Corp., San Marcos, CA.

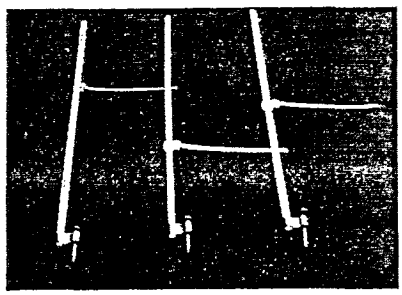
Versatile Trench Box

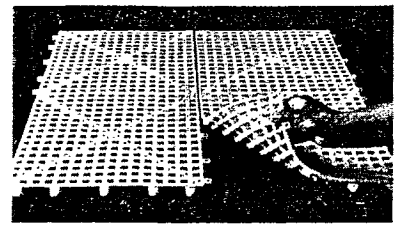


The Shorlite Shield is designed with an ultra narrow 2½-in. wall trench shield made of durable steel with the lightness and flexibility of aluminum. It is designed to work as a system box that can be stacked, hooked in-tandem, and leap frogged. The Shorlite Shield's center is made up of aluminum panels while the outside is wrapped in a steel barrier to give it durability. All-steel end tubes are part of the barrier, giving extra strong support to the ends of the box, where most of the driving force will be applied.

Kundel Industries, Warren, OH.

Circle No. E-37 on the reply card.

Stake Saves on Road Construction Costs



The Flexeon staking system was developed for accurate placing of base rock and treated base materials. When the stake is used it prevents costly overruns during the placement of base rock in confined areas such as streets and parking lots. It eliminates constant grade checking and digging for hubs. When placed on the subgrade hub, the stake has a neon horizontal marker that marks the finished rock grade without survey crews setting new grades. It is also used to mark utility access covers when placing base rock. The highly visible, durable, and reusable Flexeon stake springs back to original position when hit by a blade or other equipment. Three neon colors are offered: red, green, or orange. Standard length is 16 in. with other sizes available.

Court Construes Bid Bond Guarantee Provision

In 1989, the city of North Las Vegas, Nevada solicited bids for a public works project involving the city jail. The city required all bidders to post a bond in the amount of 5 percent of their bid price and further, upon delivery of the executed contract with the city, to furnish performance, payment and guarantee bonds.

The bid provision also provided that the contractor would forfeit the bid guarantee deposit if it did not enter into a contract within 10 days after notice of acceptance of the bid. The plaintiff duly tendered a deposit of 5 percent of its bid in 1989, but refused to pay for the performance bond, and therefore the city refused to execute a written contract. The city then retained the plaintiff's bid bond and awarded the contract to the next lowest bidder.

The plaintiff brought an action for breach of contract and restitution of its bid bond. The city counterclaimed for breach of contract and requested damages of an amount between the appellant's bid and the next lowest bid. The trial court awarded the city the damages requested, offset by the amount of the bid bond that it had retained. The appellate court was forced to construe the bid deposit provisions of the contract to determine whether the provisions should be construed as a liquidated damages provision, or a penalty provision, which would have allowed the city to obtain the additional damages it requested.

The court at *American Fire vs. City of North Las Vegas*, 849 P.2d. 352 (1993) ruled partially in favor of both parties. The court held that the contract provision was ambiguous as to whether it was intended as liquidated damages, or a penal bond. The court reviewed legislation and case law in other jurisdictions, which were not consistent in their characterization.

However, the court felt that the provision, being ambiguous, would need to be construed against the city, since it had drafted the agreement. The court also noted that the legislature had not expressly characterized bid bonds one way or the other. Therefore, the court construed the provision against the city, and held it was restricted to 5 percent as liquidated damages, and could not recover the additional penalty.

Statutory Waiver of Immunity Section Construed

Próperty owners in Albuquerque, New Mexico filed a complaint alleging property damage and personal injury caused by flooding on their property by water that came from a city arroyo. The city moved for summary judgment at the trial level on the ground that it was immune from liability under the New Mexico Tort Claims Act, NMSA 1978 § 41-4-1 through 41-4-29. The appellate court was forced to construe a very complex statute to decide whether the storm drainage system was a part of a "water utility" for purposes of statutory immunity, and whether the intent of the statute was to encompass water runoff as opposed to toxic waste water.

The court at *Espander vs. city of Albuquerque*, 849 P.2d 384 (1993), initially decided that several sections of the statute did not intend to waive statutory immunity. One section of the statute, § 41-4-6, dealt with negligence of public employees on certain public property such as public parks and public buildings. The court ruled that this section did not waive statutory immunity.

Secondly, the court decided that a subsequent section, § 41-4-8, which dealt with the discharge or release of substances such as toxic liquids or gases and waste materials, was also not meant to apply to normal water runoff, as opposed to toxic water discharge. Further, another section dealing with waiver of immunity for damages arising out of operation or maintenance of works used for diversion or storage of water, did not apply for the same reason.

However, the court found liability under a prior case in the State of New Mexico that held that water runoff was a form of liquid waste and that works for the collection and diversion of runoff water were part of a public utility or service within the ambit of § 41-4-8(a), supra. Therefore, the court remanded the case back to the trial court for disposition.

Court Declares Set-Aside Programs Unconstitutional

A Washington D.C. construction company brought an action seeking a declaration that certain minority and disadvantaged business set-aside programs enacted by the District of Columbia were unconstitutional. The District of Columbia had enacted the District Minority Contracting Act in March 1977, to set goals for the participation of minority business enterprises in the awarding of public construction contracts (D.C. Code § 1-1141). The plaintiff claimed that this program violated 42 U.S.C. § 1981 and 1983. The act provided that each agency and department of the district should allocate construction contracts in order to reach a goal of 35 percent of dollar volume of such contracts to be let to local disadvantaged business enterprises.

The district claimed that it was required to comply with certain federal statutes as a condition of receiving federal funding on state highway construction projects. Further, the district argued that a prior federal statute required each recipient of federal aid to make reasonable efforts to award at least 10 percent of those funds to certain economically and socially disadvantaged individuals. Various codes of federal regulations sections required that the governmental unit set goals for such contractor participation in public works contracts. The District of Columbia enacted the Department of Public Works Disadvantaged Business Program (DBE) in 1988 to implement such regulations. The DPW had set an overall goal of awarding 37 percent of federally funded contracts to qualified DBEs.

The court at *O'Donnell Construction Company vs. District of Columbia*, 815 F.Supp. 473 (D.C.C. 1992) ruled that the District of Columbia Minority Contracting Act was unconstitutional as it sought to implement the federal statutes. The court considered the act invalid because it relied on general allegations of discrimination in the construction industry, and contained geographic limitations that were overbroad and not sufficiently limited in duration. The court found the record devoid of evidence that any agencies had disfavored minority contractors over white contractors, or that the bid process was rigged to have any such effect.

It ruled that the district failed to show a prima facie case of overt racial discrimination in the industry and that the statute that was not sufficiently narrowly tailored to achieve specific ends. The court felt that this statute did not pass constitutional muster in this regard. The court was concerned that the ratio of minority participation was much higher than the standards set by Congress under the 1987 statute and was itself a form of reverse discrimination.

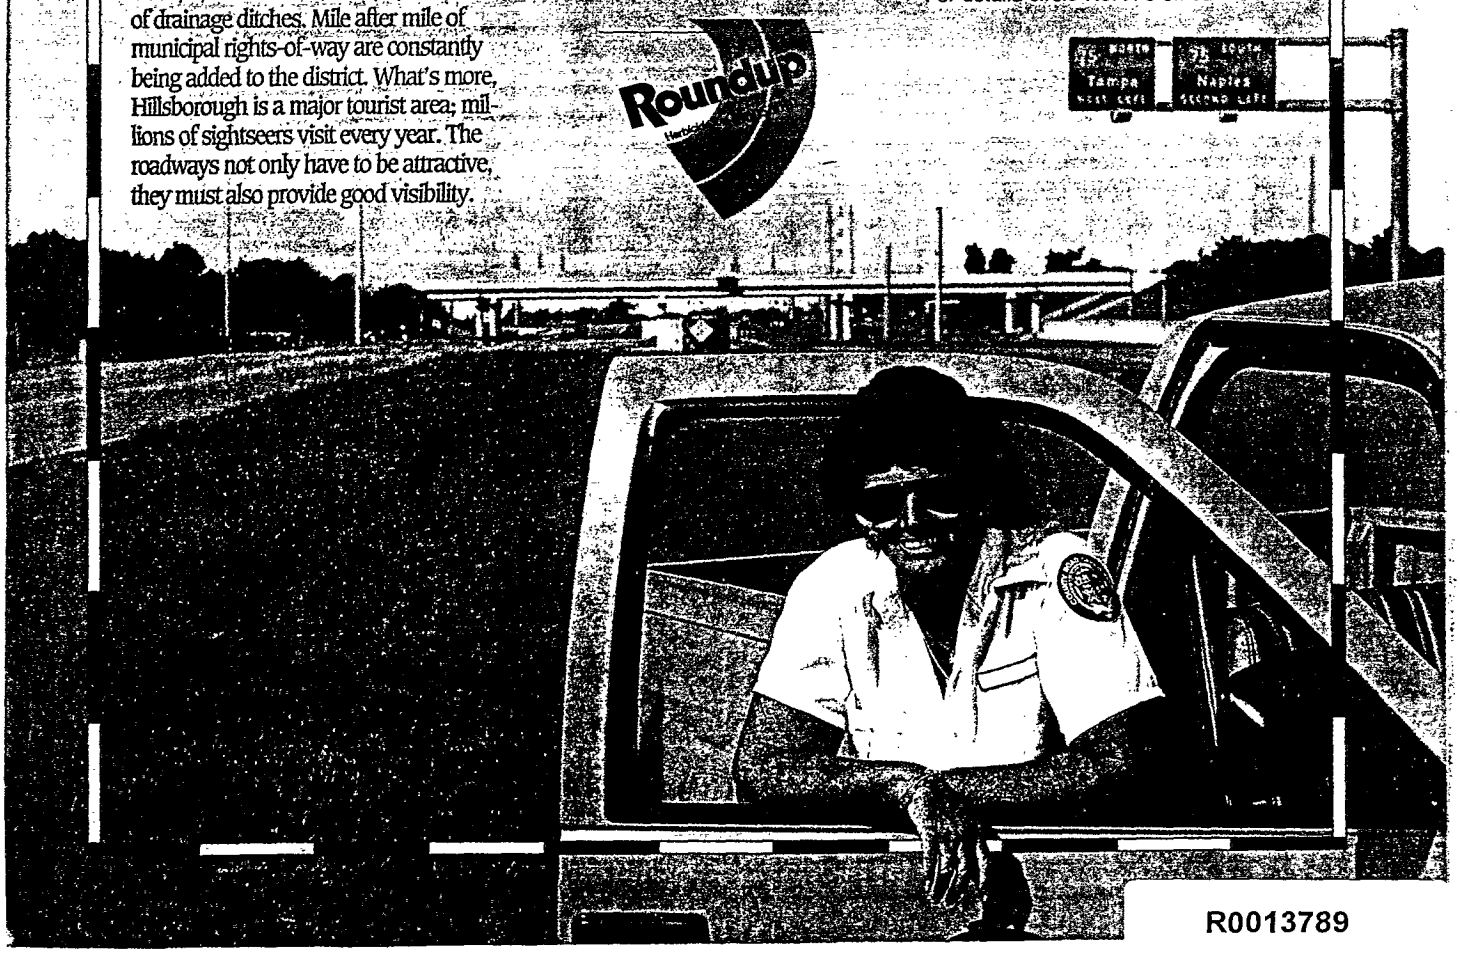
How to mow 10,000 acres

It's good to get an early start—say, around 6:30 a.m. And it doesn't hurt to have plenty of technical skill, or the kind of honest, polite demeanor that motivates a work crew. A commitment to quality, customer satisfaction and environmentalism is also a plus. But even with all of this going for her, Wanda Davis—vegetation team leader for Hillsborough County, Florida—still needs help to maintain her 10,000 acres of roadside right-of-way.

Part of the challenge is Hillsborough's subtropical climate. Vegetation has a field day. Some species grow as much as ten feet a year. And the weeds—smutgrass, paragrass, ragweed, broomsedge—look even worse than they sound.

Then there's Tampa's suburban sprawl to worry about: new subdivisions, 2,272 miles of roads, 2,200 miles of drainage ditches. Mile after mile of municipal rights-of-way are constantly being added to the district. What's more, Hillsborough is a major tourist area; millions of sightseers visit every year. The roadways not only have to be attractive, they must also provide good visibility.

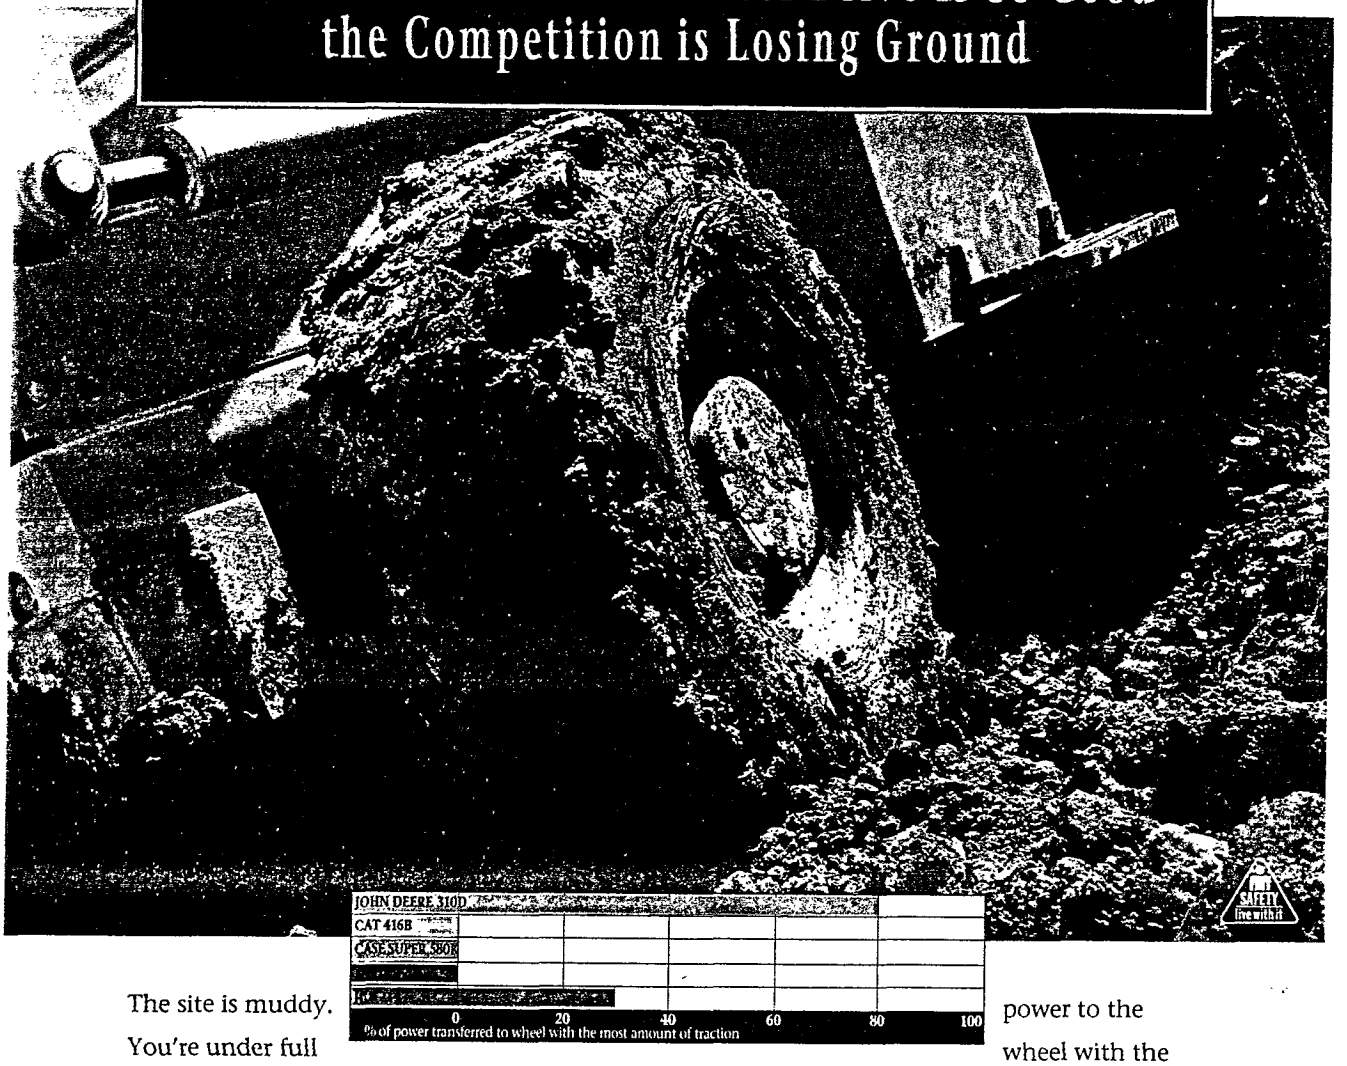
So where does Wanda turn for help to solve all these problems? Roundup® herbicide, from Monsanto. "Given what we have to accomplish, the growth rates we have down here, we could mow year-round and never get the job done. Herbicides make our roadside vegetation management program possible."



Her crews spray Roundup to control the large weeds and brush that invade road shoulders. They also use it to dust the nastier grasses, as well as to control brush and trim around guardrails, signs and mailboxes. Wanda says these treatments significantly speed up mowing. "We can run our mowers in third gear once we get the brush and trimming out of the way. And by mowing faster, we save fuel and man-hours."

So Roundup helps Wanda cut material and labor costs. (Material costs were further reduced when the price of Roundup itself was lowered.) And it has the same active ingredient as the herbicides homeowners use on their own lawns. In fact, in many ways, Roundup is actually better for the environment than mowing. Wanda notes that mowing is particularly hard on the wildlife that hides in vegetation.

The many benefits of Roundup are appreciated by the road maintenance crews, Wanda's supervisors—and the public, Wanda says. "When you let the public know what you're doing, why you're doing it, what you're accomplishing, you won't have problems with public opinion. We've taken a proactive approach with folks, and they've responded by supporting our program."



Thanks to a combination of the right people, equipment, materials—and Wanda—Hillsborough has an effective vegetation management program. Roundup is a key part of that program.

Our Mechanical Front-Wheel Drive is So Good the Competition is Losing Ground

The site is muddy. You're under full load. And a front wheel is spinning. So much for your mechanical front-wheel drive!

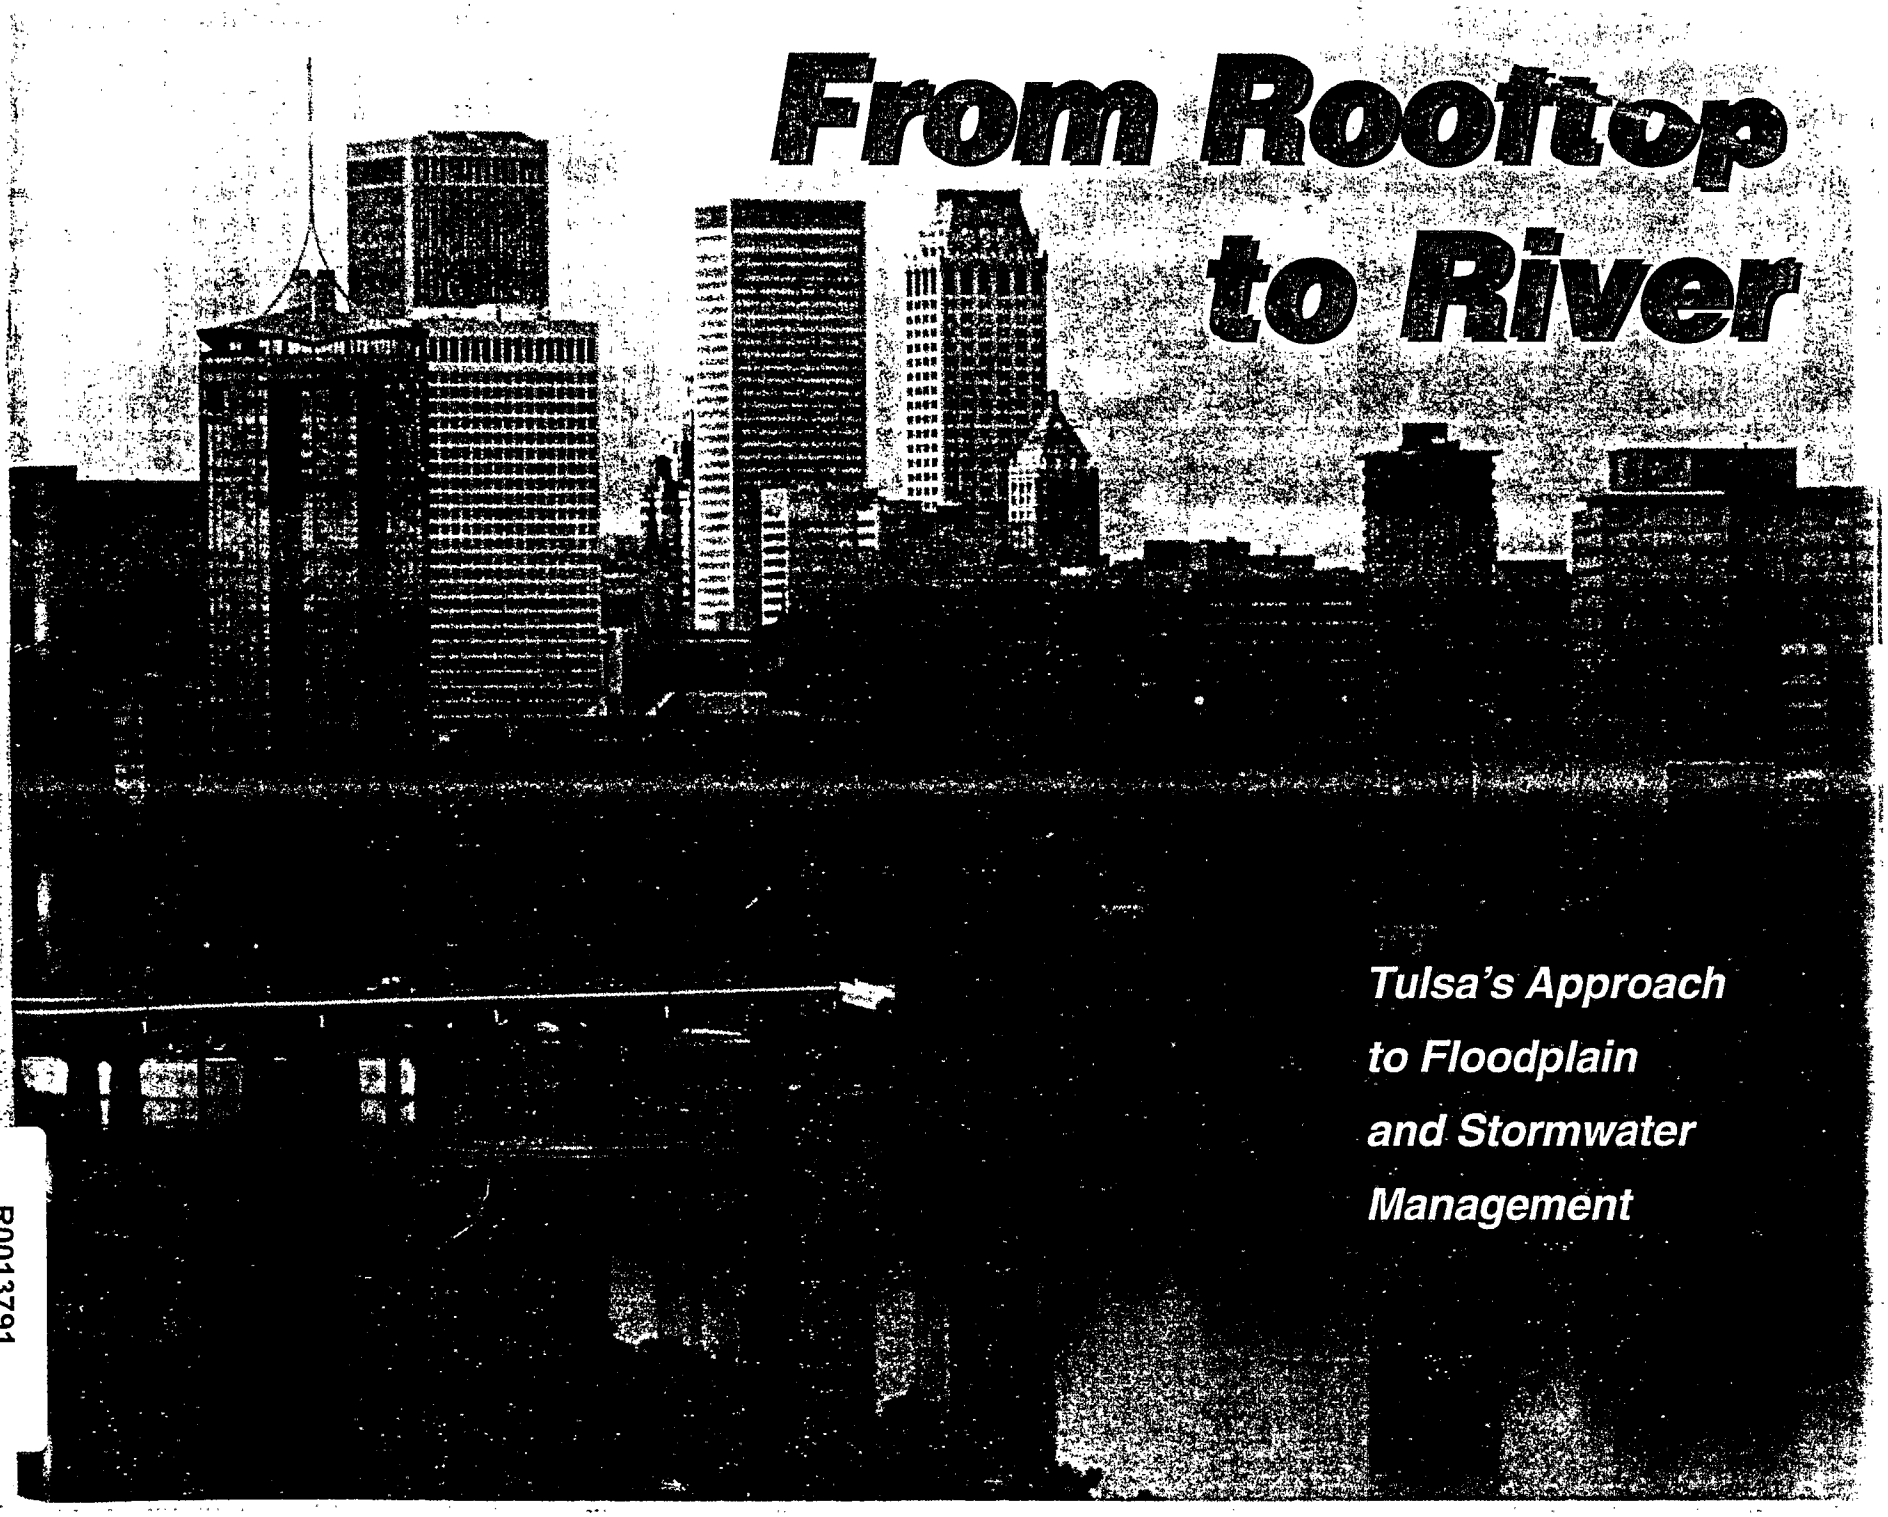
The Slipping Competition

According to a recent study, when mechanical front-wheel drive is engaged on most backhoes, power is transferred equally to each front wheel. If one wheel has no traction, all of the power goes to that spinning wheel. And you're stuck.

The True 4-Wheel-Drive Machine

Mechanical front-wheel drive is worthless if the wheel that is spinning-out gets all of the power. That's why John Deere uses mechanical front-wheel drive with a limited slip differential.

It automatically transfers 80 percent of the machine's power to the wheel with the most traction. This pulls you through the muddiest spots.



Tired of your machine slipping on the job? Get on firm footing. Order your John Deere D-Series Backhoe Loader with mechanical front-wheel-drive and get the benefits of four-wheel-drive performance. Call your dealer for a free limited slip differential demonstration today.

R0013794

Foreword: *Becoming Floodsafe*

Tulsa, Oklahoma, has been called America's most American city, because the age, race, income, and attitudes of our citizens reflect the United States as a whole. We're a test market for new products; if it works in Tulsa, it has a good chance of working elsewhere.

Tulsa's flooding problems also mirror many other towns. Our community was founded a hundred years ago on a major river and has a long history of floods, compounded by post-war growth, floodplain development, and frequent rainstorms.

By the 1980s, Tulsa's flooding had reached singular proportions. The federal government had declared Tulsa County a flood disaster area nine times in 15 years, more than any other community in the nation. Each flood was worse than the one before.

The most devastating flood in our history hit in the mid-night hours of Memorial Day 1984. Our City responded to the shock of this killer flash flood with community-wide commitment to end our recurring disasters. Determined leaders crafted a unified program to curb flood losses.

Today, Tulsa's floodplain and stormwater program is based on respect for the natural systems. It includes comprehensive watershed management, dedicated funds for maintenance and operation, a prototype alert system, and a $200 million capital improvements program.

This program is more than flood control. We're building parks in the floodplains, sports fields in stormwater detention basins, and greenway trails on creekbanks.

We are forging strong partnerships with federal and state agencies.

And we've stopped creating new problems. Since the City adopted comprehensive drainage regulations 15 years ago, we have no record of flooding in any structure built in accord with those regulations.

Because the federal government gave our program its highest ranking, Tulsans enjoy the lowest flood insurance rates in the country. We are reaping benefits from national awards and favorable publicity.

We're still building our program, and we're still learning. We know our location in "tornado alley" guarantees that Tulsa will flood again, and we're working to prepare for that inevitability. But, without question, we've come a long way. Tulsa's progress has been called an example of what can happen when a community fully commits to solving urban problems.

Like many other U.S. communities, our experience didn't come easily. This booklet has been prepared in the hope that others may benefit from Tulsa's costly lessons on our long and continuing journey toward becoming floodsafe.

M. Susan Savage
Mayor, City of Tulsa

May 1994

R0013795

Dedication: *Leadership and Courage*

This report is dedicated to two gifted leaders in the field of floodplain and stormwater management — one national and one local. Both helped Tulsa develop its program. Both epitomize the many pioneers whose contributions leave the city and the nation immeasurably enriched.

Gilbert Fowler White is the father of modern floodplain management. Mentor to many, Dr. White exemplifies the many national experts who have generously shared their vision, wisdom, and support with Tulsa. Gilbert White's sphere is global; but for 20 years, he has also been Tulsa's friend.

Joseph Davis Metcalfe led Tulsa's program during its formative years after the 1984 flood. A professional engineer and industrialist, J.D. Metcalfe has spearheaded community-improvement coalitions for decades and served as the city's elected street commissioner between 1984 and 1990. He is a patron for progress.

R0013796

Preface: *Lessons Learned*

As Tulsa's stormwater and floodplain management program evolved over many years, we learned from others, from our mistakes, and from our successes. The following are a few of the many lessons we have learned:

- Strong partnerships are essential; but local communities must accept responsibility and not expect the state or federal governments to solve all their flooding problems.
- Watersheds and drainage systems are interconnected units. Effective management demands drainage basins to be planned as integral units.
- The National Flood Insurance Program was instrumental in leading our community into floodplain management. But NFIP regulations do not take into account future watershed urbanization and the resulting increase in flood depths. Tulsa's program is based on total basin urbanization.
- In an urban area such as Tulsa, stormwater and flood programs should include multiple objectives, including recreation and environmental quality, and multiple techniques, including structural and nonstructural projects.
- Mitigation and flood-loss reduction should become the central focus of flood recovery efforts. Re-establishment of the pre-flood status quo only sets the stage for future disasters and losses.
- Pre-flood contingency and mitigation planning is the next local, state, and federal priority. We must plan in advance for our actions during and after the next floods – and there will be future floods, in Tulsa and elsewhere.

If this booklet helps us share our experiences with others, and if our lessons prove useful, it will have served its purpose well.

Charles L. Hardt, P.E.
City of Tulsa Public Works Director
and Chief Operations Officer

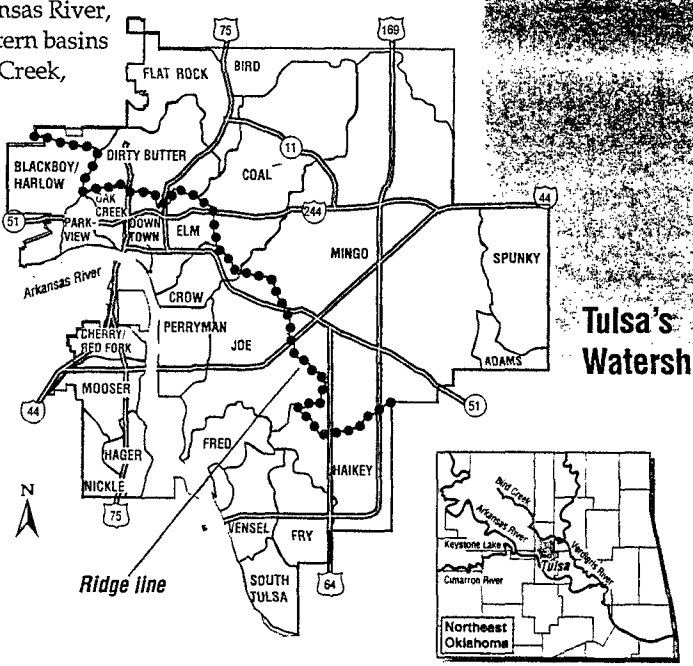
◀ Floods haunt Tulsa history. Left: circa 1943.

Setting and History

Learning the Hard Way

Tulsa is a crossroads Midwest community with a long history of flooding that mirrors, in many respects, the nation as a whole.



The city has 375,000 people and extends across 200 square miles of gently rolling terrain in northeastern Oklahoma's Osage Hills. The area is one of transition between the Ozark mountains to the east and the Great Plains to the west.

Tulsa is set on the Arkansas River, which rises in the Rocky Mountains and gathers across the Great Plains of Colorado, Kansas, and Oklahoma, thence to the Mississippi.

A ridge line divides the city. Southwestern creeks flow into the Arkansas River, and northeastern basins drain to Bird Creek, then to the Verdigris River east of Tulsa.

The fundamental lesson that nature teaches and will repeat patiently for the slow learner, is that the rivers and creeks own the floodplains.

—Jim Sellars

Tulsa's Watersheds

R0013799

When a cool front meanders south to break a warm weather pattern, the results can be awesome. Occasionally, a cool front slows to a near-halt during a hot afternoon, and the moisture piled high above the city condenses into pounding thunderstorms. Creeks and streams swell rapidly as stormwater seeks out its natural course. Floods soon follow.

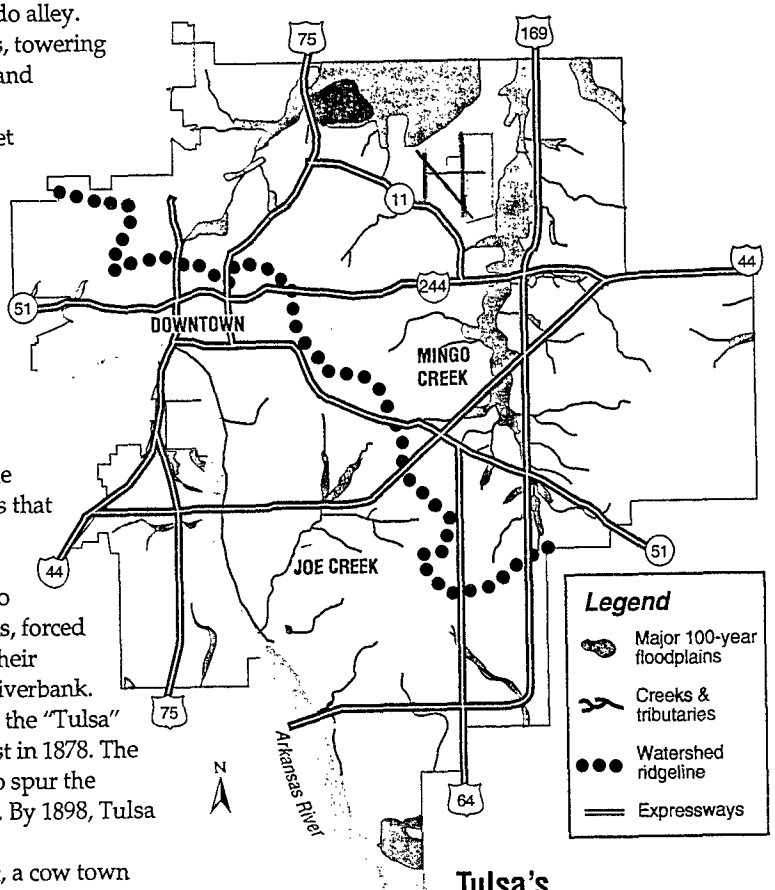
WEATHER: Tornado Alley

Tulsa's geographical crossroad is also a weather junction, an interchange amidst the hot, arid zone to the west, the temperate climate to the north, and the hot, humid zone to the south.

Warm, moist air from the Gulf of Mexico is pulled north by high-pressure systems and collides with cool northern fronts making their way south. This wide swath of convergence is known as tornado alley. When cool fronts clash with warm fronts, towering thunderheads can soar eight miles high and pack enormous energy and moisture.

The converging weather systems meet over Tulsa most often in the spring and fall, sometimes causing violent storms. Normal annual rainfall averages about 36 inches, but successive waves of thunderstorms occasionally can dump nearly half that in a few hours, with little warning.

EARLY HISTORY: Indians and Oil



In search of water for transport and survival, early settlers were drawn to the Arkansas River in the low timbered hills that would become Indian Territory and, later, Oklahoma.

Tulsa can trace its beginnings back to the early 1800s, when Lockapoka Creeks, forced from their Southern homes, rekindled their council fires beneath an oak on a high riverbank.

A Creek Indian rancher established the "Tulsa" post office at the Perryman Trading Post in 1878. The Frisco Railroad came through in 1882 to spur the shipping of Texas herds to Kansas City. By 1898, Tulsa had incorporated as a town.

What was, in more than one respect, a cow town changed dramatically in 1901. Oil was discovered on the west side of the Arkansas River at Red Fork. The boom began in earnest in 1905, when the Glenn Pool, then called the world's largest oil field, was discovered south of Tulsa. Indian Territory became the center of oil exploration and speculation.

In the wake of Oklahoma statehood in 1907, Tulsa's population grew 100 percent a year. The city gained worldwide prominence as a petroleum center and dubbed itself the "Oil Capital of the World."

Tulsa's Major Creeks

R0013800

FLOODING HISTORY: Pathways to Progress

Tulsa has grown up with flooding. Many of the causes are locational: The city is based on a wide river, in a zone of violent storms, and on a frontier where a man had a right to do as he wished with his land.

Flood records are sparse before 1900. In 1908, only a year after statehood, Arkansas River flooding at Tulsa caused $250,000 in damages ($13.15 million in 1994 dollars).

By 1920, the town had outgrown its raw, boom-town image. As riches mounted and investors and speculators poured in, Tulsa grew to a wealthy city of 72,000. Development edged closer and closer toward the river.

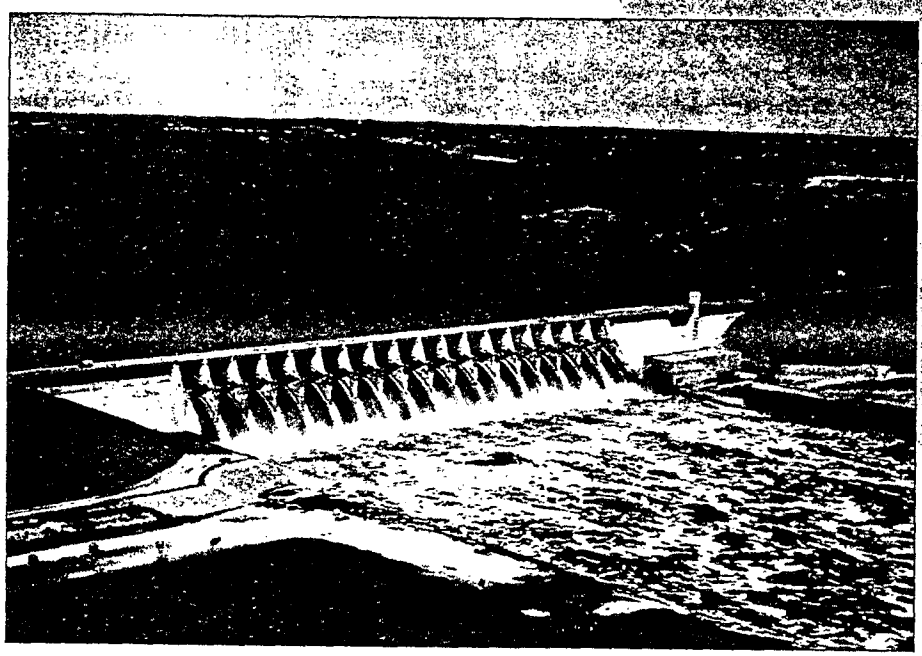
On June 13, 1923, the river flooded Tulsa's waterworks, caused $500,000 in damages ($11.94 million in 1994 dollars), and left 4,000 homeless. City fathers responded with Tulsa's first land-use plan, which envisioned upland boulevards and housing. In the lowlands, such as Mingo Creek east of town, would be generous parks and recreational trails.

The waterworks moved to higher ground, near a band of Bird Creek bottoms that became one of the nation's largest city parks. That far-sighted preservation of Tulsa's 2,800-acre Mohawk Park was destined to save the city innumerable future flood losses.

The Structural Era of Flood Control

Meanwhile, around the nation, the 1920s ushered in what has been called the Structural Era of Flood Control, generally 1928 to 1968.

In response to the Great Mississippi River Flood of 1927, Congress in 1928 passed the Lower Mississippi Flood Control Act, authorizing the U.S. Army Corps of Engineers to construct dams and levees to control flooding.



The major impact first came to Tulsa during World War II. As an emergency national defense project, and in response to 1943 flooding, the Corps built levees around Tulsa's oil refineries along the Arkansas River.

By 1950, in the post-war building boom, housing was fanning out, onto the floodplains to the south and east. Land that had periodically flooded with little harm now was awash in wave after wave of urban flooding.

By the late 1950s, flooding of newly developed subdivisions along the river spurred calls for flood control. In 1964, the Corps completed Keystone Dam 15 miles upstream from Tulsa. For years to come, Tulsans would believe that the Arkansas River was forever tamed.

Tulsa enjoyed another boom in the 1960s, when the city's population grew 25 percent. Tulsa's rapid growth required pastures and meadows to be piped and paved, as new buildings continued to spill into the lowlands of the the creeks and streams that etch the area. The rapidly urbanizing Mingo watershed was annexed to the city in 1966.

Early settlers took to the high ground, following the paths of Native Americans who honored natural laws.

▲ Keystone Dam was built upstream from Tulsa in 1964.

▼ Firemen rig a rescue line off Little Joe Creek, 1968.

The argument that floodplain dwellers should have known better stood exposed for what it was: cynical disregard for community welfare. City-wide responsibility for flood problems would eventually become conventional wisdom.

Floods struck every two to four years during the 1960s and early 1970s. The response was classic: emergency response and recovery, reconstruction as quickly as possible, and denial of the possibility that floods could reoccur.

Victims petitioned for neighborhood flood control, with limited success.

The Regulatory Era of Floodplain Management

Nationally, flood losses continued to rise despite billions of dollars in federal flood-control projects. The dilemma prompted a decade of actions that could be called the Regulatory Era of Floodplain Management, generally from 1968 to 1978.

Flood control structures offered spot protection but sometimes caused offsite problems. They also could produce a false sense of security that lured more development into floodplains, flirting with catastrophe. To compound this problem, the value of the induced growth was counted as a benefit in project evaluations.

In the 1960s, this problem was illuminated in the landmark House Document 465, *A Unified National Program for Managing Flood Losses*. In response, the late 1960s brought Presidential Executive Order 11296 espousing floodplain management and the National Flood Insurance Act of 1968, which made federally subsidized flood insurance available to communities that agreed to adopt minimum floodplain regulations to stem future losses.

The Mother's Day flood of 1970 in Tulsa caused $163,000 in damages ($340,000 in 1994 dollars) on rapidly developing Mingo and Joe creeks.

The City responded by joining the National Flood Insurance Program's "emergency program" and promising to adopt federal floodplain regulations. In August 1971, the NFIP issued its block rate maps. A month later, Labor Day floods hit Flat Rock, Bird and Haikey creeks, and many suburban communities. In December, Bird Creek flooded again. Tulsa joined the NFIP's "regular" program, adopted a new 100-year flood standard, and promised to regulate floodplain land use.

The Year of the Floods, 1974, brought April and May floods that left $744,000 in damages ($2.11 million in 1994 dollars) on Bird Creek. Violent storms June 8 caused widespread flooding on Joe, Fry, Haikey and Mingo creeks, with more than $18 million in damages ($40.24 million in 1994 dollars). On September 19, Mingo Creek flooded again; for some citizens, it was the third flood in a year.

Angry, drenched victims waded out of the floods to demand help. They contended the city wasn't enforcing NFIP regulations. They tried to halt development, to avoid deeper flooding until existing problems could be solved. Developers objected strenuously.

Thus began a community debate over floodplain management, locally called "Tulsa's great drainage war," destined to last years.

The city responded with a plan to widen part of Mingo Creek, including clearance of 33 houses in the

R0013802

right of way. The houses were removed just before the next flood.

The 1976 Memorial Day flood marked a milestone in Tulsa's search for flood solutions. A three-hour, 10-inch deluge was centered over the headwaters of Mingo, Joe and Haikey creeks. The resulting flood killed three and caused $40 million in damages ($75 million in 1994 dollars) to more than 3,000 buildings.

By this time, the victims were becoming skilled lobbyists and gathering sympathizers city-wide. They stormed City Hall.

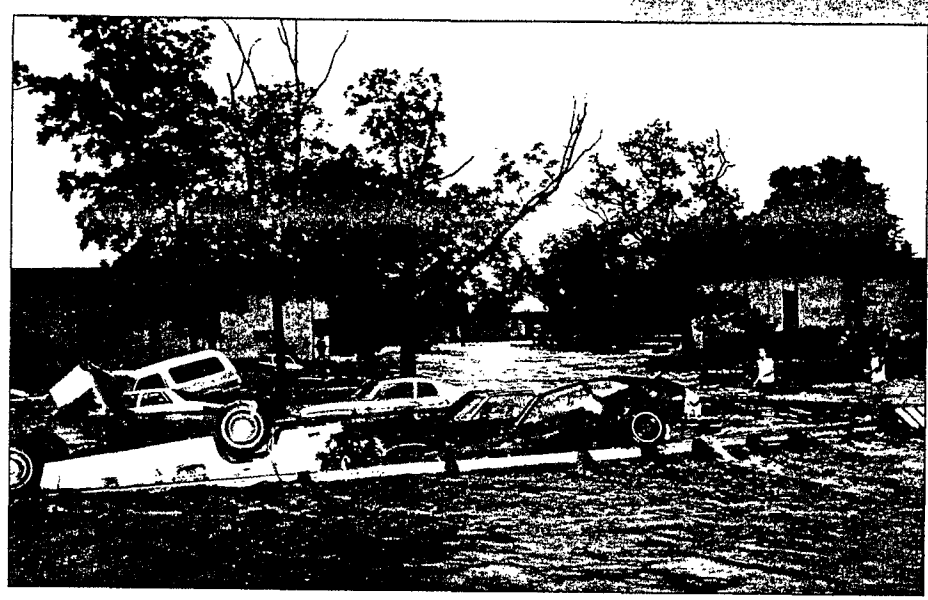
Newly elected city commissioners responded with a wave of actions. They enacted a floodplain building moratorium; hired the city's first full-time hydrologist; developed comprehensive floodplain management policies, regulations and drainage criteria; enacted stormwater detention regulations for new developments; instituted a fledgling alert and warning system; and began master drainage planning for major creeks.

In 1978, an earth change ordinance was also adopted, giving the city control over alterations to Tulsa's landscape, including floodplains and stream channels.

The Nonstructural Era of Stormwater Management

The Nonstructural Era, a third major phase of stormwater management, began with the President's 1978 Water Policy Initiative. It recognized the need to place nonstructural techniques on a par with flood-control structures and to preserve the natural values of floodplains and wetlands.

To curb continuing losses, in the early 1980s the federal government developed the Federal Interagency Hazard Mitigation process. In the days after disasters, federal teams were dispatched to identify hazard mitigation opportunities – basically ways to make the response to each disaster reduce the scope of the next one. The mitigation concept focused on correcting the *causes* of losses, including removing, raising, or floodproofing the most vulnerable of the damaged buildings.



Tulsans worked with the Federal Emergency Management Agency to develop the process. Tulsa's early exposure to the new FEMA mitigation program was to have a significant impact on the city's response to future floods.

The 1984 Memorial Day Flood, the worst in the city's history, was Tulsa's watershed point.

After a muggy Sunday afternoon, a stalled cool front produced some 15 inches of mid-night rain, centered over Mingo Creek but also extending across most of the city. The results were disastrous.

The 1984 Memorial Day Flood killed 14, injured 288, damaged or destroyed nearly 7,000 buildings, and left $180 million in damages ($257 million in 1994 dollars). Mingo Creek alone accounted for $125 million of the damages.

Tulsa's 1984 flood response focused on mitigation and flood loss reduction, rather than re-establishment of the pre-flood status quo.

© Jim Wolf

▲ The 1984 flood routed thousands, killed 14, injured 288, and caused $180 million in damages to nearly 7,000 buildings.

The newly elected mayor and street commissioner had been in office for only 19 days, but both knew the issues well. In the darkest hours of the city's worst disaster, they pledged to make their response reduce the likelihood that such a disaster would ever be repeated.

R0013803

By the 1990s, Tulsa's stormwater program was institutionalized and broadly accepted.

Before daylight, they had assembled the city's first Flood Hazard Mitigation Team to develop the city's strategy.

Within days, a new approach to Tulsa flood response and recovery was born.

As ultimately completed, the program included relocation of 300 flooded homes and a 228-pad mobile home park, $10.5 million in flood control works, and $2.1 million for master drainage plans. The total capital program topped $30 million, mostly from local capital sources, flood insurance claim checks, and federal funds.

It was only the beginning.

Tulsa Tribune photo

▲ Volunteers sandbag on the Arkansas River, 1986 flood.

A Unified Program was created after the 1984 flood.

The work didn't end with the initial flood response and recovery. In fact, it was only the first step in a long and continuing journey to make Tulsa floodsafe.

The 1984 flood also persuaded Tulsans that a coordinated, comprehensive stormwater management program was needed – from the rooftop to the river.

The Department of Stormwater Management in 1985 centralized responsibility for all city flood, drainage, and stormwater programs.

A stormwater utility fee was established by ordinance in 1986 to operate the program. The utility fee ensures stable funds for maintenance and management, independent of fickle political winds. The ordinance allots the entire fee exclusively for floodplain and stormwater management activities.

The 1986 Arkansas River Flood was a first test of the new stormwater management program. It also served as a reminder of the finite protection of Keystone Dam.

Between September and October 1986, Keystone Reservoir filled to capacity, forcing the Corps to release water at the rate of 310,000 cubic feet per second. Downstream flooding was inevitable.

At Tulsa, a private westbank levee failed, causing $1.3 million in damages to 64 buildings. The city fielded its hazard-mitigation team and cleared 13 substantially damaged structures.

Institutionalization and acceptance came in the 1990s, after Tulsans approved a change in city government from the mayor-commission to the mayor-council form.

A new Department of Public Works consolidated all public works services. Stormwater management was reintegrated and finally institutionalized into the city structure.

Today, storm drainage management is generally an accepted part of the city's services.

Tulsa's system has not been tested by a catastrophic rainfall since 1986, but the system has handled smaller rains well. Leaders believe improved maintenance, continuing capital projects, stringent regulations, and aggressive citizen awareness programs will reduce – but cannot entirely eliminate – future flood losses.

The greatest testimony to the program is that, since comprehensive regulations were adopted in 1977, the city has no record of flood damages to any building that complies with those regulations.

In the early 1990s, FEMA ranked Tulsa first in the

R0013804

nation for its floodplain management program, allowing Tulsans to enjoy the nation's lowest flood insurance rates. The program was also honored with FEMA's 1992 Outstanding Public Service Award; and the Assocation of State Floodplain Managers has twice given Tulsa its Local Award for Excellence.

Leaders consider the Tulsa program still in progress. They know that much remains to be done, and that there is an inevitable next flood ahead. The program continues to evolve.

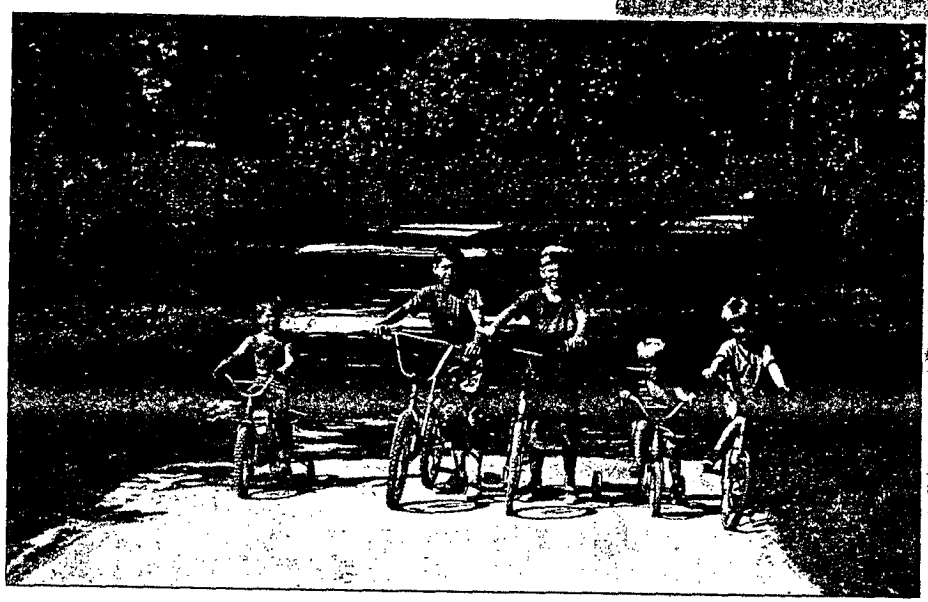
The Watershed Era of Comprehensive Management

The Great Midwest Floods on the Mississippi and other heartland rivers in 1993 caused more than $10 billion in damages to 72,000 structures and, in some cases, entire communities.

The 1993 Midwest floods spurred national leaders to re-examine their programs. Although Tulsa was not directly affected, local leaders also took advantage of the lessons that the nation was learning.

The 1993 floods served as a catalyst to launch a fourth era in the nation's attempts to stem disaster losses, according to Dr. Gilbert F. White, a leader in national floodplain management for the past 50 years, and Larry Larson, Executive Director of the Assocation of State Floodplain Managers.

That new era looks above and beyond the floodplains, beyond response to a specific disaster, and takes a longer and broader view.

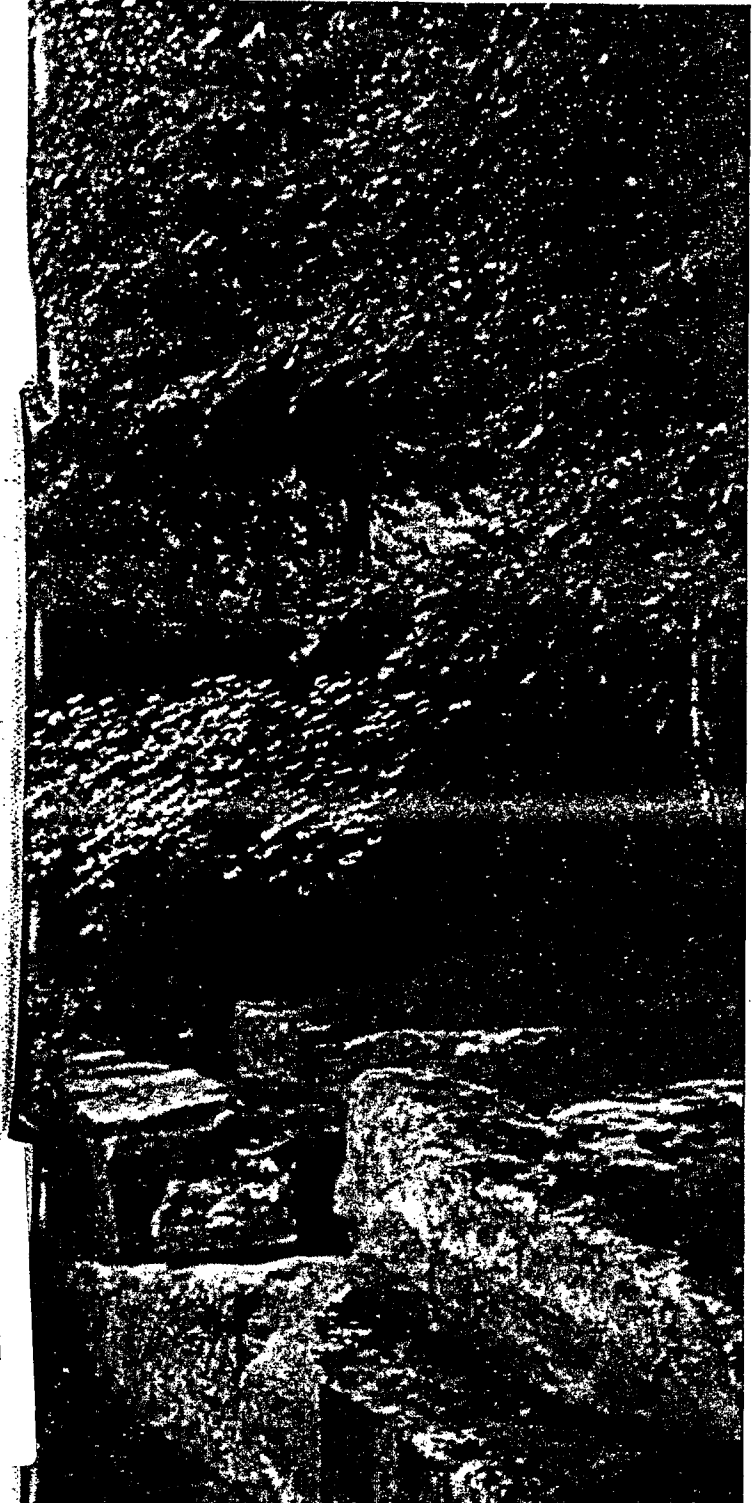


"It examines in an integrated fashion the whole regional floodplain environment," White says. "It is a program which takes into account the human values, the local resource decisions, the whole pattern of local community management as it is related to flood-hazard and the floodplain."

"Until this year," says Larson, "the government mostly helped people rebuild at risk of the next flood. A monumental change has occurred in federal attitudes and programs that assist people and communities in flood recovery. That change will result in relocation of structures out of flood hazard areas or elevation above flood levels with government assistance."

This new direction – a comprehensive, regional approach to long-term solutions, based on collaborative partnerships – mirrors the best of Tulsa's local goals and priorities.

The long journey and hard lessons continue. In the words of a former Tulsa mayor, "We're all learning – together."



The newest national era of floodplain management mirrors the best of Tulsa's local goals and priorities.

▲ Creekbank maintenance trails make excellent playgrounds.

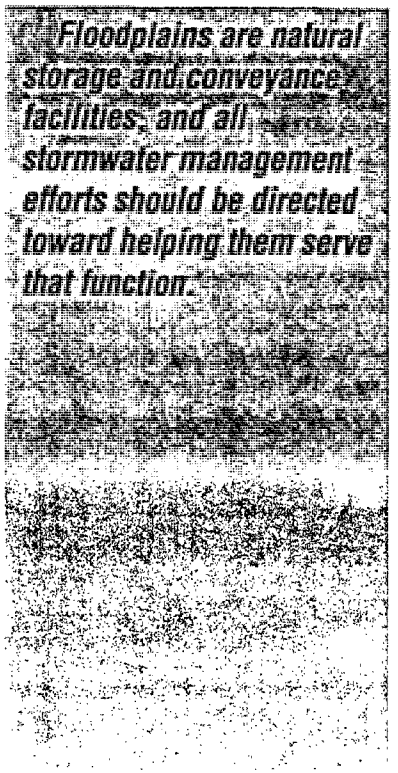
R0013806

◀ Tulsa policies encourage use of stormwater as an amenity, as in this private project at Warren Place.

Policy Framework



Watershed Management

Tulsa's program works because it is based on a unified, logical philosophy.

The philosophy evolved as Tulsa realized that management systems must take into account two key factors: the timing of flood peaks and the availability of flood storage. This awareness led Tulsa to its watershed-wide management approach to time and space allocation of stormwater.*

It is the foundation on which the program rests.

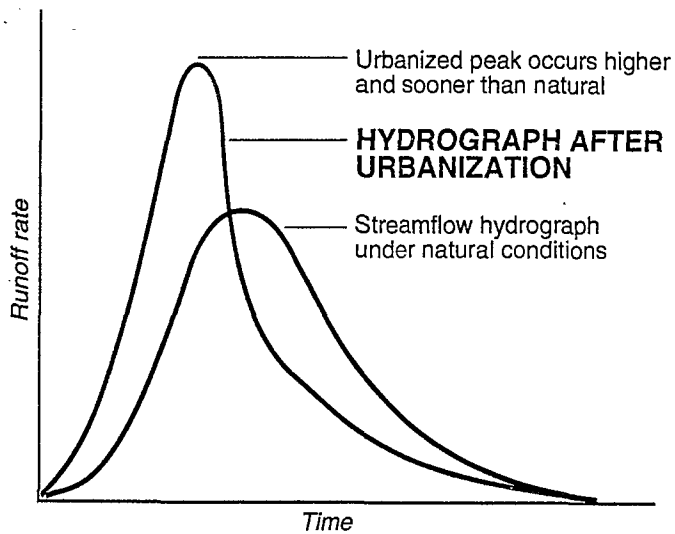
This section highlights excerpts from Tulsa's floodplain and stormwater management philosophy and policy framework.

PRINCIPLES

- **The urban environment and each watershed within it form a single, interacting system. Actions have consequences.**
- **Floodplain and stormwater management is a matter of time and space allocation. Water requires space and must be stored and conveyed, in either appropriate or inappropriate places.**
- **Floodplains and stormwater are resources. If they can become recreation or beautification assets, so much the better.**
- **Floodplain and stormwater management programs should include multiple purposes and multiple means.**
- **Changes in the natural balance require compensations. Nature bats last.**

*Tulsa's policies were gleaned from the work of many others, including the National Flood Insurance Program, Gilbert F. White, Jim Goddard, Jon Kusler, Rutherford Platt, Jack Sheaffer, Ken Wright, and FEMA's *Unified National Program for Floodplain Management*.

R0013807



Structural and non-structural approaches are both weapons in the arsenal of flood management when appropriately applied in accordance with a basin-wide plan.

CORRECTIVE POLICIES

- **Flood control works include channel modifications and stormwater detention storage.**

  Under certain circumstances, structural projects are necessary to correct past mistakes and provide spot protection. But they must be used with care, because they tend to transfer problems elsewhere, create a false sense of security, and encourage unwise use of the floodplain.

  Flood control projects should consider the entire watershed, based on master drainage plans.

Stormwater Runoff Rates Compared

Urbanization can significantly increase runoff because buildings, parking lots, and other impervious areas reduce groundwater infiltration and natural surface storage.

Peak rates of flow increase as vegetation is removed and the natural landscape is altered, replacing slowly draining wetlands, depressions, meanders, and gullies with rapidly draining urban curbs, gutters, pipes, and straight channels.

The increased speed decreases the time for runoff to peak at a given location – more water reaches a given point faster.

▲ Detention storage, such as this Mingo basin, can include amenities.

Proper, routine maintenance is essential to keep the stormwater systems working.

- **Acquisition and relocation should be used to reduce, over time, the occupancy and value of exposed property in flood-hazard areas.**

  Any proposal for corrective actions should include a careful analysis of acquisition and relocation alternatives. The value of floodplain lands for urbanization should not be used to *justify* structural projects. The value of floodplain land for park, recreation and open-space purposes and other natural values should be used to evaluate nonstructural alternatives.

  Relocation may be more cost-effective after a flood. Post-flood acquisition should be evaluated and, if possible, pre-planned.

- **Other essential corrective measures include flood insurance and floodproofing.**

R0013808

PREVENTIVE POLICIES

- **Public park, recreation, and open space use of the floodplain is the best policy.**
- **Regulatory systems are based on the "100-year flood" under fully urbanized watershed conditions.**
- **Floodplain alterations should be avoided unless they are based on a basin master drainage plan and it can be shown that they will not cause off-site problems.**
- **Regulation of floodplain uses is based on the recognition that:**

  Flooding is a public threat.

  Floodplain uses should be compatible with the natural functions of conveyance and storage.

  Floodplain uses should not reduce, restrict, or impede channel conveyance capacity, or increase downstream velocities.

  No changes can take place in the floodplain that decrease or reduce storage. If filling is allowed, compensatory storage must be provided in the floodplain.

  Development should be directed to areas free from flooding.

  All development within the regulatory floodplain requires a permit.

- **Stormwater runoff control is necessary because development on higher ground can increase flooding, siltation, and erosion.**

  Excess stormwater runoff caused by new development should be detained and released at a rate that will not increase peak discharges above that which occurred before development. Generally, regional detention basins are more effective than on-site facilities, unless a specific problem is being addressed.

- **Public facilities located in the floodplain require special attention.**
- **Other preventive actions include:**

  Public acquisition of floodplain lands.

  Disclosure of flood-hazard information to purchasers and renters.

  Flood alert, warning and emergency management systems.

  Public information, education and awareness programs.

  Development of a post-flood recovery plan, including acquisition of frequently damaged properties; relocation of occupants from floodprone areas; and preservation of floodplain lands for park, recreation and open-space purposes.

Waterways can be channeled, concrete-lined, or even buried. But the floodplain carved over centuries is the gathering point for runoff from higher lands. Regardless of our schemes, water will continue, from time to time, to reclaim its routes.

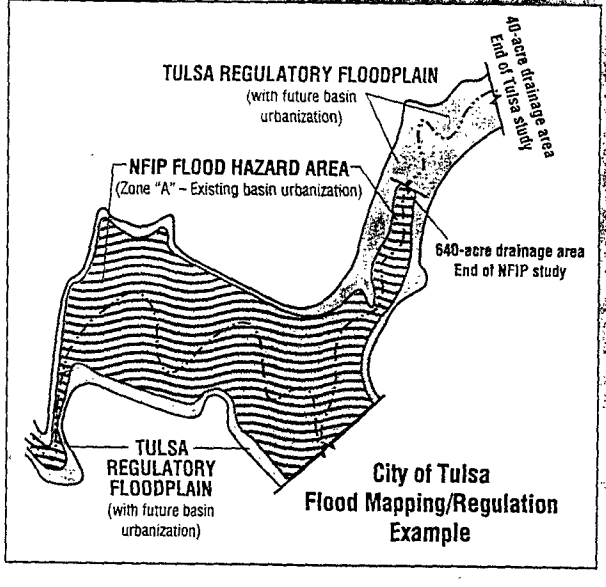
Rooftop to River



The Tulsa Program

Tulsa's floodplain and stormwater program includes three key goals:

- Prevent new problems.
- Correct existing problems.
- Enhance the community's safety, environment, and quality of life.

This section highlights major program elements used to achieve those goals.

A city can overcome its flood hazards while still encouraging responsible growth.

REGULATION

In general, Tulsa growth is welcomed – so long as it will not flood or cause flooding elsewhere.

Beyond the 100-year standard*

Experience showed that the National Flood Insurance Program's minimum standard is insufficient for Tulsa. Therefore, the city's regulations exceed NFIP's standard in several important ways, highlighted below.

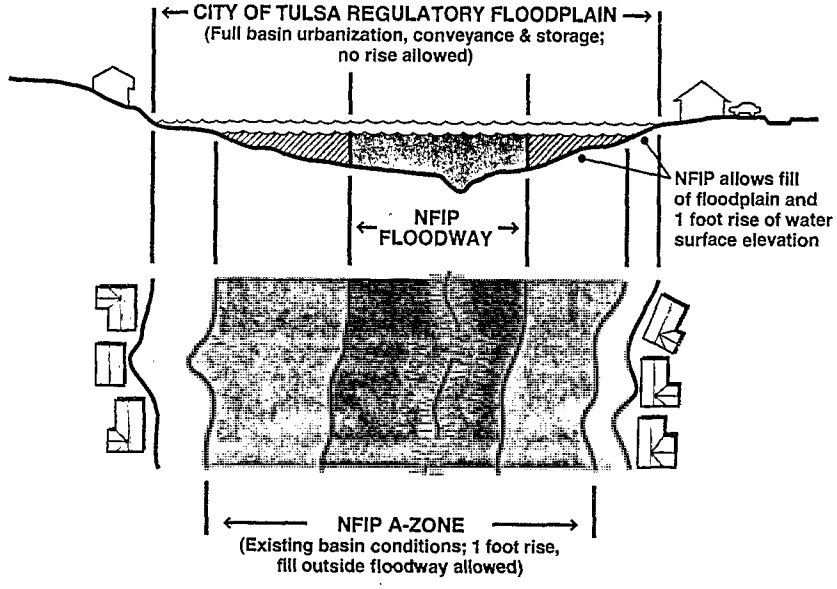
*Two terms need to be defined.

Base flood: The National Flood Insurance Program is based on the so-called "100-year flood," which has a 1 percent chance of occurring or being exceeded in any given year. This standard is also called the "base flood." It is based on watershed development as it exists at the time of the mapping.

Regulatory flood: The city's more extensive and restrictive system is based on the "regulatory flood," a 100-year flood calculated as it will occur when the basin is fully developed.

Floodplain Maps

For greater protection, Tulsa's regulatory floodplains generally exceed those mapped by the National Flood Insurance Program. Tulsa's broader floodplains are based on full future urbanization of watersheds.



R0013811

NFIP standards are inadequate for urbanizing watersheds. Many developments permitted today under less restrictive NFIP standards will flood tomorrow as upstream urbanization increases runoff.

Ultimate watershed urbanization. Runoff generally becomes deeper and faster, and floods become more frequent, as watersheds develop. Water that once lingered in hollows, meandered around oxbows, and soaked into the ground now speeds downhill, shoots through pipes, and sheets off rooftops and paving.

Insurance purposes require the NFIP floodplain maps to be based on *existing* watershed development.

But unless plans and regulations are based on future watershed urbanization, development permitted today may well flood tomorrow as uphill urbanization increases runoff. Tulsa enforces the NFIP minimum regulations and maps, to retain eligibility for federal flood insurance.

Regulatory Floodplains
Tulsa's floodplain regulations are more stringent than the National Flood Insurance Program's, because Tulsa regulations are based on full urbanization of the watershed and do not allow any rise in the water surface elevation.

In addition, the city enforces its own more extensive maps and regulations, which are based on *ultimate watershed urbanization* as forecast in the comprehensive plan.

Watershed-wide regulation. Floodplains are only part of flood-management considerations. Water gathers and drains throughout entire watersheds, from uplands to lowlands. Each watershed is an interactive element of the whole. A change at one place can cause changes elsewhere, whether planned or inadvertent. Therefore, Tulsa goes above and beyond the floodplain in its regulatory program, extending its regulations watershed-wide.

Stormwater detention. One way to avoid increased flooding downstream from new development is to provide stormwater detention basins throughout watersheds.

New or substantially improved developments must detain the excess stormwater on site – unless they are exempted in master plans or allowed to pay a fee in lieu of on-site detention. Water from detention basins is released slowly downstream.

In-lieu fees are allocated for regional detention facilities. In most instances, the city has found regional detention basins to function more satisfactorily than smaller, scattered on-site facilities.

Valley storage. Flood water cannot be compressed. It requires space. Encroachments into a channel or floodplain can dam, divert, or displace flood waters. So Tulsa requires compensatory excavation if a development – including a flood control project – would reduce valley storage. Preserving or recreating floodplain valley storage is a keystone of the city's program.

R0013812

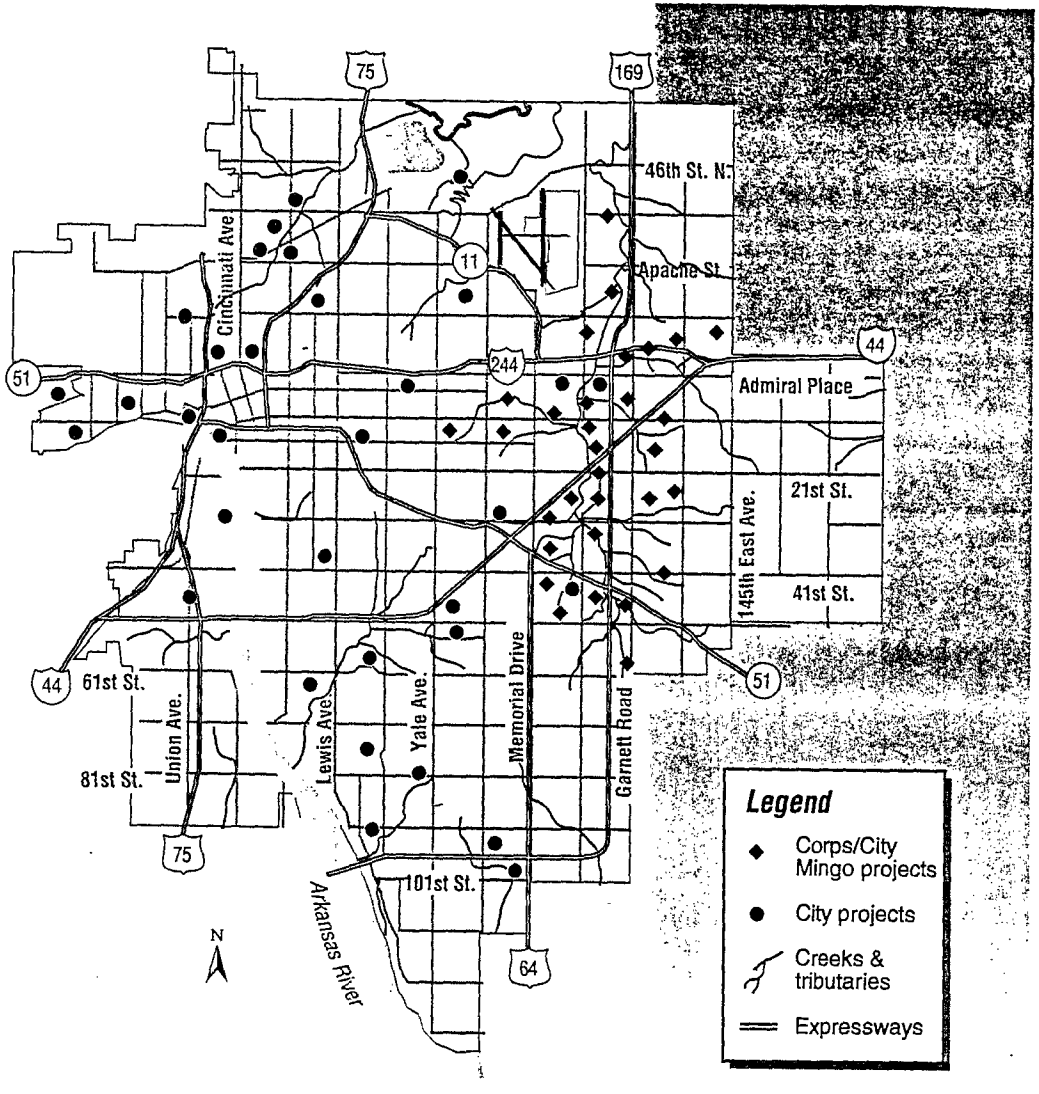
Freeboard. NFIP regulations require finished floors of new development to be at or above the base flood elevation, based on existing watershed conditions. Tulsa includes freeboard as another margin of safety, requiring finished floors to be at least 1 foot above the regulatory flood elevation, based on ultimate watershed urbanization.

Erosion and sedimentation. Erosion and sedimentation rob hillsides of valuable topsoil, dam lowlands, clog streams, and pollute rivers. Builders must control site erosion from new development.

Permits and performance standards

Tulsa requires a watershed development permit to be issued before developing, redeveloping, building, excavating, grading, regrading, paving, landfilling, berming, or diking of any property within the city. There are five types of watershed development permits: floodway, floodplain, stormwater drainage, stormwater connection, and earth change permits. Individual residential lots outside the floodplain are exempted.

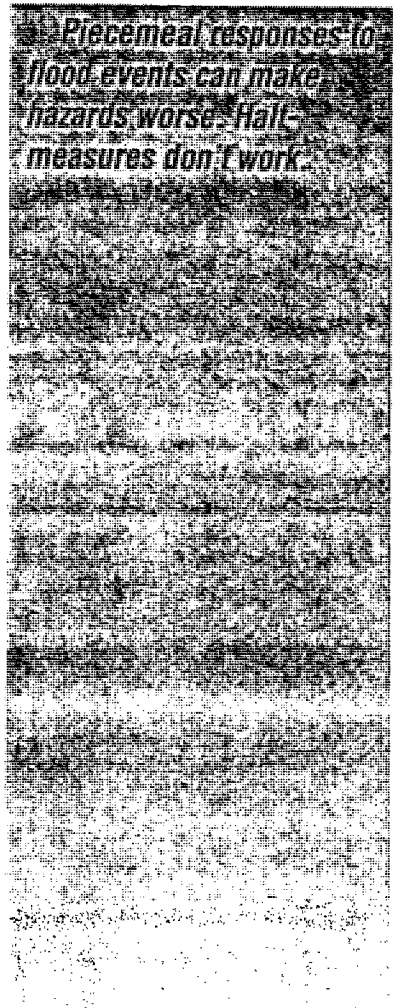
Tulsa's regulations are based on adopted floodplain maps (both Tulsa and NFIP), watershed-wide master drainage plans, and development permits based on specific performance standards.



PLANNING AND CAPITAL PROJECTS

A decade ago, Tulsa faced up to its need for half a billion dollars in corrective flood projects. The city had been built, over decades, without much of a drainage system, and the result was disastrous. The task appeared overwhelming.

Since then, Tulsa has completed or under construction more than $200 million in capital plans and projects, including $80 million in federal funds.



The capital program includes structural, nonstructural and multi-objective projects. By combining techniques, flood hazards have been reduced for thousands of Tulsans.

More than $300 million in flood-reduction projects are still needed. Tulsa's program is still under way,

Major Capital Projects
Tulsa has under way or completed more than $200 million in flood projects, most since 1984. They include structural and nonstructural projects. This map generally shows only projects costing more than $100,000.

R0013813

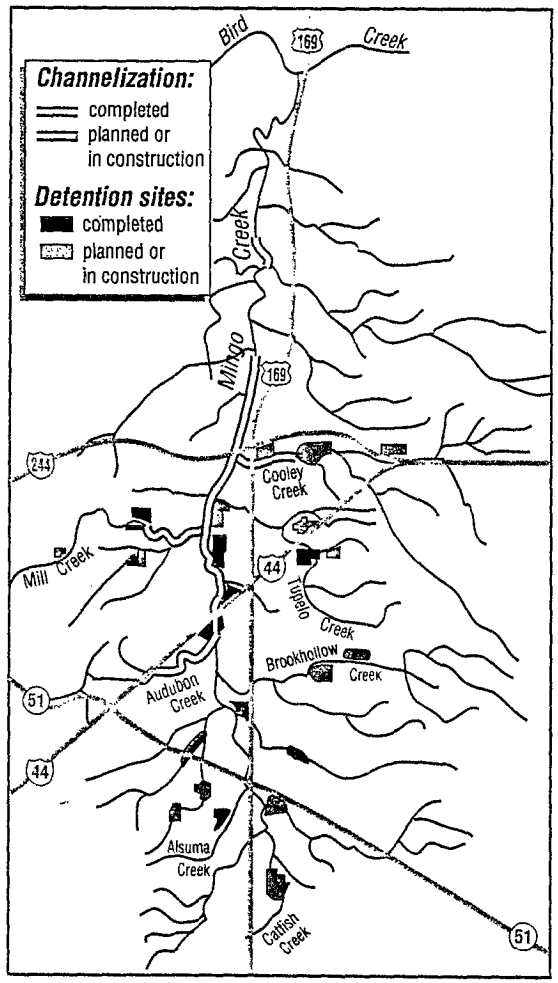
and will be for years, to correct drainage problems that were created over many decades.

Planning

The backbone of Tulsa's stormwater management system is its master drainage planning. The planning process involves extensive citizen participation, including hundreds of public meetings over the past decade.

Master drainage plans. Tulsa has completed master drainage plans for virtually all drainage basins. Each plan is a comprehensive, watershed-wide study of a drainage basin that documents existing floodplain information and recommends solutions for flooding and drainage problems.

A typical master drainage plan is developed within the context of the community, and so takes into account community values, existing conditions, goals and objectives, and future plans. The result is a plan for actions and projects, including costs and benefits.



City-wide master plan. In 1989, the city synthesized its various master drainage plans into one city-wide document, *The City of Tulsa Flood and Stormwater Management Plan, 1990-2005*. This city-wide plan ranks and prioritizes hundreds of recommended projects, to guide capital scheduling.

Capital projects

Priority-setting was challenging. Citizens in every watershed faced severe flooding problems. In general, priorities are based on hazard, cost, benefit, and feasibility.

Mingo Creek project. The 61-square-mile Mingo watershed drains the eastern one-third of the city but has accounted for two-thirds of Tulsa's flood damages in recent years. The U.S. Army Corps of Engineers and the city worked together in the late 1970s to develop a plan for Mingo flood control, which Congress authorized for construction in 1986.

The Corps estimates that the completed $143 million project will prevent $32 million in average

Mingo Creek Flood Project
Most Tulsa damage has come along Mingo Creek in east Tulsa. To curb Mingo flooding, the city and the Corps of Engineers are building the $143 million Mingo project. It includes 23 stormwater detention basins and about 10 miles of channels, all to be completed in 1996.

R0013814

annual flood damages. With an average annual cost of about $16 million, the Mingo project has a benefit-to-cost ratio of 2 to 1.

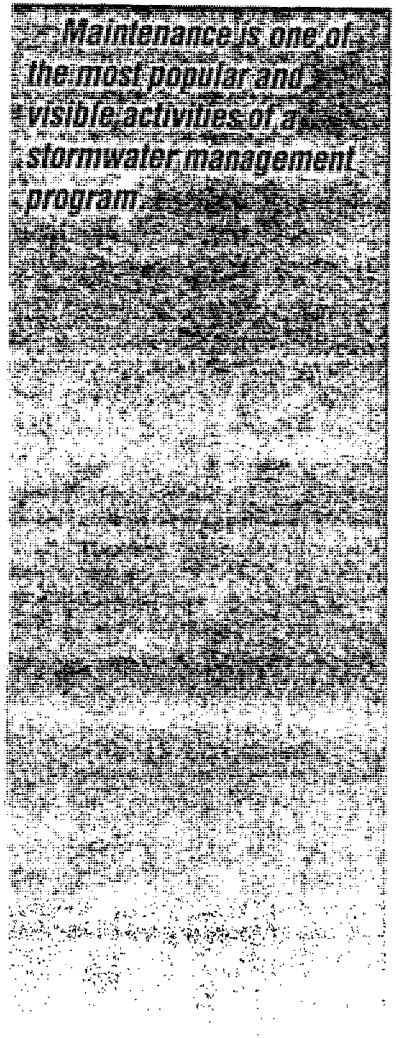
The local cooperation agreement signed by the city helped forge new legislation, written into the Water Resources Development Act of 1986, which also gives communities credit for past construction projects. The federal government recognized that before 1986 Tulsa had constructed some Mingo channels and detention basins that were compatible with the Corps project. The federal government agreed to give the city credit toward its local share plus reimbursement for the federal share of prior expenditures that pertain to the project. Tulsa has received $10 million in reimbursements and expects to receive about $10 million more.

Acquisition and relocation. Over the past 15 years, Tulsa has cleared more than 900 buildings from its floodplains. The largest clearance came after the 1984 flood, when more than 300 single-family homes and 228 mobile homes pads were acquired and cleared.

The city's floodplain program is gradually reducing its inventory of thousands of floodprone buildings. The city is also updating its post-flood mitigation plan to include acquisition and relocation recommendations for before, during, and after a flood.

Small capital projects. Many flooding and drainage projects throughout the city are localized but troublesome. They are addressed through small capital projects, generally less than $100,000 each. Every year, $700,000 is allocated from the utility fee for small projects. Some are also funded through long-range capital sources.

Floodproofing. In some instances flood damages to existing structures can be averted by spot flood-proofing, such as elevation of the existing structure on site, shields for windows and doors, and ring levees. Oklahoma law does not allow the city to spend public funds to floodproof individual structures, so currently the city's role is limited to technical assistance to private property owners.



Tulsa has cleared more than 900 buildings from its floodplains.

◀ Lands cleared after Mingo Creek floods (left) now serve as picnic grounds (below) ▼

R0013815

STORMWATER QUALITY

Stormwater quality is of growing concern in municipal drainage management. Tulsa has geared up to meet new federal requirements for stormwater discharge NPDES permits (National Pollutant Discharge Elimination System permits). Tulsa's most serious problem with runoff quality was found to be sediment, which is being addressed through vigorous regulation of erosion from construction projects.

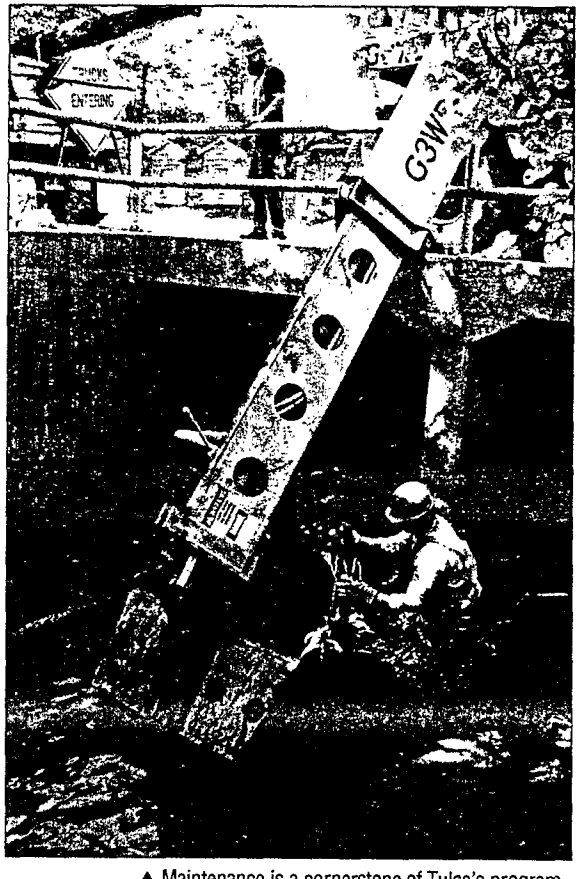
The city is also emphasizing street sweeping, environmental monitoring, and stormwater laboratory services as part of its stormwater quality program.

MAINTENANCE AND OPERATIONS

City leaders clearly saw the need for better maintenance when the 1984 flood swamped debris-choked creeks and channels, clogged and collapsed sewers, and neglected pump stations. The resulting public and private costs were enormous.

The flood triggered a search for stable, continual maintenance funding. The answer came in 1986, when city fathers approved a drainage utility fee. Now maintenance is an essential element of Tulsa's program.

The contrast is telling:



- In 1980, the city spent about $400,000 on stormwater maintenance.
- By comparison, in 1993, the city was able to spend about $6 million on stormwater maintenance.

The difference was the stormwater utility fee.

The maintenance program's first goal is to keep systems operating at full capacity.

The system includes hundreds of miles of surface channels and floodplains, thousands of miles of underground sewers, public detention basins, pump stations, roadside ditches, bridges, and the curbs and inlets along the street system.

The list of duties continues to expand, extending through turf control and tree planting, debris removal, emergency response during storms, and management of maintenance trails along drainageways.

▲ Maintenance is a cornerstone of Tulsa's program, based on stable and on-going funding by the stormwater utility fee.

EMERGENCY MANAGEMENT

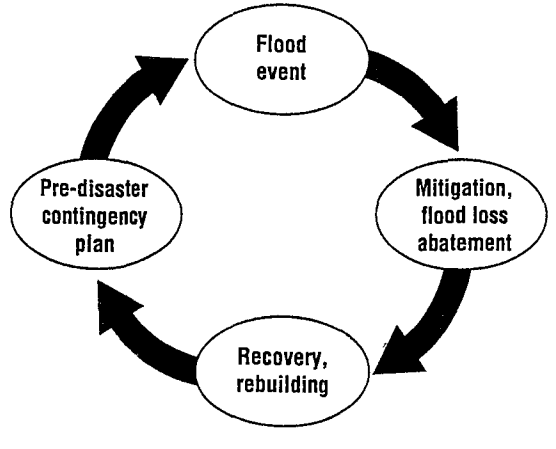
Capricious climate makes Tulsa vulnerable to weather emergencies, particularly tornadoes, violent thunderstorms, and floods.

Overall responsibility during emergencies lies with the city-county Tulsa Area Emergency Management Agency; but in flood management, TAEMA shares its lead with Tulsa's Public Works Department.

R0013816

Tulsa's emergency management goal is to reduce hazard and damage before, during and after storms.

Forecasting and warning



Flash floods require the earliest possible warnings. Tulsa's system works in cooperation with the National Weather Service, news media, TAEMA, and the City of Tulsa. A computerized ALERT system includes 39 rain, 19 stream, and seven detention gauges that report changes as they happen. The system is based on detailed basin inventories and includes a hydrologic program that develops stream and flood forecasts, to be released for appropriate action before flooding occurs.

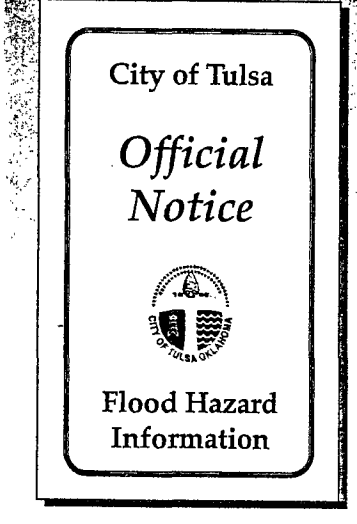
Response

Emergency response is triggered by the possibility of severe weather anywhere in the community. Response teams are guided by detailed plans and protocols – and their extensive field experience during emergencies. The plans also identify critical facilities with hazardous materials, vulnerable occupants, and essential community functions.

Recovery and mitigation

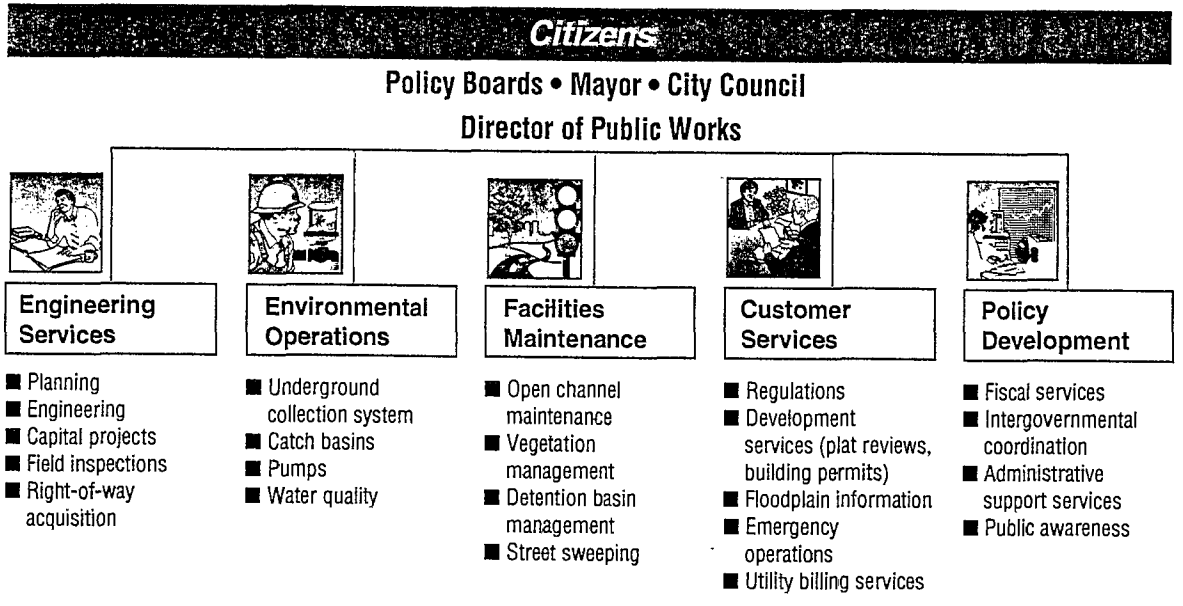
Traditionally, recovery meant rebuilding as fast as possible. But recurring disasters have taught Tulsans that rebuilding in kind can mean reinvesting in disaster. Tulsa today emphasizes mitigation projects, which seek to make the response to each disaster reduce future losses. For example, hundreds of flooded homes have been relocated to dry sites. In addition, the city is updating its flood-hazard mitigation plans, to include actions to be taken before, during, and after a flood.

▲ A prototype ALERT System helps manage emergencies.



PUBLIC AWARENESS

The city pushes public information and involvement to keep citizens aware that floods frequent Tulsa, requiring prudent preparation.



Diverse information pieces include flood maps,

R0013817

Public awareness and backing can become, over time, the best insurance against a repetition of a kind of history that wreaks physical damage and, worse, leaves emotional scars.

Stormwater Management Structure

brochures, news releases, fact sheets, reports, slide shows, videos, direct mailings, displays, speeches and presentations, roadway signs, and individual contacts – anything and everything possible to get out the word.

For example, the city mails periodic notices to floodplain occupants, warning them of hazards, offering them flood preparedness tips, and urging them to buy flood insurance.

Tulsa's stormwater ordinances include requirements that full information about flood hazards must be provided by property sellers to prospective buyers, and by landlords to tenants.

PUTTING IT ALL TOGETHER: ORGANIZATION AND FINANCE

After the 1984 flood, Tulsa leaders determined that the city's drainage program was scantily funded, poorly coordinated, and largely neglected. They termed stormwater the "forgotten utility."

Creating a comprehensive program was a daunting challenge, beginning with the staff estimate that some $500 million was needed for high-priority flood control. As for the full range of maintenance and other needs, no one could hazard a guess.

By 1985, Tulsa had pulled all related functions together into a new Department of Stormwater Management. By 1986, the city had levied a new stormwater utility fee to finance it.

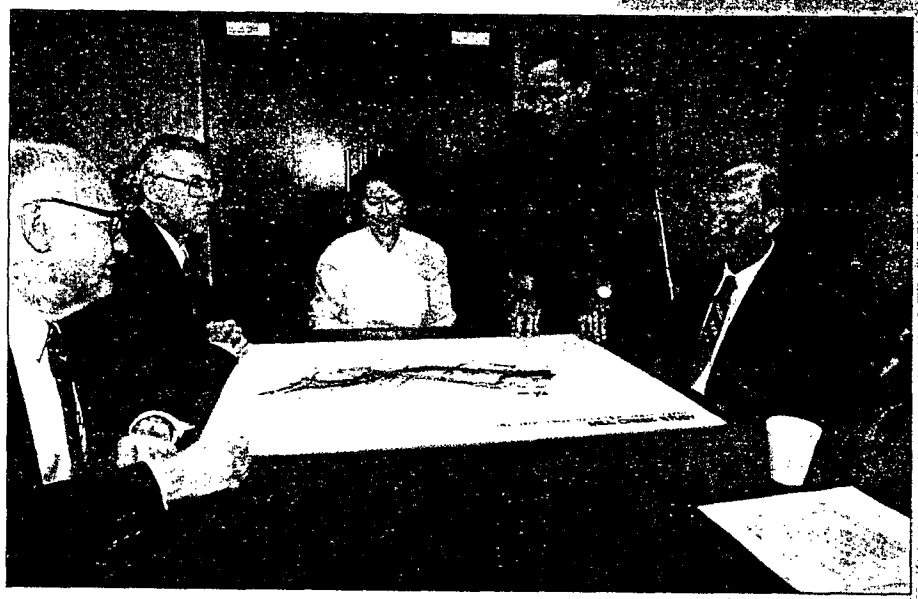
In three successful votes in 1985, 1987, and 1990, voters handily approved more than $135 million in capital sales tax and bond funds – including local match for the $143 million Corps of Engineers project to tame Mingo Creek.

With a change in the form of city government in 1990, the stormwater program was merged into a new Public Works Department.

Today, the program continues to progress, institutionalized in Public Works, under the executive wing of Mayor M. Susan Savage. Citizen advice is

R0013818

provided by the Stormwater Drainage Advisory Board, which was created after the 1984 flood. Tulsa's City Council is responsible for legislation, policy, and budgets.

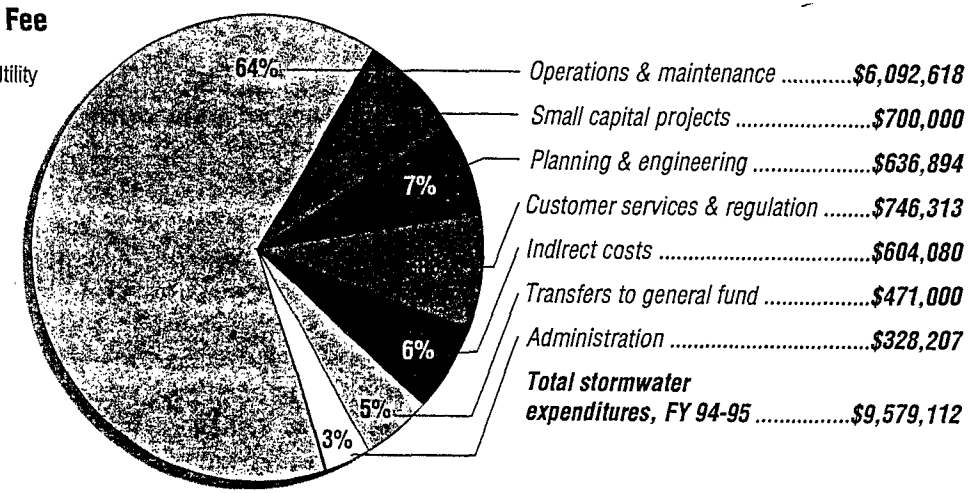


The fiscal foundation of Tulsa's program is the stormwater utility fee.

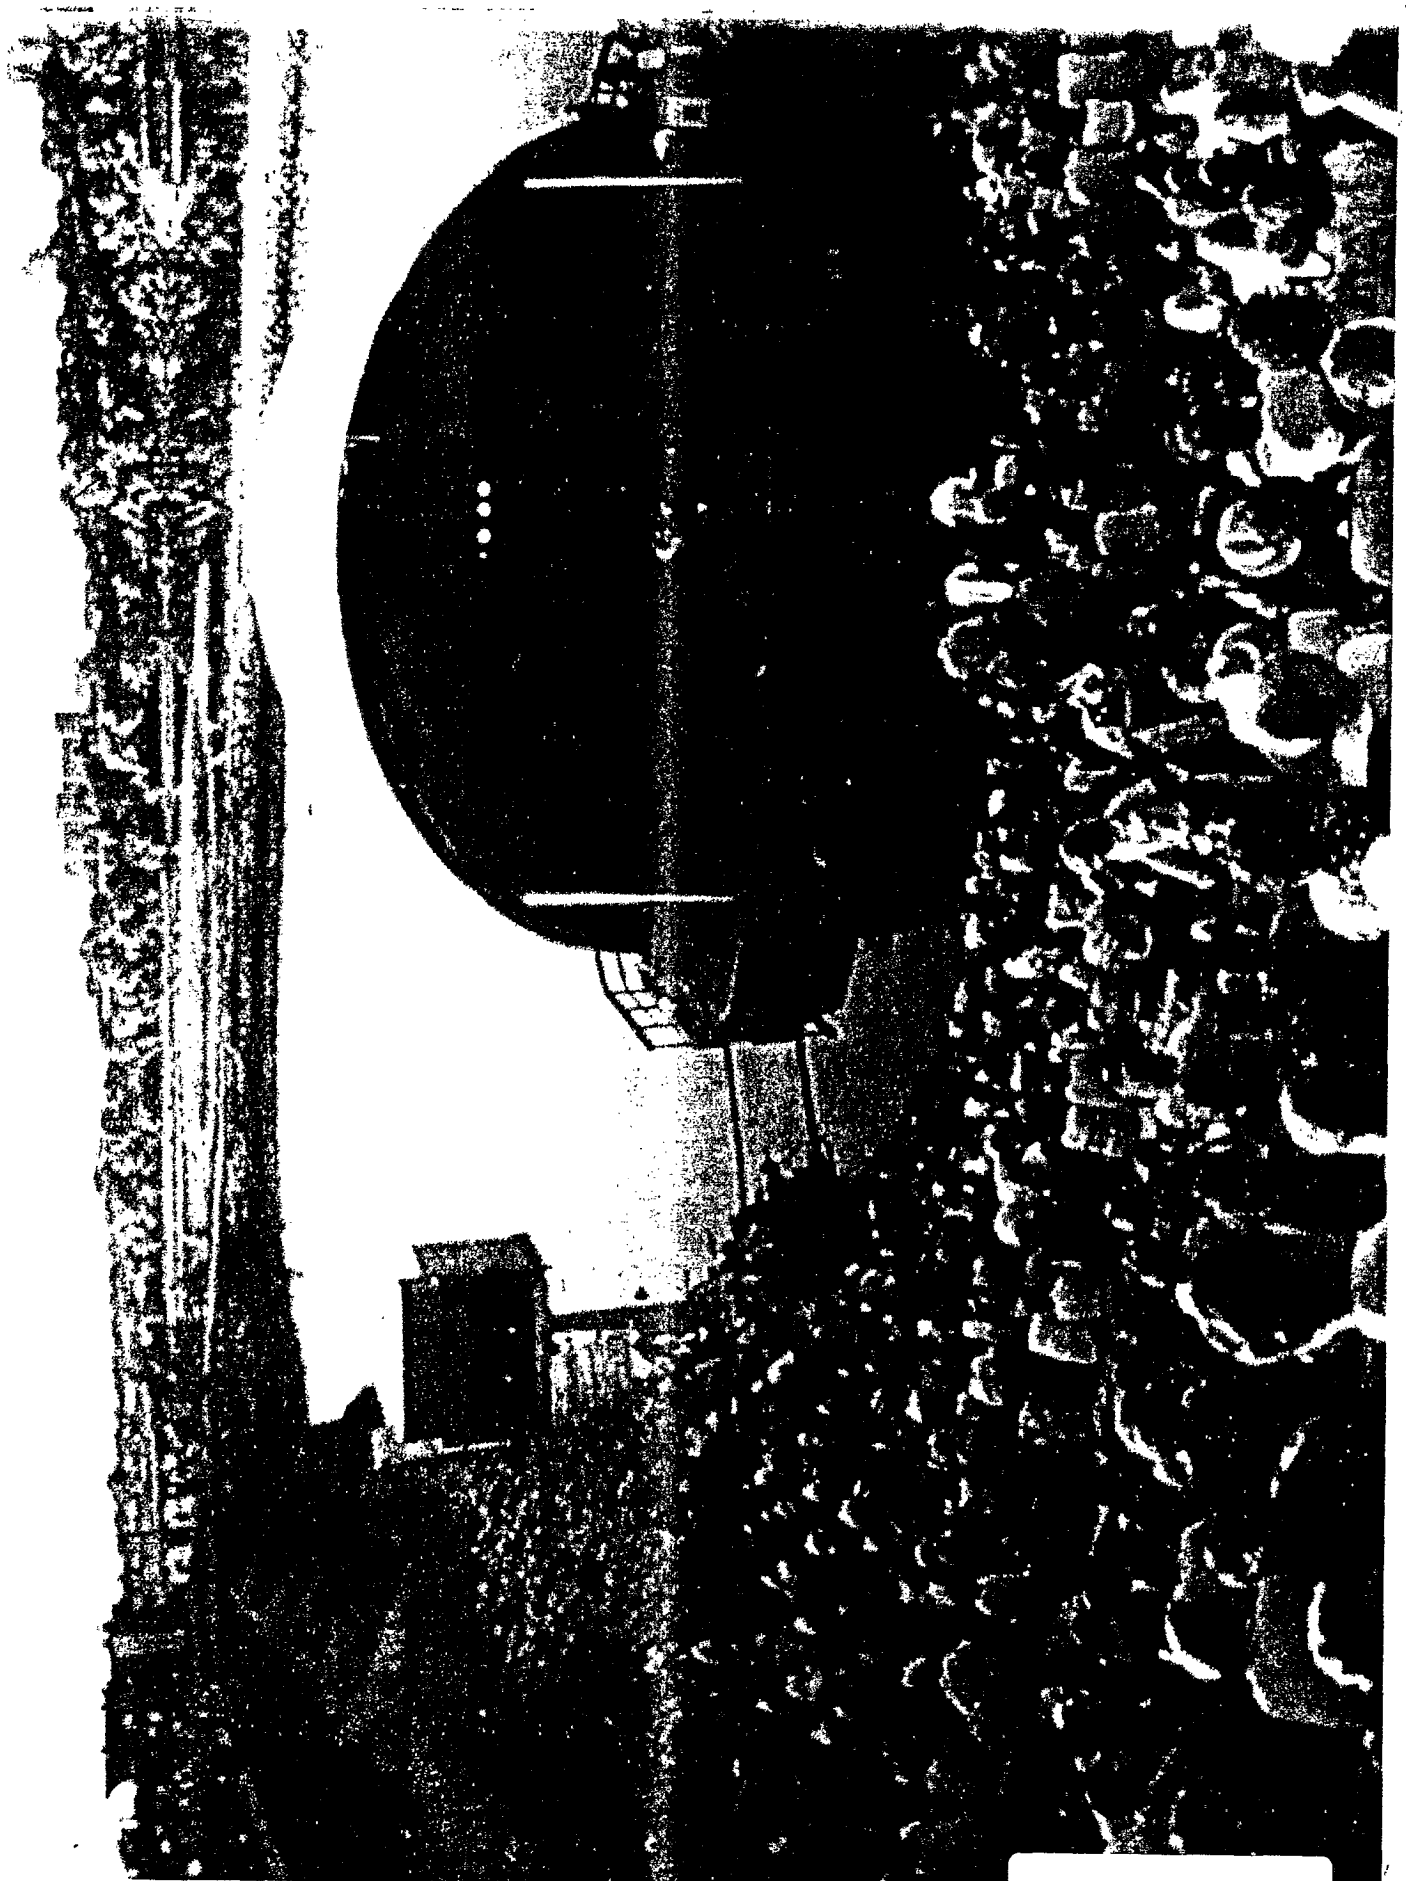
The fee was calculated by determining essential program requirements, then allocating the needed charges equitably to all homes and businesses. Residents of single-family homes pay $2.58 per month. Business owners pay the same amount for every 2,650 square feet of impervious surface on their properties.

The charge is based on the theory that stormwater runs off every property in the city; dwellers on both hillside and lowland contribute runoff. Since everybody helps create the need for a floodplain and stormwater program, everybody helps pay for it.

The utility fee yields about $9 million annually. The largest share goes to maintenance. The balance goes toward management, planning, public education, small capital projects, and other uses.

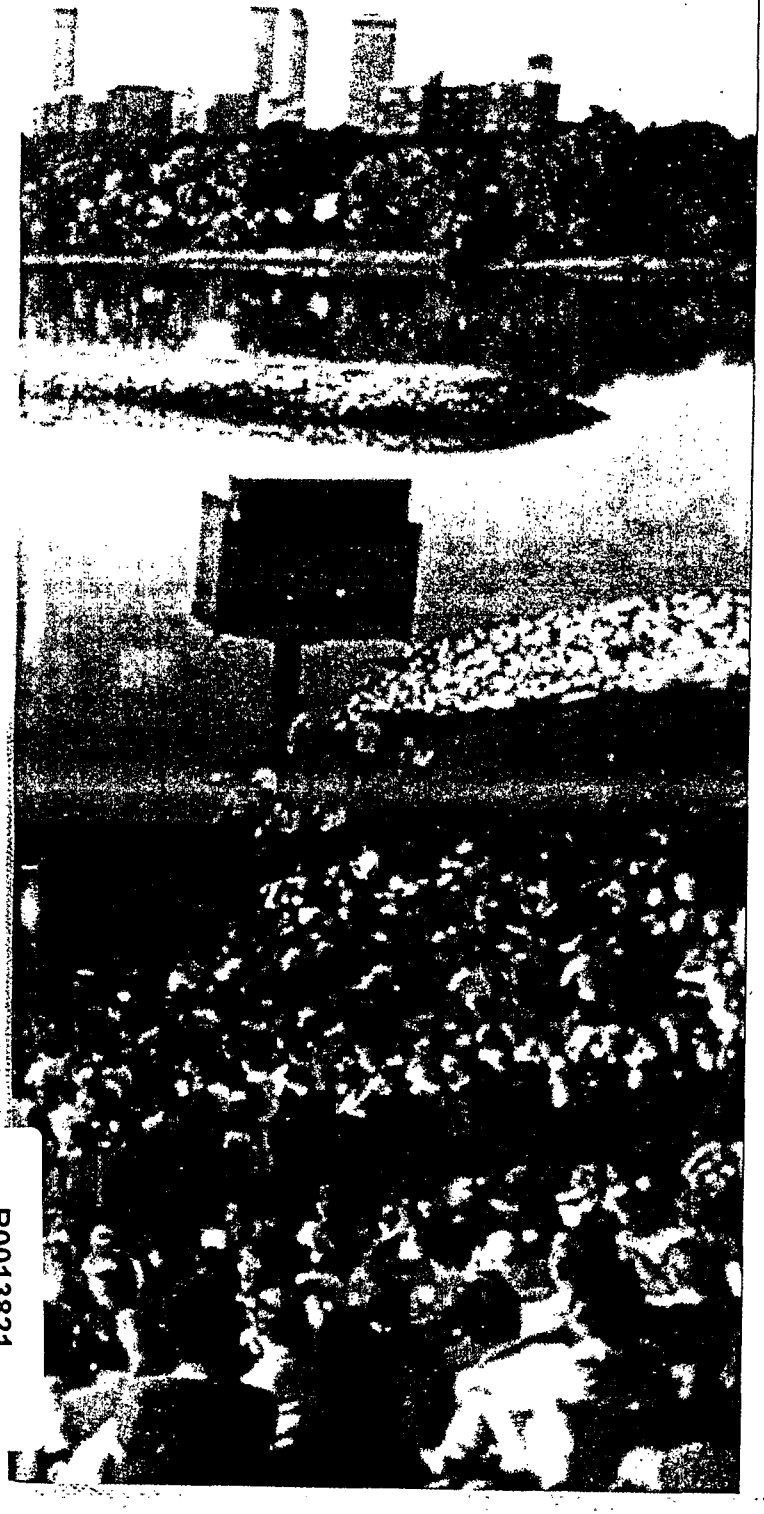


The utility fee is not used directly for major capital projects. Major projects are financed, instead, by general obligation bonds, sales tax revenues, and – when available – federal funds. Similar sources are used for master drainage planning. Other funds include fees in lieu of detention and permit fees.



▲ The Stormwater Drainage Advisory Board provides policy guidance.

Stormwater Utility Fee



Most of the Stormwater Utility Fee is budgeted for maintenance and operations. In addition, Tulsa spends about $10 million per year in local capital funds for flood projects.

R0013819

◀ Once a shunned dump, Tulsa's Arkansas River floodplain is now the city's prized River Parks.

The View Ahead

Beyond the Ark

When a town like Tulsa is battered by unrelenting disasters, the number one priority has to be public safety and loss reduction.

But in time, after enough progress and a spell of gentle weather, town leaders may be able to look beyond just "building an ark" for protection.

They are beginning to see that stormwater and floodplains can be among their most important community resources. They can become assets, not enemies.

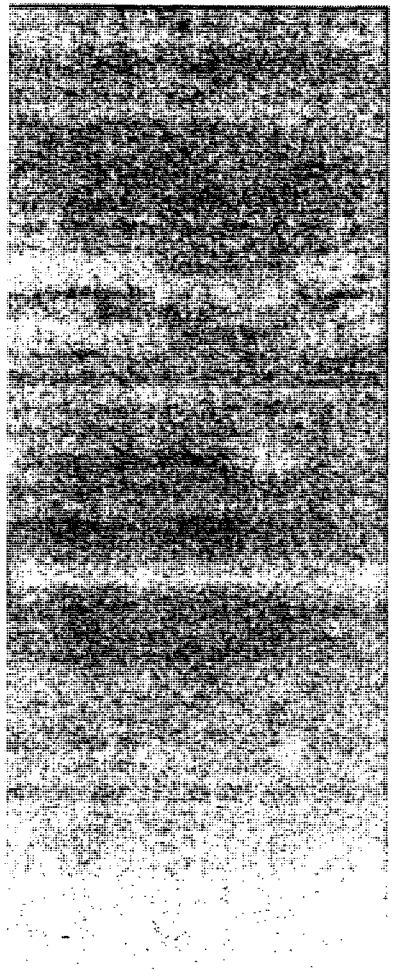
Tulsans are slowly rediscovering the graceful floodplain treatments that marked the city's fine early development.

Now, whenever possible, flood projects include active and passive recreation and environmental elements. In some cases, projects are incorporated into existing parks. Elsewhere, acquisition areas, detention basins, and floodplains include recreation.

Some projects have become small nature oases in the urban area, used by migrating birds such as Canada geese and other wildlife.

The city is converting some drainageways into greenways.

On a backbone of maintenance roads along creeks, the Tulsa Trails program is building paths for jogging, hiking, and bicycling.



Tulsa's future may well go beyond the ark, to become more than merely floodsafe.

Where once loomed death and destruction, Tulsa's future floodplains can hold strip parks, landscaped creek banks, sporting fields, and reflecting pools, all in the name of floodplain and stormwater management, for the benefit of Tulsans for generations to come.

It's a long stretch to consider flood waters that can take human life as community assets and an even longer reach to suggest that a potential killing ground can become a place of recreation and renewal.

▲ Tulsans cherish their River Parks along the Arkansas River floodplains.

"Your city, its growth, enterprise, cleanliness, beauty, and prosperity is your responsibility. Are you working at it? A City, like a tree, grows as it is trained, straight or crooked. If selfishness dominates it, it will not thrive, and no one will love it. If generous men and women with vision are its cultivators, it will grow and flourish, and the stranger at its gates will enter and ask for a chance to work for it."

ACKNOWLEDGEMENTS

This report was researched and written by Robert Iosco, Urban Water Quality Specialist, Northern Virginia Soil and Water Conservation District (NVSWCD), Fairfax, Virginia.

The author would particularly like to acknowledge the contributions of Jean R. Packard, Vice-Chairman and Director, NVSWCD, and Norman T. Jeffries, former Executive Director, NVSWCD. They reviewed many drafts and provided valuable insights. In addition, the entire NVSWCD staff deserves thanks for providing the overall assistance necessary to complete this project.

The project was funded by Grant # X-820828-01-0/1/2 from the Nonpoint Source Control Branch, Office of Water, U.S. Environmental Protection Agency, Washington, DC. The EPA Project Officer for this grant was Rod Frederick, Chief, Urban Sources Section, Nonpoint Source Control Branch.

The following individuals provided review comments:

Earl Shaver
Delaware Department of Natural Resources
Dover, DE

Warren Bell
City Engineer
City of Alexandria, VA

Leslie Tull
Environmental Officer
City of Austin, TX

Kevin McCann
Storm Water Utility Bureau
City of Orlando, FL

Dave Janik & Bernadette Taber
Buzzards Bay Project
Marion, MA

Noel Kaplan
Office of Comprehensive Planning
Fairfax County, VA
